ENCYCLOPAEDIA;
OR, A
DICTIONARY
OF
ARTS, SCIENCES,
AND
MISCELLANEOUS LITERATURE;
Constructed on a Plan,
BY WHICH
THE DIFFERENT SCIENCES AND ARTS
Are digested into the Form of Distinct
TREATISES OR SYSTEMS,
COMPREHENDING
THE HISTORY, THEORY, AND PRACTICE, OF EACH,
According to the Latest Discoveries and Improvements;
AND FULL EXPLANATIONS GIVEN OF THE
VARIOUS DETACHED PARTS OF KNOWLEDGE,
WHETHER RELATING TO
NATURAL AND ARTIFICIAL OBJECTS, OR TO MATTERS ECCLESIASTICAL,
CIVIL, MILITARY, COMMERCIAL, &C.
Including ELUCIDATIONS OF THE MOST IMPORTANT TOPICS RELATIVE TO RELIGION, MORALS, MANNERS,
AND THE ECONOMY OF LIFE:
TOGETHER WITH
A DESCRIPTION OF ALL THE COUNTRIES, CITIES, PRINCIPAL MOUNTAINS, SEAS, RIVERS, &C.
THROUGHOUT THE WORLD;
A GENERAL HISTORY, ANCIENT AND MODERN, OF THE DIFFERENT EMPIRES, KINGDOMS, AND STATES;
AND
AN ACCOUNT OF THE LIVES OF THE MOST EMINENT PERSONS IN EVERY NATION,
FROM THE EARLIEST AGES DOWN TO THE PRESENT TIMES.

Compiled from the writings of the best authors, in several languages; the most approved dictionaries, as well of general science as of its particular branches; the transactions, journals, and memoirs, of various learned societies; the MS. lectures of eminent professors on different sciences; and a variety of original materials, furnished by an extensive correspondence.

THE FIRST AMERICAN EDITION, IN EIGHTEEN VOLUMES, GREATLY IMPROVED.
ILLUSTRATED WITH FIVE HUNDRED AND FOURTY-TWO COPPERPLATES.

PHILADELPHIA:
PRINTED BY THOMAS DOBSON, AT THE STONE HOUSE, NO 41, SOUTH SECOND STREET.
M.DCC.XCIII.
[Copy-right secured according to law.]
C

C A A

THE third letter, and second consonant, of the Greek alphabet, is pronounced like k before the vowels a, o, and u; and like s before e, i, and y. C is formed, according to Scaliger, from the σ of the Greeks, by retracing the stem or upright line; though others derive it from the z of the Hebrews, which has in effect the same form; allowing only for this, that the Hebrews, reading backwards, and the Latins, &c. forwards, each have turned the letter their own way. However, the C not being the same as to found with the Hebrew capb, and it being certain the Romans did not borrow their letters immediately from the Hebrews or other orientals, but from the Greeks, the derivation from the Greek σ is the more probable. Add, that F. Monfacon, in his Palaeographia, gives us some forms of the Greek ζ, which come very near that of our C; thus, for instance, C: and Suidas calls the C the Roman καββα. The second found of C resembles that of the Greek ζ; and many instances occur of ancient inscriptions, in which ζ has the same form with our C. All grammarians agree, that the Romans pronounced their Q like our C, and their C like our K. F. Mabillon adds, that Charles the Great was the first who wrote his name with a C; whereas all his predecessors of the same name wrote it with a K: and the same difference is observed in their coins.

As an abbreviation, C stands for Caen, Carolus, Caesar, Cesar, Condemnus, &c. and CC for conflitibus.

As a numeral, C signifies 100, CC 200, &c.

C, in music, placed after the :f, intimates that the music is in common time, which is either quick or slow, as it is joined with allegro or adagio: if alone, it is usually adagio. If the C be crossed or turned, the first requires the air to be played quick, and the last very quick.

CAABA, or CAABAH, properly signifies a square stone building; but is particularly applied by the Mahometans to the temple of Mecca, built, as they pretend, by Abraham and Ishmael his son.

Before the time of Mahomet, this temple was a place of worship for the idolatrous Arabs, and is said to have contained no less than 360 different images, equaling in number the days of the Arabian year. They were all destroyed by Mahomet, who sanctified the Caaba, and appointed it to be the chief place of worship for all true believers. The temple is in length from north to south about 24 cubits: its breadth from east to west is 23: and its height 27. The door, which is on the east side, stands about four cubits from the ground; the floor being level with the bottom of the door. In the corner next to the door is the black stone, so much celebrated among the Mahometans. On the north side of the caaba, within a semicircular inclosure 50 cubits long, lies the white stone, said to be the sepulchre of Ishmael, which receives the rain-water from the caaba by a spout formerly of wood, but now of gold. The black stone, according to the Mahometans, was brought down from heaven by Gabriel at the creation of the world; and originally of a white colour; but contrasted the blackness that now appears on it, from the guilt of those sins committed by the sons of men. It is set in silver, and fixed in the south-east corner of the caaba, looking towards Bastra, about seven spans from the ground. This stone, upon which there is the figure of a human head, is held in the highest estimation among the Arabs; all the pilgrims kissing it with great devotion, and some even calling it the right hand of God. Its blackness, which is only superficial, is probably owing to the kites and touches of so many people. After the Karmatians had taken Mecca, they carried away this precious stone, and could by no means be prevailed upon to restore it: but finding at last that they were unable to prevent the concourse of pilgrims to Mecca, they sent it back of their own accord, after having kept it 22 years.

The double roof of the caaba is supported within by three octagonal pillars of aloes-wood: between which, on a bar of iron, hang some silver lamps. The outside is covered with rich black damask, adorned with an embedded band of gold, which is changed every year, and was formerly lent by the khalifs, afterwards by the sultans of Egypt, and is now provided by the Turkish emperors. The caaba, at some distance, is almost surrounded by a circular inclosure of pillars, joined towards the bottom by a low balustrade, and towards the top by bars of silver. Just without this inner inclosure, on the south, north, and west sides of the caaba, are three buildings, which are the oratories or places where three of the orthodoxy fefta assemble to perform their devotions. Towards the south-east stands an edifice which covers the well Zemzem, the treasury, and the cupola of Al Abbas. Formerly there was another cupola, that went under the name of the hemicycle, or cupola of Judea: but whether or not any remains of that are now be seen is unknown; nor is it easy to obtain information in this respect, all Christians being denied access to this holy place. As a small distance from the caaba, on the east side, is the stiletto or place of Abraham; where is another stone much respected by the Mahometans; and where they pretend...
CAB [ 2 ]

CABAL, or Cabáli, a term generally applied to the footsteps of the patriarch, telling us he stood on it when he built the caaba. Here the fourth sect of Arabs, viz.: that of Al Shafei, assembled for religious purposes.

The square colonnade, or great piazza, that at a considerable distance incloses these buildings, consists, according to Al Jannabi, of 448 pillars, and has no less than 38 gates. Mr Sale compares this piazza to that of the royal exchange at London, but allows it to be much larger. It is covered with small domes or cupolas, from the four corners of which rise as many minarets or spires, with double galleries, and adorned with gilded spires and crescents after the Turkish manner, as are also the cupolas which cover the piazza and other buildings. Between the columns of both inclosures hang a great number of lamps, which are constantly lighted at night. The first foundations of this second inclosure were laid by Omar the second khalif, who built no more than a low wall, to prevent the court of the caaba from being incroached upon by private buildings; but by the liberality of succeeding princes, the whole has been raised to that state of magnificence in which it appears at present.

This temple enjoys the privilege of an asylum for all sorts of criminals; but it is most remarkable for the pilgrimages made to it by the devout Mussulmans, who pay so great a veneration to it, that they believe a single sight of its sacred walls, without any particular act of devotion, is as meritorious, in the fight of God, as the most careful discharge of one's duty, for the space of a whole year, in any other temple.

CAAMINI, in botany, a name given by the Spaniards and others to the finest sort of Paraguay tea. It is the leaf of a shrub which grows on the mountains of Maracayaca, and is used in Chili and Peru as the tea is with us. The mountains where this shrub grows naturally are far from the inhabited parts of Paraguay; but the people of the place know so well the value and use of it, that they furnish themselves with great quantities of it from the spot. They used to go out on these expeditions many thousands together; leaving their country in the mean time exposed to the insults of their enemies, and many of themselves perishing by fatigue. To avoid these inconveniences, they have of late planted these trees about their habitations; but the leaves of these cultivated ones have not the fine flavour of those that grow wild. The king of Spain has permitted the Indians of Paraguay to bring to the town of Saintfory 12,000 arbores of the leaves of this tree every year, but they are not able to procure so much of the wild leaves annually: about half the quantity is the utmost they bring of this; the other half is made up of the leaves of the trees in their own plantations; and this fells at a lower price, and is called pabos. The arbores are about 65 pound weight; the general price is four piastras; and the money is always divided equally among the people of the colony.

CAANA, or KAAAN, a town in Upper Egypt, seated on the eastern banks of the river Nile, from whence they carry corn and pulse for the supply of Mecca in Arabia. E. Long. 32° 23'. N. Lat. 24° 30'. Here are several monuments of antiquity yet remaining, adorned with hieroglyphics.

CAB, an Hebrew dry measure, being the sixth part of a seah or samah, and the 18th part of an ephah. A cab contained 2½ pints of English corn-measure: a quarter cab was the measure of dove's dung, or more properly a fort of chick-pea; and this name, was sold at Samaria, during the siege of that city, for five shekels.

CABAL, an apt name currently given to the infamous ministry of Charles II., composed of five persons, Clifford, Ashley, Buckingham, Arlington, and Lauderdale: the first letters of whose names, in this order, furnished the appellation by which they were distinguished.

CABALLIST, in French commerce, a factor or person who is concerned in managing the trade of another.

CABALLARIA, in middle-age writers, lands held by the tenure of furnishing a horseman, with suitable equipage, in time of war, or when the lord had occasion for him.

CABALLEROS, or CAVALLEROS, are Spanish wools, of which there is a pretty considerable trade at Bayonne in France.

CABALLINE, denotes something belonging to horses; thus caballine shoes is so called, from its being chiefly used for purging horses; and common brimstone is called sulphur caballinum for a like reason.

CABALLINUS (anc. geo.), a town of the Eedu in Gallia Celtica; now Chalont sur Saone, which fee.

CABALLINUS (anc. geo.), a very clear fountain of mount Helicon in Boeotia; called Hippocrene by the Greeks, because opened by Pegafus on striking the rock with his hoof, and hence called Pegafus.

CABALLIO, or CABELLO (anc. geo.), a town of the Cavares in Gallia Narbonensis, situated on the Draculina. One of the Latin colonies, in the Notitia called Civitas Cabellorum. Now Cavanillon in Provence.

CABBAGE, in botany. See Brassica; and Agriculture, n° 40, and 169. In the Geological essays, we find this plant greatly recommended as an excellent food for cattle, producing much dung, and being an excellent substitute for hay. The author prefers the Scotch kind, as being most durable, and preferable on all other accounts. He also recommends autumn-sowed plants in preference to those sowed in the spring; the former producing a much more weighty crop than the latter. The expense of raising an acre of good cabbages he values at 14/- 15s. and its produce at 34/-

CABBAGE-Tree, or TRUE CABBAGE-PALM. See Areca.

CABBAGE-BARK Tree. See Goffrea.

CABBALA, according to the Hebrew style, has a very distinct signification from that wherein we understand it in our language. The Hebrew cabbala signifies tradition; and the Rabbins, who are called cabalists, study principally the combination of particular words, letters, and numbers, and by this means pretend to discover what is to come, and to see clearly into the sense of many difficult passages of Scripture. There are no pure principles of this knowledge, but it depends upon some particular traditions of the ancients; for which reason it is termed cabbala.

The cabalists have abundance of names which they call sacred; these they make use of in invoking of spirits, and imagine they receive great light from them.

They
They tell us, that the secrets of the cabbala were discovered to Moses on mount Sinai; and that these have been delivered to them down from father to son, without interruption, and without any use of letters; for to write them down, is what they are by no means permitted to do. This is likewise termed the oral law, because it passed from father to son, in order to distinguish it from the written laws.

There is another cabbala, called artificial, which consists in searching for abstruse and mysterious significations of a word in Scripture, from whence they borrow certain explanations, by combining the letters which compose it; this cabbala is divided into three kinds, the gematriac, the notaricon, and the temura or thumura. The first wherein consists in taking the letters of a Hebrew word for ciphers or arithmetical numbers, and explaining every word by the arithmetical value of the letters whereof it is composed. The second sort of cabbala, called notaricon, consists in taking every particular letter of a word for an entire dictionary; and the third, called thumura, i.e. change, consists in making different transpositions or changes of letters, placing one for the other, or one before the other.

Among the Christians, likewise, a certain fort of magic is, by mistake, called cabbala; which consists in using improperly certain passages of Scripture for magic operations, or in forming magic characters or figures with stars and talismans.

Some visionaries among the Jews believe, that Jesus Christ wrought his miracles by virtue of the mysteries of the cabbala.

CABBALISTS, the Jewish doctors who profess the study of the cabbala.

In the opinion of these men, there is not a word, letter, or accent in the law, without some mystery in it. The Jews are divided into two general sorts: the Karaites, who refuse to receive either tradition or the talmud, or any thing but the pure text of scripture; and the Rabbinists, or Talmudists, who, besides this, receive the traditions of the ancients, and follow the Talmud.

The latter are again divided into two other sects; pure Rabbinists, who explain the scripture in its natural sense, by grammar, history, and tradition; and cabbalists, who, to discover hidden mythicale fancies, which they suppose God to have couched therein, make use of the cabbala, and the mystical methods above-mentioned.

CABECAS, or CABESSE, a name given to the finest silks in the East Indies, as those from 15 to 20 per cent. inferior to them are called carina. The Indian workmen endeavour to pass them off one with the other; for which reason, the more experienced European merchants take care to open the bales, and to examine all the skaines one after another. The Dutch distinguish two sorts of cabecas; namely, the Moor cabeca, and the common cabeca. The former is sold at Amsterdam for about 24 schellinghen Flemish, and the other for about 18s.

CABECAS DE VIDE, a small sea-port town of Alentejo in Portugal, with good walls, and a strong castle. W. Long. 6° 43', N. Lat. 39° 0'.

CABENDA, a sea-port of Congo in Africa, situated in E. Long. 12° 2', S. Lat. 4° 5'.
The number of threads each cable is composed of is always proportioned to its length and thickness; and it is by this number of threads that its weight and value are ascertained: thus, a cable of three inches circumference, or one inch diameter, ought to consist of 48 ordinary threads, and to weigh 192 pounds; and on this foundation is calculated the following table, very useful for all people engaged in marine commerce, who fit out merchantmen for their own account, or freight them for the account of others.

### Table of the number of threads and weight of cables of different circumferences.

**Sheet Anchor Cable** is the greatest cable belonging to a ship.

**Stream Cable**, a hawser or rope, something smaller than the bowers, and used to moor the ship in a river, or haven, sheltered from the wind and sea, &c.

**Serve** or **Plate the Cable**, is to bind it about with ropes, cloths, &c. to keep it from galling in the hawse.

To **splice a Cable**, is to make two pieces fast together, by working the several threads of the rope the one into the other.

**Pay more Cable**, is to let more out of the ship. **Pay cheap the Cable**, is to hand it out apace. **'Peer more Cable**, is to let more out, &c.

**Cable's Length**, a measure of 120 fathoms, or of the usual length of the cable.

**Cabled** in heraldry, a term applied to a cross formed of the two ends of a ship's cable; sometimes also to a cross covered over with rounds of rope; more properly called a cross covered.

**Cabled Flute** in architecture, such flutes as are filled up with pieces in the form of a cable.

**Cabo de Istria**, the capital town of the province of Istria, in the territory of Venice; and the see of a bishop. It is seated on a small island in the gulf of Venice, and is joined to the main land by draw-bridges.

E. Long. 14 22 N. Lat. 45 49.

**Caboched**, in heraldry, is when the heads of beasts are borne without any part of the neck, full-faced.

**Cabolto**, in commerce, a coin of the republic of Genoa, worth about 2d. sterling.

**Cabot** (Sebastian), the first discoverer of the continent of America, was the son of John Cabot a Venetian. He was born at Bristol in 1477, and was taught by his father arithmetic, geometry, and cosmography.
CABUL, or CABOUL, a city of Asia, and capital of the province of Cabulistan. It lies in E. Long. 68° 15', N. Lat. 33° 50', on the frontiers of Great Bukharia, on the south side of the mountains which divide the territories of the Mogul from that part of Great Tartary. It is one of the finest places in that part of the world; large, rich, and very populous. As it is considered as the key of the Great Mogul's dominions on that side, great care is taken to keep its fortifications in repair, and a numerous garrison is maintained for its security. It lies on the road between Samarcand and Lahor; and is much frequented by the Tartars, Persians, and Indians. The Uzbek Tartars drive there a great trade in slaves and horses, of which it is said that no fewer are sold than 60,000 annually. The Persians bring black cattle and sheep, which renders provisions very cheap. They have also wine, and plenty of all sorts of cattle. The city stands on a little river which falls into the Indus, and thereby affords a short and speedy passage for all the rich commodities and provisions behind it, which, when brought to Cabul, are there exchanged for slaves and horses, and then conveyed by merchants of different countries to all parts of the world. The inhabitants are most of them Indian pagans, though the officers of the Mogul and most of the garrison are Mahometans.

CABULISTAN, a province of Asia, formerly belonging to the Great Mogul; but ceded in 1729 to Kouli Khan, who at that time governed Perjia. It is bounded on the north by Bukharia, on the east by Cashmere, on the west by Zabulistan and Candahar, and on the south by Multan. It is 250 miles in length, 240 in breadth, and its chief town is Cabul. This country in general is not very fruitful; but in the vales they have good pasture-lands. The roads are much infested with banditti; which obliges the natives to have guards for the security of travellers. The religion of the Cabulistanis is pagan, and their extraordinary time of devotion is the full moon in February, and continues for two days. At this time they are clothed in red, make their offerings, dance to the sound of the trumpet, and make visits to their friends in masquerade dresses. They say, their god Cufman killed a giant, who was his enemy, and that he appeared like a little child; in memory of which, they cause a child to flourish at the figure of a giant. The same tribe make bonfires, and feast together in a joyful manner. The moral part of their religion consists in charity; for which reason they dig wells and build houses for the accommodation of travellers. They have plenty of provisions, mines of gold and myrrh, fragrant woods, and drugs of many kinds. They carry on a great trade with the neighbouring countries; by which means they are very rich, and are supplied with plenty of all things.

CABURNES,
CACALIA, in botany; a genus of the polygamyæqualis order, belonging to the synephygia class of plants. The receptacle is naked; the pappus hairy; the calyx cylindrical, oblong, and calculated, or having a small calyx of very short scales only at the base.

Species. 1. The flavoseus, with a herbaceous stalk, is a native of North America. It hath a perennial creeping root which forms out many stalks, garnished with triangular spear-shaped leaves sharply fawed on their edges, of a pale green on their under side, but a deep shining green above, placed alternately. The stalks rise to the height of seven or eight feet, and are terminated by umbels of white flowers, which are succeeded by oblong seeds covered with down. It flowers in August, and the seeds ripen in October. The stalks decay in autumn, and new ones rise in the spring. This plant multiplies greatly by its spreading roots, as also by the seeds, which are spread to a great distance by the wind, the down which adheres to them being greatly increased so much, that in a few years this species may probably appear as a native of England.

2. The ficioides is a native of the Cape of Good Hope. It rises with strong round stalks to the height of seven or eight feet, woody at bottom, but soft and succulent upward, fending out many irregular branches, garnished more than half their length with thick, taper, succulent leaves, a little compressed on two sides, ending in points, covered with a whitish glaucous farina, which comes off when handled. These, when broken, emit a strong odour of turpentine, and are full of a vitrious juice; at the extremity of the branches the flowers are produced in small umbels; they are white, tumbulous, and cut into five parts at the top. The leaves of this plant are pickled by the French, who esteem them much; and in doing this they have a method of preserving the white farina upon them, which adds greatly to the beauty of the pickle when brought to table.

3. The kleina, with a compound shrubby stalk, grows naturally in the Canary Islands, but has long been cultivated in the English gardens. It rises with a thick fleshy stem divided at certain distances, as it were, into many joints. Each of these divisions swell much larger in the middle than they do at each end; and the stalks divide into many irregular branches of the same form, which, toward their extremities, are garnished with long, narrow, spear-shaped leaves of a glaucous colour, standing all round the stalks without order. As they fall off, they leave a scar at the place, which always remains on the branches. The flowers are produced in large clusters at the extremity of the branches, which are tumbulous, and of a faint carnation colour. They appear in August and September, but continue great part of October, and are not succeeded by seeds in England. There have been flanes and foills dug up at a very great depth in some parts of England having very perfect impressions of this plant upon them; from whence Dr Woodward has supposed the plants were lodged there at the universal deluge; and finding the impressions of many other plants and animals which are natives of those islands, he concludes that the water flowed higher from the south-west. This plant has been called the cabbage-tree, from the resemblance which the stalk of it has to the cabbage; others have intitled it carnation-tree, from the shape of the leaves and the colour of the flowers. Besides these, there are several other species, viz. the alpina, with kidney-shaped leaves; the glabra, with smooth leaves; the atriplicifolia, with heart-shaped incised leaves; the papillosus, with a shrubby stalk guarded on every side with broken rough foossstalks; the antae-euphorbium, with oblong oval leaves; the fonchifolia, with lyre-shaped incised leaves; and the lutea, with leaves divided into five acut parts.

Culture. The three species described above are very easily propagated. The first will propagate itself, as already mentioned, either by roots or seeds. The second is easily propagated by cuttings during the summer months: these should be cut from the plants and laid to dry a fortnight, that the wound may be healed over before they are planted. Most people plunge the pots in which these are planted into an hot bed, to promote their putting out roots; but if planted in June or July, they will root as well in the open air. Even branches broken off by accident have frequently put out roots when fallen on the ground, without any care. These branches may be kept six months out of the ground, and will take root if planted. This should have a light sandy earth, and in winter be placed in an airy glass-house, where they may enjoy the sun and air in mild weather, but must be protected from frost. During the winter feason the plants must have but little water; and in summer, when they are placed in the open air, it should not be given to them too often, nor in great quantity. The third is also propagated by cuttings, and the plants require the same culture; but must have a dry warm glass-case in winter, and very little water, being subject to rot with wet. In summer they must be placed in the open air in a warm sheltered situation, and in very dry weather refreshed moderately with water. With this management the plants will flower annually, and grow to the height of eight or ten feet.

CACAÓ. See Theobroma.
CACCOONS. See Plevillea.
CACERES, a town of Spain, in the province of Extremadura, is seated on the river Saler, and noted for the exceeding fine wool which the sheep bear in the neighbourhood. Between this town and Brocos, there is a wood, where the allies defeated the rear-guard of the duke of Berwick, on the 7th of April 1706. E. Long. 6. 47. N. Lat. 59. 15.
CACHALOT, in ichthyology. See Physeter.
CACHAN, or Cushan, a considerable town of Peria in Iraq Agemi, where they carry on an extensive trade in silk, silver, and gold broacades, and fine earthen ware. It is situated in a vast plain, 55 miles from Isphahan. E. Long. 150. 2. N. Lat. 54. 30.
CACHAO, a province of the kingdom of Tonquin in Asia, situated in the heart of the kingdom, and surrounded by the other seven. Its soil is fertile, and in some places mountainous, abounding with variety of trees, and particularly that of varnish. Most of these provinces carry on some branch of the silk manufacture, but this most of all. It takes its name from the capital, which is also the metropolis of the whole kingdom, though in other respects hardly comparable to a Chinese one of the third rank.
CACHAO, a city of the province of that name, in the kingdom of Tonquin in Asia, situated in E. Long. 105.
The circumference is said to have been between six and seven miles: some arches, porticoes, and other ornaments, are still remaining; from which, and some of its courts paved with marble, it may be concluded to have been as magnificent a structure as any of the eastern parts can show. The arsenal is likewise a large and noble building, well stored with ammunition and artillery. The English factory is situated on the north side of the city, fronting the river Song-kee. It is a handsome low-built house, with a spacious dining-room in the centre; and on each side are the apartments of the merchants, factors, and servants. At each end of the building are smaller houses for other uses, as store-houses, kitchen, &c., which form two wings with the square in the middle, and parallel with the river, near the bank of which stands a long flagstaff, on which they commonly display the English colours on Sundays and all remarkable days. Adjoining to it, on the south side, is the Danish factory, which is neither so large nor so handsome. On the same side of the river runs a long dike, whose timber and fencs are firmly fastened together, so that no part of it can be flirred without moving the whole. This work was raised on those banks to prevent the river, during the time of their vast rains, from overflowing the city; and it has hitherto afforded its end; for though the town stands high enough to be in no danger from land-floods, it might yet have been otherwise frequently damaged, if not totally laid under water, by the overflowing of that river. Some curious observations have been communicated to the royal society concerning differences between the tides of those seas and those of Europe, viz. that on the Tonquinne coast ebbs and flows but once in 24 hours; that is, that the tide is rising during the space of 12 hours, and can be easily perceived during two of the moon's quarters, but can hardly be observed during the other two. In the spring tides, which last 14 days, the waters begin to rise at the rising of the moon; whereas in the low tides, which continue the fame number of days, the tide begins not till that planet is got below the horizon. Whilst it is passing through the fixed northern signs, the tides are observed to vary greatly, to rise sometimes very high, and sometimes to be very low; but when it is once got into the southern part of the zodiac, they are then found to be more even and regular.

CACHETIC, something partaking of the nature of, belonging to, a cachexy.

CACHEO, a town of Negroland in Africa, situated on the river St Domingo. It is subject to the Portuguese, who have three forts there, and carry on a great trade in wax and slaves. W. Long. 14. 55. N. Lat. 12°.

CACHEXY, in medicine, a vicious state of the humours and whole habit. See (the Index subjoined) to Medicine.

CACHYRS, in botany: A genus of the digitina order belonging to the pentandria clafs of plants; and in the natural method ranking under the 45th order, Umbellata. The fruit is subovate, angled, and cork or spongy rind.
The flower of the Cactus, highly celebrated among the Chinese and Indians, and made of several aromatic ingredients, the perfumes, medicinal earth, and precious stones: they make the whole into a stiff paste, and form out of it several figures according to their fancy, which are dried for use; these are principally used in the East Indies, but are sometimes brought over to Portugal. In China, the principal persons usually carry a small piece in their mouths, which is a continued cordial, and gives their breath a agreeably grateful smell. It is a highly valuable medicine also, in all nervous complaints: and it is esteemed a prolonger of life, and a provocative to venery, the two great intentions of most of the medicines in use in the East.

CACOCHYLLIA, or CACOCHYMA, a sticky viscid spirit of the vital humours, especially of the mafs of blood; arising either from a disorder of the secretions or excretions, or from external contagion. The word is Greek, compound of κασσός, ill, and κοχύλε, Jew.

CACOPHONIA, in grammar and rhetoric, the meeting of two letters, or syllables, which yield an uncouth and disagreeable sound. The word is compounded of κακός, evil, and φωνή, voice.

CACOPHONY, in medicine, denotes a voice or deprivation of the voice or speech; of which there are two species, aphonia and dysphonia.

CACTUS, in botany: A genus of the monogynia order, belonging to the icofandria class of plants; and in the natural method, ranking under the 13th order, Succulentae. The calyx is monoplyrophy, superior, or above the receptacle of the fruit imbricated; the corolla polysepalous; the fruit an unilocular, polypernumous berry. To this genus Linnaeus has added the cereus and opuntia. There are 24 species, all natives of the West Indies and Mexico.

The cacti are plants of a singular structure, but especially the larger kinds of them; which appear like a large, flieby, green melon, with deep ribs, set all over with strong sharp thorns; and, when the plants are cut through the middle, their inside is a soft, pale-green, flieby fibres, very full of moisture. The fruit of all the species is frequently eaten by the inhabitants of the West Indies. The fruits are about three quarters of an inch in length, of a taper form, drawing to a point at the bottom toward the plant, but blunt at the top where the emplacement of the flower was situated. The taste is agreeably acid, which in a hot country must render the fruit more grateful.

The cochineal animals are supported on a species called cactus cochinifer. The flower of the cactus grandiflora (one of the creeping cereusses) is said to be as grand and beautiful as any in the vegetable system: it begins to open in the evening about seven o'clock, is in perfection about eleven, and fades about four in the morning; so that the same flower only continues in perfection about six hours. The calyx when expanded is about a foot in diameter, of a splendid yellow within, and a dark brown without; the petals are many, and of a pure white; and the great number of recurved stamens, surrounding the style in the centre of the flower, make a grand appearance, to which may be added the fine scent, which perfumes the air to a considerable distance. It flowers in July.

CACUS, in fabulous history, an Italian shepherd, upon mount Aventine. As Hercules was driving home the herd of King Geryon whom he had slain, Cacus robbed him of some of his oxen, which he drew backward into his den lest they should be discovered. Hercules at last finding them out by their lowing, or the robbery being discovered to him, killed Cacus with his club. He was Vulcan's son, of prodigious bulk, and half man half fayr.

CADAN, a town of Bohemia, in the circle of Zats, seated on the northern bank of the river Egra, in E. Long. 13° 34'. N. Lat. 50° 20'.

CADARI, or KADARI, a sect of Mahometans, who affer free-will; attribute the actions of men to men alone, not to any secret power determining the will; and deny all absolute decrees, and predestination. The author of this sect was Mabed ben Kaled Al Ghoni, who suffered martyrdom for it. The word comes from the Arabic, كدی, cadara, present. Ben Aun calls the Cadarians the Magi, or Manichees of the Musulmen.

CADE, a cag, cach, or barrel. A cade of herrings is a vessel containing the quantity of 500 red herrings, or 1000 sprats.

CADE-Lamb, a young lamb weaned, and brought up by hand, in a house; called pet-lamb.

CADE-Oil, in the Materia Medica, a name given to an oil much in use in some parts of France and Germany. The physicians call it oleum cades, or oleum de cade. This is suppos'd by some to be the pinnatul of the ancients, but improperly; it is made of the fruit of the oxycedrus, which is called by the people of these places cade.

CADE-Worm, in zoology, the maggot or worm of a fly called phryganea. It is used as a bait in angling. See PHRYGANEA.

CADEA, or THE LEAGUE OF THE HOUSE OF GOD, is one of those that compose the republic of the Grifons, and the most powerful and extensive of them all. It contains the bithorpic of Coire, the great valley of Engadine, and that of Bragail or Pregal. Of the 11 great, or 21 small communities, there are but two that speak the German language; that of the rest is called the Rhein, and is a dialect of the Italian. The Protestant religion is most prevalent in this league, which has been allied to the Swifs cantons ever since the year 1498. Coire is the capital town.

CADMINAC, a town of France in Quercy, on the confines of Bouergne, seated on the river Lot, in E. Long. 2° 12'. N. Lat. 44° 36'.

CADENCE, or REPOSE, in music, (from the Latin cadere to fall or descend): the termination of an harmonical phrase on a reposes, or on a perfect chord. See Music, art. 73—76, and 122—137.

CADING, in reading, is a falling of the voice below the key-note at the close of every period. In reading, whether prose or verse, a certain tone is assumed which is called the key-note; and in this tone the bulk of the words
words are founded; but this note is generally lowered towards the close of every sentence. Cadence, in the manage, an equal measure or proportion, observed by a horse in all his motions; so that his times have an equal regard to one another, the one does not embrace or take in more ground than the other, and the horse observes his ground regularly.

Cadene, one of the sorts of carpets which the Europeans import from the Levant. They are the worst sort of all, and are fold by the piece from one to two pieces per carpet.

Cadenet, a town of France in Provence, and in the Viguirie of Apt. E. Long. 5. 30. N. Lat. 43. 40.

Cades, or Kadesh, (anc. geog.) a town in the Wilderness of Zin, in Arabia Petraea; the first encampment of the Israelites, after their departure from Eziongeber; and from which the Wilderness of Zin was called Cades; the burial-place, of Miriam, with the rock and water of Meribah in it. another Cades, a town of the tribe of Judah, Joshua xv. 23. (Cadefsbarnea, called also Cades.)

Cadessbarnea, (anc. geog.) a town of the Wilderness of Paran, on the confines of Canaan, from which the spies were sent out; sometimes simply called Cades, but distinffr from the Cades in the Wilderness of Zin.

Cadet, the younger son of a family, is a term naturalized in our language from the French. At Paris, among the citizens, the cadets have an equal primacy with the reft. At Caux in Normandy, the custom, as in England, is, to leave all to the eldest, except a small portion to the cadets. In Spain, it is usual for one of the cadets in great families to take the mother's name.

Cadet is also a military term denoting a young gentleman who chooses to carry arms in a marching regiment as a private man. His views are, to acquire some knowledge in the art of war, and to pay. Cadets differ from volunteers, as in England, is to leave all to the eldest, except a small portion to the cadets. In Spain, it is usual for one of the cadets in great families to take the mother's name.

Cadet, or Cadet, a judge of the civil affairs in the Turkish empire. It is generally taken for the judge of a town; judges of provinces being distinguished by the appellation of moula.

We find numerous complaints of the avarice, iniquity, and extortion, of the Turkish cadis; all justice is here venal; the people bribe the cadis, the cadis bribe the moulas, the moulas the candlefellers, and the candlefellers the muff. Each cadis has his ferjeants, who are to summon persons to appear and answer complaints. If the party summoned fails to appear at the hour appointed, sentence is passed in favour of his adversary. It is usually vain to appeal from the sentences of the cadis, since the affair is never heard anew, but judgment is passed on the cause as fixed by the cadis. But the cadis are often exhorat and punished for crying injustice with the hawkman and mullets; the law, however, does not allow them to be put to death. Constantine had had cadis ever since the year 1390, when Bajazet I. obliged John Paleologus, Emperor of the Greeks, to receive cadis into the city to judge all controversies happening between the Greeks and the Turks settled there. In some countries of Attica, the cadis are also judges of religious matters. Among the Moors, cadis is the denomination of their higher order of priests or doctors, answering to the rabbins among the Jew.

CADIA, or CADIA, the Turkish name of Chalcedon. See Chalcedon.

Cadileshcher, a capital officer of justice among the Turks, answering to a chief justice among us.

It is said, that this authority was originally confinined to the seldyers; but that, at present, it extends itfelf to the determination of all kinds of law-suits; yet is nevertheless subject to appeals.

There are but three cadileshchers in all the grand signior's territories: the first is that of Europe; the second, of Natolia; and the third resides at Grand Cairo. This law is the most considerable: they have their seats in the divan next to the grand vizir.

Cadillac, a town of France in Guienne, and in Bazadois, near the river Garonne, with a handsome castle, situated in W. Long. o. 15. N. Lat. 44. 37.

Cadi, or Cadhi, the judge of the civil affairs in the Turkish empire. It is generally taken for the judge of a town; judges of provinces being distinguished by the appellation of moula.

This authority was originally confined to the soldiery; but that, at present, a strong line of works defends the city from all approaches along the isthmus; and, to render them still more difficult, all the gardens and little villas on the beach were in 1762 cleared away, and a dreary sandy glacis left in their room, so that now there is scarce a tree on the whole island.

It occupies the whole surface of the western extremity of the island, which is composed of two large circular parts, joined together by a very narrow bank of sand, forming altogether the figure of a chain-flot. At the south-east end, the ancient bridge of Suaco, thrown over a deep channel or river, affords a communication between the island and the continent; a strong line of works defends the city from all approaches along the isthmus; and, to render them still more difficult, all the gardens and little villas on the beach were in 1762 cleared away, and a dreary sandy glacis left in their room, so that now there is scarce a tree on the whole island.

Except the Calle Ancha, all the streets are narrow, ill-paved, and infernally stinking. They are all drawn in straight lines, and most of them intersect each other at right angles. The swarms of rats that in the nights run about the streets are innumerable; whole droves of them pass and repass continually, and these midnight revels are extremely troublesome to such as walk late. The houses are lofty, with each a veiled bimble, which being left open till night, serve passengers to retire to; this custom, which prevails throughout Spain, renders these places exceedingly offensive. In the middle of the house is a court like a deep well, under which is generally a cistern, the breeding-place of gnats and musquitos; the ground floors are ware-houses, the first stories cooking-houses or kitchen, and the principal apartment up two pair of stairs. The roofs are flat, covered with an impenetrable cement, and few are without a mirador or turret for the purpose of commanding a view of the sea. Round the parapet-wall at top are placed rows of square pillars, meant either for ornament according to some traditional mode of decoration, or to fix awnings to, that such as sit there for the benefit of the sea-breeze may be sheltered from the rays of the sun; but the most common use made of them, is to fallen ropes for drying linen upon. High above all these pinnacles, which give Cadiz a most singular appearance, stands the
the tower of signals. Here flags are hung out on the first fight of a sail, marking the size of the ship, the nation it belongs to, and, if a Spanish Indiaman, the port of the Indies it comes from. The ships are acquainted with the proper signals to be made, and these are repeated by the watchmen of the tower: as painted lips in every house, persons concerned in commerce soon learn the marks.

The city is divided into twenty-four quarters, under the inspection of as many commissioners of police; and its population is reckoned at one hundred and forty thousand inhabitants, of which twelve thousand are French, and at least as many more Italians. The square of Saint Antonio is large, and tolerably handsome, and there are a few smaller openings of no great note. The public walk, or Alameda, is pleasant in the evening: it is fenced off the coach-road by a marble rail. The sea air prevents the trees from thriving, and destroys all hopes of future shade.

From the Alameda, continuing your walk westwards, you come to the Campofanto, a large esplanade, the only airing-place for coaches; it turns round most part of the west and south sides of the island, but the buildings are straggling and ugly; the only edifice of any show is the new orphan-house; opposite to it is the fortress of St Sebastian, built on a neck of land running out into the sea. The round tower at the extremity is supposed to have saved the city, in the great earthquake of 1755, from being swept away by the fury of the waves. The building proved sufficiently solid to withstand the shock, and break the immense volume of water that threatened destruction to the whole island. In the narrow part of the isthmus the surge beat over with amazing impetuosity, and bore down all before it; among the rest the grandon of the famous tragic-poet Racine, who strove in vain to escape by urging his horse to the utmost of his speed. On St Sebastian’s feast, a kind of wake or fair is held in the fort; an astonishing number of people then passing and repassing, on a firing of wooden bridges laid from rock to rock, makes a very lively moving picture.

From hence to the wooden circus where they exhibited the bull-feasts, you keep turning to the left close above the sea, which on all these days dashes over large ledges of rock; the shore seems here absolutely inaccessible. On this shore stands the cathedral, a work of great expense, but carried on with so little vigour, that it is difficult to guess at the term of years it will require to bring it to perfection. The vaults are executed with great solidity. The arches, that spring from the clustered pillars to support the roof of the church, are very bold; the minute sculpture bestowed upon them seems superfluous, as all the effect will be lost from their great height, and from the shade that will be thrown upon them by the filling up of the piers. From the sea, the present top of the church resembles the carcase of some huge monster cast upon its side, rearing its gigantic blanched ribs high above the buildings of the city. The outward casings are to be of white marble, the bars of the windows of bronze.

Next, crossing before the land-gate and barracks, a superb edifice for strength, convenience, and cleanliness, you come down to the ramparts that defend the city on the side of the bay. If the prospect to the ocean is solemn, that towards the main land is animated in the highest degree; the men of war ride in the eastern bosom of the bay; lower down the merchantmen are spread far and near; and close to the town an incredible number of barges; of various shapes and sizes, cover the surface of the water, some moored and some in motion, carrying goods to and fro. The opposite shore of Spain is shivered with white houses, and cultivated by the towns of St Mary’s, Port-real, and others, behind which, eastward, on a ridge of hills, stands Medina Sidonia, and further back rise the mountains of Granada. Westward, Rota closes the horizon, near which was anciently the island and city of Tarifa, now covered by the sea, but at low-water some part of the ruins are still to be discerned. In a large balloon, jutting out into the bay, they have built the custom-house, the first story of which is level with the walk upon the walls. When it was resolved to erect a building so necessary to this great emporium of trade, the marquis di Squillace gave orders that no expense should be spared, and the most intelligent architects employed, in order to erect a monument, which by its taste and magnificence might excite the admiration of posterity: the result of these precautions proved a piece of vile architecture, composed of the worst of materials.

The fish here is prodigious during the last months of the flay of the flora. The packers load the art of preserving goods in great perfection; but, as they pay the freight according to the cubic palms of each bale, they are apt to squeeze down the cloths and linens so very close and hard, as sometimes to render them unfit for use. The exportation of French luxuries in dresses is enormous; Lyons furnishes most of them; England sends out bale goods; Brittany and the north, linens. Every commercial nation has a consular resident at Cadiz; those of England and France are the only ones not allowed to have any concern in trade.

In 1596, Cadiz was taken, pillaged, and burnt by the English; but in 1702 it was attempted, in conjunction with the Dutch, without success.

CADDIZADELITES, a sect of Mahometans very like the ancient Stoics. They shun feasts and diversions, and affect an extraordinary gravity in all their actions; they are continually talking of God, and some of them make a jumble of Christianity and Mahometanism; they drink wine, even in the fast of the ramadan; they love and protect the Christians; they believe that Mahomet is the Holy Ghost, practises circumcision, and justify it by the example of Jesus Christ.

CADDIMEN LETTERS, the ancient Greek or Ionic characters, such as they were first brought by Cadmus from Phoenicia; whence Herodotus also calls them Phoenician letters.—According to some writers, Cadmus was not the inventor, nor even importer of the Greek letters, but only the modeler and reformer thereof; and it was hence they acquired the appellation Caddian or Phoenician letters; whereas before that time they had been called Pelagian letters.

CADDIA. See CALAMINE.

CADIUS, in fabulous history, king of Thebes, the son of Agenor king of Phoenicia, and the brother of Phoenix, Cilix, and Europa. He carried into Greece the 16 simple letters of the Greek alphabet, and there built Thebes, in the Boeotia. The poet says, that
Cadmus that he left his native country in search of his father Europa, whom Jupiter had carried away in the form of a bull; and that, inquiring of the Delphic oracle for a settlement, he was answered, that he should follow the direction of a cow, and build a city where the cow lay down. Having arrived among the Phocenses, he was met by a cow, which conducted him through Boreotia to the place where Thebes was afterwards built: but as he was about to sacrifice his guide to Pallas, he sent two of his company to the fountain Dirce for water; when they being devoured by a serpent or dragon, he flew the monster, and afterwards, by the advice of Pallas, fowed his teeth, when there sprung up a number of armed soldiers, who prepared to revenge the death of the serpent; but on his calling a fume among these upstart warriors, they turned their weapons against each other with such animosity, that only five survived the combat, and these assisted Cadmus in founding his new city. Afterwards, to recompose his labours, the gods gave him Harmonia, or Hermione, the daughter of Mars and Venus; and honoured his nuptials with presents and peculiar marks of favour. But at length repulsing Thebes to Pentheus, Cadmus and Hermione went to govern the Elysean fields; when grown old, they were transformed into serpents; or, as others say, fent to the Elysean fields, in a chariot drawn by serpents. See Theseus.

Cadmus of Mileum, a celebrated Greek historian, was, according to Pliny, the first of the Greeks who wrote history in prose. He flourished about 350 before Christ.

Cadore, or Pieve de Cadore, a town of Italy, in the territory of Venice, and capital of a district called Cadore, famous for the birth of Titian the painter. E. Long. 13° 45'. N. Lat. 46° 25'.

Cadurco, a province of Italy, in the territory of Venice; bounded on the east by Friuli Proper, on the south and west by the Bellunese, and by the bosphorus of Brixen on the north. It is a very mountainous country, but pretty populous. The only town is Pieve de Cadore.

Cadrites, a fort of Mahometan friars, who once a-week spend a great part of the night in turning round, holding each others hand, and repeating incessantly the word hau, which signifies living, and is one of the attributes of God; during which one of them plays on a flute. They never cut their hair, nor cover their heads; and always go barefooted: they have liberty to quit their convent when they please, and to marry.

Cadzano, an island on the coast of Dutch Flanders, situated at the mouth of the Scheld, whereby the Dutch command the navigation of that river.

Caduceus, in antiquity, Mercury's rod or sceptre, being a wand entwined by two serpents borne by that deity as the ensign of his quality and office, given him according to the fable by Apollo, for his seven-stringed harp. Wonderful properties are ascribed to this rod by the poets; as laying men asleep, raising the dead, &c.

It was also used by the ancients as a symbol of peace and concord: the Romans sent the Carthaginians a javelin and caduceus, offering them their choice either of war or peace. Among that people, those who denounced war were called feculenses; and those who went to demand peace, caducatores, because they bore a caduceus in their hand.

The caduceus found on medals is a common symbol signifying good conduct, peace, and prosperity. The rod expresses power, the two serpents prudence, and the two wings diligence.

Caduci, (from cadu to "fall"), the name of a class in Linnaeus's catalogue, consisting of plants whose calyx is a simple perianthium, supporting a single flower or fructification, and falling off either before or with the petals. It stands opposed to the claffes periferiantes in the same method, and is exemplified in mustard and rannunculus.

Cadurci, Cadusius, Caduru, and Cadurca, (anc. geogr.), a town of the Cadurci, a people of Aquitania, situated between the rivers Oldes, running from the north, and the Tarnis from the south, and falling into the Garunna: now Cadours, capital of the territory of the Querci, in Guienne. A part of the Cadurci to the south next the Tarnis, were called E-lireri.

Cadus, in antiquity, a wine vessel of a certain capacity, containing 340 amphorae or firkins; each of which, according to the best accounts, held nine gallons.

Cadusia, (anc. geogr.) a people of Media Atropatene, situated to the west in the mountains, and reaching to the Caspian sea; between whom and the Medes, perpetual war and enmity continued down to the time of Cyrus.

Caecilia, in zoology, a genus of serpents belonging to the amphibia class. The caecilia has no scales; it is smooth, and moves by means of lateral rages or prickles. The upper lip is prominent, and furnished with two tentacula. It has no tail. There are but two species of this serpent, viz. 1. The tentaculata has 135 rages. It is about a foot long, and an inch in circumference, preserving an uniform cylindrical shape from the one end to the other. The teeth are very small. It has such a resemblance to an eel, that it may easily be mistaken for one; but as it has neither fins nor gills, it cannot be mistaken with the fishes. It is a native of America, and its bite is not poisonous. 2. The glutinosus, has 340 rages or prickles above, and to below, the anus. It is of a brownish colour, with a white line on the side, and is a native of the Indies.

Caecum, or Coecum, the blind gut. See Anatomy, No. 93.

Caellum, (anc. geogr.) an inland town of Pucetia, a division of Apulia, a place four or five miles above Barium or Bari; and which still retains that name.

Caellum Mons, (Itinerary); a town of Vindelicia, on the right or west side of the Iargus. Now Kulmuntz, a small town of Suabia, on the Iller.

Caerum Mons at Rome. See Ceilium.

Caelius, (Aurelius) an ancient physician, and the only one of the sect of the methodists of whom we have any remains. He was of Sicea, a town of Numidia; but in what age he lived, cannot be determined: it is probable, however, that he lived before Galen; since, though he carefully mentions all the physicians before him, he takes no notice of Galen. He had read over very diligently the ancient physticians.
CAEN, an handsome and considerable town of France, capital of Lower Normandy, with a celebrated university, and an academy of literature. It contains 60 streets and 12 parishes. It has a castle with four towers, which were built by the English. The town-house is a large building with four great towers. The royal square is the handsomest in all Normandy, and has fine houses on three sides of it; and in the middle is the statue of Louis XIV. in a Roman habit, standing on a marble pedestal, and surrounded with an iron ballustrade. It is seated in a pleasant country on the river Orne, about eight miles from the sea. William the conqueror was buried here, in the abbey of St Stephen, which he founded. W. Long. o. 27. N. Lat. 49. 11.

CAERNARVONSHIRE, a county of Wales, bounded on the north and west by the sea, on the south by Merionethshire, and on the east it is divided from Denbighshire by the river Conway. It is about 40 miles in length, and 20 in breadth; and sends one member to parliament for the shire, and another for the borough of Caernarvon. The air is very piercing; owing partly to the snow that lies seven or eight months of the year upon some of the mountains, which are so high that they are called the British Alps; and partly to the great number of lakes, which are said not to be fewer than 50 or 60. The soil in the valleys on the side next Ireland is pretty fertile, especially in barley; great numbers of black cattle, sheep, and goats, are fed on the mountains; and the sea, lakes, and rivers, abound with variety of fish. The highest mountains in the county are those called Snowdon hills, and Penmaen-mawr, which last hangs over the sea. There is a road cut out of the rock on the side next the sea, guarded by a wall running along the edge of it on that side; but the traveller is sometimes in danger of being crushed by the fall of pieces of the rock from the precipices above. The river Conway, though its course from the lake out of which it issues to its mouth is only 12 miles, yet is so deep, in consequence of the many brooks it receives, that it is navigable by ships of good burden for eight miles. Pearls are found in a large black mussel taken in this river. The principal towns are Bangor, Caernarvon the capital, and Conway. In this county is an ancient road said to have been made by Helena the mother of Constantine the Great; and Matthew of Westminster affirms, that the body of Constantius the father of the same Constantine was found at Caernarvon in the year 1283, and interred in the parish-church there by order of Edward I.

CAERNARVON, a town of Wales, and capital of the county of that name. It was built by Edward I. near the site of the ancient Segontium, after his conquest of the country in 1282, the situation being well adapted to overwhelm new subjects. It had natural resources for strength, being bounded on one side by the arm of the sea called the Menai; by the estuary of the Sciont.
Caernarvon

Exactly where it receives the tide from the former; on a third side, and a part of the fourth, by a creek of the Menai; and the remainder has the appearance of having the intrenchments completed by art. Edward undertook this great work immediately after his conquest of the country in 1282, and completed the fortifications and castle before 1274 for his queen, on April 25th in that year, brought forth within its walls Edward, first prince of Wales of the English line. It was built within the space of one year, by the labour of the peasants, and at the cost of the chief-men of the country, on whom the conqueror imposed the hateful task. The external state of the walls and castle, Mr Pennant informs us, are at present exactly as they were in the time of Edward. The walls are defended by numbers of round towers, and have two principal gates: the eastern, facing the mountains, the west, upon the Menai. The entrance into the castle is very august, beneath a great tower, on the front of which appears the statue of the founder, with a dagger in his hand, as if menacing his new-acquired unwilling subjects. The gate had four portcullises, and every requisite of strength. The towers are very beautiful. The Eagle tower is remarkably fine, and has the addition of three slender angular turrets rising from the top. Edward II. was born in a little dark room in this tower, not twelve feet long or eight in breadth: so little did, in those days, a royal concert confound either pomp or convenience. The gate through which the affectionate Eleanor entered, to give the Welsh a prince of their own, who could not speak a word of English, is at the farthest end, at a vast height above the outside ground; so could only be approached by a draw-bridge. The quay is a most beautiful walk along the side of the Menai, and commands a most agreeable view.

Caernarvon is defitute of manufactures, but has a brisk trade with London, Bristol, Liverpool, and Ireland, for the several necessaries of life. It is the residence of numbers of genteele families, and contains several very good houses. Edward I. bestowed on this town its first royal charter, and made it a free borough. Among other privileges, none of the burgesses could be convicted of any crime committed between the rivers Conway and Dyfi, unless by a jury of their own townspeople. It is governed by a mayor, who, by patent, is created governor of the castle. It has one alderman, two bailiffs, a town-clerk, and two sergeants at law. The representative of the place is elected by its burgesses, and those of Conway, Pwllheli, Nefy, and Crickaeth. The right of voting is in every one, resident or non-resident, admitted to their freedom. The town gives title of earl and marquis to the duke of Chandos, and has a good tide-harbour.

CAERWIS, a market-town of Flintshire in North Wales, situated in W. Long. 3° 25'. N. Lat. 53° 20'.

Cæsalpinia Brasletto, or Brasili-wood: a genus of the monogynous order, belonging to the deciduous elms of plants; and in the natural method ranking under the 33d order, Leguminosæ. The calyx is quincuncial, with the lowest segment larger in proportion. There are five petals, with the lowest most beautiful than the rest. It is a leguminous plant. Of this there are three species, the most remarkable of which is the brasillienis, commonly called Brasletto. It grows naturally in the warmest parts of America, Cæsalpinia from whence the wood is exported for the dye, with which it is dyed. The demand has been so great, that none of the large trees are left in any of the British plantations: so that Mr Catesby owns himself ignorant of the dimensions to which they grow. The largest remaining are not above two inches in thickness, and eight or nine feet in height. The branches are slender and full of small prickles; the leaves are pinnate; the lobes growing opposite to one another, broad at their ends, with one notch. The flowers are white, papilionaceous, with many stamens and yellow stigmas, growing in a pyramidal spike, at the end of a long slender stalk; the pods include several small round seeds. The colour produced from this wood is greatly improved by solution of tin in aqua regia.* See Cæsar, Julian, the illustrious Roman general and historian, was of the family of the Julii, who pretended they were descended from Venus by Æneas. The descendants of Aeneas, son of Æneas and Creusa, and surnamed Julianus, lived at Alba till that city was taken by Tullus Hostilius king of Rome, who carried them to Rome, where they flourished. We do not find that they produced more than two branches. The first bore the name of Tullius, the other that of Caesar. The first branch of the Caesars were those who were in public employments in the 1st year of the first Punic war. After that time we find there was always some of that family who enjoyed public offices in the commonwealth, till the time of Augustus Caesar, the subject of this article. He was born at Rome the 11th of the month Quintilis, year of the city 635, and left his father an 660. By his valour and eloquence he soon acquired the highest reputation in the field and in the senate. Beloved and respected by his fellow-citizens, he enjoyed successively every magisterial and military honour the republic could bestow consistent with its own free constitution. But at length having subdued Pompey the great rival of his growing power, his boundless ambition effaced the glory of his former actions: for, purging his favourite maxim, “that he had rather be the first man in a village than the second in Rome;” he procured himself to be chosen perpetual dictator, and, not content with this unconstitutional power, his faction had resolved to raise him to the imperial dignity; when the friends of the civil liberties of the republic hastily assassinated him in the senate-house, where they should only have seized him and brought him to a legal trial for usurpation. By this impetuous
impolitic measure they defeated their own purpose, involving the city in confusion and terror, which produced general anarchy, and paved the way to the revolution they wanted to prevent; the monarchial government being absolutely founded on the murder of Julius Cæsar. He fell in the 63rd year of his age, 43 years before the Christian era. His commentaries contain a history of his principal voyages, battles, and victories. The London edition in 1712, in folio, is preferred.

The detail of Cæsar’s transactions (so far as is consistent with the limits of this work) being given under the article Rome, we shall here only add a portrait of him as drawn by a philosopher.*

* From the Mélanges Philosophiques of M. Ophelot.

If, after the lapse of 18 centuries, the truth may be published without offence, a philosopher might, in the following terms, censure Cæsar without calumniating him, and applaud him without exciting his blushes.

"Cæsar had one predominant passion: it was the love of glory; and he passed 40 years of his life in seeking opportunities to foster and encourage it. His soul, entirely absorbed in ambition, did not open itself to other impulses. He cultivated letters; but he did not love them with enthusiasm, because he had not leisured to become the first orator of Rome. He corrupted the one half of the Roman ladies, but his heart had no concern in the fiery ardours of his enemies. In the arms of Cleopatra, he thought of Pompey; and this singular man, who disdained to concern in the fiery ardours of the world, would have been the founder of a new religion; in Arabia, he would have been the conqueror of India; in the arms of Cato watch for glory, wept, because, at the age of 30, he had not conquered the world like Alexander; and who, with the haughty temper of a despot, was more delirious to be the first man in a village than the second in Rome."

"Cæsar had the good fortune to exist in times of trouble and civil commotions, when the minds of men are put into a ferment; and opportunities of great actions are frequent; when talents are every thing, and those who can only boast of their virtues are nothing. If he had lived an hundred years sooner, he would have been no more than an obscure villain; and, instead of giving laws to the world, would not have been able to produce any confusion in it."

"I will here be bold enough to advance an idea, which may appear paradoxical to those who weakly judge of men from what they achieve, and not from the principle which leads them to act. Nature formed in the same mould Cæsar, Mahomet, Cromwell, and Koul Khan. They all of them united to genius that profound policy which makes his famous; they all of them had an evident superiority over those with whom they were surrounded; they were conscious of this superiority, and they made others conscious of it. They were all of them born subjects, and became fortunate usurpers. Had Cæsar been placed in Persia, he would have made the conquest of India; in Arabia, he would have been the founder of a new religion; in London, he would have stabbed his sovereign, or have procure his assassination under the sanction of the laws. He reigned with glory over men whom he had reduced to be slaves; and, under one aspect, he is to be considered as a hero; under another, as a monster. But it would be unfortunate, indeed, to society, if the possession of superior talents gave individuals a right to trouble its repose. Usurpers accordingly have flatterers, but no friends; strangers respect them; their subjects complain and submit; it is in their own families that humanity finds her avengers. Cæsar was assassinated by his son, Mahomet was poisoned by his wife, Koul Khan was miscarried by his nephew, and Cromwell only died in his bed because his son Richard was a philosopher."

"Cæsar, the tyrant of his country; Cæsar, who destroyed the agents of his crimes, if they failed in ad. dres; Cæsar, in fine, the husband of every wife, and the husband of every husband, has been accounted a great man by the mob of writers. But it is only the philosopher who knows how to mark the barrier between celebrity and great arts. The talents of this singular man, and the good fortune which constantly attended him till the moment of his assassination, have concealed the enormity of his actions."

Cæsar, in Roman antiquity, a title borne by all the...
CAE

CAESAR, (anc. geog.) a town of the Turones in Celtic Gaul; now Tours, the capital of Touraine. See Tours.

CAESAROMAGUS, (anc. geog.) a town of the Tribunobantes in Britain; by some supposed to be Chelmsford, by others Brentford, and by others Burford.

CAESANA, (anc. geog.) a town of Gallia Cispadana, situated on the rivers Iapis and Rubicon; now CASSONA, which see.

CAESIA SYLVIA, (anc. geog.) a wood in Germany, part of the great Sylva Hercynia, situated partly in the duchy of Cleves, and partly in Westphalia between Welfel and Kessedon.

CAESONES, a denomination given to those cut out of their mother's wombs. Pliny ranks this as an auspicious kind of birth; the elder Scipio Africallus, and the first family of Caesars, were brought into the world in this way.

CAESUS, in antiquity, a large gantlet made of raw hide, which the wrestlers made use of when they fought at the public games.—This was a kind of leathern strap, strengthened with lead or plates of iron, which encompassed the hand, the wrist, and a part of the arm, as well to defend these parts as to enforce their blows.

CAESUS, or CAESARIUS, was also a kind of girdle, made of wool, which the husband united for his spouse the first day of marriage, before they went to bed.

This relates to Venus's girdle, which Juno borrowed of her to entice Jupiter to love her. See CAESUS.

CAESURA, in the ancient poetry, is when, in the scanning of a verse, a word is divided so, as one part seems cut off, and goes to a different foot from the rest; as,

Menti nos, nunquam mendacia profunt,
where the syllables ri, li, quam, and men, are Caesars.

CAESURE, in the modern poetry, denotes a rest or pause towards the middle of an Alexandrian verse, by which the voice and pronunciation are aided, and the verse, as it were, divided into two hemistichs. See CAESUS.

CAETERIS PARIBUS, a Latin term in frequent use among mathematical and physical writers. The words literally signify, the rest (or other things) being alike or equal. Thus we say the heavier the bullet, caeteris paribus, the greater the range; i. e. by how much the bullet is heavier, if the length and diameter of the piece and strength of the powder be the same, by so much will the utmost range or distance of a piece of ordnance be the greater. Thus also, in a physical way, we say, the velocity and quantity circulating in a given time through any section of any artery, will, caeteris paribus, be according to its diameter, and nearness to or distance from the heart.

CAETOBRIX, (anc. geog.) a town of Lucania, near the mouth of the Tagus on the east side; now extinct. It had its name from its situation on the coast of Phenicis. It was very conveniently situated for trade; but had a very dangerous harbour, so that no ships could be safe in it when the wind was at south-west. Herod the Great king of Judea remedied this inconvenience at an immense expense and labour, making it one of the most convenient havens on that coast. He also beautified it with many buildings, and bestowed 12 years in the finishing and adorning it.

CAESARIAN operation. See MIDWIFERY.

CAESARIANS, Caesarienses, in Roman antiquity, were officers or ministers of the Roman emperors: They kept the account of the revenues of the emperors; and took possession, in their name, of such things as devolved or were consecrated to them. 

CÆSARODUNUM, (anc. geog.) a town of the Cesarodunenses in Britain

CAFFA, in commerce, painted cotton-cloths manufactured in the East Indies, and sold at Bengal.

CAFFA, or CAFE, a city and port-town of Crim Tartary, situated on the south-east part of that peninsula. E. Long. 37. O. Lat. 44. 55.
CAFFILA, a company of merchants or travellers, who join together in order to go with more security through the dominions of the Grand Mogul, and through other countries on the continent of the East Indies.

The Caflila differs from a caravan, at least in Persia: for the caflila belongs properly to some sovereign, or to some powerful company in Europe, whereas a caravan coming Euxine or black Indies.

The mountains afford food for the fiercer sorts; were usually brought to Rome flutt up in oak en beechen cages, artfully formed, and covered or shaded with boughs, that the creatures, deceived with the appearance of a wood, might fancy themselves in their forest. The fiercer sort were pent in iron cages, left wooden prisons should be broke through. In some prisons there are iron cages for the closer confinement of criminals. The French laws distinguish two forts of bird-cages, viz. high or singing cages, and low or dumb-cages; those who expose birds to sale are obliged to put the hens in the latter, and the cocks in the former, that persons may not be imposed on by buying a hen for a cock.

Cages, (castrum) denote also places in the ancient amphitheatres, wherein wild beasts were kept, ready to be let out for sport. The cæsære were a sort of iron cages different from dens, which were built underground and dark; whereas the cæsære being airy and light, the beasts rushed out of them with more alacrity and fierceness than if they had been pent underground.

Cage, in carpentry, signifies an outer-work of timber, enclosing another within it. In this sense we say, the cage of a wind-mill. The cage of a faf’ica-fote the wooden sides or walls which

CAGEAN, or CAGAYAN, a province of the island of Luzon, or Manila, in the East Indies. It is the largest in the island, being 80 leagues in length, and 40 in breadth. The principal city is called New Segovia, and 15 leagues eastward from this city lies cape Bajador. Doubling that cape, and coasting along 20 leagues from north to south, the province of Cagayan ends, and that of Illocos begins. The pleasurely Cagayans who pay the tribute are about 8000; but there are a great many not subdued. The whole province is fruitful: the men apply themselves to agriculture, and are of a martial disposition; and the women apply to several works in cottager. The mountains afford food for many beasts, as boars; but not so good as those of Europe. There are also abundance of deer, which they kill for their skins and horns to sell to the Chinese.

CAGLI, an ancient episcopal town of Italy, in the duchy of Urbino, situated at the foot of the Apennine mountains. E. Long. 14. 12. N. Lat. 42. 30.

CAGLIARI, (Paolo) called Paolo Veronese, an excellent painter, was born at Verona in the year 1532.

Caggiaso his father was a sculptor, and Antonio Badile his uncle was his master in painting. He was not only esteemed the best of all the Lombard painters, but for his extensive talents in the art was peculiarly styled II pittor felice, "the happy painter!" and there is scarcely a church in Venice where some of his performances are not to be seen. De Piles says, that "his picture of the marriage at Cana, in the church of St. George, is to be distinguished from his other works, as being not only the triumph of Paul Veronese, but almost the triumph of painting itself."

When the senate sent Grimani, procurator of St Mark, to be their ambassador at Rome, Paul attended him, but did not stay long, having left some pieces at Venice unfinished. Philip II. King of Spain, sent for him to paint the Eufcharist, and made him great offers; but Paul excused himself from leaving his own country, where his reputation was so well established, that most of the princes of Europe ordered their several ambassadors to procure something of his hand at any rate.

He was indeed highly esteemed by all the principal men in his time; and so much admired by the great masters, as well his contemporaries, as those who succeeded him, that Titian himself neded to say, he was the ornament of his profession. And Guido Reni being asked which of the matters his predecessors he would choose to be, were it in his power, after Raphael and Correggio,
Cajetan was employed in several other negotiations and transactions, being as ready at business as at letters. He died in 1554. He wrote Commentaries upon Aristotel's philosophy, and upon Thomas Aquinas's theology; and made a literal translation of the Old and New Testaments.

Cajem was born at Cajeta in the kingdom of Naples in the year 1469. His proper name was Thomas de Vio; but he adopted that of Cajetan from the place of his nativity. He defended the authority of the Pope, which suffered greatly at the council of Nice, in a work entitled Of the power of the Pope; and for this work he obtained the bishopric of Cajeta. He was afterwards raised to the archiepiscopal see of Palemon, and in 1557 was made a cardinal by Pope Leo X. The year following, he was sent as legate into Germany, to quiet the commotions raised against indulgences by Martin Luther; but Luther, under protection of Frederic elector of Saxony, set him at defiance; for though he obeyed the cardinal's summons in repairing to Augsburg, yet he rendered all his proceedings ineffectual.

Cajem was employed in several other negotiations and transactions, being as ready at business as at letters. He died in 1554. He wrote Commentaries upon Aristotel's philosophy, and upon Thomas Aquinas's theology; and made a literal translation of the Old and New Testaments.

CAIFONG, a large, populous, and rich town of Asia, in China, seated in the middle of a large and well cultivated plain. It stands on a strait, and when besieged by the rebels in 1642, they ordered the dykes of the river Hohangho to be cut, which drowned the city, and destroyed 300,000 of its inhabitants. E. Long. 112. 27. N. Lat. 25. 0.

CAILLE, (Nicholas Louis de la) an eminent mathematician and astronomer, was born at a small town in the diocese of Rheims in 1713. His father had served in the army, which he quitted, and in his retirement studied mathematics; and amused himself with mechanic exercises, wherein he proved the happy author of several inventions of considerable use to the public. Nicholas, almost in his infancy, took a fancy to mechanics, which proved of signal service to him in his mature years. He was sent young to school at Montes­fur-Seine, where he discovered early tokens of genius.

In 1729, he went to Paris; where he studied the classics, philosophy, and mathematics. Afterwards he went to study divinity at the college of Navarre, proposing to embrace an ecclesiastical life. At the end of three years he was ordained a deacon, and officiated as such in the church of the college de Mazarin several years; but he never entered into priests orders, apprehending that his astronomical studies, to which he became more and more devoted, might too much interfere with his religious duties. In 1739, he was joined with M. de Thury, son to M. Caffini, in verifying the meridian of the royal observatory through the whole extent of the kingdom of France. In the month of November the same year, whilst he was engaged day and night in the operations which this great undertaking required, and at a great distance from Paris, he was, without any solicitation, elected into the vacant mathematical chair which the celebrated M. Varignon had so worthy filled. Here he began to teach about the end of 1740; and an observatory was ordered to be erected for his use in the college, and furnished with a suitable apparatus of the best instruments. In May 1741, M. de la Caille was admitted into the royal academy of sciences as an adjoint member for astronomy. Besides the many excellent papers of his dispersed up and down in their memoirs, he published Elements of geometry, mechanics, optics, and astronomy. Moreover, he carefully computed all the eclipses of the sun and moon that had happened since the Christian era, which were printed in a book published by two Benedictines, entitled L'Art de voriérer les dates, &c. Paris, 1750, in 4to. Besides these, he compiled a volume of astronomical ephemerae for the years 1745 to 1755; another for the years 1755 to 1765; and a third for the years 1765 to 1775; an excellent work entitled Astronomie fundamenta nova, sive, et stellarum observationibus stabilita; and the most correct solar tables that ever appeared. Having gone through a few years series of astronomical observations in his own observatory, he formed a project of going to observe the southern stars at the
Caille.

Cape of Good Hope. This was highly approved by the academy, and by the prime minister Comte de Argent- fon, and very readily agreed to by the states of Hol- land. Upon this, he drew up a plan of the method he proposed to pursue in his southern observations; setting forth, that besides settling the places of the fixed stars, he proposed to determine the parallax of the moon, Mars, and Venus. But whereas this required corres- pondent observations to be made in the northern parts of the world, he lent to those of his correspondents who were expert in practical astronomy previous no- tice, in print, what observations he designed to make at such and such times for the said purpose. At length, on the 21st of November 1750, he failed for the Cape, and arrived there on the 10th of April 1751. He forth- with got his instruments on shore; and, with the affi- dence of some Dutch artificers, set about building an astronomical observatory, in which his apparatus of in- struments was properly disposed of as soon as it was in a fit condition to receive them.

The sky at the Cape is generally pure and serene, unless when a south-eaft wind blows. But this is of- ten the case; and when it is, it is attended with some strange and terrible effects. The stars look bigger, and seem to caper; the moon has an undulating tremor; and the planets have a fort of beard like comets. Two hundred and twenty-eight nights did our astronomer survey the face of the southern heavens; during which space, which is almost incredible, he observed more than 10,000 stars; and whereas the ancients filled the heavens with monsters and old-wives tales, the abbe de la Caille chose rather to adorn them with the instru- ments and machines which modern philosophy has made use of for the conquest of nature. With no lefs success did he attend to the parallax of the moon, Mars, Venus, and the sun. Having thus executed the purpose of his voyage, and no present opportunity offer- ing for his return, he thought of employing the vaca- tant time in another arduous attempt; no lefs than that of taking the measure of the earth, as he had al- ready done that of the heavens. This indeed had, through the munificence of the French king, been done before by different sets of learned men both in Europe and America: some determining the quantity of a de- gree under the equator, and others under the arctic circle; but it had not as yet been decided whether in the southern parallels of latitude the fame dimensions obtained as in the northern. His labours were re- warded with the satisfaction he wished for; having de- termined a distance of 410,814 feet from a place cal- led Kip-Fentyn to the Cape, by means of a bafe of 28,802 feet, three times actually measured; whence he discovered a new secret of nature, namely, that the radii of the parallels in south latitude are not the fame as those of the corresponding parallels in north lati- tude. About the 23d degree of south latitude he found a degree on the meridian to contain 342,222 Paris feet. He returned to Paris the 27th of September 1754; hav- ing in his almost four years absence expended no more than 9144 livres on himself and his companion; and at his coming into port, he refused a bribe of 100,000 livres, offered by one who thrifled lefs after glory than gain, to be flarcer in his immuity from culthom house searches. After receiving the congratulatory visits of his more intimate friends and the astronomers, he first of all thought fit to draw up a reply to some ftrictures which professor Euler had publifhed relative to the meridian, and then he fetted the results of the comparison of his own with the observations of other astronomers for the paralaxes. That of the fun he fixed at 56°; of the moon, at 56° 56'; of Mars in his opposition, 36°; of Venus, 38°. He also fetted the laws whereby astronomical refractions are varied by the different den- sity or rarity of the air, by heat or cold, and drynefs or moisture. And, lafly, he showed an easy, and by common navigators practicable, method of finding the longitude at sea by means of the moon, which he illus- trated by examples selected from his own observations during his voyages. His fame being now establisht upon fo firm a basis, the moft celebrated academies of Europe claimed him as their own; and he was unani- mously elected a member of the royal society at Lon- don; of the institute of Bologna; of the imperial academy at Petersburg; and of the royal academies of Berlin, Stockholm, and Gottenburg. In the year 1760, Mr de la Caille was attacked with a fevere fit of the gout; which, however, did not interrupt the course of his studies; for he then planned out a new and immense work, no lefs than a history of astronomy through all ages, with a comparison of the ancient and modern ob- servations, and the conftuction and use of the instru- ments employed in making them. In order to pursue the task he had imposed upon himself in a suitable re- tirement, he obtained a grant of apartments in the royal palace of Vincennes; and whilst his astronomical apparatus was erecting there, he began printing his Catalogue of the southerm stars, and the third volume of his Ephemerides. The state of his health was, towards the end of the year 1763, greatly reduced. His blood grew inflamed; he had pains of the head, ob- structions of the kidneys, loss of appetite, with an op- position of the whole habit. His mind remained un- affected, and he resolutely persifed in his studies as usual. In the month of March, medicines were ad- ministered to him, which rather aggravated than al- leviated his symptoms; and he was now fenfible, that the fame dieter which in Africa, ten years before, yielded to a few simple remedies, did in his native country bid defiance to the best physicians. This in- duced him to settle his affairs; his manuscripts he com- mitted to the care and difterction of his esteemed friend M. Maraldi. It was at laft determined that a vein should be opened; but this brought on an obfolute lethargy, of which he died, aged 32.

CAIMACAN, or CAIMACAN, in the Turkish affairs, a dignity in the Ottoman empire, anfwering to lieutenant, or rather deputy, amongst us.

There are ufually two Caimacans; one residing at Conflantinople, as governor thereof; the other attend- ing the grand vizir in quality of his lieutenant, secre- tary of state, and first minifter of his council, and gives audience to ambafladors. Sometimes there is a third caimakan, who attends the sultan; whom he acquaints with any public difturbarces, and receives his orders concerning them.

CAIMAN ISLANDS, certain American islands lying south of Cuba, and north-west of Jamaica, between 81° and 86° of weft longitude, and in 21 of north lati- tude. They are moft remarkable on account of the

fibery
Cairns. Food, and killing them as they want them.

Cain filhery

hearths rekindled them from the facred fires of the

moil

might have been for fepulchral monuments. Even this

mply.

fome folemn

rion might

nounced ; or to have been

tain-elect:

there

fhow

to have been

Carnes, the vulgar name of thofe

heaps of ftones. They have fuppofed them to have,

CARNES, or Carnes, the vulgar name of thofe

heaps of ftones which are to be feen in many places of

Britain, particularly Scotland and Wales.—They are

compofed of ftones of all dimensions thrown together

in a conical form, a flat ftone crowning the apex; (fee

Plate CXXXVII.)

Various caufes have been alphabeted by the learned for

thofe heaps of ftones. They have fuppofed them to have.

been, in times of inauguration, the places where the chief-

tain-elect ftood to flrow himfelf to behard advantage to

the people; or the place from whence judgment was pro-
nounced; or to have been erected on the road-side in ho-

nor of Mercury; or to have been formed in memory of

fome folemn conclave, particularly where accompanied

by flanding pillars of ftones; or for the celebration of

certain religious ceremonies. Such might have been

the reafons, in fome inftances, where the evidences of

fhone-chefts and urns are wanting; but there are fo

generally found, that they feem to determine the

nature of the purpofe of the piles in queftion to have

been for fepulchral monuments. Even this defination

might render them fuitable to other purpofes;

particularly religious, to which by their nature they

might be fuppofed to give additional folemnity.—

According to Toland, fires were kindled on the

tops or flat ftones, at certain times of the year, par-

icularly on the eves of the 1st of May and the 1st of

November, for the purpofe of facrificing; at which
time all the people having extinguiihed their domeftic

hearth's rekindled them from the facred fires of the

cairns. In general, therefore, these accumulations ap-

pear to have been defigned for the fepulchral protection

of heroes and great men. The fhone-chefts, the repo-

itory of the urns and ashes, are lodged in the earth be-

neath; fometimes only one, fometimes more, are found

thus depofited; and Mr Pennant mentions an ifance of 17

being difcovered under the fame pile.

Cairns are of different fizes, fome of them very large.

Mr Pennant describes one in the ifland of Arran, 114

feet over and of a vaft height. They may juftly be

fuppofed to have been proportioned in fize to the rank

of the perfon, or to his popularitv: the people of a

whole diftrift assembled to show their reftpect to the

deeafcd; and, by an active honouring of his me-

mory, fon accumulated heaps equal to thofe that af-

tonifh us at this time. But thefe honours were not mere-

ly thofe of the day; as long as the memory of the de-

eeafcd endured, not a passenger went by without add-

ing a ftone to the heap; they fuppofed it would be an

honour to the dead, and acceptable to his namcs.

Quaquam feffinam, non fui mora longa: fiecbis

Injedtis tur puleare, curras.

To this moment there is a proverbial expreffion am-

ong the highlanders allusive to the old practice: a

fupplicant will tell his patron, Carri iu dcfch or do

charms, "I will add a ftone to your cairn;" meaning,

When you are no more, I will do all poflible honour to

your memory.

Cairns are to be found in all parts of the iflands, in

Cornwal, Wales, and all parts of North Britain; they

were in ufe among the northern nations; Dahlerg,

in his 323d plate, has given the figure of one. In

Wales they are called cerneddaus; but the proverb taken

from them there, is not of the complimential kind; Kairn

ar dy ben, or, "A cairn on your head," is a token

of imprecation.

CAIRO, or Grand Cairo, the capital of Egypt,

fittuated in a plain at the foot of a mountain, in E.

Long. 32. o. N. Lat. 30. o. It was founded by Jau-

har, a Magrebian general, in the year of the Hegira

258. He had laid the foundations of it under the ho-

roscope of Mars; and for that reafon gave his new city

the name of Al Kahirah, or the Victorious, an ephemer

applied by the Arab astronomers to that planet. In

362 it became the residence of the kaliffs of Egypt,

and of conquence the capital of that country, and

has ever since continued to be fo. It is divided into

the New and Old cities. Old Cairo is on the eastern

fide of the river Nile, and is now almoft uninhabited.

The New, which is properly Cairo, is feated in a fandy

plain about two miles and a half from the old city.

It ftands on the western fide of the Nile, from which

it is not three quarters of a mile diftant. It is ex-

tended along the mountain on which it is built, for

the fake of which it was removed hither, in order, as

fome pretend, to be under its protection. Howev-

er, the change is much for the worse, as well with

gard to air as water, and the pleafantnefs of

walking in them is very inconvenient,

Some travellers have made Cairo of a

country; for it

stands

to

the

practice:

the

of imprecation.

CAIRO, or Grand Cairo, the capital of Egypt,

fittuated in a plain at the foot of a mountain, in E.

Long. 32. o. N. Lat. 30. o. It was founded by Jau-

har, a Magrebian general, in the year of the Hegira

258. He had laid the foundations of it under the ho-

roscope of Mars; and for that reafon gave his new city

the name of Al Kahirah, or the Victorious, an ephemer

applied by the Arab astronomers to that planet. In

362 it became the residence of the kaliffs of Egypt,

and of conquence the capital of that country, and

has ever since continued to be fo. It is divided into

the New and Old cities. Old Cairo is on the eastern

fide of the river Nile, and is now almoft uninhabited.

The New, which is properly Cairo, is feated in a fandy

plain about two miles and a half from the old city.

It ftands on the western fide of the Nile, from which

it is not three quarters of a mile diftant. It is ex-

tended along the mountain on which it is built, for

the fake of which it was removed hither, in order, as

fome pretend, to be under its protection. Howev-

er, the change is much for the worse, as well with

gard to air as water, and the pleafantnefs of

walking in them is very inconvenient,

Some travellers have made Cairo of a

country; for it

stands

to

the

practice:

the

eral

hun-

from them there, is not of the complimental kind;

Karn ar dy ben, or, "A cairn on your head," is a token

of imprecation.
Cairo.

There are about 500 public mosques in this city, some of which have fine minarets. The mosque of Aisha had several buildings adjoining, which were once a famous university, and 14,000 scholars and students were maintained on the foundation; but has now not above 1400, and those are only taught to read and write. All the mosques are built upon the same plan, and differ only in magnitude. The entrance is thro' the principal gate into a large square, open on the top, but well paved. Round this are covered galleries, supported by pillars; under which they pay their prayers, in the shade. On one side of the square there are particular places with basins of water, for the convenience of performing the ablutions enjoined by the Koran. The most remarkable part of the mosque, besides the minaret, is the dome. This is often bold, well proportioned, and of an astonishing magnitude. The inside foyers are carved like lace, flowers, and melons. They are built so firm, and with such art, that they will last 600 or 700 years. About the outward circumference there are large Arabic inscriptions, in relief, which may be read by those who stand below, though they are sometimes of a wonderful height.

The khanes or caravanserais are numerous and large, with a court in the middle, like their houses. Some are several stories high, and are always full of people and merchandise. The Nubians, the Abyssinians, and other African nations, which come to Cairo, have one to themselves, where they always meet with lodging. Here they are secure from insults, and their effects are all safe. Besides these, there is a bazar, or market, where all sorts of goods are to be sold. This is in a long broad street; and yet the crowd is so great, you can hardly pass along. At the end of this street is another short one, but pretty broad, with shops full of the best sort of goods, and precious merchandise. At the end of this short street there is a great khan, where all sorts of white slaves are to be sold. Farther than this is another khan, where a great number of blacks, of both sexes, are exposed to trade. Not far from the best market-place is an hospital, and a hospital for madpeople. They also receive and maintain sick people into this hospital, but they are poorly looked after.

Old Cairo has scarce anything remarkable but the granaries of Joseph; which are nothing but a high wall, lately built, which includes a square spot of ground, where they deposite wheat, barley, and other grain, which is a tribute to the baths, paid by the owners of land. This has no other covering but the heavens, and therefore the birds are always sure to have their share. There is likewise a tolerable handsome church, which is made use of by the Copts, who are Christians and the most ancient inhabitants of Egypt. Joseph's well is in the castle, and was celebrated by king Mohammed about 700 years ago. It is called Joseph's well, because they attribute everything extraordinary to that remarkable person. It is cut in a rock, and is 280 feet in depth. The water is drawn up to the top by means of oxen, placed on platforms, at proper distances, which turn about the machines that raise it. The descent is so sloping, that, though there are no steps, the oxen can descend and ascend with ease.
The river Nile, to which not only Cairo, but all Egypt is so much indebted, is now known to have its rise in Abyssinia. The increasement of the Nile generally begins in May, and in June they commonly proclaim about the city how much it is riven. Over against old Cairo the Bahr has a house, wherein the water enters to a column, which has lines at the distance of every inch, and marks at every two feet, as far as 30. When the water rises to 22 feet, it is thought to be of a dangerous height; when it rises much higher, it does a great deal of mischief. There is much pomp and ceremony used in letting the water into the canal, or half-abovementioned. The Bahr gives the first stroke towards the removal of the dike or dam. When the water has filled the canal and lakes in the city, and the numerous cisterns that are in the mosques and private houses, it is let into a vast plain, to the north-east, the extent of which is 50 miles. When the country is covered with water, it is an unpleasant sight to view the towns appearing like little islands, and the people paddling and repelling in boats.

The inhabitants of Cairo are a mixture of Moors, Turks, Jews, Greeks, and Copts, or Copits. The only difference between the habit of the Moors and Copts is their turbans; those of the Moors being white, and of the Copts white striped with blue. The common people generally wear a long black loose frock, fewed together all down before. The Jews wear a frock of the same fashion, made of cloth; and their caps are like a high crowned hat, without brims, covered with the same cloth, but not so taper. The Jewish women's are not very unlike the men's, but more light and long. The Greeks are habited like the Turks, only their turbans differ.

Provisions of all kinds are exceeding plentiful; for 20 eggs may be bought for a parrahi or penny, and bread is six times as cheap as with us. They have almost all sorts of flesh and fish; and in particular have tame buffaloes, which are very useful. They bring goats into the streets in great numbers, to sell their milk. Their gardens are well stocked with fruit-trees of various kinds, as well as roots, herbs, melons, and cucumbers. The most common flesh meat is mutton. The goats are very beautiful, and have ears two feet in length; but their flesh is in no great esteem.

CAIROAN, or CAYWAN, a city of Africa, in the kingdom of Tunis, seated in a sandy barren soil, about five miles from the gulf of Capres. It has neither spring, well, nor river; for which reason they are obliged to preserve rain-water in tanks and cisterns. It was built by the Aglabites; and is the ancient Cyrene*, but now almost lost its splendor. There is a well, however, a very superb mosque, and the tombs of the kings of Tunis are yet to be seen. E. Long. 9. 12. N. Lat. 35. 40.

CAISSON, in the military art, a wooden chest, into which several boms are put, and sometimes filled only with gunpowder: this is buried under some work, whereof the enemy intend to posses themselves, and, when they are masters of it, is fired, in order to blow them up.

CAISSON is also used for a wooden frame or chest used in laying the foundations of the piers of a bridge.

CAITHNESS, otherwise called the shire of Wick, is the most northern county of all Scotland; bounded on the east of the ocean, and by Strathnaver and Sutherland on the south and south-west: from these it is divided by the mountains Orde, and a continued ridge of hills as far as Knockfin, then by the whole course of the river Hallowdale. On the north it is washed by the Pentland or Pentland frith, which flows between this county and the Orkneys. It extends 35 miles from north to south, and about 20 from east to west. The coast is rocky, and remarkable for a number of bays and promontories. Of these, the principal are Sand-side-head to the west, pointing to the opening of Pentland frith; Orca, now Holborn-head, and Dunnet-head, both pointing northward to the frith. Dunnet-head, is a peninsula about a mile broad, and seven in compass; affording several lakes, good pasture, excellent mill-flores, and a lead-mine. Scribister bay, on the north-west, is a good harbour, where ships may ride securely. Rice-bay, on the east side, extends three miles in breadth; but is of dangerous access, on account of some sunk rocks at the entrance. At the bottom of this bay appear the ruins of two strong castles, the seat of the earls of Caithness, called Castle Sinclair, and Gernego, joined to each other by a draw-bridge. Duncan's bay, otherwise called Dunby-head, is the northern point of Caithness, and the extremest point of Caithness in Britain. At this place, the breadth of the frith does not exceed 12 miles, and in the neighbourhood is the ordinary ferry to the Orkneys. Here is likewise Clythnes pointing east, and Nohead pointing north-east. The sea in this place is very impetuous, being in constant agitation from violent counter-tides, currents, and vortices. The only island belonging to this country is that of Stroma, in the Pentland frith, at the distance of two miles from the main land, extending about a mile in length, and producing good corn. The navigation is here rendered very difficult by conflicting tides and currents, which at both ends of the island produce a great agitation in the sea. At the south end, the waves dance so impetuously, that the sailors term them the merry men of May, alluding to the house of one Mr May, on the opposite shore of Caithness, which served them as a land-mark, in the dangerous passage between the island and the continent. The property of this island was once disputed between the earls of Orkney and Caithness; but adjudged to the latter, in consequence of an experiment, by which it appeared, that venomous creatures will live in Stroma, whereas they die immediately if transported to the Orkneys. The county of Caithness, though chiefly mountainous, flattens towards the sea-coast, where the ground is arable, and produces good harvests of oats and barley, sufficient for the natives, and yielding a surplus for exportation. Caithness is well watered with small rivers, brooks, lakes, and fountains, and affords a few woods of birch, but is in general bare of trees; and even those the inhabitants plant are stinted in their growth. Lead is found at Dunnet, copper at Old Urk, and iron ore at several places; but these advantages are not improved. The air of Caithness is temperate, though in the latitude of 58, where the longeas day in summer is computed at 18 hours; and when the sun sets, he makes so small an arch of a circle below the horizon, that the people enjoy a twilight until he rises again. The fuel used by the inhabitants of Caithness consists of peat and turf, which the ground yields in great plenty. The forests
C A I

Caitheuf. forests of Moravias and Berriedale afford abundance of red-deer and roe-bucks: the country is well stored with hares, rabbits, growie, heathcocks, plover, and all kinds of game, comprehending a bird called snow-fleet, about the size of a parrow, exceedingly fat and delicious, that comes hither in large flights about the middle of February, and takes its departure in April. The hills are covered with sheep and black cattle; so numerous, that a fat cow has been sold at market for 8 s. sterling. The rocks along the coasts are frequented by eagles, hawks, and all manner of sea-fowl, whose eggs and young are taken in vast quantities by the natives. The rivers and lakes abound with trout, salmon, and eels; and the sea affords a very advantageous fishery. Divers obelisks and ancient monuments appear with hares, red-deer and roe-bucks: the country is well furnished with turf and sea-plants. The common people are well provided for their fishing boats, and cut artificial granaries: the corn is raised, sharp, but in bad sea-sons the farmer kills and feeds them to the lairds, an invincible impediment to the prosperity of the country. The women are also condemned to a shameful drudgery; it not being uncommon to see them trudging in droves of 60 or 70 to the fields, with baskets of dung on their backs, which are filled at pleasure from the dunghills by their lords and masters with their pitchforks.

The last private war in Scotland was occasioned by a dispute relating to this county. An earl of Breadalbane married an heiress of Caithness: the inhabitants would not admit her title, but set up another person in opposition. The earl, according to the custom of those times, designed to assert his right by force of arms: he raised an army of 1,500 men; but thinking the number too great, he dismissed first one 500, and then another. With the remainder he marched to the borders of Caithness. Here he thought proper to add stratagem to force. He knew that the enemy's army waited for him on the other side of the promontory of Ord. He knew also, that whilisby was then the seat of Caithness; and therefore ordered a ship laden with that precious liquor to pass round, and wilfully strand itself on the shore. The directions were punctually obeyed; and the crew in a seeming fright escaped in the boats to the invading army. The Caithness men made a prize of the ship; but making too free with the freight, became an easy prey to the earl, who attacked them during their intoxication, and gained the county, which he disposed of very soon after his conquest.

CAIUS, KEVE, or KEVE, (Dr John), the founder of Cains college in Cambridge, was born at Norwich in 1520. He was admitted very young a student in Gonville hall in the abovementioned university; and at the age of 21 translated from Greek into Latin some pieces of divinity, and into English Erasmus's paraphrase on Jude, &c. From these his juvenile labours, it seems probable that he first intended to prosecute the study of divinity. Be that as it may, he travelled to Italy, and at Padua studied physic under the celebrated Montanus. In that university he continued some time, where we are told he read Greek lectures with great applause. In 1543, he travelled through part of Italy, Germany, and France; and returning to England commenced doctor of physic at Cambridge. He practised first at Shrewbury, and afterwards at Cambridge; but removing to London, in 1547 he was admitted fellow of the college of physicians, to which he was several years president. In 1557, being then physician to queen Mary, and in great favour, he obtained a licence to advance Gonville-hall, where he had been educated, into a college; which he endowed with several considerable estates, adding an entire new square at the expense of 18341. Of this college he accepted the mastership, which he kept till within a short time of his death. He was physician to Edward VI. queen Mary, and queen Elizabeth. Towards the latter end of his life he retired to his own college at Cambridge; where, having resigned the mastership to Dr Legge of Norwich, he spent the remainder of his life as a fellow-commoner. He died in July 1572, aged 63; and was buried in the chapel of his own college. Dr Cains was a learned, active, benevolent man. In 1557, he erected a monument in St Paul's to the memory of the famous Linacre. In 1565, he obtained a grant for the college of physicians 'to take the bodies of two male-factors...
CALABRIA, a country of Italy, in the kingdom of Naples, divided into Calabria Ultra, and Calabria Citera, commonly called Ulterior and Citerior, or Further and Hither Calabria. Calabria Citerior is one of the 12 provinces of the kingdom of Naples; and bounded on the south by Calabria Ultra, on the north by Basilicata, and on the west and east by the sea; Cosenza is the capital. Calabria Ultra is washed by the Mediterranean sea on the east, south, and west, and bounded by Calabria Citera on the north. Reggio is the capital town.

This country has been almost entirely depopulated by the earthquakes of 1783. The reiterated shocks extended from Cape Spartivento to Amantea above the gulf of St Eufemia, and also affected that part of Sicily which lies opposite to the southern extremity of Italy. Those of the 5th and 7th of February, and of the 28th of March, were the most violent, and completed the destruction of every building throughout the above-mentioned space. Not one stone was left upon another south of the narrow isthmus of Squillace; and what is more disastrous, a very large proportion of the inhabitants was killed by the falling of their houses, near 40,000 lives being lost. Some perfons were dug out alive after remaining a surprising length of time buried among the rubbith. Melina became a mafs of ruins; its beautiful Palazzata was thrown in upon the town, and its quay cracked into ditches full of water. Reggio almost destroyed; Tropea greatly damaged; every other place in the province levelled to the ground.

Before and during the concussion the clouds gathered, and then hung immovable and heavy over the earth. At Palmy, the atmosphere wore so fiery an aspect, that many people thought part of the town was burning. It was afterwards remembered that an unusual heat had affected the skin of several persons just before the shock; the rivers assume a muddy ash-coloured tinge, and a sulphurous smell was almost general. A frigate passing between Calabria and Lipari felt to fever a shock, that the steerman was thrown from the helm, and the cannons were raised upon their carriages, while all around the sea exhaled a strong smell of brimstone.

Suspendent alterations were occasioned in the face of the country; rivers cooaked up by the falling in of the hills, were converted into lakes, which if not speedily drained, by some future convulsion, or opened by human labour, will fill the air with pestiferous vapours, and destroy the remnants of population. Whole acres of ground, with houses and trees upon them, were broken off from the plains, and washed many furlongs down the deep hollows which the course of the rivers had worn; there, to the astonishment and terror of beholders, they found a new foundation to fix upon, either in an uprightness or an inclining position. In short, every species of phenomenon, incident to these destructive commotions of the earth, was to be seen in its utmost extent and variety in this ruined country. Their Sicilian majesties, with the utmost expedition, dispatched vessels loaded with every thing that could be thought of on the occasion for the relief and accommodation of the diftreffed Calabrians; a general officer went from Naples with engineers and troops to direct the operations of the persons employed in clearing away and rebuilding the houses, and to defend the property.
Cala4e

property of the sufferers. The king ordered this officer to take all the money the royal treasures could supply or borrow; for, rather than it should be wanting on this pressing call, he was determined to part with his plate, nay, the very furniture of his palace. A messenger scot off from a town near Reggio on the 8th of February, travelled four days without shelter, and without being able to procure a morsel of bread; he reported nothing with a piece of cheese which he had brought in his pocket, and the vegetables he was lucky enough to find near the road. To add to all their other sufferings, the Calabrians found themselves and the miserable wreck of their fortunes exposed to the depredations of robbers and pirates. Villains landed from boats and plundered several places, and thieves went even from Naples in search of booty: In order to strike a greater terror, they dressed themselves like Algerines; but were discovered and driven off. To this accumulated distress succeeded a most insensible feaon, which obstructed every effort made to alleviate it; and almost daily earthquakes kept the inhabitants in continual dread, but of being destroyed by falls of houses, for none were left, but of being swallowed up by the splitting, or buried in the waves by some sudden inundation.

For further particulars concerning this dreadful catastrophe, and the phenomena attending it, see Earthquake.

CALADE, in the majestic, the defecut or floping declivity of a rising manege-ground, in the form of a triangle, one side of which is towards the sea. The citadel is as large as the town, and has streets, and several churches and monastaries; the number of inhabitants is reckoned to be 4000.

Calais was taken by Edward III. in 1347. Hither he marched his victorious army from Creacy, and invested the town on the 8th of September. But finding that it could not be taken by force without the destruction of great multitudes of his men, he turned the siege into a blockade, and having made strong entrenchments to secure his army from the enemy, huts to protect them from the inclemency of the weather, and stationed a fleet before the harbour to prevent the introduction of provisions, he resolved to wait with patience till the place fell into his hands by famine. The besieged, discovering his intention, turned seventeen hundred women, children, and old people out of the town, to save their provisions; and Edward had the goodness, after entertaining them with a dinner, and giving them two pence a-piece, to suffer them to pass. The garrison and inhabitants of Calais having at length consumed all their provisions, and even eaten all their horses, dogs, cats, and vermin, in the place, the governor John de Vienne appeared upon the walls, and offered to capitulate. Edward, greatly incensed at their obstinate refusal, which had detained him eleven months under their walls, at an immense expence both of men and money, sent Sir Walter Manny, an illustrious knight, to squaint the governor, that he would grant them no terms; but that they must surrender at discretion. At length, however, at the spirited remonstrances of the governor, and the persuasions of Sir Walter Manny, Edward consented to grant their lives to all the garrison and inhabitants, except fix of the principal burgesses, who should deliver to him the keys of the city, with ropes about their necks. When these terms were made known to the people of Calais, they were plunged into the deepest distress; and after all the miseries they had suffered, they could not think without horror of giving up fi.x of their fellow-citizens to certain death. In this extremity, when the whole people were drowned in tears, and uncertain what to do, Euflace de Pierre, one of the richest merchants in the place, stepped forth, and voluntarily offered himself to be one of those fix devoted victims. His noble example was soon imitated by other five of the most wealthy citizens. These true patriots, barefooted, and bare-headed, with ropes about their necks, were attended to the gates by the whole inhabitants, with tears, blessings, and prayers, for their safety. When they were brought into Edward's presence, they laid the keys of the city at his feet, and their necks. When the queen, falling upon her knees implored him to spare them, he said to her, You have no other friends who can save you. The king's remonstrance was so strong for the many toils and dangers he had suffred in this tedious siege, that he was in some danger of forgetting his usual humanity; when the queen, falling upon her knees before him, earnestly begged and obtained their lives. This great and good prince conducted these virtuous citizens, whose lives he had saved, to her own apartment, entertained them honourably, and dismissed them with presents. Edward took possession of Calais August 4th; and in order to secure a conquest of so great importance, and which had cost him so dear, he found it necessary to turn out all the ancient inhabitants, who had discovered so strong an attachment to their native prince, and to people it with English. Calais remained in subjection to England till the reign of queen Mary, when it was retaken by the duke of Guife. This general began the enterprise by ordering the privateers of Normandy and Breagute to cruise in the channel, more especially in the very straits of Calais; he then detached the duke of Nevers, with a considerable army, towards the country of Luxembourg; a motion which drew the attention of the Spaniards that way: when all things were ready, he procured an application from the people Boulogne, for a body of troops to secure them against the incursions of the Spaniards; he sent a strong detachment at their request, which was followed by another, under colour of supporting them, then repaired thither in person, secure that his officers would follow his instructions; and thus, on the first day of the new year, 1557, Calais was invested. He immediately attacked
and retired I, received from officers with 1,000 was easily carried, though the governor made three considerable number of men, kept their posts; lodge them; but the French, gorgeous attacks before the break of day, in order make a better defence; and therefore, when the lord the best terms for himself that he able to bear arms. and here were not more than 10,000, was refused, it being believed to be only an attempted the design of the French upon this fortress, to be attacked hands. The truth of the matter seems to be this: Some gave notice of it. There are very different accounts given of this matter: Some English historians say, that king Philip penetrated the design of the French upon this fortress, gave notice of it in England, and offered to take the defence of it upon himself; but that this, out of jealousy, was refused, it being believed to be only an artifice to get a place of such consequence into his own hands. The truth of the matter seems to be this: The strength of Calais confisted in its situation and outworks, which required a very numerous garrison; but this being attended with a very large expence, the best part of the troops had been sent to join Philip's army, so that the governor had not above 500 men, and there were not more than 250 of the townsmen able to bear arms. As to ammunition, artillery, and provisions, the French found there abundance, but with to render a garrison, that it was impossible to make a better defence; and therefore, when the lord Wentworth, who was governor, and whom the French call lord Damfort, was tried by his peers for the loss of this place, he was acquitted. The duke obliged all the English inhabitants to quit Calais; and beflowered the government of it upon des Termes, who was soon after made a marshall of France.

The fortifications of Calais are good; but its great-st strength is its situation among the marshes, which may be overflowed at the approach of an enemy. The harbour is not so good as formerly, nor will it admit vessels of any great burden. In times of peace, there are packet-boats going backward and forward twice a week from Dover to Calais, which is 21 miles distant. E. Long. 2. 6. N. Lat. 50. 56.

Calais and Zeetes, in fabulous history, sons of Bo-

...
CALAMUS, in botany. See Melissa, and Mentha.

CALAMUS, in botany: A genus of the monogynous order, belonging to the hexandria class of plants; and in the natural method ranking under the 5th order, Tripelaloidae. The calyx is hexaphyllous, there is no corolla, the fruit is a dry monosperous berry, imbricated backwards. There is but one species, the rotag; the stem is without branches, has a crown at top, and is every where beft with straight spines. This is the true Indian cane, which is not visible on the outside; but the bark being taken off discovers the smooth flick, which has no marks of spine on the bark, and is exactly like those which the Dutch fell to us; keeping this matter very secret, left travellers going by should take as many canes out of the woods as they please. Sumatra is said to be the place where most of these flicks grow. Such are to be chosen as are of proper growth between two joints, suitable to the fashionable length of canes as they are then worn: but such are scarce.—The calamus rotang is one of several plants from which the drug called Dragon’s-blood is obtained.

CALAMUS, in the ancient poets, denotes a simple kind of pipe or fistula, the musical instrument of the shepherds and herdsmen; usually made either of an oaten flalk or a reed.

CALAMUS Aromaticus, or Sweet-scented Flag, in the materia medica, a species of flag called aorus by Linnaeus. See Acorus.

CALAMUS Scriptrarius, in antiquity, a reed or rush to write with. The ancients made use of styles to write on tables covered with wax; and of reed, or rushes, to write on parchment, or Egyptian paper.

CALAMY (Edmund), an eminent Presbyterian divine, born at London in the year 1600, and educated at Pembroke-hall, Cambridge, where his attachment to the Arminian party excluded him from a fellowship. Dr Felton bishop of Ely, however, made him his chaplain; and, in 1639, he was chosen minister of St Mary Aldermay, in the city of London. Upon the opening of the long parliament, he distinguished himself in defence of the Presbyterian cause; and had a principal hand in writing the famous Sermo Synodicus, which, himself says, gave the start of Republicanism in England. The authors of this tract were five, the initials of whose names formed the name under which it was published; viz. Stephen Marishal, Edmund Calamy, Thomas Young, Matthew Newcomen, and William Sparrow.

He was after that an active member in the assembly of divines, was a fierce opposer of sectarism, and used his utmost endeavours to prevent those violations committed after the king was brought from the island of Wight. In Cromwell’s time he lived privately, but was illustrious in promoting the king’s return, for which he was afterwards offered a bishopric, but refused it. He was ejected for nonconformity in 1662; and died of grief at the sight of the great fire of London.

CALAMY (Edmund), grandson to the preceding (by his eldest son Mr Edward Calamy, who was ejected out of the living of Moxton in Essex on St Bartholomew’s day 1662), was born in London, April 5th 1671. After having learned the languages, and gone through a course of natural philosophy and logic at a private academy in England, he studied philosophy and civil law at the university of Utrecht, and attended the lectures of the learned Gravius. Whilst he resided here, an offer of a professor’s chair in the university of Edinburgh was made him by Mr Carlairs, principal of that university, sent over on purpose to find a person properly qualified for such an office. This he declined; and returned to England in 1691, bringing with him letters from Gravius to Dr Pocock canon of Christ church and regius professor of Hebrew, and to Dr Bernard Savilian professor of astronomy, who obtained leave for him to prosecute his studies in the Bodleian library. Having resolved to make divinity his principal study, he entered into an examination of the controversy between the conformists and non-conformists; which determined him to join the latter: and coming to London in 1692, he was unanimously chosen affidavit to Mr Matthew Sylvester at Blackfriars; and in 1694, he was ordained at Mr Annelfy’s meetinghouse in Little St Helen, and soon after was invited to become assistant to Mr Daniel Williams in Hand Alley. In 1702, he was chosen to be one of the lecturers in Salter’s-hall; and, in 1703, succeeded Mr Vincent Allot as pastor of a great congregation in Westminster. He drew up the table of contents to Mr Baxter’s history of his life and times, which was sent to the press in 1696; made some remarks on the work itself, and added to it an index; and, reflecting on the usefulness of the book, he saw the expediency of continuing it, for Mr Baxter’s history came no lower than the year 1684. Accordingly he composed an abridgment of it, with an account of many other ministers who were ejected after the restoration of Charles II.; their apology, containing the grounds of their non-conformity and practice as to the liturgy, and the useful sermons and other writings necessary to his history, till the year 1691. This work was published in 1702. He afterwards published a moderate defence of nonconformity, in three tracts, in answer to some tracts of Dr Hoadley. In 1709, Mr Calamy made a tour to Scotland; and had the degree of doctor of divinity conferred on him by the universities of Edinburgh, Aberdeen, and Glasgow. In 1713, he published a second edition of his Abridgment of Mr Baxter’s history of his life and times, which, among other additions, there is a continuation of the chirography through King William’s reign, and Queen Anne’s, down to the passing of the occasional bill; and in the close is subjoined the reformed liturgy, which was drawn
that this was a common practice among protestants. The officers of justice adopted the popular tale, and were supplied by the mob with what they accepted as evidences of the fact. The fraternity of white penitents got the body, buried it with great ceremony, and performed a solemn service for him as a martyr; the Franciscans did the same; and after these formalities no one doubted the guilt of the devoted heretical family. They were all condemned to the torture, to bring them to confession: they appealed to the parliament, who, as weak and as wicked as the subordinate magistrates, sentenced the father to the torture ordinary and extraordinary, to be broken alive upon the wheel, and then to be burned to ashes. A diabolical decree! which, to the shame of humanity, was actually carried into execution. Peter Calas, the other son, was banished for life; and the rest were acquitted. The distraught widow found some friends, and among the rest M. Voltaire, who laid her case before the council of state at Versailles, and the parliament of Thoulouze were ordered to transmit the proceedings. There the king and council unanimously agreed to annul; the capitoul, or chief magistrate of Thoulouze, was degraded and fined; old Calas was declared to have been innocent; and every imputation of guilt was removed from the family, who also received from the king and clergy considerable gratuities.

CALASH, or Caleo, a small light kind of chariot or chair, with very low wheels, used chiefly for taking the air in parks and gardens. The calash is for the most part richly decorated, and open on all sides for the convenience of the air and prospect, or at most indlosed with light mantlets of wax-cloth to be opened and shut at pleasure. In the Philosophical Transactions we have a description of a new sort of calash going on two wheels, not hung on traces, yet easier than the common coaches, over which it has this further advantage, that whereas a common coach will overturn if one wheel go on a surface a foot and a half higher than the other, this will admit of a difference of 3 feet without danger of overturning. Add, that it should turn over and over; that is, after the spokes being so turned as that they are parallel to the horizon, and one wheel flat over the head of him that rides in it, and the other flat under him, it will turn once more, by which the wheels are placed in statu quo, without any disorder to the horse or rider.

CALASIO (Marius), a Franciscan, and professor of the Hebrew language at Rome, of whom there is very little to be said, but that he published there, in the year 1621, a Concordance of the Bible, which consisted of four great volumes in folio. This work has been highly approved and commended both by Protestants and Papists, and is indeed a most admirable work. For besides the Hebrew words in the Bible, which are in the body of the book with the Latin version over against them; there are, in the margin, the differences between the Septuagint version and the vulgate; so that at one view may be found wherein the three Bibles agree, and wherein they differ. Moreover, at the beginning of every article there is a kind of dictionary, which gives the signification of each Hebrew word; affords an opportunity of comparing it with other oriental languages, viz. with the Syriac, Arabic, and Chaldee; and is extremely useful...
CALAFIRIS, for determining more exactly the true meaning of the Hebrew words.

CALASIRIS, in antiquity, a linen tunic fringed at the bottom, and worn by the Egyptians under a white woollen garment; but this last they were obliged to pull off when they entered the temples, being only allowed to appear there in linen garments.

CALATAJUD, a large and handsome town of Flanders, situated at the confluence of the rivers Xalmon and Xlioca, at the end of a very fertile valley, with a good castle on a rock.

W. Long. 2. p. N. Lat. 47. 22.

CALATHUS, as represented on ancient monuments, is it, returned it him again. Then Don Reymond, of the order of the Calatrava to the Moorish of Andalusian, he gave do. W. Long. 4.

CALATRAVA, a city of New Caste, in Spain, situated on the river Guadiana, 45 miles south of Toledo.

W. Long. 4. 20. N. Lat. 39. 0.

Knights of CALATRAVA, a military order in Spain, instituted at the Spanish town of Calatrava, upon the following occasion. When that prince took the fortress of Calatrava from the Moors of Andalusia, he gave it to the templars, who, wanting courage to defend it, returned it him again. Then Don Reymond, of the order of the Cistercians, accompanied with several persons of quality, made an offer to defend the place, which the king thereupon delivered up to them, and instuted that order. It increased so much under the reign of Alphonso, that the knights desired they might have a grand master, which was granted. Ferdinand and Isabella afterwards, with the consent of pope Innocent VIII. re-united the grand mastership of Calatrava to the Spanish crown; so that the kings of Spain are now become perpetual administrators thereof.

The knights of Calatrava bear a crown of gules, flowered, with green, &c. Their rule and habit was originally that of the Cistercians.

CALAURIA, (anc. geog) an island of Greece in the Saronic bay, over against the port of Trozen, at a distance of 40 stadia. Hither Demosthenes went twice into banishment; and here he died. Neptune was said to have accepted this island from Apollo, in exchange for Delos. The city stood on a high ridge nearly in the middle of the island, commanding an extensive view of the gulph and its coasts. There was his holy temple. The priestess was a virgin, who was dismissed when marriageable. Seven of the cities near this island held a congress at it, and sacrificed jointly to the deity. Athens, Egin, and Epidaurus were of this number, with Nauplia, for which place Argos contributed. The Macedonians, when they had reduced Greece, were afraid to violate the sanctuary, by forcing from it the fugitives, his suppliants. Antipater commanded his general to bring away the orators who had offended him, alive; but Demosthenes could not be prevailed on to surrender. His monument remained in the second century, within the cloister of the temple. The city of Calauria has been long abandoned. Traces of buildings, and of ancient walls, appear nearly level with the ground; and some flones, in their places, each with a seat and back, forming a little circle, once perhaps a bath. The temple, which was of the Doric order, and not large, as may be inferred from the fragments, is reduced to an inconsiderable heap of ruins. The island is now called Poro. It stretches along before the coast of the Morea in a lower ridge, and is separated from it by a canal only four stadia or half a mile wide. This, which is called Poro or the Ferry, in still weather may be passed on foot, as the water is not deep. It has given its name to the island, and also to the town, which consists of about 200 houses, mean and low, with flat roofs; rising on the slope of a bare disagreeable rock.

CALCADA, or St Dimiento CALCADA, a town of Spain, situated in W. Long. 3. 5. N. Lat. 42. 36.

CALCAR, a very strong town of Germany, in the circle of Westphalia, and duchy of Cleves. It belongs to the king of Prussia, and is seated near the Rhine, in E. Long. 5. 41. N. Lat. 51. 45.

CALCAR, in glas-making, the name of a small oven, or reverberatory furnace, in which the first calcination of sand and salt of potash is made for the turning them into what is called frit. This furnace is made in the fashion of an oven ten feet long, seven broad in the widest part, and two feet deep. On one side of it is a trench six inches square, the upper part of which is level with the calcar, and separated only from it by the mouth by bricks nine inches wide. Into this trench they put sea-coal, the flame of which is carried into every part of the furnace, and is reverberated from the roof upon the frit, over the surface of which the smoke flies very black, and goes out at the mouth of the calcar; the coals burn on iron grates, and the ashes fall through.

CALCAR (John de), a celebrated painter, was the disciple of Titian, and perfected himself by studying Raphael. Among other pieces he drew a nativity, representing the angels and the infant Christ; and so ordered the disposition of his picture, that the light all proceeds from the child. He died at Naples, in 1546, in the flower of his age. It was he who designed the anatomical figures of Vesal, and the portraits of the painters of Vesal.

CALCAROUS, something that partakes of the nature and qualities of calc, or lime. We say, a calcareous earth, calcareous stone. See CHEMISTRY-Index.

CALCARIUM, in antiquity, a donative or largess beffowed on Roman folders for buying shoes. In monasteries, calcarium denoted the daily service of cleaning the shoes of the religious.
CALCEOLARIA, in botany, a genus of the monogynia order, belonging to the diandria class of plants. The corolla is ringent and inflated; the calyx has two cells, and two valves; the calyx four parted and equal.

CALCHAS, in fabulous history, a famous diviner, followed the Greek army to Troy. He foretold that the siege would last ten years; and that the fleet, which was detained in the port of Aulis by contrary winds, would not sail till Agamemnon's daughter had been sacrificed to Diana. After the taking of Troy, he retired to Colophon; where, it is said, he died of grief, because he could not divine what another of his profession, called Mopsus, had discovered.

CALCULATION, in chemistry, the reducing of substances to a calx by fire. See Chemistry-Index.

CALCINATO, a town of Italy, in the duchy of Mantua, remarkable for a victory gained over the Imperialists by the French in 1706. E. Long, 9. 55. N. Lat. 45 25.

CALCULARY of a PEAR, a congeries of little strong knots dispersed through the whole parenchyma of the fruit. The calculary is most observed in rough-tasted or chock-pears. The knots lie more continuous and compact together towards the pear where they surround the acetary. About the stalk they stand more distant; but towards the cork, or flesh of the flower, they still grow closer, and there at last gather into the firmness of a plum-flone. The calculary is no vital or essential part of the fruit; the several knots whereof it consists being only so many concretions or precipitations out of the sap, as we see in urines, wines, and other liquors.

CALCULATION, the act of computing several sums, by adding, subtracting, multiplying, or dividing. See Arithmetic.

Calculation is more particularly used to signify the computations in astronomy and geometry, for making tables of logarithms, ephemerides, finding the time of eclipses, &c. See Astronomy, Geometry, and Logarithms.

CALCULUS, primarily denotes a little stone or pebble, anciently used in making computations, taking of suffrages, playing at tables, and the like. In aftertimes, pieces of ivory, and counters struck of silver, gold, and other matters, were used in lieu thereof, but still retaining the ancient names. Computals were by the lawyers called calculones, when they were either slaves or newly freed men; those of a better condition were named calculatores or numerariss; ordinarily there was one of these in each family of distinction. The Roman judges anciently gave their opinions by calculi, which were white for abolition, and black for condemnation. Hence calculus albus, in ancient writers, denotes a favourable vote, either in a person to be absolved and acquitted of a charge, or elected to some dignity or post; as calculus niger did the contrary. This usage is said to have been borrowed from the Thracians, who marked their happy or prosperous days by white, and their unhappy by black, pebbles, put each night into an urn.

Besides the diversity of colour, there were some calculi also which had figures or characters engraved on them, as those which were in use in taking the suffrages both in the senate and at assemblies of the people. These calculi were made of thin wood, polished and covered over with wax. Their form is still seen in some medals of the Caflian family; and the manner of calling them into the urns, in the medals of the Licinius family. The letters marked upon these calculi were U. R. for uti regat, and A. for antiquo; the first of which expressed an approbation of the law, the latter a rejection of it. Afterwards the judges who sat in capitol caesus used calculi marked with the letter A. for abfolute; C. for condemnans, and N. L. for non liquet, signifying that a more full information was required.

Calculation is also used in ancient grammatic writers for a kind of weight equal to two grains of cicer. Some make it equivalent to the litre, which is equal to three grains of barley. Two calculi made the ceratium.

CALCULUS Differentialis is a method of differing quantities, or of finding an infinitely small quantity, which, being taken infinite times, shall be equal to a given quantity; or, it is the arithmetic of the infinitely small differences of variable quantities.

The foundation of this calculus is an infinitely small quantity, or an infinitesimal, which is a portion of a quantity incomparable to that quantity, or that is less than any assignable one, and therefore accounted as nothing; the error accruing by omitting it being less than any assignable one. Hence two quantities, only differing by an infinitesimal, are reputed equal. Thus, in Astronomy, the diameter of the earth is an infinitesimal, in respect of the distance of the fixed stars; and the fame holds in abstract quantities. The term, infinitesimal, therefore, is merely relative, and involves a relation to another quantity; and does not denote any real ens, or being. Now infinitesimals are called differentials, or differential quantities, when they are considered as the differences of two quantities.

Sir Isaac Newton calls them momenta; considering them as the momentary increments of quantities, v. g. of a line generated by the flux of a point, or of a surface by the flux of a line. The differential calculus, therefore, and the doctrine of fluxions, are the fame thing under different names; the former given by M. Leibnitz, and the latter by Sir Isaac Newton; each of whom lay claim to the discovery. There is, indeed, a difference in the manner of expressing the quantities resulting from the different views wherein the two authors consider the infinitesimals, the one as moments, the other as differences; Leibnitz, and most foreigners, express the differentials of quantities by the same letters as variable ones, only prefixing the letter d: thus the differential of x is called d x; and that of y, d y; now d x is a positive quantity, if x continually increase; negative, if it decrease. The English, with Sir Isaac Newton, instead of d x write x (with a dot over it); for d y, &c. which foreigners object again, on account of that confusion of points, which they imagine arises when differentials are again differentiated, besides, that the printers are more apt to overlook a point than a letter. Stable quantities being always expreessed by the first letters of the alphabet d a = x, d b = y, d c = z; wherefore d (x + y) = d x + d y, and d (x - y) = d x - d y. So that the differentiating of quantities is easily performed, by the addition or subtraction of their compounds.

To difference quantities that multiply each other; the rule is, first, multiply the differential of one factor into the other factor, the sum of the two factors is the differential sought; thus, the quantities being x, y, the dif-
Calculus. differential will be \( x \cdot dy + y \cdot dx \), i.e. \( d(xy) = x \cdot dy + y \cdot dx \). Secondly, if there be three quantities mutually multiplying each other, the product of the two must then be multiplied into the differential of the third: thus suppose \( v \cdot x \cdot y \), let \( v = x \), then \( v \cdot x \cdot y \cdot dx \); consequently \( d(v \cdot x \cdot y) = d(v) \cdot x \cdot y + v \cdot d(x \cdot y) \). These values, therefore, being subtilized in the antecedent differential, \( d(x \cdot y) \cdot d(v) \), the result is, \( d(v \cdot x \cdot y) = d(v) \cdot x \cdot y + v \cdot d(x \cdot y) \). Hence it is easy to apprehend how to proceed, where the quantities are more than three. If one variable quantity increases, while the other decreases, it is evident that \( x \cdot dx - x \cdot dy \) will be the differential of \( x \cdot y \).

To differentiate quantities that mutually divide each other; the rule is, first, multiply the differential of the divisor into the dividend; and on the contrary, the differential of the dividend into the divisor; subtract the last product from the first, and divide the remainder by the square of the divisor; the quotient is the differential of the quantities mutually dividing each other. See Fluxions.

**Calculus Exponentialis.** is a method of differencing exponential quantities, or of finding and summing up the differentials or moments of exponential quantities; or at least bringing them to geometrical confections.

By exponential quantity, is here understood a power, whose exponent is variable; e.g. \( x^a \cdot a^x \cdot x' \). where the exponent \( x \) does not denote the same at all the points of a curve, but in some stands for 2, in others for 3, in others for 5, &c.

To difference an exponential quantity; there is nothing required but to reduce the exponential quantities to logarithmic ones, which done, the differencing is managed as in logarithmic quantities.—Thus, suppose the differential of the exponential quantity \( x \) required, let 

\[ x^2 = x \]

Then will \( y \cdot x = x \cdot dy \)

\[ 1 \cdot x \cdot dy + y \cdot dx = \frac{d x}{x} = \frac{d z}{x} \]

That is, \( x \cdot l x \cdot dx + x \cdot d y + x' = \cdot d x = d z \).

**Calculus Integralis, or Summatorius.** is a method of integrating, or summing up moments, or differential quantities; i.e. from a differential quantity given, to find the quantity from whose differencing the given differential results.

The integral calculus, therefore, is the inverse of the differential one: whence the English, who usually call the differential method fluxions, give this calculus, which ascends from the fluxions, to the flowing or variable quantities; or, as foreigners exprefs it, from the differences to the sums, by the name of the inverse method of fluxions.

Hence, the integration is known to be justly performed, if the quantity found, according to the rules of the differential calculus, being differenced, produce that proposed to be summed.

Suppose \( f \) the sign of the sum, or integral quantity, then \( f \cdot dx \) will denote the sum, or integral of the differential \( x \cdot dx \).

To integrate, or sum up a differential quantity: It is demonstrated, first, that \( f \cdot dx \cdot x = \) secondly, \( f \cdot (d(x+y)) = x \cdot dx \); thirdly, \( f \cdot (d(x+y)) = x \cdot dx + y \cdot dy \); fourthly, \( f \cdot (x^m \cdot dx) = \frac{dx}{x^1} \cdot \frac{d x}{x^2} \cdot \frac{d x}{x^3} \cdot \frac{d x}{x^4} \cdot \frac{d x}{x^5} \).

Sixthly, \( f \cdot (x \cdot dx) = y \cdot dy \). Of these, the fourth and fifth cases are the most frequent, wherein the differential quantity is integrated, by adding a variable unity to the exponent, and dividing the sum by the next exponent multiplied into the differential of the root, viz. the fourth case, by \( m \cdot (1 + 1) \cdot dx \), i.e. by \( m \cdot dx \).

If the differential quantity to be integrated doth not come under any of these formulas, it must either be reduced to an integral finite, or an infinite series, each of whose terms may be summed.

It may be here observed, that, as in the analysis of finites, any quantity may be raised to any degree of power; but vice versa, the root cannot be extracted out of any number required: so in the analysis of infinites, any variable or flowing quantity may be differenced; but vice versa, any differential cannot be integrated. And as, in the analysis of finites, we are not yet arrived at a method of extracting the roots of all equations, so neither has the integral calculus arrived at its perfection: and as in the former we are obliged to have recourse to approximation, so in the latter we have recourse to infinite series, where we cannot attain to a perfect integration.

**Calculus Literalis, or Literal Calculus.** is the same with spheric arithmetic, or algebra, so called from its using the letters of the alphabet; in contradistinction to numeral arithmetic, which uses figures. In the literal calculus given quantities are expreseed by the first letters, \( a b c d \); and quantities sought by the last \( x y z \), &c. Equal quantities are denoted by the same letters.

**Calculus Minus.** among the ancient lawyers, denoted the decision of a cause, wherein the judges were equally divided. The expression is taken from the history of Orestes, represented by Achilles and Euripides; at whose trial, before the Areopagites, for the murder of his mother, the votes being equally divided for and against him, Minerva interposed, and gave the casting vote or calculus in his behalf.

M. Cramer, professor at Marpurg, has a discourse expres, De Calculo Minus; wherein he maintains, that all the effect an entire equality of voices can have, is to leave the cause in flagr quo.

**Calculus Tihurrinus.** a sort of figured stone, formed in great plenty about the cata¬ractis of the Anio, and other rivers in Italy; of a white colour, and in shape oblong, round, or echinated. They are a species of the flille lapides, and generated like them; and so like sugar-plums in the whole, that is a common jest at Rome to deceive the inexperienced by serving them up as dates.

**Calculus.** in Medicine, the disease of the stone in the bladder, or kidneys. The term is Latin, and signifies a little pebble. The calculus in the bladder is called lithiasis; and in the kidneys, nephritis. See Medicine and Surgery.

Human calculi are commonly formed of different strata.
CALCUTTA, the capital of the province of Bengal, and of all the British possessions in the East-Indies, is situated on the river Hugely, a branch of the Ganges, about 100 miles from the sea, in N. Lat. 23: 30, and 88° 28'. E. Long. from Greenwich. It is but a small city, built on the site of a village called Gemindpoor. The English first obtained the Mogul's permission to settle in this place in the year 1690; and Mr. Job Channock, the company's agent, made choice of the spot on which the city stands, on account of a large shady grove which grew there; though in other respects it was the worst he could have pitched upon; for three miles to the north coast, there is a salt-water lake, which overflows in September, and when the flood retires in December, leaves behind such a quantity of fish and other putrefactive matter, as renders the air very unhealthy. The custom of the Gentooos throwing the dead bodies of their poor people into the river is also very disgraceful, and undoubtedly contributes to render the place unhealthy, as well as the cause already mentioned.

Calcutta is now become a large and populous city, being suppos'd at present to contain 500,000 inhabitants. It is elegantly built, at least the part inhabited by the English; but the rest, and that the greatest part, is built after the fashion of the cities of India in general. The plan of all these is nearly the same; their streets are exceedingly confined, narrow, and crooked, with a vast number of ponds, reservoirs, and gardens intermixed. A few of the streets are paved with brick. The houses are built, some with brick, others with mud, and a still greater number with bamboos and mats; all which different kinds of fabrics standing intermixed with one another, form a very unceon appearance. The brick houses are seldom above two stories high, but those of mud and bamboos are only one, and are covered with thatch. The roofs of the brick houses are flat and terraced. These, however, are much fewer in number than the other two kinds; so that fires, which often happen, do not sometimes meet with a brick house to obstruct their progress in a whole street. Within these 20 or 25 years Calcutta has been greatly improved both in appearance and in the salubrity of its air: the streets have been properly drained, and the ponds filled; thereby removing a vast surface of stagnant water, the exhalations of which were particularly hurtful. The citadel is named Fort William, and is superior as a fortress to any in India; but is now on too extensive a scale to answer the purpose for which it was intended, viz. the holding a post in case of extremity. It was begun on this extended plan by lord Clive immediately after the battle of Plassey. The expense attending it was supposed to amount to two millions Sterling.

Calcutta is the emporium of Bengal, and the residence of the governor-general of India. Its flourishing state may in a great measure be ascribed owing to the unlimited toleration of all religions allowed here; the Pagans being suffered to carry their idols in procession, the Mahomedans not being discommoded, and the Roman Catholics being allowed a church. At about a mile distant from the town is a plain where the natives annually undergo a very strange kind of penance on the 9th of April; some for the sins they have committed, others for those they may commit, and others in consequence of a vow made by their parents. This ceremony is performed in the following manner. Thirty bamboos, each about the height of 20 feet, are erected in the plain abovementioned. On the top of these they contrive to fix a swivel, and make two Copies of a rod of thirty feet or more crossed it, at both ends of which hangs a rope. The people pull down one end of this rope, and the devotee placing himself under it, the Brahmin pinches up a large piece of skin under both the shoulder blades, sometimes in the breasts, and thrusts a strong iron hook through each. These hooks have lines of Indian brass hanging to them, which the priest makes fast to the rope at the end of the cros fame, and at the same time puts a fast round the body of the devotee, laying it loosely in the hollow of the hooks, left by the skin's giving way, when the rope is pulled. When this is done, the people haul down the other end of the bamboo; by which means the devotee is immediately lifted up 30 feet or more from the ground, and they run round as fast as their legs can carry them. Thus the devotee is thrown out the whole length of the rope, where, as he swings, he plays a thousand antics tricks; being painted and dressed in a very particular manner, on purpose to make him look more ridiculous. Some of them continue swinging half an hour, others less. The devotees undergo a preparation of four days for this ceremony. On the first and third they abstain from all kinds of food; but eat fruit on the other two. During this time of preparation they walk about the streets in their fantastic dresses, dancing to the sound of drums and horns; and some, to express the greater amount of devotion, run a rod of iron quite through their tongues, and sometimes through their cheeks also.

Before the war of 1755, Calcutta was commonly garrisoned by 300 Europeans, who were frequently employed in conveying the company's veesels from Patna, loaded with salt-petre, piece-goods, opium, and raw silk. The trade of Bengal alone supplied rich cargoes for 50 or 60 ships annually, besides what was carried on in small vessels to the adjacent countries. It was this flourishing state of Calcutta that probably was one motive for the Nabob Surajah Dowlah to attack it in the year 1756. Having had the fort of Cooimbazar delivered up to him, he marched against Calcutta with all his forces, amounting to 70,000 horse and foot,
CAL

with 400 elephants, and invested the place on the 15th of June. Previous to any hostilities, however he wrote a letter to Mr Drake the governor, offering to withdraw his troops, on condition that he would pay him his duty on the trade for 15 years past, defray the expense of his army, and deliver up the black merchants who were in the fort. This being refused, he attacked one of the redoubts at the entrance of the town; but was repulsed with great slaughter. On the 16th he attacked another advanced post, but was likewise repulsed with great loss. Withstanding this disappointment, however, the attack was renewed on the 18th, when the troops abandoned these posts, and retreated into the fort; on which the Nabob's troops entered the town, and plundered it for 24 hours. An order was then given to attacking the fort; for which purpose a small breast-work was thrown up, and two twelve pounders mounted upon it; but without firing oftener than two or three times an hour. The governor then called a council of war, when the captain of the train informed them, that there was not ammunition in the fort to serve three days; in consequence of which the principal ladies were sent on board the ships lying before the fort. They were followed by the governor, who declared himself a quaker, and left the place to be defended by Mr Holwell the second in council. Besides the governor, four of the council, eight gentlemen in the company's service, four officers, and 100 soldiers, with 52 free merchants, captains of ships, and other gentlemen, escaped on board the ships, where were also 59 ladies, with 53 of their children. The whole number left in the fort were about 250, effective men, with Mr Holwell, four captains, five lieutenants, six ensigns, and five fergeants; as also 14 fers-captains, and 20 gentlemen of the factory. Mr Holwell then having held a council of war, divided three chests of treasure among the discontented soldiers; making them large promises also, if they behaved with courage and fidelity; after which he boldly fixed on the business of the place, and advancing the immense force which opposed him. The attack was very vigorous; the enemy having got possession of the houfes, called the English from thence, and drove them from the battlements; but they themselves were several times dislodged by the fire from the fort, which killed upwards of 12,000 men, with the loss of only five English folders the first day. The attack, however, was continued till the afternoon of the 20th; when many of the garrifon being killed and wounded, and their ammunition almost exhausted, a flag of truce was hung out. Mr Holwell intended to have availed himself of this opportunity to make his escape on board the ships, but they had fallen several miles down from the fort, without leaving even a single boat to facilitate the escape of those who remained. In the mean time, however, the back-gate was betrayed by the Dutch guard, and the enemy, entering the fort, killed all they first met, and took the rest prisoners.

The fort was taken before fix in the evening; and, in an hour after, Mr Holwell had three audiences of the Nabob, the last being in the darbar or council. In all the governor had the most positive assurances that no harm should happen to any of the prisoners; but he was surprized and enraged at finding only 5000l. in the fort, instead of the immense treasures he expected; and to this, as well as perhaps to the resentment of the jemmidades or officers, of whom many were killed in the siege, we may impute the catastrophe that followed.

As soon as it was dark, the English prisoners, to the number of 146, were directed by the jemmidades who guarded them, to collect themselves into one body, and set down quietly under the arched veranda, or piazza, to the westward of the black-hole prison. Besides the guard over them, another was placed at the fourth-end of this veranda, to prevent the escape of any of them. About 500 gunmen, with lighted matches, were drawn up on the parade; and soon after the factory was in flames to the right and left of the prisoners, who had various conjectures on this appearance. The fire advanced with rapidity on both sides; and it was the prevailing opinion of the English, that they were to be suffocated between the two fires. On this they soon came to a resolution of rushing on the guard, seizing their scymitars, and attacking the troops upon the parade, rather than be thus tamely roasted to death: but Mr Holwell advanced, and found the Moors were only searching for a place to confine them in. At that time Mr Holwell might have made his escape, by the assistance of Mr Leech, the company's smith, who had escaped when the Moors entered the fort, and returned just as it was dark, to tell Mr Holwell he had provided a boat, and would ensure his escape, if he would follow him through a passage few were acquainted with, and by which he then entered. This might easily have been accomplished, as the guard took little notice of it: but Mr Holwell told Mr Leech, he was resolved to share the fate of the gentlemen and the garrifon; to which Mr Leech gallantly replied, that "then he was resolved to share Mr Holwell's fate, and would not leave him."

The guard on the parade advanced, and ordered them all to rise and go into the barracks. Then, with their muskets prefented, they ordered them to go into the black-hole prison; while others with clubs and scymitars, pressed upon them so strong, that there was no resisting it; but, like one agitated wave impelling another, they were obliged to give way and enter; the rest following like a torrent. Few among them, the soldiers excepted, had the least idea of the dimensions or nature of a place they had never seen; for if they had, they should at all events have rushed upon the guard, and been cut to pieces by their own choice as the leffer evil.

It was about eight o'clock when these 146 unhappy persons, exhausted by continual action and fatigue, were thus plunged into a dungeon about eighteen feet square, in a close, fufy night in Bengal; shut up to the east and south, the only quarters from whence air could reach them, by dead walls, and by a wall and door to the north; open only to the west by two windows, strongly barred with iron, from which they could receive scarce any circulation of fresh air.

They had been but few minutes confined before every one fell into a perspiration so profuse, that no idea can be formed of it. This brought on a raging thirst, which increased in proportion as the body was drained of its moisture. Various expedients were thought
CALCUTTA, thought of to give more room and air. Every man was stripped, and every hat put in motion; they several times sat down on their hams; but at each time several of the poor creatures fell, and were instantly suffocated or trod to death.

Before nine o'clock every man's thirst grew intolerable, and respiration difficult. Efforts were again made to force the door; but still in vain. Many insults were used to the guards, to provoke them to fire in upon the prisoners, who gave outrageous, and many delirious. “Water, water,” became the general cry. Some water was brought; but these suplities, like sprinkling water on fire, only served to raise and feed the flames. The confusion became general, and horrid from the cries and ravings for water, and some were trampled to death. This scene of misery proved entertainment to the brutal wretches without, who supplied them with water, that they might have the satisfaction of seeing them fight for it, as they phrased it; and held up lights to the bars, that they might lose no part of the inhuman diversion.

Before eleven o'clock, most of the gentlemen were dead, and one third of the whole. Thirst grew intolerable: but Mr Holwell kept his mouth moist by sucking the perspiration out of his shirt-sleeves, and catching the drops as they fell, like heavy rain, from his head and face. By half an hour after eleven, most of the living were in an outrageous delirium. They found that water heightened their uneasiness; and “Air, air,” was the general cry. Every insuff that could be devised against the guard, all the opprobrious names that the victor and his officers could be loaded with, were repeated to provoke the guard to fire upon them. Every man had eager hopes of meeting the first shot. Then a general prayer to heaven, to hasten the approach of the flames to the right and left of them, and put a period to their misery. Some expired on others; while a steam arose as well from the living as the dead, which was very offensive.

About two in the morning, they crowded so much to the windows, that many died standing, unable to fall the like thieves and robbers preface round. When the day broke, the fence arising from the dead bodies was insufferable. At that juncture, the Susah, who had received an account of the havoc death had made among them, sent one of his officers to enquire if the chief survived. Mr Holwell was shown to him; and near fix an order came for their release. Thus they had remained in this infernal prison from eight at night until fix in the morning, when the poor remains of 146 souls, being only 23, came out alive, but most of them in a high putrid fever. The dead bodies were dragged out of the hole by the folder, and thrown promiscuously into the ditch of an unmingled ravine, which was afterwards filled with earth.

The injuries which Calculta, suffered at this time, however, were soon repaired. The place was retaken by Admiral Watson and Colonel Clive, early in 1757; Surajah Dowla was defeated, deposed, and put to death; and Meer Jaffier, who succeeded him in the Nabobship, engaged to pay an immense sum for the indemnification of the inhabitants. Since that time the immense acquisition of territory by the Brit-
C A L D E R W O O D.

bar presided as a commissioner; and it appears from his writings, that he looked upon every thing transacted in it as null and void. In May following, king James went to Scotland; and on the 17th of June held a parliament at Edinburgh: at that time the clergy met in one of the churches, to hear and advise with the bishops; which kind of assembly, it seems, was contrived in order to resemble the English convocation. Mr Calderwood was present at it, but declared publicly that he did not take any such meetings to resemble a council, and being opposed by that he did not take any such meetings to resemble a council, and being opposed by Dr Whitford and Mr Archibald Simson on behalf of the church of England. They protested for several reasons. This protest was presented to the king, with the advice of the archbishops, and such a number of the ministry, as his Majesty should think proper, to consider and conclude as to matters decent for the external policy of the church, not respecting reformation, it might be a pattern to others. Because their church was esteemed in order to proceed in the mean while in the dispatch of business; and Mr Calderwood, with several other ministers, being informed that a bill was depended on the states in parliament. However, though not made of copper; having a moveable iron handle, whereby to hang it on the chimney-hook. The word is formed from the French chaudron, or rather the Latin caldarium.

Boiling in CALDRON (caldarium decoque), is a capital punishment spoken of in the middle-age writers, decreed to divers sorts of criminals, but chiefly to debaters of the coin. One of the torments inflicted on the ancient Christian martyrs, was boiling in caldrons of water, oil, &c.

Caldwell (Richard), a learned English physician, born in Staffordshire about the year 1572. He studied physic in Brazen-Nose college Oxford; and was examined, admitted unto, and made censor of the college of physicians at London, all in one day. Six weeks after he was chosen one of the electors; and in the year 1570 was made president of that college. Mr Wood tells us, that he wrote several pieces in his profession; but he does not tell us what they were, only that he translated a book on the art of surgery, written by one Horatio More, a Florentine physician. We learn from Cambden, that Caldwell founded a chirurgical lecture in the college of physicians, and endowed it with a handsome salary. He died in 1585.

CALEA, in botany: A genus of the polygama equalis order, belonging to the syngenesia clasts of plants; and in the natural method ranking under the 40th order, Compofites. The receptacle is paleaceous, the pappus hairy, and calyx imbricated.

CALEB, one of the deputies sent by the Israelites to take a view of the land of Canaan. He made a good report of the country, and by this means revived the spirits of the dejected people; on which account, he and Joshua were the only persons who, after their leaving Egypt, settled in the land of Canaan. Caleb had,
had, for his share, the mountains and the city of Hebron, from which he drove three kings. Othniel his nephew having taken the city of Debir, Caleb gave him his daughter Achsah in marriage; and died, aged 114.

CALEDONIA, the ancient name of Scotland. From the testimonies of Tacitus, Dio, and Solinus, we find, that the ancient Caledonians comprehended all that country lying to the north of the rivers Forth and Clyde. In proportion as the Silures or Cimbri advanced towards the north, the Caledonians, being circumcised within narrower limits, were forced to transmigrate into the islands which crowd the western coasts of Scotland. It is in this period probably, we ought to place the first great migration of the British Gaël into Ireland; that kingdom being much nearer to the promontory of Galloway and Cantire, than many of the Scotch isles are to the continent of North Britain.

To the country which the Caledonians possessed, they gave the name of Cældo-clach; which is the only appellation the Scots, who speak the Gaelic language, know for their own division of Britain. Cældo-clach is a compound, made up of Cæld or Cael, the firstcolon of the ancient Gaels who transmigrated into Britain, and doch, a district or division of a country. The Romans, by transposing the letter l in Cael, and by foutening into a Latin termination the ch of doch, formed the well-known name of Caledonia.

When the tribes of North Britain were attacked by the Romans, they entered into associations, that, by uniting their strength, they might be more able to repel the common enemy. The particular name of that tribe, which either its superior power or military reputation placed at the head of the association, was the general name given by the Romans to all the confederates. Hence it is that the Mæata, who with other tribes inhabited the districts of Scotland lying southward of the frith, and the Caledonians, who inhabited the west and north-western parts, have engrossed all the glory which belonged in common, though in an inferior degree, to all the other nations settled of old in North Britain. It was for the same reason that the name of Mæata was entirely forgotten by foreign writers after the third century, and that of the Caledonians themselves but seldom mentioned after the fourth.

Britons, Caledonians, Mæata, Barbarians, are the names constantly given to the old inhabitants of North Britain, by Tacitus, Herodian, Dio, Spartan, Vopiscus and other ancient writers. The successors of these Britons, Caledonians, Mæata, and Barbarians, are called Picts, Scots, and Ataeats, by some Roman writers of the fourth century, the origin of the appellation Scotti and Picti, introduced by latter Roman authors, has occasioned much controversy among the antiquaries of these days. The dispute seems now to be fully decided by some learned critics of the present century, whose knowledge of the Gaelic language affixed their investigation. See Scotland, Picts, and Highlanders.

CALEDONIA, the name of a settlement made by the Scots on the west side of the gulf of Darien, in 1693; out of which they were harver at the request of the East-India company; for the English government pro-

hibited the other colonies sending them any provisions, so they were obliged to leave it in 1700.

New Caledonia, an island in the south sea, lately discovered by captain Cook, and, next to New Holland and New Zealand, is the largest island that has yet been discovered in that sea. It extends from 19. 37. to 22. 30. South Lat. and from 163. 57. to 167. 14. E. Long. Its length from north-west to south-east is about 80 leagues; but its greatest breadth does not exceed ten leagues. This island is diversified by hills and valleys of various size and extent. From the hills little abundance of rivulets, which contribute to fertilize the plains. Along its north-east shore the land is flat; and being well watered, and cultivated by the inhabitants after their manner, appeared to great advantage to captain Cook's people. Was it not, indeed, for those fertile spots on the plains, the whole country might be called a dreary waste: the mountains and higher parts of the land are in general incapable of cultivation. They consist chiefly of rocks, many of which are full of mounds; the little soil that is upon them is scorched and burnt up by the sun; it is, however, covered with coarse grass and other plants, and here and there covered with trees and shrubs. The country in general bears a great resemblance to those parts of New South Wales which lie under the same parallel of latitude. Several of its natural productions are the same, and the woods are without underwood as well as in that country. The whole coast seems to be surrounded by reefs and shoals, which render all access to it extremely dangerous; but at the same time guard the coasts against the attacks of the wind and sea; rendering it easily navigable along the coast by canoes, and causing it abound with fish. Every part of the coast seems to be inhabited; the plantations in the plains are laid out with great judgment, and cultivated with much labour. They begin their cultivation by setting fire to the grass, &c. with which the ground is covered, but have no notion of preparing its vigour by manure; they, however, recruit it by letting it lie for some years untouched. Out the beach was found a large irregular mass of rock, not less than a cube of ten feet, confisting of coarse-grained stone speckled full of granites somewhat bigger than pins heads, from whence it seems probable that some valuable minerals may be found on this island. It differs from all the other islands yet discovered in the South Sea, by being entirely destitute of volcanic productions. Several plants of a new species were found here; and a few young breadfruit trees, not then sufficiently grown to bear fruit, seemed to have come up without culture; plantains and sugar-canes are here in small-quantity, and the cocoa-nut trees are small and thinly planted. A new species of passion-flower was likewise met with, which was never known to grow wild anywhere but in America. Several Cupua (Melaleuca) trees were also found in flowers. Muscovites here are very numerous. A great variety of birds were seen of different classes, which were for the most part entirely new; particularly a beautiful species of parrot before unknown to zoologists. A new species of fish, of the genus called by Linnaeus tetradon, was caught here; and its liver, which was very large, presented at supper. Several species of this genus being reckoned poisonous, and the present species being remarkably
Caledonia. Dlarkably of its quality; eaten this identical fort of symptoms, being all feized with an extreme giddiness; and a violent langour and oppression feized them. Emetics were administrated with some success, but indorifics gave the greatest relief. Some dogs who had eaten the remainder of the liver were likewise taken.

Abundance of turtle was feen here. The natives had not even a name for any of them. What swarthy, or a dark chefnut brown. A somewhat woolly in some individuals: their colour is not the large lock to appear near one-tenth of an inch from each other; the ends, number of there, seldom exceeding.

The natives do not the least notion of goats, hogs, dogs, or cats, and not the least

The inhabitants are very short, tall, and in general well proportioned; their features mild; their beards not at all.

Vol.

They measure dark about four inches. They are remarkably courteous, not at all addicted to pilfering and theft; in which character of honesty they are singular, all the other nations in the South Sea being remarkably thievish. Some wear their hair long, and tie it up to the crown of their heads; others suffer only a large lock to grow on each side, which they tie up in clubs; many others, as well as all the women, wear it short.

The men go naked; only tying a string round their middle, and another round their neck. A little piece of a brown cloth made of the bark of a fig-tree, sometimes tucked up to the belt, and sometimes pendulous, scarcely deferves the name of a covering; nor indeed does it seem at all intended for that purpose. This piece of cloth is sometimes of such a length, that the extremity is fastened to the string round the neck; to this string they likewise hang small round beads of a pale green nephritic flone. Coarse garments were seen among them made of a sort of matting; but they seemed never to wear them, except when in their canoes and unemployed. The women seemed to be in a fervile state: they were the only persons of the family who had any employment, and several of them brought bundles of sticks and fuel on their back: those who had children carried them on their backs in a kind of puchel. The women also were seen to dig up the earth in order to plant it. They are in general of a dark chestnut, and sometimes mahogany brown; their stature middle-sized, some being rather tall, and their whole form rather stout, and somewhat clumsy. Their dress is the most disfiguring that can be imagined, and gives them a thick squat shape; it is a short petticoat or fringe, consisting of filaments or little cords, about eight inches long, which are fastened to a very long string which they have tied several times round their waist. The filaments, or little ropes, therefore, lie above each other in several layers, forming a kind of thick thatch all round the body, but which does not near cover the thigh: these filaments were sometimes dyed black; but frequently those on the outside only were of that colour, the rest being of a dirty grey. There was not a single instance, during the ship's stay in this island, of the women permitting any indecent familiarity with an European: they took pleasure in prattling the arts of a jilting coquette, but never became absolute wantons. The general ornaments of both sexes are ear-rings of tortoise shells, necklaces, or amulets, made both of shells and stones; and bracelets made of large shells, which they wear above the elbows.

The houfes, or huts, in New Caledonia, are circular, something like a bee-hive, and full as close and warm; the entrance is by a small door, or long square hole, just big enough to admit a man bent double: the sides are about four feet and a half high; but the roof is lofty, and peaked to a point at the top, above which is a port or flick of wood, which is generally ornamented either with carving or shells, or both. The framing is of small spars, reeds, &c. and both sides and roof are thick, and close covered with thatch made of coarse long grass. In the inside of the houfe are set up pots, to which crofs spars are fastened, and platforms made for the convenience of laying any thing on. Some houfes have two floors, one above another; the floor is made with dried grass, and here and there mats are spread for the principal people to sit or sleep on. In these houfes there was no paffage for the fmoke but through the door; they were intolerably smoky, and fo hot as to be infupportable to thofe unacquainted to them: probably the fmoke is intended to drive out the muguetos which warm here. They commonly erect two or three of these huts near each other under a clufter of lofty fig-trees, whose leaves are impervious to the rays of the sun. The canoes used here are very heavy clumsy vesfeis; they are made of two trees hollowed out, having a raised gunnel about two inches high, and closed at each end with a bulk head of the fame height; fo that the whole is like a long square trough about three feet shorter than the body of the canoe. Two canoes thus fitted are fanned to each other about three feet funder, by means of crofs-spars, which project about a foot over each fide. Over these is laid a deck or heavy platform made of plank and small round spars on which they have a fire-hearth, and generally a fire burning; they are navigated by one or two latteen fails, extended to a small latteen yard, the end of which is fixed in a notch or hole in the deck.

Norwithstanding the inoffensive disposition of the inhabitants of New Caledonia, they are well provided with
Caledonia with offensive weapons; as clubs, spears, darts, and slings for throwing stones. Their clubs are about two feet and an half long, and variously formed; some like a fcythe, others like a pick-axe; some have a head like a hawk, and others have round heads; but all are nearly made; many of their darts and spears are no less near, and ornamented with carvings. The slings are as simple as possible; but they take some pains to form the stones that they use into a proper shape, which is something like an egg, suspending both ends to be like the small one. They drive the dart by the assistance of flint cords knotted at one end and looped at the other, called by the savages hookets. These contain a quantity of red wool taken from the vambrile, or great Indian bat. Bows and arrows are wholly ripen and disperse their seeds. For particulars on one or two more, excepted. This is the more zealand. They bury their dead in the ground.

Their language bears no affinity to that spoken in the other South-sea islands, the word arrokee, and one or two more, excepted. This is the more extraordinary, as different dialects of one language were spoken not only in the catterly islands, but at New Zealand.

A musical instrument, a kind of whistle, was procured here. It was a little polished piece of brown wood about two inches long, shaped like a kind of bell, tho' apparently solid, with a rope fixed at the small end; two holes were made in it near the base, and another near the extremity of the rope, all which communicated with each other; and by blowing in the uppermost, a shrill sound like whistling was produced; no other instrument was seen among them that had the least relation to music.

Many of the New Caledonians were seen with prodigiously thick legs and arms, which seemed to be affected with a kind of leprosy; the swelling was so great as to be extremely hard, but the skin was not alike hard and scaly in all those who were afflicted with the disorder. The preternatural expansion of the arm or leg did not appear to be a great inconvenience to those who suffered it; and they seem not to intimate that they very rarely felt any pain in it; but in some the disorder began to form blotches, which are marks of a great degree of virulence.

Here they bury their dead in the ground. The grave of a chief who had been slain in battle here resembled a large mole-hill, and was decorated with spears, daggers, paddles, &c. All flesh was made in the ground round about it. Lieutenant Pickering was shewed a chief whom they named Tea-booma, and gave their arrekee or king; but nothing further is known of their government, and nothing at all of their religion.

CALEFACTIO, the production of heat in a body from the action of fire, or that impulse impressed by a hot body on others around it. This word is used in pharmacy, by way of distinction from cælition, which implies boiling; whereas calefaction is only heating a thing.

CALENBERG, a castle of Germany, in the duchy of Brunswic and principality of Calenberg. It is seated on the river Leine, and is 15 miles south of Hanover. It is subject to the duke of Brunswic Lunenburg, elector of Hanover, and king of Great Britain. E. Long. 9. 43. N. Lat. 52. 20.

CALENBERG, a principality of Lower Saxony, and one of the three parts of the duchy of Brunswic, is bounded on the north by the duchy of Verden, on the east by the principality of Zell, on the south by the principality of Grubenhagen and Wolfenbuttel, and on the west by Westphalia. It belongs to the elector of Hanover.

CALENDAR, in astronomy and chronology. See Kalender.

CALENDAR of prisoners, in law, a list of all the prisoners names in the custody of each respective sheriff. See the Calendarium Floris. In botany, a calendar containing an exact register of the respective times in which the plants of any given province or climate germinate, expand, and shed their leaves and flowers, or ripen and disperse their seeds. For particulars on this curious subject, see the articles Defoliation, Efflorescentia, Frondescentia, Fructescentia, and Germinatio.

CALENDER, a machine used in manufactories to press certain woollen and silk fluffs and linens, to make them smooth, even, and glossy, or to give them waves, or water them, as may be seen in mohairs and taffies. This instrument is composed of two thick cylinders or rollers, of very hard and well polished wood, round which the fluffs to be calendared are wound: these rollers are placed cross-wise between two very thick boards, the lower serving as a fixed base, and the upper moveable by means of a thick screw with a rope fastened to a spindle which makes its axis: the uppermost board is loaded with large stones weighing 20,000 lb. or more. At Paris they have an extraordinary machine of this kind, called the royal calendar, made by order of M. Colbert. The lower table or plank is made of a block of smooth marble, and the upper is lined with a plate of polished copper.—The alternate motion of the upper board sometimes one way and sometimes another, together with the prodigious weight laid upon it, gives the fluffs their gloss and smoothness; or gives them the waves, by making the cylinders on which they are put roll over the undermoft board. When they put a roller under the calendar, they only incline the undermoft board of the machine. The dressing alone, with the many turns they make the fluffs and linens undergo in the calender, gives the waves, or waters them, as the workmen call it. It is a mistake to think, as some have affected, and Mr Chambers among others, that they use rollers with a shallow indenture or engraving cut into them.

CALENDAR of MONTPEL, a district in the south-west corner of Perthshire in Scotland, from which a branch of the ancient family of Livingston had the title of Earl. The chief seat of the family near Fallkirk is also called Calender. Both estate and title were forfeited for being engaged in the rebellion 1715.

CALENDERS, a sort of Mahometan friars, so called from Santon Calendari their founder. This Santon went bare-headed, without a shirt, and with the skin of a wild beast thrown over his shoulders. He wore a kind of apron before, the figures of which were adornned with counterfeit precious stones. His disciples are rather a fect of Epicureans than a sect of religious. They honour a tavern as much as they do a mosque; and think they pay as acceptable worship to God by the
the free use of his creatures, as others do by the greatest authority and acts of devotion. They are called, in Persia and Arabia, Abdals, or Abdallat, i.e. persons consecrated to the honour and service of God. Their garment is a single coat, made up of a variety of pieces, and quilted like a rug. They preach in the market-places, and live upon what their auditors bestow on them. They are generally very vicious persons; for which reason they are not admitted into any houses.

CALENDSUPER, the Marigold: A genus of the polygama necessaria order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, Compositae. The receptacle is naked, there is no pappus, the calyx is polyphyllous except the frutieofa, which hath lately been augmented by Paffierat and others.

CALES (anc. geog.), a municipal city of some note in Campania, at no great distance from Calabria. The epithet Calenius is by Horace and Juvenal applied to a generous wine which the territory produced.

CALETES (anc. geog.), a people of Gallia Celtica, on the confines of Belgica, situated between the sea and the Sequana. Now called le Pays de Caux, in Normandy.

CALETURE, a fort on the island of Ceylon, at the mouth of a river of the same name. The Dutch became masters of it in 1655; but were afterwards obliged to leave it. E. Long. 80. 51. N. Lat 6. 38.

CAMEI, in zoology, the young of the ox kind.

There are two ways of breeding calves that are intended to be reared. The one is to let the calf run about with its dam all the year round; which is the method in the cheap breeding countries, and is generally allowed to make the best cattle. The other is to take them from the dam after they have sucked about a fortnight: they are then to be taught to drink flat milk, which is to be made but just warm for them, it being very dangerous to give it them too hot. The best time of weaning calves is from January to May: they should have milk for 12 weeks after; and a fortnight before that is left off, water should be mixed with the milk in larger and larger quantities. When the calf has been fed on milk for about a month, little whips of hay should be placed all about him in little ficks to induce him to eat. In the beginning of April they should be turned out to grafs; only for a few days they should be taken in for the night, and have milk and water given them: the same may also be given them in a pail sometimes in the field, till they are so able to feed themselves that they do not regard it. The grafs they are turned into must not be too rank, but short and sweet, that they may like it, and yet get it with some labour. Calves should always be weaned at grafs; for if it be done with hay and water, they often grow big-belly'd on it, and are apt to rot. When those among the males are selected which are to be kept as bulls, the rest should be kept for oxen: the fomer the better. Between 10 and 20 days is a proper age. About London almost all the calves are fattened for the butcher. The reason of this is, that there is a good market for them; and the lands there are not so profitable to breed upon as in cheaper countries. The way to make calves fat and fine is, the keeping them very clean; giving them fresh litter every day; and the hanging a large chalk-stone in some corner where they can easily get at it to lick it, but where it is out of the way of being fouled by their dung and urine. The scoops are to be placed so as not to have too much fun upon them, and to high above the ground that the urine may run off. They also bleed them once when they are a month old, and a second time before they kill
CAL, a town of Popayan in South America, situated in a valley of the same name on the river Cauca. The governor of the province usually resides there. W. Long. 78°. S. Lat. 3° 15’.

CALIBER, or CALIPER, properly denotes the diameter of any body; thus we say, two columns of the same caliber, the caliber of the bore of a gun, the caliber of a bullet, &c.

CALIBER-COMPAISES, a sort of compasses made with arched legs to take the diameter of round or swelling bodies. See COMPASSES.

Caliber-compasses, are chiefly used by gunners, for taking the diameters of the several parts of a piece of ordnance, or of bombs, bullets, &c. Their legs are therefore circular; and move on a arch of brahs, whereon is marked the inches and half inches, to show how far the points of the compasses are opened and shut.

Some are also made for taking the diameter of the bore of a gun or mortar.

The gaugers also sometimes use calibers, to embrace the two heads of any calfs, in order to find its length.

The calibers used by carpenters and joiners, is a piece of board notched triangular-wise in the middle for the taking of measure.

CALIBER-RULE, or GUNNER’S CALLIPERS, is an instrument wherein a right line is so divided as that the first part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the first as the diameters of balls of two, three, four, &c. pounds are to the diameter of a ball of one pound. The caliber is used by engineers, from the weight of the ball given, to determine its diameter or caliber, or vice versa.

The gunner’s callipers consist of two thin plates of brass joined by a rivet, so as to move quite round each other: its length from the centre of the joint is between six inches and a foot, and its breadth from one to two inches; that of the most convenient size is about nine inches long. Many scales, tables, and proportions, &c. may be introduced on this instrument; but none are essential to it, except those for taking the caliber of shot and cannon, and for measuring the magnitude of faftant and entering angles. The most complete callipers is exhibited Plate CXII. the furniture and use of which we shall now briefly describe. Let the four faces of this instrument be distinguished by the letters A, B, C, D: A and D consist of a circular head and leg; B and C consist only of a leg.

On the circular head adjoining to the head of the face A are divisions denominated ‘shot diameters; which show the distance in inches and tenths of an inch of the points of the callipers when they are opened; so that if a ball not exceeding ten inches be introduced between them, the bevil edge E marks its diameter among these divisions.

On the circular bevil part E of the face B is a scale of divisions distinguished by lb. weight of iron shot. When the diameter of any shot is taken between the points of the callipers, the inner edge of the leg A shows its weight in avoidupois pounds, provided it be lb. 1, 2, 3, 3, 4, 5; 6, 8, 9, 10, 18, 12, 16, 18, 24, 26, 32, 36, or 42; the figures nearest the bevil edge answering to the short lines in the scale, and those behind them to the longer stroke. This scale is constructed
CAL

C A L

1. CALIBER.

Drafted on the following geometrical theorem, viz. that the weights of spheres are as the cubes of their diameters.

On the lower part of the circular head of the face A is a scale of divisions marked bore of guns; for the use of which, the legs of the callipers are flipped across each other, till the steel points touch the concave surface of the gun in its greatest breadth; then the bevel edge F of the face B will cut a division in the scale showing the diameter of the bore in inches and tenths. Within the scales of first and bore diameters on the circular part of A are divisions marked pounds; the inner figures 1, 2, 3, 4, 5, 6, 7, 8, 12, 18, 26, 36, correspond to the longest lines; and the figures 1, 2, 4, 6, 9, 16, 24, 32, 42, to the short strokes. When the bore of a gun is taken between the points of the callipers, the bevel edge F will either cut or be near one of these divisions, and show the weight of iron-flot proper for that gun.

On the upper half of the circular head of the face A are three concentric scales of degrees; the outer scale consisting of 180 degrees numbered from right to left, 10, 20, &c. the middle numbered the contrary way, and the outer scale beginning at the middle with 0, and numbered on each side to 90 degrees. These scales serve to take the quantity of an angle, either entering or failing. For an entering or external angle, apply the legs of the callipers so that its outward edges coincide with the legs of the given angle, the degree cut by the bevel edge F in the outer scale shows the measure of the angle sought: for a failing or external angle, slip the edges of the callipers across each other, so that their outward edges may coincide with the legs forming the angle, and the degree marked on the middle scale by the bevel edge E will show the measure of the angle required. The inner scale will serve to determine the elevation of cannon and mortars, or of any oblique plane. Let one end of a thread be fixed into the notch on the plate B, and any weight tied to the other end; apply the straight side of the plate A to the side of the body whose inclination is sought; hold it in this position, and move the plate B, till the thread falls upon the line near the centre marked Term. Then with the bevel edge F cut the degrees on the inner scale, showing the inclination of that body to the horizon.

On the face C near the point of the callipers is a little table showing the proportion of Troy and avoidupois weights, by which one kind of weight may be easily reduced into another.

Near the extreme of the face D of the callipers are two tables showing the proportion between the pounds weight of London and Paris, and also between the lengths of the foot measure of England and France.

Near the extreme on the face A is a table containing four rules of the circle and sphere; and geometrical figures with numbers annexed to them: the first is a circle including the proportion in round numbers of the diameter to its circumference; the second is a circle inscribed in a square, and a square within that circle, and another circle in the inner square: the numbers 28, 22, above this figure exhibit the proportion of the outward square to the area of the inscribed circle, and the numbers 4, 11, below it show the proportion between the area of the inscribed square and the area of its inscribed circle. The third is a cube inscribed in a sphere; and the number 89 shows the proportion between the weights of spheres as the cubes of their diameters.

CALICUT, a kingdom of India, on this side the Ganges, where the Dutch have a factory. E. Long. 75. 27. N. Lat. 9. 5.

CALICULAN, or Quillon, a town of Asia, in the East-Indies, on the coast of Malabar, and in the peninsula on this side the Ganges, where the Dutch have a factory.
CALIBER Rule.

Plate CXII.

To make Water Power P from C to B to B to A.

Rules for Shooting.

The distance T is in feet.

Height is the height of the object above the level line.

Angle of Elevation is the angle of the line from the horizontal to the line of sight.

To determine the range, multiply the range of the object by the tangent of the angle of elevation.

Example:

If the distance is 1000 feet and the angle of elevation is 45 degrees, the range is 1000 

To find the height, multiply the range by the tangent of the angle of elevation.

Example:

If the range is 1000 feet and the angle of elevation is 45 degrees, the height is 1000 

To find the angle of elevation, divide the height by the range.

Example:

If the height is 1000 feet and the range is 1000 feet, the angle of elevation is 45 degrees.
Callicut, a town of Asa, in the kingdom of that name on the coast of Malabar. It contains a great number of mean low houses, each of which has a garden. The English had a factory here, but it is removed to Ticherry. E. Long. 76. 4. N. Lat. 11. 21.

CALIFORNIA. PLANTS (from calor heat); plants that are natives of warm climates. Such are those of the East Indies, South America, Egypt, and the Canary Islands. These plants, says Linnæus, will bear a degree of heat which is as 40 on a scale in which the freezing point is 0, and 100 the heat of boiling water. In the 10th degree of cold they cease to grow, lose their leaves, become barren, are suffocated, and perish.

CALIDUCT, in antiquity, a kind of pipes or canal disposed along the walls of houses or apartments, used by the ancients for conveying heat to several remote parts of the house from one common furnace.

CALIFORNIA, the most northerly of all the Spanish dominions on the continent of America, is sometimes distinguished by the name of New Albion, and the Illas Caribbeas; but the most ancient appellation is California; a word probably owing to some accident, or to some words spoken by the Indians and misunderstood by the Spaniards. For a long time California was thought to be an island; but Father Caimo, a German Jesuit, discovered it to be a peninsula joining to the coast of New Mexico and the southern parts of America. This peninsula extends from Cape St. Sebastian, lying in north latitude 43. 30. to Cape St. Lucar which lies in north latitude 22. 32. It is divided from New Mexico by the gulph, or as some call it the lake, of California, or Vermilion Sea, on the east; on the north, California, by that part of the continent of North America which is least known; and on the west and south, by the Pacific Ocean or great South Sea. The coasts, especially towards the Vermilion Sea, are covered with inhabited islands, on some of which the Jesuits have established settlements, such as St. Clement, Puxaros, St. Anne, Cedars (so called from the great number of these trees it produces), St. Joseph, and a multitude of others. But the islands best known are three lying off Cape St. Lucar, towards the Mexican coast. These are called Les Trois Maries, "the three Maries." They are but small, have good wood and water, salt pits, and abundance of game; therefore the English and French pirates have sometimes wintered there, when bound on cruizes in the South Seas.

As California lies altogether within the temperate zone, the natives are neither chilled with cold nor scorched with heat; and indeed the improvements in agriculture made by the Jesuits afford strong proofs of the excellency of the climate. In some places the air is extremely hot and dry; and the earth wild, rugged, and barren. In a country stretching about 800 miles in length, there must be considerable variations of soil and climate; and indeed, we find from good authority, that California produces some of the most beautiful lawns, as well as many of the most inhospitable deserts, in the universe. Upon the whole, although California is rather rough and craggy, we are assured by the Jesuits Vinages, and other good writers, that with due culture it furnishes every necessary and conveniency of life; and that, even where the atmosphere is hot, vaper, rising from the sea, and dispersed by pleasant breezes, render it of a moderate temperature.

The peninsula of California is now stocked with all sorts of domestic animals known in Spain and Mexico. Horses, mules, ass, oxen, sheep, hogs, goats, and all other quadrupeds imported, thrive and increase in this country. Among the native animals is a species of deer of the size of a young heifer, and greatly resembling it in shape; the head is like that of a deer, and the horns thick and crooked like those of a ram. The hoofs of the animal are large, round, and cloven, the skin spotted, but the hair thinner and the tail shorter than that of a deer. Its flesh is greatly esteemed. There is another animal peculiar to this country, larger and more bulky than a sheep, but greatly resembling it in figure, and, like it, covered with a fine black or white wool. The flesh of this animal is nourishing and delicious; and, happily for the natives, it is so abundant, that nothing more is required than the trouble of hunting, as these animals wander about in droves in the forests and on the mountains. Father Torquemado describes a creature which he calls a species of large bear, something like a buffalo, of the size of a steer, and nearly of the figure of a flag. Its hair is a quarter of a yard in length, its neck long and awkward, and on its forehead are horns branched like those of a flag. The tail is a yard in length, and half a yard in breadth, and the hoofs cloven like those of an ox. With regard to birds, we have but an imperfect account; only, in general, Father Vinegas tells us that the coast is plentifully stowed with peacocks, buffards, geese, cranes, and molt of the birds common in other parts of the world. The quantity of fish which refer to these coasts
C A L

California. Coasts are incredible. Salmon, turbot, barbel, skate, mackarel, &c. are caught here with very little trouble; together with pearl oysters, common oysters, lobsters, and a variety of exquisite shell-fish. Plenty of turtle are also caught on the coasts. On the South Sea coasts are some fish peculiar to it, and perhaps the most beautiful in the world; their lustrous parapathing of the finest pearl, and darting their rays through a transparent varnish of an elegant vivid blue, like the lapis lazuli. The fame of California for pearls soon drew forth great numbers of adventurers, who searched every part of the gulph, and are still employed in that work, notwithstanding fashion has greatly diminished the value of this elegant natural production. Father Torquimado observes that the tea of California affords very rich pearl fisheries; and that the hoxias, or beds of oysters, may be seen in three or four fathom water, almost as plain as if they were on the surface.

The extremity of the peninsula towards Cape St. Lucar is more level, temperate, and fertile, than the other parts, and consequently more woody. In the more distant parts, even to the farthest millions on the east coast, no large timber hath yet been discovered. A species of manna is found in this country, which, according to the accounts of the Jesuits, has all the sweetness of refined sugar without its whiteness. The natives firmly believe that this juice drops from heaven.

The Californians are well made, and very strong. They are extremely pulinianous, inconstant, fapid, and even inoffensive, and seem extremely deserving of the character given to the Indians in general, under the article America. Before the Europeans penetrated into California, the natives had no form of religion. The miffionaries indeed tell us many tales concerning them, but they do evidently bear the marks of forgery as not to be worth repeating. Each nation was then an assemblage of several cottages more or less numerous, that were all mutually confederated by alliances, but without any chief. They were strangers even to filial obedience. No kind of drudgery was used by the men; but the women made use of some coverings, and were even fond of ornamenting themselves with pearls and such other trinkets as the country afforded. What mostly displayed their ingenuity was the construction of their fishing nets, which are paid by the Jesuits to have even exceeded in neatness those made in Europe. They were made by the women, of a coarse kind of flax procured from some plants which grow there. Their houses were built of branches and leaves of trees; and, many of them, were only inclosures of earth and stone, raised half a yard high, without any covering; and even these were so small, that they could not stretch themselves at length in them. In winter, they dwelt under ground in caves either natural or artificial.

In 1526, Ferdinand Cortez having reduced and settled Mexico, attempted the conquest of California; but was obliged to return, without even taking a survey of the country, a report of his own having tipped the Mexicans to a general insurrection. Some other attempts were made by the officers of Cortez, but these were also unsuccessful; and this valuable coast was long neglected by the Spaniards, who, to this day, have but one settlement upon it. In 1595, a galleon was sent to make discoveries on the Californian shore; California, but the vessel was unfortunately lost. Seven years after the count de Monterey, then viceroy of New Spain, sent Sebastian Bifayno on the same design with two ships and a tender; but he made no discovery of importance. In 1684, the marquis de Legauza, also viceroy of New Spain, despatched two ships with a tender to make discoveries on the lake of California. He returned with an indifferent account, but was the first that ascertained that California was not an island; which was afterwards confirmed by Father Caino, as already related. In 1697, the Spaniards being discouraged by their losses and disappointments, the Jesuits solicited and obtained permission to undertake the conquest of California. They arrived among the savages with curiosities that might amuse them, corn for their food, and clothes for which they could not but perceive the necessity. The hatred these people bore the Spanish name could not support itself against their demonstration of benevolence. They testified their acknowledgments as much as their self-defensibility and their incoணnacy would permit them. These faults were partly overcome by the religious inti­mitators, who purified their project with a degree of warmth and resolution peculiar to the society. They made themselves carpenters, masons, weavers, and huf­bandmen; and by these means succeeded in imparting knowledge, and in some measure a taste for the useful arts, to this savage people, who had been all successively formed into one body. In 1745, they composed 43 villages separated from each other by the bar­renness of the foil and the want of water. The in­habitants of these small villages labored principally on corn and pulse, which they cultivate; and on the fruits and domestic animals of Europe, the breeding of which is an object of continual attention. The Indians have each their field, and the property of what they reap; but such is their want of forethought, that they would squander in a day what they had gathered, if the missionar­y did not take upon himself to distribute it to them as they stand in need of it. They manufacture some coarse fluffs; and the necessaries they are in want of are purchased with pearls, and with wine nearly resembling that of Madeira, which they sold to the Mexicians and to the galleons, and which experience hath shown the necessity of prohibiting in California. A few laws, which are very simple, are sufficient to regulate this rising state. In order to enforce them, the missionary chooses the most intelligent person of the village; who is empowered to whip and imprison; the only punishments of which they have any knowledge. In all California there are only two gar­rifons, each consisting of 30 men and a soldier with every missionary. These troops were chosen by the leg­islators, though they are paid by the government. Were the court of Madrid to push their interest with half the zeal of the Jesuits, California might become one of the most valuable of their acquisitions, on account of the pearls and other valuable articles of com­merce which it contains. At present, the little Spanish town near Cape St. Lucar is made use of for no other purpose than as a place of refreshment for the Manila ships, and the head residence of the missionar­ies.

CALIGA, in Roman antiquity, was the proper fol-
Caligati, or Caligato, in Medicine, an opacity, or cloudiness of the anterior surface of the crystalline, causing a dimness or futilition of sight.

Caligula, the Roman emperor and tyrant, A. D. 37, began his reign with every promising appearance of becoming the real father of his people; but at the end of eight months he was feized with a fever, which, as it is thought, left a frenzy on his mind: for his disposion totally changed, and he commited the most atrocious acts of impiy, cruelty, and folly: such as proclaiming his horfe conful, feeding it at his table, introducing it to the temple in the veHments of the priees of Jupiter, &c. and causitng a dimnifh or futfullfion of his, as if by mounting the horfe. After this, however, there were perfons who claimed the caliphate, as pretending to be of the family of the Absfides, and to whom the futans of Egypt rendered great honours at Cairo, as the true successors of Mahomet: but this honour was merely titular, and the rights allowed them only in matters relating to religion: and though they bore the sovereign title of caliphs, they were nevertheless subjefts and dependents of the futans. In the year of the Hegira 361, a kind of caliphate was erected by the Fatemites in Africa, and lafted till it was fupprefsed by Saladdin. Historians alfo speak of a third caliphate in Gemen or Arabia Felix, erected by some princes of the family of the Jobites. The emperors of Morocco almue the title of grand defairs; and pretend to be the true caliphs, or successors of Mahomet, though under another name.

Calippic period, in chronology, a series of seventy-six years, perpetually recurring; which elapsed, the middle of the new and full moons, as its inventor, Calippus, an Athenian, imagined, return to the fame day of the solar year, Meton, an hundred years before, had invented the period, or cycle, of nineteen years: assuming the quantity of the solar year 365.25 d. 6h. 19' 56" 50' " 31' 34'; and the lunar month, 29 d. 12 h. 45' 47" 26' 48' 30'; but Calippus, considering that the Metonic quantity of the solar year was not exact, multiplied Meton's period by 4, and thence arose a period of 76 years, called the Calippic. The Calippic period, therefore, contains 2,7759 days; and since the lunar cycle contains 235 lunations, and the Calippic period is quadruple of this, it contains 940 lunations. This period began in the third year of the 112th Olympiad, or the 438th of the Julian period. It is demonstrated, however, that the Calippic period itself is not accurate; that it does not bring the new and full moons precisely to their places: 8 h. 5' 59" 60"", being the excess of 940 lunations above 76 solar years; but brings them too late, by a whole day in 235 years.

Calista, in fabulous history, the daughter of Lycaon king of Arcadia, and one of the nymphs of Diana.
Diana. Being beloved by Jupiter, that god affirmed the form of the goddess of chastity, by which means he debouched her; but her disgrace being revealed, as she was bathing with her patroness, the incensed deity turned her and the son with which she was pregnant into bears; when Jupiter, in compassion to her sufferings, took them up into the heavens, and made them the constellations Ursâ Major and Ursâ Minor.

**CALIX.** See CALYX.

**CALIXTINS,** a name given to those, among the Lutherans, who follow the sentiments of George Calixtus, a celebrated divine, and professor at Helmâldt, in the duchy of Brunswick, who died in 1656: he opposed the opinion of St. Augufin, on predestination, grace, and free-will, and endeavored to form an union among the various members of the Romish, Lutheran, and reformed churches; or, rather, to join them in the bonds of mutual forbearance and charity.

**CALIXTINS also denote a fig in Bohemia, derived from the Hiffites, about the middle of the 15th century, who affected the use of the cup, as essential to the eucharist. And hence their name; which is formed from the Latin calix, a cup.

The Calixtins are not ranked by Romanists in the lift of heretics, since in the main they still adhered to the doctrine of Rome. The reformation they aimed at terminated in the four following articles. 1. In requiring the cup to the laity. 2. In subjeéting the criminal clerks to the punishment of the civil magistrate. 3. In stripping the clergy of their lands, lordships, and all temporal jurisdiction. 4. In granting liberty to all capable priests to preach the word of God.

**CALKA,** a kingdom of Tartary, in Asia, to the east of Siberia.

**CALKING.** See CAULKING.

Calkins, the prominent parts at the extremities of a horse's hoof, bent downwards, and forged to a sort of point.

Calkins are apt to make horses trip; they also occasion blèmes, and ruin the back sinews. If fashioned in form of a hare's ear, and the horn of a horse's heel be pared a little low, they do little damage; whereas, the great square calkins quite spoil the foot.

Calkins are either single or double, that is, at one end of the hoof, or at both; but the damed legs hurtful, as the horses can tread more even.

**CALL,** among hunters, a signal call, to engage one of the drum to march, retreat, rally, charge, &c. is obeyed by soldiers.

**CALL,** among fowlers, the noise or cry of a bird, especially to its young, or to its mate in coupling-time. One method of catching partridges is by the natural call of a hen trained for the purpose, which drawing the cocks to her, they are entangled in a net.

Different birds require different sorts of calls; but they are most of them compos'd of a pipe or reed, with a little leathern bag or purse, somewhat in form of a bellows; which, by the motion given thereto, yields a noise like that of the species of bird to be taken. The call for partridges is formed like a boat bored through, and fitted with a pipe or fawn's quill, &c. to be blown with the mouth, to make the noise of the cock partridge, which is very different from the call of the hen. Calls for quails, &c. are made of a leathern purse in shape like a pear, stuffed with horse-hair, and fitted at the end with the bone of a cat's, hare's, or coney's leg, formed like a flagolet. They are played, by squeezing the purse in the palm of the hand, at the same time striking on the flagolet part with the thumb, to counterfeit the call of the hen-quail.

**CALL of the House.** See CALLING.

**CALLA,** a name given to those, among the Lutherans, who follow the sentiments of George Calixtus, a celebrated divine, and professor at Helmâldt, in the duchy of Brunswick, who died in 1656: he opposed the opinion of St. Augufin, on predestination, grace, and free-will, and endeavored to form an union among the various members of the Romish, Lutheran, and reformed churches; or, rather, to join them in the bonds of mutual forbearance and charity.

**CALLAWARE-Robin,** or Ethiopian Arum: A genus of the Polyandria order, belonging to the Gynandra class of plants; and in the natural method ranking under the 2d order, Pipiperita. The fpatha is plain; the spadix covered with florets; there is no calyx; no petals; and the berries are monopetalous. Of this there is but one species. It hath thick, fleshy, tuberous roots, which are covered with a thin brown skin, and strike down many strong fleshy fibres into the ground. The leaves have footstalks more than a foot long, which are green and succulent. The leaves are shaped like the point of an arrow; they are eight or nine inches in length, ending in a sharp point, which turns backward; between the leaves arise the footstalk of the flower, which is thick, smooth, of the same colour as the leaves, rises above them, and is terminated by a single flower, shaped like thoe of the arum, the hood or fpatha being twisted at bottom, but spreads open at the top, and is of a pure white colour. When the flowers fade, they are succeeded by roundish fleshy berries, compreessed on two sides, each containing two or three seeds. This plant grows naturally at the Cape of Good Hope. It propagates very fast by offsets, which should be taken off in the latter end of August, at which time the old leaves decay; for at this time the roots are in their most inactive state. They are so hardy as to live without any cover in the winter. If planted in a warm border and dry soil; but with a little shelter in hard frost, they may be preferred in full growth very well.

**CALLA-Suifung,** a town of Asia, in the island of Bouson in the East Indies. It is seated about a mile from the sea, on the top of a small hill surrounded with cocoa nut-trees. See Bouson.

**CALLAO,** a strong town of South America, in Peru. It is the port of Lima, from which it is distant about five miles. The town is built on a low flat point of land on the sea-shore. It is fortified; but the fortifications were much damaged by the last great earthquake, and have not since been repaired. The town is not above nine or ten feet above the level of high-water mark; but the tide does not commonly rise or fall above five feet. The streets are drawn in a line; but are full of duff, which is very troublesome. In a square near the sea-side are the governor's house, the viceroy's palace, the parish-church, and a battery of three pieces of cannon. On the north side are the
warehouses for the merchandise brought from Chili, Mexico, and other parts of Peru. The other churches are built with reeds, and covered with timber or clay, but they look tolerably neat. There are five monasteries and a hospital, though the number of families does not exceed 400. The trade of Callao is considerable. From Chili they bring cordage, leather, tallow, dried fish, and corn; from Chiloe, cedar-planks, woollen manufactures, and carpets; from Peru, figs, wines, brandy, mafts, cordage, timber for shipping, cacao, tobacco, and molasses; from Mexico, pitch, tar, woods for dyeing, sulphur, balsa of Peru, both white and brown, as well as commodities from China. At the port of Callao the watering is easy, but the wood is a mile or two distant. Earthquakes are very frequent in these parts, which have done vahmischief of a great many. The name is compounded of *CALLICRATES*, an ancient sculptor, who engraved some of Homer's verses on a grain of millet, and another in two lines, and the like, all included under the general denomination of *callicoes*. Some of them are painted with various flowers of different colours; others are not framed, but have a stripe of gold and silver quite through the piece, and at each end is fixed a tiffie of gold, silver, and silk, intermixed with flowers. The printing of callicoes was first set on foot in London about the year 1676.

CALLICRATES, an ancient sculptor, who engraved some of Homer's verses on a grain of millet, made an ivory chariot that might be concealed under the general denomination of *callicoes*. Some of them are painted with various flowers of different colours: others are not framed, but have a stripe of gold and silver quite through the piece, and at each end is fixed a tiffie of gold, silver, and silk, intermixed with flowers. The printing of callicoes was first set on foot in London about the year 1676.

CALLICRATES is said to have written an elegant ditich on a papyrus by which means the name of the man was made as the Greeks called them, were enabled to keep pace with a speaker or person who dictated. These notes, being underfoot by few, were copied over fair, and at length, by persons who had a good hand, for sale, &c. These persons were called *calligraphi*, a name frequently met with in the ancient writers.

far forth as the Mediterranean sea, and is not unfrequent on the Scarborough coast, where it is taken by the book in 30 or 40 fathoms water. It is often found in the stomach of the cod-fish. 2. The dracenocclus, with the first bone of the back-fin shorter than its body, which is of a spotted yellow colour. It frequents the shores of Genoa and Rome. 3. The indicus has a smooth head, with longitudinal wrinkles; the lower jaw is a little longer than the upper one; the tongue is obtuse and emarginated; the apertures of the gills are large: it is of a livid colour, and the anus is in the middle of the body. It is a native of Asia.

CALLIOPE, in the Pagan mythology, the muse who presides over eloquence and heroic poetry. She was thus called from the sweetness of her voice, and was reckoned the first of the nine sibyls. Her divining-office was to record the worthy actions of the living; and accordingly she is represented with tablets in her hand.

CALLIPÆDIA, the art of getting up or breeding fine and beautiful children. We find divers rules and practices relating to this art, in ancient and modern writers. Among the magi, a sort of medicine called ermeja was administered to pregnant women, as a means of producing a beautiful issue. Of this kind were the kernels of pine-nuts ground with honey, myrrh, saffron, palm-wine, and milk. The Jews are said to have been so officious about the beauty of their children, that care was taken to have some very beautiful child placed at the door of the public baths, that the women going out being struck with his appearance, and being anxious to prevent uncouth writers. Among the magi, a sort of medicine was employed to strike their imagination. Among the Spaniards in 1638. E. Long.

CALLISTRATUS, an excellent Athenian orator, was banished for having obtained too great an authority in the government. Demosthenes was so struck with the force of his eloquence, and the glory it procured him, that he abandoned Plato, and resolved from henceforward to apply himself to oratory.

CALLITRICHE, or star-grass, in botany: A genus of the digynia order, belonging to the monandria class of plants, and in the natural method ranking under the 12th order, Holarrhena. There is no calyx, but two petals, and the capsule is bilocular and tetraspermous.

CALLOO, a fortress in the Netherlands, in the territory of Waes, on the river Scheld, subject to the house of Austria. The Dutch were defeated here by the Spaniards in 1638. E. Long. 4. 10. N. Lat. 51° 15'.

CALLOSUM CORPUS, in anatomy, a whitish hard substance, joining the two hemispheres of the brain, and appearing in view when the two hemispheres are drawn back. See Anatomy, No. 732.

CALLOT (James), a celebrated engraver born at Nancy in 1593. In his youth he travelled to Rome to learn designing and engraving; and from thence went to Florence, where he met the great Titian, took him into his service. After the death of that prince, Callot returned to his native country; when he was very favourably received by Henry duke of Lorrain, who settled a considerable pension upon him. His reputation being from henceforward spread all over Europe, the infanta of the Netherlands drew him to Brussel, where he engraved the siege of Breda. Louis XIII. made him design the siege of Rochelle, and that of the Isle of Rhe. The French king having taken Nancy in 1632, made Callot the proposal of representing that new conquest, as he had already done the taking of Rochelle; but Callot begged to be excused; and some courtiers resolving to oblige him to do it, he answered, that he would sooner cut off his thumb than do any thing against the honour of his prince and country. This excuse the king accepted; and said, that the duke of Lorrain was happy in having such faithful and affectionate subjects. Callot followed his business so closely, that, though he died at 43 years of age, he is said to have left of his own
own execution about 1500 pieces. The following are a few of the principal. 1. The murder of the innocent, a small oval plate, engraved at Florence. Callot engraved the same subject at Nancy, with some difference in the figures on the back-ground. The former is the most rare: a fine impression of it is very difficult to be found. 2. The marriage of Cana in Galilee, from Paolo Veronese, a middling-sized plate length wise. 3. The passion of Christ, on twelve very small upright plates: first impressions very scarce. 4. St John in the island of Patmos, a small plate, nearly square. 5. The temptation of St Anthony, a middling-sized plate, length wise. He also engraved the same subject larger; which, though not the best, is notwithstanding the finest print. There is a considerable difference in the treatment of the subject in the two prints. 6. The punishment, wherein is seen the execution of several criminals. The marks of the best impressions of this plate are, a small square tower which appears above the houses, towards the left, and a very small image of the Virgin placed in an angle of the wall, near the middle of the print. 7. The miseries of war, eighteen small plates, length wise. There is another set on the same subject, consisting of seven plates less than the former. 8. The great fair of Florence, so called because it was engraved at Florence. As several parts of this plate were not equally bitten by the aquafortis, it is difficult to meet with a fine impression. Callot, on his return to Nancy, re-engraved this plate without any alteration. The copy, however, is by no means equal to the original. The first is distinguished from the second by the words in Firenza, which appear below at the right-hand corner of the plate. The second has these words in the same place, Fe Florentius, or executit Nancii. There is also a large copy of this print, reversed, published by Savery; but the difference is easily distinguished between it and the true print. 9. The little fair, otherwise called the players at bowls; where also some peasants are represented dancing. This is one of the rarest of Callot's prints; and it is very difficult to meet with a fine impression of it, for the divergences and other parts of the plate fail in the biting with the aquafortis. 10. The pillory, or the new street at Nancy, a middling-sized plate, length wise. 11. The Garden of Nancy, where young men are playing with a ballon, the same. 12. View of the Port Neuf, a small plate, length wise. 13. View of the Louvre, the same. 14. Four landscape, small plates, length wise. CALLUS, or Callosity, in a general sense, any cutaneous, corneous, or osseous hardnesse, whether natural or preternatural; but most frequently it means the callus generated about the edges of a fracture, provided by nature to preserve the fractured bones, or divided parts, in the situation in which they are replaced by the surgeon. A callus, in this last sense, is a sort of jelly, which is a liquid vicious matter, that sweats out from the small arteries and bone fibres of the divided parts, and fills up the chinks or cavities between them. It first appears of a cartilaginous sub stance; but at length becomes quite bony, and joins the fractured part so firmly together, that the limb will often make greater resistance to any external violence with this part than with those which were never broken.

CALLUS is also a hard, dense, inoffensive knob, rising on the hands, feet, &c. by much friction and pressure against hard bodies.

CALM, the state of rest which appears in the air and sea when there is no wind stirring. A calm is more dreaded by a sea-faring man than a storm if he has a strong ship and a sea-room enough; for under the line excessive heat sometimes produces such dead calms, that ships are obliged to stay two or three months without being able to stir one way or other. Two opposite winds will sometimes make a calm. This is frequently observed in the gulf of Mexico, at no great distance from the shore, where some gulf or land-wind will poise the general calmer wind, as to produce a perfect calm.

Calm is never so great on the ocean as on the Mediterranean, by reason the flux and reflux of the former keep the water in a continual agitation, even where there is no wind; whereas there being no tides in the latter, the calm is sometimes so dead, that the face of the water is as clear as a looking-glass; but such calms are almost constant preludes of an approaching storm. On the coasts about Smyrna, a long calm is reputed a prognostic of an earthquake.

It is not uncommon for the vessels to be calmed, or becalmed, as the sailors express it, in the road of the confant Levantines winds, in places where they ride near the land. Thus between the two capes of Carteche toward the main, and cape Antonio in Cuba, the sea is narrow, and there is often a calm produced by some gulf of a land-wind, that poises the Levantine wind, and renders the whole perfectly still for two or three days. In this case, the current that runs here is of use to the vessels, if it sets right; when it sets easterly, a ship will have a passage in three or four days to the Havana; but if otherwise, it is often a fortnight or three weeks fails, the ship being embayed in the gulf of Mexico.

When the weather is perfectly calm, no wind at all stirring, the sailors try which way the current sets, by means of a boat which they send out, and which will ride at anchor though there is no bottom to be found, as regularly and well as if fastened by the strongest anchor to the bottom. The method is this: they row the boat to a little distance from the ship, and then throw over their plummet, which is about forty pounds weight; they let this sink to about two hundred fathom; and then, though it never reaches the bottom, the boat will turn head against the current, and ride as firmly as can be.

CALM Latitudes, in sea language, are situated in the Atlantic ocean, between the tropic of Cancer and the latitude of 29° N. or they denote the space that lies between the trade and variable winds, because it is frequently subject to calms of long duration.

CALMAR, a strong sea-port of Sweden, in the province of Smaland, divided into two towns, the old and the new; but of the former there remains only the church and a few houses. The new town is built a little way from the other, and has large handsome houses. E. Long. 16. 15. N. Lat. 56. 48.

CALMET (Augustine), one of the most learned, and laborious writers of the 18th century, was born at Mersin le Horgne, a village in the diocese of Toul in France, in the year 1672, and took the habit of the Bene-

ve been situated in Mesoopotamia, since these
phets join it with Haran, Eden, Assyria, and Chilmad,
N. Lat. 59. N. Lat. 51. 30.
CALNEH, (anc. geog.) a city in the land of Shinar, built by Nimrod, and the last city mentioned (Gen. x. 10.) as belonging to his kingdom. It is believed to be the same with Calno mentioned in Haia (x. 9.), and with Canneh in Ezekiel (xxvi. 23.) with still greater variation. It is observed, that it must have been situated in Mesoopotamia, since these prophets join it with Haran, Eden, Assyria, and Chilmad, which carried on a trade with Tyre. It is said by the Chaldee interpreters, as also by Eusebius and Jerome, to be the same with Ctesiphon, standing upon the Tigris, about three miles distant from Seleucia, and that for some time it was the capital city of the Parthians.
CALOGERI, in church-history, monks of the Greek church, divided into three degrees: the novices, called archeri; the ordinary professed; called microbatis; and the more perfect, called megalocheni: they are likewise divided into caenobites, anchorites, and recluse. The caenobites are employed in reciting their offices from midnight to sunset; they are obliged to make three genuflexions at the door of the choir, and, returning, go down to the right and to the left, to their brethren. The anchorites retire from the conversation of the world, and live in hermitages in the neighbourhood of the monasteries; they cultivate a little plot of ground, and never go out but on Sundays and holidays to perform their devotions at the next monastery. As for the recluse, they shut themselves up in grots and caverns on the tops of mountains, which they never go out of, abandoning themselves entirely to Providence: they live on the alms sent them by the neighbouring monasteries.
CALOMEL, or dulcedized sublimate of mercury. See Pharmacy, Index.
CALOPHYLLUM, in botany: A genus of the monocotyledons order belonging to the polyandria class of plants: and in the natural method classed under those called doublefyll by Linnaeus. The corolla is tetra-petalous; the calyx tetracyphylous and coloured; the fruit a globe plum. There are two species, both natives of India.
CALOTTE, a cap or coif of hair, fatting, or other stuff; an ecclesial ornament in most Popish countries. See Cap.
CALOTTE, in architecture, a round cavity or deep flufure, in form of a cap or cup, lathed and plastered, used to diminish the rise or elevation of a moderate chai-
pep, cabinet, slove, &c. which, without such an expedi-
tent, would be too high for other pieces of the apartment.

CALPE, a mountain of Andalusia in Spain; at
the foot of which, towards the sea, stands the town of Gibraltar. It is half a league in height towards the land, and so steep that there is no approaching it on that side.

CALPURNIUS, (Titus), a Latin Sicilian poet, lived under the emperor Carus and his son. We have seven of his eclogues remaining.

CALQUING, or CALKING, a term used in painting, &c. where the back-side of any thing is covered over with a black or red colour, and the strokes or lines traced through on a waxed plate, wall, or other matter, by pufing lightly over each stroke of the design with a point, which leaves an impression of the colour on the plate or wall.

CALTHA, in botany: A genus of the monocotyledons order belonging to the polyandria class of plants; and in the natural method ranking under the 26th order, Monotyllia: There is no calyx; there are five petals; no nectaria; the capsules are many, and polyporous. There is only one species known, which grows naturally in mold bogggy lands in many parts of England and Scotland. There is a variety, various double flowers, which for its beauty is preferred in gardens. It is propagated by parting the roots in autumn. It should be planted in a mottle foil and shady situation; and as there are often such places in gardens where few other plants will thrive, so these may be allowed room, and during their season of flowering will afford an agreeable variety. The flowers gathered before they expand, and preferred in falted vinegar, are a good substitute for capers. The juice of the petals, boiled with a little allum, stains paper yellow. The remarkable yellowness of the butter in spring is supposed to be caused by this plant: but cows will not eat it, unless compelled by extreme hunger; and then, Boerhaave says, it occasions such an inflammation, that they generally die. Upon May-day, the country people frow the flowers upon the pavement before their doors. Goats and sheep eat this plant; horses, cows, and swine refuse it.

CALTROP, in botany. See Tribulus.

CALTROP, in military affairs, an instrument with four iron points, disposed in a triangular form, so that three of them are always on the ground, and the fourth in the air. They are scattered over the ground where the enemy's cavalry is to pass, in order to embarrass them.

CALVARY, in anatomy, the hairy scalp or upper part of the head, which, either by disease or age, grows bald first.

CALVART (Denis), a celebrated painter, was born at Antwerp in 1552; and had for his masters Prospero Fontana and Lorenzo Sabbatini. He opened a school at Bologna, which became celebrated; and from which proceeded Guido, Albani, and other great masters. Calvart was well skilled in architecture, perspective, and anatomy, which he considered as necessary to a painter, and taught them to his pupils. His principal works are at Bologna, Rome, and Reggio.

CALVARY, a term used in Catholic countries for a
a kind of chapel of devotion raised on a hillock near a city, in memory of the place where Jesus Christ was crucified near the city of Jerusalem. The word comes from the Latin calvarium; and that from calvar, bald; in regard to the top of that hillock was bare and defilute of verdure: which is also signified by the Hebrew word geogotha. Such is the Calvary of St Valerian near Paris, which is accompanied with several little chapels, in each of which is represented in sculpture one of the mysteries of the passion.

Calvary, in heraldry, a croos so called, because it resembles the croos on which our Saviour suffered. It is always set upon steps.

Calvert, (George) afterwards lord Baltimore, was born at Kipling in Yorkshire about the year 1582, and educated at Oxford, where he took the degree of bachelor of arts, and afterwards travelled. At his return, he was made secretary to Sir Robert Cecil: he was afterwards knighted, and in 1618 appointed one of the principal secretaries of state. But after he had enjoyed that post about five years, he willingly resigned it, in order to apply himself more to his studies, that he might become a Roman-catholic, so that he might either be wanting to his trauh, or violate his conscience in discharging his office. This ingenuous confession so affected King James, that he continued him privy-councillor all his reign, and the same year created him baron of Baltimore in the kingdom of Ireland. He had before obtained a patent for him and his heirs, for the revenues of his see. It was, however, filled up to his son Cecil Calvert, lord Baltimore; and bears date June 20th, 1632.

It is held from the crown as part of the manor of Windfor, on one very singular condition, viz. to separate him entirely from the Romish church. The persecution against the Protestants in France (with whom he was now associated) obliged him to retire to Basle in Switzerland, where he published his famous Institutes of the Christian religion in 1535. The following year, he was chosen professor of divinity, and one of the ministers of the church, at Geneva. The next year, viz. 1537, he made all the people solemnly swear to a body of doctrines; but finding that religion had not yet had any great influence on the morals of the people, he, assisted by other ministers, declared, that since all their admonitions and warnings had proved unsuccessful, they could not celebrate the holy sacrament as long as these disorders reigned; he also declared, that he could not submit to some regulations made by the synod of Berne. Upon which the Synods having summoned the people, it was ordered that Calvin and two other ministers should leave the city within two days. Upon this Calvin retired to Strassburg, where he established a French church, of which he was the first minister, and was also chosen professor of divinity there. Two years after he was chosen to officiate at the diet appointed by the emperor to meet at Worms and at Ratlifon in order to appease the troubles occasioned by the difference of religion. He went with Bucer, and entered into a conference with Melaciteton. The people of Geneva now entreated him to return: to which he consented, and arrived at Geneva, September 13th 1541. He began with establishing a form of ecclesiastical discipline, and a confiitutory jurisdiction, with the power of inflicting all kinds of canonical punishments. This was greatly disliked by many persons, who imagined that the papal tyranny would soon be revived. Calvin, however, afferted on all occasions the rights of his conclave and inflexible strictness; and he caused Michael Servetus to be burnt at the stake for writing against the doctrine of the Trinity. But though the rigour of his proceedings sometimes occasioned great tumults in the city, yet nothing could shake his steadfastness and inflexibility. Amongst all the disturbances of the commonwealth, he took care of the foreign churches in England, France, Germany, and in Poland; and did more by his pen than his presence, sending his advice and instructions by letter, and writing a great number of books. This great reformer died on the 27th of May 1564, aged 55. His works were printed together at Amsterdamin 1671, in nine volumes folio: the principal of which are his Institutes, in Latin, the best edition of which is that of Robert Stephens in 1553, in folio; and his Commentaries on the Holy Scriptures. Calvin is universally allowed to have had great talents, an excellent genius, and profound learning. His style is grave and polite. Independent of his spiritual pride, his morals were exemplary; for he was pious, sober, chaste, laborious, and disinterested. But his memory can never be purified from the stain of burning Servetus: it became a reformer to adopt the most odious practice of the corrupt church of Rome.

Calvinism, the doctrine and sentiments of Calvin and his followers. Calvinism subsists in its greatest purity in the city of Geneva; and from thence it was first propagated into Germany, France, the United Provinces, and England. In France it was abolished by the revocation of the edict of Nantes in 1685.
It has been the prevailing religion in the United Provinces ever since the year 1571. The theological system of Calvin was adopted, and made the public rule of faith in England, under the reign of Edward VI, and the church of Scotland was modelled by John Knox, the disciple of Calvin, agreeably to the doctrine, rites, and form of ecclesiastical government established at Geneva. In England it has declined since the time of Queen Elizabeth; though it still subsists, some say in a little alloyed, in the articles of the established church; and in its rigour in Scotland.

The distinguishing theological tenets of Calvinism, as the term is now generally applied, respect the doctrines of Predestination, or particular Election and Reproduction, original Sin, particular Redemption, effectual, or, as some have called it, irresistible Grace in regeneration, Justification by faith, Perseverance, and the Trinity. See each of these articles.

Besides the doctrinal part of Calvin's system, which, so far as it differs from that of other reformers of the same period, principally regarded the absolute decree of God, whereby the future and eternal condition of the human race was determined out of mere sovereign pleasure and free-will; it extended likewise to the discipline and government of the Christian Church, the nature of the Eucharist, and the qualification of those who were entitled to the participation of it. Calvin considered every church as a separate and independent body, invested with the power of legislation for itself. He proposed that it should be governed by presbyters and synods composed of clergy and laity, without bishops, or any clerical subordination; and maintained, that the province of the civil magistrate extended only to its protection and outward accommodation. In order to facilitate an union with the Lutheran church, he acknowledged a real, though spiritual, presence of Christ, in the Eucharist, that true Christians were united to the man Christ in this ordinance, and that divine grace was conferred upon them, and sealed to them, in the celebration of it; and he confined the privilege of communion to pious and regenerate believers. In France the Calvinists are distinguished by the name of Huguenots; and, among the common people, by that of Puritans. In Germany they are confounded with the Lutherans, under the general title Protestants; only sometimes distinguished by the name Reformed.

CALVINISTS, in church-history, those who follow the opinions of Calvin. See the two preceding articles.

Crypto-Calvinists, a name given to the favourers of Calvinism in Saxony, on account of their secret attachment to the Genevan doctrine and discipline. Many of them suffered by the decrees of the convocation of Torgau, held in 1576. The Calvinists in their progres have divided into various branches, or jifer sects.

CALVISIUS, (Seth) a celebrated German chronicler in the beginning of the 17th century. He wrote Elucidus calendaris Gregoriani, et duplex calendarii, reformatus; and other learned works, together with some excellent treatises on music. He died in 1617, aged 61.

CALVITIES, or CALVITIUM, in medicine, balnei, or a want of hair, particularly on the scalp,...

### Excerpt

- **CALUMNY**, the crime of accusing another falsely, and knowingly so, of some heinous offence.

  **Oath of CALUMNY**; **Juramentum** (or rather *Judicandum*) **Calumnii**, among civilians and canons, was an oath which both parties in a cause were obliged to take: the plaintiff that he did not bring his charge, and the defendant that he did not deny it, with a design to abuse each other, but because they believed their cause was just and good; that they would not deny the truth, nor create unnecessary delays, nor offer the judge or evidence any gifts or bribes. If the plaintiff refuted this oath, the complaint or libel was dismissed.

- **CALVUS** (Cornelius Licinius), a celebrated Roman orator, was the friend of Catullus; and flourished 64 B.C. Catullus, Ovid, and Horace, speak of him.

- **CALX** properly signifies *limes*, but is also used by chemists and physicians for a fine powder remaining after the calcination or corrosion of metals and other mineral substances. All metallic calcis, at least all those made by fire, are found to weigh more than the metal from which they were originally produced. See the article Fire.

- **CALX Viva**, or *quick-lime*, that whereon no water has been cast, in contradistinction to lime which has been flaked by pouring water on it.

- **CALYBITES**, the inhabitants of a cottage, an appellation given to divers fainets on account of their long residence in some hut, by way of mortification.
CALYCIRO, in botany, the 16th order in Linnaeus's *Fragmenta methodi naturalis*, consisting of plants which, as the title imports, have the stamina (the flower) inferted into the calyx. This order contains the following genera, viz. cleamnus, hippophae, olphys, and trophis. See Botany, sect. vi. 16.

CALYCLITÆ (from *calyx* the flower-cup), a phylematic botanist, so termed by Linnaeus, who has arranged all vegetables from different species, structure, and other circumstances, of the calyx or flower-cup. The only systems of this kind are the *Character plantarum novus*, a posthumous work of Magnolius, professor of botany at Montpellier, published in 1720; and Linnaeus's *Methodus calycina*, published in his *Classis plantarum*, at Leyden, in 1738. See Botany, p. 425.

CALYDON, (anc. geog.), a town of Leolia, situated seven miles and a half from the sea, and divided from the Easte Indies. The word comes from *calypso*, a fabulous history, a goddesse, who was the daughter of Oceanus and Tethys; or, as others say, of Atlas. She was queen of the island of Ogygia, from which her name was called the island of *Calypso*. According to Homer, Ulyses suffered shipwreck on her coast, and laid with her several years.

CALYPTRA, among botanists, a thin membraneous involucrum, usually of a conic figure, which covers the parts of fruitification. The capsules of most of the mosses have *calyptrae*.

CALYX, among botanists, a general term expressing the cup of a flower, or that part of a plant which surrounds and supports the other parts of the flower. The cups of flowers are very various in their structure, and on that account distinguished by several names, as perianthium, involucrum, *lathia, gluma*, &c. See Botany, p. 439.

CALZADA, a town of Old Castile in Spain, seated on the river Leglera. W. Long 2° 47'. N. Lat. 42° 12'.

CAMÆA, in natural history, a genus of the femipellucid gems approaching to the onyx structure, being composed of zones, and formed on a chryaffine ball; but having their zones very broad and thick, and laid alternately one on another, with no common matter between; usually less transparent, and more debased with earth, than the onyxes. 1. One species of the camæa is the dull-looking onyx, with broad black and white zones; and in the *camæa* of the moderns, and the Arabian onyx. This species is found in Egypt, Arabia, Persia, and the East Indies. 2. Another species of the *camæa* is the dull broad zoned, green and white *camæa*, or the *jaspicamea* of the Italians; it is found in the East Indies, and in some parts of America. 3. The third is the hard *camæa*, with broad white and chefnut coloured veins. 4. The hard *camæa*, with bluish, white, and stell-coloured broad veins, being the fardonyx of Pliny's time, only brought from the East Indies.

CAMALÆU, or CAMÆU, a word used to express a peculiar sort of onyx: also by some to express a stone, whereon are found various figures, and representations of landscapes, &c. formed by a kind of *lusus nature*; so as to exhibit pictures without painting. The word comes from *calambula*, a name the Orientals give to the onyx, when they find, in preparing it, another colour; as who should say, a second stone. It is of these *camalæus* Pliny is to be understood when he speaks of the manifold picture of gems, and the party-coloured spots of precious stones: *Comit. pictura tam multiplex, lapidumque tam diversores maculae*.

CAMALÆUS is also applied by others to those precious stones, as onyxes, cornels, and others, whereon the lapidaries employ their art to aid nature, and perfect those representations. See CAMÆA.

CAMALÆUS is also frequently applied to any kind of gem, whereon figures may be engraved either indently or in relieve. In this sense the lapidaries of Paris are called in their statutes, cutters of camalæus.

A society of learned men at Florence undertook to procure all the *cameos* or *calamæus*, and intaglios in the great duke's gallery to be engraved; and began to draw the heads of divers emperors in *cameo*.

CAMALDIANS, CAMALDIANS, or CAMALDOLITES, an order of religious, founded by Romuald, an Italian fanatic, in 1023, in the horrible defart of Camaldoli, otherwise called Campo-Malduli, situate in the state of Florence, on the Apennines. Their rule is that of St Benedict; and their houses, by the statutes, are never to be less than five leagues from cities. The *Camaldalians* have not borne that title from the beginning of their order; till the clofe of the eleventh century they were called Romualdines, from the name of their founder. Till that time, Camaldulian was a particular name for those of the defart Camaldoli; and D. Grandi oberves, was not given to the whole order, in regard it was in this monastery that the order commenced, but because the regulation was best maintained here.

Guido Grandi, mathematician of the great duke of Tuscany, and a monk of this order, has published *Camaldalian Differences*, on the origin and establishment of it. The *Camaldolites* were distinguished into two classes, of which the one were COENOBITES, and the other PERMITES.

CAMALDOLUNUM (anc. geog.), a town of the Trinobantes, the first Roman colony in Britain, of veterans, under the emperor. From the itineraries it appears to have flood where now Malden stands. It continued to be an open place under the Romans; a place of pleasure rather than strength; yet not unadorned with splendid works, as a theatre and a temple of Claudius: which the Britons considered as badges of favery, and which gave rife to several seditions and commotions. It stands on a bay of the sea, at the mouth of the Chelmer, in the county of Essex; the modern name is curtailed from the ancient.

CAMARANA, an island of Arabia, in the Red Sea, whose inhabitants are little and black. It is the belle
CAMMISSEI, or CAMAG (Andreas), painter of history and landscape, was born at Bevagna, and at first learned the principles of design and colouring from Domenichino; but afterwards he studied in the school of Cesare Sacchi, and proved a very great painter. He was employed in St Peter's at Rome, as also at John Lateran; and his works are extremely admired, for the sweetness of his colouring, the elegance of his landscape, and the perfection of his pencil. Sandrart testifies that the world was deprived of so promising a genius, in the very bloom of life, when his reputation was daily advancing. He died in 1657. At St John Lateran are to be seen, the Battle of Constantine and Maxentius; and the Triumph of Constantine, which are noble and grand compositions; and his reputation was daily advancing. He died in 1657. At St John Lateran are to be seen, the Battle of Constantine and Maxentius; and the Triumph of Constantine, which are noble and grand compositions; and they afford sufficient proofs of the happiness of his invention and the correctness of his execution. Also at Wilton, the seat of the Earl of Wilton, is a picture of Venus with the Graces, said to be by the hand of Camaggi. CAMARECUM, (anc. geog.), the capital of the Nervii, a people of Gallia Belgica, (Antonine, Peutinger) before whose time no mention was made of it. Now Cambray, capital of the Cambresis, in French Flanders. E. Long. 3.

CAMARINA, (anc. geog.) a city of Sicily, built by the Syracusans on an eminence near the sea, in the south of Sicily, to the west of the promontory Pachynum, between two rivers, the Hippariss and Oanus. Of so famous a city nothing now remains but its name and ancient walls, a mile and a half in compass, with the flight remains of houses: now called Cambrama. CAMARINA Palus, a marsh or lake, near the city Camarina, and from which it took its name. In time of drought, the fench of the lake produced peffidium; upon which the inhabitants consulted the oracle, whether they should not quite drain it. The oracle diffued them; they notwithstanding drained it, and opened a way for their enemies to come and plunder their city: hence the proverb, Ne novet Camarina, that is, not to remove one evil to bring upon a greater. Now Lago di Camarina, situate in a beautiful plain, under the very walls of Camarina, and of a triangular form.

CAMAYEU. See CAMAYEU.

CAMBAIA, or CAMBA, a town of Asia, in India, and in the peninsula on this side the Ganges; capital of a province of the same name; but more commonly called Guzarat. It is seated at the bottom of a gulph of the same name, on a small river; is a large place with high walls, and has a pretty good trade. The produce and manufactures are inferior to few towns in India; for it abounds in corn, cattle, and silk; and cornelian and agate stones are found in its rivers. The inhabitants are noted for embroidery; and some of their quilts have been valued at 401. It is subject to the Great Mogul. E. Long. 72. 15. N. Lat. 22. 30.

CAMBAYES, in commerce, cotton cloths made at Bengal, Madras, and some other places on the coast of Coromandel. They are proper for the trade of Marsellese, whether the English at Madras send great numbers of them. Many are also imported into Holland.

CAMBER, according to monkish historians, one of the three sons of Brutus, who, upon his father's death, had that part of Britain assigned him for his share, called from him Cambria, now Wales.

CAMBER-BEAM, among builders, a piece of timber in an edifice cut arch-wise, or with an obtuse angle in the middle, commonly used in platforms, as church-leads, and on other occasions where long and strong beams are required.

CAMBERED-DECKS, among ship-builders. The deck or flooring of a ship is said to be cambered, or to lie cambering, when it is higher in the middle of the ship's length, and droops toward the stem and stern, or the two ends. Also when it lies irregular; a circumstance which renders the ship very unfit for war.

CAMBERT, a French musician in the 17th century, was at first admired for the manner in which he touched the organ, and became superintendant of the music to Anne of Austria the queen-mother. The abbe Perrin associated him in the privilege he obtained of his majesty, of setting up an opera in 1669. Cambert set to music two pastorals, one entitled Pomona, the other Ariadne, which were the first operas given in France. He also wrote a piece entitled The pains and pleasures of love. These pieces pleased the public; yet in 1672, Lully obtaining the privilege of the opera, Cambert was obliged to go to England, where he became superintendant of the music to King Charles II., and died there in 1677.

CAMBIO, an Italian word which signifies exchange; commonly used at Provence, and in some other countries, particularly Holland.

CAMBIST, a name given in France to those who trade in notes and bills of exchange. The word cambist, though a term of antiquity, is even now a technical word, of some use among merchants, traders, and bankers. Some derive it from the Latin cambium, or rather cambio.

CAMBLET, or CHAMBLET, a stuff sometimes of wool, sometimes silk, and sometimes hair, especially that of goats, with wool or silk: in some, the warp is silk and wool twisted together, and the wool hair.

The true or oriental camblet is made of the pure hair of the fort of goats, frequent about Angora, and which makes the riches of that city, all the inhabitants whereof are employed in the manufacture and commerce of camblets. It is certain we find mentioned in middle-age writers of stuffs made of camel's hair, under the denominations of camelium and camesium, whence probably the origin of the term; but these are represented as strangely coarse, rough, and prickly, and seem to have been chiefly used among the monks by way of mortification, as the hair-shirt of later times.

We have no camblets made in Europe of the goats' hair alone; even at Brussels, they find it necessary to add a mixture of woollen thread.

England, France, Holland, and Flanders, are the chief places of this manufacture. Brussels exceeds them all in the beauty and quality of its camblets: those of England are reputed the second.

Figured camblets, are those of one colour, whereon are stamped various figures, flowers, foliage, &c. by means of hot irons, which are a kind of moulds, pasted together with the stuff, under a press. These are chiefly
Camlets buy brought from Amiens and Flanders: the commerce of these was anciently much more considerable than at present.

Watered-Camlets, those which, after weaving, receive a certain preparation with water; and are afterwards passed under a hot-press, which gives them a smoothness and luster.

Waxed-Camlets, are those whereon waves are impressed, as on tabbies; by means of a calender under which they are passed and repassed several times.

The manufacturers, &c. of camlets are to take care they do not acquire any Falte and needleflafs: it being almost impossible to get them out again. This is notorious, even to a proverb: we say, a person is like camlet, he has taken his plain.

CAMBODIA, a kingdom of Asia, in the East-Indies, bounded on the north by the kingdom of Laos, on the east by Cochin-China and Chiapa, and on the south and west by the gulf and kingdom of Siam; divided by a large river called Mecon. The capital town is of the same name, seated on the western shore of the said river, about 150 miles north of its mouth. This country is annually overflowed in the rainy season, between June and October; and its productions and fruits are much the same with those usually found between the tropics. E. Long. 104. 15. Lat. 12. 40.

CAMBODUNUM, (Itinerary;) a town of the Brigantes, in Britain; now in ruins, near Almonbury, in Yorkshire. Weishefter, (Telbot.) Also a town of Vendicilia, on the Cambus: now Kampen, in Susbia.

CAMBOGIA, in botany: A genus of the monogynia order, belonging to the polyanidia class of plants; and in the natural method ranked under the 28th order, Trilocae. The corolla is tetrapetalous; the calyx tetraphyllous; and the fruit is a pome with eight cells, and solitary feeds. There is but one species, the gamboge, which they are native of India, which yields the gamboge.

CAMBRIA, a name for the principality of Wales.

CAMBRIC, in commerce, a species of linen made of flax, very fine and white; the name of which was originally derived from the city of Cambray, where they were first manufactured. They are now made at other places in France.

The manufacture of cambrics hath long since proved of extraordinary advantage to France. For many years it appeared that England did not in this article contribute less than 200,000l. per annum to the interest of France. This proved motive sufficient to induce the parliament of Great Britain to enact many salutary laws to prevent this great loss of wealth. See 18 Geo. II. c. 36. and 21 Geo. II. c. 26. See also Stat. 32 Geo. II. c. 32 and 4 Geo. III. c. 27, which regulates the cambric manufacture, not long since introduced into Winclesea in Suffolk; but very soon abolished. The cambrics now allowed in Britain are manufactured in Scotland and Ireland. Any persons convicted of wearing, selling (except for exportation), or making up for hire any cambric or French lawn, are liable to a penalty of 5l. by the two first statutes cited above.

CAMBRIDGE, a town of England, and capital of the county of that name. It takes the name of Cambridge from the bridge over the Cam, which divides the town into two parts. Either it or a place in the neighborhood was styled Camboritum in the time of the Romans. It suffered much during the wars with the Danes. Here was a castle built by William the Conqueror, of which the gatehouse yet remains, and is now the county goal. By Doomsday-book it appears, that it then had ten wards, containing 367 houses. In William Rufus's reign it was quite destroyed by Roger de Montgomery, but Henry II. bestowed many privileges upon it, particularly an exemption from the power of the sheriffs, on condition of its paying...
The university enjoys great privileges. It is governed by the chancellor, who is always some nobleman, and may be changed every three years, and has a commissary under him; the high steward, chosen by the faculty; the vice-chancellor chosen by the whole body of the university, out of two named by the heads of the colleges; two provosts chosen every year; two taxers, who, with the proctors, regulate the weights and measures. The other officers are, a regifter, or keeper of the archives, three esquire beadle, one yeoman beadle, and a library keeper. Each college has its schools and library, as at Oxford, of which those of Trinity and St John are the most considerable. King George I. purchased for 1000l. the library of Dr Moor bishop of Ely, consisting of 30,000 volumes, and made a present of it to the university; which, out of a good part of it, erected, in 1739, a fine marble statue of that prince in the senate-hall of King’s-college. A present of modern languages and history was also made here the same year by the Rev. Mr. Waterhouse, two for himself and two to teach under him, by king George I. in 1724. In 1728, a professorship for natural philosophy was erected by Dr Woodward, a professor at Gresham college, London, with a salary of 150l. a year. The same gentleman left them also his collection of fossils, and a part of his library. The master and fellows of Catherine-hall are trustees of an hospital for the cure of poor diseased people gratis; for the building and furnishing of which, Dr Addenbrooke left 4000l. Each college has its chapel for worship; but public sermons are preached at St Mary’s church. The following are the most remarkable structures: 1. The chapel of king’s-college, which for its contrivance and extent, fine carved work in wood and stone, and painted windows, is hardly to be equalled in the world. It is entirely of free stone, roof and all, without one pillar to support it. 2. Trinity-college and library, wonderful both for the design and execution. We must not omit to observe, that a fellowship was founded at Magdalen-college, called the travelling Norfolk fellowship, because it is appropriated to gentlemen of that country. E. Long. o. 7. N. Lat. 52. 15.

CAMBRIDGESHIRE, a county of England, bounded on the east by Norfolk, on the south by Essex and Hertsfordshire, on the west by Bedfordshire and Huntingdonshire, and on the north by Lincolnshire. It is about 40 miles long, 25 broad, and 150 in circumference. It lies in the diocese of Ely; and sends six members to parliament, two for the county, two for the university, and two for the town of Cambridge. The air is very different in different parts of the county. In the fens it is moist and foggy, and therefore not so wholesome; but in the south and east parts it is very good, these being much drier than the other: but both, by late improvements, having been rendered very fruitful, the former by draining, and the latter by cinque-foil: so that it produces plenty of corn, especially barley, saffron, and hemp, and affords the richest pastures. The rivers abound with fish, and the fens with wild fowl. The principal manufactures of the county are malt, paper, and bakets. The chief rivers are the Oule, which divides the county into two parts, and is navigable from Cambridge to Lynn in Norfolk; the Cam, which in the British signifies crooked, to denote its winding; the Welland, the Glene, the Witham, and that called Peterborough river, which is navigable to that city from Wiltzmbtch. The fens called Bedford level consist of about 300,000 acres of marshy ground, lying in Cambridge, Norfolk, Suffolk, Huntingdonshire, Northamptonshire, and Lincolnshire, and surrounded on all hands, except towards the sea, with high lands. As it appears to have been dry land formerly, the great change it has undergone must have been owing either to a violent breach and inundation of the sea, or to earthquakes. As the towns in and about the fens were great sufferers by the stagnation of the waters in summer, and want of provisions in winter, many attempts were made to drain them, but without success, until the time of Charles I. in which, and that of his son, the work was happily completed. In these fens are a great many decoys, in which incredible numbers of ducks, and other wild fowl, are caught during the season.

CAMBRIDGE, in New-England, a pleasant village, Mary’s and other fens of Boston, famous for its university, consisting of four elegant brick edifices, viz. Harvard Hall, Massachusetts Hall, Hollis Hall, and Holden chapel, handomely inclofed. Harvard Hall is divided into six apartments; one of which is appropriated for the library, one for the museum, two for the philosophical apparatus, one is used for a chapel, and the other for a dining hall. The library in 1737, consistit of 12,000 volumes; and will be continually increasing from the interest of permanent funds, as well as from casual benefactions. The philosophical apparatus belonging to this university, cost between 1400 and 15000 lawful money, and is the most elegant and complete of any in America.

Agreeably to the present constitution of Massachusetts, his excellency the governor, the council and senate, the president of the university, and the ministers of the congregational churches in the towns of Boston, Charlestown, Cambridge, Watertown, Roxbury, and Dorchester, are ex officiis, overseers of the university.

The corporation is a distinct body, consisting of seven members, in whom is vested the property of the university.

The instructors in the university, are a president, Hollisian professor of divinity, Hollisian professor of the mathematics and natural philosophy, Hancock professor of oriental languages, professor of anatomy and surgery; professor of the theory and practice of physic; professor of chemistry and materia medica, and four tutors.

This university as to its library, philosophical apparatus and professorships, is at present the first literary institution on this continent. It has generally from 120 to 1500 students.

CAMBRIDGE, in Maryland, a pleasant village on Choptank river, about ten miles from its entrance into Chesapeake Bay, a place of considerable trade. N. Lat. 38° 35’. W. Lat. W. Long. 76° 20’.

CAMBRIDGE Manuscript, a copy of the Gospels and Acts of the Apostles in Greek and Latin. Beza founded it in the monastery of Irenæus at Lyons, in the year 1562, and gave it to the university of Cambridge in 1582. It is a quarto size, and written on vellum; sixty-six leaves of it are much torn and mutilated.
Cambyses of which are supplied by a later transcriber. Beza
conjectures, that this manuscript might have existed so
ekely as the time of Irenaeus: Weitstein apprehended
that it either returned or was first brought from Egypt
into France; that it is the same copy which Druth-
mar, an ancient expeditor, who lived about the year
840, had seen, and which, he oberves, was ascribed to
St Hilary; and that R. Stephens had given a parti-
cular account of it in his edition of the New Testa-
ment in 1550. It is usually called *Stephens's second
manuscript*. Mill agrees with F. Simon in opinion,
that it was written in the western part of the world by
a Latin scribe, and that it is to a great degree inter-
polated and corrupted: he observes, that it agrees so
much with the Latin Vulgate, as to afford reason for
concluding, that it was corrected or formed upon a
corrupt and faulty copy of that translation. From
this and the Clermont copy of St Paul's Epistles, Beza
published his larger Annotations in 1582.

CAMBYES. See *(History of)* PERSIA.
CAMCHATKA. See KAMCHATKA.

Camden (William), the great antiquarian, was
born in London in the year 1551. His father was a
native of Lichfield in Staffordshire, who feudalising
in London, became a member of the company of painter-
trainers, and lived in the Old Bailey. His mother was
of the ancient family of Carven, of Wirkington, in
Cumberland. He was educated first at Christ's hospi-
 tal, and afterwards at St Paul's school; from thence
he was sent in 1566 to Oxford, and entered servant of
Magdalen college; but being disappointed of a de-
my's place, he removed to Broad-gate hall, and some-
what more than two years' after, to Christ-church,
where he was supported by his kind friend and patron
Dr Thornton. About this time he was a candidate for
a fellowship of All-Souls college, but lost it by the in-
terest of the Popish party. In 1570, he supplicated
the regents of the university to be admitted bachelor of
arts; but in this also he miscarried. The following
year Mr Camden came to London, where he prosecu-
et his favourite study of antiquity, under the patron-
age of Dr Goodman, dean of Westminster, by whose
interest he was made second master of Westminster
school in 1575. From the time of his leaving the uni-
versity to this period, he took several journeys to dif-
ter parts of England, with a view to make observa-
tions and collect materials for his *Britannia*, in which
he was now deeply engaged. In 1581 he became inti-
mately acquainted with the learned president Briffon,
who was then in England; and in 1586 he published
the first edition of his *Britannia*. In 1593 he succeed-
et to the headmanship of Westminster school on
the resignation of Dr Grant. In 1597 he published his
Greek grammar, and the same year was made Clarence-
ux king at arms. In the year 1600 Mr Camden
made a tour to the north, as far as Carlisle, accompa-
nied by his friend Mr (afterwards Sir Robert) Cotton.
In 1606 he began his correspondence with the celebrated
president de Thou, which continued to the death of
that faithful historian. In the following year he pub-
lished his last edition of the *Britannia*, which is that
from which the several English translations have been
made; and in 1608 he began to digest his materials
for a history of the reign of queen Elizabeth. In
1609, after recovering from a dangerous illness, he
retired to Chislehurst in Kent, where he continued to
spend the summer-months during the remainder of
his life. The first part of his annals of the queen did not
appear till the year 1615, and he determined that the
second volume should not appear till after his death (A).

The work was entirely finished in 1617; and from
that time he was principally employed in collecting
more materials for the further improvement of his
*Britannia*. In 1622, being now upwards of 70, and
finding his health decline apace, he determined to lose
no time in executing his design of founding a history-
library in the university of Oxford. His deed of gift
was accordingly transmitted by his friend Mr Heather,
to Mr Gregory Wheare, who was, by himself, ap-
pointed his first professor. He died at Chislehurst, in
1625, in the 73d year of his age; and was buried
with great solemnity in Westminster-abbey in the foot
aile, where a monument of white marble was erected to his memory. Camden was a man of sin-
gular modesty and integrity; profoundly learned in the
history and antiquities of Britain, and a judicious and
conscientious historian. He was revered and
esteemed by the literati of all nations, and will be ever
remembered as an honour to the age and country
wherein he lived. Besides the works already men-
tioned, he was author of an excellent Greek grammar,
and of several tracts in Hearne's collection.

CAMEL, in zoology. See *CAMELUS*.

CAMEL. In mechanics, a kind of machine used in
Holland for raising or lifting ships, in order to bring
them over the Pampas, which is at the mouth of the
river Y, where the shallowness of the water hinders large
ships from passing. It is also used in other places, parti-
cularly at the dock of Peterburg, the vessels built here
being in their passage to Cronstadt lifted over the bar by
means of camels. These machines were originally in-
vented by the celebrated De Wit, for the purpose a-
bovementioned; and were introduced into Russia by
Peter the Great, who obtained the model of them
when he worked in Holland; as a common shipwright.

A camel is composed of two separate parts, whose
outfides are perpendicular, and whose inides are concave,
shaped so as to embrace the hull of a ship on both sides.
Each part has a small cabin with sixeen pumps and
ten plgs, and contain twenty men. They are armed to
a ship underneath by means of cables, and entirely
enclose its sides and bottom; being then towed to the
bar,

(A) The reign of queen Elizabeth was so recent when the first volume of the annals was published, that
many of the persons concerned, or their dependents, were still living. It is no wonder, therefore, that
the honest historian should offend those whose actions would not bear inquiry. Some of his enemies were clam-
orous and troublesome; which determined him not to publish the second volume during his life, but that po-
terity might be in no danger of disappointment, he deposited one copy in the Cotton library, and transmitted
another to his friend Dupuy at Paris. It was first printed at Leyden in 1625.
Camelus
African Camel or Dromedary

Plate CXLII

Bactrian Camel

[Images of a dromedary and a bactrian camel]
CAMELIA, in botany: A genus of the family Magnoliaceae, consisting of about 200 species of plants, native to the Orient, and in the natural method ranking under the 37th order, Columniferae. The calyx is imbricated and polyphyllous, with the interior leaves larger than the exterior ones. Of this genus there is but one species, native both of China and Japan. Thunberg, in his Flora Japonica, describes its growing every where in the groves and gardens of Japan, where it becomes a prodigiously large and tall tree, highly esteemed by the natives for the elegance of its large and very variable blossoms, and its evergreen leaves; it is there found with fingle and double flowers, which also are white, red, and purple, and produced from April to October. Representations of this flower are frequently met with in Chinese paintings. In Britain, the Camellia is generally treated as a flower plant, and propagated by layers; it is sometimes placed in the greenhouse; but it appears to be one of the properest plants imaginable for the conservatory. At some future time it may, perhaps, not be uncommon to treat it as a Lauriflora or Magnolia; the price at which it has hitherto been sold, may have prevented its being hazarded in this way. The blossoms are of a firm texture, but apt to fall off long before they have lost their brilliancy; it therefore is a practice with some to stick such deciduous blossoms on some fresh bud, where they continue to look well for a considerable time. Petiver considered this plant as a species of tea-tree; and future observations will probably confirm his conjecture.

CAMELODUM. See Camellodunum.

CAMELOPARDALIS, in zoology, the trivial name of a species of Cervus.

CAMELUS, in zoology, a genus of quadrupeds belonging to the order of pecora. The characters of the camel are these: It has no horns; it has five fore-teeth in the under jaw; the laniaries are wide set, three in the upper, and two in the lower jaw; and there is a fissure in the upper lip, resembling a cleft in the lip of a hare. The species are:

1. The dromedarius, or Arabian camel, with one bunch of protuberance on the back. It has four callous protuberances on the fore-legs, and two on the hind ones. This species is common in Africa, and the warmer parts of Asia; not that it is spread over either of the continents. It is a common beast of burden in Egypt, and along the countries which border on the Mediterranean Sea; in the kingdom of Morocco, Sora, or the Defer; and in Ethiopia; but no where south of those kingdoms. In Asia, it is equally common in Turkey and Arabia; but is scarcely seen farther north than Persia, being too tender to bear a more severe climate.

2. The Bactrianus, or Bactrian camel, has two bunches on the back, but is in all other respects like the preceding, of which it seems to be a mere variety, rather than a different species; and is equally adapted for riding or carrying loads. It is still found wild in the deserts of the temperate parts of Asia, particularly in those between China and India. There are larger and more generous than the domesticated race. The Bactrian camel, which is very common in Asia, is extremely hardy, and in great use among the Tartars and Mongols, as a beast of burden, from the Caspian Sea to the empire of China. It bears even so severe a climate as that of Siberia, being found about the lake Baikal, where the Burais and Mongols keep great numbers. They are far less than those which inhabit Western Tartary. Here they live during winter on willows and other trees, and are by this diet reduced very lean. They lose their hair in April, and go naked all May, amidst the forests of that severe climate, to thrive, they must have dry ground and salt marishes. There are several varieties among the camels. The Turkman is the largest and strongest. The Arabian is hardy. What is called the Dromedary, Mahary, and Ragnahl, is very swift. The common fort travel about 30 miles a day. The latter, which has a less bunch, and more delicate shape, and also as much inferior in size, never carries burdens; but is used to ride on. In Arabia, they are trained for running-matches: and in many places for carrying couriers, who can go above 100 miles a day on them; and that for nine days together, over burning deserts, uninhabitable by any living creature. The African camels are the most hardy, having more durable and more dreadful deferts to pass over than any of the others, from Numidia to the kingdom of Ethiopia. In Western Tartary there is a white variety, very scarce, and sacred to the idols and priests. The Chinese have a fivt variety, which they call by the expressive name of Fong Kyo Fo, or camels with feet of the wind. Fat of camels, or, as those people call it, oil of bunches, being drawn from them, is esteemed in many disorders, such as ulcers, numbness, and consumptions. This species of camel is rare in Arabia, being an exotic, and only kept by the great men.

Camels have constituted the riches of Arabia from the time of Job to the present day. The patriarch reckoned 660 camels among his pastoral treasures, and the modern Arabs estimate their wealth by the number of these useful animals. Without them great part of Africa would be wretched; by them the whole commerce is carried through arid and burning tracts, imperious but by beasts which Providence formed expressly for the scorched deserts. Their foles are adapted to the sands they are to pass over, their toughnefs and spungy softnefs preventing them from cracking. Their great powers of sustaining abstinence from drinking, enables them to pass over unwatered tracts for many days, without requiring the least liquid; and their patience under hunger is such, that they will travel many days fed only with a few dates, or some small balls of bean or barley-meal, or on the miserable thorny plants they meet with in the deserts.

The Arabs regard the camel as a present from heaven, a sacred animal, without whose assistance they could neither subsist, carry on trade, nor travel. Ca-
Camel's milk is their common food. They also eat its flesh, that of the young camel being reckoned highly favourable. Of the hair of those animals, which is fine and soft, and which is completely favoury. of Arabs. Hence they armi of the world would perish in pursuit of a troop of Arabs. Hence they never submit, unless from choice, to any power. With a view to his predatory expeditions, the Arab inflicts, rears, and exercises his camels. A few days after their birth, he folds their limbs under their belly, forces them to remain on the ground, and, in this situation, loads them with a pretty heavy weight, which is never removed but for the purpose of replacing a greater. Instead of allowing them to feed at pleasure, and to drink when they are dry, he begins with regulating their meals, and makes them gradually travel long journeys, diminishing the quantity of their aliment. When they acquire some strength, they are trained to the course. He excites their emulation by the example of motion and fatigue, his camels are perpetually regulated. He excites their emulation by the example of motion and fatigue, his camels are perpetually the purpose of replacing a greater. Instead of allowing, at the same time, the quantity of their aliment. His course. He excites their emulation by the example of motion and fatigue, his camels are perpetually regulating their meals, and makes them gradually travel long journeys, diminishing the quantity of their aliment. When they acquire some strength, they are trained to the course. He excites their emulation by the example of motion and fatigue, his camels are perpetually regulated. He excites their emulation by the example of motion and fatigue, his camels are perpetually

Fatigue, hunger, thirst, and meagreness, are not the only inconveniences to which these animals are subjected: To all these evils they are prepared by mortification. One male is only left for eight or ten females; and the labouring camels are generally geldings. They are unquestionably weaker than unmated males; but they are more tractable, and at all seasons ready for service. While the former are not only unmanageable, but almost furious during the rutting season, which lasts forty days, and returns annually in the spring. It is then said, that they foam...
The camel is the genuine treasure of Asia. He is more valuable than the elephant; for he may be had to perform an equal quantity of labour at a twentieth part of the expense. Besides, the whole species are under subjection to man, who propagates and multiplies them at pleasure. But he has no fitch dominion over the elephants, whom he cannot multiply, and the individuals of whom he conquers with great labour and difficulty. The camel is not only more valuable than the elephant, but is perhaps equal in utility to the horse, the ass, and the ox, when their powers are united. He carries as much as two mules, though he eats as little, and feeds upon herbs equally coarse as the asfs. The female furnishes milk longer than the cow. The flesh of a young camel is as good and wholesome as veal: The Africans and Arabs fill their pots and tubs with it, which is tried with great ease, and preferred in this manner during the whole year for their ordinary repasts: The hair is finer and more in request than the best wool. Even their excrements are useful: for sal ammoniac is made of their urine; and their dung, dried in the sun and pulverized, serves for litter to themselves, as well as to horses, with which people frequently travel in countries where no hay or straw can be had. In fine, their dung makes excellent fuel, which burns freely, and gives as clear and nearly as hot a flame as dry wood, which is of great use in the deserts, where not a tree is to be found, and where, for want of combustible materials, fire is as scarce as water.

2. The Glama, Llama, or South-American camel-sheep, has an almost even back, small head, fine black eyes, and very long neck, bending much, and very protuberant near the junction with the body: in a tame state, with smooth short hair; in a wild state, with long coarse hair, white, grey, and russet, discolored in spots; with a black line from the head along the top of the back to the tail, and belly white. The spotted may possibly be the tame, the last the wild, llamas. The tail is short; the height from four to four and a half; the length from the neck to the tail, six feet. The carcase divided of skin and offals, according to the editor of Mr Byron's voyage, weighed 200 lb. They are under the service of man. They are very useful in the deserts, and for want of combustible materials, fire is as scarce as water.
inhabit that vast chain of mountains their whole length to the straits of Magellan; but except where these hills approach the sea, as in Patagonia, never appear on the coasts. Like the camel, they have powers of abating long from drink, sometimes for four or five days: like that animal, their food is coarse and trifling.

—In a wild state, they keep in great herds in the highest and steepest parts of the hills; and while they are feeding, one keeps censory on the pinnacle of some rock: if it perceives the approach of any one, it neighs; the herd takes the alarm, and goes off with incredible speed. They outrun all dogs, for there is no other way of killing them but with the gun. They are killed for the sake of their flesh and hair; for the Indians weave the last into cloth. From the form of the parts of generation in both sexes, no animal copulates with such difficulty. It is often the labour of a day, antequam annum ipsum venereum inceptum, et absolvant.

4. The Pecos, or sheep of Chili, has no bench on the back. It is covered with a fine valuable wool, which is of a rote red colour on the back of the animal, and white on the belly. They are of the same nature with the preceding; inhabit the same places, but are more capable of supporting the rigour of frost and snow: they live in vast herds; are very timid, and exceedingly swift. The Indians take the pecos in a strange manner: they tie cords with bits of cloth or wool hanging to them, above three or four feet from the ground, cross the narrow pusses of the mountains, then drive those animals towards them, which are so terrified by the shiver of the rags, as not to dare to pass, but, huddling together, give the hunters an opportunity to kill them with their flings as many as they please. The tame ones will carry from 50 to 75 lb. but are kept principally for the sake of the wool and the flesh, which is exceedingly well tasted.

CAMERA EOLIÆ, a contrivance for blowing the fire, for the fusion of ores, without bellows; by means of water falling through a funnel into a close vessel, which sends from it so much air or vapour as continually blows the fire: if there be the space of another vessel for it to expatiate in by the way, it there lessens its humidity, which otherwise might hinder the work. This contrivance was named camera Eolia by Kircher.

CAMERA Lucida, a contrivance of Dr Hook for making the image of any thing appear on a wall in a light room, either by day or night. Opposite to the place or wall where the appearance is to be, make a hole of at least a foot in diameter, or if there be a high window with a cement of this dimension in it, this will do much better without such hole or cement opened. At a convenient distance, to prevent its being perceived by the company in the room, place the object or picture intended to be represented, but in an inverted situation. If the object be a flat, or a living creature, it must be much enlightened by casting the sun's rays on it, either by reflection, refraction, or both. Between this object and the place of representation put a broad convex glass, ground to such a convexity as that it may represent the object distinctly in such place. The nearer this is situated to the object, the more will the image be magnified on the wall, and the further the less; such diversity depending on the difference of the sphere of the glasses. If the object cannot be conveniently inverted, there must be two large glasses of proper spheres, situated at suitable distances, easily found by trial, to make the representation erect. This whole apparatus of object, glasses, &c. with the perfections employed in the management of them, are to be placed without the window or hole, so that they may not be perceived by the spectators in the room, and the operation itself will be easily performed. Phil. Trans. No. 38. p. 714, seq.

CAMERA Obcura, or Dark Chamber, in Optics, a machine, or apparatus, representing an artificial eye; wherein the images of external objects, received through a double convex glass, are exhibited distinctly, and in their native colours, on a white sheet placed within the machine, in the focus of the glass.

The first invention of this instrument is ascribed to Baptista Porta. See his Magia Naturalis, lib. xvii. cap. 6. first published at Franffort about the year 1580 or 1591; the first four books of this work were published at Antwerp in 1560.

The camera obcura affords very diverting spectacles; both by exhibiting images perfectly like their objects, and each clothed in their native colours; and by experiencing, at the same time, all their motions; which latter no other art can imitate. By means of this instrument, a person unacquainted with designing will be able to delineate objects with the greatest accuracy, and judicious, and another well versed in painting will find many things herein to perfect his art. See the construction under DIOPTRICS.

CAMERARIA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 30th order, Centorta. There are two horizontal folicles at the base of the seed-case. The seeds are inserted in a proper membrane. Of this there are two species: the latifolia, and the angustifolia. The first is a native of the islands of Cuba, and Martinique. By means of this instrument, a person unacquainted with designing will be able to delineate objects with the greatest accuracy, and judicious, and another well versed in painting will find many things herein to perfect his art. See the construction under DIOPTRICS.
Cam•er•a•ri•us [61]

Cam•er•a•ri•us

ed writers of his time, was born in 1500, at Bamberg, a city of Franconia: and obtained great reputation by his writings. He translated into Latin Herodotus, Demosthenes, Xenophon, Euclid, Homer, Theocritus, Sophocles, Lucian, Theodoret Nicephorus, &c. He published a catalogue of the bishops of the principal sees; Greek epistles; Accounts of his journeys, in Latin verse; a Commentary on Plautus; the Lives of Helius Eobanus, Heffus, and Philip Melanthon, &c. He died in 1574.

Cam•er•a•ri•us (Joachim), son of the former, and a learned physician, was born at Nuremberg in 1534. After having finished his studies in Germany, he went into Italy, where he obtained the eleeum of the learned. At his return he was courted by several princes to live with them; but he was too much devoted to books, and the study of chemistry and botany, to comply. He wrote an hourts medicus, and several other works. He died in 1598.

Cam•er•a•te•d

Cam•er•a•te•d, among builders the fame with vaulted or arched.

Cam•er•et•bay

Cam•er•et•bay, in the province of Brittany in France, forms the harbour of Brest. See Brest.

Cam•er•i•no

Cam•er•i•no, a town of the ecclesiastical state in Italy, situated in E. Long. 15° 7'. N. Lat. 45° 5'.

Cam•er•li•ng•o

Cam•er•li•ng•o, according to Ducauce, signified formerly the pope's or emperor's tresfare: at present, camerlingo is no where used but at Rome, where it denotes the cardinal who governs the ecclesiastical state and administrators justice. It is the most eminent office at the court of Rome, because he is at the head of the treasury. During a vacation of the papal chair, the cardinal camerlingo publishes edicts, coins money, and executes every other prerogative of a sovereign prince; he has under him a treasurer-general, auditor-general, and 12 prelates called clerks of the chamber.

Cam•eron

Cam•eron (John), one of the most famous divines among the Protestants of France in the 17th century, was born at Glasgow in Scotland, where he taught the Greek tongue; and having read lectures upon that language for about a year, travelled, and became professor at several universities, and minister at Brougham. He published theological lectures; 2. Icon Johannis Camerontis; and some miscellaneous pieces. He died in 1625, aged 60.

Cam•eroni•ans

Cam•eronians, a sect or party in Scotland, who separated from the Presbyterians in 1666, and continued to hold their religious assemblies in the fields.

The Cameronians took their denomination from Richard Cameron, a famous field-preacher, who, refusing to accept the indulgence to tender confessions, granted by King Charles II. as such an acceptance seemed an acknowledgment of the king's supremacy, and that he had before a right to silence them, made a defension from his brethren, and even headed a rebellion in which he was killed. His followers were never entirely reduced till the Revolution, when they voluntarily submitted to king William.

The Cameronians adhered rigidly to the form of government established in 1648.

Cam•eroni•ans

Cam•eronians, or Cameronites, is also the denomination of a party of Calvinists in France, who asserted that the will of man is only determined by the practical judgment of the mind; that the cause of men doing good or evil proceeds from the knowledge which God infuses into them; and that God does not move the will physically, but only morally, in virtue of its dependence on the judgment of the mind. They had this name from John Cameron, a famous professor, first at Glasgow, where he was born, in 1580, and afterwards at Bordeaux, Sedan and Saumur; at which place he broached his new doctrine of grace and free-will, which was formed by Amyrand, Cappell, Bochart, Daille, and others of the more learned among the reformed ministers, who judged Calvin's doctrines on these points too harsh. The Cameronians are a fort of mitigated Calvinists, and approach to the opinion of the Armenians. They are also called Universalists, as holding the universality of Christ's death; and sometimes Amyraldists. The rigid adherents to the synod of Dort accused them of Pelagianism, and even of Manicheism. The controversy between the parties was carried on with a zeal and subtility scarcely conceivable; yet all the question between them was only, Whether the will of man is determined by the immediate action of God upon it, or by the intervention of a knowledge which God impresses into the mind? The synod of Dort had defined that God not only illuminates the understanding, but gives motion to the will by making an internal change therein. Cameron only admitted the illumination, whereby the mind is morally moved, and explained the sentiment of the synod of Dort so as to make the two opinions consistent.

Cam•es

Cam•es, a name given to the small slender rods of cast-lead, of which the glaziers make their turned lead.

Their lead being cast into slender rods of twelve or fourteen inches long each, is called the cane; sometimes also they call each of these rods a cane, which being afterwards drawn through their vice, makes their turned lead.

Cam•il•lus

Cam•il•lus (Marcus Furius), was the first who rendered the family of Furius illustrious. He triumphed four times, was five times dictator, and was honoured with the title of the second founder of Rome. In a word, he acquired all the glory a man can gain in his own country. Lucius Auleius, one of the tribunes, prosecuted him to make him give an account of the spoils taken at Veii. Camillus anticipated judgment, and banished himself voluntarily. During his banishment, instead of rejoicing at the devastation of Rome by the Gauls, he exerted all his wisdom and bravery to drive away the enemy; and yet kept with the utmost firmness the sacred law of Rome, in refusing to accept the command which several private persons offered him. The Romans, who were beleaguered in the capitol, created him dictator in the year 363; in which office he acted with so much bravery and conduct, that he entirely drove the army of the Gauls out of the territories of the commonwealth. He died in the 81st year of his age, 365 years before the Christian era.

Cam•ill•i

Cam•ill•i and Cam•ill•i, in antiquity, boys and girls of ingenious birth, who ministered in the sacrifices of the gods; and especially those who attended the flamen dialis, or priest of Jupiter. The word seems borrowed from the language of the ancient Hetrurians, where
CAMINHA

where it signified minister, and was changed from caf-
millitus. The Tuilcans also give the appellation Camil-
lur to Mercury in quality of minister of the gods.

CAMINHA, a maritime town of Portugal, in the
province of Entre-Douro-e-Minho, with the title of a
diocese. It is situated at the mouth of the river Min-
ho, in W. Long. 9. 15. N. Lat. 41. 44.

CAMIS or KAMS, in the Japanese theology, de-
note deified souls of ancient heroes, who are supposed
still to interest themselves in the welfare of the people
over whom they anciently commanded.

The camis answer to the heroes in the ancient Greek
and Roman theology, and are venerated like the fants
in the modern Romith church.

Besides the heroes or camis beatified by the confess
of antiquity, the mikaddis, or pontiffs have deified
many others, and continue still to grant the apotheoses
to new worthies, so that they swarm with camis: the
principal one is Tengu Dai Sin, the common father of
Japan, to whom are paid devotions and pilgrimages
extraordinary.

CAMISADE, in the art of war, an attack by fur-
prize in the night, or at the break of day, when the
enemy is supposed to be a-bed. The word is said to
have taken its rise from an attack of this kind: where-
in, as a badge or signal to know one another by, they
bore a staff, in French called chemise, or camise, over
their arms.

CAMISARDS, a name given by the French to
the Calvinists of the Cevennes, who formed a league,
and took up arms in their own defence, in 1688.

CAMELEINE, a slight fluff, made of hair and
coarse silk, in the manner of camlet. It is now out of
fashion.

CAMMA, and GOBBI, two provinces of the king-
dom of Loango in Africa. The inhabitants are con-
tinually at war with each other. The weapons they
formerly used in their wars were the short pike, bows
and arrows, sword and dagger; but since the Europe-
ans have become acquainted with that coast, they
have supplied them with fire-arms. The chief town of
Gobbi lies about a day's journey from the sea. Their
rivers abound with a variety of fish; but are infected
with sea-horces, which do great mischief both by land
and water. The principal commodity with the natives
is in logwood, elephant's teeth, and tails, the hair of
which is highly valued, and used for several curious
purposes.

CAMMIN, a maritime town of Germany, in Brau-
denburg Pomerania, situated in E. Long. 15° N. Lat.
54°.

CAMOENS (Louis de), a famous Portuguese poet,
the honour of whose birth is claimed by different cities.
But according to N. Antonio, and Manuel Correa, his
intimate friend, this event happened at Lisbon in 1527.
His family was of considerable note, and originally
Spanish. In 1570, Vazco Perez de Camoens, disilcil-
ed at the court of Castile, fled to that of Lisbon, where
king Ferdinand immediately admitted him into his
council, and gave him the lordships of Sardoal, Pun-
nete, Marasso, Amendos, and other considerable lands;
the certain proof of the eminence of his rank and abili-
ties. In the war of the succession, which broke out
on the death of Ferdinand, Camoens sided with the
king of Castile, and was killed in the battle of Alja-
barota. But though John I. the victor, seized a great
part of his estate, his widow, the daughter of Gonfalo,
Tereya, grand mother of the order of Christ, and ge-
eral of the Portuguese army, was not reduced beneath
her rank. She had three sons who took the name of
Camoens. The family of the eldest intermarried with
the first nobility of Portugal; and even, according to
Castera, with the blood royal. But the family of the
second brother, whose fortune was flender, had the su-
perior honour to produce the author of the Lusiad.

Early in his life the misfortunes of the poet began.
In his infancy, Simon Vaz de Camoens, his father,
commander of a vessel, was shipwrecked at Goa, where,
with his life, the greatest part of his fortune was lost.
His mother, however, Anne de Macedo de Santarem,
provided for the education of her son Louis at the uni-
versity of Coimbra. What he acquired there, his
works discover; an intimacy with the classics, equal to
that of a Scaliger, but directed by the taste of a Mil-
ton or a Pope.

When he left the university, he appeared at court.
He was handsome; had speaking eyes, it is said; and
the finest complexion. Certain it is, however, he was
a polished scholar, which, added to the natural arour
and gay vivacity of his disposition, rendered him an
accomplished gentleman. Courts are the scenes of
intrigue; and intrigue was fashionable at Lisbon. But
the particulars of the amours of Camoens rest unknown.
This only appears: he had aspired above his rank, for
he was banished from the court; and in several of his
sonnets he describes this misfortune to love.

He now retired to his mother's friends at Santarem.
Here he renewed his studies, and began his poem on
the discovery of India. John III. at this time prepared
an armament against Africa. Camoens, tired of his in-
avtive obscure life, went to Cenza in this expedition,
and greatly distinguished his valour in several encoun-
ters. In a naval engagement with the Moors in the
straits of Gibraltar, in the conflict of boarding, he was
among the foremost, and lost his right eye. Yet nei-
er hurry of actual service nor the dissipation of the
camp could disable his genius. He continued his Liv-
edas, and several of his most beautiful sonnets were
written in Africa; while as he expected to return.

One hand the pen, and one the sword, employed.
The fame of his valour had now reached the court,
and he obtained permission to return to Lisbon. But,
while he solicited an establishment which he had meri-
ced in the ranks of battle, the malignity of evil tongues,
as he calls it in one of his letters, was injuriously pur-
ed upon him. Though the bloom of his early youth
was effaced by several years residence under the scorch-
ning heavens of Africa, and though altered by the loss
of an eye, his presence gave uneasiness to the gentle-
men of some families of the first rank where he had
formerly visited. Jealousy is the characteristic of the
Spanish and Portuguese; its resentment knows no
bounds, and Camoens now found it prudent to banish
himself from his native country. Accordingly in
1553, he failed for India, with a resolution never to
return. As the ship left the Tagus, he exclaimed, in
the words of the sepulchral monument of Scipio Af-
ricanus: "Ungrateful patria, non posse debis officia met " "Ungrate-
ful
C A M [ 63 ]

When Camoens arrived in India, an expedition was ready to fail to revenge the king of Cochin on the king of Pimenta. Without any rest on shore after his long voyage he joined this armament, and in the encounter of the Alagada islands displayed his usual bravery.

In the year following, he attended Manuel de Vaz concello in an expedition to the Red Sea. Here, says Faria, as Camoens had no use for his sword, he employed his pen. Nor was his activity confined in the fleet or camp. He visited Mount Felix and the adjacent inhospitable regions of Africa, which he so strongly pictures in the Lusiad, and in one of his little pieces where he laments the absence of his missives.

When he returned to Goa, he enjoyed a tranquillity which enabled him to bestow his attention on his Epic Poem. But this facility was interrupted, perhaps by his own imprudence. He wrote some satires which gave offence; and by order of the viceroy Francisco Barreto, he was banished to China.

The accomplishments and manners of Camoens soon found him friends, though under the disguise of banishment. He was appointed commissary of the defunct in the island of Macao, a Portuguese settlement in the bay of Canton. Here he continued his Lusit; and here also, after five years residence, he acquired a fortune, though small, yet equal to his wishes. Don Constantine de Braganza was now viceroy of India; and Camoens, desirous to return to Goa, resigned his charge. In a ship, freighted by himself, he set sail; but was shipwrecked in the gulf near the mouth of the river Mebon on the coast of China. All he had acquired was lost in the waves; his poems, which he held in one hand, while he swammed with the other, were lost himself possessed of when he stood friendless on the unknown shore. But the natives gave him a most humane reception: this he has immortalised in the prologue in the tenth Lusit; and in the seventh he tells us, that here he lost the wealth which satisfied his wishes.

*Agua da esperança ja adquirida.*

*Now blest with all the wealth fond hope could crave,
Soon I behold that wealth beneath the wave*

*Foretold—*

*My life, like Judah's heaven-doom'd king of yore,
By miracle prolong'd—*

On the banks of the Mebon, he wrote his beautiful paraphrase of the psalm, where the Jews, in the finest strain of poetry, are represented as hanging their harps on the willows by the rivers of Babylon, and weeping their exile from their native country. Here Camoens continued some time till an opportunity offered to carry him to Goa. When he arrived at that city, Don Constantine de Braganza, the viceroy, whose characteristic was politeness, admitted him into intimate friendship, and Camoens was happy till he came Redondo assumed the government. Those who had formerly procured the banishment of the fatirist, were silent while Constantine was in power; but now they exerted all their arts against him. Redondo, when he entered on office, pretended to be the friend of Camoens; yet, with all that unfeeling indifferency with which he made his most horrible witticisms on the Zamorim, he suffered the innocent man to be thrown into the common prison. After all the delay in bringing witnesses, Camoens, in a public trial, fully refuted every accusation of his conduct while commissary at Macao, and his enemies were loaded with ignominy and reproach. But Camoens had some creditors; and these detained him in prison a considerable time, till the gentlemen of Goa began to be ashamed that a man of his singular merit should experience such treatment among them. He was set at liberty; and again he assumed the profession of arms, and received the allowance of a gentleman volunteer, a character at this time common in Portuguese India. Soon after, Pedro Barreto, appointed governor of the fort at Sofala, by high promises, allureid the poet to attend him thither. The governor of a distant fort, in a barbarous country, shares in some measure the fate of an exile. Yet, though the only motive of Barreto was, in this unpleasant situation, to retain the conversation of Camoens at his table, it was his chief care to render the life of his guest agreeable. Chagrined with his treatment, and a considerable time having elapsed in vain dependence upon Barreto, Camoens resolved to return to his native country. A ship, on the homeward voyage, at this time touched at Sofala, and several gentlemen who were on board were desirous that Camoens should accompany them. But this the governor ungenerously endeavoured to prevent, and charged him with a debt for board. Anthony de Cabrera, however, and Hector de Sylveira, paid the demand; and Camoens, says Faria, and the honour of Barreto, were fold together.

After an absence of 16 years, Camoens, in 1569, returned to Lisbon, unhappy even in his arrival, for the petition then raged in that city, and prevented his publication for three years. At last, in 1572, he printed his Lusitad, which in the opening of the first book, in a most elegant turn of compliment, he addressed to his prince, king Sebastian then in his 18th year. The king, says the French translator, was so pleased with his merit, that he gave the author a pension of 4000 reals, on condition that he should reside at court. But this salary, says the same writer, was withdrawn by cardinal Henry, who succeeded to the crown of Portugal, lost by Sebastian at the battle of Alcazar.

Though the great patron of one species of literature, a species the revere of that of Camoens, certain it is, that the author of the Lusitad was utterly neglected by Henry, under whose inglorious reign he died in all the misery of poverty. By some, it is said, he died in an alms-house. It appears, however, that he had not even the certainty of subsistence which these hobbes provide. He had a black servant, who had grown old with him, and who had long experienced his master's humanity. This grateful Indian, a native of Java, who, according to some writers gave his master's life in the unhappy shipwreck where he lost his effects, begged in the streets of Lisbon for the only man in Portugal on whom God had bestowed those talents which have a tendency to direct the spirit of a downward age. To the eye of a careful observer, the fate of Camoens throws great light on that of his country, and will appear strictly connected with it. The same ignorance, the same degeneracy in spirit, which suffer Camoens to depend on his share of the alms begged in the streets by his old hoary fer-
Camomile, want, the same spirit which caused this, sunk the kingdom of Portugal into the most abject vassalage ever experienced by a conquered nation. While the grandees of Portugal were blind to the ruin which impending over them, Camoens beheld it with a pungency of grief which hastened his exit. In one of his letters he has these remarkable words: Em fim accertava a vida, / Cansada ao fim, / E passou o campo a nume prospéfitico, / I'm ending the course of my life, the world will winnow how I have loved my country. I have returned, not only to die in her bosom, but to die with her."

In this unhappy situation, in 1579, in his 62d year, the year after the fatal defeat of Don Sebastian, died Louis de Camoens, the greatest literary genius ever produced by Portugal; in martial courage and spirit of honour, nothing inferior to her greatest heroes. And in a manner suitable to the poverty in which he died, he was buried.

CAMOMILE, in botany. See Antherem. CAMP, the ground on which an army pitch their tents. It is marked out by the quarter master general, who appoints every regiment their ground.

The chief advantages to be minded in choosing a camp are considered, as marshes, woods, rivers, and inclosures; and if the camp be near the enemy, with no river or marsh to cover it, the army ought to be intrenched. An army always encamps fronting the enemy; and generally in two lines, running parallel about 500 yards distance; the horse and dragoons on the wings, and the foot in the centre; sometimes a body of two, three, or four brigades is encamped behind the two lines, and is called the body of reserve. The artillery and baggage waggons are generally encamped in the rear of the two lines. A battalion of foot is allowed 80 or 100 paces for its camp; and 30 or 40 for an interval between one battalion and another. A squadron of horse is allowed 30 for its camp, and 30 for an interval, and more if the ground will allow it.

Where the grounds are equally dry, those camps are always the most healthful that are pitched on the banks of large rivers; because, in the hot season, situations of this kind have a stream of fresh air from the water, serving to carry off the moist and putrid exhalations. On the other hand, next to marshes, the worst encampments are on low grounds close befet with trees; for then the air is not only moist and hurtful in itself, but by stagnating becomes more susceptible of corruption. However, let the situation of camps be ever so good, they are frequently rendered infectious by the putrid effluvia of rotten straw, and the privies of the army; more especially if the bloody flux prevails, in which case the bell method of preventing a general infection, is to leave the ground with the privies, foil straw, and other filth of the camp, behind. This method is frequently done if circumstances or the military operations; but when these render it improper to change the ground often, the privies should be made deeper than usual, and once a-day a thick layer of earth thrown into them till the pits are near full; and then they are to be well covered, and supplied by others. It may also be a proper caution to order the pits to be made either in the front or the rear, as the then stationary winds may befal carry off the effluvia from the camp. Moreover, it will be necessary to change the straw frequently, as being not only apt to rot, but to retain the infections streams of the sick. But if fresh straw cannot be procured, more care must be taken in airing the tents, as well as the old straw.

The disposition of the Hebrew encampment was at first laid out by God himself. Their camp was of a quadrangular form, surrounded with an inclosure of the height of 10 hands-breadth. It made a square of 10 miles in compass about the tabernacle; and within this was another, called the Levites camp. The Greeks had also their camps fortified with gates and ditches. The Lacedemonians made their camp of a round figure, looking upon that as the most perfect and defensible of any form: we are not, however, to estimate, that they thought of the form of their camp, as never to be dispensed with when the circumstances of the place require it. Of the rest of the Greek camps, it may be observed, that the most valiant of the soldiers were placed at the extremities, the rest in the middle. Thus we learn from Homer, that Achilles and Ajax were posted at the ends of the camp before Troy, as bulwarks on each side of the rest of the princes.

The figure of the Roman camp was a square divided into two principal parts: in the upper parts were the general's pavilion, or praetorium, and the tent of the chief officers; in the lower, those of inferior degree were placed. On one side of the praetorium stood the quartermaster, or apartment of the treasurer of the army; and near this the forum, both for a market place and the assembling of councils. On the other side of the praetorium were lodged the legati; and below it the tribunes had their quarters, opposite to their respective legions. Aside of the tribunes were the quarters of the foreign troops, over against their respective wings; and behind these were the lodgments of the evocati, then those of the extraordinaries and abletei equites, which concluded the higher part of the camp. Between the two partitions was a spot of ground called principia, for the altars and images of the gods, and probably also for the chief ensigns. The middle of the lower partition was assigned to the Roman horse; next to them were quartered the triarii; then the principes, and close by them the hactati; afterwards the foreign horse, and lastly the foreign foot. They fortified their camp with a ditch and parapet, which they termed fossa and vallum; in the latter some distinguished two parts, viz. the agger or earth, and the fides or wooden stakes driven in to secure it. The camps were sometimes surrounded by walls made of hewn stone; and the tents themselves formed of the same matter.

In the front of the Turkish camp are quartered the janizaries and other foot, whose tents encompass their aga; in the rear are the quarters of the sables and their horsemen. The body of the camp is pitted by the lately tents or pavilions of the vizier or general, rais effendior chancellor, kahja or steward, the telletdar bailiaw or lord treasurer, and kapilar kahfa or master.
master of the ceremonies. In the middle of these tents is a spacious field, wherein are erected a building for the divan, and a hafna or treasury. When the ground is marked out for a camp, all wait for the pitching of the tent taliâ, the place where the courts of justice are held; it being the disposition of this that is to regulate all the rest.

The Arabs still live in camps, as the ancient Scythes did. The camp of the Affyrm Emir, or king of the country about Tadmor, is described by a traveller who viewed it, as spread over a very large plain, and possessing no vast a space, that though he had the advantage of a rising ground he could not see the utmost extent of it. His own tent was near the middle; scarce distinguishable from the rest, except that it was bigger, being made, like the others, of a sort of hair-cloth.

Camp, is also used by the Siamese, and some other nations in the East Indies, as the name of the quarters which they assign to foreigners who come to trade with them. In these camps, every nation forms, as it were, a particular town, where they carry on all their trade, not only keeping all their warehous and shops there, but also to live in these camps with their whole families. The Europeans, however, are so far indulged, that at Siæn, and almost everywhere else, they may live either in the cities or suburbs, as they shall judge most convenient.

Camp fight, or Kamp fight, in law writers, denotes the trial of a cause by duel, or a legal combat of two champions in the field, for decision of some controversy.

In the trial by camp fight, the accuser was, with the peril of his own body, to prove the accused guilty; and by offering him his glove, to challenge him to this trial, which the other must either accept of, or acknowledge himself guilty of the crime whereof he was accused.

If it were a crime deserving death, the camp fight was for life and death: if the offence deserved only imprisonment, the camp fight was accomplished when one combatant had fudated the other, so as either to make him yield or take him prisoner. The accused had liberty to choose another to fight in his stead, but the accuser was obliged to perform it in his own person, and with equality of weapons. No women were permitted to be spectators, nor men under the age of thirteen. The priests and the people who looked on, were engaged freely in prayer, that the victory might fall to him who had right. None might cry, shriek, or give the least sign; which in some places was executed with so much strictness, that the executioner stood ready with an axe to cut off the right hand or foot of the party that should offend herein.

He that, being wounded, yielded himself, was at the other's mercy either to be killed or suffered to live. But if life were granted him, he was declared infamous by the judge, and disabled from ever bearing arms, or riding on horseback.

Camp. See Campagna.

Campaign, in the art of war, denotes the space of time that an army keeps the field, or is encamped. The beginning of every campaign is considerably more unhealthy than if the men were to remain in quarters. After the first fortnight or three weeks encampment, the sickness decreases daily; the most infirm being by the time in the hospitals, and the weather daily growing warmer. This healthy rate continues throughout the summer, unless the men get wet clothes, or wet beds; in which case, a greater or less degree of the dysentery will appear in proportion to the preceding heats. But the most sickly part of the campaign begins about the middle or end of August, whilst the days are still hot, but the nights cool and damp, with fogs and dewes; then, and not sooner, the dysentery prevails; and though its violence is over by the beginning of October, yet the remitting fever gaining ground, continues throughout the rest of the campaign, and never entirely ceases, even in winter-quarters, till the frosts begin. At the beginning of a campaign the sickness is so uniform, that the number may be nearly predicted; but for the rest of the season, as the dicea, are then of a contagious nature, and depend so much upon the heats of summer, it is impossible to foresee how many may fall sick from the beginning to the end of autumn. It is also observed, that the last fortnight of a campaign, if protracted till the beginning of a new campaign, is attended with more sickness than the first two months encampment: so that it is better to take the field a fortnight sooner, in order to return into winter-quarters, as much the earlier. As to winter expeditions, though severe in appearance, they are attended with little sickness, if the men have strong shoes, quarters, fuel, and provisions. Long marches in summer are not without danger, unless made in the night, or so early in the morning as to be over before the heat of the day.

Campagna, in botany, an order of plants in the Frangulae methodi naturalis of Linæus, in which are the following genera, viz. convolvulus, ipomæa, polemonium, campanula, roella, viola, &c.

See Broca.

Campanella, (Thomas) a famous Italian philosopher, born at Silo in Calabria, in 1568. He distinguished himself by his steady proficiency in learning; for at the age of 13 he was a perfect master of the ancient orators and poets. His peculiar inclination was to philosophy, to which he at last confined his whole time and study. In order to arrive at truth, he shook off the yoke of authority: by which means the novelty of some of his opinions exposed him to many inconveniences; for at Naples he was thrown into prison, in which he remained 27 years, and during this confinement wrote his famous work entitled Abbeium triumphant. Being at length set at liberty, he went to Paris, where he was graciously received by Louis XIII. and cardinal Richelieu; the latter procured him a pension of 2000 livres, and often consulted him on the affairs of Italy. Campanella passed the remainder of his days in a monastery of Dominicans at Paris, and died in 1639.

Campagnè (Matthew) of Spoletto, curate at Rome, wrote a curious treatise on the art of cutting glasses for spectacles, and made several improvements in optics, allisted by his brother and pupil Joseph. He died after 1678.

Campagna, a town of Italy, in the kingdom of Naples, and in the farther principato, with a bishop's see. E. Long. 15. 30. N. Lat. 40. 40.

Campana, or Campagna di Roma, ancintly Latium, a province of Italy, bounded on the west by the
Campania. Tiber and the sea, on the south-west by the sea, on the south by Terra di Lavoro, on the east by Abruzzo, and on the north by Sabina. Though the soil is good, it produces little or nothing, on account of the heavy duties on corn; and though the waters are good the air is unwholesome. It is subject to the Pope, and is about 60 miles in length on the Mediterranean sea.

It baths been generally thought of this country, that something in it peculiarly noxious during the summer-time; but Mr Condamine is of opinion that it is not more unhealthy than any other marily country. His account follows. "It was after the invasion of the Goths in the sixth and seventh centuries that this corruption of the air began to manifest itself. The bed of the Tiber being covered by the accumulated ruins of the edifices of ancient Rome, could not but fail itself considerably. But what permits us not to doubt of this fact is, that the ancient and well-preferred pavement of the pantheon and its poricio is overflowed every winter; that the water even rises there sometimes to the height of eight or ten feet; and that it is not possible to suppose that the ancient Romans have ever built a temple in a place so low as to be covered with the waters of the Tiber on the feast inundation. It is evident, then, that the level of the bed of this river is raised several feet, which could not have happened without forming there a kind of dikes or bars. The choking up of its canal necessarily occasioned the overflow and reflux of its waters in such places as till then had not suffered inundations: to these overflows of the Tiber were added all the waters that escaped out of the ancient aqueducts, the ruins of which are still to be seen, and which were entirely broken and destroyed by Tullia. What need, therefore, of any thing more to infect the air, in a hot climate, than the exhalations of such a mass of stagnating waters, deprived of any discharge, and become the receptacle of a thousand impurities, as well as the grave of several millions both of men and animals? The evil could not but increase from the same causes while Rome was exposed to the incursions and devastations of the Lombards, the Normans, and the Saracens, which lasted for several centuries. The air was become so infectious there at the beginning of the 13th century, that Pope Innocent III. wrote, that few people at Rome arrived to the age of forty years, and that nothing was more uncommon there than to see a peron of sixty. A very short time after, the popes transferred the seat of their residence to Avignon; during the seventy-two years they remained there, Rome became a desert; it was not till the beginning of the 18th century that Leo X. under whom Rome began to resume her wonted splendor, gave himself some trouble about re-establishing the salubrity of the air; but the city being burnt after beleaguered by the tyrant Charles V. saw itself plunged again into all its old calamities; and from 85,000 inhabitants, which it contained under Leo X. it was reduced under Clement VIII. to 32,000. In short, it is only since the time of Pius V. and Sixtius V. at the end of the 16th century, that the popes have constantly employed the necessary methods for purifying the air of Rome and its environs, by procuring proper discharges for the waters, drying up humid and marshy grounds, and covering the banks of the Tiber and other places required uninhabitable with fourfold effusiveness. Since that time a person may dwell at Rome, and go in or out of it at all seasons of the year. At the beginning, however, of the present century, they were still afraid to lie out of the city in summer, when they had resided there; as they were also to return to it, when once they had quitted it. They never ventured to sleep at Rome, even in broad day, in any other house than their own. They are greatly relaxed at present from the ancient servitudes: I have seen cardinals, in the months of July and August, go from Rome to lie at Praeneste, Albano, &c. and return the next or the following days to the city, without any detriment to their health. I have myself tried all these experiments, without suffering the least inconvenience from them. I have even seen, in the last war in Italy, two armies encamped under the walls of Rome at the time when the heats were most violent. Yet, notwithstanding all this, the greatest part of the country people dare not still venture to lie during that season of the year, nor even as much as sleep in a carriage, in any part of the territory comprehended under the name of the Campagna of Rome."

CAMPANIFORM, or CAMPANULATED, an appellation given to flowers resembling a bell.

CAMPANINI, a name given to an Italian marble dug out of the mountains of Carrara, because, when it is worked, it sounds like a bell.

CAMPANULA, or BELL-FLOWER; a genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 29th order, Campanaeae. The corolla is campanulated, with its funiculus closed up by the valves that support the stamens; the stigma is trisid; the capsula inferior, or below the receptacles of the flower, opening and emitting the seeds by lateral pores.

Species. Of this genus there are no fewer than 41 species enumerated by botanical writers; but the following are the most worthy of attention. 1. The pyramidalis hath thick tuberous roots filled with a milky juice; it sends out strong, smooth, upright stalks, which rise to the height of four feet, garnished with smooth oblong leaves a little indented at the edges. The flowers are produced from the side of the stalks, and are regularly set on for more than half their length, forming a sort of pyramid; these are large, open, and shaped like a bell. The most common colour of the flowers is blue, though some are white, but the former are most esteemed. 2. The decurrens, or peach-leaved bell-flower, is a native of the northern parts of Europe; of this there are some with white, and some with blue flowers, and some with double flowers of both colours. These last have of late been propagated in such abundance as to have almost banished from the gardens those with single flowers by the medium, commonly called Canterbury bell-flower, a biennial plant, which perishes soon after it has ripened its seeds. It grows naturally in the woods of Italy and Austria; but is cul-
Campanula cultivated in the British gardens for the beauty of its flowers, which are blue, purple, white, and striped, with double flowers of all the colours. This species hath oblong, rough, hairy leaves, serrated on their edges; from the centre of these rises a fliff, hairy, fowery stalk, about two feet high, sending off several lateral branches, garnifled with long, narrow, hairy leaves fowed on their edges. From the setting on of these leaves proceed the footstalks of the flower; tho' which are of a fmall part of the flallk and branches, diminishing gradually in their length upward, and thereby forming a fort of pyramid. The flowers of this kind are very large, so make a fine apparence. The feeds ripen in September, and the plants decay foon after.

4. The trachelium, with nettle leaves, hath a peren- nial root, which feeds up several fflf hairy stalks having two ribs or angles. These put out a few feve-rate branches, garnifled with oblong hairy leaves deeply fawed on their edges. Toward the upper part of the stalks, the flowers come out alternately upon short trijrid foot-stalks having hairy emplacements.

The colours of the flowers are a deep and a pale blue and white, with double flowers of the fame; the double flored kind only merit a place in gardens. 5. The latifolia, or greatfeil bell-flower, hath a perennial root, composed of many fevy fibres that abound with a milky juice. From these arife feveral strong, round fngle stalks, which never put out branches, but are garnifled with oval spear-shaped leaves slightly indented on their edges. Towards the upper part of the flalk the flowers come out fingly upon short foot-stalks; their colours are blue, purple, and white. 6. The rapunculus, or rampion, hath roundifh feivy roots, which are eatable, and much cultivated in France for fallads; fome years fince it was cultivated in the Eng- liffh gardens for the fame purpofe, but is now generally neglected. It is a native of Britain: but the roots of the wild flalk never grow to half the flize of thofe which are cultivated. 7. The specular, with yellow eye-fright leaves, is an annual plant with fnder flalks rising a foot high, branching out on every fide, and garnifled with oblong leaves a little curled on their edges; from the wings of the leaves come out the flowers fitting clofe to the flalks, which are of a beautifh purple inclining to a violet colour. In the evening, they contract and fold into a pentagonal figure; from whence it is by fome called viola pandonius, or five-cornered violet. 8. The hybrida, or common Venus looking-glas. This feldom rises more than fix inches high, with a flalk branching from the bottom upward, and garnifled with oval leaves fitting clofe to the flalks, from the base of which the branches are produced, which are terminated by flowers very like the former flalk. This was formerly cultivated in the gardens: but fince the former kind hath been introduced, it hath almoft fupplantfed this; for the other is a much taller plant, and the flowers larger, though of a lefs beautiful colour. 9. The canariensis, with an orach leaf and tuberous root, is a native of the Canary iflands. It hath a thick feivy root of an irregular form; fometimes running downward like a paripin, at other times dividing into feveral knobs near the top; and when any part of the root is broken, there fliws out a milky juice at the wound. From the head or crown of the root arise one, two, three, or more stalls, in proportion to the flze of the root: but that in the centre is generally larger and rises higher, than the others. These stalls are very tender, round, and of a pale green; their joints are far diftant from each other; and when the roots are strong, the stalls will rise to ten feet high, sending out feveral lateral branches. At each joint they are garnifled with two, three or four spear-shaped leaves, with a sharp pointed beard on each fide. They are of a fia-green; and, when they firft come out, are covered fightly with an fh-coloured pounce. From the joints of the flalk the flowers are produced, which are of the perfect bell-flape, and hang downward; they are of a flame-colour, marked with ftripes of a brownih red: the flower is divided into five parts; at the bottom of each is feated a nectarium, covered with a white transparent skin, much refeembling thofe of the crown imperial, but smaller. The flowers begin to open in the beginning of October, and there is often a fecafeeion of them till March. The stalls decay to the root in June, and new ones spring up in August.

Culture, &c. The firft fort is cultivated to adorn halls, and to place before chimneys in the summer when it is in flower, for which purpose there is a fuitable place; for when the roots are flrong, they will fend out four or five stalks which will rise as many feet high, and are adored with flower all great part of their length. When the flowers begin to open, the pots are removed into the rooms, where, being shaded from the fun and rain, the flowers will continue long in beauty; and if the pots are every night removed into a more airy situation, but not exposed to heavy rains, the flowers will be fairer, and continue much longer in beauty. Thofe plants which are thus treated, are feldom fit for the purpose the following fseason; therefore a fupply of young ones must be annually raised. The plant may be propofed either by dividing the roots or by feed, but the latter produces the moft vigorous and beft flowering plants. The feed must be fown in autumn in boxes or pots filled with light undunged earth, and placed in the open air till the froot or hard rains come on; then they must be placed under a hotbed frame, where they may be sheltered from both; but in mild weather the glaffes fhould be drawn off every day, that they may enjoy the free air: with this management the plants will come up early in the spring, and then they must be removed out of the frame, placing them firft in a warm situation; but, when the feafon becomes warm, they fhould be fo placed as to have the morning fun only. In September the leaves of the plants will begin to decay, at which time they fhould be transplanted; therefore there must be one or two beds prepared, in proportion to the number of plants. Thofe beds must be in a warm situation, and the earth light, fandy, and without any mixture of dung. The plants must then be taken out of the pots or cafes very carefully, fo as not to bruife their roots; for they are very tender, and on being broken the milky juice will flow out plentifully, which will greatly weaken them. Thofe fhould be planted at about fix inches distance each way, with the head or crown of the root half an inch below the surface. If the feafon proves dry, they must be gently watered three or four days after they are planted; the beds fhould also be covered with mats in the day time, but
which should be taken off at night, to let the dew fall on the plants. Towards the end of November the beds should be covered over with some old tanners bark to keep out the frost; and where there is not conveniency for covering them with frames, they should be arched over with hoops, that in severer weather they may be covered with mats. In the spring the mats must be removed, and, the following summer, the plants kept free from weeds. In autumn, the earth should be stirred between them, some fresh earth spread over the beds, and the plants covered in winter as before. In these beds the plants may remain two years, during which time they are to be treated-in the manner before directed. The roots will now be strong enough to flower; so, in September they should be carefully taken up, and some of the most promising carefully planted in pots; the others may be planted in warm borders, or in a fresh bed, at a greater distance than before, to allow them room to grow. Those plants which are potted should be sheltered in winter from great rains and hard frosts, otherwise they will be in danger of rotting, or at least will be too weakened as not to flower with any strength the following summer; and those which are planted in the full ground, should have some old tanners bark laid round them to prevent the frost from getting at the roots. The second, third, fourth, and fifth sorts are easily propagated by parting the roots, or by seeds, that no particular directions for their culture need be given. The sixth sort, which is cultivated for its excellent roots, may be propagated by seeds, which are to be sown in a shady border; and when the plants are about an inch high, the ground shall be hoed as is practised for onions, to cut up the weeds, and thin the plants, to the distance of three or four inches; and when the weeds come up again they must be hoed over to destroy them: this, if well performed in dry weather, will make the ground clean for a long time; so that, being three times repeated, it will keep the plants clean till winter, which is the season for eating the roots, when they may be taken up for use as wanted. They will continue good till April, at which time, if they are fed with manure, their stalks will become hard and fit for use.—The seventh and eighth sorts are easily propagated by seeds, which they produce in plenty. If these, and the Venus naevolens, dwarf lychnis, candy-tuft, and other low annual flowers, are properly mixed in the border of the flower-garden, and sown at two or three different seasons, so as to have a succession of them in flower, they will make an agreeable variety. If these seeds are sown in autumn, the plants will flower early in the spring; but if sown in the spring, they will not flower till the middle of June; and if a third sowing is performed about the middle of May, the plants will flower in August; but from these, good seeds must not be expected.—The ninth sort is propagated by cutting the roots, which must be done with caution: for if they are broken or wounded, the milky juice will flow out plentifully; and if planted before the wounds are flinned over, it occasions their rott:ing; therefore when any of them are broken, they should be laid in the green-house a few days to heal. These roots must not be too often parted, if they are expected to flower well; for by this means they are weakened. The best time for transplanting and parting their roots is in July, soon after the stalks are de-
Campbell.

der Middleton he obstinately perverted to haras and infelt the victorious Engilta; and it was not till he received orders from that general, that he would submit to accept of a capitulation. Such jealousy of his loyal attachments was entertained by the commonwealth and protector, that a pretence was soon after taken upon to commit him to prison; and his confinement was rigorously continued till the restoration. The king, sensible of his services, had remitted to him his father's forfeiture, and created him earl of Argyle; and when a most unjust sentence was passed upon him by the Scots parliament, Charles had anew remitted it. In the subsequent part of this reign Argyle behaved himself dutifully; and though he seemed not disposed to go all lengths with the court, he always appeared, even in his opposition, a man of mild dispositions and peaceable deportment.

A parliament was summoned at Edinburgh in summer 1661, and the duke was appointed commissioner. Besides granting money to the king, and voting the indefitiable right of succession, this parliament enacted a telt, which all persons poifplled of offices, civil, military, or ecclesiastical, were bound to take. In this telt the king's supremacy was ascertained, the covenant renounced, pultive obedience afforded to, and all obligations disclaimed of endeavouring any alteration in civil or ecclesiastical establishments. This was the frame of the telt as proposed by the courtiers; but the country party proposed also a clause of adherence to the Protestant religion, which could not with decency be rejected. The whole was of an enormous length, considered as an oath; and, what was worse, a confession of faith was there ratified which had been imposed a little after the reformation, and which contained many articles altogether forged by the parliament and nation. Among others, the doctrine of reformation was inculcated; so that the telt being voted in a hurry, was found upon examination to be a medley of absurdity and contradiction. Though the courtiers could not reject the clause of adhering to the Protestant religion, they proposed, as a requisite mark of respect, that all princes of the blood should be exempted from taking that oath. This exception was jealously opposed by Argyle; who observed that the sole danger to be dreaded for the Protestant religion must proceed from the perversion of the royal family. By insisting on such topics, he drew on himself the secret indignation of the duke of York, of which he soon felt the fatal consequences.

When Argyle took the telt as a privy counsellor, he subjoined, in the duke's presence, an explanation which he had before hand communicated to that prince, and which he believed to have been approved by him. It was in these words: "I have considered the telt, and am very defirous of giving obedience as far as I can. I am confident that the parliament never intended to impose contradictory oaths: therefore I think no man can explain it but for himself. Accordingly I take it as far as it is consistent with itself and the Protestant religion. And I do declare that I mean not to bind myself, in my station, and in a lawful way, from wilfully and endeaVouring any alteration, which I think to the advantage of church or state, and not repugnant to the Protestant religion and my loyalty: and this I understand as a part of my oath." The duke, as was natural, heard it with great tranquillity: no one took the least offence: Argyle was admitted to sit that day in council: and it was impossible to imagine that a capital offence had been committed, where occasion seemed not to have been given so much as for a crown or reprimand.

Argyle was much surpried a few days after, to find that a warrant was issued for committing him to prison: that he was indicted for high treason, leaft-making, and perjury; and that from the innocent words abovementioned an accusation was extracted, by which he was to forfeit life, honours, and fortune. It is needless to enter into particulars, where the iniquity of the whole is so evidently apparent. Though the sword of justice was displayed, even her semblance was not put on; and the forms of law were preferred to fuldify, or rather aggravate, the opprobrium. Of five judges, three did not scruple to find the guilt of treason and leaft-making to be incurred by the prisoner: a jury of 15 noblemen gave verdict against him; and the king, being consulted, ordered the sentence to be pronounced, but the execution of it to be suspended till further orders. Argyle, however, saw no reason to trust to the justice or mercy of such enemies: He made his ecape from prison, and till he could find a ship for Holland he concealed himself during some time in London. The king heard of his lurking-place, but would not suffer him to be arrested. All the parts, however, of his sentence, so far as the government in Scotland had power, were rigorously executed; his estate confiscated, his arms reversed and torn. Having got over to Holland, he remained there during the remaining part of the reign of Charles II. But thinking himself at liberty, before the coronation of James II. to exert himself in order to recover the constitution by force of arms, he concerted measures with the duke of Monmouth, and went into Scotland, to assemble his friends: but not meeting with the success he expected, he was taken prisoner; and being carried to Edinburgh, was beheaded upon his former unjust sentence, June 30, 1675. He showed great constancy and courage under his misfortunes: on the day of his death he ate his dinner very cheerfully; and, according to custom, slept after it a quarter of an hour or more, very soundly. At the place of execution, he made a short, grave, and religious speech; and, after solemnly declaring that he for­gave all his enemies, submitted to death with great firmness.

Campbell, (Archibald) first duke of Argyle, son to the preceding, was an active promoter of the revolution. He came over with the Prince of Orange; was admitted into the convention as Earl of Argyle, tho' his father's attainder was not reversed; and in the claim of rights the sentence against him was declared to be, what most certainly it was, a reapproach upon the nation. The establishment of the crown upon the Prince and Princesses of Orange being carried by a great majority in the Scottish convention, the earl was sent from the nobility with Sir James Montgomery and Sir John Dalrymple from the barons and boronlgs, to offer the crown, in the name of the convention, to their Majesties, and tendered them the coronation oath; for which, and many other eminent services, he was admitted a member of the privy council, and, in 1690, made one of the Lords of the Treasury. He was af­
Campbell, who succeeded his father as Duke of Argyll, Marquis of Kintyre and Lorn, Earl of Campbell and Cowell, Viscount of Lochow and Glengla, Lord Inverary, Mull, Morvern, and Terrey, by letters-patent, bearing date at Kennington the 23rd of June 1701. He sent over a regiment to Flanders for King William's service, the officers of which were chiefly of his own name and family, who bravely distinguished themselves through the whole course of the war. He married Elizabeth, daughter of Sir Lionel Tollemah of Helmingham in the county of Suffolk, by Elizabeth duchess of Lauderdale his wife, daughter and heir of William Murray earl of Dyraf, by whom he left issue two sons and a daughter; namely, John duke of Argyll, the subject of the next article; Archibald, who succeeded his brother as Duke of Argyll; and Lady Anne, married to James Stuart, second earl of Bute, by whom she had the present earl.

Campbell, (John) second duke of Argyll, and also duke of Greenwich and baron of Chatham, son to the subject of the preceding article, was born on the 10th of October 1680; and, on the very day when his grandfather suffered at Edinburgh, fell out of a window three years earl of Dysart, by whom he left issue of subject. Duke of Greenwich and baron of Chatham, son to the present duke of Argyll; and Lady Anne, married to James Stuart, second earl of Bute, by whom she had the present earl.

In 1704, her Majesty reviving the Scottish order of the thistle, his grace was installed one of the knights of that order, and was soon after appointed high-commissioner to the Scotch parliament; where, being of great service in promoting the intended union, he was on his return created a peer of England, by the titles of baron of Chatham and duke of Greenwich, and was in all respects treated with the greatest respect. His grace first distinguished himself in his military capacity at the battle of Oudenarde; where he commanded as brigadier-general, with all the bravery of youth and the conduct of a veteran officer. He was present under the duke of Marlborough at the siege of Ghent, and took possession of the town. He had also a considerable share in the victory obtained over the French at the battle of Malplaquet, by dislodging them from the wood of Pult, and gaining a portion of great consequence. In this sharp engagement, several market-balls passed through the duke's clothes, hat, and periok. Soon after this action, he was sent to take the command in Spain; and after the reduction of Port Mahon, he returned to England. His grace having now a seat in the house of lords, he centered the measures of the ministry with such freedom, that all his places were disposed of to other noblemen: but at the accession of George I, he recovered his influence. At the breaking out of the rebellion in 1715, he was made commander in chief of his majesty's forces in North Britain; and was the principal means and cause of the total extinction, at that time, of the rebellion in Scotland, without much bloodshed. In direct opposition to him, or that part of the army he commanded, at the head of all his Campbells, was placed Campbell earl of Braidalbin, of the same family and kindred, by some fatal error that ever misguided and misled that unhappy family of the Stuarts and all its adherents. The consequence was, that both sets of Campbells, from family affection, refused to strike a stroke, and retired out of the battle. He arrived at London March 6th 1716, and was in high favour; but, to the surprise of people of all ranks, he was in a few months divested of all his employments: and from this period to the year 1718, he signalized himself in a civil capacity, by his uncorrupted patriotism and manly eloquence. In the beginning of the year 1719, he was again admitted into favour, appointed lord-steward of the household, and in April following was created duke of Greenwich. He continued in the administration during all the remaining part of that reign; and, after his late majesty's accession, till April 1740; when he delivered a speech with such warmth, that the ministry being highly offended, he was again divested from his employments. To thee, however, on the change of the ministry, he was soon restored; but not approving of the measures of the new ministry more than those of the old, he gave up all his posts for the last time, and never after engaged in affairs of state. He now enjoyed privacy and retirement; and died of a paralytic disorder on the 4th of October 1743. To the memory of his grace a very noble monument was erected in Westminster-Abbey, executed by the ingenious Roulliac.

The duke of Argyll, though never first minister, was a very able statesman and politician, most steadfastly fixed in those principles he believed to be right, and not to be shaken or changed. His delicacy and honour were so great, that it hurt him to be even suspected; witnesses that application fald to be made to him by one of the adherents of the Stuart family before the last rebellion in order to gain his interest, which was considerable both in Scotland and England. He immediately sent his letter to the secretary of state; and it vexed him much even to have an application made him, lest any person should think him capable of acting a double part. When he thought measures wrong or corrupt, he cared not who was the author, however great or powerful he might be; witnesses his boldly attacking the great duke of Marlborough in the house of lords, about his forage and army contracts in Flanders, in the very zenith of his power and popularity, though in all other respects he was the most able general of his time. The duke of Argyll, on all occasions, spoke well, with a firm, manly, and noble eloquence; and seems to deserve the character given of him by Pope:

Argyle the state's whole thunder born to weild, And shake alike the senate and the field.

In private life, the duke's conduct was highly exemplary. He was an affectionate husband and an indulgent master. He seldom parted with his servants till age had rendered them incapable of their employments; and then he made provision for their subsistence. He was liberal to the poor, and particularly to perfons of merit in difficult cases: but though he was ready to patronize deserving persons, he was extremely caution-

Campbell. tious not to deceive any by lavish promises, or leading them to form vain expectations. He was a strict economid, and paid his tradesmen punctually every month; and though he maintained the dignity of his rank, he took care that no part of his income should be wasted in empty pomp or unnecessary expenses. He was twice married, and left five daughters, but no male issue. The titles of duke and earl of Greenwich and baron of Chatham became extinct at his death; but in his other titles he was succeeded by his brother Archibald earl of Ia, the subject of the next article.

Campbell, (Archibald) third Duke of Argyile, brother, to the subject of the preceding article, was born at Hamhoulfe, in England, in June 1682, and was educated at the University of Glasgow. He afterwards applied himself to the study of the law at Utrecht; but upon his father's being created a Duke he betook himself to a military life, and served some time under the duke of Marlborough. Upon quitting the army, in which he did not long remain, he applied to the acquisition of that knowledge which would enable him to make a figure in the political world. In 1705, he was constituted transferor of Scotland, and made a considerable figure in Parliament, though he was not more than twenty-three years of age. In 1706, he was appointed one of the commissioners for treating of the Union; and the same year was created Lord Ormflay, Dunoon, and Arrois, Vicount and Earl of Ilay. In 1708, he was made an extraordinary Lord of Seilion; and when the Union was effected, he was chosen one of the Sixteen Peers for Scotland, in the first Parliament of Great-Britain; and was constantly elected to every future Parliament till his death, except the fourth. In 1710, he was made Justice-General of Scotland. In 1711, he was called to the privy council; and upon the accession of George I. he was nominated lord regifter of Scotland. When the rebellion broke out in 1715, he again betook himself to arms, in defence of the house of Hanover, and by his prudent conduct in the West Highlands, he prevented General Gordon, at the head of three thousand men, from penetrating into the country, and raising levies. He afterwards joined his brother at Stirling, and was wounded at the battle of Dumbldin. In 1725, he was appointed keeper of the privy seal; and, from this time, he was entrusted with the management of Scotch affairs. In 1734, upon his resigning the privy seal, he was made keeper of the great seal, which office he enjoyed till his death. Upon the decease of his brother, he became duke of Argyile, hereditary justice general, lieutenant, sheriff, and commissary of Argyleshire and the Western isles, hereditary great master of the household, hereditary keeper of Dunstaffnage, Carrick, and several other castles. He was also chancellor of the University of Aberdeen; and laboured to promote the interest of that, as well as of the other universities of Scotland. He particularly encouraged the school of phyfic at Edinburgh, which has now acquired so high a reputation. Having the chief management of Scotch affairs, he was also extremely attentive to promote the trade, manufactures, and improvements of his country. It was by his advice that, after the rebellion in 1745, the Highlanders were employed in the royal army. He was a man of great endowments both natural and acquired, well versed in the laws of his country, and pos-

fessed considerable parliamentary abilities. He was likewise eminent for his skill in human nature, had great talents for conversation, and had collected one of the most valuable private libraries in Great-Britain. He built himself a very magnificent seat at Inverary. The faculties of his mind continued sound and vigorous till his death, which happened suddenly on the 15th of April 1761, in the 79th year of his age. He was married, but had no issue; and was succeeded in his titles and the estates of his family by John Campbell, fourth duke of Argyile, son of the honourable John Campbell of Mammuore, who was the second son of Archibald the ninth earl of Argyile.

The family of Argyile was heritable justice-general for Scotland till abolished by the jurisdiction act. They are still heritable masters of the king's houhold in Scotland, and keepers of Dunstaffnage and Carrick.

Campbell, (John) an eminent historical, biographical, and political writer, was born at Edinburgh, March 6, 1707-8. His father, Robert Campbell of Glemlyon, Esq; was captain of horse in a regiment commanded by the then earl of Hyndford, and his mother Elizabeth, daughter of --- Smith, Esq; of Windfor in Berkshire, had the honour of claiming a descent from the poet Waller. Our author, their fourth son, was at the age of five years brought from Scotland to Windsor, where he received the first principles of his education; and at a proper age, he was placed out as a clerk to an attorney, being intended for the law. This profession, however, he never followed; but by a close application to the acquisition of knowledge of various kinds, became qualified to appear in the literary world. In 1736, before he had completed his 30th year, he gave to the public, in two volumes folio, "The Military History of Prince Eugene and the Duke of Marlborough," enriched with maps, plans, and cuts. The reputation hence acquired, occasioned him soon after to be solicited to take a part in the "Ancient Universal History." Whilst employed in this capital work Mr Campbell found leisure to entertain the world with other productions. In 1739, he published the "Travels and Adventures of Edward Brown," 8vo. In the same year appeared his, "Memoirs of the Balhaw Duke de Ripperdu," 8vo, reprinted with improvements, 1740. These memoirs were followed, in 1741, by the "Concise History of Spanish America," 8vo. In 1742, he was the author of "A Letter to a Friend in the Country, on the Publication of Thurloe's State Papers," giving an account of their discovery, importance and utility. The same year was distinguished by the appearance of the 1st and 2d volumes of his "Lives of the English Admirals, and other eminent British Seamen." The two remaining volumes were completed in 1744; and the whole, not long after, was translated into German. This was the first of Mr Campbell's works to which he prefixed his name; and it is a performance of great and acknowledged merit. In 1743, he published "Hermippus revived," a second edition of which, much improved and enlarged, came out in 1749, under the following title: "Hermippus Redivivus: or the Sage's Triumph over Old Age and the Grave. Wherein a method is laid down for prolonging the life and vigour of man. Including a commentary upon an ancient inscription, in which this great secret is revealed; sup-
Dr Campbell in 1736 married Elizabeth, daughter of Benjamin Vobe, of Leominster, in the county of Hereford, gentleman, with whom he lived nearly 40 years in the greatest conjugal harmony and happiness. So wholly did he dedicate his time to books, that he seldom went abroad: but to relieve himself as much as possible from the inconveniences incident to a sedentary life, it was his custom, when the weather would admit, to walk in his garden; or otherwise in some room of his house, by way of exercise. By this method, united with the strictest temperance in eating, and an equal abstinence in drinking, he enjoyed a good state of health, though his constitution was delicate. His domestic manner of living did not preclude him from a very extensive and honourable acquaintance. His house, especially on a Sunday evening, was the resort of the most distinguished persons of all ranks, in particular of such as had rendered themselves eminent by their knowledge or love of literature. He received foreigners, who were fond of learning, with an affability and kindness which excited in them the highest respect and veneration; and his instructive and cheerful conversation made him the delight of his friends in general. He was during the latter part of his life, agent for the province of Georgia in North America; and died at the close of the year 1775, in the 67th year of his age. The doctor's literary knowledge was by no means confined to the subjects on which he more particularly treated as an author; he was well acquainted with the mathematics, and had read much in medicine. It hath been with great reason believed, that if he had dedicated his studies to the last science, he would have made a very conspicuous figure in the physical profession. He was eminently versed in the different parts of sacred literature; and his acquaintance with the languages extended not only to the Hebrew, Greek, and Latin among the ancient, and to the French, Italian, Spanish, Portuguese, and Dutch, among the moderns; but likewise to the Oriental tongues. He was particularly fond of the Greek language. His attainments of such a variety of knowledge was exceedingly assisted by a memory surprisingly retentive, and which indeed astonished every person with whom he was conversant. In communicating his ideas, he had an uncommon readiness and facility; and the style of his works, which had been formed upon the model of that of the celebrated bishop Sprat, was picturesque, easy, flowing, and harmonious. To all these accomplishments of the understanding, Dr Campbell joined the more important virtues of a moral and pious character. His disposition was gentle and humane, and his manners kind and obliging. He was the tenderest of husbands, a most indulgent parent, a kind master, a firm and sincere friend. To his great Creator he paid the constant and ardent tribute of devotion, duty, and reverence; and in his correspondences he shewed that a sense of piety was always nearest his heart.

**CAMBELLTOWN,** a parliament town of Argyllshire in Scotland, seated on the lough of Kilkerran, on the eastern shore of Kintyre or Cantyre, of which it is the capital. It hath a good harbour; and is now a very considerable place, though within these 50 years, only a petty fishing town. It has in fact been created by the fishery: for it was appointed the place...
CAMPDEN, [ 73 ]

CAMPDEN, a small town of Gloucestershire in England, containing about 200 houles. It gives title of Viceroy, by courtesy, to Earl of Gainsborough for four years. W. Long. 5. 10. N. Lat. 54.

CAMPEN, a strong town of Overfiel in the United Provinces. It hath a citadel and a harbour; but the latter is often filled up with sand. It was taken by the Dutch in 1573, and by the French in 1672; but they abandoned it the following year. It is situated near the mouth of the river Yfetl and Zuidcr. E. Long. 93. 7. N. Lat. 40. 20.

CAMPEACHY, a town of Mexico in South America, seated on the eaff coast of a bay of the same name, on the west of the province of Yucataro. It is defended by a good wall and strong forts; but is neither fo rich, nor carries on such a trade, as formerly; for it having been the port for the sale of logwood, the tree which it is cut being about 30 miles distant. It was taken by the English in 1596; by the buccaneers in 1673; and by the Flibustiers of St Domingo in 1685, who set on fire and blew up the citadel. W. Long. 93. 7. N. Lat. 50.

CAMPEACHY-Wood, in botany. See HEMATOXYLUM.

CAMPEN, a strong town of Overfiel in the United Provinces. It hath a citadel and a harbour; but the latter is often filled up with sand. It was taken by the Dutch in 1573, and by the French in 1672; but they abandoned it the following year. It is situated near the mouth of the river Yfetl and Zuidcr. E. Long. 93. 5. N. Lat. 52. 38.

CAMPESTR, in antiquity, a fort of cover for the privities, worn by the Roman soldiers in the field exercises; being girt under the navel, and hanging down to the knees. The name is supposed to be formed from campus, the field or place where the Roman soldiers performed their exercises.

CAMPHE, or CAMPHE, a solid concrete juice extracted from the wood of the laurus camphora. See LAURUS, CHEMISTRY, and MATERIA MEDICA.

Pure camphire is very white, pellucid, somewhat unctuous to the touch; of a bitterish aromatic taste, yet accompanied with a fene of coolness; of a very fragrant smell, somewhat like that of rosemary, but much stronger. It has been very long esteemed one of the most efficacious diaphoretics; and has been celebrated in fevers, and epidemical diseases. It has been very long esteemed one of the most efficacious diaphoretics; and has been celebrated in fevers, and epidemical diseases. It has been very long esteemed one of the most efficacious diaphoretics; and has been celebrated in fevers, and epidemical diseases. It has been very long esteemed one of the most efficacious diaphoretics; and has been celebrated in fevers, and epidemical diseases.

CAMPION (Edmond), an English Jesuit, was born at London, of indigent parents, in the year 1540; and educated at Christ's hospital, where he had the honor to speak an oration before queen Mary on her accession to the throne. He was admitted a scholar of St John's college in Oxford at its foundation, and took the degree of master of arts in 1564. About the same time he was ordained by a bishop of the church of England, and became an eloquent Protestant preacher. In 1566, when queen Elizabeth was entertained by the university of Oxford, he spoke an elegant oration before her majesty, and was also respondent in the philosophy act in St Mary's church. In 1568, he was junior proctor of the university. In the following year, he went over to Ireland, where he wrote a history of that kingdom, and turned papist; but being found rather too affiduous in perfusing others to follow his example, he was committed to prison. He soon however, found means to make his escape. He landed in England in 1571; and thence proceeded to Doway in Flanders, where he publicly recanted his former heresy, and was created bachelor of divinity. He went soon after to Rome, where, in 1573, he was admitted of the society of Jesus, and was sent by the general of that order to Vienna, where he wrote his tragedy called Neder et umbreusia, which was acted before the emperor with great applause.

From Vienna he went to Prague in Bohemia, where he resided in the Jesuits college about six years, and then returned to Rome. From thence, in 1580, he was sent by Pope Gregory XIII. with the celebrated Father Pallotti, to convert the people of England. From Pitts we learn, that, some time before, several English priests, inspired by the Holy Ghost, had undertaken to convert their countrymen; that some of them had suffered imprisonment, chains, tortures, and ignominious death, with becoming indigence and contempt; but being at last that the labor was abundant and the labourers few, they solicited the assistance of the Jesuits.
Campian Jesuits; requesting, that though not early in the morning, they would at least in the third, sixth, or ninth hour, send labourers into the Lord's vineyard. In consequence of this solicitation, the above two were sent to England. They arrived in an evil hour for Campian, at Dover; and were next day joyfully received by their friends at London. He had not been long in England, before Wallingham the secretary of state, being informed of his uncommon affability in the cause of the church of Rome, used every means in his power to have him apprehended, but for a long time without success. However, he was at last taken by one Eliott, a noted priest-taker, who found him in the house of Edward Yates, Esq. at Lyford in Berkshire, and conducted him in triumph to London, with a paper on his hat, on which was written campian the Jesuit. He was imprisoned in the tower; where, Wood says, "he did undergo many examinations, abuses, wrackings, and torments;" exquisitisimus cruciatibus tortus, says Pitts. It is hoped, for the credit of the reformers, this torturing part of the story is not true. The poor wretch, however, was condemned, on the statute 25 Ed. III. for high treason; and butchered at Tyburn, with two or three of his fraternity. However, though criminal in the eye of the law, or of the English gentry, might be the zeal of this Jesuit for the salvation of the poor heretics of that kingdom, biographers of each personage unite in giving him a great and amiable character. "All writers (says the Oxford antiquary), whether Protestants or Papists, say, that he was a man of admirable parts; an elegant orator, a subtle philosopher and disputant, and an exact preacher whether in English or the Latin tongue, of a sweet disposition, and a well-polished man." Fuller, in his church-history, says, "he was of a sweet nature, constantly carrying about him the charms of a plausible behaviour, of a fluent tongue, and good parts." His History of Ireland, in two books, was written in 1579; and published, by Sir James Ware, from a manuscript in the Cotton library, Dublin, 1633, folio. He wrote also Chronologia universalis, a very learned work; and various other tracts.

Campicursio, in the ancient military art, a march of armed men for several miles, from and back again to the camp, to instruct them in the military pace. This exercise was nearly akin to the decursio, from which it only differed, in that the latter was performed by horsemen, the former also by foot.

Campidoctores, or Campiductores, in the Roman army, were officers who instructed the soldiers in the discipline and exercises of war, and the art of handling their weapons to advantage. These are also sometimes called campigenii, and armidoctores.

Campiductor, in middle-age writers, signifies the leader or commander of an army, or party.

Campion, in botany, the English name of the Lychinis.

Campion, a town of the kingdom of Tanguth in Tartary. It was formerly remarkable for being a place through which the caravans passed on the road from Bokhara to China. E. Long. 104. 55. N. Lat. 40. 25.

Campistrion, a celebrated French dramatic author, was born in 1566. Racine directed his poetical talents to the theatre, and assistit him in his first pieces. He died in 1723.

Campita, in church history, an appellation given to the donatists, on account of their assembling in the field, for want of churches. For a similar reason, they were also denominated Montefes and Rupitani.

Campili, or Campoli, a town of Italy, in the kingdom of Naples, and in the farther Abruzzo, situated in E. Long. 13. 55. N. Lat. 42. 38.

Campno major, a town of the province of Alençon in Portugal. W. Long. 7. 24. N. Lat. 38. 50.

Campredon, a town of Catalonia in Spain, seated at the foot of the Pyrenean mountains. The fortifications were demolished by the French in 1694. W. Long. 1. 56. N. Lat. 42. 20.

Campis (Francis de), abbot of Notre Dame at Sigi, was born at Amiens in 1643; and distingghished himself by his knowledge of medals, by writing an history of France, and several other works. He died at Paris in 1723.

Campvere. See Veer.

Campus, in antiquity, a field or vacant plain in a city, not built upon, left vacant on account of flows, combats, exercises, or other uses of the citizens.

Campus Maius, in ancient authors, an anniverary assembly of the ancient citizens, performed on May-day, when they confederated together for the defence of their kingdom against all its enemies.

Campus Martius, a large plain in the suburbs of ancient Rome, lying between the Quirinal and Capitoline mounts and the Tiber, thus called because consecrated to the god Mars, and set apart for military sports and exercises to which the Roman youth were trained, as the use and handling of arms, and all manner of feats of activity. Here were the races run, either with chariots oringle horses; here also stood the villa publica, or place for the reception of ambassadors, who were not permitted to enter the city. Many of the public comitia were held in the same field, part of which was for that purpose cantoned out. The place was also nobly decorated with statues, arches, columns, porticoes, and the like structures.

Campus Scleratus, a place without the walls of ancient Rome, where the Vestals who had violated their vows of virginity were buried alive.

Camul, a town of Asia, on the eastern extremity of the kingdom of Cilicia, on the frontiers of Tangut. E. Long. 99. 5. N. Lat. 37. 15.

Camus, a person with a low flat nose, hollowed in the middle. The Tartars are great admirers of camus beauties. Rubrquis observes, that the wife of the great Jenghiz Khan, a celebrated beauty, had only two holes for a nose.

Camus (John Peter), a French prelate born in 1582. He was author of a number of pious romances (the taine of his time), and other theological works, to the amount of 200 vols. His definition of politics is remarkable: Ars non tantum regendi, quam fallendi, hominis; "the art not so much of governing, as of deceiving mankind." He died in 1682.

Can, in the sea-language, as can-pump, a vessel where with sseamen pour water into the pump to make it go.

Can-Boy, See Bouy.

Can-hook, an instrument used to sling a cauldron by the ends of the handles: it is formed by fixing a broad and flat
CANAAN

Canaan. (anc. geog.) a town on the confines of the Upper and Lower Galilee; memorable for the turning water into wine (John). The birth place of Simeon, called Canaanite from this place, and of Nathaniel.

Canaan, the fourth son of Ham. The irreverence of Ham towards his father Noah is recorded in Gen. ix. Upon that occasion the patriarch cursed him in a branch of his posterity: "Curfed," says he, "be Canaan; a servant of servants shall he be unto his brethren." This curse being pronounced, not against Ham the immediate transgressor, but against his son, who does not appear, from the words of Moses, to have been any ways concerned in the crime, hath occasioned several conjectures. Some have believed that Noah cursed Canaan, because he could not well have cursed Ham himself, whom God had not before blessed. Others think Moab's chief intent in recording this prediction was to raise the spirits of the Israelites, then entering on a terrible war with the children of Canaan, by the assurance, that, in consequence of the curse, that people were destined by God to be subdued by them. For the opinion of those who imagine all Ham's race were here accursed, seems repugnant to the plain words of Scripture, which confine the malediction to Canaan and his posterity; and is also contrary to fact. Indeed, the prophecy of Noah, that Canaan "should be a servant of servants to his brethren," seems to have been wholly completed in him. It was completed with regard to Shem, not only in that a considerable part of the seven nations of the Canaanites were made slaves to the Israelites, when they took possession of their land, as part of the remainder of them were afterwards enslaved by Solomon; but also by the subsequent expeditions of the Assyrians and Persians, who were both descended from Shem; and under whom the Canaanites suffered subjection, as well as the Israelites; not to mention the conquest of part of Canaan by the Elamites, or Persians, under Chedorlaomer, prior to them all. With regard to Japheth, we find a completion of the prophecy, in the successive conquests of the Greeks and Romans in Palestine and Phoenicia, where the Canaanites were settled, but especially in the total subversion of the Carthaginian power by the Romans; besides some invasions of the northern nations, as the posterity of Thogarma and Magog; wherein many of them, probably, were carried away captive.

The posterity of Canaan were very numerous. His eldest son was Sidon, who at least founded and populated the city of Sidon, and was the father of the Sidonians and Phoenicians. Canaan had besides ten sons, who were the fathers of so many people, dwelling in Palestine, and in part of Syria; namely, the Hitites, the Jebusites, the Amorites, the Girgarites, the Hivites, the Arphites, the Sittites, the Arvadites, the Zemaries, and Hamathites.

Land of Canaan, the country so named from Canaan the son of Ham. It lies between the Mediterranean sea and the mountains of Arabia, and extends from Egypt to Phoenicia. It is bounded to the east by the mountains of Arabia; to the south by the wilderness of Paran, Idumea, and Egypt; to the west by the Mediterranean, called in Hebrew the Great Sea; to the north by the mountains of Libanus. Its length from the city of Dan (since called Caesarea Philippi, or Paneas, which stands at the foot of these mountains) to Beerheba, is about 70 leagues; and its breadth from the Mediterranean sea to the eastern borders, is in some places 30. This country, which was first called Canaan, from Canaan the son of Ham, whose posterity possessed it, was afterwards called Palestine, from the people which the Hebrews called Philistines, and the Greeks and Romans corruptly Palestinian, who inhabited the sea coasts, and were first known to them. It likewise had the name of the Land of Promise, from the promise God made Abraham of giving it to him; that of the Land of Israel, from the Israelites having made themselves masters of it; that of Judah, from the tribe of Judah, which was the most considerable of the twelve; and lastly, the happiest it had of being blessed by the presence, actions, miracles, and death of Jesus Christ, has given it the name of the Holy Land, which it retains to this day.

The first inhabitants of this land therefore were the Canaanites, who were descended from Canaan, and the eleven sons of that patriarch. Here they multiplied extremely; trade and war were their first occupations; these gave rise to their riches, and the several colonies scattered by them over almost all the islands and maritime provinces of the Mediterranean. The measure of their idolatry and abominations was completed, when God delivered their country into the hands of the Israelites. In St Athanasius's time, the Africans still said they were descended from the Canaanites; and it is said, that the Punic tongue was almost entirely the same with the Canaanite and Hebrew language. The colonies which Cadmus carried into Boeotia, and his brother Cilix into Cilicia, came from the flock of Canaan. The cities of Sicily, Sar- dinia, Malta, Cyprus, Corfu, Majorca and Minorca, Gades and Ebusus, are thought to have been peopled by the Canaanites. Bochart, in his large work entitled Canaan, has set all this matter in a good light.

Many of the old inhabitants of the north-west of the land of Canaan, however, particularly on the coast or territories of Tyre and Sidon, were not driven out by the children of Israel, whence this tract seems to have retained the name of Canaan a great while after those other parts of the country, which were better inhabited by the Israelites, had lost the said name. The Greeks called this tract inhabited by the old Canaanites along the Mediterranean sea, Phoenicia; the more inland parts, as being inhabited partly by Canaanites, and partly by Syrians, Syrophoenicia; and hence the woman said by St Matthew (xv. 22.) to be a woman of Canaan, whose daughter Jesus cured, is said by St Mark (vii. 26.) to be a Syrophoenician by nation, as she was a Greek by religion and language.

CANAAN, or the province of Quebec, an extensive country of North America, bounded on the north-east by the gulf of St Lawrence, and St John's river; on the south-west, by lands inhabited by the savage Indians, which are frequently included in this province; on the south, by the province of Nova-Scotia, the states of New England, and New-York; and on the north-
Canada [76]

Canada, north-west, by other Indian nations. Under the name of Canada, the French comprehended a very large territory; taking into their claim part of New-Scotland, New-England, and New-York on the east, and extending it on the west as far as the Pacific Ocean. That part, however, which was reduced by the British arms in the last war, lies between 61 and 81 degrees of west longitude, and between 43 and 52 of north latitude. The climate is not very different from that of the northern British colonies; but as it is much further from the sea, and more to the northward, than of the parts, latitude. The climate is not very different from that of many parts extremely fertile; producing many kinds of grain, fruits, and vegetables. The uncultivated parts is such a rent forts of grains, fruits, and vegetables. The French had traders, who like the original inhabitants, traversed the vast lakes and rivers in canoes, with incredible industry and patience, carrying their goods into the remotest parts of America, and among nations entirely unknown to us. These again brought the furs, &c. home to them, as the Indians were thereby habituated to trade with them. For this purpose, people from all parts, even from the distance of 1000 miles, came to the French fair at Montreal, which began in June, and sometimes lasted three months. On this occasion many feccumities were observed, guards were

felves to carry on a considerable trade upon the great lakes of fresh water which these countries environ. Here are five lakes, the leaft of which is of greater extent than the fresh-water lakes to be found in any other part of the world: these are the lake Ontario, which is no less than 300 leagues in circumference; Erie, or Ofewgo, longer, but not so broad, is about the same extent. That of the Huron spreads greatly in width, and is about 300 leagues in circuit; as also is that of Machigian, though like lake Erie it is rather long, and comparatively narrow. But the lake Superior is larger than any of these, being no less than 500 leagues in circumference. All these are navigable by any vessels, and they all communicate with each other; but the passage between Erie and Ontario is interrupted by a vast stupendous fall or catacra, called the falls of Niagara*. The river St Lawrence, * See Ni amongst already observed, is the outlet of these lakes, by which they discharge themselves into the ocean. The French built forts at these several straits, by which the lakes communicate with one another, and on that side where the lake of them communicates with the river. By these, while the country was in their possession, they effectually secured to themselves the trade of the lakes, and preferred an influence over all the Indian nations that lie near them.

The most curious and interesting part of the natural history of Canada is the animals there produced. Thence are flags, elk, deer, bears, foxes, martins, wild cats, ferrets, weasels, large squirrels of a greyish hue, hares and rabbits. The southern parts, in particular, breed great numbers of wild bulls, divers forts of roe bucks, geats, wolves, &c. The marshes, lakes, and pools, with which this country abounds, swarm with otters and beavers, of which the white are highly valued, as well as the right black kind. A vast variety of birds are also to be found in the woods; and the river St Lawrence abounds with such quantities of fish, that it is affirmed by some writers, this would be a more profitable article that even the fur-trade.—There are in Canada a multitude of different Indian tribes; but these are observed to decrease in number where the Europeans are most numerous; owing chiefly to the immoderate use of spirituous liquors, of which they are excessively fond. Their manner of living we have already particularly described. The principal towns are Quebec, Trois Rivières, and Montreal. The commodities required by the Canadians from Europe are, wine, or rather rum; cloths, chiefly coarse; linen; and wrought iron. The Indian trade requires rum, tobacco, a fort of stuff blankets, guns, powder, balls, and flints, kettles, hatchets, toys, and trinkets of all kinds. While the country was in possession of the French, the Indians supplied them with poultry; and the French had traders, who like the original inhabitants, traversed the vast lakes and rivers in canoes, with incredible industry and patience, carrying their goods into the remotest parts of America, and among nations entirely unknown to us. These again brought the furs, &c. home to them, as the Indians were thereby habituated to trade with them. For this purpose, people from all parts, even from the distance of 1000 miles, came to the French fair at Montreal, which began in June, and sometimes lasted three months. On this occasion many fome aments were observed, guards were
were placed, and the governor assented to preserve order in so great and various a concourse of savage nations. But sometimes great disorders and tumults happened; and the Indians frequently gave for a dram all that they were poled of. It is remarkable, that many of these nations actually paid by the English settlement of Albany in New-York, and travelled 200 miles farther to Montreal, though they could have purchased the goods they wanted cheaper at the former.

Since Britain became possessed of Canada, their trade with that country has generally employed 34 ships and 400 seamen; their exports, on an average of three years, in skins, furs, ginseng, make-root, capillaire, and wheat, amount to 150,000L. Their imports from Great Britain are computed at nearly the same sum. It will, however, be always impossible to overcome certain inconveniences arising from the violence of the winter. This is so excessive from December to April, that the broadest rivers are frozen over, and the snow lies commonly from four to six feet deep on the ground, even in those parts of the country which lie three degrees south of London, and in the temperate latitude of Paris. Another inconvenience arises from the falls in the river St Lawrence below Montreal, which prevent ships from penetrating to that port from the interior of inland commerce. The communication therefore with Canada, and the immense regions beyond it, will always be interrupted during the winter season, until roads are formed that can be travelled without danger from the Indians. For these savage people often commit hostilities without any previous notice; and frequently, without any provocation, they commit the most horrid ravages for a long time with impunity.

Canada was undoubtedly discovered by Sebastian Cabot, the famous Italian adventurer, who failed under a commission from Henry VII. But though the English monarch did not think proper to make any use of this discovery, the French quickly attempted it; and we have an account of their fishing for cod on the banks of Newfoundland, and along the sea-coast of Canada, in the beginning of the 16th century. About the year 1506, one Denys, a Frenchman, drew a map of the gulf of St Lawrence; and two years after, one Aubert, a ship master of Dieppe, carried over to France some of the natives of Canada. As the new country, however, did not promise the fame amazing quantities of gold and silver produced by Mexico and Peru, the French for some years neglected the discovery. At last, in the year 1523, Francis I. a fertile and enterprising prince, sent four ships, under the command of Verazani, a Florentine, to prosecute discoveries in that country. The particulars of this man's first expedition are not known. All we can learn is, that he returned to France, and next year he undertook a second. As he approached the coast, he met with a violent storm; however, he came so near as to perceive the natives on the shore, making friendly signs to him to land. This being found impracticable by reason of the surf upon the coast, one of the sailors threw himself into the sea; but, endeavouring to swim back to the ship, a large fish him on shore without signs of life. He was, however, treated by the natives with such care and humanity, that he recovered his strength, and was allowed to swim back to the ship, which immediately returned to France. This is all we knew of Verazani's second expedition. He undertook a third, but was no more heard of, and it is thought that he and all his company perished before he could form any colony.

In 1534, one Jacques Cartier of St Malo was sent under a commission from the French king, and on the 10th of May arrived at Cape Bonavista in Newfoundland. He had with him two small ships beside the one in which he failed. He cruised along the coasts of that island, on which he discovered inhabitants, probably the Eskimans. He landed in several places along the coast of the Gulf, and took possession of the country in the king's name. On his return, he was again sent out with a commission, and a pretty large force; he returned in 1535, and passed the winter at St Croix; but the fea soon proved so severe, that he and his companions must have died of the cold, had they not, by the advice of the natives, made use of the decocion of the tops and bark of the white pines. As Cartier, however, could produce neither gold nor silver, all that he could say about the utility of the settlement was disregarded; and in 1540, he was obliged to become pilot to one M. Roberval, who was by the French king appointed viceroy of Canada, and who failed from France with five vessels. Arriving at the gulf of St Lawrence, they built a fort; and Cartier was left to command the garrison in it, while Roberval returned to France for additional recruits to his new settlement. At last, having embarked in 1549, with a great number of adventurers, neither he nor any of his followers were heard of more.

This fatal accident so greatly discouraged the court of France, that, for 50 years, no measures were taken for supplying with necessaries the settlers that were left. At last, Henry IV. appointed the Marquis de la Roche lieutenant-general of Canada and the neighbouring countries. In 1598 he landed on the isle of Sable, which he absurdly thought to be a proper place for a settlement, though it was without any port, and without produce except briars. Here he left about 40 malefactors, the refuse of the French jails. After cruising for some time on the coast of Nova Scotia, without being able to relieve these poor wretches, he returned to France, where he died of a broken heart. His colony must have perished, had not a French ship been wrecked on the island, and a few sheep driven upon it at the same time. With the boards of the ship they erected huts; and while the sheep fed they lived on them, feeding afterwards on fish. Their clothes wearing out, they made coats of seal-skins; and in this miserable condition they spent seven years, when Henry ordered them to be brought to France. The king had the curiosity to see them in their seal-skin dresses, and was so moved with their appearance, that he forgave them all their offences, and gave each of them 50 crowns to begin the world anew.

In 1600, one Chauvin, a commander in the French navy, attended by a merchant of St Malo, called Pontgrave, made a voyage to Canada, from whence he returned with a very profitable quantity of furs. Next year he repeated the voyage with the same good fortune, but died while he was preparing for a third. The many speciments of profit to be made by the Canadian trade, at last induced the public to think favourably of it. An armament was equipped, and the command of it given to Pontgrave, with powers to extend his discoveries.
varies up the river St Lawrence. He failed in 1603, having in his company Samuel Champlain, who had been a captain in the navy, and was a man of parts and spirit. It was not, however, until the year 1608, that the colony was fully established. This was accomplished by founding the city of Quebec, which from that time commenced the capital of all the settlements in Canada.

The colony, however, for many years continued in a low way, and was often in danger of being totally exterminated by the Indians. As the particulars of these wars, however, could neither be entertaining, nor indeed intelligible, to many of our readers, we choose to omit them, and in general observe, that the French not only concluded a permanent peace with the Indians, but so much ingratiated themselves with them, that they could with the greatest ease prevail upon them at any time to murder and scalp the English in their settlements. These practices had a considerable share in bringing about the war with France, when the whole country was conquered by the British in 1761.

The most remarkable transaction in this conquest was the siege of Quebec; for a particular account of which, see that article. And for the transactions here during the late American war, see America (United States of), no 195, 200-207.

Canal of Communication, an artificial cut in the ground, supplied with water from rivers, springs, &c. in order to make a navigable communication between one place and another.

The particular operations necessary for making artificial navigations depend upon a number of circumstances. The situation of the ground; the vicinity or connexion with rivers; the ease or difficulty with which a proper quantity of water can be obtained; and many other circumstances necessarily produce great variety in the structure of artificial navigations, and augment or diminish the labour and expense of executing them. When the ground is naturally level, and unconnected with rivers, the execution is easy, and the navigation is not liable to be disturbed by floods; but, when the ground rises and falls, and cannot be reduced to a level, artificial methods of raising and lowering vessels must be employed; which likewise vary according to circumstances.

A kind of temporary sluices are sometimes employed for raising boats over falls or floods in rivers by a simple operation. Two posts or pillars of mason-work, with grooves, are fixed, one on each bank of the river, at some distance below the boat. The boat having passed these posts, planks are let down across the river by pulling into the grooves, by which the water is dammed up to a proper height for allowing the boat to pass up the river over the shoal.

The Dutch and Flemings at this day sometimes, when obstructed by cascades, form an inclined plane or rolling-bridge upon dry land, along which their vessels are drawn from the river below the cascade into the river above it. This, it is said, was the only method employed by the ancients, and is still used by the Chinee, who are said to be entirely ignorant of the nature and utility of locks. These rolling bridges consist of a number of cylindrical rollers which turn easily on pivots, and a mill is commonly built near by, so that the same machinery may serve the double purpose of working the mill and drawing up vessels.

A lock is a bason placed lengthwise in a river or canal, lined with walls of masonry on each side, and terminated by two gates, placed where there is a cascade or natural fall of the country; and so constructed, that the bason being filled with water by an upper sluice to the level of the waters above, a vessel may ascend thro' the upper gate; or the water in the lock being reduced to the level of the water at the bottom of the cascade, the vessel may descend through the lower gate; for when the waters are brought to a level on either side, the gate on that side may be easily opened. But as the lower gate is strained in proportion to the depth of water it supports, when the perpendicular height of the water exceeds 12 or 15 feet, more locks than one become necessary. Thus, if the fall be 17 feet, two locks are required, each having 8 ½ feet fall; and if the fall be 26 feet, three locks are necessary, each having 8 ½ feet 8 inches fall. The side-walls of a lock ought to be very strong. Where the natural foundation is bad, they should be founded on piles and platforms of wood: they should likewise slope outward; in order to resist the pressure of the earth from below.

Plate CXIV. fig. 1. A perspective view of part of a canal: the vessel L, within the lock AC.—Fig. 2. Section of an open lock; the vessel L about to enter.—Fig. 3. Section of a lock full of water; the vessel L raised to a level with the water in the superior canal.—Fig. 4. Ground section of a lock. L, a vessel in the inferior canal. C, the under gate. A, the upper gate. GH, a subterraneous passage for letting water from the superior canal run into the lock. KF, a subterraneous passage for water from the lock to the inferior canal.

X and Y (fig. 1.) are the two flood-gates, each of which consists of two leaves, fitting upon one another, so as to form an obtuse angle, in order the better to resist the pressure of the water. The first (X) prevents the water of the superior canal from falling into the lock; and the second (Y) dams up and sustains the water in the lock. These flood-gates ought to be very strong, and to turn freely upon their hinges. In order to make them open and shut with ease, each leaf is furnished with a long lever A, A; C, C. They should be made very tight and close, that as little water as possible may be lost.

By the subterraneous passage GH (fig. 2, 3, & 4) which descends obliquely, by opening the sluice G, the water is let down from the superior canal D into the lock, where it is slop and retained by the gate C when shut, till the water on the lock comes to be on a level with the water in the superior canal D; as represented, fig. 3. When, on the other hand, the water contained by the lock is to be let out, the passage GH must be shut by letting down the sluice G, the gate A must be also shut, and the passage KF opened by raising the sluice K; a free passage being thus given to the water, it descends through KF, into the inferior canal, until the water in the lock is on a level with the water in the inferior canal B; as represented, fig. 3.

Now, let be required to raise the vessel L (fig. 2) from the inferior canal B to the superior one D; if the lock happens to be full of water, the sluice G must be shut, and also the gate A, and the sluice K opened,
Canal. So that the water in the lock may run out till it is on a level with the water in the inferior canal B. When the water in the lock comes to be on a level with the water at B, the leaves of the gate C are opened by the levers C 5, which is easily performed, the water on each side of the gate being in equilibrio; the vessel then falls into the lock. After this the gate C and the sluice K are shut, and the sluice G opened, in order to fill the lock, till the water in the lock, and consequently the vessel, be upon a level with the water in the superior canal D; as is represented in fig. 2. The gate A is then opened, and the vessel passes into the canal D.

Again, let it be required to make a vessel descend from the canal D into the inferior canal B. If the lock is empty, as in fig. 2, the gate C and sluice K must be shut, and the upper sluice G opened, so that the water in the lock may rise to a level with the water in the upper canal D. Then open the gate A, and let the vessel pass thro' into the lock. Shut the gate A and the sluice G; then open the sluice K, till the water in the lock be on a level with the water in the inferior canal; then the gate C is opened, and the vessel passes along into the canal B, as was required.

It is almost needless to spend time in enumerating the many advantages which necessarily result from artificial navigations. Their utility is now so apparent, that most nations in Europe give the highest encouragement to undertakings of this kind wherever they are practicable. The advantages of navigable canals did not escape the observation of the ancients. From the earliest accounts of society we read of attempts to cut through large isthmuses, in order to make a communication by water, either betwixt different nations, or distant parts of the same nation, where land-carriage was long and expensive. Herodotus relates, that the Cnidians, a people of Caria in Asia Minor, designed to out the isthmus which joins that peninsula to the continent; but were superstitious enough to give up the undertaking, because they were interdicted by an oracle. Several kings of Egypt attempted to join the Red-Sea to the Mediterranean. Cleopatra was exceedingly fond of this project. Soliman II. emperor of the Turks, employed 50,000 men in this great work. This canal was completed under the caliphate of Omar, but afterwards allowed to fall into disrepair; so that it is now difficult to discover any traces of it. Both the Greeks and Romans intended to make a canal across the Isthmus of Corinth, which joins the Morea and Achaea, in order to make a navigable passage by the Ionic sea into the Archipelago. Demetrius, Julius Caesar, Caligula, and Nero, made several unsuccessful efforts to open this passage. But, as the ancients were entirely ignorant of the use of water-locks, their whole attention was employed in making level cuts, which is probably the principal reason why they so often failed in their attempts. Charlemagne formed a design of joining the Rhine and the Danube, in order to make a communication between the ocean and the Black Sea, by a canal from the river Almutz which discharges itself into the Danube, to the Reditz, which falls into the Main, and this last falls into the Rhine near Mayence; for this purpose he employed a prodigious number of workmen; but he met with so many obstacles from different quarters, that he was obliged to give up the attempt.

The French at present have many fine canals: that of Briare was begun under Henry IV. and finished under the direction of cardinal Richelieu in the reign of Louis XIII. This canal makes a communication betwixt the Loire and the Seine by the river Loing. It extends 11 French great leagues from Briare to Montargis. It enters the Loire a little above Briare, and terminates in the Loing at Cepoi. There are 42 locks on this canal.

The canal of Orleans, for making another communication between the Seine and the Loire, was begun in 1675, and finished by Philip of Orleans, regent of France, during the minority of Louis XV. and is furnished with 20 locks. It goes by the name of the canal of Orleans; but it begins at the village of Kombles, which is a short French league from the town of Orleans.

But the greatest and most useful work of this kind is the junction of the ocean with the Mediterranean by the canal of Langnedoc. It was proposed in the reigns of Francis I. and Henry IV. and was undertaken and finished under Louis XIV. It begins with a large reservoir 4000 paces in circumference, and 24 feet deep, which receives many springs from the mountain Noire. This canal is about 64 leagues in length, is supplied by a number of rivulets, and is furnished with 104 locks, of about eight feet each. In some places it passes over bridges of vast height; and in others it cuts thro' solid rocks for 1000 paces. At one end it joins the river Garonne near Toulouse, and terminates at the other in the lake Tau, which extends to the port of Cette. It was planned by Francis Riquet in 1666, and finished before his death, which happened in 1680.

In the Dutch, Austrian, and French Netherlands, there is a very great number of canals; that from Bruges to Oostend carries vessels of 200 tons.

The Chinese have also a great number of canals; that which runs from Canton to Pekin extends about 825 miles in length, and was executed about 800 years ago.

It would be an endless task to describe the numberless canals in Holland, Russia, Germany, &c. We shall therefore confine ourselves to those that are either already finished, or at present executing, in Great-Britain.

As the promoting of commerce is the principal intention of making canals, it is natural to expect that their frequency in any nation should bear some proportion to the trade carried on in it, providing the situation of the country will admit of them. The present state of England and Scotland confirms this observation. Though the Romans made a canal between the Nynie, a little below Peterborough, and the Witham, three miles below Lincoln, which is now almost entirely filled up, yet it is not long since canals were revived in England. They are now however become very numerous, particularly in the counties of York, Lincoln, and Chester. Most of the counties betwixt the mouth of the Thames and the Bristol channel are connected together either by natural or artificial navigations; those upon the Thames and its reaching within about
20 miles of the Clyde; when the subscription and a subsequent loan being exhausted, the work was flopped in 1775. The city of Glasgow, however, by means of a collateral branch, opened a communication with the Firth, which has produced a revenue of about L. 6000 annually; and, in order to finish the remaining six miles, the government in 1794 gave L. 50,000 out of the forfeited estates, the dividends arising from this sum to be applied to making and repairing roads in the Highlands of Scotland. Accordingly the work has been resumed; and by contract, under a high penalty, must be entirely completed in November 1789. The aqueduct bridge over the Kilven (now finished, and supposed the greatest of the kind in the world) consists of four arches, and carries the canal over a valley 65 feet high and 420 in length, exhibiting a very singular effort of human ingenuity and labour. To supply the canal with water was of itself a very great work. There is one reservoir of 50 acres 24 feet deep, and another of 70 acres 22 feet deep, into which many rivers and springs terminate, which it is thought will afford sufficient supply of water at all times. This noble undertaking was finished, and the bill at cost L. 200,000. It is the greatest of the kind in Britain, and without doubt will be of great national utility; though it is to be regretted that it had not been executed on a still larger scale, the locks being too short for transporting large meals.

**Canal**

In anatomy, a duct or passage through which any of the juices flow.

**Cananor**

A large maritime town of Asia, on the coast of Malabar, in a kingdom of the same name, with a very large and safe harbour. It formerly belonged to the Portuguese, and had a strong fort to guard it; but in 1663, the Dutch, together with the natives, drove them away; and after they became masters of the town, enlarged the fortifications. They have but a very small trade; but there is a town at the bottom of the bay independent of the Dutch, whose prince can bring 20,000 men into the field. The Dutch fort is large, and the governor’s lodgings are at a good distance from the gate; so that, when there was a skirmish between the factory and the natives, he knew nothing of it till it was over. E. Long. 78° 10’. N. Lat. 12° 0’.

**Canara**

A small kingdom of Asia, on the coast of Malabar, whose king can raise a considerable army. The natives are generally Mahometans; and the country produces pepper, cardamoms, ginger, mirbolans, and tamarinds, in which they drive a considerable trade.

**Canara, a kingdom of Asia, on the coast of Malabar**. The inhabitants are Gentoos, or Pagans; and there is a pagod, or temple, called Rawtrat, which is visited every year by a great number of pilgrims. Here the custom of burning the wives with their husbands has its beginning, and is practised to this day. The country is generally governed by a woman, who keeps her court at a town called Baydur, two days journey from the sea. She may marry whom she pleases; and is not obliged to burn with her husband, like her female subjects. They are so good observers of their laws, that a robbery or murder is scarce ever heard of among them. The Canars have forts built of earth along the coast, which are garnished with 200 or 300 souldiers, to guard against the robberies of their neighbours.
Canarias, or the GRAND CANARY, is an island in the
Atlantic Ocean, about 180 miles from the coast of Af-rica. It is about 100 miles in circumference, and 33
in diameter. It is a fruitful island, and famous for the
wine that bears its name. It contains about 150,000
inhabitants, but they were a conquered people, and live
in the same manner, as the people of Barbary in complex-ity. There is no iron. After the discovery of the Spaniards, iron was dug from the soil, and was used to make utensils. The inhabitants are chiefly Spaniards; though there are some of the first people remaining, whom they call Guanches, who are somewhat civilized by their intercourse with the Spaniards. They are a hardy, ac-
tive, bold people, and live on the mountains. Their
chief food is goat's milk. Their complexion is swarthy,
and their noses flat. The Spaniards were the first to make use of the wine called Canary or Sack.

The Canary-birds are subject to many diseases, particularly imps, which affect the head, cause them
to fall suddenly from the perch, and die in a short
time, if not speedily cured. The most approved me-thod is an ointment made of fresh butter and capon's
grease melted together. With this the top of the
bird's head is to be anointed for two or three days,
and it will dissolve the impomhus; but if the medici-
cine has been too long delayed, then, after three or
four times anointing, see whether the place of his
head be soft; and if so, open it gently, and let out
the matter, which will be like the yolk of an egg; when
this is done, anoint the place, and the bird will be
cured. At the same time he must have figs with his
other food, and in his water a slice or two of liqueur,
with white figar-candy.

The Canary-birds are distinguished by different names at different times and ages; such as are about three years old are called adults; and those above two are named
eriffs; those of the first year under the care of the old
ones, are termed branchers; those that are new born,
and cannot feed themselves, pushers; and those brought
up by hand, nestlings.

The Canary-birds may be bred with ease; and, if
treated with proper care, they will become as vigorous
and healthful as in the country from whence they have
their name. The cages in which these birds are
kept are made either of walnut-tree or oak, with bars of wire; because these being woods of
strength, do not require to be used in large pieces.
The common shape of cages, which is cylindrical, is very improper for these birds; for this allows little room to walk, and without that the birds usually become melancholy. The most proper of all shapes is the high and long, but narrow.

If these birds eat too much, they grow over-fat, lose their shape, and their singing is spoiled: or at least they become so idle, that they will scarce ever sing. In this case their vicarial is to be given to them in a much smaller quantity, and they will by this means be recovered by degrees to all their beauty, and will sing as at first.

At the time that they are about to build their nests, there must be put into their cages some hay, dried thoroughly in the sun: with this must be fixed some moss dried in the same manner, and some flag's hair; and great care is to be taken of breeding the young, in the article of food. As soon as the young birds are eight days old, or somewhat more, and are able to have been kept thus about eight days, they are to be put in a room where of hearing the voice of any other bird. After they be given them early in the morning, one are sufficient for these young melancholy, and will not sing with a black cloth, and for the fifteen days following excited to sing by a bird-pipe; but this is not to be left out, and he will always after this live in friendship with the female.

If the male become sick during the time of the female's sitting or bringing up her young, he must be removed immediately, and only brought to the side of her cage at certain times, that she may see him, till he is perfectly cured; and then he is to be shut up again in his cage in the middle.

Canary-birds are various in their notes, some having a sweet song, others a lowish note, others a long song, which is best, as having the greatest variety of notes: but they sing chiefly either the titlark or nightingale notes. See SONG of Birds.

Cancelled, a town of France, in Upper Brittany, by the sea-side, where there is a road. Here the British landed in 1758, in their way to St Maloes, where they burnt a great number of ships in the harbour, and then retired without loss. This town was in their power; but they acted like generous enemies, and did no hurt to this nor any other on the coast. W. Long, 0 13. N. Lat. 41° 45′.

Canceller, in falconry, is when a light brown hawk, in her stooping, turns two or three times upon the wing, to recover herself before the feizes.

Cancell, a term used to denote lattice windows, of those made of cross bars disposed latticewise; it is also used for rails or ballustrades inclosing the communion table, a court of justice, or the like, and for the network in the inside of hollow bones.

Cancelling, in the civil law, an act whereby a peron contents that some former deed be rendered null and void. This is otherwise called refization. The word comes from the Latin cancellare to encompass or pale a thing round. In the proper sense of the word, to cancel, is to deface an obligation, by passing the pen from top to bottom, or across it; which makes a kind of checker lattice, which the Latins call cancelli.

Cancer, in zoology, a genus of infects belonging to the order of infecta apera. The generic characters are these: they have eight legs, (feldom ten or six); besides the two large claws which answer the purpose of hands. They have two eyes at a considerable distance from each other, and for the most part supported by a kind of pedunculi or footstalks; the eyes are likewise elongated and movable; they have two clawed pulps, and the tail is jointed. This genus includes the lobster, shrimp, &c. There are no less than 87 species of cancer, distinguished principally by the length of their tails and the margins of their breasts. The following are the most remarkable.

1. The gammarus, or common common thorax, short ferrated finnot; very long antennae; and lobsters between them two shorter ones, bifid; claws and fangs large, the greater tuberculated, the lesser ferrated on the inner edge; four pair of legs; six joints in the tail; tail-fins rounded. It inhabits all the rocky shores of America, but chiefly where there is a depth of water. In Llyn in Wales, a certain small lobster, nothing
Cancer. After, nothing different except in size, burrows in the sand. They are brought in vast quantities from the Orkney isles, and many parts of the eastern coast of Scotland, to the London markets. Sixty or seventy thousand are annually brought from the neighbourhood of Montrose alone.—The lobster was well known to the ancients, and is well described by Aristotle under the name of *scylla*. It is found as far as the Hellepont; and is now called at Constantinople *licuuda* and *licuuda*.

Lobsters fear thunder, and are apt to caust their claws on a great clap; it is said that they will do the same on the firing of a great gun; and that, when men of war meet a lobster boat, a jocular threat is used, that, if the master does not sell them good lobsters, they will salute him.

The habitat of this species is in the clearest water, at the foot of rocks that impend over the sea. This has given opportunity of examining more closely into the natural history of the animal, than of many others who live in an element that prohibits most of the human researches, and limits the enquiries of the most inquisitive. Some lobsters are taken by hand; but the greater quantity in pots, a fort of trap formed of twigs, and baited with garbage; they are formed like a wire moufe-trap, so that when the lobster gets in, there is no return. These are fastened to a cord sunk in the sea, and their place marked by a buoy.—They begin to breed in the spring, and continue breeding most part of the summer. They propagate *more humains*, and are extremely prolific. Dr Balfour says he counted 12,444 eggs under the tail, besides those that remained in the body unprotruded. They deposit those eggs in the sand, where they are soon hatched.

Lobsters change their crust annually. Previous to their putting off their old one, they appear sick, languid and reflifts. They totally acquire a new coat in a few days; but during the time that they remain defenceless, they seek some very lonely place, for fear of being devoured by fuch of their brethren as are not in the same situation. It is also remarkable, that lobsters and crabs will renew their claws, if by accident they are torn off; and it is certain they will grow again in a few weeks, though they never attain to the strength of the firft. They are very voracious animals, and feed on seaweeds, garbage, and all sorts of dead bodies. The pincers of one of the lobsters large claws are furnished with knobs, and those of the other are always ferrated. With the former it keeps firm hold of the flanks of submarine plants, and with the latter it cuts and minces its food very dexterouily. The knobbed or numb claw, as the fishermen call it, is sometimes on the right and sometimes on the left side indifferently. It is more dangerous to be feized by them with the cutting claw than the other; but in either cafe, the quickest way to get disengaged from the creature is to pull off its claw. The female or ten lobster does not caft her shell the fame year that she depofiês her ova, or, in the common phrase, is in *berry*. When the ova firft appear under her tail, they are small and extremely black; but they become in succession almost as large as ripe elder berries before they are deposited, and turn of a dark brown colour, epecially towards the end of the time of her depofiing them. They continue full, and depofiing the ova in constant succession, as long as any of that black substance can be found in their body, which, when boiled, turns of a beautiful red colour, and is called their coral. Hen-lobsters are found in berry at all times of the year, but chiefly in winter. It is a common mistake, that a berried hen is always in perfection for the table. When her berries appear large and brownish, the will always be found exhausted, wanty and poor. Though the ova be caft at all times of the year, they seem only to come to life during the warm summer months of July and August. Great numbers of them may then be found, under the appearance of tadpoles, swimming among the little pools left by the tides among the rocks, and many also under their proper form from half an inch to four inches in length. In examining their shells, it is hard to conceive how the lobster is able to draw the fin of their large claws out, leaving the shell entire and attached to the shell of their body, in which state they are comtantly found. The fishermen say, the lobster pines before casting, till the fin of its large claw is no thicker than the quill of a goose, which enables it to draw its parts through the joints and narrow passage near the trunk. The new shell is quite membraneous at first, but hardens by degrees. Lobsters only grow in size while their shells are in their soft state. They are chosen for the table, by their being heavy in proportion to their size; and by the hardnec of their shells on their sides, which, when in perfection, will not yield to moderate pressure. Barnacles and other small fish adhering to them are reckoned certain signs of superior goodness. Cock-lobsters are in general better than the hens in winter; they are distinguished by the narrowness of their tails, and by their having a strong spine upon the centre of each of the tranverse processes beneath the tail, which support the four middle plates of their tails. The fin of a lobster's claw is more tender, delicate, and easy of digestion, than that of the tail. In summer, the lobsters are found near the shore, and thence to about five fathoms water; in winter, they are seldom taken less than 12 or 15 fathoms. Like other fishes, they are much more active and alert in warm weather than in cold. In the water, they can run nimbly upon their legs or small claws; and, if alarmed, can spring, tat! the cutting claw is more tender, delicate, and easy of digestion, than that of the tail. In summer, the lobsters are in full perfection, will

2. The friguros, or plated lobster, with a pyra-
The Diogenes, shrimp, &c. clawed, the two Hermit-joints; the feelers; claws small, smooth, with two small spines on each side; two first pair of legs clawed, the two next subdivided; tail confisting of five joints; the caudal fins rounded. It inhabits many of the rivers in England, lodged in holes which they form in the clayey banks. Cardan says, that this species indicates the goodness of water; for in the beet water they are boiled into the reddish colour.

4. The ferratus, or prawn, with a long ferrated fin bending upwards; three pair of very long filiform feelers; claws small, furnished with two fangs; smooth thorax; five joints to the tail; middle caudal fin subdivided, two outmost flat and rounded. It is frequent in several shores among loose stones; sometimes found at sea, and taken on the surface over 30 fathoms depth of water; cinerous when fresh, of a fine red when boiled.

5. The crangon, or hrimp, with long flesser feelers, and between them two projecting lamina; claws with a single, hooked, moveable fang; three pair of legs; seven joints in the tail; the middle caudal fin subdivided, the four others rounded and fringed, a spine on the exterior side of each of the outmost. It inhabits the shores of Britain in vast quantities, and is the most delicious of the genus.

6. The squilla, with a finnot like a prawn, but deeper and broader; its inferior feelers longer in proportion to the bulk; the sub-caudal fins rather larger; is, at full growth, not above half the bulk of the former.—It inhabits the coasts of Kent; and is sold in London under the name of the white hrimp, as it assumes that colour when boiled.

7. The atomos, or atom-lobster, with a slender body; filiform antennae; three pair of legs near the head; behind which are two pair of oval vesicles; beyond are three pair of legs, and a flesser tail between the last pair. It is very minute, and the help of the microscope is often necessary for its inspection.

8. The pulax, or flea hrimp, with five pair of legs, and two claws imperfect; with 12 joints of the body. It is very common in fountains and rivulets; swims very swiftly in an incurved posture on its back; embraces and protects its young between the legs; does not leap.

9. The locust, or locust-lobster, with four antennae; two pair of imperfect claws; the first joint ovated; body consists of 14 joints, in which it differs from the former. It abounds in summer, on the shore, beneath stones and algae; leaps about with vast agility.

10. The diogenes, soldier-erab, or hermit crab, with rough claws; the left claw is the longest (this being the only difference between the diogenes and bernardus); the legs are subdivided, and ferrated along the upper ridge; the tail naked and tender, and furnished with a hook, by which it secures itself in its lodging. This species is parasitic; and inhabits the empty cavities of turbinated shells, changing its habitation according to its increase of growth from the small *nirite* to the large *uloea*. Nature denies it the strong covering behind, which it hath given to other of this class; and therefore directs it to take refuge in the deserted caves of other animals. They crawl very fast with the shell on their back; and at the approach of danger draw themselves within the shell, and, thrusting out the larger claw, will pinch very hard whatever molests them. Aristotle describes it very exactly under the name of *alugia*

By the moderns it is called the soldier, from the idea of its dwelling in a tent; or the hermit, from retiring into a cell.

It is very diverting to observe this animal when wanting to change its shell. The little soldier is seen busily parading the shore along that line of pebbles and shells which is formed by the eastermost wave; still, however, dragging its old incommendable habitation at its tail, unwilling to part with one shell, even though it be troublesome appendage, till it can find another more convenient. It is seen flopping at one shell, turning it, and passing it by; going on to another, contemplating that a while, and then slipping its tail from its old habitation to try on the new; this also is found to be inconvenient, and it quickly returns to its old shell again. In this manner it frequently changes, till at last it finds one light, roomy, and commodious; to this it adheres, though the shell be sometimes so large as to hide the body of the animal, claws and all. Yet it is not till after many trials, and many combats also, that the soldier is thus completely equipped; for there is often a contest between two of them for some well-looked favourite shell for which they are rivals. They both endeavour to take possession; they strike with their claws, they bite each other, till the weakest is obliged to yield by giving up the object of dispute; it is then that the victor immediately takes possession, and parades it in his new conquest three or four times back and forward upon the strand before his envious antagonist. When this animal is taken, it sends forth a feeble cry, endeavouring to feize the enemy with its nippers; which if it fastens upon, it will sooner die than quit the grasp.

The hermit-crabs frequent mostly those parts of the sea-shores which are covered with thurbs and trees, producing various wild fruits on which they subsist; though they will also feed on the fragments of fish and other animal substances cast on shore. When roosted in the shell, they are esteemed delicate. The hermit-crab, hung in the air, dissolves into a kind of oil, which speedily cures the rheumatism, if rubbed upon the part.

11. The vocans, or sand-crab, is but of a small size; its colour light brown, or dusky white. It has eight legs and two claws, one of which is double the size of the other: these claws serve both to defend and to feed themselves with. The head has two square holes, which are receptacles for its eyes; out of which it thrusts them, and draws them in again at pleasure. Their abode is only on the sandy shores of lathers, and many others of the Bahama islands. They run very fast, and retreat from danger into little holes they make in the sand.

12. The grapalus, or redotted crab, hath a round body, the legs longer and larger than in other kinds; the claws red; except which, the whole is motiled in a beautiful manner with red and white. These crabs inhabit the rocks hanging over the sea; they are the nimblest of all others, and run with surprising agility along the upright side of a rock, and even under the rocks that hang horizontally below the water. This they are often necessitated to do for escaping the assaults of rapacious birds that pursue them. These crabs never

Cancer. never go to land; but frequent mostly those parts of
the promontories and islands of rocks in and near the
sea, where, by the continual and violent agitation of
the waves against the rocks, they are always wet, con-
tinually receiving the spray of the sea, which often
washes them into it; but they at length return to
the rock again, not being able to live under water, and yet
requiring more of that element than any of the crusta-
cceans kinds that are not fish.

13. The granulatus, or rough-shelled crab: these
crabs are pretty large, and are commonly taken from
the bottom of the sea in shallow water; the legs are
small in proportion to the body; the two claws are re-
markably large and flat. The whole shell is covered
over with innumerable little tubercles like flaggreen:
the colour is brown, variously stained with purple.

14. The cancer erythropus, or red-claw crab; is of
a small size, and brown colour; it hath two claws of
unequal bigness, red at the ends; and eight legs, which
sccn of less use to them than in other crabs; for when
on the ground, they crawl with slow pace, dragging
their bodies along; but they are mostly seen grasping
with their claws, and hanging to some sea plant, or
other marine substance.

The pea-
crab.

15. The pioum, or pea-crab, with rounded and
smooth thorax, entire and blunt; with a tail of the size
of the body, which commonly is the bulk of a pea.
It inhabits the mufcle, and has a repute of
feive
their vigilant friend.

to have been the confentable inmates of the
ches on the front; five ferrated teeth on
claws ovated; next joint toothed; hind feet fabulate;
body covered with short, brown, velvet-like pile; claws covered with minute tubercles;
small spines round the top of the second joint; hind
legs broadly ovated.—This is among the species taken
notice of by Aristotle on account of the broad feet,
which, he says, assist them in swimming; as web-feet
do the water-fowl. It inhabits the western coast of
Anglesea.

19. The horridus, or horrid-crab, with a projecting
bifurcated fhit, the end diverging; body heart-
shaped; with the claws and legs covered with long and
very sharp spines.—It is a large species, and inhabits
the rocks on the eastern coasts of Scotland. It is com-
mon to Norway and Scotland, as many of the marine
animals and birds are.

20. The ruticola, land-crab, or violet-crab, with a
smooth entire thorax, and the two last joints of the feet
armed with spines. It inhabits the Bahamas islands,
as well as most lands between the tropics; and feeds
upon vegetables.

These animals live not only in a kind of orderly so-
ciety in their retreats in the mountains, but regularly
once a year march down to the sea-side in a body of
some millions at a time. As they multiply in great
numbers, they choose the month of April or May to
begin their expedition; and then fally out by thou-
sands from the stumps of hollow trees, from the clefts
of rocks, and from the holes which they dig for them-
selves under the surface of the earth. At that time
the whole ground is covered with this band of adventur-
ers; there is no setting down one’s foot without tread-
ing upon them. The sea is their place of deification,
and to that they direct their march with right-lined
precision. No geometrician could send them to their
defined station by a shorter course; they neither turn
to the right nor left, whatever obstacles intervene; and
even if they meet with a house, they will attempt to
scale the walls to keep the unbroken tenor of their way.
But though this be the general order of their route,
they, upon other occasions, are obliged to conform to
the face of the country; and if it is intersected with
rivers, they are then seen to wind along the course of
the stream. The procession sets forward from the
mountains with the regularity of an army under the
guidance of an experienced commander. They are
commonly divided into three battalions; of which the
first consists of the strongest and boldest males, that,
like pioneers, march forward to clear the route and
face the greatest dangers. These are often obliged to
halt for want of rain, and to go into the most conve-
nient encampment till the weather changes. The main
body of the army is composed of females, which never
leave the mountains till the rain is set in for some time,
and then descend in regular battalions, being formed into
columns of 50 paces broad, and three miles deep, and
so close that they almost cover the ground. Three
or four days after this, the rear-guard follows, a frag-
Cancer, a roundish, unequal, hard, and livid tumour, generally seated in the glandular parts of the body, supposed to be so called, because it appears at length with surging veins hollowing out from it, as to resemble, as it is thought, the figure of a crab-fish; or, others say, because like that fish, where it has once got, it is scarce possible to drive it away. See (the Index subjoined to) Medicine.

Cancer, in astronomy, one of the twelve signs, represented on the globe in the form of a crab, and thus marked (♀) in books. It is the fourth constellation in the starry zodiac, and that from which one quadrant of the ecliptic takes its denomination. The reason generally assigned for its name as well as figure, is a supposed resemblance which the sun's motion in this sign bears to the crab-fish. As the latter walks backwards, so the former, in this part of his course, begins to go backwards, or recede from us; though the disposition...
CANDAHAR, a province of Persia, bounded on the north by the province of Balk; on the east, by that of Cabul; on the south, by Buchor and Sablestan; and on the west, by Sigetan. There have been bloody wars between the Indians and Persians on account of this province; but in 1650 it fell to the Persians. The inhabitants are known by the name of Aghhans, or Afghans, who have often endeavoured to throw off the yoke. But in 1737, they were severely punished for such an attempt. See Persia.

CANDAHAR, the capital of the above province, is seated on a mountain; and being a place of great trade, has a considerable fortress. The caravans that travel from Persia and the parts about the Caspian sea to the East Indies, choose to pass through Candahar, because there is no danger of being robbed on this road, and provisions are very reasonable. The religion is Mahometanism, but there are many Baniyans and Gucrees. E. Long. 67° 5. N. Lat. 33° 6.

CANDAULES, the last king of Lydia, of the family of the Heraclides. See Lydia.

CANDELARES, from Candelas, a candle, the name of an order in the former editions of Linnaeus's Fragments of a natural method, consisting of three genera, rhizophora, nyssa, and minujops. They are removed, in the latter editions, into the order Holoceraee, to which see.

CANDIA, the modern name of the island of Crete (see Crete). The word is a variation of Khanda, which was originally the Arabian name of the metropolis only, but in time came to be applied to the whole island.

Candia came into the possession of the Venetians by purchase in the year 1194, as related under the article Crete; and soon began to flourish under the laws of that wise republic. The inhabitants, living under the protection of a moderate government, and being encouraged by their masters, engaged in commerce and agriculture. The Venetian commandants readily afforded to those travellers who visited the island, that assistance which is necessary to enable them to extend and improve useful knowledge. Belon, the naturalist, is lavish in praise of their good offices, and describes, in an interesting manner, the flourishing state of that part of the island which he visited.

The seat of government was established at Candia. The magistrates and officers, who composed the council, resided there. The provost-general was president. He possessed the chief authority; and his power extended over the whole principality. It continued in the possession of the Venetians for five centuries and an half. Cornaro held the chief command at the time when it was threatened with a storm on the side of Constantinople. The Turks, in the space of a year, had been employed in preparing a vast armament. They deceived the Venetian, by affuring him that it was intended against Malta. In the year 1645, in the midst of a solemn peace, they appeared unexpectedly before Crete with a fleet of 400 sail, having on board 60,000 land forces, under the command of four pachas. The emperor Ibrahim, under whom this expedition was undertaken, had no fair pretext to offer in justification of his enterprise. He made use of all that perfidy which characterizes the people of the east, to impose on the Venetian senate. He loaded their ambassador with presents, directed his fleet to bear for Cape Matapan, as if they had been going beyond the Archi-
Archipelago; and caused the governors or Tira and Cerigna to be solemnly assured, that the republic had nothing to fear for her possessions. At the very instant when he was making these assurances, his naval armament entered the gulf of Canea’s and, passing between that city and St Theodore, anchored at the mouth of Platania.

The Venetians, not expecting this sudden attack, had made no preparations to repel it. The Turks landed without opposition. The site of St Theodore is but a league and a half from Canea. It is only three quarters of a league in compass. The Venetians had erected two forts there; one of which, standing on the summit of the highest eminence, on the coast of that little isle, was called Turluru; the other, on a lower situation, was named St Theodore. It was an important object to the Mussulmans to make themselves masters of that rock, which might annoy their ships. They immediately attacked it with ardour. The first of those fortresses, being defiinate of soldiers and cannon, was taken without firing a blow. The garrison of the other consisted of about 60 men. They made a gallant defence, and stood out till the last extremity; and when the Turks at last prevailed, their number was diminished to 10, whom the captain-pacha cruelly caused to be beheaded.

Being now masters of that important post, as well as of Lazarat, an elevated rock, standing about a league from Canea, the Turks invested the city by sea and land. General Cornaro was struck, as with a thunder-clap, when he learned the descent of the enemy. In the whole island there were no more than 3500 infantry, and a small number of cavalry. The besieged city was defended only by 1000 regular troops, and a few citizens, who were able to bear arms. He made haste to give the republic notice of his distress, and posted himself off the road, that he might the more readily succour the besieged city. He threw a body of 350 men into the town, before the lines of the enemy were completed. He afterwards made several attempts to strengthen the besieged with other reinforcements; but in vain. The Turks had advanced in bodies close to the town, had carried a half-moon battery, which covered the gate of Retimo, and were battering the walls night and day with their numerous artillery. The besieged defended themselves with resolution, and the smallest advantage which the besiegers gained cost them dear. General Cornaro made an attempt to arm the Greeks, particularly the Spachions, who boasted loudly of their valour. He formed a battalion of these. But the aera of their valour was long past. When they beheld the enemy, and heard the thunder of the cannon, they took to flight; not one of them would stand fire.

While the senate of Venice were deliberating on the means to be used for relieving Canea, and endeavouring to equip a fleer, the Mahometan generals were sacrificing the lives of their followers to bring their enterprise to a glorious termination. In different engagements they had already lost 20,000 warriors; but, descending into the ditches, they had undermined the walls, and blown up the most impregnable forts with explosions of powder. They sprang one of those mines beneath the bastion of St Demetri. It overturned a considerable part of the wall, which crushed all the defenders of the bastion. That instant the besiegers sprang up with their fabrics in their hands, and taking advantage of the general consternation of the besieged on that quarter, made themselves masters of the post. The besieged, recovering from their terror, attacked them with unequalled intrepidity. About 400 men failed to 2000 Turks already firmly posted on the wall, and pressed upon them with such obstinate and dauntless valour, that they killed a great number, and drove the rest down into the ditch. In this extremity, every person in the city was in arms. The Greek monks took up muskets; and the women, forgetting the delicacy of their sex, appeared on the walls among the defenders, either supplying the men with ammunition and arms, or fighting themselves; and several of those daring heroines lost their lives.

For 50 days the city held out against all the forces of the Turks. If, even at the end of that time, the Venetians had sent a naval armament to its relief, the kingdom of Canea might have been saved. Doubtless, they were not ignorant of this well known fact. The north wind blows straight into the harbour of Canea. When it blows a little briskly, the sea rages. It is then impossible for any squadron of ships, however numerous, to form in line of battle in the harbour, and to meet an enemy. If the Venetians had set out from Cerigo with a fair wind, they might have reached Canea in five hours, and might have entered the harbour with full sails, without being exposed to one cannon-shot; while none of the Turkish ships would have dared to appear before them; or if they had ventured, must have been driven back on the shore, and dashed in pieces among the rocks. But, instead of thus taking advantage of the natural circumstances of the place, they sent a few galleys, which, not daring to double Cape Spada, coasted along the southern shore of the island, and failed of accomplishing the design of their expedition.

At last, the Caneans, despairing of relief from Venice, seeing three breaches made in their walls, thought which the infields might easily advance upon them, exhausted with fatigue, and covered with wounds, and reduced to the number of 500 men, who were obliged to fascinate themselves round the walls, which were half a league in extent, and undermined in all quarters, demanded a parley, and offered to capitulate. They obtained very honourable conditions; and after a glorious defence of two months, which cost the Turks 20,000 men, marched out of the city with the honours of war. Those citizens, who did not chuse to continue in the city, were permitted to remove; and the Ottomans, contrary to their usual practice, faithfully observed their stipulations.

The Venetians, after the loss of Canea, retired to Retimo. The captain-pacha laid siege to the citadel of the Sude, situated in the entrance of the bay, on a high rock, of about a quarter of a league in circumference. He raised earthen-batteries, and made an ineffectual attempt to level its ramparts. At last, despairing of taking it by assault, he left some forces to block it up from all communication, and advanced towards Retimo. That city, being unwalled, was defended by a citadel, standing on an eminence which overlooks the harbour. General Cornaro had retired thither. At the approach of the enemy, he advanced from
The Turks having landed additional forces on the island, they introduced the plague, which was almost a constant attendant on their armies. This dreadful pest rapidly advanced, and, like a devouring fire, wasting all before it, destroyed most part of the inhabitants. The rest, fleeing in terror before its ravages, escaped into the Venetian territories, and the island was left almost desolate.

The siege of the capital commenced in 1646, and was protracted much longer than that of Troy. Till the year 1648, the Turks fearlessly gained any advantages before that city. They were often routed by the Venetians, and sometimes compelled to retire to Retimo. At that period Ibrahim was solemnly deposed, and his eldest son, at the age of nine years, was raised to the throne, under the name of Mahomet IV. Not satisfied with confining the sultan to the horrors and obscurity of a dungeon, the partisans of his son strangled him on the 19th of August, in the same year. That young prince, who mounted the throne by the death of his father, was afterwards expelled from it, and condemned to pass the remainder of his life in confinement.

In the year 1649, Ufsein Pacha, who blockaded Candia, receiving no supplies from the Porte, was compelled to raise the siege, and retreat to Canea. The Venetians were then on the sea with a strong squadron. They attacked the Turkish fleet in the bay of Smyrna, burnt 12 of their ships and 2 galleys, and killed 6000 of their men. Some time after, the Mahometans having found means to land an army on Candia, renewed the siege of the city with greater vigour, and made themselves masters of an advanced fort that was very troublesome to the besieged; which obliged them to blow it up.

From the year 1650 till 1658, the Venetians, continuing the sieges of the sea, intercepted the Ottomans every year in the straits of the Dardanelles, and fought them in four naval engagements; in which they defeated their numerous fleets, sunk a number of their caravels, took others, and extended the terror of their arms even to the walls of Constantinople. That capital became a scene of tumult and disorder. The Grand Signior alarmed, and trembling for his safety, left the city with precipitation.

Such glorious successes revived the hopes of the Venetians, and discouraged the courage of the Turks. They converted the siege of Candia into a blockade, and suffered considerable losses. The Sultan, in order to exclude the Venetian fleet from the Dardanelles, and to open to his own navy a free and safe passage, caused two fortresses to be built at the entrance of the straits. He gave orders to the Pacha of Canea to appear again before the walls of Candia, and to make every possible effort to gain the city. In the mean time, the republic of Venice, to improve the advantages which they had gained, made several attempts on Canea. In 1660, that city was about to surrender to their arms, when the Pacha of Rhodes, hastening to its relief, reinforced the defenders with a body of 2000 men. He happily doubled the extremity of Cape Mele, though within sight of the Venetian fleet, which was recalled from Cape Spada, and could not advance one fathom to oppose an enemy, considerably weaker than themselves.

Kiopuli, son and successor to the vâr of that name, who had long been the support of the Ottoman empire, knowing that the murmurs of the people against the long continuance of the siege of Candia were rising to an height, and fearing a general revolt, which would be fatal to himself and his master, set out from Byzantium, about the end of the year 1666, at the head of a formidable army. Having escaped the Venetian fleet, which was lying off Canea with a view to intercept him, he landed at Palio Cafirg, and formed his lines around Candia. Under his command were four Pachas, and the flower of the Ottoman forces. These troops, being encouraged by the presence and the promises of their chiefs, and supported by a great quantity of artillery, performed prodigies of valor. All the exterior forts were destroyed. Nothing now remained to the besieged but the barren line of the walls, unproctected by fortresses; and these being battered by an incessant discharge of artillery, soon gave way on all quarters. Still, however, what patience may perhaps regard as incredible, the Candians held out three years against all the forces of the Ottoman empire. At last they were going to capitulate, when the hope of assistance from France reanimated their valor and rendered them invincible. The expected succours arrived on the 26th of June 1669. They were conducted by the duke of Noailles. Under his command were a great number of French noblemen, who came to make trial of their skill in arms against the Turks.

Next day after their arrival, the ardour of the French prompted them to make a general sally. The duke of Beaufort, admiral of France, assumed the command of the forlorn hope. He was the first to advance against the Moislitans, and was followed by a numerous body of infantry and cavalry. They advanced furiously upon the enemy, attacked them within their trenches, forced the trenches, and would have compelled them to abandon their lines and artillery, had not an unforeseen accident damped their courage. In the midst of the engagement a magazine of powder was set on fire; the foremost of the combatants lost their lives; the French ranks were broken; several of their leaders, among whom was the duke of Beaufort, disappeared for ever; the soldiers fled in disorder: and the duke of Noailles, with difficulty, effected a retreat within the walls of Candia. The French accused the Italians of having betrayed them; and on that pretext prepared to set off sooner than the time agreed upon. No intreaties of the commandant could prevail with them to delay their departure; so they reimbarked. Their departure determined the fate of the city. There were now no more than five hundred men to defend it. Morofini capitulated with Kiopuli, to whom he surrendered the kingdom of Crete, excepting only the Sude, Grabula, and Spina-Longua. The grand vâr made his entrance into Candia on the 4th of October 1670; and stayed eight months in that city, inspecting the repairation of its walls and fortresses.

The three fortresses left in the hands of the Venetians
Candidians by the treaty of capitulation remained long after in their possession. At last they were all taken, one after another. In short, after a war of thirty years continuance, in the course of which more than two hundred thousand men fell in the island, and it was deluged with streams of Christian and Mahometan blood, Candidia was entirely subdued by the Turks, in whose hands it still continues.

Of the history of Candidia travellers speak with rupture. The heat is never excessive; and in the plains violent cold is never felt. In the warmest days of summer the atmosphere is cooled by breezes from the sea. Winter properly begins here with December and ends with January; and during that short period snow never falls on the lower grounds, and the surface of the water is rarely frozen over. Most frequently the weather is as fine then as it is in Britain at the beginning of June. These two months have received the name of winter, because in them there is a copious fall of rain, the sky is obscured with clouds, and the north winds blow violently; but the rains are favourable to agriculture, the winds chase the clouds towards the foot of the mountains, where a repository is formed for those waters which are to fertilize the fields; and the inhabitants of the plain suffer no inconvenience from these transient blizzards. In the month of February, the ground is overspread with flowers and rising crops. The rest of the year is almost one continued fine day. The inhabitants of Crete never experience any of those mortifying returns of piercing cold, which are so frequently felt in Britain and even more so in other countries, and which, succeeding suddenly after the cherishing heat of spring, nip the blossoming flowers, wither the open buds, destroy half the fruits of the year, and are fatal to delicate constitutions. The sky is always unclouded and serene; the winds are mild and refreshing breezes. The radiant sun proceeds in smiling majesty along the azure vault, and ripens the fruits on the lofty mountains, the rising hills, and the plains. The nights are no less beautiful; their coolness is delicious. The atmosphere not being overloaded with vapours, the sky unfolds to the observer's view a countless profusion of stars; those numerous stars sparkle with the most vivid rays, and shine the azure vault in which they appear fixed, with gold, with diamonds, and with rubies. Nothing can be more magnificent than this light, and the Cretans enjoy it for six months in the year.

To the charms of the climate other advantages are joined which augment their value: There are scarce any morasses in the island; the waters never stand here in a state of stagnation; they flow in numberless streams from the tops of the mountains, and form here and there large fountains or small rivers that empty themselves into the sea; the elevated situation of their springs cause them to dash down with such rapidity, that they never lose themselves in pools or lakes, consequently insects cannot deposit their eggs upon them, as they would be immediately hurried down into the sea; and Crete is not infected like Egypt with those clouds of insects which swarm in the hedges, and whose stinging is insufferably painful, nor is the atmosphere here loaded with those noxious vapours which rise from marshy grounds.

The mountains and hills are overspread with various kinds of thyme, favoury, wild thyme, and with a multitude of odoriferous and balsamic plants; the rivulets which flow down the valleys are overhung with myrtle and laurel rosettes; clumps of orange, citron, and almond trees, are plentifully scattered over the fields; the gardens are adorned with rafts of Arabian jasmine. In spring, they are belittled with beds of flowers, some extensive plains are arrayed in saffron; the cavities of the rocks are fringed with sweet-smelling dinners. In a word, from the hills, the vales, and the plains, on all hands, there arise clouds of exquisitely perfumes, which embalm the air, and render it a luxury to breathe it.

As to the inhabitants, the Mahometan men are generally from five feet and an half to six feet tall. They bear a strong resemblance to ancient statues; and it must have been after such models that the ancient artists wrought. The women also are generally beautiful. Their dresses do not restrain the growth of any part of their bodies, and their shape therefore affumes those admirable proportions with which the hand of the Creator has graced his fairest workmanship on the earth. They are not all handsome or charming; but some of them are beautiful, particularly the Turkish ladies. In general, the Cretan women have a riving throat, a neck gracefully rounded, black eyes sparkling with animation, a small month, a fine nose, and cheeks delicately coloured with the fresh vermilion of health. But the oval of their form is different from that of Europeans, and the character of their beauty is peculiar to their own nation.

The quadrupeds belonging to the island are not of a ferocious temper. There are no lions, tigers, bears, wolves, foxes, nor indeed any dangerous animal here. Wild goats are the only inhabitants of the forests that overspread the lofty mountains; and these have nothing to fear but the ball of the hunter; hares inhabit the hills and the plain; sheep graze in security on the thyme and the heath; they are folded every night, and the shepherd sleeps soundly without being disturbed with the fear that wild animals may invade and ravage his folds.

The Cretans are very happy in not being exposed to the troublesome bite of noxious insects, the poison of serpents, and the rapacity of the wild beasts of the defart. The ancients believed that the island enjoyed these singular advantages, on account of its having been the birth-place of Jupiter. "The Cretans (say the ancients) celebrate in their songs the beneficence of Jupiter, and the favour which he conferred on their island, which was the place of his birth and education, by freeing it from all noxious animal, and even rendering it unfit for nourishing those noxious animals that are introduced into it from foreign countries."

Dittany holds the first rank among the medicinal plants which are produced in Crete. The praises bestowed on the virtues of this plant by the ancients are altogether extravagant; yet we perhaps treat the medicinal virtues of this plant with too much contempt, its leaf is very balsamic, and its flower diffuses around it a delicious odour. At present the inhabitants of the island apply it with success on various occasions. The leaf, when dried and taken in an infusion with a little sugar, makes a very pleasant drink, of a finer flavour than tea. It is there an immediate cure for a weak
CANDIA [91]

CANDIA weak stomach, and enables it to recover its tone after a bad digestion.

Diseases are very rare in a country whose atmosphere is exceedingly pure; and in Candia, epidemical diseases are unknown. Pests prevail here in summer, but are not dangerous; and the plague would be wholly unknown, had not the Turks destroyed the lazarets that were established by the Venetians, for strangers to do quarantine in. Since the period when these were demolished, it is occasionally introduced by dys from Smyrna and Constantinople. As no precautions are taken against it, it gains ground, and spreads over the island from one province to another; and as the colds and heats are never intertemperate, it sometimes continues its ravages for six months at a time.

This fine country is infected with a disease somewhat less dangerous than the plague, but whose symptoms are somewhat more hideous; that disease is the leprosy. In ancient times, Syria was the focus in which it raged with most fury: and from Syria it was carried into several of the isles of the Archipelago. It is infectious, and is instantly communicated by contact. The victims who are attacked by it, are driven from society, and confined to little rainy hovels on the highway. They are strictly forbidden to leave these miserable dwellings, or hold intercourse with any person. Those poor wretches have generally beside their huts a small garden producing pulse, and feeding poultry; and with that support, and what they obtain from passengers, they find means to drag out a painful life in circumstances of shocking bodily distempers. Their bloated skin is covered with a scaly crust, speckled with red and white spots, which afflict them with intolerable itchinngs. A hoarse and tremulous voice issues from the bottom of their breasts. Their words are scarce articulated; because their tongue inwardly preys upon the organs of speech. These frightful spectres gradually lose the use of their limbs. They continue to breathe till such time as the whole mass of their blood is corrupted, and their bodies entirely in a state of putrefaction. The men are not attacked by this distemper: it confines itself to the poor, chiefly to the Greeks. But those Greeks observe strictly their four lentis; and eat nothing during that time but salt fish, botordo, salted and flinked pickled olives, and chefe. They drink plentifully of the hot and muddy wines of the island. The natural tendency of such a regimen must be, to fire the blood, to thicken the fluid part of it, and thus at length to bring on a leprosy.

Candia is at present governed by three Pachas, who reside respectively at Candia, Canas, and Retimo. The first, who is always a Pacha of three years, may be considered as viceroy of the island. He enjoys more extensive powers than the others. To him the inspection of the forts and arsenals is entrusted. He nominate to such military employments as fall vacant, as well as to the governments of the Sode, Grabofs, Spina Longa, and Gira-petra. The governors of these forts are denominated Beys. Each of them has a confidential and three general officers under him: one of whom is commander of the artillery; another of the cavalry; and the third of the janizaries.

The council of the pacha consists of a kaisan, who is the channel through which all orders are issued, and all favours bestowed; an aga of the janizaries, colonel-general of the troops, who has the chief care of the regulation of the police; two topizi bachis; a desdertar, who is treasurer-general for the imperial revenues; a keeper of the imperial treasury; and the chief officers of the army. This government is entirely military, and the power of the pacha farisqur is absolute. The justice of his sentences is never called into question; they are instantly carried into execution.

The people of the law are the muftis, who is the religious head, and the cadi. The first interprets those laws which regard the division of the patrimony among the children of a family, successions, and marriages; in a word, all that are contained in the Koran; and he also decides on every thing that relates to the ceremonies of the Mussulman religion. The cadi cannot pronounce sentence on affairs connected with these laws, without first taking the opinion of the mufti in writing, which is named Faitsa. It is his business to receive the declarations, complaints, and donations of private persons; and to decide on such differences as arise among them. The pacha is obliged to consult those judges when he puts a Turk legally to death, but the pacha, who is dignified with three tails, sets himself above all laws, condemns to death, and sees his sentence executed, of his own proper authority. All the mosques have their liams, a kind of curate, whose duty is to perform the service. There are schoolmasters in the different quarters of the city. These persons are much respected in Turkey, and are honoured with the title of Effendi.

The garrisons of Candia consists of forty-six companies, composing a military force of about ten thousand men. All these forces do not reside constantly in the city, but they may be mustered in a very short time. They are all regularly paid every three months excepting the janizaries, none of whom but the officers receive pay. The different gradations of this military body do not depend on the pacha. The council of each company, consisting of veterans, and of officers in actual service, has the power of naming to them. A person can occupy the same post for longer than two years; but the pacha of Sorbag, or captain, which is purchased at Constantinople, is held for life. The cadi, or cook, is also continued in his employment as long as the company to which he belongs is satisfied with him. Each company has its almoner, denominated imam.

The garrisons of Canas and Retimo, formed on a similar plan, are much less numerous. The first consists of about three thousand men, the other of five hundred; but as all the male children of the Turks are enrolled among the janizaries as soon as born, the number of these troops might be greatly augmented in time of war; but, to say the truth, they are far from formidable. Moll of them have never seen fire, nor are they ever exercised in military evolutions.

The pachas of Canas and Retimo are no less absolute, within the bounds of their respective provinces, than the pacha of Candia. They enjoy the same privileges with him, and their council consists of the same officers. These governors chief object is to get rich as speedily as possible; and in order to accomplish that end, they practise all the arts and cruelties of oppression, to squeeze money from the Greeks. In truth,
The Capuchins

The Jews, of whom there are not many in the island, amount only to 200,000 Jews.

Total is 350,000 souls.

This fertile country is in want of nothing but industry, and fertile lands, secure of enjoying the fruit of their labours. It might maintain four times its present number of inhabitants.

Antiquity has celebrated the island of Crete as containing an hundred populous cities: and the industry of geographers has preferred their names and situations. Many of these cities contained no fewer than thirty thousand inhabitants; and by reckoning them, on an average, at six thousand each, we shall in all probability be rather within than beyond the truth. This calculation gives for an hundred cities 600,000

By allowing the same number as inhabitants of the towns, villages, and all the rest of the island, 600,000

The whole number of the inhabitants of ancient Crete will amount to 1,200,000

This number cannot be exaggerated. When Candia was in the hands of the Venetians, it was reckoned to contain nine hundred four-score and sixteen villages.

It appears, therefore, that when the island of Crete enjoyed the blessing of liberty, it maintained to the number of eight hundred and forty-nine thousand eight hundred more inhabitants than it does at present. But since those happier times, they have been deprived of her laws by the tyranny of the Romans; has groaned under the destructive sway of the monarchs of the lower empire; has been exposed for a period of an hundred and twenty years to the ravages of the Arabs; has since passed under the dominion of the Venetians; and has at last been subjected to the despotism of the Turks, who have produced a dreadful depopulation in all the countries which have been subdued by their arms.

The Turks allow the Greeks the free exercise of their religion, but forbid them to repair their churches or monasteries; and accordingly they cannot obtain permission to repair their places of worship, or religious houses, but by the powerful influence of gold. From this article the pachas derive very considerable sums.

They have twelve bishops as formerly, the first of whom assumes the title of archbishop of Gortynia. He resides at Candia; in which city the metropolitical church of the island stands. He is appointed by the patriarch of Constantinople; and has the right of nominating to all other bishoprics of the island: the names of which are, Gortynia, Cnossus, Mirabella, Iyara, Gire-petra, Arcadia, Cherronee, Lambis, Niphopomat, Retimo, Canea, Cilamo. These bishoprics are nearly the same as under the reign of the Greek emperors. The patriarch wears a triple tiara, writes his signature in red ink, and answers for all the debts of the clergy.

To enable him to fulfil his engagements, he lays impositions on the rest of the bishops, and particularly on the monasteries, from which he draws very handsome contributions. He is considered as the head of the Greeks, whom he protects, as far as his fonder credit goes. The orders of government are directed to him on important occasions; and he is the only one of all the Greeks in the island who enjoys the privilege of entering the city on horseback.

CANDIA, is the capital of the above island, situated on its northern coast, in E. Long. 25° 60. N. Lat. 35° 30. It stands on the same situation which was formerly occupied by Heraclea, and is the seat of government under the Turks. Its walls, which are more than a league in compass, are in good repair, and defended by deep ditches, but not protected by any exterior fort. Towards the sea it has no attacks to fear; because the shallowness of the harbour renders it inaccessible to ships of war.

The Porte generally commits the government of this island to a Pacha of three tailes. The principal officers, and several bodies of the Ottoman soldiery, are stationed here. This city, when under the Venetians, was opulent, commercial, and populous; but it has now lost much of its former strength and grandeur. The harbour, naturally a fine haven, in which ships are securely sheltered from every storm, is every day becoming narrower and shallower. At present it admits only boats and small ships after they have discharged a part of their freight. These vessels, which the Turks are obliged to Candia, are obliged to go almost empty to the ports of Standie, whether their cargoes are conveyed to them in barks. Such inconveniences are highly unfavourable to commerce; and as government never thinks of removing them, the trade of Candia is therefore considerably decayed.

Candia, which was embellished by the Venetians with regular streets, handsome houses, a fine square, and a magnificent citadel, contains at present but a small number of inhabitants, notwithstanding the vast extent of the area inclosed within its walls. Several divisions of the city are void of inhabitants. That in which the market-place stands is the only one which discovers any stir of business, or show of afluence. The Mahometans have converted most of the Christian temples into mosques; yet they have left two churches to the Greeks, one to the Armenians, and a synagogue to the Jews. The Capuchins possess a small convent, with a chapel in which the vice-count of France hears mass. At present he is the only Frenchman who attends it, as the French merchants have taken up their residence at Canea.

Well of the city of Candia is an extensive range of hills;
CANDIDATE, a person who aspires to some public office.

In the Roman commonwealth, they were obliged to wear a white gown during the two years of their soliciting a place. This garment, according to Plutarch, they wore without any other clothes, that the people might not suspect they concealed money for purchasing votes, and also that they might more easily show to the people the scars of those wounds they had received in fighting for the defence of the commonwealth. The candidates usually declared their pretensions a year before the time of election, which they spent in making interest and gaining friends. Various arts of popularity were practiced for this purpose, and frequent circuits made round the city, and visits and compliments to all sorts of persons, the process of which was called ambitus. See Ambitus.

CANDIDATE MILITAE, an order of soldiers, among the Romans, who served as the emperor's bodyguards to defend him in battle. They were the tallest and strongest of the whole troops, and most proper to inspire terror. They were called candidati, because clothed in white, either that they might be more conspicuous, or because they were considered in the way of preference.

CANDISH, a considerable province of Asia, in the dominions of the Great Mogul, bounded by Chytor and Malva on the north, Orissa on the east, Decan on the south, and Guzarat on the west. It is populous and rich; and abounds in cotton, rice, and indigo. Barampore is the capital town.

CANDLE, a small taper of tallow, wax, or spermaceti; the wick of which is commonly of several threads of cotton, spun and twisted together.

A tallow-candle, to be good, must be half sheep's and half bullock's tallow; for hog's tallow makes the candle gutter, and always gives an offensive smell, with a thick black smoke. The wick ought to be pure, sufficiently dry, and properly twisted; otherwise the candle will emit an inconstant vibratory flame, which is both prejudicial to the eyes and insufficient for the distinct illumination of objects.

There are two sorts of tallow-candles: the one dipped, the other moulded: the former are the common candles; the others are the invention of the fleur le Bregre at Paris.

As to the method of making candles in general: After the tallow has been weighed, and mixed in the due proportions, it is cut into very small pieces, that it may melt the sooner; for the tallow in lamps, as it comes from the butchers, would be in danger of burning or turning black, if it were left too long over the fire. Being perfectly melted and skimmed, they pour a certain quantity of water into it, proportionable to the quantity of tallow. This serves to precipitate to the bottom of the vessel the impurities of the tallow which may have escaped the skimmer. No water, however, must be thrown into the tallow designed for the three first dips; because the wick, being fill quite dry, would imbibe the water, which makes the candles crackle in burning, and renders them of bad use. The tallow, thus melted, is poured into a tub, through a coarse sieve of horse-hair, to purify it still more, and may be used after having stood three hours. It will continue fit for use 24 hours in summer and 15 in winter. The wicks are made of spun cotton, which the tallow-chandlers buy in skins, and which they wind up into bottoms or clues. Whence they are cut out, with an instrument contrived on purpose, into pieces of the length of the candle required; then put on the sticks or broaches, or else placed in the moulds, as the candles are intended to be either dipped or moulded.

Wax-candles are made of a cotton or flaxen wick, slightly twisted, and covered with white or yellow wax. Of these, there are several kinds: some of a conical figure, used to illuminate churches, and in processions, funeral ceremonies, &c. (see TAPER); others of a cylindrical form, used on ordinary occasions. The first are either made with a lade or the hand. 1. To make wax-candles with the lade. The wicks being prepared, a dozen of them are tied by the neck, at equal distances, round an iron circle, suspended over a large bason of copper tinned, and full of melted wax: a large lade full of this wax is poured gently on the tops of the wicks one after another, and this operation continued till the candle arrive at its defined bigness; with this precaution, that the three first ladies be poured on at the top of the wick, the fourth at the height of \( \frac{1}{3} \), the fifth at \( \frac{1}{4} \), and the sixth at \( \frac{1}{4} \), in order to give the candle its pyramidal form. Then the candles are taken down, kept warm, and
CANDLES

and rolled and smoothed upon a walnut-tree table, with a long square instrument of box, smooth at the bottom.

2. As to the manner of making wax-candles by the hand, they begin to soften the wax, by working it several times in hot water, contained in a narrow but deep caldron. A piece of the wax is then taken out, and dipped by little and little around the wick, which is hung on a hook in the wall, by the extremity opposite to the neck; so that they begin with the big end, diminishing till they defend towards the neck. In other respects the method is nearly the same as in the former cafe. However, it must be observed, that, in the former cafe, water is always used to moisten the several instruments, to prevent the wax from flicking; and in the latter, oil of olives, or lard, for the hands, &c. The cylindrical wax-candles are either made as the former, with a ladle, or drawn. Wax-candles drawn, are so called, because actually made in the manner of wire, by means of two large rollers of wood, turned by a handle, which, turning backwards and forwards several times, pafs the wick through melted wax contained in a brafs basin, and at the same time through the holes of an instrument like that used for drawing wire fastened at one side of the basin.

If any candlers in Britain mix with their wares any thing deceitfully, &c. the candlers shall be forfeited.

Stat. 23 Eliz. and a tax or duty is granted on candles, by 8 and 9 Anne, cap. 6. made for sale, of one penny a pound, besides the duty upon tallow, by 8 Anne, cap. 9. And by 24 Geo. III. cap. 11. an additional duty of an halfpenny a pound: and by the same an additional duty of an halfpenny a pound is laid upon all candles imported (except those of wax and spermaceti, for which see WAX-CANDLES), subject also to the two additional 5 per cent. imposed by 19 and 22 Geo. III. besides the duty of 2½d. formerly imposed by 2 W. etf. 2. cap. 4. 8 Anne, cap. 9. and 9 Anne, cap. 6.

And every maker of candles, other than wax candles, for sale, shall annually take out a licence at L. 1. The maker of candles shall, in four weeks within the bills, and elsewhere in six weeks, after entry, clear off the duties on pain of double duty: nor shall any after default in payment on pain of double value; 8 Anne, cap. 9.

The makers of candles are not to use melting hоuses, without making a true entry, on pain of L. 100, and to give notice of making candles to the excise officer for the duties: and of the number, &c. or shall forfeit L. 50. Stat. 11. Geo. I. cap. 30. See also 21 Geo. II. cap. 21. and 26 Geo. II. cap. 22. No maker of candles for sale shall begin to make candles, without notice first given to the officer, unless from September 29th to March 25th yearly, between seven in the morning and five in the evening, and from March 25th to September 29th, between five in the morning and seven in the evening, on pain of L. 10, 8 Anne, cap. 26. The penalty of obstructing the officer is L. 20, and of removing of candles before they are surveyed L. 20, 8 Anne, cap. 9. The penalty of privately making candles is the forfeiture of the flame and utensils, and L. 100, 5 Geo. III. cap. 43. And the penalty of mingling weighed with unweighted candles, of removing them before they are weighed, or of concealing them, is the forfeiture of L. 100, 11 Geo. cap. 30. Candles, for which the duty hath been paid, may be exported, and the duty drawn back; but no draw-back shall be allowed on the exportation of any foreign candles imported. 8. Ann. cap. 9. 23 Geo. II. cap. 21.

The Roman candles were at first little strings dip in pitch, or surrounded with wax; though afterwards they made them of the papyrus, covered likewise with wax; and sometimes also of rushes, by stripping off the outer rind, and only retaining the pith.—For religious offices, wax candles were used; for vulgar uses, those of tallow. Lord Bacon proposes candles of divers compositions and ingredients, as also of different sorts of wicks; with experiments of the degrees of duration, and light of each. Good houf-wives bury their candles in flour or bran, which it is said increases their lasting almost half.

Experiments to determine the real and comparative value of burning CANDLES of different sorts and fixes.

N.B. The time that one candle lasted was taken from an average of several trials in each fixe.

It is observable, in opins, that the flame of two candles joined, give a much stronger light than both of them separate. The observation was suggested by Dr Franklin. Probably the union of the two flames produces a greater degree of heat, whereby the vapour is attenuated, and the particles of which light consists more copiously emitted.

Lighting a CANDLE by a small spark of electricity. This method, which is an invention of Dr Ingenhousz, is recorded in the Phil. Trans. vol. 68. It is done by a small phial, having eight or ten inches of metallic coating, or even less, charged with electricity, which may be done at any time of the night by a person who has an electric machine in his room. “When I have occasion to light a candle,” says he, “I charge a small coated phial, whose knob is bent outwards, so as to hang a little over the body of the phial; then I wrap some loose cotton over the extremity of a long brass pin or wire, so as to flick moderately fast to its subsistance. I next roll this extremity of the pin wrapped up with cotton in some fine powder of (which, I always keep in readiness upon the table for this purpose, either in a wide-mouthed phial or in a
Candle, or Candlberry.

Candle, a feast of the church held on the second day of February, in honour of the purification of the Virgin Mary. It is borrowed from the practice of the ancient Christians, who on that day used abundance of lights both in their churches and processions, in memory, as is supposed, of our Saviour's being on that day declared by Simeon 'to be a light to lighten the Gentiles.' In imitation of this custom, the Roman-catholics on this day consecrate all the tapers and candles which they use in their churches during the whole year. At Rome, the Pope performs that ceremony himself; and distributes wax-candles to the cardinals and others, who carry them in procession through the great hall of the Pope's palace. This ceremony was prohibited in England by an order of council in 1548.

Candlemas, in England, is made one of the four terms of the year for paying and receiving rents or borrowed money, &c.—In the courts of law, Candlemas term begins 15th January, and ends 3d February.

Candlestick, an instrument to hold a candle, made in different forms, and of all sorts of matter.

The golden candlestick was one of the sacred utensils made by Moses to be placed in the Jewish tabernacle. It was made of hammered gold, a talent in weight. It consisted of seven branches supported by a base or foot. These branches were adorned at equal distances with six flowers like lilies, and with as many bowls and knobs placed alternately. Upon the flock and four branches of the candlestick were the golden lamps, which were immovable, wherein were put oil and cotton.

These seven lamps were lighted every evening, and extinguished every morning. The lamps had their tongs or snuffers to draw the candle in or out, and dished underneath them to receive the sparks or droppings of the oil. This candlestick was placed in the antechamber of the sanctuary on the south side, and served to illuminate the altar of perfume and the tabernacle of the shew-bread. When Solomon had built the temple of the Lord, he placed in it ten golden candlesticks of the same form as that described by Moses, five on the north and five on the south side of the holy place; but after the Babylonian captivity, the golden candlestick was again placed in the temple, as it had been before in the tabernacle by Moses. This sacred utensil, upon the destruction of the temple by the Romans, was lodged in the temple of peace built by Vespasian; and the representation of it is still to be seen on the triumphal arch at the foot of Mount Palatine, on which Vespasian's triumph is delineated.

Candy, a large kingdom of Asia, in the island of Ceylon. It contains about a quarter of the island; and as it is encompassed with high mountains, and covered with thick forests, through which the roads and paths are narrow and difficult, the king has them guarded to prevent his subjects from going into other countries. It is full of hills, from whence rivulets proceed which are full of fish; but as they run among the rocks, they are not fit for boats: however, the inhabitants are very dexterous in turning them to water their land, which is fruitful in rice, pille, and hemp. The king is absolute, and his subjects are idolaters. The capital town is of the same name.

Candy, a town of Asia, and capital of a kingdom of...
of the same name, in the island of Ceylon. It has been often burnt by the Portugeuefe, when they were masters of these coasts. The houses are very poor, low, and badly furnished. E. Long. 79. 12. N. Lat. 7. 35.

CANDY, or Sugar-Candy, a preparation of sugar made by melting and crystallizing it six or seven times over, to render it hard or transparent. It is of three kinds, white, yellow, and red. The white comes from the leaf-fugar, the yellow from the cassonado, and the red from the turpincado.

CANDYING, the art of preserving simples in substance, by boiling them in sugar. The performance of this originally belonged to the apothecaries, but is now become a part of the business of the confectioner.

CANE, in botany. See ARUNDO and CALAMUS.

Cane, denotes also a walking flick. It is customary to adorn it with a head of gold, silver, agate, &c. Some are without knots, and very smooth and even; others are full of knots about two inches distance from one another. These last have very little elasticity, and will not bend so well as the others.

Canes of Bengal are the most beautiful which the Europeans bring into Europe. Some of them are five feet, five inches English measure: the cane of Toulouse and the Upper Languedoc, is equal to the varre of Arragon, and contains five feet 8½ inches; at Montpellier, Provence, Dauphine, and the Lower Languedoc, to six English feet ½ inches.

CANEHA, a considerable town of the island of Candia, where a bark-reefe. It was built by the Venetians, and occupies part of the site of the ancient CYDONIA. It is but about two miles in compass; encircled on the land side with a single wall, extremely thick; and defended by a broad and deep ditch, cut through a bed of rock, which extends all around the wall. By cutting it still deeper, they might cause the sea to flow round its ramparts; on which they have raised high platforms, that their great guns might command a wider extent of the adjacent plain. The city has only one gate, the gate of Retimo, protected by a half-moon battery, which is the only exterior fort. The side which faces the sea is the best fortified. On the left of the harbour are four batteries, rising one above another, and planted with a number of large cannon of cast metal, marked with the arms of Venice. The first of these batteries stands close on the brink of the sea. The right side of the harbour is defended only by a strong wall, extending along a chain of pointed rocks which it is dangerous for ships to approach. At the extremity of this wall, there is an old castle, falling into ruins. Beneath that castle, the Venetians had immense arsenals, vaulted with stone. Each of these vaults was of sufficient length, breadth, and height, to serve as a work-shop for building a ship of the line. The ground is floping, and the outermost part of these spacious arsenals is on a level with the sea; so that it was very easy to launch the ships built there into the water. The Turks are suffering that magnificent work to fall into ruins.

The city of Canea is laid out on a fine plan. The streets are large and straight; and the figures adorned with fountains. There are no remarkable buildings in it. Most of the houses are flat-roofed, and have only one story. Those contiguous to the harbour are adorned with galleries, from which you enjoy a delightful prospect. From the windows you discover the large bay formed between Cape Spada and Cape Melec, and all the ships that are entering in or passing out. The harbour, at present, receives ships of 200 tons burden; and it might be enlarged so as to admit the largest frigates. Its mouth is exposed to the violence of the north winds, which sometimes swell the billows above the ramparts. But, as it is narrow, and the bottom is good, ships that are well moored run no danger. At the time when Tournafort visited Crete, Canea did not contain more than five or six thousand inhabitants. But, at present, when the gates of Girapetra, Candia, and Retimo are choked up, the merchants have retired to Canea; and it is reckoned to contain 16,000 souls. The environs of the town are admirable; being adorned with forests of olive-trees mixed with fields, vineyards, gardens, and brooks bordered with myrtle-trees and lattal-roles. The chief revenue of this town consists in oil-olive. E. Long. 24. 15. N. Lat. 35. 28.

CANELLA, in botany: A genus of the monogynia order belonging to the dodecandra class of plants; and in the natural method ranking under the 12th order, Holocaracata. The calyx is three lobi, the petals are five; the antheræ 16, growing in an uncurculated or bladder-shaped neftarium; and the frut is a trilocular berry, with two seeds. There is but one species, the alba; which grows usuallly about 20 feet high, and eight or ten inches in thickness, in the thick woods of most of the Bahama islands. The leaves are narrow at the stalk, growing wider at their ends, which are broad and rounding, having a middle rib only; they are very smooth, and of a light shining green. In May and June the flowers, which are pentapetalons, come forth in clusters at the ends of the branches: they are red, and very fragrant, and are succeeded by round berries, of the size of large peas, green, and when ripe (which is in February) purple, containing two shining black seeds, flat on one side, otherwise not unlike in shape to a kidney bean: these seeds in the berry are enveloped in a filmy mucilage. The whole plant is very aromatic, the bark particularly, being more used in distilling, and in greater esteem, in the more northern parts of the world than in Britain.

The bark is the canella alba of the flippers. It is brought to us rolled up into long quills, thicker than cinnamon, and both outwardly and inwardly of a white colour, slightly inclining to yellow. Infusions of it in water are of a yellowish colour; and smell of the canella; but they are rather bitter than aromatic. Tinctures in rectified spirit have the warmth of the bark, but little of its smell. Proof-spirit diffolves the aromatic as well as the bitter matter of the canella, and is therefore the best meucrum.

The canella is the interior bark fed from an outward thin
CANELLA, or CANNEL, a large country in the island of Crete, called formerly the kingdom of Creta. It contains a great number of canes, the principal of which are occupied by the Dutch. The chief riches of this country consist in cinnamon, of which there are large forests. There are five towns on the coast, some forts, and a great number of harbours. The rest of the country is inhabited by the natives; and there are several rich mines, from whence they get rubies, sapphires, topazes, cat's-eyes, and several other precious stones.

CANEPORE, in Grecian antiquity, virgins who, when they became marriageable, presented certain baskets full of little curiosities to Diana, in order to get leave to depart out of her train, and change their state of life.

CANEPORIA, in Grecian antiquity, a ceremony which made part of a feast, celebrated by the Athenians virgins on the eve of their marriage-day. At Athens the canephoria consisted in this; that the maid, conducted by her father and mother, went to the temple of Minerva, carrying with her a basket full of presents to engage the gods to make the marriage-state happy; or, as the scholiast of Theocritus has it, the basket was intended as a kind of honourable amends made to that goddes, the protector of virginity, for abandoning her party; or as a ceremony to appease her wrath. Sidra calls it a festival in honour of Diana.

CANE, in Egypt and other eastern countries, a poor fort of buildings for the reception of strangers and travellers. People are accommodated in these with a room at a small price, but with no other necessaries: so that, excepting the room, there are no greater accommodations in these houses than in the defarts, only that there is a market near.

CANS, in astronomy, the grey-hounds, two new constellations, first established by Feveius, between the tail of the Great Bear and Bootes' arms, above the Coma Berenices. The first is called aferior, being that next the Bear's tail; the other inferior. They comprehended 25 stars, of which Tycho only observed two. The longitudes and latitudes of each are given by Feveius. In the British Catalogue they are 25.

CANETO, a strong town of Italy in the duchy of Mantua, seated on the river Cagio, which was taken by the Imperialists in 1702, afterwards by the imperialists, and then by the French in 1705. E. Long. to 45. N. Lat. 40. 55.

CANGA, in the Chinese affairs, a wooden clog borne on the neck, by way of punishment for divers offenses. The canga is composed of two pieces of wood notched, to receive the criminal's neck; the load lies on his shoulders, and is more or less heavy according to the quality of his offense. Some cangas weigh 20 lb.; the generality from 30 to 60. The Mandarin condemn to the punishment of the canga. Sentence of death is sometimes changed for this kind of punishment.

CANGE, (Charles du Fresne sieur du), one of the most learned writers of his time, was born at Aumins in France, and studied at the Jefuits college in that city. Afterwards he applied himself to the study of law at Orleans, and gained the reputation of his works; among which are: 1. The history of the empire of Conftantinople under the French emperors. 2. John Cinnamus's six books of the history of the affairs of John and Manuel Comnenus in Greek and Latin, with historical and philological notes. 3. Clefsium ad Scriptores mediae et infime Latinitatis.

CANGI, CANGI, or Cangi, anciently a people of Britain, concerning whose situation antiquaries have been much perplexed. They are all the same people. Camden discovered some traces of them in many different and distant places, as in Somcrsfetshire, Wales, Derbyshire, and Cheshire; and he might have found as plain vestiges of them in Devonshire, I orkfhir, Eicex, Wiltshire, &c. Mr. Fordey and others are no less perplexed and undecided in their opinions on this subject. But Mr. Baxter seems to have discovered the true cause of all this perplexity, by observing that the Cangi or Cangii were not a distinct nation seated in one particular place, but such of the youth of many different nations as were employed in pasturage, in feeding the flocks and herds of their respective tribes. Almost all the ancient nations of Britain had their cangii, their pafloriata valores, the keepers of their flocks and herds, who ranged about the country in great numbers, as they were invited by the favor and plenty of pasture for their cattle. This is the reason that vestiges of their name are to be found in so many different parts of Britain; but chiefly in those parts which are most fit for pasture. These cangii of the different British nations, naturally brave, and rendered still more hardy by their way of life, were constantly armed for the protection of their flocks from wild beasts; and these arms they occasionally employed in the defence of their country and their liberty.

CANGIAGIO, or CANGIAGIO, (I dodici) one of the most eminent of the Genoese painters, was born in 1527. His works at Genoa are very numerous; and he was employed by the king of Spain to adorn part of the Etruria. It is remarked of him, that he was not only a most expeditious and rapid painter, but also that he worked equally well with both hands.
and by that unusual power he executed more designs, and finished more grand works with his own pencil, in a much shorter time, than most other artists could do with several assistants. He died in 1683.

In the royal collection at Paris, there is a Sleeping Cupid, as large as life, and likewise judith with her attendant; which are painted by Cangiagio, and are an honour to that matter. And in the Pembroke collection at Wilton, is a picture, reputed the work of Cangiagio, representing Christ bearing his Cross.

CANICULA, is a name proper to one of the stars of the constellation canis major, called also simply the *See Sirius dog-star; by the Greeks τηρης, στερ[is]. Canicula is the tenth in order in the Britannic catalogue; in Tycho's and Ptolemey's it is the second. It is situated in the mouth of the constellation; and is of the first magnitude, being the largest and brightest of all the stars in the heavens. From the rising of this star not co林ically, or with the sun, but heliacally, that is, its emersion from the sun's rays, which now happens about the 15th day of August, the ancients reckoned their dio caniculares, or dog-days. The Egyptians and Ethiopians began their year in the mouth of the constellation; and is of the first rising, which is called the Canis canarius, or canicular year. This year constituted ordinarily of 365 days, and every fourth year of 366, by which it was accommodated to the civil year. The reason of their choice of the canicula before the other stars to compute their time by, was not only the superior brightness of that star, but because its heliacal rising was in Egypt a time of singular note, as falling on the greatest augmentation of the Nile, the reputed father of Egypt. Ephesien adds, that the Canicula is a dog, the representative of the sun, or rather because it was partakes of, or has any relation to, the nature of a dog.

**Canine Teeth** are two sharp edged teeth in each jaw; one on each side, placed between the incisors and molars.

**Canini,** (John Angelo and Marc Anthony) brothers and Romans, celebrated for their love of antiquities. John excelled in designs for engraving on stones, particularly heads; Marc engraved them. They were encouraged by Colbert to publish a collection of heads of the heroes and great men of antiquity, collected from medals, antique stones, and other ancient remains; but John died in one of those attempts. The work was given to Canini, however, procured alliance, published and printed in Italian in 1669. The cuts of this edition were engraved by Canini, Picard, and Vaut; and a curious explanation is given, which discovers the skill of the Canini in history and mythology. The French edition of Amsterdam, 1731, is in Latin.

**Canis, or Dog** in zoology, a genus of quadrupeds, belonging to the order of ferae. The characters of the dog are these: he has six fore-teeth in the upper jaw, those in the fides being longer than the intermediate ones, which are lobated; in the under jaw there are likewise six fore-teeth, those in the fides being lobated. He has six grinders in the upper jaw, and six in the under jaw. The teeth called dog-teeth, in each side, both in the lower and upper jaw; they are sharp-pointed, bent a little inward, and stand at a distance from any of the rest.

There are 14 species of this genus, viz.

I. The Familias, or Domestic Dog, is distinguished from the other species by having his tail bent to the Dog-left side; which mark is so singular, that perhaps the tail of no other quadruped is bent in this manner. Of See Plates this species there are a great number of varieties. Lin. CXVIII, nunc enumerates 11, and Buffon gives figures of no less than 27. The mastiff is about the size of a wolf, with the sides of the lips hanging down, and a full round body. The large Danish dog differs only from the former in being fuller in the body, and generally of a larger size. The grey-hound is likewise the same with the mastiff; but its make is more slender and delicate. Indeed the difference betwixt these three dogs, although perfectly indistinguishable at first sight, is not greater than that betwixt a Dutchman, a Frenchman, and an Italian. The shepherd's dog, the wolf-dog, and what is commonly called the Siberian dog, to which may be joined the Lapland dog, the Canada dog, and, in general, all those which have straight ears and a pointed snout, are all one kind, differing only in thickness, the roughness or smoothness of their skin, the length of their legs and tails. The hound or beagle, the terrier, the braque or harrier, and the spaniel, may be considered as the same kind: they have the same form and the same instincts; and differ only in the length of their legs, and size of their ears, which in each of them are long, soft, and pendulous. The bull-dog, the small Danish dog, the Turkish dog, and the Iceland dog, may likewise be considered as the same kind, all the varieties in their appearance taking their rise merely from climate. For instance, the Turkish dog, which has no hair, is nothing else but the small Danish dog transported to a warm climate, which makes the hair fall off. A dog of any kind loses its hair in very warm climates. But this is not the only change which arises from the difference of climate. In some countries, the voice is changed.,
The variety called the Highland grey-hound, and now become very scarce, is of very great size, strong, deep-cheeked, and covered with long rough hair. This kind was much esteemed in former days, and used in great numbers by the powerful chieftains in their magnificent hunting-matches. It had as sagacious nostrils as the blood-hound, and was as fierce.

f. The third species is the leovinarius, or lorarius; the leoviner or lyemmer; the first name is derived from the lightness of the kind; the other from the old word lyemme, thong; this species being used to be led in a thong, and dipped at the game. Our author says that this dog was a kind that hunted both by scent and fight; and in the form of its body observed a medium between the hound and greyhound. This probably is the kind now known by the name of the Irish grey-hound, a dog now extremely scarce in that kingdom, the late king of Poland having procured from them as many as possible. They were of the kind called by Buffon le grand Danois, and probably imported there by the Danes who long possessed that kingdom. Their use seems originally to have been for the chase of wolves with which Ireland swarmed till the latter end of the last century. As soon as these animals were extirpated, the numbers of the dogs decreased; for, from that period, they were kept only for State.

g. The vortagus, or tumbler, is a fourth species; which took its prey by mere curiosity, depending neither on the caginess of its nose, nor its swiftness; if it came into a warren, it neither barked, nor ran on the rabbits; but by a seeming neglect of them, or attention to something else, deceived the object till it got within reach, so as to take it by a sudden spring. This dog was less than the hound, more frangible, had prickled up ears, and by Dr Caius's description seems to answer to the modern lurcher.

The third subdivision of the more generous dogs comprehends those which were used in fowling.

h. First, the Hispaniarius, or spanteri; from the name, it may be supposed that we were indebted to Spain for this breed. There were two varieties of this kind: the first used to squire the game, which are the same with the sparters. The other variety was used only for the net, and was called index, or the setter; a kind well known at present. Britain has been long remarkable for producing dogs of this sort, particular care having been taken to preserve the breed in the utmost purity. They are still distinguished by the name of English Spaniels; so that, notwithstanding the derivation of the name, it is probable they are natives of Great Britain.

i. The aquatipus, or finder, was another species used in fowling; was the same with the water-sparie; and was used to find or recover the game that was shot.

k. The Melitus, or fitor, the spaniel gentle or comforter of Dr Caius (the modern lap-dog), was the laft of this division. The Maltese little dogs were as much esteemed by the fine ladies of past times as those of Bologna are among the modern. Old Hollinghead is

1. The Gratus, fit inter canes, "the first in rank among dogs;" that it was formerly esteemed so, appears from the forest-laws of King Canute, who enabled that no one under the degree of a gentleman should presume to keep a grey-hound; and still more strongly from an old Welsh saying which signifies, that "you may know a gentleman by his hawk, his horse, and his grey-hound."

Dr Caius has left, among several other traits relating to natural history, one written expressly on the species of British dogs; besides a description of the variety of dogs then existing in that country, he has added a systematical table of them, which we shall here insert, and explain by a brief account of each kind.

SYNOPSIS OF BRITISH DOGS.

Hounds. 1. The most generous kinds. 2. Dogs of chase.

- Terrier
- Harrier
- Blood-hound
- Gaze-hound
- Grey-hound
- Leviner, or Lycemer
- Tumbler
- Spaniel
- Setter
- Water-spaniel, or finder
- Spaniel gentle, or comforter
- Shepherd's dog
- Maltiff, or ban dog.
- Wappe
- Turnspit
- Dancer

1. a. The first variety is the terrarius or terrier, which takes its name from its subterraneous employ; being a small kind of hound used to force the fox or other beasts of prey out of their holes; and in former times, rabbits out of their burrows into nets.

b. The levinarious, or harrier, is a species well known at present; it derives its name from its use, that of hunting the hare; but under this head may be placed the fox-hound, which is only a stronger and fleetier variety, applied to a different chase.

c. The fanguinarius, blood-hound, or hounds of the Scots, was a dog of great use, as already noticed under the article Blood-Hound.

The next subdivision of this species of dogs comprehends those that hunt by the eye; and whose faculties depend either upon the quickness of their sight, their swiftness, or their curiosity.

d. The agfasus, or gaze-hound, was the first; it chased indifferently the fox, hare, or buck. It would seek from the herd the fairest and fairest deer; pursue it by the eye; and, if lost for a time, recover it again by its singular distinguishting faculty; nay, should the beast rejoi the herd, this dog would fix unerringly on the same. This species is now lost, or at least unknown to us.

e. The next kind is the leporarius, or gre-hound. Dr Caius informs us, that it takes its name quad præcipu
ridiculously severe on the fair of his days for their executive passion for these little animals; which is sufficient to prove that it was, in his time, a novelty. 2. The second grand division of dogs comprehends the rastris, or those that were used in the country.

a. The first species is the pajaloralis, or shepherd's dog; which is the same that is used at present, either in guarding the flocks, or in driving herds of cattle. This kind is so well trained for these purpooses as to attend to every part of the herd, be it ever so large; confine them to the road; and force in every straggler, without doing it the least injury.

b. The next is the cattedicus, or catenarius; the mastiff or fad dog; a species of great size and strength, and a very loud barker. Cain tells us that three of these were reckoned a match for a bear; and these climates, his ears are withnot doing it.

2. The second grand division of dogs comprehends of a geographical chart, preferring as much as possible, the position of the different climates to which each variety naturally belongs. The shepherd's dog, as already mentioned, is the root of the tree. This dog, when transported into Lapland, or other very cold climates, assumes an ugly appearance, and shrinks into a smaller size: but, in Russia, Iceland, and Siberia, where the climate is less rigorous, and the people more advanced in civilization, it seems to be better accomplished. These changes are occasioned solely by the influence of these climates, which produce no great alteration in the figure of this dog; for, in each of these climates, his ears are erect, his hair thick and long, his aspect wild, and he barks less frequently, and in a different manner, than in more favourable climates, where he acquires a finer polish. The Iceland dog is the only one that has not his ears entirely erect; for their extremities are a little inclined; and Iceland, of all the northern regions, has been longest inhabited by half civilized men.

The same shepherd's dog, when brought into temperate climates, and among a people perfectly civilized, as Britain, France, and Germany, would, by the mere influence of the climate, lose his savage aspect, his erect ears, his rude, thick, long hair, and assume the figure of a bull dog, the hound, and the Irish greyhound.

The bull-dog and Irish greyhound have their ears still partly erect, and very much refembl’d, both in their size, and their man! He seems to be better accommodated. The genealogical chart, or tree, of the species of dogs, in which he makes the acquaintance of the different climates, is intend’d to give an idea of their varieties as arising from a degeneration in particular climates, and from a commixture of the different races. It is constructed in the form of a geographical chart, preferring as much as possible, the position of the different climates to which each variety naturally belongs. The shepherd’s dog, as already mentioned, is the root of the tree. This dog, when transported into Lapland, or other very cold climates, assumes an ugly appearance, and shrinks into a smaller size: but, in Russia, Iceland, and Siberia, where the climate is less rigorous, and the people more advanced in civilization, it seems to be better accomplished. These changes are occasioned solely by the influence of these climates, which produce no great alteration in the figure of this dog; for, in each of these climates, his ears are erect, his hair thick and long, his aspect wild, and he barks less frequently, and in a different manner, than in more favourable climates, where he acquires a finer polish. The Iceland dog is the only one that has not his ears entirely erect; for their extremities are a little inclined; and Iceland, of all the northern regions, has been longest inhabited by half civilized men.

The hound, the harrier, and the terrier, constitute but one race; for, it has been remarked, that in the same litter, hounds, harriers, and terriers, have been brought forth, though the female hound had been covered by only one of these three dogs. I have joined the common harrier to the Dalmatian dog, or harrier of Bengal, because they differ only in having more or fewer spots on their coat. I have also linked the turnip, or terrier with crooked legs, with the common terrier; because the defect in the legs of the former has originally proceeded from a difference similar to the rickets, with which some individuals had been affected, and transmitted the deformity to their descendants.

The hound, when transported into Spain and Barbary, where all animals have fine, long, bushy hair, would be converted into the Spanish and water-dog. The great and small spaniel, which differ only in size, when brought into Britain, have changed their white colour into black, and become, by the influence of climate, the great and little King Charles's dog: To these may be joined the pyramine, which is only a King-Charles's dog, black like the others, but marked with red on the four legs, and a spot of the same colour above each eye, and on the muzzle.

The Irish greyhound, transported to the north, is become the great Dalmatian dog; and, when carried to the south, was converted into the common greyhound.
The largest grey-hounds come from the Levant, those of a smaller size from Italy; and those Italian grey-hounds, carried into Britain, have been still farther diminished.

The great Danish dog, transported into Ireland, the Ukraine, Tartary, Epirus, and Albania, has been changed into the Irish grey-hound, which is the largest of all dogs.

The bull-dog, transported from Britain to Denmark, is become the little Danish dog; and the latter, brought into warm climates, has been converted into the Turkish dog. All these races, with their varieties, have been produced by the influence of climate, joined to the effects of shelter, food, and education. The other dogs are not pure races, but have proceeded from mixtures of those already described. I have marked, in the table, by dotted lines, those which form a pure race with a mongrel.

The grey-hound and Irish grey-hound have produced the mongrel grey-hound, called also the grey-hound with wolf's hair. The muzzle of this mongrel is less refined to the head than that of the true grey-hound, which is very rare in France.

The great Danish dog and the large spaniel have produced the Calabrian dog, which is a beautiful animal, with long bushy hair, and larger than the Irish grey-hound.

The spaniel and terrier have produced the dog called berger.

From the spaniel and little Danish dog has proceeded the lion-dog, which is now very rare.

The dogs with long, fine, crisp red hair, called the bouffe dogs, and which are larger than the water-dog, proceed from the spaniel and water-dog.

The little water-dog comes from the water-dog and small spaniel.

From the bull-dog and Irish grey-hound proceeds a mongrel called the mastiff, which is larger than the bull-dog, and resembles the latter more than the Irish grey-hound.

The pug-dog proceeds from the bull-dog and small Danish dog.

All these dogs are simple mongrels, and are produced by the commixture of two pure races. But there are other dogs, called double mongrels, because they proceed from the junction of a pure race with a mongrel. The bullard pug-dog is a double mongrel from a mixture of the pug-dog with the little Danish dog. The Alicant dog is also a double mongrel, proceeding from the pug-dog and small spaniel. The Maltese, or lap-dog, is a double mongrel, produced between the small spaniel and little water-dog.

Lastly, there are dogs which may be called triple mongrels, because they are produced by two mixed races. Of this kind are the Artois and officer dogs, which are produced by the pug-dog and the bullard pug-dog; to which may be added the dogs called street-dogs, which resemble no particular kind, because they proceed from races which have previously been several times mixed.

The following is a systematic catalogue of all the known dogs, as arranged by Mr. Pennant in his History of Quadrupeds:

1. Shepherd's dog (Canis domesticus, Lin. Le Chien de Berger, Buff.); so called, because it becomes without discipline almost infamously the guardian of the flocks, keeps them within bounds, reduces the stragglers to their proper limits, and defends them from the attacks of the wolves. They have that variety in England, but it is small and weak. It is the natural of Canis abovementioned. Those of France and the Alps are very large and strong; sharp-nosed; erect and sharp eared; very hairy, especially about the neck; and have their tails turned up or curled; and by accident their faces often show the marks of their combats with the wolf.

Its varieties or nearest allies are: a, Pomeranian dog, a, Siberian dog. The other varieties in the inland parts of the empire and Siberia noticed by Buffon, are chiefly from the shepherd's dog; and there is a high-limbed taper-bodied kind, the common dog of the Cilcme and independent Tartars, excellent for the chase and all uses.

2. The hound, or dog with long, smooth, and pendulous ears. This is the same with the blood-hound in Cains's Table, (Le Chien courant, Buff. Canis fagax, Lin.) It is the head of the other kinds with smooth hanging ears. a, Harrier; b, Dalmatian, vulgarly called the Danish, a beautiful pointed dog; c, Terrier; d, Water dog, great and small.

From this stock branches out another race with pendant ears, covered with long hairs, and less in size; which form,

3. The Spaniel; (Canis avicularius, Lin.) Those of this kind vary in size from the setting dog to the springing spaniels, and some of the little lap-dogs; as, a, King Charles's. Charles II. never went out except attended by numbers of this kind. b, Le pyrane of Buffon. For this sort, though common in Britain, there is no English name. It is black, marked on the legs with red, and having a spot of the same colour above each eye. c, The Shock-dog.

4. Dogs with short pendant ears, and long legs and bodies; as,

a, Irish grey-hound; (le Matin, Buff.): a variety once very frequent in Ireland, and used in the chase of the wolf; now very scarce. Probably the same with the leviner in Cain's Table, described above.

b, Common grey-hound, described above under Cain's Table; (Le Louvier et Schreber, Buff. Canis graius, Lin.) Its varieties are, 1. Italian grey-hound, small and smooth.

2. Oriental grey-hound, tall, slender, with very pendulous ears, and very long hairs on the tail hanging down a great length.

c, Danish dog, of a stronger make than a grey-hound: the largest of dogs; (le Grand Danis, Buff.) Mr. Pennant thinks it probable, that this kind were the dogs of Epirus, mentioned by Aritoteles, lib. iii. c. 21.; or those of Albania, the modern Schirwan or East Georgia, so beautifully described by Pliney, lib. viii. c. 40. Perhaps to this head may be referred the vast dogs of Thibet, said by Marco Paolo to be as big as asses, and used in that country to take wild beasts, and especially the wild oxen called Beymami.

d, Maltiff, (le Dogue de forte race, Buff. Canis moloDius, Lin.) Very strong and thick made; the head large; the lips great, and hanging down on each side: a fine and noble countenance; grows to a great size: A British kind. See above under Dr. Cain's Table.

5. Dogs with short pendant ears, short compact bodies,

bodies, short noses, and generally short legs. a, Bulldog (le Dogue, Buff.), with a short nose, and under jaw longer than the upper: a cruel and very fierce kind, often biting before it barks; peculiar to England; the breed is rarer than has been since the barbarous custom of bull-baiting has declined. b, Pug-dog, (le Dogue, Buff.): A small species; an innocent resem­blance of the last. c, Baflard pug, (le Roquet, Buff.): A degenerate species with naked bodies; having lost their hair by the heat of climate.

Dogs are found in the Society islands, New Zealand, and the Low islands; there are also a few in New Holland. Of these are two varieties:

a, Resembling the sharp-nosed pricked-ear shepherd's cur. Tho'f of New Zealand are of the largest fort. In the Society islands they are the common food, and are fattened with vegetables, which the natives cram down their throats as fish are steamed, and baked for the table. They grow very fat, and are allowed, even by Europeans who have got there, to procure a puke, he eats the leaves of the quicken- 
grafs, the bearded wheat-grafts, or the rough cock's-foot graps, which gives him immediate relief. When he steals a piece of flesh, as conscious of the immorality of the action, he runs off with his tail hanging and bent in betwixt his feet.

His drink is water, which he takes in small quantities at a time, by licking with his tongue. He is in some measure obliged to lick in this manner, otherwise his nose would be immersed in the water.

His excrements are generally hard foyals, which, especially after eating bones, are white, and go by the name of album graecum among physicians. This album graecum was for a long time in great repute as a septic; but it is now entirely disregarded. He does not throw out his excrements promiscuously upon every thing that happens to be in the way, but upon flones, trunks of trees, or barren places. This is a wife institution of nature; for the excrements of a dog destroy almost every vegetable or animal substance. They are of such a putrid nature, that if a man's shoe touches them when recently expelled, that particular part will rot in a few days. He observes the same method in making his urine, which he throws out at a side. It is remark­able, that a dog will not pass a flone or a wall, against which any other dog has pissed, without following his example, although a hundred should occur in a few minutes, in so much that it is astonishing how such a quantity can be secreted in so short a time.

The dog is an animal not only of quick motion, but remarkable for travelling very long journeys. He can easily keep up with his master, either on foot or horse-back, for a whole day. When fatigued, he does not sweat, but lolls out his tongue. Every kind of dog can swim; but the water-dog excels in that article.

The dog runs round when about to lie down, in order to discover the most proper situation. He lies gen­erally on his breast, with his head turned to one side, and sometimes with his head above his two fore-feet. He sleeps little, and even that does not seem to be very quiet: for he often start, and seems to hear with more acuteff in sleep than when awake. They have a tremulous motion in sleep, frequently move their legs, and bark, which is an indication of dream­ing.

Dogs are possessed of the sensation of smelling in a high degree. They can trace their master by the smell of his feet in a church, or in the streets of a populous city. This sensation is not equally strong in every kind. The hound can trace game, or his master's steps, 24 hours afterwards. He barks more furiously the nearer he approaches the fowls, unless he be beat and trained to silence.

The dog eats enviously, with oblique eyes; is an enemy to beggars; bites at a fow as it is; is fond of licking wounds; howls at certain notes in music, and often urines on hearing them.

With regard to the propagation of dogs, the females admit the males before they are 12 months old. They remain in season 10, 12, or even 15 days, during which time they will admit a variety males. They come in season generally twice in the year, and more fre­quently in the cold than in the hot months. The male discovers the condition of the female by the smell; but the feldom admits him the first six or seven days. One
coitus will make her conceive a great number of young; but, when not restrained, she will admit several dogs every day: this seems to have no choice or predilection, except in favour of large dogs: from this circumstance it sometimes happens, that a small female, who has admitted a matrif, periplies in bringing forth her young. During the time of copulation, these animals cannot separate themselves, but remain united so long as the erection subsists. His is owing to the structure of the parts. The dog has not only a bone in his penis, but in the middle of the corpus cavernosum there is a large hollow, which is blown up in the time of erection to a considerable bulk. The female, on the other hand, has a larger clitoris than perhaps any other animal: besides, a large firm protuberance rises in the time of copulation, and remains perhaps longer than that of the male, and prevents him from retracting till it subsides: accordingly, after the act of copulation is over, the male turns about in order to rest himself on his legs, and remains in that position till the parts turn scabrous. The female goes with young about nine weeks. They generally bring forth from six to twelve puppies. Those of a small size bring forth five, four, and sometimes but two. They continue to copulate and bring forth during life, which lasts generally about 14 or 15 years. The whelps are commonly blind, and cannot open their eyes till the 10th or 12th day: the males are like the dog, the females like the bitch. In the fourth month, they lose some of their teeth, which are soon succeeded by others.

The dog has such a strong resemblance to the wolf and the fox, that he is commonly supposed to be the production of one or other of these animals tamed and civilized. Buffon informs us, that he kept a young dog and a young wolf together till they were three years of age, without their discovering the least inclination to copulate. He made the same experiment upon a dog and a fox; but their antipathy was rather increased when the female was in season. From these experiments he concludes, that dogs, wolves, and foxes, are perfectly distinct genera of animals. There has, however, been lately an instance to the contrary: Mr. Brooke, animal-merchant in Holborn, turned a wolf to a Pomeranian bitch in heat; the congrés was immediate, and as usual between dog and bitch: the production was ten puppies. Mr. Brooke was informed by a gentleman at Gordon Castle, that he had very much the resemblance of a wolf, and also much of its nature; being dipp’d at a weak deer, it instantly caught at the animal’s throat and killed it. “I could not learn (says Mr. Pennant) whether this mongrel continued its species; but another of the same kind did, and stocked the neighbourhood of Fochabers, in the county of Moray (where it was kept), with a multitude of cubs of a most wolfish aspect. — There was lately living a mongrel offspring of this kind. It greatly resembled its wolf parent. It was first the property of Sir Woltein Dixey; afterwards of Sir Willoughby Aiton. During day it was very tame; but at night sometimes relapsed into ferocity. It never barked, but rather howled; when it came into fields where sheep were it would feign lameness, but if no one was present would instantly attack them. It had been seen in copulation with a bitch, which afterwards panned: the breed was imagined to resemble in many respects the supposed fire. It died between the age of five and six.—The bitch will also breed with the fox. The woodman of the manor of Monewell, in Oxfordshire, has a bitch, which constantly follows him, the offspring of a tame dog-fox by a shepherd’s cur, and the again has had puppies by a dog. Since there are such authentic proofs of the further continuance of the breed, we may surely add the wolf and fox to the other supposed stocks of those faithful domestics.”

With regard to the natural disposition of the dog: in a savage state, he is fierce, cruel, and voracious; but, when civilized and accustomed to live with men, he is polished of every amiable quality. He seems to have no other desire than to please and protect his master. He is gentle, obedient, submissive, and faithful. These dispositions, joined to his almost unbounded sagacity, justly claim the esteem of mankind. Accordingly no animal is so much cherished and respected: he is to ducile, and so much formed to please, that he assumes the very air and temper of the family in which he resides.

An animal endowed with such uncommon qualities must answer many useful purposes. His fidelity and vigilance are daily employed to protect our persons, our flock, or our goods. The acuteness of his smell gains him employment in hunting: he is frequently employed as a turnspit: at Brussels and in Holland he is trained to draw little carts to the herb-market; and in the northern regions draws a sledge with his master in it, or laden with provisions. The Kamchatkans, Equimaux, and Greenlanders, strangers to the fadder virtues, treat these poor animals with great neglect. The former, during summer, the season in which they have greatest numbers, are fed with fish bones and spise, i.e. putrid fish preserved in pits, and served up to them mixed with hot water. Those used for draught are castrated; and four, yoked to the carriage, will draw five loads, or a hundred and ninety English pounds, besides the driver; and thus laden, will travel 100 versts, or 20 miles a-day; or if unloaded, can be sent by water in four days over the Lena and Yenisei rivers. Its use in war is great; it is turned against its master, so as to be as useful as possible to the enemy. The Kamchatkans make use of the skins of dogs for clothing, and the long hair for ornament: some nations are fond of them as a food, and reckon a fat dog a great delicacy. Both the African and American savages use these animals in sacrifices to their gods, to bespeak favour or avert evil. When the Kossik dreads any infection, they kill a dog, wind the intestines round two poles, and pass between them.
The Greenlanders are not better masters. They leave their dogs to feed on muckle or berries; unless in a great capture of seals, when they treat them with the blood and garbage. These people also sometimes eat their dogs; use the skins for coverlets, for clothing, or to border and seam their habits; and their belt thread is made of the guts. These northern dogs in general are large; and in the frigid parts at least have the appearance of wolves; are usually white, with a black face; sometimes varied with black and white, sometimes all white; rarely brown or all black: have sharp noses, thick hair, and short ears; and seldom bark, but set up a sort of growl or savage howl. They sleep abroad; and make a lodge in the snow, lying with only their noses out. They swim most excellent; and will hunt in packs the ptarmigan, arctic fox, polar bear, and seals lying on the ice. The natives sometimes use them in the chase of the bear. They eat their dogs; leave the ice sharp sometimes all white; rarely brown or all black: have their furs. Hudson's bay make use of the wolfish kind to draw their carriages.

Hudfon's bay make use of the wolfish kind to draw their carriages.

They will fight among themselves even to death. Egede says that they will travel over the ice fifteen German miles in a day, or sixty English, with sledges loaded with their masters and five or six large seals.

Those of the neighbouring island of Iceland have a great resemblance to them. As to those of Newfoundland, it is not certain that there is any distinct breed: most of them are curs, with a crook of the maififf: some will, and others will not, take the water; absolutely refusing to go in. The country was found uninhabited, which makes it more probable that they were introduced by the Europeans, who use them, as the factory does in Hudson's bay, to draw firing from the woods to the forts. The ravages which they make in the bay are of the wilful kind to draw their furs.

It is singular, that the race of European dogs show as strong an antipathy to this American species as they do to the wolf itself. They never meet with them, but they shew all possible signs of dislike, and will fall on and worry them: while the wolfish breed, with every mark of timidity, puts its tail between its legs, and runs from the rage of the others. This aversion to the wolf is natural to all genuine dogs; for it is well known that a whelp, which has never seen a wolf, will at first fight tremble, and run to its master for protection: an old dog will instantly attack it. Yet these animals may be made to breed with one another as above shown: and the following abstract of a letter from Dr Pallas to Mr Pennant, dated October 5th 1781, affords a further confirmation of the fact. "I have seen at Moscow about twenty splendid animals from dogs and black wolves. They are for the most part like wolves, except that some carry their tails higher, and have a kind of hoarse barking. They multiply among themselves: and some of the whelps are greyish, rufy, or even of the whitish hue of the arctic wolves: and one of those I saw, in shape, tail, and hair, and even in barking, so like a cur, that was it not for his head and ears, his ill-natured look, and fearfulness at the approach of man, I should hardly have believed it was of the same breed."

The dog is liable to many diseases, as the feb, madness, &c. and he seldom wants the tænia, or tape-worm in his guts, especially if he drinks dirty water.

II. The second species of this genus is the Lupus, The Wolf, or Wolf. He has a long head, pointed nose, ears erect and sharp, long legs, well clothed with hair, tail bushy and bending down, with the tip black; head and neck all coloured; body generally pale brown tinged with yellow; sometimes round white, and sometimes entirely black. The wolf is larger and terror than a dog. His eyes sparkle, and there is a great degree of fury and wildness in his looks. He draws up his claws when he walks, to prevent his tread from being heard. His neck is short, but admits of very quick motion to either side. His teeth are large and sharp; and his bite is terrible, as his strength is great. The wolf, cruel, but cowardly and voluptuous, sties from man; and seldom ventures out of the woods, except prodded by hunger: but when this becomes extreme, he braces danger, and will attack men, horses, dogs, and cattle of all kinds; even the graves of the dead are not proof against his rapacity. These circumstances are finely describ'd, in the following lines:

By wintry famine rous'd,
Cruel as death, and hungry as the grave!
Burning for blood! bony, and ghastly, and grim!
Assembling wolves in raging troops to descend;
And, pouring o'er the country, bear along,
Keen as the north-wind sweeps the gladly frow.
All is their prize. They stilet on the feed,
Prey but him to earth, and pierce his mighty heart.
Nor can the bull his awful front defend,
Or shake the murthering fawages away,
Rapacious at the mother's throat they prey,
And tear the screaming infant from her breast.
The god like face of man avails him nought.
Even beauty, force divine! at w'hole bright glance

The generous lion fronds in soften'd gaze,
On church yards drear (inhuman to relate!)
The disappointed prowlers fall, and dig
The shrouded body from the grave: o'er which,
Mix'd with foul shades and frighted ghshes, they howl.

Thomson's Winter.

The wolf, unlike the dog, is an enemy to all society, and keeps no company even with those of his own species. When several wolves appear together, it is not a society of peace, but of war: it is attended with tumult and dreadful prowlings, and indicates an attack upon some large animal, as a flag, an ox, or a formidable mastiff. This military expedition is no sooner finished, than they separate, and each returns in silence to his solitude. There is even little intercourse between the males and females: They feel the mutual attractions of love but once a-year, and never remain long together. The females come in season: many males follow the same female, and this affection is more bloody than the former; for they growl, chafe, fight, and tear one another, and often sacrifice
The female commonly lives a long time, fatigues her admirers, and retires, while they sleep, with the most alert or most favourite male.

They adhere to the female only when they wish to copulate, and when the female is ready to bring forth. When the females are about to bring forth, they copulate again, and have an offensive penis, which are generally five or six inches long, and, when erected, look like the horns of a ram. When first brought to them, they are often overpowered with terror, that he may be either killed or taken alive without resistance: he allows himself to be chained, muzzled, and led where you please, without exhibiting the least symptom of resentment or discontent.

The sense of smell of the wolf are excellent, but particularly his sense of hearing, which often extends farther than his eye. The sound of carriage strikes him at the distance of more than a league. He likewise scents live animals very far, and hunts them a long time by following their track. When he scents the wood, he never loses the wind. He flies upon the borders of the forest, smells on all sides, and receives the emanation of the dead animals; yet he devours the most putrid carcasses. He is fond of human flesh; and, if stronger, he would perhaps eat no other. Wolves have been known to follow armies, to come in troops to the field of battle where bodies are carelessly interred, to tear them up, and to devour them with an insatiable avidity: and, when once accustomed to human flesh, these wolves ever after attack men, prefer the shepherd to the flock, devour women, and carry off children. Wolves of this vicious disposition are called loups garous by the French peasants, who suppose them to be possessed with some evil spirit; and of this nature were the wulf of the old Saxons.

The wolf inhabits the continents of Europe, Asia, Africa, and America, Kamtchaka, and even as high as the Arctic Circle. The wolves of north America, are the smallest; and, when reclaimed, are the dogs of the natives: the wolves of Senegal the largest and fiercest; they prey in company with the lion. Tho' of the Cape are grey striped with black; others are black.—They are found in Africa as low as the Cape; and are believed to inhabit New Holland, animals resembling them having been seen there by the late circumnavigators. Dampier's people also saw some half-starved animals in the same country, which they supposed to be wolves. In the east, and particularly in Persia, wolves are exhibited as spectacles to the people. When young, they are learned to dance, or rather to perform a kind of wrestling with a number of men. Charlin tells us, that a wolf, well educated in dancing, is sold at 500 French crowns. This fact proves, that these animals, by time and restraint, are susceptible of some kind of education. M. Buffon brought up several of them: "When young, or during their first year (he informs us), they are very docile, and even carefull; and, if well fed, neither disturb the poultry or any other animal: but, at the age of three months or two years, their natural ferocity appears, and they must be chained, to prevent them from running off and doing mischief. I brought up one till the age of 18 or 19 months, in a court along with fowls, none of which he ever attacked; but for his first day, he killed the whole in one night, with-
J cryef did fome years ago allow a
elans. A young, old, and very old. They know them by the
tracks of their feet. The older the wolf, his feet is
the larger. The file-wolf’s feet are longer and more
flender; her heel is also thinner, and her toes thinner.
A good blood-hound is necessary for hunting the wolf:
and, when he falls into the fcent, he must be coaxed
and encouraged: for all dogs have an aversion from the
wolf, and proceed with coldness in the chase.
When the wolf is raised, the gre-hounds are let
loose in pairs, and one is kept for dilobging him, if
he gets under cover; the other dogs are led before as
a reserve. The first pair are let loose after the wolf,
and are supported by a man on horse-back; then the
second pair are let loose, at the distance of seven or
eight hundred paces; and, laftly, the third pair, when
the other dogs begin to join and to tease the wolf.
The whole together foon reduce him to the left extre­
mit y; and the hunters complete the bufines by flab­
bing him with a dagger. The dogs have fuch a re­
tance to the wolf’s fcent, that it must be prepared and
feafoned before they will eat it. The wolf may also
be hunted with beagles or hounds; but as he darts
always straight forward, and runs for a whole day
without fopping, the chance is irkifome, unlefs the
beagles be supported by grey-hounds, to tease him,
and give the hounds time to come up.

Wolves are now fo rare in the populated parts of
America, that the inhabitants leave their theep the
whole night unguarded; yet the government of Penn­
sylvania and New-Jersey did fome years ago allow a
reward of twenty thillings, and the laft even thirty
thillings for the killing of every wolf. Tradition in­
fomed them what a favage fhote animals had been
in the colonies, f0 they wifely determined to prevent the
like evil. In their infancy, wolves came down in multitudes from the mountains, often attracted by the
fmell of the corpfe of hundreds of Indians, who
died of the small-pox, brought among them by the
Europeans. The animals did not confine their
attacks to the dead, but even devoured in their holes the
fick and dying fpecies.

Before being hunted, wolves are destroyed by pit­
falls, traps, or poiison. A peafant in France who kills
a wolf, carries its head from village to village, and
collects fome small reward from the inhabitants: the
Kirgis-Collacks take the wolves by the help of a large
hawk called berikut, which is trained for the divifion,
and will fatten on them and tear out their eyes. Brit­
ain, a few centuries ago, was much infected by them. It
was, as appears by Hollinghed, very noxious to the
flocks in Scotland in 1577; nor was it entirely extir­
pated till about 1650, when the left wolf fell by the
hand of the famous Sir Ewen Cameron. We may
therefore with confidence affirm the non-exifence of
these animals, notwithstanding M. de Buffon maintains
that the English pretend to the contrary. It has
been a received opinion, that the other parts of
Britain were in early times delivered from this peft
by the care of king Edgar. In England he attempted
to effec t it, by commuting the punishments of certain
crimes into the acceptance of a certain number of wolves
tongues from each criminal; and in Wales by con­
turining the tax of gold and silver into an annual tax
of 300 wolves heads. But, notwithstanding these his
endeavours, and the affections of some authors, his
scheme proved abortive. We find, that fome cen­
turies after the reign of that Saxon monarch, these
animals were again increafed to fuch a degree as to
become again the objec t of royal attention: ac­
cordingly Edward I. iffued out his royal mandate to Pe­
ter Corbet to superintend and affift in the de­
struction of them in the feveral counties of Gloucef­
fter, Worcelfter, Hereford, Salop, and Stafford; and in
the afjcndant county of Derby (as Cambiden, p. 902,
inform us), certain perfon$ at Wormhill held their
lands by the duty of hunting and taking the wolves
that infected the country, whence they were fty­
led wofe-bunt. To look back into the Saxon times,
we find, that in Athelstan’s reign wolves abounded to
in Yorkshire, that a retreat was built at Flixton, in
that county, “to defend fengers from the wolves,
that they should not be devoured by them,” and that
the ravages did those animals make during winter, par­
ticularly in January, when the cold was feverest, that
the Saxons diftinguifhed that month by the name of
the wolf-month. They alfo called an outlaw wolf’s-head,
as being out of the protection of the law, profcribed,
and as liable to be killed as that deftructive beast.
Ireland was infected by wolves for many centuries after
their extinction in England; for there are accounts of
fome being found there as late as the year 1710, the
laft pretention for killing of wolves being made in the
county of Cork about that time.

In many parts of Sweden the number of wolves has
been considerably diminished by placing poisoned car­
cakes in their way: but in other places they are found
in great multitudes. Hunger fometimes compels them to
eat lichens; fhote vegetables were found in the
body of one killed by a foldier; but it was fo weak,
that it could scarcely move. It probably had fed on
the lichen vulpinus, which is a known poiion to fhote
animals. Madness, in certain years, is apt to feize
the wolf. The confquences are often very me­
lancholy. Mad wolves will bite hogs and dogs, and
the laft again the human fpecies. In a single parish
34 perfon$ were victims to this dreadful malady.
The fhoms are the fame with thole attendant on the
bite of a mad dog. Fury sparkles in their eyes; a glu­
tinous saliva diﬄus from their mouths; they carry their
tails low, and bite indifferently men and bees. It
is remarkable that this disease happens in the depth of
winter, fo can never be attributed to the rage of
the dog-days. Often towards spring, wolves get upon
the ice of the sea, to prey upon the young feals, which
they catch alike: but this repulf often proves fatal to
them; for the ice, detached from the shore, carries
them to a great distance from land, before they are
feafible of it. In some feas a large district is by this
means delivered from thofe pernicious bees; which
are heard howling in a moft dreadful manner, far in
the fea. When wolves come to make their attack on
a castle, they never fail attempting to frighten away the
men by their cries; but the found of the horn makes
them flying like lightning.

There is nothing valuable in the wolf but his skin
which
Hyæna.

able; his odour makes them know it is.

He vomits frequently, and emits himself oftener than he fills. In time, the wolf is conterminously disagreeable; his aspect is base and savage, his voice dreadful, his odour intolerable, his disposition perverse, his manners furious, odious and destractive when living; and, when dead, he is perfectly useless.

III. The Hyæna has a straight jointed tail, with the hair of its neck erect, small naked ears, and four toes on each foot. It inhabits Caucasian Turkey, Syria, Per
dia, and Barbary. Like the jackal, it violates the tombs of the dead, and greedily devours the putrid contents of the grave; like it, preys on the herds and flocks; yet for want of other food, will eat the roots of plants, and the tender shoots of the palms: but, contrary to the nature of the former, it is an un
fhociable animal; is solitary, and inhabits the chafins of the rocks. The superstitious Arabs, when they kill one, carefully bury the head, lest it should be employed for magical purposes; as the neck was of old by the Thelkalian forcers.

Viccra non lynx, non dix nodus hyæna.

Defunt.

Lucan, vi. 672.

The ancients were wild in their opinion of the hyæna; they believed that its head consisted of one bone without any joint; that it changed its sex; imitated the human voice; had the power of charming the shepherds, and, as it were, rivetting them to the place they stood on: no wonder that an ignorant Arab should attribute preternatural powers to its remains. They are cruel, fierce, and untameable animals, of a rage which will make them face stronger quadrupeds than themselves. Kempter relates, that he saw one which had put two lions to flight, regarding them with the utmost coolness. Their voice is hoarse, a disagreeable mixture of growling and roaring.

Mr Pennant describes a variety of this species, undistinguished by former naturalists which he calls the spotted hyæna. It has a large and flat head; some long hairs above each eye; very long whiskers on each side of the nose; a short black mane, hair on the body short and smooth; ears short and a little pointed, their outside black, inside cinereous; face and upper part of the head black; body and limbs reddish brown, marked with distinct black round spots; the hind legs with black transverse bars; the tail short, black, and full of hair. It inhabits Guinea, Ethiopia, and the Cape; lives in holes in the earth, or cliffs of the rocks; preys by night; howls horribly; breaks into the folds, and kills two or three sheep; devours as much as it can, and carries away one for a future repast; will attack mankind, scrape open graves, and devour the dead. Bofman has given this creature the name of jackal; by which Buffon being misled, makes it synonymous with the common jackal. This hyæna is called the tiger

wolf by the colonists at the Cape, where it is a very common and formidable beast of prey. Of this ani

mal, formerly but imperfectly known, the following account is given by Dr Sparrmann in his voyage to the Cape.

"The night, or the dusk of the evening only, is the time in which these animals seek their prey, after which they are used to roam about both separately and in flocks. But one of the most unfortunate properties of this creature is that it cannot keep its own counsel. The language of it cannot easily be taken down upon paper: however, with a view to make this species of wolf better known than it has been hitherto, I shall relate, that it is in many of its found something like the following, audac, and sometimes ooto, yelled out with a tone of despair (at the interval of some minutes between each howl), that nature obliges this, the most voracious animal in all Africa, to discover itself, just as it does the most venomous of all the American serpents, by the rattle in its tail, itself, to warn every one to avoid its mortal bite. This same rattle

howse would seem, in consequence of thus betraying its own delights, and of its great inactivity (to be as it were nature's leg child), if, according to many credible accounts, it had not the wondrous property of charming its prey by fixing its eye upon it. Its like is affirmed also of the tiger-wolf. This creature, it is true, is obliged to give information against itself; but, on the other hand, it is actually possessed of the peculiar gift of being enabled, in some measure, to imitate the cries of other animals; by which means this arch-deceiver is sometimes lucky enough to beguile and attract calves, foals, lambs, and other animals. Near some of the larger farms, where there is a great deal of cattle, this ravenous beast is to be found almost every night; and at the same time frequently from one hour to another betraying itself by its howlings, gives the dogs the alarm. The pearsaffs assured me, that the cunning of the wolves was so great (adding, that the trick had now and then even succeeded with some of them), that a party of them, half flying and half defending themselves, would employ the whole pack of dogs to follow them to the distance of a gun-shot or two from the farm, with a view to give an opportunity to the rest of the wolves to come out from their ambuscade, and, without meeting with the least resistance, carry off booty sufficient for themselves and their fugitive brethren. As the tiger-wolf, though a much larger and stronger animal, does not venture, without being driven to the utmost necessity, to measure its strength with the common dog, this is certainly an evident proof of its cowardice. Neither does this same voracious beast dare openly to attack oxen, cows, horse, or any of the large animals, while they make the least appearance as if they would defend themselves, or even as long as they do not betray any signs of fear. On the other hand, it has art enough to rush in upon them suddenly and unexpectedly, at the same time setting up a horrid and strange cry, so as to let them have a running in consequence of the fright, that it may afterwards keep close to their heels with safety, till it has an opportunity with one bite or stroke to rip up the belly of its prey (even though it should be so large an animal as a draught ox), or else give it some dangerous bite, and so at one single blow make itself master of its antagonist. On this account the peasants are obliged to drive their cattle home every evening, for it
it is dark, excepting the more considerable droves of
draught oxen, which they let roam about day
and night to seek their food unattended, by reason that
they are used both to the country and the artifices of
the wolves, and can therefore the easier depend upon
and defend each other.

"Travellers, on the other hand, who are obliged to
keep on in their journey, frequently suffer great losses
by turning their cattle out at night; especially of
the young ones, which are easiest feared. The Hotentots
informed me that it was still within the memory of
man, that the tiger-wolf was bold enough to steal
upon them and molest them in their huts, particularly
by carrying off their children. This, however, is now
no longer the case; a circumstance, perhaps, proceeding
from the introduction of fire-arms into the coun-
try, a circumstance, which in these latter times, has
caulked this, as well as other wild beasts, to stand in
greater awe of man than it did formerly. I have heard
the following story of the tiger-wolf mentioned, as be-
ing related in a certain treatise on the Cape, of which
I now cannot exactly remember the title. The tale is
laughable enough, though perhaps not quite so pro-
bable. "At a feast near the Cape one night, a trum-
peter who had got his fill was carried out of doors in
order that he might cool himself, and get sober again.
The scent of him soon drew thither a tiger-wolf, which
threw him on his back, and dragged him along with
him as a corse, and consequently a fair prize, up to-
wards Table-mountain. During this, however, our
drunken musician waked, enough in his senses to know
the danger of his situation, and to sound the alarm
with his trumpet, which he carried fastened to his side.
The wild beast, as may easily be supposed, was not
less frightened in his turn. Any other besides a trum-
peter would, in such circumstances, have undoubtedly
been no better than wolf's meat.

In the mean while it is certain, that these wolves are
to be found almost every dark night about the
farms at the Cape, where they devour the offals of
bones, fish, &c. which are thrown out there in great
quantities, and drag away with them what they cannot
eat. The inhabitants repay these good offices of the
hyæna with fire and unlimited privileges of entry and
egres. The dogs too hereabouts, perfectly accustomed
to their company, are said never to throw any
impe-
diment in their way; so that the beast, entertained
and fed in the very heart of the town, has been seldom
known to do any mischief there. It is likewise a well-
known fact, that these wolves in different parts of
Africa, exhibit different degrees of courage; this,
however, may perhaps proceed from their being of dif-
ferent species in different parts.

"Yet in this very greediness of the hyæna, and its
disposition to confume every thing it can get at, the
provident economy of nature is abundantly evinced.
The flowery fields at the Cape would certainly soon
become hideous and disfigured with carcases and skele-
tous, the relics of the great quantity of game of all
sorts which graze and die there in Succession, were not
the tiger-wolf manifestly subservient to nature in
the regulation of her police, by clearing her theatre from
them; nay, I had almost said the wolf alone; for
lions and tigers, for example, never eat bones, and are
not very fond of carcases. These are serviceable in
another way. They make the other animals vigilant
and attentive to the functions for which nature has de-
signed them; and besides answering several other in-
tentions of Providence, they serve, in conjunction with
mankind, to keep in a just equilibrium the increase of
the animal kingdom; so that it may not exceed the
supplies afforded by it the vegetable part of the cre-
ation, and by this means prevent the necessary removal
of the latter by feeds, &c. and thus by desolating it
and laying it waste, in the end impoverish and de-
stroy themselves, and die most wretchedly in hunger;
so that, notwithstanding the immense quantities of
game existing in this country, there are very
feddom found any bones in the humps they have left,
and never after the tiger, lion, jackal, wild cat,
and wild dog. These latter animals, that they may not
cumber and litter the ground which nature has or-
dained them to clear, never go out of their dens and
ravens when they find themselves sick and disabled;
but there, opposed with hunger and disease, await
the transitory moment, when they must pay obedience
to nature's last law."

IV. The MEXICANUS has a smooth, crooked tail. The Mexi-
can wolf is also called the mountain-cat by Seba. It agrees with the European wolf in its
manners, attacks cattle, and sometimes men.

V. THE Vulpes, or Fox, has a straight tail, white at the Fox.
grant to the point. His body is yellowish, or rather straw-
coiled; his ears are small and erect; his hips are whit-
ish, and his forehead black. From the base of the tail
a strong scent is emitted, which to some people is very
fragrant, and to others extremely disagreeable.
The fox is a native of almost every quarter of the globe, and
is if such a wild and savage nature that it is impossible
fully to tame him. He is esteemed to be the most
fugacious and the most crafty of all beasts of prey.
The former quality he shows in his method of pro-
viding himself with an asylum, where he retires from
perilling dangers, here he dwells, and where he brings
up his young; and his craftiness is chiefly discovered
by the schemes he falls upon in order to catch lambs,
geese, hens, and all kinds of small birds. The fox fixes
its abode on the borders of dry streams and waters,
and in the neighbourhood of cottages; he lurks near the
fowling of cocks, in the crowing of the poultry.
He scents them at a distance; he chooses his time with judgment; he conceals his
road as well as his design; he slips forward with cau-
tion, sometimes even trailing his body, and seldom
makes a fruitless expedition. If he can leap the wall,
or get in, he ravages the court-yard, cuts all to death,
and then retires softly with his prey, which he either hides under the herbage, or carries off
to his kennel. He returns in a few minutes for an-
other, which he carries off, or conceals in the same
manner, but in a different place. In this way he pro-
ceeds till the progress of the sun, or some movements
perceived in the house, advertise him that it is time to
suspend his operations, and to retire to his den. He
plays the same game with the catchers of thrushes,
woodcocks, &c. He visits the nests and bird-lime very
close in the morning, carries of successively the birds
which are entangled, and lays them in different places,
especially near the sides of high-ways, in the furrows,
under the herbage or bush wood, where they sometimes
**C A N**

**Canis**

The two or three days; but he knows perfectly where to find them when he is in need. He hunts the young hares in the plains, seizes the old ones in their lairs, never misfires those which are wounded, digs out the rabbits in the warrens, disfavors the nests of partridges and quails, seizes the mothers on the eggs, and destroys a vast quantity of game. The fox is exceedingly voracious; besides feets of all kinds, he eats with equal avidity, eggs, milk, cheese, fruits, and particularly grapes. When the young hares and partridges fall him, he makes war against rats, field-mice, serpents, lizards, toads, &c. Of these he destroys vast numbers; and this is the only service he does to mankind. He is so fond of honey, that he attacks the wild bees, wasps, and hornets. They at first put him to flight by a thousand flings; but he retires only for the purpose of rolling himself on the ground to cruel them; and he returns to it often to the charge, that he obliges them to abandon the hive, which he soon uncovers, and devours both the honey and wax. In a word, he eats fishes, lobsters, grass hoppers, &c.

The fox is not easily and never fully tamed; he languishes when deprived of liberty; and if kept too long in a domestic state, he dies of chagrin. Foxes produce but once a year; and the litter commonly consists of four or five, seldom six, and never less than three. When the female is full, the litter retires, and seldom goes out of her hole, where she prepares a bed for her young. She comes in season in the winter; and young foxes are born in the month of April. When the perceives that her retreat is discovered, and that her young have been disturbed, she carries them off by one, and goes in search of another habitation. The young are brought forth blind; like the dogs, they grow 18 months or two years, and live 13 or 14 years.—The fox, as well as the generous wolf, will produce with the dog-kind, as noticed above.

The fences of the fox are equally good as those of the wolf; his sentience is more delicate; and the organs of his voice are more pliant and perfect. The wolf sends forth only frightful howlings; but the fox barks, yelps, and utters a mournful cry like that of the peacock. In winter, and especially in the season, he calls his hair. He fleeps found, and may be easily approached without weakening: he fleeps in a round form, like the dog; but, when he only reposes himself, he extends his hind legs, and lies on his belly. It is in this situation that he flies the birds along the hedges, and mediates schemes for their surprize. The fox flies when he hears the explosion of a gun, or smells gun-powder. He is exceedingly fond of grapes, and does much mischief in vineyards. Various methods are daily employed to destroy foxes: they are hunted with dogs; iron traps are frequently set at their holes; and their holes are sometimes smoked to make them run out, that they may the more readily fall into the snares, or be killed by dogs or fire-arms.

The chase of the fox requires less apparatus, and is more amusing, than that of the wolf. To the latter every dog has great reluctance: but all dogs hunt the fox spontaneously and with pleasure; for, though his own odor be strong, they often prefer him to the stag or the hare. He may be hunted with terriers, hounds, &c. Whenever he finds himself pursued, he runs to his hole; the terriers with crooked legs, or turnpits, go in with moft ease. This mode answers very well when we want to carry off a whole litter of foxes, both mother and young. While the mother defends herself against the terriers, the hunters remove the earth above, and either kill or seize her alive. But, as the holes are often under rocks, the roots of trees, or forked too deep in the ground, this method is frequently unsuccessful. The most certain and most common method of hunting foxes, is to begin with flushing up their holes, to place a man with a gun near the entrance, and then to search about with the dogs. When they fall in with him, he immediately makes for his hole; but when he comes up to it he is met with a discharge from the gun. If the fox escapes the shot, he runs with full speed, takes a large circuit, and returns again to the hole, where he is fired upon a second time; but, finding the entrance shut, he now endeavours to escape by darting straight forward, with the design of never reviving his former habitation. He is then pursued by the hounds, whom he seldom fails to fatigue, because he purposefully passes through the thickest parts of the forest or places of the most difficult access, where the dogs are hardly able to follow him; and, when he takes to the plains, he runs straightforward, without stopping or doubling.

Of all animals the fox has the most significant cries, which it emits even in its palpitations of love, fear, hatred, &c. It is remarkably playful and feemingly amorous, like all savage creatures half reclaimed, with the least offence bite those it is most familiar with. It is a great admirer of all its fellow, and which frequently amuses and exercises itself, by running in circles to catch it; and, in cold weather, wraps it round its nose. The snail of this animal is in general very strong, but that of the urine is remarkably fetid. This seems so offensive, even to itself, that it will take the trouble of digging a hole in the ground, stretching its body at full length over it; and there, after depositing its water, covers it over with the earth, as the cat does its dung. The snail is so obnoxious, that it has often proved the ruin of the fox's escape from the dogs; who, having shot the avenger of his effluvia, or effluvium, as to avoid encountering the animal it came from. It is said that the fox makes use of its urine as an expedient to force the cleanly badger from its habitation: whether that is the means is rather doubtful; but that the fox makes use of the badger's hole is certain: not through want of ability to form its own retreat, but to save itself some trouble; for after the expulsion of
C A N  [ 1 1 0 ]  C A N

Canis. of the first inhabitants, the fox improves as well as enlarges it considerably, adding several chambers, and providing making several entrances to secure a retreat from every quarter. In warm weather, it will quit its habitation for the sake of basking in the sun, or to enjoy the free air; but then it rarely lies exposed, but chooses some thick brake, that it may rest secure from surprize. Crows, magpies, and other birds, who consider the fox as their common enemy, will often, by their notes of anger, point out its retreat. The skin of this animal is furnished with a warm soft fur, which in many parts of Europe is used to make muffs and to line cloths. Vast numbers are taken in Le Valais, and the Alpine parts of Switzerland. At Lauzanne there are furriers who are in possession of between 2000 and 3000 skins, all taken in one winter.

Of the fox there are several varieties, derived from colour:

1. The field-fox, or alopex of Linnaeus, who makes it a distinct species; but it is every way the same with the common fox, except in the point of the tail, which is black.

2. The crofs-fox, with a black mark passing transversely from shoulder to shoulder, with another along the back to the tail. It inhabits the coldest parts of Europe, Asia, and North-America: a valuable fur, thicker and softer than the common fort; great numbers of the skins are exported from Canada.

3. The black fox is the most cunning of any, and its skin the most valuable; a lining of it is in Russia, esteemed preferable to the finest tables: a single skin will sell for 400 rubles. It inhabits the northern parts of Asia and North-America. The last is inferior in goodnefs.

4. The brant fox, as described by Geofner and Linnaeus, is of a fiery redness; and called by the frift brand-fuch, by the lafth brandraeff; it is fcarce half the fize of the common fox: the nofe is black, and much flharper; the space round the ears ftrufingous; the forehead, back, shoulders, thighs, and fides black mixed with black, alſo-colour, and black; the belly yellow-fifth; the tail black above, red beneath, and cinereous on its fide. It is a native of Pennsylvania.

5. The cufcuf-fox, with upright ears, foft, downy hair; tail bulfy; colour in summer pale tawney, in winter grey; the bafe and tip of the tail black; a small kind. It inhabits the depafs beyond the Yack: lives in holes; bowls and barks: is caught by the Kirgis Caſſacks with falcons and grey-hounds; 40 or 50,000 are annually taken, and sold to the Russians, at the rate of 40 kopeks, or 20 pence each: the former tie their skins instead of money; great numbers are fent into Turkey.

6. There are three varieties of foxes found in the mountainous parts of Britain, which differ a little in form, but not in colour, from each other. They are distinguished in Wales by as many different names. The milgi, or gre-bounded-fox, is the largest, tallest, and boldeft; and will attack a grown ſheep or wedder: the mastiff-fox is lefs, but more strongly built: the corgi, or cur-fox is the leaft; lurks about hedges, out-houſes, &c. and is the moſt pernicious of the three to the feathered tribe. The frift of thee varieties has a white tag or tip to the tail; the laft a black. When hunted, they never run directly forward, but make a great ma-

ny doublings and turnings; and when in danger of being taken, they emit fuch a smell from their pofterious that the hunters can hardly endure it.

VI. The Lagopus, or Arctic fox, with a hair nife; short rounded ears almost hid in the fur; long and soft hair, somewhat woolly; short legs; toes covered on all parts, like that of a common hare, with fur; tail shorter and more bulfy than that of the common fox, of a blufh grey or alſo colour, sometimes white: the young of the grey are black before they come to maturity: the hair much longer in winter than in fummer, as is uſual with animals of cold climates. It inhabits the countries bordering on the Frozen Sea; Kamfchatka, the Ifles between it and America, and the opposite parts of America discovered in captain Bluring's expedition, 1741; is again found in Greenland, Iceland, Spitzbergen, Nova Zembla, and Lapland. It burrows underground, forms holes many feet in length, and strews the bottom with moft. In Greenland and Spitzbergen, it lives in the cliffs of rocks, not being able to burrow, by reason of the fvt: two or three pair inhabit the fame hole. They are in heat about Lady-day; and during that time, they continue in the open air, but afterwards take to their holes. They go with young nine weeks: like dogs, they continue united in copulation: they bark like that animal, for which reaon the Russians call them peftis, or dogs. They have all the cunning of the common fox; can eat geese, docks, and other water-fowl, before they can fly; on grove of the country, on hares, and the eggs of birds; and in Greenland (through neceffity) on berries, thel fith, or any thing the sea flings up. But their principal food in the north of Asia and in Lapland is the leming, or Lapland marmot: those of the countries laft mentioned are very migratory, purfuing the leming which is a wandering animal: sometimes thefe foxes will defert the country for three or four years, probably in purfuit of their prey; for it is well known that the migrations of the leming are very inconstant, it appearing in some countries only once every few years. The people of Jenofa ſufpect they go to the banks of the Oby. Their chief rendezvous is on the banks of the Frozen Sea, and the rivers that flow into it, where they are found in great troops. The Greenlanders take them either in pitfalls dog in the fnow, and baided with the capell ſfish; or in springs made with whalebone, laid over a hole made in the fnow, firewed over at bottom with the fame kind of ſfish; or in traps made like little huts, with flat ſtones, with a broad one by way of door, which falls down (by means of a ſtring baited on the inſide with a piece of ſteel) whenever the fox enters and pulls it at. The Greenlanders prefer the ſkins for traſf; and in cafes of neceffity eat the ſteel. They alfo make buttons of the ſkins; and split the tendons, and make use of them instead of thread.

The blue ſkins are much more esteemed than the white.

VII. The Indica, or American fox (the coyel of The an- Fernandez, the loup-renard of Bougainville), has short tartar pointed ears; irides hazel; head and body cinereous Fox brown; hair more woolly than that of the common fox, refembling much that of the arctic; legs dafhed with ruff colour; tail bulfy, tipped with white; shorter and more bulfy than that of the common fox, to which it is about one-third inferior in fize. It has much the habit of the wolf, in ears, tail, and strength of limbs. The
The French therefore call it loup-renard, or wolf-fox. It may be a wolf degenerated by climate. The largest are those of Senegal: the next are the European; those of North America are still smaller. The Mexican wolves, which Mr Pennant apprehends to be this species, are again less; and this, which inhabits the Falkland islands near the extremity of South America, is dwindled to the size described. This is the only land animal of those distant islands: it has a fennel smell, and barks like a dog. It lives near the shores; kennels like a fox; and forms regular paths from bay to bay, probably for the convenience of surprising the waterfowl, on which it lives. It is at times very meagre, from want of prey; and is extremely tame. The islands were probably stocked with those animals by means of masts of ice broken from the continent, and carried by the currents.

The grey-fox of Catech. VII. The Grey-fox of Carolina, &c. has a sharp nose; sharp, long, upright ears; legs long; colour grey, except a little reddish about the ears. It inhabits Carolina, and the warmer parts of North America: it differs from the Arctic fox in form, and the nature of its dwelling; agrees with the common fox in the first, varies from it in the last: it never burrows, but lives in hollow trees; it gives no diversion to the sportsman; for after a mile’s chase, it takes to its retreat; it has no strong smell; it feeds on poultry, birds, &c. These foxes are easily made tame; their skins, when in season, make use of for muffins.

The silver Fox of Louisiana. VIII. The Silver Fox of Louisiana. It resembles the common fox in form, but has a moist beautiful coat. The short hairs are of a deep brown; and over them spring long silvery hairs, which give the animal a very elegant appearance. They live in forests abounding in game, and never attempt the poultry which run at large. The woody eminences in Louisiana are every where pierced with their holes.

The Barbary Fox. X. The Barbary Fox, (le Chouchal, Buff,) or jackal-adive, has a long and slender nose, sharp upright ears, long bushy tail: colour, a very pale brown; space above and below the eyes, black; from behind each ear, there is a black line, which soon divides into two, which extend to the lower part of the neck; and the tail is surmounted with three broad rings. This species is of the size of the common fox, but the limbs are shorter, and the nose is more slender.—M. de Buffon informs us, that Mr Bruce told him this animal was common in Barbary, where it was called thakel, But Mr Pennant observes, that Mr Bruce should have given it a more distinguishing name: for thakels, or taneels, is no more than the Arabic name for the common fox, which is also frequent in that country.

The Jackal. XI. The Aureus, Schakal, or Jackal, as described by Mr Pennant, has yellowish brown irides; ears erect, formed like those of a fox, but shorter and less pointed: hairy and white within; brown without, tinged with dusky; head shorter than that of a fox, and nose blunt: lips black, and somewhat loose: neck and body very much resembling those of that animal, but the body more compressed: the legs have the same resemblance, but are longer: tail thicker at the middle, tapering to the point: five toes on the fore-feet: the inner toe very short, and placed high: four toes on the hind-feet: all covered with hair even to the claws. The hairs are much flimmer than those of a fox, but scarcely to fluff as those of a wolf; short about the nose; on the back, three inches long; on the belly shorter. Those at the end of the tail four inches long. Colour of the upper part of the body a dirty tawny; on the back, mixed with black: lower part of the body of a yellowish white: tail tippd with black; the rest of the same colour with the back: the legs of an unmixed tawny brown: the fore legs marked (but not always) with a black spot on the knees; but on no part are those vivid colours which could merit the title of golden, bestowed on it by Kempfer.—The length of this animal from the nose to the root of the tail is little more than twenty-nine inches English: the tail, to the ends of the hairs, ten three quarters; the tip reaching to the top of the hind legs: the height, from the space between the shoulders to the ground, rather more than eighteen inches and a half; the hind parts a little higher.—This species inhabits all the hot and temperate parts of Asia, India, Persia, Arabia, Great Tartary, and about Mount Caucasus, Syria, and the Holy Land. It is found in most parts of Africa, from Barbary to the Cape of Good Hope.

Professor Gledenlstedt*, the able describer of this long-lost animal, remarks, that the cæcum entirely agrees in form with that of a dog, and differs from that of the wolf and fox. And Mr Pennant observes, that there is the fame agreement in the teeth with those of a dog; and the same variation in them from those of the two other animals. These circumstancies strengthen the opinion entertained by some writers, that the dogs of the old world did derive their origin from one or other of them. The jackals have indeed so much the nature of dogs, as to give reasonable cause to imagine that they are at least the chief flock from which is sprung the various races of those domestic animals. When taken young, they grow instantly tame; attach themselves to mankind; wag their tails; love to be foked; distinguish their masters from others; will come on being called by the name given to them; will lean on the table, being encouraged to it: they drink, lapping; and make water sideways, with their legs held up. Their dung is hard: odorat arom alterius, cobar et copula junctus. When they see dogs, instead of flying, they seek them, and play with them. They will eat bread eagerly; notwithstanding they are in a wild state carnivorous. They have a great resemblance to some of the Calmuc dogs, which perhaps were but a few decades removed from the wild kinds. Our dogs are probably derived from those reclaimed in the early ages of the world; altered by numberless accidents into the many varieties which now appear among us.

The wild schakals go in packs of 40, 50, and even two hundred, and hunt like hounds in full cry from evening to morning. They destroy flocks and poultry, but in a less degree than the wolf or fox: ravage the streets of villages and gardens near towns, and will even destroy children, if left unprotected. They will enter stables and out-houses, and devour skins, or say thing made of that material. They will familiarly enter a tent, and eat whatsoever they can find from the sleeping traveller. In default of living prey, they will feed on roots and fruits; and even on the most infected carrion: they will greedily disinter the dead, and devour the putrid carcasses; for which reason, in many countries the graves are made of a great depth. They attend

---

their voice naturally is a howl. Barking, Mr Pennant observes, is lately inherent; and in their state of nature seldom exerted; but its different modifications are adventitious, and expressive of the new sensations and emotions gained by a domestic state. Their howlings and clamours in the night are dreadful, and so loud that people can scarcely hear one another speak. Dellow says, their voice is like the cries of a great many children of different ages mixed together: when one begins to howl, the whole pack join in the cry. Kaempfer says, that every now and then a fort of bark is intermixed; which confirms what is above ascertained by Mr Pennant. Dellow agrees in the account of their being tamed, and entertained as domestic animals. During day they are silent. They dig burrows in the earth, in which they lie all day, and come out at night to range for prey: they hunt by the nose, and the valves of their nostrils, being much more acute than those of any other animal. The pack. The jackal is described by Appian, under the name of Ano. Zebos, or yellow wolf; who mentions its horrible howl. It may, as M. de Buffon conjectures, be the dog of Aristotle, who mentions it with the remark, that it has something of the squirrel; and that it lives on the fruits. C A N I S. The Meso- melas, or Cepheus of Schreber, the tenth of Kenite of the Hottentots, has erect yellowish brown ears, mixed with a little black hairs: the head and neck, with a few black hairs: the body and also the back part of the legs are of a yellowish brown, lighter on the body: the throat, breast, and belly white. On the neck, shoulders, and back, is a bed of a black: broad on the shoulders, and growing narrower to the tail: when the hairs are smooth, the part on the neck seems barred with white; that on the shoulders with white comb marks, one within the other, the end pointing to the back: when the hairs are ruffled, these marks vanish, or grow less distinct, and a hoaryness appears in their head. The tail is bushy, of a yellowish brown; marked on the upper part with a longitudinal stripe of black, and towards the end encircled with two rings of black, and is tipped with white. In length, the animal is two feet three quarters, to the origin of the tail: the tail is one foot. This species inhabits the countries about the Cape of Good Hope, and probably is found as high as the line.

XIII. The Thous has a smooth crooked tail: the upper part of its body is grey, and its belly white. It is about the size of a large cat; and, according to Linnaeus, is found at Surinam; it is mentioned by no other naturalist.

XIV. The Zezza. This animal has a very point-like visage; large bright black eyes; very large ears, of a bright rose-colour, internally lined with long hairs; the orifice so small as not to be visible, probably covered with a valve or membrane: the legs and feet are like thoe of a dog; the tail is taper; colour between a straw and pale brown. Length from nofe to tail, ten inches; ears, three inches and a half long; tail, fix: height, next, five. It inhabits the vall deart of Siara, which extends beyond mount Atlas: It burrows in the sandy ground, which shows the necessity of the orifices to the ears; and is so excessively swift, that it is only rarely taken alive. It feeds on insects, especially locusts: its on its rump: is very vigilant: barks like a dog, but much fuller, and that chiefly in the night: never is observed to be sporting. We are indebted to Mr Eric Skioldebrand, the late Swedish consul at Algiers, for our knowledge of this singular animal. He never could procure but one alive, which escaped before he examined his teeth: the genus is very uncertain: the form of its head and legs, and some of its manners, determined Mr Pennant to rank it in this genus. That which was in possession of Mr Skioldebrand fed freely from the hand, and would eat bread or boiled meat. Buffon has given a figure of this animal: but from the authority of Mr Bruce attributes to it a different place, and different manners. He says that it is found to the south of the Palus Tritonis, in Libya; that it has something of the nature of the hare, and something of the squirrel: and that it lives on the palm-trees, and feeds on the fruits.

C A N I S Major, the great dog in astronomy, a constellation of the southern hemisphere, below Orion's feet, though somewhat to the westward of him; whose stars Ptolemy makes 29: Tycho observed only 13; Hevelius 21; in the British catalogue they are 31.

C A N I S Minor, the little dog, in astronomy, a constellation of the northern hemisphere; called also by the Greeks, Fraccon, and by the Latinus Antecoris and Caniceidia. The stars in the constellation canis minor, are in Ptolemy's catalogue 2; in Tycho's, 5; in Hevelius's, 13; and in the British catalogue, 14.

CANISUS, (Henry) a native of Nimeguen, and one of the most learned men of his time, was professor of canon law at Ingolstadt; and wrote a great number of books; the principal of which are. 1. Summa Iuris Canonici. 2. Antiquae lectiones, a very valuable work. He died in 1609.

CANITZ, (The baron of) a German poet and statesman, was of an ancient and illustrious family in Brandenburg, and born at Berlin in 1564, five months after his father's death. After his early studies, he travelled to France, Italy, Holland, and England; and upon his return to his country, was charged with important negotiations by Frederic II. Frederic III. employed him also. Canitz united the statesman with the poet; and was condemn'd in many languages, dead
Canker, as well as living. His German poems were published for the tenth time, 1750, in 8vo. He is said to have taken Horace for his model, and to have written purely and delicately. But he did not content himself with barely cultivating the fine arts in himself; he gave all the encouragement he could to them in others. He died at Berlin, in 1699, privy councillor of state, aged 45.

Canker, among farriers. See Farrer, §§ xx. 2.

Canna, in botany: A genus of the monogynia order, belonging to the monandria class of plants; and in the natural method ranking under the eighth order, Scitamineae. The corolla is erect, and divided into five parts, with a distinct lip bipartite and rolled back; the style lanceolate, and growing to the corolla; the calyx is triphyllous.

Species. 1. The indica, or common broad-leaved flowering canna, is a native of both Indies; the inhabitants of the British islands in America call it Indian foot, from the roundness and hardnearth of the seeds. It hath a thick, flaky, tuberous root, which divides into many irregular knobs; it sends out many large oval leaves, without order. At their first appearance the leaves are like a twisted horn; but afterwards expand, and are near a foot long, and five inches broad in the middle; lengthening gradually to both ends, and terminated in a point. The stalks are herbaceous, rifting four feet high, and are encompassed by the broad leafy footstalks of the leaves; at the upper part of the stalk the flowers are produced in loose spikes, each being as first covered with a leafy hood, and turns to a brown colour. The flowers are succeeded by a fruit or capsule, oblong, rough, and crowned with three-corned emaplement of the flower which remains. When the fruit is ripe, the capsule opens lengthwise into three cells, at the rounded, flowering, hard, and black seeds.

2. The latifolia, with a pale red flower, is a native of Carolina, and some other northern parts of America. 3. The glanca, with a very large flower, is a native of South America. 4. The lutea, with obtuse oval leaves, is least common in America than the other sorts. 5. The coccinea, bath larger leaves than any of the other species, and the stalks rife much higher. The flowers are produced in large spikes; and are of a bright crimson, or rather scarlet colour.

Culture. These plants must always be kept in pots of rich earth, to be moved to shelter in winter. They are propagated by seeds sown on a hot-bed, in the spring; and in summer, when the plants are a little advanced in growth, prick them separately in small pots of rich earth, plunging them also in the hot-bed, giving shade, water, and fresh air; to which last harden them by degrees, till they bear it fully. In October they must be removed into a very good stove or green house.

Cannabis, in botany: A genus of the pentandria order, belonging to the dioecia class of plants; and in the natural method ranking under the 53d order, Scabridae. The calyx of the male is quinquepartite, with no corolla. In the female the calyx is monophyllous, entire, and gaping at the side; there is no corolla, but two styles; the fruit is a nut, bivalved, within the cloven calyx. Of this there is but one species, viz., the sativa. This is propagated in the rich sandy parts of England in great quantities, for its bark, which is useful for cordage, cloth, &c. and the seeds abound with oil. Hemp is always sown on a deep, moist, rich, soil, such as is found in Holland, Lincolnshire, the fens of the island of Ely, where it is cultivated to great advantage, as it might be in many other parts of England where there is a soil of the same kind; but it will not thrive on clayey or stiff cold land. The ground on which hemp is desired to be sown, should be well ploughed, and made very fine by harrowing. About the middle of April the seed may be sown; three bushels is the usual allowance for an acre, but two are sufficient. In the choice of the seed, the heaviest and brightest coloured should be preferred; and particular care should be had to the kernel of the seed. For the greater certainty in this manner, some of the seeds should be cracked, to see whether they have the germ or future plant perfect: for, in some places, the male plants are drawn out too soon from the female, i.e. before they have impregnated the female plants with the farina; in which case, though the seeds produced by their females may seem fair to the eye, yet they will not grow,* according to the doctrine of Linnaeus.

When the plants are come up, they should be hoed out in the same manner as is practised for turnips, &c., leaving them two feet apart; observe also to cut down all the weeds, which, if well performed, and in dry weather, will destroy them. This crop, however, will require a second hoeing, in about six weeks after the first; and, if this is well performed, the crop will require no further care. The first season for pulling hemp is usually about the middle of August, when they begin to pull what they call the finble hemp, being that which is composed of the male plants; but it would be the much better method to defer this for a fortnight or three weeks longer, until those male plants have fully shed their flowers, with which the seeds will prove only empty husks. The male plants decay soon after they have shed their farina. The second pulling is a little after Michaelmas, when the seeds are ripe. This is usually called karle hemp, and consists of the female plants which were left. This karle hemp is bound in bundles of a yard compassed, according to statute measure, which are laid in the sun for a few days to dry; and then it is stacked up, or houfed, to keep it dry till the seed can be threshed out. An acre of hemp, on a rich soil, will produce near three quarters of seed, which, together with the unwrought hemp, is worth from six to eight pounds. Hemp is esteemed very effectual for destroying weeds; but it accomplishes this by overruling the ground, and thus robbing them of their nourishment, so that a crop of it must not be repeated on the same spot.

Some seeds of a large kind of hemp growing in China were lately sent by the English East India Company to the Society for the encouragement of Arts, Manufactures, and Commerce, who distributed them to the members and other gentlemen who appeared likely to cultivate them; and from experiments made in consequence,
Cannabis. Ann., quence, the plant has been found to succeed perfectly in England. The first trials were rather unpromising, the hemp produced from the foreign seeds proving of very little value. But the Reverend Dr Hinton of Northwold, who made the above trial in 1786, having accidentally sowed some ripe seeds of that crop, sowed them in May 1787 on a spot of good land. They came up well, and attained as much as one ton of Northwold, who made the above trial in 1786, will yet, however, require a few years to determine whether this species will continue to retain its great size, or will degenerate and become the common hemp of Europe.

From the leaves of hemp pounded and boiled in water, the natives of the East Indies prepare an intoxicating liquor of which they are very fond. The plant, when fresh, has a rank narcotic smell; the water in which the stalks are soaked, in order to separate the hemp, takes on a mithridatic taste, in fact to be violently poisonous, and to produce its effects almost as soon as drank. The seeds also have some smell of the herb, and their taste is acrid and sweetish: they are recommended, boiled in milk, or triturated with water into an emulsion, against coughs, heat of urine, and the like. They are also said to be useful in incontinence of urine, and for restraining venereal appetites; but experience does not warrant their having any virtues of that kind.

Cannae, (anc. geog.) a town of Apulia in the Adriatic, at the mouth of the river Aufidus, rendered famous by a terrible overthrow which the Romans received from the Carthaginians under Hannibal. The Roman confuls Emilius Paulus and Terentius Varro, being authorized by the senate to quit the defensive plan, and stake the fortunes of the republic on the chance of a battle, marched from Canusium, and encamped a few miles east, in two unequal divisions, with the Aufidus between them. In this position they meant to wait for an opportunity of engaging to advantage; but Hannibal, whose critical situation in a desolated country, without refuge or allies, could admit of no delay, meant to inflame the vanity of Varro by some trivial advantages in skirmishes between the light horse. The Romans, elated with these successes, determined to bring matters to a speedy conclusion; but, finding the ground on the south side too confined for the operation of so large an army, crossed the river; and Varro, resting his right wing upon the Aufidus, drew out his forces in the plain. Hannibal, whose head quarters were at Canae, no sooner perceived the enemy in motion, than he forded the water below, and marshalled his troops in a line opposite to that of his adversaries.

The Romans were vastly superior in number to the Carthaginians; but the latter were superior in cavalry. The army of the former, consisting of 87,000 men, was drawn up in the usual manner; the *hastati* in the first line, the *principes* in the second, and the *triarii* in the third. The cavalry were posted on the wings. On the right, the Roman knights flanked the legions; in the left, the cavalry of the allies covered their own infantry. The two confuls commanded the two wings, Emilius the right, and Terentius the left; and the two proconsuls Servilius and Attilius the main body. On the other hand, Hannibal, whose army consisted of 40,000 foot and 10,000 horse, placed his Gaulish and Spanish cavalry in his left wing, to face the Roman knights; and the Numidian horse in his right, over against the cavalry of the allies of Rome. As to his infantry, he divided the African battalions into two bodies; one of which he posted near the Gaulish and Spanish horse, the other near the Numidians. Between these two bodies were placed on one side the Gaulish, on the other the Spanish infantry, drawn up in such a manner as to form an obtuse angle projecting a considerable way beyond the two wings. Behind this line he drew up a second which had no projection. Afdrubal commanded the left wing; Maheral the right; and Hannibal himself, with his brother Mago, the main body. He had also taken care to post himself in such a manner that the wind *vulturinus*, which rises at certain fixed times, should blow directly in the faces of the Romans during the fight, and cover them from such attacks. The onset was begun by the light-armed infantry; the Romans discharging their pikes, and the *baculares* their stones, with pretty equal success; nevertheless, the consul Emilius was wounded. Then the Roman cavalry in the right wing advanced against the Gaulish and Spanish in Hannibal's left. As they were shut in by the river Aufidus on one side, and by their infantry on the other, they did not fight, as usual, by charging and wheeling off, and then returning to the charge; but continued fighting each man against his adversary, till one of them was killed or retired. After they had made prodigious efforts on both sides to overbear each other, they all on a sudden dismissed their efforts, and fought on foot with great fury. In this attack the Gauls and Spaniards soon prevailed; put the Romans to the rout; and, purifying them along the river, strewed the ground with their dead bodies, Afdrubal giving no quarter. This action was fierce over, when the infantry on both sides advanced. The Romans first fell upon the Spaniards and Gauls, who, as already observed, formed a kind of triangle projecting beyond the two wings. These gave ground, and, purifying Hannibal's directions, sunk into the void space in their rear; by which means they instensely brought the Romans into the centre of the African infantry, and then the fugitives rallying, attacked them in front, while the Africans charged them in both flanks. The Romans, being by this artful retreat drawn into the snare and surrounded, no longer kept their ranks, but formed several platoons in order to face every way. Emilius, who was on the right wing, seeing the danger of the main body, at the head of his legionaries acted the part both of a soldier and general, penetrating into the heart of the enemy's battalions, and cutting great numbers of them in pieces. All the Roman cavalry that were left, attended the brave consul on foot; and, encouraged by his example, fought like men in despair. But, in the mean time, Afdrubal, at the head of a detachment of Gaulish and Spanish
Spanish infantry brought from the centre, attacked
Emilius's legionaries with such fury, that they were
forced to give ground and fly; the conful being all
covered with wounds, was at last killed by some of
the enemy who did not know him. In the main body,
the Romans, though inlevted on all sides, continued
to tell their lives dear; fighting in phalanx, and making
a great slaughter of those in their right. But being at length
overpowered, and disheartened by the death of the two
proconsuls Servilius and Attilius who headed them,
they dispersed and fled, some to the left, and others to
the right, as they could find opportunity; but the Numi-
nidian horse cut most of them in pieces: the whole
plain was covered with heaps of dead bodies, innume-
rous that Hannibal himself, thinking the battlecry too
terrible, ordered his men to put a stop to it. There is
a great disaffection among authors as to the number
of Romans killed and taken at the battle of Cannae.
According to Livy, the republic lost 50,000 men, in-
cluding the auxiliaries. According to Polybius, of
6000 Roman horse, only 70 escaped to Venusia with
the victorious army, and 200 of the auxiliary horse.
As to the infantry, that writer tells us, that 70,000 of
the Roman foot died on the field of battle fighting like
brave men; and that 13,000 were made prisoners.
According to Dionysius of Halicarnassus, of 6000
horse, only 370 escaped the general slaughter, and of
80,000 foot, 2000 only were left. The most moderate
computation makes the number of Romans killed to
amount to 45,000. The scene of action is marked
out to posterity, by the name of Pezzo di Sangue,
"Field of Blood."
These plains have more than once, since the Punic
war, afforded room for men to accomplish their mutual
destruction. Melo of Bari, after raising the standard
of revolt against the Greek emperors, and defeating
their generals in several engagements, was at last rout-
ed here in 1019, by the Catapan Bolanus. Out of
two hundred and fifty Norman adventurers, the flower
of Melo's army, only ten escaped the slaughter of the
day. In 1201, the archbishop of Palermo and his re-
bellious associates, who had taken advantage of the
nonage of Frederic of Swabia, were cut to pieces at
Cannae by Walter de Brienne, sent by the pope to de-
defend the young king's dominions.
The traces of the town of Cannae are very faint,
consisting of fragments of altars, cornices, gates, walls,
vaults and under-ground granaries. It was destroyed
by fire the year before the battle; but being rebuilt, became
an episcopal see in the infancy of Christianity. It was
again ruined in the sixth century, but seems to have
subsisted in an humble state many ages later; for we
read of its contending with Barletta for the territory,
which till then had been enjoyed in common by them;
and in 1284, Charles I. subdued an edict for divi-
ding the lands to prevent all future litigation. The
prosperity of the towns along the coast, which increas-
ed in wealth and population by embarkations for the
Crusades, and by traffic, proved the annihilation of the
great inland cities, and Cannae was probably abandon-
ated entirely before the end of the thirteenth century.
CANNON. In commerce, white cotton cloths
brought from the East-Indies. They are a proper
commodity for trading on the coast of Guinea, par-

CANNES, a town of France in Provence, and in
the viguerie of Graffe, seated on the coast of the Me-

CANNIBAL, a modern term for an anthropo-
phagous or man-eater, more especially in the West-Indies. See

CANNON, a military engine for throwing balls,
&c., by the help of GUNPOWDER.

The invention of brass cannon is by Laney ascribed
to J. Owen; he says, that they were first known in
England in the year 1353; but yet acknowledges,
that, in 1346, there were four pieces of cannon in the
English army at the battle of Crevy, and that these
were the first that were known in France. And Me-
zeray relates, that king Edward, by five or six pieces
of cannon struck terror into the French army, it be-
ing the first time they had seen any of these thunder-
ing machines; though others affirm that cannon were
known also in France at the same time; but that the
French king, in his hurry to attack the English, and
in confidence of victory, left all his cannon behind him
as useless incumbrances (See ARTILLERY). The Ger-
mans carry the invention further back, and attribute
it to Albertus Magnus, a Dominican monk, about the
year 1250. Volissi rejects all these opinions, and finds
the origin of cannon in China almost 1500 years ago.
According to him they were mounted by the emperor Kitye
in the year of Christ 85. For further particulars of their
history, &c., see GUNNERY.

For the casting of cannon, see FOUNDERY. For
their different parts, proportions, management, opera-
tion, and effects, see GUNNERY.

CANNON, with letter-founders and printers, the
name of the largest size of letters they use.
CANNONADE, the application of artillery to the
purposes of war, or the direction of its efforts against
some distant object intended to be seized or destroyed,
as a ship, battery, or fortresses. See GUNNERY.

Since a large ship of war may be considered as a
combination of floating batteries, it is evident that the
efforts of her artillery must be greatly superior to those
of a fortresses on the sea-coast; that is to say, in gen-
eral; because, on some particular occasions, her situ-
ation may be extremely dangerous, and her cannonading
inefficial. Her superiority confits in several circum-
stances, as the power of bringing her different batte-
ries to converge to one point; of shifting the line of her
attack so as to do the greatest possible execution
against the enemy, or to lie where she will be the least
exposed to his shot; and chiefly because, by employ-
ing a much greater number of cannon against a fort
than it can possibly return, the impression of her artil-
illery against stone-walls soon becomes decisive and irre-
futable. Besides these advantages in the attack, the is
also greatly superior in point of defense: because the
cannon-shot, passing with rapidity through her sides,
seems to do any execution out of the line of their flight,
or occasion much mischief by their splinters; whereas
they very soon shatter and destroy the faces of a para-
apet, and produce incredible havoc among the men by
the fragments of the flions, &c. A ship may also re-

P 2
treat when she finds it too dangerous to remain longer exposed to the enemy's fire, or when her own fire cannot produce the desired effect. Finally, the fluctuating situation of a ship, and of the element on which the reef, renders the effects of bombs very uncertain, and altogether destroys the effects of the risochets, or rolling and bounding shot, which is so pernicious, and destructive in a fortress or land engagement. The chief inconvenience to which a ship is exposed, on the contrary, is, that the low-laid cannon in a fort near the brink of the sea, may strike her repeatedly on or under the surface of the water, so as to sink her before her cannonade can have any considerable efficacy.

CANNULA, in surgery, a tube made of different metals, principally of silver and lead, but sometimes of iron.

They are introduced into hollow ulcers, in order to facilitate a discharge of pus or any other substance; or into wounds, either accidental or artificial, of the large cavities, as the thorax or abdomen: they are used in cutting for the removal of the contents, as the thorax or abdomen: they are used in cutting for the introduction of cauteries, or for the application of a drain for urine.

CANNULAS are used for introducing cauteries, or for the application of a drain for urine, either external or potential, into hollow parts, in order to guard the parts adjacent to that to be cauterized, from injury. They are of various figures; some being oval, some round, and others crooked.

CANO, a kingdom of Africa, in Negroland, with a town of the same name. It is bounded by Zaara on the north, by the river Niger on the south, the kingdom of Agades on the west, and that of Caffina on the east. Some of the inhabitants are herdsmen, and others till the ground and dwell in villages. It produces corn, rice, and cotton. Here are also many deserted and mountains covered with woods, in which are wild citrus and lemon trees. The walls and houses of the town are made of clay, and the principal inhabitants are merchants.

CANOIA, a town of Italy, in the duchy of Milan, seated on the western bank of Lago Maggiore, or the Greater Lake.

CANOE, a boat of Indian origin or vehicle, formed of the trunk of a tree hollowed, and sometimes of several pieces of the bark put together.

Canoes are of various sizes, according to the uses for which they may be designed, or the countries wherein they are formed. The largest are made of the cotton tree; some of them will carry between 20 and 30 hogheads of sugar or molasses. Some are made to carry sail; and for this purpose are steeped in water till they become pliant; after which their sides are extended, and strong beams placed between them, on which a deck is afterwards laid that serves to support their sides. The other forts very rarely carry sail, unless when going before the wind: their sails are made of a sort of short filk grafs or rlufes. They are commonly rowed with paddles, which are pieces of light wood somewhat refembling a corn-thovel; and instead of rowing with it horizontally like an oar, they manage it perpendicularly. The small canoes are very narrow, having only room for one person in breath, and seven or eight lengthwise. The rowers, who are generally American savages, are very expert in managing their paddles uniformly, and in balancing the canoes with their bodies; which would be difficult for a stranger to do, how well accustomed ever to the conducting of European boats, because the canoes are extremely light, and liable to be overturned. The American Indians, when they are under the necessity of landing to avoid a water fall, or of crossing the land from one river to another, carry their canoes on their heads, till they arrive at a place where they can launch them again. This is the general construction of canoes, and method of managing them: but some nations have vessels going under the name of canoes, which differ considerably from the above; as the inhabitants of Greenland, Hudson's-bay, Otaheite, &c.

CANON, a person who possesses a prebend, or revenue allotted for the performance of divine service, in a cathedral or collegiate church.

Canons are of no great antiquity: Pauchier observes, that the name canon was not known before Charlemagne; at least the first we hear of are in Gregory de Tours, who mentions a college of canons instituted by Baldwin XVI. archbishop of that city, in the time of Clotharius I. The common opinion attributes the institution of this order to Chrodegangus, bishop of Metz, about the middle of the eighth century.

Originally canons were only priests, or inferior ecclesiastics, who lived in community; residing by the cathedral church, to assist the bishop; depending entirely on his will; supported by the revenues of the bishopric; and living in the same house, as his domestics, or counsellors, &c. They even inherited his moveables till the year 817, when this was prohibited by the council of Aix-la-Chapelle, and a new rule substituted in the place of that which had been appointed by Chrodegangus, and which was observed for the most part in the west till the twelfth century. By degrees, these communities of priests, flaking off their dependence, formed separate bodies; whereas the bishops, however, were still heads. In the tenth century, there were communities or congregations of the same kind, established even in cities where there were no bishops; these were called collegiares, as they used the terms congregation and college indiscriminately: the name chapter, now given to these bodies, being much more modern. Under the second race of the French kings, the canonical, or collegiate life, had spread itself all over the country; and each cathedral had its chapter, distinct from the rest of the clergy. They had the name canon from the Greek διακονος, which signifies three different things; a rule, a pension, or fixed revenue to live on, and a catalogue or matricula; all which are applicable to them.

In time, the canons freed themselves from their rules, the observance relaxed, and, at length, they ceased to live in community; yet they still formed bodies; pretending to other functions besides the celebration of the common office in the church; yet affirming the rights of the rest of the clergy; making themselves a necessary council of the bishop; taking upon them the administration of a fee during a vacancy, and the election of a bishop to supply it. There are even some chapters exempt from the jurisdiction of the bishop, and owning no head but their dean. After the example of cathedral chapters, collegiate ones also continued to form bodies, after they had abandoned living in community.

Canons are of various kinds; as,
C A N

Cardinal Canons, which are those attached, and, as the Latins call it, incoordinati, to a church, as a priest is to a parish.

Domical Canons, where young canons, who not being in orders, had no right in any particular chapters.

Expatriation Canons, were such as, without having any revenue or prebend, had the title and dignities of canons, a voice in the chapter, and a place in the choir; till such time as a prebend should fall.

Foreign Canons, were such as did not officiate in the canonicities to which they belonged. To these were opposed manifold canons, or canons refidentiary.

Lay, or honorary Canons, are such among the laity as have been admitted, out of honour and respect, into some chapter of canons.

Regular Canons, are canons that still live in community; and who, like religious, have, in process of time, to the practice of their rules, added the solemn profession of vows. They are called regulars, to distinguish them from those secular canons who abandon living in community, and at the same time the observance of the canons made as the rule of the clergy, for the maintenance of the ancient discipline. The canons refulted in their simplicity till the eleventh, some the twelfth century, when some of them, departing from the community, took with them the name of canons, or acapellous priests, because they declined to live in community with the bishop; and those who were left thenceforth acquired the denomination of canons regular, and adopted most of the provisions of the rule of St Augustine. This order of regular canons of St Augustine was brought into England by Adelwald, confessor to Henry I. who created a priory at Noftel in Yorkshire; and obtained for them the church of Carlisle as an episcopal see, with the privilege of choosing their own bishop. They were irregularly protected and encouraged by Henry I. who gave them the priory of Danfable in 1107, and by queen Maud, who, in the following year, gave them the priory of the Holy Trinity in London. It appears, that under the reign of Edward I. they had 53 priories.

Tertiary Canons, those who had only the third part of the revenues of the canonicate.

Canon, in an ecclesiastical sense, is a law or rule, either of doctrine or discipline, enacted especially by a council, and confirmed by the authority of the sovereign.

Canons are properly decisions of matters of religion; or regulations of the policy and discipline of a church, made by councils, either general, national, or provincial. Such are the canons of the council of Nice, or Trent, &c.

There have been various collections of the canons of the Eastern councils: but four principal ones, each ampler than the preceding. The first, according to Usher, A. D. 380, containing only those of the first oecumenical council, and the first provincial ones: they were but 164 in number. To these Dionysius E resisting, in the year 520, added the 30 canons of the apostles, and those of the other general councils. The Greek canons in this second collection end with those of the council of Chalcedon; to which are subjoined those of the council of Sardica, and the African canons. The fourth and last collection comes down as low as the second council of Nice; and it is on this that Balsamon and Zonaras have commented.

Apothetical Canons, are those which have been officially ascribed to St Clement. Bellarmine, Baronius, &c. have them to be genuine canons of the apostles: Coccinus observes, that they cannot be ascribed to the apostles or Clement, because they are not received with other books of scripture, are not quoted by the writers of the first ages, and contain many things not agreeable to the apostolical times: Hincmar, De Marca, Beveridge, &c. take them to be framed by the bishops who were the apostles' disciples in the second or third century; S. Balnage is of opinion, that they were collected by an anonymous writer in the fifth century; but Daille, &c. maintain them to have been forged by some heretic in the sixth century. The Greek church allow only 50 of them, and the Latins only 50; though there are 54 in the edition given of them in the Corpus Juris Canonici.

Canon is also used for the authorized catalogue of the sacred writings. See Bibli.

The ancient canon, or catalogue of the books of the Old Testament, was made by the Jews, and is ordinarily attributed to Ezra; who is said to have distributed them into the law, the prophets, and the hagiography, to which our Saviour refers, Luke, chap. xxiv. ver. 44. The same division is also mentioned by Josephus, cont. Appion.

This is the canon allowed to have been followed by the primitive church, till the council of Carthage; and, according to St Jerome, this consisted of no more than 22 books; answering to the number of the Hebrew alphabet; though at present they are classified into 24 divisions, containing Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Joshua, Judges, Samuel, Kings, I and II Samuel, I and II Kings, I and II Chronicles, the twelve minor prophets, the Psalms, the Proverbs, Job, Canticles, Ruth, Lamentations, Ecclesiastes, Esther, Daniel, Ezra, comprehending the book of Nehemiah and the Chronicles. However, this order is not universally observed, either among Jews or Christians: nor were all the books above enumerated admitted into the canon in Ezra's time. It is most likely, says Dr Prideaux, that the two books of Chronicles, Ezra, Nehemiah, Esther, and Malachi, were added in the time of Simon the Just, when the canon was completed. But that council enlarged the canon very considerably, taking into it the books which we call apocryphal; which the council of Trent has further enforced, enjoining all these to be received as books of Holy Scripture, upon pain of anathema, and being attested of hereby. The Romanists, in defence of this canon, say, that it is the same with that of the Council of Hippo, held in 394; and with that of the third council of Carthage, in 597; at which were present 46 bishops, and, among the rest, St Augustin; who declared that they received it from their fathers.

Their canon of the new testament perfectly agrees with ours. It consists of books that are well known; some of which have been universally acknowledged; such are the four Gospels, the Acts of the Apostles, the thirteen Epistles of St Paul, one Epistle of St Peter, and
and one Epistle of St John: and others, concerning which doubts were entertained, but which were afterwards received as genuine; such are the epistle to the Hebrews, that of James, the second of Peter, the second and third of John, that of Jude, and the Revelation. These books were written at different times, and they are authenticated, not by the decrees of councils, or infallible authority, but by such kinds of evidence as is thought sufficient in the case of any other ancient writings. They were very extensively diffused; they were read in every Christian society; they were valued and preserved with care by the first Christians; they were cited by Christian writers of the second, third and fourth century, as by Ireneaus, Clement the Alexandrian, Tertullian, Origen, Eusebius, &c. and their genuineness is proved by the testimony of those who were contemporaneous with the apostles themselves, and by tradition. The four Gospels, and most of the other books of the New Testament, were collected either by one of the apostles, or some of their disciples and successors, before the end of the first century. The catalogue of canonical books furnished by the more ancient Christian writers, as Origen about the year 210, Eusebius and Athanasius in 315, Epiphanius in 370, Jerome in 382, Austin in 394, and many others, agrees with that which is now received among Christians. For the time of writing the several books of the New Testament, see the titles of the books themselves; as the Gospel of St Matthew, Mark, &c.

Some of the fathers distinguished the inspired writings into three classes; protocanonical, deuto-canonical, and apocryphal.

**Psalchal Canon.** A table of the moveable feasts, showing the day of Easter, and the other feasts depending on it, for a cycle of 19 years.

The paschal canon is supposed to be the calculation of Eusebius of Cesarea; and to have been done by order of the council of Nice.

**Canon.** In monastic orders, a book wherein the religious of every convent have a fair transcript of the rules of their order, frequently read among them as their local statutes. This is also called regula, as containing the rule and institution of their order.

The canon differs from the missale, martyrologium, and nechrologium.

**Canon.** Again, is used for the catalogue of Saints acknowledged and canonized in the Roman church.

**Canon.** Is also used, by way of excellence in the Romish church, for the secret words of the mafs, from the preface to the Pater; in the middle of which the priest consecrates the host. The common opinion is, that the canon of the mafs commences with Teigitur, &c. The people are to be on their knees, hearing the canon; and are to rehearse it to themselves, so as not to be heard.

**Canon.** In the ancient music, is a rule or method of determining the intervals of notes.

Ptolemy rejecting the Aristoxenian way of measuring the intervals in music, by the magnitude of a tone (which was supposed to be formed by the difference between a diapente and a diatessaron), thought that musical intervals should be distinguished, according to the ratios or proportions which the sounds terminating those intervals bear to one another, when considered according to their degree of acuteness or gravity; which, before Aristoxenus, was the old Pythagorean way. He therefore made the diapason consist in a double ratio; the diapente, in a sesquialterate; the diatessaron, in a sesquiquadrate; and the tone itself, in a sesquitertuine; and all the other intervals, according to the proportion of the sounds that terminate them: wherefore taking the canon (as it is called) for a determined line of any length, he shows how this canon is to be cut accordingly, so that it may represent the respective intervals: and this method answers exactly to experiment, in the different lengths of musical chords. From this canon, Ptolemy and his followers have been called Canonicus; as those of Aristoxenus were called Muffaeus.

**Canon.** In modern music, a kind of fugue, which they call a perpetual fugue, because the different parts beginning one after another, repeat incessantly the same air.

Formerly, says Zarlino, they placed, at the head of perpetual fugues, particular directions which showed how this kind of fugues was to be sung; and these directions being properly the rules by which perpetual fugues were composed were called canonici, rules, or canons. From this custom, others taking the title for the thing signified, by a metonymy, termed this kind of composition canon. Such canons as are composed with the greatest facility, and of consequence most generally used, begin the fugue either with the octave or the unison; that is to say, that every part repeats in the same tone the melody of the preceding. In order to form a canon of this kind, it is only necessary for the composer to make an air according to his taste; to add in score as many parts as he chooses, where the voices in octave or unison repeat the same melody; then forming a single air from all these parts successively executed, to try whether this succession may form an entire piece which will give pleasure, as well in the harmony as the melody.

In order to execute such a canon, he who sings the first part begins alone, and continues till the air is signified; then recommences immediately, without any suspension of sound or interruption of time: as soon as he has ended the first couplet, ought to serve for the perpetual subject upon which the whole canon has been composed, the second part begins and repeats the same couplet, whilst the first who had begun, form the second: others in succession begin, and proceed the same way, as soon as he who precedes has reached the end of the first couplet. Thus, by incessantly recommencing, an universal close can never be found, and the canon may be repeated as long as the fingers please.

A perpetual fugue may likewise consist of parts which begin with the intervals of a fourth or fifth, or, in other words, every part may repeat the melody of the first, a fourth, or a fifth higher or lower. It is then necessary that the whole canon should be invented di prima intensione, as the Italians say; and that sharps or flats should be added to the notes, whose natural gradations do not answer exactly, by a fourth or fifth, to the melody of the preceding part, and produce the same intervals with itself. Here the composer cannot pay the least regard to modulation; his only care is, that the melody may be the same, which renders the formation of
The power of making laws was exercised by the church before the Roman empire became Christian. The canon-law that obtained throughout the West, till the 12th century, was the collection of canons made by Dionysius Exiguus in 520, the capitularies of Charlemagne, and the decrees of the popes from Sylaceus to Anaflatius.

The canon-law, even when papal authority was at its height in England, was of no force when it was found to contradict the prerogative of the king, the laws, statutes, and customs of the realm, or the doctrine of the established church.

The ecclesiastical jurisdiction of the see of Rome in England was founded on the canon-law; and this created quarrels between kings and several archbishops and prelates who adhered to the papal usurpation.

Besides the foreign canons, there were several laws and confutations made there for the government of the church: but all these received their force from the royal power; so, at any time, the ecclesiastical courts did, by their sentence, endeavor to enforce obedience to such canons, the courts at common law, upon complaints made, would grant prohibition. The authority vested in the church of England of making canons, was ascertained by a statute of Henry VIII. commonly called the act of the clergy's submissions; by which they acknowledged, that the convocation had always been assembled by the king's writ; so that though the power of making canons resided in the clergy met in convocation, their force was derived from the authority of the king's assenting to, and confirming them.

The old canons continued in full force till the reign of James I. when the clergy being assembled in convocation, the king gave them leave to treat and consult upon canons; which they did, and presented them to the king, who gave them the royal assent: these were a collection out of the several preceding canons and injunctions. Some of these canons are now obsolete. In the reign of Charles I. several canons were passed by the clergy in convocation.

Canonicæ, in the Romish church, a woman who enjoys a prebend, affixed, by the foundation, to maids, without their being obliged to renounce the world or make any vows.

Canonica, in philosophical history, an appellation given by Epicurus to his doctrine of logic. It was called canonica, as consisting of a few canons or rules, for directing the understanding in the pursuit and knowledge of truth. Epicurus's canonica is represented as a very slight and insufficient logic by several of the ancients, who put a great value on his ethics and physics. Laertius even affirms us, that the Epicureans rejected logic as a superfluous science; and Plutarch complains that Epicurus made an unskillful and preposterous use of syllogisms. But these cautions seem too severe. Epicurus was not averse to the study of logic, but even gave better rules in this art than those philosophers who aimed at no glory but that of logics. He only seems to have rejected the dialectics of the Stoics, as full of vain fabilities and deceits, and fitted rather for parade and disputation than real use. The terrors of Epicurus's canonica consists in his doctrine of the criteria of truth. All questions in philosophy are either concerning words or things; concerning things,
we seek their truth; concerning words, their signification: things are either natural or moral; and the
former are either perceived by sense or by the understand-
ing. Hence, according to Epicurus, ariste three
criteria of truth, viz. sense, anticipation or prema-
tion, and poilion. The great canon or principle of
Epicurus’s logic is, that the senses are never deceived;
and therefore, that every sensation or perception of an
appearance is true.

**Canonical**, something that belongs to, or par-
takes of, the nature of a rule or canon.  

**Canonical Hours**, are certain stated times of the
day, confined, more especially by the Romish church,
to the offices of prayer and devotion. Such are *mattins, larid, sext, ninth, vespers*. In Britain the canonical hours are from eight to twelve in the forenoon, before or after which marriage cannot be legally performed in any parish-church.  

**Canonical Obedience**, is that submission which, by the ecclesiastical laws, the inferior clergy are to pay to their bishops, and religious to their superiors.  

**Canonical Sin**, in the ancient church, those which were capital or mortal. Such especially were idolatry, murder, adultery, herefy, and schism.  

**Canonical Punishments**, are those which the church may inflict, such as excommunion, degradation, and penance; in Roman Catholic countries, also fasting, alms, whipping, &c.  

**Canonical Life**, the method or rule of living pre-
scribed by the ancient clergy who lived in community. The canonical life was a kind of medium between the monastic and clerical lives. Originally the orders of monks and clerks were chirally distinct; but pious persons, in process of time, influenced colleges of prelates and canons, where clerks brought up for the ministry, as well as others already engaged therein, might live under a fixed rule, which, though somewhat more easy than the monastic, was yet more restrained than the secular. This was called the *canonical life*, and those who embraced it *canons.* Authors are divided about the founder of the canonical life. Some will have it to be founded by the apostles; others ascribe it to pope Urban I. about the year 1230, who is said to have founded orders of canons to provide such of their clergy as were willing to live in community, with necessaries out of the revenues of the church. The generality ascribes it to St. Augustine; who, having gathered a number of clerks to devote themselves to religion, instituted a monastic within his episcopal palace, where he lived in community with them. Augustinus Panvinius brings the institution somewhat lower: according to him, pope Gelasius I. about the year 495, placed the first regular canons of St. Augustine in the Lateran church.  

**Canonical Letters**, in the ancient church, were a form of testimonials of the orthodox faith, which the bishops and clergy sent each other to keep up the catholic communion, and distinguishing orthodox Christians from Arians and other heretics. They were denominated canonical, either as being composed according to a certain rule or form, or because they were given to the *canonicis*, that is, those comprehended in the canon or catalogue of their church. When they had occasion to travel into other dioceses or countries, dimissory and recommendatory letters, also letters of peace, &c. were to many species of canonical letters.  

**Canonical** is also an appellation given to those epistles in the New Testament more frequently called *catholic or general epistles.*  

**Canonicum**, in a general sense, denotes a tax or tribute.  

**Canonick** is more particularly used in the Greek church for a fee paid by the clergy to bishops, archbishops, and metropolitan, for degrees and promotions.  

**Canonick** also denotes a due of first-fruits, paid by the Greek laity to their bishops, or, according to Du Cange, to their priests. The *canonick* is assessed according to the number of houfes or chimneyes in a place.

The emperor Isaac Comnenus made a constitution for regulating the *canonick* of bishops, which was confirmed by another made in 1086, by his nephew Alexis Comnenus. A village containing thirty fires, was to pay for its *canonick* one piece of gold, two of silver, one sheep, six bushels of barley, six of wheat flour, six measures of wine, and thirty hens.  

**Canonist**, a person skilled in or who makes pro-
| cession of the study and practice of the canon law. Ca |

| nonists and civilians are usually combined in the same |

| persons: and hence the title of *doctor juris canoniz |

| gus,* or legum doctor, usually expressed in abbrevia |

| ture, L. L. D. or J. U. D.  

**Canonization**, a ceremony in the Romish church, by which persons deceased are ranked in the catalogue of the saints. It succeeds beatification.  

Before a beatified person is canonized, the qualifica-
tions of the candidate are strictly examined into, in some consistories held for that purpose; after which, one of the consistorial advocates, in the presence of the pope and cardinals, makes the panegyric of the person who is to be proclaimed a saint, and gives a particular detail of his life and miracles: which done, the holy father decrees his canonization, and appoints the day.  

On the day of canonization the pope officiates in white, and their eminences are dress in the same colour. St. Peter’s church is hung with rich tapestry, upon which the arms of the pope, and of the prince or state requiring the canonization, are embroidered in gold and silver. An infinite number of lights blaze all round the church, which is crowded with pious souls, who wait with devout impatience till the new saint has made his public entry as it were into paradise, that they may offer up their petitions to him without danger of being rejected.  

The following maxim with regard to canonizations is now observed, though it has not been followed above a century, viz. not to enter into the inquiries prior to canoni-
zation, till 50 years, at least, after the death of the peron to be canonized. By the ceremony of canonization, it appears that this rite of the modern Romans has something in it very like the apothesis or deifica-
tion of the ancient Romans, and, in all probability, takes its rise from it; at least several ceremonies of the same nature are conspicuous in both.  

**Canonry**, the benefice filled by a canon. It differs from a prebend, in that the prebend may subsist without
without the canonical: whereas the canonical is inseparable from the prebend: again, the rights of franchises, and other privileges, are annexed to the canonical, and not to the prebend.

CANOPUS, in astronomy, a star of the first magnitude in the rudder of Argo, a constellation of the southern hemisphere.

Canopus, in Pagan mythology, one of the deities of the ancient Egyptians, and, according to some, the god of water. It is said, that the Chaldeans, who worshipped fire, carried their fancied deity thro’ other countries to try its power, in order that, if it obtained the victory over the other gods, it might be acknowledged as the true object of worship; and it having easily subdued the gods of wood, stone, brass, silver, and gold, its priests declared, that all gods did it homage. This the priests of Canopus hearing, and finding that the Chaldeans had brought their god to contend with Canopus, they took a large earthen vessel, in which they bored several holes, which they afterwards filled with water, painted it of several colours, and fitting the head of an idol to it, brought it out, in order to contend with the Chaldean deity. The Chaldeans accordingly kindled their fire all around it; but the heat having melted the wax, the water gushed out thro’ the holes, and extinguished the fire; and thus Canopus conquered the god of the Chaldeans.

Canopus, or Canopus, according to Strabo, had been Menelaus’s pilot, and had a temple erected to him in a town called Canopus, near one of the mouths of the Nile. Dionysius mentions it.

Voßius remarks, on this occasion, the vanity of the Greeks, who, as he conjectures, hearing of an Egyptian deity named Canopus, took from thence an opportunity of defying the pilot of Menelaus who bore the same name, and giving out that the Egyptian god Canopus had been a Greek. F. Monfacon gives several representations of this deity. One, in allusion to the victory abovementioned, throws out water on every side through little holes.

Canopus, or Canopus, (anc. geog.) a town of the Lower Egypt, on the Mediterranean, an hundred and twenty stadia, or fifteen miles to the east of Alexandria; as old as the war of Troy, Canopus, Canopus, Menelaus’s steersman, being there buried. Canopaei, the gentilitious name; famous for their luxury and debauchery, (Strabo, Juvenal.) See ABOUXIR.

Canopy, in architecture and sculpture, a magnificent kind of decoration, serving to cover and crown an altar, throne, tribunal, pulpit, chair, or the like. The word is formed from the barbarous Latin canopium, of canum, a net spread over a bed to keep off the gnats, canus, a gnat.

Canopies are also borne over the head in processions of state, after the manner of umbrellas. The canopy of an altar is more peculiarly called Giborion.

The Roman grandees had their canopies, or spread veils, called thenia, over their chairs: the like were also in temples over the statues of the gods. The modern cardinals still retain the use of canopies.

Canosa, a town of Puglia in Italy, occupying part of the site of the ancient Canosium. The old city was founded by Dionysius, according to Strabo. It afterwards became a Roman colony, and one of the most considerable cities of this part of Italy for extent, population, and magnificence in building. The sea of Canosium seems to have been built on a narrow flat: but this pomp only served to mark it as a capital object for the avarice and fury of the Barbarians. Genicicus, Tolitl, and Flavian, treated it with extreme cruelty. The deplorable state to which this province was reduced in 590 is concisely but strongly painted by Gregory the Great, in these terms: "On every tide we hear groans! on every tide we behold crowds of mourners, cities burnt, castles rased to the ground, countries laid waste, provinces become deserts, some citizens led away captives, and others humanly murthered." No town in Puglia suffered more than Canosa from the outrages of the Saracens; though the contest between the Greeks and Normans increased the miseries of its wretched inhabitants, which was filled by a conflagration that happened 1111. It was burnt by duke Robert. In 1195, it was assigned, by agreement, to Bohemund prince of Antioch, who died here in 1111. Under the reign of Ferdinand the Third, this estate belonged to the Grimaldus. On their forfeiture, the Affiititi acquired it, and still retain the title of marquis, though the Capeci are the proprietors of the fief.

The ancient city stood in a plain between the hills and the river Ofanto, and covered a large tract of ground. Many brick monuments, though degraded and stripped of their marble casing, still attest its ancient grandeur. Among them may be traced the fragments of aqueducts, tombs, amphitheatre baths, military columns, and two triumphal arches, which, by their position, seem to have been two city gates. The present town stands above, on the foundations of the old citadel, and is a most pitiful remnant of so great a city; not containing above three hundred houses. The church of St Sabinus, built, as is said, in the sixth century, is now without the inclosure. It is astonishing, that any part of this ancient cathedral should have withstood so many calamities. Its altars and pavements are rich in marbles; and in a small court adjoining, under an octagonal cupola, is the mausoleum of Bohemund, adorned in a minute Gothic style.

Canso, a sea-port town of Acadia, or Nova Scotia, in North America, fronting which separates Nova Scotia from Cape Breton. Near this town is a fine fishery for cod. W. Long. 62. N. Lat. 46.

Canstat, a town of Swabia, in Germany, in the duchy of Wirtemberg, situated on the river Neckar, in E. Long. 9. 9. N. Lat. 48. 51.

Cant, a quaint affected manner of speaking, adapted chiefly to the lower sort. Skinner racks his invention for the origin of this word; which he successively deduces from the German, Flemish, and Saxon tongues. According to the general opinion, Cant is originally the proper name of a Cameronian preacher in Scotland, who by exercise had obtained the faculty of talking in the pulpit in such a tone, as was understood by none but his own congregation; since Andrew Cant’s time, the word has been extended to signify all sudden exclamations, and whining unmusical tones, especially in praying and preaching. But this origin
CANTABRIA, (anc. geo.), a district of Terracottensis, on the Oceanus Cantabricus or bay of Biscay; now Biscay. The inhabitants were famous for their warlike character. In conjunction with the Asturians, they carried on desperate wars with the Romans; but were subdued by them about 25 years before Christ. Being impatient, however, of a foreign yoke, they in a few years revolted. Most of their youth had been already taken prisoners by the Romans, and sold for slaves to the neighbouring nations; but having found means to break their chains, they cut the throats of their masters; and returning into their own country, attacked the Roman garrisons with incredible fury. Agrippa marched against them with great expedition; but, on his arrival, met with so vigorous a resistance, that his soldiers began to despair of ever being able to reduce them. As the Cantabrians had waged war with the Romans for upwards of 200 years, they were well acquainted with their manner of fighting, no way inferior to them in courage, and were now become desperate; well knowing, that if they were conquered, after having so often attempted to recover their liberty, they must expect the most severe usage, and cruel slavery. Animated with this reflection, they fell upon the Romans with a fury hardly to be expressed, routed them in several engagements, and defended themselves when attacked by the enemy with such intrepidity, that Agrippa afterwards owned, that he had never, either by sea or land, been engaged in a more dangerous enterprise. That brave commander was obliged to use intrigues, menaces, and to brand some of his legionaries with ignominy, before he could bring them to enter the lists with such a formidable enemy. But having at last, with much ado, prevailed upon them to try the chance of an engagement in the open field, he so animated them by his example, that after a most obstinate dispute, he gained a complete victory, which indeed cost him dear, but put an end to that destructive war. All the Cantabrians fit to bear arms were cut in pieces; their castles and strong holds taken and razed; and their women, children, and old men (none else being left alive), were obliged to abandon the mountainous places, and settle in the plain.

Dr Wallis seems to make the Cantabrian the ancient language of all Spain: which, according to him, like the Gaulish, gave way to a kind of broken Latin called *romances, or romanfs*, which by degrees was refined into the Castilian or present Spanish. But we can hardly suppose, that so large a country, inhabited by such a variety of people, spoke all the same language. The ancient Cantabrian, in effect, is still found to subsist in the more barren and mountainous parts of the province of Biscay, Asturias, and Navarre, as far as Bayonne, much as the Britifh does in Wales; but the people only talk it: for writing, they use either the Spanish or French, as they happen to live under the one or the other nation. Some attribute this to jealousy of foreigners learning the mysteries of their language; others to a poverty of words and expressions. The Cantabrian does not appear to have any affinity with any other known language, abating that some Spanish words have been adopted in it for things whose use the Biscayens were anciently unacquainted with. Its pronunciation is not defective. The Lord's prayer, in the Cantabrian tongue, runs thus: *Cursus auter ceremoniae, sanctifica hodie nominem tuum, et veni hodie veniam, ego veni hodie veniam tibi, ut in terris, ut in coelis.*

CANTABRIA, in botany: A fynonym of a species of Convulvulus.

CANTABRUM, in antiquity, a large kind of flag used by the Roman emperors, distinguished by its peculiar colour, and bearing on it some words or motto of good omen, to encourage the soldiers.

CANTACUZENUS, (Johannes) of Confantinople, a celebrated statesman, general, and historian, was born in that city, of a very ancient and noble family. He was bred to letters; and was educated in the highest offices of the state. The emperor Andronicus loaded him with wealth and honour; made him generalissimo of his forces; and was desirous of having him join him in the government, but this he refused. Andronicus dying in 1341, left to Cantacuzenus the care of the empire, till his son John Paleologus, who was then but nine years of age, should be fit to take it upon himself. This trust he faithfully discharged; till the empress dowager and her faction forming a party against him, declared him a traitor. On this the principal nobility and the army befought him to ascend the throne; and accordingly he was crowned on the 21st of May 1342. This was followed by a civil war, which lasted five years; when he admitted John a partner with him in the empire, and their union was confirmed by his giving him his daughter in marriage. Suspicions and enmities, however, soon arising, the war broke out again, and continued till John took Confantinople in 1355. A few days after, Cantacuzenus, unwilling to continue the effusion of blood, abdicated his share of the empire and retiring to a monastery, took the habit of a monk, and the name of Joseph. His wife also retired to a nunnery, and changed her name of Irene for that of Eugenia. In this retirement he lived till the year 1411, when he was upwards of 100 years of age. Here he wrote a history of his own times, a Latin translation of which, from the Greek manuscript, was pub-
CANTALVERS, published by Pontanus at Ingolstadt, in 1603: and a splendid edition was printed at Paris in 1645, in three volumes folio, of the original Greek, and Pontanus's Latin version. He also wrote an apology for the Christian religion against that of Mahomet, under the name of Christiophorus.

CANTALVERS, in architecture, pieces of wood framed into the front or sides of a house, to suspend the mouldings and eyes over it.

CANTAR, or CANTARE, an eastern weight, of different value in different places, equal at Acre in Turkey to 603 pounds, at Tunis and Tripoli to 114 pounds.

Cantor is also an Egyptian weight, which is denominated a quintal, and consists of an hundred or of an hundred and fifty rotolos, according to the goods they are to weigh.

CANTARO is also an Egyptian weight, which at Naples is equivalent to 25 pounds, at Genoa to 150 pounds. At Leghorn there are three kinds of cantaros, one weighing 150 pounds, another 151, and a third 160 pounds.

CANTARO is also a Spanish liquid measure, in use especially at Alicante, containing three gallons.

CANTARO is also a measure of capacity, used at Cochin, containing four rubies, the rubi 12 rotolos.

CANTARINI, (Simon) a famous painter, called the Pefaro, from his being born at Pefaro, was the disciple of Guido; and copied the manner of his master so happily, that it is often difficult to distinguish between their works. He died at Verona in 1648.

CANTATA, in music, a song or composition, intermixed with recitative, airs, and different movements, chiefly intended for a single voice, with a thorough bass, though sometimes for other instruments.

The cantata, when performed with judgment, has something in it very agreeable; the variety of the movement not clogging the ear, like other compositions. It was first used in Italy, then in France, whence it passed to us.

CANTAZARO, an episcopal city of Italy, in the kingdom of Naples, and in the territory of Calabria Ulterior. It is the residence of the governor of the province, and is seated near the sea, in E. Long. 17° 0'.

CANTECROIX, a small territory of the Netherlands, in Brabant, and in the quarter of Antwerp, with the title of a principality; there is a small town of the same name, but Lirc is the capital.

CANTEMIR, (Demetrius) son of a prince of Moldavia. Disappointed by not succeeding his father in that dignity, held under the Ottoman Port, he went over with his army to the Czar Peter the great, against whom he had been sent by the Grand Signior: he signified himself in the Czar's service; and in the republic of letters, by a Latin history of the origin and decline of the Ottoman empire, &c. Died in 1725.

CANTEMIR, (Antiochus) esteemed the founder of the Ruffian poetry, was the youngest son of the preceding. Under the most ingenious professors, whom the czar had invited to Peterburgh, he learned mathematics, physics, history, moral philosophy, and polite literature; without neglecting the study of the Holy Scriptures, to which he had a great inclination. scarce had he finished his academic course, when he printed a Concordance to the Psalms in the Ruffian language, and was elected member of the academy. The affairs of state in which he was soon after engaged, did not make him neglect his literary pursuits. In order to make himself useful to his fellow-citizens, he composed his satires, to ridicule certain prejudices which had got footing among them. When but 23 years of age, he was nominated minister at the court of Great Britain; and his dexterity in the management of public affairs was as much admired as his talent for the sciences. He had the same reputation in France, whither he went in 1738, in quality of minister plenipotentiary, and soon after was invested with the character of ambassador extraordinary. The wife and prudent manner in which he conducted himself during the different revolutions which happened in Russia during his absence, gained him the confidence and esteem of three successive princes. He died of a dropy, at Paris, in 1744, aged 44. Besides the pieces already mentioned, he wrote, 1. Some fables and odes. 2. A translation of Horace's epistles into Ruffian verse. 3. A prose translation of Fontenelle's plurality of worlds; and, 4. Algarotti's dialogues on light. The abbe Guazzo has written his life in French, and translated his satires into that language.

CANTERBURY, a city of England, and capital of the county of Kent, situated in E. Long. 1° 15'. N. Lat. 51° 16'. It had the names of Durwurium and Darvurium given it by the Romans, and Durberia by Bede, which are thought to be derived from Darwich, signifying a rapid stream, such as the Stour, on which it stands, i.e. The Britons call it Caer-Kent, i.e. the city of Kent; and its present English name is of the same import, derived from the Saxon. Modern writers in Latin call it Cantuaria. Its great antiquity appears not only from Antoninus's itinerary, but from the military way which has been discovered here, and the caufeways leading to Dover and Lymme, besides the coins and other curiosities found about it. The Archbishop and metropolitical dignity seems to have been settled here very early; and to prevent its being removed, an anathema was decreed against any who should attempt it. After that, the city flourished greatly; though it suffered in common with other towns, during the Danish invasions, and at other times by the casualties of fire. The city was given entirely to the bishops by William Rufus, and was held in the utmost veneration in the Popilh times, especially after the murder of Becket in the reign of Henry II. to whose shrine so great was the respect, and so rich were the offerings, that Erasmus, who was an eye-witnefs of its wealth, says the whole church and chapel in which he was interred glittered with jewels; and at the dissolution, the plate and jewels filled two great chests, each of which required eight strong men to carry out. The cathedral was granted by Ethelbert, king of Kent, upon his conversion, to Auffin the monk, together with his palace, and the royalty of the city and its territories. This Auffin founded a monastery for monks, called from him Augustin. After the cathedral had been several times destroyed by fire and rebuilt, the present was begun about the year 1174, and augmented and embellished by the succeeding archbishops, till it was completed in the reign of Henry V. It is a noble Gothic pile, and before the reformation had 37
CANTERBURY.

CANTERBURY.

A great many kings, princes, cardinals, and archbishops, are buried in it. At the dissolution, Henry VIII. seized all the revenues both of the church and monastery, except what he allotted for the maintenance of a dean, 12 prebendaries, and six preachers, whom he established in place of the monks. During the great rebellion, it suffered much; the usurper Cromwell having made a stable of it for his draughts. After the restoration, it was repaired, and made what it now appears.

Besides the cathedral and other churches, as well as a monastery, the city had anciently a college on the south-side, and strong walls, with towers, a ditch, and rampart; it had also a mint and an exchange. As to its government, it seems to have been entirely subject to the archbishop, both in spirituals and temporals; at least from the time that William Rufus gave it solely to bishop Anselm, till the reformation. It is now a county of itself; and the corporation consists of a mayor, recorder, 12 aldermen, a sheriff, 24 common-council-men, a mace-bearer, sword-bearer, and four serjeants at arms. Every Monday a court is held at Goldhill for civil and criminal causes; and every other Tuesday for the government of the city. Here were formerly 2000 or 3000 French Protestants employed in the silk manufacture; but this branch is now greatly decayed.

The diocese of Canterbury contains 257 parishes, besides chapels, in Kent, and about 100 more in other dioceses. These are called Peculiars; it being an ancient privilege of this see, that, whereasover the archbishops had either mansors or advowsons, the place was exempted from the jurisdiction of the ordinary of the diocese where it was situated, and was deemed in the diocese of Canterbury. This see is valued in the king's books at L. 2816: 17: 92, but is reckoned to produce but is reckoned to produce but is reckoned to produce a clear revenue of L. 651: 18: 21. This see had many great privileges in the time of Popery, some of which it still retains. The archbishop is appointed prime and metropolitan of all England, and is the first peer in the realm; having the precedence of all dukes, not of the blood-royal, and all the great officers of state. In common speech, he is styled His Grace, and he writes himself Divina Providentia; whereas other bishops style themselves Divina Permissione. At coronations, he places the crown on the king's head; and, wherever the court may be, the king and queen are the proper domicile parishioners of the archbishop of Canterbury.

The bishop of London is accounted his provincial dean, the bishop of Winchester his sub-dean, the bishop of Lincoln his chancellor, and the bishop of Rochester his chaplain. This see hath yielded to the church 18 fants; to the church of Rome, 9 cardinals; to the civil state of England 12 lord chancellors, 4 lord treasurers, and 1 lord chief justice; and 9 chanellers to the University of Oxford. To this see belongs only one archdeacon, viz. of Canterbury. To the cathedral belongs an archbishop, a dean, a chan­cellor, an archdeacon, 12 prebends, 6 preachers, 6 minor canons, 6 substitutes, 12 lay clerks, 10 choristers, 2 masters, 30 scholars, and 12 alfnmen.

CANTERBURY-BELL, in botany: The English name of a species of Campanula.

CANTERUS, (William) an eminent linguist and philologist, was born at Utrecht, in 1542. He studied at Louvain and Paris; and gave surprising proofs of his progress in Greek and Latin literature. He afterwards visited the several universities of Germany and Italy; and died at Louvain, in 1575, aged 37. He understood fix languages, besides that of his native country; and, notwithstanding his dying so young, wrote several philological and critical works, among which are, Note, Scholia, Emendationes, et Explicatio­nes, in Euripide, Sophiæum, Aeschyrum, Cicororum, Properti­um, Aesopium, &c. and many translations of Greek authors.

CANTHARIDES. See CANTHARIS and MELOE.

CANTHARIS, in zoology, a genus of insects belonging to the order of Insecta Coleoptera. The feelers of this genus are fetaceons; the head is margined, and shorter than the head: the elytra, or wing-cases, are flexible; and the sides of the belly are plaited and papillous. Linnaeus enumerates 27 species of the cantharís, most of them to be found in different parts of Europe. The cantharis used in making blistering plasters, is ranked under a different genus, viz. the MELOE.

CANTHI, in anatomy, cavities at the extremities of the eye-lobes, commonly called the corners of the eye: the greater of them, or the greater canthus, is next the nose; the lesser of them, or the little canthus, lies towards the temple.

CANTICLES, a canonical book of the Old Testament, otherwise called the Song of Solomon; by the Jews the Song of Songs, Canticum Canticorum. The book of Canticles is usually supposed to be an epithalamium composed by Solomon, on occasion of his marriage with the king of Egypt's daughter. But those who penetrate farther into the mystery, find in it the marriage of Jesus Christ with human nature, the church, and good men. On this principle the Canticles is held to be a continued allegory, wherein, under the terms of a common wedding, a divine and spiritual marriage is expressed. This long contains the adventures of seven days and seven nights; the exact time allowed for the celebration of marriage among the Hebrews. The Jews themselves, apprehending the book liable to be underfooted in a gross and carnal manner, prohibited the reading of it before the age of 30, and the same usage anciently obtained in the Christian church. Among the ancients, Theodore Mopucetanus rejected the book of Canticles as not divine. Divers rabbins have also questioned its being written by inspiration. It is alleged, that the name of God is not once found in it. Mr Whitton has a different exprefs to prove that the Canticles is not a sacred book of the Old Testament. He alleges it indeed to have been written by king Solomon the son of David; but afferts that it was composed at the time when that prince, blinded by his concubines, was sunk in lust and idola­
This chiefly refers to the general character of vanity and disfigurements which reign in the Canti- tiles; in which there is not, according to W. Cilntiana, where it properly

Mr Whitton will have it to have been taken into the canon long after his landing; particularly, they made these islands, for he and his followers were both Roman camp. The Cantii did not make the same vigorous.

CANTIMARONS, or Cantimarons, and not of half in the water, there being only a place in the

CANTING, a sea-phræse, denotes the act of turning any thing about.

CANTING Language, or dialeet, is a mysterious form of jargon used by gypsies, thieves, and forlorn beggars, to express their feniments to each other, without being understood by the rest of mankind. This dialect is not founded on any rules: yet, even out of that irregularity many words seem to retain something of scholarishness; as for instance, a gown, from *toga* in the Latin; *pamnain*; bread, from *panis*; *cæfan*; cheese, from *caefus*, &c. It is observable, that, even unknown to ourselves, we have adopted some of their terms into our vulgar language: as *kite* and *lick* to cheat; *bounty*, to vapour; *bowfe*, strong drink; *fich*, to steal; *flag*, to whip; *rig*, game or ridicule; *roah*; to rally; *rhino*, money. From the same source proceed the words *fham*, *banter*, *bubble*, *billy*, *sharper*, *cutting*, *fleaffing*, *flaming*, &c. An anonymous author has given a canting dictionary, comprehending all the terms used by the several tribes of gypsies, beggars, shoplifters, highwaymen, foot-pads, and other classes of cheats and villains, with a collection of songs in the canting dialect; London, 1725, 8vo.

CANTIUM, (anc. geog.) a promontory of Brit-ain, literally denoting a head land; giving name to a territory called Cantium, now Kent; and to a people called Cantiis, (Cæfar,), commended for their great humanity and politeness. The promontory now called North Foreland. It is supposed that this was the first district in Britain which received a colony from the continent; and that it had frequently changed its masters, by new colonies coming over from time to time, and driving the inhabitants further north. In the midst of all these revolutions it still retained its ancient name (which was so agreeable to its shape and situation), and gave the name to all the succedaneous tribes by which it was inhabited. Those who polluted the time of the first Roman invasion were evidently of Belgic origin, and had come over so lately, that they differed in nothing from their countrymen on the continent. “The inhabitants of Kent (says Cæsar) are the most civilized of all the Britons, and differ but very little in their manners from the Gauls.” This great resemblance between the people of Kent and their neighbours on the continent, might be partly owing to the situation of their country, which being nearest to the continent, was most frequented by strangers from thence. It was this situation also which exposed them to the first attacks of the Romans. For Cæsar, in both his expeditions into Britain, landed in Kent; and therefore we may conclude, that the Cantii had a great share in the vigorous opposition that was made to his landing, and in the several battles and skirmishes which were fought against him after his landing; particularly, they made a very bold, but unsuccessful attempt, upon his naval camp. The Cantii did not make the same vigorous resistance to the Romans on their next invasion in the reign of Claudius. For Annius Plautius, the Roman general in that expedition, traversed their country without seeing an enemy; and as they now submitted to the power of Rome without a struggle, so they continued in a state of quiet submission to it to the very last. The situation of Cantium occasioned its being much frequented by the Romans, who generally took their way through it in their marches to and from the continent. Few places in Britain are more frequently mentioned by the Roman writers than Rutupium and Portus Rutupensis, most probably Richborough and Stonar. Rutupium was the name in those times that Dover is now: the usual place of embarking for, and landing from, the continent. Before the final departure of the Romans out of Britain, Portus Dubris, now Dover, had become a considerable place, and a well frequented harbour, where the third tert of Antoninus, and, from whence they often embarked for Gaul. Portus Lemanus, supposed to be Lime near Weft Hythe, was also a noted sea-port in these times, and the termination of the fourth tert of Antoninus. Du­robrivæ and Durovernum, now Rochester and Canterbury, were both Roman towns and itations, and are often mentioned in the itinerary and other books. Besides these, there were several other Roman stations, towns, and forts in Cantium, which need not be particular enumerated here. Cantium, in the most perfected state of the Roman government, made a part of the province which was called Flavia Caesariensis.

CANTO denotes a part or division of a poem, answering to what is otherwise called a book. The word is Italian, where it properly signifies sing. Tasso, Ari­osto, and several other Italians, have divided their longer or heroic poems into cantos. In imitation of them,
Scarron has also divided his Gigantomachia, and Boileau his Lutrin, into Cantos or songs. The like usage has been adopted by some English writers, as Butler, who divides his Hudibras, and Dr Garth his Dipin­fary, into Cantos. A late translator of part of Virgil's Aeneid has even subdivided a book of Virgil into several Cantos.

Canto, in the Italian music, signifies a song; hence canto semplice is where all the notes or figures are equal, and called alfo canto fermo; canto figurato, that where the figures are unequal, and express different motions. Canto alfo signifies the treble part of a song; hence canto concertante, the treble of the little chorus; canto ripieno, the treble of the grand chorus, or that which sings only now and then in particular places. Canto signifies the first treble, unless some other word be added to it, as secoondo; in which case it denotes the second treble.

Canton, in geography, denotes a small district or country constituting a distinct government; such are the cantons of Switzerland.

Canton, Quang-tong, or Kanton, one of the southern provinces of China; bounded on the north-east by Fokien, on the north by Kiang-fu, on the west by Quang-tung and the kingdom of Tonking, and every where else by the sea. The country is diversified with hills and plains, and the soil in general so fertile that it produces all crops usual in Europe, as well as many of the fruits of Europe, and those common in other parts of the Indies; the province of Canton produces some peculiar to itself. Abundance of valuable aromatic woods are alfo to be met with in this province, as well as eagle-wood, ebony, &c.; and in the mineral kingdom the province furnishes gold, precious stones, tin, quicksilver, and copper. Silk and sugar are alfo cultivated here, and pearls are fiill up on the coasts; so that every thing which can contribute to the pleasure or convenience of life is to be met with in Canton. One begins (says F. Premare) to have an idea of China, on entering the river Canton. Both sides of it present large fields of rice which resemble green meadows, and extend beyond the reach of flight. They are intersected by an infinite number of small canals, in such a manner that the banks which pafs and repafs in them seem at a distance, while the water which carries them is concealed, to glide along the graves. Farther inland the country appears covered with trees and cultivated along the valleys; and the whole fiene is interfereed with villages, rural seats, and fuch a variety of delightful prospects, that one is never tired of viewing them, and regrets to be obliged to pafs them so quickly.

All the coasts of this province abound with fish, and furnish vast numbers of crabs, oysters, and tortoifes of an immenfe fize. The inhabitants keep a prodigious number of tame ducks, which they hatch in ovens or dangoilfs, though it does not appear that they borrowed this custom from the Egyptians. The docility of these creatures exceeds what we fhould be apt at first to imagine. The inhabitants load a number of small banks with them, and carry them in flocks to feed on the sea-shore, while they fiind shrimps and other animals proper for their nourishment. But though the ducks from the different banks are thus unavoidably mixed together in the day-time, they are easily collected by only beating on a bason, on which they immediately collect themselves into different flocks, and each returns to its proper bark.

In this province the Chinefs have alfo a method of preserving not only the flefh of their ducks in fuch a manner that it loses nothing of its original flavour, but their eggs alfo. The latter operation is performed by covering the eggs with a coat of clay mixed with salt. When mixed in this manner, it fens that the salt has the property of penetrating through the pores of the shell, and thus impregnating the substance in the egg, which it could not do by fimple folution of water.

Canton, though it fuffered much in the Chinefe wars, is at prefent one of the most flourishing provinces of the empire; and being at a great distance from court, its government is one of the most important. A great number of fortresses, many of which are cities provided with numerous Garrifons, have been built along the coasts for the fuppreffion of pirates and robbers; for which purpofe alfo a certain number of troops are kept properly poifed in different parts of the province. It is divided into ten districts, which contain as many cities of the fìrft class, and 84 of the fècond and third. The air in general is warm but healthy, and the people are very induitrious. They poifel in an eminent degree the talent of imitation, fo that if they are only fhewn any European work they can execute others like it with furprising exactness. The moft remarkable cities in the province besides Canton the capital are, 1. Chao-tcheou-fou, chiefly noted for a monaftery of the bonzes in its neighbourhood, to which the adjacent country belongs, and the origin of which is traced back for 8 or 900 years. It has under its jurifiction fix cities of the third class; near one of these grows a reed of which feveral inlroments are made, which cannot be diftinguifhed from real ebony. The air of Chao-tcheou-fou, however, is unhealthy; and great numbers of the inhabitants are carried off annually by contagious diftempers, which prevail from the middle of October to the beginning of December.

2. Kao-tcheou-fou, situated in a delightful and plentiul country. In the neighbourhood is found a fingular kind of stone much resembaling marble, on which are natural representations of rivers, mountains, landsfapes, and trees. These stones are cut into flabs, and made into tables, &c. Crabs are alfo caught on the coasts here, which very much resembife thoufands of Europe; but, fays M. Groifter, they have this singularity, that when taken out of the water, they become petrified without lofing any thing of their natural figure. 3. Kun-tcheou-fou, the capital of the island of Hai-nan. See Hai-nan.

Canton, a large, populous, and wealthy city of China, capital of the province of that name, stands on the banks of the river Ta, or great river, which, near the city, is wide and fpiacious. The wall of the city is very high, and about fix or feven miles in circumference, though not more than one-third of the ground is occupied by buildings, the other parts being appropriated to pleafure grounds or to fish-ponds. The country is extremely pleafant, and towards the eafh hilly, fo as to command a beautiful prospect of the city and inlands, the compafs of which, together, is about ten miles.

The buildings of Canton are in general low, confifting of one story and a ground flour, which is covered with earth or red tiles in order to keep it cool; but the houses
of the most respectable merchants and mandarins are comparatively lofty and well built. In different parts of the city and suburbs are jofu houfes or temples, in which are placed the images worshipped by the Chinese; before whom are placed, at particular feaons, a vast variety of sweetmeats, oranges, great plenty of food ready dressed, and also incense, which is kept perpetually burning. The streets of Canton are long and narrow, paved with flat stones, adorned at intervals with triumphal arches, which have a pleasing effect, and much crowded with people. On both sides are shops as in London, appropriated to the sale of different commodities; and a kind of awning is extended from house to house, which prevents the sun's rays from incommoding either inhabitants or passengers. At the end of every street is a barrier, which, with the gates of the city, are shut in the evening. In China Street, which is pretty long and considerably wider than the rest, reside merchants; whose trade, so far as respects China, lacketed ware, fans, &c. is wholly confined to Europeans. Most of them speak the foreign languages tolerably well, or at least sufficiently intelligible to transact business. Besides these merchants, there is a company of twelve or thirteen, called the Cohong; who have an exclusive right by appointment from authority to purchase the cargoes from the different ships, and also to supply them with tea, raw filks, &c. in return. The establishment of the Cohong, though injurious to private trade, is admirably well adapted for the security of the different companies with which they traffic; because each individual becomes a guarantee for the whole: so that if one fail, the others consider themselves as responsible.

In Canton there are no carriages; all burdens are carried by porters across their shoulders on bamboos; as are also the principal people in reclining chairs, and the ladies always. The streets of Canton may be traversed from morning till evening without seeing a woman; those excepted who are Tartars, and even these but very seldom.

On the wharf of the river, which is commodious and pleasing, stand the factories of the different European nations, viz. the Dutch, French, Swedes, Danes, English, &c. In those reside the supercargoes belonging to their respective companies, who are appointed to dispose of the cargoes brought to market; to supply the ships with others for Europe in return; and, during their absence, to contract with the merchants for such articles as may be judged necessary for the next fleet. Between the residents of the factories the most perfect cordiality subsists; in each a common and splendid table is kept at the company's expense, and visits are reciprocally exchanged; so that nothing is wanting to make residence at Canton agreeable to an European, but the pleasure naturally resulting from the society of women.

The side of the river next the city is covered with boats, which form a kind of town or streets, in which live the poorer part of the Chinese, or rather the descendants of the Tartars. Some of the men come on shore in the morning to their respective employments, and in those sampans or boats which are not stationary, the women and also the men carry passengers from place to place in the same manner as is done by wherries on the Thames. On this river live many thousand souls who never were permitted to come on shore; whose only habitation is their boat; in which they eat, drink, sleep, carry on many occupations, keep ducks, &c. and occasionally a hog.

The manufactures of Canton are principally carried on in the suburbs; though it has been frequently supposed that they were confined to the city; and this, by some writers, has been given as a reason why Europeans are not permitted to enter within the gates. But this is a mistake; and perhaps the true reason for this very singular restraint is, that the houses in which they keep their women are chiefly within the city.

At Wampoo, a large commodious place for anchor-age, and which is about 12 or 14 miles from Canton, the European vessels lie and unload their cargoes, which are transmitted by lighters to the factories; and by the same conveyance receive their respective freights. Between this place and the city are three hoppos, or custom-houses, at which the boats palling and repassing are obliged to stop, and undergo with its passengers an examination, in order to prevent smuggling. The lighters just mentioned, and also the captain's pinnace, are, however, excepted; the former having proper officers on board for the purpose, and the latter being narrowly watched and examined at the landing.

The weather at Canton is, in summer, extremely hot; and in the months of December, January, and February, cold: the country is nevertheless pleasant and healthful, abounding with all the necessaries and delicacies of life, which may be procured on terms much cheaper than in Europe. The number of inhabitants has been estimated at one million; but later calculations have made the number considerably less. N. Lat. 23° 30'. E. Long. 113° 20'.

CANTON, (John) an ingenious natural philosopher, was born at Stroud, in Gloucestershire, in 1718; and was placed, when young, under the care of a Mr Davis, of the same place, a very able mathematician, with whom, before he had attained the age of ten years, he had gone through both vulgar and decimal arithmetic. He then proceeded to the mathematics, and particularly to algebra and astronomy, wherein he had made considerable progress, when his father took him from school, and put him to learn his own business, which was that of a broad cloth weaver. This circumstance was not able to damp his zeal for the acquisition of knowledge. All his leisure time was devoted to the avidous cultivation of astronomical science; and, by the help of the Caroline tables, annexed to "Wing's Astronomy," he computed eclipses of the moon and other phenomena. His acquaintance with that science he applied likewise to the constructing of several kinds of dials. But the studies of our young philosopher being frequently pursed to very late hours, his father, fearing that they would injure his health, forbid him the use of a candle in his chamber any longer than for the purpose of going to bed, and would himself often see that his injunction was obeyed. The son's thirst of knowledge was, however, so great, that it made him attempt to evade the prohibition, and to find means of secreting his light till the family had retired to rest, when he rode to procure undisturbed his favourite pursuits. It was during this prohibition, and at these hours,
In 1752, our philosopher was so fortunate as to be the first person in England, who, by attracting the electric fire from the clouds during a thunder-storm, verified Dr Franklin's hypothesis of the similarity of lightning and electricity. Next year, his paper intitled, "Electrical Experiments, with an attempt to account for their several Phenomena," was read at the Royal Society. In the same paper Mr Canton mentioned his having discovered, by a great number of experiments, that some clouds were in a positive, and some in a negative, state of electricity. Dr Franklin, much about the same time, made the like discovery in America. This circumstance, together with our author's constant defence of the doctor's hypothesis, induced that excellent philosopher, immediately on his arrival in England, to pay Mr Canton a visit, and gave rise to a friendship which ever after continued without interruption or diminution. In the "Lady's Diary for 1756," our author answered the prize question that had been proposed in the preceding year. The question was, "How can we call the shooting of stars be best accounted for; what is the substance of this phenomenon; and in what state of the atmosphere doth it most frequently show itself?" The solution, though anonymous, was so satisfactory to his friend, Mr Thomas Simpson, who then conducted that work, that he sent Mr Canton the prize, accompanied with a note, in which he said, he was sure that he was mistaken in the author of it, as no one besides, that he knew of, could have answered the question. Our philosopher's next communication to the public was a letter in the "Gentleman's Magazine for September 1759," on the electrical properties of the tornatull, in which the laws of that wonderful stone are laid down in a very concise and elegant manner. On December 17th, in the same year, was read at the Royal Society, "An attempt to account for the regular diurnal variation of the Horizontal Magnetic Needle; and also for its irregular variation at the time of an Aurora Borealis." A complete year's observations of the diurnal variations of the needle are annexed to the paper. On Nov. 5, 1761, our author communicated to the Royal Society an account of the Transit of Venus, June 6, 1761, observed in Spital-square. Mr Canton's next communication to the Society, was a letter addressed to Dr Benjamin Franklin, and read Feb. 4, 1762, containing some remarks on Mr Delaval's electrical experiments. On Dec. 16, in the same year, another curious addition was made by him to philosophical knowledge, in a paper, intituled, "Experiments to prove that water is not incompletable." These experiments are a complete refutation of the famous Florentine experiment which so many philosophers have mentioned as a proof of the incompletabillity of water. On St Andrew's day 1763, our author was the third time elected one of the council of the Royal Society; and on Nov. 8, in the following year, were read, before that learned body, his farther "Experiments and observations on the completablility of water, and some other fluids." The establishment of this fact, in opposition to the received opinion, formed on the hasty decision of the Florentine academy, was thought to be deserving of the Society's gold medal. It was accordingly moved for in the council of 1764; and after several invidious delays, which terminated much
much to the honour of Mr Canton, it was presented to him November 30, 1765.

The next communication of our ingenious author to the Royal Society, which we shall take notice of in this place, was on Dec. 22, 1768, being "An easy method of making a Phosphorus that will imbibe and emit light like the Bolognian stone; with experiments and observations." When he first showed to Dr Franklin the instantaneous light acquired by some of this phosphorus from the near discharge of an electriﬁed bottle, the doctor immediately exclaimed, "And God said, let there be light, and there was light." The dean and chapter of St Paul's having, in a letter to the president, dated March 6, 1769, requested the opinion of the Royal Society relative to the best and most effective method of ﬁxing electrical conductors to preserve that cathedral from damage by lightning, Mr Canton was one of the committee appointed to take the letter into consideration, and to report their opinion upon it. The gentlemen joined with him in this business were, Dr Watson, Dr Franklin, Mr Delaval, and Mr Willon. Their report was made on the 8th of June following; and the mode recommended by them has been carried into execution. The last paper of our author's, which was read before the Royal Society, was on Dec. 21, 1769; and contained "Experiments to prove that the Luminousness of the Sea arises from the putrefaction of its animal substances." In the account now given of his communications to the public, we have chiefly confounded ourselves to such as were the most important, and which threw new and distinguished light on various objects in the philosophical world. Besides these, he wrote a number of papers, both in earlier and in later life, which appeared in several different publications, and particularly in the Gentleman's Magazine.

The close and sedentary life of Mr Canton, arising from an unremitted attention to the duties of his profession, and to the prosecution of his philosophical enquiries and experiments, probably contributed to shorten his days. The disorder in which he fell, and which carried him off, was a dropy. His death happened on March 22, 1772, in the 54th year of his age.

CANTONING, in the military art, is the allotting distinct and separate quarters to each regiment, so that the town where they are quartered being divided into as many cantons as there are regiments.

CANTRED, or CANTREF, signifies an hundred villages. It is a British word, compounded of the adjective cant, i. e. hundred; and tref, a town or village. In Wales some of the counties are divided into cantreds, as in England into hundreds.

CANTRE, (from Cantire, signifying a headland); the southern division of the shire of Argyll in Scotland. It is a peninsula, stretching 37 miles from north to south, and seven miles in breadth. It is mostly plain, arable, and populous; inhabited promiscuously by Highlanders and Lowlanders; the latter being invited to settle in this place by the Argyll family, that the lands might be the better cultivated. It gives the title of marquess to the duke, and is by Lochlynn divided from Argyll Proper. This loch is an inlet from the sea, about 60 miles in length and four in breadth, affording heretoof an excellent herring ﬁshery. There are many paltry villages in this country, but no town of any conformation except Campbelltown.

Cantyre was granted to the house of Argyle after a suppression of a rebellion of the Macdonalds of the Isles (and it is suppos'd of this peninsula) in the beginning of the last century, and the grant was afterwards ratified by parliament. The ancient inhabitants were the Macdonals, Mac-eachrains, Mac-kays, and Macmaths.

Mull of CANTREF, the south cape or promontory of the peninsula. There is here a light-house 253 feet above the sea at high-water, situated on the rocks called the Merchants, Lat. 55. 22. Long. 5. 42. west of London. The sound of Ila from the light-house bearing, by the compass, N. by E. distant 27 miles; the south end of Ila N. N. W. distant 25 miles; the north end of Rathlin island, N. W. by W. one half W.; the Maidens Rocks, S. by W. one half W. distant 16 miles; Copeland light, S. by W. one half W. distant 31 miles. The lantern is seen from N. N. E. on S. by W. 1 4th W. and intermediate points of the compass N. of these points.

CANTZ, a town of Silesia in Germany. E. Long. 16. 36. N. Lat. 51. 6.

CANVAS, in commerce, a very clear unbleached cloth of hemp, or flax, woven regularly in little squares. It is used for working tapestry with the needle, by putting the threads of gold, silver, silk, or wool, through the intervals or squares.

CANVAS is also a coarse cloth of hemp, unbleached, somewhat clear, which serves to cover women's stays, also to stiffen men's clothes, and to make some other of their wearing apparel, &c.

CANVAS is also used among the French for the model or first words whereon an air or piece of music is composed, and given to a poet to regulate and ﬁnish. The canvas of a song contains certain notes of the composer, which show the poet the measure of the verses he is to make. Thus Du Lozay says, he has canvas for ten sonnets against the mufic.

CANVAS is also the name of a cloth made of hemp, and used for ship-fails.

CANS, among painters, is the cloth on which they usually draw their pictures; the canvas being smoothed over with a ﬂick-stone, then linned and afterwards whitened over, makes what the painters call their primed cloth, on which they draw their ﬁrst sketches with coal or chalk, and afterwards ﬁnish with colours.

CANUSIUM, (anc. geog.) a town of Apulia, on the right or south side of the Aufidus, to the west of Cannes; whether the Romans ﬂed after the defeat sustained there. It was famous for its red ﬁshing wool; whence those who wore clothes made of it were called Canusineti. Now called CANOSA; which see.

CANUTE, the ﬁrst Danish king of England after Ironside. He married Emma widow of king Eadward; and put to death several persons of quality who stood in his way to the crown. Having thus settled his power in England, he made a voyage to his other kingdom of Denmark, in order to repel the attacks of the king of Sweden; and he carried along with him a great body of the English under the command of the earl of Gwino. This nobleman had here an opportunity of performing a service by which he both reconciled the
C A N

king's mind to the English nation, and, gaining to himself the friendship of his sovereign, laid the foundation of that immense fortune which he acquired to his family. He was stationed next the Swedish camp; and, observing a favourable opportunity which he was obliged suddenly to seize, he attacked the enemy in the night, drove them suddenly from their trenches, threw them into disorder, pursued his advantage, and obtained a decisive victory over them. Next morning, Canute, seeing the English camp entirely abandoned, imagined that these disaffected troops had deserted to the enemy; and he was agreeably surprised to find that they were at that time engaged in pursuit of the discomfited Swedes. He was so pleased with this success, and the manner of obtaining it, that he bestowed his daughter in marriage upon Godwin, and treated him ever after with the most entire confidence and regard.

In another voyage which he afterwards made to Denmark, Canute attacked Norway, and expelled the jot but unwarlike Olans from his kingdom, of which he kept possession till the death of that prince. He had now by his conquests and valor attained the utmost height of his ambition; and having left war and intrigues, he felt the unsatisfactory nature of all human enjoyments; and, equally weary of the glory and turmoils of this life, he began to cast his view towards that future existence which is so natural for the human mind, whether fattied by prosperity or disfigured with adversity, to make the object of its attention. Unfortunately the spirit which prevailed in that age gave a wrong direction to his devotion; and, instead of making atonement to those whom he had formerly injured by his acts of violence, he entirely employed himself in those exercises of piety which the monks represented as most meritorious. He built churches; he endowed monasteries; he enriched ecclesiastics; and he bestowed revenues for the support of chantries at Aflington and other places, where he appointed prayers to be said for the souls of those who had there fallen in battle against him. He even undertook a pilgrimage to Rome, where he founded a considerable church; and, besides obtaining some privileges for the English school erected there, he engaged all the princes through whose dominions he was obliged to pass, to defiit from those heavy impositions and tolls which they were accustomed to exact from the English pilgrims. By this spirit of devotion, no less than by his equitable and politic administration, he gained in a good measure the affections of his subjects.

Canute, who was the greatest and most powerful prince of his time, sovereign of Denmark and Norway as well as of England, could not fail to meet with adulation from his courtiers; a tribute which is liberally paid even to the meanest and weakest of princes. Some of his flatterers breaking out one day in admiration of his grandeur, exclaimed, that every thing was possible for him: upon which the monarch, it is said, ordered a chair to be set on the sea-shore while the tide was making; and, as the waters approached, he commanded them to retire, and to obey the voice of him who was lord of the ocean. He resigned to sit some time in expectation of their submilion; but when the sea still advanced towards him, and began to wash him with its billows, he turned to his courtiers, and remarked to them, That every creature in the universe was frile and impotent, and that power refided with one Being alone, in whose hands were all the elements of nature, who could say to the ocean, “Thus far shalt thou go, and no farther,” and who could level with his nod the most towering piles of human pride and ambition. From that time, it is said, he never would wear a crown. He died in the 20th year of his reign; and was interred at Winchester, in the old monastery.

CAZONE, in music, signifies, in general, a song, where some little fugues are introduced; but it is sometimes used for a sort of Italian poem, usually pretty long, to which music may be composed in the style of a cantata. If this term be added to a piece of instrumental music, it signifies much the same as canzona: if placed in any part of a sonata, it implies the same meaning as allegro, and only denotes that the part to which it is prefixed is to be played or sung in a brisk and lively manner.

CAZONE, a diminutive of canzone, denoting a little short song. The canzonette neapolitanne has two strains, each whereof is sung twice over, as the vaudevilles of the French: The canzonette flaccida is a species of jig, the measure whereof is usually twelve-eighths, and fix-eighths, and sometimes both, as rondeaus.

CAORLO, a small island in the gulf of Venice, on the coast of Friuli, 20 miles south-west of Aquileia, subject to Venice. It has a town of the same name, with a bishop's see.

CAOUTCHOUC, Elastic Resin, or India Rubber, a substance produced from the fyingare-tree of Cayenne, and other parts of South America, and possessed of the most singular properties. No substance is yet known which is so pliable, and at the same time so elastic; and it is farther a matter of curiosity, as being capable of resisting the action of very powerful menstrua. From the account of M. de la Condamine, we learn, that this substance oozes out, under the form of a vegetable milk, from incisions made in the tree: and that it is gathered chiefly in time of rain, because, though it may be collected at all times, it flows then most abundantly. The means employed to infiltrate and insinuate it, M. de la Borde says, are kept a profound secret. M. Bomare, and others, affirm, that it thickens and hardens gradually by being exposed to the air; and as soon as it acquires a solid consistence, it manifests a very extraordinary degree of flexibility and elasticity. Accordingly the Indians make boots of it, which water cannot penetrate, and which, when smoked, have the appearance of real leather. Bottles are also made of it, to the necks of which are fastened hollow reeds, so that the liquor contained in them may be squirited through the reeds or pipes by preasure. One of these filled with water is always preferred to each of the gueftas at their entertainments, who never fail to make use of it before eating. This whimfical custom led the Portuguese in that country to call the tree that produces this resin pa di xirina, and hence the name of siringat is given both to the tree and to its resinous production. Flambeaux, an inch and a half in diameter, and two feet long, are likewise made of this resin, which give a beautiful light, have no bad smell, and burn twelve hours. A kind of cloth is also prepared from it, which the
the inhabitants of Quito apply to the same purposes as our oil-cloth and fail-cloth. It is formed, in fine, by means of moulds, into a variety of figures for use and ornament; and the process is said to be thus:—The juice, which is obtained by incision, is spread over pieces of clay formed into the desired shape, and as fast as one layer is dry, another is added, till the vehicle be of the proper thickness; the whole is then held over a strong smoke of vegetables on fire, whereby it hardens into the texture and appearance of leather; and before the finishing, while yet soft, is capable of having any impression made on the outside, which remains ever after. When the whole is done, the inside mould is picked out.

Ever since this resin has been known in Europe, its chemical qualities, and other interesting properties, have been very diligently investigated. In particular, it has been endeavored to discover some method of dissolving it in such a manner that it would assume different figures with equal facility, and elegance, and other solvents, render it extremely fit for the construction of tubes, catheters, and other instruments, in which these properties are wanted. In order to form this resin into small tubes, M. Macquer prepared a solid cylindrical mould of wax, of the desired size and shape; and then dipping a pencil into the ethereal solution of the resin, dabbed the mould with it, till he had covered it with a coat of resin of a sufficient thickness. The whole piece is then thrown into boiling water; by the heat of which the wax is soon melted, and rises to the surface, leaving the resinous tube completely formed behind.

A resin similar to this was some years ago discovered by M. Poivre, in the isle of France; and there are various milky juices extracted from trees in America and elsewhere, which by previous mixtures and preparations are formed into an elastic resin, but of an inferior quality to that of Cayenne: such, for instance, are the juices obtained from the Cecropia peltata, the Ficus religiosa and indica, etc.

Of the genuine trees, those growing along the banks of the river of the Amazonas are described by M. Condamine as attaining a very great height, being at the same time perfectly straight, and having no branches except at top, which is but small, covering no more than a circumference of ten feet. Its leaves bear some resemblance to those of the manioc: they are green on the upper part, and white beneath. The seeds are three in number, and contained in a pod consisting of three cells, not unlike those of the ricinus or palma Christi; and in each of them there is a kernel, which being stripped and boiled in water produces a thick oil or fat, answering the purposes of butter in the cookery of that country.

A method of dissolving this elastic gum without ether, for the purposes of a varnish or the like, is as follows: Take one pound of the spirit of turpentine, and a pound of the gum cut into very small pieces; pour the turpentine into a long-necked matrass, which must be placed in a sand-bath; throw in the gum, not all at once, but by little and little according as it is perceived to dissolve: When it is well dissolved, pour into the matrass a point of nut or linseed oil, or oil of poppies, rendered diffusive in the usual manner with litharge: Then let the whole boil for a quarter of an hour, and the preparation is finished. This would make an excellent varnish for air-balloons, were it not so expensive on account of the price of the gum. Another method, invented by Mr Baldwin, is as follows. Take any quantity of the caoutchouc, as two ounces avoidopis: cut it into small bits with a pair of scissors. Put a strong iron ladle (such as plumbers or glaziers melt their lead in) over a common pot-coal or other fire. The fire must be gentle, glowing, and without smoke. When the ladle is hot, much be-
low a red heat, put a single bit into the ladle. If black smoke issues, it will presently flame and disappear; or it will evaporate without flame; the ladle is then too hot. When the ladle is less hot, put in a second bit, which will produce a white smoke. This white smoke will continue during the operation, and evaporate the caoutchouc: therefore no time is to be lost; but little bits are to be put in, a few at a time, till the whole are melted. It should be continually and gently stirred with an iron or brass spoon. Two pounds, or one quart, of the best drying oil (or of raw linseed oil which, together with a few drops of neats foot oil, which, together with a few drops of neats foot oil, will make the caoutchouc: therefore no time is to be lost; and evaporation of the allcient Romans, was to denote that they had acquired full liberty, and were no longer subject to the rod of their superiors; in imitation of the ancient Romans, who gave a pileus, or cap, to their slaves, in the ceremony of making them free: whence the proverb, Vocare ferues ad pileum. Hence, also, on medals, the cap is the symbol of liberty, whom they represent holding a cap in her right hand, by the point.

The Romans were many ages without any regular covering for the head: when either the rain or sun was troublesome, the lappet of the gown was thrown over the head; and hence it is that all the ancient statues appear bareheaded, excepting sometimes a wreath, or the like. And the same usage obtained among the Greeks, where, at least during the heroic age, no caps were known. The form of caps or covers of the head in use among the Romans on divers occasions, were the pileus, pileus, cucullus, galerus, and palladium; the differences between which are often confounded by ancient as well as modern writers.

The French clergy wear a shallow kind of cap, called calotte, which only covers the top of the head, made of leather, satin, worsted, or other stuff. The red cap is a mark of dignity allowed only to those who are raised to the cardinalate. The peculiar clergy are distinguished by black leathern caps, the regulars by knot and worsted ones.

Churchmen, and the members of univeristies, students in law, physic, &c. as well as graduates, wear square caps. In most universities doctors are distinguished by peculiar caps, given them in assuming the doctorate. Wickliff calls the canons of his time bisfercati, from the caps. Pasquier observes, that in his time, the caps worn by the churchmen, &c. were called square caps; though, in effect, they were round yellow caps.

The Chinese have not the use of the hat, like us; but wear a cap of a peculiar structure, which the laws of civility will not allow them to put off: it is different for the different feasons of the year: that used in summer is in form of a cone, ending at top in a point. It is made of a very beautiful kind of mat, much valued in that country, and lined with satin: to this is added, at top, a large lock of red silk, which falls all round as low as the bottom; so that in walking, the silk fluctuating regularly on all sides, makes a graceful appearance: sometimes, instead of silk, they used a kind of blackish red hair, the luffre whereof no weather efficaces. In winter they wear a plash cap, bordered with marlcat's or fox's skin: as to the rest, like those for the summer. These caps are frequently fold for eight or ten crowns: but they are so short, that the ears are exposed.

The cap is sometimes used as a mark of infamy; in Italy the Jews are distinguished by a yellow cap; at Lucca by an orange one. In France, those who had been bankrupts were obliged ever after to wear a green cap, to prevent people from being imposed on in any future commerce. The French heart (arts in 1564, 1622, 1628, 1688, it was decreed, that if they were at any time found without their green cap, their protection should
should be null, and their creditors impoverished to call them into prison: but the sentence is not now executed.

**Cap of Maintenance**, one of the regalia, or ornaments of state belonging to the kings of England, before whom it was carried at the coronation and other great solemnities. **Caps of Maintenance** are also carried before the mayors of the several cities in England.

**Cap**, in ship building, a strong, thick, block of wood, used to confine two masts together, when one is erected at the head of the other in order to lengthen it. It is for this purpose furnished with two holes perpendicular to its length and breadth, and parallel to its thickness: one of these is square, and the other round; the former being solidly fixed upon the upper end of the lower mast, whilst the latter receives the mast employed to lengthen it, and secures it in this position.

**CAPACIO**, an episcopal town of Italy, in the kingdom of Naples, and in the Hither Principato. E. Long. 15. 18. N. Lat. 40. 40.

**CAPACITY**, in a general sense, an aptitude or disposition to hold or retain any thing.

**CAPACITY**, in geometry, is the solid contents of any body; also our hollow measure for wine, beer, corn, salt, &c. are called **measures of capacity**.

**CAPACITY**, in law, the ability of a man, or body politic, to give or take lands or other things, or fix actions.

**English law** allows the king two capacities: a natural, and a political: in the first, he may purchase lands to him and his heirs; in the second, to him and his successors. The clergy of the church of England have the like.

**CAPARASON**, or **CAPARISON**, the covering or clothing laid over an horse; especially a sumptuous horse, or horse of state. The word is Spanish, being an augmentative of **cape**, **caput**, head.

Anciently the caparasons were a kind of iron armour, wherewith horses were covered in battle.

**CAPE**, in geography, an high land running out with a point into the sea, as Cape-Nord, Cape-Horn, the Cape of Good Hope, &c.

**CAPE-Elk.** See CERVUS.

**CAPE-Bret.** See BRETON.

**CAPE-Coafl Caffle.** See COAST.

**CAPE-Goode Hope.** See GOOD HOPE.

**CAPE-Verd.** See VERC

**CAPELL, (Edward)** a gentleman well known by his indefatigable attention to the works of Shakespeare, was a native of the county of Suffolk, and received his education at the school of St. Edmund's Bury. In the dedication of his edition of Shakespeare, in 1768, to the duke of Grafton, he observes, that "his father and the grandfather of his grace were friends, and to the patronage of the deceased nobleman he owed the leisure which enabled him to bestow the attention of 20 years on that work." The office which his grace bestowed on Mr Capell was that of Deputy-Inspector of the plays, to which a salary is annexed of 200l. a-year. So early as the year 1745, as Mr Capell himself informs us, shook at the licentiously of Hanmer's plan, he first projected an edition of Shakespeare, of the strictest accuracy, to be collated and published, in due time, ex fide codicem. He immediately proceeded to collect and compare the oldest and rarest copies; noting the original excellencies and defects of the rarest quartos, and distinguishing the improvements or variations of the first, second, and third folios: and, after many years labour, produced a very beautiful small octavo, in 10 volumes, with "an Introduction." There is not, the authors of the Monthly Review observe, among the various publications of the present literary era, a more singular composition than that "Introduction." In style and manner, it is more obsolete and antique than the age of which it treats. It is Lord Herbert of Cherbury, walking the new pavement in all the trappings of romance: but, like Lord Herbert, it displays many valuable qualities accompanying this air of extravagance, much found lovely, and appropriate erudition. In the title-page of "Mr William Shakespeare his Comedies, Histories, and Tragedies," it was also announced and promulgated, "Whereunto will be added, in some other volumes, notes critical and explanatory, and a body of various readings entire." "The Introduction" likewise declared, that these "notes and various readings" would be accompanied with another work, disclosing the sources from which Shakespeare "drew the greater part of his knowledge in mythological and classical matters, his fable, his history, and even the seeming peculiarities of his language—to which," says Mr Capell, "we have given for title, The School of Shakespeare." Nothing surely could be more properly conceived than such designs, nor have we ever met with any thing better grounded on the subject of "the learning of Shakespeare" than what may be found in the long note to this part of Mr Capell's Introduction. It is more solid than even the popular "Eddy" on this topic. Certain quaintnesses of style, and peculiarities of printing and punctuation, attended the whole of this publication. The outline, however, was correct; and the critic, with unremitting toil, proceeded in his undertaking. But while he was diving into the classics of Caxton (to continue the Reviewers account), and working his way underground, like the river Mole, in order to emerge with all his glories; while he was looking forward to his triumphs; certain other active spirits went to work upon his plan, and, digging out the promised treasures, laid them prematurely before the public, defeating the effect of our critic's discoveries by anticipation. Steevens, Malone, Farmer, Percy, Reed, and a whole host of literary ferrets, burrowed into every hole and corner of the warrens of modern antiquity, and overran all the country, whose map had been delineated by Edward Capell. Such a contingency nearly staggered the steady and unshaken perseverance of our critic, at the very eve of the completion of his labours, and as his editor informs us—for, alas! at the end of near 40 years, the publication was posthumous, and the critic himself no more!—he was almost determined to lay the work wholly aside. He persevered, however, by the encouragement of some noble and worthy persons: and to such their encouragement, and his perseverance, the public was, in 1783, indebted for three large volumes in 4to, under the title of "Notes and various readings of Shakespeare; together with the School of Shakespeare, or Extracts from divers English Books,
CAPERNAUM, a town of Galilee, was the home of Jesus Christ. It was a center for commerce and trade, and it was the place where Jesus taught and performed miracles. The town was located on the Sea of Galilee, and it was a hub of activity for the early Christian church. It was also known for its strategic location, making it a point of contention for control during the Roman Empire. The town was later abandoned and became a ruin until it was rediscovered and studied by archaeologists in the 19th century.

CAPEROLANS, a congregation of religious in Italy, so called from Peter Caperole, their founder, in the 13th century.

The Milanci and Venetians being at war, the enemies occasioned thereby spread itself to the very confines. The superiors of the province of Milan, of minor brothers, which extended itself as far as the territories of the republic of Venice, carried it so haughtily over the Venetians, that those of the convicts of Brescia resolved to shake off a yoke which was grown infupportable to them. The superiors, informed of this, expelled out of the province those whom they considered as the authors of this design; the principal of whom were Peter Capero, Matthew de Tharvillo and Bonaventure of Brescia. Peter Capero, a man of an enterprising genius, found means to separate the convents of Brescia, Bergamo, and Cremona, from the province of Milan, and subject them to the conventuals. This occasioned a law-suit between the vicar-general and these convents, which was determined in favour of the latter; and these convents, in 1475, by the authority of Pope Sixtus IV, were erected into a difficult vicariate, under the title of Brescia. This not satisfying the ambition of Capero, he obtained, by the interposition of the Doge of Venice, that this vicariate might be erected into a congregation, which was called from him Capero. This congregation still subsists in Italy, and is composed of 24 convents, situated in Brescia, Bergamo, and Cremona.

CAPERQUIN, a town in Ireland, in the county of Waterford, and province of Munster, situated on the river Blackwater. W. Long. 7. 50. N. Lat. 52. 5.

CAPESTAN, a town of France, in Lower Languedoc, in the diocese of Narbonne, and near the royal canal. E. Long. 3. 5. N. Lat. 43. 35.

CAPH, a Jewish measure of capacity for things estimated by Kimchi at the 20th part of the log, by Arbuthnot at the 16th part of the hin, or 22d of the shea, amounting to five-eighths of an English pint. The caph does not occur in Scripture as the name of any measure.

CAPHAR, a duty which the Turks raise on the Christians who carry or send mercantile from Aleppo to Jerusalem and other places in Syria.

This duty of caphar was first imposed by the Christians themselves, when they were in possession of the Holy Land, for the maintenance of the troops which were planted in difficult passes to observe the Arabs and prevent their incursions. It is still continued, and much increased by the Turks, under pretence of defending the Christians against the Arabs; with whom, nevertheless, they keep a secret intelligence, favouring their excursions and plunderings.

CAPHTOR, (anc. geog.) a town or district of Higher Egypt; and hence the people called Caphtorim or Caphtorati. — Caphtor is an island of Egypt, At Caphtor, (Jeremiah); probably one of those in the Nile. Dr Wells supposes it to be Copa, which floods in a small island. Thence came the Caphtorim or Caphtarati, in Palestine; who with the Philistines confined to extirpate the Hevaei; and whose name was swallowed up in that of the Philistines.

CAPI-A-GA, or CAPI-AGA, a Turkish officer who is governor of the gates of the seragli, or grand master of the seragli.
C'apilla­ment, lIlent of his table, and allows him at the rate of tabcvt fixty judgment in an french is very moderate; the grand abundance of
is of divers kinds; as, itops his hand. The capi­aga cannot be balhaw when he

CAPILLARY Tubes, in physics, are small pipes of glafs, whose canals are extremely narrow, their diameter being

The accent of water, &c. in capillary tubes, is a phenomenon that has long embarrasfed the philosophers:

In order to account for this phenomenon, it will be necessary first to premife, that the attraction between

Now these particles form a periphery contiguous to the surface, the upper part of which attracts and raises the surface, while the lower part, which is in contact with it, supports it: so that neither the thickness nor length of the tube is of any confequence here; the periphery of particles only, which is always proportionable to the diameter of the bore, is the only acting power. The quantity of the fluid raised will therefore be as the surface of the bore which it fills, that is, as the diameter; for otherwise the effect would not be proportional to the cause, since the quantities are always as the ratio of the diameters; the heights therefore to which the fluids will rise, in different tubes, will be inversely as the diameters.

Some doubt whether the law holds throughout, of the accent of the fluid being always higher as the tube is smaller: Dr Hook's experiments, with tubes almost as fine as cobwebs, seem to shew the contrary. The water in these, he observes, did not rise so high as one would have expected. The highest he ever found it, was at 21 inches above the level of the water in the basin; which is much short of what it ought to have been by the law abovementioned. See Cohesion.

CAPILLARY Vejfels. Many small veffels of animal bodies have been discovered by the modern invention of injecting the veffels of animals with a coloured fluid which
CAPILLUS VENERIS. See A DIANTHUM.

CAPILPUS, or CAPILPUS, (Camillus), a native of Mantua, in the 16th century. He wrote a book, entitled, The Stratagem; in which he relates not only what was perpetrated at Paris during the massacre on St. Bartholomew's day, but also the artful preparations which preceded that horrid massacre. It is, however, blended with a great number of falsities.

CAPILPUS, (Lechus) an Italian poet, brother to the former, made himself famous by his Centos of Virgil. The manner in which he applied Virgil's expressions to represent things which the poet never dreamt of, is admirably. His Cento again! but answering had the superintendency of the choir, or band of music, to perform their duty.

The capilpus is also called 

CAPISTCOLUS, in ecclesiastical writers, denotes a dignitary in certain cathedrals, who had the superintendency of the choir, or band of music, answering to what in other churches is called chanter or precentor. The word is also written cabifcola, and capitahola, q. d. the head of the school, or band of music.

The capilpus is also called iosalicnus, as having the instruction of the young clerks and choristers, how to perform their duty.

CAPITA, (distribution by) in law, signifies the appointing to every one an equal share of a personal estate; when all the claimants claim in their own rights, as in equal degrees of kindred, and not due representation.

CAPITA, (succession by), where the claimants are next in degree to the ancestor, in their own right, and not by right of representation.

CAPITAL, of the Latin caput, "the head," is used on various occasions, to express the relation of a head, chief, or principal: thus,

CAPITAL City, in geography, denotes the principal city of a kingdom, state, or province.

CAPITAL Stock, among merchants, bankers, and traders, signifies, the sum of money which individuals bring to make up the common flock of a partnership when it is first formed. It is also said of the flock which a merchant at first puts into trade for his account. It likewise signifies the fund of a trading company or corporation, in which the word flock is generally added to it. Thus we say, the capital flock of the bank, &c. The word capital is opposed to that of profit or gain, though the profit often increases the capital, and becomes of itself part of the capital, when joined with the former.

CAPITAL Crime, such a one as subjects the criminal to capital punishment, that is, to loss of life.*

CAPITAL Punishment, in painting, denotes one of the finest and most excellent pieces of any celebrated master.

CAPITAL Letters, in printing, large or initial letters, wherein titles, &c. are composed; with which all periods, verbes, &c. commence; and wherewith also all proper names of men, kingdoms, nations, &c. begin. The practice which, for some time, obtained among our printers, of beginning every sublative with a capital, is now justly fallen into disrepute; being a manifest perversion of the design of capitals, as well as an offence against beauty and distinctness.

CAPITAL, in architecture, the uppermost part of a column or pillar, serving as the head or crowning, and placed immediately over the shaft, and under the entablature. See ARCHITECTURE.

CAPITANA, or CAPTAIN Galley, the chief or principal galley of a state, not dignified with the title of a kingdom. The capitana was anciently the denomination of the chief galley of France, which the commander went on board of. But since the suppression of the office of captain-general of the galleys in 1669, they have no capitana, but the first galley is called reale, and the second parere.

CAPITANATA, one of the 12 provinces of the kingdom of Naples, in Italy, bounded on the north by the Gulph of Venice, on the east by the Terra di Barri, on the south by the Basilicata and the Farther Principato, and on the west by the county di Molife and a small part of Hither Abruzzo. It is a level country, without trees; the soil sandy, the air hot; the land, however, near the rivers is fertile in pastures. The capital town is Manfredonia.

CAPITANEATE, in a general sense, the same with capitania. Capitanes, in Prussia, are a kind of noble-fends, or serjeants, which, besides their revenue, raise their owners to the rank of nobility. They are otherwise called serjes.

CAPITANEUS, in ancient law writers, denotes a tenant in capite, or chief.

CAPITANEUS Ecclesiae, the same with advocate.

CAPITANIA, in geography, an appellation given to the 12 governments established by the Portuguese in the Brails.

CAPITATION, a tax or imposition raised on each person, in proportion to his labour, industry, office, rank, &c. It is a very ancient kind of tribute. The Latins call it tributum, by which taxes on persons are distinguished from taxes on merchandise, which were called verbilia.

Capitations are seldom practised but in great exigencies of state. In France the capitation was introduced by Louis XIV. in 1669; and is a tax very different from the taille, being levied from all persons, whether they be subject to the taille or not. The clergy pay no capitation, but the princes of the blood are not exempted from it.

CAPITAE, in law, (from capas; i.e. rent; whence tenere in capite, is to hold of the king, the head or lord paramount of all the lands in the kingdom): an ancient tenure of land, held immediately of the king, as of his crown, either by knight's service, or by socage. It is now abolished. See TENURE.

CAPITE Cons, in antiquity, the lowest rank of Roman citizens, who in public taxes were rated the least of all, being such as never were worth above 365 asses. They were supposed to have been thus called, because they
they were rather counted and marshalled by their heads
than by their effects. The capite consilii made part of the
sixth class of citizens, being below the proletarii, who
formed the other moiety of that class. They were not
enrolled in the army, as being judged not able to support
the expense of war; for in those days the soldiers
maintained themselves. It does not appear, that before
Caesar Marius any of the Roman generals lifted
the capite consilii in their armies.

CAPITOL, CAPITOLIUM, in antiquity, a famous
fort or castle, on the Mons Capitolinus at Rome, where-
in was a temple dedicated to Jupiter, thence also de-
nominated Capitolinus, in which the senate anciently
assembled; and which still serves as the city-hall, or
town-house, for the meeting of the conferrators of the
Roman people.—It had its name capitol, from caput, a
man's head, said to have been found fresh, and yet
bleeding, upon digging the foundation of the temple
built in honour of Jupiter. Arnobius adds, that the
fort or citadel of the Roman people.—It had its name
tempeemenai, the year of Rome 139. His successor Servius
was called the other moiety of the temple to Jupiter; and two wings; the one consecrated to Juno,
his sceptre, and the other to Minerva:

The capitol consisted of three parts; a nave sacred
to Jupiter; and two wings, where the Senate, the
frontispiece and sides were surrounded with galleries, in
which those who were honoured with triumphs
entered the senate at a magnificent banquet, after the fa-
crifices had been offered to the gods.

Both the inside and outside were enriched with an in-
finity of ornaments, the most distinguished of which
was the statue of Jupiter, with his golden thunderbolt,
his sceptre, and crown. In the capitol also were a
temple to Jupiter the guardian, and another to Juno,
with the mint; and on the summit of the hill was the
temple of Concord. This beautiful edifice contained
what passed in his tithing, and to inform the inhabitants
of the Sybil's, &c.

The capitol was burnt under Vitellius, and rebuilt
under Vespasian. It was burnt a second time by light-
ing under Titus, and restored by Domitian.

Anciently the name capitol was likewise applied to
all the principal temples, in most of the colonies
throughout the Roman empire; as at Constantinople,
Jerusalem, Carthage, Ravenna, Capua, &c.—That of
Thoulofle, has given the name of capitaus to its sche-
vis or citizens.

CAPITOLINE GAMES, annual games instituted by
Camillus, in honour of Jupiter Capitolinus, and in com-
memoration of the capitol's not being taken by the
Gauls. Plutarch tells us, that a part of the ceremony
confisted in the public criers putting up the Hieramis
fale by auction: they also took an old man, and try-
ing a golden bulla about his neck, exposed him to the
public derision. Pausanias says they also dressed him in a
prize. In the year of another kind of Capitoline games
instituted by Domitian, wherein were rewards
and crowns bestowed on the poets, champions, orators,
historians, and musicians. These last Capitoline games
were celebrated every five years, and became so famous,
that instead of calculating time by idraa, they began
to count by Capitoline games, as the Greeks did by O-
ympia. It appears, however, that this custom was
not of long continuance.

CAPITOLINUS, (Julius) an historian in the begin-
going of the fourth age under Dioecletian, to whom
he ascribed the Lives of Venus, Antoninus Pius, Clod-
ianus Balbinus, Macrinus, the Maximi, and the Gor-
dians. He wrote other lives, which are most of them
lost.

CAPITOUL, or CAPITOL, an appellation given
to the chief magistrates of Thoulofle, who have the ad-
ministration of justice and policy both civil and mer-
cantile in the city. The capitouls at Thoulofle are
much the same with the chevins at Paris, and with the
consuls, bailiffs, burger-masters, mayors, and aldermen,
&c. in other cities. In the ancient acts they are called
confules capitularii or capitouls, and their body capitou-
lim. From this last come the words capitularii and
capitolus. The appellation was derived from hence,
that they have the charge and custody of the town-hou-
se which was ancienlly called capitol.

The office only lasts one year, and ennobles the bear-
ers. In some ancient acts they are called capitulum no-
itum Toulouse. Those who have borne it, flyle them-
seif afterwards burgesses. They are called to all gen-
eral councils, and have the justimagnum; that is, that,
when the year of their administration is expired, their pic-
ures are drawn in the town-house: a custom which
they have retained from the ancient Romans, as may
be seen in Sigeinus.

CAPITOULATE, an appellation given to the
several quarters or districts of the city of Thoulofle,
each under the direction of a capitoul; much like the
wards of London, under their aldermen. Thoulofle
is now divided into eight capitoulates or quarters, which
are subdivided into musterus, each of which has its
ating-man, whose business is to inform the capitoul of
what passes in his tithing, and to inform the inhabitants
of the tithing of the orders of the capitoul.

CAPITULAR, or CAPITULARY, denotes an act
passed in a chapter, either of knights, canons, or reli-
gious.

The capitularia, or capitularies of Charlemagne, Charles
the Bald, &c. are the laws, both ecclesiastical and ci-
vil, made by those emperors in the general councils
or assemblies of the people; which was the way in which
the constitutions of most of the ancient princes were
made; each person present, though a plebeian, lefing
his hand to them.

Some distinguish these from laws; and say, they
were only supplements to laws. They had their name,
capitulars, because divided into capitula, chapters, or
sections. In these capitulars did the whole French
government of the clergy, and the French jurisprudence
anciently consist. In process of time, the name was changed for that of ordinances.

Some distinguish three kinds of capitulars, according
to the difference of their subject-matter: those on ec-
clesiastical affairs, are really canons, extracted from
councils; those on secular affairs, real laws; those re-
ating to particular persons, or occasions, private reg-
ulations.

CAPITULATION, in military affairs, a treaty
made between the inhabitants or garrison of a place
besieged
 CAP [ 138 ]

Cappadocia, a considerable town of Italy, in Istria, on the gulf of Trieste, with a bishop’s see, and subject to the Venetians. The air is wholesome and temperate; its principal revenue consists in wine and salt. E. Long. 14. 0. N. Lat. 45. 48.

CAPON, a cock-chicken, gilded as soon as left by the dam, or as soon as he begins to crow. They are of use either to lead chickens, ducklings, pheasants, &c. and defend them from the kites and buzzards; or to feed for the table, they being reckoned more delicate than either a cock or a hen.

CAPONIERE, or CAPONIERE, in fortification, a covered lodgement, sunk four or five feet into the ground, encompassed with a little parapet about two feet high, serving to support several planks covered with earth. The caponiere is large enough to contain 15 or 20 soldiers; and is usually placed in the glacis on the extremity of the counter-scarp, and in dry moats; having little embrasures for the soldiers to fire through.

CAPPADOCIA, an ancient kingdom of Asia, comprehending all that country which lies between Taurus and the Euxine sea. It was divided by the Persians into two satrapics or governments; by the Macedonians into two kingdoms, the one called Cappadocia ad Taurus; the other, Cappadocia ad Pontum, and commonly Pontus; for the history, &c. of which last, see the article Pontus.

CAPPADOCIA Magna, or Cappadocia properly so called, lies between the 38th and 41st degrees of north latitude. It was bounded by Pontus on the north, Lycaonia and part of Armenia Major on the south, Galatia on the west, and Euphrates and part of Armenia Minor on the east. The first king of Cappadocia we read of in history was Pharnaces, who was preferred to the crown by Cyrus king of Persia, who gave him his sister Atossa in marriage. This is all we find recorded of him, except that he was killed in a war with the Hyrcanians. After him came a succession of eight kings, of whom we know scarce any thing but that they continued faithful to the Persian interest. In the time of Alexander the Great, Cappadocia was governed by Ariarathes II. who, notwithstanding the vast conquests and fame of the Macedonian monarch, continued unshaken in his fidelity to the Persians. Alexander was prevented by death from invading his dominions; but Perdiccas marching against him with a powerful and well disciplined army, dispersed his forces, and having taken Ariarathes himself prisoner, crucified him, with all those of the royal blood whom he could get into his power. Diódorus tells us that he was killed in the battle. He is said to have reigned 82 years. His son Ariarathes III. having escaped the general slaughter of the royal family, fled into Armenia, where he lay concealed, till the civil divisions which arose among the Macedonians gave him a fair opportunity of recovering his paternal kingdom. Amynates, at that time the governor of Cappadocia, opposed him; but being defeated in a pitched battle, the Macedonians were obliged to abandon all the strong holds. Ariarathes, after a long and peaceable reign, left his kingdom to his son Ariarathes II. He applied himself more to the arts of peace than war, in consequence of which Cappadocia flourished greatly during his reign. He was succeeded by his son Ariarathes IV. who
CAPPADOCIA, who proved a very warlike prince, and having overcome Artsaces, founder of the Parthian monarchy, considerably enlarged his own dominions.

He was succeeded by Ariarathes V. who marrying the daughter of Antiochus the Great, entered into an alliance with that prince against the Romans: but Antiochus being defeated, the king of Cappadocia was obliged to sue for peace, which he obtained, after having paid 200 talents by way of fine, for taking up arms against the people of Rome. He afterwards offered the republic with men and money against Peripius king of Macedon, on which account he was by the senate honoured with the title of the friend and ally of the Roman people. He left the kingdom in a very flourishing condition to his son Mithridates, who on his accession took the name of Ariarathes VI.

This prince (furnamed Philotas, from the filial respect and love he showed his father from his very infancy) immediately renewed the alliance with Rome. Out of mere good-nature he restored Mithrobuzanes to Ladiades king of Lesser Armenia to his father's kingdom, though he foresaw that the Armenians would lay hold of that opportunity to join Artaxias, who was then on the point of invading Cappadocia. These differences, however, were settled before they came to an open rupture, by the Roman legates; and Ariarathes seeing himself thus delivered from an impending war by the mediation of the republic, permitted the senate with a golden crown, and offered his service wherever they thought proper to employ him. The senate in return sent him a staff, and chair of ivory; which were presents usually bestowed on those only whom they looked upon as attached to their interest. Not long before this, Demetrius Soter king of Syria had offered Ariarathes his sister in marriage, the widow of Peripius king of Macedon: but this offer the king of Cappadocia was obliged to decline for fear of offending the Romans; and his做得 was in the highest degree acceptable to the republic, who reckoned him among the chief of her allies. Demetrius, however, being, greedy immunity at the flight put upon his sister, set up a pretender to the throne, one Orophernes, a sophist, or, as others call him, a natural son of the deceased king. The Romans ordered Eumenes king of Pergamus to assist Ariarathes with all his forces: which he did, but to no purpose: for the confederates were overthrown by Demetrius, and Ariarathes was obliged to abandon the kingdom to his rival. This happened about 155 years before Christ, and the usurper immediately dispatched embassadors to Rome with a golden crown. The senate declined accepting the present, till they heard his pretensions to the kingdom; and this Orophernes, by falsified witnesse, made appear so plain, that the senate decreed that Ariarathes and he should reign as partners; but next year, Orophernes was driven out by Attalus brother to Eumenes, and his successor to the kingdom of Pergamus.

Ariarathes, being thus restored, immediately demanded of the Priennians 400 talents of gold which Orophernes had deposited with them. They honestly replied, that as they had been trusted with the money by Orophernes, they could deliver it to none but himself, or such as came in his name. Upon this, the king entered their territories with an army, destroying all with fire and sword. The Priennians, however, still persevered in their integrity; and though the city was besieged by the united forces of Ariarathes and Antiochus, not only made an obstinate defence, but found means to restore the fine to Orophernes. At last they applied to the Romans for assistance, who enjoined the two kings to raise the siege, under pain of being declared enemies to the republic. Ariarathes immediately obeyed; and marching his army into Assyria, joined Alexander Zephyrius against Demetrius Soter, by whom he had been formerly driven out of his kingdom.

In the very first engagement Demetrius was slain, and his army entirely dispersed, Ariarathes having on that occasion given uncommon proofs of his courage and conduct. Some years after, war breaking out between the Romans and Artilbonicus, who claimed the kingdom of Pergamus in right of his father, Ariarathes joined the former, and was slain in the same battle in which P. Grassus proconsul of Asia was taken, and the Roman army cut in pieces. He left six sons by his wife Laodice, on whom the Romans bestowed Lycaonia and Cilicia. But Laodice, fearing left her children when they came of age, should take the government out of her hands, poisoned five of them; the youngest only having escaped her cruelty by being conveyed out of the kingdom. The queen herself was soon after put to death by her subjects, who could not bear her cruel and tyrannical government.

Laodice was succeeded by Ariarathes VII. who soon after his accession, married another Laodice, daughter of Mithridates the great, hoping to find in that prince a powerful friend to support him against Nicomedes king of Bithynia, who laid claim to part of Cappadocia. But Mithridates instead of assisting, procured one Gordius to poison his unhappy son-in-law; and, on his death, feizd the kingdom, under pretence of maintaining the rights of the Cappadocians against Nicomedes, till the children of Ariarathes were in a condition to govern the kingdom. The Cappadocians at first fancied themselves obliged to their new protector; but, finding himamong whom they were in a condition to make head against them; but, contrary to his expectation, he was met on the frontiers by the king of Cappadocia with an army no way inferior to his own. Hereupon he invited Ariarathes to a conference; and, in sight of both armies, flayed him with a dagger, which he had concealed under his garment. This struck such terror into the Cappadocians, that they immediately dispersed, and gave Mithridates an opportunity of poising himself of the kingdom without the least opposition. The Cappadocians, however, not able to endure the tyranny of his preceptors, soon
Pharnaces restored the king of Cappadocia, and empire, resigned zanes of all his dominions; but eas of pirates who greatly infested the coasts of Cappadocia. Before Mithridates invaded the kingdom at the head of a very numerous army, and having drawn Ariarathes to a battle, defeated his army with great slaughter, and obliged him to abandon the kingdom. The unhappy prince soon after died of grief; and Mithridates befoothed the kingdom on his son, who was then but eight years old, giving him also the name of Ariarathes. But Nicomedes Philopater king of Bythynia, fearing left Mithridates, having now got possession of the whole kingdom of Cappadocia, should invade his territories, fuborned a youth to pass himself for the third son of Ariarathes, and to present to them a petition in order to be restored to his father's kingdom. With him he went to Rome, Laodice, sister of Mithridates, whom he had married after the death of her former husband Ariarathes. Laodice declared before the senate that she had three sons by Ariarathes, and that the petitioner was one of them; but that the had been obliged to keep him concealed, lest he should undergo the same fate with his brothers. The senate assured him that they would at all events reinstate him in his kingdom. But, in the meantime, Mithridates having notice of these transactions, dispatched Gordius to Rome, to undeceive the senate, and to persuade them that the youth to whom he had resigned the kingdom of Cappadocia was the lawful son of the late king, and grandson to Ariarathes who had left his life in the service of the Romans against Arilonicus. This unexpected embassy put the senate upon enquiring more narrowly into the matter, whereby the whole plot was discovered; upon which Mithridates was ordered to resign Cappadocia, and the kingdom was declared free. The Cappadocians, however, in a short time sent ambassadors to Rome, acquainting the senate that they could not live without a king. This greatly farried the Romans, who had such an aversion to royal authority; but they gave them leave to elect a king of their own nation. All the family of Pharmacides was now extinct, the Cappadocians chose Ariobarzanes; and their choice was approved by the senate, he having on all occasions shewn himself a steady friend to the Romans.

Ariobarzanes had scarce taken possession of his kingdom when he was driven out by Tigranes king of Armenia; who resigned Cappadocia to the son of Mithridates, in pursuance of an alliance previously concluded between the two parties. Ariobarzanes fled to Rome; and, having engaged the senate in his cause, he returned into Asia with Sylla, who was enjoined to restore him to his kingdom. This was easily performed by Sylla, who, with a small body of troops, routed Gordius who came to meet him on the borders of Cappadocia at the head of a numerous army. Sylla, however, had scarce turned his back, when Ariobarzanes was again driven out by Ariarathes the son of Mithridates, on whom Tigranes had befoothed the kingdom of Cappadocia. This obliged Sylla to return into Asia, where he was attended with his usual successes; and Ariobarzanes was again placed on the throne. After the death of Sylla, he was the third time forced by Mithridates to abandon his kingdom; but Pompey, having entirely defeated Mithridates near mount Stella, restored Ariobarzanes to his throne, and rewarded him for his services during the war, with the provinces of Phrygia, Cilicia, and part of Cappadocia. The king, however, being now advanced in years and desirous of spending the remainder of his life in ease, resigned the crown to his son Ariobarzanes, in presence of Pompey; and never afterwards troubled himself with affairs of state.

Ariobarzanes II. proved no less faithful to the Romans than his father had been. On the breaking out of the civil war between Cæsar and Pompey, he sided with the latter; but after the death of Pompey, he was received into favour by Cæsar, who even bestowed upon him great part of Armenia. While Cæsar was engaged in a war with the Egyptians, Pharnaces king of Pontus invaded Cappadocia, and stripped Ariobarzanes of all his dominions; but Cæsar, having defeated Pharnaces, restored the king of Cappadocia, and honoured him with new titles of friendship. After the murder of Cæsar, Ariobarzanes, having refused to join Brutus and Cassius, was by them declared an enemy to the republic, and soon after taken prisoner and put to death. He was succeeded by his brother Ariobarzanes III., who was by Marc Anthony deprived both of his kingdom and life; and in him ended the family of Ariobarzanes.

Archelaus, the grandson of that general of the same name who commanded against Sylla in the Mithridatic war, was by Marc Anthony placed on the throne of Cappadocia, though nowise related either to the family of Pharnaces or Ariobarzanes. His preferment was entirely owing to his mother Glaphyra, a woman of great beauty, but of loose behaviour, who, in return for her compliance with the desires of Anthony, obtained the kingdom of Cappadocia for her son. In the war between Augustus and Anthony, he joined the latter; but at the intercession of the Cappadocians, was pardoned by the emperor. He afterwards received from him Armenia the Lesser, and Cilicia Tachis, for having affiliated the Romans in clearing the seas of pirates who greatly infested the coasts of Asia. He contrived a strict friendship with Herod the Great, king of Judea; and even married his daughter Glaphyra to Alexander, Herod's son. In the reign of Tiberius, Archelaus was summoned to appear before the senate; for he had always been hated by that emperor, because in his retirement at Rhodes he had paid him no sort of respect. This had proceeded from no averlion in him to Tiberius, but from the warning given Archelaus by his friends at Rome. For Caius Cæsar, the presumptive heir to the empire, was then alive, and had been sent to compose the differences of the caesars, whence the friendship of Tiberius was then looked upon as dangerous. But when he came to the empire, Tiberius, remembering the disrespect shown him by Archelaus, enticed the latter to Rome by means of letters from Livia, who promised him her son Tiberius's pardon, provided he came in person to implore it. Archelaus obeyed the summons, and, hastened to Rome, where he was received by the emperor with great wrath and contempt, and soon after accused as a criminal in the senate. The crimes of which he was accused were mere fictions; but his concern at seeing himself treated as a malefactor was so great, that he died soon after of grief; or, as others say, laid vio
CAPPARIS, a name given by some authors to a worm that adheres to and gnaws the bottoms of ships; to which it is extremely pernicious, especially in the East and West Indies: to prevent this several ships have been lately hathed with copper; the first trial of which was made on a British frigate the Alarm.

CAPPARIS, in botany: A genus of the monogyne order, belonging to the polyandria class of plants; and in the natural method ranking under the 25th order, Patamineae. The calyx is tetraphyllum and coriaceous; their petals are four; the stigmas are long; the fruit is a berry, carnose, unilocular and pedunculated, or furnished with a footstalk.

There are seven species. The spinosa, or common caper, is a low shrub, generally growing out of the joints of old walls, the fissures of rocks, and among rubbish, in most of the warm parts of Europe: it hath woody stalks, which fend out many lateral slender branches, under each of these are placed two short croaked spines, between which and the branches come out the footstalks of the leaves, which are finge, short, and content a round smooth entire leaf. At the intermediate joints, between the branches, come out the flowers on long foot-stalks; before these expand the bud, with the impalement is gathered for pickling. Those which are last expanded in form of a single rose, having five large white petals, which are roundish and concave; in the middle are placed a great number of long stigmas, surrounding a fyle which rises above them, and crowned with an ovall gemmata, which afterwards becomes a capsule filled with kidney-shapped seeds.

Culture. This plant is very difficultly preferred in Britain: it delights to grow in crevices of rocks, old walls, &c. and always thrives best in an horizontal posture: so that when planted either in poits or in the full ground, they seldom thrive, though they may be kept alive for some years. They are propagated by seeds in the warm parts of Europe, but very seldom in Britain.

Uses. The buds, pickled with vinegar, &c. are brought to Britain annually from Italy and the Mediterranean. They are supposed to excite appetite and all digestion; and to be particularly useful as detention and apertents in obstructions of the liver and spleen.

CAPRA, or GOAT, a genus of quadrupeds belonging to the order of pectora. The horns are hollow, turned upwards, erect, and scabrous. There are eight fore-teeth in the under jaw, and none in the upper; and they have no dog-teeth. This genus consists of 14 species, viz.

I. The Hircus, or common goat, with arched carinated horns, and a long beard. It is a native of the eastern mountains.

The goat is an animal of more fagacity than the sheep. Instead of having an antipathy at mankind, they voluntarily mingle with them, and are easily tamed. Even in uninhabited countries, they betray no savage dispositions. In the year 1698, an English vessel having put in to the island of Bonavista, two negroes came aboard, and offered gifts to the captain as
many goats as he pleased. The captain expressed his astonishment at this offer. But the negroes replied, that there were only 12 persons on the island; that the goats had multiplied to such a degree, that they became extremely troublesome; and that, instead of having any difficulty in catching them, they followed the men wherever they went, and were so obstinately officious, that they could not get quit of them upon any account whatever.

Goats are sensible of carelessness and capable of a considerable degree of friendship. They are stronger, more agile, and less timid, than sheep. They have a lively, capricious, and wandering vivacity; for which reason, they are become extremely liable to so many diseases; and frequently leap upon the very points of rocks. They are more easily supported than any other animal of the same size; for there is hardly an herb, or the bark of a tree, which they will not eat with pleasure. Neither are they so particular as sheep, as to be confined to the very points of rocks. They are more adapted for the glove factory, especially that of the kid: abroad it is drest and made into stockings, bed-ticks, bed-hangings, sheets, and even shirts. In the army it covers the horsemans arms, and carries the foot-soldier's provisions. As it takes a

The buck will copulate when he is a year old, and the female when she is seven months. But as this is rather premature, they are generally restrained till they be 18 months or two years. The buck is bald, beautiful, and vigorous; one is sufficient to serve 150 females. A buck for propagation should be large, handsome, and about two years of age; his neck should be short and sandy; his head slender; his ears pendant: his thighs thick; his limbs firm; his hair black, thick, and soft; and his beard should be long and bushy. The females are generally in season from September to the end of November. At that time the males drive whole flocks of the females continually from place to place, and fill the whole atmosphere around them with their strong disagreeable odour; which, though as disagreeable as affenfetia itself, yet may be conducive to prevent many distempers, and to cure nervous and hysterical ones. Horseflesh is supposed to be much refreshed by it; on which account many people keep a he-goat in their fields or stables.

Goats go with young four months and an half, and bring forth from the latter end of February to the latter end of April; having only two teats, they generally bring forth but one or two young; sometimes three; and in good warm pastures there have been instances, tho' rare, of their bringing forth four at a time. They continue fruitful till they are seven years of age; but a buck goat is seldom kept after he is five. Both young and old are affected by the weather; a rainy season makes them thin, a dry sunny one makes them fat and blithe: their excellen venery prevents their longevity; for in our climate they seldom live above 11 or 12 years.

Though the food of this animal cofts next to nothing, as it can support itself even upon the most barren mountains, their produce is valuable. In Britain the whitef wigs are made of their hair; for which purpose that of the he-goat is moft in request; the whitef and clearest is selected from that which grows on the haunches, where it is longest and thickest: a good skin well haired is fold for a guinea: though a skin of bad hue, and so yellow as to baffle the barber's skill to bleach, will not fetch above 18d. or 2s. The Welsh goats are far superior in size, and in length and finenes of hair, to those of other mountainous countries. Their usual colour is white: those of France and the Alps are short-haired, reddish, and the horns small. Boilers made from the hair of a goat were in use in the days of Saul, as appears from 1 Samuel xix. 13. The species very probably was the Angora goat, which is only found in the East; and whose soft and silky hair supplied a most luxuriant couch.

The first of the goat is in great esteem as well as the hair. Many of the inhabitants of Caernarvonshire suffer these animals to run wild on the rocks in winter as well as in summer; and kill them in October for the sake of their fat, either by shooting them with bullets, or by running them down with dogs like deer. The goats killed for this purpose are about four or five years old. Their fat will make candles far superior in whiteness and goodness to those made from that of the sheep or ox, and accordingly brings a much greater price in the market; nor are the horns without their use, the country people making of them excellent handles for tucks and pen-knives. The skin is peculiarly well adapted for the glove manufactory, especially that of the kid: abroad it is drest and made into stockings, bed-ticks, bed-hangings, sheets, and even shirts. In the army it covers the horsemans arms, and carries the foot-soldiers provisions. As it takes a dye better than any other skin, it was formerly much used for hangings in the houses of people of fortune, being susceptible of the richest colours, and when flowered and ornamented with gold and silver became an elegant and superb furniture.

The flesh is of great use to the inhabitants of those countries which abound with goats; and affords them a cheap and plentiful provision in the winter-months, when the kids are brought to market. The haunches of the goat are frequently salted and dried, and supply all the uses of bacon: this by the Welch is called coch yr weden, or hung venison. The meat of a fplayed goat of six or seven years old (which is called byfr) is reckoned the best; being generally very fat and sweet. This makes an excellent pottage; goes under the name of rock venison; and is little inferior to that of the deer.

The milk of the goat is sweet, nourishing, and medicinal. It is an excellent foucedancum for a's milk; and has (with a tea-spoonful of hardhorn drank warm in bed in the morning, and at four in the afternoon, and repeated for some time) been a cure for phthisical people before they were gone too far. In some of the mountainous parts of Scotland and Ireland, the milk is made into whey, which has done wonders in this and other cafes where coolers and refinatives are necessary; and to many of those places there is as great a retort of patients of all ranks, as there is in England to the Spas or baths. It is not suprising that the milk of this animal is so salutary, as it browes only on the tops, tendrils, and flowers, of the mountain shrubs, and medicinal herbs; rejecting the grosser parts.
The Angora goat is a variety that is found only in the tract that surrounds Angora and Belbazar, towns in Asia Minor. For the diffusion of three or four days journey. Strabo seems to have been acquainted with this kind; for speaking of the river Halys, he says, that there are goats found near it that are not known in other parts. In the form of their body they differ from the common goat, being shorter; their legs too are shorter, their sides broader and flatter, and their horns straighter; but the most valuable characteristic is their hair, which is soft as silk, of a glossy silvery whiteness, and curled in locks of eight or nine inches in length. This hair is the basis of the fine British camletts, and imported to England in form of thread; for the Turks will not permit it to be exported raw, lest it supports a multitude of poor, who live by spinning it. The goat-herds of Angora and Belbazar are extremely careful of their flocks, frequently combing and washing them. It is observed, that if they change their climate and pasture, they lose their beauty; we therefore suspect that the delin of Baron Alstroemer, a patriotic Swede, turned out fruitlessly, who imported some into his own country, to propagate the breed for the sake of their hair.

b. The Capricorn of Buffon is another variety, having short horns, the ends turned forwards, their sides annulated, and the rings more prominent before than behind.

II. The ibex, or wild-goat, is the flock from whence the tame species sprung. It has large knotty horns reclined upon its back, is of a yellowish colour, and its beard is black. The females are lefs, and have smaller horns, more like those of a common he-goat, and with few knobs on the upper surface: they bring one young offspring when he is an year old; the males are larger. The chamois is of a yellowish colour, and its back is a little divided. It inhabits the Alps of Dauphine, Switzerland, and Italy; the Pyrenean mountains; Greece, and Crete: does not dwell so high in the hills as the ibex, and is found, in greater numbers.

The chamois is of the size of a domestic goat, and its hair is as soft as that of a hind. His vivacity is delightful, and his agility truly admirable. These animals are very social among themselves: we find them going in pairs, or in little flocks of from three to twenty; and sometimes we see from 60 to 100 of them dispersed in different flocks along the declivity of the same mountain. The males keep at a distance from the rest except in the mating season, when they join the females, and beat off all the young. At this period, their air is still stronger than that of the wild, bucks. They bleat often, and run from one mountain to another. Their feeding is in the month of October and November, and they bring forth in March and April. A young female takes the male at the age of 18 months. The females bring forth one, but rarely two at a time. The young follow their mothers till October, if not dispersed by the hunters or the wolves. We are assured that they live between 20 and 30 years. Their flesh is very good. A fat chamois will yield from 10 to 12 pounds of flesh, which is harder and better than that of the goat. The blood of the chamois is extremely hot, and it is said, to have qualities and virtues nearly equal to those of the wild goat. The hunters sometimes mix the blood of the wild and chamois goat: at other times they fell the blood of the wild goats for that of the chamois. The voice of the chamois is a very low and almost imperceptible kind of bleating, resembling that of a hoarse domestic goat. It is by this bleating that they collect together, particularly the mothers and their young. But, when alarmed, or when they perceive their enemy, or any thing the nature of which they cannot distinguish, they advertize one another by a kind of whistling noise. The sight of the chamois is very penetrating, and his sense of smelling is acute. When the fees a man distinctively, he stops for some time, and flies off when he makes a nearer approach. His sense of hearing is equally acute as that of smelling; for he hears the smallest noise. When the wind blows in the direction between him and a man, he will perceive the scent at the distance of more than half a league. Hence, when he foresees or hears any thing which he cannot see, he whistles or blows with such force, that the rocks and forests re-echo the sound. If there are many of them near, they all take the alarm. This whistling is as long as the animal can blow without taking breath. It is first sharp, and turns flat at the end. The chamois then stops for a moment, looks round on all sides, and begins whistling afresh, which he continues from time to time. His agitation is extreme. He strikes the earth with his feet; he leaps upon the highest stones he can find; he again looks round, leaps from one eminence to another; again, when he discovers any thing, he flies off. The whistling of the male is sharper than that of the female. This whistling is performed through the nostrils, and consists of a strong blowing, similar to the sound which a man may make by fixing his tongue to the palate, with his teeth nearly shut, his lips open, and somewhat extended, and blowing long and with great force. The chamois feeds on the finest herbs. He selects the most delicate parts of plants, as the flowers and the tenderest buds. He is very fond of some aromatic herbs, particularly of the carline thistle and genipay, which are
are the hottest plants that grow in the Alps. When he eats green herbs, he drinks very little. He is very fond of the leaves and tender buds of shrubs. He resembles like the common goat. The food he likes seems to announce the heat of his constitution. This animal is admired for his large round eyes, whose size corresponds with the vivacity of his disposition. His head is adorned with two small horns, from half a foot to nine inches in length. Their colour is a fine black, and they are placed on the front nearly between his eyes; and, instead of being reflected backward, like those of other animals, they advance forward above the eyes, and bend backward at the points, which are extremely sharp. He adjusts his ears most beautifully to the points of his horns. Two tufts of black hair defend from his horns to the sides of his face. The rest of the head is of a yellowish white colour, which never changes. The horns of the chamois are used for the heels of canes. Those of the female are smaller and less crooked. The skin of the chamois, when dressed, is very strong, nervous, and supple, and makes excellent riding-breeches, gloves, and vests. Garments of this kind last long, and are of great use to manufacturers. The chamois goats are so impatient of heat, that, in summer, they are only to be found under the shades of caverns in the rocks, among masses of congealed snow and ice, or in elevated forests on the northern declivities of the most drearful mountains, where the rays of the sun seldom penetrate. They suffer in the mornings and evenings, and seldom during the day. They traverse the rocks and precipices with great facility, where the dogs dare not follow them. There is nothing more worthy of admiration than to see these animals climbing or descending inaccessible rocks. They neither mount nor descend perpendicularly, but in an oblique line. When descending, particularly, they throw themselves down across a rock which is nearly perpendicular, and of 20 or 30 feet in height, without having a single prop to support their feet. In descending, they strike their feet three or four times against the rock, till they arrive at a proper resting-place below. The spring of their tendons is so great, that, when leaping about among the precipices, one would imagine they had wings instead of limbs. It has been alleged by some, but without foundation, that the chamois, in climbing and descending rocks, supports himself by his horns. It is by the strength and agility of his limbs that the chamois is enabled to climb and descend rocks. His legs are very fine and tall; those behind are somewhat longer, and always crooked, which favours their springing to a great distance; and, when they throw themselves from a height, the hind legs receive the shock, and perform the office of two springs in breaking the fall. In great snows, and during the rigour of winter, the chamois goads inhabit the lower forests, and live upon pine leaves, the buds of trees, buxus, and fuch green or dry herbs as they can find by scratching off the snow with their feet. The forests that delight them most, are those which are very full of rocks and precipices. The hunting of the chamois is very difficult and laborious. The mode most in use is to kill them by surplice. The hunters conceal themselves behind rocks or large fiones, taking care that the wind blows opposite to them, and, when a favourable opportunity occurs, shoot them with musket-balls. They are likewise hunted in the same manner as flags and other animals, by pelting some of the hunters in narrow passages, while others beat about to raise the game. Men are preferable for this purpose to dogs; for dogs too quickly difperfe the animals, who fly off suddenly to the distance of four or five leagues. V. The DEPRESSA is an African goat, with small depressed horns, bent inwards, lying on the head. It is about the size of a kid; and the hair is long and pendulous. VI. The REVERSA is likewise an African goat, with erect horns, and curved a little forwards. It is about the size of a kid of a year old. It inhabits Juba or Whidaw in Africa. VII. The GAZELLA has long, erect, cylindrical horns, annulated near the base. It inhabits Egypt, the Cape, Arabia, the Levant, and India, dwelling in the plains. VIII. The CERVICAPRA, with plated cylindrical horns, inhabits Barbary. The hair near the horns is longer than in any other part of the body. The females want horns. Mr Halleques gives the following account of this species: "The cervicapra is larger swifter, and wilder, than the common rock-goat, and can fiercely be taken without a falcon. It is met with near Aleppo. I have seen a variety of this which is common in the East, and the horns appear different; perhaps it is a distinct species. This animal loves the smoke of tobacco; and, when caught alive, will approach the pipe of the huntsman, though otherwise more timid than any animal. This is perhaps the only creature, besides man, that delights in the smell of a poisonous and flaming plant. The Arabians hunt it with a falcon (faiilus gentilis, Lin.) I had an excellent opportunity of seeing this sport near Nazareth in Galilee. An Arab, mounted on a swift courser, held the falcon in his hand, as huntsmen commonly do: when he elided the rock-goat on the top of the mountain, he let loose the falcon, which flew in a direct line like an arrow, and attacked the animal; fixing the talons of one of his feet into the chest of the creature, and the other into its throat, extending his wings obliquely over the animal; spreading one towards one of its ears, and the other to the opposite hip. The animal, thus attacked, made a leap twice the height of a man, and freed himself from the falcon: but being wounded, and losing his strength and speed, he was again attacked by the falcon; which fixed the talons of both its feet into the throat of the animal, and held it fast, till the huntsman coming up, took it alive, and cut its throat; the falcon drinking the blood as a reward for his labour. A young falcon, which was learning, was likewise put to the throat of the goat; by this means are young falcons taught to fix their talons in the throat of the animal, as being the proper part; for should the falcon fix them in the creature's hip, or some other part of the body, the huntsman would not only lose his game, but his falcon also: for the animal, rosted by the wound, which could not prove mortal, would run to the dens and the tops of the mountains, whither its enemy, keeping its hold, would be obliged to follow; and, being separated from its master, must of course perish." IX. The
Capra. 

IX. The *bezoartica*, or bezoar goat, is bearded, and has cylindrical, arched, and wholly annulated horns. It is a native of Persia. The bezoar is found in one of its flames, called *abomasus*. See *Bezoar* and *Abomasus*.

X. The *tartarea*, or saiga of Buffon, has cylindrical, straight, annulated horns; the points inclining inward, the ends smooth; the other part furrowed with very prominent annuli; of a pale yellow colour, and the greatest part fempellucid; the cutting teeth are placed to loose in their sockets, as to move with the leaf touch. The male is covered with rough hair like the he-goat, and has a very strong smell; the female is smooth. The hair on the bottom of the fides and the throat is long, and reembles wool; that on the sides of the neck and head is hoary; the back and sides of a dirty white; the beard, belly, and inside of the thighs, of a thinning white. The females are defigurate of horns. These animals inhabit all the defects from the Danube and Dnieper to the river Irtith, but not beyond. Nor are they ever seen to the north of 54 or 55 degrees of latitude. They are found therefore in Poland, Moldavia, about Mount Caucasus, and the Caspian Sea, and Siberia. In the dry and open deferts, where falt-springs abound, feeding on the falt, the a - crid and aromatic plants of those countries, and grow in the fummer-time very fat: but their fides are penetrated by worms. The fat reembles that of mutton; in shape, like that of a buck: the head is reckoned the most delicate part.

XI. The *ammon*, has femicircular, plain, white horns, and no beard. It is about the fize of a ram, and is a native of Siberia.

XII. The *aegagrus* of Pallas, or Caucasian goat, has smooth black horns, tharply ridged on their upper parts, and hollowed on their outward fides. No velutins of knots or rings, but on the upper surface are some heavy flining; bend much back, and are much hooked at the end, approaching a little at the points. On the chin is a great beard, duky, mixed with chefit. The fore-part of the head is black, the fides mixed with brown: there is no beard of the animal grey, or grey mixed with roft-colour. Along the middle of the back, from the neck to the tail, it is a black lift; and the tail is black. The female is either diftitute of horns, or has very short ones. In fize it is superior to the large he-goats, but in form and agility refembles a flag: yet Monardus compares it to the he-goat, and fays that it has the fect of the goat. They inhabit the lower mountains of Caucasus and Taurus, all Asia Minor, and perhaps the mountains of India. They abound on the inhospitable hills of Laar and Khorazan in Persia; and according to Monardus are also found in Africa. It is an animal of vast agility. Monardus was witness to the manner of its faving itself from injury by falling on its horns; for he faw that which he describes leapt from a high tower, precipitating itself on its horns; then springing on its legs, and leaping about, without receiving the least harm. This is one of the animals which yields the once-valued alexipharmic, the Bezoar-flame; which is a concretion formed of many coats, incrufing a nucleus of small pebble, ftones of fands, bits of straw, or buds of trees. The incrufing coats are created from the vegetable food of the acme, especially the rich, dry, and hot herbs of the Persian and Indian mountains. Its virtues are now expolled, and it is reckoned only an absorbent, and that of the weakest kind.

XIII. *Gno*, with fearchful horns, and thick at the base, bending forward close to the head, then suddenly reverting upwards. The mouth is square; the noftils covered with broad flaps. From the nose, half way up the front, is a thick oblong-square brush of long flufh-black hairs reflected upwards, on each side of which the other hairs are long, and point closely down the neck. Round the eyes are defipated in a radiated form, several frong hairs. The nose is flat, and a little arched. On the top a strong and upright mane, reaching from the horns beyond the shoulders. On young, they may easily be made tame; but if caught when at full age, are fo wild and fo-obstinate as to refuse all food. When they die, their noftils are quite flicced.

They are hunted for the fake of their flesh, horns, and skins, which are excellent for gloves, belts, &c. The hunters always approach them against the wind, lealt they should smell their enemy; they also avoid putting on red or white clothes, or any colours which might attract their notice. They are either fhot, or taken by dogs; or by the black eagle, which is trained to this species of falconry. Their belt feafon is in September: at other times, the skins are penetrated by worms. The fat reembles that of mutton; in shape, like that of a buck: the head is reckoned the most delicate part.
the chin is a long white beard; and on the gullet a very long pendulous bunch of hair. On the breast, and between the fore-legs, the hairs are very long and black. The tail reaches to the first joint of the legs, and is full of hair like that of a horse, and quite white. The body is thick; and covered with smooth short hair of a rust brown colour tied with white. The legs are long, elegant, and slender, like those of a flag. On each foot is only a single spur or hind hoof.—

It is a strange compound of animals: having a vaft head like that of an ox; body and tail, like a horse; legs like a flag; and the fimus lacrymales of an antelope. The ordinary size of it is about that of a common galloway; the length of it being somewhat above five, and height of it rather more than four feet.—These animals inhabit in great numbers the fine plains of the great Namaqua, far north of the Cape of Good Hope, extending from S. lat. 25, to 28. 42, where Africa seems at once to open its vast treasures of hoofed quadrupeds. It is an exceedingly fierce animal: on the flight of any body it usually drops its head and puts itself into an attitude of offence; and will dart with its horns against the pales of the inclosure towards the persons on the outside; yet it will afterwards take the bread which is offered. It will often go upon its knees, run swiftly in that singular posture, and furrow the ground with its horns and legs. The Hottentots call it Cewau from its voice. It has two notes, one resembling the bellowing of an ox, the other more clear. It is called an ox by the Europeans.

XIV. The Dorcas, or antelope, has cylindrical annulated horns, bent backward, contorted, and arising from the front between the eyes. It is a native of Africa and Mexico. These animals are of a moft elegant and active make; of a restless and timid disposition; extremely watchful; of great vivacity; remarkably swift; exceedingly agile; and molt of their boundings so light, so elatic, as to strike the spectator with astonishment. What is very singular, they will flop in the middle of their course, for a moment gaze at their pursuers, and then resume their flight.

As the chase of these animals is a favourite diversion with the eastern nations, from that may be collected proofs of the rapid speed of the antelope tribe. The grey-hound, the fleetest of dogs, is unequal in the course; and the sportsman is obliged to call in the aid of the falcon trained to the work, to seize on the animal and impede its motions, to give the dogs time to overtake it. In India and Perfia a fort of leopard is made use of in the chase: this is an animal that takes its prey, not by swiftness of foot, but by the greatness of its springs, by motions similar to that of the antelope; but should the leopard fail in its first essay, the game escapes. The fleetness of this animal was proverbial in the country it inhabited even in the earliest times: the speed of Ahabel is beautifully compared to that of the tzebi; and the Gadites were said to be as swift as the roes upon the mountains. The sacred writers took their similes from such objects as were before the eyes of the people they addressed themselves to. There is another instance drawn from the same subject: the disciple raised to life at Joppa was supposed to have been called Tabitha, i.e. Dorcas, or the Antelope; from the beauty of her eyes; and this is still a common comparison in the calf: Aine el Cazaz, or, "You have eyes of an Antelope," is the greatest compliment that can be paid to a fine woman.

Some species of the antelopes form herds of 2000 or 3000, while others keep in small troops of five or six. They generally reside in hilly countries; though some inhabit plains: they often browse like the goat, and feed on the tender shoots of trees, which give their flesh an excellent flavour. This is to be understood of those that are taken in the chase; for those that are fattened in houses are far less delicious. The flesh of some species are said to taele of musc, which perhaps depends on the qualities of the plants they feed on.

Mr Pennant makes the antelope a distinct genus of animals, forming a link between the goat and the deer; with the frift of which they agree in the texture of the horns which have a core in them, and they never cast them; with the tail, in the elegance of their form, and great swiftness. He distinguishes several species, among which he ranks the gazella, the cervicapra, the bezoar-tica, and the tartaria of Linnaeus, described above, VII. VIII. IX. X. with the moschus grimmius of the same author. See Moschus.

The other species of antelopes distinguished by zoologists are:

1. The Kevella of Pallas, or flat-horned antelope, has horns twelve inches long, flattened on their sides, inclining first backwards, bending in the middle, and then reverting forwards, at their ends, and annulated with from fourteen to eighteen rings: the upper side of the body is reddish brown; the lower part and buttocks are white: the size equal to a small roebuck. They inhabit Senegal; where they live in great flocks, are easily tamed and are excellent meat.

2. The corine antelope, with very slender horns, six inches long, surrounded with circular rages: on each side of the face is a white line; beneath that, is one of black: the neck, body, and flanks are tawny; belly and infide of the thighs white, on the knees is a tuft of hair. It is less than a roebuck, and inhabits Senegal.

3. The nagor, or red antelope, with horns 5½ inches long; one or two flight rings at the base: ears much longer than the horns: hair stiff and bright; in all parts of a reddish colour, palest on the cheeks: tail very short. Inhabits Senegal and the Cape; where it is very frequent, and is a common food.

4. The dams or swift antelope (le Nanguer, Buff), with round horns, eight inches long, reverting at their ends. The general colour is tawny; but this species varies in that particular. It inhabits Senegal; and is easily tamed. It is very swift; Elkan compares its flight to the rapidity of a whirlwind.

5. The elk-antelope of Sparrman (Indian antelope of Pennant), has thick straight horns, marked with two prominent spiral ribs near two-thirds of their length, smooth towards their end; some above two feet long. The head is of a reddish colour, bounded on the cheeks by a dusky line. The forehead is broad; the nose pointed. On the forehead is a stripe of long loose hairs; and on the lower part of the dewlap, a large tuft of black hair. Along the neck and back, from head to tail, is a black short mane: the rest of the body is of a bluish grey, tinged with red. The tail does not reach to the first joint of the leg; is covered with short ci-
The legs are short, surrounded at their junction with the legs by a circle of black hairs. The height to the shoulders is five feet. It is thick bodied and strongly made; but the legs are slender. It wants the finus laebranantis. The females are horned like the males.—The Caffres call this species empusos and poffo. The Dutch of the Cape call it the eland or elk. M. de Buffon, by mistake, calls this the conudos, which he ought to have befalse on his conudos. It inhabits India, Congo, and the other parts of Africa. They live in herds; but the old males are often solitary. They gallop seemingly with a heavy pace, yet go swiftly. They drop on their knees to be discerned. This Mr Shaw makes his descriptions, as he supposes from the dried skins of this animal. He informs us, that in this animal there is a pore one line in diameter, an inch or an inch and a half below and before the internal angle of the eye. From this pore, which is the aperture of a caruncle that lies below, there is secreted a matter almost like car-wax, which he observed the Hottentots kept in a piece of skin as a rare and excellent medicine; on the dried skin of the animal, this pore is easily to be discerned. This Mr Sparman supposes is the reason why so great and accurate a zoologist as M. Pallas (who describes it in his Speleologia under the denomination of Antelope bubalis) makes no mention of this pore, as he made his descriptions chiefly from the dried skins of this animal. The use of this pore, which is also found in the deer, is for affording free respiration, a circumstance of essential to beasts of this species.

7. The springer, with slender horns, annulated half way, and twice contorted. The ears very long and dusky. The face, cheeks, nose, chin, and throat, are white. The whole upper side of the neck, part of the lower, the back, the sides, and outside of the limbs, are of a pale yellowish brown. The chest, belly, and infide of the limbs, are white; the sides and belly divided by a broad band of chestnut, which runs down part of the shoulders. The tail reaches to the first joint of the leg; the upper part white; the lower black, and furnished with long hair. The buttocks are white; and from the tail half way up the back is a stripe of white, expansible at pleasure. This elegant species weighs about fifty pounds, and is rather less than a roebuck. It inhabits the Cape of Good Hope, where it is called the spring-bok, from the prodigious leaps it takes on the light of any body. When alarmed, it has the power of expanding the white face about the tail into the form of a circle, which returns to its linear form when the animal is tranquil. These animals migrate annually from the interior parts in small herds, and continue in the neighbourhood of the Cape for two or three months; then join companies, and go off in troops consisting of many thousands, covering the great plains for several hours in their passage. They are attended in their migrations by numbers of hyenas, and other wild beasts, which make great destruction among them. They are excellent eating, and with other antelopes are the venison of the Cape. Mr Maffen informs us, that they also make periodical migrations, in seven or eight years, in herds of many hundreds thousands, from the north, as he supposes from vol. ixvi. of Terra de Natal. They are compelled to it by the excessive drought which happens in that region, when sometimes there does not fall a drop of rain for two or three years. These animals in their course defolate Caffraria, spreading over the whole country, and not leaving a blade of grass. Lions attend them; where one of these beasts of prey are, his place is known by the void visible in the middle of the timorous herd.

8. The striped antelope, has smooth horns, twisted spirally, and compressed sideways, with a ridge on one side following the wreathe: they consist of three bends; and are sometimes four feet and a half long measured in a straight line. They are naturally of a dusky colour, and wrinkled; but are generally brought over highly polished. The females are destitute of horns. In the upper jaw is a hard horny substance, dilated in ridges. The length of the animal is nine feet; the legs are slender; the general colour is of a reddish cast, mixed with grey; and from the tail, along the top of the back, to the shoulders, is a white stripe; from which are seven others, four pointing towards the thighs, and three towards the belly; but they vary in number of stripes. On the upper part of the neck is a short mane; beneath the neck, from the throat to the breast, are some long hairs hanging down. It inhabits the Cape of Good Hope, where it is called coelotes, and is said to leap to a most astonishing height. This species wants the finus laebranantis.

9. The bosh-bok, or wood-goat of the Cape, a species of antelope, according to Mr Sparman, unknown to all the cultivators of natural history, whether ancient or modern, till it was described in the memoirs of the Swedish academy for the year 1780, quarter 3d, by the name of antelope fylvetica. This animal has
Capra. has obtained the name it goes by, in consequence of its being the only one among the gazelles in Africa, which may be properly said to live in the woods and groves. In size, the bosch-bok is somewhat above two feet and a half high. The horns are ten inches and a half long; the ears half the length of the horns, or five inches. The horns are black, in some measure triangular, and at the same time wreathed, so that both the sides and angles have somewhat of a spiral turn. At bottom they are rather rough, in consequence of a set of almost innumerable wavy-rings; which, however, are not elevated much above the surface. At top they are conical and sharp-pointed, and in that part as smooth as though they had been polished. The teeth of this animal are like those of other antelopes. It has no fore-teeth or incisors except in the lower jaw, where it has eight. There is no porous corneus in this, as there is in some other antelopes. The hairs on the head are very short and fine; afterwards they become more rough and rugged, resembling goats hair more than that of gazels or harts. Forwards on the neck, breast, sides, and belly, they are an inch and a half or two inches long. On the ridge of the neck, and on all along that of the back, they are three or four inches in length, so as to form a kind of mane there, terminating in a tail about a finger's breadth long. On the hind part of the thighs and buttocks like wife, the hairs are eight inches long; the legs and feet are slender, and covered with short hairs; the fetlock-joints are small; the nose and under-lip are decorated with black-whiskers about an inch long. The predominant colour in this animal is dark-brown, which occupies the principal part of the sides, the back, the upper part of the tail, the upper part of the chest and fore-ribs, and the fore-part of the belly. A still darker brown, bordering upon black, is discoverable on the outside of the shoul ders, and some part of the fore-ribs. The fore-part of the nose, from the eyes to the muzzle, is of a foot colour. The ears are likewise as black as foot on the outside, but on the inside grey; and both outwards and inwards covered with hairs still shorter than those of the head; excepting half the fore-part of the lower edge, where the hairs are white and half an inch long. Divers small white spots, from nine to twelve in all, are seen on each of the haunches and on the sides near them. A narrow line of long white hairs extends from the neck all along the back and tail, in the middle of the long brown hairs already described. From the chine of the back to the sides run five white parallel streaks, which, however, are only discoverable by a close inspection.

This creature does much mischief to the vineyards and kitchen-gardens of the Cape colonists; and it shows a great deal of craft and artifice in avoiding the snares and traps set for it, as well as the ambuscades of the sportmen. As the bosch-bok runs but slowly, it sometimes happens that he is caught by dogs. When he sees there is no other resource, he puts himself into a posture of defence; and when he is going to butt, kneels down, like the white-footed antelope and the hartbeest. The colonists are not very fond of hunting him in this manner, the sport on this occasion generally falls his life at a very dear rate, by gor ring and killing some of their loot and most spirited boundls. This creature's horns, which are its chief defence, sometimes also prove its bane, by being entangled in the bushes and small branches of trees, which thus stop the beast in its flight. In some measure to avoid this, it carries its nose horizontally and straight forward while it runs; so that its horns lie, as it were, directly on its neck: notwithstanding which, their horns are generally worn away a little on the fore-part, and thus acquire some degree of polish.—This species of antelope is monogamous, or keeps in pairs. It is swifter in woodlands than the dogs, which likewise sooner lose scent of him there. The female, which is without horns, and on that account runs about in the forest more free and unimpeded, does not suffer herself so easily to be hunted out of the woods, having there, as well as on the plains, a more certain defence against the dogs in her legs, than the male has in his horns, especially as she is not so bulky and heavy as the male. Her breast is said to be very plump and smooth, but the flesh in general is not very tender.

10. The leucoryx with the nose thick and broad, like that of a cow; the ears somewhat fleshy; body clumsy and thick: The horns long, very slightly incurvated, slender, annulated part of the way: black, pointed. The tail reaching to the frill joint of the legs, and tufted. The colour is in all parts a flo wy whiteness, except the middle of the face, sides of the cheeks, and limbs, which are tinged with red.—This species is about the size of a Welch rant; and inhabits Gom Bahrein, a nile in the gulph of Baflora.

11. The picta, white-footed antelope, or nyl-ghaub; with short horns, bending a little forward; ears large, marked with two black stripes; a small black mane on the neck, and half way down the back; a tuft of long black hairs on the fore-part of the neck; above that, a large spot of white; another between the forelegs on the chest; one white spot on each foot; two on each hind-foot; the tail is long, tufted with black hairs. The colour of the male is a dark grey. The female is of a pale brown colour; with a mane, tuft, and striped ears, like the male; on each foot three transverse bands of black and two of white: It is destitute of horns. The height to the top of the shoulders is four feet and an inch; the length from the bottom of the neck to the anus, four feet. The head is like that of a flag; the legs are delicate. These animals inhabit the desert and interior parts of India, remote from the settlements. They are brought down as curiosities to the Europeans, and have of late years been frequently imported into England. In the days of Aurengzebe, they abounded between Delhi and Lahore, on the way to Cashmire. They were called nyl-gaeb, or blue or grey bulls; and were one of the objects of chase, with that mighty prince, during his journey. They were inclosed by his army of hunters within nets, which being drawn closer and closer, at length formed a small precinct; into this the king, his omrahs, and hunters, entered, and killed the beasts with arrows, spears or muskets; and sometimes in such numbers, that Aurengzebe used to send quarters as presents to all his great people. They are usually very gentle and tame, will feed readily, and lick the hands which give them food. In confinement they will eat oats, but prefer grass and hay; are very fond of wheaten bread; and when thirsty, they will drink
two gallons at a time. They are said to be at times very vicious and fierce. When the males fight, they drop on their knees at a distance from one another, make their approaches in that attitude, and when they come near, spring and dart at each other. They will often, in a state of confinement, fall into that posture without doing any harm. They will, notwithstanding, attack mankind unprovoked. A labourer, who was looking over some pales which included a few of them, was alarmed by one of the males flying at him like lightning; but he was saved by the intervention of the woodwork, which it broke to pieces, and at the same time one of its horns—They have bred in England, they are supposed to go nine months with young, and have sometimes two at a birth.

12. The scripta, or harnessed antelope (legniq, Buff.) has straight horns nine inches long, pointing backwards, with two spiral ribs. The general colour is a deep tawny; but the sides are more light-colored marked with two transverse bands of white, crossed by two others from the back to the belly; the rump with three white lines pointing downwards on each side; and the thighs are spotted with white. The tail is ten inches long, covered with long rough hairs.—It inhabits the plains and woods of Senegal, living in large herds. It is frequent at the Cape, where it is called the bonte-bok, or spotted goat.

Capra-Saulta, in meteorology, a fiery meteor or exhalation sometimes seen in the atmosphere. It forms an inflected light, resembling in some measure the caperings of a goat; whence it has its name.

CAPRICES, in botany: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, perenn. The calyx is quinquepartite; the corolla campanulated, quinquefoil, with acute segments; the capsule bivalved, bicocular, and polysemous. There is but one species, the bifoliata, which is a native of the warm parts of America. Being a troublesome weed, and without beauty, it is never cultivated, except in botanic gardens for the sake of variety.

CAPRAROLA, one of the most magnificent places in Italy, seated on a hill, in Ronciglione, whose foot is watered by the river Tircia. It was built by cardinal Farreze; and has five fronts, in the middle of which is a round court, though all the rooms are square, and well proportioned. It is 27 miles north-west of Rome.

CAPRAE. See CAPRI.

CAPREOLUS (Elias), an excellent civilian, and learned historian, born in Brescia, in Italy, wrote an history of Brescia, and other works: died in 1579.

CAPRI, (anciently Caprea), a city and island at the entrance of the gulph of Naples, E. Long. 14° 50'. N. Lat. 40° 45'.—The island is only four miles long and one broad; the city is a bishop's see, situated on a high rock at the west end of the island. Caprea was anciently famous for the retreat of the emperor Tiberius for seven years, during which he indulged himself in the most scandalous debaucheries.* Before Tiberius came hither, Capri had attracted the notice of Augustus as a most eligible retreat, though in sight of populous cities, and almost in the centre of the empire. His successor preferred it to every other residence; and in order to vary his pleasures, and enjoy the advantages as well as avoid the inconveniences of each revolving season, built twelve villas in different situations, dedicated to the twelve greater gods: the ruins of some of them are still to be seen; at Santa Maria are extensive vaults and refectories; and on an adjoining brow are the remains of a light-house; two broken columns indicate the entrance of the principal court. According to Dion Cassius, this island was wild and barren before the Caesars took it under their immediate protection: at this day a large portion of its surface is uncultivated and impracticable; but every spot that will admit the hoe is industriously tilled, and richly laden with the choicest productions of agriculture. The odium attached to the memory of Tiberius proved fatal to his favourite abode; hence was his death proclaimed at Rome, when the senate issued orders for the demolition of every fabric he had raised on the island, which by way of punishment was thenceforward destined to be a state prison. The wife and sister of Commodus were banished to its inhospitable rocks, which were soon stained with their blood. In the middle ages Capri became an appendage of the Amalfitan republic, and after the downfall of that state, belonged to the duchy of Naples. There flourished this island, which, a few days before the death of Tiberius, was overthrown by an earthquake.

CAPRIATA, (Peter John) a civilian and historian, was born at Genoa. He wrote in Italian, the history of the wars of Italy; an English translation of which was printed in London in 1665.

CAPRICORN, in astronomy, one of the 12 signs of the zodiac. See ASTRONOMY, no. 404.

The ancients accounted Capricorn the tenth sign; and when the sun arrived thereat, it made the winter solstice with regard to our hemisphere: but the stars having advanced a whole sign towards the east, Capricorn is now rather the 11th sign; and it is at the sun's entry into Sagittarius that the solstice happens, though the ancient manner of speaking is still retained.

This sign is represented on ancient monuments, medals, &c. as having the fore-part of a goat and the hind-part of a fish, which is the form of an Ægipian; sometimes simply under the form of a goat.

Tropic of Capricorn, a terrestrial circle of the sphere, which is parallel to the equinoctial, and at 23° 50' distance from it southwards; passing through the beginning of Capricorn.

CAPRIFICATION, a method used in the Levant, for ripening the fruit of the domestic fig-tree, by means of infects bred in that of the wild fig-tree.

The most ample and satisfactory account of this curious operation in gardening are those of Tournesfort and Pontedera: the former, in his Voyage to the Levant, and in a Memoir delivered to the academy of sciences at Paris in 1705; the latter, in the Anthologia. The substance of Tournesfort's account follows, "Of the thirty species or varieties of the domestic fig-tree which are cultivated in France, Spain, and Italy, there are
are but two cultivated in the Archipelago. The first species is called ormis, from the old Greek ermos, which answers to caprificus in Latin, and signifies a wild fig-tree, or fig in the garden or gareded in. The former bears successively, in the same year, three sorts of fruit, called fornite, craterites, and orni, which, though not good to eat, are found absolutely necessary towards ripening those of the garden-fig. These fruits have a sleek even skin; are of a deep green colour; and contain in their dry and mealy inside several male and female flowers placed upon distinct foot-falves, the former above the latter. The fornite appear in August, and continue to November without ripening; in these are bred small worms, which turn to a sort of gnats, the latter fruit, called orni, is called forts offruit, called former above the latter. The tree. The second is the domestic fig, which is called the fig of the garden-fig. These fruits begin to open, and enclose the eggs deposited by the gnats when they pricked them. In May, the third sort of fruit called orni, begins to be produced by the wild fig-trees. This is much bigger than the other two; and when it grows to a certain size, and its bud begins to open, it is pricked in that part by the gnats of the craterites, which are strong enough to go from one fig to another to deposite their eggs. In sometimes happens that the gnats of the craterites are flown to come forth in certain parts, while the orni in those very parts are disposed to receive them. In this case, the husbandman is obliged to look for the craterites in another part, and fix them at the end of the branches of those fig-trees whose orni are in a fit disposition to be pricked by the gnats. If they mis the opportunity the orni fall, and the gnats of the craterites fly away. None but those that are well acquainted with the culture know the critical moment of doing this; and in order to know it, their eye is perpetually fixed on the buds of the fig; for that part not only indicates the time that the prickers are to infuse forth, but also when the fig is to be successfully pricked: if the bud is too hard and compact, the gnat cannot lay its eggs; and the fig drops when the bud is too open.

The use of all these three sorts of fruit is to ripen the fruit of the garden fig-tree, in the following manner. During the months of June and July, the peasants take the orni, at the time their grans are ready to break out, and carry them to the garden fig-trees: if they do not nick the moment, the orni fall; and the fruit of the domestic fig-tree, not ripening, will in a very little time fall in like manner. The peasants are so well acquainted with these precious moments, that, every morning, in making their inspection, they only transfer to their garden fig-trees such orni as are well conditioned, otherwise they lose their crop. In this case, however, they have one remedy, though an indifferent one; which is, to flrew over the garden fig-trees another plant in whose fruit their is also a species of gnats which answer the purpose in some measure."

The caprisiation of the ancient Greeks and Romans, described by Theophrastus, Plutarch, Pliny, and other authors of antiquity, corresponds in every circumstance with what is practiced as this is done in the Archipelago and in Italy. These all agree in declaring that the wild fig-tree, caprificus, never ripened its fruit; but was absolutely necessary for ripening that of the garden or domestic fig, over which the husbandmen suspended its branches. The reason of this fact, as has been formerly said, is that the punctures of these insects the visles of the fruit are laceraied, and thereby a greater quantity of nutritious juice derived thither. Perhaps, too, in depositing their eggs, the gnats leave behind them some spot of liquor proper to ferment gently with the milk of the figs, and to make their flesh tender. The figs in Provence, and even at Paris, ripen much sooner for having their buds pricked with a straw dipped in olive-oil. Plums and pears likewise pricked by some insects, ripen much the faster for it; and the flesh round such puncture is better tafted than the rest. It is not to be disputed, that considerable changes happen to the contexture of fruits so pricked, just as the same as to parts of animals pierced with a sharp instrument. Others have supposed that these insects penetrated the fruit of the tree to which they were brought, and gave a more free admission to the air, and to the sun. Linnaeus explained the operation, by supposing that the insects brought the farina from the wild fig, which contained male flowers only, to the domestic fig, which contained the female ones. Hasselquinst, from what he saw in Palestine, seemed to doubt of this mode of fructification. M. Bernard, in the Memoirs of the Society of Agriculture, opposes it more decidedly. He could never find the insect in the cultivated fig; and, in reality, it appeared to leave the wild fig, after the stamens were mature and their pollen diluted: besides, he adds, what they may have brought on their wing must be rubbed away, in the little aperture which they would form for themselves. At Malta, where there are seven or eight varieties of the domestic fig, this operation is only performed on thee which ripen latest; the former are of a proper size, fine flavour, and in great abundance without it, so that he thinks the caprisiation only hastens the ripening. He examined the parts of fructification of the fig; and he observes, if this operation be made previous to the ripening, that round the eye of the fig, and in the substance of its covering, may be seen triangular dentated leaves, pressed one against another; and under these leaves are the stamens, whose pollen is destined for the impregnation of the grains, which fill the rest of the fruit. These male organs are much more numerous in the wild fig than in the domestic; and the stamens are found to contain a yellow dust which may be collected when it is ripe. The wild figs, when ripe, are not succulent, and have no taste, though the grains are disposed in the same manner as in the other kind. The pith of the grain of the wild fruit serves as food to a species of the cynips, whose larva is white, till the moment of its transformation; and it is by an opening, in the direction of the pitif, that the insect penetrates the grain. From this account it is thought probable, that the insect is only communicated by accident to the domestic fig, and that the flowers of this genus are sometimes hermaphrodites. But the number of hermaphrodite flowers being fewer on the cultivated than on the wild fig, the seeds are fecundated more certainly and quickly by the caprisiation; and every botanist knows, that when the pistil of the orange flower withers, while if by any accident it is delayed, it continues in bloom much longer. This view of the subject, therefore,
CAPRIMULGUS, GOAT-SUCKER, or FERN-owl, in ornithology, a genus of birds belonging to the order of passerines. The beak is incurvated, small, tapering, and depressed at the base; the mouth opens very widely.

The European, with the tubes of the nostrils hardly visible. It feeds on moths, gnats, darts, or chafers; from which Charleton calls it a dorr-bawk, its food being entirely of that species of beetle during the month of July, the period of that insect’s flight in the country. This bird migrates. It makes but a short flight in Britain: appears the latter end of May; and disappears, in the northern parts of Britain, the latter end of August; but, in the southern, stays about a month later. It inhabits all parts of Britain from Cornwall to the county of Ross. Mr. Scopoli seems to credit the report of their sucking the teats of goats, an error delivered down from the days of Aristotle. Its notes are sensible vibration to any little building it spots, and continues at intervals very short, and produces several kinds of fruits; but the black and orange, and ferruginolls, disposed in lines, bars, and spots. The male is distinguished from the female by a great oval white spot near the end of the three first quill-feathers, and another on the outermost feathers of the tail. This is the only one of the genus which is found in Europe. A variety lies in size, being only eight inches in length, inhabits Virginia, in summer: arrives there towards the middle of April, and frequents the mountainous parts, but will frequently approach the hоuses in the evening, where it lingers on a rail or post, and cries for several times together very loud, somewhat like the word whispering, or whisper-will, the first and last syllables pronounced the loudest. After continuing in one place for some time, it flies to another, and does the same; sometimes four or five cry all together: this noise it begins just after sun-set, and continues at intervals till just before sun-rise. It does not catch insects always on the wing; for it frequently sits upon a convenient place, and leaps up after them as they fly by, and returns to the same spot again. It makes no nest, but lays the eggs, which are two in number, and of a dull green with dusky spots and streaks, on the bare ground in the open fields. Kalm says that the flesh is good to eat. Another variety, larger, inhabits Virginia and Carolina; where it is called the rain-bird, because it seldom appears in the day-time, except when the sky, being obscured with clouds, betokens rain. It is said to lay the eggs on the ground, and that they are not unlike those of the Lapwing.

2. The Americanus, has the tubes of the nostrils very conspicuous. It is a night bird, and is found in America.

There are several other species or varieties inhabiting different countries, and differently marked, but all nearly similar in their manners.

CAPRIOLES, in the manege, leaps that a horse makes in the same place without advancing, in such a manner, that, when he is at the height of the leap, he jerks out with his hinder legs even and near. It is the most difficult of all the high manege. It differs from a croupade, in this, that, in a croupade, a horse does not show his shoes; and from a balladade, because in this he does not jerk out. To make a horse work well at caprioles, he must be put between two pillars, and taught to raise first his fore-quarters, and then his hind-quarters while his fore ones are yet in the air; for which end you must give him the whip and the poinfons.

CAPSA, (anc. geog.) a large and strong town of Numidia, situated amidst vast deserts, waffe, uncultivated, and full of serpents, where Jugurtha kept his treasures. In his time it was taken and razed by Marius, the Roman general, who put to death all the citizens capable of bearing arms, and sold the rest for slaves. It was, however, afterwards rebuilt by the Romans, and strongly fortified; but, on the decline of their empire, was taken and demolished a second time, by Océbana famous Arab general. The walls of the citadel are still remaining, and are monuments of the ancient glory and strength of Capşa. They are 24 feet in height, and five in thickness, built of large square stones, and have now acquired the solidity and firmness of a rock. The walls of the town were rebuilt by the inhabitants since their first demolition; but were afterwards destroyed by Jacob Almanzar, who sent a governor and troops into the province. In Marmol’s time Capşa was very populous, and abounded with fatly moisques and other strutures of superb and elegant workmanship: but at present it is occupied by a poor and indigent people, fleeced and oppressed by the Tunesian government. In the very centre of the city stands an inclosed fountain, which both supplies the people with drink, and affords them an agreeable bath. The adjacent country is now cultivated, and produces several kinds of fruits; but the climate is unhealthy. The inhabitants are remarkable for their peculiarities of temper. Both men and women dress handomely except their feet, which they cover with coarse shoes of bungling workmanship, and made of the rough skins of wild beasts, equally inconvenient and unbecoming. E. Long. 9. 3. N. Lat. 33. 15.

CAPSARIUS, from capsa, fatchel, in antiquity, a servant who attended the Roman youth to school, carrying a fatchel with their books in it, sometimes also called librarian.

CAPSARIUS was also an attendant at the baths, to whom persons committed the keeping of their clothes.

CAPSARIUS, (from capsa, "a cheff," among the Roman bankers, was he who had the care of the money-cheff or coffer.

CAPSICUM, or Guinea-pepper: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 28th order, Luride. The corolla is verticillated, and the fruit a fuplefs berry.
Capicium. Species. 1. The annuum, with oblong fruit, is the common long-podded capicium commonly cultivated in the gardens. Of this there is one kind with red, and another with yellow fruit: and of these there are several varieties, differing only in the size and figure of their fruit. 2. The tetragonum, commonly called bell-pepper. The fruit of this is red, and is the only kind proper for pickling, the skin being tender; whereas those of the other sorts are thin and tough. The pods are from an inch to an inch and a half or two inches long; are very large, swelling, and wrinkled, flattened at the top, where they are angular, and sometimes fland erect, at others grow downward. 3. The cerasiforme, with a round smooth fruit, doth not grow so tall as the other sorts, but spreads near the ground; the leaves come out in clusters, are of a shining green, and stand on long footstalks. The fruit is of a beautiful red, and of the size of a cherry. 4. The pyramidal, is a native of Egypt, and hath much narrower leaves than the other sorts. The pods always grow erect, and are produced in great plenty, so that the plants make a good appearance for three months in the winter. 5. The minimum, commonly called bird-pepper, rises with a shrubby stalk four or five feet high; the leaves are of a lucid green; the fruit grows on the division of the branches, flanding erect; these are small, oval, and of a bright red; they are much more sharp and biting than those of the other sorts. Besides these species, botanists describe as many more; viz. the cordiforme, with heart-shaped fruit; the angulorum, with angular heart-shaped fruit; the olivaforme, with oval fruit; the conoide, commonly called ben-pepper, with a conical red fruit growing erect; and the zuifecenes, with small pyramidal fruit growing erect; commonly called Barbary pepper. These, however, have no remarkable properties different from the others.

Culture. The three first species are annual plants, and must be propagated by seeds sown on a hot-bed in the spring, and treated in the same manner with other exotics; they will however bear the open air, after being inured to it by degrees. The plants of the second sort, whose fruit is used for pickling, should be taken from the hot-bed, and planted in a rich spot of ground in a warm situation about a foot and an half asunder. They must be shaded till they have taken root, and afterwards duly watered in dry weather, which will greatly promote their growth and cause them to be more fruitful, and likewise enlarge the size of the fruit. By this management, three or four crops of fruit for pickling may be obtained the same year. The other sorts are more tender; and therefore must be planted in pots plunged in a moderate hot-bed, and sheltered under a frame.

Uses, &c. The second sort, as already observed, produces fruit fit for pickling; for which purpose they must be gathered before they arrive at their full size, while their rind is tender. They must be flit down on one side to get out the seeds, after which they should be soaked two or three days in salt and water; when they are taken out of this and drained, boiling vinegar must be poured on them in a sufficient quantity to cover them, and closely floped down for two months; then they should be boiled in the vinegar to make them green; but they want no addition of any spice, and are the wholesomest and best pickle in the world. The tenth species is used for making what is called cayenne-butter, or pepper-pots, by the inhabitants of America, and which they esteem the best of all the spices. The following is a receipt for making of a pepper-pot:

"Take of the ripe seeds of this sort of capicium, and dry them well in the sun; then put them into an earthen or stone pot, mixing flour between every stratum of pods; and put them into an oven after the baking of bread, that they may be thoroughly dried: after which they must be well cleansed from the flour; and if any of the stalks remain adhering to the pods, they should be taken off, and the pods reduced to a fine powder; to every ounce of this add a pound of wheat-flour, and as much leaven as is sufficient for the quantity intended. After this has been properly mixed and wrought, it should be made into small cakes, and baked in the same manner as common cakes of the same size: then cut them into small parts, and bake them again, that they may be as dry and hard as difficult; which being powdered and sifted, is to be kept for use." This is prodigiously hot and acrimonious, setting the mouth as it were on fire. It is by some recommended as a medicine for flatulencies; but it is greatly to be doubted whether all these hot irritating medicines are not productive of more harm than good, in England at least. If the ripe pods of capicium are thrown into the fire, they will raise strong and noisome vapours, which occasion vehement sneezing, coughing, and often vomiting, in those who are near the place, or in the room where they are burnt. Some persons have mixed the powder of the pods with snuff, to give to others for diversion: but where it is in quantity, there may be danger in using it; for it will occasion such violent fits of sneezing, as may break the blood-veins of the head.

Capsquares, strong plates of iron which come over the trunnions of a gun, and keep it in the carriage. They are fastened by a hinge to the prize-plate, that they may lift up and down, and form a part of an arch in the middle to receive a third-part of the thickens of the trunnions: for two-thirds are let into the carriage, and the other end is fastened by two iron wedges called the fore-locks and keys.

Capstan, or Capstern, a strong massive column of timber, formed like a truncated cone, and having its upper extremity pierced with a number of holes to receive the bars or levers. It is let perpendicularly down through the decks of a ship; and is fixed in such a manner, that the men, by turning it horizontally with their bars, may perform any work which requires an extraordinary effort.

A capstern is composed of several parts, where A is Plate the barrel, B the whelps, C the drum-head, and D the CXXVII. spindle. The whelps rise out from the main body of the capstern like butteftes, to enlarge the sweep, so that a greater quantity of cable, or whatever rope encircles the barrel, may be wound about it at one turn, without adding much to the weight of the capstern. The whelps reach downwards from the lower part of the drum-head to the deck. The drum-head is a broad, cylindrical piece of wood resembling a mill-stone, and fixed immediately above the barrel and whelps, the outside of this piece are cut a number of square holes parallel to the deck to receive the bars. The spindle or pivot D, which is fixed with iron, is the axis or
CAPTAIN, or foot upon which the captern rests, and turns round in the uancer, which is a fort of iron socket let into a wooden stock or standard called the flap, resting upon and bolted to the beams.

Besides the different parts of the captern above explained, it is furnished with several appendages, as the bars, the pins, the pawls, the flat, and the sacker, already described. The bars are long pieces of wood or arms, thrust into a number of squared holes in the drum-head all round, in which they are as the radius of a circle, or the spokes in the knave of a wheel. They are used to heave the captern round, which is done by the men setting their breasts against them, and walking about, like the machinery of a horse-mill, till the operation is finished. — The pins, small bolts of iron thrust perpendicularly through the holes of the drum-head, and through a correspondent hole in the end of the bar, made to receive the pins when the bars are fixed. They are used to confine the bars, and to prevent them from working out as the men heave, or when the ship labours. Every pin is fastened to the drum-head with a small iron chain; and that the bars may exactly fit their respective holes, they are all numbered.

— The pawls, no. 1, are situated on each side the captern, being two short bars of iron, bolted at one end through the deck to the beams close to the lower part of the whelps; the other end, which occasionally turns round the deck, being placed in the intervals of the whelps, as the captern turns round, prevents it from recolling or turning back by any sudden jerk of the cable, as the ship rises on the sea, which might greatly endanger the men who heave. There are also hanging pawls, no. 3, used for the same purposes, reaching from the deck above to the drum-head immediately below it. The twister is a rope passed horizontally through holes in the outer end of the bars, and drawn very tight; the intent of this is to keep the men steady as they walk round when the ship rocks, and to give room for a greater number of sailors by pulling upon the twister itself.

The most frequent use of the captern is to heave in the cable, and thereby remove the ship or draw up the anchor. It is also used to wind up any weighty body, as the masts, artillery, &c. In merchant-ships it is likewise frequently employed to discharge or take in the cargo, particularly when confiitting of weighty materials that require a great exertion of mechanical powers to be removed.

There are commonly two capterns in a man of war, the main and the gear captern; the former of which has two drum-heads, and may be called a double one. This is represented in no. 3. The latter is represented in no. 2. Formerly the bars of the captern went entirely thro' the head of it, and consequently were more than double the length of the present ones; the holes were therefore formed at different heights, as represented in no. 1. But this machine had several inconveniences, and has long been entirely diffused in the navy. Some of these fort of capterns, however, are still retained in merchant-ships, and are usually denominated crabs. The situation of the bars in a crab, as ready for heaving, is represented in no. 4.

To Rig the Captern, is to fix the bars in their respective holes, and thrust in the pins, in order to confine them. — To heave the Captern, is the order to slacken the rope heaved round upon it, of which there are generally two turns and a half about the barrel at once, and sometimes three turns. — To heave the Captern, is to go round with it heaving on the bars, and drawing in any rope of which the purchase is created. — To rock the Captern, is to go the rope upon which they have been heaving. — To pawl the Captern, is to fix the pawls to prevent it from recolling during any pause of heaving.

CAPSULE, in a general sense, denotes a receptacle or cover in form of a bag. Capsule, among botanists, a dry hollow seed-vefsel or pericarpium, that cleaves or splits in some determinate manner. See PERICARP.

This species of seed veffel is frequently flibby and succulent, like a berry, before it has attained maturiti; but, in ripening, becomes dry, and often so elastic as to dart the seeds from their departments with considerable velocity. This elasticity is remarkably conficuous in wood-sorfel; balsam, impatiens; African hips, peum, madagascanum; frankia, wisteria, hableria, lathrea; and many others. The general aptitude or disposition of this species of seed-vefsel to cleave or separate for the purpose of dispersing its seeds, distinguishes it not less remarkably than its texture from the pulpy or succulent fruits of the apple, berry, and cherry kind. This opening of the capsule for discharging its seeds when the fruit is ripe, is either at the top, as in moss plants; at the bottom, as in triglochin; at the side through a pore or small hole, as in campanula and orchis; horizontally, as in platanus, amaranthus, and angalis; or longitudinally, as in convolvulus. All fruit that is jointed opens at every one of the joints, each of which contains a single seed. Capsules, in splitting, are divided, externally, into one or more pieces, called by Linnaeus valves. The internal divisions of the capsules are called cells, locumenta: these, in point of number, are exceedingly diversified; some having only one cell, as the primrose; and others many, as the water-lily. Hence a capsule is termed unilocular, bilocular, trilocular, &c. according as it has one, two, three, &c. cells or cavities.

CAPSULE ATRIBARIAE, called also glandula renales, and renes florifcenturiae. See ANATOMY, no. 100.

CAPTAIN, a military officer, whereof there are several kinds, according to their commands.

CAPTAIN of a Troop or Company, an inferior officer who commands a troop of horse or a company of foot, under a colonel. The duty of this officer is to be careful to keep his company full of able bodied soldiers; to visit their tents and lodgings, to see what is wanting; to pay them well; to caufe them keep themselves neat and clean in their clothes, and their arms bright. He has power in his own company of making jerjeys, corporals, and lanpedefades. In the horfe and foot guards, the captains have the rank of colonels.

CAPTAIN-General, he who commands in chief.

CAPTAIN-Lieutenant, he who with the rank of captain, but the pay of lieutenant, commands a troop or company in the name and place of some other person who is dispenced with on account of his quality from performing the functions of his post.

Thus the colonel being usually captain of the first company

Vol. IV.
CAPTAIN of a Ship of War, the officer who commands a ship of the line of battle, or a frigate carrying 20 or more cannon. The charge of a captain in the British navy is very comprehensive, in as much as he is not only answerable for any bad conduct in the military government, navigation, and equipment of the ship he commands, but also for any neglect of duty or ill management in his inferior officers, whose several charges he is appointed to superintend and regulate.

On his first receiving information of the condition and quality of the ship he is appointed to command, he must survey her condition, and make the necessary preparations to fit her for sea. So strict, indeed, are the injunctions laid on him by the lord high admiral, or commissioners of the admiralty, that he is forbid to lie out of his place, unless by particular leave from the admiralty, or from his commander in chief. He is enjoined to draw a laudable example of honour and virtue to the officers and men; and to discontinue all disolute, immoral, and disorderly practices, and such as are contrary to the rules of subordination and discipline; as well as to correct those who are guilty of such offences as are punishable according to the usage of the sea. He is ordered particularly to survey all the military stores which are sent on board, and to return whatever is deemed unfit for service. His diligence and application are required to procure his complement of men; observing carefully to enter only such as are fit for the necessary duty, that the government may not be put to unnecessary expence. When his ship is fully manned, he is expected to keep the established number of men complete, and superintend the muster himself. If there is no clerk of the check at the port, when his ship is employed on a cruising station, he is expected to keep a book of the whole length of time previously appointed; but if he is compelled by some unexpected accident to return to port sooner than the time limited, he ought to be very cautious in the choice of a good situation for anchoring, ordering the master or other careful officer to find and discover the depths of water and dangers of the coast. Previous to any possibility of an engagement with the enemy, he is to quarter the officers and men to the necessary stations according to their office and abilities, and to exercise them in the management of the artillery, that they may be more expert in time of battle. His station in the time of an engagement is on the quarter-deck; at which time he is expected to take all opportunities of annoying his enemy, and improving every advantage over him; to exhibit an example of courage and fortitude to his officers and crew; and to place his ship opposite to his adversary in such a position that every cannon shall do effectual execution.

At the time of his arrival in port, after his return from abroad, he is to assemble his officers, and draw up a detail of the observations that have been made during the voyage, of the qualities of the ship as to her trim, ballast, flowage, manner of sailing, for the information and direction of those who may succeed him in the command; and this account is to be signed by himself and officers, and to be returned to the resident commissioner of the navy at the port where the ship is discharged.

CAPTAIN of a Merchant-ship, who has the direction of the ship, her crew, and lading, &c. In small ships and short voyages, he is more ordinarily called the master. In the Mediterranean, he is called the patronus.

The proprietor of the vessel appoints the captain or master; and he is to form the crew, and choose and hire the pilots, mates, and seamen; though, when the proprietor and master reside on the same spot, they generally act in concert together.

CAPTAIN Bajhaw, or Capundan Bajhaw, in the polity of the Turks, signifies the Turkish high admiral. He possesses the third office of the empire, and is invested with the same power at sea that the vizir has on shore. Solomon II. instituted this office in favour of the famous Barbaroossa, with absolute authority over the officers of the marine and arsenal, whom he may punish, cashier, or put to death, as soon as he is without the Dardanelles. He commands in chief in the maritime countries, cities, castles, &c. and, at Constantinople, is the first magistrate of police in the villages on the side of the port, and the canal of the Black-Sea. The mark of his authority is a large seal, which he carries in his hand, both in the arsenal and with the army. The captain-bajhaw enjoys two sorts of revenues; one fixed, the other casual. The first arise from a capitation of the islands in the Archipelago, and certain governments in Notolia and Galipoli. The latter consist in the pay of the men who die during a campaign; in a fifth of all prizes made by the bogs; in the profits accruing from the labour of the slaves, whom he hires as rowers to the grand signor; and in the contributions he exacts in all places where he passes.

CAPTION, in Scots law, a writ issuing under his majesty's signet, in his majesty's name, obtained at the instance of a creditor in civil debt, commanding messengers at arms and other officers of the law to apprehend and imprison the person of the debtor until he pay the debt. It is also the name of a writ issued by the court of Session against the agents of the court, to return papers belonging to processes or law-suits, or otherwise to go to prison.

CAPTIVE, a slave, or a person taken from the enemy.

Formerly captives in war became the slaves of those who took them; and though slavery, such as obtained among the ancients, is now abolished, some shadow of it still remains in respect of prisoners of war, who are accounted the property of their captors, and have no right to liberty but by concession from them.

The Romans used their captives with great severity; their necks were exposed to the soldiers to be trampled on, and their persons afterwards sold by public auction. Captives were frequently burnt on the funeral piles of the ancient warriors, as a sacrifice to the infernal.
fernal gods. Those of royal or noble blood had their heads shaven, and their hair sent to Rome to serve as decorations for female toys, &c. They were led in triumph loaded with chains through Rome, in the emperor's train, at least as far as the foot of the Capitoline mount, for they were not permitted to ascend the sacred hill, but carried thence to prison. Those of the freedmen were honoured with golden chains on their hands and feet, and golden collars on their necks. If they made their escape, or killed themselves, to avoid the ignominy of being carried in triumph, their images or effigies were frequently carried in their place.

CAPTIVITY, in a general sense, the state or condition of a captive.

CAPTIVITY, in sacred history, a punishment which God inflicted upon his people for their vices and infidelities. The first of these captivities is that of Egypt, from which Moses delivered them; after which, are reckoned the greatest and most remarkable were those of Judah and Jerusalem, which happened under the kings of each of these kingdoms. It is generally believed, that the ten tribes of Israel never came back again after their dispersion; and Josephus and St Jerome are of this opinion: nevertheless, when we examine the wranglings of the prophets, we find the return of Israel from captivity pointed out in a manner almost as clear as that of the tribes of Benjamin and Judah: See Hosen i. 10, 11. Amos ix. 14. The captivities of Judah are generally reckoned four; the fourth and last of which fell in the year of the world 3416, under Zedekiah: and from this period begins the 70 years captivity foretold by Jeremiah.

Since the destruction of the temple by the Romans, the Hebrews bore that they have always had their heads or particular princes, whom they call princes of the captivity, in the east and west. The princes of the captivity in the east governed the Jews that dwelt in Babylonia, Assyria, and Persia; and the princes of the captivity in the west governed those who dwelt in Judea, Egypt, Italy, and in other parts of the Roman empire. He who reigned in Judea commonly took up his abode at Tiberias, and assumed the name of Reg. chaboth, " head of the fathers or patriarchs. He presided in assemblies, decided in cases of concurrence, levied taxes for the expenses of his visits, and had officers under him who were dispatched through the provinces for the execution of his orders. As to the princes of the captivity at Babylon, or the east, we know neither the original nor succession of them. It only appears that they were not in being before the end of the second century.

CAPTURE, a prize or prey; particularly that of a ship taken at sea. Captures made at sea were formerly held to be the property of the captors after a possession of twenty-four hours; but the modern authorities require, that before the property can be changed, the goods must have been brought into port, and have continued a night inira presidia, in a place of safe custody, so that all hope of recovering them was lost.

CAPTURE also denotes an arrest or seizure of a criminal, debtor, &c. at land.

CAPUA, (anc. geog.) a very ancient city of Italy, in Campania, and capital of that district. It is famous for the abode of Hannibal the Carthaginian general after the battle of Cannae, and where Livy accuses him, but unjustly, of having erenvered himself with pleasures*.

The history of Capua is thus shortly deduced by Mr Swinburne. "It was a settlement of the Ofici known before the foundation of Rome; as the amazing fertility of the land and lucrative commerce poured immense wealth upon its inhabitants, it became one of the most extensive and magnificent cities in the world. With riches excessive luxury crept in, and the Capuans grew inefete; but by their inefficiency they soon lost the power of repelling those neighbouring nations which their inelence had exasperated: For this reason Capua was continually exposed to the necessity of calling in foreign aid, and endangering its safety by the uncommon temptations it offered to needy auxiliaries. The Roman soldiers sent to defend Capua were on the point of making it their prey; and their lives and property were saved by the office of Rome; so that they were the only thing of having enervated the power of the Capuans warmly censured the quarrel of Carthage: Hannibal made Capua his winter-quarters after the campaign of Cannae; and there, if we are to believe historians, his rough and hitherto invincible soldiers were enraptured by pleasure and indolence.

"When through a failure of supplies from Carthage Hannibal was under a necessity of remaining in Britain, and leaving the Capuans to defend themselves, this city, which had been long invetted, was rendered at discretion to the consul Appius Claudius and Q. Fulvius Flaccus. The senators were put to death, the nobles imprisoned for life, and all the citizens fold and dispersed. Vibius, the chief of Hannibal's friends, avoided this ignominious fate, and escaped from the cruel vengeance of the Romans by a voluntary death.

—When the mob insatiate on the gates being thrown open to the enemy, Vibius assembled his steady associates, and sat down with them to a superb banquet, after which each of the guests swallowed a poisonous draught, and expired in full possession of their freedom. The buildings were spared by the victor; and Capua was left to be merely a harbour for the husbandmen of the plain, a warehouse for goods, and a granary for corn: but so advantageous a situation could not long be neglected: colonies were sent to inhabit it, and in process of time it regained a degree of importance.

"Generic the Vandal was more cruel than the Roman conquerors had been; for he massacred the inhabitants, and burnt the town to the ground. Narfes rebuilt it; but in 841 it was totally destroyed by an army of Saracens, and the inhabitants driven into the mountains. Some time after the retreat of these savage invaders, the Lombards ventured down again into the plain, but not deeming their force adequate to the defence of so large a circuit as the old city, they built themselves a smaller one on the river, and called it Capua.—They chose the site of Casilinum, famous in the second Po-
Capuchins

Anciently an outlawed felon was said to have *caput lupinum*, and might be knocked on the head like a wolf, by any one that should meet him; because, having renounced all law, he was to be dealt with as in a state of nature, when every one that should find him might slay him: yet now, to avoid such inhumanity, it is held that no man is entitled to kill him wantonly and wilfully; but in so doing he is guilty of murder, unless it is done in the endeavour to apprehend him.
Caracci. and Xiphilin represent the emperor Caracalla as the inventor of this garment, and hence suppose the appellation Caracalla was first given him. Others, with more probability, make the caracalla originally a Gallic habit, and only brought to Rome by the emperor abovementioned, who first enjoined the soldiers to wear it. The people called it antoninian, from the same prince, who had borrowed the name of Antonius. The caracalla was a sort of caftock, or surtout, Salmafius, Scaliger, and after them Du-Cange, even take the name caftague to have been formed from that of caracque, for caracalla. This is certain from St. Jerome, that the caracalla, with a retrenchment of the capuchin, became an ecclesiastical garment. It is described as made of several pieces cut and sewed together, and hanging down to the feet; but it is more than probable there were some made shorter, especially out of Rome, otherwise we do not see how it could have fitted the soldiers purposes.

Caraccas, a district of Terra Firma in South America, belonging to the Spaniards. The coast is rocky and mountainous, interferred with small fertile valleys; subjected at certain seasons of the year to dry north-wet winds, but blest in general with a clear air and wholesome climate. A very great illicit trade is carried on by the English and Dutch with this province, notwithstanding all the vigilance of the Spaniards, who have courts perpetually employed, and breach-work raised in all the valleys. A vast number of cacao-trees are cultivated in this province; and it is reckoned that the crop of cacao produced here amounts to more than 100,000 fanegas of 110 pounds each. The country of Santa Fe confines 20,000; Mexico a little more; the Canaries a considerable; and Europe from 50 to 60,000. The cultivation of the plant employs 10 or 12,000 negroes. Such of them as have obtained their liberty have built a little town called Nirva, into which they will not admit any white people. The chief town is likewise called Caraccas, and is situated in Lat. 10. 10. Dampier says it stands at a considerable distance from the sea; is large, wealthy, and populous; and extremely difficult of access, by reason of the steep and craggy hills over which an enemy must take his route. The commerce of this town, to which the port of Guaira at two leagues distance serves for a harbour, was, for a long time open to all the subjects of the Spanish monarchy, and is still so to the Americans; but the Europeans are not so well treated. In 1728 a company was formed at St. Sebastian, which obtained an exclusive right of maintaining connections with this part of the new world. Four or five ships, which they dispatch every year, fail from thence, but they return to Cadiz.

Caracci, (Lewis, Augustin, and Hannibal), three celebrated painters of the Lombard school, all of Bologna. Lewis was born in 1555, and was confraternal to Augustin and Hannibal who were brothers, the sons of a tailor, who was yet careful to give them a liberal education. They were both disciples of their cousin Lewis. Augustin gained a knowledge of mathematics, natural philosophy, music, poetry, and most of the liberal arts; but, though painting was his principal pursuit, he learned the art of engraving from Cornelius Cort, and surpassed all the masters of his time. Hannibal, again, never deviated from his pencil. These three painters, at length, having reaped all the advantages they could by contemplation and practice, formed a plan of association, continued always together, and laid the foundation of that celebrated school which has ever since been known by the name of Caracci's academy. Neither all the young students, who had a view of becoming masters, refrained to be instructed in the rudiments of painting; and here the Caracci taught freely, and without reserve, all that came. Lewis's charge was to make a collection of antique statues and bas-reliefs. They had designs of the bel corps, and a collection of curious books on all subjects relating to their art; and they had a skilful anatomist always ready to teach what belonged to the knitting and motions of the muscles, &c. There were often disputations in the academy; and not only painters, but men of learned professions, proposed questions, which were always decided by Lewis. Every body was well received; and though stated hours were allotted to treat of different matters, yet improvements might be made at all hours by the antiquities and the designs which were to be seen.

The fame of the Caracci reaching Rome, the cardinal Farnefe sent for Hannibal thither, to paint the gallery of his palace. Hannibal was the more willing to go, because he had a great desire to see Raphael's works, with the antique statues and bas-reliefs. The gusto which he took there from the ancient sculpture, made him change his Bolognian manner for one more learned but less natural in the design and in the colouring. Augustin followed Hannibal, and left in his understanding of the Farnefe gallery; but the brothers not rightly agreeing, Farnefe sent Augustin to the court of the duke of Parma, where he died in the year 1602, being only 45 years of age. His most celebrated piece of painting is that of the communion of St. Jerome, in Bologna.

In the mean while, Hannibal continued working in the Farnefe gallery at Rome; and, after inconceivable pains and care, finished the paintings in the perfection in which they are now to be seen. He hoped that the cardinal would have rewarded him in some proportion to the excellence of his work, and the time it took him up, which was eight years; but he was disappointed. The cardinal, inflamed by an ignorant Spaniard his domestic, gave him but a little above 200l. though it is certain he deferred more than twice as many thousands. When the money was brought him, he was so surprized at the injustice done him that he could not speak a word to the person who brought it. This confirmed him in a melancholy to which his temper naturally inclined, and made him resolve never more to touch his pencil; which resolution he had undoubtedly kept, if his necessities had not compelled him to break it. It is said that his melancholy gained so much upon him, that at certain times it deprived him of the use of his senses. It did not, however, put a stop to his amours; for he immediately fell in love with the nunes, which he had retired for the recovery of his health, brought a dispute upon him of which he died in 1609, when he was 40 years of age. His veneration for Raphael was so great, that it was his deathbed request to be buried in the same tomb with him; which was accordingly done, in the pantheon or rounda at Rome. There are extant several
Several prints of the blessed Virgin, and some other subjects etched by the hand of this incomparable artist. He is said to have been a friendly, plain, honest, and open-hearted man: very communicative to his scholars: and so extremely kind to them, that he generally kept his money in the same box with his colours, where they might have recourse to either as they had occasion.

While Hannibal Caracci worked at Rome, Lewis was courted from all parts of Lombardy, especially by the clergy, to make pictures in their churches; and we may judge of his capacity and facility, by the great number of pictures he made, and by the preference that was given him to other painters. In the midst of these employments Hannibal solicited him to come and assist him in the Farnese gallery: and so earnestly, that he could not avoid complying with his request. He went to Rome; corrected several things in that gallery; painted a figure or two himself; and then returned to Bologna, where he died in 1619, aged 64.

CARACOL, in the manage, the half turn which an horsemans makes, either to the right or left.—In the army, the horse always makes a caracol after each discharge, in order to pass the rear of the squadron.

CARACOL, in architecture, denotes a stair-case in a helix or spiral form.

CARACOLI, a kind of metal of which the Caribbees, or natives of the Leiffer Antilles, make a sort of ornament in the form of a crescent, which they also call caracoli.—This metal comes from the main land: and the common opinion is, that it is a compound of silver, copper, and gold, something like the Corinthian bras among the ancients. These metals are so perfectly mixed and incorporated together, that the compound which results from them, it is said, has a colour that never alters, how long ever it remains in the sea or under ground. It is somewhat brittle; and they who work at it are obliged to mix a large proportion of gold with it, to make the compound more tough and malleable.

CARACT, or CARAT, the name of that weight which expresses the degree of fineness that gold is of. The word is also written, carrat, karrat, and karat. Its origin is contestible: But the most probable opinion is that of Kennet, who derives it from caratta, a term which anciently denoted any weight, and came not till of later days to be appropriated to that which expresses the fineness of gold and the gravity of diamonds.

These carats are not real determinate weights, but only imaginary. The whole mals, or the weight what it will, is conceived to be divided into 24 carats; and as many 24ths parts as it contains of pure gold, it is called gold of so many carats, or so many carats fine. Thus, gold of 18 carats is a mixt, of which 18 parts is pure gold, and the other fix an inferior metal, &c. This is the common way of reckoning in Europe, and at the gold mines in the Spanish West Indies, but with some variation in the subdivision of the carat: among us, it is divided into four grains; among the Germans, into 72 parts; and by the French, according to Mr Heliot, into 52. The Chinese reckon by a different division called touches, of which the highest number, or that which denotes pure gold, is 100, so that 100 touches correspond to our 24 carats, &c.

CARACT is also a certain weight which goldsmiths and jewellers use wherewith to weigh precious stones and pearls.—In this sense, the word is by some supposed to be derived from the Greek σηχής, a fruit which the Latins call filique, and we cárab bean; each of which may weigh about four grains of wheat, whence the Latin filique has been used for a weight of four grains. This carat weighs four grains, but they are something lighter than the grains of other weights. Each of these grains is subdivided in 1, 2, 3, 4, &c.

CARACTACUS, a renowned king of the ancient Briton people called Silures, inhabiting South Wales. Having valiantly defended his country seven years against the Romans, he was at length defeated; and flying to Carismonda, queen of the Brigantes (inhabitants of Yorkshire), was by her treacherously delivered up to the Romans, and led in triumph to the empire, weighing nine drachms. It goes at Confiantinople for 120 spers. There are four sorts of them, which are all equally current and of the same value.

CARAITES, in the ecclesiastical history of the Jews, a religious sect among that people, whereof there are still some subsisting in Poland, Russir, Confiantinople, Cairo, and other places of the Levant, whose distinguishing tenet and practice it is, to adhere closely to the words and letter of the scripture, exclusive of allegories, traditions, and the like.

Leo of Modena, rabbin of Venice, observes, that of all the heresies among that people, before the destruction of the temple, there is none now left but that of the Caraim, a name derived from Miera, which signifies the pure text of the Bible; because of their keeping to the Pentateuch, observing it to the letter, and rejecting all interpretations, paraphrases, and constitutions of the rabbins. Aben Ezra, and some other rabbins, treat the Caraites as Sadducees; but Leo de Juda calls them, more accurately, Sadducees reformed; because they believe the immortality of the soul, paradise, hell, reformation, &c. which the ancient Sadducees denied. He adds, however, that they were doubtless originally real Sadducees, and springing from among them.

M. Simon, with more probability, supposes them to have risen hence; that the more knowing among the Jews opposing the dreams and reveries of the rabbins, and using the pure texts of scripture to refute their groundless traditions, had the name of Caraim given them; which signifies as much as the barbarous Latin, Scripturarit, i.e. people attached to the text of scripture. The other Jews give them the odious name Sadducees, from their agreement with those sectaries on the head of traditions. Scaliger, Vollius, and Spanheim, rank the Caraites among the Sabians, Magi, Manichees, and Mussulmans, but by mistake: Wolfgang, Fabricius, &c. say the Sadducees and Esseni were called Caraites, in opposition to the Pharisees: others take them for the doctors of the law so often mentioned in the gospel; but these are all conjectures. Josephus and Philo make no mention of them; which shows...
CARAITES. In all probability, this sect was not formed till after the collection of the second part of the Talmud, or the Gemara; perhaps not till after the compiling of the Mishna in the third century. The Caraites themselves pretend to be the remains of the ten tribes led captive by Shalmanezer. Wolfius, from the Memoirs of Mardochaeus, a Carait, refers their origin to a massacre among the Jewish doctors, under Alexander Jannæus, their king, about 100 years before Christ; because Simeon, son of Schelach, and the queen's brother, making his escape into Egypt, there forged his pretended traditions; and, at his return to Jerusalem, published his visions; interpolating the law after his own fancy, and supporting his novelties on the notices which God, he said, had communicated by the mouth of Moses, whose depollary he was: he gained many followers; and was opposed by others, who maintained, that all which God had revealed to Moses was written. Hence the Jews became divided into two sects, the Caraites and the Rabbinists; among the first, Judas, son of Tabbai, distinguished himself; among the latter, Hillel. Wolfius reckons not only the Sadducees, but also the Scribes, in the number of Caraites. But the addres of the Pharisees prevailed against them all; and the number of Caraites decreased: Anan, indeed, in the eighth century, retrieved their credit a little; and rabbi Schalomon in the ninth. They succeeded pretty well till the fourteenth; but since that time they have been declining.

The Caraites are but little known; their works coming only into very few hands, even among the greatest Hebrews. Buxtorf never saw more than one; Selden two; but Mr Trigland says, he has recovered enough to speak of them with allowance. He afferts, that soon after the prophets had ceased, the Jews became divided on the subject of works, and supererogation: some maintaining their necessity from tradition; whilst others keeping close to the written law, set them aside; and it was from these last that Caraitism commenced. He adds, that after the return from the Babylonish captivity, the observance of the law being to be reestablisht, there were severall practices found proper for that end; and these once introduced, were looked upon as essential, and appointed by Moses; which was the origin of Pharisaism; as a contrary party, continuing to keep close to the letter, founded Carasitism.

The modern Caraites, Leo of Modena observes, have their synagogues and ceremonies; they pretend to be the sole proper Jews, or observers of the laws of Moses; calling the rest by the term Rabbanim, or followers of the Rabbins: these hate the Caraites mortally; refusing to ally or even converse with them, and treating them as manznerim, or baffards; because of their rejecting the constitutions of the rabbins relating to marriages, repudiations, purifications of women, &c. This aversion is so great, that if a Carait would become a rabbinist, he would never be received by the other Jews.

The Caraites, however, do not absolutely reject all kind of traditions; but only such as do not appear well-grounded. Selden, who is very express on this point, in his Uxor Hebraica, observes, that besides the mere text, they have certain interpretations, which they call hereditary, and which are proper traditions.
There are four regular caravans which go yearly to Mecca; the first from Damascus, composed of the pilgrims from Europe and Asia; the second from Cairo, for the Mahometans of Barbary; the third from Zibith, a place near the mouth of the Red Sea, where those of Arabia and India meet; the fourth from Babylon, where the Persians assemble. Most of the inland commerce of the East is carried on by caravans. The late czar Peter the Great established a trade between Russia and China by means of a caravan. M. Bougnon, geographer to the duke of Lorraine, has given a treatise of the caravans of merchants in Asia; wherein he shews what they are composed of, how many forts there are, the several uses of the different forts of animals in them; the prices given for them, the officers and men appointed to conduct them, and the pay of each, with their manner of marching, halting, fighting, retreating, &c. Caravans of this kind are large as the caravan bachi, or chief, of a caravan, viz. the caravan bachi, or chief; the captain-guide; captain of ret; and captain of distribution. The first has absolute command over all the ret; the second is absolute in the march; the office of the third only comprises when the caravan stops and makes a stay; to the fourth it belongs to dispose of every part of the corps, in case of an attack or battle; he has also the inspection over the distribution of provisions, which is made under him by several distributors, who give security to the master of the caravan, and have each of them a certain number of persons, elephants, dromedaries, &c., to take care of at their own peril. The treasurer of the caravan makes his account as the caravan bachi, or chief of the caravan, and has under him several agents and interpreters, who keep journals of all that passes, for the satisfaction of those concerned in fitting out the caravan.

Any dealer is at liberty to form a company, in order to make a caravan. He in whose name it is raised, is considered as the caravan bachi, or chief of the caravan, unless he appoint some other in his place. If there are several merchants equally concerned, they elect a caravan bachi; after which, they appoint officers to conduct the caravan and decide all controversies that may arise during the journey. There are also fea caravans; establishe on the same footing, and for the same purposes: such is the caravan of vellies from Constantinople to Alexandria.

CARAVANSERA, or CARAVANSEERA, a place appointed for receiving and loading the caravans. It is commonly a large square building, in the middle of which there is a very spacious court; and under the arches or piazzas that surround it there is a bank raised some feet above the ground, where the merchants, and those who travel with them in any capacity, take up theirlodgings as well as they can; the beasts of burden being tied to the foot of the bank. Over the gates that lead into the court, there are sometimes little rooms, which the keepers of the caravanseras let out at a very high price to fuch as have a mind to be private. The caravanseras in the East are something of the nature of the inns in Europe; only that you meet with little accommodation either for man or beast, but are obliged to carry almost every thing with you; there is never a caravansera without a well, or spring of water. These buildings are chiefly owing to the charity of the Mahometans; they are esteemed sacred dwellings, where it is not permitted to insult any person, or to pillage any of the effects that are deposited there. There are also caravanseras where most things may be had for money; and as the profits of these are considerable, the magistrates of the cities to whose jurisdiction they belong, take care to flourish them well. There is an inspector, who, at the departure of each caravan, fixes the price of the night's lodging, from which there is no appeal.

CARAVANSEERASKIER, the steward or keeper of a caravansera. He keeps an account of all the merchandise that are sold upon truth, and demands the payments of the sums due to the merchants for what has been sold in the caravansera, on the seller's paying two per cent.

CARAVEL; thus they call a small vessel on the coast of France, which goes to fish for herring on the banks. They are commonly from 25 to 30 tons burden. Those which are designed for the fame fishery in the British channel are called by the French tringarts: these are from 12 to 15 tons burden.

CARAWAY, in botany. See CARUM.

CARBONADE, or CARBONADO, in cookery; flesh, fowl, or the like, seafoned and broiled on the coals.

CARBUNCLE, in natural history, a very elegant gem, whose colour is deep red, with an admixture of scarlet.

This gem was known among the ancients by the name of anthrax. It is usually found pure and faultless, and is of the same degree of hardnes with the sapphire; it is naturally of an angular figure; and is found adhering, by its base, to a heavy stone. It is naturally of a deep sapphire: it is naturally of the emery kind: its usual size is near a quarter of an inch in length, and two thirds of that in diameter in its thickest parts: when held up against the sun, it looses its deep tinge, and becomes exactly of the colour of a burning charcoal, whence the propriety of the name which the ancients gave it. It bears the fire unaltered, not parting with its colour, nor becoming at all the paler by it. It is found only in the East Indies, so far as is yet known; and there but very rarely.

CARBUNCLE, or ANTHRAX, in medicine, an inflammation which arises, in time of the plague, with a vesicle or blister almost like that produced by burning.

CARUNCLE, in heraldry, a charge or bearing, consisting of eight radii, four whereof make a common crofs, and the other four a faltier.

Some call these radii buttie, or staves, because round, and enriched with buttons, or pearled like pilgrim's staves, and frequently tipped or terminated with flower-de-luces; others blazon them royal sceptres, placed in faltier, pale and sable.

CARCASSE, or CARCUS, in the art of war, an iron cale, or hollow capacity, about the bigness of a bomb, of an oval figure, made of ribs of iron, filled with combustible matters, as meal-powder, salpetre, sulphur, broken glass, shavings of horn, turpentine, tallow, &c. It has two or three apertures out of which the fire is to blaze; and the design of it is to be thrown...
CARCASSONNE, an ancient city of France, in Lower Languedoc, with a bishop’s see. It is divided into the upper and lower town. They are both surrounded with walls; and though their situations are different they are both watered by the river Aude. The upper town is seated on a hill, with a castle that commands it, as well the lower town. It is strong, not only by its position on a craggy rock, but also by several large towers which are joined to its walls, and which render it of difficult access. The cathedral church is remarkable for nothing but its antiquity. The lower town is large, and built after the modern taste. The streets are very straight, and lead to a large square in the middle, from whence may be seen the four gates of the town. There is here a manufacture of cloth. The neighbouring country is full of olive-trees; and in the mountains there is a fine marble, commonly called marble of Languedoc. E. Long. 2. 25. N. Lat. 43. 11.

This place bore a considerable share in that celebrated crusade undertaken against the Albigenses in the beginning of the 13th century, and which forms one of the most astonishing instances of superstition and of atrocious barbarity to be found in the annals of the world. When the royal power was nearly annihilated, during the reigns of the last kings of the Carlingian race in France, most of the cities of Languedoc erected themselves into little independent states, governed by their own princes. Carcassonne was then under the dominion of viccounts. At the time when Pope Innocent III. patronized and commanded the prosecution of hostilities against the Albigenses for the crime of heresy, Raymond the reigning viccount was included in that prosecution. Simon de Montfort, general of the army of the church, invested the city of Carcassonne in 1209. The inhabitants terrified at the fate of several other places where the most dreadful massacres had been committed, demanded leave to capitulate; but this act of mercy was only extended to them under a condition equally cruel, incredible, and unparalleled in history, if we were not compelled to believe it by the unanimous testimony of all the contemporary writers. The people found in the place were all obliged, without distinction of rank or sex, to evacuate it in a state of nudity; and Arques the vicomte was not exempted, though young and beautiful, from this ignominious and shocking punishment. “On les fit forter tout mados de la ville de Carca­sonne (tous un an­cient aubard) afin qu'ils recourrent de la honte, en montrant ces parties du corps que la paitie de la langue n'exprime pas, sesquelles ils avoient aboie, et s'en etoient servis dans des crimes execrables.” It seems by this imposition that the Albigenses were accused by their enemies of some enormities, probably unjust, and familiar to those which religious enmity and prejudice have attributed to the followers of Zwicndorf in the present century.

CARCERES, in the ancient Circenian games, were inclosures in the circus, wherein the horses were restrained till the signal was given for Rantering, when, by an irremediable circumstance, they all at once flew open.

CARCHEMISH, (anc grog.) a town lying upon Carchemish the Euphrates, and belonging to the Assyrians. Nebuchadnezzar king of Egypt took it from the king of Assyria, 2 Chr. xxxv. 20. Nebuchadnezzar garrisoned in it, which was taken and cut to pieces, in the fourth year of Jehoiachin king of Judah, by Nebuchadnezzar king of Babylon, 2 Kings xxv. 20. Nebuchadnezzar, &c. (x. 9.) speaks of Carchemish, and seems to say that Tiglath-pileser made a conquest of it, perhaps from the Egyptians. This is thought to be the same city with that called Circeum by the Greeks and Latins.

CARCINOMA, in medicine; the same with Cancer.

CARD, among artificers, an instrument consisting of a block of wood, bented with sharp teeth, serving to arrange the hairs of wool, flax, hemp, and the like: there are different kinds of them, as hand-cards, stock-cards, &c. They are made as follows:

A piece of thick leather, of the size intended for the card, is strained in a frame for that purpose; and then pricked full of holes, into which the teeth or pieces of iron wire are infected. After which the leather is nailed by the edges to a flat piece of wood, in the form of an oblong square, about a foot in length and half a foot in breadth, with a handle placed in the middle of one of the longer sides.

The teeth are made in the following manner. The wire being drawn of the size intended, a thin or number of wires are cut into proper lengths by means of a gauge, and then doubled in a tool contrived for that purpose: after which they are bent into the proper direction by means of another tool; and then placed in the leather as mentioned above.

CARDS, among gamesters, little pieces of thin pasteboard of an oblong figure, of several sizes, but most commonly, in Britain, three inches and an half long and two and an half broad, on which are painted several points and figures.

The moulds and blocks for making cards are exactly like those that were used for the first printed books. They lay a sheet of wet or moist paper on the block, which is first lightly done over with a fort of ink made of lamp-black diluted in water, and mixed with some flarch to give it a body. They afterwards rub it off with a round lift. The court-cards are coloured by means of several patterns, styled flavo-files. They consist of papers cut through with a penknife; and in these apertures they apply severally the various colours, as red, black, &c. These patterns are painted with oil-colours, that the brushes may not wear them out; and when the pattern is laid on the pasteboard, they lightly pass over it a brush full of colour, which, leaving it within the openings, forms the face or figure of the card.

Among sharper, divers sorts of false and fraudulent cards have been contrived: as 1. Marked cards, where the aces, kings, queens, knaves, are marked on the corners of the backs with spots of different number and order, either with clear water, or water tinged with pale Indian ink, that these in the secret may distinguish them. Aces are marked with single spots on two corners opposite diagonally; kings with two spots at the same corners; knaves with the same number transversed. 2. Brief cards, those which are longer or broader than the rest; chiefly used at whist and piquet. The
CARDS

Cards, broad cards are usually for kings, queens, knaves, and aces; the long for the rook. Their design is to direct the cutting to enable him in the secret to cut the cards disadvantageously to his adversary, and draw the perfunctory without the fraud to cut them favourably for the sharper. As the pack is placed either endwise or sidewise to him that is to cut, the long or broad cards naturally lead him to cut to them. Brevet cards are sometimes made thus by the manufacturer; but, in defect of these, sharper's pare all but the breves with a penknife or razor. 3. Corner bend, denotes four cards turned down finely at one corner, to serve as a signal to cut by. 4. Middle bend, or Kington-bridge, is where the tricks are bent two different ways, which causes an opening or arch in the middle, to direct likewise the cutting.

Cards were invented about the year 1390, to divert Charles VI. of France, who had fallen into a melancholy disposition. The inventor proposed, by the figures of the four suits or colours, as the French call them, to represent the four classes of men in the kingdom. By coeurs (hearts) are meant the gens de coeur, choir-men, or ecclesiastics; and therefore the Spaniards, who certainly received the use of cards from the French, have copas, or chalices, instead of hearts. The nobility, or prime military part of the kingdom, are represented by the ends or points of lances or pikes; and our ignorance of the meaning or resemblance of the figure induced us to call them spades: The Spaniards have espadas, swords, in lieu of pikes, which are of similar import. By diamonds are denoted the order of citizens, merchants, or tradesmen, carreaux, (square, stones, tiles, or the like): The Spaniards have a coin, discatos, which answers to it; and the Dutch call the French word carreaux "freemen," stones and diamonds, from the form. Trefoils, the trefoil-leaf, or clover-gras (correctly called clubs), alludes to the husbandmen and peasants. But how this fuit came to be called clubs is not easily explained; unlefs, borrowing the game from the Spaniards, who have baffes (flaves or clubs) instead of the trefoils, we give the Spanish significance to the French figure.

The history of the four kings, which the French, in drollery, sometimes call the cards, are David, Alexander, Charles, and Louis, which names are, and still are, on the French cards. These respective names represent the four celebrated monarchies of the Jews, Greeks, Romans, and Franks under Charlemagne. By the queens are intended Argine, Either, Judith, and Pallas (names retained in the French cards), typical of birth, piety, fortitude, and wisdom, the qualifications residing in each person. Argine is an anagram for regina, queen by descent. By the knaves were designed the servants to knights (for knave originally meant only servant); but French pages and valets, now indiscriminately used by various orders of persons, were formerly only allowed to persons of quality, esquire (esquire), shield or armor bearers. Others fancy that the knights themselves were designated by those cards; because Hugier and Labire, two names on the French cards, were famous knights at the time cards were supposed to have been invented.

Deceptions with Cards. See Legendarian, sect. 1.

CARDAMINE, in botany: A genus of the siliquea order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 25th order, Siliqueae. The siliga parts abun­der with a spring, and the valves roll spirally backward; the stigma is entire, and the calyx a little gaping. Of this there are 15 species; but the most remarkable is the pratensis, with a large purplish flower. This grows naturally in many parts of Britain, and is also called cuckow-flower. There are four varieties, viz. the single, with purple and white flowers, which are frequently intermixed in the meadows; and the double, of both colours. The single forms are not admitted into gardens; but the double deserve a place, as making a pretty appearance during the time they are in flower. They will thrive in a moist shady border: and are propagated by parting their roots, which is best performed in autumn. They delight in a soft loamy soil, not too rich. By some the plant is reckoned antifcorbutic.

CARDAMOM, in the Materia Medica. See Amomum.

CARDAN, (Jerom) one of the most extraordinary geniuses of his age, was born at Pavia on the 24th of September 1501. As his mother was not married, she tried every method to procure an abortion, but without effect. She was three days in labour, and they were at last obliged to cut the child from her. He was born with his head covered with black curled hair. When he was four years old, he was carried to Milan; his father being an advocate in that city. At the age of 20, he went to study in the university of that city; and two years afterwards he explained Euclid. In 1524, he went to Padua; and the same year he was admitted to the degree of master of arts: in the end of the following year, he took the degree of doctor of physic. He married about the year 1531. For ten years before, his impotency had hindered him from having knowledge of a woman; which was a great mortification to him. He attributed it to the evil influences of the planet under which he was born. When he enumerated, as he frequently does, the greatest misfortunes of his life, this ten years impotency is always one. At the age of 32, he became professor of mathematics at Milan. In 1539, he was admitted member of the college of physicians at Milan; in 1543, he read public lectures of medical science in that city, and at Pavia one year following: but discouraged in his undertaking, he could not get payment of his salary, and returned to Milan. In 1552, he went into Scotland, having been sent for by the archbishop of St. Andrew's, who had in vain applied to the French king's physicians, and afterwards to those of the emperor of Germany. This prelate, then 43 years old, had for ten years been afflicted with a shortness of breath, which returned every eight days for the two last years. He began to recover from the moment that Cardan prescribed for him. Cardan took his leave of him at the end of six weeks and three days, leaving him prescriptions which in two years wrought a complete cure.

Cardan's journey to Scotland gave him an opportunity of visiting several countries. He crost France in going thither; and returned through Germany, and the Low Countries, along the banks of the Rhine. It was on this occasion he went to London, and calculated king Edward's nativity. This tour took up about four months; after which, coming back to Milan, he continued there till the beginning of October 1552; and
CARD [ 163 ]

Cardano, and then went to Pavia, from whence he was invited to Bologna in 1562. He taught in that city till the year 1570; at which time he was thrown into prison; but some months after he was sent home to his own house. He left Bologna in 1571: and went to Rome, where he lived for some time without any public employment. He was, however, admitted a member of the college of physicians, and received a pension from the pope. He died at Rome on the 21st of September 1575, according to Thuanus. This account might be sufficient to show the reader that Cardan was of a very sickly temper; but he will have a much better idea of his singular and odd turn of mind by examining what he himself has written concerning his own good and bad qualities. He paid himself congratulatory compliments for not having a friend in this world; but that, in requital, he was attended by an aerial spirit, emanated partly from Saturn and partly from mercury, who was the constant guide of his actions, and teacher of every duty to which he was bound. He declared, too, that he was so irregular in his manner of walking the streets, as induced all beholders to point at him as a fool. Sometimes he walked very slowly, like a man absorbed in profound meditation; then all on a sudden quickened his steps, accompanying them with very absurd attitudes. In Bologna, his delight was to be drawn about in a mean vehicle with three wheels. When nature did not visit him with any pain, he would procure to himself that disagreeable sensation by biting his lips so wantonly, or pulling his fingers to such a vehement degree, as sometimes to force the tears from his eyes: and the reason he assigned for so doing, was to moderate certain impetuous sallies of the mind, the violence of which was to him far more insupportable than pain itself; and that the force consequent of such a severe discipline was the enjoying the pleasure of health. He says elsewhere, that, in his greatest tortures of soul, he used to whip his legs with rods, and bite his left arm; that it was a great relief to him to weep, but that very often he could not: that nothing gave him more pleasure than to talk of things which made the whole company easy; that he spoke on all subjects, in feaon and out of season: and he was so fond of games of chance, as to spend whole days in them, to the great prejudice of his health.

Cardano makes no scruple of owning the fact of his family and reputation, for he even stucked his furniture and his wife's jewels.

CARDIGANSHIRE, a county of South Wales, Cardigan

bound on the North by Merionethshire and Mont-
gomeryshire, on the east by Radnorshire and Brecks-
nockshire, on the west by the Irish Sea, and on the
south by Caermarthenshire. Its length from North-
west to south-east is about 44 miles, and its breadth
near 20. The air, as in other parts of Wales, varies
with the soil, which in the southern and western parts
is more upon a level than this principality generally is,
which renders the air mild and temperate. But as the
northern and eastern parts are mountains, they are
consequently more barren and bleak. However,
there are cattle bred in all parts; but they have nei-
ter wood nor coals of their own for fuel: they have
rich lead mines, and fish in plenty, with fowls both
tame and wild. The principal rivers are the Teivy,
the Ridol, and the Tiffagh. This county hath five
market-towns, viz. Cardigan, Aberystwith, Llanbad-
arnavun, Llanbedar, and Tregaron, with 77 parishes;
and was formerly computed to have upward of 3000
houses, and 320,000 acres of land. It sends two
members to parliament; one for the county, and one for
Cardigan.

CARDINAL, in a general sense, an appellation
given to things on account of their pre-eminence.
The word is formed of the Latin cardo, a hinge; it being
on these fundamental points that all the rest of the
ame kind are supposed to turn. Thus, justice, pru-
dence, temperance, and fortitude, are called the four
cardinal virtues, as being the basis of all the rest.

CARDINAL Flower, in botany. See Lobelia.

CARDINAL Points, in cosmography, are the four
intersections of the horizon with the meridian, and the
prime vertical circle. Of these, two, viz. the inter-
sections of the horizon and meridian, are called North
and South, with regard to the poles they are directed
to. The other two, viz. the intersections of the ho-
izon, and first vertical, are called East and West.

The cardinal points, therefore, coincide with the
cardinal regions of the heavens; and are 90° dis-
tant from each other. The intermediate points are
called collateral points.

CARDINAL Points, in astrology, are the rising and
setting of the sun, the zenith, and nadir.

CARDINAL Signs, in astronomy, are Aries, Libra,
Cancer, and Capricorn.

CARDINAL Winds, are those that blow from the car-
dinal points.

CARDINAL Numbers, in grammar, are the numbers
one, two, three, &c. which are indeclinable; in oppo-
sition to the ordinal numbers, first, second, third,
fourth, &c.

CARDINAL, an ecclesiastical prince in the Romish
church, being one who has a voice in the concave at
the election of a pope. Some say the cardinals were
called from the Latin incardinatus, which signifies
the adoption in any church made of a priest of a for-

eign church, driven thence by misfortune; and add,
that the use of the word commenced at Rome and
Ravenna: the revenues of the churches of which cities
being very great, they became the common refuge of
the unhappy priests of all other churches.

The cardinals compose the pope’s council or senate;
and in the Vatican is a constitution of pope John, which
regulates the rights and titles of the cardinals; and
which
The title of cardinal is also given to some bishops, e. g., to those of Mentz and Milan: the archbishop of Bourges is also, in ancient writings, called cardinal; and the church of Bourges, a cardinal church. The abbot of Vendome calls himself cardinalius.

The cardinals are divided into three classes or orders; containing six bishops, fifty priests, and fourteen deacons; making in all seventy; which constitute what they call the sacred college. The cardinal bishops, who are, as it were, the pope's vicars, bear the titles of the bishoprics assigned to them; the rest take such titles as are given them: the number of cardinal bishops has been fixed; but that of cardinal priests and deacons, and consequently the sacred college itself, is always fluctuating. Till the year 1125, the college only consisted of fifty-two or fifty-three: the council of Constance reduced them to twenty-four; but Sixtus IV. without any regard to that restriction, raised them again to fifty-three, and Leo to fifty-five. Thus, as the number of cardinal priests was anciently fixed to twenty-eight, new titles were to be established, in proportion as new cardinals were created. As for the cardinal deacons, they were originally no more than seven for the fourteen quarters of Rome; but they were afterwards increased to nineteen, and after that were again diminished.

According to Onuphrius, it was pope Pius IV. who first enacted, in 1562, that the pope should be chosen only by the Senate of cardinals; whereas, till that time, the election was by all the clergy of Rome. Some say, the election of the pope rested in the cardinals, exclusive of the clergy, in the time of Alexander III. in 1160. Others go higher still, and say, that Nicholas II. having been elected at Sienna, in 956, by the cardinals alone, occasioned the right of election to be taken from the clergy and people of Rome; only leaving them that of confirming him by their consent; which was at length, however, taken from them. See his decree for this purpose, given in the Roman council of 1059, in Hardouin's Acta Conciliorum, tom. vi. pt. i. p. 1165. Whence it appears, that the cardinals who had the right of suffrage in the election of his successors, were divided by this pontiff into cardinal bishops and cardinal clerks: meaning by the former the seven bishops who belonged to the city and territory of Rome; and by the latter, the cardinal prelates, or ministers of the twenty-eight Roman parishes, or principal churches. To these were added, in process of time, under Alexander III. and other pontiffs, new members, in order to appease the tumults occasioned by the edict of Nicholas II. At the creation of a new cardinal, the pope performs the ceremony of opening and fluttering his mouth; which is done in a private sacristy. The shutting his mouth implies the depriving him of the liberty of giving his opinion in congregations; and the opening his mouth, which is performed 15 days after, signifies the taking off this restraint. However, if the pope happens to die during the time a cardinal's mouth is shut, he can neither give his voice in the election of a new pope, nor be himself advanced to that dignity.

The dress of the cardinal is a red cassock, a short purple mantle, and a red hat.

The
The cardinals began to wear the red hat at the council of Lyons, in 1243. The decree of pope Urban VIII., whereby it is appointed, near the cardinal's palace, and he is styled ille cardy.

When cardinals are sent to the courts of Princes, it is in quality of legates a latere; and when they are appointed governors of towns, their government is called by the name of legation.

CARDINAL has also been applied to secular officers. Thus, the prime ministers in the court of the emperor Theodosius, are called cardinales. Caflidors, lib. vii. formul. 31. makes mention of the cardinal prince of the city of Rome; and in the list of officers of the duke of Braganza, in 1447, we meet with one Raoul de Thorel, cardinal of Quillart, chancellor, and servant of the vicount de Rohan: which shows it to have been an inferior quality.

CARDO Id, in the higher geometry, an algebraic curve, so called from its resemblance to an heart.

CARICUS, in the seafaring language, the caulks of the vessel.

CARDIVUS, among grammarians, a character marked in the margin, or interlined, which ought to come from its resemblance to a character marking a double career; if left, a semi-career.

CARDICIA, the eastern province of Finland; divided into Swedish Carelia, and Moscovite Carelia. The capital of the latter is Povenza, and of the former Weihburg.

CARELSROON, a sea-port town of Sweden, in Blekingia, or Bleking, on the Baltic Sea, with a very good harbour defended by two forts. It was built in 1679, and is very populous, with arsenals for the marine; the house of the director-general of the admiralty is in this town, and here the Swedes lay up their royal navy. E. Long. 15. 5. N. Lat. 56. 15.

CARENTAN, a town of France in Lower Normandy, and in the Cotentin, with an ancient castle. W. Long. 1. 14. N. Lat. 49. 20.

CARET, among grammarians, a character marked thus, signifying that something is added on the margin, or interlined, which ought to come in where the caret stands.

CAREW, (George) born in Devonshire in 1557, an eminent commander in Ireland, was made president of Munster by queen Elizabeth; when, joining his forces with the earl of Thomond, he reduced the Irish insurgents, and brought the earl of Desmond to his trial. King James made him governor of Guernsey, and created him a baron. As he was a valiant commander, he was no less a polite scholar; and wrote 'Pasca Hibernia,' a history of the late wars in Ireland, printed after his death, in 1653. He made several collections for a history of Henry V. which are digested into Speed's History of Great Britain. Besides these, he collected materials of Irish history in four large MSS. volumes now in the Bodleian library, Oxford.

CAREW, (Thomas) descended from the family of Carew in Gloucestershire, was gentleman of the privy chamber to Charles I. who always esteemed him one of the most celebrated wits of his court. He was much respected by the poets of his time, particularly by Ben Johnson and Sir William Davenant; and left behind him several poems, and a masque called 'Calum Britan-niwm,' performed at Whitehall on Shrove Tuesday night, 1633, by the king, and several of his nobles with their ladies. Carew was allied in the contrivance by Inigo Jones, and the music was set by Mr Henry Lawes of the king's chapel. He died in the prime of life, about the year 1639.

CAREW, (Richard) author of the 'Survey of Cornwall,' was the eldest son of Thomas Carew of Easf Anthony, and was born in 1555. When very young, he became a gentleman-commoner of Christ-church college, Oxford; and at 14 years of age had the honour of disputing, extempore, with the afterwards famous
mon Sir Philip Sydney, in the presence of the earls of Leicester, Warwick, and other nobility. After spending three years at the university, he removed to the Middle Temple, where he resided the same length of time, and then travelled into foreign parts. Not long after his return to England, he married, in 1577, Juliana Arundel, of Trelissick. In 1581, Mr Carew was made justice of the peace, and in 1586 was appointed high-sheriff of the county of Cornwall; about which time he was likewise queen’s deputy for the militia. In 1589, he was elected a member of the college of Antiquaries, a distinction to which he was intituted by his literary abilities and pursuits. What particularly engaged his attention was his native county, his “Survey” of which was published, in 4to, at London, in 1602. It hath been twice reprinted, first in 1723, and next in 1769. Of this work Cambden hath spoken in high terms, and acknowledges his obligations to the author. In the prefent improved state of topographical knowledge, and since Dr Borlase’s excellent publications relative to the county of Cornwall, the value of Carew’s “Survey” must have been greatly diminished. Mr Gough remarks, that the history and monuments of this county were faintly touched by Carew; but it is added, that he was a person extremely capable of describing them, if the infancy of those studies at that time had afforded light and materials. Another work of our author was a translation from the Italian, intituled, “The Examination of Men’s Wits. In which, by discovering the variety of natures, is showed what profession each one is apt, and how far he shall profit therein.” This was published at London in 1594, and afterwards in 1604; and tho’ Richard Carew’s name is prefixed to it, hath been principally ascribed by some perons to his father. According to Wood, Carew wrote also, “The true and ready Way to learn the Latin Tongue,” in anser to a query, whether the ordinary method of teaching the Latin by the rules of grammar be the best mode of instructing youths in that language? This tract is involved in Mr Hartlib’s book upon the same subject, and with the same title. It is certain that Carew was a gentleman of considerable abilities and literature, and that he was held in great estimation by some of the most eminent scholars of his time. He was particularly intimate with Sir Henry Spelman, who extols him for his ingenuity, virtue, and learning.

Carew, (George) brother to the subject of the last article, was educated in the university of Oxford, after which he studied the law in the inns of court, and then travelled to foreign countries for farther improvement. On his return to his native country, he was called to the bar, and after some time was appointed secretary to Sir Christopher Hatton lord chancellor of England. This was by the especial recommendation of queen Elizabeth herself, who gave him a prothonotaryhip in the chancery, and conferred upon him the honour of knighthood. In 1597, Sir George Carew, who was then a matter in chancery, was sent ambassador to the king of Poland. In the next reign, he was one of the commissioners for treating with the Scotch concerning an union between the two kingdoms; after which he was appointed ambassador to the court of France, where he continued from the latter end of the year 1605 till 1609. During his residence in that country, he formed an intimacy with Thaunus, to whom he communicated an account of the transactions in Poland whilst he was employed there, which was of great service to that admirable author in drawing up the 21st book of his history. After Sir George Carew’s return from France, he was advanced to the important post of master of the court of Ward’s, which honourable situation he did not long live to enjoy; for it appears from a letter written by Thaunus to Cambden in the spring of 1613, that he was then lately deceased. Sir George Carew married Thomasine, daughter of Sir Francis Godolphin, great grandfather of the lord treasurer Godolphin, and had by her two sons and three daughters. When Sir George Carew returned, in 1609, from his French embassy, he drew up, and addressed to James I. “A Relation of the State of France, with the characters of Henry IV. and the principal Persons of that Court.” The characters are drawn from personal knowledge and close observation, and might be of service to a general historian of that period. The composition is peripetious and manly, and entirely free from the pedantry which prevailed in the reign of James I. but this is the least surprising, as Sir George Carew’s tale had been formed in a better era, that of queen Elizabeth. The valuable tract we are speaking of lay for a long time in MS, till happily falling into the hands of the earl of Hardwicke, it was communicated by him to Dr Birch, who published it, in 1749, at the end of his “Historical View of the Negotiations between the Courts of England, France, and Brussel, from 1592 to 1617.” That intelligent and industrious writer justly observes, that it is a model upon which ambassadors may form and digest their notions and representations; and the late celebrated poet Mr Gray hath spoken of it as an excellent performance.

CAREY, (Harry) a man distinguished by both poetry and music, but perhaps more so by a certain facetiousness, which made him agreeable to every body. He published in 1720 a little collection of poems; and in 1732, six cantatas, written and composed by himself. He also composed many songs for modern comedies, particularly those in the “Proved Husband;” he wrote a farce called “The Contrivances;” in which were several little songs to very pretty airs of his own composition; he also made two or three little dramas for Goodman’s-fields theatre, which were very favourably received. In 1729, he published by subscription his poems much enlarged: with the addition of one intituled “Namby Pamey,” in which Ambrose Phillips is ridiculed. Carey’s talents, says his historian, lay in humour and in satirical satire: to ridicule the rant and bombast of modern tragedy he wrote one, to which he gave the strange title of “Chronophantastologos,” act 1d in 1724. He also wrote a farce called “The Honest Yorkshireman.” Carew was a thorough Englishman, and had an unforfeituable aversion to the Italian opera and the fingers in it: he wrote a burlesque opera on the subject of the “Dragon of Wantley;” and afterwards a sequel to it, intituled, “The Dragonets;” both which were esteemed a true burlesque upon the Italian opera. His qualities being of the entertaining kind, he was led in-
CAR [168] CARIBBEAN ISLANDS.

Cargados to more expences than his finances could bear, and thus was frequently in distress. His friends however were always ready to affit him by their little subscriptions to his works: and encouraged by these, he republished, in 1740, all the songs he had ever compos'd, in a collection, intituled, "The Musical Century, in 100 English Ballads, &c." and, in 1743, his dramatic works, in a small volume, 4to. With all his mirth and good-humour, he seems to have been at times deeply affected with the malevolence of some of his own profession, who, for reasons that no one can guess at, were his enemies: and this, with the prejudice of his circumstances, is supposed to have occasioned his untimely end; for, about 1744, in a fit of desperation, he laid violent hands on himself, and, at his house in north Warner-street, Cold-bath Fields, put an end to a life, which, says Sir John Hawkins, had been led without reproach. It is to be noted, and it is somewhat singular in such a character, that in all his songs and poems on wine, love, and such kind of subjects, he seems to have manifested an inviolable regard for decency and good manners.

Cargadors, a name which the Dutch give to those brokers whose business it is to find freight for ships outward bound, and to give notice to the merchants, who have commodities to fend by sea, of the ships that are ready to sail, and of the places for which they are bound.

Cargapol, or Kargopol, the capital of a territory of the same name, in the province of Dwina, in Muscovy: E. Long. 106°, N. Lat. 63°.

Cargo denotes all the merchandizes and effects which are laden on board a ship.

Super-cargo, a person employed by merchants to go on a voyage, oversee the cargo, and dispose of it to the best advantage.

Caria, (anc. geog.) a country of the Hither Asia; whose limits are extended by fome, while they are contracted by others. Mela, Pliny, extend the maritime Caria from Japhus and Halicarnassus, to Cadynda, and the borders of Lycia. The inland Caria Ptolemy extends to the Meander and beyond. Car, Cariatis, Caris, Carita, and Caris, are the generic names: Caris and Caris are the epithets. In Care periculum, was a proverbial saying on a thing expos'd to danger, but of no great value. The Cares being the Swifs of those days, were hired and placed in the front of the battle, (Cicer.) Cum Caris Carif, denoted the behaviour of clowns. The Cares came originally from the islands to the continent, being formerly subject to Minoes, and called Leleges; this the Cretans affirm, and the Cares deny, making themselves aborigines. They are of a common original with the Myry and Lydis, having a common temple, of a very ancient standing, at Melos, a town of Caria, called Tousis Caris Deinobreun, (Hector.) Homer calls the Carians, barbarians in language.

Cariati, a town of Italy, in the kingdom of Naples, and province of Hither Calabria, with a bishop's see, and the title of a principality. It is two miles from the golf of Taranto, and 37 north-east of Cocenza. E. Long. 17° 19'. N. Lat. 30° 38'.

Caribbee Islands, a cluster of islands situated in the Atlantic ocean between 59° and 83° degrees of west longitude, and between 11° and 18° degrees of north latitude. They lie in the form of a bow or semicircle, stretching almost from the coast of Florida north, to near the river Oronoque. Those that lie nearest the east have been called the Windward Islands, the others the Leeward, on account of the winds blowing generally from the eastern point in those quarters. Abbe Raynal conjectures them to be the tops of very high mountains formerly belonging to the continent, which have been changed into islands by some revolution that has laid the flat country under water. The direction of the Caribbee islands, beginning from Tobago, is nearly north and N. N. W. This direction is continued forming a line somewhat curved towards the north west, and ending at Antigua. In this place the line becomes at once curved; and extending itself in a straight direction to the west and north west, meets in its course with Porto-Rico, St Domingo, and Cuba, known by the name of the Leeward Islands, which are separated from each other by channels of various breadths. Some of these are fix, others 15 or 20 leagues broad: but in all of them the soundings are from 100 to 120 or 150 fathoms. Between Grenada and St Vincent's there is also a small archipelago of 30 leagues, in which the soundings are above ten fathoms. The mountains in the Caribbee islands run in the same direction as the islands themselves. The direction is so regular, that if we were to consider the tops of these mountains only, independent of their bafes, they might be looked upon as a chain of hills belonging to the continent, of which Martinico would be the most north-westely promontory. The springs of water which flow from the mountains in the Windward Islands, run all in the western parts of these islands. The whole eastern coast is without any running water. No springs come down there from the mountains: and indeed they would have there been useless; for after having run over a very short tract of land, and with great rapidity, they would have fallen into the sea. In Porto Rico, St Domingo, and Cuba, there are a few rivers that discharge themselves on the northern side, and whose sources rise in the mountains running from east to west, that is, thro' the whole length of these islands. From the other side of the mountains facing the south, where the sea, flowing with great impetuousity, leaves behind it marks of its inundations, several rivers flow down, the mouths of which are capable of receiving the largest ships. The soil of the Caribbees consists mostly of a layer of clay or gravel of different thickness; under which is a bed of stone or rock. The nature of some of those soils is better adapted to vegetables than others. In those places where the clay is drier and more friable, and mixes with the leaves and remains of plants, a layer of earth is formed of greater depth than where the clay is moister. The sand or gravel has different properties according to its peculiar nature: wherever it is less hard, less compact, and less porous, small pieces separate themselves from it, which, though dry, preserve a certain degree of coldness useful to vegetation. This soil is called in America parnier-sand soil. Wherever the clay and gravel do not go through such modifications, the soil becomes barren, as soon as the layer formed by the decomposition of the original plants is destroyed.—By a treaty concluded in January 1660.
between the French and English, the Caribs were confined to the islands of St. Vincent's and Dominica, where all the scattered body of this people were united, and at that time did not exceed in number 6000 men. See St. Vincent's and Dominica.

As the Caribee islands are all between the tropics, their inhabitants are exposed, allowing for the varieties resulting from difference of situation and soil, to a perpetual heat, which generally increases from the rising of the sun till an hour after noon, and then declines in proportion as the sun declines. The variations of the temperature of the air seem to depend rather on the wind than on the changes of the season. In those places where the wind does not blow, the air is excessively hot, and none but the easterly winds contribute to temper and refresh it: those that blow from the south and west afford little relief; but they are much less frequent and less regular than that which blows from the east. The branches of the tree exposed to the influence of the latter are forced round towards the west: but their roots are stronger, and more extended under the ground, towards the east than towards the west; and hence they are easily thrown down by strong east winds or hurricanes from that quarter. The easterly wind is fierce felt in the Caribbee islands before 9 or 10 o'clock in the morning, increases in proportion as the sun rises above the horizon, and decreases as it declines. Towards the evening it ceases entirely to blow on the coasts, but not on the open sea. It has also been observed that it blows with more force, and more regularity, in the dog-days than at any other time of the year.

The rain also contributes to the temperature of the Caribee islands, though not equally in them all. In those places where the easterly wind meets with nothing to oppose its progress, it dispels the clouds as they begin to rise, and causes them to break either in the woods or upon the mountains. But whenever the storms are too violent, or the blowing of the easterly wind is interrupted by the changeable and temporary effect of the westerly and westerly ones, it then begins to rain. In the other Caribee islands, where this wind is not generally blowing, the rains are far less frequent and plentiful, especially in the winter season, which lasts from the middle of July to the middle of October, that, according to the most accurate observations, as much rain falls in one week, as in our climates in a year. Instead of these mild refreshing showers which fall in the European climates, the rains of the Caribee islands are torrents, the found of which might be mistaken for hail, were not that almost totally unknown under so burning a sky. These showers indeed refresh the air; but they occasion a dampness, the effects of which are not less disagreeable than fatal. The dead must be interred within a few hours after they have expired. Meat will not keep sweet above 24 hours. The fruits decay, whether they are gathered ripe or before their maturity. The bread must be made up into biscuits, to prevent its growing mouldy. Common wines turn sour, and iron turns rusty, in a day's time. The seeds can only be preserved by constant attention and care, till the proper season returns for sowing them. When the Caribee islands were first discovered, the corn that was conveyed there for the support of the Europeans, was so soon damaged, that it became necessary to send it out in the ears. This necessary precaution so much enhanced the price of it, that few were able to purchase it. Flour was then substituted in lieu of corn; which lowered indeed the expenses of transport, but had this inconvenience, that it was sooner damaged. It was imagined by a merchant, that if the flour were entirely separated from the bran, it would have the double advantage of being cheaper and keeping longer. He caused it therefore to be sifted, and put the finest flour into strong bags, and beat it close together with iron hammers, till it became so close a body that the air could scarcely penetrate it. This method was found to answer the purpose: and if, by it, the flour cannot be preferred as long as in dry and temperate climates, it may be kept for six months, a year, or longer, according to the degree of care taken in the preparation.

However troublesome these effects of the rain may be, it is attended with some others still more formidable; namely, frequent and dreadful earthquakes. These happening generally during the time or towards the end of the rainy season, and when the tides are highest, some ingenious naturalists have supposed that there might be connection between them. The waters of the sky and of the sea undermine, dig up, and ravage the earth in several different ways. Among the various shocks to which the Caribee islands are exposed from the fury of the boisterous ocean, there is one distinguished by the name of raz de maree, or whirlpool. It constantly occurs once, twice, or thrice from July to October, and always on the western coasts, because it takes place after the time of the westerly or southerly winds, or while they blow. The waves, which, at a distance seem to advance gently within 400 or 500 yards, suddenly swell against the shore, as if acted upon in an oblique direction by some superior force, and break with the greatest impetuosity. The ships which are then upon the coast, or in the roads beyond it, unable either to keep their anchors or to put out to sea, are dashed to pieces against the land, and all on board most commonly perish. The hurricane is another phenomenon in these islands, by which incredible damage is occasioned; but happily it occurs not often.

The produce of the Caribee islands is exceedingly valuable to the Europeans, consisting of sugar, rum, molasses, indigo, &c. a particular account of which is given under the names of the respective islands as they occur in the order of the alphabet.

Caribbiana, or Caribiana, the north east coast of Terra Firma, in South America, otherwise called New Andalusia.

Carica, the papaw: A genus of the decandria order, belonging to the dicoty clafs of plants; and in the natural method ranking under the 38th order, Trioses. The calyx of the male almost none; the corolla is quinquefoil and funnel-shaped; the filaments in the tube of the corolla, a longer and shorter one alternately. The calyx of the female quinquevented; the corolla is pentagonal, with five filaments; the fruit an unilocular and polypermous berry.

Species. 1. The papaya rifes with a thick, soft, herbaceous item, to the height of 18 or 20 feet, naked till within two or three feet of the top. The leaves come out on every side, upon very long footstalks.
Thefe which are situated undermost are almost horizontal; but those on the top are erect: these leaves in full grown plants are very large, and divided into many lobes deeply sinuate. The stem of the plant, and also the footstalks of the leaves, are hollow. The flowers of the male plant are produced from between the leaves on the upper part of the plant. They have four foottalks near two feet long: at the end of which the flowers stand in loose clusters, each having a separate footstalk: these are of a pure white, and have an agreeable odour. The flowers of the female papaya also come out from between the leaves towards the upper part of the plant, upon very short footstalks, fitting close to the stem: they are large, and bell-shaped, composed of six petals, and are commonly yellow; when these fall away, the germen swells to a large fleshy fruit, of the size of a small melon. These fruits are of different forms: some angular, and compressed at both ends; others oval, or globular; and some pyramidal. The fruit, and all the other parts of the tree abound with a milky acid juice, which is applied for killing of ring-worms. When the roundish fruit are nearly ripe, the inhabitants of India boil and eat them with their meat as we do turnips.

But they soak them for some time in salt and water, until the fruit is tender. When they are grown to a large size, they should be removed into separate pots, each having a separate short stalk, the lobes of the leaves entire the branches of which are built or framed.

CARICATURA, in painting, denotes the concealment of real beauties, and the exaggeration of blemishes, but still so as to preserve a resemblance of the object. The word is Italian; formed of carica, a load, burden, or the like.

CARICOUS, an epithet given to such tumours as resemble the figure of a fig. They are frequently found in the piles.

CARIRES, the corruption or mortification of a bone. See Medicine and Surgery, Index.

CARIGNAN, a fortified town of Piedmont, situated on the river Po, about seven miles south of Turin. E. Long. 7. 25. N. Lat. 44. 30. It was taken in 1544 by the French; who demolished the fortifications, but spared the castle. It was also taken, and retaken, in 1601.

CARILLONS, a species of chimes frequent in the low countries, particularly at Ghent and Antwerp, and played on a number of bells in a belfry, forming a complete series or scale of tones and feminine, like those on the harpsichord and organ. There are petals communicating with the great bells, upon which the carillonner with his feet plays the base to sprightly airs, performed with the two hands upon the upper species of keys. These keys are projecting sticks, wide enough to be struck with violence and velocity by either of the hands edgeways, without the danger of hitting the neighbouring key. The player is supplied with a thick leather covering for the little finger of each hand, to guard against the violence of the stroke. These carillons are heard through a large town.

CARINA, a Latin term, properly signifying the keel of a ship; or that long piece of timber running along the bottom of the ship from head to stern, upon which the whole structure is built or framed.

CARINA is also frequently used for the whole capacity or bulk of a ship; containing the hull or all the space below the deck. Hence the word is also sometimes used by a figure for the whole ship.

CARINA is also used in the ancient architecture. The Romans gave the name carina to all buildings in form of a ship, as we still give the name nave to the middle or principal vault of Gothic churches; because it has that figure.

CARINA, among anatomists, is used to denote the pisum doffis as likewise for the fibrous rudiments or embryo of a chick appearing in an incubated egg. The carina consists of the entire periosteum, as they appear after ten or twelve days incubation. It is thus called, because crooked in form of the keel of a ship—Botani-
CARKE, denotes the 30th part of a CARRAF of wool.

CARLE. See CHUR.

CARLETON, (Sir Dudley) was born in Oxfordshire, 1573, and bred in Chrift-church college. He went as secretary to Sir Ralph Winwood into the Low Countries, where king James resigned the caufatory towns to the States; and was afterwards employed for 20 years as ambaʃador to Venice, Savoy, and the United Provinces. King Charles created him vicount Dorchell, and appointed him one of his principal secretaries of state; in which office he died in 1621. He was esteemed a good flatesman, though an honest man, and published several political works.

CARLINA, the CARLINE THISTLE: A genus of the polygamy æqualis order, belonging to the syngnæfia class of plants; and in the natural method ranking under the 49th order, Compoſite. The calyx is radiated with long coloured marginal feals. There are seven species, only one of which is a native of Britain, viz. the vulgaris. The others are natives of the south of France or Italy; and are very easily propagated in Britain by seeds, which must be sown on a bed of very undug earth, where they are to remain, as they do not bear transplanting. When the plants appear above ground, they should be carefully weeded, and afterwards thinned, leaving them about ten inches or a foot asunder. The second year most of them will flower; but, unless the season proves dry, they rarely produce good seeds in Britain, and some of the plants decay soon after they have flowered, so that it is pretty difficult to maintain them there. The roots are used in medicine, and for that purpose are imported from those countries where the plants grow naturally. As we receive them, they are about an inch thick, externally of a brown colour, and covered with numerous small holes appearing on the surface as if worm-eaten. They have a strong smell, and a sub-acrid, bitterish, weakly, aromatic taste. They are looked upon to be warm aphrodisiacs and diapho­atics. Frederic Hoffman, the elder relates that he has observed a decoction of them in broth to occasion vomiting. They have been for some time greatly esteemed among foreign physicians; but never were much in use in Britain. The present practice has entirely rejected them, nor are they often to be met with in the shops.

CARLINE, or CARLINE THISTLE. See CARLI­NA. It is said to have been discovered by an angel to Charlemagne, to cure his army of the plague; whence its denomination.

CARLINE, or CAROLINE, a silver coin current in the Nespolian dominions, and worth about 8d. of our money.

CARLINES, or CARLINGS, in a ship, two pieces of timber lying fore and aft, along from one beam to another, directly over the keel; serving as a foundation for the whole body of the ship. On these the ledges rest, whereon the planks of the deck and other matters of carpentry are made fast. The carlines have their ends let into the beams called culver-tail-wife.

CARLINE-KNEES, are timbers going athwart the ship,
from the sides to the hatch-way, serving to sustain the deck on both sides.

CARLINGFORD, a port-town of Ireland, seated on Carlingford bay, in the county of Louth, and province of Leinster, 22 miles north of Drogheda. W. Long. 6° 24'. N. Lat. 54° 5'.

CARLISLE, the capital city of the county of Cumberland, seated on the south of the river Eden, and between the Patterdale, the Caude and the east. It is surrounded by a strong stone-wall, and has a pretty large cattle in the western part of it, as also a citadel in the eastern part, built by Henry VIII. It flourished in the time of the Romans, as appears from the antiquities that are to be met with here, and the Roman coins that have been dug up. At the departure of the Romans this city was ruined by the Scots and Picts; and was not rebuilt till the year 695, by Egfrid, who encompassed it with a wall, and repaired the church. In the 8th and 9th centuries, the whole country was again ruined, and the city laid desolate by the incursions of the Norwegians and Danes. In this condition it remained till the time of William Rufus; who repaired the walls and the cattle, and caused the houses to be rebuilt. It was fortified by Henry I. as a barrier against Scotland; he also placed a garrison in it, and made it an episcopal see. It was twice taken by the Scots, and afterwards burnt accidentally in the reign of Richard II. The cathedral, the suburbs, and 1200 houses, were destroyed at that time. It is at present in a good condition; and has three gates, the English on the south, the Scotch on the north, and the Irish on the west. It has two parishes, and as many churches; St. Cuthbert and St. Mary's, the last of which is the cathedral, and is separated from the town by a wall of its own. The eastern part, which is the new, is a curious piece of workmanship. The choir with the ailes is 71 feet broad; and has a flatly east window 48 feet high and 30 broad, adorned with curious pillars. The roof is elegantly vaulted with wood; and is embellished with the arms of England and France quartered; as also with Piercy's, Lucy's, Warren's, Moubray's, and many others. In the choir are the monuments of three bishops who are buried there. The fee was erected in 1133 by king Henry I. and made suffragan to the archbishop of York. The cathedral church here had been founded a short time before by Walter, deputized in these parts for king William Rufus, and by him dedicated to the Virgin Mary. He likewise built a monastery, and filled it with canons regular of St. Auguffine. This foundation continued till the dissolution of monasteries, when its lands were added to the fee, and the maintenance of a dean, &c. placed here in their room. The church was almost ruined by the usurper Cromwell and his soldiery; and has never since recovered its former beauty, although repaired after the restoration. This diocefe contains the greatest part of the counties of Cumberland and Westmoreland, in which are only 93 parishes; but the (as all the northern are exceeding large; and of these there are 1200 houses. Here is one archdeacon, viz. of Carlisle. The fee is valued in the king's books at L. 500: 4: 11s., but is computed to be worth annually L. 2800. The clergy's tenth amounts only to L. 161: 1: 7s. To this cathedral belong a bishop, a dean, a chancellor, an archdeacon, four prebendaries, eight minor canons, &c. and other inferior officers and servants.

The Picts wall, which was built across the country from Newcastle, terminates near this place. Carlisle was a fortified place, and still has its governor and lieutenant-governor, but no garrison. It was taken by the rebels Nov. 15, 1745; and was retaken by the duke of Cumberland on the 20th of December following, and deprived of its gates. It is governed by a mayor, twelve aldermen, two bailiffs, &c. and has a considerable market on Saturdays. The manufactures of Carlisle are chiefly of printed linens, for which near 3000l. per annum is paid in duties. It is also noted for a great manufacture of whips, in which a great number of children are employed. —Salmons appear in the Eden in numbers; so early as the months of December and January; and the London and even Newcastle markets are supplied with early fish from this river; but it is remarkable, that they do not visit the Elk in any quantity till April; notwithstanding the mouths of the two rivers are at a small distance from each other. —Carlisle sends two members to parliament, and gives title of Earl to a branch of the Howard family.

CARLOCK, in commerce, a sort of singlafs, made with the furgeon's bladder, imported from Archangel. The chief use of it is for clarifying wine, but it is also used by the dyers. The best carlock comes from Afric,
According to the original scheme, it was intended that large magazines for the accommodation of men of war, be provided with provision stores, which have been taken in the year 1806. It is said to be a province of modern origin, and is distinguished into the former lying to the east of the river Maine, in E. Long. 9. 51. N. Lat. 43. and the latter lying to the west of the same sea, Its name is from the Greek, "Carilla," and signifies a province of modern origin, and is distinguished into the former lying to the east of the river Maine, in E. Long. 9. 51. N. Lat. 43. and the latter lying to the west of the same sea, Its name is from the Greek, "Carilla," and signifies a province of modern origin, and is distinguished into the former lying to the east of the river Maine, in E. Long. 9. 51. N. Lat. 43. and the latter
The word comes from the Latin *carminare*, to card or tease wool, and figuratively to attenuate and diffuses wind or vapours, and promote their discharge by perpiration. Though Dr. Quincy makes it more mystical: He says it comes from the word *carmen*, taking it in the sense of an invocation or charm; and makes it to have been a general name for all medicines which operated like charms, i.e. in an extraordinary manner. Hence, as the most violent pains were frequently those arising from pent-up wind, which immediately cease upon diffusion; the term *carminatives* became in a peculiar sense applied to medicines which gave relief in windy cases, as if they cured by enchantment: but this interpretation seems a little too far strained.

CARMINE, a powder of a very beautiful red colour, bordering upon purple; and used by painters in miniature, though rarely on account of its great price. The manner of preparing it is kept a secret by the colour-makers; neither do any of those receipts which have for a long time been published concerning the preparation of this and other colours at all answer the purpose. See *Colour-Making*.

CARMONA, a town of Italy in Friuli, and in the county of Goritz, seated on a mountain near the river Indri. It belongs to the house of Austria. E. Long. 5° 27'. N. Lat. 42° 19'.

CARMINE, an ancient town of Spain in Andalusia. The gate towards Seville is one of the most extraordinary pieces of antiquity in all Spain. It is seated in a fertile country, 15 miles east of Seville. W. Long. 5° 37'. N. Lat. 37° 24'.

CARNATION, in botany. See DIANTHUS.

CARNATION-COLOUR, among painters, is understood of all the parts of a picture, in general, which represent flesh, or which are naked and without drapery. Titian and Corregio in Italy, and Rubens and Vandyke in Flanders, excelled in carnations. —In colouring for flesh, there is so great a variety, that it is hard to lay down any general rules for instruction therein; neither are there any regarded by those who have acquired a skill this way: the various colouring for carnations may be easily produced, by taking more or less red, blue, yellow, or fihet, whether for the first colouring, or for the finishing the colouring for women should be bluish, for children a little red, both fresh and gay; and for the men it should incline to yellow, especially if they are old.

Carnation, among dyers. To dye a carnation, or red rote colour, it is directed to take liquor of wheat bran a sufficient quantity, alum three pounds, tartar two ounces; boil them and enter twenty yards of broad cloth; after it has boiled three hours, cool and wash it: take fresh clear bran liquor a sufficient quantity, madder five pounds; boil and sodden according to art. —The Bow dyers know that the solution of juniper, or delved tin, being put in a kettle to the alum and tartar, in another proceeds, make the cloth, &e. attract the colour into it, so that none of the cochineal is left, but the whole is absorbed by the cloth.

CARNEADES, a celebrated Greek Philosopher, was a native of Cyrene in Africa, and founder of the third academy. He was so fond of study, that he not only avoided all entertainments, but forgot even to eat at his own table; his maid-servant Melida was obliged to put the viands into his hands. He was an antagonist of the Stoics; and applied himself with great energy
CAR

CARNEADES gerrnfit to refute the works of Chrysippus, one of the most celebrated philosophers of their sect. The power of his eloquence was dreaded even by a Roman senate. The Athenians being condemned by the Romans to pay a fine of 500 talents for plundering the city of Oropus, sent ambassadors to Rome, who got the fine mitigated to 100 talents. Carneades the academic, Diogenes the Stoic, and Critolaus the Peripatetic, were charged with this embassy. Before they had an audience of the senate, they harangued to great multitudes in different parts of the city. Carneades' eloquence was distinguished from that of the others by its strength and rapidity. Cato the elder made a motion in the senate, that these ambassadors should be immediately sent back, because it was very difficult to discern the truth through the arguments of Carneades. The Athenian ambassadors (aided many of the senators) were sent rather to force us to comply with their demands, than to solicit them by persuasion; meaning, that it was impossible to retort the power of that eloquence with which Carneades addreesed himself to them. According to Plutarch, the youth at Rome were so charmed by the fine orations of this philosopher, that they forsook their exercises and other diversions, and were carried with a kind of madness to philosophy. The humour of philosophising spreading like enthusiasm. This grieved Cato, who was particularly afraid of the facility of wit and strength of argument with which Carneades managed either side of a question. Carneades harangued in favour of justice one day, and the next day against it, to the admiration of all who heard him, among whom were Galba and Cato, the greatest orators of Rome. This was his element; he delighted in demolishing his own work; because it served in the end to confirm his grand principle, that there are only probabilities or resemblances of truth in the mind of man; so that of two things directly opposite, either may be chosen indifferently. Quintilian remarks, that though Carneades argued in favour of injustice, yet he himself acted according to the strict rules of justice. The following was a maxim of Carneades: "If a man privately knew that his enemy, or any other person whose death might be of advantage to him, would come to fit down on graves in which there lurked an asp, he ought to give him notice of it, though it were in the power of no person whatever to blame him for being silent." Carneades, according to Suidas, lived to be 85 years old; others make him to be 90; his death is placed in the 4th year of the 162d Olympiad.

CARNEDDE, in British antiquity, denotes heaps of stones supposed to be druidical remains, and thrown together on occasion of confirming and commemorating a covenant. Gen. xxxi. 46. They are very common in the Isle of Anglesey, and were also used as sepulchral monuments, in the manner of tumuli; for Mr Rowland found a curious urn in one of these carn- edde. Whence it may be inferred, that the Britons had the custom of throwing stones on the deceased. From this custom is derived the Welch proverb, Karu ardiben, "ill betide thee."

CARNEIA, in antiquity, a festival in honour of Apollo, surnamed Carneus, held in most cities of Greece, but especially at Sparta, where it was first instituted. The reason of the name, as well as the occasion of the institution, is controverted. It lasted nine days, beginning on the 13th of the month Carneus. The ceremonies were an imitation of the method of living and discipline used in camps.

CARNEL.—The building of ships first with their timber and beams, and after bringing on their planks, is called carnel-work, to distinguish it from clinch-work.

Vessels also which go with mizen-fails instead of main-fails are by some called carnels.

CARNELIAN, in natural history, a precious stone, of which there are three kinds, distinguished by three colours, a red, a yellow, and a white. The red is very well known among us; is found in roundish or oval masses, much like our common pebbles; and is generally met with between an inch and two or three inches in diameter: it is of a fine, compact, and clothe texture: of a glossy surface; and, in the several specimens, is of all the degrees of red, from the palest flesh-colour to the deepest blood-red. It is generally free from spots, clouds, or variegations; but sometimes it is veined very beautifully with an extremely pale red, or with white: the veins forming concentric circles, or other less regular figures, about a nucleus, in the manner of those of agates. The pieces of carnelian which are all of one colour, and perfectly free from veins, are those which our jewelers generally make use of for seals, though the variegated ones are much more beautiful. The carnelian is tolerably hard, and capable of a very good polish; it is not at all affected by acid menstrums: the fire divests it of a part of its colour, and leaves it of a pale red; and a strong and long continued heat will reduce it to a pale dirty grey.

The finest carnelians are those of the East Indies; but there are very beautiful ones found in the rivers of Silesia and Bohemia; and there are some notpicable ones in England.

Though the ancients have recommended the carnelian as astringent, and attributed a number of fanciful virtues to it, we know of no other use of the stone than the cutting feals on it; to which purpose it is excellently adapted, as being not too hard for cutting, and yet hard enough not to be liable to accidents, to take a good polish, and separate easily from the wax.

CARNERO, in geography, a name given to that part of the gulph of Venice which extends from the western coast of Illyria to the island of Grossa and the coast of Morlachia.

Carnero is likewise the name of the cape to the west of the mouth of the bay of Gibraltar.

CARNIFEX, among the Romans, the common executioner. By reason of the ordeals of his office, the carnifex was expressly prohibited by the laws from having his dwelling-house within the city. In middle age writers carnifex also denotes a butcher.

Under the Anglo-Danish kings, the carnifex was an officer of great dignity; being ranked with the archbishop of York, earl Goodwin, and the lord steward. Flor. Wicorn. ann. 1040. Rex Hardecanutus Affricum Ebor. Archip. Goodwinum comitem, Edricum dipenfatorum, Thordum sauum carniscem, & altos magni dignitatis viros Londinum nifi.

CARNIOLA, a duky of Germany bounded on the south by the Adriatic sea, and that part of Illyria polynomial
Carniola, possessed by the republic of Venice; on the north, by Carnithia and Stiria; on the east, by Scavonia and Carinthia; on the west, by Friuli, the county of Gorz or Goritz, and a part of the gulph of Venice; extending in length about 110 miles, and in breadth about 50. It had its ancient name Carnia, as well as the modern one Carniola, from its ancient inhabitants the Carni, a tribe of Scythians, otherwise called Japides, whence this and the adjacent countries were also called Japida. Carniola is full of mountains, some of which are cultivated and inhabited, some covered with wood, others naked and barren, and others continually buried in snow. The valleys are very fruitful. Here are likewise mines of iron, lead and copper; the latter by the commonalty, and the reason of abstinence then ensuing. Accordingly, in the cattle, open breasts, and lying on a hard bench without mean. The Italians, particularly at Venice, holding from the sovereign's magazines. There are. mines of iron, lead and copper; besides many medicinal springs and inland lakes. The common people are very hearty, going barefooted in winter through the snow, with open breaths, and sleeping on a hard bench without bed or bolster. Their food is also very coarse and mean. In winter, when the snow lies deep on the ground, the mountaineers bind either small bales, or long thin narrow boards, like the Laplanders, to their feet, on which, with the help of a stick or pole, they descend with great velocity from the mountains. The languages chiefly in use are the Scavonian or Wendish, and German; the first by the commonalty, and the latter by people of fashion. The duchy is divided into the Upper, Lower, Middle, and Inner, Carniola. The principal commodities exported hence are, iron, steel, lead, quicksilver, white and red wine, oil of olives, cattle, sheep, chaff, linen, and a kind of woolen stuff called mahlum, Spanish leather, honey, walnuts, and timber; together with all manner of wood-work, as boxes, dishes, &c.—Christianity was first planted here in the eight century. Lutheranism made a considerable progress in it; but, excepting the Walchians or Ufikokes, who are of the Greek church, and flyle themselves Staravoziri, i.e. old believers, all the inhabitants at present are Roman Catholics. Carniola was long a marquisate or marquessate; but in the year 1231 was erected into a duchy. As its proportion towards the maintenance of the army, it pays annually 363,171 florins; but only two regiments of foot are quartered in it. CARNIVAL, or Carnaval, a time of rejoicing, a feast of mirth, observed with great solemnity by the Italians, particularly at Venice, holding from the twelfth day till Lent. The word is formed from the Italian Carnaval; which Mr Du Cange derives from Carna-vel, by reason the 12th then goes to pot, to make amends for the feast of abstinence then ensuing. Accordingly, in the corrupt Latin, he observes, it was called Carnalevamen, and Carnivorium; as the Spaniards still denominate it Carnes tollendas. Feasts, balls, operas, concerts of music, intrigues, marriages, &c. are chiefly held in carnival time. The carnival begins at Venice the second holiday in Christmas: Then it is they begin to wear masks, and open their play-houses and gaming houses; the place of St Mark is filled with mountebanks, jack-puddings, pedlars, whores, and such like mob, who flock thither from all parts. There have been no less than seven sovereign princes and 30,000 foreigners here to partake of these diversions. CARNIVOROUS, an epithet applied to those animals which naturally seek and feed on flesh. It has been a dispute among naturalists, whether man is naturally carnivorous. Those who take the negative side of the question, infult chiefly on the structure of our teeth, which are molly incisors or molars; not such as carnivorus animals are furnished with, and which are proper to tear flesh in pieces; to which it may be added, that, even when we do feed on flesh, it is not without a preparatory alteration by boiling, roasting, &c. and even then that it is the hardest of digestion of all foods. To these arguments Dr Wallis subjoins another, which is that all quadrupeds which feed on herbs or plants have a long colon, with a cæcum at the upper end of it, or somewhat equivalent, which conveys the food by a long and large progres, from the stomach downwards, in order to its slower passage and longer stay in the intestines; but that, in carnivorus animals, such cæcum is wanting, and instead thereof there is a more short and slender gut, and a quicker passage through the intestines. Now, in man, the cæcum is very visible; a strong presumption that nature, who is still confident with herself, did not intend him for a carnivorous animal.—It is true, the cæcum is but small in adults, and seem of little or no use; but in a fetus it is much larger in proportion: And it is probable, our customary change of diet, as we grow up, may occasion this shrinking. But to these arguments, Dr Tyfon replies, that if man had been by nature designed not to be carnivorous, there would doubtless have been found, somewhere on the globe, people who do not feed on flesh; which is not the case. Neither are carnivorous animals always without a colon and cæcum; nor are all animals carnivorous which have these parts: the opossum, for instance, hath both a colon and cæcum, and yet feeds on poultry and other flesh; whereas the hedge-hog, which has neither colon nor cæcum, and so ought to be carnivorous, feeds only on vegetables. Add to this, that hogs, which have both, will feed upon flesh when they can get it; and rats and mice, which have large cæcums, will feed on bacon as well as bread and cheese. Lastly, the human race are furnished with teeth necessary for the preparation of all kinds of foods; from whence it would seem, that nature intended we should live on all. And as the alimentary duct in the human body is fitted for digesting all kinds of food, ought we not rather to conclude, that nature did not intend to deny us any? It is no less disputed whether mankind were carnivorous before the flood. St Jerom, Chrysostom, Theodoros, and other ancients, maintain, that all animal food was then forbidden; which opinion is also strenuously supported among the moderns by Curr.ca, and refuted by Heiddegger, Banzius, Backhart, &c. See Antediluvians. CARNOSITY is used by some authors for a little flesh.
Belides
dy excrecence, tuber
e, or weal, formed in the
urethra, the neck of the bladder, or yard, which flops
the passage of the urine.—Carnalities are very dif
cult of cure: they are not easily known but by introduc
ing a probe into the passage, which there meets with re
sistance. They usually arise from some venereal ma
day ill managed.

CARO, (Annibale) a celebrated Italian poet, was
born at Civita Nuovo in 1507. He became secre
try to the Duke of Parma, and afterwards to Cardinal
Parnefe. He was also made a knight of Malta. He
translated Virgil’s Æneid into his own language with
rich propriety and elegance of expression, that he was
allowed by the best judges to have equalled the origi
nal. He also translated Aristotle’s rhetoric, two ora
tories of Gregory Nazianzen, with a discourse of Cy
rian. He wrote a comedy; and a miscellany of his
poems was printed at Venice in 1584. He died at
Rome in 1566.

CAROLINA, (North and South) two of the United
States of North America, lieing between 32° and 36°,
30 N. Lat. and 76° and 91° W. Long. Bounded on the
east by the Atlantic, on the west by the river Missillopi,
on the north by Virginia, and on the south by Georgia
and Florida.

This country is seated between the extremities of
heat and cold, though the heat is more troublesome in
summer than the cold in winter; their winters being
very short, and the frosts frequently succeed by warm days. The air is generally serene
and clear the greatest part of the year; but in Febru
ary and March the inhabitants have a custom of
burning the woods, which causes such a smoke as to
strangers would seem to proceed from a fog or thick
ness in the air. The smoke of the tar-kilns likewise
deceives strangers, and gives them an ill opinion of the
air of Carolina; to which add conduces a custom of
the Indians of setting fire to the woods in their hunt
ings, for many miles round. The great rains are in
winter, though they are not without heavy showers at midsummer; add to these the constant dews that fall in the night, which refresh the ground and supply the plants with moisture. In Carolina, the north
winds are strong in the winter, and very powerful
ther; but they are not of long continuance. Weater
ly winds bring very pleasant weather; but the fouth
erly are hot and uncomfortable, occasioning fevers and
other disorders. But this must be understood in sum
mer, for in winter they are very comfortable. The
depth of winter is towards the latter end of February,
and then the ice is not strong enough to bear a man’s
weight. In August and September there are some
times great storms and squalls of wind, which are so
violent as to make lanes of 100 feet wide, more or less,
 thro’ the woods, tearing up the trees by the roots. These
storms generally happen once in about seven years;
and are attended with dreadful thunder, lightning, and
heavy rains. They commonly happen about the time
of the hurricanes which rage to fatally among the is
lands between the tropics; and seem to be occasioned
by them, or to proceed from the same cause: but by the
time they reach Carolina, their force is much ab
ated; and the farther north they proceed, so much the
more do they decrease in fury. The soil on the coast
is sandy; but farther up, the country is so fruitful
that they have not yet been at the trouble to manage
their land. The grains most cultivated are Indian corn
and rice, though any fort will thrive well enough; they
have also grife of several forts, little known in England.
All kinds of garden stuff usual in England are culva
ted here, and may be had in great plenty. They
export large quantities yearly of rice, pitch, tar, tur
pentine, deer-fkins, and timber for building; cyprefs,
cedar, safffras, oak, walnut, and pine. Besides these
they also fend out beef, pork, tallow, hides, furs, wheat,
peas, potatoes, honey, bees-wax, myrtle-wax, tobacco,
snake-root, cotton, several forts of gums and medicinal
drugs. Indigo is also cultivated in this country, but of
an inferior quality to that which is raised in the Carib
bee islands. The culture of vines in this country has
made but little progress, from the idea that the frosts,
though not of long continuance, are yet sufficient to
check the growth of the vine, as well as olives, dates,
oranges, &c. but as population increases these articles
will become of much importance. The furs are bought
of the Indians with vermilion, lead, gunpowder, coarse
cloth, iron, and spirituous liquors. The aspect of the coun
try is very fine, being adorned with beautiful rivers and
creeks, and the woods with lofty timber, which afford
delightful and pleasant seats for the planters, and ren
der the fencing their lands very easy. And as they
have plenty of fish, wild fowl, and venison, besides other
necessaries which this country produces naturally, they
live easy and luxuriously.

Carolina was discovered by Scobban Cabot, about the
year 1500, in the reign of Henry VII. but the set
ling of it being neglected by the English, a colony of
French Protestants, by the encouragement of Admiral
Coligni, were transported thither; and named the place
Arx Carolina, in honour of their prince, Charles IX. of France: but in a short time that
colony was destroyed by the Spaniards; and no other
attempt was made by any European power to settle there
until the year 1664, when 800 English landed at Cape
Fear in North Carolina, and took possession of the coun
try. In 1670 Charles II. of Britain granted Carolina
to the Lords Berkley, Clarendon, Albemarle, Craven,
and Ashley, Sir George Carteret, Sir William Berkley,
Sir John Coliton. The plan of government for this
new colony was drawn up by the famous Mr. Locke,
who very wisely proposed an universal toleration in re
ligions matters. The only restriction in this respect
was, that every perfon claiming the protection of that
settlement, should, at the age of 17, register himself in
some particular communion. To civil liberty, however,
our philosopher was not so favourable; the code of Car
olina gave to the eight proprietors who founded the colo
ny, and to their heirs, not only all the rights of a mon
arch, but all the powers of a legislatian. The court,
which was composed of this sovereign body, and called
the Palatine Court, was invested with the right of no
mitating to all employments and dignities, and even of
confering nobility; but with new and unprecedented
titles. They were, for instance, to create in each coun
try two cortiques, each of whom was to be possessed of
24,000 acres of land; and a landgraces, who was to
have 80,000. The persons on whom these honours
should be bestowed were to compose the upper house,
and their pollsions were made unalienable. They had
only the right of farming or letting out a third part of

Vol. IV.
Carolina, them at the most for three lives. The lower house was composed of the deputies from the several counties and towns. The number of this representative body was to be increased as the colony grew more populous. No tenant was to pay more than a shilling per acre, and even this rent was redeemable. All the inhabitants, however, both slaves and freemen, were under an obligation to take up arms upon the first order from the Palatine court.

It was not long before the defects of this constitution became apparent. The proprietary lords used every endeavours to establish an arbitrary government; and, on the other hand, the colonists exerted themselves with great zeal to avoid servitude. In consequence of this struggle, the whole province, distracted with tumults and dissensions, became incapable of making any progress, though great things had been expected from its particular advantages of situation. The toleration in religious matters was a part of the original constitution, dissensions arose likewise on that account. In 1705, Carteret, now Lord Granville, who, as the oldest of the proprietors, was sole governor of the colony, formed a design of obliging all the non-conformists to embrace the ceremonies of the Church of England; and this act of violence, though disavowed and rejected by the mother-country, inflamed the minds of the people. In the year 1712, a dangerous conspiracy was formed by the Coree and Tuscorora tribes of Indians, to murder and expel this infant colony. The foundation for this conspiracy is not known. Probably they were offended at the encroachments upon their hunting ground. They managed their conspiracy with great cunning and profound secrecy. They surrounded their principal town with a breast-work to secure their families. Here the warriors convened to the number of 1200. From this place of rendezvous they sent out small parties, by different roads, who entered the settlement under the mask of friendship. At the change of the full moon, all of them had agreed to begin their murderous operations the same night. When the night came, they entered the houses of the planters, demanding provisions, and pretending to be offended, fell to murdering men, women and children without mercy or distinction. One hundred and thirty-seven settlers, among whom were a Swiss baron, and almost all the poor Palatines that had lately come into the country, were slaughtered that night. Such was the ferocity and dispatch of the Indians in this expedition, that none knew what had befallen his neighbour, until the barbarians had reached their own door. Some few, however, escaped and gave the alarm.—The militia assembled in arms, and kept watch day and night, until the news of the sad disaster had reached the province of South Carolina. Governor Craven lost no time in sending a force to their relief.—The assembly voted £4000 for the service of the war. A body of 600 militia, under the command of colonel Barnwell, and 366 Indians of different tribes, with different commanders, marched with great expedition, through a hideous wilderness, to their assistance. In their first encounter with the Indians, they killed 300 and took 100 prisoners. After this defeat the Tuscororas retreated to their fortified town—Carolina— which was shortly after surrendered to colonel Barnwell. In this whole expedition it was computed that near a thousand Tuscororas were killed, wounded and taken.

The remainder of the tribe soon after abandoned their country, and joined the Five Nations, with whom they have ever since remained. The lords proprietors having refused to contribute towards the expenses of an expedition, of which they were to share the immediate benefits, were deprived of their prerogative, except Lord Granville, who still retained his eighth part. The relief received a remuneration of about 24,000l. The colony was taken under the immediate protection of the crown, and from that time began to flourish. The division into North and South Carolina now took place, and from that time peace being restored unto the internal government as well as with the Cherokees and other Indian tribes, these provinces began to breathe, and their trade increased with wonderful rapidity. See NORTH CAROLINA and SOUTH-CAROLINA (A).

CAROLINE. See CARLINE.

Caroline-Books, the name of four books, composed by order of Charlemagne, to refute the second council of Nice. These books are couched in very harsh and severe terms, containing 120 heads of accusation against the council of Nice, and condemning the worship of images.

CARLOSTADIANs, or CARLOSTADISANS, an ancient sect or branch of Lutherans, who denied the real presence of Christ in the eucharist.

They were thus denominatred from their leader Andrew Caroloftadis, who having originally been arch-deacon of Wittenberg, was converted by Luther, and was the first of all the reformed clergy who took a wife: but disagreeing afterwards with Luther, chiefly in the point of the sacrament, founded a sect apart. The Caroloftadisans are the same with what are otherwise denominated Sacramentarians, and agree in most things with the Zuinglians.

CAROLUS, an ancient English broad piece of gold struck under Charles I. Its value has of late been at 23 shillings Sterling, though at the time it was coined it is said to have been rated at 20 shillings.

CAROLUS, a small copper coin, with a little silver mixed with it, struck under Charles VIII. of France. The carolus was worth 12 deniers when it ceased to be current. Those which are still current in trade in Lorrain, or in some neighbouring provinces, go under the name of French fols.

CAROTIDS, in anatomy, two arteries of the neck, which convey the blood from the aorta to the brain: one called the right, and the other the left, carotid.

CARP, in ichthyology, the English name of a species of cyprinids. See CYPRINUS; also CARP-FISHING.

The carp is the most valuable of all kinds of fish for stocking of ponds. It is very quick in its growth, and brings forth the spawn three times a year, so that the increase is very great. The female does not begin to breed till eight or nine years old; so that in breeding-ponds a supply must be kept of carp of that age.

(A) As communications of importance have been promised to the publisher concerning these States, it was judged expedient to refer further particulars to the above articles.
Carp and tench thrive very well of three years old, carpes in marley yards; they love also clay-ponds well of grass under the water. A pound of one acre extent will very well feed the fish, four males growing from five inches to one inch to one inch in a year. A hundred fishes, and six thousand breams, and two thousand tenches. A hundred fishes should be thrown into carp-ponds, to help to fatten the fish. Grains, blood, chicken-guts, and the like, may at times be thrown into carp-ponds, to help to fatten the fish. To make them grow large and fat, the growth of grasses under the water should by all means be encouraged. For this purpose, as the water decreases in the summer, the sides of the pond left naked and dry should be well raked with an iron rake, to destroy all the weeds, and cut up the surface of the earth; hay-feed should then be thrown plentifully in these places; and more ground prepared in the same manner, as the water falls more and more away. By this means there will be a fine and plentiful growth of young grass along the sides of the pond to the water's edge; and when the rains fill up the pond again, this will be cleared under the water, and will make a feeding-place for the fish, where they will come early in the morning, and will fatten greatly upon what they find there.

CARPATES, or APES BASTARNICAE, (anc. geogr.) a range of mountains, running out between Poland, Hungary, and Transylvania. Now called the Carpathian Mountains.

CARPATHIUM, (Marr, Horace, Ovid); the sea that washes the island Carpathus.

CARPATHUS, an island on the coast of Asia, two hundred fathoms in compass, and an hundred in length. Its name is said to be from its situation on the coast of Carpathus between the Rhodus and Cretan seas, which from this island is called the Carpathian Sea, and has to the north the Ionian, to the south the Egyptian, to the west the Cretan and African seas. It is two hundred furlongs in compass, and a hundred in length. It had anciently according to Strabo, four cities; according to Sclavon mentions but one, which he calls Pheidias. This island is now called Scarpanto.

CARPEA, a kind of dance anciently in use among the Athenians and Magnesians, performed by two persons, the one acting a labourer, the other a robber. The labourer, laying by his arms, goes to ploughing and fowing, still looking warily about him as if afraid of being robbed; the robber at length appears, and the labourer quitting his plough, breaks himself to his arms, and fights in defence of his oxen. The whole was performed to the sound of flutes, and in cadence. Sometimes the robber was overcome and sometimes the labourer; the victor's reward being the oxen and plough. The design of the exercise was to teach and accustom the peasants to defend themselves against the attacks of ruffians.

CARPENTER, a person who practices carpentry. Carpenter. Carpenter.

The word is formed from the French charpentier, which signifies the same, formed of charpente, which denotes timber; or rather from the Latin carpenterius, a maker of carpenter, or carriages.

Carpenter of a Ship, an officer appointed to examine and keep in order the frame of a ship, together with her mats, yards, boats, and all other wooden machinery. It is his duty in particular to keep the ship tight; for which purpose he ought frequently to review the decks and sides, and to caulk them when it is necessary. In the time of battle, he is to examine up and down, with all possible attention, in the lower apartments of the ship, to stop any holes that may have been made by shot, with wooden plugs provided of several sizes.

CARPENTERAS, an episcopal town of Provence in France, and capital of Venaissin. It is subject to the pope; and is seated on the river Auvon, at the foot of a mountain. E. Long. 5. 6. N. Lat. 44. 4.

CARPENTRY, the art of cutting, framing, and joining large pieces of wood, for the use of building. It is one of the arts subervient to architecture: it is divided into house-carpentry and ship-carpentry: the first is employed in raising, roofing, flooring of houses, &c. and the second the building of ships, barges, &c. The rules in carpentry are much the same with those of joinery; the only difference is, that carpentry is used in the large and coarser work, and joinery in the smaller and curious.

CARPENTUM, in antiquity, a name common to divers sorts of vehicles, answering to coaches as well as wagons, or even carts among us. The carpentum was originally a kind of car or vehicle in which the Roman ladies were carried; though in after times it was also used in war. Some derive the word from carso; others from Carmenta the mother of Evander, by a conversion of the m into p.

CARPET, a sort of covering of stuff, or other materials, wrought with the needle or on a loom, which is part of the furniture of a house, and commonly spread over tables, or laid upon the floor.

There are also carpets of Persia, which, as far as they are the most esteemed: though at Paris there is a manufactury for the manufacture and sale of Persian carpets, where they make them little inferior, not so fine as the true Persian carpets. They are velvety, and perfectly imitate the carpets which come from the Levant. There are also carpets of Germany, some of which are made of woolen stuffs, as ferges, &c. and called square carpets: others are made of wool also, but wrought with the needle, and pretty often embellished with silk; and, lastly, there are some made of dogs' hair. There are likewise carpets made in Britain, which are used either as floor-carpets, or to cover chairs, &c. It is true, they are not arrived at the like perfection in this manufacture with their neighbours the French; but may not this be owing to the want of a like public encouragement?

CARPI, a principality of Modena in Italy, lying about four leagues from that city. It formerly belonged to the house of Pio; the elder sons of which bore the title of Prince of St Gregory. In the beginning of the 14th century Manfroy was the first prince of Carpi; but in the 16th, the emperor Chas. V. gave the principality to Alfonso duke of Ferrara.
CARPI

This nobleman, in recompence, gave to Albert Pio, whom the principality of Carpi belonged of right, the estate of Saluzzo and some other lands. Albert was, however, at last obliged to retire to Paris, where, being stripped of all his estates, he died in 1538, with the reputation of being one of the best and bravest men of his age. The family of Pio is yet in being, and continues attached to the French court. Some of them have even been raised to the purple, and still make a figure in Europe.

CARPI, a town of Italy in the duchy of Modena, and capital of the said mentioned principality. It has a strong castle, and is situated in E. Long. 11. 12. N. Lat. 44. 45.

CARPI, a town of the Veronese in Italy, memorable for a victory gained by the Imperialists over the French in 1701. It is subject to the Venetians; and is situated on the river Adige, in E. Long. 11. 39. N. Lat. 45. 10.

CARPI, (Ugo da) an Italian painter, of no very considerable talents in that art, but remarkable for being the inventor of that species of engraving on wood, distinguishing the name of chiaro-furo, in imitation of drawing. This is performed by using more blocks than one; and Ugo da Carpi usually had three; the first for the outline and dark shadows, the second for the lighter shadows, and the third for the half tint. In that manner he struck off prints after several designs, and caricatures of Raphael; particularly one of the Sybil, a Daughter of the Cross, and the History of Simon the Sorcerer. He died in 1500. This art was brought to a still higher degree of perfection by Balthasar Fe-ruzzi of Siena, and Parmigianno, who published several excellent designs in that manner.

CARPI, (Giroldano da) history and portrait painter, was born at Ferrara in 1501, and became a disciple of Garofalo. When he quitted that master, he devoted his whole time, thoughts, and attention, to study the works of Correggio, and to copy them with a most critical and observant eye; in which labour he spent several years at Parma, Modena, and other cities of Italy, where the chief works of that exquiste painter were preserved. He acquired such an excellence in the imititation of Correggio's style, and copying his pictures, that many paintings finished by him were taken for originals, and not only admired, but were eagerly purchased by the connoisseurs of that time. Nor is it improbable that several of the paintings of Giroldano da Carpi pass at this day for the genuine work of Correggio himself. He died in 1556.

CARPINUS, the horn-beam, in botany: A genus of the polyandria order, belonging to the monoe- cha clas of plants; and in the natural method ranking under the 50th order, Amentacea. The calyx of the male is monophyllous and ciliated; there is no corolla, but 20 lamina. The calyx of the female is monophyllous and ciliated; no corolla; 2 germens, with 2 styles on each. The fruit is an egg-shaped nut. There are two species, viz.

1. The betulus, or common hornbeam; a deciduous tree, native of Europe and America. Its leaves are of a darkish green, and about the size of those of the beech, but more pointed and deeply ferrated. Its branches are long, flexible, and crooked; yet in their general appearance very much resemble those of the beech; indeed there is so great a likeness between those two trees, especially in the thrifty and underwood state, that it would be difficult to distinguish them at the first glance, were it not for that glossy varnish with which the leaves of the beech are strongly marked. In the days of Evelyn, when topiary work was the gardener's idol, the hornbeam might be considered as deserving of those endearing expressions which that enthusiastic writer has been pleased to lavish upon it; nevertheless, as an ornamental in modern gardening it stands low; and its present uses are few. As an underwood it affords stakes and eddies, fuel and charcoal. Its timber ranks with that of the beech and the yew; and the inner bark is much used in Scandinavia to dye yellow. The only superior excellency of the hornbeam lies in its fits for fence fences for sheltering gardens, nurseries, and young plantations from the severities of the winter season. It may be trained to almost any height, and by keeping it trimmed on the sides it becomes thick of branches, and consequently thick of leaves; which being by their nature retained upon the plant after they wither, a hornbeam hedge occasions a degree of shelter nearly equal to that given by a brick wall. Indeed, being less reflective than that expensive fence, it affords a more uniform temperature of air to the plants which stand near it. In this point of view, too, the hornbeam is useful to be planted promiscuously, or in alternate rows, amongst more tender plants in exposed situations, in the same manner as the birch; the hornbeam has a strong preference: namely, it is warmer in winter—and Hanbury says, the hornbeam is peculiarly grateful to hares and rabbits; consequently it may prevent their injuring its more valuable neighbours; yet, like Evelyn, he seems to be of opinion that it is disaffected by deer. If this be really the case, the hornbeam may upon many occasions be introduced into the deer-parks with inglorious propriety.

Of this species there are three varieties: The Eastern Hornbeam, Flowering Hornbeam, American Hornbeam. The eastern hornbeam arrives to the leaf height of all the forts; about ten feet is the farthest of its growth, and it looks pretty enough with trees of the same growth. The leaves are by no means so large as the common fort; and as the branches are always closer in proportion to the smallness of the leaves, where a low hedge is wanted of the deciduous kind, this would not be an improper tree for the purpose, either to be kept fenced, or suffered to grow in its natural state. The bark of this fort is more spotted than that of the common. The flowering hornbeam is the most free floater of any of the forts; and will arrive to be the highest, the common hornbeam only excepted. It will grow to be thirty or forty feet high. The branches of this tree are less spotted with greyish spots than any of the other forts. The leaves are very rough, of a dark-green colour, and longer than the common fort. The property which the common hornbeam is poffed off, of retaining its leaves all winter, does not belong to this fort, the leaves of which constantly fall off in the autumn with other deciduous trees. American hornbeam is a more elegant tree than any of the former forts. The branches are slender, covered with a brownish speckled bark, and are more sparingly sent forth than from any of the others.
CARPUS, the writing. See Anatomy, p. 38.

CARR, a kind of rolling throne, used in triumphs, and at the splendid entries of princes. See Chariot.

The word is from the ancient Gaulish, or Celtic, Carr; mentioned by Caesar, in his commentaries, under the name Carrus. Plutarch relates, that Camillus, having entered Rome in triumph, mounted on a carr drawn by four white horses, it was looked on as too haughty an innovation.

Carr is also used for a kind of light open chariot. The carr, on medals, drawn either by horses, lions, or elephants, usually signifies either a triumph or an apotheosis; sometimes a procession of the images of the gods at a solemn supplication, and sometimes of those of some illustrious family at a funeral. The carr covered and drawn by mules, only signifies a consecration, and the honour done any one of having his image carried at the games of the circus. See consecration, &c.

CARRAC, or Carraca, a name given by the Portuguese to the vessels they sent to Brissil and the East Indies; being very large, round built, and fitted for fight as well as burden. Their capacity lies in their depth, which is very extraordinary. They are narrower above than underneath, and have sometimes seven or eight floors; they carry about 2000 tons, and are capable of lodging 2000 men; but of late they are little used. Formerly they were also in use among the knights of Rhodes, as well as among the Genoese, and other Italians. It is a custom among the Portuguese, when the carracas returned from India, not to bring any boat or floon for the service of the ship beyond the island of St. Helena; at which place they are applied: but the only use the Europeans make of it is in Venice treacle and mitridate; and in these not a great deal, for cubbs and juniper berries are generally substituted in its place.

CARPOCRATIANS, a branch of the ancient Gnostics, so called from Carpostates, who in the second century revived and improved upon the errors of Simon Magus, Menander, Saturnius, and other Gnostics. He owned, with them, one sole principle and father of all things, whose name as well as nature was unknown. The world, he taught, was created by angels, vailly inferior to the first principle. He opposed the divinity of Jesus Christ; making him a mere man, begotten carnally on the body of Mary by Joseph, though possessed of uncommon gifts which set him above other creatures. He inculcated a community of women; and taught, that the soul could not be purified, till it had committed all kinds of abominations, making that an necessary condition of perfection.

CARPOLITHI, or Fruit-stone Rocks of the Germans, are composed of a kind of jasper, of the nature of the amygdaloids, or almond-stones. Bretzard afferts that the latter are those which appear to be composed of elliptical pieces like petrified almonds, though in truth they are only small oblong pieces of calcareous stone rounded by attrition, and sometimes small mullcshells connected by a flony concretion. The name of carpolithi, however, is given in general by writers on fossils to all sorts of flony concretions that have any resemblance to fruit of whatever kind.

CARUS, the writing. See Anatomy, p. 38.

CARR, a kind of rolling throne, used in triumphs, and at the splendid entries of princes. See Chariot.

The word is from the ancient Gaulish, or Celtic, Carr; mentioned by Caesar, in his commentaries, under the name Carrus. Plutarch relates, that Camillus, having entered Rome in triumph, mounted on a carr drawn by four white horses, it was looked on as too haughty an innovation.

Carr is also used for a kind of light open chariot. The carr, on medals, drawn either by horses, lions, or elephants, usually signifies either a triumph or an apotheosis; sometimes a procession of the images of the gods at a solemn supplication, and sometimes of those of some illustrious family at a funeral. The carr covered and drawn by mules, only signifies a consecration, and the honour done any one of having his image carried at the games of the circus. See consecration, &c.

CARRAC, or Carraca, a name given by the Portuguese to the vessels they sent to Brissil and the East Indies; being very large, round built, and fitted for fight as well as burden. Their capacity lies in their depth, which is very extraordinary. They are narrower above than underneath, and have sometimes seven or eight floors; they carry about 2000 tons, and are capable of lodging 2000 men; but of late they are little used. Formerly they were also in use among the knights of Rhodes, as well as among the Genoese, and other Italians. It is a custom among the Portuguese, when the carracas returned from India, not to bring any boat or sloon for the service of the ship beyond the island of St. Helena; at which place they are applied: but the only use the Europeans make of it is in Venice treacle and mitridate; and in these not a great deal, for cubbs and juniper berries are generally substituted in its place.

CARPOCRATIANS, a branch of the ancient Gnostics, so called from Carpostates, who in the second century revived and improved upon the errors of Simon Magus, Menander, Saturnius, and other Gnostics. He owned, with them, one sole principle and father of all things, whose name as well as nature was unknown. The world, he taught, was created by angels, vailly inferior to the first principle. He opposed the divinity of Jesus Christ; making him a mere man, begotten carnally on the body of Mary by Joseph, though possessed of uncommon gifts which set him above other creatures. He inculcated a community of women; and taught, that the soul could not be purified, till it had committed all kinds of abominations, making that an necessary condition of perfection.

CARPOLITHI, or Fruit-stone Rocks of the Germans, are composed of a kind of jasper, of the nature of the amygdaloids, or almond-stones. Bretzard afferts that the latter are those which appear to be composed of elliptical pieces like petrified almonds, though in truth they are only small oblong pieces of calcareous stone rounded by attrition, and sometimes small mullcshells connected by a flony concretion. The name of carpolithi, however, is given in general by writers on fossils to all sorts of flony concretions that have any resemblance to fruit of whatever kind.

CARUS, the writing. See Anatomy, p. 38.

CARR, a kind of rolling throne, used in triumphs, and at the splendid entries of princes. See Chariot.

The word is from the ancient Gaulish, or Celtic, Carr; mentioned by Caesar, in his commentaries, under the name Carrus. Plutarch relates, that Camillus, having entered Rome in triumph, mounted on a carr drawn by four white horses, it was looked on as too haughty an innovation.

Carr is also used for a kind of light open chariot. The carr, on medals, drawn either by horses, lions, or elephants, usually signifies either a triumph or an apotheosis; sometimes a procession of the images of the gods at a solemn supplication, and sometimes of those of some illustrious family at a funeral. The carr covered and drawn by mules, only signifies a consecration, and the honour done any one of having his image carried at the games of the circus. See consecration, &c.

CARRAC, or Carraca, a name given by the Portuguese to the vessels they sent to Brissil and the East Indies; being very large, round built, and fitted for fight as well as burden. Their capacity lies in their depth, which is very extraordinary. They are narrower above than underneath, and have sometimes seven or eight floors; they carry about 2000 tons, and are capable of lodging 2000 men; but of late they are little used. Formerly they were also in use among the knights of Rhodes, as well as among the Genoese, and other Italians. It is a custom among the Portuguese, when the carracas returned from India, not to bring any boat or sloon for the service of the ship beyond the island of St. Helena; at which place they are applied: but the only use the Europeans make of it is in Venice treacle and mitridate; and in these not a great deal, for cubbs and juniper berries are generally substituted in its place.
they sink them on purpose, in order to take from the crew all hopes or possibility of saving themselves, in case of shipwreck.

CARRARA MARBLE, among artificers, the name of a species of white marble, which is called marmo lucens, and calcis firmum by the ancients: it is distinguished from the Parian, now called the statuary marble, by being harder and less bright.

CARRARA, a town of Turkey in Europe, with a Greek archbishop's see. E. Long. 22. 25. N. Lat. 40. 27.

CARRIDGE, a vehicle serving to convey persons, goods, merchandizes, and other things, from one place to another.

For the construction and mechanical principles of wheel-carriages, see MECHANICS.

CARRIDGE of a common, the frame or timber-work on which it is mounted, serving to point it for shooting, or to carry it from one place to another. It is made of two planks of wood, commonly one half the length of the gun, called the cheeks, and joined by three wooden tranfums, strengthened with three bolts of iron. It is mounted on two wheels, but on a march has two fore-wheels with limbers added. The principal parts of a carriage are the cheeks, tranfums, bolts, plates, train, bands, bridge, bed, hooks, trunnion holes, and capriscarpe.

Block-CARRIDGE, a cart made on purpose for carrying mortars and their beds from place to place.

Truck-CARRIDGE, two short planks of wood, supported on axe-trees, having four trucks of fold wood for carrying mortars or guns upon battery, where their own carriages cannot go. They are drawn by men.

CARRICK, the southern division of the shire of Ayr in Scotland. It borders on Galloway; stretches 32 miles in length; and is a hilly country fit for pasturage. The chief rivers are the Stencher and Giren, both abounding with salmon; here are also several lakes and forests; and the people on the coast employ themselves in the herring-fishtery, though they have no harbour of any conquence. The only towns of this district are Bargeny and Maybole, two inconsiderable villages; yet the firft gave the title (now extinct) of baron to a branch of the Hamilton family. The prince of Wales, as prince of Scotland, is earl of Carrick.

CARRICK on the Suir, a town of Ireland, in the county of Tipperary and province of Munster. W. Long. 7. 14. N. Lat. 52. 16.

CARRICK-FERGUS, a town of Ireland, in the county of Antrim and province of Ulifter. It is a town and county in itself, and sends two members to parliament. It is very rich and populous, with a good harbour; and is governed by a mayor, recorder, and sheriffs. It has, however, been of far greater conquence than at present, as appears from the mayor having been admiral of a considerable extent of coast in the counties of Down and Antrim, and the corporation enjoying the customs paid by all vessels within these bounds, the creeks of Belfast and Bangor excepted. This grant was repurchased, and the custom-house transferred to Belfast—Here is the skeleton of a fine house built by Lord Chichester in the reign of James I. an old Go-thic church with many family monuments, and a very large old castle. The town was formerly walled round, but some part of the walls is still remaining entire. Carrick-fergus is seated by a bay of the same name in the Irish channel; and is noted for being the landing place of king William in 1690. Here alo Thurot made a defect in 1759, took possession of the castle, and carried away hostages for the ransom of the town; but being soon after pursued by commodore Elliot, his three ships were taken, and he himself was killed.

CARRIER, is a person that carries goods for others for hire. A common carrier, having the charge and carriage of goods, is to answer for the fame, or the value, to the owner. And where goods are delivered to a carrier, and he is robbed of them, he shall be charged and answer for them, because of the hire. If a common carrier who is offered his hire, and who has convenience, refuses to carry goods, he is liable to an action, in the same manner as an inn-keeper who refuses to entertain a guest. See ASSUMPT.

One brought a box to a carrier, with a large sum of money, and the carrier demanded of the owner what was in it; he anfwered, that it was filled with silks, and such like goods: upon which the carrier took it, and was robbed, and adjudged to make it good; but a special acceptance, as provided there is no charge of money, would have excused the carrier. A person delivered to a carrier's book-keeper two bags of money sealed up, to be carried from London to Exeter, and told him that it was L 200, and took his receipt for the fame, with promise of delivery for L 200. per cent. carriage and risk: though it be proved that there was L 400 in the bags, if the carrier be robbed, he shall answer only for L 200, because there was a particular undertaking for that sum and no more; and his reward, which makes him answerable, extends no farther. If a common carrier lofes goods which he is incurned to carry, a special action on the cafe lies against him, on the custom of the realm, and notrover; and for a common carrier by boat. An action will lie againſt a porter, carrier, or barge-man, upon his bare receipt of the goods, if they are lost through negligence. Also a lighter man spoiling goods he is to carry, by letting water come to them, action of the cafe lies against him, on the common custom.

CARRIER-PIGEON, or courrier-pigeon, a fort of pigeon used, when properly trained, to be sent with letters from one place to another. See Columna.

Though you carry these birds hood-winked, 20, 30, 40 or 100 miles, they will find their way in a very little time to the place where they were bred. They are trained to this service in Turkey and Persia; and are carried ftrill, while young, short flights of half a mile, afterwards more, till at length they will return from the farthest part of the kingdom. Every Balbaw has a basket of these pigeons bred in the feraglio, which, upon any emergent occasion, as an interposition, or the like, he dispatches, with letters braised under their wings, to the seraglio; which proves a more speedy method, as well as a more safe one, than any other; he sends out more than one pigeon, however, for fear of accidents. Lithgow affurres us, that one of these birds will carry a letter from Babylon to Aleppo, which
which is 30 days journey, in 48 hours. This is also a very ancient practice ; Hiries and Brutus, at the siege of Modena, held a correspondence with one another by means of pigeons. And Ovid tells us, that Tauroph(thenes), by a pigeon tained with purple, gave notice to his father of his victory at the Olympic Games, sending it to him at Aegina.

In modern times, the most noted were the pigeons of Aleppo, which served as couriers at Alexandria and Bagdad. But this use of them has been laid aside for the last 30 or 40 years, because the Cud robbers killed the pigeons. The manner of sending advice by them was this: they took pairs which had young ones, and carried them on horseback to the place from whence they wished them to return, taking care to let them have a full view. When the news arrived, the correspondent tied a billet to the pigeon's foot, and let her loose. The bird impatient to see its young, flew off like lightning, and arrived at Aleppo in ten hours from Alexandria, and in two days from Bagdad. It was not difficult for them to find their way back, since Aleppo may be discovered at an immense distance. This pigeon has nothing peculiar in its form, accept its noftrils, which, instead of being smooth and even, are swelled and rough.

CARRON, a small but remarkable river in Scotland, rising about the middle of the isle of Arran, between the friths of Forth and Clyde. Both its source, which is from within the fhire of Stirling, which it falls into, and ran parallel to it for several miles. Near the middle of its course, in a pleasant valley, stand two beautiful mounts, called the Hills of Dunipace, which are taken notice of by most of the Scottish historians as monuments of great antiquity. The whole structure of these mounts is of earth; but they are not both of the same form and dimensions. The more easterly one is perfectly round, resembling an oven, and about fifty feet in height: And this is an artificial work does not admit of the least doubt; but we cannot affirm the same, with equal certainty, of the other, though it has been generally supposed to be so too. It bears no resemblance to the easterly one either in shape or size. At the foundation it is nearly a triangular form; but the superstructure is quite irregular; nor does the height thereof bear any proportion to the extent of its base. These mounts are now planted with firs, which, with the parih-church of Dunipace standing in the middle between them, and the river running hard by, give this valley a very romantic appearance. The common account

of these mounts is, that they were erected as monuments of a peace concluded in that place between the Romans and the Caledonians, and that their name partakes of the language of both people; Dunipace signifies a hill in the old language of that island, and Pax "peace" in the language of Rome. The compound word, Dunipace, signifies "the hills of peace." And we find in history, that no less than three treaties of peace were, at different periods, entered into between the Romans and Caledonians; the first, by Severus, about the year 210; the second, soon after, by his son Caracalla; and the third, by the usurper Carausus, about the year 280; but of which of these treaties Dunipace is a monument, we do not pretend to determine. If the concurring testimony of historians and antiquaries did not agree in giving this original to these mounts, we would be tempted to conjecture that they are sepulchral monuments. Human bones and urns have been discovered in earthen fabrics of this kind in many parts of Britain, and the little mounts or barrows, which are scattered in great numbers about Stonhenge in Salisbury plain are generally supposed to have been the sepulchres of the ancient Britons. See Barrows.

From the valley of Dunipace, the river runs for some time in a deep and hollow channel, with steep banks on both sides; here it passes by the foundations of the ancient Roman bridge; not far from which, as is generally thought, was the scene of the memorable conference between the Scotch patriot William Wallace and Robert Bruce, father to the king of that name, which first opened the eyes of the latter to a just view, both of his own true interest and that of his country. After the river has left the village and bridge of Larbert, it soon comes up to another small valley, through the midst of which it has now worn out to itself a straight channel: whereas, in former ages, it had taken a considerable compass, as appears by the track of the old bed, which is still visible. The high and circling banks upon the fourth-side, give this valley the appearance of a spacious bay: and, according to the tradition of the country, there was once an harbour here: nor does the tradition seem altogether groundless: pieces of broken anchors having been found here, and some of them within the memory of people yet alive. The stream-sides would still flow near the place, if they were not kept back by the dam-head built across the river at Stenhouse; and there is reason to believe, that the frith flowed considerably higher in former ages than it does at present. In the near neighbourhood of this valley, upon the south, stand the ruins of ancient Camelon; which, after it was abandoned by the Romans, was probably inhabited, for some ages, by the natives of the country.

Another ancient monument, called Arthur's Oven, once stood upon the banks of Carron; but was, with a spirit truly Gothic, entirely demolished about 40 years ago. The corner of a small inclosure between Stenhouse and the Carron-iron-works, is pointed out as the place of its situation. This is generally supposed to have been a Roman work; though it is not easy to conceive what could be their motive for erecting such a fabric, at so great a distance from any other;
of their works, and in a spot which, at that time, must have been very remote and unfrequented. The form of it is said to have been perfectly round, and rising perpendicular for some yards at first, but afterwards gradually contracted, till it terminated in a narrow orifice at the top.

As Carron extends over the half of the 14th century, and runs to near the ancient boundaries of the Roman empire, the adjacent country fell naturally to be the scene of many battles and reencounters. Historians mention a bloody battle fought near this river between the Romans and the confederate army of the Scots and Picts in the beginning of the 5th century. The scenes of fame of Offian's poems were, in the opinion of the translator, upon the banks of this river. Here Fingal fought with Caracal, the son of the king of the world, supposing to have been the same with Caracalla the son of the Roman emperor Severus. Here also young Oscar, the son of Offian, performed some of his heroic exploits. Hereabout was the stream of Crona, celebrated in the ancient compositions of the Gaelic bard; possibly that now called the water of Bonny, which runs in the neighbourhood of the Roman wall, and discharges itself into Carron at Dunipace. In those poems, mention is made of a green vale upon the banks of this river, from the valiant John Graham, who fell there, and whose grave-stone is to be seen in the church-yard of Falkirk. The scenes of fame of Crom, celebrated in the ancient compositions of the Gaelic bard, and the manner of its entrance into the church-yard of Falkirk.

The river Carron, though it hath long since ceased to be navigable amid the din of arms, still preserves its fame, by lending its aid to trade and manufactures; (see the next article) — The river is navigable for some miles near its mouth, and a considerable trade is carried on upon it by small craft; for the convenience of which, its channel has of late years been straightened and much shortened, and the great Canal has its entrance from it.

CARRON-WORKS, a large iron-foudastery, two miles north from Falkirk in Scotland. They are conveniently situated on the banks of the Carron, three miles above its entry into the frith of Forth. Above 100 acres of land have been converted into reservoirs and pools, for water diverted from the river, by magnificent dams built about two miles above the works, which, after turning 18 large wheels for the several purposes of the manufacture, falls into a tide-navigation that conveys their cargais to the sea.

These works are the greatest of the kind in Europe, and were established in 1760. At present, the buildings are of vast extent; and the machinery, constructed by Mr Smeaton, is the first in Britain, both in elegance and correctness: there are 1600 men employed, to whom is paid weekly above 350l. Sterling; which has greatly enriched the adjoining country.
nother charter of the same reign at 100 acres: in the
time of Edward I. at 150 acres: and in the 23d of
Edward III. a carrucate of land in Barchester contain-
ed 112 acres, and in Middleton 150 acres.

By a statute under William III. for charging per-
fons to the repair of the highways, a plough-land 
was rated at a fifty pound per annum, and may contain
houses, mills, wood, pasture, &c.

CARRYING, in falconry, signifies a hawk's fly-
ging away with the quarry. Carrying is one of the ill
qualities of a hawk, which the acquires either by a
dislike of the falconer, or not being sufficiently broke
to the lure.

CARRYING, among huntsmen. When a hare runs
on rotten ground (or even sometimes in a frost), and
it flicks to her feet, they say the carries.

CARRYING, among riding-masters. A horse is said
to carry low, when having naturally an ill-shaped neck,
he lowers his head too much. All horses that arm
themselves carry low, but a horse may carry low with-
out arming. A French branch, or gigot, is prescribed as
useful against carrying low.

A horse is said to carry well, when his neck is rai-
ed, or arched, and he holds his head high and firm,
without constraint.

CARRYING wind, a term used by dealers in hor-
ses to express such a one as frequently toffes his nose
as high as his ears, and does not carry handomely.
This is called carrying wind; and the difference be-
tween carrying in the wind, and beating upon the
hand, is this: that the horse who beats upon the
hand, shakes the brace and refits it, while he shakes
his head; but the horfe that carries in the wind puts
up his head without shaking, and sometimes beats up
on the hand. The opposite to carrying in the wind,
is arming and carrying low; and even between these
two there is a difference in wind.

CARS, or KARS, a considerable and strong town of
Asia, in Armenia, feated on a river of the same name,
with a castle almost impregnable. E. Long. 43. 50.
N. Lat. 41. 30.

CARSE, or Carps of Cowry, a diocese of Perchfibre
in Scotland. It lies on the north side of the Tay, and
extends 14 miles in length from Dundee to Perth, and
is from two to four in breadth. It is a rich plain
country, cultivated like a garden, and producing as
good harvefts of wheat as any in Great Britain. It
abounds with all the necessaries of life; but from its
low damp situation, the inhabitants are subject to a
sicknes and the commonalty are in great want of firing.
In this diocese, not far from the Tay, stands the houfe
of Errol, which formerly belonged to the Earls of that
name, the chiefls of the ancient family of Hay, here-
ditary contables of Scotland.

CARSTAIRS, (William) an eminent Scots Divine,
whose merit and good fortune called him to act in
great scenes, and to associate with men to whose so-
ciety and intercourse bis birth gave him few preten-
tions to aspire. A small village, in the neighbourhood
of Glasgow, was the place of his nativity. His father,
of whom little is known, exercised the functions of a
clergyman.

Young Carstairs turned his thoughts to the profes-
sion of theology; and the perfections and oppre-
sions of government, both in regard to civil and reli-
gious liberty, having excited his strongest indignation,
it became a matter of prudence that he should proce-
due his studies in a foreign university. He went ac-
cordingly to Utrecht; and his industry and attention
being directed with skill, opened up and unfolded those
faculties which he was about to employ with equal
honour to his country and himself.

During his residence abroad, he became acquainted
with Penitential Fagel, and entered with warmth in-
to the interest of the Prince of Orange. On his re-
turn to Scotland to procure a licence to teach doc-
tines which he had studied with the greatest care, he
became disjointed with the proud and insolent conduct
of Archbishop Sharp, and prepared to revitit Holland;
where he knew that religious liberty was respected,
and where he hoped he might better his condition by
the connexions he had formed.

His expectations were not vain. His prudence, his
reverence, and his political address, were strong recom-
mendations of him to the Prince of Orange; and he was
employed in personal negotiations in Holland, England,
and Scotland. Upon the elevation of his talent to the
English throne, he was appointed the King's chap-
lain for Scotland, and employed in settling the affairs
of that kingdom. William, who carried politics into
religion, was solicitous that episcopacy should prevail
there as universally as in England. Carstairs, more
vervant in the affairs of his native country, saw all the
impropriety of this, and the danger that would arife
from the enforcing of it. His reafonings, his re-
monstrances, his intrigues, overcame the firmness
of king William. He yielded to confiderations founded
alike in policy and in prudence; and to Carstairs, Scot-
land is indebted for the full establishment of its church
in the Presbyterian form of government.

The death of King William was a severe afflection
to him; and it happened before that Prince had pro-
vided for him with the liberality he deserved. He
was continued, however, in the office of chaplain for
Scotland by Queen Anne; and he was invited to ac-
cpt the Principality of the University of Edinburgh.
He was one of the minifters of the city, and four times
moderator of the general assembly. Placed at the
head of the church, he profecuted its interest with
zeal and with integrity. Nor were his influence and
activity confined to matters of religion. They were
exercised with success in promoting the culture of the
arts and sciences. The universities of Scotland owe
him obligations of the highest kind. He procured, in
particular, an augmentation of the salaries of their
professors; a circumstance to which may be ascribed
their reputation, as it enabled them to cultivate with
spirit the different branches of knowledge.

A zeal for truth, a love of moderation and order,
prudence and humanity, distinguished Principal Car-
stairs in an uncommon degree. His religion had no
mixture of austerity; his secular transactions were
attended with no imitation of artifice; and the verfa-
tility of his talents made him pass with ease from a
court to a college. He was among the last who suf-
feref torture before the privy-council, in order to
make him divulge the secrets intrusted to him, which
he firmly resisted; and after the revolution, that in-
human instrument the thumb-screw was given to him
in a prefect by the council.—This excellent perfon
died
C A R  [ 186 ]  C A R

Carfughi died in 1751; and in 1774 his State-papers and Letters, with an account of his life, were published in one vol. 4to, by the Rev. Dr M'Cormick.

Carfughi (Raüer) a Jesuit, born at Citerna in Tuscany, in 1647, was the author of a Latin poem, entitled, Ars bene fortundal, which is esteemed both for the elegance of the style and for the excellent precepts it contains. He also wrote some epigrams. He died in 1709.

C A R T A M A, a town of Spain in the kingdom of Grenada, formerly very considerable. It is seated at the foot of a mountain, near the river Guadala-Medina, in W. Long. 4. 28. N. Lat. 36. 40.

C A R T, a land-carriage with two wheels, drawn commonly by horSES, to carry heavy goods, &c. from one place to another. The word seems formed from the French charrette, which signifies the fame, or rather the Latin carretta, a diminutive of carus. See C A R R.

In London and Westminster carts shall not carry more than twelve sacks of meal, seven hundred and fifty bricks, one child of coals, &c. on pain of forfeiture of the horses, (5 Geo. I. c. 6.) By the laws of the city, cart-men are forbidden to ride either on their carts or horses. They are to lead or drive them on foot through the streets on the forfeiture of ten shillings, (Stat. 1 Geo. I. cap. 57.) Criminals used to be drawn to execution in a cart. Bawds and other malefactors are whipped at the cart's tail.

Scripture makes mention of a fort of carts or drags used by the Jews to do the threshing. They were supported on low thick wheels, bound with iron, which were rolled up and down on the heaves, to break them, and force out the corn. Something of the like kind also obtained among the Romans, under the denomination of planiftra, of which Virgill makes mention, (Georg. I.)

Tardaque Eleusine matris volventia planiftra, Tribulagae, trahereque.

On which Servius observes, that trahere denotes a cart without wheels, and tribula a fort of cart armed on all sides with teeth, used chiefly in Africa for threshing corn. The Sepuqant and St Jerome represent these carts as furnished with saws, infomuch that their surface was befit with teeth. David having taken Rabbah, the capital of the Ammonites, ordered all the inhabitants to be cruelled to pieces under such carts, moving on wheels fet with iron teeth; and the king of Damascus is said to have treated the Israelites of the land of Gilead in the same manner.

C A R T-Bote, in law, signifies wood to be employed in making and repairing instruments of husbandry.

C A R T-S of War, a peculiar kind of artillery anciently in use among the Scots. They are thus described in an act of parliament, A. D. 1456: "It is thocht speidfull, that the King mak requiteit to certain of the great barons of the land that are of any myght, to mak carts of weir, and ilk cart twa Gunnis, and ilk ane to have twa chalmers, with the remanent of the graith that effairs thereto, and an cunning man to hrut thame." By another act, A. D. 1471, the prelates and barons are commanded to provide such carts of war against their old enemies the English.

C A R T-E, the historian, was the son of Mr Samuel C a r t e prebendary of Litchfield, and born in 1686. When he was reader in the abbey-church at Bath, he took occasion, in a 30th of January sermon, 1714, to vindi cate Charles I. with respect to the irish massacre, which drew him into a controversy with Mr Chandler the dissenting minister; and on the accession of the present royal family he refused to take the oaths to government, and put on a lay habit. He is said to have acted as a kind of secretary to Bishop Atterbury before his troubles; and in the year 1722, being accused of high treason, a reward of 1000l. was offered for apprehending him: but Queen Caroline, the great patroness of learned men, obtained leave for him to return home in security. He published, 1. An edition of Tho mas, in seven volumes folio. 2. The Life of the first Luke of Ormond, three volumes, folio. 3. The history of England, four volumes, folio. 4. A Collection of Original Letters and Papers concerning the affairs of England, two volumes 8vo.; and some other works. He died in April 1754.—His history of England ends in 1654. His design was to have brought it down to the Revolution; for which purpose he had taken great pains in copying every thing valuable that could be met with in England, Scotland, France, Ireland, &c.—He had (as he himself says, p. 43. of his Vindication of a full answer to a letter from a bystander), "read abundance of collections relating to the time of King Charles II. and had in his power a series of memoirs from the beginning to the end of that reign; in all those intrigues and turns at court, at the latter end of that king's life, which bishop Burnet, with all his gout for tales of secret history, and all his genius for conjectures, does not pretend to account for, are laid open in the clearest and most convincing manner; by the person who was most affected by them, and had the best reason to know them."—At his death, all his papers came into the hands of his widow, who afterwards married Mr Jernegan, a member of the church of Rome. They are now deposited in the Bodleian library, having been delivered by Mr Jernegan to the university, 1778, for a valuable consideration. While they were in this gentleman's possession, the earl of Hardwicke paid 200l. for the perusal of them. For a consideration of 300l. Mr Macpherson had the use of them; and from these and other materials compiled his history and state-papers. Mr Carte was a man of a strong constitution and indefatigable application. When the studies of the day were over, he would eat heartily; and in conversation was cheerful and entertaining.

C a r t e-Blanche, a sort of white paper, signed at the bottom with a person's name, and sometimes also sealed with his seal, giving another person power to supersign what conditions he pleaseth. Much like this is the French blanc signé, a paper without writing, except a signature at the bottom, given by contending parties to arbitrators or friends, to fill up with the conditions they judge reasonable, in order to end the difference.

C a r t e, an agreement between two states for the exchange of their prisoners of war.

C a r t e signifies also a letter of defiance or a challenge to decide a controversy either in a tournament or in a single combat. See D u e l.

C a r t e-S hips, a ship commissioned in time of war to
CAR

[187]

C A R

exchange the prisoners of any two hostile powers; also to carry any particular request or proposal from one to another: for this reason, the officer who commands her is particularly ordered to carry no cargo, ammunition, or implements of war, except a single gun for the purpose of firing signals.

CARTES, (Rene des) descended of an ancient family in Touraine in France, was one of the most eminent philosophers and mathematicians in the 17th century. At the Jesuits College at la Fleche, he made a very great progress in the learned languages and polite literature, and became acquainted with Father Marfenne. His father designed him for the army; but his tender constitution then not permitting him to expose himself to such fatigues, he was sent to Paris, where he launched into gaming, in which he had prodigious success. Here Marfenne persuaded him to return to study; which he purued till he went to Holland, in May 1616, where he engaged as a volunteer among the prince of Orange's troops. While he lay in garrison at Breda, he wrote a treatise on music, and laid the foundation of several of his works. He was at the siege of Rochelle in 1628; returned to Paris; and, a few days after his return, at an assembly of men of learning in the house of Monfignor Bagni, the Pope's Nuncio, was prevailed upon to explain his sentiments with regard to philosophy, when the nuncio urged him to publish his system. Upon this he went to Amsterdam, and from hence to Franeker, where he began his metaphysical meditations, and drew up his "Treatise on Meteorology." He made a short tour to England; and, not far from London, made some observations concerning the declination of the magnet. He returned to Holland, where he finished his "Treatise on the World."

His books made a great noise in France; and Holland thought of nothing but discarding the old philosophy, and following him. Voetius being chosen rector of the university of Utrecht, procured his philosophy to be prohibited, and wrote against him; but he immediately published a vindication of himself. In 1647, he took a journey into France, where the king, on the recommendation of 300 learned persons, fixed his residence. He attended the court; but his health failed, and he was sent to the island of Cyprus, for the young women to go on certain stated days, before marriage, to the sea-side, there to look for strangers, that might possibly arrive on their coasts, in order to prostitute themselves for gain, that they might thereby acquire a dowry. Out of these, the Tyrians selected 80, whom they carried along with them. From Cyprus they sailed directly for the coast of Africa; and at last safely landed in the province called Africa Propria, not far from Utica, a Phoenician city of great antiquity. The inhabitants received their countrymen with great demonstrations of joy, and invited them to settle among them. The common fable is, that the Phoenicians imposed upon the Africans in the following manner: They desired, for their intended settlement, only as much ground as an ox's hide would encompass. This request the Africans laughed at; but were surprised, when, upon their granting it, they saw Elifa cut the hide into the smallest shreds, by which means it surrounded a large territory; in which the built the citadel called Byrsa. The learned, however, are now uncertain as to the name of the citadel.
Car

The Carthaginians entered into a treaty with the Romans. It related chiefly to matters of navigation and commerce. From it we learn, that the whole island of Sardinia, and part of Sicily, were then subject to Carthage; that they were very well acquainted with Carthage the coasts of Italy, and had made some attempts upon and Rome, on them before this time; and that, even at this early period, a spirit of jealousy had taken place between the two republics. Some time near this period, the Carthaginians had a mind to discontinue the tribute they had hitherto paid the Africans for the ground on which their city stood. But, notwithstanding all their power, they were at present unsuccessful; and at last were obliged to conclude a peace, one of the articles of which was, that the tribute should be continued.

By degrees the Carthaginians extended their power Sicily invaded over all the islands in the Mediterranean, Sicily ex- by the celebrated; and for the entire conquest of this, they made Carthaginian vessels preparations, about 480 years before Christ. Their navy consisted of 300,000 men; their fleet was composed of upwards of 2000 men of war, and 3000 transports; and with such an immense armament, they made no doubt of conquering the whole island in a single campaign. In this, however, they found themselves miserably deceived. Hamilcar their general having landed his numerous forces, invested Himera, a city of considerable importance. He carried on his attacks with the greatest assiduity; but was at last attacked in his trenches by Gelon and Theron, the tyrants of Syracuse and Agrigentum, who gave the Carthaginians one of the greatest overthrows mentioned in history. An hundred and fifty thousand were they killed in the battle and pursuit, and all the rest taken utterly de- prived; so that of so mighty an army, not a single person escaped. Of the 2000 ships of war and 3000 transports, of which the Carthaginian fleet consisted, eight ships only, which then happened to be at sea, made their escape; the rest immediately fell for Carthage; but were all lost and every soul perished, except a few who were saved in a small boat, and at last reached Carthage with the dismal news of the total loss of the fleet and army. No words can express the consternation of the Carthaginians upon receiving the news of so terrible a disaster. Ambassadors were immediately dispatched to Sicily, with orders to conclude a peace upon any terms. They put to sea without delay; and landing at Syracuse, threw themselves at the conqueror’s feet. They begged Peace con- ged, with many tears, to receive their city into cliuded, favour, and grant them a peace on whatever terms they should choose to prescribe. He granted their request on condition that Carthage should pay him 2000 talents of silver to defray the expense of the war; that they should build two temples, where the articles of the treaty should be lodged and kept as sacred; and that for the future they should abstain from human sacri- fices. This was not thought a dear purchase of a peace for which there was such occasion; and to show their gratitude for Gelon’s moderation, the Carthaginians complimented his wife Demarata with a crown of gold worth 100 talents.

From this time we find little mention of the Carthaginians for 70 years. Some time during this period, however, they had greatly extended their dominions
Carthage and its influence in Africa, and likewise shaken off the tribute which gave them so much uneasiness. They had warm disputes with the inhabitants of Cyrene the capital of Cyrenaica, about a regulation of the limits of their respective territories. The consequence of these disputes was a war, which reduced both nations to so low, that they agreed first to a secession of arms, and then to a peace. At last it was agreed, that each state should appoint two commissioners, who should settle out from their respective cities on the same day, and that the spot on which they met should be the boundary of both states. In consequence of this, two brothers called 'Philæni' were sent out from Carthage, who advanced with great celerity, while those from Cyrene were much more slow in their motions. Whether this proceeded from accident or design, or perjury, we are not certainly informed; but, be this as it will, the Cyreneans finding themselves greatly outstripped by the Philæni, accused them of breach of faith, alleging that they had set out before the time appointed, and consequently that the convention between their principals was broken. The Philæni desired them to propose some expedient whereby their differences might be accommodated; promising to submit to it, whatever it might be. The Cyreneans then proposed, either that the Philæni should retire from the place where they were, or that they should be buried alive upon the spot. With this last condition the brothers immediately complied, and by their death gained a large extent of territory to their country. The Carthaginians ever after celebrated this as a most brave and heroic action; paid them divine honours; and endeavoured to immortalize their names by erecting two altars there, with suitable inscriptions upon them.

Sicily invaded anew. About the year before Christ 412, some disputes happening between the Egypotines and Selinuntines, inhabitants of two cities in Sicily, the former called the Carthaginians to their assistance; and this occasioned a new invasion of Sicily by a nation. Great preparations were made for this war; Hannibal, whom they had appointed general, was empowered to raise an army equal to the undertaking, and equip a suitable fleet. They also appointed certain funds for defraying all the expenses of the war, intending to exact their whole force to reduce the island under their sujection.

The Carthaginian general having landed his forces, immediately marched for Selinus. In his way he took Emporium, a town situated on the river Mazara; and having arrived at Selinus, he immediately invested it. The besieged made a very vigorous defence; but at last the city was taken by storm, and the inhabitants were treated with the utmost cruelty. All were massacred by the savage conquerors, except the women who fled to the temples; and these escaped, not through the merciful dispossession of the Carthaginians, but because they were afraid, that if driven to despair they would set fire to the temples, and by that means consume the treasure they expected to find in those places. Sixteen thousand were massacred; 2250 escaped to Agrigentum; and the women and children, about 5000 in number, were carried away captives. At the same time the temples were plundered, and the city razed to the ground.

After the reduction of Selinus, Hannibal laid siege to Himera; that city he despaired of all things to become master of, that he might revenge the death of his grandfather Hamilcar, who had been slain before it by Gelon. His troops, flushed with their late successes, behaved with undaunted courage; but finding his battering engines not to answer his purpose sufficiently, he undermined the wall, supporting it with large beams of timber, to which he afterwards set fire, and thus laid part of it flat on the ground. Notwithstanding this advance, however, the Carthaginians were several times repulsed with great slaughter; but at last they became masters of the place, and treated it in the same manner as they had done Selinus. After this, Hannibal, dispersing his Sicilian and Italian allies, returned to Africa.

The Carthaginians were now so much elated, that they meditated the reduction of the whole island. But as the age and infirmities of Hannibal rendered him incapable of commanding the forces alone, they joined in commissioin with him Imlinar the son of Hanno, one of the same family. On the landing of the Carthaginian army, all Sicily was alarmed, and the principal cities put themselves into the best state of defence they were able. The Carthaginians immediately marched to Agrigentum, and after a very vigorous resistance from the walls with great fury. The besieged, however, defended themselves with incredible resolution, in a sally burnt all the machines raised against their city, and repulsed the enemy with great slaughter. The Syracusians in the mean time, being alarmed at the danger of Agrigentum, sent an army to its relief. On their approach they were immediately attacked by the Carthaginians; but after a sharp dispute the latter were defeated and forced to fly to the very walls of Agrigentum, with the loss of 6000 men. Had the Agrigentine commanders now sallied out, and fallen upon the fugitives, in all probability the Carthaginian army must have been destroyed; but either through fear or corruption they refused to fit out of the place, and this occasioned the loss of it. Immense And taken. Booby was found in the city; and the Carthaginians behaved with their usual cruelty, putting all the inhabitants to the sword, not excepting even those who had fled to the temples.

The next attempt of the Carthaginians was design- ated against the city of Gela; but the Gelates, being greatly alarmed, implored the protection of Syracuse; and, at their request, Dionysius was sent to allit them with 2000 foot and 400 horse. The Gelates were so well satisfied with his conduct, that they treated him with the highest marks of distinction; they even sent ambassadors to Syracuse to return thanks for the important services done them by sending him farther; and soon after he was appointed generalissimo of the Syracusan forces and those of their allies against the Carthaginians. In the mean time Imlinar, having raised the city of Agrigentum, made an incursion into the territories of Gela and Comarina; which having ravaged in a dreadful manner, he carried off such immense quantity of plunder, as filled his whole camp. He then marched against the city: but though Gela before it was but indifferently fortified, he met with a very vigorous resistance; and the place held out for a long time without receiving any assistance from its allies.
Abandoned making their
abitants.

Peace eluded.

To amuse the enemy, he left
his march with great celerity. The Carthaginians
battted the Carthaginian camp, but was repulsed
by the Carthaginian army greatly weakened, partly by the
plague which had broken out in their city, did not depoid, but fell
officers to Europe, with considerable sums, to raise troops
with the utmost diligence. Ten galleys were also sent
from Carthage to destroy all the ships that were found
in the harbour of Syracuse. The admiral, according to
his orders, entered the harbour in the night, without
being discovered by the enemy; and having sunk all
of the ships he found there, returned without the loss of a man.

This all while the Motyans defended themselves with
incredible vigour; while their enemies, defirous of
revenging the cruelties exercised upon their countrymen by the Carthaginians; fought like lions. At last
the place was taken by storm, and the Greek soldiers
began a general massacre. For some time Dionysius
was not able to restrain their fury: but at last he
proclaimed that the Motyans should fly to the Greek
temples; which they accordingly did, and a flood was
put to the slaughter; but the soldiers took care thoroughly to plunder the town, in which they found a great treasure.

The following spring, Dionysius invaded the Carthaginian territories, and made an attempt upon Egela; but here he was again disappointed. The Carthaginians were greatly alarmed at his progress; but, next
year, notwithstanding a considerable loss sustained in a sea-fight with Leptines, Himilco their general landed
a powerful army at Panormus, seized upon Eryx, and then advancing towards Motya, made himself master of it, before Dionysius could send any forces to its relief. He next advanced to Messana, which he like-
wise besieged and took; after which most of the Siculi
revolted from Dionysius.

Notwithstanding this defection, Dionysius, finding his forces still amount to 50,000 foot and 3000 horse, advanced against the enemy. At the same time, Leptines was sent with the Syracusan fleet against that of the Carthaginians, but with positive orders not to break the line of battle upon any account whatever. But, notwithstanding these orders, he thought proper to divide his fleet, and the consequence of this was a total defeat; above 100 of the Syracusan galleys being sunk or taken, and 20,000 of their men killed in the battle or in the pursuit. Dionysius disheartened by this misfortune, returned with his army to Syracuse, being afraid that the Carthaginian fleet might become masters of that city, if he should advance to fight the land army. Himilco did not fail immediately to invest the capital;
In this place; the Carthaginians being apprized that the Corinthian succours were detained by tempestuous weather at Thurium, posted a strong squadron, under Hanno their admiral, to intercept them in their passage to Sicily. But that commander, not imagining the Corinthians would attempt a passage to Sicily in such a stormy season, left his station at Thurium, and ordering his seamen to crown themselves with garlands, and adorn their vessels with bucklers both of the Greek and Carthaginian form, failed to Syracuse in a triumphant manner. Upon his arrival there, he gave the troops in the citadel to understand, that he had taken the succours Timoleon expected, thinking by this means to intimidate them to surrender. But, while he thus trifled away his time, the Corinthians marched with great expedition to Rhegium, and, taking the advantage of a gentle breeze, were easily wafted over into Sicily. Mago, the Carthaginian general, was no sooner informed of the arrival of this reinforcement, than he was struck with terror, though the whole Corinthian army did not exceed 4000 men; and, soon after, fearing a revolt of his mercenaries, he weighed anchor, in spite of all the remonstrances of Icetas, and set sail for Africa. Here he no sooner arrived, than, overcome with grief and shame for his unparalleled cowardice, he laid violent hands on himself. His body was hung upon a gallows or cross, in order to deter succeeding generals from forfeiting their honour in so flagrant a manner.

After the flight of Mago, Timoleon carried all before him. He obliged Icetas to renounce his alliance with the state of Carthage, and even deposed him, and continued his military preparations with the greatest vigour. On the other hand, the Carthaginians prepared for the ensuing campaign with the greatest alacrity. An army of 70,000 men was sent over, with a fleet of 200 ships of war, and 1000 transports laden with warlike engines, armed chariots, horses, and all other sorts of provisions. This immense multitude, however, was overthrown on the banks of the Crimis by Timoleon: 10,000 were left dead on the field of battle; and of these, above 5000 were native Carthaginians of the chief families in the city. Above 15,000 were taken prisoners; all their baggage and provisions, with 200 chariots, 1000 coats of mail, and 10,000 shields, fell into Timoleon's hands. The spoil, which consisted chiefly of gold and silver, was so immense, that the whole Sicilian army was three days in collecting it and stripping the slain. After this signal victory, he left his mercenary forces upon the frontiers of the enemy, to plunder and ravage the country; while he himself returned to Syracuse with the rest of his army, where he was received with the greatest demonstrations of joy. Soon after, Icetas, grown weary of his private station, concluded a new peace with the Carthaginians; and, having assembled an army, ventured an engagement with Timoleon: but in this he was utterly defeated; and himself, with Eupolemus his son, and Euthymus general of his horse, were brought bound to Timoleon by their own soldiers. The two first were immediately executed as tyrants and traitors, and the last murdered in cold blood; Icetas's wives and daughters were likewise cruelly put to death after a public trial. In a short time after, Marcus, another of the Carthaginian confederates, was over
Peace concluded.

War renewed.

Agathocles raises himself to the throne of Syracuse.

Agathocles seeing himself stripped of almost all his dominions, and his capital itself in danger of falling into the hands of the enemy, formed a design which, were it not attested by writers of undoubted authority, would seem absolutely incredible. This was no less than to transfer the war into Africa, and lay siege to Carthage, the enemy's capital, at a time when he himself was besieged, and only one city left to him in all Sicily. Before he departed, however, he made all the necessary preparations for the defence of the place, and appointed his brother Andranus governor of it. He also gave permission to all who were not willing to stand the fatigues of a siege to retire out of the city. Many of the principal citizens, Justin says 1600, accepted of this offer; but they were no sooner got out of the place, than they were cut off by parties posted on the road for that purpose. Having seized upon their citadels, Agathocles raised a considerable sum, which was intended in some measure to defray the expense of the expedition; however, he carried with him only 50 talents to supply his present wants, being well assured that he should find in the enemy's country whatever was necessary for his subsistence. As the Carthaginians had a much superior fleet, they for some time kept the mouth of the harbour blocked up: but at last a fair opportunity offered; and Agathocles hoisting sail, by the activity of his rowers soon got clear both of the port and city of Syracuse. The Carthaginians purified him with all possible expedition; but, notwithstanding their utmost efforts, Agathocles got his troops landed with very little opposition.

Soon after his forces were landed, Agathocles burnt He burns his ships, probably that his soldiers might behave with his fleet. the greater resolution, they saw no possibility of flying from their danger. He first advanced to a place called the Great City. This, after a feeble resistance, he took and plundered. From hence he marched to Tunis, which furnished him with the first munitions; and Agathocles levelled both places with the ground.

The Carthaginians were at first thrown into the greatest consternation; but soon recovering themselves, the citizens took up arms with so much alacrity, that in a few days they had on foot an army of 40,000 foot and 1000 horse, with 2000 armed chariots. The Carthaginian command of this army they entrusted to Hanno and Bomilcar, two generals between whom there subsisted great animosity. This occasioned the defeat of their whole army with the loss of their camp, though all the forces of Agathocles did not exceed 14,000 in number. Among other rich spoils the conqueror found many chariots of curious workmanship, which carried 20,000 pair of fetters and manacles that the enemy had provided for the Sicilian prisoners. After this defeat, the Carthaginians, supposing themselves to have fallen under the displeasure of their deities on account of their neglecting to sacrifice children of noble families...
In the meantime the Agrigentines, finding that Haruclcar was defeated night-time.

These to them, resolved to expiate this guilt. Accordingly 200 children of the first rank were sacrificed to their bloody gods, besides 300 other persons who voluntarily offered themselves to pacify the wrath of these deities.

After these expiations, Hamilcar was recalled from Sicily. When the messengers arrived, Hamilcar commanded them not once to mention the victory of Agathocles; but, on the contrary, to give out among the troops that he had been entirely defeated, his forces all cut off, and his fleet destroyed by the Carthaginians. This threw the Syracusians into the utmost despair; however, one Eurymon, an Etolian, prevailed upon Antandrus, not to content to a capitulation, but to stand a general assault. Hamilcar being informed of this, prepared his battering engines, and made all the necessary preparations to storm the town without delay.

But while matters remained in this situation, a galley, which Agathocles had caused to be built immediately after the battle, got into the harbour of Syracuse, and acquainted the inhabitants with the certainty of Agathocles's victory. Hamilcar observing that the garrison flocked down to the port on this occasion, and expecting to find the walls unguarded, ordered his soldiers to erect scaling-ladders, and begin the intended assault. The enemy having left the ramparts quite exposed, the Carthaginians mounted them without being discerned, and had almost possessed themselves of an entire part lying between two towers, when the patrol discovered them. Upon this a warm dispute ensued; but at last the Carthaginians were repulsed with loss. Hamilcar, therefore, finding it in vain to continue the siege after such glad tidings had restored life and soul to the Syracusians, drew off his forces, and sent a detachment of 5000 men to reinforce the troops in Africa. He still entertained hopes, however, that he might oblige Agathocles to quit Africa, and return to the defence of his own dominions. He spent some time in making himself master of such cities as were taken by the Syracusians; and after having brought all their allies under subjection, returned again to Syracuse, hoping to surmise it by an attack in the night-time. But being attacked while advancing thro' narrow passages, where his numerous army had not room to move, he was defeated with great slaughter, and himself taken prisoner, carried into Syracuse, and put to death.

In the mean time the Agrigentines, finding that the Carthaginians and Syracusians had greatly weakened each other by this war, thought it a proper opportunity to attempt the sovereignty of the whole island. They therefore commenced a war against both parties; and prosecuted it with such success, that in a short time they wrested many places of note both out of the hands of the Syracusians and Carthaginians.

In Africa the tyrant carried every thing before him. He reduced most of the places of any note in the territories of Carthage; and being about to cross the king of Libya had declared against him, he immediately entered Libya Superior, and in a great battle overthrew that prince, putting to the sword a good part of his troops, and the general who commanded them; after which he advanced against the Carthaginians with such expedition, that he surprized and defeated them, with the loss of 2000 killed, and a great number taken prisoners. He next prepared for the siege of Carthage itself; and in order thereto advanced to a post within five miles of that city. On the other hand, notwithstanding the great losses they had already sustained, the Carthaginians, with a powerful army, encamped between him and their capital. In this situation Agathocles received advice of the defeat of the Carthaginian forces before Syracuse, and the head of Hamilcar their general. Upon this he immediately rode up to the enemy's camp, and showing them the head, gave them an account of the total destruction of their army before Syracuse. This threw them into such consternation, that in all human probability Agathocles would have made himself master of Carthage, had not an unexpected mutiny arisen in his camp, which gave the Carthaginians an opportunity of recovering from their terror.

The year following an engagement happened, in which neither party gained any great advantage; but an alliance was soon after the tyrant, notwithstanding all his victories, found himself unable to carry on the war alone; and therefore endeavoured to gain over to his interest Ophellas, one of the captains of Alexander the Great. In this he perfectly succeeded; and, to succour his new ally the more effectually, Ophellas went to Athens for a body of troops. Having finished his military preparations, Ophellas found his army to consist of 10,000 foot and 600 horse, all regular troops, besides 100 chariots, and a body of 10,000 men, attended by their wives and children, as though he had been going to plant a new colony. At the head of these forces he continued his march towards Agathocles for 18 days; and then encamped at Automale, a city about 3000 stadia distant from the capital of his dominions. From thence he advanced through the Regio Syrta; but found himself reduced to such extremities, that his army was in danger of perishing for want of bread, water, and other provisions. They were also greatly annoyed by serpents and wild beasts, with which that desert region abounded. The serpents made the greatest havoc among the troops; for, being of the same colour with the earth, and extremely venomous, many soldiers, who trod upon them without being observed, were instantly killed. At last, after a very fatiguing march of two months, he approached Agathocles, and encamped at a small distance from him, to the no small terror of the Carthaginians, who apprehended the most fatal consequences from this junction. Agathocles at first carriethim, and ad- vised him to take all possible care of his troops that the former had undergone so many fatigues; but soon after cut off his head, through treachery, and then by fair words and promises persuaded his troops to serve under himself.

Agathocles now finding himself at the head of a numerous army, assumed the title of King of Africa, intending soon to complete his conquests by the reduction of Carthage. He began with the siege of Utica, which was taken by assault. After this he marched against Hippo Diarrhytus, the Bifera of the moderns, which was also taken by storm; and after this most of the people bordering upon the sea-coasts, and even those who inhabited the inland parts of the country, submitted to him. But in the midst of this career of success, the Sicilians formed an association in Carthage, to return favourable home.
Archagathus, after his father's departure, greatly extended the African conquests. He sent Eumachus at the head of a large detachment to invade some of the neighbouring provinces, while he himself, with the greatest part of his army, observed the motions of the Carthaginians. Eumachus falling into Numidia, first took the great city of Tocas, and conquered several of the Numidian cantons. Afterwards he besieged and took Phellina; which was attended with the submission of the Alphadelphiaeans, a nation, according to Diodorus, as black as the Ethiopians. He then reduced several cities; and being at last elated with such a run of good fortune, resolved to penetrate into the more remote parts of Africa. Here he at first met with successes; but hearing that the barbarous nations were advancing in a formidable body to give him battle, he abandoned his conquests, and retreated with the utmost precipitation towards the sea-coasts, after having lost abundance of men.

This unfortunate expedition made a great alteration for the worse in the affairs of Archagathus. The Carthaginians being informed of Eumachus's bad success, resolved to exert themselves in an extraordinary manner to repair their former losses. They divided their forces into three bodies: one of these they sent to the sea-coasts, to keep the towns there in awe; another they dispatched into the Mediterranean parts, to preferve the allegiance of the inhabitants there; and the last body they ordered to the Upper Africa, to support their confederates in that country. Archagathus being apprized of the motions of the Carthaginians, divided his forces likewise into three bodies. One of these he sent to observe the Carthaginian troops on the sea-coasts, with orders to advance afterwards into the Upper Africa; another under the command of Æchirion, one of his generals, he posted at a proper distance in the heart of the country, to have an eye both on the enemy and the barbarous nations; and with the last, which he led in person, he kept nearer Carthage, preferring a communication with the other two, in order to send them succours, or recall them, as the exigency of affairs should require.—The Carthaginian troops sent into the heart of the country, were commanded by Hannibal, a general of great experience, who being informed of the approach of Æchirion, laid an ambuscade for him, into which he was drawn and cut off with 4000 foot and 200 horse. Himilco, who commanded the Carthaginian forces in Upper Africa, having advice of Eumachus's march, immediately advanced against him. An engagement ensued, in which the Greeks were almost totally cut off, or perished with thirst after the battle, out of 8000 foot only 30, and of 800 horse only 40, having the good fortune to make their escape.

Archagathus receiving the melancholy news of these two defeats, immediately called in the detachments he had sent out to harass the enemy, which would otherwise have been inhumanly cut off. He was, however, in a short time hemmed in on all sides in such a manner as to be reduced to the last extremity for want of provisions, and ready every moment to be swallowed up by the numerous forces which surrounded him. In this deplorable situation Archagathus received an express from Archagathus, acquainting him of the losses he had sustained, and the scarcity of provisions he laboured under. Upon this the tyrant, leaving the care of the Sicilian war to one Leptines, by a stratagem got 18 Etruscan ships that came to his assistance out of the harbour; and then engaging the Carthaginian squadron which lay in its neighbourhood, took five of their ships, and made all their men prisoners. By this means he became master of the port, and secured a passage into it for the merchants of all nations, which soon restored plenty to that city, where the famine before had begun to make great havoc. Supplying himself, therefore, with a sufficient quantity of necessaries for the voyage he was going to undertake, he immediately set sail for Africa.

Upon his arrival in this country, Archagathus received the forces, and found them to consist of 6000 Greeks, as many Samnites, Celts, and Etruscans; besides 10,000 Africans, and 1500 horse. As he found his troops almost in a state of despair, he thought this a proper time for offering the enemy battle. The Carthaginians, however, did not think proper to accept the challenge; especially as by keeping close in their camp, where they had plenty of every thing, they could harve the Greeks to a surrender without striking a stroke. Upon this Archagathus attacked the Carthaginian camp with great bravery, made a considerable impression upon it, and might perhaps have carried it, had not his mercenaries deserted him almost at the first onset. By this piece of cowardice he was forced to retire with precipitation to his camp, whither the Carthaginians purfued him very closely, doing great execution in the pursuit.

The next night, the Carthaginians sacrificed all the sufferers of distinction as a greatful acknowledgment to the gods for the victory they had gained. While they were employed in the inhuman work, the wind, still freshly rising, wafted the flames to the sacred tabernacle near the altar, which was entirely consumed, as well as the general's tent, and thole of the principal officers adorning it. A dreadful alarm took place through the whole camp, which was heightened by the great progres of the fire. For the soldiers tents consisting of very combustible materials, and the wind blowing in a most violent manner, the whole camp was almost entirely laid in ashes; and many of the soldiers endeavouring to carry off their arms, and the rich baggage of their officers, perished in the flames. Some of those who made their escape met with a fate equally unhappy: For, after Archagathus had received the last blow, the Africans deserted him, and were in that instant coming over in great numbers to the Carthaginians. These, the persons who were flying from the flames took to be the whole Syracusan army advancing in order of battle to attack their camp. Upon this a dreadful confusion ensued. Some took to their heels; others fell down in heaps one upon another; and others engaged their comrades, mistaking them for the enemy. Five thousand men lost their lives in this tumult, and the rest thought proper to take refuge within the walls of Carthage; nor could the appearance of day-light, for some time, diffuse
C A R

Another in that of Agathocles.

59 The Syracusians seeing a body of troops advancing towards them in good order, concluded that the enemy were marching to attack them, and therefore immediately cried out "To arms." The flames ascending out of the Carthaginian camp into the air, and the lamentable outcries proceeding from thence, confirmed them in this opinion, and greatly heightened their confusion. The consequence was much the same as in the Carthaginian camp; for coming to blows with one another instead of the enemy, they scarce recovered their senses upon the return of light, and the intestine fray was so bloody, that it cost Agathocles 4000 men.

This last disaster so disheartened the tyrant, that he immediately set about contriving means for making his escape privately; and this he did at length, though with great difficulty, effected. After his departure, his two sons were immediately put to death by the soldiers, who, choosing a leader from among themselves, made peace with the Carthaginians upon the following conditions: 1st. That the Greeks should deliver up all the places they held in Africa, receiving from them 300 talents; 2nd. That such of them as were willing to serve in the Carthaginian army should be kindly treated, and receive the usual pay; and, 3d. That the rest should be transported to Sicily, and have the city of Selinus for their habitation.

From this time, to that of the first war with the Romans, we find nothing remarkable in the history of the Carthaginians. The first Punic war, as it is commonly called, happened about 256 years before Christ. At that time, the Carthaginians were possessed of extensive dominions in Spain; they had made considerable progress in Spain; were masters of Sardinia, Corsica, and all the islands on the coast of Italy; and had extended their conquests to a great part of Sicily. The occasion of the first rupture between the two republics was as follows. The Mamertines being insulted in their town, and reduced to great straits by Hiero king of Syracuse, had resolved to deliver up Messina, the only city they now possessed, to that prince, with whose mild government and strict probity they were well acquainted. Accordingly, Hiero was advancing at the head of his troops to take possession of the city, when Hannibal, who, at that time commanded the Carthaginian army in Sicily, prevented him by a stratagem. He came to meet Hiero, as if it were to congratulate him on his victory; and amnestied him while some of the Carthaginian troops filed off towards Messina. Hereupon the Mamertines, seeing their city supported by a new reinforcement, were divided into several opinions. Some were for accepting the protection of Carthage; others were for surrendering to the king of Syracuse; but the greater part were for calling in the Romans to their assistance. Deputies were accordingly dispatched to Rome, offering the possession of the city to the Romans, and in the most moving terms imploiring protection. This, after some debate, was agreed to; and the consul Appius Claudius received orders to attempt a passage to Sicily, at the head of a powerful army. Being obliged to stay some time at Rome, however, one Caius Claudius, a person of great intrepidity and resolution, was dispatched with a few vessels to Rhegium. On his arrival there, he observed the Carthaginian squadron to be so much superior to his own, that he thought it would be little better than madness to attempt at that time to transport forces to Sicily. He crossed the straits, however, and had a conference with the Mamertines, in which he prevailed upon them to accept of the protection of Rome; and on this he made the necessary preparations for transporting his forces. The Carthaginians being informed of the resolutions of the Romans, sent a strong squadron of galleys under the command of Hanno, to intercept the Roman fleet; and accordingly the Carthaginian admiral, coming up with them near the Roman coast of Sicily, attacked them with great fury. During the engagement a violent storm arose, which detained many of the Roman vessels against the rocks, and did a vast deal of damage to their squadron; by which means Claudius was forced to retire to Rhegium, and this he accomplished with great difficulty. Hanno restored all the vessels he had taken; but ordered the deputies sent with them, to expostulate with the Roman general upon the infringement of the treaties subsisting between the two republics. This expostulation, however just, produced an open rupture; Claudius soon after poising himself at Messina.

Such was the beginning of the first Punic war, Carthago which is said to have lasted 24 years. The first year, the Carthaginians and Syracusians laid siege to Messina; and this defeat so much disheartened Hiero with the Carthaginians, that he soon after concluded an alliance with the Romans. After this treaty, having no enemy to contend with but the Carthaginians, the Romans made themselves masters of all the cities on the western coast of Sicily, and at the end of the campaign carried back most of their troops with them to take up their winter-quarters in Italy.

The second year, Hanno, the Carthaginian general, Agrippen fixed his principal magazine at Agrigentum. This turn taken place was very strong by nature, and had been rendered the Romans by the Roman army of 50,000 foot, 6000 horse, and 60 elephants, landed at Lilybaeum, and from thence marched to Heraclae, within 20 miles of Agrigentum. There the general received a deputation from some of the inhabitants of Erbeis, where the Romans had their magazines, offering to put the town into his hands; which was accordingly delivered up; and by this means the Romans now came so much disheartened, that they had certainly been obliged to abandon their enterprise, had not Hiero supplied them with provisions. But all the assistance he was able to give could not long have supported them.
them, as their army was so much weakened by disorders occasioned by famine, that, out of 100,000 men of whom it originally consisted, scarce a fourth part remained fit for service, and could no longer subsist on such parsiimonious supplies. But in the mean time Hannibal acquainted Hanno that the city was reduced to the utmost distress; upon which he resolved to venture an engagement, which he had before declined. In this the Romans were victorious, and the city surrendered at discretion, though Hannibal, with the greatest part of the garrison made their escape. This ended the campaign; and the Carthaginians being greatly chagrined at their bad success, fined Hanno of an immense sum of money, and deprived him of his command, appointing Hamilcar to succeed him in the command of the land army, and Hannibal in that of the fleet.

The third year, Hannibal received orders to ravage the coasts of Italy; but the Romans had taken care to post detachments in such places as were most proper to prevent his landing, so that the Carthaginians found it impossible to execute his orders. At the same time the Romans perceiving the advantages of being masters of the sea, set about building 120 galleys.—While this was doing they made themselves masters of most of the inland cities, but the Carthaginians reduced or kept feady in their interest most of the maritime ones; so that both parties were equally successful during this campaign.

The fourth year, Hannibal by a stratagem made himself master of 17 Roman galleys; after which he committed great ravages on the coast of Italy, whither he had advanced to take a view of the Roman fleet. But he was afterwards attacked in his turn, lost the greatest part of his ships, and with great difficulty made his own escape. Soon after he was totally defeated by the confiduous Dullius, with the loss of 80 ships taken, thirteen sunk, 7000 men killed, and as many taken prisoners. After this victory Dullius landed in Sicily, put himself at the head of the land forces, relieved Segesta besieged by Hamilcar, and made himself master of Macella, though defended by a numerous garrison.

The fifth year, a difference arose between the Romans and their Sicilian allies, which came to such a height, that they encamped separately. Of this Hamilcar availed himself, and attacking the Sicilians in their entrenchments, put 4000 of them to the sword. He then drove the Romans from their posts, took several cities from them, and overran the greatest part of the country. In the mean time, Hannibal, after his defeat, failed with the shattered remains of his fleet to Carthage; but in order to secure himself from punishment, he sent one of his friends with all speed, before the event of the battle was known there, to acquaint the senate, that the Romans had put to sea with a good number of heavy ill-built vessels, each of them carrying some machine, the use of which the Carthaginians did not understand; and asked, whether it was the opinion of the senate that Hannibal should attack them. These machines were the corvi, which were then newly invented, and by means of which, chiefly, Dullius had gained the victory. The senate were unanimous in their opinion, that the Romans should be attacked; upon which the messenger acquainted them with the unfortunate event of the battle. As the senators had already declared themselves for the engagement, they spared their general's life, and, according to Polybius even continued him in the command of the fleet. In a short time, being reinforced by a good number of galleys, and attended by some officers of great merit, he failed for the coast of Sardinia. He had not been long here, before he was surprized by the Romans, who carried off many of his ships, and took great numbers of his men prisoners. This so incensed the rest, that they feized their unfortunate admiral, and crucified him; but who was his immediate successor does not appear.

The sixth year, the Romans made themselves masters of the islands of Corsica and Sardinia. Hanno, who commanded the Carthaginian forces in the latter, delivered himself at a city called Olbia with incredible bravery; but being at last killed in one of the attacks, the place was surrendered, and the Romans soon became masters of the whole island.

The seventh year, the Romans took the town of Mytelae in Sicily, from whence they marched towards Camarina, but in their way were surrounded in a deep valley, and in the most imminent danger of being cut off by the Carthaginian army. In this extremity, a legatary tribune, by name M. Calpurnius, defired the general to give him 300 chosen of a legion of men, promising, with this small company, to find any tribute the enemy such employment as should oblige them to leave a passage open for the Roman army. He performed his promise with a bravery truly heroic; for, having seized, in spite of all opposition, an eminence, and entrenched himself on it, the Carthaginians, jealous of his design, flocked from all quarters to drive him from his post. But the brave tribune kept their whole army in play, till the confid taking advantage of the diversion, drew his army out of the bad situation in which he had imprudently brought it.—The legionaries were no sooner out of danger, than they hastened to the relief of their brave companions; but all they could do was to save their bodies from the in-1fults of their enemies: for they found that all dead on the spot, except Calpurnius, who lay under an heap of dead bodies, all covered with wounds, but still breathing. His wounds were immediately dressed, and it fortunately happened that none of them proved mortal; and for this glorious enterprise he received a crown of gramen. After this the Romans reduced several cities, and drove the enemy quite out of the territory of the Agrigentines; but were repulsed with great loss before Lipara.

The eighth year, Regulus, who commanded the Carthaginian fleet, observing that of the Carthaginians lying along the coast in disorder, failed with a squad of 10 galleys to observe their number and strength, or dering the rest of the fleet to follow him with all expedition. But as he drew too near the enemy, he was surrounded by a great number of Carthaginian galleys. The Romans fought with their usual bravery; but being overpowered with numbers, were obliged to yield. The confid, however, found means to make his escape, and join the rest of the fleet; and then had his full revenge of the enemy, 18 of their ships being taken, and 8 sunk.

The ninth year, the Romans made preparations for invading
CAR

65

Regulus vades Africa. Their fleet for this purpose consisted of 330 galleys, each of them having on board 120 soldiers and 350 rowers. The Carthaginian fleet consisted of 330 sail, and was much better manned than that of the Romans. The two fleets met near Ecnomus, a promontory in Sicily; where, after a bloody engagement which lasted the greater part of the day, the Carthaginians were entirely defeated, with the loss of 30 galleys sunk, and 63 taken with all their men. The Romans lost only 24 galleys, which were all sunk.—After this victory, the Romans having retaken their fleet, set sail for the coast of Africa with all expedition. The first land they got sight of was Cape Hermes, where the fleet lay at anchor for some time waiting till the galleys and transports came up. From thence they coasted along till they arrived before Ciprea, a city to the east of Carthage, where they made their first descent.

66

Carthaginians in great conformation. No words can express the consternation of the Carthaginians, on the arrival of the Romans in Africa. The inhabitants of Ciprea were so terrified, that, according to Zonaras, they abandoned the place, which the Romans immediately took possession of. Having left there a strong garrison to secure their shipping, and keep the adjacent territory in awe, they moved nearer Carthage, taking a great number of towns: they likewise plundered a prodigious number of villages, laid vast numbers of noblemen's feasts in ashes, and took above 20,000 prisoners. In short, having plundered and ravaged the whole country, almost to the gates of Carthage, they returned to Ciprea laden with the immense booty they had acquired in the expedition.

67

Success of Regulus. The tenth year, Regulus pushed on his conquests with great rapidity. To oppose his progress, Hamilcar was recalled from Sicily, and with him Bothar and Aedrural were joined in command. Hamilcar commanded an army just equal to that of Regulus. The other two commanded separate bodies, which were to join him, or act apart as occasion required. But, before they were in a condition to take the field, Regulus, purging his conquests, arrived on the banks of the Braga, a river which empties itself into the sea at a small distance from Carthage. Here he had a monstrous serpent to contend with, which, according to the accounts of those days, infected the waters of the river, poisoned the air, and killed all other animals with its breath alone. When the Romans went to draw water, this huge dragon attacked them; and, twisting itself round their bodies, either squeezed them to death or swallowed them alive. As its hard and thick scales were proof against their darts and arrows, they were forced to have recourse to the halisæ, which they made use of in the sieges to throw great stones, and to beat down the walls of besieged cities. With these they discharged showers of huge stones against this new enemy, and had the good luck, with one of them, to break his back-bone; which disabled him from twisting and winding his immense body, and by that means the Romans made use of the opportunity of approaching and dispatching him with their darts. But his dead body corrupted the air and the water of the river; and spread so great an infection over the whole country, that the Romans were obliged to decamp. We are told that Regulus sent to Rome the skin of this monster, which was 120 feet long; and that it was hung up in a temple, where it was preserved to the time of the Numantine war.

68

He kills a monstrous serpent. Having passed the river, he besieged Adir, or Adda. Defeats the not far from Carthage, which the enemy attempted to relieve; but as they lay encamped among hills and rocks, where their elephants, in which the main strength of their army consisted, could be of no use, Regulus attacked them in their camp, killed 17,000 of them, and took 5000 prisoners, and 18 elephants. Upon the fame of this victory, deputations came from all quarters, insomuch that the conqueror in a few days became master of 80 towns; among which were the city and port of Utica. This increased the alarm at Carthage; which was reduced to despair, when Regulus laid siege to Tunis, a great city about nine miles from the inhabitants; and the public magazines were soon exhausted; and, as the city was full of selfish merchants, who took advantage of the public distress, to sell provisions at an exorbitant price, a famine ensued, with all the evils which attended it.

69

And reducet Carthage. In this extremity Regulus advanced to the very gates of Carthage; and having encamped under the walls, sent deputies to treat of a peace with the senate. The deputies were received with inexpressible joy; but the conditions they proposed were such that the senate could not bear them without the greatest indignation. They were, 1. That the Carthaginians should relinquish all claims to Sardinia, Corsica, and Sicily. 2. That they should restore to the Romans all the prisoners they had taken from them since the beginning of the war. 3. That if they cared to redeem any of their own prisoners, they should pay so much a head for them as Rome should judge reasonable. 4. That they should for ever pay the Romans an annual tribute. 5. That for the future they should fit out but one man of war for their own use, and 50 triremes to serve in the Roman fleet, at the expense of Carthage, when required by any of the future conquests. These extravagant demands provoked the senators, who loudly and unanimously rejected them; the Roman deputies, however, told them that Regulus would not alter a single letter of the proposals, and that they must either conquer the Romans or obey them.

70

In this extreme distress, some mercenaries arrived from Greece, among whom was a Macedonian, by appointment named Xanthippus, a man of great valour and experience in war. This man, having informed himself of the circumstances of the late battle, declared publicly, that their overthrow was more owing to their own misconduct than to the superiority of the enemy. This discourse being spread abroad, came at last to the knowledge of the senate; and by them, and even by the desire of the Carthaginian generals themselves, Xanthippus was appointed commander in chief of their forces. His first care was to discipline his troops in a
The Romans were surprised at the sudden alteration they observed in the enemy's conduct; but Regulus, elated with his last successes, came and encamped at a small distance from the Carthaginian army in a vall plain, where their elephants and horse had room to act. The two armies were parted by a river, which Regulus boldly passed, by which means he left no room for a retreat in case of any misfortune. The engagement began with great fury; but ended in the total defeat of the Romans, who except 2000 that escaped to Clupea, were all killed or taken prisoners, and among the latter was Regulus himself. The loss of the Carthaginians scarce exceeded 800 men.

The Carthaginians remained on the field of battle till they had stripped the slain; and then entered their metropolis, which was almost the only place left them, in great triumph. They treated all their prisoners with great humanity, except Regulus; but as for him, he had so inflamed them in his prosperity, that they could not forbear showing the highest marks of their resentment. According to Zonaras and others, he and Numidia, to which the Sicans surrendered, were both taken, and paraded through the whole city, which was almost the only place left them, in triumph.

The eleventh year of this war, the Romans purposed to equip a new fleet. But their treasures being now much reduced, they were no sooner landed, than they found themselves in want of provisions, to evacuate both Clupea and Utica, and abandon Africa altogether. Being deprived of means of subsisting the end of their confulate, they were resolved to stand neutral, refused to comply with their request; telling them, that he could not without breach of fidelity assist one friend against another. However, the republic of Carthage making an effort, equipped a fleet of 100 vessels, and raised an army of 30,000 men, horse and foot, and 240 elephants, appointing Adrabil commander in chief both of the fleet and army. The Romans then finding the great advantages of a fleet, resolved to equip one not without standing all former disasters; and while the vessels were building, two consuls were chosen, men of valour and experience, to superintend the setting ones in Sicily. Metellus, however, one of the former consuls being continued with the title of procenful, found

Carthage.

82. Carthaginians utterly defeated.

Twenty thousand of the enemy were killed, and many elephants. An hundred and four elephants were taken with their leaders, and sent to Rome, where they were hunted and put to death in the circus.

83. Lilybaeum besieged by the Romans.

The 15th year, the Romans besieged Lilybaeum; and the siege continued during the rest of the first Punic war, and was the only thing remarkable that happened during that time*. The Carthaginians, on the first news of its being besieged, sent Regulus with some deputies to Rome to treat of a peace; but instead of forwarding the negotiation, he hindered it; and notwithstanding he knew the terms prepared for him at Carthage, could not be prevailed upon to stay at Rome, but returning to his enemies country, was put to a most cruel death. During this siege, the Roman fleet under Claudius Pulcher was utterly defeated by Adherbal the Carthaginian admiral. Ninety of the Roman galleys were lost in the action, 8000 of their men either killed or drowned, and 20,000 taken and sent prisoners to Carthage; and the Carthaginians gained this signal victory without the loss of a single ship, or even a single man. Another Roman fleet met a still severer fate. It consisted of 120 galleys, 800 transports, and was laden with all sorts of military stores and provisions. Every one of these vessels was lost by a storm, with all they contained, not a single plank being saved that could be used again; so that the Romans found themselves once more deprived of their whole naval force.

84. They were defeated at sea by the Carthaginians.

In the mean time, the Carthaginian forces having shown a disposition to mutiny, the senate sent over Hamilcar Barca, father of the famous Hannibal, to Sicily. He received a charter of pittance from the senate to act as he thought proper; and by his excellent conduct some revolution took place, and gave him the greatest general of his age. He defended Eryx, which he had taken by force, with such vigour, that the Romans would never have been able to make themselves masters of it, had they not fitted out a new fleet at the expense of private citizens, which, having utterly defeated that of the Carthaginians, Hamilcar, notwithstanding all his valour, was obliged to yield up the place which he had so long and so bravely defended. The following articles of peace were immediately drawn up between the two commanders. 1. The Carthaginians shall evacuate all the places which they have in Sicily, and entirely quit that island. 2. They shall, in 20 years, pay the Romans, at equal payments every year, 2000 talents of silver, that is, L. 437,250 Sterling. 3. They shall restore the Roman captives and defectors without ransom, and redeem their own prisoners with money. 4. They shall not make war upon Hiero king of Syracuse, or his allies. These articles being agreed to, Hamilcar surrendered Eryx upon condition that all his soldiers should march out with him upon his paying for each of them 18 Roman denarii. Hostages were given on both sides, and deputies were sent to Rome to procure a ratification of the treaty by the Senate. After the senators had thoroughly informed themselves of the state of affairs, two more articles were added, viz. 1. That 1000 talents should be paid immediately, and the 2200 in the space of 10 years at equal payments. 2. That the Carthaginians should quit all the little islands about Italy and Sicily, and never more come near them with ships of war, or raise mercenaries in those places. Necessity obliged Hamilcar to consent to these terms; but he returned to Carthage with an hatred to the Romans, which he did not even suffer to die with him, but transmitted to his son the great Hannibal.

The Carthaginians were no sooner got out of this bloody and expensive war, than they found themselves engaged in another which was like to have proved fatal to them. It is called by ancient historians the Libyan war, or the war with the mercenaries. The principal occasion of it was, that when Hamilcar returned to Carthage, he found the republic so much impoverished, that, far from being able to give their troops the largesses and rewards promised them, it could not pay them their arrears. He had committed the care of transporting them to one Cifeo, who, being an officer of great penetration, as though he had foreseen what would happen, did not ship them off all at once, but in small and separate parties, that those who came first might be paid off and sent home before the arrival of the rest. The Carthaginians at home, however, did not act with the same prudence. As the flate was almost entirely exhausted by the last war, and the immense sum of money, in consequence of the peace, paid to the Romans, they judged it would be a laudable action to save something to the public. They did not therefore pay off the mercenaries in proportion as they arrived, thinking it more proper to wait till they all came together, with a view of obtaining some remission of their arrears. But being too soon sensible of their wrong conduct on this occasion, by the frequent disorders these barbarians committed in the city, they with some difficulty prevailed upon the officers to take up their quarters at Sicca, and the heavy taxes imposed on them for their soldiers, subsidies, and promises to comply with their pretenions when the remainder of their troops arrived from Sicily. Here, being wholly immersed in idleness, to which they had long been strangers, a neglect of discipline ensued, and of course a peevish and licentious spirit immediately took place. They were now determined not to acquiesce in receiving their bare pay, but to insist upon the rewards Hamilcar had promised them, and even to compel the state of Carthage to comply with their demands by force of arms. The senate being informed of the mutinous disposition of the foilldiers, dispatched Hanno, one of the suffetes, to pacify them. Upon his arrival at Sicca, he expatriated largely upon the poverty of the state, and the heavy taxes with which the citizens of Carthage were loaded; and therefore, instead of anfwering their high expectations, he defired them to be satisfied with receiving part of their pay, and remit the remainder to serve the pressing exigencies of the republic. The mercenaries being highly provoked, that neither Hamilcar, nor any other of the principal officers who commanded them in Sicily, and were the best judges of their merit, made their appearance on this occasion, but Hanno, a person utterly unknown, and above all others.
Carthage, others utterly disagreeable to them, immediately had recourse to arms. Assembling therefore in a body to the number of 20,000, they advanced to Tunis, and immediately encamped before that city.

The Carthaginians being greatly alarmed at the approach of so formidable a body to Tunis, made large concessions to the mercenaries, in order to bring them back to their duty; but, far from being softened, they grew more incontinent upon these concessions, taking them for the effects of fear; and therefore were altogether averse to thoughts of accommodation. The Carthaginians, making a virtue of a necessity, showed a disposition to satisfy them in all points, and agreed to refer themselves to the opinion of some general in Sicily, which they had all along desired. Leave the choice of such commander entirely to them. Gisco was accordingly pitched upon to mediate this affair, the mercenaries believing Hamilcar to have been a principal cause of the ill treatment they met with, since he never appeared among them, and, according to the general opinion, had voluntarily resigned his commission. Gisco soon arrived at Tunis with money to pay the troops; and after conferring with the officers of the several nations apart, he harmonized them in such a manner, that a treaty was upon the point of being concluded, when Spendius and Mathos, two of the principal mutineers, occasioned a tumult in every part of the camp. Spendius was by nation a Campanian, who had been a slave at Rome, and had fled to the Carthaginians. The apprehensions he was under of being delivered to his old master, by whom he was sure to be hanged or crucified, prompted him to break off the accommodation. Mathos was an African, and free born; but as he had been active in raising the rebellion, and was well acquainted with the implacable disposition of the Carthaginians, he knew that a peace must infallibly prove his ruin. He therefore joined with Spendius, and insinuated to the Africans the danger of concluding a treaty at that juncture, which could not but leave them exposed to the rage of the Carthaginians. This forsook the Africans, who were much more numerous than the troops of any other nation, that they immediately assembled in a tumultuous manner. The foreigners soon joined them, being inspired by Spendius with an equal degree of fury. Nothing was now to be heard but the most horrid oaths and imprecations against Gisco and the Carthaginians. Whoever offered to make any remonstrance, or lend an ear to temperate counsels, was stoned to death by the enraged multitude. Nay, many persons loft their lives barely for attempting to speak, before it could be known whether they were in the interest of Spendius or the Carthaginians.

In the midst of these commotions, Gisco behaved with great firmness and intrepidity. He left no method untried to soften the officers and calm the minds of the soldiers; but the torrent of sedition was now so strong, that there was no possibility of keeping it within bounds. They therefore seized upon the military chief, dividing the money among themselves in part of their arrears, put the person of Gisco under an arrest, and treated him, as well as his attendants, with the utmost indignity. Mathos and Spendius, to destroy the remoteest hopes of an accommodation with Carthage, applauded the courage and resolution of their men, loaded the unhappy Gisco and his followers with iron, and formally declared war against the Carthaginians. All the cities of Africa united to whom they had sent deputies to exhort them to declare war, recover their liberty, soon came over to them, except Utica and Hippo Diarrhythus. By this means their army being greatly increased, they divided it into two parts, with one of which they moved towards Utica, whilst the other marched to Hippo, in order to besiege both places. The Carthaginians, in the mean time, found themselves ready to kindle under the prelude of their misfortunes. After they had been harassed 24 years by a most cruel and destructive foreign war, they entertained some hopes of enjoying repose. The citizens of Carthage drew their particular subsistence from the rents or revenues of their lands, and the public expenses from the tribute paid from Africa; all which they were not only deprived of at once, but, what was worse, had it directly turned against them. They were destitute of arms and forces either by sea or land; had made no preparations for the sustaining of a siege, or the equipping of a fleet. They suffered all the calamities incident to the most ruinous civil war; and, to complete their misery, had not the least prospect of receiving assistance from any foreign friend or ally. Notwithstanding their deplorable situation, however, they did not despond, but pursued all the measures necessary to put themselves into a posture of defence. Hanno was appointed commander in chief of all their forces; and the most arduous efforts were made, not only to repel all the attempts of the mutineers, but even to reduce them by force of arms.

In the mean time Mathos and Spendius laid siege to Utica and Hippacra at once; but as they were carried on by detachments drawn from the army for that purpose, they remained with the main body of their forces at Tunis, and thereby cut off all communication betwixt Carthage and the continent of Africa. By this means the capital was kept in a kind of blockade. The Africans likewise were harassed by perpetual alarms, advancing to the very walls of Carthage by day as well as by night, and treating with the utmost cruelty every Carthaginian that fell into their hands.

Hanno was dispatched to the relief of Utica with a They are good body of forces, 100 elephants, and a large defeated by train of battering engines. Having taken a view of the enemy, he immediately attacked their intrenchments, and, after an obstinate dispute, forced them. The mercenaries lost a vast number of men; and consequently the advantages gained by Hanno were so great, that they might have proved decisive, had he made a proper use of them. But becoming secure after his victory, and his troops being every day the more defeated in their duty, the mercenaries, having rallied their fore-ces, fell upon him, cut off many of his men, forced the ret to fly into the town, retook and plundered the camp, and seized all the provisions, military stores, &c. brought to the relief of the besieged. Nor was this the only instance of Hanno's military incapacity. Notwithstanding he lay encamped in the most advantageous manner near a town called Corza, at which place he twice overthrew the enemy, and had it in his
Hamilcar Barcas appointed to command against them.

He defeats them.

Power to have totally ruined them, he yet neglected to improve those advantages, and even suffered the mercenaries to possess themselves of the Ithmus, which joined the peninsula on which Carthage flood, to the continent of Africa.

These repeated mistakes induced the Carthaginians once more to place Hamilcar Barcas at the head of their forces. He marched against the enemy with 10,000 men, horse and foot; being all the troops the Carthaginians could then assemble for their defence; a full proof of the low fate to which they were at that time reduced. As Mathos, after he had possessed himself of the Ithmus, had posted proper detachments in two places on two hills facing the continent, and guarded the bridge over the Bagrada, which through Hannibal’s neglect he had taken, Hamilcar saw little probability of engaging him upon equal terms, or indeed of coming at him. Observing, however, that on the blowing of certain winds the mouth of the river was choaked up with sand, so as to become slip, the winds continued; he halted for some time at the river’s mouth, without communicating his design to any person. As soon as the wind favoured his intended project, he paddled the river privately by night, and immediately after his passage he drew up the troops in order of battle, and advancing into the plain where his elephants were capable of acting, moved towards Mathos, who had posted the detachment near the bridge. This daring action greatly surprised and intimidated the Africans. However, Spendius receiving intelligence of the enemy’s motions, drew a body of 10,000 men out of Mathos’s camp, with which he attended Hamilcar on one side, and ordered 15,000 from Utica to observe him on the other, thinking by this means to surround the Carthaginians, and cut them all off at one stroke. By feigning a retreat, Hamilcar found means to engage them at a disadvantage; and gave them a total overthrow, with the loss of 6000 killed and 2000 taken prisoners. The rest fled, some to the town at the bridge, and others to the rank of Utica. He did not, however, give them time to recover from their defeat, but pursued them to the town near the bridge before mentioned; which he entered without opposition, the mercenaries flying in great confusion to Tunis; and upon this many towns submitted of their own accord to the Carthaginians, whilst others were reduced by force.

Notwithstanding these disasters, Mathos pushed on the siege of Hippo with great vigour, and appointed Spendius and Autarius, commanders of the Gauls, with a strong body, to observe the motions of Hamilcar.

These two commanders, therefore, at the head of a choice detachment of 6000 men drawn out of the camp at Tunis, and 2000 Gallic horse, attended the Carthaginian general, approaching him as near as they could with safety, and keeping close to the skirts of the mountains. At last Spendius, having received a strong reinforcement of Africans and Numidians, and possesseing himself of all the heights surrounding the plain in which Hamilcar lay encamped, resolved not to let slip so favourable an opportunity of attacking him. Had a battle now ensued, Hamilcar and his army must in all probability have been cut off; but by the defection of one Naravafus, a young Numidian nobleman, with 2000 men, he found himself enabled to offer his enemies battle. The fight was obstinate and bloody; but at last the mercenaries were entirely overthrown, with the loss of 10,000 men killed and 4000 taken prisoners. All the prisoners that were willing to enrol in the Carthaginian service, Hamilcar received among his troops, supplying them with the arms of the soldiers who had fallen in the engagement. To the rest he gave full liberty to go where they pleased; upon condition that they should never for the future bear arms against the Carthaginians; informing them at the same time, however, that as many violators of this agreement as fell into his hands must expect to find no mercy.

Mathos and his associates, fearing that this affected Hamilcar might occasion a defection among the troops, thought that the best expedient would be to put them upon some action so execrable in its nature that no hopes of reconciliation might remain. By their advice, therefore, Gisco and all the Carthaginian prisoners were put to death; and when Hamilcar sent to demand the remains of his countrymen, he received for answer, that whoever presumed hereafter to come upon that errand, should meet with Gisco’s fate; after which they came to a resolution to treat with the fame barbarity all such Carthaginians as should fall into their hands. In return for this enormity, Hamilcar threw all the prisoners that fell into his hands to be devoured by wild beasts; being convinced that compasion served only to make his enemies more fierce and untractable.

The war was now carried on generally to the advantage of the Carthaginians; nevertheless, the malecontents still found themselves in a capacity to take the field with an army of 50,000 men. They watched Hamilcar’s motions; but kept on the hills, carefully avoiding to come down into the plains, on account of the Numidian horse and Carthaginian elephants. Hamilcar, being much superior in skill to any of their generals, at last fluth them up in a plot so contrived that it was impossible to get out of it. Here he kept them strictly besieged, and the mercenaries, not daring to venture a battle, began to fortify their camp and surround it with ditches and intrenchments. They were soon pressed by famine so sorely, that they were obliged to eat one another; but they were driven by desperation of their guilt, and there, Hamilcar, fore no definite terms of accommodation. At last being reduced to the utmost extremity of misery, they insinuated that Spendius, Autarius, and Zarkas, their leaders, should in person have a conference with Hamilcar, and make proposals to him. Peace was accordingly concluded upon the following terms, viz. That ten of the ringleaders of the malecontents should be left entirely to the mercy of the Carthaginians; and that the troops should all be disarmed, every man retiring only in a single coat. The treaty was no sooner concluded, than Hamilcar, by virtue of the first article, seized upon the negotiators themselves, and the army being informed that their chiefs were under arrest, had immediately recourse to arms, as suspecting they were betrayed; but Hamilcar, drawing out his army in order of battle, surrounded them, and either cut them to pieces, or freyed.
After the destruction of this army, Hamilcar invested Tunis, whither Mathos had retired with all his remaining forces. Hamilcar had another general, named Hannibal, joined in the command with him. Hannibal’s quarter was on the road leading to Carthage, and Hamilcar’s on the opposite side. The army was no sooner encamped, than Hamilcar caufed Spendius, and the rest of the prisoners, to be led out in the view of the besieged, and crucified near the walls. Mathos, however, observing that Hannibal did not keep so good a guard as he ought to have done, made a sally, attacked his quarters, killed many of his men, took several prisoners, among whom was Hannibal himself, and plundered his camp. Taking the body of Spendius from the cros, Mathos immediately substituted Hannibal, in its room; and 30 Carthaginian prisoners of distinction were crucified around him. Upon this disaffair, Hamilcar immediately decamped, and posted himself along the sea-coast, near the mouth of the river Bagrada.

The senate, though greatly terrified by this unexpected blow, omitted no means necessary for their preservation. They sent 30 envoys, with Hanno at their head, to solicit with Hamilcar about the proper measures for putting an end to this unnatural war, conjuring, in the most prefling manner, Hanno to be reconciled to Hamilcar, and to sacrifice his private resentment to the public benefit. This, with some difficulty, was effected: and the two generals came to full resolution to act in concert for the good of the public. The senate at the same time, ordered all the youth capable of bearing arms to be preffed into the service; by which means a strong reinforcement being sent to Hamilcar, he soon found himself in a condition to act offensively. He now defeated the enemy in all encounters, drew Mathos into frequent disputes, and gave him one notable over­ throw near Leptis. This reduced the rebels to the necessity of hazarding a decisive battle, which proved fatal to them. The mercenaries fled almost at the first oner; and most of their army fell in the field of battle, and in the pursuit. Mathos, with a few, escaped to a neighbouring town, where he was taken alive, carried to Carthage and executed; and then, by the reduction of the revolted cities, an end was put to this war, which from the excises of cruelty committed in it, according to Polybius, went among the Greeks by the name of the insipible war.

During the Lybian war, the Romans upon some absurd pretences, wrefted the island of Sardinia from the Carthaginians; which the latter not being able to resist, were obliged to submit to. Hamilcar finding his country not in a condition to enter into an immediate war with Rome, formed a scheme to put it on a level with that haughty republic. This was by making an entire conquest of Spain, by which means the Carthaginians might have troops capable of coping with the Romans. In order to facilitate the execution of this scheme, he inspired both his son-in-law Afdrubal, and his son Hannibal, with an implacable averterion to the Romans, as the great oppressors of his country’s grandeur. Having completed all the necessary preparations, Hamilcar, after having greatly enlarged the Carthaginian dominions in Africa, entered Spain, where he commanded nine years, during which time he subdued many warlike nations, and amassed an immense quantity of treasure, which he distributed partly amongst his troops, and partly amongst the great men at Carthage; by which means he supported his interests with these two powerful bodies. At last, he was killed in a battle, and was succeeded by his son-in-law Afdrubal. This general fully answered the expectations of his countrymen; greatly enlarged their dominions in Spain; and built the city of New Carthage, now Carthagena. He made such progress in his conquests, that the Romans began to grow jealous. They did not, however, choose at present to come to an open rupture, on account of the apprehensions they were under of an invasion from the Gauls. They judged it most proper, therefore, to have recourse to milder methods; and prevailed upon Afdrubal to conclude a new treaty with them. The articles of it were:

1. That the Carthaginians should not pass the Iberus.
2. That the Saguntines, a colony of Zacynthians, and a city situated between the Iberus and that part of Spain subject to the Carthaginians, as well as the other Greek colonies there, should enjoy their ancient rights and privileges.

Hannibal, after having governed the Carthaginian dominions in Spain for eight years, was treacherously murdered by a Gaul whom matter he had put to death. Three years before this happened, he had written to Carthage, to desire that young Hannibal, then twenty-two years of age, might be sent to him. This request was complied with, notwithstanding the opposition of Hanno; and from the first arrival of the young man in the camp, he became the darling of the whole army. The great resemblance he bore to Hamilcar, rendered him extremely agreeable to the troops. Every talent and qualification he seemed to possess that can contribute towards forming a great man. After the death of Afdrubal, he was saluted general by the army with the highest demonstrations of joy.

He immediately put himself in motion; and, in the first campaign conquered the Oscaes, a nation seated near the Iberus. The next year he subdued the Vaccaei, another nation in that neighbourhood. Soon after, the Carpoctani, one of the most powerful nations in Spain, declared against the Carthaginians. Their army consisted of 100,000 men, with which they proposed to attack Hannibal on his return from the Vaccaei; but by a stratagem they were utterly defeated, and the whole nation obliged to submit.

Nothing now remained to oppose the progress of the Carthaginian arms but the city of Saguntum. Hannibal, however, for some time, did not think proper to come to a rupture with the Romans by attacking that place. At last he found means to embroil some of the neighbouring cantons, especially the Turdetani, or, as Appian calls them, the Torbolidus, with the Saguntines, and thus furnished himself with a pretence to attack their city. Upon the commencement of the siege, the Roman senate dispatched two ambassadors to Hannibal, with orders to proceed to Carthage in case the general refused to give them satisfaction. They were scarce landed when Hannibal, who was carrying on the siege of Saguntum with great vigour,
Carthage.

 Vigour, sent them word that he had something else to do than to give audience to ambassadors. At last, however, he admitted them; and, in answer to their remonstrances, told them, that the Saguntines had drawn their misfortunes upon themselves, by committing hostilities against the allies of Carthage; and at the same time desired the deputies, if they had any complaints to make of him, to carry them to the Senate of Carthage. On their arrival in that city, they demanded that Hannibal might be delivered up to the Romans to be punished according to his deserts; and this not being complied with, war was immediately declared between the two nations.

The Saguntines are said to have defended themselves for eight months with incredible bravery. At last, however, the city was taken, and the inhabitants were treated with the utmost cruelty. After this conquest, Hannibal put his African troops into winter-quarters at New Carthage; but in order to gain their affection, he permitted the Spaniards to retire to their respective homes.

The next campaign, having taken the necessary measures for securing Africa and Spain, he passed the Pyrenees, subdued all the nations between that river and to the Pyrenees, appointed Hanno commander of all the new conquered district, and immediately began his march for Italy. Upon muttering his forces, after they had been weakened by sieges, defection, mortality, and a detachment of 10,000 foot and 1000 horse left with Hanno to support him in his new post, he found them to amount to 50,000 foot and 9000 horse, all veteran troops, and the best in the world. As they had left their heavy baggage with Hanno, and were all light armed, Hannibal easily crossed the Pyrenees; passed by Rufeino, a frontier town of the Gauls; and arrived on the banks of the Rhone without opposition. This river he passed, notwithstanding some opposition from the Gauls; and was for some time in doubt whether he should advance to engage the Romans, who, under Scipio, were bending their march that way, or continue his march for Italy. But to the latter he was soon determined by the arrival of Magillus prince of the Boii, who brought rich presents with him, and offered to conduct the Carthaginian army over the Alps. Nothing could have happened more favourable to Hannibal's affairs than the arrival of this prince, since there was no room to doubt the sincerity of his intentions. For the Boii bore an implacable enmity to the Romans, and had even come to an open rupture with them upon the first news that Italy was threatened with an invasion from the Carthaginians.

It is not known with certainty where Hannibal began to ascend the Alps. As soon as he began his march, the petty kings of the country assembled their forces in great numbers; and taking possession of the eminences over which the Carthaginians must necessarily pass, they continued harassing them, and were no sooner driven from one eminence than they feized on another, disputing every foot of land with the enemy, and destroying great numbers of them by the advantage they had of the ground. Hannibal, however, having found means to posted himself of an advantageous post, defeated and dispersed the enemy; and soon after took their capital city, where he found the prisoners, horses, &c. that had before fallen into the hands of the enemy, and likewise corn sufficient to serve the army for three days. At last, after a most fatiguing march of nine days, he arrived at the top of the mountains. Here he encamped, and halted two days, to give his wearied troops some repose, and to wait for the stragglers. As the snow was lastly fallen in great plenty, and covered the grounds as high as their toes; the Africans and Spaniards, who were much affected with the cold. In order therefore to encourage them, the Carthaginian general led them to the top of the highest rock on the side of Italy, and thence gave them a view of the large and fruitful plains of Infubria, acquainting them that the Gauls, whose country they saw, were ready to join them. He also pointed out to them the place whereabout Rome stood, telling them, that by climbing the Alps, they had scaled the walls of that rich metropolis; and having thus animated his troops, he decamped, and began to descend the mountains. The difficulties they met with in their descent were much greater than those that had occurred while they ascended. They had indeed no enemy to contend with, except some scattered parties that dared to fight; but the deep snows, the mountains of ice, craggy rocks, and frightful precipices, proved more terrible than any enemy. After they had for some days marched through narrow, steep, and slippery ways, they came at last to a place which neither elephants, horses, nor men, could pass. The way which lay between two precipices was exceeding narrow; and the declivity, which was very steep, had become more dangerous by the falling away of the earth. Here the guides stopped; and the whole army being terrified, Hannibal proposed at first to march round about, and attempt some other way; but all places round him being covered with snow, he found himself reduced to the necessity of cutting away into the rock itself, through which his men, horses, and elephants, might descend. This work was accomplished with incredible labour; and then Hannibal, having spent nine days in ascending, and six in descending, the Alps, gained at length Infubria; and, notwithstanding all the disasters he had met with by the way, entered the country with all the boldness of a conqueror.

Hannibal, on his entry into Infubria, reviewed his army, when he found that of the 50,000 foot with whom he set out from New Carthage five months and 15 days before, he had now but 20,000, and that his 9000 horse were reduced to 6000. His first care, after he entered Italy, was to refresh his troops; who after so long a march, and such inexpressible hardships, looked like as many skeletons raised from the dead, or savages born in a desert. He did not, however, suffer them to languish long in idleness; but joining the Infubrians, who were at war with the Taurinum Taurinians, laid siege to Taurinum, the only city in Taurinum. After this, he entered the country, and in three days time became master of it, putting all who resisted to the sword. This struck the neighbouring barbarians with such terror, that of their own accord they submitted to the conqueror, and supplied his army with all the supplies of provisions.

Scipio, the Roman general, in the mean time, who had gone in quest of Hannibal on the banks of the Rhone, was surprised to find his antagonist had crossed the Alps, and was already on the confines of his empire.
Carthage had the Alps and entered Italy. He therefore returned with the utmost expedition. An engagement ensued near the river Ticinus, in which the Romans were defeated. The immediate consequence was, that Carthage crossed it, and Hannibal continued his march to the banks of the Po. Here he laid two days, before he could cross that river over a bridge of boats. He then sent Mago in pursuit of the enemy, who having rallied their scattered forces, and repassed the Po, were encamped at Placentia. Afterwards having concluded a treaty with several of the Gallic cantons, he joined his brother with the rest of the army, and again offered battle to the Romans: but this they thought proper to decline; and at last the consul, being intimidated by the defection of a body of Gauls, abandoned his camp, passed the Trebia, and posted himself on an eminence near that river. Here he drew lines round his camp, and waited the arrival of his colleague with the forces from Sicily.

Hannibal, being apprised of the consul's departure, sent out the Numidian horse to harass him on his march; himself moving with the main body to support them in case of need. The Numidians arriving before the rear of the Roman army had quite passed the Trebia, put to the sword or made prisoners all the stragglers they found there. Soon after, Hannibal coming up, encamped in sight of the Roman army, on the opposite bank. Here having learned the character of the consul Sempronius lately arrived, he soon brought him to an engagement, and entirely defeated him. Ten thousand of the enemy retired to Placentia; but the rest were either killed or taken prisoners. The Carthaginians pursued the flying Romans as far as the Trebia, but did not think proper to repass that river on account of the great danger. The consul Flaminius, sent an express to Carthage with the news of the battle, named a dictator, as was their custom in times of great danger. The person they chose to this office was Fabius Maximus, surnamed Vercuvius; a man as cool and cautious as Sempronius and Flaminius were warm and impetuous. He set out with a design not to engage Hannibal, but only to watch his motions, and cut off his provisions, which he knew was the most proper way to destroy him in a country so far from his own. Accordingly he followed him through Umbria and Picenum, into the territory of Adria, and then through the territories of the Marrucini and Fanianis to Apulia. When the enemy marched, he followed them; when they encamped, he did the same; but for the most part on eminences, and at some distance from their camp, watching all their motions, cutting off their stragglers, and keeping them in a continual alarm. This cautious method of proceeding greatly disconcerted the Carthaginians, but at the same time raised discontent in his own army. But neither

these discontented, nor the ravages committed by Hannibal, could prevail on Fabius to alter his measures. The former, therefore, entered Campania, one of the finest countries of Italy. The ravages he committed there, raised such complaints in the Roman army, that the dictator, for fear of irritating his soldiers, was obliged to pretend a desire of coming to an engagement. Accordingly he followed Hannibal with more expedition than usual; but at the same time avoided, under various pretences, an engagement with more care than the enemy fought it. Hannibal finding he could not by any means bring the dictator to a battle, resolved to quit Campania, which he found abundance of more fruit and wine than corn, and to return to Samnium through the passes called Eribanus. Fabius concluding from this march that this was his design, got there before him, and encamped on Mount Callicula, which commanded the passes, after having placed several bodies in all the avenues leading to it.

Hannibal was for some time at a loss what to do; but at last contrived the following stratagem, which put to hazard nor guard against. Being encamped at the foot of Mount Callicula, he ordered Aframith to pick out of the cattle taken in the country, 2000 of the strongest and mildest oxen, to tie faggots to their horns, and to have them and the herdsmen ready without the camp. After supper, when all was quiet, the cattle were brought in good order to the hill, where Fabius had placed some Roman parties in ambush to flop up the passes. Upon a signal given, the faggots on the horns of the oxen were set on fire; and the herdsmen, supported by some battalions armed with small javelins, drove them on quietly. The Romans seeing the light of the fires, imagined that the Carthaginians were marching by torch-light. However, Fabius kept close in his camp, depending on the troops he had placed in ambush to flop up the passes. Upon a signal given, the faggots on the horns of the oxen were set on fire; and the herdsmen, supported by some battalions armed with small javelins, drove them on quietly. The Romans seeing the light of the fires, imagined that the Carthaginians were marching by torch-light. However, Fabius kept close in his camp, depending on the troops he had placed in ambush to flop up the passes. Upon a signal given, the faggots on the horns of the oxen were set on fire; and the herdsmen, supported by some battalions armed with small javelins, drove them on quietly.

Hannibal finding he could not by any means bring the dictator to a battle, resolved to quit Campania, which he found abundance of more fruit and wine than corn, and to return to Samnium through the passes called Eribanus. Fabius concluding from this march that this was his design, got there before him, and encamped on Mount Callicula, which commanded the passes, after having placed several bodies in all the avenues leading to it.

Hannibal was for some time at a loss what to do; but at last contrived the following stratagem, which put to hazard nor guard against. Being encamped at the foot of Mount Callicula, he ordered Aframith to pick out of the cattle taken in the country, 2000 of the strongest and mildest oxen, to tie faggots to their horns, and to have them and the herdsmen ready without the camp. After supper, when all was quiet, the cattle were brought in good order to the hill, where Fabius had placed some Roman parties in ambush to flop up the passes. Upon a signal given, the faggots on the horns of the oxen were set on fire; and the herdsmen, supported by some battalions armed with small javelins, drove them on quietly. The Romans seeing the light of the fires, imagined that the Carthaginians were marching by torch-light. However, Fabius kept close in his camp, depending on the troops he had placed in ambush to flop up the passes. Upon a signal given, the faggots on the horns of the oxen were set on fire; and the herdsmen, supported by some battalions armed with small javelins, drove them on quietly. The Romans seeing the light of the fires, imagined that the Carthaginians were marching by torch-light. However, Fabius kept close in his camp, depending on the troops he had placed in ambush to flop up the passes. Upon a signal given, the faggots on the horns of the oxen were set on fire; and the herdsmen, supported by some battalions armed with small javelins, drove them on quietly.

Soon after this, the dictator was recalled to Rome; and as Hannibal, notwithstanding the terrible ravages he had committed, had all along spared the lands of Fabius, the latter was suspected of holding a secret correspondence with the enemy. In his absence, Minucius, the general of the horse, gained some advantages, which greatly tended to increase the discontent with the dictator, infomuch that before his return Minucius was put upon an equal footing with himself. The general of the horse proposed that each should command his day; but the dictator chose rather to divide the army, hoping by that means to save at least a part of it. Hannibal soon found means to draw Minucius from an engagement, and, by his masterly skill in laying ambuscades, covered himself with every side, and would have been cut off with all his troops, had not Fabius hastened to his assistance, and relieved him. Then the two armies waiting, advanced in good order to renew the fight; but Hannibal, not caring to venture a second action, found a retreat, and retired to his camp; and Minucius, being ashamed of his rashness, resigned the command of the army to Fabius.

The year following, the Romans augmented their army to 87,000 men, horse and foot; and Hannibal being reduced to the greatest straits for want of provisions, resolved to leave Samnium, and penetrate into the heart of Apulia. Accordingly he decamped in the night; and by leaving fires burning, and tents standing in his camp, made the Romans believe for some time that his retreat was only feigned. When the truth was discovered, Aemilius was against pursuing him; but Terentius, contrary to the opinion of all the officers in the army, except the proconfular Servilius, was obstinately bent on following the enemy; and overtook them at Canne, till this time an obscure village in Apulia. A battle ensued in this place, as any memorable of any mention in history; in which the Romans, though almost twice as numerous to the Carthaginian army, were defeated at Cannae, being overthrown by Hannibal's cavalry in feats of rejoicing, and next day in stripping the dead bodies of the unhappy Romans: after which the victorious general invested their two camps, where he found 4000 men.

The immediate consequences of this victory, as Hannibal had foreseen, was a disposition of that part of Italy called the Old Province, Magna Graecia, Tarquinia, and part of the territory of Capua, to submit to him. The neighbouring provinces likewise discovered an inclination to shake off the Roman yoke, but wanted first to see whether Hannibal was able to protect them. His first march was into Samnium, being informed that the Hirpini and other neighboring nations were disposed to enter into an alliance with the Carthaginians. He advanced to Compsa, which opened its gates to him. In this place he left his heavy baggage, as well as the immense plunder he had acquired. After which he ordered his brother Mago, with a body of troops destined for that purpose, to profess himself all of the fortresses in Campania, the most delicious province of Italy. The humanity Hannibal had all along shown the Italian prisoners, as well as the fame of the complete victory he had lately obtained, brought to powerfully upon the Lucani, Brutii, and Apulians, that they expressed an eager desire of being taken under his protection. Nay, even the Campanians themselves, a nation more obliged to the Romans than any in Italy, except the Latins, discovered an inclination to abandon their natural friends. Of this the Carthaginian general receiving intelligence, he bent his march towards Capua, not doubting but that, by means of the popular faction there, he should easily make himself master of it; which accordingly happened. Soon after this place had made its submission, many cities of the Brutii opened their gates to Hannibal, who ordered his brother Mago to take possession of them. Mago was then dispatched to Carthage, with the important news of the victory at Cannae, and the consequences attending it. Upon his
his arrival there, he acquainted the senate, that Hannibal had defeated six Roman generals, four of whom were consuls, one dictator, and the other general of horse to the dictator; that he had engaged six consul- lars armies, killed two consuls, wounded one, and driven another out of the field with scarce 50 men to attend him; that he had routed the general of the horse, who was of equal power with the consuls; and that the dictator was esteemed the only general fit to command an army, merely because he had not the courage to engage him; and as a demonstrative proof of what he advanced, he produced, according to some authors, three halffles and a half of gold rings, taken from knights and senators who had been killed in the various engagements.

Hitherto we have seen Hannibal surprisingly victorious; and, indeed, if we consider what he had already done, we shall find his exploits superior to those of any other general, either ancient or modern. Other commanders have been celebrated for victories gained over barbarous and uncivilized nations. Alexander the Great invaded and overran the empire of Perse; but that kingdom was then funk in sloth and effeminacy, so as to be an easy conquest: but had the great commander turned his arms against the western nations, who were of a more martial disposition, it is more than probable he had not conquered so easily. Hannibal, on the other hand, lived at a time when such combinations were formed as a demonstration of what he could do. Hannibal, in the whole world. That nation he attacked with an army of only 26,000 men, without resources either for recruits, money, or provisions, except what he could procure in the enemies country. With these he had for three years resisted the Roman armies, which had been hitherto invincible by all other nations. Their armies had been commanded by generals of different temperaments, dispositions, and abilities: the losses they sustained are by the Roman writers imputed to the faults of the generals themselves; but experience had abundantly shown, that these commanders, with all their faults, were able to conquer the most warlike nations, when commanded by another than Hannibal. In the battles fought with the Romans he had destroyed 200,000 of their men, and taken 50,000 prisoners; yet from the time of the battle of Cannae, the affairs of this great man totally declined. The reason of this is, by the Roman historians, said to be, that when he put his army into winter-quarters in Capua, he so encraved himself and his army by debaucheries in that place, that he became no longer capable of coping with the Roman forces. But this seems by no means to have been the case; for the Roman historians themselves own, that, after the battle of Cannae, he gave their armies many and terrible defeats, and took a great number of towns in their sight.

The true reason of that reverse of fortune which Hannibal now experienced, was his not having sufficient resources for recruiting his army. On the first news, indeed, of his success at Carthage, a body of 4000 Numidian cavalry, 40 elephants, and 10,000 talents of silver, were granted by the senate. A large detachment of Spanish forces was also appointed to follow them; and that these last might be ready in due time, Mago set out immediately for Spain to raise 20,000 foot and 4000 horse there. Had this ample supply been sent with proper expedition, it is by no means probable that the Romans would have had any occasion to reflect upon Hannibal's conduct at Capua. That general would undoubtedly have obliged the haughty republic to submit to the superior force of his arms the next campaign. But, notwithstanding the influence of the Barcinian faction at Carthage, Hannibal and his adherents found means not only to retard the march of the supplies intended, but even to diminish their number. Mago, through the artifices of that infatuated party, could obtain an order for only 12,000 foot and 2500 horse, and even with this inconsiderable body of troops he was sent into Spain. Hannibal being thus deferred by his country, found himself obliged to act on the defensive; his army amounting to no more than 26,000 foot and 4000 horse. But though obliged to act in this manner, he was only hindered from conquering the utmost efforts of the whole Roman power not being able to drive this small army out of Italy for more than 14 years.

The Romans, though greatly reduced, were not yet exhausted. They were able to send two consuls with their regular armies into the field, fully recruited and in good order; and as neither the Gauls nor Italians were natural allies of the Carthaginians, they did not fail to abandon them on the first reverse of fortune. After the Romans had recovered from the confusion into which they were thrown by the defeat at Cannae, they chose a dictator, and recalled Marcellus, the conqueror of Syracuse, from Sicily. All the young Romans, above 17 years of age, of what rank ever, were obliged to infli in themselves; as were also those who had already served their legal time. By this means four legions and 10,000 horse were soon raised in the city. The allies of Rome, the colonies, and the municipia, furnished the contingent as usual. To these were added 8000 of the youngest and strongest slaves in the city. The republic purchased them of their masters, but did not oblige them to serve without their own consent, which they gave, by anfwering Vale, "I am willing;" whence they were called volones, to distinguish them from the other troops. As the Romans, after the loss of so many battles, had no swords, darts, or bucklers, left in their magazines, the volones were supplied with the arms which had been formerly taken from the enemy, and hung up in the public temples and porticoes. The finances of Rome were no less exhausted; but this defect was supplied by the liberality of her citizens. The senators flowing the example, were followed first by the knights, and afterwards by all the tribes, who stripping themselves of all the gold they had, brought it to the public treasury. The senators only returned their rings, and the bulk about their children's necks. As for the silver coin, it was now, for the first time, alloyed with copper, and increased in its value. Thus the finances were put into a good condition, and a competent army raised.

This was plainly the last effort the Romans could make; and could Hannibal have procured a sufficient supply of men and money to enable him to cope with this army, and to break it as he had done the others before, there could have been no more resistance made on their part. He began, however, to be in want of money;
CAR

They refuse to treat of peace.

Hei

Hannibal, who now came to the head of the Roman army, to the number of about 35,000 men, marched out of the city, under the command of the dictator, while Marcellus kept the remains of Varro's army, amounting to about 15,000 men, at Castrum, in readiness to march whenever there should be occasion.

Thus the Roman forces were still superior to those of Hannibal; and as they now saw the necessity of following the example of Fabius Maximus, no engagement of any consequence happened the first year after the battle of Cannae. Hannibal made a fruitless attempt upon Nola, expecting it would be delivered up to him; but this was prevented by Marcellus, who had entered that city, and fallying unexpectedly from three gates upon the Carthaginians, obliged them to retire in great confusion with the loss of 3000 men. This was the first advantage that had been gained by the Romans where Hannibal had commanded in person, and raised the spirits of the former not a little. They were, however, greatly dejected, on hearing that the confuls Pothinius Albinus, with his whole army, had been cut off by the Boi, as he was crossing a forest. Upon this it was resolved to draw all the Roman forces out of Gaul and other countries, and turn them against Hannibal; so that the Carthaginian flight daily more and more in need of those supplies, which yet never arrived from Carthage. He reduced, however, the cities of Nuceria, Calatium, Petelia, Centinum, Croton, Locri, and several others in Great Greece, before the Romans gained any advantage over him, except that before Nola already mentioned. The Carthaginians who had espoused the Carthaginian interest, raised an army of 14,000 of their own nation in favour of Hannibal, and put one Marius Alitus at the head of it; but he was surprized by the confuls Sempronius, who defeated and killed him with 2000 of Carthaginian men. It was now found, that Hannibal had concluded a treaty of alliance, offensive and defensive with Philip king of Macedon; but to prevent any disturbance from that quarter, a Roman army was sent to Macedon. Soon after this Marcellus defeated Hannibal in a pitched battle, having armed his men with fceptred pikes used generally at sea, and chiefly in boarding of ships; by which means the Carthaginians were pierced through, while they were totally unable to hurt their adversaries with the short javelins they carried. Marcellus pursued them close; and, before they got to their camp, killed 5000, and took 600 prisoners; losing himself about 1000 men, who were trod down by the Numidian horse, commanded by Hannibal in person. After this defeat the Carthaginian general found himself defeated by 1200 of his best horse, partly Spaniards, and partly Numidians, who had crossed the Alps with him. This touched him so sensibly, that he left Campania, and retired into Apulia.

The Romans still continued to increase their forces; and Hannibal, not having the same resources, found it impossible to act against so many armies at once. Fabius Maximus advanced into Campania, who, with Hannibal, was obliged to return in order to save Capua. He ordered Hanno, however, at the head of 17,000 foot and 1700 horse, to seize Beneventum; but he was utterly defeated, scarce 2000 of his men being left alive. Hannibal himself, in the mean time advanced to Nola, where he was again defeated by Marcellus. He now began to lose ground; the Romans retook and began Castrum, Accia in Apulia, Arpi, and Aternum; to lose ground, but the city of Tarentum was delivered up to him by its inhabitants. The Romans then entered Campania, and ravaged the whole country, threatening Capua with a siege. The inhabitants immediately acquainted Hannibal with their danger; but he was so intent upon retaining the citadel of Tarentum, that he could not be prevailed upon to come to their assistance. In the mean time Hanno was again utterly defeated by Fulvius, his camp taken, and he himself forced to fly into Bruttium with a small body of horse. The confuls then advanced with a design to besiege Capua in form. But in their way, Sempronius Gracchus, a man of great bravery, and an excellent general, was betrayed by a Lucanian and killed, which proved a very great detriment to the republic. Capua, however, was soon invested on all sides; and the besieged once more sent to Hannibal, who now came to their assistance with his horse, his light-armed infantry, and 32 elephants. He found means to inform the besieged of the time he designed to attack the Romans, in vain, ordering them to make a vigorous sally at the same time. The Roman generals, Appius and Fulvius, upon the first news of the enemy's approach, divided their troops, Appius taking upon him to make head against the garrison, and Fulvius to defend the intrenchments against Hannibal. The former found no difficulty in repulsing the garrison, and would have entered the city with them, had he not been wounded at the very gate, which prevented him from pursuing his design. Fulvius found it more difficult to withstand Hannibal, whose troops behaved themselves with extraordinary resolution. A body of Spaniards and Numidians. 
The Carthaginians had the boldness to pass the ditch, and, in spite of all opposition, climbing the ramparts, penetrated into the Roman camp; but not being properly seconded by the rest, they were all to a man cut in pieces. The Carthaginian general was so disheartened at this, especially after the garrison was repulsed, that he founded a retreat, which was made in good order. His next attempt for the relief of Capua was to march to Rome, where he hoped his approach would strike so much terror, that the armies would be called from before Capua; and that the Capuans might not be disheartened by his sudden departure, he found means to acquaint them with his design. The news of his approach caused great consternation in the metropolis. Some of the senators were for calling all the armies in Italy into the neighborhood of Rome, as thinking nothing less was able to resist the terrible Carthaginian. But Fabius told them that Hannibal's design was not to take Rome, but relieve Capua; upon which Fulvia was recalled to Rome with 15,000 foot, and 1000 horse; and thus obliged Hannibal again to retire. He then returned before Capua so suddenly that he surprised Appius in his camp, drove him out with the loss of a great number of men, and obliged him to entrench himself; on some eminences, where he expected to be soon joined by his colleague Fulvius. As Hannibal, however, now expected to have all the Roman forces upon him, he could do nothing more for the relief of Capua, which was, of consequence, obliged to submit to the Romans.

A little before the surrender of Capua, Hannibal came up with a Roman army commanded by one M. Centenius Penula, who had signalized himself on many occasions as a centurion. This rash man being introduced to the senate, had the assurance to tell them, that if they would trust him with a body of only 7000 men, he would give a good account of Hannibal. They gave him 8000, and his army was soon increased to double that number. He engaged the Carthaginians on Hannibal's first offering him battle; but after an engagement of two hours, was defeated, himself and all his men being slain, except about 1000. Soon after, having found means to draw the praetor Cneius Fulvius into an ambuscade, Hannibal cut in pieces almost his whole army, consisting of 18,000 men. In the mean time Marcellus was making great progress in Samnium. The city of Salapia was beheaded, he soon after gave the praetor Fulvius Centumales, whom he surprised and cut off, with 13,000 of his men. After this defeat, the great Marcellus advanced with his army to oppose Hannibal. Various engagements happened without any thing decisive. In one of them the Romans are said to have been defeated, and in another Hannibal; but, notwithstanding these, it was neither in the power of Marcellus, nor any other Roman general, totally to defeat or disperse the army of Hannibal in person. Nay, in the eleventh year of the war, Hannibal found means to decoy into an ambuscade, and cut off, the great Marcellus himself; the consequence of which was, that the Romans were obliged to raise the siege of Locri, with the loss of all their military engines.

Hitherto the Carthaginian, though no longer the Carthaginian affairs entirely roused to action. This was the defeat of Alcuvibul, Hannibal's brother, who had left Spain, and was marching to his assistance. He crossed the Pyrenees without any difficulty; and, as the silver mines had supplied him with a very considerable quantity of treasure, he not only prevailed upon the Gauls to grant him a passage through their territories, but likewise to furnish him with a considerable number of recruits. Meeting with many favorable circumstances to expedite his march, he arrived at Placentia sooner than the Romans, or even his brother Hannibal expected. Had he continued to use the same expedition with which he set out, and hastened to join his brother, it would have been utterly impossible to have saved Rome; but, fitting down before Placentia, he gave the Romans an opportunity of assembling all their forces to attack him. At last he was obliged to raise the siege, and began his march for Umbria. He sent a letter to acquaint his brother of his intended motion; but the messenger was intercepted; and the two confuls, joining their armies, with united forces fell upon the Carthaginians. As the latter were inferior both in numbers and resolution, they were utterly defeated, and Alcuvibul was killed. About the same time, Hannibal himself is said to have suffered several defeats, and was retired to Carthage; but, on the fatal news of his brother's defeat and death, he was filled with despair, and retired to the extremity of Brutium; where, assembling all his forces, he remained for a considerable time in a state of inaction, the Romans not daring to disturb him, so formidable did they esteem him alone, though every thing about him went to wreck, and the Carthaginian affairs seemed not far from the verge of destruction. Livy tells us, that it was difficult to determine whether his conduct was more wonderful in prosperity or in adversity. Notwithstanding which, Brutium being but a small province, and many of its inhabitants being either forced into the service, or forming themselves into parties of banditti, so that a great part of it remained uncultivated, he found it a difficult matter to subdue there, especially as no manner of supplies were sent him from Carthage. The people there were so obstinate about preferring their polemions in Spain, and as little concerned about the situation of affairs in Italy, as if Hannibal had met with an uninterrupted course of successes, and no disaster befell his since he first entered that country.

All their felicitous, however, about the affairs of Spain, was to no purpose; their generals, one after another, were defeated by the Romans. They had indeed cut off the two Scipios; but found a much more formidable enemy in the young Scipio Africanus. He overthrew them in conjunction with Mactia, king of Numidia; and the latter, thereafter, abandoned their interest. Soon after, Syphax, king of the Maedjellii, was likewise persuaded to abandon their party. Scipio also gave the Spanish Reguli a great overthrow; and reduced the cities
The obliged to deliver all the Roman fingers after for the army, and buy horses to remount the cavalry. His arrival He entered into a league with the Regulus of the army of Magnolands to Italy. He landed in Italy. The cities of New Carthage, Gades, and many other important places. At last the Carthaginians began to open their eyes when it was too late. Mago was ordered to abandon Spain, and fail with all expedition.

Mago lands to Italy. He landed on the coast of Liguria with an army of 12,000 foot and 200 horse; where he surprised Genoa, and also seized upon the town and port of Savo. A reinforcement was sent him to this place, and new levies went on very briskly in Liguria; but the opportunity was passed, and could not be recalled. Scipio having carried all before him in Spain, passed over into Africa, where he met with no enemy capable of opposing his progress. The Carthaginians then, seeing themselves on the brink of destruction, were obliged to recall their armies from Italy, in order to save their city. Mago, who had entered Infibra, was defeated by the Roman forces there; and having retreated into the maritime parts of Liguria, met a courier who brought him orders to return directly to Carthage. At the same time, Hannibal was likewise recalled. When the messengers acquainted him with the senate's pleasure, he expressed the utmost indignation and concern, groaning, gnashing his teeth, and scarce refraining from tears. Never banished man, according to Livy, showed so much regret in quitting his native country, as Hannibal did at going out of that of the enemy.

The Carthaginian general was no sooner landed in Africa, then he sent out parties to get provisions for the army, and buy horses to remount the cavalry. He entered into a league with the Regulus of the Arcadiæ, one of the Numidian tribes. Four thousand of Syphax's horse came over in a body to him; but as he did not think proper to repose any confidence in them, he put them all to the sword, and distributed their horses among his troops. Vermina, one of Syphax's sons, and Mafetulus, another Numidian prince, likewise joined him with a considerable body of horse. Most of the fortified places in Massinissa's kingdom either surrendered to him upon the first summons, or were taken by force. Narce, a city of considerable note there, he made himself master of by stratagem. Tychæus, a Numidian Regulus, and faithful ally of Syphax, whose territories were famous for an excellent breed of horses, reinforcing him also with 2000 of his best cavalry, Hannibal advanced to Zama, a town about five day's journey distant from Carthage, where he encamped. He thence sent out spies to observe the posture of the Romans. These being brought to Scipio, he was so far from inflicting any punishment upon them, which he might have done by the laws of war, that he commanded them to be led about the camp, in order to take an exact survey of it, and then dismissed them. Hannibal, admiring the noble alluriance of his rival, sent a messenger to Scipio to inquire into his interview with him; which, by means of Massinissa, he obtained. The two generals, therefore, encoraged by equal detachments of horse, met at Nadaagara, where, by the assistance of two interpreters, they held a private conference. Hannibal flattered Scipio in the most refined and arithful manner, and expatiated upon all those topics which he thought could influence that general to grant his nation a peace upon tolerable terms; amongst other things, that the Carthaginians would willingly confine themselves to Africa, since such was the will of the gods, in order to procure a lasting peace, whilst the Romans would be at liberty to extend their conquest to the remotest nations. Scipio answered, that the Romans were not prompted by ambition, or any finer views, to undertake either the former or present war against the Carthaginians; but by justice, and a proper regard for their allies. He also observed that the Carthaginians had, before his arrival in Africa, not only made him the same proposals, but likewise agreed to pay the Romans 5000 talents of silver, restore all the Roman prisoners without ransom, and deliver up all the galleys. He insisted on the perfidious conduct of the Carthaginians, who had broke a truce concluded with them; and told him, that, so far from granting them more favourable terms, they ought to expect more rigorouis ones; which if Hannibal would submit to, a peace would ensue; if not, the decision of the dispute must be left to the sword.

This conference, between two of the greatest generals of the world ever produced, ending without; Scipio, Mago and Hannibal. recalled. Hannibal's proceedings after his arrival in Africa. He has an interview with Scipio.
The peace between Carthage and Rome was scarce signed, when Masinissa unjustly made himself master of part of the Carthaginian dominions in Africa, under pretence that these formerly belonged to his family. The Carthaginians, through the villanous mediation of the Romans, found themselves under a necessity of ceding these countries to that ambitious prince, and of entering into an alliance with him. The good understanding between the two powers continued for many years afterwards; but at last Masinissa violated the treaties subsisting between him and the Carthaginian republic, and not a little contributed to its subversion.

After the conclusion of the peace, Hannibal still kept up his credit among his countrymen. He was intrusted with the command of an army against some neighbouring nations in Africa; but this being disagreeable to the Romans, he was removed from it, and rivalled to the dignity of praetor in Carthage. Here he remained for some time, reforming abuses, and putting the affairs of the republic into a better condition; but this likewise being disagreeable to the Romans, he was obliged to fly to Antiochus king of Syria. After his flight, the Romans began to look upon the Carthaginians with a suspicious eye; though, to prevent every thing of this kind, the latter had ordered two ships to pursue Hannibal, had confiscated his effects, ruled his house, and by a public decree declared him an exile. Soon after, disputes arising between the Carthaginians and Masinissa, the latter, notwithstanding the manifold iniquity of his proceedings, was supported by the Romans. That prince, grasping at further conquests, endeavoured to embroil the Carthaginians with the Romans, by ascertaining that the former had received ambassadors from Perseus king of Macedon: that the senate assemblèd in the temple of Aesculapius in the night-time in order to confer with them; and that ambassadors had been dispatched from Carthage to Perseus, in order to conclude an alliance with him. Not long after this, Masinissa made an irruption into the province of Tylica, where he soon poiffessed himself of 70, or, as Apian will have it, 50 towns and castles. This obliged the Carthaginians to apply with great importance to the Roman senate for redress, their hands being so tied up by an article in the last treaty, that they could not repel force by force, in cafe of an invasion, without their consent. Their ambassadors begged, that the Roman senate would settle once for all what dominions they were to have, that they might from thenceforth know what they had to depend upon; or if their fate had any way offended the Romans, they begged that they would punish them themselves, rather than leave them exposed to the insults and vexations of so merciless a tyrant. Then profiting themselves on the earth, they burst out into tears. But, notwithstanding the impudence their speech made, the matter was left undecided; so that Masinissa had liberty to pursue his rapines as much as he pleased. But whatever villainous disguises the Romans might have with regard to the republic of Carthage, they affected to show a great regard to the principles of justice and honour. They therefore sent Cato, a man famous for committing enormities under the specious pretence of public spirit, into Africa, to accommodate all differences between Masinissa and the Carthaginians. The latter very well knew their fate, had they submitted to such a mediation; and therefore appealed to the treaty concluded with Scipio, as the only rule by which their conduct and that of their adversary ought to be examined. This unreasonable appeal so incensed the righteous Cato, that he pronounced them a devoted people, and from that time resolved upon their destruction. For some time he was oppressed by Scipio Nasica; but the people of Carthage, knowing the Romans to be their inveterate enemies, and reflecting upon the iniquitous treatment they had met with from them ever since the commencement of their disputes with Masinissa, were under great apprehensions of a visit from them. To prevent a rupture as much as possible, by a decree of the senate, they impeached Afdrubal general of the army, and Carthalo commander of the auxiliary forces, together with their accomplices, as guilty of high treason, for being the authors of the war against the king of Numidia. They sent a deputation to Rome, to discover what sentiments were entertained there of their late conduct, and to know what satisfaction the Romans required. These messengers meeting with a cold reception, others were dispatched, who returned with the same success. This made the unhappy citizens of Carthage believe that their destruction was resolved upon; which threw them into the utmost despair. And indeed they had but too just grounds for such a melancholy apprehension, the Roman senate now discovering an inclination to fall in with Cato's measures. About the same time, the city of Utica, being the second in Africa, and famous for its immense riches, as well as its equally commodious and capacious port, submitted to the Romans. Upon the possession of so important a fortress, which, by reason of its vicinity to Carthage, might serve as a place of arms in the attack of that city, the Romans declared war against the red by the Carthaginians without the least hesitation. In consequence of this declaration, the consuls M. Manlius Nepos, and L. Marcus Censorinus, were dispatched with an army and fleet to begin hostilities with the utmost expedition. The land forces consisted of 80,000 foot and 4000 chosen horse; and the fleet of 50 quinqueremes, besides a vast number of transports. The consuls had secret orders from the senate not to conclude the operations but by the destruction of Carthage, without which, it was pretended, the republic could not but look upon all her possessions as insecure. Pursuant to the plan they had formed, the troops were first landed at Lilybaeum in Sicily, from whence, after receiving a proper refreshment, it was proposed to transport them to Utica.

The answer brought by the last ambassadors to Carthage had not a little alarmed the inhabitants of that city. But they were not yet acquainted with the resolutions taken at Rome. They therefore sent fresh ambassadors thither, whom they invested with full powers to act as they thought proper for the good of the republic, and even to submit themselves without reserve to the pleasure of the Romans. But the most sensible persons among them did not expect any great succours from this condensation, since the early
The Romans demand 300 hostages.

And all the Carthaginian arms, military machines, &c.

They command them to destroy their city.

The Carthaginians resolve to sustain a siege.

The Romans in the mean time the consuls delayed drawing near to Carthage, not doubting but the inhabitants, whom they imagined impotent to sustain a siege, would, upon cool reflection, submit; but at length, finding themselves deceived in their expectation, they came before the place and invested it. As they were still persuaded that the Carthaginians had no arms, they flattered themselves that they should easily carry the city by assault. Accordingly they approached the walls in order to plant their scaling-ladders; but the Romans, who were to their great surprize discovered a prodigious multitude of men on the ramparts, flinging in the arms they had newly made. The legionaries were terrified at this unlooked-for sight, that they drew back, and would have retired, if the consuls had not led them on to the attack: which, however, proved unsuccessful; the Romans, in spite of their utmost efforts, being obliged to give over the enterprise, and lay aside all thoughts of taking Carthage by assault. In the mean time Afdrubal, having collected from all places subject to Carthage a prodigious number of troops, came and encamped within reach of the Romans, and soon reduced them to great straits for want of provisions. As Marcus, one of the Roman consuls, was poled near a marsh, the exhalations of the stagnating waters, and the heat of the season, infected the air, and caused a general sickness among his men. Marcus, therefore, ordered his fleet to draw as near the shore as possible, in order to transport his troops to an healthier place. Asdrubal being informed of this motion, ordered all the old barks in the harbour to be filled with faggots, tow, sulphur, bitumen, and other combustible materials; and then taking advantage of the wind, which blew towards the enemy, let loose home to precipice the electors; and the Carthaginians looking upon the absence of one of the consuls to be a good omen, made a brisk fire in the night; and would have surprised the consul's camp, but Eumilanus, with some squadrons, marched out of the
gave opposite to the place where the attack was made, and, coming round, fell unexpectedly on their rear, and obliged them to return in disorder to the city.

Afrubal had posted himself under the walls of a city named Nepheris, 24 miles distant from Carthage, and situated on a high mountain, which seemed inaccessible on all sides. From thence he made incursions into the neighbouring country, intercepted the Roman convoys, fell upon their detachments sent out to forage, and even ordered parties to infilt the confular army in their camp. Hereupon the consul resolved to drive the Carthaginian from this advantageous post, and set out for Nepheris. As he drew near the hills, Afrubal suddenly appeared at the head of his army in order of battle, and fell upon the Romans with incredible fury. The confular army overthrew the attack with great resolution; and Afrubal retired in good order to his post, hoping the Romans would attack him there. But the consul being now convinced of his danger, resolved to retire. This Afrubal no sooner perceived, than he rushed down the hill, and falling upon the enemy’s rear, cut a great number of them in pieces. The whole Roman army was now saved by the bravery of Scipio Emilianus, who, with head of 300 horse, he subdued the attack of all the forces commanded by Afrubal, and covered the legions, while they passed a river in their retreat before the enemy. Then he and his companions threw themselves into the stream and swam across it. When the army had crossed the river, it was perceived that four manipuli were wanting; and soon after they were informed that they had retired to an eminence, where they resolved to fell their lives as dear as possible. Upon this news Emilianus, taking with him a chosen body of horse, and provisions for two days, crossed the river, and flew to the assistance of his countrymen. He seized an hill over against that on which the four manipuli were posted; and, after some hours repose, marched against the Carthaginians who kept them invested, fell upon them at the head of his squadron with the boldness of a man determined to conquer or die, and in spite of all opposition opened a way for his fellow-soldiers to escape. On his return to the army, his companions, who had given him over for lost, carried him to his quarters in a kind of triumph; and the manipuli he had saved gave him a crown of sprays. By these and some other exploits, Emilianus gained such reputation, that Cato, who is said never to have commended any body before, could not refuse him the praises he deferred; and is said to have foretold that Carthage would never be reduced till Scipio Emilianus was employed in that expedition.

The next year, the war in Africa fell by lot to the consuls L. Calpurnius Piso; and he continued to employ Emilianus in several important enterprises, in which he was attended with uncommon success. He took several cities; and in one of his excursions, found means to have a private conference with Phanesas, general, under Afrubal, of the Carthaginian cavalry, and brought him over, together with 2200 of his horse to the Roman interest. Under the consul Calpurnius Piso himself, however, the Roman arms were unsuccessful. He invested Clupea; but was obliged to abandon the enterprise, with the loss of a great number of men killed by the enemy in their fallacies.

From this place he went to vent his rage on a city newly built, and thence called Neapolis, which professed a strict neutrality, and had even a safeguard from the Romans. The consul, however, plundered the place, and spilt the inhabitants of all their effects. After this he laid siege to Hippogretas, which employed the Roman fleet and army the whole summer; and, on the approach of winter, the consul retired to Utica, without performing a single action worth notice during the whole campaign.

The next year Scipio Emilianus was chosen consul, and ordered to pass into Africa; and upon his arrival, the face of affairs was greatly changed. At the time of his entering the port of Utica, 3500 Romans were in great danger of being cut in pieces before Carthage. These had besieged Megalai, one of the suburbs of the city; but as they had not furnished themselves with provisions to subsist there, and could not retire, being closely invested on all sides by the enemy’s troops, the praetor Mancinus, who commanded this detachment, seeing the danger into which he had brought himself, dispatched a light boat to Utica, to acquaint the Romans there with his situation. Emilianus received this letter a few hours after his landing; and immediately flew to the relief of the besieged Romans, obliged the Carthaginians to retire within their walls, and safely conveyed his countrymen to Utica. Having then drawn together all the troops, Emilianus applied himself wholly to the siege of the capital.

His first attack was upon Megalai; which he carried by assault, the Carthaginian garrison retreating into the citadel of Byrsa. Afrubal who had commanded the Carthaginian forces in the field, and was now governor of the city, was so enraged at the losss of Megalai, that he caused all the Roman captives taken in the two years the war lasted, to be brought upon the ramparts and thrown headlong, in the sight of the Roman army, from the top of the wall; after having, with an excess of cruelty, commanded their hands and feet to be cut off, and their eyes and tongues to be torn out. He was of a temper remarkably inhuman, and it is said that he even took pleasure in seeing some of these unhappy men flayed alive. Emilianus, in the mean time was busy in drawing lines of circumvallation and contravallation across the neck of land which joined the isthmus on which Carthage stood, and by that means, all the avenues on the land-side of Carthage being shut up, the city could receive no provisions that way. His next care was to raise a mole in the sea, in order to block up the old port, and the new one being already shut up by the Roman fleet; and this great work he effected with immense labour. The mole reached from the western neck of land, of which the Romans were masters, to the entrance of the port; and was 90 feet broad at the bottom and 80 at the top. The besieged, when the Romans first began this surprising work, laughed at the attempt; but were no less alarmed than surprised, when they beheld a vast mole appearing above water, and by that means the port rendered inaccessible to ships, and quite useless. Prompted by despair, however, the Carthaginians, with incredible and most miraculous industry, dug a new basin, and cut a passage into the sea, by which they could receive the provisions that were sent them by their troops in the field. With the same diligence...
The inhabitants of the country, who could not retire on either side. The day after, the conful endeavoured to make himself master of a terrace which covered the city on the side next the sea; and on this occasion the besieged signalized themselves in a most remarkable manner. Great numbers of them, naked and unarmed, went into the water in the dead of the night, with unlighted torches in their hands; and having, partly by swimming, partly by wading, got within reach of the Roman engines, they struck fire, lighted their torches, and threw them with fury against the machines. The sudden appearance of these naked men, who looked like so many monsters started up out of the sea, so terrified the Romans who guarded the machines, that they began to retire in the utmost confusion. The conful, who commanded the detachment in person, and had continued all night at the foot of the terrace, endeavoured to stop his men, and even ordered those who fled to be killed. But the Carthaginians, perceiving the confusion the Romans were in, threw themselves upon them like so many wild beasts; and having put them to flight only with their torches, they set fire to the machines, and entirely consumed them.

This, however, did not discourage the conful: he renewed the attack a few days after, carried the terrace by assault, and lodged 4000 men upon it. As this was an important post, because it pent in Carthage on the sea-side, Emilianus took care to fortify and secure it against the sallies of the enemy; and then, winter approaching, he suspended all further attacks upon the place till the return of good weather. During the winter season, however, the conful was not inactive. The Carthaginians had a very numerous army under the command of one Diogenes, strongly encamped near Nepheus, whence convoys of provisions were sent by sea to the besieged, and brought into the new bafon. To take Nepheus, therefore, was to deprive Carthage of her chief magazine. This Emilianus undertook, and succeeded in the attempt. He first forced the enemy's entrenchments, put 70,000 of them to the sword, and made 10,000 prisoners; all the inhabitants of the country, who could not retire to Carthage, having taken refuge in this camp. After this, he laid siege to Nepheus, which was reduced in 22 days. AIdruba being disheartened by the defeat of the army, and touched with the misery of the besieged now reduced to the utmost extremity for want of provisions, offered to submit to what conditions the Romans pleased, provided the city was spared; but this was absolutely refused.

Early in the spring, Emilianus renewed the siege of Carthage; and in order to open himself a way into the city, he ordered Laelius to attempt the reduction of Cotho, a small island which divided the two ports. Emilianus himself made a sally attack on the citadel, in order to draw the enemy thither. This stratagem had the desired effect; for the citadel being a place of the greatest importance, most of the Carthaginians hastened thither, and made their utmost efforts to repulse their aggressors. But in the mean time Laelius having, with incredible expedition, built a wooden bridge over the channel which divided Cotho from the isthmus, entered the island, scaled the walls of the fortresses which the Carthaginians had built there, and made himself master of that important post. The proconsul, who was engaged before Byrsa, no sooner understood, by the loud shouts of the troops of Laelius, that he had made himself master of Cotho, than he abandoned the false attack, and unexpectedly fell on the Roman army encamped on the neighboring gate of the city, which he broke terrify.

Then he appeared with his whole army before Byrsa; which so terrified the Carthaginians, who had fled thither for refuge, that first of all 25,000 women, and then 30,000 men, came out of the gates in such a condition as moved pity. They threw themselves prostrate before the Roman general, asking no favour but life. This was readily granted, not only to them, but to all that were in Byrsa, except the Roman defitters, whose number amounted to 900. AIdruba's wife earnestly intreated her husband to suffer her to Cruelty and join the suppliants, and carry with her to the proconsul her two sons, who were as yet very young; but bal.
Afrubal's wife appeared on the roof. There Afrubal's wife spoke the following words: "I, your wife, am食べ to be spared. But in the meantime, your children shall be destroyed."

After this, Afrubal, finding them all resolved to defend themselves to the last breath, committed himself to his wife and children, after which he, in a most cowardly and mean-spirited manner, came and privately threw himself at the conqueror's feet. The Carthaginians in the citadel no longer understood that their commander had abandoned the place, than they threw open the gates, and put the Romans in possession of Byrsa. They had now no enemy to contend with but the Romans; who, being reduced to despair, retreated into the temple of Aesculapius, which was as a second temple within the first. There the proconsul attacked them; and these unhappy wretches, finding there was no way to escape, set fire to the temple. As the flames spread, they retreated from one part of the building to another, till they got to the roof. There Afrubal's wife appeared in her most beautiful attire, and having uttered the most bitter imprecations against her husband, whom the flames were now advancing on, she exclaimed: "Wretch! May heaven curse thee! Thou hast caused these disasters! Thou hast thrown thyself into the flames!"

Having thus spoken, the flames advanced so fast that Afrubal's wife was consumed. Afrubal, however, was not killed, and, with two children, he was saved. He set fire to the temple, and the flames spread to the city, which was plundered. The Romans then destroyed the city, and left it in ruins.}

Afrubal's wife then went to Rome and informed the Senate of the fate of the city. The Senate then ordered the city to be rebuilt. Afrubal was then freed from the Romans, and returned to his native country. He then built a temple in honor of the gods, and from that time on, he lived in peace and tranquility.
Carthage, to which the accent was by

fodder, &c. in depth with the foundations abovementioned, were large enough to hold tallories high, though the walls were but two: they were arched; and, in the lower part, corresponding

as to their religion, manners, &c. being much the same with the Phoenicians, of which they were a colony, the reader is referred for an account of these things to the article Phoenicia.

On the ruins of Carthage there now stands only a small village called Melcha. The few remains of Carthage consist only of some fragments of walls and 17 cisterns for the reception of rain water.

There are three eminences, which are so many mafs of fine marble pounded together, and were in all probability the sites of temples and other distinctive buildings. The present ruins are by no means the remains of the ancient city destroyed by the Romans; who after taking it entirely erased it, and plowed up the very foundations; so truly they adhered to the well-known advice perpetually inculcated by Cato the Elder, Delenda est Carthage. It was again rebuilt by the Gracchi family, who conducted a colony to repopulate it; and continually increasing in splendour, it

became at length the capital of Africa under the Roman emperors. It flourished near 700 years after its first demolition, until it was entirely destroyed by the Saracens in the beginning of the 7th century.

It is a singular circumstance that the two cities of Carthage and Rome should have been built just opposite one to the other; the bay of Tunis and the mouth of the Tiber being in a direct line.

Littora littoribus contraria, fluitibus undas,

Arma armis.

Vigo. Ed. 1. 4.

New-Carthage, Carthage,

New-Carthage, a considerable town of Mexico, in the province of Coftarica. It is a very rich, trading place. W. Long. 86. 7. N. Lat. 9. 5.

CARTHAGENA, a province of South America, and one of the most considerable in New Spain, on account of the great trade carried on by it; for the country itself is neither fertile, rich, nor populous. The capital city, called likewise Carthaginea, is situated in W. Long. 77. N. Lat. 11. on a sandy island, by most writers called a peninsula; which, forming a narrow passage on the south-west, opens a communication with that called Tierra Bomba, as far as Bocca Chica. The little island which now joins them was formerly the entrance of the bay: but it having been filled up by orders of the court, Bocca Chica became the only entrance: this, however, has been filled up since the attempt of Vernon and Wentworth, and the old passage again opened. On the north side the land is so narrow, that, before the wall was begun, the distance from sea to sea was only 35 toises; but afterwards enlarging, it forms another island on this side; so that, excepting these two places, the whole city is entirely surrounded by salt water. To the eastward it has a communication by means of a wooden bridge, with a large suburb called Xemani, built on another island, which is also joined to the continent by a bridge of the same materials. The fortifications both of the city and suburbs are built after the modern manner, and lined with freestone; and, in time of peace, the garrison consists of ten companies of 77 men each, besides militia. The city and suburbs are well laid out, the streets straight, broad, uniform, and well paved. All the houses built of stone or brick, only one story high, well contrived, neat, and adorned with balconies and lattices of wood, which is more durable in that climate than iron, the latter being soon corroded by the acrimonious quality of the atmosphere. The climate is exceedingly unhealthy. The Europeans are particularly subject to the terrible disease called the black vomit, which sweeps off multitudes annually on the arrival of the galleons. It seldom continues above three or four days; in which time the patient is either dead or out of danger, and if he recovers is never subject to a return of the same distemper.

—This disease has hitherto killed all the art of the Spanish physicians; as has also the leprosy, which is very common here. In Carthagena, likewise, that painful tumour in the legs, occasioned by the entrance of the Dracunculus or Guinea-worm, is very common and troublesome. Another disorder peculiar to this country, and to Peru, is occasioned by a little insect called Nigua, so extremely minute, as scarce to be visible to the naked eye. This insect breeds in the durt, infinuates itself into the soles of the feet and the legs, piercing the skin with such facility, that there is no
being aware of it, before it has made its way to the
spear. If it is perceived in the beginning, it is extracted
with little pain; but having once lodged its head, and
pierced the skin, the patient must undergo the pain of an
infection, without which a nodus would be formed, and
a multitude of infects ingendered, which would soon
overspread the foot and leg. One species of the nigra
is venomous; and when it enters the toe, an inflam-
matory swelling, greatly resembling a venereal bubo,
takes place in the groin.

CARTHAGENA, a sea-port town of Spain in the
kingdom of Marcia, and capital of a territory of the
same name; built by Aahribal, a Cartaginian general,
and named after Carthage. It has the chief harbour
in all Spain, but nothing else very considerable; the
bishop's see being transferred to Toledo. In 1760 it
was taken by Sir John Leake; but the Duke of
Berwick retook it afterwards. W. Long. o. 58. N. Lat.
37. 36.

CARTHAMUS, in botany: a genus of the order of
polygamaequalis, belonging to the syngeneia
clis of plants, and in the natural method ranking
under the 49th order, Composite. The calyx is ovate,
imbricated with scales, close below, and augmented
with subovate foliaceous appendices at top.—Of this genus
there are nine species; but the only remarkable one is
the foundation of a saffron-coloured flower. This
is a native of Egypt and some of the warm parts of
Africa. It is at present cultivated in many parts of Eu-
rope, and also in the Levant, from whence great quan-
tities of it are annually imported into Britain for the
purposes of dyeing and painting. It is an annual
plant, and rives with a stiff ligneous stalk, about two
feet and a half or three feet in height, dividing up-
wards into many branches, garnished with oval point-
ed leaves fitting close to the branches. The flowers
grow finge at the extremity of each branch; the heads
of the flowers are large, inclosed in a seally impalement;
each scale is broad at the base, flat, and formed like a
leaf of the plant, terminating in a sharp spine. The
lower part of the impalement spreads open; but the
scales above closely embrace the florets, which are of
a fine saffron colour, and are the part used for the
purposes abovementioned. The good quality of this
commodity is in the colour, which is of a bright saff-
ron hue: and in this the Britth carthamus very of-
ten fails; for if there happens much rain during the
time the plants are in flower, the flowers change to
a dark or dirty yellow, as they likewise do if the
flowers are gathered with any moisture remaining upon
them.—The plants are propagated by seeds, which
should be sown in drills, at two feet and a half distance
from one another, in which the seed should be scat-
tered finely. The plants will appear in leas than a
month; and in three weeks or a month after, it
will be proper to hoe the ground; at which time the plants
should be left six inches distant: after this they will
require a second hoeing; when they must be thinned
to the distance at which they are to remain. If after
this time they are hoed a third time, they will require no
farther care till they come to flower; when, on the
other hand, if the flower is intended for use, the
florets should be cut off from the flowers as they come to
perfection; but this must be performed when they are perfectly dry;
and then they should be dried in a kiln with a moder-
ate fire, in the same manner as the true saffron. But
in those flowers which are propagated for seed, the
Carthusians
florets must be cut off, or the seeds will prove aborti-
tive.—The seeds of carthamus have been celebrated as
a cathartic; but they operate very slowly, and for the
most part disorder the stomach and bowels, especially
when given in infusion: triturated with distilled aro-
matic waters, they form an emulsion less offensive, yet
inferior in efficacy to the more common purgatives.
They are eaten by a species of Egyptian parrot, which
is very fond of them; to other birds or beasts they
would prove a mortal poison.

CARTHUSIANS, a religious order founded in
the year 1085, by one Bruno. The Carthusians, so
called from the defect Carthusae, the place of their
inquisition, are remarkable for the austerity of their
rule. They are not to go out of their cells, except to
church, without leave of their superior; nor speak to
any person without leave. They must not keep any
portion of their meat or drink till next day; their beds
are of straw, covered with a felt; their clothing two
hair-cloths, two cows, two pair of hose, and a cloak,
all coarse. In the refectory, they are to keep their
eyes on the dish, their hands on the table, their atten-
tion on the reader, and their hearts fixed on God.
Women are not allowed to come into their churches.
It is computed that there are 172 houses of Carthus-
ians; whereof five are of Nuns, who practise the same
austeritys as the Monks. They are divided into 16
provinces, each of which has two visitors. There have
been several canonized saints of this order, four cardi-
inals, 70 archbishops and bishops, and a great many
very learned writers.

CARTHUSIAN Powder, the same with kermes-mineral.
See KERMES.

CARTILAGE, in anatomy, a body approaching
to the nature of bones; but lubricious, flexible, and
elastic. See ANATOMY.

CARTILAGINOUS, in ichthyology, a title given
to all fish whose muscles are supported by cartilages
instead of bones; and comprehends the same genera III. 75.
of fish to which Linnaeus has given the name of am-
phibia nantes: but the word amphibia ought properly
to be confined to such animals as inhabit both ele-
ments; and can live, without any inconvenience, for
a considerable time, either on land, or in water; such
tortoises, frogs, and several species of lizards; and,
among the quadrupeds, hippopotamis, &c. &c.
Many of the cartilaginous fish are viviparous, being
excluded from an egg, which is hatched within them.
The egg consists of a white and a yolk; and is lodged
in a case formed of a thick tough substance, not unlike
softened horn: such are the eggs of the ray and shark
kinds. Some again differ in this respect, and are ovi-
parous; such are the flurgeon, and others.

They breathe either through certain apertures be-
neath, as in the rays; on the sides, as in the flarks,
&c. or on the top of the head, as in the pipe-fish:
they have not covers to their gills like the bony
fish.

CARTMEL, a town of Lancashire in England.
It is seated among the hills called Carmel-fells, not far
from the sea, and near the river Kent; adorned with
a very handsome church, built in the form of a creos
like a cathedral. The market is well supplied with
corn, sheep, and fish. W. Long. 2. 43. N. Lat. 54. 15.

CARTON, or CARTOON, in painting, a design
drawn
drawn on strong paper, to be afterwards called through, and transferred on the freth plaster of a wall to be printed in freco. It is also used for a design coloured, for working in Mosaic, tapestry, &c. This from the Italian Cartoni, (scarti "paper," and orn "large,") denoting many sheets of paper pasted on canvas, on which large designs are made, whether coloured or with chalks only. Of these many are to be seen at Rome, particularly by Domenichino. Those by Andrea Mantegna, which are at Hampton Court, were once coloured, but the most famous performances of this sort are, printed in colour. It is also used for a design coloured, and filled with a ball of a pound weight; and sometimes it is made for the guns, being of a ball of half or quarter a pound weight, according to the nature of the gun, tied in form of a bunch of grapes, on a tampion of wood and coated over. These were made in the room of partridge-shot.

CARTRIDGE, in the military art, a case of packboard or parchment, holding the exact charge of a fire-arm. Those for muskets, carabines, and pistols, hold both the powder and ball for the charge; and those of cannon and mortars are usually in cases of packboard or tin, sometimes of wood, half a foot long, and adapted to the caliber of the piece.

CARTRIDGE-BOX, a case of wood or turned iron, covered with leather, holding a dozen musket-cartridges. It is worn upon a belt, and hangs a little lower than the right pocket-hole.

CARTWRIGHT, (William) an eminent divine and poet, born at Northway, near Tewksbury, in Gloucestershire, in September 1611. He finished his education at Oxford; afterwards went into holy orders, and became a most florid preacher in the university. In 1642, he had the place of successor in the church of Salisbury; and, in 1643, was chosen junior proctor in the university. He was also metaphysical reader there. Wit, judgment, elocution, a graceful person and behaviour, occasioned that esteem of him from dean Fell, "That he was the utmost that 'man could come to.'" He was an expert linguist; an excellent orator; and at the same time was esteemed an admirable poet. There are extant of his, four plays, and some poems. He died in 1643, aged 33.

CARGE, carvagium, the name with Carvage.

Henry III. is said to have taken carvage, that is to two marks of silver of every knight's fee, towards the marriage of his sister Isabella to the emperor. Carvage could only be imposed on the tenants in capite. Carvage also denotes a privilege whereby a man is exempted from the service of carvage.

CARUCATURUS, in ancient law books, he that held land in socage, or by plough tenure.

CARUCATE. See Carucate.

CARVER, a cutter of figures or other devices in wood. See Carving.

Carvers answer to what the Romans called sculptores, who were different from calicatores, or engravers, as these last wrought in metal.

Carver is also an officer of the table, whose business is to cut up the meat, and distribute it to the guests. The word is formed from the Latin carpitor, which signifies the same. The Romans also called him carpus, sometimes felitor, flendentis magister, and fructor.

In the great families at Rome, the carver was an officer of some figure. There were masters to teach them the art regularly, by means of figures of animals cut in wood. The Greeks also had their carvers, called dups, q. d. deribitores or distributor. In the primitive times, the master of the feast carved for all his guests. Thus in Homer, when Agamemnon's ambassadors were entertained at Achilles's table, he himself...
himself carved the meat. Of later times, the same office on solemn occasions was executed by some of the chief men of Sparta. Some derive the custom of distributing to every guest his portion, from those early ages when the Greeks first left off feeding on acorns, and learned the use of corn: The new diet was so great a delicacy, that to prevent the guests from quarrelling about it, it was found necessary to make a fair distribution.

In Scotland, the king has a hereditary carver in the family of Arranther.

CARUI, or Carvi, in botany. See Carum.

CARVING, in a general sense, the art or act of cutting or fashioning a hard body by means of some sharp instrument, especially a chisel. In this sense carving includes flatiny and engraving, as well as cutting in wood.

CARVING, in a more particular sense, is the art of engraving or cutting figures in wood. In this sense carving, according to Pliny, is prior both to statuary and painting.

To carve a figure or design, it must first be drawn or pasted on the wood; which done, the rest of the block, not covered by the lines of the design, are to be cut away with little narrow-pointed knives. The wood fitted for the use is that which is hard, tough, and close, as beech, but especially box: to prepare it for carving, it is planed smooth on the wood, and let it dry; which done, they fall to cutting or carving, as above.

CARUM, in botany: a genus of the digynia order, in the natural method ranking under the 45th order, Umbellifera. The fruit is ovate, oblong, and furrated; the petals are carinated below, and emarginated by their bodies. About the size of a myrtle berry, supplied to owe their origin to the breaking off the surface of the paper gently, till all the strokes of the figure appear distinctly. This done, they fall to cutting or carving, as above.

CARUM, in botany: a genus of the digynia order, belonging to the paeonidiæ class of plants; and in the natural method ranking under the 45th order, Umbellifera. The fruit is ovate, oblong, and furriated; the involucrum monophyllous; the petals are carinated or keel-shaped below, and emarginated by their infection.

Species, &c. 1. The carui, or caraway of the shops, grows naturally in many places of Britain. It is a biennial plant, which rises from seeds one year, flowers the next, and perishes soon after the seeds are ripe. It hath a taper root like a parsnip, but much smaller, which runs deep into the ground, sending out many small fibres, and hath a strong aromatic taste. From the root arise one or two smooth, solid, channelled flanks, about two feet high, garnished with winged leaves, having long naked foot-flanks. The hispanicum is also a biennial, and is a native of Spain. It rises with a stronger flank than the former, which seldom grows more than a foot and a half high; but is closely garnished with fine narrow leaves like those of dill. Both these plants are propagated by seeds which ought to be sown in autumn. Sheep, goats, and swine, eat this plant; cows and horses are not fond of it. Parkinson says, the young roots of cara-way are better eating than parsnips. The tender Carumula leaves may be boiled with pot herbs. The seeds have an aromatic smell, and a warm pungent taste. They are used in cakes, incrusted with sugar, as sweet-meats, and distilled with spirituous liquors, for the sake of the flavour they afford. They are in the number of the four greater hot seeds; and frequently employed, as a stomachic and carminatives, in flatulent colics and the like.

CARUNCULA, or caruncle, in anatomy, a term denoting a little piece of flesh, and applied to several parts of the human body. Thus, Caruncula Myrtiformis, in anatomy, fleshy knobs about the size of a myrtle berry, supposed to owe their origin to the breaking of the hymen. See Anatomy, n° 108.

Caruncles in the urethra, proceeding from a goitre, or an ulceration of the urethra, may be reduced by introducing the bougie.

Carus, a sudden deprivation of fenfe and motion, affecting the whole body. See (the Index subjoined to) Medicine.

Carus, (Marcus Aurelius) was raised from a low station, by his great merit, to be emperor of Rome in 282. He showed himself worthy of the empire; he subdued its enemies, and gave the Romans a prospect of happy days, when he was unfortunately killed by lightning in 284.

Carwar, a town of Asia, on the coast of Malabar in the East-Indies, and where the English East-India company have a factory, fortified with two bastions. The valleys about it abound in corn and pepper, which is the chief article of trade. The woods on the mountains abound with quadrupeds, such as bears, wolves, monkeys, wild hogs, deer, civet, and a sort of beeches of a prodigious size. The religion of the natives is Paganism; and they have a great many strange and superstitious customs. E. Long. 73. 7. N. Lat. 15. 0.

Cayrae-Ae, (Stephanus); Caryae, arum, (Pausanias) a town of Laconia, between Sparta and the borders of Messenia: where stood a temple of Diana, thence called Caryatis, idus; whose annual festival, called Caryae, arum, was celebrated by Spartan virgins with dances. An inhabitant, Caryates, and Caryatis; Caryatis apis a Laconian bee, (Stephanus.)

Caryae-arum, (anc. geog.) a place in Arcadia towards the borders of Laconia. Whether from this of Arcadia, or that of Laconia, the Columnæ Caryatis of Vitruvius and Pliny (which were statues of matrons in robes or long robes) took the appellation, is disputed.

Cary, (Lucius) Lord viscount Falkland, was born in Oxfordshire, about the year 1610; a young nobleman of great abilities and accomplishments. About the time of his father's death 1633, he was made gentleman of the privy chamber to king Charles I., and afterwards secretary of state. Before the assembling of the long parliament, he had devoted himself to literature, and every pleasure which a fine genius, a generous disposition, and an opulent fortune, could afford; when called into public life, he stood foremost in all attacks on the high prerogatives of the crown; but when civil convulsions came to an extremity, and it was necessary to choose a side, he tempered his zeal, and
and defended the limited powers that remained to monarchy. Still anxious however for his country, he seems to have dreaded equally the prosperity of the royal party, or that of the parliament; and among his intimate friends, often sadly reiterated the word peace. This excellent nobleman freely exposed his person for the king in all hazardous enterprises, and was killed in the 54th year of his age at the battle of Newberry. In Welwood's memoirs we are told, that whilst he was with the king at Oxford, his majesty went one day to see the public library, where he was shown among other books a Virgil, nobly printed, and exquisitely bound. The lord Falkland, to divert the king, would have his majesty make a trial of his fortune by the Sorres Virgiliame, an usual kind of divination in ages past, made by opening a Virgil. The king opening the book, the page which happened to come up, was that part of Dido's imprecation against Aeneas, iv. 615, &c. which is thus translated by Dryden.

"Oppress'd with numbers in the unequal field,  
His men discourage'd, and himself expell'd;  
Let him for succour sue from place to place,  
Torn from his subjects and his son's embrace," &c.

King Charles seeming concerned at this accident, the lord Falkland, who observed it, would likewise try his own fortune in the same manner; hoping he might fall upon some passage that could have no relation to his cafe, and thereby divert the king's thoughts from any impression the other might make upon him: but the place lord Falkland stumbled upon was yet more suited to his destiny than the other had been to the king's; being the following expressions of Evander, upon the untimely death of his son Pallus, Æn. xi. 152.

"O Pallas! thou hast fail'd thy plaintive word,  
To fight with caution, not to tempt the sword,  
I warn'd thee, but in vain: for well I knew  
What perils youthful ardour would pursue;  
That boiling blood would carry thee too far;  
Young as thou art in dangers, raw to war.  
O curb' thy arms, disfart'rous doom,  
Prelude of bloody fields and fights to come!"

He wrote several things, both poetical and political; and in some of the king's declarations, supposed to be penned by lord Falkland, we find the first regular definition of the English constitution that occurs in any composition published by authority. His predecessor, the first viscount Cary, was ennobled for being the first who gave king James an account of queen Elizabeth's death.

CARY, (Robert) a learned English chronologist, born in Devonshire about the year 1615. On the repossession, he was preferred to the archdeaconry of Exeter; but on some pretext was ejected in 1660, and spent the rest of his days at his rectory of Porlemouth, where he died in 1698. He published "Pala- logenia Chronica," a chronology of ancient times, in three parts, didactic, apodeictical, and canonical; and translated the hymns of the church into Latin verse.

CARYATES, in antiquity, a name of the virgins of the place. During Xerxes's invasion, the Laconians not daring to appear and celebrate the customary solemnity, to prevent incurring the anger of the gods by such an intermission, the neighbouring swains are said to have assembled and sung pastoral or bacchic, which is said to have been the origin of bacchic poetry.

CARYATIDES, or CARArites. See Architecture, no. 56.

CARYL, (Joseph) a divine of the last century, bred at Oxford, and some time preacher to the society of Lincoln's inn, an employment he filled with much applause. He became a frequent preacher before the long parliaments, a licent of their books, one of the assembly of divines, and one of the triers for the approbation of ministers; in all which capacities he shewed himself a man of considerable parts and learning, but with great zeal against the king's person and cause. On the restoration of Charles II. he was silenced by the act of uniformity, and lived privately in London, where, besides other works, he distinguished himself by a laborious Exposition of the Book of Job; and died in 1672.

CARYLL, (John) a late English poet, was of the Roman Catholic persuasion, being secretary to queen Mary the wife of James II. and one who followed the fortunes of his abdicating master; who rewarded him, first with knighthood, and then with the honorary titles of earl Caryll and baron Darford. How long he continued in that service is not known; but he was in England in the reign of queen Anne, and recommended the subject of the "Rape of the Lock" to Mr Pope, who at its publication addressed it to him. He was also the intimate friend of Pope's "Unfortunate Lady." He was the author of two plays: 1. "The English Prince, or the Death of Richard III. 1667," 4to.; 2. "Sir Salomon, or the Cautious Mermaid," 1671, 4to.; and in 1700, he published "The Psalms of David, translated from the Vulgat," 2 vols. In Tonson's edition of Ovid's Epistles, that of "Bricsis to Achilles" is said to be by Sir John Caryll; and in Nichols's Select Collection of Miscellanious Poems, vol. II. p. 1, the first Eclogue of Virgil is translated by the same ingenious poet. He was living in 1717, and at that time must have been a very old man. See three of his letters in the "Additions to Pope," vol. II. p. 114.

CAYOCAR, in botany: A genus of the teregrinia order, belonging to the polyandria class of plants. The calyx is quinquipetale, the petals five, the styles more frequently four. The fruit is a plum, with nepicles, and four furrows netted.

CAYOPHYLLÆI, in botany, the name of a very numerous family or order in Linnaeus's fragments of a natural method: containing, besides the clas of the same name in Tournefort, many other plants, which from their general appearance seem pretty nearly allied to it. The following are the genera, viz. Agrotómena, Cucubalus, Dianthus, Drypis, Gynophila, Lychinis, Saponaria, Silene, Velazia, Alfine, Arearia, Bofonia, Ceraflum, Cherleria, Glinus, Holclea, Leoflingia, Moehringia, Polycarpum, Ssina, Spargula, Stellaria, Minuartia, Mollugo, Ortega, Pharmacum, Queria. All the plants of this order are herbaceous, and
CARYOPHYLLUS, the pike, in botany. See Dianthus.

Caryophyllus, the clove-tree, in botany: A genus of the monotypia order, belonging to the polyandri class of plants; and in the natural method ranking under the 19th order, Hesperideae. The corolla is terrapetalous; the calyx tetraphyllous; the berry monomerofermous below, bicarpellate above, the receptacle of the flower. Of this there is but one species, viz. the aromaticus, which is a native of the Molucca islands, particularly of Amboyna, where it is principally cultivated. The clove-tree resembles, in its bark, the olive; and is about the height of the laurel, which it extremities alfo refembles in its leaves. No verdure is ever feen growing under the 19th order, monofpermous below when gathered, become of a deep brown. The pretty red and hard. When they arrive at this fon for gathering the cloves is from as they dry, they assume a dark yellowifh heart. Large cloths are fpread to receive them, and they are upon the tree, continue to grow till afterwards either dried in the fun or in the fmoke of meal, to make the fingers mart when handled, and the relin contained in this dafs. Their pungency proceeds from the fpice illands: but the degree of moist ure must be more carefully watched in the latter; for there a bag of cloves will, in one night's time, attract so much wa ter, that it may be prefl ed out of them by squeezing them with the hand.

The clove-tree is never cultivated in Europe. At Amboyna the company have allotted the inhabitants 4000 parcels of land, on each of which they were at firft allowed, and about the year 1720 compelled, to plant about 125 trees, amounting in all to 500,000. Each of these trees produces annually on an average more than two pounds of cloves; and confequently the collective produce must weigh more than a million. The cultivator is paid with the specie that is constantly returned to the company, and receives some unbleached cottons which are brought from Cormandel.

CARYOTA, in botany: A genus belonging to the natural order of Pultia. The male calyx is common, the corolla tripartite; the flamina very numeroso: the female calyx the fame; the corolla trirpetite; one petif, and a differmous berry.

CAS, in ancient and middle-age writers, is used to denote a cottage or house.

Cas Santa, denotes the chapel of the holy virgin at Loreto.—The Santa Casa is properly the house, or rather chamber, in which the blessed virgin is faid to have been born, where he was betrothed to her fpoufe Joseph, where the angel faunted her, the Holy Ghoft overshadowed her, and by confequence where the Son of God was conceived or incarnated. Of this building the Catholics tell many wonderful stories too childish to tranfcribe. The Santa Casa or holy chamber conſists of one room, forty-four spans long, eighteen broad, and twenty-three high. Over the chimney, in a niche, flands the image called the great Madona or Lady, four feet high, made of cedar, and, as they fay, wrought by St. Luke, who was a carver as well as a phyfician. The mantle or robe she has on, is covered with innumerable jewels of ineffable value. She has a crown, given her by Louis XIII. of France, and a little crown for her fon.

Casal, a strong town of Italy in Mountferrat, with a citadel and a bishoips. It was taken by the French from the Spaniards in 1649; and the duke of Mantua fold it to the French in 1681. In 1695 it was taken by the allies, who demolished the fortifications; but the French retook it, and fortified it again. The king of Sardinia became master of it in 1706, from whom the French took it in 1745; however, the king of Sardinia got possession again in 1746. It is fed on the river Po, in E. Long. 6. 37. N. Lat. 54. 7.

Casal-Maggiore, a small strong town of Italy, in the duchy of Milan, fed on the river Po. E. Long. 11. 5. N. Lat. 45. 6.

Casa Nova (Marc Antony) a Latin poet, born...
CASAN, a considerable town of Asia, and capital of a kingdom of the same name in the Ruffian empire, with a strong castle, a citadel, and an archbishop's see. The country about it is very fertile in all sorts of fruits, corn, and pumkes. It carries on a great trade in furs, and furnishes wood for the building of ships.

The kingdom of Casan is bounded on the north by Permia, on the east by Siberia, on the south by the river Wolga, and on the west by the province of Moscow. E. Long. 53. 25. N. Lat. 55. 28.

CASAS, (Bartolomew de la) bishop of Chiapa, distinguished for his humanity and zeal for the conversion of the Indians, was born at Seville in 1474; and went with his father, who failed to America, with Christopher Columbus in 1493. At his return to Spain he embraced the faith of a ecclesiastic, and obtained a curacy in the island of Cuba; but some time after quitted his cure in order to procure liberty for the Indians, whom he saw treated by the Spaniards in the most cruel and barbarous manner, which naturally gave them an unconquerable aversion to Christianity. Bartolomew excelled himself with extraordinary zeal, for 50 years together, in his endeavours to persuade the Spaniards that they ought to treat the Indians with equity and mildness; for which he suffered a number of perjuries from his countrymen. At last the court, moved by his continual remonstrances, made laws in favour of the Indians, and gave orders to the governors to observe them, and fee them executed. He died in Madrid in 1566, aged 92. He wrote several works, which breathed nothing but humanity and virtue. The principal of them are, 1. An account of the destruction of the Indies. 2. Several treatises in favour of the Indians, against Dr Sepulveda, who wrote a book to justify the inhuman barbarities committed by the Spaniards. 3. A very curious, and now scarce, work in Latin, on this question, "Whether kings or princes can, consistently with conscience, or in virtue of any right or title, alienate their subjects, and place them under the dominion of another sovereign?"

CASATI, (Paul) a learned Jesuit, born at Placentia in 1617, entered early among the Jesuits; and, after having taught mathematics and divinity at Rome, was sent into Sweden to labour amongst the Swedes, whom he prevailed on to embrace the popish religion. He wrote, 1. Vacuum praefcriptum. 2. Terra machinix mota. 3. Mechanicorum, libri 10. 4. De Igne Disputationes; which is much esteemed. 5. De aqua, Disputationes. 6. Hydrostatic Disputationes. 7. Optica Disputationes; which is remarkable that he wrote this treatise on optics at 88 years of age, and after he was blind. He also wrote several books in Italian.

CASAUDON, (Laas) was born at Geneva in 1559; and Henry IV. appointed him his library-keeper in 1603. After this prince's death, he went into England with Sir Henry Wotton, ambassador from King James I. where he was kindly received and engaged in writing against Baronius's annals: he died not long after this, in 1614; and was interred in Westminster-abbey, where a monument was erected to him. He was greatly skilled in the Greek and in criticism; published several valuable commentaries; and received the highest elegiums from all his cotemporaries.

CASAUDON, (Merio) son of the preceding, was born at Geneva in 1599. He was bred at Oxford, and took the degree of master of arts in 1621. The same year he published a book in defence of his father against the calumnies of certain Roman Catholics; which gained him the favours of King James I. and a considerable reputation abroad. He was made prebendary of Canterbury by archbishop Laud. In the beginning of the civil war he left all his spiritual promotions, but still continued to publish excellent works. Oliver Cromwell, then lieutenant-general of the parliament's forces, would have employed his pen in writing the history of the late war; but he declined it, owning that his subject would oblige him to make such reflections as would be ungrateful, if not injurious, to his lordship. Notwithstanding this answer, Cromwell, sensible of his worth, ordered three or four hundred pounds to be paid him by a bookseller in London whose name was Cromwell, on demand, without requiring from him any acknowledgment of his benefactor. But this offer he rejected, though his circumstances were then mean. At the same time it was proposed by his friend Mr Greaves, who belonged to the library at St James's, that, if Casaubon would gratify Cromwell in the request above-mentioned, all his father's books which were then in the royal library, having been purchased by King James, should be restored to him, and a pension of 300 l. a-year paid to the family as long as the youngest son of Dr Casaubon should live; but this also was refused. He likewise refused handsome offers from Christina queen of Sweden, being determined to spend the remainder of his life in England. At the restoration he recovered all his preferments, and continued writing till his death in 1671. He was the author of an English translation of Marcus Aurelius Antoninus's meditations, and of Lucius Florus; editions of several of the classics, with notes; a treatise of life and custom; a treatise of ethnology; with many other works; and he left a number of MSS. to the university of Oxford.

CASURINA, in botany: A genus of the monarchia order, belonging to the monocœa class of plants. The male has the calyx of the amenum; the corolla a bipartite small scale. The female has a calyx of the amenum, no corolla; the sytle bipartite.

CASCADE, a steep fall of water from a higher into a lower place. The word is French, formed from the Italian catarata, which signifies the same; of catarata, to fall; and that from the Latin cataris. Cascades are either natural, as that at Tivoli, &c. and artificial, as those of Verailles, &c. and either falling with gentle descent, as those of Sceaux; or in form of a buffet, as at Trianon; or down steps, in form of a perron, as at St. Clois; or from facade to facade, &c.

CASCAIS, a town of Estremadura in Portugal, situated at the mouth of the river Tagus, 17 miles east of Lisbon. W. Long. 10. 15. N. Lat. 38. 40.

CASCARILLA. See CLUTIA and CRETON.

CASE, among grammarians, implies the different infections.
C A S [ 2 2 2 ] C A S

indences or terminations of nouns, serving to express the different relations they bear to each other, and to the things they represent. See Grammar.

Case also denotes a receptacle for various articles; as a case of knives, of lancets, of pilots, &c.

Case, in printing, a large flat oblong frame placed sloping, divided into several compartments or little square cells; in each of which are lodged a number of types or letters of the same kind, whence the composer takes them out, each as he needs it, to compose his matter. See Printing.

Case is also used for a certain numerous quantity of divers things. Thus a case of crown-glass contains usually 24 tables, each table being nearly circular, and about three feet fix inches diameter; of Newcastle glass, 35 tables; of Normanby glass, 25.

Case-hardening of Iron, is a superficial conversion of that metal into steel, by the ordinary method of conversion, namely by cementation with vegetable or animal coals. This operation is generally practised upon small pieces of iron wrought into tools and instruments to which a superficial conversion is sufficient; and it may be performed conveniently by putting the pieces of iron to be case-hardened, together with the cement, into an iron box, which is to be closely shut and exposed to a red heat during some hours. By this cementation a certain thickness from the surface of the iron will be converted into steel, and a proper hardness may be afterwards given by sudden extinction of the heated pieces of converted iron in a cold fluid. See Steel.

Case-shot, in the military art, musket-balls, flones, old iron, &c. put into cafes, and shot out of great guns.

Case-mate, or Case-mate, in architecture, a hollow moulding, which some architects make one-sixth of a circle, and others one-fourth. Case-mate is also used in building, for a little moveable window, usually within a larger, being made to open or turn on hinges.

Case-men, in fortification, lodgings built in garrison-towns, generally near the rampart, or in the walle places of the town, for lodging soldiers of the garrison. There are usually two beds in each casern for four soldiers to lie, who mount the guard alternately; the third part being always on duty.

Caseerta, an episcopal town of Italy in the kingdom of Naples, and in the Terra di-Lavoro, with the title of a duchy, seated at the foot of a mountain of the same name, in E. Long. 15° 5'. N. Lat. 41° 5'.

Cases, (Peter-James) of Paris, the most eminent painter of the French school; the churches of Paris and of Versailles abound with his works. He died in 1754, aged 79.

Cash, in a commercial style, signifies the stock or ready money which a merchant or other person has in his present dispoal to negotiate; so called from the French term caisse, i.e. chaff or caffer for the keeping of money.

M. Savary shows that the management of the cash of a company is the most considerable article, and that wherein its good or ill success chiefly depends.

Cash-book. See Book-keeping.

Cashel, or Cashel, a town of Ireland in the county of Tipperary, and province of Munster, with an archbishop's see. The ruins of the old cathedral testify its having been an extensive as well as handsome Gothic structure, boldly towering on the celebrated rock of Cashel, which taken together form a magnificent object, and bear honourable testimony to the labour and ingenuity, as well as the piety and zeal, of its former inhabitants. It is seen at a great distance, and in many directions. Adjoining it are the ruins of the chapel of Cormac M'Culilnan, at once king and archbishop of Cashel, supposed to be the first stone building in Ireland; and feems, by its rude imitation of pillars and capitals, to have been copied after the Greek architecture, and long to have preceded that which is usually called Gothic. Cormac M'Culilnan was a prince greatly celebrated by the Irish historians for his learning, piety, and valour. He wrote, in his native language, a history of Ireland, commonly called the "Psalter of Cashel", which is still extant, and contains the most authentic account we have of the annals of the country to that period, about the year 900. On the top of the rock of Cashel, and adjoining the cathedral, is a lofty round tower, which proudly defied the too successful attempts of archbishop Price, who in this century unroofed and thereby demolished the ancient cathedral founded by St Patrick. In the choir arc the monuments of M. Magrath, archbishop of this see in the reign of Queen Elizabeth, and some other curious remains of antiquity. Cashel was formerly the royal seat and metropolis of the kings of Munster; and on the ascent to the cathedral is a large stone on which every new king of Munster was, as the inhabitants report from tradition, solemnly proclaimed. Cashel is at present but small to what we may suppose it to have been in ancient days. The archbishop's palace is a fine building. Here is a very handsome market house, a feions house, the county infirmary, a charter-school for twenty boys and the same number of girls, and a very good barrack for two companies of foot. The present archbishop Dr Agar hath finished a very elegant church begun by his predecessor, W. Long, 7. 36. N. Lat. 52° 16'.

Cashew-nut. See Anacardium.

Cashier, the cash-keeper; he who is charged with the receiving and paying the debts of a society.

Cashiers of the Bank, are officers who sign the notes that are illued out, examine and mark them when returned for payment, &c.

Cashmir, a province of Asia in the dominions of the Mogul. It is situated at the extremity of Hindoostan, northward of Lahore, and is bounded on the one side by a ridge of the great Caucasus, and on the other by the little Tartarian Thibet and Musulman. The extent of it is not very considerable; but being girt in by a zone of hills, and elevated very considerably above an arid plain, which stretches many miles around it, the fenes which it exhibits are wild and picturesque. Rivers, hills, and valleys, charmingly diversify the landscape. Here, Mr Sullivan informs us, a cascade rushes from a foaming precipice; there a tranquil stream glides placidly along; the tinkling rill too, founds amidst the groves; and the feathered choristers sing the song of love, close sheltered in the glade.
At what time Calhunire came under the dominion of the Mogul government, and how long, and in what manner it was independent, before it was annexed to the territories of the house of Timur, are points that are beyond our present purpose. Though inconsiderable as to its revenues, it was uniformly held in the highest estimation by the emperors of Hindoostan. Thither they repaired, in the plenteous of their great deeds, when the affairs of state would admit of their absence; and there they divested themselves of form and all the oppressive ceremony of state. The royal manner of travelling to Calhunire was grand, though tedious and unwieldy, and shewed, in an eminent degree, the splendid and magnificent nature of an eastern potentate. Arrangtzebe, we are told, seldom began his march to the affairs of men, besides he was on the road, which was beyond our tendants of his feraglio, and that to its revenues, it was uniformly held aerailed the defiles of all the rivers that supply the country, together with the firearms which continually pour from its mountains, enables the husbandman to cultivate with ease the soil he appropriates to agriculture; whilst the gardener's labour is amply repaid in the abundant produce of his fruit. In short, nature wears her gayest clothing in this enchanting spot. The rivers supply the inhabitants with almost every species of fish; the hills yield sweet herbage for the cattle; the plains are covered with grass of various denominations, and the woods are flored with variety of game. The Calfmireans, according to our author, seem a race distinct from all others in the East: their persons are more elegant, and their complexions more delicate and more tinged with red. They have several curious manufactures much valued in India. They are all Mahometans or Idolaters. Calhunire is the capital town.

CASIMIR, the name of several kings of Poland. See (History of) Poland.

CASIMIR, (Matthias Sorbiewski) a Polith Jesuit, born in 1597. He was a most excellent poet; and is, says M. Baillet, an exception to the general rule of Agritile and the other ancients, which teaches us to expect nothing ingenious and delightful from the Horace elixers. His odes, epodes, and epigrams, have been thought not inferior to those of the finest wits of Greece and Rome. Dr Watts has translated one or two of his small pieces, which are added to his Lyric Poems. He died at Warsaw in 1640, aged 43. There have been many editions of his poems, the best of which is that of Paris, 1759.

CASING of TIMBER-WORK, among builders, is the plastering the house all over the outside with mortar, and then flaking it while wet by a ruler, with the corner of a trowel, to make it resemble the joints of free-stone. Some direct it to be done upon heart-laths, because the mortar would, in a little time, decay the sap-laths; and to lay on the mortar in two thicknesses, viz. a second before the first is dry.

CASK, a piece of defensive armour with which to cover the head and neck; otherwise called the head-piece and helmet. The word is French, casque, from caisse, a diminutive of capis a helmet. Le Gentille observes, that anciently, in France, the gens d'armes all wore casques. The king wore a casque gilt; the dukes and counts silvered; gentlemen of extraction polished steel; and the rest plain iron.

The cask is frequently seen on ancient medals, where we may observe great varieties in the form and fashion thereof; as the Greek fashion, the Roman fashion, &c. F. Joubert makes it the most ancient of all the coverings of the head, as well as the most universal. Kings, emperors, and even gods themselves, are seen therewith. That which covers the head of Rome has usually two wings like those of Mercury: and that of some kings is furnished with horns like those of Jupiter Ammon; and sometimes barely bulls or rams horns, to express uncommon force.

CASK, in heraldry, the same with helmet. See HERALDRY, No. 45.

CASK, a vessel of capacity, for preserving liquors of divers kinds; and sometimes also dry goods, as sugar, almonds, &c. A cask of sugar is a barrel of that commodity, containing from eight to eleven hundred weight. A cask of almonds is about three hundred weight.

CASKET, in a general sense, a little cofier or cabinet. See CABINET.

CASKETS, in the iea language, are small ropes made of sinnet, and fastened to gromets, or little rings upon the yards; their use is to make fast the fall to the yard when it is to be furled.

CASLON, (William) eminent in an art of the greatest consequence to literature, the art of lettering, was born in 1609, in that part of the town of Hale Owen which is situated in Shropshire. The king justly attained the character of being the Coryphaeus in that employment, he was not brought up to the busines; and it is observed by Mr Mores, that this handy-work is so concealed among the artificers of it, that he could not discover that any one had taught it to another, but every person who had used it had learned it of his own genuine inclination. Mr Caflon served a regular apprenticeship to an engraver of ornaments on gun-barrels; and after the expiration of his term, carried on this trade in Vine-street, near the Minories. He did not, however, solely confine his ingenuity to that instrument; but employed himself likewise in making tools for the book-binders, and for the chasing of silver plate. Whilft he was engaged in this busines, the elder Mr Bowyer accidentally saw, in a bookbeller's shop, the lettering of a book uncommonly neat; and enquiring who the artist was by whom the letters were made, was hence induced to seek an acquaintance with Mr Caflon. Not long after, Mr Bowyer took Mr Caflon to Mr James's foundery, in Bartholomew-cloke. Caflon had never before that time seen any part of the busines; and being asked by his friend, if he thought he could undertake to cut types, he
he requested a single day to consider the matter, and then replied that he had no doubt but he could. Upon this answer, Mr Bowyer, Mr Bettenham and Mr Watts had such a confidence in his abilities, that they lent him £500 to begin the undertaking, and he applied himself to it with equal affiduity and success. In 1720, the society for promoting Christian knowledge, in consequence of a representation from Mr Solomon Negri, a native of Damascus in Syria, who was well skilled in the Oriental tongues, and had been professor of Arabic in places of note, deemed it expedient to print, for the use of the Eastern churches, the New Testament and Psalter in the Arabic language. These were intended for the benefit of the poor Christians in Palestine, Syria, Mesopotamia, Arabia, and Egypt, the constitution of which countries did not permit the exercise of the art of printing. Upon this occasion Mr Cahan was pitched upon to cut the font; in his specimens of which he distinguished it by the name of English Arabic. Under the farther encouragement of Mr Bowyer, Mr Bettenham, and Mr Watts, he proceeded with vigour in his employment; and he arrived at length to such perfection, that he not only freed England from the necessity of importing types from Holland, but in the beauty and elegance of those made by him he so far exceeded the productions of the best artificers, that his workmanship was frequently exported to the Continent. In this manner he became, in process of time, the most capital one that existed in that or in any other country. Having acquired opulence in the course of his employment, he was put into the commission of the peace for the county of Middlesex. Towards the latter end of his life, his eldest son being in partnership with him, he retired in a great measure from the active execution of business. His death happened in January 1766.

CASP. [224]  

Cipjan.

Caspian.

Caspian Sea, a large lake of salt water in Asia, bounded by the province of Atrakhan on the north, and by part of Persia on the south, east, and west. It is upwards of 400 miles long from north to south, and 300 broad from east to west. This sea forms several gulfs, and embraces between Atrakhan and Astrabad an incredible number of small islands. Its bottom is mud, but sometimes mixed with shells. At the distance of some German miles from land it is 500 fathoms deep; but on approaching the shore it is every where so shallow, that the smallest vessels, if loaded, are obliged to remain at a distance.

When we consider that the Caspian is inclosed on all sides by land, and that its banks are in the neighbourhood of very high mountains, we easily see why the navigation in it should be perfectly different from that in every other sea. There are certain winds that dominate over it; with such absolute sway, that vessels are often deprived of every resource; and in the whole extent of it there is not a port that can truly be called safe. The north, north-east, and east winds, blow most frequently, and occasion the most violent tempests. Along the eastern shore the east winds prevail; for which reason vessels bound from Persia to Atrakhan always direct their course along this shore.

Although the extent of the Caspian Sea is immense, the variety of its productions is exceedingly small. This undoubtedly proceeds from its want of communication with the ocean, which cannot impart to it any portion of its inexhaustible stores. But the animals which this lake nourishes multiply to such a degree, that the Russians, who alone are in condition to make them turn to account, justly consider them as a never failing source of profit and wealth. It will be understood that we speak of the fish of the Caspian and of its fisheries, which make the sole occupation and principal trade of the people inhabiting the banks of the Wolga and of the Yaik. This business is distinguished into the great and lesser fisheries. The fish comprehended under the first division, such as the flurgeon and others, abound in all parts of the Caspian as well as in the rivers that communicate with it, and which ascend at spawning-time. The small fishes, such as the salmon and many others, observe the general law of quitting the salt waters for the fresh, nor is there an instance of one of them remaining constantly in the sea.

Seals are the only quadrupeds that inhabit the Caspian; but they are there in such numbers as to afford the means of subsistence to many people in that country as well as in Greenland. The varieties of the species are numerous, diversified, however, only by the colour. Some are quite black, others quite white; there are some whith, some yellowish, some of a mouse-colour; and some streaked like a tiger. They crawl by means of their fore-feet upon the islands, where they become the prey of the common and the men who kill them with long clubs. As soon as one is dispatched, he is succeeded by several who come to the assistance of their unhappy companion, but come only to share his fate. They are exceedingly tenacious of life, and endure more than thirty hard blows before they die. They will even live for several days after having received many mortal wounds. They are most terrified by fire and smoke; and as soon as they perceive them, retreat with the utmost expedition to the sea. These animals grow to very fat, that they look rather like oil-bags than animals. At Atrakhan is made a sort of grey soup with their fat mixed with pot-sauce, which is much valued for its property of cleansing and taking grease from woolen stuffs. The greatest numbers of them are killed in spring and autumn. Many small vessels go from Atrakhan merely to catch seals.

If the Caspian has few quadrupeds, it has in proportion full fewer of those natural productions which are looked upon as proper only to the sea. There have never been found in it any zoophytes, nor any animal of the order of molusca. The fame may almost be said of shellfish; the only ones found being three or four species of cockle, the common mussel, some species of flails, and one or two others.

But to compensate this deficiency, it abounds in birds of different kinds. Of those that frequent the shores there are many species of the goose and duck kind, of the flork and heron, and many others of the wader tribe. Of birds properly aquatic, it contains the grebe, the crested dived, the pelican, the cormorant, and almost every species of gull. Crows are so fond of fish, that they haunt the shores of the Caspian in prodigious multitudes.

The waters of this lake are very impure, the great numbers of rivers that run into it, and the nature of its bottom, affecting it greatly. It is true, that in general the waters are salt; but though the whole western shore extends...
Caspian. extends from the 46th to the 33rd degree of north latitude, and though one might conclude from analogy that these waters would contain a great deal of salt, yet experiments prove the contrary: and it is certain that the saltiness of this sea is diminished by the north, north-east, and north-west winds; although we may fairly conclude, that it owes its saltiness to the mines of salt which lie along its two banks, and which are either already known or will be known to posterity. The depth of these waters also diminishes gradually as you approach the mouth of the river; and the saltiness in the same way grows less in proportion to their proximity to the land, the north winds not unfrequently causing the rivers to discharge into it vast quantities of troubled water impregnated with clay. These variations which the sea is exposed to are more or less considerable according to the nature of the winds; they affect the colour of the river waters to a certain distance from the shore, till these mixing with those of the sea, which then assume the saltiness, the fine green colour appears, which is natural to the ocean, and to which those of water that are impregnated with naphtha. It is well known, that besides its salt taste, all seawater has a sensible bitterness, which must be attributed not only to the salt itself, but to the mixture of different substances that unite with it, particularly to different sorts of alum, the ordinary effect of different combinations of acids. Besides this, the waters of the Caspian have another taste, bitter too, but quite different, which affects the tongue with an impression similar to that made by the bile of animals; a property which is peculiar to this sea, though not equally sensible at all seasons. When the north and north-west winds have raged for a considerable time, this bitter taste is sensibly felt; but when the wind has been south, very imperfectly. We shall endeavour to account for this phenomenon.

The Caspian is surrounded on its western side by the mountains of Caucasus, which extend from Derbent to the Black Sea. These mountains make a curve near Afrakhan, and directing their course towards the eastern shore of the Caspian, lose themselves near the mouth of the Jâf, where they become secondary mountains, being disposed in strata. As Caucasus is an inexhaustible magazine of combustible substances, it consequently lodges an astonishing quantity of metals in its bowels. Accordingly, along the foot of this immense chain of mountains, we sometimes meet with hot springs, sometimes springs of naphtha of different quality; sometimes we find native sulphur, mines of vitriol, or lakes heated by internal fires. Now the foot of mount Caucasus forming the immediate western shore of the Caspian Sea, it is very easy to imagine that a great quantity of the constituent parts of the former must be communicated to the latter: but it is chiefly to the naphtha, which abounds so much in the countries which surround this sea, that we must attribute the true cause of the bitterness peculiar to its waters; for it is certain that this bitumen flows from the mountains, sometimes in all its purity, and sometimes mixed with other substances which it acquires in its passage through subterranean channels, from the most inferior parts of these mountains to the sea, where it falls to the bottom by its specific gravity. It is certain too, that the north and north-west winds doth the greatest quantities of this naphtha; whence it is evident that the bitter taste must be most sensible when these winds prevail. We may also conjecture why this sea is not so strong at the surface as in the neighbourhood of the shore, the waters there being less impregnated with salt, and the naphtha which is united with the water by the salt, being then either carrried to a distance by the winds or precipitated to the bottom.

But it is not a bitter taste alone that the naphtha communicates to the waters of the Caspian: these waters were analysed by M. Gmelin, and found to contain, besides the common sea-salt, a considerable proportion of Glauber-salt, intimately united with the former, and which is evidently a production of the naphtha.

As the waters of the Caspian have no outlet, they are dischargeth by subterranean canals through the earth, where they deposit beds of salt; the surface of which corresponds with that of the sea. The two great deferts which extend from it to the exit as well as well off the banks of a fine earth, in which the salt is formed by efflorefcence into regular crystals; for which reason salt showers and dew are exceedingly common in that neighbourhood. The salt of the marshes at Afrakhan, and that found in efflorefcence in the deserts, is by no means pure sea-salt, but much debased by the bitter Glauber salt we mentioned above. In many places indeed it is found with crystals of a lozenge shape, which is peculiar to it, without any cubical appearance, the form peculiar to crystals of sea-salt.

A great deal has been written on the successive augmentation and decrease of the Caspian sea, but with little truth. There is indeed to be perceived in it a certain rise and fall of its waters; in which, however, no observation has ever discovered any regularity.

Many, suppose (and there are strong presumptions in favour of the supposition), that the shores of the Caspian were much more extensive in ancient times than they are at present, and that it once communicated with the Black Sea. It is probable too, that the level of this last sea was once much higher than it is at present. If then it be allowed, that the waters of the Black Sea, before it procured an exit by the Straits of Constaninople, rose several fathoms above their present level, which from many concuring circumstances may easily be admitted, it will follow, that all the plains, of the Crimea, of the Kuman, of the Wolga, and of the Jâf, and those of Great Tartary beyond the lake of Arat, in ancient times formed but one sea, which embraced the northern extremity of Caucasus by a narrow strait of little depth; the vellites of which are still obvious in the river Manych.
Cassander, determined to obtain their portraits, because in that branch he excelled beyond competition. The Grand Duke of Tuscany, who was an excellent judge of merit in all professions, and as liberal an encourager of it, invited Niccolò to his court; and he there painted the portraits of that prince and the princes Violante his consort. Those performances procured him uncommon applause, as well as a noble gratitude, and he was employed and carried by the principal nobility of Florence. Besides several historical subjects painted by this master while he resided in that city, one was a very capital design: The subject of it was the Conspicuity of Catiline; it consisted of nine figures as large as life, down to the knees; and the two principal figures were represented as with one hand joined in the presence of their companions, and in their other hand holding a cup of blood. Some of the English nobility on their travels sat to him for their portraits; and to paint her portrait; in which he succeeded so marks of favour and honour; but he had not the time, dying in London, universally regretted, in the 19th year of his reign.

Cassandra, in fabulous history, the daughter of Priam and Hecuba, was beloved of Apollo, who promised to bellow on her the spirit of prophecy, provided she would consent to his love. Cassandra seemed to accept the proposal; but had no sooner obtained that gift, than she laughed at the temple, and broke her word. Apollo, being enraged, avenged himself by causing no credit to be given to her predictions; hence she in vain prophesied the ruin of Troy. Ajax, the son of Oileus, having ravished her in the temple of Minerva, he was struck with thunder. She fell into the hands of Agamemnon, who loved her to distraction; but in vain did she predict that he would be assassinated in his own country. He was killed, with her, by the intrigues of Clytemnestra; but their death was avenged by Orestes.

Casano, a town of Italy in the duchy of Milan, rendered remarkable by an obstinate battle fought there between the Germans and French in 1705. It is subject to the Hous of Austria, and is seated on the river Adda. In E. Long. 10. 10. N. Lat. 45. 20. Casano, a town of Italy in Calabria citerior, in the kingdom of Naples, with a bishop's see. E. Long. 16. 20. N. Lat. 39. 55. Cassavi, or Cassada. See Jatropha.

Cassel, a town of French Flanders, and capital of a chatelany of the same name: It is seated on a mountain, where the terrace of the castle is full to be seen; and from whence there is one of the finest prospects in the world; for one may see no less than 32 towns, with a great extent of the sea, from whence it is distant 15 miles. E. Long. 2. 27. N. Lat. 50. 48. Cassel, the capital city of the landgrave of Hesse-cassel, in the circle of the Upper Rhine in Germany; (see Hesse-cassel). It is divided into the Old, New, and High towns. The New Town is built, the houses being of stone, and the streets broad. The houses of the Old Town, which is within the walls, are mostly of timber; but the streets are broad, and the market-places spacious. The place is strongly fortified, but the fortifications are not regular. It contains about 32,000 inhabitants, of whom a great proportion are French Protestants. Thence have established
CASSIA, in botany: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 33rd order, *Lomertiae.* The calyx is pentaphyllous; petals five; anther three upper, three lower; three-beaked; a legnorium plant. There are 30 species, all of them natives of warm climates. The most remarkable are:

1. The filla or purging cassia of Alexandria. It is a native of Egypt and both Indies, where it rises to the height of 40 or 50 feet, with a large trunk, divided into many branches, garnished with winged leaves, composed of five pairs of fjer-shaped lobes, which are smooth, having many transverse nerves from the midrib to the border. The flowers are produced in long spikes at the end of the branches, each standing upon a pretty long footstalk; these are composed, like the former, of fine yellow concave petals, which are succeeded by cylindrical pods from one to two feet long, with a dark brown woody shell, having a longitudinal seam on one side, divided into many cells by transverse partitions, each containing one or two oval, smooth, compressed seeds, lodged in a blackish pulp, which is used in medicine. There are two sorts of this drug in the shops; one brought from the Easft Indies, the other from the Orient; the canes or pods of the latter are generally large, rough, thick-rinded, and the pulp nauseous; those of the former are less, smoother, the pulp blacker, and of a sweeter taste; this is preferred to the other. Such pods should be choosen as are weighty, new, and do not make a rattling noise (from the seeds being loose within them) when shaken. The pulp should be of a bright shining black colour, and a sweet taste, not harsh, which happens from the fruit being gathered before it has grown fully ripe, or fouriyr, which it is apt to turn upon keeping: it should neither be very dry nor very moist, nor at all mouldy; which, from its being kept in damp cellars or moistened, in order to increase its weight, it is very subject to be. Greatest part of the pulp dissolves both in water and in rectified spirit, and may be extracted from the cane by either. The shops employ water, boiling the bruised pod therein, and afterwards evaporating the solution to a due consistence. This pulp is a gentle laxative medicine, and frequently given in a dose of some drams, in collyve habits. Some direct a dose of two ounces or more as a cathartic, in inflammatory cases, where the more acid purgatives have no place: but in these large quantities it generally nauseates the stomach, produces flatulencies, and sometimes gripings of the bowels; especially if the cassia be not of a very good kind: these effects may be prevented by the addition of aromatics, and exhibiting it in a liquid form. Geoffroy says, it does excellent service in the painful tension of the belly, which sometimes follows the imprudent use of antimoniculz; and that it may be advantageously united with the more acid purgatives, or antimonic emetics, or employed to abate their force. Vallesfreri relates that the purgative virtue of this medicine is remarkably promoted by manna; that a mixture of four drams of cassia, and two of manna, purges as much as twelve drams of cassia or thirty-two of manna alone. Severtius observes, that the urine is apt to be turned of a green colour by the use of cassia: and sometimes, where a large quantity has been taken, blackish. This drug gives name to an officinal electuary, and is an ingredient also in another.

2. The cassia fennia is a shrubby plant cultivated in Persia, Syria, and Arabia, for the leaves, which form a considerable article of commerce. They are of an oblong figure, sharp-pointed at the ends, about a quarter of an inch broad, and not a full inch in length, of a lively yellowish green colour, a faint not very disagreeable smell, and a fishescr, bitterish, nauseous taste. They are brought from the above places, dried and picked from the stalks, to Alexandria in Egypt, and thence imported into Europe. Some inferior sorts are brought from Tripoli and other places; these may easily be distinguished by their being either narrower, longer, and sharper pointed; or larger, broader, and round pointed, with small prominent veins; or large and obtuse, of a fresh green colour, without any yellow cast. Senna is a very useful cathartic, operating mildly, and yet effectually; and, if judiciously doled and managed, rarely occasioning the ill consequences which too frequently follow the exhibition of the stronger purges. The only inconveniences complained of in this drug are, its being apt to gripe, and its nauseous smell. The gripping quality depends upon a resinous substance, which, like the other bodies of this class, is naturally disposed to adhere to the coats of the intestines. The more this resin is divided by such matters as take off its tenacity, the less adhesive, and consequently the less irritating and gripping it will prove; and the less it is divided, the more gripping; hence senna given by itself, or infusions made in a very small quantity of fluid, gripe severely, and purge less than when diluted by a large portion of suitable menstruum, or divided by mixing the infusion with oily emulsions. The ill flavour of this drug is said to be abated by the addition of water-spirit; but we cannot conceive that this plant, whose smell is manifestly fecid and the taste nauseous and bitter, can at all improve those of senna; others recommend bohea tea, though neither has this any considerable effect. The smell of senna resists in its most volatile parts, and may be discharged by lightly boiling infusions of it made in water: the liquor thus freed from the peculiar flavour of the senna, may be easily rendered grateful to the taste, by the addition of any proper aromatic tincture or distilled water. The colleges both of London and Edinburgh have given several formulae for the exhibition of this article, such as those of infusion, powder, tincture, and electuary. The dose of senna in infusorion, is from a scruple to a dram; in infusion, from one to three or four drams. It has been customary to reject the peculics of the leaves of senna as of little or no use: Geoffroy however observes, that they are not much inferior in efficacy to the leaves themselves. The pods or seed vessels met with among the senna brought to us, are by the college of Brulmofer preferred to the leaves: they are less apt to gripe, but proportionately less purgative. 

CASSIA-Ligneæ. See LAURUS.
CASSIA, in botany. SCUTELARIA.
CASSIDA, in zoology, a genus of insects belonging to the class of Lepidoptera.
Plate CXVI.

CASMER, or Casmer, the name of a thin tweed woolen cloth, much in fashion for summer use.

CASSIMIRE or Cashmere. See Cashmere.

Cassine, in botany: A genus of the trigynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 23d order, Duflofæ. The calyx is quinquepartite; the petals are five; and the fruit is a triferpermous berry. There are three species, all of them natives of warm climates.

Of these the most remarkable is the yapon, which is a native of the maritime parts of Virginia and Carolina. It rises to the height of ten or twelve feet, having out branches from the ground upward, garnished with spear shaped leaves placed alternately, which continue green through the year. The flowers are produced in close whorls round the branches, at the footstalks of the leaves; they are white, and divided into five parts, almost to the bottom. The berries are of a beautiful red colour, and as they continue most part of the winter upon the plants without being touched by the birds, we may reasonably conclude that they are polldied of a poisonous quality; as few of the wholesome innocent fruits escape their depredations. The Indians, however, have a great veneration for this plant, and at certain seasons of the year come in great numbers to fetch away the leaves. On such occasions their usual custom, says Miller, is to make fire upon the ground, and, putting on it a great kettle full of water, they throw in a large quantity of yapon leaves; and when the water has boiled sufficiently, they drink large draughts of the decoction out of the kettle; which seldom fails to vomit them very feverishly. In this manner, however, they continue drinking and vomiting for three days together, until they imagine themselves sufficiently cleansed; they then gather every one a bundle of the shrub, and carry it home with them.—In the operation of these leaves by vomiting, those who have tasted of them say, that there is no nausea feintation or pain. The matter discharging comes away in a full stream by the mouth, without any violence, or so much as dispoing the patient to reach, or decline his head. The Spaniards who live near the gold mines of Peru, are frequently obliged to drink an infusion of this herb in order to moisten their breaths; without which they are liable to a sort of suffocation, from the strong metallic exhalations that are continually proceeding from the mines. In Paraguay, the Jesuits make a great revenue by importing the leaves of this plant into many countries under the name of Paraguay or South-sea tea, which is drunk in the same manner as that of China or Japan is with us. It is with difficulty preserved in England.

Cassini, Johannes Dominicus) a most excellent astronomer, born at Piedmont, in 1652. His early proficiency in astronomy procured him an invitation to be mathematical professor at Bologna when he was no more than 15 years of age; and a comet appearing in 1652, he discovered that comets were not accidental meteors, but of the same nature, and probably governed by the same laws, as the planets. In the same year he solved a problem given up by Kepler and Bullialdus as insolvable, which was, to determine geometrically the apogee and eccentricity of a planet from its true and mean place. In 1665, he was appointed inspector-general of the fortifications of the castle of Urbino, and had afterwards the care of all the rivers in the ecclesiastical state: he still however prosecuted his astronomical studies, by discovering the revolution of Mars round his own axis; and, in 1666, published his theory of Jupiter's satellites. Cassini was invited into France by Louis XIV. in 1669, where he settled as the first professor in the royal observatory. In 1672, he demonstrated the line of Jupiter's diurnal rotation; and in 1689, discovered four more satellites belonging to Saturn, Huygens having found one before. He inhabited the royal observatory at Paris more than forty years; and when he died in 1712, was succeeded by his own son James Cassini.

Cassiodorus, (Marcus Aurelius) secretary of state to Theodoric king of the Goths, was born at Squillace, in the kingdom of Naples, about the year 470. He was conful in 514, and was in great credit under the reigns of Athalaric and Vitiges; but at seventy years of age retired into a monastery in Calabria, where he amused himself in making fun-dials, water hour-glasses, and perpetual lamps. He also formed a library; and composed several works, the best edition of which is that of father Garret, printed at Rome in 1679. Those most esteemed are his Divine Institutions, and his Treatise on the Soul. He died about the year 622.

Cassiopeia, in fabulous history, wife to Cepheus king of Ethiopia, and mother of Andromeda. She thought herself more beautiful than the Nereides, who desired Neptune to revenge the affront; so that he sent a sea-monster into the country, which did much harm. To appease the god, her daughter Andromeda was exposed to the monster, but was rescued by Perseus; who obtained of Jupiter, that Cassiopeia might be placed after his death among the stars: hence the constellation of that name.

Cassiopeia, in astronomy, one of the constellations of the northern hemisphere, situated next to Cepheus. In 1672, there appeared a new star in this constellation, which first surpassed in magnitude and brightness Jupiter himself; but it diminished by degrees, and at last disappeared at the end of eighteen months. It alarmed all the astronomers of that age, many of whom wrote dissertations on it; among the rest Tycho Brahe, Kepler, Maurolycus, Lyceus, Gramineus, &c. Beza, the landgrave of Hesse, Kofa, &c. wrote to prove it a comet, and the same which appeared to the Magi at
CASSUARIO, a town of India, in Afa, situated on the river Gangas, in the province of Bengal. E. Long. 87, and N. Lat. 24. 

CAST, is peculiarly used to denote a figure or small flane of bronze. See Bronze. 

CAST, among the founders, is applied to tubes of wax fitted in divers parts of a mould of the same matter; by means of which, when the wax of the mould is removed, the melted metal is conveyed into all the parts which the wax before policed. 

CAST, also denotes a cylindrical piece of brass or copper, slit in two, lengthwise, used by the founders in foundry, to form a canal or conduit in their moulds, whereby the metal may be conveyed to the different pieces intended to be cast. 

CAST, among plumbers, denotes a little brass funnel at one end of a mould, for casting pipes without soldering, by means of which the melted metal is poured into the mould. 

CAST, or Caff, in speaking of the eastern affairs, denotes a tribe, or number of families, of the same rank and profession. The division of a nation into casts chiefly obtains in the dominions of the Great Mogul, kingdom of Bengal, island of Ceylon, and the great peninsula opposite thereto. In each of these there are, according to father Martin, four principal casts, viz. the cast of the baniins, which is the first and most noble; the cast of the rajas, or princes, who pretend to be defended from divers royal families; the cast of the choutres, which comprehends all the artificers; and that of the parias, the lowest and most contemptible of all: though Henry Lord, it must be observed, divides the Indians about Surat into four casts, somewhat differently from Martin, viz. into brahins, or priests; cuttay, or soldiers; shuddary, which we call baniins, or merchants; and wafe, the mechanics or artificers. Every art and trade is confined to its proper cast, nor is allowed to be exercised by any but those whose fathers professed the same. So that a tailor's son can never rise to be a painter, nor a painter's son fall to be a tailor; though there are some employments that are proper to all the casts, e.g. every body may be a soldier, or a merchant. There are also divers casts which are allowed to till the ground, but not all. The cast of parias is held infamous, so much so that it is a disgrace to have any dealings or conversation with them; and there are some trades in the cast of choutres, which debase their professors almost to the same rank. Thus shoemakers, and all artificers in leather, as also fishermen, and even shepherds, are reputed no better than parias. 

CASTAGNO, (Andrea Dal) historical painter, was born at a small village called Castagno, belonging to the territory of Tuscany, in 1469; and being deprived of his parents, was employed by his uncle to attend the herds of cattle in the fields; but, having accidentally seen an ordinary painter at work in the country, he obtained him for some time with surprize and attention, and afterwards made such efforts to imitate him, as astonished all who saw his productions. The extraordinary genius of Andrea became at last a common topic of discourse in Florence; and so far excited the curiosity of Bernardetto de Medici, that he sent for Andrea; and perceiving that he had promising talents, he placed him under the care of the best
CASTALIO, (Sebastian), was born at Chezillon, on the Rhone, in the year 1515. Calvin conceived such an esteem and friendship for him, during the stay he made at Strasbourg in 1540 and 1541, that he lodged him some days at his house, and procured him a regent's place in the college of Geneva. Castalio, after continuing in this office near three years, was forced to quit it in the year 1544, on account of some particular opinions which he held concerning Solomon's song, and Christ's descent into hell. He retired to Basel, where he made Greek professor, and died in that place in 1564, aged 48. He incurred the high displeasure of Calvin and Theodore Beza, for differing with them concerning predestination and the punishment of heretics. His works are very considerable both on account of their quality and number. In 1545, he printed at Basel four books of dialogues, containing the principal histories of the Bible in elegant Latin; so that youth might thereby make a proficiency in piety and in the Latin tongue at the same time. But his principal work is a Latin and French translation of the scriptures. He began the Latin translation at Geneva in 1542, and finished it at Basel in 1550. It was printed at Basel in 1551, and dedicated by the author to Edward VI. king of England. The French version was dedicated to Henry II. of France, and printed at Basel in 1555. The fault which has been most generally condemned in his Latin translation, is the affectation of using only classical terms.

CASTALENAS, CASTAGNETTES, or CASTANET-TAS, a kind of musical instrument, wherewith the Moors, Spaniards, and Bohemians, accompany their dances, farands, and guitars. It consists of two little round pieces of wood dried, and hollowed in manner of a spoon, the concavities whereof are placed on one another, fastened to the thumb, and beat from time to time with the middle finger, to direct their motion and cadences. The castanets may be beat either nine times in the space of one measure, or four times of a minute.

CASTANOVITZ, a town of Croatia, situated on the river Una, which divides Chriftendom from Turkey. E. Long. 17° 20'. N. Lat. 45° 40'. It is subject to the Houfe of Aultra.

CASTEL, (Lewis Betrand), a learned Jesuit, was born at Monpeller in 1688, and entered among the Jesuits in 1702. He studied polite literature in his youth; and at length applied himself entirely to the study of mathematics and natural philosophy. He distinguished himself by writing on gravity; the mathematics; and on the music of colours, a very whimsical idea, which he took great pains to reduce to practice. His piece on gravity, entitled Traité de la Penfateur universelle, was printed at Paris, in 1724. He afterwards published his Mathematique universelle; which occasioned his being unanimously chosen a fellow of the Royal Society of London, without the least solicitation. He was also a member of the academies of Bourdeaux and Rouen; but his Clefus oculaire made the most noise; and he spent much time and expence in making an harpsichord for the eye, but without success. He also wrote for and against Sir Isaac Newton, and published several other works; the principal of which are, Le Plan de l'Artabesque, and a treatise entitled Optique de Couleur. He led a very exemplary life, and died in 1757.

CASTELAMARA, a town of Italy, in the kingdom of Naples, and in the lither Principato, with a bishop's see and a good harbour. E. Long. 14° 25'. N. Lat. 41° 40'.

CASTEL-ARAGONESE, a strong town of Italy, in the island of Sardinia, with a bishop's see, and a good harbour. It is seated on the N.W. coast of the island, in E. Long. 8° 57'. N. Lat. 40° 56'.

CASTEL-BONDE, a town of Portugal, and capital of the province of Beira; seated on the river Lym, 32 miles N.W. of Alcantara. W. Long. 8° 0'. N. Lat. 39° 35'.

CASTEL-FOLIAT, a very small, but well-fortified frontier town of the Bolognese, in Italy, belonging to the Pope.

CASTEL-de-VIDE, a small strong town of Alentejo. It was taken by Philip V. W. Long. 6° 25'. N. Lat. 39° 15'.

CASTEL-FOLIAT, a town of Spain, in Catalonia, seated on an inaccessible eminence, between Gironne and Campredon,
CASTEL, (Bernard) an Italian painter, was born at Genoa, in 1557; and excelled in colouring and in portraits. He was the intimate friend of Tasso, and took upon himself the task of designing and etching the figures of his Jerusalem Delivered. He died at Genoa in 1629.

Valerio Castelli, one of his sons, was born at Genoa in 1625, and surpassed his father. He particularly excelled in painting battles; which he composed with spirit, and executed with so pleasing a variety, and so great freedom of hand, as gained him universal applause. His horses are admirably drawn, thrown into attitudes that are natural and becoming, full of motion, action, and life. In that style of painting he showed all the fire of Tintoretto, united with the fine taste of composition of Paolo Veronese. He died in 1659. The works of this master are not very frequent; but they are deservedly held in very high esteem. It is believed that a greater number of his easel pictures are in the collections of the nobility and gentry of England, than in any other part of Europe.

CASTELLORUM OPERATIO, castle-work, or service and labour done by inferior tenants for the building and upholding of castles of defence; towards which some gave personal assistance, and others paid their contributions. This was one of the three necessary charges to which all lands among the Anglo-Saxons were expressly subject.

CASTELVETRO, (Lewis) a native of Modena, of the 16th century, famous for his Comment on Ariosto’s Poetics. He was prosecuted by the inquisition for a certain book of Melanthon, which he had translated into Italian. He retired to Baill, where he died.

CASTIGATION, among the Romans, the punishment of an offender by blows, or beating with a wand or switch. Castigation was chiefly a military punishment; the power of inflicting which on the foldiery was given to the tribunes. Some make it of two kinds; one is called flagellation; the other with rods, called flagellatio: the latter was the most dishonourable.

CASTIGATORY for SCOLDS. A woman indicted for being a common scold, if convicted, shall be placed in a certain engine of correction, called the trebucke, castigator, or cucking-flood; which, in the Saxon language, signifies the folding-flood; though now it is frequently corrupted into the ducking-flood; because the residue of the judgment is, that, when she is placed therein, she shall be plunged in water for her punishment.

CASTIGLIONE, (Giovanni Benedetto) a celebrated painter, was born at Genoa in 1616. His first master was Gio-Battista Paggi. Afterwards he studied under Andrea Ferrari; and lastly perfected himself from the instructions of Anthony Van Dyke, who at that time resided at Genoa. He painted portraits, historical pieces, landscapes, and castles: in the latter of which he is said chiefly to have excelled; as also in fairs, markets, and all kinds of rural scenes. By this master we have also a great number of etchings, which are all spirited, free, and full of taste. The effect is, in general, powerful and pleasing; and many of them have a more harmonized and finished appearance, than is usual from the
CASTILGIONI, the point, to little assisted by the graver. His drawing of the naked figure, though by no means correct, is notwithstanding managed in a style that indicates the hand of the master.

His son, Francesco, was bred under himself, and excelled in the same subjects; and it is thought that many good paintings which are ascribed to Benedetto, and a fresco that has been seen at Palma, or in modern collections, are copies after his by his son Francesco, or perhaps originals of the younger Castiglione.

CASTIGLIONE, a small, but strong town of Italy, in Mantua, with a castle. It was taken by the Germans in 1701, and the French defeated the Imperialists near it in 1706. E. Long. 10. 29. N. Lat. 43° 23'.

CASTIGLIONI, (Balthazar) an eminent Italian nobleman, descended from an illustrious and ancient family, and born at his own villa at Calémino in the duchy of Milan in 1478. He studied painting, sculpture, and architecture, as appears from a book he wrote in favour of these arts; and excelled so much in these that Raphael Urbino, and Buonaroti, though incomparable artists, never thought their works complete without the approbation of Count Castiglione. When he was 26 years of age, Guido Ubaldo, Duke of Urbino, sent him ambassador to Pope Julius II. He was sent upon a second embassy to Louis XII. of France, and upon a third to Henry VII. of England. After he had dispatched his business here, he returned, and began his celebrated work intitled the Courrier; which he completed at Rome in 1516. This work is full of moral and political instruction; and if we seek for the Italian tongue in perfection, it is said to be no where better found than in this performance. A version of this work, together with the original Italian, was published at London in 1727, by A. P. Castiglione, a gentleman of the family, who resided there under the patronage of Dr Gibson bishop of London. Count Castiglione was sent by Clement VII. to the court of the Emperor Charles V. in quality of legate, and died at Toledo in 1529.

CASTILE, (New) or THE KINGDOM OF TOLEDO, a province of Spain, bounded on the north by Old Castile, on the east by the kingdoms of Aragon and Valencia, on the south by that of Murcia and Andalusia, and on the west by the kingdom of Leon. It is divided into three parts; Aragon to the north, Mancha to the east, and Sierra to the south. Madrid is the capital. Both these provinces are very well watered with rivers, and the air is generally pure and healthy; but the land is mountainous, dry, and uncultivated, through the laziness of the inhabitants. The north part produces fruits and wine, and the south good pithers and fine wool. These provinces are divided by a long chain of mountains, which run from east to west.

CASTLE, (Old) a province of Spain, with the title of a kingdom. It is about 192 miles in length, and 115 in breadth; bounded on the south by New Castile, on the east by Aragon and Navarre, on the north by Biscay and Atbara, and on the west by the kingdom of Leon and Galicia. Castille de Oro, a large and fertile country in South America, lying to the west of Oroonoko. It comprehends eight governments; viz. Terra Firma,
Casting. calt or mold thus formed may be taken off from the subject entire.

When the model or original subject is of a round or erect form, a different method must be pursued; and the mold must be divided into several pieces: or, if the subject consists of detached and projecting parts, it is frequently most expedient to cast such parts separately, and afterwards join them together.

Where the original subject or mold forms a round, or spherial, or any part of such round or spherial, more than one half the plaster must be used without any frame to keep it round the model; and must be tempered with water to such a consistence, that it may be wrought with the hand like very soft paste; but though it must not be so fluid as when prepared for flat figured models, it must yet be as moist as is compatible with its cohering sufficiently to hold together; and being thus prepared, it must be put upon the model, and compreded with the hand, or any flat instrument, that the parts of it may adapt themselves in the most perfect manner, to those of the subject, as well as be compact with respect to themselves. When the model is so covered to a convenient thickness, the whole must be left at rest till the plaster be set and firm, so as to bear dividing without falling to pieces, or being liable to pull out of its form by flight violence; and it must then be divided into pieces, in order to its being taken off from the model, by cutting it with a knife with a very thin blade; and being divided, must be cautiously taken off, and kept till dry; but it must be always carefully observed, before the separation of the parts be made, to snatch them crofs the joints, or lines of the division, at proper distances, that they may with safety and certainty be properly conjoined again; which would be much more precarious and troublesome without such directive marks. The art of properly dividing the molds, in order to make them separate from the model, requires more dexterity and skill than any other thing in the art of casting; and does not admit of rules for the most advantageous conduct of it in every case. Where the subject is of a round or spherial form, it is best to divide the mold into three parts, which will then easily come off from the model; and the same will hold good of a cylinder, or any regular curve figure.

The mold being thus formed, and dry, and the parts put together, it must be first greased, and placed in such a position that the hollow may lie upwards, and then filled with plaster mixed with water, in the same proportion and manner as was directed for the casting the mold; and when the cast is perfectly set and dry, it must be taken out of the mold, and repaired where it is necessary; which finishes the operation.

This is all that is required with respect to subjects where the surfaces have the regularity abovementioned: but where they form curves which intersect each other, the conduct of the operation must be varied with respect to the manner of taking the cast of the mold from off the subject or model; and where there are long projecting parts, such as legs or arms, they should be wrought in separate casts. The operator may easily judge from the original subjects, what parts will come off together, and what require to be separated; the principle of the whole consisting only in this, that where under-workings, as they are called, occur, that is, wherever a straight line drawn from the bulge or inflection of any projection, would be cut or crooked, by any part of such projection, such part cannot be taken off without a division; which must be made either in the place where the projection would cross the straight line; or, as that is frequently difficult, the whole projection must be separated from the main body, and divided also lengthwise into two parts: and where there are no projections from the principal surfaces, but the body is so formed as to render the surface a composition of such curves, that a straight line being drawn parallel to the surface of one part would be cut by the outline, in one or more places, of another part, a division of the whole should be made, so as to reduce the parts of it into regular curves, which must then be treated as fixes.

In larger masses, where there would otherwise be a great thickness of the plaster, a corps or body may be put within the mold, in order to produce a hollow in the cast: which both saves the expense of the plaster, and renders the cast lighter.

This corps may be of wood, where the forming a hollow of a straight figure, or a conical one with the basis outward, will answer the end; but if the cavity require to be round, or of any curve figure, the corps cannot be then drawn while entire; and consequently should be of such matter as may be taken out piece-meal. In this case, the corps is best formed of clay; which must be worked upon wires to give it tenacity, and suspended in the hollow of the mold, by crossed wires lying over the mouth; and when the plaster is sufficiently set to bear handling, the clay must be picked out by a proper instrument.

Where it is desired to render the plaster harder, the water with which it is tempered should be mixed with parchement size properly prepared, which will make it very firm and tenacious.

In the same manner, figures, busts, &c. may be cast of lead, or any other metal, in the molds of plaster: only the expence of plaster, and the tediousness of its becoming sufficiently dry, when in a very large mass, to bear the heat of melted metal, renders the use of clay, compounded with some other proper materials, preferable where large subjects are in question. The clay, in this case, should be washed over till it be perfectly free from gravel or flones; and then mixed with a third or more of fine sand to prevent its cracking; or, instead of sand, coal-ashes sifted fine may be used. Whether plaster or clay be employed for the casting in metal, it is extremely necessary to have the mold perfectly dry; otherwise the moisture being rarified, will make an explosion that will blow the metal out of the mold, and endanger the operator, or at least crack the mold in such a manner as to frustrate the operation. Where the parts of a mold are larger, or project much, and consequently require a greater tenacity of the matter they are formed of to keep them together, flocks of cloth, prepared like those designed for paper-hangings, or fine cotton plucked or cut till it is very short, should be mixed with the ashes or sand before they are added to the clay to make the composition for the mold. The proportion should be according to the degree of cohesion required; but a small quantity will answer the end, if the other ingredients
of the composition be good, and the parts of the mold properly linked together by means of the wires above directed.

There is a method of taking casts in metals from small animals, and the parts of vegetables, which may be practiced for some purposes with advantage: particularly for the decorating grooves or rock-work, where nature is imitated. The proper kinds of animals are lizards, snakes, frogs, birds, or insects: the casts of which, if properly coloured, will be exact representations of the originals.

This is to be performed by the following method. A coffin or proper chest for forming the mold being prepared of clay, or four pieces of boards fixed together, the animal or parts of vegetables must be suspend

ed in it by a string; and the leaves, tendrils, or other detached parts of the vegetables, or the legs, wings, &c. of the animals, properly separated and adjusted in their right position by a small pair of pincers; a due quantity of plaster of Paris and calcined talc, in equal quantities, with some alum plumbum, must then be tempered with water to the proper confidence for casting; and the subject from whence the cast is to be taken, as also the sides of the coffin, moulded with spirit of wine. The coffin or chest must then be filled with the tempered composition of the plaster and talc, putting at the same time a piece of straight stick or wood to the principal part of the body of the subject, and pieces of thick wire to the extremities of the other parts, in order that they may form, when drawn out after the matter of the mold is properly set and firm, a channel for pouring in the melted metal, and vents for the air; which otherwise, by the rarefaction it would undergo from the heat of the metal, would blow it out or burst the mold. In a short time the plaster and talc will set and become hard, when the stick and wires may be drawn out, and the frame or coffin in which the mold was cast taken away; and the mold must then be put first into a moderate heat, and afterwards, when it is as dry as can be rendered by that degree, removed into a greater; which may be gradually increased till the whole be red-hot. The animal, or part of any vegetable, which was included in the mold, will then be burnt to a coal; and may be totally calcined to ashes, by blowing for some time gently into the channel and passages made for pouring in the metal, and giving vent to the air, which will, at the same time that it destroys the remainder of the animal or vegetable matter, blow out the ashes. The mold must then be suffered to cool gently; and will be perfect; the destruction of the substance of the animal or vegetable having produced a hollow of a figure correspondent to it: but it may be nevertheless proper to shake the mold, and turn it upside down, as also to blow with the bellows into each of the air-vents, in order to free it wholly from any remainder of the ashes; or, where there may be an opportunity of filling the hollow with quicksilver without expense, it will be found a very effectual method of clearing the cavity, as all dust, ashes, or small detached bodies will necessarily rise to the surface of the quicksilver, and be poured out with it. The mold being thus prepared, it must be heated very hot when used, if the cast be made with copper or brass: but a less degree will serve for lead or tin: and the matter being poured in, the mold must be gently struck, and then suffered to rest till it be cold: at which time it must be carefully taken from the cast, but without the least force; for such parts of the matter as appear to adhere more strongly, must be softened by soaking in water, till they are entirely loosened, that none of the more delicate parts of the cast may be broken off or bent.

Where the alum plumbum, or talc, cannot easily be procured, the plater may be used alone; but it is apt to be calcined by the heat used in burning the animal or vegetable from whence the cast is taken, and to become of too incohering and crumbly a texture; or, for cheapness, Sturbridge or any other good clay, washed over till it be perfectly fine, and mixed with an equal part of sand, and some clucks cut small, may be employed. Pounded pumice stone and plaster of Paris, taken in equal quantities, and mixed with washed clay in the same proportion, is said to make excellent molds for this and parallel uses.

Casts of metals, or such small pieces as are of a similar form, may be made in plater by the method directed for bars relieves.

Indeed there is nothing more required than to form a mold by laying them on a proper board; and having surrounded them by a rim made of a piece of a card, or any other pasteboard, to fill the rim with soft tempered plaster of Paris; which mould, when dry, will serve for several casts. It is nevertheless a better method to form the mold of melted sulphur; which will produce a sharper impression in the cast, and be more durable than those made of plaster.

The casts are likewise frequently made of sulphur, which being melted must be treated exactly in the same manner as the plaster.

For taking casts from medals, Dr Lewis recommends a mixture of flowers of brimstone and red lead: equal parts of these are to be put over the fire in a ladder, till they become to the confidence of paper; then they are kindled with a piece of paper, and stirred for some time. The vessel being afterwards covered close, and continued on the fire, the mixture grows fluid in a few minutes. It is then to be poured on the metal, previously oiled and wiped clean. The casts are very neat; their colour sometimes a pretty deep black, sometimes a dark grey: they are very durable; and when polished, may be washed clean in spirits of wine.

Dr Leston recommends tin-foil for taking off casts from metals. The thinnest kind is to be used. It should be laid over the subject from which the impression is to be taken, and then rubbed with a brush, the point of a skewer, or a pin, till it has perfectly received the impression. The tin-foil should now be pared close to the edge of the medal, till it is brought to the same circumference: the medal must then be reversed, and the tin-foil will drop off into a chip-box or mold placed ready to receive it. Thus the concave side of the foil will be uppermost, and upon this plater of Paris, prepared in the usual manner may be poured. When dry, the whole is to be taken out, and the tin-foil flickling on the plater will give a perfect representation of the medal, almost equal in beauty to silver. If the box or mold is a little larger than the medal, the plater running round the tin-foil will give the appearance of a white frame or circular border.
Califs, or piece of a familiar form; and having heated it red-hot, hold it over a vessel containing water, and touch it very slightly with a roll of sulphur, which will immediately dissolve it, and make it fall in drops into the water. As much iron as may be wanted being thus dissolved, pour the water out of the vessel, and pick out the drops formed by the melted iron from those of the sulphur, which contain little or no iron, and will be distinguishable from the other by their colour and weight. The iron will, by this means, be rendered fusible, so that it will run with less heat than is required to melt lead; and may be employed for making califs of medals, and many other such purposes, with great convenience and advantage.

Impressions of medals, having the same effect as califs, may be made also of inglafs glue, by the following means. Melt the stigglass, beaten, as when commonly used, in an earthen pipkin, with the addition of as much water as will cover it, stirring it gently till the whole is dissolved; then with a brush of camel’s hair, cover the medal, which should be previously well cleaned and warmed, and then laid horizontally on a board or table, greased in the part around the medal. Let them rest afterwards till the glue be properly hardened; and then, with a pin, raise the edge of it; and separate it carefully from the medal: the cast will be thus formed by the glue as hard as horn; and so light, that a thousand will scarcely weigh an ounce. In order to render the relief of the medal more apparent, a small quantity of carmine may be mixed with the melted inglafs; or the medal may be previously coated with leaf-gold by brushing on it, and then laying it on the leaf, which will by that means adhere to it; but the use of leaf-gold is apt to impair a little the sharpness of the impression.

Impressions of medals may be likewise taken in putty; but it should be the true kind made of calks of tin, and drying oil. These may be formed in the molds, previously taken in platter or sulphur; or molds may be made in its own substance, in the manner directed for those of the platter. These impressions will be very sharp and hard; but the greatest disadvantage that attends them, is their drying very slowly, and being liable in the mean time to be damaged.

Impressions of prints, or other engravings, may be taken from copper-plates, by cleaning them thoroughly, and pouring plaster upon them: but the effect in this way is not strong enough for the eye; and therefore the following method is preferable, where such impressions on platter are desired.

Take vermillion, or any other coloured pigment, finely powdered, and rub it over the plate: then pass a folded piece of paper, or the flat part of the hand, over the plate, to take off the colour from the lights or parts where there is no engraving: the proceeding must then be the same as where no colour is used. This last method is also applicable to the making of impressions of copper-plates on paper with dry colours: for the plate being prepared as here directed, and laid on the paper properly moistened, and either placed under the rolling-press, or any other way strongly forced down on the paper, an impression of the engraving will be obtained.

Impressions may be likewise taken from copper-plates, either on platter or paper, by means of the smoke of a candle or lamp: if, instead of rubbing them with any colour, the plate be held over the candle or lamp till the whole surface become black, and then wiped off by the flat of the hand, or paper.

These methods are not, however, of great use in the case of copper-plates, except where impressions may be desired on occasions where printing-ink cannot be procured: but as they may be applied likewise to the taking impressions from snuff-boxes, or other engraved subjects, by which means designs may be instantly borrowed by arists or curious persons, they may in such instances be very useful.

The expedient of taking impressions by the smoke of a candle or lamp may be employed also for botanical purposes in the case of leaves, as a perfect and durable representation of not only the general figure, but the contexture and disposition of the larger fibres, may be extemporaneously obtained at any time. The same may be nevertheless done in a more perfect manner, by the use of linseed oil, either alone, or mixed with a small proportion of colour, where the oil can be conveniently procured: but the other method is valuable in a considerable point of the being practicable at all times, and in all places, within the time that the leaves will keep fresh and plump. In taking these impressions, it is proper to bruise the leaves, so as to take off the projections of the large ribs, which might prevent the other parts from plying to the paper.

Leaves, as also the petals, or flower-leaves, of plants, may themselves be preferred on paper, with their original appearance, for a considerable length of time, by the following means.—Take a piece of paper, and rub it over with inglafs glue, treated as above directed for taking impressions from medals; and then lay the leaves in a proper position on the paper. The glue laid on the paper being fer, bruise over the leaves with more of the same; and that being dry likewise, the operation will be finished, and the leaves fix secured from the air and moisture, that they will retain their figure and colour much longer than by any other treatment.

Butterflies, or other small animals of a flat figure, may also be preferred in the same manner.

Casting of feathers is more properly called moulding orewing.

A horse casts his hair, or coat, at least once a-year, viz. in the spring when he casts his winter coat; and sometimes, at the close of autumn, he casts his summer coat, in case he has been ill kept. Horses also sometimes cast their hoofs, which happens frequently to coach-horses brought from Holland: these, being bred in a moist marshy country, have their hoofs too flabby: so that coming into a drier soil, and left juicy proven-
CASTLE, a fortefis, or place rendered defensible either by nature or art. It frequently signifies in Britisn the principal habitation of noblemen. In the time of Henry II., there were no less than 1155 caftles in England, each of which contained a monarch.

CASTLES, walled with flone, and designed for residence as well as defence, are, for the moft part, according to Mr Grote, of no higher antiquity than the conquest: for although the Saxons, Romans, and even, according to some writers on antiquity, the ancient Britons, had caftles built with flone; yet thefe were both few in number, and, at that period, through neglect or invasions, either destroyed, or so much decayed, that little more than their ruins were remaining. This is attested by many of the historians and antiquaries, and assigned as a reason for the facility with which William made himself master of that country.

This circumstance was not overlooked by so good a general as the Conqueror; who, effectually to guard against invasions from without, as well as to awe his newly acquired subjects, immediately began to erect castles all over the kingdom, and likewise to repair and augment the old ones. Besides, as he had parcelled out the lands of the English amongst his followers, they, to protect themselves from the refentment of those so defpoited, built strong holds and caftles on their estates. This likewise caused a considerable increase of these fortresses; and the turbulent and unsettled state of the kingdom in the succeeding reigns, served to multiply them prodigiously, every baron or leader of a party building castles; infomuch, that towards the latter end of the reign of King Stephen, they amounted to the almost incredible number of 1115.

As the feudal system gathered strength, these castles became the heads of baronies. Each caftle was a manor: and its feuitaire, owner, or governor, the lord of that manor. Markets and fairs were directed to be held there; not only to prevent frauds in the king’s duties or customs, but also as they were elected places where the laws of the land were observed, and as which had a very particular privilege. But this good order did not long last: for the lords of caftles began to arrogate to themselves a royal power, not only within their caftles, but likewise its environs; exercising judicature both civil and criminal, coin of money, and arbitrarily fixing forage and provision for the subsistence of their garrisons, which they afterwards demanded as a right: at length their infolence and oppression grew to such a pitch, that according to William of Newbury, “there were in England as many kings, or rather tyrants, as lords of caftles;” and Matthew Paris fays them, very real devils and dens of thieves.

Casts were not solely in the possession of the crown and the lay barons, but even bishops had these fortresses; though it seems to have been contrary to the canons, from a plea made use of in a general council, in favour of King Stephen, who had seized upon the strong caftles of the bishops of Lincoln and Salisbury. This prohibition (if such existed) was however very little regarded; as in the following reigns many strong places were held, and even defended, by the ecclesiastics: neither was more obedience afterwards paid to a decree made by the Pope at Viterbo, the fifth of the kalends of June 1220, wherein it was ordained, that no person in England should keep in his hands more than two of the king’s caftles.

The licentious behaviour of the garrisons of these places becoming insupportable, in the treaty between King Stephen and Henry II., when only duke of Normandy, it was agreed, that all the caftles built within a certain period should be demolished; in consequence of which many were actually razed, but not the number stipulated.

The few caftles in being under the Saxon government, were probably, on occasion of war or invasions, garrisoned by the national militia, and at other times lightly guarded by the domestics of the princes or great personages who resided therein; but after the conquest, when all the estates were converted into baronies held by knight’s service, caftle-guard coming under that denomination, was among the duties to which particular tenants were liable. From these services the bishops and abbots, who till the time of the Normans had held their lands in frank almoign, or free alms, were, by this new regulation, not exempted; they were not indeed, like the laity, obliged to personal service, it being sufficient that they provided fit and able perons to efficaciate in their stead. This was however at first stoutly opposed by Anfelm archbishop of Canterbury; who being obliged to find some knights to attend King William Rufus in his wars in Wales, complained of it as an innovation and infringement of the rights and immunities of the church.

It was no uncommon thing for the Conqueror and the kings of those days, to grant estates to men of approved fidelity and valour, on condition that they should perform castlegate in the royal caftles, with a certain number of men, for some specified time; and sometimes they were likewise bound by their tenures to keep in repair and guard some particular tower or bulwark, as was the case at Dover caftle.

In process of time these services were commuted for annual rents, sometimes fyled ward-penny, and way-fee, but commonly caftle-guard rents, payable on fixed days, under prodigious penalties called farstaid. At Rochester, if a man failed in the payment of his rent of caftle-guard on the feast of St Andrew, his debt was doubled every tide during the time for which the payment was delayed. These were afterwards restrained by an act of parliament made in the reign of King Henry VIII. and finally annihilated, with the tenures by knight’s service, in the time of Charles II. Such caftles as were private property were guarded either by mercenary folders, or the tenants of the lord or owner.

Casts which belonged to the crown, or fell to it either by forfeiture or escheat (circumstances that frequently happened in the diluted reigns of the feudal times), were generally committed to the custody of some faithful person, who seems to have been indifferently styled governor and constable. Sometimes also they were put into the possession of the sheriff of the county, who
The materials of which castles were built, varied according to the places of their erection; but the manner of their construction seems to have been pretty uniform. The outside of the walls were generally built with the stones nearest at hand, laid as regularly as their shapes would admit; the infills were filled up with the like materials, mixed with a great quantity of fluid mortar, which was called by the workmen grunt-work.

The general shape or plan of these castles depended entirely on the caprice of the architects, or the form of the ground intended to be occupied: neither do they seem to have confined themselves to any particular figure in their towers; square, round, and polygonal, oftentimes occurring in the original parts of the same building.

The situation of the castles of the Anglo-Norman kings and barons, was most commonly on an eminence, and near a river; a situation on several accounts eligible. The whole face of the castle (which was frequently of great extent and irregular figure) was surrounded by a deep and broad ditch, sometimes filled with water, and sometimes dry, called the fossa. Before the great gate was an outwork, called a barbacan, or ante-walled, which was a strong and high wall, with turrets upon it, designed for the defence of the gate and draw-bridge. On the inside of the ditch stood the wall of the castle, about eight or ten feet thick, and between 20 and 30 feet high, with a parapet, and a kind of embrasures, called crennells, on the top. On this wall at proper distances square towers of two or three stories high were built, which served for lodging some of the principal officers of the proprietor of the castle, and for other purposes; and on the inside were erected lodgings for the common servants or retainers, granaries, stordehouses, and other necessary offices. On the top of this wall, and on the flat roofs of these buildings, stood the defenders of the castle, when it was beleaguered and from thence discharged arrows, darts, and stones, on the besiegers. The great gate of the castle stood in the course of this wall, and was strongly fortified with a tower on each side, and rooms over the passage, which was closed with thick folding-doors of oak, often plated with iron, and with an iron portcullis or grate let down from above. Within this outward wall was a second or inner wall, which served for lodging the largest and most perfect castles, the outer bailey, or bal­lium, in which stood commonly a church or chapel. On the inside of this outer bailey was another ditch, wall, gate, and towers, inclosing the inner bailey or court, within which the chief tower or keep was built. This was a very large square fabric, four or five stories high, having small windows in prodigious thick walls, which rendered the apartments within it dark and gloomy. This great tower was the palace of the prince, prelate, or baron, to whom the castle belonged, and the residence of the constable or governor. Under ground were dismal dark vaults, for the confinement of prisoners, which made it sometimes be called the dungeon.

In this building also was the great hall, in which the owner displayed his hospitality, by entertaining his numerous friends and followers. At one end of the great halls of castles, palaces, and monasteries, there was a place raised a little above the rest of the floor, called the deis, where the chief table stood, at which persons of the highest rank dined. Though there was unquestionably great variations in the structure of castles, yet the most perfect and magnificent of them seem to have been constructed nearly on the above plan. Such, to give one example, was the famous castle of Bedford, as appears from the following account of the manner in which it was taken by Henry III. A.D. 1224. The castle was taken by four assaults. "In the first was taken the barbacan; in the second the outer baillia; at the third attack, the wall by the old tower was thrown down by the miners, where, with great danger, they poiffessed themseves of the inner baillia, through a chink; at the fourth assault the miners set fire to the tower, so that the smoke burst out, and the tower itself was cloven to that degree, as to show visibly some broad chinks; whereupon the enemy surrendered." See a representation of a castle in Plate CXXXVII, where 1 is the barbican, 2, the ditch or moat; 3 the wall of the outer baillium, 4 outer baillium, 5 the artificial mount, 6 the wall of the inner baillium, 7 the inner baillium, 8, the keep or dungeon.

Before the accession of James VI. to the throne of England, the situation of Scotland was such, that every baron's house was more or less fortified, according to the power and consequence of its lord, or according to the situation of the castle. Near Edinburgh or Stirling, where the inhabitants were more pollinised in their annals, and overawed by the fear of government, no more was necessary than towers capable of resisting the curfew attack of robbers and thieves, who never durst flop to make a regular investment, but plundered by forpride, and, if repulsed, instantly fled away. Such was Melville Castle. It is not so much composed of a strong built tower of three stories, embattled at the top, and was sufficiently strong to resist a sudden attack, undissembled by artillery, or other engines of war. But, when further removed, as in Perthshire, Invernesshire, or Aberdeenshire, then it was necessary to better defend, and the aids of a peel or dungeon, with outer walls, moat, and wet ditch, barbakin, &c. added to enable the powerful lord to resist the formidable attack of his powerful adversary. The history of Scotland, so late as the reign of the Stewart family, affords a number of melancholy instances of invertebrate feuds among the greater and lesser barons of that period; by which method of fortification then in use was seldom adequate to the defence of the castle against the storm or blockade of the enraged chieflain. The castle of Doun seems to answer this description of fortification, and has made several gallant defences, in the annals of Scotland. The third kind of fortresses we meet with in Scotland are those situated on the borders of England, or on the coasts of the kingdom, and in the western isles, and very remote places. Many of the old castles in Scotland were situated on an island, in a deep lake, or on a peninsula, which by a broad deep cut was made an island. Of this kind was Lochmaben, in the stewary...
CASTLE, (Edmund). See CASTLE.

CASTLE-Bar, a borough and market-town, capital of the county of Mayo in Ireland, is a well-inhabited place, and carries on a brisk trade: it has a barracks for a troop of horse; and there is here a charter-school capable of receiving fifty children, and endowed with two acres of land, rent-free, by the Right Honourable Lord Lucan, who has also granted a lease of twenty acres more at a pepper-corn yearly.

CASTLE-Cary, a remarkable Roman station about four miles west from Falkirk on the borders of Stirlingshire in Scotland. It comprehends several acres of ground, is of a square form, and is surrounded with a wall of stone and mortar: all the space within the walls has been occupied by buildings, the ruins of which have raised the earth eight or ten feet above its natural surface; so that the fort now seems like an hill-top surrounded with a funk fence. In 1770, some workmen employed in searching for stones for the great canal which passes very near it, discovered several apartments of stone; and in one of them a great number of stones about two feet in length, and standing erect, with marks of fire upon them, as if they had been employed in supporting some vessels under which fire was put. In a hollow of the rock near this place, in 1771, a considerable quantity of wheat quite black with age was found, with some wedges and hammer supposed to be Roman.

CASTLE-Rising, a borough-town of Norfolk in England, which sends two members to parliament. E. Long. 0. 40. 40. N. Lat. 52. 46.

CASTLE-work, service or labour done by inferior tenants for the building and upholding castles of defence, toward which some gave their personal assistance and others paid their contributions. This was one of the three necessary charges to which the Anglo-Saxons were expressly subjected.

CASTLE-TOWN, the capital of the isle of Man, feated on the south-west part of the island. It has a strong castle; but of no great importance, on account of its distance from the rocky and shallow harbour. W. Long. 4. 39. N. Lat. 53. 30.

CASTOR, the BEAVER, in zoology, a genus of quadrupeds belonging to the order of glires. The fore-teeth of the upper jaw are truncated, and hollowed in a tranverse angular direction. The tops of the fore-teeth of the lower jaw lie in a transverse direction; and the tail is depressed. There are three species of cadlor, viz.

1. The fiber or common beaver, with a plain ovated tail, is found on the banks of the rivers in Europe, Asia, and America. It has short ears hid in the fur: a blunt nose; the fore-feet small, the hinder large: its length from nofe to tail about three feet, tail about one foot. It is from the inguinal glands of this animal that the cator is obtained; it is contained in cords or pouches resembling a dog's teeficles. Nothing equals the art with which these animals confruct their dwellings. They choose a level piece of ground, with a small rivulet running through it. This they form into a pond, by making a dam across it by driving into the ground flakes of five or six feet in length, placed in rows, wattling each row with plant twigs, and filling the interlinces with clay, ramming it down close. The side next the water is floped, the other perpendicular;
CaO: or. openings, but their tops and the number of jhore. They are built on piles; are either Each beaver forms its bed of bark and boughs of trees. Th, ofe they lodge under water, and fetch into their apartments as qnires. Lawfon fays, they are fize, fame fall to gnawing with their teeth trees of great length to the water; others dive, and with their feet to the water; works upwards, but never to the vaulted, fa that their work, or on shore feeding on poplar bark. If they hear any noife when at work, they immediately jump into the water, and continue there some time; and when they rise, it is at a distance from the place where they went in. They sometimes are taken with traps: these are nothing but poplar sticks laid in a path near the water; which when the beaver begins to feed upon, they caufe a large log of wood to fall upon their necks, which is put in motion by their moving of the sticks, and confequently requires an ingenious contrivance. The favages generally prefer this way of taking them, because it does not damage their skins. In the winter time they break the ice in two places at a distance from the houfe, the one behind the other. Then they take away the broken ice with a kind of rake, the better to know where to place their flakes. They fatten their nets to these, which have large mehes, and sometimes are eighteen or twenty yards in length. When these are fixed, they proceed to demolish the houfe, and turn a dog therein; which terri­fy­ing the beaver, he immediately leaves it, and takes to the water; after which, he is soon entangled by the net.

2. The mofchatus, with a long, comprefled, lanceolated tail, and palmed feet. It has a long tender nofe like that of a threw-moufe; no external ears, and very small eyes. Length from nofe to tail, seven inches; of the tail, eight. It is the water-rat of Clufins; and inhabits Lapland, Ruflia, the banks of the rivers Wolga and the Yaick. It never wanders far from the fides; is very flow in its pace; makes holes in the cliffs, with the entrance far beneath the lowest full of the water; works upwards, but never to the surface, only high enough to be beyond the highest flow of the river: feeds on fish; is devoured by the pikes and fileri, and gives thofe fish fo strong a flavour of musk as to render them not eatable; has the fame fcent as the former, efpecially about the tail, out of which is expressed a fort of musk very much refeeming the genuine kind. The skins are put into chefts among clothes, to drive away moths. At Orenburgh the skins and tails fell for 15 or 20 copees per hundred. They are fo common near Nizney Novogorod, that the peafants bring 500 a-piece to market, where they are fold for one rube per hundred. The German name for thofe animals is bifeonratze: the Ruflian wychozol.

3. The zibethicus, or musk-rat, with a long, comprefled, lanceolated tail, and the toes of the feet separated from each other. Length from nofe to tail, one foot; of the tail, nine inches. This species inhabits North America, breeds three or four times in a year, and brings from three to fix young ones at a time: during summer the male and female confort together: at the approach of winter they unite in families, and retire into small round edifices covered with a dome, formed of herbs and reeds cemented with.
Clytemnestra, who being begotten having an amour with Leda, the wife of Tylldarus other noble youths of Greece in the expedition to common name of derived was forth two eggs, each containing twins. From-derived was forth two eggs, each containing twins. From

form magazines like the beavers: during winter their habits are covered many feet deep with snow and ice; but they creep out and feed on the roots beneath: they quit their old habitats annually, and form new ones: the fur is soft and much esteemed: the whole animal, during summer, has a most exquisite smell of music, which it loses in winter: perhaps the scent is derived from the calamus aromaticus, a favourite food of this animal. Leckerbot says they are very good to eat.

CASTOR, in astronomy, a moiety of the constellation GEMINI; called also APOLLO. Its latitude northwards, for the year 1700, according to Hevelius, was 10° 4' 23"; and its longitude, of Cancer, 16° 4' 14". It is also called Ralgunze, Apollo, Aphellan, Avellar, and Anelar.

CASTOR and POLLUX, in Pagan mythology, Jupiter having an amour with Leda, the wife of Tyndarus king of Sparta, in the form of a swan, the brought forth two eggs, each containing twins. From that impregnated by Jupiter proceeded Pollux and Helena, who were both immortal; from the other Castror and Clytemnestra, who being begot by Tyndarus were both mortal. They were all, however, called by the common name of Tyndarides. These two brothers entered into an inviolable friendship; they went with the other noble youths of Greece in the expedition to Colchis, and, on several occasions, signalized themselves by their courage; but Castror being at length killed, Pollux obtained leave to share his own immortality with him; so that they are said to live and die alternately every day: for, being translated into the skies, they form the constellation of gemini, one of which stars rises as the other sets.

A martial dance, called the Pyrrhic or Gafforian dance, was invented in honour of those deities whom the Cephelentes placed among the Dii Magni, and offered to them white lambs. The Romans also paid them particular honours on account of the assistance they are said to have given them in an engagement against the Latins; in which, appearing mounted on white hores, they turned the scale of victory in their favour, for which a temple was erected to them in the forum.

CASTOR and POLLUX, a fiery meteor, which at sea appears sometimes sticking to a part of the ship, in form of one, two, or even three or four fire-balls: when one is seen alone, it is more properly called HELENA; two are denominated Castror and Pollux, and sometimes Tyndarides. Castror and Pollux are called by the Spaniards, San Elmo; by the French, St Elme, St Nicholas, St Clare, St Helene; by the Italians, Hermo; by the Dutch, Vree Vuuren.

Castror and Pollux are commonly judged to portend a cessation of the storm, and a future calm; being rarely seen till the tempest is nigh spent. Helena alone portends ill, and witnesses the severest part of the storm yet behind. When the meteor flicks to the masts, yards, &c. they conclude, from the air's not having motion enough to dissipate this flame, that a profound calm is at hand; if it flutter about, it indicates a storm.

CASTOREUM, in the Materia Medica, CASTOR; Castoreum, the inguinal glands of the beaver. The ancients had a notion that it was lodged in the testicles: and that the animals, when hard pressed, would bite them off, and leave them to its pursuers, as if conscious of what they wanted to destroy him for. The best fort of castror is what comes from Ruflia. So much is Russian castror superior to the American, that two guineas per pound is paid in Britain for the former, and only 8s 6d. for the latter. The Russian castror is in large hard round pods, which appear, when cut, full of a brittle, red, liver-coloured substance, intermixed with membranes and fibres exquisitely interwoven. An inferior fort is brought from Danzig, and is generally put and moist. The American castror, which is the worst of all, is in longish thin pods. Ruflia castror has a strong disagreeable smell; and an acrid, bitterish, and nauseous taste. Water extracts the nauseous part, with little of the finer bitter; rectified spirit extracts this last without much of the nauseous; proof-spirit both: water elevates the whole of its flavour in distillation; rectified spirit brings over nothing. Castror is looked upon as one of the capital nerve and antisyphilitic medicines; some celebrated practitioners, nevertheless, have doubted its virtues; and Newman and Stahl declare it insignificant. Experience, however, has shown that the virtues of castror are considerable, tho' less than they have been generally supposed.

CASTRATION, in surgery, the operation of gelding, i.e. of cutting off the testicles, and putting a male animal out of a capacity of generation.

Castration is much in use in Asia, especially among the Turks, who practise it on their slaves, to prevent any commerce with their women. The Turks often make a general amputation.

Castration also obtains in Italy, where it is used with a view to preserve the voice for singing. See Eunuch.

The Persians, and other eastern nations, have divers methods of making eunuchs, different from those which obtain in Europe: we say, of making eunuchs, for it is not always done among them by cutting, or even collision. Centa and other poisonous herbs do the same office, as is shewn by Paulus Aegineta. Those enxious in this manner are called zhibis. Besides which there is another fort named thalam, in whom the genitals are left entire, and only the veins which should feed them are cut; by which means the parts do indeed remain, but so lax and weak, as to be of no use.

Castration was for some time the punishment of adultery. By the laws of the Vitigths, sodomyites underwent the same punishment.

By the civil law, it is made penal in physicians and surgeons to castrate, even with consent of the party, who is himself included in the same penalty, and his effects forfeited. The offence of Mayhem by castration is, according to all old writers, felony; though committed upon the highest provocation. See a record to this purpose of Henry III. transcribed by Sir Edward Coke, 3 Inst. 62. or Blackstone's Com. vol. iv. p. 206.

Castration is sometimes found necessary on medicinal considerations, as in mortifications, and some other diseases of the testicles, especially the sarcoccele and vericelle. Some have also used it in maniac cafes.
Castro, (Pietro de) a celebrated painter, who flourished about the middle of the 17th century. The subjects which this great artist chose to paint, were what are distinguished by the name of still life, vases, shells, musical instruments, gems, vessels of gold, silver, and crystal, books, and rich bracelets; and in these subjects his choice and disposition were elegant, and his execution admirable.

Castro, (Castracani) a celebrated Italian general, was born (nobody knows of whom) at Lucca in Florence in 1284, and left in a vineyard covered with leaves, where he was found by Dianora a widow lady, the sister of Antonio, a canon of St Michael in Lucca, who was descended from the illustrious family of the Castracani. The lady having no children, resolved to bring him up, and educated him as carefully as if he had been their own. They intended him for a priest; but he was fiercely 14 years old when he began to devote himself to military sports, and those violent exercises which suited his great strength of body. The factions named the Guelfs and Ghibelines then shared all Italy between them; divided the popes and the emperors; and engaged in their different interests not only the members of the same town, but even those of the same family. Francesco, a considerable person on the side of the Ghibelines, offering Castruccio's uncommon spirit and great qualities, prevailed with Antonio to let him turn soldier; on which Castruccio soon became acquainted with every thing belonging to that profession, and was made a lieutenant of a company of foot by Francesco Guinigi. In his first campaign he gave such proofs of his courage and conduct as spread his fame all over Lombardy; and Guinigi, dying soon after, committed to him the care of his son and the management of his estate. Still distinguishing himself by his exploits, he filled his commander in chief with fresh jealousy and envy, that he was imprisoned by stratagem in order to be put to death. But the people of Lucca soon released him, and afterwards chose him for their sovereign prince.

The Ghibelines considered him as the chief of their party; and those who had been baffled from their country fled to him for protection, and unanimously promised that if he could restore them to their cities, they would serve him so effectually that the sovereignty of their country should be his reward. Flattered by these promises, he entered into a league with the prince of Milan. He kept his army constantly on foot, employing it as best suited his own designs. For services he had done the pope, he was made senator of Rome with more than ordinary ceremony; but while there, received news which obliged him to hasten back to Lucca. The Florentines entered into a war with him, but Castruccio fought his way through them, and the supreme authority of Tuscany was ready to fall into his hands, when a period was put to his life. In May 1228, he gained a complete victory over his enemies, who amounted to 50,000 foot and 10,000 horse; in which 22,000 of them were slain, with the loss of not quite 16,000 of his own men; but as he was returning from the field of battle, tired with the action, and covered with sweat, he halted a little, in order to thank and care for his soldiers as they passed; when, the north wind blowing upon him, he was immediately seized with an ague, which he at first neglected, but it carried him off in a few days, in the 44th year of his age.

Machiavel, who has written the life of Castruccio, says, that he was not only an extraordinary man in his own age, but would have been fo in any other. He was of a noble aspect, and of the most winning address. He had all the qualities that make a man great; was grateful to his friends, just to his subjects, terrible to his enemies. No man was more forward to encounter dangers; no man more careful to escape them. He had an uncommon presence of mind, and often made repartees with great finartness. Some of them are recorded, which discover a singular turn of humour;
Cafurolcio and, for a specimen, we shall mention three or four of them.—Palling one day through a street where there was a house of bad fame, he surprised a young man, who was just coming out, and who, upon seeing him, was all over blushes and confusion: “Friend, you should not be ashamed when you come out, but when you go in.”—One asking a favour of him with a thousand impertinent and superfluous words: “Hark you, friend; when you would have any thing with me for the future, send another man to ask it.”—Another great talker having tired him with a tedious discourse, excused himself at last, by saying, he was afraid he had been troublesome. “No indeed, (replied he), for I did not mind one word you said.”—He was forced to put a citizen of Lucca to death, who had formerly been a great instrument of his advancement; and being reproached by somebody for it, Causulilo, comporting with all the respect due to his friends intimating that such freedoms might diminish the reverence that denots a catafalco, or a lofty tomb of in honour of fame person of eminence, usually in the church and deacon were to take their charge his duty, and what he may have done for his courtiers, and has different points, from whence the light reflected in the language of their own mariners, from whence it differs chiefly in variable like what similar stones, an inch in diameter, was in the writer’s story, as shows it was left while in the writer’s possession.

Casy, in zoology. See Pelis.

Cat, in sea-affairs, a ship employed in the coal-trade, formed from the Norwegian model. It is distinguished by a narrow stern, projecting quarters, a deep waist, and by having ornamental figures on the prow. These vessels are generally built remarkably strong, and carry from four to six hundred tons, or, in the language of their own mariners, from 20 to 30 keels of coal.

Cat, is also a sort of strong tackle, or combination of pulleys, to hook and draw the anchor perpendicularly up to the cat-head. See Cat-Heads.

Cat’s eye, or Sun-fleame, of the Turks, a kind of gem found chiefly in Siberia. Cat’s eye is by the Latins called oculus cati, and sometimes onyx pallas, as having white zones or rings like the onyx; and its colour variable like opal, from which last it differs chiefly by its superior hardnes. It is very hard, and semi-transparent and has different points, from whence the light is reflected with a kind of yellowish radiation somewhat similar to the eyes of cats, from whence it had its name. The leaf of them are very scarce, and jewelers cut them round to the greatest advantage. One of these stones, an inch in diameter, was in the possession of the duke of Tuscany.

Cat-fish, in ichthyology. See Squids.

Cat-cauls, a denomination given to small strings for fiddles, and other instruments, made of the interlines of sheep or lambs, dried and twisted together, either singly, or several together. These are sometimes coloured red, sometimes blue, but are commonly left whitish or brownish, the natural colour of the gut.
They are also used by watch-makers, cutters, turners, and other artificers. Great quantities are imported into England, and other northern countries, from Lyons and Italy.

Catacomb, a purchase of ropes employed to brace in the shrouds of the lower masts behind their yards, for the double purpose of making the shrouds more tight, and of affording room to draw in the yards more obliquely, to trim the sails for a side-wind, when they are said to be close hauled.

Cat-Heads, two strong short beams of timber, which project almost horizontally over the ship's bows on each side of the bow-sprit; being like two radii which extend from a centre taken in the direction of the bow-sprit. That part of the cat-head which rests upon the forecastle, is securely bolted to the beams; the other part projects like a crane as above described, and carries in its extremity two or three small wheels or sheaves of brass or strong wood, about which a rope called the cat-fall passes, and communicates with the cat-block, which also contains three sheaves. The machine formed by this combination of pulleys is called the Cat, which serves to pull the anchor up to the cat-head, without tearing the ship's sides with its flukes. The cat-head also serves to suspend the anchor clear of the forecastle, is securely bolted to the beams; the

CATACOUSTIC CURVES, in the higher geometry, that species of caustic curves which are formed by reflection. See Fluxions.

CATCHRESIS, in rhetoric, a trope which borrows the name of one thing to express another. Thus Milton, describing Raphael's decent from the empyreal heaven to paradise, says,

"Down thither prone in flight,
"He speeds, and through the vaft etherial sky
"Sails between worlds and worlds."  

CATACOMB, a grotto, or subterraneous place for the burial of the dead. Some derive the word catacomb from the place where ships are laid up, which the modern Latins and Greeks call cumbas. Others say, that cata was used for ad, and catacumbas for adumbas; accordingly, Dadin says, they anciently wrote catacumbas. Others fetch the word Catacomb from the Greek seme, and κυμβος, a hollow, cavity, or the like.

Anciently the word catacomb was only underfoot of the tombs of St Peter and St Paul; and M. Chatelet obverses, that among the more knowing of the people of Rome, the word catacomb is never applied to the subterraneous burying-places hereafter mentioned, but only to a chapel in St Sebastian, one of the seven national churches; where the ancient Roman calendars say the body of St Peter was deposited, under the confuteul of Tufcans and Basilius, in 238.

Catacombs of Italy: a vast assemblage of subterraneous sepulchres about Rome, chiefly at about three miles from that city in the Via Appia; supposed to be the sepulchres of the martyrs; and which are visited accordingly out of devotion, and relics thence taken and dispersed throughout the catholic countries, after having been first baptized by the pope under the name of some saint. These catacombs are said by many to be caves or cells wherein the primitive Christians hid and assembled themselves together, and where they interred such among them as were martyred. Each catacomb is three feet broad, and eight or ten high; running in form of an alley or gallery, and communicating with others: in many places they extend within a league of Rome. There is no masonry or vaulting therein; but each supports itself: the two sides, which we may look on as the pareties or walls, were the places where the dead were deposited; which were laid lengthwise, three or four rows over one another, in the fame catacomb, parallel to the alley. They were commonly closed with large thick tyles, and sometimes pieces of marble, cemented in a manner imitable by the moderns. Sometimes, though very rarely, the name of the deceased is found on the tyle; frequently a palm is seen, painted or engraven, or the cipher XP, which is commonly read pro Christo. The opinion held by many Protestant authors is, that the catacombs are heathen sepulchres, and the same with the putrefy mentioned by Festus Pompeius; maintaining, that whereas it was the praclice of the ancient Romans to burn their dead, the custom was, to avoid expense, to throw the bodies of their slaves to rot in holes of the ground; and that the Roman Christians, observing, at length, the great veneration paid to relics, resolved to have a flock of their own; entering therefore the catacombs, they added what ciphers and inscriptions they pleased; and then shut them up again, to be opened on a favourable occasion. Those in the secret, add they, dying or removing, the contrivance was forgot, till chance opened them at last. But this opinion has even less of probability than the former. Mr Monroe, in the Philosophical Transactions, supposes the catacombs to have been originally the common sepulchres of the first Romans, and dug in consequence of these two opinions, viz. That shades hate the light; and that they love to hover about the places where the bodies are laid.

Though the catacombs of Rome have made the greatest noise of any in the world, there are such belonging to many other cities. Those of Naples, according to bishop Burnet, are much more noble and spacious than the catacombs of Rome. Catacombs have
Catacombs have also been discovered at Syracuse, and Catania in Sicily, and in the island of Malta. The Roman catacombs take particular names from the churches in their neighbourhood, and seem to divide the circumference of the city into the walls between them, extending their galleries every where under, and a vast way from it; so that all the ground under Rome, and for many miles about it, some say 20, is hollow. The largest, and those commonly shown to strangers, are the catacombs of San Sebastianio, those of Saint Agnese, and the others in the fields a little off Saint Agnese. Women are only allowed to go into the catacombs in the church-yard of the Vatican on Whit-Fun-Monday, under pain of excommunication. There are men kept constantly at work in the catacombs. As soon as these labourers discover a grave with any of the flattened marks of a faint upon it, intuition is given to the cardinal Comerlingo, who immediately sends men of Rome. After the labourers have examined a gallery, they stop up the entry that leads to it; so that most of them remain thus closed up; only a few being left open to keep up the trade of showing them to strangers. This they lay is done to prevent people from losing themselves in these subterraneous labyrinths, which indeed has often happened; but more probably to deprive the public of the means of knowing whither and how far the catacombs are carried.

The method of preserving the dead in catacombs seems to have been common to a number of the ancient nations. The catacombs of Egypt are still extant about nine leagues from the city of Grand Cairo, and two miles from the city of Zaccara. They extend from thence to the pyramids of Pharaoh, which are about eight miles distant. They lie in a field covered with a fine running sand, of a yellowish colour. The country is dry and hilly; the entrance of the tomb was the physicians in this country a few feet below the covering of sand. They extend a great way under ground, so as to be under the city of Memphis, and in a manner to undermine its environs. In some of the chambers the walls are adorned with figures and hieroglyphics; in others the mummies are found in tombs, round the apartment catacombs hollowed out in the rock.

The Egyptians seem to have excelled in the art of embalming and preserving their dead bodies; as the mummies found in the Egyptian catacombs are in a better state than the bodies found either in the Italian catacombs, or those of any other part of the world. See EMBALMING and MUMMY.

Laying up the bodies in caves, is certainly the original way of disposing of the dead; and appears to have been propagated by the Phcenicians throughout the countries to which they sent colonies: the interring as we now do in the open air or in temples was first introduced by the Chirilians. When an ancient hero died or was killed in a foreign expedition, as his body was liable to corruption, and for that reason unfit to be transported entire, they fell on the expedient of burning, in order to bring home the ashes, to oblige them to follow; and his country might not be defitute of the benefit of his tattle. It was thus burning seems to have had its original; and by degrees it became common to all who could bear the expences of it, and took place of the ancient burying: thus catacombs became disused among the Romans, after they had borrowed the manner of burning from the Greeks, and then none but slaves were laid in the ground. See BURIAL, &c.

Catalaunia, called also Durocatalaunia, a town of Gallia Belgica: Catalaunia, the people. A name rather of the lower age than of classical antiquity. Now Chelons or Marne, in Campaign. E. Long. 4° 35. N. Lat. 48° 55.

Cata womus, (from κατά and δρόμος, I run), in antiquity, a stretched sloping rope in the theatres, drawn down which the funambuli walked to show their skill. Somewhat have taken the word to signify the hippodrome or decurionorum wherein the Roman knights used to exercize themselves in running and fighting on horseback. But the most natural meaning is that of a rope fastened at one end to the top of the theatre, and at the other to the bottom, to walk or run down, which was the highest glory of the ancient helenobates or funambuli. Elephants were also taught to run down the catadromus. Suetonius speaks of the exploit of a Roman knight, who passed down the catadromus mounted on an elephant's back.

Catachogion, a heathen festival at Ephesus, celebrated on the 22d of January, in which the devotees run about the streets, dressed in divers antic and unseemly manners, with huge cudgels in their hands, and carrying with them the images of their gods; in which guise they ravished the women they met with, abused and often killed the men, and committed many other disorders, to which the religion of the day gave a sanction.

Catagraphia, in antiquity, denote oblique figures or views of mens faces; answering to what the moderns call profiles. Catagraphs are said to be the invention of Simon Clementius, who first taught painters to vary the looks of their figures, and sometimes direct them upwards, sometimes downwards, and sometimes sidewayes or backwards.

Catalepsy, or Catalepsis, in medicine, a kind
CATALOGUE, a list or enumeration of the names of several books, men, or other things, disposed according to a certain order.

Catalogues of books are digested in different manners, some according to the order of the times when the books were printed, as that of Mattaire; others according to their form and size, as the common booksellers-catalogues; others according to the alphabetical order of the authors names, as Hyde's catalogue of the Bodleian library; others according to the alphabetical order of matters or subjects, which are called real or classical catalogues, as those of Lepenius and Draisius; lastly, others are digested in a mixed method, partaking of several of the former, as de Seine's catalogue of cardinal Sfius's library, which is first divided according to the subjects or sciences, and afterwards the books in each are recited alphabetically.

The most applauded of all catalogues is that of Thuanus's library, in which are united the advantages of all the rest. It was first drawn up by the two Puteani in the alphabetical order, then digested according to the sciences and subjects, by Ihm. Bulliardus, and published by F. Quenel at Paris in 1679; and reprinted, though incorrectly, at Hamburg, in 1704. The books are here ranged with justice under their several sciences and subjects, regard being still had to the nation, sect, age, &c. of every writer. Add, that only the best and choicest books in every subject are found here, and the most valuable editions. Yet the catalogue of M. le Telliers archbishop of Rheims's library, made by M. Clement, is not inferior to any published in our age, either on account of the number and choice of the books, or the method of its disposition. One advantage peculiar to this catalogue is, the multitude of anonymous and pseudonymous authors detected in it, scarce to be met with elsewhere. Some even prefer it to Thuanus's catalogue, as containing a greater variety of classed and books on particular subjects.

The conditions required in a catalogue are, that it indicate at the same time the order of the authors and of the matters, the form of the book, the number of volumes, the chronological order of the editions, the language it is written in, and its place in the library; so that all these circumstances may appear at once in the shortest, clearest, and exactest manner possible. In this view, all the catalogues yet made will be found to be defective.

An anonymous French writer has laid down a new plan of a catalogue, which shall unite all the advantages, and avoid all the inconveniences of the rest.

The Jesuits of Antwerp have given us a catalogue of the popes, which makes what they call their Propylaeum.

CATALOGUE of the Stars, is a list of the fixed stars, disposed in their several constellations; with the longitudes, latitudes, &c. of each.

The first who undertook to reduce the fixed stars into a catalogue was Hipparchus Rhodius, about 120 years before Christ; in which he made use of the observations of Timocharis and Arystyllus for about 180 years before him. Ptolemy retained Hipparchus's catalogue, containing 1026 fixed stars; though he himself made abundance of observations, with a view to a new catalogue, A. D. 140. About the year of Christ 880, Albategni, a Syrian, brought down the same to his time. Anno 1437, Ulugh Begh, king of Parthia and India, made a new catalogue of 1022 fixed stars, since translated out of Persian into Latin by Dr Hyde. The third who made a catalogue from his own observations was Tycho Brahe, who determined the places of 777 stars for the year 1600, which Kepler from other observations of Tycho, afterwards increased to the number of 1000 in the Rudolphine Tables; adding those of Ptolemy omitted by Tycho, and of other authors, so that his catalogue amounts to above 1160. At the same time, William Landgrave of Hesse, with his mathematician Christopher Rothmannus and Julius Byrgius, determined the places of 400 fixed stars by his own observations, with their places rectified for the year 1593; which Hevelius prefers to those of Tycho's. Ricciobus, in his Uranonomia Reformata, determined the places of 101 stars for the year 1700, from his own observations: for the rest he followed Tycho's catalogue; altering it where he thought fit. Anno 1667, Dr Halley, in the island of St Helena, observed 350 southern stars not visible in our horizon. The same labour was repeated by F. Noel in 1770, who published a new catalogue of the same stars constructed for the year 1687.

Bayer, in his Uranometria, published a catalogue of 1160 stars, compiled chiefly from Ptolemy and Tycho, in which every star is marked with some letter of the Greek alphabet; the biggest star in any constellation being denoted by the first letter, the next by the second, &c. and if the number exceeds the Greek alphabet, the remaining stars are marked by letters of the Roman alphabet, which letters are preferred by Flamstead, and by Senex on his globes. The celebrated Hevelius composed a catalogue of 1888 stars in 153 of which were observed by himself; and their places were computed for the year 1660.

The last and greatest is the Britannic catalogue, compiled from the observations of the accurate Mr Flamstead: who, for a long series of years devoted himself wholly thereto. As there was nothing wanting either in the observer or apparatus, we may look on this as a perfect work so far as it goes. It is to be regretted the impression had not passed through his own hands; that now extant, was published by authority, but without the author's consent: it contains 2734 stars. There was another published in 1725, pursuant to his testament; containing no less than 3000 stars, with their places rectified for the year 1689: to which is added Mr Sharp's catalogue of the southern stars not visible in our hemisphere, adapted to the year 1726.

CATALONIA, a province of Spain, bounded on the north by the Pyrenean mountains, which divide it from France; by the kingdom of Aragon and Valencia on the west; and by the Mediterranean sea on the fourth and east. It is 155 miles in length, and 100 in breadth. It is watered by a great number of rivers; the principal of which are the Llobregat, the Ter, and the
Catalonia. The air is temperate and healthy; but the land is mountainous, except in a few places. It produces, however, corn, wine, oil, pulse, flax, and hemp, sufficient for the inhabitants. The mountains are covered with large forests of tall trees, such as the oak, the ever-green oak, the beech, the pine, the fir, the chestnut, and many others: with cork-trees, thorns, and medicinal plants. There are several quarries of marble of all colours, crystall, alabaster, amethysts, and lapis lazuli. Gold dust has been found among the sands of one or two of the rivers; and there are mines of tin, iron, lead, alum, vitriol, and salt. They are hardy, courageous, active, vigorous, and good soldiers, but apt to be discontented.

The air is temperate and healthy; but the inhabitants are hardy, courageous, active, vigorous, and good soldiers, but apt to be discontented. The river Lobregat divides Catalonia into two parts, the east and west, according to their situation. This province comprehends 17 vigueries or districts: two of which are in Rouillon, and belong to the French. The rest are subject to the Spaniards. The principal towns are Barcelona the capital, Terragona, Tortosa, Lerida, Soloniana, Cordova Vich, Girona, Sen d'Urgel, Puj Cerda, and Cervera. Catalonia was the last province in Spain which submitted to Philip in the succession-war.

CATAMENIA, in medicine. See MENSES.

CATAMITE, a boy kept for sodomitical practices.

CATANA, or CATANIA, (anc. geog.) a town of Sicily, situated opposite to Etna, to the south-east; one of the five Roman colonies: anciently built by the people of Naxus seven years after the building of Syracuse, 728 years before Christ. It was the country of Charondas, the famous lawgiver. The town is called Catanea. See CATANEA.

CATANANCHE, CANDIA LION-FOOT: A genus of the polygamiæ æquiliæ order, belonging to the syngenesia clav of plants; and in the natural method ranking under the 49th order, Compositæ. The receptacle is paleaceous; the calyx imbricated; the papus furnished with awns by a calicium of five stiff hairs. There are three species, of which the cerulea is the most remarkable. This sends out many long, narrow, hairy leaves, which are jagged on their edges like those of the buckthorn plantain, but broader; the jags are deeper, and at greater distances: these lie flat on the ground, turning their points upwards. Between the leaves come out the flower flacks, which are in number proportionable to the size of the plant; for, from an old thriving root, there are frequently eight or ten, while young plants do not send out above two or three. These flacks rise near two feet high, dividing into many small branches upward, garnished with leaves like those below, but smaller, and without jags on their edges; each of these smaller branches are terminated by single heads of flower, of five stiff hairs. This is a perennial plant, and may be propagated by seeds or slips. The seeds may be sown in the spring on a bed of common earth; and in the autumn following the plants may be removed to the places where they are to remain. The seeds ripen in August. This plant is a pretty ornament in gardens, and is easily kept within bounds.

CATANEA, or CATANIA, a city of Sicily, seated on a gulph of the same name, near the foot of Mount Etna or Gibel. It was founded by the Cialetians soon after the settlement of Syracuse, and enjoyed great tranquillity till Hiero I. expelled the whole body of citizens; and after replenishing the town with a new flock of inhabitants, gave it the name of Etna; immediately after his decease, it regained its ancient name, and its citizens returned to their abodes. Catania fell into the hands of the Romans, among their earliest acquisitions in Sicily, and became the residence of a praetor. To make it worthy of such an honour, it was adorned with sumptuous buildings of all kinds, and every convenience was procured to supply the natural and artificial wants of life. It was destroyed by Pompey's fan, but restored with superior magnificence by Augustus. The reign of Decias is famous in the history of this city for the martyrdom of its patroness St Agatha. On every emergency her intercession is implored. She is piously believed to have preferred Catania from being overwhelmed by torrents of lava, or shaken to pieces by earthquakes; yet its ancient edifices are covered by repeated streams of volcanic matter; and almost every house, even her own church, has been thrown to the ground. In the reign of William the Good, 20,000 Catanians, with their pastor at their head, were destroyed before the sacred veil could be properly placed to check the flames. In the last century the eruptions and earthquakes raged with reprobated violence, and Catania was twice demolished. See ETNA.

The present prince of Biscar has been at infinite pains, and spent a large sum of money, in working down to the ancient town, which on account of the numerous torrents of lava that have flowed out of Mount Etna for these last thousand years, is now to be sought for in dark caverns many feet below the present surface of the earth. Mr Swinburne informs us that he descended into the baths, sepulchres, an amphitheatre, and a theatre, all very much injured by the various catastrophes that have befallen them. They are erected upon old beds of lava, and even built with square portions of the same substance, which in no instance appears to have been fused by the contact of new lavas. The scint or stones of cold lava, have constantly prove& as strong a barrier against the flowing torrent of fire as any other stone could have been, though some authors were of opinion that the hot matter would melt the old mafs and incorporate with it.

This city has been frequently defended from the burning streams by the bold mafs of its own ramparts, and by the air compressed between them and the lava; as appears by the torrent having flpt within a small distance of the walls, and taken another direction. But when the walls were broken or low, the lava collected itself till it rose to a great height, and then poured over in a curve. A similar prodigy befell the Terro del Greco near Naples, where the stream of liquid fire from Vesuvius divided itself into two branches, and left a church untouched in the middle. There is a well at the foot of the old walls of Catania, where the lava, after running along the parapet, and then falling...
The church here is a noble fabric. It is accounted the largest in Sicily, though neither a porch nor cupola has been erected, from a doubt of the solidity of the foundations, which are no other than the bed of lava that ran out of Etna in 1669, and is supposed to be full of cavities. The organ is much esteemed by connoisseurs in musical instruments.

Catania, according to Mr. Swinburne's account, is reviving with great splendor. \textit{"It has already (he says) much more the features of a metropolis and royal residence than Patræmo;} the principal streets are wide, straight, and well paved with lava. An obelisk of red granite, placed on the back of an antique elephant of tontochrome stands in the centre of the great square, which is formed by the town-hall, seminary, and cathedral. The cathedral erected by the abbott Angerus in the year 1094, was endowed by earl Roger with the territories of Catania and Etna, for the small acknowledgement of a glass of wine and a loaf of bread offered once a year. It has suffered so much by earthquakes, that little of the original structure remains, and the modern parts have hardly anything except their materials to recommend them. The other religious edifices of the city are profusely ornamented, but in a bad taste. The spirit of building seems to have feized upon this people, and the prince of Biscari's example adds fresh vigour. It was natural to suppose men would be backward in erecting new habitations, especially with any degree of luxury, on ground so often shaken to its centre, and so often buried under the ashes of a volcano; but such is their attachment to their native soil, and their contempt of dangers they are habituated to, that they rebuild their houses on the warm cinders of Vesuvius, the quaking plains of Calabria, and the black mountains of Sciarra at Catania; it is however surprising to see such embellishments lavished in so dangerous a situation. There is a great deal of activity in the disposition of this people; they know by tradition that their ancestors carried on a flourishing commerce; and that, before the fiery river filled it up, they had a spacious convenient harbour, where they now have a creek for a felucia: they therefore with to restore those advantages to Catania, and have often applied to government for assistance towards forming a mole and port, an undertaking their strength alone is unequal to; but whether the refusal originates in the deficiencies of the public treasury or the jealousy of other cities, all their projects have ended in fruitless applications. The number of inhabitants dwelling in Catania amounts to 30,000; the Catanians make it double: A considerable portion of this number appertains to the university, the only one in the island, and the nurseries of all the lawyers." E. Long. 15. 19. N. Lat. 37. 30.

CATANZARO, a city in the kingdom of Naples, the capital of Calabria Ulterior, with a bishop's see. It is the usual residence of the governor of the province, and is seated on a mountain, in E. Long. 18. 20. N. Lat. 38. 58.

CATAPHONICS, the science which confiders the properties of reflected sounds. See Acoustics.

CATAPHORA, in medicine, the name as Coma.

CATAPHRACTA, (from ἑτά, and φρακτός, I for-
The capital-piece of the machine is a nut or cross-pin of iron, 17, seen at C, and hammered cold into its form. It divides the bore of the capitals exactly in two equal parts, and fixed in grooves about an inch deep. This piece, or nut, ought to be about two inches and one-third thick at the top 18, as represented in the section at B; and rounded off and polished as much as possible, that the cords folded over it may not be hurt or cut by the roughness or edges of the iron. Its height ought to be eight inches, decreasing gradually in thickness to the bottom, where it ought to be only one inch. It must be very exactly inflected in the capitals.

After placing the two capitals in the holes of the two beams in a right line with each other, and fixing the two crofs diametrical nuts or pieces over which the cordage is to wind, one end of the cord is reeved through a hole in one of the capitals in the base, and made fast to a nail within side of the beam. The other side of the cord is then carried through the hole in the opposite beam and capital, and so wound over the crofs pieces of iron in the centre of the two capitals, till they are full, the cordage forming a large skain. The tension or straining of the cordage ought to be equally equal, that is, the several foldings of the cord over the capital-pieces should be equally strained, and so near each other as not to leave the least space between them. As soon as the first folding or skain of cord has filled up one whole space or breadth of the capital pieces, another must be carried over it; and so on, always equally straining the end till no more will pass through the capitals, and the skain of cordage entirely fills them, obliterating it from time to time with soap.

At three or four inches behind the cordage, thus wound over the capital pieces, two very strong upright beams 21 are raised; these roll on 22, 24 inches thick, crofsed over at top by another of the same thickness. The height of the upright beams is 17 diameters; each supported behind with very strong props 25, fixed at bottom in the extremities of the base 2, 3. The crofs beam 24 is supported in the same manner by a prop in the centre.

The arm, or stylus 22, should be of found 8th. Its length is from 15 to 16 diameters of the base of the capitals. The end at the bottom, or that fixed in the middle of the skain, is 10 inches thick, and 14 broad. To strengthen the arm or tree, it should be wrapped round with a cloth dipped in strong glue like the tree of a faddle, and bound very hard with waxed thread of the sixth of an inch in diameter from the large end at bottom, almost to the top, as represented in the figure.

At the top of the arm, just under the iron-hand or receiver 27, a strong card is fastened, with two loops twisted one within another, for the greater strength. Into these two loops the hook of a brafs pulley 28 is put. The cord 29 is then reeved through the pulley, and fastened to the roll 30. The cock or trigger 31, which
CATAPOULTA

which serves as a stay, is then brought to it, and
made fast by its hook to the extremity of the hand
27, in which the body to be discharged is placed.
The pulley at the neck of the arm is then unhooked,
and when the trigger is to let it off, a stroke must be
given upon it with an iron bar or crow of about an
inch in diameter; on which the arm, flies up with a
force almost equal to that of a modern mortar. The
elevation or hemachor 23, placed exactly in the middle
of the cross-beam 24, should be covered with tanned
ox-hide, and stuffed with hair, the arm striking against
it with inconceivable force. It is to be observed, that
the tree or arm 22 describes an angle of 90 degrees,
beginning at the cock, and ending at the hemachor or
elevation.

CATAPULTA for Arrows, Spears, or Darts. Some of
the spears, &c. thrown by these engines are said to
have been 18 feet long, and to have been thrown with
such velocity as to take fire in their course.

A B C D is the frame that holds the darts or
arrows, which may be of different numbers, and placed
in different directions. E F F is a large and strong
iron spring, which is bent by a rope that goes over
three pulleys I, K, L; and is drawn by one or several
men; this rope may be

thrown

up of all difficulties may appear wonderful, and yet
easy, simple, and natural.

It is a very preposterous artifice of some writers to
show the catastrophe in the very title of the play. Mr
Dryden thinks that a catastrophe resulting from a mere
change in the sentiments and resolutions of a person,
without any other machinery, may be so managed as to
be exceedingly beautiful.

It is a dispute among the critics, whether the cata-
trope should always fall out favourably on the side of
virtue or not. The reasons on the negative side seem
the strongest. Aristotle prefers a shocking catastrophe to
a happy one—The catastrophe is either simple or com-
plicated. The first is that in which there is no change in
the state of the principal persons, nor any discovery
or unravelling, the plot being only a mere passage out
of agitation into quiet repose. In the second, the prin-
cipal persons undergo a change of fortune, in the man-
ner already defined.

CATCH, in poetry, the third part of the
ancient drama; being that wherein the intrigue, or
action, set forth in the epistle, is supported, carried on,
and heightened, till it be ripe for the unravelling
in the catastrophe. Scaliger defines it, the full growth
of the fable, while things are at a stand in that con-
fusion to which the poet has brought them.

CATASTROPE, in dramatic poetry, the fourth
and last part in the ancient drama; or that immediate-
l y succeeding the catastrophe; or, according to others,
the third only; the whole drama being divided into pro-
tasis, epistasis, and catastrophe, or in the terms of
Aristotle, prologue, epilogue, and exode.

The catastrophe clears up every thing, and is noth-
ing else but the discovery or winding up of the plot.
It has its peculiar place: for it ought entirely to be con-
tained, not only in the last act, but in the very conclu-
sion of it; and when the plot is finishe’d, the play should
be so also. The catastrophe ought to turn upon a single
point, or start up on a sudden.

The great art in the catastrophe is, that the clearing
up of all difficulties may appear wonderful, and yet
easy, simple, and natural.

It is a very preposterous artifice of some writers to
show the catastrophe in the very title of the play. Mr
Dryden thinks that a catastrophe resulting from a mere
change in the sentiments and resolutions of a person,
without any other machinery, may be so managed as to
be exceedingly beautiful.

It is a dispute among the critics, whether the cata-
trope should always fall out favourably on the side of
virtue or not. The reasons on the negative side seem
the strongest. Aristotle prefers a shocking catastrophe to
a happy one—The catastrophe is either simple or com-
plicated. The first is that in which there is no change in
the state of the principal persons, nor any discovery
or unravelling, the plot being only a mere passage out
of agitation into quiet repose. In the second, the prin-
cipal persons undergo a change of fortune, in the man-
ner already defined.

CATCH, in the musical sense of the word, a fugue
in the union, wherein, to humour some conceit in the
words, the melody is broken, and the fuge interrupted
in one part, and caught again or supported by another;
as in the catch in Shakespeare’s play of the Twelfth-
night, where there is a catch sung by three persons, in
which the humour is, that each who sings, calls, and is
called knowe in turn: Or, as defined by Mr Jackson, “a
catch is a piece for three or more voices, one of which
leads, and the other follow in the same notes. It
must be so contrived, that after (which are made for that
purpose) in the music of one line be filled up with a word
or two from another line; these form a croz’p purpose, or
catch, from whence the name.”

CATCH-FLY, in botany. See LYTEHIS.

CATCH-Pole, (quasi one that catches by the pole), a
term used, by way of reproach, for the bailiff’s follow-
er or assistant.

CATCH-Word, among printers, that placed at the bot-
tom of each page, being always the first word of the
following page.

CATECHESIS, in a general sense, denotes an in-

struction
Catechetical instruction given any person in the rudiments of an art or science; but more particularly of the Christian religion. In the ancient church, catechets was an instruction given either to children, or adult heathens, preparatory to their receiving of baptism. In this sense, catecheta stands contradiinguished from mystagogiae, which were a higher part of instruction given to those already initiated, and containing the mysteries of faith. Those who give such instructions are called catecheta; and those who receive them, catechumens.

CATECHETIC, or CATECHETICAL, something that relates to oral instruction in the rudiments of Christianity. Catechetical schools were buildings appointed for the office of the catechist, adjoining to the church, and called catechumenon: such was that in which Origen and many other famous men read catechetical lectures at Alexandria. See CATECHUMEN.

CATECHISM, in its primary sense, an instruction, or institution, in the principles of the Christian religion, delivered vivis voce, and so as to require frequent repetitions, from the disciple or hearer, of what has been said. The word is formed from καταστίγμαν, a compound of καταστίγμα, q. d. circumstima, alluding to the noise or din made in this sort of exercise, or to the zeal and earnestness whereby things are to be inculcated over and over on the learners. Anciently the candidates for baptism were only to be instructed in the secrets of their religion by tradition vivis voce, without writing; as also had been the case among the Egyptian priests, and the British and Gaulish druids, who only communicated the mysteries of their theology by word of mouth.

Catechism is more frequently used in modern times for an elementary book, wherein the principal articles of religion are humorously delivered in the way of question and answer.

CATECHIST, καταστίγμα, καταστίγματος, he that catechizes, i. e. he that instructs novices in the principles of religion.

Catechist more particularly denotes a person appointed by the church to instruct those intended for baptism, by word of mouth, in the fundamental articles of the Christian faith. The catechists of churches were ministers usually distinct from the bishops and presbyters, and had their auditories or catechumenon apart. Their business was to instruct the catechumens, and prepare them for the reception of baptism. But the catechists did not constitute any distinct order of the clergy, but were chosen out of any other order. The bishop himself sometimes performed the office; at other times presbyters, or even readers or deacons, were the catechists. Origen seems to have had no higher degree in the church than reader, when he was made catechist at Alexandria, being only 18 years of age, and consequently incapable of the deaconship.

Catechu, in the materia medica, the name of a herbageous plant, of the species of Japan earth and gum arabic, each two ounces, and of sugar of roses fifteen ounces, beat together with a little water. It is recommended as a mild refrigerent, &c.

Catechumen, a candidate for baptism, or one who prepares himself for the receiving thereof.

The catechumens, in church-history, were the lowest order of Christians in the primitive church. They Categorical had some title to the common name of Christian, being a degree above pagans and heretics, though not constituted by baptism. They were admitted to the state of catechumens by the imposition of hands, and the sign of the cross. The children of believing parents were admitted catechumens, as soon as ever they were capable of instruction; but at what age those of heathen parents might be admitted, is not so clear. As to the time of their continuance in this state, there were no general rules fixed about it; but the practice varied according to the difference of times and places, and the readiness and proficiency of the catechumens themselves.

There were four orders or degrees of catechumens; the first were those instructed privately without the church, and kept at a distance for some time from the privilege of entering the church, to make them the more eager and devout of it. The next degree were the audientes, so called from their being admitted to hear sermons, and the scriptures read in the church, but were not allowed to partake of the prayers. The third sort of catechumens were the genu-flectentes, so called because they received imposition of hands kneeling. The fourth order was the competentes et electi, denoting the immediate candidates for baptism, or such as were appointed to be baptized the next approaching festival; before which, strict examination was made into their proficiency under the several stages of catechetical exercises.

After examination, they were exercised for twenty days together, and were obliged to fasting and confession, some days before baptism, they went veiled; and it was customary to touch their ears, saying, Ephes. i. c. Be opened; as also to anoint their eyes with clay; both ceremonies being in imitation of our Saviour's practice, and intended to shadow out to the catechumens their condition both before and after their admission into the Christian church.

CATEGORICAL, in a general sense, is applied to those things ranged under a CATEGORY.

Categorical also imports a thing to be absolute, and not relative: in which sense it stands opposed to hypothetical. We say, a categorical proposition, a categorical syllogism, &c.

A categorical answer denotes an express and pertinent answer made to any question or objection proposed.

CATEGORY, in logic, a series or order of all the predicates or attributes contained, under any genus.

The school-philosophers distribute all the objects of our thoughts and ideas into certain genera or classes, not too much, say they, to learn what they do not know, as to communicate a distinct notion of what they do know; and these classes the Greeks called categories, and the Latins predicaments.

Aristotle made ten categories, viz. quantity, quality, relation, action, passion, time, place, duration, and habit, which are usually expressed by the following technical ditich:

|-------|------|--------|------------------|-------|

CATEK. See BENGAL, n° 15.

CATENARIA, in the higher geometry, the name of a curve-line formed by a rope hanging freely from two
CAT [ 251 ]

CATERPILLAR, in zoology, the name of all winged insects when in their reptile or worm-like state. See ERUCUS.

Method of Destroying CATERPILLARS on Trees.—

Take a chafing-dish with lighted charcoal, and placing it under the branches that are loaded with caterpillars, throw some pinches of brimstone upon the coals. The vapour of the sulphur, which is mortal to these insects, will not only destroy all that are on the tree, but prevent it from being infested with them afterwards. A pound of sulphur will clear as many trees as grow on several acres. This method has been successfully tried in France. In the Journal Occasionalis, the following is said to be infallible against the caterpillars feeding on cabbage, and perhaps may be equally serviceable against those that infest other vegetables. Sow with hemp all the borders of the ground where you mean to plant your cabbage; and, although the neighbourhood is infested with caterpillars, the space inclosed by the hemp will be perfectly free, not one of the vermin will approach it.

CATERPILLAR-Eaters, a name given by some authors to a species of worms bred in the body of the caterpillar, and which eat its flesh; these are owing to a certain kind of fly that lodges her eggs in the body of this animal, and they, after their proper changes, become flies like their parents.

Mr. Reaumur has given us, in his history of insects, some very curious particulars in regard to these little worms. Every one of them, he observes, spins itself a very beautiful case; a cylindrical figure, made of a very strong sort of silk; these are the cases in which this animal spends its state of chrysalids; and they have a mark by which they may be known from all other animal productions of this kind, which is, that they have always a broad stripe or band surrounding their middle, which is black when the rest of the case is white, and white when that is black. Mr. Reaumur has had the pains and patience to find out the reason of this singularity, which is this: the whole sheil is spun of a silk produced out of the creature's body; this at first runs all white, and towards the end of the spinning turns black. The outside of the case must necessarily be formed first, as the creature works from within; consequently this is truly white all over, but it is transparent, and shows the last spun or black silk through it. It might be supposed that the whole inside of the shell should be black; but this is not the case: the whole is fashioned before this black silk comes; and this is employed by the creature, not to line the whole, but to fortify certain parts only; and therefore is all applied either to the middle, or to the two ends omitting the middle; and so gives either a black band in the middle, or a blackness at both ends, leaving the white in the middle to appear. It is not unfrequent to find a fort of small cases, lying about garden walks, which move of themselves; when these are opened, they are found to contain a small living worm. This is one of the species of these caterpillar-eaters; which as soon as it comes out of the body of that animal, spins itself a case for its transformation long before that happens, and lives in it without food till that change comes on; and it becomes a fly like that to which it owed its birth.

CATERVA, in ancient military writers, a term used in speaking of the Gaulish or Celtiberian armies, denoting a body of 6000 armed men. The word catterva, or catterarius, is also frequently used by ancient writers to denote a party or corps of soldiers in disorder or disarray: by which it stands distinguished from cohort or turma, which were in good order.

CATESBRIA, theilly-thorn: A genus of the monogyny order, belonging to the tetrandra class of plants; and in the natural method ranking under the 28th order, Luridae. The corolla is monopetalous, funnel-shaped, very long above the receptacle of the fruit; the stamens are within its throat; the fruit a polypermous berry. There is only one species, viz. the Spinosis, which was discovered in the island of Providence by Mr. Catesby, who gathered the seeds, and brought them to England. It rises to the height of ten or twelve feet, and is covered with a pale ruffle; bark; the branches come out alternately, and are garnished with small leaves resembling those of the box-tree, coming out in clusters all round the branches at certain distances; the flowers hang downward, and come out from the side of the branches: they are tubulous and near six inches long, very narrow at their base, but widening upwards towards the top, where it is divided into four parts which spread open, and are reflexed backward. They are of a dull yellow colour. This plant is propagated by seeds which must be procured from the country where it grows. The seeds must be sown on a hot-bed, and are to be treated in the same manner as other tender exotics.

CATHARINUS, in pharmacy, medicines of a caustic nature, serving to eat off proud fleas.

CATHARINE, Knights of St. Catharine of Mount Sinai, an ancient military order, erected for the assistance and protection of pilgrims going to pay their devotion to the body of St. Catharine, a virgin of Alexandria, distinguished for her learning, and said to have suffered martyrdom under Maximin. The body of the martyr having been discovered on mount Sinai, caused a great concourse of pilgrims; and travelling being very dangerous, by reason of the Arabs, an order of knighthood was erected in 1063, on the model of that of the holy sepulchre, and under the patronage of St. Catharine: the knights of which obliged themselves by oath to guard the body of the saint, keep the roads secure, observe the rules of St. Basil, and obey their grand master. Their habit was white, and on it were represented the instruments of martyrdom whereby the saint had suffered: viz. a halberd armed with spikes, and traverfed with a sword stained with blood.

CATHARINE, Fraternity of St. Catharine at Sienna, a sort of religious society instituted in that city, in honour of St. Catharine, a saint famous for her revelations, and for her marriage with Jesus Christ, whose wedding ring is still preserved as a valuable relic. This fraternity yearly endows a certain number of destitute virgins, and has the privilege of redeeming annually two criminals condemned for murder, and the same number of debtors, by paying their debts.

CATHARTICS, in medicine, remedies which produce
Catherine

CATHEDRAL, in botany. See AEGEAE.

CATHEDRAL, in a general sense, a chair. — The word is more particularly used for a professor's chair, and a preacher's pulpit.

CATHEDRA is also used for the bishop's see, or throne, in a church.

CATHEDRAL, a church wherein is a bishop's see or seat; See CHURCH, and BISHOP. The word comes from the Greek καθεδρα, "chair," of καθεδραν, sedes, "I sit." The denomination cathedra seems to have taken its rise from the manner of sitting in the ancient churches, or assemblies of primitive christians; in these, the council, i. e. the elders and priests, was called Presbyterium; at their head was the bishop, who held the place of chairman, Cathedratis, or Cathedraeius; and the prebys, who sat on either side, were also called by the ancient fathers, Aesofines Episcoporum. The episcopal authority did not reside in the bishop alone; but in all the prebys, whereof the bishop was president. A cathedral, therefore, originally, was different from what it is now; the christians, till the time of Constantine, having no liberty to build any temple: by their churches they only meant their assemblies, and by cathedrals, nothing more than confuburbies.

CATHARINE. See PARR.

CATHARINE. Empress of Russia, a most extraordinary personage, whose history deserves to be given in detail. She was a natural daughter of a country girl; and was born at Ringen, a small village upon the lake Viercherve, near Dorp in Livonia. The year of her birth is uncertain; but, according to her own account, she came into the world on the 5th of April, 1687. Her original name was Martha, which the change for Catherine when the embraced the Greek religion. Count Rofen, a lieutenant-colonel in the Swedif service, who owned the village of Ringen, supported, according to the custom of the country, both the mother and the child: and was, for that reason, fopowed by many persons to have been her father. She left her mother when she was but three years old; and, as count Rofen died about the fame time, she was left in fo deflute a situation, that the parish-clerk of the village received her into his house. Soon afterwards Guile, Lutheran minister of Marienburg, happening, in a journey through those parts, to fee the foundling, took her under his protection, brought her up in his family, and employed her in attending his children. In 1701, and about the 14th year of her age, she espoused a dragon of the Swedif garrifon of Marienburg. Many different accounts are given of this transaction; one author of great credit affirms that the bride and bridegroom remained together eight days after their marriage; another, of no less authority, afferts, on the contrary, that on the morning of their nuptials her husband being bent with a detachment for Riga, the marriage was never consummated. Thus much is certain, that the dragon was absent when Marienburg surrendered to the Rusfians; and Catherine, who was referred for a higher fortune, never saw him more.

General Bauer, upon the taking of Marienburg, saw Catherine among the prisoners; and, being smitten with her youth and beauty, took her to his house, where she superintended his domestic affairs, and was Catharine, fopossed to be his mistress. Soon afterwards she was removed into the family of prince Menzikof, who was no less struck with the attractions of the fair captive. With him she lived until 1704; when, in the 17th year of her age, she became the mistress of Peter the Great, and won so much upon his affections, that he espoused her on the 29th of May 1711. The ceremony was secretly performed at Jaworof in Poland, in the presence of General Bruce; and on the 20th of February, 1712, it was publicly solemnized with great pomp at Peterburgh.

Catherine, by the most unweaied affiduity and unremitted attention, by the softness and complacency of her disposition, but above all by an extraordinary vivacity and gaiety of temper, acquired a wonderful ascendancy over the mind of Peter. The latter was Subject to occasional horrors, which at times rendered him gloomy and fupicious, and raised his passions to such an height as to produce a temporary madness. In these dreadful moments Catherine was the only person who durft venture to approach him; and fuch was the kind of fascination she had acquired over his fenes, that her presence had an instantaneous effect, and the first found of her voice compeled his mind and calmed his agonies. From these circumstances she seemed necessary, not only to his comfort, but even to his very exiftence, the became his ineparable companion on his journeys into foreign countries, and even in all his military expeditions.

The peace of Pruth, by which the Russian army was reftored from certain deftruftion, has been wholly attributed to Catherine, though she was little more than an instrument in procuring the content of Peter. The latter, in his campaign of 1711 against the Turks, having imprudently led his troops into a disadvantageous situation, took the desperate resolution of cutting his way through the Turkif army in the night. With this resolution he retired to his tent in an agony of despair, and gave positive orders that no one should be admitted under pain of death. In this important juncture the principal officers and the vice-chancellor Shaffirof, assembled in the presence of Catherine, and drew up certain preliminaries in order to obtain a truce from the grand vizir. In consequence of this determination, plenipotentiaries were immediately dispatched without the knowledge of Peter, to the grand vizir, and a peace obtained upon more reasonable conditions than could have been expected. With these conditions Catherine, notwithstanding the orders iffued by Peter, entered his tent, and prevailed upon him to sign them. Catherine, by her conduct on this occasion, acquired great popularity; and the emperor particularly approves her conduct to Pruth as one of the reasons which induced him to crown her publicly at Moscow with his own hand. This ceremony was performed in 1724; and although designed by Peter only as a proof of his affection, was the principal cause of her subsequent elevation.

Her influence continued undiminished until a short time before the death of the emperor, when some circumstances happened which occasioned such a coolness between them as would probably have ended in a total rupture, if his death had not fortunately intervened. The
were too well known, and come... her motions. From the page's... discovery, complimentary arbour of the garden with her favourite Mons; while his page, upon the watch without the arbour.

...and Mons was carried to the winter palace, but... of the... days of her husband... and Mons was carried to the winter palace, where no one had admission to him but Peter, who himself brought him his provisions. A report was at the same time circulated, that they were imprisoned for having received bribes, and making their influence over the empress subservient to their own mercenary views. Mons being examined by Peter, in the presence of major-general Ushakov, and threatened with the torture, confessed the corruption which was laid to his charge. He was beheaded; his sister received five strokes of the knout, and was banished into Siberia; two of her sons, who were chamberlains, were also degraded, and sent as common soldiers among the Russian troops in Persia. On the day subsequent to the execution of the sentence, Peter conveyed Catherine in an open carriage under the gallows, to which was nailed the head of Mons. The empress, without changing colour at this dreadful sight, exclaimed, "What a pity it is that there is so much corruption amongst us!"

This event happened in the latter end of the year 1724; and as it was soon followed by Peter's death, and Catherine upon her accession recalled Madame Balke, it has been suspected that the shortened the days of her husband by poison. But notwithstanding the critical situation for Catherine in which he died, and her subsequent elevation, this charge is totally defective of the least shadow of proof: for the circumstances of Peter's disorder were too well known, and the peculiar symptoms of his last illness sufficiently account for his death, without the necessity of recurring to poison.

While Peter was yet lying in the agonies of death, several opposite parties were endeavouring to dispose of the crown. At a considerable meeting of many among the principal nobility, it was secretly determined, on the moment of his disfellowship, to arrest Catherine, and to place Peter Alexievitch upon the throne. Bassevitz, apprized of this resolution, repaired in person to the empress, although it was already night: "My grief and consternation," replied Catherine, "render me incapable of acting myself: do you and prince Menzikof confit together, and I will embrace the measures which you shall approve in my name." Bassevitz, finding Menzikof asleep, awakened and informed him of the pressing danger which threatened the empress and her party. As no time remained for long deliberation, the prince instantly seized the treasure, secured the fortresses, gained the officers of the guards by bribes and promises, also a few of the nobility, and the principal clergy. These partizans being convened in the palace, Catherine made her appearance: she claimed the throne in right of her coronation at Moscow; she expunged the ill effects of a minority; and promised, that "so far from depriving the great-duke of the crown, she would receive it only as a sacred deposit, to be restored to him when the should be united, in another world, to an adored husband, whom she was now upon the point of losing."

The pathetic manner with which she uttered this address, and the tears which accompanied it, added to the previous distribution of large sums of money and jewels, produced the desired effect: at the close of this meeting the remainder of the night was employed in making the necessary preparations to infuse her affection in case of the emperor's death. Peter at length expired in the morning of the 28th of January 1725. This event being made known, the senate, the generals, the principal nobility and clergy, hastened to the palace to proclaim the new sovereign. The adherents of the great duke seemed to care for success, and the friends of Catherine were avoided as persons doomed to destruction. At this juncture Bassevitz whispered one of the opposite party, "The empress is mistress of the treasure and the fortresses; she has gained over the guards and the fynod, and many of the chief nobility; even here she has more followers than you imagine; advise therefore your friends to make no opposition as they value their heads." This information being rapidly circulated, Bassevitz gave the appointed signal, and the two regiments of guards, who had been gained by a large party to declare for Catherine, and had already surrounded the palace, beat to arms. "Who has dared," exclaimed prince Repnin, the commander, "to order out the troops without my knowledge?" "I, returned general Butckerlin, without pretending to dispute your authority, in obedience to the commands of my most gracious mistress." This short reply was followed by a dead silence. In this moment of suspense an anxiety Menzikof entered, preceding Catherine, supported by the duke of Holftein. She at first attempted to speak, but was prevented by sighs and tears from giving utterance to her words: at length, recovering herself, "I come (he said), notwithstanding the grief which now overwhelms me, to assure you, that, submissive to the will of my departed husband, whose memory will be ever dear to me, I am ready to devote my days to the painful occupations of government until Providence shall summon me to follow him." Then, after a short pause, she artfully added, "If the great-duke will profit by my instructions, perhaps I shall have the consolation, during my wretched widowhood, of forming for you an emperor worthy of the blood and the name of him whom you have now irretrievably lost." "As this crisis (replied Menzikof) is a moment of such importance to the good of the empire, and requires the most mature deliberations, your ma...
Catherine, jealously will permit us to confer, without refraining, that this whole affair may be transacted without reproach, as well in the opinion of the present age as in that of posterity.” “Acting as I do (answered Catherine), more for the public good than for my own advantage, I am not afraid to submit all my concerns to the judgment of such an enlightened assembly; you have not only my permission to confer with freedom; but I lay my commands upon you all to deliberate maturely on this important subject, and I promise to adopt whatever may be the result of your decisions.” At the conclusion of these words the assembly retired into another apartment, and the doors were locked.

It was previously settled by Menzikof and his party that Catherine should be empress, and the guards, who surrounded the palace with drums beating and colours flying, effectually vanquished all opposition. The only circumstance, therefore, which remained, was to give a just colour to her title, by perfuming the assembly that Peter intended to have named her his successor. For this purpose Menzikof demanded of that emperor’s secretary, whether his late master had left any written declaration of his intentions! The secretary replied, “That a little before his last journey to Moscow he had destroyed a will; and that he had frequently expressed his design of making another, but had always been prevented by the reflection, that if he thought his people, whom he had raised from a state of barbarism to an high degree of power and glory, could be ungrateful, he would not expose his final intentions to the infiltion of a refusal; and that if they recollected what they owed to his labours, they would regulate their conduct by his intentions, which he had disclosed with more solemnity than could be manifested by any writings.” An altercation now began in the assembly; and some of the nobles having the courage to oppose the accession of Catherine, Theophanes archbishop of Plovdiv called to their recollection the oath which they had all taken in 1722 to acknowledge the successor appointed by Peter; and added, that the sentiments of that emperor delivered by the secretary were in effect an appointment of Catherine. The opposite party, however, denied these sentiments to be so clear as the secretary chose to infinuate; and inferred, that as their late monarch had failed to nominate his heir, the election of the new sovereign should revert to the state. Upon this the archbishop further testified, that the evening before the coronation of the empress at Moscow, Peter had declared in the house of an English merchant, that he should place the crown upon her head with no other view than to leave her mistress of the empire after his decease. This attestation being confirmed by many persons present, Menzikof cried out, “What need have we of any testament! A refusal to conform to the inclination of our great sovereign, thus authenticated, would be both unjust and criminal. Long live the empress Catherine!” These words being instantly repeated by the greatest part of those who were present, Menzikof, isolating Catherine by the title of empress, paid his first obeisance by kissing her hand; and his example was followed by the whole assembly. She next presented herself at the window to the guards, and to the people, who shouted exclamations of “Long live Catherine!” while Menzikof scattered amongst them handfuls of money. Thus Catherine (says a contemporary) was raised to the throne by the guards, in the same manner as the Roman emperors by the praetorians cohorts, without either the appointment of the people or of the legions.

The reign of Catherine may be considered as the reign of Menzikof, that empress having neither inclination or abilities to direct the helm of government; and she placed the most implicit confidence in a man who had been the original author of her good fortune, and the sole instrument of her elevation to the throne.

During her short reign her life was very irregular; she was extremely averse to business; would frequently, when the weather was fine, pass whole nights in the open air; and was particularly intemperate in the use of tokaoy-wine. These irregularities, joined to a cancer and a dropy, hastened her end, and she expired on the 17th of May 1727, a little more than two years after her accession to the throne, and in about the 40th year of her age.

As the deaths of sovereigns in despotic countries are seldom imparted to natural causes, that of Catherine has also been attributed to poison; as if the disorders which preceded her frame were not sufficient to bring her to her grave. Some affirm, that she was poisoned in a glass of spirituous liquor; others, by a pear given her by general Diever. Suspicions also fell upon prince Menzikof, who, a short time before her decease, had a terible misunderstanding with her; and who was accused of hastening her death that he might reign with still more absolute power during the minority of Peter II. But these reports deferve not the least credit, and were merely dictated by the spirit of party or by popular rumour.

Catherine was in her person under the middle-size, and in her youth delicate and well-formed, but inclined to corpulency as she advanced in years. She had a fair complexion, dark eyes, and light hair, which she was always accustomed to dye with a black colour. She could neither read nor write; her daughter Elizabeth usually signed her name for her, and particularly to her last will and testament; and Count Osterman generally put her signature to the public decrees and dispatches. Her abilities have been greatly exaggerated by her panegyrists. Gordon, who had frequently seen her, feems, of all writers, to have represented her character with the greatest justice, when he says, “She was a very pretty look’d woman, of good figure, but not of that sublimity of wit, or rather that quickness of imagination, which some people believe. The great reason why the czar was so fond of her, was her exceeding good temper; she never was seen peevish, or out of humour; obliging and civil to all, and never forgetful of her former condition; withal, mighty grateful.” Catherine maintained the pomp of majesty with an air of ease and grandeur united; and Peter used frequently to express his admiration at the propriety with which she supported her high station, without forgetting that she was not born to that dignity.

The following anecdotes will prove that the bore her elevation meekly; and, as Gordon affirms, was never forgetful of her former condition. When Wurmby, who had been tutor to Gluck’s children at
the time that Catherine was a domestie in that cler­
gaman's family, presented himself before her after her mar­riage with Peter had been publicly solemnized, she re­collected and addressed him with great compla­ency, "What, thou good man, art thou still alive! I will provide for thee." And the accordingly settled upon him a pension. She was no less attentive to the family of her benefactor Gluck, who died a prisoner at Moscow: the petitioned his widow; made him a for­page; portioned the two eldest daughters; and ad­vanced the youngest to be one of her maids of honour. If we may believe Weber, she frequently enquired af­ter her first husband; and, when she was helped with Prince Menziken, used secretly to send him small sums of mon­ey, until, in 1705, he was killed in a skirmish with the enemy.

But the most noble part of her character was her pecu­lar humanity and compassion for the unfortunate. Motrye has paid a handsone tribute to this excelle­ence. "She had, in former, the government of all his (Peter's) passions; and even saved the lives of a great many more persons than Le Fort was able to do; she inspired him with that humanity, which, in the opinion of his subjects, nature seemed to have denied him. A word from her mouth in favour of a wretch, just going to be sacrificed to his anger, would dis­arm him; but if he was fully resolved to satisfy that paffion, he would give orders for the execution when he was absent, for fear she should plead for the victim." In a word, to use the expression of the celebrated Munich, "Elle estoit prompte la mediatisere entre le monarque et ses sujets."

CATHARINE (Order of St) in modern history, belongs to ladies of the first quality in the Russian court. It was instituted in 1714 by Catherine wife of Peter the Great, in memory of his signal eflcape from the Turks in 1711. The emblems of this order are a red cross, supported by a figure of St Catherine; and fastened to a scarlet flaping edged with silver, on which are inscri­bed the name of St Catherine, and the motto, umeris et in pace.

CATHERTON, a town of Ireland, in the coun­ty of Cork, and province of Leinster: seated on the river Barrow: 16 miles N. E. of Kilkenny. W. Long. 7. 1. N. Lat. 52. 45.

CATHCROUCH, a county of Ireland, about 28° miles in length, and eight in breadth; bounded on the east by Wicklow and Wexford, on the west by Queen's county, on the north by Kildare, and on the south and south-west by Wexford. It contains 5600 houses, 42 parishes, five baronies or boroughs, and sends six members to parliament, viz: two for the county, two for Catherlowg, and two for Old Leighlin.

CATHETER, in surgery, a fithetical instrument, uti­sally made of silver, to be introduced into the bladder, in order to searsh for the stone, or discharge the urine when suppressed. See SURGERY.

CATHETERS, in geometry, a line or radius falling perpendicularly on another line or surface; thus the cathe­rii of a right-angled triangle, are the two sides that include the right angle.

Catheters of Incidence, in acoustics, a right line drawn from a point of the object, perpendicular to the reflecting plane.

Catheters of Reflection, or of the Eye, a right line drawn from the eye perpendicular to the reflecting plane.

Cathetus of Obligation, a right line drawn perpen­dicular to the speculum, in the point of incidence or re­flexion.

Cathetus, in architecture, a perpendicular line, supposed to pass through the middle of a cylindrical body, as a balusters, column, &c.

CATHNESS. See Cathness.

CATHOLIC, in a general sense, denotes any thing that is universal or general.

Catholic Church. The rise of heretics induced the primitive Christian church to assume to itself the appel­lation of catholic, being a Characteristic to distingui­sh itself from all sects, who, though they had party names, sometimes sheltered themselves under the name of Christians.

The Romish church distinguishes itself now by the name of catholic, in opposition to all those who have separated from her communion, and whom the con­fessors as heretics and schismatics, and herself only as the true and Christian church. In the strict sense of the word, there is no catholic church in being, that is, no univerfal Christian communion.

Catholic King, is a title which has been long here­ditary to the king of Spain. Mariana pretends, that Reccared first received this title after he had destroy­ed Arianism in his kingdom, and that it is found in the council of Toledo for the year 586. Valse acribes the origin of it to Alphonius in 738. Some allege that it has been used only since the time of Ferdinand and Isabella. Colombiey says, it was given them on occasion of the expulsion of the Moors. The Bollandists pretend it had been borne by their predecessors the Visigoth kings of Spain; and that Alexander VI. only renewed it to Ferdinand and Isabella. Others say, that Philip de Valois first bore the title; which was given him after his death by the ecle­cifics, on account of his favouring their interests.

In some epitaphs of the ancient popes, the title catho­lic is given to the kings of France and of Jerusalem, as well as to several patriarchs and primates.

CATHOLICON, in pharmacy, a kind of soft purgative emetic, so called, as being supposed an univer­sal purger of all humors.

CATILINE, (Lucius) a Roman of a noble family, who having spent his whole fortune in debauchery, formed the design of oppressing his country, destroy­ing the senate, feizing the public treasury, setting Rome on fire, and usurping a sovereign power over his fellow-citizens. In order to succeed in this design, he drew some young noblemen into his plot; whom he prevailed upon, it is said, to drink human blood as a pledge of their union. His conspiracy, however, was dis­covered by the vigilance of Cicero, who was then consul. Upon which retiring from Rome, he put himself at the head of an army, with several of the con­spirators, and fought with incredible valour against Petrius, lieutenant to Anthony, who was colleague with Cicero in the confilidship; but was defeated and killed in battle. See (History of) Rome.—Sallust has given an excellent history of this conspiracy.

CATO, (Marcus Portius) the Senofor, one of the greatest men among the ancients, was born at Tufcul­lum in the year of Rome 539, about the 23rd before Chrif.
Cato.

Chrlft. He began to bear arms at 17; and, on all occasions, showed extraordinary courage. He was a man of great sobriety, and reckoned no bodily exercise unworthy of him. He had but one horse for himself and his baggage, and he looked after and dressed it himself. At his return from his campaigns, he betook himself to plough his ground; not that he was without slaves to do it, but it was his inclination. He dressed also like his slaves, sat down at the same table with them, and partook of the same fare. He did not in the mean while neglect to cultivate his mind, especially in regard to the art of speaking; and he employed his talents, which were very great, in generously pleading causes in the neighbouring cities without fee or reward. Valerius Flaccus, who had a country-feat near Cato, conceiving an esteem for him, persuaded him to come to Rome; where Cato, by his own merit, and the influence of so powerful a patron, was soon taken notice of, and promoted. He was first of all elected tribune of the soldiers for the province of Sicily. He was next made quaestor in Africa under Scipio. Having in this last office reproved him for his profuse expenses to his soldiers, the general answered, that "he did not want to exact a quaestor, but would make war at what expense he pleased; nor was he to give an account to the Roman people of the money he spent, but of his enterprises, and the execution of them." Cato, provoked at this answer, left Sicily, and returned to Rome.

Afterwards Cato was made praetor, when he fulfilled the duties of his office with the strictest justice. He conquered Sardinia, governed with admirable moderation, and was created confuhl. Being tribune in the war of Syria, he gave distinguished proofs of his valor against Antiochus the Great; and at his return flushed candidate for the office of censor. But the nobles, who not only envied him as a new man, but dreaded his influence, set up against him seven powerful competitors. Valerius Flaccus, who had introduced him into public life, and had been his colleague in the consulship, was a ninth candidate, and these two united their interests. On this occasion Cato, far from employing soft words to the people, or giving hopes of gentleness or complaisance in the execution of his office, loudly declared from the rostra, with a threatening look and voice, "That the times required firm and vigorous magistrates to put a stop to that growing luxury which menaced the public with ruin; censors who would cut up the evil by the roots, and restore the rigour of ancient discipline." It is to the honour of the people of Rome, that, notwithstanding these terrible intimations, they preferred him to all his competitors, who courted them by promises of a mild and easy administration: the comitia also appointed his friend Valerius to be his colleague, without whom he had declared that he could not hope to compass the reformation he had in view. Cato's merit, upon the whole, was superior to that of any of the great men who flourished against him. He was temperate, brave, and indefatigable; frugal of the public money, and not to be corrupted. There is scarce any talent requisite for public or private life which he had not received from nature, or acquired by industry. He was a great politician, an able statesman, an eloquent orator, a learned historian, and very knowing in rural affairs. Yet, with all these accomplishments, he had very great faults.

His ambition being poisoned with envy, disturbed both his own peace and that of the whole city as long as he lived. Though he would not take bribes, he was unmerciful and unconceivable in amassing wealth by all such means as the law did not permit.

The first act of Cato in his new office, was naming his colleague to be prince of the senate; after which the censors struck out of the list of the senators the names of seven persons; among whom was Lucius the brother of T. Flaminius. Lucius, when confuls, and commanding in Gaul, had with his own hand murdered a Boan of distinction, a deferter to the Romans; and he had committed this murder purely to gratify the curiosity of his pathic, a young Carthaginian, who longing to see somebody die a violent death, had reproached the general for bringing him away from Rome just when there was going to be a fight of gladiators. Titus Flaminius, full of indignation at the dishonour done to his brother, brought the affair before the people; and inflicted upon Cato's giving the reason of his proceeding. The censor related the story; and when Lucius denied the fact, put him to his oath. The accused, relating to swear, was deemed guilty; and Cato's conduct seemed too cruel to the nobles and their wives as the taxes he laid upon luxury in all its branches; dress, housefod furniture, women toilets, chariots, slaves, and equipage. These articles were all taxed at three per cent. of the real value. The people, however, in general, were pleased with his regulations; insomuch that they ordered a statue to be erected to his honour in the temple of Health, with an inscription that mentioned nothing of his victories or triumph, but imported only that by his wife ordinances in his censorship he had returned the manners of the republic. Plutarch relates, that before this, upon some of Cato's friends expounding their surplus, while many persons without merit or reputation had statues, he had none; he answered, "I had much rather it should be asked why the people have not erected a statue to Cato, than why they have." Cato was the occasion of the third Punic war. Being dispatched to Africa to terminate a difference between the Carthaginians and the king of Numidia, on his return to Rome he reported, that Carthage was grown excessively rich and populous, and he warmly exhorted the senate to destroy a city and republic, during the existence of which, Rome could never be safe. Having brought from Africa some very large fags, he showed them to the confcript fathers in one of the lap-pets of his gown. "The country (says he) where this fine fruit grows, is but three days voyage from Rome." We are told, that from this time he never spoke in the senate upon any subject, without concluding with these words, "I am also of opinion, that Carthage ought to be destroyed." He judged, that, for a people debauched by prosperity, nothing was more to be feared than a rival state, always powerful, and now from its misfortunes grown wise and circumspect. He held it necessary to remove all dangers that could be apprehended from without, when the republic had within so many dissenters threatening her destruction.

From the censor dignified and severe, the reader will
will not perhaps be displeased to turn his view upon Cato sociable and relaxed. For we should have a false notion of him, if we imagined that nothing but a sad austerity prevailed in his speech and behaviour. On the contrary, he was extremely free; and often with his friends he introduced into the conversation with lively discourses and witty sayings. Of these Plutarch has collected a pretty large number; we shall relate but one, and make use of Balzac's paraphrase, and the preface with which he introduces it. "The very centurions, though knaves seemed to be one of the functions of their office, did not altogether lay aside raillery. They were not always bent upon severity; and the first Cato, that troubleome and intolerable honest man, ceased sometimes to be troublesome and intolerable. He had some glimpses of mirth, and some intervals of good humour. He dropped now and then some words that were not unpleasant, and you may judge of the rest by this. He had married a very handsome wife; and history tells us that she was extremely afraid of the thunder, and loved her husband well. These two passions prompted her to the same thing; she always pitched upon her husband as a handy article to grow under; and threw herself into his arms at the first noise she fancied the heard in the sky. Cato, who was then well pleased with the storm, and very willing to be carried, could not conceal his joy. He revealed that domestic secret to his friends; and told them one day, speaking of his wife, "that she had found out a way to make him love bad weather; and that he never was so happy as when Jupiter was angry." It is worth observing, that this was during his censorship; when he degraded the senator Manlius, who would probably have been conful the year after, only for giving a kiss to his wife in the day-time, and in the presence of his daughter.

Cato died in the year of Rome 604, aged 85. He wrote several works. 1. A Roman History. 2. Concerning the art of war. 3. Of rhetoric. 4. A treatise of husbandry. Of these, the last only is extant.

Cato (Marcus Porcius) commonly called Cato Minor, or Cato of Utica, was great grandson of Cato the Censor. It is said, that from his infancy he discovered by his speech, by his conuenience, and even his childish sports and recreations, an infusibleliss of mind; for he would force himself to go through with whatever he had undertaken, though the task was ill suited to his strength. He was rough towards those that flattered him, and quite intractable when threatened; was rarely seen to laugh, or even to smile; was not easily provoked to anger; but if once incensed, hard to pacify. Sylla having had a friendship for the father of Cato, bent often for him and his brother, and talked familiarly with them. Cato, who was then about 14 years of age, seeing the heads of great men brought there, and observing the fighs of those that were present, asked his preceptor, "Why does no body kill this man?" Because, said the other, he is more feared than he is hated. The boy replied, Why then did you not give me a sword when you brought me hither, that I might have stabbed him, and freed my country from this slavery?

He learned the principles of the Stoic philosophy, which so well suited his character, under Antipater of Tyre, and applied himself diligently to the study of it. Eloquence he likewise studied, as a necessary means to defend the cause of justice, and he made a very considerable proficiency in that science. To increase his bodily strength, he indulged himself to suffer the extremes of heat and cold; and used to make journeys on foot, and bare-headed in all seasons. When he was sick, patience and abstinence were his only remedies: he shut himself up, and would see no body till he was well. Though remarkably fohcr in the beginning of his life, making it a rule to drink but once after supper, and then retire, he insensibly contracted a habit of drinking more freely, and of sitting at table till morning. His friends endeavoured to excuse this, by saying that the affairs of the public engaged his attention all the day; and that, being ambitious of knowledge, he passed the night in the conversation of philosophers. Catullus wrote that Cato was once found dead drunk at the corner of a street, early in the morning, by a great number of people who were going to the levee of some great man; and that when, by uncovering his face, they perceived who it was, they blushed for shame: "You would have thought (adds Catullus), that Cato had found them drunk, not they him." Pity observes, that by this reflexion he praises his enemy at the same time that he blames him. And Seneca, his extravagant panegyrist, ventures to assert, that it is easier to prove drunkenness to be a virtue, than Cato to be vicious. He affected singularity, and, in things indifferent, to act directly contrary to the taste and fashions of the age. Magnanimity and constancy are generally ascribed to him; and Seneca would fain make that haughtiness and contempt for others which, in Cato, accompanied those virtues, a matter of praise. Cato, says Seneca, having received a blow in the face, neither took revenge nor was angry; he did not even pardon the affront, but denied that he had received it. His virtue raised him so high, that injury could not reach him. He is reputed to have been chaste in his youth. His first love was Lepida; but when the marriage was upon the point of being concluded, Metellus Scipio, to whom she had been promised, interfered, and the preference was given to him. This affair extremely exasperated our Stoic. He was for going to law with Scipio; and when his friends had diverted him from that design, by showing him the ridicule of it, he revenged himself by making victories upon his rival. When this first flame subsided, he married Attilia the daughter of Serranus, had two children by her, and afterwards divorced her for her very indifferent conduct.

He served as a volunteer under Gallus in the war of Spartaeus; and when military rewards were offered him by the commander, he refused them, because he thought he had no right to them. Some years after, he went a legionary tribune into Macedon under the praetor Rubrius: in which station he appeared, in his dress, and during a march, more like a private soldier than an officer; but the dignity of his manners, the elevation of his sentiments, and the superiority of his views, set him far above those who bore the titles of generals and proconsuls. It is said, that Cato's design in all his behaviour was to engage the soldiers to the love of virtue; whole affections he engaged thereby to himself, without his having that in his intention. "For the sincere love of virtue, (adds Seneca), is the..."
CAT [ 258 ]

Cato's passion for the virtuous. Those who praise the worthy without loving them, pay homage to their glory; but are neither admirers nor imitators of their virtues." When the time of his service expired, and he was leaving the army, the soldiers were all in tears; so effectually had he gained their hearts by his conducing manners, and sharing in their labours. After his return home, he was chosen to thequeflorship; and had scarce entered on his charge, when he made a great reformation in the queflor's office, and particularly with regard to the registers. These registers, whose places were for life, and through whose hands passed incessantly all the public accounts, being to act under young magistrates inexperienced in business, afforded an air of importance; and, instead of asking orders from the queflors, pretended to direct and govern as if they themselves were the queflors. Cato reduced them to their proper sphere.

One thing by which Cato extremely pleased the people, was his making the affinns to whom Sylla had given considerable rewards out of the treasury, for murdering the procrifed, difgorge their gains. Plutarch tells us, that Cato was so exact in discharging the duties of a senatir, as to be always the first who came to the house, and the last who left it; and that he never quittefl Rome during those days when the senate was to meet. Nor did he fail to be present at every assembly of the people, that he might awe those who, by an ill-judged facility, bestowed the public money in largesse, and frequently, through mere favour, granted remission of debts due to the state. At first his authority and stiiffness displeased his colleagues; but afterwards they were glad to have his name to oppose to all the unjust solicitations, against which they would have found it difficult to defend themselves. Cato very readily took upon him the task of reforming.

Cato, to keep out a very bad man, put in for the tribunate. He sided with Cicero against Catiline, and opposed Caesar on that occasion. His enemies sent him to recover Cyprus, which Ptolemy had forfeited, thinking to hurt his reputation by so difficult an undertaking; yet none could find fault with his conduct.

Cato laboured to bring about an agreement between Caesar and Pompey; but seeing it in vain, he sided with the latter. When Pompey was slain, he fled to Utica; and being pursued by Caesar, advised his friends to be gone, and throw themselves on Caesar's clemency. His son, however, remained with him; and Statilius, a young man, remarkable for his hatred to Caesar.

The evening before the execution of the purpose he had formed with regard to himself, after bathing, he sipped with his friends and the magistrates of the city. They sat late at table, and the conversation was lively. The discourse falling upon this maxim of the Stoics, that "the wife man alone is free, and that the vicious are slaves;" Demetrius, who was a Peripatetic, undertook to confute it from the maxims of his school. Cato, in answer, treated the matter very ampl; and with so much earnestness and vehemence of voice, that he betrayed himself, and confirmed the suspicions of his friends, that he designed to kill himself. When he had done speaking, a melancholy silence ensued; and Cato perceiving it, turned the discourse to the present situation of affairs, expressing his concern for those who had been obliged to put to sea, as well as for those who had determined to make their escape by land, and had a dry and handy defeat to pass. After supper, the company being dismissd, he walked for some time with a few friends, and gave his orders to the officers of the guard: and going into his chamber, he embraced his son and his friends with more than usual tenderness, which further confirmed the suspicions of the revolution he had taken. Then laying himself down on his bed, he took up Plato's Dialogue on the immortality of the Soul. Having read for some time, he looked up, and missing his sword, which his son had removed while he was at supper, he called a slave, and asked who had taken it away; and receiving no pertinent answer, he resumed his reading. Some time after, he asked again for his sword; and, without showing any impatience, ordered it to be brought to him: but, having read out the book, and finding nobody had brought him his sword, he called for all his servants, fell into a rage, and struck one of them on the mouth with so much violence, that he very much hurt his own hand, crying out in a passioned manner, "What! do my own son and family conspire to betray me, and deliver me up naked and unarmed to the enemy?" Immediately his son and friends rushed into the room; and began to lament, and to beseech him to change his resolution. Cato raising himself, and looking fiercely at them, "How long is it," said he, "since I have left my fences, and my son is become my keeper? Brave and generous son, why do you not bind your father's hands, that when Caesar comes, he may find me unable to defend myself? Do you imagine that without a sword I cannot end my life? Cannot I destroy myself by holding by breath for some moments, or by striking my head against the wall?" His son answered with his tears, and retired. Apollonides and Demetrius remained with him, and to them he addressed himself in the following words: "Is it to watch over me that ye sit silent here? Do you pretend to force a man of my years to live? or can you bring any reason to prove, that it is not safe and unworthy of Cato to beg his safety of an enemy? or why do you not persuade me to learnwhat I have been taught, that, rejecting all the opinions I have hitherto defended, I may now, by Caesar's means, grow wiser, and be yet more obliged to him than for life alone? Not that I have determined any thing concerning myself; but I would have it in my power to perform what I shall think fit to resolve upon: and I shall not fail to ask your counsel, when I have occasion to act up to the principles which your philosophy teaches. Go tell my son, that he should not compel his father to what he cannot persuade him." They withdrew, and the sword was brought by a young slave. Cato drew it, and finding the point to be sharp; "Now," said he, "I am my own master." And, laying it down, he took up his book again; which, it is reported, he read twice over. After this he slept so soundly that he was heard to snore by those who were near him. About midnight he called two of his freedmen, Clearchus his physician, and Eupus whom he chiefly employed in the management of his affairs. The last he sent to the port, to see whether all the Roman
CATOPTRICS.

CATOPTRICS is that part of optics which explains the properties of reflected light, and particularly that which is reflected from mirrors.

As this and the other branches of optics are fully treated under the collective word, we shall, in the present article, 1st, give a summary of the principles of the branch, in a few plain aphorisms, with some preliminary definitions; and, 2dly, infert a set of entertaining experiments founded upon them.

Sect. I. Definitions.

1. Definitions

1. Every polished body that reflects the rays of light is called a mirror, whether its surface be plane, spherical, conical, cylindrical, or of any other form whatever.

2. Of mirrors there are three principally used in optical experiments: The plane mirror $GHI$, (fig. 1.) The spherical convex mirror, $GHI$, (fig. 2.) and the spherical concave mirror $GHI$, (fig. 3.)

3. The point $K$, (fig. 2, 3.) round which the reflecting surface of a spherical mirror is decentered, is called its centre. The line $KH$, drawn from its centre perpendicular to its two surfaces, is the axis of the mirror; and the point $H$, to which that line is drawn, is its vertex.

4. The distance between the lines $AG$ and $BG$, (fig. 1.) is called the angle of incidence, and the distance between $BG$ and $CG$ is the angle of reflection.

Sect. II. Aphorisms.

1. The image $DF$, (fig. 1.) will appear as far behind the mirror, as the object $AC$ is before it.

2. The image will appear of the same size, and in the same position as the object.

3. Every such mirror will reflect the image of an object of twice its own length and breadth.

4. If the object be an opaque body, and its rays fall on the mirror nearly in direct lines, there will be only one image visible, which will be reflected by the inner surface of the glass. But,

5. If the object be a luminous body, and its rays fall very obliquely on the mirror, there will appear, to an eye placed in a proper position, several images; the first of which, reflected from the outer surface of the glass, will not be so bright as the second, reflected from the inner surface. The following images, that are produced by the repeated reflections of the rays between the two surfaces of the glass, will be in proportion less vivid, to the eighth or tenth, which will be scarcely visible.

1. The image $DF$, (fig. 2.) will always appear II. in a spherical convex mirror.

2. The image will be in the same position as the object. 3. It will be less than the object.

4. It will be curved, but not, as the mirror, spherical.

5. Parallel rays falling on this mirror will have the focus or image at half the distance of the centre $K$, from the mirror.

6. In converging rays, the distance of the object must be equal to half the distance of the centre, to make the image appear behind the mirror.

7. Diverging rays will have their image at less than half the distance of the centre. If the object be placed in the centre of the mirror, its image will appear at one-eighth of that distance behind it.

8. That point where the image appears of the same size, in a dimensions as the object, is the centre of that mirror.

2. Parallel rays will have their focus at one-half the distance of the centre.

3. Converging rays will form an image before the mirror.

4. In diverging rays, if the object be at less than one half the distance of the centre, the image will be behind the mirror, erect, curved, and magnified, as $Kk2DEF$. 

Romans were gone; to the physician he gave his hand to be dressed, which was swelled by the blow he had given his slave. This being an intimation that he intended to live, gave great joy to his family. Butas soon returned, and brought word that they were all gone except Cratus, who had stayed upon some business, but was just ready to depart. He added, that the wind was high, and the sea rough. Thesewords drew a sigh from Cato. He sent Butas again to the port, to know whether there might not be some one, who, in the hurry of embarkation, had forgot some necessary provisions, and had been obliged to put back. If the ship was not cut, but was just ready to depart. He added, that all was gone except one.

The spherical concave mirror $GHI$, (fig. 3.)

In the spherical convex mirror, $GHI$, (fig. 2.)

The point $K$, (fig. 2, 3.) round which the reflecting surface of a spherical mirror is decentered, is called its centre. The line $KH$, drawn from its centre perpendicular to its two surfaces, is the axis of the mirror; and the point $H$, to which that line is drawn, is its vertex.

The distance between the lines $AG$ and $BG$, (fig. 1.) is called the angle of incidence, and the distance between $BG$ and $CG$ is the angle of reflection.
CATOPTRICS.

DEF, (fig. 3.) but if the distance of the object be greater, the image will be before the mirror, Inverted and diminished, as DEF, (fig. 4.)

5. The sun's rays falling on a concave mirror, and being parallel, will be collected in a focus at half the distance of its centre, where their heat will be augmented in proportion of the surface of the mirror to that of the focal spot.

6. If a luminous body be placed in the focus of a concave mirror, its rays being reflected in parallel lines will strongly enlighten a space of the same dimension with the mirror, at a great distance. If the luminous object be placed nearer than the focus, its rays will diverge, and consequently enlighten a larger space. It is on this principle that reverberators are constructed.

IV. In all plane and spherical mirrors the angle of incidence is equal to the angle of reflection.

SECT. III. Entertaining Experiments.

1. Of all our senses the sight is certainly subject to the greatest illusion. The various writers on optics have described a great number of instances in which it deceives us, and have constantly endeavoured to investigate the causes, to explain their effects, and to reconcile appearance with reality. We every day discover new phenomena, and doubtless many more are to be found, that a discovery which at first seemed of little consequence, has led to matters of the highest importance.

Take a glass bottle A (fig. 14,) and fill it with water to the point B; leave the upper part BC empty, and cork it in the common manner. Place this bottle opposite a concave mirror, and beyond its focus, that you may appear rendered in its image.

Now it is remarkable in this apparent bottle, that the water, which, according to all the laws of catoptrics, and all the experiments made on other objects, should appear at ab, appears on the contrary at bc, and consequently the part ab appears empty.

If the bottle is inverted and placed before the mirror (as in fig. 15,) its image will appear in its natural erect position; and the water, which is in reality at BC, will appear at ab.

If while the bottle is inverted it be uncorked, and the water run gently out, it will appear, that while the part BC is empty, that of ab in the image is filling; and what is likewise very remarkable, as soon as the bottle is empty the illusion ceases, the image also appearing entirely empty. If the bottle likewise be quite full there is no illusion.

While the bottle is held inverted, and partly empty, some drops of water fall from the bottom A towards BC; it seems in the image as if there were formed at the bottom of the part ab, bubbles of air that rise from a to b; which is the part that seems full of water. All these phenomena constantly appear.

The remarkable circumstances in this experiment, are, first, not only to see an object where it is not; but secondly, that of two objects which are really in the same place, as the surface of the bottle and the water it contains, the one is seen at one place, and the other at another; and to see the bottle in the place of its image, and the water where neither it nor its image are.

II. Construct a box A B, of about a foot long, eight inches wide, and six high; or what other dimension you shall think fit, provided it does not greatly vary from these proportions.

On the inside of this box, and against each of its opposite ends A and B, place a mirror of the same size. Take off the quicksilver from the mirror that you place at B, for about an inch and a half, at the part C, where you are to make a hole in the box of the same size, by which you may easily view its inside. Cover the top of the box with a frame, in which must be placed a transparent glass, covered with a gauze, on the side next the inner part of the box. Let there be two grooves at the parts E and F to receive the two painted scenes hereafter mentioned. On two pieces of cut pasteboard let there be skilfully painted on both sides (see fig. 6. and 7.) any subject you think proper; as woods, gardens, bowers, colonades, &c. and on two other pasteboards, the same subjects on one side only; observing that there ought to be on one of them some object relative to the subject placed at A, that the mirror placed at D may not reflect the hole at C on the opposite side.

Place the two boards painted on both sides in the grooves E and F; and those that are painted on one side only, against the opposite mirrors C and D; and then cover the box with its transparent top. This box should be placed in a strong light to have a good effect.

When the eye is placed at C, and views the objects on the inside of the box, of which some, as we have said, are painted on both sides, they are successively reflected from one mirror to the other; and if, for example, the painting consists of trees, they will appear like a very long vista, of which the eye cannot discern the end; for each of the mirrors reflecting the objects, continually more faintly, contribute greatly to augment the illusion.

III. Take a square box ABCD, of about six inches long, and twelve high; cover the inside of it with four four plane mirrors, which must be placed perpendicularly to the bottom of the box CBFD.

Place certain objects in relief on the bottom of this box; suppose, for example, a piece of fortification, (as fig. 9.) with tents, soldiers, &c. or any other subject that you judge will produce an agreeable effect by its disposition when repeatedly reflected by the mirrors.

On the top of this box place a frame of glass, in form of the bottom part of a pyramid, whose base AGEB is equal to the size of the box; its top I LN must form a square of six inches, and should not be more than four or five inches higher than the box. Cover the four sides of this frame with a gauze, that the inside may not be visible but at the top, I LN, which should be covered with a transparent glass.

When you look into this box through the glass I LN, the mirrors that are diametrically opposite each other, mutually reflecting the figures included, the eye beholds a boundless extent, completely covered with
these objects; and if they are properly disposed, the illusion will occasion no small surprize, and afford great entertainment.

Note. The nearer the opening ILN is to the top of the box, the greater will be the apparent extent of the subject. The same will happen if the four mirrors placed on the sides of the box be more elevated. The objects, by either of these dispositions, will appear to be repeated nine, twenty-five, forty-nine times, &c. by taking always the square of the odd numbers of the arithmetical progression 3, 5, 7, 9, &c. as is very easy to conceive, if we remember that the hexagon, (that subject.) between the mirrors, place little figures of pasteboard, support the box, the greater will be the square of the odd numbers of the arithmetical progression 3, 5, 7, 9, &c. as is very easy to conceive, if we remember that the hexagon, (that subject.)

All these different dispositions, properly directed, as well with regard to the choice as position of the objects, will constantly produce very remarkable and pleasing illusions.

If instead of placing the mirrors perpendicular, they were to incline equally, so as to form part of a reversed pyramid, the subject placed in the box would then have the appearance of a very extensive globular or many-sided figure.

IV. On the hexagonal or six-sided plane ABCDEF draw six semi-diameters GA, GB, GC, GD, GE, GF; and on each of these place perpendicularly two plane mirrors, which must join exactly at the centre G, and which placed back to back must be as thin as possible. Decorate the exterior boundary of this piece (which is at the extremity of the angles of the hexagon) with six columns, with the same time serve to support the mirrors, by grooves formed on their inner sides. (See the profile H.) Add to these columns their entablatures, and cover the edifice in such manner as you shall think proper.

In each one of these six triangular spaces, contained between the mirrors, place little figures of pasteboard, in relief, representing such objects as when seen in an hexagonal form will produce an agreeable effect. To these add small figures of enamel; and take particular care to conceal, by some object that has relation to the subject, the place where the mirrors join, which, as we have said before, all meet in the common centre G.

When you look into any one of the six openings of this palace, the objects there contained being repeated six times, will seem entirely to fill up the whole of the building. This illusion will appear very remarkable; especially if the objects made choice of are properly adapted to the effect that is to be produced by the mirrors.

Note, if you place between two of these mirrors part of a fortification, as a curtain and two demi-batlions, you will see an entire citadel, with its six battlements. Or if you place part of a ball-room, ornamented with chandeliers and figures in enamel, all those objects being here multiplied, will afford a very pleasing prospect.

V. Within the case ABCD, place four mirrors, O, P, Q, R, so disposed that they may each of them make an angle of forty-five degrees, that is, that they may be half way inclined from the perpendicular, as transparent in the figure. In each of the two extremities AB, fig. 11, make a circular overture, in one of which fix the tube GL, in the other the tube MF, and observe that in each of these is to be inserted another tube, as H and I (a).

Furnish the first of these tubes with an object-glass at G, and a concave eye-glass at F. You are to observe that in regulating the focus of these glasses, with regard to the length of the tube, you are to suppose it equal to the line G, or visual pointed ray, which entering at the overture G, is reflected by the four mirrors, and goes out at the other overture F, where the ocular glass is placed. Put any glas you will into the two ends of the moveable tubes H and I; and lastly place the machine on a fland E, moveable at the point S, that it may be elevated or depressed on pleasure.

When the eye is placed at F, and you look through the tube, the rays of light that proceed from the object T, passing through the glasses G, are successively reflected by the mirrors, O, P, Q, and R, to the eye at F, and there paint the object T, in its proper situation, and these rays appear to proceed directly from that object.

The two moveable tubes H and I, at the extremities of each of which a glass is placed, serve only the more to diffuse the illusion, for they have no communication with the interior part of the machine. This instrument being moveable on the stand E, may be directed to any object; and if furnished with proper glasses will answer the purpose of a common perspective.

The two moveable tubes H and I being brought together, the machine is directed toward any object, and defiring a person to look in at the end F, you ask him if he can distinctly that object. You then separate the two moveable tubes, and leaving a space between them sufficient to place your hand, or any other solid body, you tell him that the machine has the power of making objects visible through the most opaque body; and as a proof you desire him then to look at the same object, when, to his great surprize, he will see it as distinct as when there was no solid body placed between the tubes.

Note. This experiment is the more extraordinary, as it is very difficult to conceive how the effect is produced. The two arms of the case appearing to be made to support the perspectival glasses; and to whatever object it is directed, the effect is still the same.

(a) These four tubes must terminate in the substance of the case, and not enter the inside, that they may not hinder the effect of the mirrors. The fourfold reflection of the rays of light from the mirrors, darkens in some degree the brightness of the object; some light is also lost by the magnifying power of the perspective: If, therefore, instead of the object-glass at G, and concave eye-glass at F, plane glasses were substituted; the magnifying power of the perspective will be taken away, and the object will appear brighter.
CATOPTRICS.

VI. In the partition AB, make two openings, CD, and EF, of a fourth high, and ten inches wide, and about a foot distant from each other. Let them be at the common height of a man's head; and in each of them place a transparent glass, surrounded with a frame like a common mirror.

Behind this partition place two mirrors H and I, inclined to it in an angle of forty-five degrees: that is half-way between a line drawn perpendicular to the ground and its surface; let them be both 18 inches square: let all the space between them be inclosed by boards or pasteboard painted black, and well closed, that no light may enter; let there be also two curtains to cover them, which may be drawn aside at pleasure.

When a person looks into one of these supposed mirrors, instead of seeing his own face, he will perceive the object that is in front of the other; so that if the two persons present themselves at the same time before these mirrors, instead of each one seeing himself, they will reciprocally see each other.

Note, There should be a fconce with a figure of a foot and its surface; let them be both 18 inches square; let all the space between them be inclosed by boards or pasteboard painted black, and well closed, that no light may enter; let there be also two curtains to cover them, which may be drawn aside at pleasure.

When a person looks into one of these supposed mirrors, instead of seeing his own face, he will perceive the object that is in front of the other; so that if the two persons present themselves at the same time before these mirrors, instead of each one seeing himself, they will reciprocally see each other.

This experiment may be considerably improved by placing the two glasses in the partition in adjoining rooms, and a number of persons being previously placed in one room, when a stranger enters the other, you may tell him his face is dirty; and direct him to see in it once more, he will then, to his further satisfaction, make an aperture at G, near the top of the side E, and if the rays shine thereon, he will be convinced that the glass was not so clean as it appeared to be.

Note, When a man looks in a mirror that is placed perpendicular to another, his face will appear entirely deformed. If the mirror be a little inclined, so as to make an angle of 80 degrees (that is, one-ninth part from the perpendicular), he will then see all the parts of his face, except the nose and forehead. If it be inclined to 60 degrees (that is, one-third part), he will appear with three noses and six eyes: in short, the apparent deformity will vary at each degree of inclination; and when the glass comes to 45 degrees (that is, half-way down), the face will vanish. If, instead of placing the two mirrors in this situation, they are so disposed that their junction may be vertical, their different inclinations will produce other effects; as the situation of the object relative to these mirrors is quite different. The effects of these mirrors, though remarkable enough, occasions but little surprize; as there is no method of concealing the cause by which they are produced.

VI. In the partition AB, make two openings, CD, and EF, of a fourth high, and ten inches wide, and about a foot distant from each other. Let them be at the common height of a man's head; and in each of them place a transparent glass, surrounded with a frame like a common mirror.

Behind this partition place two mirrors H and I, inclined to it in an angle of forty-five degrees: that is half-way between a line drawn perpendicular to the ground and its surface; let them be both 18 inches square; let all the space between them be inclosed by boards or pasteboard painted black, and well closed, that no light may enter; let there be also two curtains to cover them, which may be drawn aside at pleasure.

When a person looks into one of these supposed mirrors, instead of seeing his own face, he will perceive the object that is in front of the other; so that if the two persons present themselves at the same time before these mirrors, instead of each one seeing himself, they will reciprocally see each other.

This experiment may be considerably improved by placing the two glasses in the partition in adjoining rooms, and a number of persons being previously placed in one room, when a stranger enters the other, you may tell him his face is dirty; and direct him to see in it once more, he will then, to his further satisfaction, make an aperture at G, near the top of the side E, and if the rays shine thereon, he will be convinced that the glass was not so clean as it appeared to be.

Note, When a man looks in a mirror that is placed perpendicular to another, his face will appear entirely deformed. If the mirror be a little inclined, so as to make an angle of 80 degrees (that is, one-ninth part from the perpendicular), he will then see all the parts of his face, except the nose and forehead. If it be inclined to 60 degrees (that is, one-third part), he will appear with three noses and six eyes: in short, the apparent deformity will vary at each degree of inclination; and when the glass comes to 45 degrees (that is, half-way down), the face will vanish. If, instead of placing the two mirrors in this situation, they are so disposed that their junction may be vertical, their different inclinations will produce other effects; as the situation of the object relative to these mirrors is quite different. The effects of these mirrors, though remarkable enough, occasions but little surprize; as there is no method of concealing the cause by which they are produced.

Note, A glass mirror should be always here used, as those of metal do not represent the objects with equal vivacity, and are beside subject to tarnish. It is also necessary that the box be sufficiently large, that you may not be obliged to use a mirror whose focus is too short; for in that case, the right lines near the border of the picture will appear bent in the mirror, which will have a disagreeable effect, and cannot be avoided.

IX. The rays of a luminous body placed in the focus of a concave mirror being reflected in parallel lines, fire to a second mirror be placed diametrically opposite the first, it will, by recollecting those rays in its focus, set fire to a combustible body.

Place two concave mirrors, A and B, at about 12 or 15 feet distance from each other, and let the axis of each of them be in the same line. In the focus C of one of them, place a live coal, and in the focus D of the other, some gun-powder. With
CATOPTRICS.

a pair of double bellows, which make a continual blast, keep constantly blowing the coal, and notwithstanding the distance between them, the powder will presently take fire.

It is not necessary that these mirrors be of metal or brass, those made of wood or plateboard, gilded, will produce the explosion, which has sometimes taken effect at the distance of 50 feet, when mirrors of eighteen inches, or two feet diameter, have been used.

This experiment succeeds with more difficulty at great distances; which may proceed from the moisture in a large quantity of air. It would doubtless take effect more readily, if a tin tube, of an equal diameter with the mirrors, were to be placed between them.

This experiment succeeds with more difficulty at great distances; which may proceed from the moisture in a large quantity of air. It would doubtless take effect more readily, if a tin tube, of an equal diameter with the mirrors, were to be placed between them.

The phenomena that may be produced by means of concave mirrors are highly curious and astonishing. By their aid, spectres of various kinds may be exhibited. Suppose, for example, a person with a drawn sword places himself before a large concave mirror, but farther from it than its focus; he will then see an inverted image of himself in the air, between him and the mirror, of a less size than himself. If he steadily present the sword towards the centre of the mirror, an image of the sword will come out therefrom towards the sword in his hand, point to point, as it were to fence with him; and by his pushing the sword nearer the image will appear to come nearer him, and almost to touch his breast, having a striking effect upon him.

If the mirror be turned 45 degrees, or one-eighth round, the reflected image will go out perpendicular to the direction of the sword presented, and apparently come to another person placed in the direction of the motion of the image. If that person is unsatisfied with the experiment, and does not see the original sword, he will be much surprised and alarmed. This experiment may be another way diversified, by telling any person, that at such an hour, and in such a place, he should see the apparition of an absent or deceased friend (of whose portrait you are in possession). In order to produce this phantom, instead of the hole in the partition AB in the last figure, there must be a door which opens into an apartment to which there is a considerable defect. Under that door you are to place the portrait, which must be inverted and strongly illuminated, that it may be lively reflected by the mirror, which must be large and well polished. Then having introduced the incredulous spectator at another door, and placed him in the proper point of view, you suddenly throw open the door at AB; when, to his great astonishment, he will immediately see the apparition of his friend.

It will be objected, perhaps, that this is not a perfect apparition, because it is only visible at one point of view, and by one person. But it should be remembered, that it was an established maxim in the last centuries, that a spectre might be visible to one person and not to others. So Shakespeare makes both Hamlet and Macbeth see apparitions that were not visible to others, present at the same time. It is not unlikely, moreover, that this maxim took its rise from certain apparitions of this kind that were railed by the monks, to serve some purposes they called religious; as they alone were in possession of what little learning there then was in the world.

Opticians sometimes grind a glass mirror concave in one direction only, as it is laid longitudinally; it is in fact a concave portion of a cylinder, the breadth of which may be considered that of the mirror. A person looking at his face in this mirror, in the direction of its concavity, will see it curiously distorted in a very lengthened appearance; and by turning the cylindrical mirror a quarter round, its profile will appear distorted another way, by an apparent increase in width only. Another curious and singular property attends this sort of mirrors: If in a very near situation before it, you put your finger on the right hand side of your nose, it will appear the same in the mirror; but if in a distant situation, somewhat beyond the centre of concavity, you again look at your face in the mirror, your finger will appear to be removed to the other or left-hand side of your nose. This, though something extraordinary, will in its caufe appear very evident from a small consideration of the properties of spherical concave mirrors.
CATROU, (Francis) a famous Jesuit, born at Paris in 1659. He was engaged for twelve years in the Journal de Trevoux, and applied himself at the same time to other works, which distinguished him among the learned. He wrote a general History of the Mogul empire, and a Roman history, in which he was assisted by father Rouille, a brother Jesuit. Catrou died in 1737; and this last history was continued by Rouille, who died in 1740.

CATTERTHUN, a remarkable Caledonian poft, a few miles north of the town of Brechin in the county of Angus in Scotland. Mr. Pennant describes it as of uncommon strength. "It is (says he) of an oval form made of a stupendous pile of loose white stones, whose convexity, from the base within to that without, is 122 feet. On the outside a hollow, made by the disposition of the stones, surrounds the whole. Round the base is a deep ditch, and below that about 100 yards, are vestiges of another, that went round the hill. The area within the stone mound is 32 acres; the axis, or length of the oval, is 456 feet, the transverse diameter 200. Near the east side is the foundation of a rectangular building; and on most parts are the foundations of others small and circular: all which had once their superstructures, the shelter of the poileffors of the poft: there is also a hollow, now being used as a well of the place." There is another fortification, but of inferior strength, in the neighbourhood. It is called the Brown Catterthun, from the colour of the ramparts which are composed of earth. It is of a circular form, and consists of various concentric dikes. On one side of this rife a small rill, which, running down the hill, has formed a deep gulley. From the side of the fortres is another rampart, which extends parallel to the rill, and then reverts, forming an additional poft or retreat. The meaning of the word Catter-thun is Camp-town; and Mr. Pennant thinks these might probably be the pofts occupied by the Caledonians before their engagement at the foot of the Grampian Mountains with the celebrated Agricola. See (History of) Scotland.

CATTI, a people of Germany, very widely spread, on the east reaching to the river Sala, on the north to Wedphalia; occupying, besides Hesse, the Wetteran, and part of the tract on the Rhine, and on the banks of the river Lohne. The Hercynian forest began and ended in their country.

CATTIVELLAUNI, anciently a people of Britain, seated in the country which is now divided into the counties of Hertford, Bedford, and Bucks. The name of this ancient British people is written in several different ways by Greek and Roman authors being sometimes called Catti, Caffii, Catticelani, Cattinidani, Cattieludani, &c. That they were of Belgic origin cannot be doubted, and it is not improbable, that they derive their name of Catti from the Belgic word Catrin, which signifies illustrious or noble, and that the addition of Vellauni, which means on the banks of rivers, might be given them after their arrival in Britain, as descriptive of the situation of their country. However this may be, the Cattivellani formed one of the most brave and warlike of the ancient British nations when Cæsar invaded Britain, and long after. Cattivellanus, their prince, was made commander in chief of the confederated Britons, not only on account of his own personal qualities, but also because he was at the head of one of their bravest and most powerful tribes. In the interval between the departure of Cæsar and the next invasion under Claudius, the Cattivellani had reduced several of the neighbouring states under their obedience; and they again took the lead in the opposition to the Romans at their second invasion, under their brave but unfortunate prince Caracalla. The country of the Cattivellani was much frequented and improved by the Romans, after it came under their obedience. Verulamium, their capital, which stood near where St Albans now stands, became a place of great consideration, was honoured with the name and privileges of a municipium or free city, and had magistrates after the model of the city of Rome. This place was taken and almost destroyed by the insurgents under Boudicca; but it was afterwards rebuilt, restored to its former splendor, and surrounded with a strong wall, some vestiges of which are still remaining. Duracorbive and Magavintonum, in the second siter of Antoninus, were probably Donfable and Fenny-Stratford, at which places there appear to have been Roman stations. The Salena of Ptolemy, a town in the country of the Cattivellani, was perhaps situated at Saludy, in Bedfordshire, where several Roman antiquities have been found. There were, besides these, several other Roman forts, stations, and towns in the country, which it would be tedious to enumerate. The territories of the Cattivellani made a part of the Roman province called Britannia Prima.

CATTLE, a collective word, which signifies the four-footed animals, which serve either for tilling the ground, or for food to men. They are diffignified into large, or black cattle; and into small cattle: of the former are horses, bulls, oxen, cows, and even calves and heifers; amongst the latter are rams, ewes, sheep, lambs, goats, kids, &c. Cattle are the chief stock of a farm: they who deal in cattle are styled graziers.

CATULLUS, (Caesar Valerianus) a Latin poet, born at Verona, in the year of Rome 666. The harmony of his numbers acquired him the esteem and friendship of Cicero, and other great men of his time. Many of his poems, however, abound with gross obscenities. He wrote satirical verses against Cæsar, under the name of Marmoro. He spent his whole life in a state of poverty; and died in the flower of his age, and the height of his reputation. Joseph Scaliger, Paffer, Muret, and Isaac Volfius, have written learned notes on this poet.

ires of the fiate, who
reawaked in him to comply with the de¬
ires of the fiate, who

Cavalcante, (Guido) a nobleman of Florence
in the 13th century, who having followed the party of the
Guelfes, experienced the changeablenes of fortune.
He fhowed great strength of mind in his mis¬
fortunes, and never neglected to improve his talents.
He wrote a treatife in Italian concerning fyle, and
some verses which are esteemed. His poem on the love
of this world, has been commented on by feveral
learned men.

Cavalier, a horfeman, or perfon mounted on
horfback; especially if he be armed withal, and have
a military appearance.

Anciently, the word was restrained to a knight, or
miles. The French still use Chevalier in the fame
fence.

Cavalier, considered as a faction. See Britain,
n° 109.

Cavalerie, in fortification, an elevation of earth of
different fapes, fitted ordinarily in the gorge of a
battalion, bordered with a parapet, and cut into more
or lefs embrafures, according to the capacity of the
cavalier. Cavaliers are a double defence for the faces
of the opposite battalion: they defend the ditch, break
the besiegers galleries, command the traverses in dry
moats, flour the falient angle of the counterfeap,
where the besiegers have their counter-batteries,
and enflafe the enemies trenches, or oblige them to mul¬
tiply their parallels; they are likewise very service¬
able in defending the breach and the reen¬
crements of the besieged, and can very much in¬
commodate the en¬
crements which the enemy make, being lodged in the
battalion.

Cavalier, in the menege, one that understands
horfes, and is prafified in the art of riding them.

CAVALIERI, (Bonaventure) an eminent mathe¬
matician in the 17th century, a native of Milan, and
a friar of the order of the Jefuati of St. Jerome, was
professor of mathematics at Bologna, where he pub¬
lished feveral mathematical books, particularly the
Method of Indivifibles. He was a scholar of Galileo.
His Direftorium generale Uranometricum contains great
variety of moft useful practices in trigonometry and
afronomy. His trigonometrical tables in that work
are excellent.

Cavalry, a body of foldiers that charge on
horfback. The word comes from the French, ca¬
valerie, and that from the corrupt Latin, caballus, a
horfe.

The Roman cavalry confifted wholly of tho¬
esta called equites, or knights, who were a dif¬
tinct order in the dis¬
tribution of citizens. —The Grecian cavalry were
divided into cataphraca and non cataphraca, i. e. into
heavy and light armed. —Of all the Greeks, the Thes¬
salians excelled molt in cavalry. The Lacedemonians,
inhabiting a mountainous country, were but meanly
furnished with cavalry, till, carrying their arms into
other countries, they found great occasion for horfes
to support and cover their foot. The Athenian ca¬
vality, for a confiderable time, confifted only of 96 hor¬
femen: after expelling the Periabans out of Greece, they
increased the number to 300: and afterwards to 1200,
which was the highest pitch of the Athenian cavalry.
The Turkish cavalry confifts partly of Spanis, and part¬
ly of horfemen raised and maintained by the Zaimis
and Timariots.

The chief use of the cavalry is to make frequent
excursions to disturb the enemy, intercept his con¬
voys, and defoy the country: in battle to fupport
and cover the foot, and to break through and disor¬
der the enemy; also to fccure the retreat of the foot.
Formerly, the manner of the fighting of the cavalry
was
C A V

1. wiss, after firing their pithola or carabinas, to wheel off, and to give opportunity for loading again. Gustavus Adolphus is said to have first taught the cavalry to charge through, to march straight up to the enemy, with the sword drawn in the bridlehand, and each man having fired his piece, at the proper distance, to betake himself to his sword, and charge the enemy as was found most advantageous.

CAVAN, a town of Ireland, and capital of a county of the same name, in the province of Ulster, situated in W. Long. 7° 32'. N. Lat. 53° 40'.

CAVAN, a county of Ireland, 47 miles in length, and 23 in breadth; is bounded on the east by Monaghan, and on the south by Longford, West-Meath, and East-Meath. It has but two towns of any note, viz. Cavan and Kilmore. It winds five members to parliament; two for the county, two for Cavan, and one for Kilmore. It contains upwards of 8000 houses, 37 parishes, seven baronies, and two boroughs.

CAUCASUS, the name of a very high mountain of Asia, being one of that great ridge which runs between the Black and Caspian seas. Sir John Chardini describes this as the highest mountain, and the most difficult of paths, of any he had seen. It has frightful precipices, and in many places the roads are cut out of the solid rock. At the time he passed it, the mountain was entirely covered with snow; so that, in many places, his guides behoved to clear the way with hoes. The mountain is 36 leagues over, and the summit of it eight leagues in breadth. The top is perpetually covered with snow: and our traveller relates, that the two days he seemed to be in the clouds, and was not able to see 20 paces before him. Excepting the very top, however, all the parts of Mount Caucasus are extremely fruitful; abounding in honey, corn, fruits, hogs, and large cattle. The vines twine about the trees, and rife so high, that the inhabitants cannot gather the fruit from the uppermost branches. There are many streams of excellent water, and a vast number of villages. The inhabitants are for the most part Christians of the Georgian Church. They have fine cloisters, and the women are very beautiful.—In the winter they wear snow-shoes in the form of rackets, which prevent their sinking in the snow, and enable them to run upon it with great facility.

CAUDEC, a rich, populous, and trading town in Normandy, and capital of the territory of Caux. It is situated at the foot of a mountain near the river Seine, in E. Long. 46° 46'. N. Lat. 40° 30'.

CAUDEX, by Malphigi and other botanists, is used to signify the stem or trunk of a tree: by Linnaeus, the stock or body of the root, part of which ascends, part descends. The ascending part raises itself gradually above ground, serving frequently for a trunk, and corresponds in some measure to the caudex of former writers: the descending part strikes gradually downward into the ground, and puts forth radicles or small fibres, which are the principal and essential part of every root. The descending caudex therefore corresponds to the radix of other botanists. Agreeably to this idea, Linnaeus considers trees and shrubs as roots above ground: an opinion which is confirmed by a well-known fact, that trees, when inverted, put forth leaves from the descending caudex, and radicles or roots from the ascending. For the varieties in the descending caudex, see the article RADEX.

CAUDIUM, (anc. geog.) a town of Samnium, on the Via Appia, between Caelia and Beneventum: Caudinus, the epithet. The Caudine Forks, or Turcules, were memorable by the disgrace of the Romans; being spears disposed in the form of a gallows under which prisoners of war were made to pass, and gave name to a defile or narrow pass near Caudium, Livy: where the Samnites obliged the Roman army and the two confuls to lay down their arms and pass under the gallows, or yoke, as a token of submission.

CAVE, any large subterraneous hollow. These were undoubtedly the primitive habitations, before men began to build edifices above ground. The primitive method of burial was also to dispose the bodies in caves, which seems to have been the origin of catacombs. They long continued the proper habitations of shepherds. Among the Romans, caves (antar) used to be consecrated to nymphs, who were worshipped in caves, as other gods were in temples. The Persians also worshipped their god Mithras in a natural cave, consecrated for the purpose by Zoroaster. The cave of the nymph Egeria is still shown at Rome. Kircher, after Gaffarelus, enumerates divers species of caves; as divine, natural, &c.—Of natural caves some are possessed of a medicinal virtue, as the Grotto de Serpente; others are poisonous or medicinal; some are replete with metallic exhalations, and others with waters. Divine caves were those said to affect the human mind and passions in various ways, and ever to inspire with a knowledge of future events. Such were the sacred caverns at Delphi which inspired the Pythia; the Sibyl's cave at Cumae, still shown near the lake Avernus; the cave of Trophonius, &c.

CAVE, (Dr William), a learned English divine born in 1637, educated in St John's college Cambridge; and successively minister of Hasley in Oxfordshire, all-hallows the Great in London, and of Hinton. He became chaplain to Charles II. and in 1669 was installed a canon of Windsor. He compiled The Lives of the Primitive Fathers in the three first centuries of the church, which is esteemed a very useful work; and Hibernia Literaria, &c. in which he gives an exact account of all who had written for or against Christianity, from the time of Chrift to the 14th century: which works produced a warm controversy between Dr Cave and M. Le Clerc, who was then writing his Bibilothques Universelles in Holland, and who charged the doctor with partiality. Dr Cave died in 1713.

CAVE, (Edward) printer, celebrated as the projector of the Gentleman's Magazine,—the first publication of the species, and linece

The fruitful mother of a thousand more, who was born in 1691. His father being disappointed of some small family expectations, was reduced to follow the trade of a shoemaker at Rugby in Warwickshire. The free school of this place, in which his son had, by the rules of its foundation, a right to be instructed, was then in high reputation, under the Rev. Mr Holyock, to whose care most of the neighbouring families, even of the highest rank, entrusted their sons. He had judgment.
to discover, and for some time generously to encourage the genius of young Cave; and was so well pleased with his quick progress in the school, that he declared his intention to breed him for the university, and recommend him as a servant to some of his scholars of high rank. But prosperity which depends upon the caprice of others, is of short duration. Cave’s superiority in literature excited him to an invidious familiarity with boys whom he knew were far above him in rank and expectations; and, as in unequal associations it always happens, whatever unlucky prank was played was imputed to Cave. When any mischief, great or small, was done, though perhaps others boasted of the stratagem when it was successful, yet upon detection or miscarriage, the fault was sure to fall upon poor Cave. The harsh treatment he experienced from this source, and which he bore for a while, made him at last leave the school, and the hope of a literary education, to seek some other means of gaining a livelihood.

He was first placed with a collector of the excise; but the insolence of his mistresses, who employed him in servile drudgery, quickly disgusted him, and he went up to London in quest of a more suitable employment. He was recommended to a timber-merchant at the Bankside: and while he was there on looking, is said to have given hopes of great mercantile abilities: but the place he soon left, and was bound apprentice to Mr Collins, a printer of some reputation, and deputy alderman. This was a trade for which men were formerly qualified by a literary education, and which was pleasing to Cave, because it furnished some employment for his scholastic attainments. Here, therefore, he resolved to settle, though his master and mistresses lived in perpetual discord, and their house was therefore no comfortable habitation. From the inconvenience of these domestic tumults he was soon released, having in only two years attained so much skill in his art, and gained so much the confidence of his master, that he was sent without any superintendent to conduct a printing-house at Norwich, and publish a weekly paper. In this undertaking he met with some opposition, which produced a public controversy, and procured young Cave the reputation of a writer.

His master died before his apprenticeship was expired, and he was not able to bear the perverseness of his mistresses. He therefore quit his house upon stipulated allowance, and married a young widow with whom he lived at Bow. When his apprenticeship was over, he worked as a journeyman at the printing-house of Mr Barber, a man much distinguished and employed by the Tories, whose principles had at that time so much prevalence with Cave, that he was for some years a writer in Mill’s Journal. He afterwards obtained by his wife’s interest a small place in the post-office; but still continued, at his intervals of attendance, to exercise his trade, or to employ himself with some typographical business. He corrected the Gradius ad Parnassum: and was liberally rewarded by the company of flanioners. He wrote an Account of the Criminals, which had for some time a considerable sale; and published many little pamphlets that accident brought into his hands, of which it would be very difficult to recover the memory. By the correspondence which his place in the post-office facilitated, he procured a country newspaper, and fold their intelligence to a journal in London for a guinea a week. He was afterwards raised to the office of clerk of the franks, in which he acted with great spirit and firmness; and often stopped franks which were given by members of parliament to their friends, because he thought such extension of a peculiar right illegal. This raised many complaints; and the influence that was exerted against him procured his ejection from office. He had now, however, collected a sum sufficient for the purchase of a small printing-office, and began the Gentleman’s Magazine; an undertaking to which he owed the influence in which he passed the last 20 years of his life, and the large fortune which he left behind him.

When he formed the project, he was far from expecting the success which he found; and others had fo little prospect of its consequence, that though he had for several years talked of his plan among printers and booksellers, none of them thought it worth the trial. That they were not (says Dr Johnson) restrained by their virtue from the execution of another man’s design, was sufficiently apparent as soon as that design began to be gainful; for in a few years a multitude of magazines arose, and perished: only the London Magazine, supported by a powerful association of booksellers, and circulated with all the art and all the cunning of trade, exempted itself from the general fate of Cave’s invasers, and obtained though not an equal yet a considerable sale.

Cave now began to aspire to popularity; and being a greater lover of poetry than any other art, he sometimes offered subjects for poems, and proposed prizes for the best performers. The first prize was 50l. for which, being newly acquainted with wealth, and thinking the influence of 50l. extremely great, he expected the first authors of the kingdom to appear as competitors; and offered the allotment of the prize to the universities. But when the time came, no name was seen among the writers that had been ever seen before; the universities and several private men rejected the province of affigning the prize. The determination was then left to Dr Cromwell Mortimer and Dr Birch; and by the latter the award was made, which may be seen in Gent. Mag. Vol. VI. p. 39.

Mr Cave continued to improve his Magazine, and had the satisfaction of seeing its success proportionate to his diligence, till in 1753 his wife died of an asthma. He seemed not at first much affected by her death, but in a few days lost his sleep and appetite, which he never recovered. After having lingered about two years, with many vicissitudes of amendment and relapse, he fell by drinking acid liquor into a diar- rhoea, and afterwards into a kind of lethargic insensibility; and died Jan. 10, 1754, having just concluded the 23d annual collection.

CAVEARE. See CAVEATING.

CAVEAT, in law, a kind of process in the spiritual courts, to stop the proving of a will, the granting of administration, &c. to the prejudice of another. It is also used to stop the institution of a clerk to a benefice.

CAVEATING, in fencing, is the shifting the sword from one side of that of your adversary to the other.
CAVENDISH, (Sir William) descended of an ancient and honourable family, was born about the year 1505, the second son of Thomas Cavendish, of Caven­dish in Suffolk, clerk of the pipe in the reign of Henry VIII. Having had a liberal education, he was taken in to the family of the great cardinal Wolsey, whom he served in the capacity of gentleman-usher of the chamber, and afterwards conferred his into his service. He died, and delayed going to court till he had been in high favour at court than a camp: that when the civil war broke out, his circumstances were now so bad, that himself and wife were reduced to the necessity of pawning their clothes for a dinner. He afterwards removed to Antwerp, that he might be nearer his own country; and there, though under great difficulties, retired for several years: but, notwithstanding his distresses, he was treated, during an exile of eighteen years, with extraordinary marks of distinction. On his return to England at the restoration, he was advanced to the dignity of earl of Ogle and duke of Newcastle. He spent his time in a country retirement, and was the patron of men of merit. His grace died in 1679, aged 84. He wrote a treatise on horsemanship, which is esteemed; and some comedies, which are not.

Mr Granger observes, that he was master of many accomplishments, and was much better qualified for a court than a camp: that he understood horsemanship, music, and poetry; but was a better horsemann than musician, and a better musician than poet.

CAVENDISH, (Margaret) duchess of Newcastle, famous for her voluminous productions, was born about the latter end of the reign of James I. and was the youngest sister of Lord Lucas of Coleheffer. She married the duke of Newcastle abroad in 1645; and on his return after the restoration, spent the remainder of her life in writing plays, poems, with the help of her husband, to the amount of about a dozen of folios. "What gives the best idea of her unbounded passion for scribbling (sa.s Mr Walpole), was her finding revising the copies of her works, left, as she said, it should disturb her following conceptions." She died in 1673.

CAVENDISH, (William) the first duke of Devonshire, and one of the most distinguished patriots in the British annals, was born in 1640. In 1677, being then member for Derby, he vigorously opposed the venal measures of the court; and, the following year, was one of the committee appointed to draw up articles of impeachment against the lord treasurer Danby. In 1679, being re-elected to serve for Derby in a new parliament, Charles II. thought fit to make him a privy councilor; but he soon withdrew from the board, with his friend lord Ruffel, when he found that popish interest prevailed. He carried up the articles of impeachment to the house of lords, against lord chief justice Scroggs, for his arbitrary and illegal proceed-
CAVENDISH. In the court of the king’s bench; and when the king declared his resolution not to sign the bill for excluding the Duke of York (afterwards James II.), he moved the house of commons, that a bill might be brought in for the association of all his majesty’s protestant subjects. He also openly named the king’s evil counsellors, and voted for an address to remove them from his presence and councils for ever. He nobly appeared at lord Russel’s trial, in defence of that great man, at a time when it was feared more criminal to be an accomplice than a witness for him. The same fortitude, activity, and love of his country, animated this illustrious patriot to oppose the arbitrary proceedings of James II.; and when he saw there was no other method of saving the nation from impending slavery, he was the foremost in the association for invading over the prince of Orange, and the first nobleman who appeared in arms to receive him at his landing. He was created Duke of Devonshire in 1694, by William and Mary. His last public service was in the union with Scotland, for concluding of which he was appointed a commissioner by queen Anne. He died in 1707, and ordered the following inscription to be put on his monument.

Williamus Dux Devon,

Bonorum Principum Fidelis Subditus,

Iulius et Infius Tyrannus.

William Duke of Devonshire,

Of good Princes the faithful Subject,

The Enemy and Aversion of Tyrants.

Besides being thus estimable for public virtues, his grace was distinguished by his literary accomplishments. He had a poetical genius, which showed itself particularly in two pieces, written with equal spirit, dignity, and delicacy: these are, an ode on the death of queen Mary; and an allusion to the archbishop of Cambrai’s supplement to Homer. He had great knowledge in the languages, was a true judge in history, and a critic to any person of the circle, to be only a fragment of his time; it being an opinion, particularly a sort of mullet, with a species of the spawn of fiurgeon. A kind of caviare brought from Muscovy is prepared from the bellugs, a fish eight or ten feet long, caught in the Caspian sea, which is much preferable to that made of the spawn of fiurgeon. A kind of caviare, or rather sanguinaria, is also made from the spawn of some other fishes; particularly a sort of mullet caught in the Mediterranean. See MUGIL and BOTARIO.

Infeel CAVIARE. See AXAYACATL.

CAVIDOS. See CAVIDOS.

CAVIL, (cavillatio) is defined by some a fallacious kind of reason, carrying some resemblance of truth, caviare from Archangel, but commonly buy it at second hand of the English and Dutch. —According to Savary, the best caviare brought from Muscovy is prepared from the bellugs, a fish eight or ten feet long, caught in the Caspian sea, which is much preferable to that made of the spawn of fiurgeon. A kind of caviare, or rather sanguinaria, is also made from the spawn of some other fishes; particularly a sort of mullet caught in the Mediterranean. See MUGIL and BOTARIO.

CAUKING, or CAULKING, of a ship, is driving a quantity of oakum, or old ropes unwitted and drawn aunder, into the seams of the planks, or into the intervals where the planks are joined together in the ship’s decks or sides, in order to prevent the entrance of water. After the oakum is driven very hard into these seams, it is covered with hot and melted pitch or rosin, to keep the water from running out. Among the ancients, the first who made use of pitch in caulking were the inhabitants of Phœcea, afterwards called Corsica. Wax and rosin appear to have been commonly used previous to that period; and the Poles at this time use a sort of animal clay for the same purpose, on their navigable rivers.

CAULKING-Irons, are iron chisels for that purpose. Some of these irons are broad, some round, and others grooved. After the seams are filled with oakum, it is done over with a mixture of tallow, pitch, and tar, as low as the ship draws water.

CAUL, in anatomy, a membrane in the abdomen, covering the greatest part of the guts called, from its structure, Reticulum, but most frequently Omentum. See ANATOMY, n° 90.

CAUL is likewise a little membrane, found on some children, encompassing the head when born.

Drelincourt takes the caul to be only a fragment of the membranes of the foetus; which ordinarily break at the birth of the child. Lampridius tells us, that the midwives fold this caul at a good price to the advocates and pleaders of his time; it being an opinion, that while they had this about them, they should carry with them a force of persuasion which no judge could withstand: the canons forbid the use of it; because some witches and forcers, it seems, had abused it.

CAULIFLOWERS, in gardening, a much esteemed species of cabbage. See Brasia.

CAURIS, in natural history, is a name given by some to the genus of shells called, by the generality of writers, corallana, and concha venere. It is from a false pronunciation of this word cauris, which we call these shells porcellana. See CORSELAN-Shell.

CAURSINES, (Courins) were Italians that came into England about the year 1235, terming themselves the
the Pope's merchants, but driving no other trade than
letting out money; and having great banks in Eng-
land, they differed little from Jews, save (as history
fays) they were rather more mercifulls to their debtors.
Some will have them called Courisini, quasi Caufa Ur-
fini, bearich and cruel in their caufes; others Coarfini
or Corifini, as coming from the ille of Corfica; but
Cowel fays, they have their name from Courfiani, Caufiri,
a town in Lombardy, where they first practifed their
arts of ufury and extortion; from whence, spreading
themselves, they carried their infamous trade through
most parts of Europe, and were a common plague to
every nation where they came. The then bishop of
London excommunicated them; and king Henry III.
banifhed them from his kingdom in the year 1240.
But, being the pope's folicitors and money-changers,
they were permitted to return in the year 1250; tho'
in a very short time they were again driven out of the
kingdom on account of their intolerable exactions.

CAUSA MATRIMONII PRELOCUTI, in common
law, a writ that lies where a woman gives land to a man
in fee to the intent he shall marry her, and he refufes
in a very subtile matter, which passes from the magnet to the
needle, and forces it from its place. He can even
show you, in a figure, where there magnetic effluvia
issue from the magnet, what round they take, and
what way they return home again. And thus he thinks
he comprehends perfectly how, and by what caufe,
the motion of the needle is produced.

A Carteefian philofopher enters deeper into the caufe
of this phenomenon. He observes, that the magnet
does not touch the needle, and therefore can give it
no impulfes. He pities the ignorance of the failor. The
effect is produced, fays he, by magnetic effluvia, or
fubtile matter, which paffes from the magnet to the
needle, and forces it from its place. He can even
show you, in a figure, where these magnetic effluvia
issue from the magnet, what round they take, and
what way they return home again. And thus he thinks
he comprehends perfectly how, and by what caufe,
the motion of the needle is produced.

A Newtonian philofopher inquires what proof can
be offered for the exiftence of magnetic effluvia, and
can find none. He therefore holds it as a fiction, a
hypothesi; and he has learned that hypofhes ought
to have no place in the philofophy of nature. He
confesses his ignorance of the real caufe of this motion,
and thinks that his buifeifs as a philofopher is only to
find from experiment the laws by which it is regulated
in all cafes.

These three perffons differ much in their fentiments
with regard to the real caufe of this phenomenon; and
the man who knows moft is he who is fenfible that he
knows nothing of the matter Yet all the three fpeak
the fame language, and acknowledge that the caufe
of this motion is the attractive or repulsive power of
the magnet.

What has been faid of this, may be applied to every
phenomenon that falls within the compafs of natural
philofophy. We deceive ourselves, if we conceive
that we can point out the real efficient caufe of any
one of them.

The grandeft discovery ever made in natural philo-
...
discover the laws of nature; and then to apply those laws to the solution of the phenomena of nature. This was all that this great philosopher attempted, and all that he thought attainable. And this indeed he attained in a great measure, with regard to the motions of our planetary system, and with regard to the rays of light.

But supposing that all the phenomena which fall within the reach of our senses were accounted for from general laws of nature justly deduced from experience; that is, supposing natural philosophy brought to its utmost perfection; it does not discover the efficient cause of any one phenomenon in nature.

The laws of nature are the rules according to which the effects are produced; but there must be a cause which operates according to these rules. The rules of navigation never navigated a ship. The rules of architecture never built a house.

Natural philosophers, by great attention to the course of nature, have discovered many of her laws, and have very happily applied them to account for many phenomena; but they have never discovered the efficient cause of any one phenomenon; nor do those who have different notions of the principles of the science make any such pretense.

Upon the theatre of nature we see innumerable effects, which require an agent endowed with active power; but the agent is behind the scene. Whether it be the Supreme Cause alone, or a subordinate cause, or causes; and if subordinate causes be employed by the Almighty, what their nature, their number, and their different offices may be; are things hid, for wise reasons, without doubt, from the human eye.

 أيضًا، خلال كتبه، وصف العديد من الأدوية، بما في ذلك السلفارمين وأكسيوكريميتا، حيث أن هذه النباتات تحتوي على سموم تدميرية تصل إلى الدماغ، مما يمكن أن يؤدي إلى سوء الفطام. بفضل علماء الأدوية الجدد، بدأوا في استخدام هذه الأدوية بشكل أسرع وأكثر كفاءة.

The cause of a disease is defined by Galen to be that during the presence of which we are ill, and which being removed the disorder immediately ceases. The doctrine of the causes of diseases is called ETIOLOGY.

Physicians divide causes into procaurlic, antecedent, and continent.

PROCAURIC CAUSE, or a cause which brings about an effect, is either an occasion which of its own nature does not beget a disease, but happening on a body inclined to diseases, breeds a fever, gout, &c. (such as are watching, fasting and the like); or an evident and manifest cause, which immediately produces the disease, as being sufficient thereto, such as is a sword in respect of a wound.

ANTecedENT CAUSE, or a cause which predisposes the body, from whence some disease may arise; such as a plethora in respect of a fever, a cacocehumia in respect of a fever.

Continent, Conjoint, or Proximate Cause, that principle in the body which immediately adheres to the disease, and which being present, the disease is also present; or, which being removed, the disease is taken away: such is the stone in a nephritic patient.

CAUSEWAY, or CAUSEY, a massive construction of stone, flates, and facelines; or an elevation of fat, viscous earth, well beaten; serving either as a road in wet marshy places or as a mole to retain the waters of a pond or prevent the river from overflowing the lower ground. See ROAD.—The word comes from the French Chauy, or Chauysse; and Causeway, from the Latin Coacuta, or Coacata; according to Somner and Spelman, a calacando. Bergier rather takes the word to have had its rise à petitum caelestis, quibus territur. Some derive it from the Latin colo, or French chaux, as supposing it primarily to denote a way paved with chalk-flones.

CAUSEWAY, calectum, or calea, more usually denotes a common hard raised way, maintained and repaired with stones and rubbles.

DESPER'S CAUSED, a famous work of this kind, which ranges through the county of Northumberland in England, commonly supposed to be Roman, though Mr Horley suspects it to be of later times.

GIANT'S CAUSEWAY, is a denomination given to a huge pile of stone columns in the district of Coleraine in Ireland. See GIANT'S CAUSEWAY.

CAUSSIN, (Nicholas) parnised the just, a French Jesuit, was born at Troyes in Champagne, in the year 1580; and entered into the Jesuits order when he was 26 years of age. He taught rhetoric in several of their colleges, and afterwards began to preach by which he gained very great reputation. He increased this reputation by publishing books, and in time was preferred to be confessor to the king. But he did not discharge this office to the satisfaction of Cardinal Richelieu, though he discharged it into the satisfaction of every honest man; and therefore, it is not to be wondered at that he came at length to be removed. He died in the Jesuits convent at Paris in 1651. None of his works did him more honour than that which he entitled LA COURCE SAINTE. It has been printed a great many times; and translated into Latin, Italian, Spanish, Portuguese, German, and English. He published several other books both in Latin and French.

CAUSTICITY, a quality belonging to several substances, by the acrimony of which the parts of living animals may be corroded and destroyed. Bodies which have this quality, when taken internally, are true poisons. The causticity of some of these, as of arsenic, is so deadly, that even their external use is prohibited by prudent physicians. Several others as nitrous acid, lapis infernalis or lunar caustic, common caustic, butter of antimony, are daily and successfully used to consume fungous flesh, to open ulcers, &c. They succeed very well when properly employed and skillfully managed.

The causticity of bodies depends entirely on the state of the saline, and chiefly of the acid, matters they contain. When these acids happen to be at the same time much concentrated, and slightly attached to the matters with which they are combined, they are then capable of acting, and are corrosive or caustic. Thus fixed and volatile alkalies, although they are themselves caustic, become much more so by being treated with quicklime; because this substance deprives them of much of their inflammable matter, and all their fixed air, which binds and restrains the action of their saline principle. By this treatment, then the saline principle is more disengaged, and rendered more capable of action. Also all combinations of metallic matters with acids form salts more or less corrosive, because these acids are deprived of all their superabundant water, and are besides but imperfectly saturated with the metallic matters. Nevertheless, some other circumstances is necessary to constitute the causticity of these saline metals.
Cauritic. metallic matters. For the same quantity of marine acid, which, when pure and diluted with a certain quantity of water, would be productive of no harm, shall, however, produce all the effects of a corrosive poison, when it is united with mercury in corrosive sublimate, although the sublimate shall be dissolved in so much water that its causticity cannot be attributed to the concentration of its acid. This effect is, by some chemists, attributed to the great weight of the metallic matters with which the acid is univited; and this opinion is very probable, seeing its causticity is nothing in this way. Some are reckoned more acrid than the acids in a separate state; but its dissolving power, or its disposition to combine with other bodies, and this disposition is nothing else than attraction.

On this subject Dr Black observes, that the compounds produced by the union of the metals with acids are in general corrosive. Many of them applied to the skin destroy it almost as fast as the mineral acids; and some of the most powerful potential cauteries are made in this way. Some are reckoned more acid than the pure acids themselves; and they have more powerful effects when taken internally, or at least seem to have. Thus we can take 10 or 12 drops of a fustic acid, diluted with water, without being disturbed by it; but the same quantity of acid previously combined with silver, quicksilver, copper, or regal of antimony, will throw the body into violent disorders, or even prove a poison, if taken all at once.

This increased activity was, by the mechanical philosophers, supposed to arise from the weight of the metallic particles. They imagined that the acid was composed of minute particles of the shape of needles or wedges; by which means they were capable of entering the pores of other bodies, separating their atoms from each other, and thus dissolving them. To these acid spiculae the metallic particles gave more force; and the momentum of each particular needle or wedge was increased in proportion to its increase of gravity by the additional weight of the metallic particle. But this theory is entirely fanciful, and does not correspond with facts. The activity of the compound is not in proportion to the weight of the metal; nor are the compounds always poifomed of any great degree of acrimony; neither is it true that any of them have a greater power of destroying animal substances than the pure acids have.

There is a material difference between the powers called stimulis and corrosives. Let a person apply to any part of the skin a small quantity of metallic caustic, and likewise a drop of strong nitrous acid, and he will find that the acid acts with more violence than the caustic; and the disorders that are occasioned by the compounds of metals and acids do not proceed from a causticity in them, but from the metal affecting and proving a stimulus to the nerves; and that this is the case, appears from their affecting some particular nerves of the body. Thus the compounds of regal of antimony and mercury with the vegetable acids, do not shew the smallest degree of acrimony; but taken internally, they produce violent convulsive motions over the whole body, which are occasioned by the metallic matter having a power of producing this effect; and the acid is only the means of bringing it into a dissolved state, and making it capable of acting on the nervous system. In general, however, the compounds of metallic substances with acids may be considered as milder than the acids in a separate state; but the acid is not so much neutralized as in other compounds, for it is less powerfully attracted by the metal; so that alkaline salts, absorbent earths, or even heat alone, will decompose them; and some of the inflammable substances, as spirit of wine, aromatic oils, &c. will attract the acid, and precipitate the metal in its metallic form; and the metals can be employed to precipitate one another in their metallic form; so that the cohesion of these compounds is much weaker than those formed of the same acids with alkaline salts or caustic.

Cautics, in physics, an appellation given to medicines of so hot and fiery a nature, that, being applied, confume, and as it were burn, the texture of the parts; like hot iron.

Cautics are generally divided into four sorts; the common strong caustic, the common milder caustic, the antimonial caustic, and the lunar caustic. See PHARMACY and CHEMISTRY.

Cautic Curves, in the higher geometry, a curve formed by the concourse or coincidence of the rays of light reflected from some other curve.

Causus, or Burning Fever, a species of continual fever, accompanied with a remarkable inflammation of the blood.

Cauterosis, the act of burning or fear of some morbid part, by the application of fire either actual or potential. In some places they cauterize with burning tow, in others with cotton or moxa, in others with live coals; some use Spanish wax, others pyramidal pieces of linen, others gold or silver: but Severinus recommends flame blown through a pipe; but what is usually preferred among us is a hot iron.

Cauterizing irons are of various figures; some flat, others round, some curved, &c. of all which we find draughts in Albucasis, Scultetus, and Ferrara, and others. Sometimes a cauterity is applied through a capsule, to prevent any terror from the sight of it. This method was invented by Placentinus, and is described by Scultetus. In the use of all cauteries, care is to be taken to defend the neighbouring parts, either by a lamina, defensive platter, or lint moistened in oxideyater. Sometimes the hot iron is transmitted through a copper cannula, for the greater safety of the adjoining parts. The degrees and manners of cauterizing are varied according to the nature of the disease and the part affected.

Cautery, in surgery, a medicine for burning, eating, or corroding any solid part of the body. Cauteries are diffinguished into two classes; actual and potential; by actual cauteries are understood red hot instruments, unifiable of iron, and by potential cauteries are understood certain kinds of corroding medicines. See PHARMACY.

Cautus, in the civil and Scots law, denotes much the same with what, in the law of England, is called Bail.

Cauturer, in Scots law, that person, who becomes bound for another to the performance of any deed or obligation. As to the different kinds and effects of Cautusry, see Law, Part III. No 1 clxxv. 19.

Caxa, a little coin made of lead mixed with some feeris.
CAYENNE, a rich town and island in South-America, and capital of the French settlements there, is bounded on the north by the Dutch colonies of Surinam, and situated in W. LONG. 53° 10'. N. LAT. 5° 0'.

This settlement was begun in 1635. A report had prevailed for some time before, that, in the interior parts of Guiana, there was a country known by the name of del Dorado, which contained immense riches in gold and precious stones; more than ever Cortez and Pizarro had found in Mexico and Peru; and this false had fired the imagination of every nation in Europe. It is supposed that this was the country in quest of which Walter Raleigh went on his last voyage; and, as the French were not behind their neighbours in their endeavours to find out so desirable a country, some attempts, for this purpose, were likewise made by that nation much about the same time; which at last coming to nothing, the adventurers took up their residence on the island of Cayenne. In 1643, some merchants of Rouen united their flock, with a design to support the new colony; but, committing their affairs to one Poncet de Breteigny, a man of a ferocious disposition, he declared war both against the colonists and savages, in conformance of which he was soon maf- facrved. This catastrophe entirely extinguished the ar- mour of these associates; and in 1651 a new company was establisht. This promised to be much more con- siderable than the former; and they set out with such a capital as enabled them to collect 700 or 800 colonis- ts in the city of Paris itself. These embarked on the Seine, in order to fall down to Havre de Grace; but unfortunately the Abbe de Marivault, a man of great virtue, and the principal promoter of the under- taking, was drowned as he was stepping into his boat. Another gentleman, who was to have acted as general, was affaihnated on his passage; and 12 of the principal adventurers, who had promised to put the colony into a flourishing situation, not only were the principal perpetrators of this fact, but uniformly behaved in the same atrocious manner. As at last they hanged one of their own number; two died; three were banished to a desert island; and the rest abandoned themselves to every kind of excess. The commandant of the citadel deserted to the Dutch with part of his garrison. The savages, roused by numberless provocations, fell upon the remainder; so that the few who were left thought themselves happy in escaping to the Leeward Islands in a boat and two canoes, abandoning the fort, am- munition, arms, and merchandise, fifteen months after they had landed on the island.

In 1663, a new company was formed, whose capital amounted only to L. 8750. By the assistance of the ministry they expelled the Dutch, who had taken pos-
Caylus.

In his natural temper he was gay and priggishly, had a taste for pleasure, a strong passion for independence, and an invincible aversion to the servitude of a court. Such were the instructors of the count de Caylus. He was only twelve years of age when his father died at Brussels in 1704. After finishing his exercises, he entered into the corps of the Monjueforset; and in his first campaign in the year 1709, he distinguished himself by his valor in such a manner, that Louis XIV. commended him before all the court, and rewarded him with an ensigncy in the Gendarmerie. In 1711 he commanded a regiment of dragoons, which was called by his own name; and he signalized himself at the head of it in Catalonia. In 1715, he was at the siege of Fribourg, where he was exposed to imminent danger in the bloody attack of the covered way. The peace of Rastade having left him in a state of inactivity ill-suited to his natural temper, his vivacity soon carried him to travel into Italy; and his curiosity was greatly excited by the wonders of that country, where antiquity is still fruitful, and produces so many objects to improve taste and to excite admiration. The eyes of the count were not yet learned; but he was struck with the fight of so many beauties, and soon became acquainted with them. After a year's absence, he returned to Paris with so strong a passion for travelling, and for antiquities, as induced him to quit the army.

He had no sooner quitted the service of Louis, than he sought for an opportunity to get out for the Levant. When he arrived at Smyrna, he visited the ruins of Ephesus. From the Levant he was recalled in February 1717 by the tenderness of his mother. From that time he left not France, but to make two excursions to London. The academy of painting and sculpture adopted him an honorary member in the year 1731; and the count, who loved to realize titles, spared neither his labour, nor his credit, nor his fortune, to instruct, afflct, and animate the artists. He wrote the lives of the most celebrated painters and engravers that have done honour to this illustrious academy; and by extending the limits of the art, which seemed to him to move in too narrow a circle, he collected, in three different works, new subjects for the painter, which he had met with in the works of the ancients.

Such was his passion for antiquity, that he wished to have had it in his power to bring the whole of it to life again. He saw with regret, that the works of the ancient painters, which have been discovered in our times, are effaced and destroyed almost as soon as they are drawn from the subterraneous mansions where they were buried. A fortunate accident furnished him with the means of saving the composition and the colouring of the pictures of ancient Rome. The coloured drawings which the famous Pietro Sante Bartoli had taken there from antique pictures, fell into his hands. He had them engraved; and, before he enriched the king of France's cabinet with them, he gave an edition of them at his own expense. It is perhaps the most extraordinary book of antiquities that ever will appear. The whole is painted with a purity and a precision that are mimimable; we see the liveliness and the freshness of the colouring that charmed the Caylars. There were only 30 copies published; and there is no reason to expect that there will hereafter be any more.

Count de Caylus was engaged at the same time in an enterprise still more favourable to Roman grandeur, and more interesting to the French nation. Colbert had framed the design of engraving the Roman antiquities that are still to be seen in the southern provinces of France. By his orders Mignard the architect had made drawings of them, which count de Caylus had the good fortune to recover. He resolved to finish the work begun by Colbert, and to dedicate it to that great minister; and so much had he this enterprise at heart, that he was employed in it during his last illness, and warmly recommended it to M. Mariette.

In 1742, Count Caylus was admitted honorary member of the academy of belles lettres; and then it was that he seemed to have found the place for which nature designed him. The study of literature now became his ruling passion; he consecrated to it his time and his fortune; he even renounced his pleasures to give himself wholly up to that of making some discovery in the field of antiquity. But amidst the fruits of his research and invention, nothing seemed more flattering to him than his discovery of encaustic painting. A description of Pliny's, but too concise a one to give him a clear view of the matter, suggested the idea of it. He availed himself of the friendship and skill of M. Magault, a physician in Paris, and an excellent chemist; and by repeated experiments found out the secret of incorporating wax with divers tints and colours, and of making it obedient to the pencil. Pliny has made mention of two kinds of encaustic painting practiced by the ancients; one of which was performed with wax, and the other upon ivory, with hot punctures of iron. It was the former that Count Caylus had the merit of reviving; and M. Muntz afterwards made many experiments to carry it to perfection.

In the hands of Count Caylus, literature and the arts lent each other a mutual aid. But it would be endless to give an account of all his works. He published above 40 dissertations in the Memoirs of the Academy of Belles Lettres. The artist was particularly attentive to; and to prevent their falling into mistakes from an ignorance of costume, which the ablest of them have sometimes done, he founded a prize of 500 livres, the object of which is to explain, by means of authors and monuments, the usages of ancient nations. In order that he might enjoy with the whole world the treasures he had collected, he caused them to be engraved, and gave a learned description of them in a work which he embellished with 800 copperplates.

The strength of his constitution seemed to give him hopes of a long life; but a humour settling in one of his legs, which entirely destroyed his health, he expired on the 5th of September 1765, and by his death his family is extinct. The tomb erected to the honours of count Caylus is to be seen in the chapel of St Germain-l'Auxerrois, and deserves to be remarked. It is perfectly the tomb of an antiquary. This monument was an ancient sepulchral antique, of the most beautiful porphyry, with ornaments in the Egyptian taste. From the moment he procured it, he had
Ceanothus. garden where he used to look upon it with a tranquil but thoughtful eye, and pointed it out to the inspection of his friends.

The character of Count Caylus is to be traced in the different occupations which divided his cares and his life. In society he had all the frankness of a foal-dier, and a politeness which had nothing in it of deceit or circumvention. Born independent, he applied to studies which suited his taste. His heart was yet better than his abilities. In his walks he used frequently to try the honesty of the poor by feeding them with a piece of money to get change for him. In these cases he enjoyed their confusion at not finding him; and then presenting himself, used to commend their honesty, and give them double the sum. He said frequently to his friends, "I have this day loot a crown; but I was sorry that I had not an opportunity of giving a second. The beggar ought not to want integrity."

Cayster, or Caystrus, (anc. geog.) a river of Ionia, whose mouth was in great numbers. Its source was in the Montes Cilbiani, (Pliny). Caystrus Campus was a part of the territory of Ephesus. Campi Caystriani of Lydia, were the plains lying in the middle between the inland parts and Mount Tmolus.

Cazerom, or Cazeron, a city of Asia in Peria, situated in E. Long. 70. N. Lat. 39. 15.

Cazic, or Cazique, a title given to the petty kings, princes, and chiefs, of the several countries of America, excepting those of Peru, which are called Caziques. The French call them caziques, a denomination which they always give to the Tartarian lords.—The cazics, in some places, are of a light green color, grow irregularly on the branches, and not opposite by pairs, as has been asserted. They are late in the spring before they shoot. The flowers grow at the ends of the twigs in clusters: They are of a white colour, and when in bloom give the shrub a most beautiful appearance. Indeed it seems to be almost covered with them, as there is usually a cluster at the end of nearly every twig; and the leaves which appear among them serve as ornaments only, like myrtle in a distant nosegay; nature however has denied them smell. This tree will be in bloom in July; and the flowers are succeeded by small brownish fruit, in which the seeds will sometimes ripen in England.

This plant is propagated by layering; or from seeds sown in pots of compost, consisting of two parts virgin earth well tempered and one part sand, about a quarter of an inch deep; being equally careful to defend the young seedlings from an extremity of cold in winter, as from the parching drought of the summer months. The best time of layering them is in the summer, just before they begin to flower: At that time lay the tender twigs of the spring shoots in the earth, and nip off the end which would produce the flowers. By the autumn twelvemonth some of them will be rooted. At the floods, however, the plants should remain until the spring, when they should be taken off, and the best rooted of the strongest may be planted in the nursery-way, or in a dry soil and well sheltered place, where they are to remain; while the bad-rooted ones and the weakest should be planted in pots; and if these are plunged into a moderate warmth of dung, it will promote their growth, and make them good plants before autumn. In the winter they should be guarded against the frosts; and in the spring they may be planted out where they are to remain.

Cebes, of Theso, a Socratic philosopher, author of the admired Table of Cebes; or "Dialogues on the birth, life, and death of Mankind." He flourished about 405 years before Christ. The above piece is mentioned by some of the ancient writers, by Lucian, D. Laertius, Tertullian, and Suidas: but of Cebes himself we have no account, save that he is once mentioned by Plato, and once by Xenophon. The former says of him, in his "Phaedo," that he was a sagacious inquisitor of truth, and never averted without the most convincing reasons: the latter, in his "Memorabilia," ranks him among the few intimates of Socrates, who excelled the rest in the innocence of their lives. Cebes's Table is usually printed with Epictetus's Manual.

Cecil, (William) lord Burleigh, treasurer of England in the reign of queen Elizabeth, was the son of Richard Cecil, Esq; master of the robes to king Henry VIII. He was born in the house of his grandfather, David Cecil, Esq; at Bourn in Lincolnshire, in the year 1520; and received the rudiments of his education in the grammar-school at Grantham. From thence
had brought with him two Irish chaplains, enthusiastic in their profession, and was so pleased with his offer, which was the more extraordinary, as being at a time when the Greek language was by no means universally understood. In 1541 he went to London, and became a member of the society of Gray's-Inn, with an intention to study the law; but he had not been long in that situation, before an accident introduced him to King Henry, and gave a new bias to his pursuits. O'Neil, a famous Irish chief, coming to court, had brought with him two Irish chaplains, violent bigots to the Romish faith; with these Mr Cecil, visiting his father, happened to have a warm dispute in Latin, in which he displayed uncommon abilities. The king being informed of it, ordered the young man into his presence, and was so pleased with his offer, that he became a member of the society.

The king being informed of it, ordered the young man into his presence, and was so pleased with his offer, that he became a member of the society. At the age of 16 he read a lecture, in which he displayed uncommon abilities. The sight and judgment of his friend must have been subdued, for he was made secretary of state for 40 years, and guided the helm of government during the most glorious period of English history. From this period we find him the primum mobile of every material transaction during the glorious reign of Queen Elizabeth. Notwithstanding the temporary influence of other favourites, Lord Burleigh was, in fact, her prime minister, and the person in whom the chief confidence in matters of real importance. Having filled the highest and most important offices of the state for 40 years, and guided the helm of government during the most glorious period of English history, he departed this life on the 4th of August 1598, in the 78th year of his age. His body was removed to Stamford, and there deposited in the family vault, where a magnificent tomb was erected to his memory. Notwithstanding his long enjoyments of such lucrative employments, he left only an estate of L.4000 per annum, L.11,000 in cash, and 40,000 in money, and effects worth about L.30,000. He lived, indeed, in a manner suitable to his high rank and importance. He had four places of residence, viz., his lodgings at court, his house in the Strand, his seat at Burleigh-Park near Stamford, and his seat at Tedworth. The laft of these was his favourite place of retirement, where he frequently entertained the queen at a vast expense.

Cecilia. 

Cecilia, (St) the patroness of music, has been honoured as a martyr ever since the fifth century. Her story as delivered by the notaries of the Roman church, and from them transcribed into the Golden Legend and other books of the like kind, says, that she was a Roman lady born of noble parents, about the year 225. That, notwithstanding she would destroy him, Valerianus, somewhat heresy, the book, as the calamon, says the book, was given to understand by his spouse, that she was nightly visited by an angel, and that he must forbear to approach her, otherwise the angel would destroy him. Valerianus, somewhat troubled at these words, desired that he might see his rival the angel; but his spouse told him that was impossible, unless he would consent to be baptised and become a Christian. This he consented to; after which, returning to his wife, he found her in her closet at prayer, and by her side, in the shape of a beautiful young man, the angel clothed with brightness, after some conversation with the angel, Valerianus told him that he had a brother named Tiburtius, whom he greatly wished to see a paraker of the grace which he himself had received. The angel told him that his desire was granted, and that they should be both crowned with martyrdom in a short time. Upon this the angel vanished, and was not long in showing himself as good as his word; Tiburtius was converted, and both he and his brother Valerianus were beheaded. Cecilia was offered her life upon condition that she should be visited in a dry bath, i.e. an inclosure, from whence the air was excluded, having a slow fire underneath it; which kind of death was sometimes inflicted by the Romans upon women of quality who were criminals. Upon the spot where her house stood, is a church said to have been built by pope Urban I. who administered baptism to her husband and his brother: it is the church of St Cecilia at Trastevere: within is a most curious painting of the saint, as also a flately monument with a cumbent statue of her with her face downwards. There is a tradition of St Cecilia, that she excelled in music; and that the angel who was thus enamoured of her, was drawn from the celestial regions by the charms of her melody; this has been deemed authoratative for making her the patroness of music and musicians. The legend of St Cecilia has given frequent occasion to painters and sculptors to exercise their genius in representations of her, playing on the organ, and sometimes on the harp. Raphael has painted her singing with a refulent in her hands; and Domenichino and Mignard, Cecropia singing and playing on the harp.

Cecropia, the founder and first king of Athens, about the time of Moses the lawgiver of the Hebrews. He was the first who established civil government, religious rites, and marriage among the Greeks; and died after a reign of 50 years. See ATTICA, n° 4.

Cedrus, in botany. See Juniperus and Pinus. The species of cedar famous for its duration, is that popularly called by us the cedar of Lebanon (Pinus cedrus), by the ancients cedrus magnus, or the great cedar; also cedrato, Kadara. See the article Pinus.

Cedrenus, (George) a Greek monk, lived in the 7th age, and wrote "Annals, or an abridged History, from the Beginning of the World to the Reign of Isaac Comnenus emperor of Constantinople, who succeeded Michael IV. in 1057." This work is no more than an extract from several historians. There is an edition of it, printed at Paris in 1647, with the Latin version of Xylander, and the notes of father Goar a Dominican.

Cedrus, the cedar-tree, mahogany, &c. See Juniperus, Pinus, and Sweeten. Ceiling, in architecture, the top or roof of a lower room; or a covering of plaster, over laths nailed on the bottom of the joists that bear the floor of the upper room; or where there is no upper room, on joists for the purpose; hence called ceiling joists. The word ceiling answers prettily to the Latin laeunus, "every thing over head." Plastered ceilings, are much used in Britain, more than in any other country: nor are they without their advantages, as they make the room lightsome; are good in case of fire; stop the passage of the dust; lessen the noise over head; and, in summer, make the air cooler.

Ceiling, in sea-language, denotes the inside planks of a ship.

Cemelia, from καιμης, "to be laid up," in antiquity, denotes choice or precious pieces of furniture or ornaments, reserved or laid up for extraordinary occasions and uses; in which fene, sacred garments, vessels, and the like, are reputed the cemelia of a church. Medals, antique stones, figures, manuscripts, records, &c. are the cemelia of men of letters.

Cemeliarchium, the repository or place where cemelia are preferred.

Cemellyphylax, (from καιμηλια and φυλακος, I keep), the keeper or curator of a collection of cemelia; sometimes also denominated cemeliarcha. The cemeliarcha, or cemellyphylax, was an officer in the ancient churches or monasteries, answering to what was otherwise denominated chartophylax, and cistus archeverum. Celaene, (anc. geog.) the capital of Phrygia Magna, situated on a cognominous mountain, at the common sources of the Maeander and Marisias. The king of Peria had a strong palace beneath the citadel, by the springs of the Marnias, which rose in the market-place, not less in size than the Maceander, and flowed through the city. Cyrus the younger had also a palace there, but by the springs of the Maceander, which river passed likewise through the city. He leg.
Celandine, or Celasnus, which lake bad, moreover, an extensive paradise or park, full of wild beasts, which he hunted on horseback for exercise or amusement; and watered by the Maederland, which ran through the middle. Xerxes was said to have built these palaces and the Citadel after his return from his expedition into Greece.

Aniochus Soter removed the inhabitants of Celâna into a city, which he named from his mother, Apamea; and which became afterwards a mart inferior only to Ephesus. See Apamea.

Celandine, in botany. See Chelidonium.

Celano, a town of Italy, in the kingdom of Naples, in Farther Abruzzo. It is seated a mile from the lake Celano, anciently called Fusinus. E. Long. 13° 39'. N. Lat. 41° 36'.

Celarent, in logic: a mode of syllogism, wherein the major and conclusion are universal negative propositions, and the minor an universal affirmative.

E. g. cf. E. None whose understanding is limited can be omniscient.

\(\therefore\) Every man's understanding is limited.

\(\therefore\) Eni Therefore no man is omniscient.

Celastrus, in botany: a genus of the monogynia order, belonging the pentandria class of plants; and in the natural method ranked under the 43d order, Daunaya. The corolla is pentapetalous and perfect; the capsule quinquelocular and trilocular; the seeds veiled. There are 11 species; two of which are introduced to Britain.

1. The bullatus, an uncertain deciduous shrub, is a native of Virginia. It is about four feet in growth, rising from the ground with several flasks, which divide into many branches, and are covered with a brownish bark. The leaves are of a fine green colour, and grow alternately on the branches. They are of an oval figure, and have their edges undivided. The flowers are produced in July, at the ends of the branches, in loose spikes. They are of a white colour, and in their native countries are succeeded by very ornamental scarlet fruit; but in Britain this seldom happens. It is easily propagated from seeds sown, about an inch deep, in beds of good freth mould made fine. They seldom come up until the second, and sometimes not before the third spring. It is also propagated by layers; which work must be performed on the young wood, in the autumn, by a slit at the joint. These layers may be expected to strike root by the autumn following; when they may be taken up and planted in the nursery-ground. This shrub must have a well-sheltered situation, otherwise the leaves are apt to fall off at the approach of frosty weather. And Millar says, that, growing naturally in moist places, it will not thrive well in a dry soil.

2. The scandens, or biffard eunomus, with woody twining flasks, rising by the help of neighbouring trees or bushes to the height of 12 feet. The leaves are oblong, terraced, of a pleasant green colour, pale, and waved underneath, and grow alternately on the branches. The flowers are produced in small bunches, from the sides of the branches, near the ends. They are of a greenish colour, appear in June; and are succeeded by roundish, red, three-cornered capsules, containing ripe seeds, in the autumn. This species is exceedingly hardy, and makes a beautiful appearance among other trees in the autumn, by their beautiful red berries, which much resemble those of the Spindle-tree, and which will be produced in vast profusion on the tops of other trees, to the height of which these plants by their twining property climb. They should not be planted near weak or tender trees, to climb on; for they embrace the stalks so closely as to bring on death to any but the hardiest trees and shrubs. It is propagated, 1. By laying down the young shoots in the spring. By the autumn they will have struck root, and may then be taken off and set in the places where they are designed to remain. 2. By seeds; which should be sown soon after they are ripe, otherwise they will be two and sometimes three years before they come up. When they make their appearance, nothing more need be done than keeping them clear from weeds all summer and the winter following; and in the spring the strongest plants may be drawn out, and set in the nursery for a year, and then removed to the places where they are designed to remain; whilst the weakest, being left in the seed-bed one year more, may undergo the same discipline.

In Senegal the negroes use the powder of the root as a specific against gonorrhoeas, which is said to cure in eight or sometimes in three days. An infusion of the bark of a species of loftrtree, which grows in the Ile of France, is said to pollute the same virtues.

. Celebes, an island in the Indian sea, seated under the equator, and called by some Magafler. The length and breadth has not been accurately computed; but the circumference, at a medium, is about 3oo miles. It had formerly six kingdoms, which are reduced to one. The air is hot and moist; and subject to great rains during the north-west winds, which blow from November to March, at which time the country is overflowed, and for this reason they build their houses on piles of wood 10 feet high. The most healthful time is during the northern monsoons, which seldom fail blowing regularly in one part of the year. The chief vegetables are rice and cocoa; but they have ebony, sanders, &c. Their fruits and flowers are much the same as in the neighbouring parts of the Indies. They have pepper, sugar, and oil, and the finest cotton, and opium. The natives have olive complexions, and the women have shining black hair. They are thought to be very handsome by the Dutch and Chinese, who often purchase them for bedfellows. The men are industrious, robust, and make excellent soldiers. Their arms are sabres, and trunks, from whence they blow poisoned darts, which are pointed with the tooth of a sea-fish. Some likewise use poisoned daggers. They were the last of the Indian nations that were enslaved by the Dutch, which could not be effectually till after a long war. They teach their children to read and write, and their characters have some resemblance of the Arabic. Their religion being Mahometan, the men indulge themselves in many wives and concubines. The employment of the women is spinning, cookery, and making their own and their husbands clothes. The men wear jewels in their ears, and the women gold chains about their necks. The inhabitants in general go half naked, without any thing on their head, legs, or feet, and some have nothing but a cloth about their middle. The streets of
Celeres, the town Macasus are spacious, and planted with trees on every side. It stands by the side of the only large river they have in the island. The Dutch have a fort here, mounted with 40 guns, and garrisoned with 700 men. There is only one other town of note, called Jampandam, where they also have a fort. The island is not near so populous as when the Dutch conquered it; the men being hired for soldiers in most of the neighbouring countries.

The religion of these islands was formerly idolatry. They worshiped the sun and moon. They sacrificed to them in the public squares, having no materials which they thought valuable enough to be employed in raising temples. About two centuries ago, some Christians and Mahometans having brought their opinions to Celeres, the principal king of the country took a dislike to the national worship. Having convened a general assembly, he ascended an eminence, when, spreading out his hands towards heaven, he told the Deity, that he would acknowledge for truth that doctrine whole minimizers should first arrive in his dominions, and as the winds and waves were at his command. Almighty would have himself to blame if he embraced a falsehood. The assembly broke up, determined to wait the orders of heaven, and to obey the first missionaries that should arrive. The mahometans were the most active, and their religion accordingly prevailed.

CELERES, in Roman antiquity, a regiment of body-guards belonging to the Roman kings, established by Romulus, and composed of 300 young men, chosen out of the most illustrious Roman families, and approved by the suffrages of the curios of the people, each of which furnished ten. The name comes from celer, "quick, ready;" and was given them because of their promptness to obey the king.

The celeres always attended near the king's person, to guard him, to be ready to carry his orders, and to execute them. In war, they made the van-guard in the engagement, which they always began first; in retreats, they made the rear-guard.

Though the celeres were a body of horse, yet they usually dismounted, and fought on foot; their commander was called tribune, or prefect of the celeres. They were divided into three troops, of 100 each, commanded by a captain called centurio; their tribune was the second person in the kingdom.

Plutarch says, Numa broke the celeres; if this be true, they were soon re-established; for we find them under most of the succeeding kings: witness the great Brutus, who expelled the Tarquins, and who was the tribune of the celeres.

CELERI, in botany, the English name of a variety of the Apium Graveolens.

The seed of celeri should be sown at two or three different times, the better to continue it for use thro' the whole season without running up to feed. The first sowing should be in the beginning of March, upon a gentle hot-bed; the second may be at the end of the same month, which ought to be in an open spot of light earth, where it may enjoy the benefit of the sun; the third time of sowing should be in the latter end of April, or beginning of May, on a light soil; and if exposed to the morning sun only, it will be so much the better, but it should not be under the drip of trees. The middle of May, some of the plants of the first sowing will be fit to transplant for blanching.

The manner of transplanting it is as follows: after having cleared the ground of weeds, you must dig a trench by a line about 10 inches wide, and 8 or 9 inches deep, loosing the earth in the bottom, and laying it level: and the earth that comes out of the trench should be equally laid on each side the trench, to be ready to draw in again to earth the celeri as it advances in height. These trenches should be made at three feet distance from each other: then plant your plants in the middle of the trench, at about four or five inches distance, in one straight row, having before trimmed the plants, and cut off the tops of the long leaves: and as they are planted, you must observe to cover the earth well to their roots with your foot, and to water them plentifully until they have taken new root. As these plants advance in height, you must observe to draw the earth on each side close to them, being careful not to bury their hearts, nor ever to do it but in dry weather; otherwise the plants will rot. When your plants have advanced a considerable height above the trenches, and all the earth, which was laid on the sides thereof, has been brought in earthing them up, you must then make use of a spade to dig up the earth between the trenches, which must also be made use of for the same purpose continuing from time to time to earth it up until it is fit for use. The last crop should be planted in a drier soil, to prevent its being rotted with too much wet in the winter. You will do well to cover your ridges of celeri with some peat-baulm, or some such light covering, when the frost is very hard, which will admit the air to the plants; for if they are covered too close, they will be very subject to rot: by this means you will preserve your celeri till spring; but you must remember to take off the covering when you expect the weather will permit, otherwise it will be apt to cause the celeri to pipe, and run to seed. The celeri, when fully blanched, will not continue good above three weeks or a month before it will rot or pipe; therefore, in order to continue it good, you should have, at least, six or seven different seasons of planting, proportioned to the consumption.

The other sort of celeri, which is commonly called celeriac, is to be managed in the same manner; excepting that this should be planted on the level ground, or in very shallow drills: for this plant seldom grows above eight or ten inches high, so requires but little earthing up; the great excellence of this being in the size of the root, which is often as large as ordinary turnips.

The best method to save the seed of celeri, is to make choice of some long good roots of the upright celeri, which have not been too much blanched, and plant them out, at about a foot asunder, in a moist soil, early in the spring; and when they run up to feed, keep them supported with stakes, to prevent their being broken down with the wind: and in July, when the feed begins to be formed, if the season should prove very dry, it will be proper to give some water to the plant, which will greatly help its producing good feeds. In August these seeds will be ripe, at which time it should be cut up, in a dry time, and...
CELESTINS, a religious order so called from their founder Peter de Meuron, afterwards raised to the pontificate under the name of Celestin V. This Peter, who was born at Isernia, a little town in the kingdom of Naples, in the year 1215, of lowly parents, retired, while very young, to a solitary mountain, in order to dedicate himself wholly to prayer and mortification. The fame of his piety brought several, out of curiosity, to see him; some of whom, charmed with his virtues, renounced the world to accompany him in his solitude. With these he formed a kind of community, the first of its kind in the year 1254, which was approved by Pope Urban IV. in 1254, and erected into a distinct order, called the hermits of St. Damien. Peter de Meuron governed this order till 1286, when his love for solitude and retirement induced him to quit the charge. In July 1294, the great reputation of his sanctity raised him, though much against his will, to the pontificate. He then took the name of Celestin V. and his order that of Celestins from him. By his bull he approved their constitutions, and confirmed all their monasteries to the number of 20. But he sat too short time in the chair of St. Peter to do many great things for his order; for having governed the church five months and a few days, and considering the great burden he had taken upon him, to which he thought himself unequal, he solemnly renounced the pontificate in a conistory held at Naples.

After his death, which happened in 1296, his order made great progress not only in Italy, but in France likewise; whether the then general Peter of Tivoli, elected 12 religious, at the request of king Philip the Fair, who gave them two monasteries; one in the forest of Orleans, and the other in the forest of Compiègne at mount Chartres. This order likewise passed into several provinces of Germany. They have about 96 convents in Italy, and 21 in France, under the title of priories.

The Celestins live two hours after midnight, to say matins. They can no street at any time, except when they are sick. They fast every Wednesday and Friday, from Easter to the feast of the exaltation of the holy cross; and, from that feast to Easter, every day. As to their food, it consists of a white gown, a capuche, and a black capulary. In the choir, and when they go out of the monastery, they wear a black cowl with the capuche: their shirts are of serge.

CELESTES, or CELEST, (from κέλετος, a race-horse,) in antiquity, denote sarge or saddle-horses; by way of contradistinction from those yoked or harnessed together, called bigarii, quadrigeri, &c. The same denomination is also given to the cavaliers or riders on Celusma horsecab; and hence some deduce celeres, the name of Romulus's guard.

CELEUSMA, or CELEUMA, in antiquity, the shout or cry of the seamen, whereby they animated each other in their work of rowing. The word is formed from κιλέω, to call, to give the signal.

CELEUSMA was also a kind of song or formula, rehearsed or played by the master, or others, to direct the strokes and movements of the mariners, as well as to encourage them to labour. See CELUSTES.

CELEUSTES, in ancient navigation, the boat-swan or officer appointed to give the rowers the signal when they were to pull, and when to stop. He was also denominated epopes, and by the Romans porticus, sometimes simply bortator.

CELIBACY, the state of unmarried persons. Scaliger derives the word from the Greek κρῖνμα, "bed," and κρίνω λίγυς, "I leave" others say it is formed from cali beatitudo; q. d. the blissfulness of heaven.

The ancient Romans used all means imaginable to discourage celibacy. Nothing was more usual than for the confuls to impose a fine on bachelors. Dionysius Halicarnassensis mentions an ancient constitution whereby all persons of full age were obliged to marry. But the first law of that kind, of which we have any certainty, is that under Augustus, called lex Julia de martiandis ordinibus. It was afterwards denominated Papia Poppea, and more usually Julia Papia, in regard of some new sanction, and amendments made to it under the consuls Papus and Poppeus. By this law divers prerogatives were given to persons who had many children; penalties imposed on those who lived a single life, as that they should be incapable of receiving legacies, and not exceeding a certain proportion.

CELIBATE, the name with celibacy; but it is chiefly used in speaking of the single life of the Popish clergy, or the obligation they are under to abstain from marriage. In this sense we say the law of celibate. Monks and religious take a vow of celibate; and what is more, of chastity.

The church of Rome imposes an universal celibacy on all its clergy, from the pope to the lowest deacon and subdeacon. The advocates for this usage pretend, that a vow of perpetual celibacy was required in the ancient church as a condition of ordination, even from the earliest apostolic ages. But the contrary is evident from numerous examples of bishops and archbishops, who lived in a state of matrimony, without any prejudice to their ordination or their function. It is generally agreed that most of the apostles were married. Some say all of them, except St. Paul and St. John. Others say St. Paul himself was married, because he writes to his yoke-fellow, whom they interpret his wife. Be this as it will, in the next ages after the apostles, we have accounts of divers married bishops, presbyters, and deacons, without any reproof or mark of dishonour set on them; e.g. Valent, presbyter of Philipp, mentioned by Polycarp; and Chrestemon, bishop of Nikus. Novatus was a married presbyter of Carthage, as we learn from Cyprian; who himself was also a married man, as Pagi confesses; and so was Cæcilius the presbyter who converted him; and Numidius another presbyter of Carthage. The reply
reply which the Romanists give to this is, that all married persons, when they came to be ordained, promised to live separately from their wives by consent, which answered the vow of celibacy in other persons. But this is not only said without proof, but against it. For Novatus, bishop of Carthage, was certainly allowed to cohabit with his wife after ordination; as appears from the charge that Cyprian brings against him, that he had struck and abused his wife, and thereby caused her to miscarry. There seems indeed to have been, in some cases, a tendency towards the introduction of such a law, by one or two zealots; but the motion was no sooner made, than it was quashed by the authority of wiser men. Thus Eusebius observes, that Pinythus, bishop of Gnossis in Crete, was for laying the law of celibacy upon his brethren; but Dionysius bishop of Corinth wrote to him, that he should consider the weakness of men, and not impose that heavy burden on them. In the council of Nice, anno 325, the motion was renewed for a law to oblige the clergy to abstain from all conjugal society with their wives, whom they had married before their ordination; but Paphnutius, a famous Egyptian bishop, and one who himself never was married, vigorously declined against it, upon which it was unanimously rejected. So Socrates and Sozomen tell the story; to which all that Eusebius, after Bellarmin, has to say, is, that he suspects the truth of it. The council in Trullo, held in 692, made a difference in this respect between bishops and presbyters; allowing presbyters, deacons, and all the inferior orders, to cohabit with their wives after ordination; and giving the Roman church a smart rebuke for the contrary prohibition, but at the same time laying an injunction upon bishops to live separate from their wives, and appointing the wives to beseech themselves to a monastic life, or become deaconesses in the church. And thus was a total celibate established in the Greek church, as to bishops, but not any others. In the Latin church, the like establishment was also made, but by slow steps in many places. For in Africa, even bishops themselves cohabited with their wives at the time of the council of Trullo. The celibacy of the clergy, however, appears of an ancient standing, if not of command and necessity, yet as of counsel and choice. But as it is clearly neither of divine nor apostolical institution, it is, at first, hard to conceive from what motive the court of Rome perished to very obligingly to impose this institution on the clergy. But we are to observe that this was a leading step to the execution of the project formed of making the clergy independent of princes, and rendering them a separate body to be governed by their own laws. In effect, while priests had children, it was very difficult to prevent their dependence on princes, whose favours have such an influence on private men; but having no family, they were more at liberty to adhere to the Pope.

CELIODOGRAPHIA, the description of the spots which appear on the surfaces of the sun and planets. See Astronomy, No 58, &c.

CELL, or CELLA, in ancient writers, denotes a place or apartment usually under ground, and vaulted, in which were floored up some sort of necessaries, as wine, honey, and the like; and according to which it was called Cella Vinaria, Gloriæ, Melaria, &c. The word is formed from the Latin cella, to conceal.

CELLA was also used for the lodge or habitation of a common prostitute, as being anciently under ground, hence also denominated fornix.

On which place an ancient scholiast remarks, that the names of the whores were written on the doors of their several cells; by which we learn the meaning of inscripta cella in Martialis, lib. xi. ep. 46.

CELLA was also applied to the bed-chambers of domestics and servants; probably as being low and narrow.—Cicero, inveighing against the luxury of Antony, says, the beds in the very cells of his servants were spread with pompos purple coverlets.

CELL is also applied to the members or apartments of baths. Of these there were three principal called frigidaria, tepidaria, and caldaria; to which may be added a fourth, called cella affa, and sometimes fictatoria.

CELLA likewise signifies the adjut, or inmost and most retired parts of temples, wherein the images of the gods to whom the edifices were consecrated were preferred. In this sense we meet with cella Jacob, cella Concordia, &c.

CELL is also used for a lesser or subordinate sort of minifier dependent on a great one, by which it was erected, and continues still to be governed. The great abbey of England had most of them cells in places distant from the mother abbey, to which they were accountable, and from which they received their superiors. The alien priories in England were cells to abbey in Normandy, France, Italy, &c. The name cell was also given to rich and considerable monasteries not dependent on any other.

CELL signifies also a little apartment or chamber, such as those wherein the ancient monks, solitaries, and hermits, lived in retirement. Some derive the word from the Hebrew שמא, i. e., "a prison, or place where any thing is shut up."

The same name is still retained in divers monasteries. The dormitory is frequently divided into so many cells or lodges. The Carthusians have each a separate house, which serves them as a cell. The hall wherein the Roman concave is held, is divided, by partitions, into divers cells, for the several cardinals to lodge in.

CELL is also a name given to the little divisions in honey-combs, which are always regular hexagons. See Bees.

CELL, in botany, is applied to the hollow places between the partitions in the pods, holts, and other food-vessels of plants; according as there is one, two, three, or of these cells, the vessel is said to be unilocular, bilocular, trilocular, &c.

CELLS, in anatomy, little bags, or bladders, where fluids or other matters are lodged; called loculi, cellulae, &c. Thus the cellula adiposa are the little cells where the fat is contained; cellulae in the colon, are spaces wherein the excrements are detained till voided, &c.

CELLAR, or Cellarium in ancient writers, denotes the fame with cella, viz. a conservatory of estables, or drinkable.
Cellar. Cellars, in modern building, are the lowest rooms in a house, the ceilings of which usually lie level with the surface of the ground on which the house is built; or they are situated under the pavement before the house, especially in streets and squares.

Cellars, or cellerers, (Cellerarius or Cellarius), an officer in monasteries, to whom belong the care and procurement of provisions for the convent. The denomination is said to be borrowed from the Roman law, where cellarius denotes an examiner of accounts and expenses. Ulpian defines it thus: 'Cellarius, id eft, idaeo praepositus ut rationes fualve fint.'

The cellarius was one of the four obedientiaris, or great officers of monasteries; under his ordering was the piftrimum or bakehouse, and the braicum, or brew-house. In the richer houses there were particular lands set apart for the maintenance of his office, called condì della cafe.

Cellarius, or cellerer, (Cellerarius or Cellarius), an officer in monasteries, to whom belong the care and procurement of provisions for the convent. The denomination is said to be borrowed from the Roman law, where cellarius denotes an examiner of accounts and expenses. Ulpian defines it thus: 'Cellarius, id eft, idaeo praepositus ut rationes fualve fint.'

The cellarius was one of the four obedientiaris, or great officers of monasteries; under his ordering was the pistrocum or bakehouse, and the braicum, or brew-house. In the richer houses there were particular lands set apart for the maintenance of his office, called condì della cafe.

t'r;ta:,

fe would be often unintelligible, often misunderstood by us. He shows us also, how the ancients cared dif-
temperies by friction, bathing, &c. His eight books
de Medicina have been several times printed. The El-
zivir edition, in the year 1650, by Vander Linden, is
the best, as being entirely corrected from his manu-
scripts.

CELSUS, an Epicurean philosopher, in the second
century. He wrote a work against the Christians, en-
titled, The true Discourse; to which Origens, at the de-
sire of Ambrose his friend, wrote a learned answer. To
this philosopher Lucian dedicated his Pseudanumiaci.

CELTES, or CELTES, an ancient nation, by which
most of the countries of Europe are thought to have
been peopled. The compilers of the Universal Histo-
ry are of opinion, that they are descended from Gomer
the eldest son of Japhet, the son of Noah. They think
that Gomer settled in the province of Phrygia in Asia;
Aithkenaz his eldest son, or Toparzah his youngest, or
both, in Armenia, and Riphath the second son in
Capadocia. When they spread themselves wider, they
seem to have moved regularly in columns without in-
terfering with or disturbing their neighbours. The
defendants of Gomer, or the Celtes, took the left hand,
infenibly spreading themselves westward towards Po-
land, Hungary, Germany, France, and Spain; while
the descendants of Magog, Gomer's brother, moving
eastward, peopled Tartary.

In this large European tract, the Celtes began to ap-
pear a powerful nation under a regular monarchy, or
rather under several considerable kingdoms. Mention
is made of them indeed in so many parts of Europe, by
ancient geographers and historians, that Oertelius took
Celtica to be a general name for the continent of Eu-
rope, and made a map of it bearing this title. In those
parts of Asia, which they possessed, as well as in the dif-
ter parts of Europe, the Celtes went by various names.
In Leper Asia they were known by the names of
Titans, and Sacks; in the northern parts of Eu-
rope, by those of Cymmerians, Cymbrics, &c.; and in
the southern parts they were called Celts, Gauls, or
Catalans.

With respect to the government of the Celtes we
are entirely in the dark. All we know is, that the
curettes, and afterwards druids and bards, were the
interpreters of their laws; judged all causes whether
criminal or civil; and their sentence was reckoned so
facred, that whoever refused to abide by it was by
them excluded from attending at their sacred rites;
after which no man dared converse with him; so that
this punishment was reckoned the most severe of all,
even severer than death itself.

They neither reared temples nor statues to the deity,
but destroyed them wherever they could find them,
planting in their stead large spacious groves; which
being open on the top and sides, were, in their opin-
ion, more acceptable to the divine Being, who is ab-
solutely unconfined. In this their religion seems to
have resembled that of the Perfees and disciples of
Zoroaster. The Celtes only differed from them in
making the oak instead of the fire the emblem of the
deity; in choosing that tree above all others to plant
their groves with, and attributing several supernatural
virtues both to its wood, leaves, fruit, and misfletce;
alike which were made use of in their sacrifices and
other parts of their worship. But after they had adopt-
ed the idolatrous superstition of the Romans and other
nations, and the apotheosis of their heroes and prin-
ces, they came to worship them much in the same
manner: as Jupiter under the name of Tarum, which
in the Celtic signifies thunder: Mercury, whom some
authors call Heus or Hepas, probably from the Celtic
hand, which signifies a dog, and might be the Anubis
lustrans of the Egyptians. But Mars was held in
the greatest veneration by the warlike, and Mercury by
the trading part of the nation. The care of religion
was immediately under their curettes, since known by
the name of druids and bards. These were, as Ca-
far tells us, the performers of sacrifices and all reli-
gious rites, and expounders of religion to the people.

They also instructed youth in all kinds of learning,
such as philosophy, astronomy, astrology, &c. Their
doctrines were taught only by word of mouth, effec-
ting them too sacred to be committed to writing.

Other more common subjects, such as their hymns to
their gods, the exploits of princes and generals in time
of war, and especially before a battle, were conched
in elegant verse; and recited, or rather sung, on all
proper occasions; though even these were also kept
from vulgar eyes, and either committed to memory, or
if to writing, the whole was a secret to all the laity.
The latter indeed seems the most probable, for
what Caesar hints is true; namely, that these poetic
records were increased in his time to such a bulk, that
it took up a young bard near 20 years to learn them
by heart. Diodorus tells us farther, that these poets
used to accompany their songs with instrumental music,
such as that of organs, harps, and the like; and that
they were held in such veneration, that if, in the time
of an engagement between two armies, one of these
bards appeared, both sides immediately ceased fighting.

The reason of this was, that they were universally
believed to be prophets as well as poets; so that it was
thought dangerous as well as injurious to disobey what
they profphes came from their gods. These prophetic
philosophers kept academies, which were resorted to
not only by a great number of their own youth, but also
of those from other countries, insomuch that Aristotle
says their philosophy passed from thence into Greece,
and not from Greece thither. Diodorus likewise
quotes a passage from Hecateus, which is greatly in
their praise; vizi. that the druids had some kind of in-
struments by which they could draw distant objects
nearer, and make them appear larger and plainer;
and by which they could discover even seas, mountains,
and valleys, in the moon. But whatever might be their
learning, it is certain, that in proceeds of time, they
adopted several very barbarous cultums, such as facri-
ficing human victims to their gods as more acceptable
to them than those of any other animals. And Diodorus
tells us of another inhuman cultum they used in their
divinations, especially in great matters, which was
done by killing some of their slaves, or some prisoners
of war, if any they had, with a scimitar, to draw their
agony from the running of his blood from his mangled
limbs.

For the history, &c. of the different Celtic nations
see the article GAUL, &c.

CELTES, certain ancient instruments of a wedge-
like form, of which several have been discovered in
NAA different
Celtiberia is botany: A genus of the monocot order, belonging to the polygama class of plants; and in the natural method ranking under the 53d order, Scapridiae. It is a hermaphroditic plant: The female calyx is quinquistrate; there is no corolla; there are five flamina, and two hyales. The fruit is a monoporous plum. In the male, there is no calyx: the corolla is hexapetalous; there are six flamina, and an embryo of a pitilium. There are three species, all of the same genus: 1. The Australis or Southern Celtis, a deciduous tree, native of Africa and the South of Europe. 2. The Occidentalis or Western Celtis, a native of Virginia. And 3. The Orientalis or Eastern Celtis, a native of Armenia. The two first species grow with large, fair, straight stems; their branches are numerous and diffuse; their bark is of a darkish grey colour; their leaves are of a pheasant green; three or four inches long, deeply serrated, end in a narrow point, nearly resembling the leaves of the common fling-nettle, and continue on the trees till late in the autumn: So that one may easily conceive what an agreeable variety these trees would make. Add to this, the pleasant shade they afford. The leaves are late in the spring before they show themselves; but they make amends for this, by retaining their verdure till near the close of autumn, and then do not resemble most deciduous trees, whose leaves show their approaching fall by the change of their colour; but continue to exhibit themselves of a pleasant green even to the last. Hanbury speaks highly of the celtis as a timber-tree: he says, "The wood of the Loc-tree is extremely durable. In Italy they make their flutes, pipes, and other wind-instruments of it. With us the coach-makers use it for the frames of their vehicles." Millar mentions also the wood of the Occidentalis being used by the coach-makers. The third species will grow to about twelve feet; and the branches are numerous, smooth, and of a greenish colour. The leaves are smaller than those of the other sorts, though they are of a thicker texture, and of a lighter green. The flowers come out from the wings of the leaves, on slender foot-stalks: They are yellowish, appear early in the spring, and are succeeded by large yellow fruit.

Propagation, &c. All the species are propagated from seeds, which ripen in England, if they have a favourable autumn; but the foreign seeds are the most certain of producing a crop. These seeds should be sown, soon after they are ripe, either in boxes, or in a fine warm border of rich earth, a quarter of an inch deep; and in the following spring many of the young plants will appear; though a great part often lie till the second spring before they show their heads. If the seeds in the bedsshoot early in the spring, they should be hooped, and protected by mats from the frosts, which would nip them in the bud. When all danger from frosts is over, the mats should be laid aside till the parching beams of the sun got powerful; when, in the day time, they may be laid over the hoops again, to screen the plants from injury. The mats should be constantly taken off every night, and the young plants should never be covered either in rainy or cloudy weather. During the whole summer, these seedlings should be frequently watered in dry weather, and the beds kept clean of weeds, &c. In the autumn, they must be protected from the frosts, which often come early in that season, and would not fail to destroy their tops. The like care should be continued all winter to defend them from the severe enemies. In this ferniary they may remain, being kept clean of weeds and watered in dry weather, till the end of June, when they should be taken out of their beds, and planted in others at six inches distance. And here let no one (continues Hanbury) be startled at my recommending the month of March, for this is the month that has found by repeated experience, that the plants will be then almost certain of growing, and will continue their shoots till the autumn; whereas I have ever perceived, that many of those planted in March, have frequently perished, and that those which did grow made hardly any shoot that year, and showed the early figure of a flinted tree. In June, therefore, let the ground be well dug, and prepared for this work; and let the mould be rich and good; But the operation of removing must be deferred till rain comes; and if the season should be dry, this work may be postponed till the middle of July. After a shower, therefore, or a night's rain, let the plants be taken out of their beds, and pricked out at six inches distance from each other. After this, the beds in which they are planted should be hooped, and covered with mats when the sun shines; but these must always be taken away at night, as well as in rainy or cloudy weather. With this management, they will have shot to a good height by the autumn, and have acquired so much hardiness and strength as to need no farther care than to be kept clear of weeds.
Cement

Cement is the general name for any gluttonous substance capable of uniting and keeping things together in chole collection. In this sense the word cement comprehends mortar, folder, glue, &c. but has been generally restricted to the compositions used for holding together broken glazes, china, and earthen ware. For this purpose the juice of garlic is recommended as exceedingly proper, being both very strong, and, if the operation is performed with care, leaving little or no mark. Quicklime and the white of an egg mixed together, and expeditiously used, are also very proper for this purpose. Mr Lewis recommends a mixture of quicklime and cheefe, in the following manner: "Sweet cheese folded thin and stirred with boiling hot water, changes into a tenacious slime which does not mingle with the water. Worked with fresh parcels of hot water, and then mixed upon a hot stone with a proper quantity of unskated lime, into the consistence of a paste, it proves a strong and durable cement for wood, stone, earthen-ware, and glass. When thoroughly dry, which will be in two or three days, it is not in the least acted upon by water. Cheese barely beat with quicklime, as directed by some of the chemists for letting cracked glasses, is not near so efficacious." A composition of the drying oil of linseed and white-lead is also used for the same purposes, but is greatly inferior.

Cement in building is used to denote any kind of mortar of a stronger kind than ordinary. The cement commonly used is of two kinds; hot, and cold. The hot cement is made of rosin, beeswax, brick-dust, and chalk, boiled together. The bricks to be cemented are heated, and rubbed one upon another, with cement between them. The cold cement is that above described for cementing china, &c. which is sometimes, though rarely, employed in building.

The ruins of the ancient Roman buildings are found to cohere so strongly, that most people have imagined the ancients were acquainted with some kind of mortar, which, in comparison of ours, might justly be called cement; and that to our want of knowledge of the materials they used, is owing the great inferiority of modern buildings in their durability. In 1770, one M. Loriot, a Frenchman, pretended to have discovered the secret of the ancient cement, which, according to him, was no more than a mixture of powdered quicklime with lime which had been long skated and kept under water. The skated lime was first to be made up with sand, earth, brick-dust, &c. into mortar after the common method, and then about a third part of quicklime in powder was added to the mixture. This produced an almost instantaneous petrification, something like what is called the setting of alabaster, but in a much stronger degree; and was possessed of many wonderful qualities needless here to relate, seeing it has never been known to succeed with any other person who tried it. Mr Anderson, in his essays on agriculture, has discussed this subject at considerable length, and seemingly with great judgment. He is the only person we know, who has given any rational theory of the uses of lime in building, and why it comes to be the proper basis of all cements. His account is in substance as follows:

Lime which has been skated and mixed with sand, becomes hard and confidcnt when dry, by a process similar to that which produces the natural Halite, in caverns. These are always formed by water dropping from the roof. By some unknown and inexplicable process of nature, this water has dissolved in it a small portion of calcareous matter in a calcic slate. As long as the water continues covered from the air, it keeps the earth dissolved in it; it being the natural property of calcareous earths, when deprived of their fixed air, to dissolve in water. But when the small drop of water comes to be exposed to the air, the calcareous matter contained in it begins to attract the fixable part of the atmosphere. In proportion as it does so, it also begins to separate from the water, and to realign its native form of limestone or marble. This process Mr Anderson calls a crystallization; and when the calcareous matter is perfectly crystallized in this manner, he affirms that it is to all intents and purposes limetone or marble of the same consistence as before: and "in this manner (says he), within the memory of man, have huge rocks of marble been formed near Matlock in Derbsire." If lime in a calcic slate is mixed with water, part of the lime will be dissolved, and will also begin to crystallize. The water which parted with the crystallized lime, will then begin to act upon the remainder, which it could not dissolve before; and thus the process will continue, either till the lime be all reduced to an effete, or (as he calls it) crystalline slate, or something hinders the action of the water upon it. It is this crystallization which is observed by the workmen when a heap of lime is mixed with water, and left for some time to macerate. A hard crust is formed upon the surface, which is ignorantly called freezing, though it takes place in summer as well as in winter. If therefore the hardness of the lime, or its becoming a cement, depends entirely on the formation of its crystals, it is evident, that the perfection of the cement must depend on the perfection of the crystals, and the hardness of the matters which are entangled among them. The additional substances used in making of mortar, such as sand, brick-dust, or the like, according to Mr Anderson, serve only for a purpose similar to what is answered by flicks put into a vessel full of any saline solution, namely, to afford the crystals an opportunity of fastening themselves upon it. If therefore the matter interpolated between the crystals of the lime is of a friable, brittle nature, such as brick dust or chalk, the mortar will be of a weak and imperfect kind; but when the particles are hard, angular, and very difficult to be broken, such as those of river or pit-fand, the mortar turns out exceedingly good and strong. Sea-fand is found to be an improper material for mortar, which Mr Anderson ascribes to its being less angular than the other kinds. That the crystallization may be the more perfect, he also recommends a large quantity of water, that the ingredients.
Cement. be perfectly mixed together, and that the drying be as slow as possible. An attention to these circumstances, he thinks, would make the buildings of the moderns equally durable with those of the ancients; and from what remains of the ancient Roman works, he thinks a very strong proof of his hypothesis might be adduced. The great thickness of their walls necessarily required a vast length of time to dry. The middle of them was composed of pebbles thrown in at random, and which have evidently had mortar so thin as to be poured in among them. By this means, a great quantity of the lime would be dissolved, and the crystallization performed in the most perfect manner; and the indefatigable pains and perseverance for which the Romans were so remarkable in all their undertakings, leave no room to doubt that they would take care to have the ingredients mixed together as well as possible. The consequence of all this is, that the buildings formed in this manner are all as firm as if cut out of a solid rock; the mortar being equally hard, if not more so, than the stones themselves.

Notwithstanding the bad success of those who have attempted to repeat M. Lorio's experiments, however, Dr Black informs us, that a cement of this kind is certainly practicable. It is done, he says, by powdering the lime while hot from the kiln, and throwing it into a thin paste of sand and water; which, not flaking immediately, absorbs the water from the mortar by degrees, and forms a very hard mass. "It is plain (he adds) that the strength of this mortar depends on using the lime hot or fresh from the kiln."

By mixing together gypsum and quick-lime, and then adding water, we may form a cement of tolerable hardnes, and which apparently might be used to advantage in making troughs for holding water, or lining small canals for it to run in. Mr Wiegley says, that a good mortar or cement, which will not crack, may be obtained by mixing three parts of a thin magma of flaked lime with one of powdered gypsum; but adds, that it is used only in a dry situation. A mixture of tars with flaked lime acquires in time a honey hardnes, and may be used for preventing water from entering a barn, and similar buildings.

Cement, among engravers, jewellers, &c. is the same with the hot cement used in building; and is used for keeping the metals to be engraved firm to the block, and also for filling up what is to be chiseled. Cement, in chemistry, is used to signify all those powders and pastes with which any body is surrounded in pots or crucibles, and which are capable by the help of fire of producing changes upon that body. They are made of various materials, and are used for different purposes, as for parting gold from silver, converting iron into steel, copper into brass; and by cementation more considerable changes can be effected upon bodies, than by applying to them liquids of any kind; because the active matters are then in a state of vapour, and suffused by a very considerable degree of heat.

Cement which quickly hardens in Water. This is described in the pothumous works of Mr Hooke, and is recommended for gilding live craw-fish, carps, &c. without injuring the fish. The cement for this purpose is prepared, by putting some Burgundy pitch into a new earthen pot, and warming the vessel till it receives so much of the pitch as will flick round it; then shewing some finely powdered amber over the pitch when growing cold, adding a mixture of three kinds of linseed oil, and one of oil turpentine, covering the vessel and boiling them for an hour over a gentle fire, and grinding the mixture as it is wanted with as much punchy-stone in fine powder as will reduce it to the consistence of paint. The fish being wiped dry, the mixture is spread upon it; and the gold leaf being then laid on, the fish may be immediately put into water again, without any danger of the gold coming off, for the matter quickly grows hard in the water.

Cement-Pot, are those earthen pots used in the cementation of metals.

Cementation, the act of corroding or otherwise changing a metal by means of a cement.

Cemetery (κηρυρησις, from κηρυσσω to "speak") a place set apart or consecrated for the burial of the dead.

Anciently none were buried in churches or churchyards: it was even unlawful to inter in cities, and the cemeteries were without the walls. Among the primitive Christians these were held in great veneration. It even appears from Eusebius and Tertullian, that, in the early ages, they assembled for divine worship in the cemeteries. Valerian seems to have consecrated the cemeteries and other places of divine worship, but they were restored again by Gallienus. As the martyrs were buried in these places, the Christians chose them for building churches on, when Constantine established their religion; and hence some derive the rule which still obtains in the church of Rome, never to consecrate an altar without putting under it the relics of some saint. The practice of consecrating cemeteries is of some antiquity. The bishop walked round it in procession, with the crozier or pastoral staff in his hand, the holy water-pot being carried before, out of which the aspersions were made.

Cenchrus, in botany: A genus of the monocot order, belonging to the poaceae class of plants; and in the natural method ranking under the 4th order, Gramina. The involucrum is laciniated, and the calyx is a biserous glume, with one floret-male, and three floret-female. The involucrum is laciniated, and the calyx is a biserous glume, with one floret-male, and three floret-female. The involucrum is laciniated, and the calyx is a biserous glume, with one floret-male, and three floret-female. The involucrum is laciniated, and the calyx is a biserous glume, with one floret-male, and three floret-female. The involucrum is laciniated, and the calyx is a biserous glume, with one floret-male, and three floret-female. The involucrum is laciniated, and the calyx is a biserous glume, with one floret-male, and three floret-female. The involucrum is laciniated, and the calyx is a biserous glume, with one floret-male, and three floret-female. The involucrum is laciniated, and the calyx is a biserous glume, with one floret-male, and three floret-female. The involucrum is laciniated, and the calyx is a biserous glume, with one floret-male, and three floret-female. The involucrum is laciniated, and the calyx is a biserous glume, with one floret-male, and three floret-female.
The Jewish censo was a small fort of casting-dish, covered with a dome, and suspended by a chain. Josephus tells us, that Solomon made twenty thousand gold centers for the temple of Jerusalem, to offer perfumes in, and fifty thousand others to carry fire in.

CENSIO, in antiquity, the act or office of the censo. See CENSUS.

Censo included both the rating or valuing a man's estate, and the imposing multas and penalties.

Censo, habitation, a punishment inflicted on a Roman soldier for some offence, as laziness or luxury, whereby his habita, or hear, was taken from him, and consequently his wages and hopes of preferment stopped.

CENSITUS, a person censoed, or entered in the censoial table. See CENSUS.

In an ancient monument found at Ancyra, containing the actions of the emperor Otho, we read, Quo lausto citium Romanorum, Censita jussa capit capra quadragies. Centum millia & sexaginta tria.

CENSITUS is also used in the civil law for a servile fort of tenants, who pays capitation to his lord for the land he holds of him, and is entered as such in the lord's rent-roll. In which sense, the word amounts to the same with capite censo, or capite censo. See CAPE CENT.

CENSOR, (from censere to 'see' or 'perceive'), one of the prime magistrates in ancient Rome. Their business was to register the effects of the Roman citizens, to impose taxes in proportion to what each man possessed, and to take cognizance or inspection of the manners of the citizens. In consequence of this last part of their office, they had a power to censo vice or immorality by inflicting some public mark of ignominy on the offender. They had even a power to create be an esuit, exfematus, and expel from the senate such as they deemed unworthy of that office. This power they sometimes exercised without sufficient grounds; and therefore a law was at length passed that no senator should be degraded or disgraced in any manner, until he had been formally accused and found guilty by both the censo. It was also a part of the censoian jurisdiction, to fill up the vacancies in the senate, upon any remarkable deficiency in their number; to let out to farm all the lands, revenues, and customs, of the republic; and to contract with artificers for the charge of building and repairing all the public works and edifices both in Rome and the colonies of Italy. In all parts of their office, however, they were subject to the jurisdiction of the people; and an appeal always lay from the sentence of the censo to that of an assembly of the people.

The first two censo were created in the year of Rome 311, upon the senate's observing that the censo were so much taken up with war, as not to have time to look into other matters. The office continued to the time of the emperors, who assumed the censo power, calling themselves morum prefects; though Vespasian, and his sons took the title of censo. Decius attempted to restore the dignity to a particular magistrate. After this we hear no more of it, till Constantine's time, who made his brother censo, and he seems to have been the last that enjoyed the office.

The office of censo was so considerable, that for a long time none aspired to it till they had passed for the centum. At first the censo enjoyed their dignity for five years, but in 420 the Lictor Mamertinus made a law restraining it to a year and an half, which was afterwards observed very strictly. At first one of the censo was elected out of a patrician, and the other out of a plebeian family; and upon the death of either, the other was discharged from his office, and two new ones elected, but not till the next lulsum. In the year of Rome 622, both censo were chosen from among the plebeians; and after that time the office was shared between the senate and people.

—After their election in the Comitia Centuriata, the censo proceeded to the capitol, where they took an oath not to manage either by favour or disaffection, but to act equitably and impartially throughout the whole course of their administration.

The republic of Venice still has a censo of the manners of their people, whose office lasts six months.

CENSORS OF BOOKS, are a body of doctors or others established in divers countries, to examine all books before they go to the press, and to see they contain nothing contrary to faith and good manners.

At Paris the faculty of theology claim this privilege, as granted to them by the pope; but, in 1624, new commissions of four doctors were created, by letters-patent, the sole censo of all books, and answerable for everything contained therein.

In England, they had formerly an officer of this kind, under the title of licenser of the press; but, since the revolution the press has been laid under no such restraint.

Censorinus, a celebrated writer in the third century, well known by his treatise De Die Natalis. This treatise, which was written about the year 228, Gerard Vossius calls a little book of gold; and declares it to be a most learned work of the highest use and importance to chronologers, since it connects and determines with great exactness, some of the principal events in pagan history. It was printed at Cambridge, with the notes of Lidenbrokius, in 1695.

Censure, a judgment which condemns some book, person, or action; or, more particularly, a reprimand from a superior. Ecclesiastical censo are penalties by which, for some remarkable misbehaviour, Christians are deprived of the communion of the church, or prohibited to execute their clerical office.

Census, in Roman antiquity, an authentic declaration made before the censo, by the several subjects of the empire, of their respective names and places of abode. This declaration was registered by the censo; and contained an enumeration, in writing, of all the estates, lands, and inheritances they possessed; their quantity, quality, place, wives, children, domestics, tenants, slaves. In the provinces the censo served not only to discover the substance of each person, but where, and in what manner and proportion, taxes might be best imposed. The censo at Rome is commonly...
CENTAURIA, in botany: A genus of the polygama fruticans order, belonging to the synangia class of plants; and in the natural method ranking under the 49th order, Compositae. The receptacle is bristly; the pappus simple; the corolla of the radius funnel-shaped, longer than those of the disk, and irregular.

CENTAUR, in astronomy, a part or moiety of a southern constellation, in form half-man half-horse; usually joined with the wolf. The word comes from κενταύρος, formed of κέντας, pungo; χαλλός, bull; q. d. bull pricker. The stars of this constellation, in Ptolemy's Catalogue are 37; in Tycho's 4; and in the Britannic Catalogue, with Sharp's Appendix, 39.

CENTAURS, in mythology a kind of fabulous monsters, half men, and half horses. The poets pretend that the centaurs were the sons of Ixion and a cloud; the reason of which fancy is, that they retired to a castle called ἰεσώτος, which signifies a "cloud." This fable is differently interpreted; some will have the centaurs to have been a body of shepherds and herdsmen, rich in cattle, who inhabited the mountains of Arcadia, and to whom is attributed the invention of bucolic poetry. Palæphæus, in his book of incredibles, relates, that under the reign of Ixion, king of Thessaly, a herd of bulls on mount Thessaly run mad, and ravaged the whole country, rendering the mountains inaccessible; that some young men who had found the art of taming and mounting horses undertook to clear the mountains of these animals, which they purified on horseback, and thence obtained the appellation of Centaurs. Thissuccess rendering them insolent, they insulted the Lapithæ, a people of Thessaly; and because when attacked they fled with great rapidity, it was supposed they were half horses and half men. - The Centaurs in reality were a tribe of Lapithæ, who inhabited the city Pelaerinion adjoining to mount Pelion, and first invented the art of breaking horses, as is intimated by Virgil.

CENTAUREA, GREATER CENTAURY: A genus of the polygama fruticans order, belonging to the synangia class of plants; and in the natural method ranking under the 49th order, Compositae. The receptacle is bristly, the pappus simple, the corolla of the radius funnel-shaped, longer than those of the disk, and irregular. There are 61 species. The root of one of them called glaftifolia, is an article in the materia medica. It has a rough, somewhat acrid taste, and abounds with a red viscous juice. Its rough taste has gained it some esteem as an astringent; its acrimony as an aperient; and its glutinous quality as a vulnerary; but the present practice takes very little notice of it in any intention. Another of the species in the cyamus or blue bottle, which grows commonly among corn. The expressed juice of this flower stains linen of a beautiful blue colour, but is not permanent. Mr Boyle says that the juice of the inner petals, with a little alum, makes a beautiful permanent colour, equal to ultramarine.

Leffer Centaur. See Gentiana. CENTEE, in botany: A genus of the tetrandra order, belonging to the monoeica class of plants; and in the natural method ranking under the 11th order, Sermentae. The male involucrum is tetraphylous and quinquenflowerous, with four petals; the female
involucrum is diphylloid and uniferous; the petals four; the germ inferior; two styles; and a bilocular ovary.

CENTENARIUS, or CENTENARIO, in the middle age, an officer who had the government or command, with the administration of justice, in a village. The centenarii as well as vicarii were under the jurisdiction and command of the count. We find them among the Franks, Germans, Lombards, Goths, &c.

CENTENARIUS was also used for an officer who had the command of 100 men; most frequently called a CENTURION.

CENTENARIUS, in monasteries, was an officer who had the command of 100 monks.

CENTENINUM ovum, among naturalists, denotes a sort of hen's egg much smaller than ordinary, vulgarly called a cock's egg; from which it has been fabulously held that the cockatrice has produced. The name is taken from an opinion, that these had thrown the woman, in whose frontal while all the other parts of a body move about it, the particulars of her

which all the lazies, membra'nts, &c. in common with others. In Lincolnshire, England; the place of the yolk is

whence centeninium, q. d. the hundredth egg.—These eggs have no yolks, but in other reprefents differ not from common ones; having the albumen, chalazas, membranes, &c. in common with others. In the place of the yolk is found a little body like a serpentine coiled up, which doubtless gave rise to the fable of the basilisk's origin from thence. Their origin is with probability ascribed by Hervey to this, that the yolks in the vitellary of the hen are exhausted before the albumen.

CENTER, or CENTRE, in a general sense, signifies a point equally distant from the extremities of a line, figure, or body. The word is formed from the Greek ἱσθή, a point.

CENTER of Gravity, in mechanics, that point about which all the parts of a body do in any situation exactly balance each other.

Center of Motion, that point which remains at rest, while all the other parts of a body move about it.

Center of a Sphere, a point in the middle, from which all lines drawn to the surface are equal.

Hermes Trismegistus defines God an intellectual sphere, whose center is everywhere, and circumference nowhere.

CENTESIMA USURA, that wherein the interest in an hundred months became equal to the principal; i.e. when the money is laid out at one per cent. per month; answering to what in our style would be called 12 per cent. for the Romans reckoned their interest not by the year, but by the month.

CENTESIMATION, a milder kind of military punishment, in cases of desertion, mutiny, and the like, where only every hundredth man is executed.

CENTILOQUIUM, denotes a collection of 100 sentences, opinions, or sayings.

The centiolumen of Hermes, contains 100 aphorisms, or astrological sentences, supposed to have been written by some Arab, falsely ascribed to Hermes Trismegistus. It is only extant in Latin, in which it has several times been printed. —The centiolumen of Ptolemy is a famous astrological piece, frequently confounded with the former, consisting likewise of 100 sentences or doctrines, divided into short aphorisms, intitled also in Greek Σεντίλιος, as being the fruit or re-

CEN [289] CEN

fult of the former writings of that celebrated astro-

mer, viz. his quadrupartium and alias ejus; errant, by reason that herein is shown the use of astrological calculations.

CENTIPES, in zoology. See SCIOLOPENDRA.

CENTIPED WORM, a term used for such worms as have a great many feet, though the number does not amount to 100, as the term seems to import.—M. Mallet relates the history of a man, who, for three years, had a violent pain in the lower part of the forehead near the root of the nose: as length he felt an itching, and afterwards something moving within his nostril, which he brought away with his finger; it was a worm of the centiped kind, an inch and a half long, which run swiftly. It lived five or six days among tobacco. The patient was free of his pain ever after. Mr Littre mentioned a like case in 1708, of a larger centiped voided at the nose, after it had thrown the woman, in whose frontal it was, into convulsions, and had almost deprived her of her reason.

CENTILIVRE, (Safauna) a celebrated comic writer, was the daughter of Mr Freeman of Holbeach, in Lincolnshire, England; and had such an early turn for poetry, that it is said she wrote a song before she was seven years old. Before she was twelve years of age, she could not only read Moliere in French, but enter into the spirit of all the characters. Her father dying, left her to the care of a step-mother; whose treatment not being agreeable to her, she determined, though almost delirious of money and every other necessity, to go up to London to seek a better fortune than what she had hitherto experienced. As she was proceeding on her journey foot, she was met by a young gentleman from the university of Cambridge, the afterwards well-known Anthony Hammond, Esq; who was so extremely struck with her youth and beauty, that he fell instantly in love with her; and inquiring into the particulars of her story, soon prevailed upon her unexperienced innocence to seize on the protection he offered her, and go with him to Cambridge. After some months cohabitation, he persuaded her to come to London; where, in a short time she was married to a nephew of Sir Stephen Fox. But that gentleman not living with her above a twelvemonth, her wit and beauty soon procured her a second husband, whose name was Carrol and who was an officer in the army; but he having the misfortune to be killed in a duel about a year and an half after their marriage, she became a second time a widow. For the sake of support she now applied to her pen, and became a votary of the muse; and it is under this name of Carrol that some of her earlier pieces were published. Her first attempt was in tragedy, in a play called the Ferjeuver Husband; yet her natural vivacity leading her afterwards to comedy, we find but one more attempt in the bulkin among 18 dramatic pieces which she afterwards wrote.

In 1706, she wounded the heart of one Mr Joseph Centlivre, yeoman of the month, or in other words principal cook to her Majesty, who married her; and, after passing several years happily together, she died at his house in Spring-Garden, Charing-Cross, in December 1723.
This lady for many years enjoyed the intimacy and esteem of the most eminent wits of the times, viz. Sir Richard Steele, Mr. Rowe, Budgell, Farquhar, Dr. Sewell, &c. and very few authors received more tokens of esteem and patronage from the great. With regard to her merit as a writer, it must be allowed that her plays do not abound with wit, and that the language of them is sometimes even poor, cursive, incorrect, puerile; but then her plots are busy and well conducted, and her characters in general natural and well marked.

CENTNER, or Docimastic Hundred, in metallurgy and assaying, is a weight divisible, first into an hundred, and thence into a greater number of other smaller parts; but though the word is the same both with the assayers and metallurgists, yet it is to be understood as expressing a very different quantity in their different acceptation of it. The weights of the metallurgists are easily understood, as being of the common proportion, but those of the assayers are a thousand times smaller than these, as the portions of metals or ores examined by the assayers are usually very small.

The assayers, who extract metals out of their ores, use a weight divided into an hundred equal parts, each part a pound, the whole they call a centner or hundred weight; the pound is divided into thirty-two parts, or half ounces, and the half ounce into two drams.

These divisions and denominations of the metallurgists are easily understood, but the same words, tho' they are equally used by assayers, with them express very different quantities; for as the centner of the metallurgists contains an hundred pounds, the centner of the assayers is really no more than one dram, to which the other parts are proportioned.

As the assayers' weights are divided into such an extreme degree of minuteness, and are so very different from all the common weights, the assayers usually make them themselves in the following manner, out of small silver, or fine gold-plates, of such a size, that the mark of their weight, according to the division of the dram, which is the docimastic or assaying centner, may be put upon them. They first take for a basis one weight, being about two-thirds of a common dram: this they mark (64 lb.) Then having at hand some granulated lead, washed clean, well dried, and sifted very fine, they put as much of it into one of the small dishes of a fine balance as will equipollute the (64 lb.) as it is called, just mentioned: then dividing this granulated lead into very nice halves, in the two scales, after taking out the first silver weight, they obtain a perfect equilibrium between the two scales; they then pour the granulated lead out of one dish of the scales, and instead of it put in another silver weight, which they make exactly equiponderant with the lead in the other scale, and mark it (32 lb.) If this second weight, when first put into the scale, exceed by much the weight of the lead, they take a little from it by a very fine file; but when it comes very near, they use only a whetstone to wear off an extremely small portion at a time. When it is brought to be perfectly even and equal to the lead, they change the scales to see that no error has been committed, and then go on in the same manner till they have made all the divisions, and all the small weights. Then to have an entire centner or hundred weight, they add to the (64 lb.) as they call it, a 32 lb. and a 4 lb. and weighing against them one small weight, they make it equal to them, and mark it (100) This is the docimastical, or assaying centner, and is really one dram.

CENTO, in poetry, a work wholly composed of verses or passages promiscuously taken from other authors, only disposed in a new form and order.—Proba Falconia has written the life of Jesus Christ in centos taken from Virgil. Alexander Rofs has done the like in his Chriiftrost, and Stephen de Pleure the fame.

CENTONARIO, in antiquity, certain of the Roman army, who provided different sorts of stuff called centones, made use of to quench the fire which the enemies engines threw into the camp. These centonarii kept with the carpenters and other officers of artillery.

CENTRAL FORCES, the powers which cause a moving body to tend towards, or recede from, the center of motion. See MECHANICS.

CENTRAL RULE, a rule discovered by Mr. Thomas Baker, whereby to find the centre of a circle designed to cut the parabola in as many points as an equation to be constructed hath real roots. Its principal use is in the construction of equations, and he hath applied it with good success as far as biquadratics.

The central rule is chiefly founded on this property of the parabola, that, if a line be inscribed in that curve perpendicular to any diameter, a rectangle formed of the segments of the inscribed is equal to the rectangle of the intercepted diameter and parameter of the axis.

The central rule has the advantage over Cartes and De Laure's methods of constructing equations, in that both these are subject to the trouble of preparing the equation by taking away the second term.

CENTRIFUGAL FORCE, that force by which all bodies that move round any other body in a curve tend towards, or recede from, the center of their motion in a tangent to the periphery of the curve, and that in every part of it. See MECHANICS.

CENTRIFUGAL-MACHINE, a very curious machine, invented by Mr. Erkine, for raising water by means of a centrifugal force combined with the pressure of the atmosphere.

It consists of a large tube of copper, &c. in the form of a crofs, which is placed perpendicular in the water, and refta at the bottom on a pivot. At the upper part of the tube is a horizontal cog-wheel, which touches the cogs of another in a vertical position; so that by the help of a double winch, the whole machine is moved round with very great velocity.

Near the bottom of the perpendicular part of the tube is a valve opening upwards; and near the two extremities, but on the contrary sides of the arms, or crofs part of the tube, are two other valves opening outwards. These two valves are, by the assistance of springs, kept shut till the machine is put in motion, when the centrifugal velocity of the water forces them open, and discharges itself in a cistern or refevoir placed there for that purpose.

On the upper part of the arms are two holes, which
are closed by pieces screwing into the metal of the tube. Before the machine can work, these holes must be opened, and water poured in through them, till the whole tube be full: by this means all the air will be forced out of the machine, and the water supported in the tube by means of the valve at the bottom.

The tube being thus filled with water, and the holes closed by their screw caps, it is turned round by means of the winch, when the water in the arms of the tube acquires a centrifugal force, opens the valves near the extremities of the arms, and flies out with a velocity nearly equal to that of the extremities of the fall arms.

The above description will be very easily understood by the figure we have added on Plate CXXVII., which is a perspective view of the centrifugal machine, erected on board a ship. ABC is the copper tube. D, a horizontal cog-wheel, furnished with twelve cogs. E, a vertical cog-wheel, furnished with thirty-six cogs. F, F, the double winch. a, the valve near the bottom of the tube. b, b, the two pivots on which the machine turns. c, one of the valves in the crofs-piece; the other at d, cannot be seen in this figure, being on the other side of the tube. e, e, the two holes through which the water is poured into the machine. GH, the cillern or refervoir. I, I, part of the ship's deck. The diftance between the two valves, c, d, is fix feet. The diameter of these valves is about three inches; and that of the perpendicular tube about seven inches.

If we suppose the men who work the machines can turn the winch round in three seconds, the machine will move round its axis in one second; and consequently each extremity of the arms will move with a velocity of 18.8 feet in a second. Therefore a column of water of three inches diameter will flye through each of the valves with a velocity of 18.8 feet in a second; but the area of the aperture of each of the valves is 7.14 inches; which being multiplied by the velocity in inches = 225.6, gives 1610.784 cubic inches, the quantity of water discharged through one of the apertures in one second; so that the whole quantity discharged in that space of time through both the apertures is 3221.568 cubic inches; or 193294.08 cubic inches in one minute. But 60812 cubic inches make a tun, or beer-measure; consequently, if we suppose the centrifugal machine revolve round its axis in one second, it will raise nearly 3 tons 44 gallons in one minute: but this velocity is certainly too great, at least to be held for any considerable time; so that, when this and other deficiencies in the machine are allowed for, two tons is nearly the quantity that can be raised by it in one minute.

It will perhaps be unnecessary to observe, that as the water is forced up the perpendicular tube by the pressure of the atmosphere, this machine cannot raise water above 32 feet high.

An attempt was made to substitute this machine in place of the pumps commonly used on ship-board, but the labour of working was found to be so great as to render the machine inferior to the chain-pump. A considerable improvement, we apprehend, would be, to load with a weight of lead the ends of the tubes thro' which the water flies, which would make the machine turn with a great deal more ease, as the centrifugal force of the lead would in some measure act the part of a centrifugal flye.
rions of these orders; and the centurions are sometimes styled *principes ordinum*, and *principes centurionum*. We may take notice too what a large field there lay for promotion: first through all the orders of the hastati; then quire through the principes; and afterwards from the lat order of the triarii to the primipilus, the most honourable of the centurions, and who delights to be particularly described. This officer, besides his title of primipilus, went under the several titles of *dux legionis*, *praefidius legionis*, *primus centurionum*, and *primus centurio*; and was the first centurion of the triarii in every legion. He preceded over all the other centurions, and generally gave the word of command by order of the tribunes. Besides this, he had the care of the eagle, or chief standard, of the legion: hence, *aquila praefis*, is to bear the dignity of primipilus; and hence *aquila* is taken by Pliny for the said office. Nor was this station only honourable, but very profitable: for he had a special stipend allowed him, probably as much as a knight's elate; and, when he left that charge, was repaid equal to the members of the equestrian order, bearing the title of *primipilarius*, in the same manner as those who had discharged the greatest civil offices were dyed over after, *confulares*, *centuriae*, *confivia*.

**CENTURIPES, Centurips, or Centuripe, (anc. geog.)** a town in the fourth-west of the territory of Etna, on the river Cyamatorn: Now *Centorsi, or Centuripe*. It was a democratical city, which, like Syracuse, received its liberty from Timoleon. Its inhabitants cultivated the fine arts, particularly sculpture and engraving. In digging for the remains of antiquities, cameos are no where found in such abundance as at Centuripe and its environs. The situation of the place is romantic: it is built on the summit of a vast group of rocks, which was probably chosen as the most difficult of access, and consequently the propertist in times of civil commotion. The remains still existing of its ancient bridge are a proof of its having been a considerable city. Cicero speaks of it as such. It was taken by the Romans, plundered and oppressed by Verris, destroyed by Pompey, and restored by Otho, who made it the residence of a Roman colony.

**CENTURY, in a general sense, any thing divided into, or consisting of, an hundred parts. The marquis of Worcester published a *Century* of inventions, (for a specimen of which, see *Acoustics*, p. 27,) and Dr Hooke has given a *decimate* of inventions, as part of a *Century*, of which he affirmed himself master. It is remarkable, that both in the century of the former, and the decimate of the latter, we find the principle on which Savary's fire or steam engine is founded. See *Steam-Engine*.**

**CENTURY in antiquity. The Roman people, when they were assembled for the electing of magistrates, enacting of laws, or deliberating upon any public affair, were always divided into centuries, and voted by centuries, in order that their votes might be the more easily collected, whence these assemblies were called *comitia centuriata*. The Roman cohorts were also divided into centuries. See *Century* and *Cohort*.**

**CENTURION, (in chronology, the space of one hundred years. This method of computing by centuries is generally observed in church history, commencing from the time of our Saviour's incarnation: in which sense we say the first century, the second century, &c.**

**CENTURIES of Magdeburg, a famous ecclesiastical history, ranged into 13 centuries, carried down to the year 1298, compiled by several hundred protestants of Magdeburg, the chief of whom was Placius Illyricus.**

**CENTUSSIS, in Roman antiquity, a coin containing 100 asses.**

**CENTZONTLI, in ornithology, the Mexican name of the *Turdus polyglottus*. See *Turdus*.**

**CEODES, in botany: A genus of the dioecia order, belonging to the polygama class of plants. There is no calyx; the corolla is monopetalous, with a short turbinated tube; the flamina are ten subulated filaments; the anthera roundish.**

**CEORLES, the name of one of the classes or orders into which the people were distinguished among the Anglo-Saxons. The ceorles, who were perfons completely free, and defended from a long race of freemen, constituted a middle class between the labourers and mechanics (who were generally slaves, or defended from slaves) on the one hand, and the nobility on the other. They might go where they pleased, and pursue any way of life that was most agreeable to their humour; but for many of them applied to agriculture, and farming the lands of the nobility, that a ceorl was the most common name for a husbandman or farmer in the Anglo-Saxon times. These ceorls, however, seem in general to have been a kind of gentlemen farmers; and if any one of them profpered so well as to acquire the property of five hides of land, upon which he had a church, a kitchen, a bell-tower, and great gate, and obtained a seat and office in the king's court, he was esteemed a nobleman or thane. If a ceorl applied to learning, and attained to priest's orders, he was also considered as a thane; his wardrobe, or price of his life, was the same, and his testimony had the same weight in a court of justice. When he applied to trade, and made three voyages beyond sea, in a ship of his own, and with a cargo belonging to himself, he was also advanced to the dignity of a thane. But if a ceorl had a greater propensity to arms than to learning, trade, or agriculture, he then became a soldier, or military retainer, to some potent man. Thus the temple of honour and the several professions esteemed worthy of a freeman.**

**CEOS, CEA, CIA, or COS, (anc. geog.) one of the Cyclades, lies opposite to the promontory of Achaia called *Santium*, and is 50 miles in compass. This island is commended by the ancients for its fertility and richness of its pastures. The first silk stuffs, if Pliny and Solinus are to be credited, were wrought here. Ceos was particularly famous for the excellent figs it produced. It was first peopled by Aritaeus, the son of Apollo and Cyrene, who, being grieved for the death of his son Aitaeus, retired from Thebes, at the persuasion of his mother, and went over with some Theban...**
CEPHALANTHUS, BUMBLE-WOOD: (1) CEPHALIC, in a general meaning, signifies any thing belonging to the head.

CEPHALIC Medicines, are remedies for disorders of the head. Cordials are comprehended herein, as are all whatever promotes a free circulation of the blood through the brain.

Except when the disorder arises from excess of heat, or an inflammatory disposition in the head, moist topicals should never be used; but always dry ones.

To rub the head after it is shaved proves an infallable cure for a cephalalgia, a stuffing of the head, and a weakness of the eyes, arising from a weak and relaxed state of the fibres. And as by every fresh evacuation of the humours their quantity is not only lessened, but also their recommementulous parts derived thither, the more frequently the head is shaved, the larger quantity of humour is discharged; so that the frequent shaving of the head and beard is likewise a potential blister; and in as much as it is useful, it is a cephalic. CEPHALIC Vein, in anatomy, creeps along the arm between the skin and the muscles, and divides it into two branches: the external goes down to the wrist, where it joins the basilica, and turns up to the back of the hand; the internal branch, together with a small one of the basilica, makes the median. The ancients used to open this vein for disorders of the head, for which reason it bears this name; but a better acquaintance with the circulation of the blood informs us, that there is no foundation for such a notion.

CEPHALENIA, or CEPHALENIA, an island of the Ionian sea between Ithaca and Zacynthus, known in Homer's time by the names of Samus and Epirus Melana, is about eighty miles in length, forty in breadth, and a hundred and thirty in compass. It had anciently four cities, one of which bore the name of the island. Strabo tells us, that in his time there were only two cities remaining; but Pliny speaks of three; adding, that the ruins of Same, which had been destroyed by the Romans, were still in being. Same was the metropolis of the island, and is supposed to have flourished in the place which the Italians call Porto Guiscardo. The names of the four cities were, according to

CEOS, AS THAT TIME UNINHABITED. Diodorus Siculus tells us, that he retired to the island of Cos; but the ancients, as Servius observes, called both these islands by the name Cos. Be that as it will, the island of Cos became so populous, that a law prevailed there, commanding all persons upwards of sixty to be poisoned, that others might be able to subist; so that none above sixty were to be seen in the island, being obliged, after they arrived at that age, either to submit to the law, or abandon the country, together with their effects. Cos had, in former times, four famous cities, viz. JULIS, Carthaca, Corellia, and Praetoria. The two latter were, according to Pliny, swallowed up by an earthquake. The other two flourished in Strabo's time. Carthaca stood on a rising ground, at the end of a valley, about three miles from the sea. The situation of it agrees with that of the present town of Zia, which gives name to the whole island. The ruins both of Carthaca and Julis are still remaining; those of the latter take up a whole mountain, and are called by the modern inhabitants Polis, that is, the city. Near this place are the ruins of a stately temple, with many pieces of broken pillars, and statues of most exquisite workmanship. The walls of the city were of marble, and some pieces are still remaining above 12 feet in length. Julis was, according to Strabo, the birth place of Simonides, Bacchylides, and others from that on each side of

CEPA, the ONION. See ALLIUM.

The leaves stand opposite by pairs on the twigs, and also sometimes by threes, and are of a light green colour. Their upper surface is smooth; they have a strong nerve running from the foot-stalk to the point, and several others from that on each side to the borders: These, as well as the foot-stalk, in the autumn dye to a reddish colour. The flowers, which Cephalene, are aggregate flowers, properly so called, are produced at the ends of the branches, in globular heads, in July. The florets which compose these heads are funnel-shaped, of a yellow colour, and fastened to an axis which is in the middle.—The cephalanthus is propagated from seeds, which are exported to Great-Britain. These should be sown as soon as they arrive, and there will be a chance of their coming up the first spring; though they often lie till the spring after before they make their appearance. They may be sown in good garden mould of almost any soil, if somewhat moist the better, and should be covered about a quarter of an inch deep. This throb is also propagated by layers. If the young shoots are laid in autumn, they will have stuck good root by the autumn following, and may be then taken up, and set in the places where they are designed to remain. Cuttings of this tree, also, planted in the autumn in a rich, light, moist soil, will grow; and by that means also plenty of these plants may be soon obtained.
CERATONIA, the CAROB TREE, or St John's bread: A genus of the polyandria order, belonging to the leguminosae clafs of plants; and in the natural method ranking under the 33d order, Leguminosae. The caulis is diphylous, and grown to the germe; there is no corolla; the stamens are two; the seed is two-horned and compli­

CERASUS, in botany. A genus of the monogynia order, belonging to the monogynia clafs of plants; and in the natural method ranking under the 30th order, Holocarpaceae. The male calyx is bipartite; there is no corolla; the filament is long: The female calyx is diphylous, and grown to the germe; there is no corolla; the stamens are two; the seed is two-horned and compli­
CEREBUS, in fabulous history, a dreadful three-headed mastiff, born of Typhon and Echidna, and placed to guard the gates of hell. He fawned upon those who entered, but devoured all who attempted to get hence. He was, however, mastered by Hercules, who dragged him up to the earth, when, in struggling, a foam dropped from his mouth, which produced the poisonous herb called aconite or wolf's-bane.

Some have supposed that Cerberus is the symbol of the earth, or of all-devouring time; and that its three heads represent the present, past, and future. The victory obtained by Hercules over this monster, denotes the conquest which this hero acquired over his passions. Dr Bryant supposes that Cerberus was the name of a place, and that it signified the temple of the Sun; deriving it from Kir-Abor, the place of light. This temple was also called Tor-Caphe-El, which was changed to Tor-Caphe-Hel, and hence Cerberus was supposed to have had three heads. It was likewise called Tor-Kera, Turris Regia; whence τηρα, from τρις, three, and κεφαλή, head.

CERCEI, in heraldry: a crofs cercei is a crofs which, opening at the ends, turns round both ways like a ram's horn. See CROSS.

CERCIS, the Judas-tree: A genus of the monogynia order, belonging to the decidua class of plants; and in the natural method ranking under the 33d order, Lomentaceous. The calyx is quinquedentate, and gibbose below; the corolla papilionaceous, with a short vexillum or flag-petal under the wings or side-petals; a leguminous plant. There are

1. The bulbiferum, common Judas-tree, or Italian cercis, a native of Italy and other parts of the south of Europe.—These differ in the height of their growth in different places: in some they will arrive to be fine trees, of near twenty feet high; whilst in others they will not rise to more than ten or twelve feet, sending forth young branches irregularly from the very bottom. The stem of this tree is of a dark greyish colour, and the branches, which are few and irregular, have a purple tint. The leaves are smooth, heart-shaped, and roundish, of a pleasant green on their upper surface, hoary underneath, and grow alternately on long footstalks. The flowers are of a fine purple: They come out early in the spring, in clusters, from the side of the branches, growing upon short foot-stalks; and in some situations they are succeeded by long flat pods, containing the seeds, which, in very favorable seasons, ripen in England. Some people are fond of eating these flowers in faggards, on which account alone in some parts this tree is propagated. The varieties of this species are, 1. The Flesh-coloured; 2. The White-flowered; and, 3. The Broad-podded Judas-tree. 

2. The Canadianis, or Canadian cercis, will grow to the size of the first sort in some places. The branches are also irregular. The leaves are cordate, downy, and placed alternately. The flowers usually are of a palish red colour, and show themselves likewise in the spring, before the leaves are grown to their size. These too are often eaten in faggards, and afford an excellent pickle. There is a variety of this with deep red, and another with purple flowers. The pleasure which these trees will afford in a plantation may be easily conceived, not only as they exhibit their flowers in clusters, in different colours, early in the spring, before the leaves are grown to such a size as to hide them; but from the different size of the upper and lower leaves of the branches; above being of a fine green, the other of a hoary cast: So that on the same tree, even in this respect, is shown variety; an improvement whereof is made by the waving winds, which will present them alternately to view.

Propagation. As these species will not take root by layers, they must be propagated by seeds, which may be had from abroad. They are generally brought us found and good, and may be sown in the months of February or March. Making any particular compost for their reception is unnecessary; common garden mould, of almost every sort, will do very well, and this being well dug, and cleared of all roots, by watering in the dry season; will prevent them alternately to view. So that whoever is desirous of drawing the seedlings of a year old to plant out, must not destroy the bed, but draw them carefully out, and sifted over the seeds, after they are sown, about half an inch thick. Part of the seeds will come up in the spring, and the others will remain until the spring following; so that whoever is desirous of drawing the seedlings of a year old to plant out, must not destroy the bed, but draw them carefully out, and after that there will be a succeeding crop. However, be this as it will, the seeds being come up, they must be weeded, and encouraged by watering in the dry season; and they will require no further care during the first summer. In the winter also they may be left to themselves, as they are very hardy; though not so much but that the ends of the branches will be killed by the frost, may, sometimes, to the very bottom of the young plant, where it will shoot out again fresh in the spring. Whoever, therefore, is desirous of securing his seedlings, plants from this evil, should have his beds hooped, in order to throw mats over them during the hard frosts. Toward the latter end of March, or beginning of April the plants having been in the seed-bed one or two years, they should be taken out, and planted in the nursery: The distance of one foot aunder, and two feet in the rows, should be given them. Hoeing, the weeds down in the summer must also be allowed, as well as digging between the rows in the winter. Here they may stand until they are to be removed finally; but they must be gone over in the winter with the knife, and such irregular branches taken off.
After the battle of Cannae, the desolation was so great at Rome, that there were no women to celebrate the feast, by reason they were all in mourning; so that it was omitted that year.

Cerealia, in botany, from Ceres the goddess of corn; Linnaeus's name for the larger eculent seeds of the grapes: these are rice, wheat, rye, barley, oats, millet, panic grass, Indian millet, and maize. To this head may be likewise referred dannel, (tolium); which, by preparation, is rendered eculent.

Cerebellum, the hinder part of the head. See Anatomy, n° 133.

Cerebrum, the brain. Its structure and use are not so fully known as some other parts of the body, and different authors consider it in various manners. However, according to the observations of those most famed for their accuracy and dexterity in anatomical inquiries, its general structure is as given in Anatomy, n° 132.

Dr Hunter observes, that the principal parts of the medullary substance of the brain in idiots and madmen, such as the thalamus, the pons or bridge, and the other evil: this last, according to him, was the creator of the world, and the god that appeared under the old law. The first, whom he called unknown, was the father of Jesus Christ; who, he taught, was incarnate only in appearance, and was not born of a virgin; nor did he suffer death but in appearance. He denied the resurrection; and rejected all the books of the Old Testament, as coming from an evil principle. Marcion, his disciple, succeeded him in his errors.

Cerealia, in antiquity, feasts of Ceres, instituted by Triptolemus, son of Cereus king of Eleusis in Attica, in gratitude for his having been instructed by Ceres, who was supposed to have been his nurse, in the art of cultivating corn and making bread.

There were two feasts of this kind at Athens; and one called Eleusinia, the other Theoaphoria. See the article Eleusinia. What both agreed in, and was common to all cerealia, was, that they were celebrated with a world of religion and purity; so that it was esteemed a great pollution to meddle, on those days, in conjugal matters. It was not Ceres alone that was honoured here, but also Bacchus. The victims offered were hogs, by reason of the waste they make in the products of the earth: whether there was any wine offered or not, is matter of much debate among the critics. Plautus and Macrobius seem to countenance the negative side: Cato and Virgil the positive. Macrobius says, indeed, they did not offer wine to Ceres, but mulsum, which was a composition of wine and honey boiled up together: that the sacrifice made on the 21st of December to that goddess and Hercules, was a pregnant sow, together with cakes and mulsum; and that this is what Virgil means by Mili Baccho. The cerealia passed from the Greeks to the Romans, who held them for eight days successively; commencing, as generally held, on the fifth of the ides of April. It was the women alone who were concerned in the celebration, all dressed in white: the men, likewise in white, were only spectators. They eat nothing till after sun-set; in memory of Ceres, who in her search after her daughter took no repast but in the evening.
of each rite into the church, and its gradual advancement to superstition therein. Many of them were borrowed from Judaism; but more seemingly from Paganism. Dr Middleton has given a fine discourse on the conformity between the pagan and Paphian ceremonies, which he exemplifies in the use of incense, holy water, lamps, and candles, before the thrones of saints, votive gifts or offerings round the thrones of the deceased, &c. In effect, the altars, images, crofes, processions, miracles, and legends; nay, even the most hierarchically, pontifical, religious orders, &c. of the present Romans, he shows, are all copied from their heathen ancestors.—We have an ample and magnificent account of the religious ceremonies and customs of all nations in the world, represented in figures delineated by Picart, with historical explanations, and many curious dissertations.

Mater of the Ceremonies, an officer instituted by King James I. for the more honourable reception of ambassadors and strangers of quality. He wore about his neck a chain of gold, with a medal under the crown of Great Britain, having on one side an emblem of peace, with this motto, Beati pacifici; and on the other, an emblem of war, with Dies et mon droit: his salary is 500l. per annum.

Affiant Mater of the Ceremonies, is to execute the employment in all points, whenever the master of the ceremonies is absent. His salary is 14l. 13s. and 4d. per annum.

Marshall of the Ceremonies is their officer, being subordinate to them both. His salary is 100l. per annum.

Cerena, a town in the kingdom of Naples, and in the Hither Calabria, with a bishop's see. It is seated on a rock, in E. Long. 17° 5'. N. Lat. 39° 23'.

Ceres, a Pagan deity, the inventor or goddess of corn; in like manner as Bacchus was of wine.

According to the poets, she was the daughter of Saturn and Ops, and the mother of Proserpine, whom the had by Jupiter. Pluto having stolen away Proserpine, Ceres travelled all over the world in quest of her daughter, by the help of a torch, which she had lighted in Mount Etna.

As Ceres was thus travelling in search of her daughter, she came to Celeus king of Eleusis, and under took to bring up his infant son Triplolemus. Being desirous to render her charge immortal, she fed him in the day-time with sweet milk, and in the night covered him with fire. Ceres observing an unusual improvement in his son, resolved to watch his nurse, to which end he hid himself in that part of the house where she used to cover the child with fire; but when he saw her put the infant under the embers, he cried out and discovered himself. Ceres punished the curiosity and indiscretion of the father with death. Afterwards she taught the youth the art of sowing corn and other fruits, and mounted him in a chariot drawn by winged dragons, that he might traverse the world, and teach mankind the use of corn and fruits. After this, having discovered, by means of the nymph Arethusa, that Proserpine was in the infernal regions, she applied to Jupiter, and obtained of him that Proserpine should be restored, on condition that she had tasted nothing during her stay in that place: but it being discovered, by the information of Afcalaphus, that, as she was walking in Pluto's orchard, she had gathered an apple, and had tasted of some of the seeds, she was forever forbidden to return. Ceres, out of revenge, turned Afcalaphus into an owl. At length, Jupiter, to mitigate her grief, permitted that Proserpine should pass one half of the year in the infernal regions with Pluto, and the other half with her mother on earth.

Cicero speaks of a temple of Ceres at Catanea in Sicily, where was a very ancient statue of that goddess, but entirely concealed from the sight of men, every thing being performed by matrons and virgins.

Ceret, a town of France in Roussillon, with a magnificent bridge of a single arch. It is seated near the river Tec, in E. Long. 2° 45'. N. Lat. 42° 23'.

Cereus, in botany. See Cactus.

Cerigo, an island in the Archipelago, anciently called Cythera; noted for being the birth-place of Helen, and, as the poets say, of Venus. At present, there is nothing very delightful in the place; for the country is mountainous, and the soil dry. It abounds in hares, quails, turtle, and excellent falmons. It is about 50 miles in circumference, and had formerly good towns; but there is now none remaining but that which gives name to the island. This is strong both by art and nature, it being seated on a craggy rock. The inhabitants are Christian Greeks, and subject to the Venetians, who keep a governor there, whom they change every two years.

Cerines, a town in the island in Cyprus, with a good castle, an harbour, and a bishop's see. E. Long. 33° 25'. N. Lat. 35° 22'.

Cerinthian, ancient heretics, who denied the deity of Jesus Christ. They took their name from Cerinthus, one of the first heresiers in the church, being contemporary with St John. See Cerinthus.

They believed that Jesus Christ was a mere man, born of Joseph and Mary; but that, in his baptism, a celestial virtue descended on him in form of a dove; by means whereof he was consecrated by the holy Spirit, and made Christ. It was by means of this celestial virtue, therefore, that he wrought so many miracles; which, as he received it from heaven, quitted him after his passion, and returned to the place whence it came; so that Jesus, whom they called a pure man, really died and rose again; but that Christ, who was distinguished from Jesus, did not suffer at all. It was partly to refuse this sect, that St John wrote his gospel. They received the gospel of St Matthew, to counterbalance their doctrine of circumcision, from Christ's being circumcised; but they omitted the genealogy. They discarded the epistles of St Paul, because that apostle held circumcision abolished.

Cerinthus, a heresiarch, contemporary with the P...
Ceropogia, Certhis, apostles, ascribed the creation not to God, but to angels. He taught that Jesus Christ was the son of Joseph, and that circumcision ought to be retained under the gospel. He is looked upon as the head of the converted Jews, who raised in the church of Antioch the tumult of which St. Luke has given the history in the 11th chapter of the Acts. Some authors ascribe the book of the Apocalypse to Cerithius; adding, that he put it off under the name of St. John, the better to authorise his reveries touching Christ's reign upon earth: and it is even certain that he published some works of this kind under the title of Apocalypse. See Apocalyptic.

Ceropogia, in botany: a genus of the monogynia order, belonging to the pterandria class of plants; and in the natural method ranking under the 30th order, Contertae. There are two erect follicles; the seeds plumose or covered with a feathered pappus; the limb of the corolla convolute or closing at top.

Ceruthia, in ornithology, the creeper or ox-eye, a genus belonging to the order of picae. The beak is arched, slender, sharp, and triangular; the tongue is sharp at the point; and the feet are of the walking kind, i.e., having the toes open and unconnected. Of this genus near 50 species have been enumerated by ornithologists; but Mr. Latham supposes that many now described as species, will be found hereafter to be mere varieties; which, he adds, is no wonder, since many creepers do not gain their full plumage till the third year's moult. The following are a few of the most remarkable:

1. The familiaris, or common ox-eye, is grey above, and white underneath, with brown wings, and ten white spots on the ten prime feathers. This bird is found in most parts of Europe, though it is believed nowhere so common as in Britain. It may be thought more scarce than it really is by the less attentive observer; for, supposing it on the body or branch of any tree, the moment it observes any one, it gets to the opposite side, and so on. Let a person walk round the tree ever so often. The facility of its running on the bark of a tree, in all directions, is wonderful: this it does with as much ease as a fly on a glass window. Its food is principally, if not wholly, insects, which it finds in the clinks and among the moss of trees. It builds its nest in some hole of a tree, and lays generally five eggs, very rarely more. These are all-coloured, marked at the end with spots and streaks of a deeper colour; and the shell is observed to be pretty hard. It remains in the places which it frequents during the winter, and builds its nest early in the spring.

2. The hook-billed green creeper has a bill an inch and a quarter long, and bent quite in the shape of a semicircle; the plumage in general is olive green, palest beneath, and somewhat inclined to yellow: the quills and tail are dusky; the legs dusky brown; and the feathers just above the knee, or garter, white. It inhabits the Sandwich Islands in general, and is one of the birds whose plumage the natives make use of in constructing their feathered garments; which, having three or greenish feathers intermixed with the beautiful scarlet and yellow ones belonging to the next species, and hence yellow-tufted Bee-eater*, make some of the most beautiful coverings of these islanders.

3. The hook-billed red creeper has the bill somewhat less hooked than the last species; the general colour of the plumage is scarlet; wings and tail black. In some birds the forehead is of a buff-colour; and the parts about the head and neck have both a mixture of buff and dusky black, which are suspected to be the birds not yet arrived at their full plumage.

4. The pullices, or brown and white creeper, according to Edwards, is not above half the size of the European creeper. The upper part of the body is brown, with a changeable gloss of copper; the under parts are white; the quills brown, edged with glossy copper; the tail blackish, the outer feather tipped with white. The bird from which Edwards drew his figure had a label tied to it, by the name of Honey-thief. And that they are fond of honey is manifest, from those who keep birds at the Cape of Good Hope having many forts in large cages, and supplying them with only honey and water; but besides this, they catch a great many flies, which come within the reach of their confinement; and these two make up their whole subsistence; indeed, it has been attempted to transport them to the Cape of Good Hope, but the want of flies on board a ship prevented them living more than three weeks; so necessary are insects to their subsistence.

5. The Loteni, or Loten's creeper, has the head, neck, back, rump, and tail coverts, of green gold; beneath, from the breast to the vent, of velvet black, which is separated from the green on the neck by a transverse bright violet band, a line and half in breadth: the inner wing coverts are of this last colour; the middle coverts are of green gold; and the greater coverts are of very fine black, edged with green gold on the outer edge: the quills are of the same colour, as also the tail feathers. The female differs in having the breast, belly, sides, thighs, under wing and tail coverts, of a dirty white, spotted with black; and the wings and tail not of so fine a black. It inhabits Ceylon, Madagascar; and is called Angalanian.

Buffon tells us, that it makes its nest of the down of plants, in form of a cup, like that of a chaffinch, the female laying generally five or six eggs; and that it is sometimes choked by a spider as large as itself, and very voracious, which feizes on the whole brood, and sucks the blood of the young birds.

6. The cornelia, or blue creeper, has the head of a moist elegant blue; but on each side there is a stripe of black like velvet, in which the eye is placed: the chin and throat are marked with black in the same manner; the rest of the body violet blue. It inhabits Cayenne. Sebas says, that it makes its nest with great art. The outside is composed of dry stalks of grass, or such like; but within of very downy soft materials, in the shape of a retort, which it suspends from some weak twig, at the end of a branch of a tree; the opening or mouth downwards, facing the ground: the neck is a foot in length, but the real nest is quite at the top, so that the bird has to climb up this funnel-like opening to get at the nest. Thus it is secure from every harm; neither monkey, snake, nor lizard, daring to venture at the end of the branch, as it would not steadily support them.

7. The cardinal creeper, (Lev. Mufi) has the head, neck, and breast, of crimson colour; down the middle of
of the back is a stripe of the same colour to the rump; the rest of the body is black; and the wings and tail are black. It inhabits the cultivated parts of the island of Tanna; there known as Kuyameta, and lives by picking the nectar of flowers.

8. The mocking-crane is of the size of the lesser teal. On the checks is a narrow white spot: the head, especially on the crown, is inclined to violet: the plumage in general is olive green, inclining above; and the head and bill, and in course gives plumage. Bo¡m of flowers which have a plumish-coloured

avoid an outlawry, or the like, it was alleged that law, or in the service of the mayor of Bourdeallx, this should hold a sufficient trial of the contempt in refusing to
dispense

the party alleging it, that the custom ought to be thus tried: else it must be tried by the country. As, the custom of distributing the effects of freemen deceased; of enrolling apprentices; or that the mayor is feared of one man and another; if any of these, or other similar points come in issue. 4. The trial of all customs and prudential of the courts shall be by certificate from the proper officers of those courts respectively; and what return was made on a writ by the sheriff or under-sheriff, shall be only tried by his own certificate.

CERTIORARI, in law, a writ which issues out of the chancery, directed to an inferior court, to call the records of a cause there depending, in order that justice may be done. And this writ is obtained upon complaint, that the party who seeks it has received hard usage, or is not like to have an impartial trial in the inferior court. A certiorari is made returnable either in the king's bench, common pleas, or in chancery.

It is not only issued out of the court of chancery, but likewise out of the king's bench, in which last mentioned court it lies where the king would be certified of a record. Indictments from inferior courts, and proceedings of the quarter-sessions of the peace, may also be removed into the king's bench by a certiorari: and here the very record must be returned, and not a transcript of it; though usually in chancery, if a certiorari be returnable there, it removes only the tenor of the record.

CERTITUDE, considered in the things or ideas which are the objects of our understanding, is a necessary agreement or disagreement of one part of our knowledge with another, as applied to the mind, it is the perception of such agreement or disagreement; or such a firm, well-grounded assent, as excludes not only all manner of doubt, but all conceivable possibility of a mistake.

There are three sorts of certitude, or assurance, according to the different natures and circumstances of things. 1. A physical or natural certitude, which depends upon the evidence of sense; as that I see such or such a colour, or hear such or such a sound; no body questions the truth of this, where the organs, the medium, and the object, are rightly disposed. 2. Mathematical certitude is that arising from mathematical evidence; such is, that the three angles of a triangle are equal to two right ones. 3. Moral certitude is that founded on moral evidence, and is frequently equivalent to a mathematical one; as that there was formerly such an emperor as Julius Cæsar, and that he wrote the commentaries which pass under his name; because the historians of these times have recorded it, and no man has ever disproved it since: this affords a moral certitude, in common sense so great, that one would be thought a fool or a madman for denying it.

CERTOSA, a celebrated Cistercian monastery, in the territory of the Pavie, in the duchy of Milan, four miles from Pavia; its park is surrounded with a wall 20 miles in circumference; but there are several small towns and villages therein.

CERVANTES. See SAAVEDRA.

CERVERA, a town of Spain, in Catalonia, seated on a small river of the same name, in E. Long. 1° 9'. N. Lat. 41° 28'.

CERVIA, a sea-port town of Italy, in Romagna, with a bishop's see, seated on the gulf of Venice, in E. Long. 12° 5'. N. Lat. 44° 16'.

CERVICAL, among anatomists, denote the arteries, veins, &c. which pass through the vertebrae and muscles of the neck, up to the skull.
CERVIX, in anatomy, properly denotes the hind part of the neck; as contradistinguished from the fore part, which is called jugulum, or the throat.

Cervix of the Scapula, denotes the head of the shoulder-blade, or that upper process whose sinea receives the head of the humerus.

Cervix of the Uterus, the neck of the uterus, or that oblong canal, or passage between the internal and external orifices, which receives and includes the penis like a sheath, whence it is also called vagina.

Cerumen, a thick, viscous, bitter, excrementitious humour, separated from the blood by proper glands placed in the meatus auditorium, or outer passage of the ear.

Ceruss, white-lead, a sort of calx of lead, made by exposing plates of that metal to the vapour of vinegar. See Chemistry-Index.

Cerofs, as a medicine, is used externally either mixed in ointments, or by sprinkling it on old gleetting and watery ulcers, and in many diseas of the skin. If, when it is reduced into a fine powder, it is received in with the breath in inspiration, and carried down into the lungs, it causes incurable althmas. Instances of the very pernicious effects of this metal are too often seen among those persons who work in any form, but particularly among the workers in white-lead.

The painters use it in great quantities; and that it may be afforded cheap to them, it is generally adulterated with common whiting.

Cervus, or Deer, in zoology, a genus of quadrupeds belonging to the order of Pecora. The horns are solid, brittle, covered with a hairy skin, and growing from the top; they likewise fall off and are renewed annually. There are eight fore-teeth in the under jaw, and they have no dog-teeth. The species of this genus enumerated by Linnaeus are seven, viz.

1. The Camelopardalis, or Giraffe, with simple or unbranched horns, straight, about six inches long, covered with hair, and terminate at the end and tuffed; if they touch a tubercle, about two inches high, resembling a third horn. The fore legs are not much longer than the hind legs; but the shoulders are of a vast length, which gives the disproportionate height between the fore and hind parts: the head is like that of a flag; the neck is slender and elegant, and on the upper side is a short mane: the ears are large: the legs are strong, covered with hairs: the rump, was confirmed by Mr Gordon, who relates, that a giraffe, which he had wounded, suffered him to approach it as it lay on the ground, without offering to strike with its horns, or showing any inclination to revenge itself: he even stroked it over its eyes several times, when it only closed them, without any signs of resentment. Its throat was afterwards cut for the sake of its skin; and when in the pangs of death, it drank from a river, the surface of which is lower than the bank on which it stands.

The giraffe here described, which Mr Gordon, who dissected it, says was the largest he had ever seen, was 15 feet 4 inches Rhinland measure (about 15 feet 10 inches English) from the ground to the top of its head; the length of the body, from the chest to the rump, was 5 feet 7 inches Rhinland measure. M. Vaillant affirms, that he has seen several which were at least 17 feet high; and M. Vosmaer declares, that he has been afforded by some very respectable inhabitants of the Cape, that they had seen and killed giraffes, which
The fleece of the moose is extremely sweet and nourishing. The Indians say, that they can travel three times farther after a meal of moose, than after any other animal food. The tongues are excellent; but the nofe is perfect marrow, and esteemed the greatest delicacy in Canada. The skin makes excellent buff; being strong, soft, and light. The Indians dress the hide, and, after soaking it for some time, stretch and render it supple by a lather of the brains in hot water. They not only make their snow-foles of the skin, but after a chase form the canoes with it: theyfew the skins neatly together, cover the frames with an unctuous earth, and embark in them with their spoils to return home. The hair on the neck, withers, and hams of a full-grown elk, is of much use in making mattresses and faddles; being by its great length well adapted for those purposes. The palmed parts of the horns are farther excavated by the savages, and converted into ladles, which will hold a pint.

It is not strange that so useful an animal should be a principal object of chase. The savages perform it in different ways. The first, and the more simple, is before the lakes or rivers are frozen. Multitudes assemble in their canoes, and form with them a waft crecent; each horn touching the shore. Another party perform their share of the chase among the woods; they surround an extensive tract, let loose their dogs, and press towards the water with loud cries. The animals, alarmed with the noise, fly before the hunters, and plunge into the lake, where they are killed by the persons in the canoes, prepared for their reception, with lances or clubs. The other method is more artful. The savages inclose a large space with stakes hedged with branches of trees, forming two sides of a triangle: the bottom opens into a second inclosure, completely triangular. At the opening are hung numbers of bales, made of skins of raw hides. The Indians, as before, approach in a canoe, and with all kinds of noise drive into the first inclosure not only the mooses, but the other species of deer which abound in that country: some, in forcing their way into the farther triangle, are caught in the canoes by the neck or horns; and those which escape the canoes, and pass the little opening, find their fate from the arrows of the hunters, directed at them from all quarters. They are often killed with the gun. When they are first unharbour'd, they squat with their hind parts and make water, at which instant the sportman fires; if he misses, the moose sets off in a most rapid trot, making, like the rein-deer, a prodigious rattling with its hoofs, and will run for 20 or 30 miles before it comes to bay or takes the water. But the utmost time for their diversion is the winter. The hunters avoid entering on the chase till the sun is strong enough to melt the frozen crust with which the snow is covered, otherwise the animal can run over the firm surface: they wait till it becomes soft enough to impede the flight of the moose; which finks up to the shoulders, founders, and gets on with great difficulty. The sportsman pursues at his ease on his broad rakers, or snow-
CER [ 302 ]

As weak against the mountain heeds they pull
Their bearing breast in vain, and piteous pray,
He lays them quivering on the enfanglin'd snows,
And with loud thouns rejoicing bears them home.

THOMPSON.

The opinion of this animal's being subject to the epilepsy seems to have been universal, as well as the care it finds by scratchng its ear with the hind hoof till it draws blood. That hoof has been used in Indian medicine for the falling-ICKS; they apply it to the heart of the afflicted, make him hold it in left hand, and rub his ear with it. They use it also in the colic, pleurisy, vertigo, and purple fever; purgnging the hoof, and drinking it in water. The Algonkins pretend that the flesh imparts the disease; but it is notorious that the hunters in a manner live on it with impunity. The favages good omen; and are persuaded that those who dream pretend

The elk

The colour is generally a brown with some black about the face, and a black lift dawn the hind part of the neck and between the shoulders. Stags are common to Europe, Barbary, the north of Asia, and America. In spring, they shed their horns, which fall off spontaneously, or by rubbing them gently against the branches of trees. It is seldom that both horns fall off at the same time, the one generally preceding the other a day or two. The old flags call their horns first, which happens about the end of February or beginning of March. An aged flag, or one in the seventh year or upwards, does not cast his horns before the middle of March; a stag of five years sheds his horns in April; young flags, or those from three to five years old, shed their horns in the beginning, and those which are in their second year, not till the middle or end of May. But in all this there is much variety; for old flags sometimes cast their horns sooner than those which are younger. Besides, the shedding of the horns is advanced by a mild, and retarded by a fever and long winter.

As soon as the flags cast their horns, they separate from each other, the young ones only keeping together. They no longer haunt the deepet recesses of the forest, but advance into the cultivated country, and remain among brothwood during the summer, till their horns are renewed. In this season, they walk with their heads low to prevent their horns from rubbing against the branches; for they continue to have sensibility till they acquire their full growth. The horns of the oldest flags are not half completed in the middle of May, and acquire their full length and hardness before the end of July. Those of the younger flags are proportionally later both in shedding and being renewed. But as soon as they have acquired their full dimensions and solidity, the flags rub them against the trees, in order to clear them of a skin with which they are covered.

Soon after the flags have polished their horns, they begin to feel the impressions of love. Towards the end of August or beginning of September, they leave the coppice, return to the forests, and search for the hinds. They cry with a loud voice; their neck and throat swell; they become perfectly reftless, and traverse in open day the fields and the fallow grounds; they strike their horns against trees and hedges; in a word, they seem to be transported with fury, and run from country to country till they find the hinds or females, whom they pursue and compel into compliance; for the female at first avoids and flies from the male, and never omits to his embraces till she be fatigued with the pursuit. The old hinds likewise come in season before the younger ones. When two flags approach the same hind, they must fight before they enjoy. If nearly equal in strength, they threaten, paw the ground, set up terrible cries, and attack each other with such fury, that they often inflict mortal wounds with the strokes of their horns. The combat never terminates but in the defeat or flight of one of the rivals. The conqueror lores not a moment in enjoying his victory, unless another rival approaches, whom he is again obliged to attack and repel. The oldest flags are always masters of the field; because they are stronger and more furious than the young ones, who must wait patiently till their superiors tire, and quit their mirthfells. Sometimes, however, the young flags accomplish their purpofes when the old ones are fighting, and, after a hafti gratification, fly off. The hinds prefer the old flags, not because they are most courageous, but because they are much more ardent. They are likewise more inoffuant, having often several females at a time; and when a flag has but one hind, his attachment to her does not continue above a few days: He then leaves her, goes in quest of another, with whom he remains a fmall shorter time; and in this manner passes from one to another till he is perfectly exhausted.

This ardour of love lasts only three weeks, during which the flags take very little food, and neither sleep nor reft. Night and day, they are either walking, running, fighting, or enjoying the hinds. Hence, at the end of the rutting season, they are so meagre and exhausted, that they recover not their strength for a confiderable time. They generally retire to the borders of the forests, feed upon the cultivated fields, where they find plenty of nourishment, and remain there till their strength is re-established. The rutting season of old flags commences about the beginning, and ends about the 20th day of September. In those of fix or seven years old, it begins about the 10th of September, and concludes in the beginning of October. In young flags, or those in their third, fourth, or fifth year, it begins about the 20th of September, and terminates about the 15th of October; and at the end of October, the rutting is all over, excepting among the prickets, or those which have entered into their second year; because they, like the young hinds, are lateft of coming into season. Hence, at the beginning of November, the season of love is entirely finifhed; and the flags, during this period of weakness and latitu de, are easily hunted down.
and other nuts are plentiful, the flags soon recover their strength, and a second rutting frequently happens at the end of October; but it is of much shorter duration than the first.

In climates warmer than that of France, the rutting time, like the fawns, is more forward. Aristotle informs us, that, in Greece, it commences in the beginning of August, and terminates about the end of September. The hinds go with young eight months and some days, and seldom produce more than one fawn. They bring forth in May or the beginning of June, and so anxiously conceal their fawns, that they often expose themselves to be chased, with a view to draw off the dogs, and afterwards return to take care of their young. All hinds are not fertile; for some of them never conceive. The barren hinds are grooser and fatter than those which are prolific, and also come soonest in season. The young are not called fawns or saloœ after the sixth month: The {knobs of their horns then begin to appear, and they take the name of knobbars till their horns lengthen into faders, and then they are called brooks and flaggards. During the first season they never leave their mothers. In winter, the flags and hinds of all ages, keep together in flocks, which are always more numerous in proportion to the rigour of the season. They separate in spring: The hinds retire to bring forth; and, during this period, the flocks confisit only of knobbars and young flags. In general, the flags are inclined to associtate, and nothing but fear or necessity obliges them to differce.

The life of the flag is sentient in alternate plenty and want, vigour and debility, health and sickness, without having any change introduced into his constitution by those opposite extremes. He lives as long as other animals which are not subjected to such vicissitudes. As he grows five or six years, he lives seven times that number, or from 35 to 40 years. What has been reported concerning the longevity of the flag merits no credit. It is only a popular prejudice which prevailed in the days of Aristotle, and which that philosopher considered as improbable, because neither the time of gestation nor the growth of the young flag, indicated long life. This authority ought to have abolished the prejudice; but it has been renewed, in the ages of ignorance, by a fabulous account of a flag taken by Charles VI. in the forest of Senlis, with a collar upon which was written this inscription, Caesar hoc me donavit. The love of the marvellous inclined men to believe that this animal had lived 1000 years, and had his collar from a Roman Emperor, rather than to sup­pose that he came from Germany, where all the emperors take the name of Caesar.

The flag appears to have a fine eye, an acute snell, and an excellent ear. When listening, he raises his head, erects his ears, and hears from a great distance. When he is going into a copice, or other half covered place, he flops to look round him on all sides, and scents the wind, to discover if any object is near that might disturb him. He is a simple and yet a curious and crafy animal. When hailed or called to from a distance, he flops short, and looks steadfastly, and with a kind of admiration at carriages, cattle, or men; and if they have neither arms nor dogs, he moves on unconcernedly, and without flying. He appears to listen with great tranquillity and delight to the shepherd's pipe; and the hunters sometimes employ this artifice to encourage and deceive him. In general, he is least afraid of men than of dogs, and is never suspicious, or uses any arts of concealment, but in proportion to the disturbances he has received. He eats little, and has a choice in his aliments; and after his stomatch is full, he lies down, and ruminates at leisure. He seems to ruminate with less facility than the ox. It is only by violent shakes that the flag can make the food rise from his first stomatch. This difficulty proceeds from the length and direction of the passage through which the aliment has to go. The neck of the ox is short and straight, but that of the flag is long and arched; and therefore greater efforts are necessary to raise the food. These efforts are made by a kind of hiccup, the movement of which is apparent, and continues during the time of ruminnation. His voice is stronger and more quivering, in proportion as he advances in years. The voice of the hind is shorter and more feeble. She never bellows from love, but from fear. The flag, during the rutting season, bellows in a frightful manner: He is then so transported, that nothing disturbs or terrifies him. He is therefore easily surpriséd; as he is loaded with fat, he cannot keep long before the dogs. But he is dangerous when at bay, and attacks the dogs with a species of fury. He drinks none in winter nor in spring, the dews and tender herbage being then sufficient to extinguish his thirst; but during the parching heats of summer, to obtain drink, he frequents the brooks, the marshes, and the fountains; and in the season of love, he is so over-heated, that he searches every where for water, not only to satisfy his immoderate thirst, but to bathe and refresh his body. He then swims easier than at any other times on account of his fatness. He has been observed crossing very large rivers. It has even been alleged, that, attracted by the odour of the hinds, the flags, in the rutting season, throw themselves into the sea, and pass from one island to another at the distance of several leagues. They leap still more nimbly than they swim; for, when pursuing, they easily clear a hedge or a pale fence of six feet high. Their food varies in different seasons. In autumn, after rutting, they search for the buds of green shrubs, the flowers of broom or heath, the leaves of brambles, &c. During the fnows of winter, they feed upon the bark, moss, &c. of trees; and in mild weather, they browse in the wheat-fields. In the beginning of spring, they go in quest of the catkins of the trembling poplar, willow, and hazel-trees, the flowers and buds of the cornel tree, &c. In summer, when they have great choice, they prefer rye to all other grain, and the black berry-bearing alder to all other wood. The flesh of the fawn is very good; that of the hind and knlobber not absolutely bad; but that of the flag has always a strong and disagreeable taste. The skin and the horns are the most useful parts of this animal. The skin makes a pliable and very durable leather. The horns are used by cutlers, sword-fippers, &c. and a volatile spirit, much employed in medicine, is extracted from them by the chymists.

In America, flags feed eagerly on the broad-leaved Kalma; yet that plant is a poison to all other horned animals: their intestines are found filled with it during winter. If their carriages are given to dogs, they become stupified, and as if drunk, and often are so ill
Cervus

as hardly to escape with life. The American flags grow very fat; their tallow is much esteemed for making of candles. The Indians eat them. As they are very shy animals, the natives cover themselves with a hide, leaving the horns erect; under the shelter of which they walk within the reach of the herd. De Bríe, in the 25th place of the History of Florida, gives a very correct representation of this animal method of obtaining food when it was visited by the French in 1564. Their skins are an article of commerce imported by the Hudson's Bay Company; but brought from the distant parts far inland by the Indians, who bring them from the neighbourhood of the lakes. In most parts of North America they are called the grey moose, and the elk; this has given occasion to the mistaken notion of that great animal being found in Virginia and other southern states.

In Britain the flag is become less common than formerly; its excelle vicissitudes during the rutting season, and the badness of its flesh, induce most people to part with the species. Stags are still found wild in the Highlands of Scotland; in herds of four or five hundred, the stag at full liberty over the wild hills of the north. Formerly the great Highland chiefs used to hunt with the magnificence of an eastern monarch, assembling four or five thousand of their clans, who drove the deer into the toils, or to the stations the lairds had placed themselves in; but as this pretence was frequently used to collect their valiant for rebellious purposes, an act was passed prohibiting any assemblies of this nature. Stags are likewise met with on the moors that border on Cornwall and Devonshire; and in Ireland on the mountains of Kerry, where they add greatly to the magnificence of the romantic scenery of the lake of Killarney. The flags of Ireland during its unseasonable state, and while it remained an almost boundless track of forest, had an exact agreement in habit with those that range at present through the wilds of America. They were less in body, but very fat; and their horns of a size far superior to those of Europe, but in form agreed in all points.

The chase of the flag has been formed into an art, and requires a species of knowledge which can only be learned by experience: It implies a royal assembly of men, hounds, and dogs, all so trained, prattled, and disciplined, that their movements, their researches, and their skill, must concur in producing one common end. The huntman should know the age and the sex of the animal; he should be able to distinguish with precision, whether the flag he has harassed with his hounds be a knapper, a young flag, in his sixth or seventh year, or an old flag. The chief marks which convey this intelligence is derived from the foot, and the excrement. The foot of the flag is better formed than that of the hind, or female. Her leg is more gross and nearer the heel. The impressions of his feet are rounder, and farther removed from each other. He moves more regularly, and brings the hind-foot into the impression made by the fore-foot. But the distance between the steps of the hind are shorter, and her hind-feet strike not regularly the track of the fore-feet. Stags, for this reason, always place their hind-foot exactly in the track of the fore-foot, excepting when they find their food. On this point, the old flags mingle as often as the young ones, but in this they are more regular than the hind or young flag, placing the hind-foot always at the side of the fore-foot, and never beyond or within it. When the huntman, from the dryness of the season, or other circumstances, cannot judge by the foot, he is obliged to trace the animal backwards, and endeavour to find its dung. This mark requires, perhaps, greater experience than the knowledge of the foot; but without it the huntman would be unable to give a proper report to the company. After the report of the huntman, and the dogs are led to the refuge of the flag, he ought to encourage his hound, and make him rest upon the track of the flag, till the animal be unharnessed. Instantly the alarm is given to uncouple the dogs, who, by the voice of the chase, and the horn of the huntman. He should also diligently observe the foot of the flag, in order to discover whether the animal has flattered, and substituted another in its place. But it is then the business of the hunters to separate, and to recall the dogs which have gone astray after false game. The huntman should always accompany his dogs, and encourage, without preying them too hard. He should assist them in detecting all the arts of escape used by the flag; for this animal has remarkable address in deceiving the dogs. With this view he often returns twice or thrice upon his former steps; he endeavours to raise hinds or younger flags to accompany him, and draw off the dogs from the object of their pursuit: he then flies with redoubled speed, or springs off at sides, lies down on his belly, and conceals himself. In this case, when the dogs have lost his foot, the huntmen, by going backwards and forwards, assist them in recovering it. But if they cannot find it, they suppose that he is refting within the circuit they have made, and go in quest of him. But if they are still unable to discover him, there is no other method left, but, from viewing the country, to conjecture where he may have taken refuge, and repair to the place. As soon as they have recovered his foot, and put the dogs upon the track, they pursue with more advantage, because they perceive that the flag is fatigued. Their armour augments in proportion to his fethenefis; and their scent becomes more dillie than the animal grows warm. Hence they redouble their cries and their speed; and though the flag prefers still more arts of escape than formerly, as his swiftness is diminished, his arts and doubtings become gradually less effectual. He has nev*o, other resource but to fly from the earth which he tread, and get into the waters, in order to cut off the scent from the dogs. The huntmen go round these waters, and again put the dogs on the track of his foot. The flag, after taking to the water is incapable of running, far, and is soon at bay. But he still attempts to defend himself by his horns, wounds the dogs, and even the huntmen when too forward, by blows with his horns, till one of them cuts his

4. The Tarandus, or Rein-deer, is a native of Lapland, and the northern parts of Europe, Asia, and America. The horns are large, cylindrical, branched, and palmed at the tops. Two of the branches hang over the face. He is about the size of a buck, of a dirty whitish colour; the hairs of his skin are thick and strong. To the Laplanders this animal is the sublimate of the horse, the cow, the goat, and the sheep; and is their only wealth: the milk affords them cheese; the bones, spoons. During the winter it supplies the want of a horse, and draws their sledges with amazing swiftness, over the frozen lakes and rivers, or over the snow, which at that time covers the whole country. A rich Laplander ispossessed of a herd of 1000 rein deer. In autumn they seek the reach of the wild rein; which they kill for the sake of the skins, either to clothe themselves, or to cover their tents. They know not the cleanly delicacy of the milk or cheese; but they are likely to attack the drove, detach and hum them down: the wolves, who single out the richest of the fpecies is not so universal as the fog: rare in France and Germany. It is found in Greece, the Holy Land, and the north of China. They are very numerous in England; but, except on a few chafes, confined in parks. None originally in America. They are easily tamed; and their flesh, which goes by the name of venison, is in high esteem among the luxurious. During rutting-time they will contend

raw, dressed, and dried and smoked with the snow

latch. The wearied hunters will drink the raw blood; but it is usually dressed with the berries of the heath: they eagerly devour the contents of the stomach, but use the intestines boiled. They are very fond of the fat, and will not lose the least bit. The skin, sometimes a part of their clothing, dressed with the hair on, is soft and plant; it forms also the inner lining of their tents, and most excellent blankets. The tendons are their bow-string, and when split are the threads with which they sew their jackets.

The Greenlanders, before they acquired the knowledge of the gun, caught them by what was called the clapper-hunt. The women and children surrounded a large space, and, where people were wanting, set up poles capped with a turf in certain intervals, to terrify the animals; they then with great noise drove the reindeer into the narrow defiles, where the men lay in wait and killed them with harpoons or darts. But they are now become very scarce.

The rein-deers are found in the neighborhood of Hudson's Bay; in most amazing numbers, columns of eight or ten thousand are seen annually passing from north to south in the months of March and April, driven out of the woods by the wathenred, seeking refreshment on the shore, and a quiet place to drop their young. They go to rut in September, and the males soon after fled their horns; they are at that season very fat, but for rank and bulky as not to be eatable. The females drop their young in June, in the most frequented spots they can find; and then they likewise lose their horns. Beasts of prey follow the herds; first, the wolves, who single out the stragglers (for they know not the cleanest delicacy of the milk or cheese); next, the dogs, who glide up the sides of the herds, and then they eagerly devour the contents of the stomach, which is composed of butter. The skins and horns are also an article of commerce, and used in London by the bakers. The Indians shoot them in the winter. The English make hedges with stakes and boughs of trees along the woods for five miles in length, leaving openings at proper intervals behind with snares, in which multitudes are taken. The Indians also kill great numbers during the seasons of migration, watching in their canoes, and spearing them while passing over the rivers of the country, or from island to island; for they swim most admirably well.
with each other for their mistresses, but are less fierce than the flag; during that season, the male will form a hole in the ground, make the female lie down in it, and then often walk round and smell at her. Moore speaks of a species found on the banks of the Gambia, in the interior parts of Africa, near Barracouda, called Tungong, which he says differed not in form from the English fallow-deer; only that its size was equal to that of a small horse, and weighed 300 lb. It had also on its neck an erect black mane, four or five inches long.—Mr White, in his Natural History of Peliborn, mentions as a piece of information to naturalists, that if some curious gentleman would procure the head of a fallow-deer, and have it buried, to obviate any inconveniency, they can open two thistles, which he found it furnished with two piricaula, or breathing places, beside the nostrils; probably analogous to the pidentia lacrymatoria in the human head. When deer are thirsty they plunge their noses, like some horses, very deep under water, while in the act of drinking, and continue in that situation for a considerable time; but, to obviate any inconveniency, they can open two vents, one at the inner corner of each eye, having a communication with the nose. This seems, as our author observes, to be an extraordinary provision of nature; for it looks as if these creatures could not be suffocated, though their mouths and nostrils were both stopped. This curious formation of the head, he further remarks, may be of singular service to beasts of chase, by affording them free respiration; and no doubt these additional nostrils are thrown open when they are hard run. Mr Pennant has observed the same curious organization in the antelope. See Capra.

6. The Capreolus, or Roe-buck, has erect cylindrical, branched horns, and forked at the top. His size is only three feet nine inches long, two feet three inches high before, and two feet seven inches high behind: weight from 50 to 60 lb. Though the leaf of the deer-kind, his figure is most elegant and handsonde. His eyes are more brilliant and animated than those of the flag. His limbs are more nimble, his movements quicker, and he bounds, seemingly without effort, with equal vigour and agility. His coat, or hair, is always clean, smooth, and glossy. He never wallows in the mire like the flag. He delights in dry and elevated situations, where the air is purest. He is likewise more crafty, conceals himself with greater address, is more difficult to trace, and derives superior resources from instinct; for though he has the misfortune to leave behind him a stronger fcent than the flag, which redoubles the ardour and appetite of the dogs, he knows how to withdraw himself from their pursuit, by the rapidity with which he begins his flight, and by his numerous refinblings. He delays not his arms of defence till his strength fails him; but, as soon as he finds that the first efforts of a rapid chase have been unsuccessful, he repeatedly returns on his former steps; and after confounding by these opposite movements, the direction he has taken, after intermixing the present with the past emanations from his body, he rises from the earth with a great bound, and retiring to a hide, he lies down flat on his belly; and in this immovable situation, he allows the whole troop of his deceived enemies to pass very near him.

The roe-deer differs from the flag and fallow-deer in disposition, temperament, manners, and almost every natural habit. Instead of associating in herds, they live in separate families. The father, mother, and young, go together, and never mix with strangers. They are constant in their amours, and never unfaithful like the flag. As the females generally produce two fawns, the one male and the other female, these young animals, brought up and nourished together, acquire to their mutual affection, that they never quit each other, unless one of them meets with a misfortune, which never ought to separate lovers. This attachment is more than love; for though always together, they feel the aridure of the rut but once a year, and it continues only fifteen days, commencing at the end of October, and ending before the fifteenth day of November. They are not then, like the flag, overloaded with fat; they have no strong smell, no fury, in a word, nothing that can change the state of their bodies. During this period, they indeed suffer not their fawns to remain with them. The father drives them off, as he is obliged to oblige them to yield their place to those which are to succeed, and to form new families for themselves. However, after the rutting season is past, the fawns return to their mother, and remain with her some time; after which they separate for ever, and remove to a distance from the place which gave them birth.

The female goes with young five months and a half, and brings forth about the end of April or beginning of May. She produces two at a time, which he is obliged to conceal from the buck while very young. In 10 or 12 days they acquire strength sufficient to enable them to follow her. When threatened with danger, the hides them in a close thicket, and, to preserve them prefers herself to be chased. But notwithstanding all her care and anxiety, the young are sometimes carried off by men, dogs, or wolves.

Roe-bucks prefer a mountainsous woody country to a plain one. They were formerly very common in Wales, in the north of England, and in Scotland; but at present the species nowhere exists in Great-Britain, except in the Scottish highlands. In France they are more frequent; they are also found in Italy, Sweden, and Norway; and in Asia they are met with in Siberia. The first that are met with in Great Britain, are in the woods on the south side of Loch-Rannoch, in Perthshire: the laft in thofe of Longwai, on the southern borders of Caithness; but they are most numerous in the beautiful forests of Invercauld, in the midft of the Grampian hills. They are unknown in Ireland. Wild roes, during summer, feed on grasses; and are very fond of the rubus fatustilis, called in the Highlands the roebuck berry; but in the winter time, when the ground is covered with snow, they browse on the tender branches of the fir and birch.

7. The Guinecenis, about the size of a cat, is of a greyish colour, and black underneath. It is a native of Guinea, and the size and figure of its horns have not been hitherto described with any precision.

8. The Axis, or Speckled Deer, has slender trifurcated horns; the first branch near the base, the second near the top, each pointing upwards. This species is about the size of the fallow-deer; of a light red colour; the body beautifully marked with white spots; along
The hunters are sure of finding the game there; for notwithstanding they are often disturbed, the buffaloes and deer are so passionately fond of the favourable regale, as to bid defiance to all danger, and return in droves to these favourite haunts.

The deer are of the first importance to the savages. The skins form the greatest branch of their trade, by which they procure from the colonists, by way of exchange, many of the articles of life. To all of them the flesh is the principal food throughout the year; for drying it over a gentle but clear fire, after cutting it into small pieces, it is not only capable of long preservation, but is very portable in their sudden excursions, especially when reduced to powder, which is frequently done.

Hunting is more than an amusement to these people. They give themselves up to it not only for the sake of subsistence, but to fit themselves for war, by habituating themselves to fatigue. A good hunter is an able warrior. Those who fail in the sports of the field are never supposed to be capable of supporting the hardships of a campaign; they are degraded to ignoble offices, such as dressing the skins of deer, and other employments allotted only to slaves and women.

When a large party meditates a hunting-march, which is usually at the beginning of winter, they agree on a place of rendezvous, often 500 miles distant from their homes, and a place perhaps that many of them had never been at. They have no other method of fixing on the spot than by pointing with their finger. The preference is given to the eldest, as the most experienced. When this matter is settled, they separate into small parties, travel and hunt for subsistence all the day, and rest at night; but the women have no certain resting-places. The savages have their particular hunting countries; but if they violate the limits of those belonging to other nations, feuds ensue, fatal as those between Percy and Douglas in the famed Chevi Chace. As soon as they arrive on the borders of the hunting country (which they never fail doing to a man, be their respective routes ever so distant or so various), the captain of the band delineates on the bark of a tree his own figure with a rattlesnake twined round him with diffused mouth; and in his hand a bloody tomahawk. By this he implies a destructive menace to any who are bold enough to invade their territories, or to interrupt their diversion.—The chase is carried on in different ways. Some surprise the deer by using the flail of the head, horns, and hide; but the general method is performed by the whole body. Several hundreds distinguish in a line, encompassing a vast space of country, fire the woods, and drive the animals into some strait or peninsula, where they become an easy prey. The deer alone are not the object; foxes, raccoons, bears, and all beasts of fur, are thought worthy of attention, and form articles of commerce with the Europeans.

The number of deer destroyed in some parts of America is incredible; as is pretended, from an absurd idea which the savages have, that the more they destroy, the more they shall find in succeeding years. Certain it is that multitudes are destroyed; the tongues only preferred, and the carcasses left a prey to wild beasts. But the motive is much more political. The savages...
in the civil law for a voluntary surrenders of a person's effects to his creditors, to avoid imprisonment. See the article Bankrupt.

In several places the cession carried with it a mark of infamy, and obliged the person to wear a green cap or bonnet; at Lucca, an orange one; to neglect this was to forfeit the privileges of the cession. This was originally intended to signify that the cessionary became poor through his own folly. The Italian lawyers describe the ceremony of cession to consist in striking the bare breech three times against a stone, called *Lapis Vituperis*, in presence of the judge. Formerly it consisted in giving up the girdles and keys in court: the ancients using to carry at their girdles the chief utensils whereby they got their living; as the scrivener his escritoire, the merchant his bag, &c.

The form of cession among the ancient Gauls and Romans was as follows: The cessionary gathered up dust in his left hand from the four corners of the house, and standing on the threshold, holding the door post in his right hand, threw the dust back over his shoulders; then stripping to his shirt, and quitting his girdle and bags, he jumped with a pole over the hedge; hereby letting the world know, that he had nothing left, and that when he jumped all he was worth was in the air with him. This was the cession in criminal matters. In civil cases, it was sufficient to lay a bough, a switch or a broken straw, on the threshold: this was called *obrenerenda per durtillum et felucam*.

Cession, in the ecclesiastical law, is when an ecclesiastical person is created a bishop, or when a person of a parish takes another benefice, without dispensation, or being otherwise qualified. In both these cases their first benefices became void by cession, without any renunciation; and to those livings that the person had, who was created bishop, the king may present for that time, whoever is patron of them; and in the other case the patron may present: but by dispensation of retainer, a bishop may retain some or all the preferments he was intituled to before he was made bishop.

CESTRUM, bastard jasmine: A genus of the monogynia order, belonging to the pentandra clafs of plants; and in the natural method ranking under the 28th order, *Lorideae*. The corolla is funnel-shaped; the stamens each sending out a little tooth about the middle of the inside. There are six species, all of them natives of the warmest parts of America; so cannot be preferred in Britain without artificial heat. They are flowering shrubs, rising in height from five to twelve feet, with flowers of a white, herbaceous, or pale yellow colour. The flowers of one species commonly called *Badmington Jasmine*, have the property of sending out a strong scent after sunet. They may be propagated either by seeds or cuttings.

CETUI, a French word, signifying he or him, frequently used in the English law writings. Thus, *Cetui qui trueta*, a person who has lands, &c., committed to him for the benefit of another; and if such person does not perform his trust, he is compellable to it in chancery, *Cetui qui vie*, one for whose life any lands, &c., are granted. *Cetui qui usque*, a person to whose use any one is infeoff'd of lands or tenements. Formerly the seoffees to usfs were deemed owners of the
CETUS, in astronomy, the whale; a large constellation of the southern hemisphere, under Pisces, and next the water of Aquarius. The stars in the constellation Cetus, in Ptolemy's catalogue, are twenty-two; in Tycho's twenty-one; in Hevelius's forty-five; in the British catalogue ninety-seven.

Cetus is represented by the poets, as the sea-monster which Neptune, at the suit of the nymphs, sent to devour Andromeda for the pride of her mother, and which was killed by Perseus. In the mandible of cetus is a variable star which appears and disappears periodically, passing through the several degrees of magnitude both increasing and diminishing, in about 333 days. See Astronomy, no. 45.

CEVA, a strong town of Piedmont in Italy, seated upon the river Tanero, with a strong fort, in E. Long. 8. 8 N. Lat. 44. 20.

CEVENNES, mountains of Languedoc in France, remarkable for the frequent meetings of the Protestants there as a place of security against the tyranny of their governors. In queen Anne's reign there was an attempt made to shift them by an English fleet in the Mediterranean; but to no purpose, for the French had occupied the passes.

CEUTA, a maritime town of Barbary in Africa, and in the kingdom of Fez, seated on the straits of Gibraltar, opposite that place, in W. Long. 6. 25 N. Lat. 36. 35. John king of Portugal took it from the Moors in 1415, but it now belongs to Spain. In 1697, it sustained a vigorous siege by the Moors.

CEYLON, a large island in the East Indies, about 250 miles in length and 200 in breadth. It abounds in trees and shrubs, valuable both on account of their timber and the guns or spicas they produce. Among these Mr. Ives enumerates the euphorbium, tulip-tree, ebony, red-wood, caffia, cocoa-nut, cotton, lime, mango, citron, coffee; the trees producing balam of cassia, gum gamboge, lac, and anguvenale. This last is as yet unknown in Europe; but, according to the information of a Dutch surgeon, an oil or balsam is produced from it by distillation, which is of great use in paralytic complaints. There is also another gum named badule, which has been but lately discovered, and of which the ues is as yet unknown. Here is also the black and yellow teak, the wood of which is of a most beautiful grain, but so hard that the cutting of it proves very destructive to the carpenters' tools. But the most remarkable, as well as the most useful, of the vegetable productions of Ceylon, is the cinnamon-tree, which grows wild in every wood on the south-west part of the island. The very young trees are not fit for binding, and the old ones are cut down for firewood. The common flowering shrubs, of which the whole island is full, send forth a most agreeable fragrance every morning and evening. It abounds with high hills, between which the soil is a fair red earth; and the valleys are extremely pleasant, having a clear rivulet running thro' almost every one of them. Thus the finest fruits grow in vast plenty, and may be had at the most trifling rates; a pine-apple being bought for less than a penny, and so of the rest. Other provisions are almost equally cheap.

CETACEOUS, an appellation given to the fishes of the whale kind; the characters of which are: they have no gills; there is an orifice on the top of the head, through which they breathe; and one back fin; the number of their fins never exceed three, viz. two pectoral fins, and one back fin; but in some species the last is wanting. Their tails are placed horizontally, or flat in respect to their bodies; contrary to the direction of those of all other fishes, which have them in a perpendicular line. This situation of the tail enables them to force their bodies slowly to the surface of the water to repel, and then to perform several other functions. They have the power of uttering sounds, such as bellowing and making other noises denied to genuine fish. Like land animals they show in all their actions a great power of charming and conciliating love.

Nature on this tribe hath bestowed an internal structure in all respects agreeing with that of quadrupeds; and in a few others the external parts in both are similar. Cetaceous fish, like land animals, breathe by means of lungs, being destitute of gills. This obliges them to rise frequently on the surface of the water to repel, to sleep on the surface, as well as to perform several other functions. They have the power of uttering sounds, such as bellowing and making other noises denied to genuine fish. Like land animals they show in all their actions a great power of charming and conciliating love.

Notwithstanding the many parts and properties which cetaceous fish have in common with land animals, yet there still remain others which render it more natural to place them, with Ray, in the rank of fish; the form of their bodies agrees with that of fish; they are entirely naked, or covered only with a smooth skin; they live conflantly in the water, and have all the actions of fish.

CETE, the name of Linnaeus's seventh order of mammalia, comprehending the Monodon, Balea, Physeter, and Delphinus.

CETERACH, in botany, the trivial name of a species of Asplenium.

CETTE, a maritime town of France, in Languedoc, seated at the place where the canal of Languedoc begins, between Montpellier and Aigues, on the bay of Maguelone in the Mediterranean sea. E. Long. 3. 15 N. Lat. 43. 25.

CETUS, among ancient poets, a fine embroidered girdle said to be worn by Venus, to which Homer attributes the power of charming and conciliating love. The word is also written cethun and cethon; it comes from cestus, a girdle, or other thing embroidered or wrought with a needle; derived, according to Servius, from cestus, pangere; whence also inceus, a term used at first for any indecency by undoing the girdle, &c. but now restrained to that between persons near akin. See INTOX.

CEY [310]

Ceylon—cheap; a dozen of fowls or five ducks being sold for a rupee, not quite half-a-crown of English money. Here the Dutch show a poisonous fruit called by them Adam's apple. In shape it resembles the quarter of an apple cut out, with the two inlines a little convex, and a continued ridge along the outer edges; and is of a beautiful orange colour. Pepper, ginger, and cardamoms, are also produced here; as well as five kinds of rice, which ripen one after another.

Ceylon produces also topazes, garnets, rubies, and other precious stones, which are discovered by washing the soil wherein they grow. It has likewise ores of copper, iron, and probably of tin, with veins of black crystal.

Common deer are found in this island in great abundance, as well as Guinea-deer; but the horned cattle are both very small and scarce, six of them weighed all together, but 714 pounds, and one of these weighed only 70 pounds. They have, however, the largest and best elephants in the world; and their woods are infested by tygers, the most terrible of all ravenous beasts. They abound also with snakes of a monstrous size, one of which has been known to destroy a tyger and devour him at one meal. Mr Ives saw one 15 feet long and 30 inches in circumference. Spiders, centipedes, and scorpions, also grow here in an enormous size. Our author saw a spider here as large as a road, with brown hair upon it, and legs as thick as the Shank of a large tobacco-pipe. A scorpion, taken out of a piece of wood, was eight inches long, from head to tail, exclusive of the claws; the shell was as hard as that of a crab: and our author killed a centipede more than seven inches long. Here the mantis or creeping leaf is met with; which our author supposes to be a species of grasshoppers, having every member we fee in common insects, though in shape and appearance it greatly resembles a leaf. It is of a green colour. The sea-coasts abound with fish, which are to be had very cheap. Neither harp-hells nor ventile-trains were seen here; but there are abundance of painted cockles, and others commonly called Panama shells.

"The natives of this island (says our author) are the stoutest Indians I ever saw. Mr Knox in his history reports many strange things of their religion and customs, none of which I had any opportunity of seeing. He says 'that they have various ways of treating their dead. Some burn them, which is not uncommon in India; while others throw their limbs up into the forks of trees.' This may be true, because when our wood-cutters were once hewing down a flack of timber, there fell from it the skull and many bones of a human body; and I also saw here a human body hanging on a tree. Other historians relate, that the natives of Ceylon feed on human flesh; nay, that they eat the bodies of their deceased parents, imagining that no other sepulchre is so fit for them as their own bowels, since thereby they think they are changed into their own substance, and live again in themselves. This shocking custom is reported of the ancient Scythians, and possibly might have been used by the inhabitants of Ceylon, but is now in both countries entirely abolished; and yet even at this day these islanders are said to make cups of their parents skulls, with a view, that in midst of their mirth and jollity they may be sure to preserve a respectful remembrance of them."

The Ceylonese make use of boats hollowed out of the trunks of trees, which are about 12 or 14 feet long, but only as many inches broad within. The tree part in the bottom is much larger; but when the boat, on account of the size of the tree, is too small, they make a trough on the top of it square at both ends. Some boats, however, are much larger, being built between two trees; and with these they coast along shore; the others are for fishermen. It lies from E. Long. 78° to 82°, and from N. Lat. 5° to 10°.

The conquest of this island was the first attempt of Albuquerque the celebrated Portuguese admiral. He found it well peopled, and inhabited by two different nations, the Bedus inhabiting the northern, and the Gingles who dwelt in the southern parts. The former were very barbarous, but the latter a good deal more polished. Besides the advantages already mentioned, which these nations derived from their mines of precious stones, they carried on the greatest pearl-fishery in the East. These nations the Portuguese conquered, and tyrannized over in such a manner, that they afflicted the Dutch in expelling them from the island; and by their united efforts this was accomplished in 1658, after a bloody and obstinate war. All the Portuguese settlements fell into the hands of the Dutch East India company, who still keep possession of them, excepting a small district on the eastern coast without any port, from whence the sovereign of the country had his seat. These settlements formed a regular track, extending from two to twelve leagues into the inland parts of the island. The company have appropriated all the productions of the island. The several articles of trade are, 1. Amethysts, sapphires, topazes, and rubies; the last are very small, and very indifferent. The Moors, who come from the coast of Coromandel buy them, paying a moderate tax; and when they are cut, sell them at a low price in the different countries. 2. Pepper, which the company buy for about 4d. per pound; coffee, for which they only pay 2d. and cardamom, which has no fixed price. These articles are all of an inferior quality, and through the indolence of the inhabitants will never turn to any account. 3. An hundred bales of handkerchiefs, pagnes, and gingham, of a fine red colour, which are fabricated by the Malabars of Jafnapatan. 4. A small quantity of ivory, and about 50 elephants, which are carried to the coast of Coromandel. 5. Areca, which the company buys at about 8s. 9d. the ammona, and sells on the spot at L. 1, 12s. to the merchants of Bengal, Coromandel, and the Maldives; who give in return rice, coarse linen, and cowries. 6. The pearl fishery, which was formerly of great consequence; but is now so much exhausted as not to bring in more than L. 8,750 per annum. The annual expenses of the colony may amount to about L. 96,250; their revenues and small branches of commerce produce only about L. 87,500.

-This deficiency must be supplied out of the pro-

liged to provide for the expences of the wars in which
they are frequently engaged with the king of Candy,
who is present the sole sovereign of the island. These
are very detrimental to the interests of the Holland-
ers; for which reason they endeavoured to engage
the good will of this monarch by showing him all ima-
ginable civilities. The harmony, however, has been
often interrupted. In a bloody war which terminated
on the 14th of February 1766, the Ceylonese monarch
was driven from his capital, so that the Dutch made a
very advantageous treaty. Their sovereignty was
acknowledged over all that part of the country they
possessed before the troubles broke out; and that part
of the coasts held by the natives was ceded to them.
They were allowed to gather cinnamon in all the
plains; and the court was to sell them the best for,
which is produced in the mountains, at the rate of
L. x. 16s. 8d. for 18 lb. The government engaged to
have no connection with any foreign power; and
even to deliver up any Europeans who might happen
to stray into the island. In return for so many conces-
sions, the king was to receive annually the value of
the produce of the ceded coasts; and from thence his
subjects were to be furnished gratis with as much salt
as they had occasion for. The Ceylonese are in the
most miserable situation: they are in a state of total
inactivity; live in huts without any furniture; and
subsist upon fruits; those who are the most affluent
have no other covering than a piece of coarse linen
wreath about their waist.

CHACE.  See CHAIS.

CHACO, a large country of South America situ-
ated between 19° and 37° S. Lat. It belongs to the
Spaniards, by whom it was conquered in 1536. It is
not naturally fruitful, but abounds in gold mines, which
are so much the more valuable that they are easily
worked. The works are carried on by about 8000
blacks, who deliver every day to their masters a cer-
tain quantity of gold; and what they can collect
above this, belongs to themselves; as well as what
they find on those days that are consecrated to religion
and reft, upon condition that during the festival they
maintain themselves. This enables many of them to
purchase new property; after which they intermarry
with the Spaniards.

CHADCHOD, in Jewish antiquity, Ezekiel men-
tions chadchud among the several merchandizes which
were brought to Tyre. The old interpreters, not
very well knowing the meaning of this term, con-
tinued it in their translotion. St Jerom acknowledges
that he could not discover the interpretation of it.
The Chaldee interprets it pearls; others think that
the onyx, ruby, carbuncle, crystal or diamond is
meant by it.

CHÆRONEA, (anc. geog.) the laft town, or
rather the last village, of Boeotia, towards Phocis;
the birth-place of Plutarch: famous for the fatal defeat
of the confederate Greeks by Philip of Macedon. This
place was confidered by Philip as well adapted to the
operations of the Macedonian phalanx; and the ground
for his encampment, and afterwards the field of battle,
were chosen with equal fagacity: having in view on
one fide a temple of Hercules, whom the Macedonians
regarded as the author of their royal house, and the
high protector of their fortune; and on the other the
banks of the Thermodon, a small river flowing into
the Cephisus, announce by the oracles of Greece as
the defiled fene of defolation and woe to their unhap-
py country. The generals of the confederate Greeks
had been much lefs careful to avoid themselves of
the powerful functions of superition. Unrestrained by
inafficiencs, the Athenians had left their city at the
exftoration of Demofthenes, to wait no other omen
but the caufe of their country. Regardles of
oracles, they afterwards advanced to the ill-fated Ther-
modon, accompanied by the Thebans, and the feanty
reinforcements rafied by the islands and fates of Pelo-
ponnisus which had joined their alliance. Their army
amounted to 30,000 men, animated by the noblest
calfe for which men can fight, but commanded by the
Athenians Lycicles and Chares; the firft but little, and
the second unfavourably known; and by Theagenes
the Theban, a perfon strongly fpofed of treafcry: all
three creatures of cabal and tools of faction, flames
of interefi or voluptuousness, whose characters (es-
pecially as they had been appointed to command the only
flates whose fame, rather than virtue, yet oppofed the
public enemy) are alone fufficient to prove that Greece
was rife for ruin.

When the day approached for abolifhing the totter-
ing independence of thofe turbulent republics, which
their own internal vices, and the arms and intrigues of
Philip, had been gradually undermining for 22 years,
both armies formed in battle array before the riing
of the sun. The right wing of the Macedonians was
headed by Philip, who judged proper to oppose in
perfon the dangerous fury of the Athenians. His son
Alexander, only 19 years of age, but surrounded by
experienced officers, commanded the left wing, which
faced the Sacred Band of the Thebans. The auxi-
ilaries of either army were pofed in the centre. In
the beginning of the action, the Athenians charged
with impetuosity, and repelled the oppofing divisions
of the enemy; but the youthful ardour of Alexander
obliged the Thebans to retire, the Sacred Band being
cut down to a man. The activity of the young prince
completed their diforder, and purfued the scattered
multitude with his Thelfian cavalry.

Meantime the Athenian generals, too much elated
by their firft advantage, loft the opportunity to im-
profe it; for having repelled the centre and right wing
of the Macedonians, except the phalanx, which was
compofed of choft men, and immediately commanded
by the king, they, instead of attempting to break this
formidable body by attacking it in flank, pressed for-
ward againft the fugitives, the infolent Lycicles ex-
claiming in vain triumph, "Purfue, my brave coun-
trymen! let us drive the cowards to Macedon." Philip
oberved this rash folly with contempt; and faying to
thofe around him, "Our enemies know not how to
conquer," commanded his phalanx, by a rapid evolui-
on, to gain an adjacent eminence, from which they pour-
ed down, firm and collected, on the advancing Athen-
ians, whose confidence of success had rendered them
totally insenfible to danger. But the irresistible shock of the
Macedonian spear converted their fury into defpair.
Above a thoufand fell, two thoufand were taken pri-
soners.
CHAÆ [312] CHÆ

Antipater, the most trusted of his ministers, to offer
them peace on such favourable terms as they had little
reason to expect. They were required to send deputies
to the Ithmus of Corinth, where, to adjust their
respective contingents of troops for the Persian expe-
dition, Philip proposed assembling early in the spring
a general convention of all the Grecian states; they
were ordered to surrender the life of Samos, which
actually formed the principal station of their fleet, and
the main bulwark and defence of all their maritime or
inflar possessions; but they were allowed to enjoy,
unmolested, the Attic territory, with their hereditary
form of government.

CHÆROPHYLLUM, CHERVIL: A genus of the
digynia order, belonging to the pentandria clas of
plants; and in the natural method ranking under the
45th order, Umbellateae. The involucrum is reflexed-concave; the petals inflexed-cordate; the fruit oblong
and smooth. There are seven species, of which,
called cow-weed and wild chervil, are weeds common
in many places of Britain. The roots of the fifth have
been found poisonous when used as parfuits; the
fruits afford an indifferent yellow dye; the leaves
and stalks a beautiful green. Its preference indicates
a fertile and grateful soil. It ought to be rooted out
from all pastures early in the spring, as no animal
but the ass will eat it. It is one of the most early
plants in flowering, so that by the beginning of April
the leaves are near two feet high. The leaves are
recommended by Geoffroy as aperient
and diuretic, and at the same time grateful to the palate and
stomach. He even afferts, that dropsies which do not
yield to this medicine can scarcely be cured by any
other. He directs the juice to be given in the dose of
three or four ounces every fourth hour, and continued
for some time either alone, or in conjunction with
nirc and syrup of the five opening roots.—The other
species of chærophyllum are not cultivated of any remark-
able property.

CHÆTODON, in ichthyology, a genus of fishes
belonging to the order of thoracii. The teeth are
very numerous, thick, succulent, and flexible; the rays
of the gills are fix. The back-fin and the fin at the
anus are fleshy and squamous. There are 23 species,
distinguished from each other principally by the figure
of the tail, and the number of spines in the back-fin.
The most remarkable is the rostratus, or shooting-fish,
having a hollow, cylindrical beak. It is a native of
the East Indies, where it frequents the sides of the
sea and rivers in search of food, from its singular
manner of obtaining which it receives its name. When
it spits a fly sitting on the plants that grow in shallow
water, it swims on to the distance of five, or
six feet; and then, with a surprising dexterity, it
ejcts out of its tubular mouth a single drop of water,
which never fails striking the fly into the water, where
it soon becomes its prey.

CHAFF, in husbandry, the husks of the corn, se-
parated by screening or winnowing it. It signifies al-
so the rind of corn, and firaw cut small for the use of
cattle.

CHAFF-Cutter, a machine for making chaff to feed
horses.—The advantages of an easy and expeditious
method of cutting straw into chaff by an engine
which could be used by common labourers have been long
long acknowledged, and various attempts have been made to bring such an engine to perfection. But the objections to most of them have been their complicated structure, their great price, and the noise they make in working; all which inconveniences seem to have been lately removed by an invention of Mr James Pike, watchmaker of Newton Abbot in Devonshire. Of his engine, which is of a simple and cheap construction, the following description, and figure referred to, are extracted from the Transactions of the Society of Arts for 1787.

The engine is fixed on a wood frame, which is supported with four legs, and on this frame is a box for containing the straw, four feet six inches long, and about ten inches broad; at one end is fixed across the box two rollers inlaid with iron, in a diagonal line about an eighth of an inch above the surface; on the ends of these rollers are fixed two strong brass wheels, which takes one into the other. On one of these wheels is a contract wheel, whole teeth taken in a worm on a large arbour; on the end of this arbour is fixed a wooden wheel, two feet five inches diameter and three inches thick; on the inside of part of this wheel is a knife, and every revolution of the wheel the knife passes before the end of the box and cuts the chaff, which is brought forward between the rollers, which are about two inches and a half asunder; the straw is brought on by the worm taking one tooth of the wheel every round of the knife; the straw being too pressed between the rollers, the knife cuts off the chaff with so great ease, that twenty-two bushels can be cut within the hour, and makes no more noise than is caused by the knife passing through the chaff.

A is the box into which the straw is put. B, the upper roller, with its diagonal projecting ribs of iron, the whole moving by the revolution of the brass wheel C on the axis of which it is fixed. D, a brass wheel, having upon it a face wheel, whose teeth take into the endless screw on the arbour E, while the teeth on the edge of this wheel enter between those on the edge of the wheel C. On the axis of the wheel D is a roller, with iron ribs similar to B, but hid within the box. E, the arbour, one of the ends of which being made square and passing through a mortise in the centre of the wooden wheel F, is tightened by a strong ferew and nut; the other end of this arbour moves round in a hole within the wooden block C. H, the knife, made fast by screw to the wooden wheel F, and kept at the distance of nearly three quarters of an inch from it by means of a strip of wood of that thickness, of the form of the blade, and reaching to within an inch of the edge. I, the handle mortised into the outside of the wooden wheel F.

CHAFFER, in zoology, a species of beetle. See SCARABAEUS.

CHAFFERCONNERS, in commerce, printed linens manufactured in the Great Mogul's dominions. They are imported by the way of Surat; and are of the number of those linens prohibited in France.

CHAFFERY, in the iron-works, the name of one of the two principal forges. The other is called the forge. When the iron has been brought at the finery into what is called an ingot, it is hammered into a bar in its middle, but with its two ends rough, the business to be done at the chaffery is the reducing the whole to the same shape, by hammering down these rough ends to the shape of the middle part.

CHAFFINCH, in ornithology, the English name of a species of Fringilla.

CHAGRE, a fort of America in the province of Darien at the mouth of a river of the same name. It has been taken several times by the buccaneers, and last of all by Admiral Vernon in 1740. W. Long. 82° 7'. N. Lat. 9° 50'.

CHAIN, (Catena) a series of several rings, or links, fitted into one another.

There are chains of divers matters, fizes, forms, and for divers uses.—Ports, rivers, streets, &c. are clored with iron chains; rebellious cities are punished by taking away their chains and barriers.

The arms of the kingdom of Navarre are, Chains, Or, in a field Gules. The occasion hereof is referred to the kings of Spain leagued against the Moors; who having gained a celebrated victory against them in 1212, in the distribution of the spoils the magnificent tent of Mitalmai in fell to the king of Navarre, being the first that broke and forced the chains thereof.

A gold chain, is one of the ornaments or badges of the dignity of the chief magistrates of a city, as the mayor of London, the provost and bailies of Edinburgh, &c.—Something like this obtained among the ancient Gauls: the principal ornament of their persons in power and authority was a gold chain, which they wore on all occasions; and even in battle, to distinguish them from the common folders.

Chain also denotes a kind of string, of twisted wire; serving to hang watches, tricker-cases, and other valuable toys upon. The invention of this piece of curious work is owing to the English; whence, in foreign countries, it is denominated the English chain. These chains are usually either of silver or gold, some of gilt copper; the thread or wire of each kind to be very fine.—For the fabric, or making of these chains: a part of the wire is folded into little links of an oval form; the longest diameter about three lines; the shortest one. These, after they have been exactly folded, are again folded into two; and then bound together or interwove, by means of several other little threads of the same thickness; some whereof, which pass from one end to the other, imitate the warp of a stuff; and the others, which pass transverse, the woof. There are at least four thousand little links in a chain of four pendants; which are by this means bound so equally, and withal so firmly together, that the eye is deceived, and takes the whole to consist of one entire piece.

Chain is also a kind of measure in France, in the trade of wood for fuel. There are chains for wood by rale, for wood by the rope, for faggots, for cleft wood, and for round ficks. There are also chains for measuring the sheaves of all sorts of corn, particularly with regard to the payment of tithes; for measuring bottles of hay, and for measuring horses. All these are divided into feet, inches, hands, &c. according to the use they are designed for. CHAIN, in measuring a meafore, consisting of a certain number of links of iron wire, usually a hundred; serving to take the dimensions of fields, &c.
This is what Merienne takes to be the arsipendium of the ancients.

The chain is of various dimensions, as the length or number of links varies: that commonly used in measuring land, called Gunter's chain, is in length four poles or perches: or sixty-six feet, or a hundred links; each link being seven inches . . . Whence it is easy to reduce any number of those links to feet, or any number of feet to links.

This chain is entirely adapted to English measures; and its chief convenience is in finding readily the numbers contained in a given field. Where the proportions of square feet and acres differ, the chain, to have the same advantages as Gunter's chain, must also be varied. Thus in Scotland, the chain ought to be of 74 feet, or 24 Scotch ells, if no regard be had to the difference between the Scotch and English foot; but if regard be had to this difference, the Scotch chain ought to consist of 74½ English feet, or 74 feet 4 inches and ½ of an inch. This chain being divided into a hundred links, each of these will be 8½ inches.

That ordinarily used for large distances, is in length a hundred feet; each link one foot. For small parcels, as gardens, &c., is sometimes used a small chain of one pole, or sixteen feet and a half length; each link one inch . . .

Some in lieu of chains use ropes; but these are liable to several irregularities; both from the different degrees of moisture, and of the force which stretches them. Schwemmer, in his Practical Geometry, tells us, he has observed a rope sixteen feet long, reduced to fifteen in an hour's time, by the mere falling of a hoar frost. To obviate these inconveniences, Wolfin directs, that the little strands whereof the rope consists be twisted contrary ways, and the rope dipped in boiling hot oil; and when dry, drawn through melted wax. A rope thus prepared, will not get or lose any thing in length, even though kept under water all day.

**Chain-Pump.** See Pump.

**Chain-Shot,** two bullets with a chain between them. They are used at sea to shoot down yards or masts, and to cut the throuds or rigging of a ship.

**Top-Chain,** on board a ship, a chain to fling the fall-yards in time of battle, in order to prevent them from falling down when the ropes by which they are hung happen to be shot away or rendered incapable of service.

**Chain-Wales, or Channels, of a ship,** portebollarts, are broad and thick planks projecting horizontally from the ship's side, abreast of and somewhat behind the masts. They are formed to extend the throuds from each other, and from the axis or middle line of the ship, so as to give a greater security and support to the masts, as well as to prevent the throuds from damaging the gunwale, or being hurt by rubbing against it. Every mast has its chain-wales, which are either built above or below the second deck-ports in a ship of the line: they are strongly connected to the side by knees, bolts, and standards, besides being confined thereto by the chains whose upper ends pass through notches on the outer edge of the chain-wales, so as to unite with the throuds above.

**Chains,** in ship-building, are strong links or plates of iron, the lower ends of which are bolted through the ship-side to the timbers.

**Hanging in Chains,** a kind of punishment inflicted on murderers. By Stat. 25. Geo. II. c. 37, the judge shall direct such be executed on the next day but one, unless Sunday intervene; and their bodies to be delivered to the surgeons to be dissected and anatomized; and he may direct them afterwards to be hung in chains. During the interval between sentence and execution, the prisoner shall be kept alone, and sustained only with bread and water. The judge, however, hath power to respite the execution, and relax the other restraints of the act.

**Chain-Island,** an island lately discovered by Captain Wallis in the South-sea. It seemed to be about five miles long and as much broad, lying in the direction of north-west and south-east. It appeared to consist of a double range of woody islands joined together by reefs, so as to compose one island of an oval figure, with a lagoon in the middle. The trees are large; and from the smoke that issued from these woods, it appeared to be inhabited. W. Long. 145. 54. S. Lat. 17. 23.

**Chajotli, or ChavOTT, a Mexican fruit of a round shape, and similar in the husk with which it is covered to the chestnut, but four or five times larger, and of a much deeper green colour. Its kernel is of a greenish white, and has a large stone in the middle, which is white, and like it in subfusance. It is boiled, and the stone eat with it. This fruit is produced by a twining perennial plant, the root of which is also good to eat. See Plate CXXXVIII.

**Chair, (Cathedra)** was anciently used for the pulpit, or suggenn, whence the priest spoke to the people. It is still applied to the place whence professors and regents in universities deliver their lectures, and teach the sciences to their pupils: thus, we say, the professor's chair, the doctor's chair, &c.

**Curule-Chair,** was an ivory seat placed on a car, wherein were seated the prime magistrates of Rome, and those to whom the honour of a triumph had been granted.

**Sedan-Chair,** a vehicle supported by poles, wherein persons are carried; borne by two men. There are two hundred chairs allowed by act of parliament in London; and no person is obliged to pay for a hackney-chair more than the rate allowed by the act for a hackney-coach driven two-thirds parts of the said distance. 9 Ann. c. 19. and 12 Geo. I. c. 12. to four hundred. See Hackney-Coaches.

**Chair** is also applied by the Romanists to certain feasts, held anciently in commemoration of the translation of the fae, or feast of the vicarage of Chrift, by St. Peter. The perforated chair, wherein the new-elected pope is placed, F. Mabillon observes, is to be seen at Rome: but the origin thereof he does not attribute, as is commonly done, to the adventure of Pope Joan; but says there is a mystery in it; and it is intended, to explain to the pope those words of scripture, that God draws the poor from out of the dust and mire.

**Chairman,** the President, or speaker of an assembly,
CHA

CHAIDE, assembly, company, &c. We say, the chairman of a committee, &c.

CHALCE, or CHALEC, a sort of light open chariot, or calash.

CHALCEDON, according to Vicius, was first introduced by Agustus into the use of post-chaises; but the invention is generally ascribed to Trajan, and was probably only improved by Trajan, and succeeding emperors.

CHALAZA, among naturalists, a white knotty sort of string at each end of an egg, formed of a plexus of the fibres of the membranes, whereby the yolks and white are connected together. See Egg.

CHALCAS, in botany: A genus of the monogyne order, belonging to the pentandria clafs of plants. The calyx is quinquepartite; the corolla campullata, with the petals heeled; the stigma round-headed and warty.

CHALCEDON, or CALCEDON, anciently known by the names of Procratellus and Colbusa, a city of Bithynia, situated at the mouth of the Euxine, on the north extremity of the Trachian Bosphorus, over against Byzantium. Pliny, Strabo, and Tacitus, call it The City of the Blind; alluding to the answer which the Pythian Apollo gave to the founders of Byzantium, who, consulting the oracle relative to a place where to build a city, were directed to choose that spot which lay opposite " to the habitation of the blind;" that is, as was then understood, to Chalcodon: the Chalcedonians well deserving that epithet for having built their city and warty.

CHALCEDON, or CALCEDY, in natural history, a genus of the semi-opaque gems. They are of an even and transparent, and entirely free from inclusions, and are found in the Tyssian Apollo gave to the founders of Byzantium, who, consulting the oracle relative to a place where to build a city, were directed to choose that spot which lay opposite " to the habitation of the blind;" that is, as was then understood, to Chalcodon: the Chalcedonians well deserving that epithet for having built their city and warty.

CHALCEDON, in the Christian times, become famous on account of the council which was held there against Eutyches. The emperor Valens caused the walls of this city to be levelled with the ground for riding with Procopius, and the materials to be conveyed to Constantinople, where they were employed in building the famous Valentinian aqueduct. Chalcodon is at present a poor place, known to the Greeks by its ancient name, and to the Turks by that of Cuthaest, or "the judges town."

CHALCEDONY, in natural history, a genus of the semi-opaque gems. They are of an even and transparent, and entirely free from inclusions, and are found in the Tyssian Apollo gave to the founders of Byzantium, who, consulting the oracle relative to a place where to build a city, were directed to choose that spot which lay opposite " to the habitation of the blind;" that is, as was then understood, to Chalcodon: the Chalcedonians well deserving that epithet for having built their city and warty.

CHALCEDON, or CALCEDY, in natural history, a genus of the semi-opaque gems. They are of an even and transparent, and entirely free from inclusions, and are found in the Tyssian Apollo gave to the founders of Byzantium, who, consulting the oracle relative to a place where to build a city, were directed to choose that spot which lay opposite " to the habitation of the blind;" that is, as was then understood, to Chalcodon: the Chalcedonians well deserving that epithet for having built their city and warty.

CHALCIDENE, or CHALCIDYCE, an inland country of Syria, having Antioch or Seleucia on the west, Cyrrhestica on the north, the south Apamene and Coele Syria, and to the east Chalybonitis; being so called from its principal city Chalis. This province, one of the most fruitful in Syria, was feized by Ptolemy the son of Mennecus during the troubles of Syria, and by him as a separate kingdom. His son is flyed by Josephus and Hegesippus only Prince of Chalis, but his son Lyfias is honoured both by Josephus and Dio with the title of King. Upon the death of Antiochus Dionysius king of Syria, Ptolemy attempted to make himself master of Damascus and all Coele Syria; but the inhabitants, having an utter aversion to him on account of his cruelty and wickedness, chose rather to submit to Aretas king of Arabia, by whom Antiochus and his whole army had been cut off. He opposed Pompey on his entering Syria; but was by him defeated, taken prisoner, and sentenced to death; which, however, he escaped by paying a thousand talents, and was left also in possession of his kingdom. After Arifobulus king of Judæa had been poisoned by the friends of Pompey, and Alexander his son beheaded at Antioch, he sent Philippius his son to Acalon, whether the widow of Arifobulus had retired with her children, to bring them all to Chalis: proposing, as he was in love with one of the daughters named Alexandria, to maintain them in his own kingdom in a manner suitable to their rank; but Philippius like-
wife being in love with Alexandria, married her on the way; for which presumption Ptolemy put him to death on his return, and then took her to wife. On account of this affinity, he supported to the utmost of his power Antigonus the younger son of Artibolus who took the field at the head of a considerable army, but on his entering Judea was entirely defeated by Herod. Ptolemy soon after died, and was succeeded by his son Lyfanias; who, espousing the cause of the Ammonian family with great warmth, promised to Barzapharnes who commanded the Parthian troops in Syria, and to Pacorus the king's son, a thousand talents and five hundred women, provided they should put Antigonus in possession of the kingdom of Judea, and depose Hyrcanus. He was not long after put to death by Marc Antony, at the indignation of Cleopatra; who, in order to have his dominions, accused him falsely of having entered into an alliance with the Parthians.

CHALCIDIAN, CHALCIDICUM, or CHALCEDONIUM, in the ancient architecture, a large magnificent hall belonging to a tribunal or court of justice. — Festus says, it took its name from the city of Chaleis; but he does not give the reason. Philander will have it to be the court or tribunal where affairs of money and coinage were regulated; so called from χαλκός, bronze, and δίκαιος, justice. Others say the money was struck in it; and derive the word from χαλκός, and δίκαιος, judge. In Vitruvius, it is used for the auditory of a basilica; in either of the ancient writers for a hall or apartment where the heathen imagined their gods to eat. CHALCIDICE, (anc. geog.) an ancient district of Macedonia, stretching northwards between the Sinus Toronæus and Singiticus. Formerly a part of Thrace, but invaded by Philip of Macedon. Named from the city Chaleis near Olynthus.

CHALCIDIANUS, a famous platonic philosopher in the third century, who wrote a commentary, which is esteemed, from the Timæus of Plato. This work has been translated from the Greek into Latin.

CHALCIS, a city of Chalcidice. See CHALCIDICUS.

(anc. geog.)—Another of Eolia, near the mouth of the river Evenus, on the Ionian Sea, at the foot of a conical mountain; and therefore called by some Echeclus. (Stobaeus, Cato.) on the Eurusipus, the country of Lycochropus the poet, one of the seven which formed the constellation Pleiades. Now Negroponte. E. Long. 24. 30. Lat. 38. 30.—A fourth, the capital of Chalcidice in Syria; differing from the furnaces ad Belum, a mountain or a river; and ad Liburnum, from its situation (Pliny).

CHALCITIS, one of the divisions or districts of Mœmopatia, to the south of Anemuthia, the most northern district, near to Armenia, and situated between Edessa and Carræ. Chalchitis (Pliny), an island opposite to Chaleis.

CHALCODULESAS (Demetrius) a learned Greek, born at Constantineople, left that city after its being taken by the Turks, and afterwards taught Greek in several cities in Italy. He composed a Greek grammar; and died at Milan in 1513.

CHALCODULESAS (Leonius) a famous Greek historian of the 15th century, was born at Athens; and wrote an excellent history of the Turks, from Othman, who reigned about the year 1300, to Mahomet II. in 1422.

CHALDEA, (anc. geog.) taken in a larger sense, included Babylonia; as in the prophecies of Jeremiah and Ezekiel. In a restricted sense, it denoted a province of Babylonia, toward Anaïa Deférar, called in Scripture The land of the Chaldeans. Named from Chas'd the fourth son of Nahor. See BABYLONIA.

CHALDEE LANGUAGE, that spoken by the Chaldeans or people of Chaldea. It is a dialect of the Hebrew.

CHALDEE PARAPHRASE, in the rabbinical style, is called TARGUM. There are three: Chaldee paraphrases in Walton's Polyglot; viz. that of Onkelos, that of Jonathan son of Uziel, and that of Jerusalem.

CHALDRON, a dry English measure, consisting of thirty fix bushels, heaped up according to the sealed bushel kept at Guildhall, London; but on shipboard, twenty-one chaldrons of coals are allowed to the core. The chaldron should weigh two thousand pounds.

CHALCIE, the cup or vessel used to administer the wine in the sacrament, and by the Roman Catholics in the mafs.

The use of the chalice, or communicating in both kinds, is by the church of Rome denied to the laity, who communicate only in one kind, the clergy alone being allowed the privilege of communicating in both kinds.

CHALK, Craea, is a white earth found plentifully in Britain, France, Norway, and other parts of Europe, said to have been originally dug chiefly in the island of Crete, and thence to have received its name of Craea. They have a very easy way of digging chalk in the county of Kent in England. It is there found on the sides of hills, and the workmen undermine it so far as appears proper; then digging a trench at the top as far distant from the edge as the undermining goes at bottom, they fill this with water, which sinks through in the space of a night, upon which the whole flake falls down at once. In other parts of the kingdom, chalk generally lies deeper, and they are forced to dig for it at considerable depths, and draw it up in buckets.

Chalk is of two kinds; hard, dry, and firm, or soft and unfertile; both of which are adapted to various purposes. The hard and dry kind is much the properest for burning into lime; but the soft and unfer­tile chalk is best for using as a manure for lands. Chalk whether burnt into lime or not, is in some cases an excellent manure. Its mode of operating on the soil is explained under the article AGRICULTURE, n° 20, 25, &c.

Pure chalk melts easily with alkali and flint into a transparent colourless glass. With alkaline fels it melts somewhat more difficulty, and with borax somewhat more easily, than with flint or sand. It requires mainly its weight of borax, and its whole weight of alkali, to fuse it. Sal mirabilis, and sandier, which do not vitrify at all with the crysolite earths, form with half their weight of chalk, the first a yellowish black, the latter a greenish, glass. Nitre, on the other hand, one of the most active fluxes for flint, does not perfectly vitrify with chalk. This earth notably promotes the vitrification of flint; a mixture of the two requiring less alkali than either of them separately. If glass made from flint and alkali is fur­
Chalk is a species of earth of which there are many sorts. It is employed in various ways, such as for painting, in glass-making, and in other industries. It is known in many parts of the world, and its properties are well studied by scientists.

**Black-Chalk**: A type of chalk that is used for drawing and painting. It is known for its smoothness and ease of use.

**Red-Chalk**: A type of chalk that is used for painting and writing. It is known for its red color.

**Chalk-Land**: The area where chalk is found. It is known for its white and clean properties.

**Chalk-Stones**: These are found in medicine and are used as a substitute for chalk.

**Chalk-Stone**: A type of stone that is similar to chalk but is harder and more durable.

**Chalk-Marks**: Marks made with chalk that are used for drawing and painting.

**Challenge**: A type of stone that is used for making marks and is known for its durability.
Challenges. 1. In civil cases challenges are of two sorts; challenges to the array, and challenges to the poll.

1. Challenges to the array are at once an exception to the whole panel, in which the jury are arrayed, or set in order by the sheriff in his return; and they may be made upon account of partiality or some defect in the sheriff or his under officer who arrayed the panel. Also, though there be no personal objection against the sheriff, yeft if he arranges the panel at the nomination, or under the direction of either party, this is good cause of challenge to the array. Formerly, if a lord of parliament had a cause to be tried, and no knight was returned upon the jury, it was a cause of challenge to the array: also by the policy of the ancient law, the jury was to come de vicinis, from the neighbourhood of the vill or place where the cause of action was laid in the declaration: and therefore some of the jury were obliged to be returned from the hundred in which such vill lay, and, if none were returned, the array might be challenged from defect of hundreders. For, living in the neighbourhood, these were supposed to know beforehand the characters of the parties and witnesses; and therefore they better knew what credit to give to the facts alleged in evidence. But this convenience was over-balanced by another very natural and almost unavoidable inconvenience; that jurors coming out of the immediate neighbourhood, would be apt to intermix their prejudices and partialities in the trial of right. And this the law was so sensible of, that it for a long time has been gradually relinquishing this practice; the number of necessary hundreders in the whole panel, which in the reign of Edward III. were constantly fixing, being in the time of Fortescue reduced to four; afterwards by statute 27 Eliz. c. 6. to two; and at length, by statute 4 and 5 Anne, c. 16. It was entirely abolished upon all civil actions, except upon penal statutes; and upon those also by the 24 Geo. II. c. 18. the jury being now only to come de corpore comitatus, from the body of the county at large, and not de vicinis, or from the particular neighbourhood. The array by the ancient law may also be challenged, if an alien be party to the suit, and, upon a rule obtained by his motion to the court for a jury de mediatate linguae, such a one be not returned by the sheriff pursuant to the statute 28 Edward III. c. 15. enforced by 18 Hen. VI. c. 29. which enacts, that where either party is an alien born, the jury shall be one-half denizens and the other aliens (if so many be forthcoming in the place), for the more impartial trial: A privilege indulged to strangers in no other country in the world; but which is as ancient in England as the time of King Ethelred, in whose statute de monticulis, Wallia (then aliens to the crown of England), c. 3. it is ordained, that "duodenali legales homines, quorum fex Walli et fex Angli erant, Anglis et Walliis jus dicunto."

2. Challenges to the polls, in capita, are exceptions to particular jurors; and seem to answer the recuratio judicii in the civil and canon laws; by the conceptions of which, a judge might be refused upon any suspicion of partiality. By the laws of England also, in the times of Barchon and Fleta, a judge might be refused for good cause; but now the law is otherwise, and it is held that judges or justices cannot be challenged. For the law will not suppose a possibility of bias or favour in a judge who is already sworn to administer impartial justice, and whose authority greatly depends on that presumption and idea. And should the fact at any time prove flagrantly such, as the delicacy of the law will not premise beforehand, there is no doubt but that such misbehaviour would draw down a heavy censure from those to whom the judge is accountable for his conduct. But challenges to the polls of the jury (who are judges of fact) are reduced to four heads by Sir Edward Coke: propter honos receptum; propter deficitum; propter affectum; and propter delictum. 1. Propter honos receptum; as, if a lord of parliament be impanelled on a jury, he may be challenged by either party, or he may challenge himself. 2. Propter deficitum; as, if a jurymen be an alien born, this is defect of birth; if he be a slave or bondman, this is defect of liberty, and he cannot be a liber et legali homo. Under the word homo also, though a name common to both sexes, the female is however excluded, propter deficitum sexus; except when a widow reigns herself with child in order to exclude the next heir, and a supposititious birth is suspected to be intended; then, upon the writ de ventre inficiendo, a jury of women is to be impanelled to try the question whether with child or not. But the principal deficiency is defect of estate sufficient to qualify him to be a juror, which depends upon a variety of statutes. 3. Jurors may be challenged propter affectum, for suspicion of fome's Comm. bias or partiality. This may be either a principal challenge, or to the favour. A principal challenge is such, where the cause affighted carries with it, prima facie, evident marks of suspicion either of malice or favour; as, if a juror is of kin to either party within the ninth degree; that he has an intereft in the cause; that there is an action depending between him and the party; that he has taken money for his verdict, &c. which, if true, cannot be over-ruled, for jurors must be omne exceptione maiores. Challenges to the favour, are where the party hath no principal challenge; but objects only some probable circumstances of suspicion, as acquaintance, and the like; the validity of which must be left to the determination of triors, whose office is to decide whether the juror be favourable or unfavorable. 4. Challenges propter delictum, are for some crime or misdemeanor that affects the juror's credit, and renders him infamous: As for a conviction of treason, felony, perjury, or conspiracy; or if, for some infamous offence, he hath received judgment of the pillory or the like.

II. In criminal cases, challenges may be made either on the part of the king, or on that of the prisoner; and either to the whole array, or to the separate polls, for the very same reasons that they may be in civil causes. For it is here at least as necessary as there, that the sheriff or returning officer be totally indifferent; that, where an alien is indicted, the jury should be de midietate, or half foreigners, if so many are found in the place (which does not indeed hold in treasons, aliens being very improper judges of the breach of allegiance; nor yet in the case of Egyptians under the statute 22 Hen. VIII. c. 10.) that on every panel there should be a competent number of hundreders; and that the particular jurors should be omne exceptions maiores, not liable to objections either propter honos or receptum.
Challenges on any of the foregoing accounts are styled challenges for cause; which may be without stint in both civil and criminal trials. But in criminal cases, or at least in capital ones, there is, in favor of wise, allowed to the prisoner an arbitrary and capricious species of challenge to a certain number of jurors, without showing any cause at all; which is called a peremptory challenge: a provision full of that tenderness and humanity to prisoners for which our laws are famous. This is grounded on two reasons: 1. As every one must be sensible what sudden impressions and unaccountable prejudices we are apt to conceive upon the bare looks and gestures of another; and how necessary it is, that a prisoner, when put to defend his life, should have a good opinion of his jury, the want of which might totally disconcert him; the law wills not that he should be tried by any one man against whom he has conceived a prejudice even without being able to allign a reason for such his dislike. 2. Because upon challenges for cause flown, if the reason alligned prove insufficient to set aside the juror, perhaps the bare questioning his indifference may sometimes provoke a resentment; to prevent all ill consequences from which, the prisoner is still at liberty, if he pleases, peremptorily to set him aside.

This privilege of peremptory challenges, though granted to the prisoner, is denied to the king by the statute 33 Edward I. Stat. 4. which enacted, that the king shall challenge no jurors without alligning a cause certain to be tried and approved by the court. However, it is held that the king need not allign his cause of challenge till all the panel is gone through, and unless there cannot be a full jury without the persons so challenged. And then, and not sooner the king's counsel must show the cause; otherwise the juror shall be sworn.

The peremptory challenges of the prisoner must, however, have some reasonable boundary; otherwise he might never be tried. This reasonable boundary is settled by the common law to the number of 35; that is, one under the number of three full juries. For the law judges, that 35 are fully sufficient to allow the most timorous man to challenge through mere caprice; and that he who peremptorily challenges a greater number, or three full juries, has no intention to be tried at all. And therefore it deals with one who peremptorily challenges above 35, and will not retract his challenge, as with one who stands mute or refuses his trial; by sentencing him to the peine forte et dure in felony, and by attainting him in treason. And so the law stands at this day with regard to treason of any kind. But by statute 22 Hen. VIII. c. 14. (which, with regard to felonies, stands unrepealed), no perdon arraigned for felony can be admitted to make more than 20 peremptory challenges.

Challon-sur-Saone, an ancient town of France, in Burgundy, and capital of the Chalonnais, with a citadel and bishop's see. It is seated on the river Saone, in E. Long. 5. 7. N. Lat. 46. 47.

Challons-sur-Marne, a large episcopal town of France, in Champagne. It carries on an considerable trade in balloons, and other woollen stuffs. It is seated between two fine meadows on the rivers Marne, Mau, and Nau, in E. Long. 4. 37. N. Lat. 48. 57.

Chaloner, (Sir Thomas) a statesman, soldier, and poet, descended from a good family in Denbigh in Wales, was born at London about the year 1515. Having been educated in both universities, but chiefly at Cambridge, he was introduced at the court of Henry VIII, who sent him abroad in the retinue of Sir Henry Knevet ambassador to Charles V, and he had the honour to attend that monarch on his fatal expedition against Algiers in 1541. Soon after the fleet left that place, he was shipwrecked on the coast of Barbary in a very dark night; and having exhausted his strength by swimming, he chanced to strike his head against a cable, which he had the presence of mind to catch hold of with his teeth; and, with the loss of several of them, was drawn up by it into the ship to which he belonged. Mr Chaloner returned soon after to England, and was appointed first clerk of the council, which office he held during the reign of that Engl. On the accession of Edward VI, he became a favourite of the Duke of Somerset, whom he attended to Scotland, and was knighted by that nobleman after the battle of Mulfelburgh, in 1547. The protector's fall put a stop to Sir Thomas Chaloner's expectations, and involved him in difficulties. During the reign of Queen Mary, being a determined procident, he was in some danger; but having many powerful friends, he had the good fortune to escape. On the accession of Elizabeth, he appeared again at court; and was so immediately distinguished by her Majesty, that she appointed him ambassador to the emperor Ferdinand I. being the first ambassador she nominated. His commission was of great importance; and the queen was so well satisfied with his conduct, that, soon after his return, she sent him in the same capacity to Spain; but Sir Thomas was by no means satisfied with this instance of her majesty's confidence: the courts of England and Spain being at this time extremely dishabridged with each other, he feared that his mission would be very hazardous; and so it proved; but Elizabeth must be obeyed. He embarked for Spain in 1561, and returned to London in 1564, in consequence of a request to his sovereign, in an elegy written in imitation of Ovid. After his return, he resided in a house built by himself in Clerkenwell-cloae, where he died in the year 1565, and was buried in St Paul's. Sir William Cecil succeeded as chief mourner at his funeral.

So various were the talents of Sir Thomas Chaloner, that he excelled in every thing to which he applied himself. He made a considerable figure as a poet. His poetical works were published by William Malins, master of St Paul's school. His capital work was that "Of restoring the English rebus, in ten books," which he wrote when he was ambassador in Spain. It is remarkable, that this great man, who knew how to transact as well as to write upon the most important affairs of states and kingdoms, could descend to compose a dictionary for children, and to translate from the Latin a book of the office of Servants, merely for the utility of the subjects.

Chaloner, (Sir Thomas) the younger, though inconsiderable as an author, deserves to be recorded as a skilful naturalist, in an age wherein natural history was...
very little understood in this or any other country; and particularly as the founder of the alum-works in Yorkshire, which have since proved so exceedingly advantageous to the commerce of Britain. He was the only son of Sir Thomas Chaloner mentioned in the last article, and was born in the year 1559. Being very young at the time of his father's death, the lord treasurer Burleigh taking charge of his education, sent him to St. Paul's school, and afterwards to Magdalen college in Oxford, where, like his father, he discovered extraordinary talents for Latin and English poetry. About the year 1580, he made the tour of Europe, and returned to England before 1584; for, in that year, we find him a frequent attendant in the court of queen Elizabeth. About this time he married the daughter of Sir William Fleetwood, recorder of London. In 1591 he was knighted: and, some time after, discovered the alum-mines on his estate at Giborough, near the river Tees in Yorkshire (A)

Towards the latter end of the queen's reign, Sir Thomas visited Scotland; and returning to England in the retinue of king James I. found such favour in the sight of his majesty, that he was immediately appointed governor to prince Henry, whom he well knew. About this time he married the wife, the daughter of Mr William Blount of London, by whom he had some children. He died in the year 1615, and was buried at Chiswick in Middlesex. His eldest son William was created a baronet in the 38th of James anno 1620. The title was extinct in 1681. He wrote, 1. Dedication to Lord Burleigh of his poetical works, dated 1579. 2. The virtue of nitre, wherein is declared the sundry cures by the fame effected. Lond. 1584, 4to.

CHALYBEAT, in medicine, an appellation given to any liquid, as wine or water, impregnated with particles of iron or steel. See MINERAL WATERS.

CHALYBES, (anc. geog.) an ancient people of the Illyrian Aia. Their situation is differently assigned; Strabo placing them in Paphlagonia, to the east of Syria; Apollonius Rhodius and Stephanus, on the east of the Thebmon, in Pontus; called Halizones by Homer. They either gave their name to, or took it from, their iron manufactures, (Xenophon, Val. Piacus,) their only support, their foil being barren and ungrateful, (Dionysius Periegetes.)

CHAM, or KHAN, the title given to the sovereign princes of Tartary.

The word, in the Persian, signifies mighty lord; in the Scalvonic, emperor. Sperlingius, in his Differeniation on the Danish term of Majesty, koning, king, thinks the Tartarian cham may be well derived from it; adding, that in the north they say kan, konnen, konung, konning, &c. The term cham is also applied, among the Perkans, to the great lords of the court, and the governs of provinces.

CHAM, in geography, a town of the Bavarian palatinate, situated on a river of the same name, about 25 miles north-east of Ratibon; E. Long. 13° N. Lat. 49° 15'.

CHAMA, in zoology, a genus of shell-fish belonging to the order of veneres tellaceae. The shell is thick, and has two valves; it is an animal of the oyster kind. Linnaeus enumerates 14 species, principally distinguished by the figure of their shells.

CHAMADE, in war, a certain beat of a drum, or sound of a trumpet, which is given the enemy as a signal to inform them of some proposition to be made to the commander, either to capitulate, to have leave to bury their dead, make a truce, or the like.—Menage derives the word from the Italian chiamate, of clamare to "cry."

CHAMEDRYS, in botany. See VERONICA.

CHAMÆLEON, in zoology, the trivial name of a species of LACERTA.

CHAMÆPITYS, in botany. See TREUCRIUM.

CHAMÆROPS, in botany: a genus of the family of palmæ. The hermaphrodite calyx is tripartite; the corolla tripetalous; there are fix flamina, three pistils, and three monoecorous plums. The male, in a distinct plant, the same as the hermaphrodite. There are two species, the most remarkable of which is the glabra, a native of the West-Indies, and warm parts of America, also of the corresponding latitudes of Asia and Africa. It never rises with a tall stem; but when the plants are old, their leaves are five or fix feet long, and upwards of two feet broad; they spread open like a fan, having many foldings, and at the top are deeply divided like the fingers of a hand. This plant the Americans call thatch, from the use to which the leaves are applied. Under the name of palmetto, however, Mr Adanson describes a species of palm which grows naturally at Senegal, whose trunk rises from 50 to 60 feet in height; from the upper end of the trunk issue a bundle of leaves, which, in turning off, form a round head; each leaf represents a fan of five or six feet in expansion, supported by a tail of the fame length. Of these trees, some produce male flowers, which are conseqently barren; other are female, and loaded with fruit, which succed each other uninterruptedly almost the whole year round. The fruit of the large palmettos, Mr Adanson affirms to be of the bignefs of an ordinary melon, but rounder: it is enveloped in two skins as tough as leather, and as thick as strong parchment; within the fruit is yellowish, and full of filaments fastened to three large kernels in the middle. The negroes are very fond of this fruit;
CHAMARIM, a word which, when baked under the ashes, is laid to table like a quince.

The little palmetto may be easily raised in Britain from seeds brought from America; but, as the plants are tender, they must be constantly kept in a warm-house.

CHAMARIM, in the Jewish antiquities, is the Hebrew name for that which the Greeks call Pyr.ia or Pyrateria; and St. Jerom in Leviticus has translated Singulatlas, Initiala, delubra. These chamari were, according to Rabbi Solomon, idols exposed to the sun, upon the tops of houses. Abenezra says they were portable chapels or temples made in the form of chariots, in honour of the Sun. What the Greeks call Pyraria, were temples consecrated to the sun and fire, riots, in honour of the gods, and were perpetually kept on fire. They were built upon eminences; and were large inclosures without covering, where the sun was worshipped. The Guebres, or worshippers of fire, in Peru and the East-Indies, have full these Pyrarias. The word chamari is derived from Chaman, which signifies to warm, or burn.

CHAMARIM, a word which occurs in several places of the Hebrew bible, and is generally translated the priests of the idols, or the priests clothed in black; because chamar signifies "black," or "blackness." St. Jerom, in the second book of Kings, renders it arufpices. In Hosea and Zephania, he translates it a·di·swi or church-wardens. But the best commentators are of opinion, that by this word we are to understand the priests of the false gods, and in particular the worshippers of fire; because they were, as they say, drest in black; or perhaps the Hebrews gave them this name in derision, because, as they were continually employed in taking care about the fuel, and keeping up the fire, they were always as black as smiths or colliers. We find priests, among those of Isis, called melanophori, that is to say, that wear black; but whether this may be by reason of their dresting in black, or whether it were because they wore a certain shining black veil in the processions of this goddess, is not certain. Cama. mar, in Arabic, signifies the "moon." Isis is the same deity. Grotius thinks the Roman priests, called camilli, came from the Hebrew chamari. Those among the heathens who sacrificed to the infernal gods were drested in black.

CHAMBER, in building, a member of a lodging, or piece of an apartment, ordinarily intended for sleeping in; and called by the Latins cubiculum. The word comes from the Latin camera; and that, according to Nisod, from the Greek σκουφος, vault or curve; the term chamber being originally confined to places arched over.

A complete apartment is to consist of a hall, antichamber, chamber, and cabinet.

Privy-Chamber, in England. Gentlemen of the privy-chamber are servants of the king, who are to wait and attend on him and the queen at court, in their diversions, &c. Their number is forty-eight, under the lord-chamberlain, twelve of whom are in quarterly waiting, and tw of thele lie in the privy-chamber.

In the absence of the lord-chamberlain, or vice-chamberlain, they execute the king's orders: at coronations, two of them perfume the dukes of Aquitain and Normandy; and six of them, appointed by the lord-chamberlain, attend ambassadors from crumpled Chamber heads to their audiences, and in public entries. The gentlemen of the privy chamber were instituted by Henry VII.

CHAMBER, in policy, the place where certain affairs are held, also the assemblies themselves. Of these some are established for the administration of justice, others for commercial affairs.

Of the first kind are, 1. Star-chamber, so called, because the roof was painted with stars; the authority, power, and jurisdiction of which, are absolutely abolished, by the statute 17 Car. I. 2. Imperial chamber of Spire, the supreme court of judicatory in the empire, erected by Maximilian I. This chamber has a right of judging by appeal; and is the last resort of all civil affairs of the states and subjects of the empire, in the same manner as the aulic council of Vienna.

Nevertheless it is restrained in several cases; it takes no notice of matrimonial causes, these being left to the pope; nor of criminal causes, which either belong to particular princes or towns in their respective territories, or are cognizable by all the states of the empire in a diet. By the treaty of Osnaburg, in 1648, fifty assessors were appointed for this chamber, whereof 24 were to be Protestants, and 26 Catholics; besides five presidents, two of them Protestants, and the rest Catholics. 3. Chamber of accounts, a sovereign court in France, where accounts are rendered of all the king's revenues, inventories, and avowals thereof registered; oaths of fidelity taken, and other things relating to the finances transacted. There are nine in France, that of Paris is the chief; it registers proclamations, treaties of peace, naturalizations, titles of nobility, &c. All the members wear long black gowns of velvet, of satin, or damask, according to their places. 4. Ecclesiastical chambers in France, which judge by appeal of differences about collecting the tythes. 5. Chamber of audience, or grand chamber, a jurisdiction in each parliament of France, the counsellors of which are called juges, or judges, as those of the chamber of inequities are called rapo­rteurs, reporters of processess by writing. 6. Chamber of the edict, or miparry, a court established by virtue of the edict of pacification in favour of those of the reformed religion. This chamber is now suppressed. 7. Apostolical chamber of Rome, that wherein affairs relating to the revenues of the church and the pope are transacted. This council consists of the cardinal-camerlengos, the governor of the rota, a treasurer, an auditor, a president, one advocate-general, a solicitor-general, a commissary, and 12 clerks. 8. Chamber of London, an apartment in Guildhall, where the city money is deposited.

Of the last fort are, the chambers of commerce; the chambers of assurance; and the royal or synodal chamber of booksellers in France.

1. The chamber of commerce is an assembly of merchants and traders, where the affairs relating to trade are treated of. There are several established in most of the chief cities of France; and in Britain there have lately been chambers of this kind erected, particularly in London, Edinburgh, and Glasgow.

2. Chamber of assurance in France, denotes a society of merchants and others for carrying on the business of insuring; but in Holland, it signifies a court of justice, where causes relating to insurance are tried.
Chamberlain. Chamber of bookfellers in Paris, an assembly consisting of a syndic and assistants, elected by four delegates from the printers, and twelve from the booksellers, to visit the books imported from abroad, and to search the houses and sellers of marble paper, printers, and dealers in printed paper for hangings, who are prohibited from keeping any letters proper for printing books. In the visitation of books, which ought to be performed by three persons at least from among the syndic and assistants, all libels against the honour of God and the welfare of the state, and all books printed either within or without the kingdom in breach of their regulations and privileges, are stop, even with the merchandizes which may happen to be in the bales with such libels or other prohibited books. The days appointed for this chamber to meet are Tuesdays and Fridays, at two o'clock in the afternoon.

CHAMBER, in military affairs. 1. Powder-chamber, or bomb-chamber; a place sunk under ground for holding the powder, or bombs, where they may be out of danger, and secured from the rain. 2. Chamber of a mine; the place most commonly of a cylindrical form, where the powder is confined. 3. Chamber of a mortar; that part of the chase, much narrower than the rest of the cylinder, where the powder lies. It is of different forms; sometimes like a reversed cone; sometimes globular, with a neck for its communication with the cylinder, whence it is called a bottled chamber; but most commonly cylindrical, that being the form which is found by experience to carry the ball to the greatest distance.

CHAMBERLAIN, an officer charged with the management and direction of a chamber. See Chamber, in policy.

There are almost as many kinds of chamberlains as chambers, the principal whereof are as follows.

Lord Chamberlain of Great-Britain, the sixth great officer of the crown, to whom belongs livery and lodging in the king's court; and there are certain fees due to him from each archbishop or bishop when they perform their homage to the king, and from all peers at their creation, or doing their homage. At the coronation of every king, he is to have forty ells of crimson velvet for his own robes. This office was granted heritably to the family of Steward, Duke of Lenox; and when their male line failed, King Charles II. conferred it in like manner upon his natural son, whom he created duke of Monmouth, and on his forfeiture it went to the duke of Lenox; but that family surrendered the office to the crown in 1703.

Lord Chamberlain of the Household, an officer who has the oversight and direction of all officers belonging to the king's chambers, except the precedent of the king's bed-chamber.

He has the oversight of the officers of the wardrobe at all his majesty's houses, and of the removing wardrobes, or of beds, tents, revels, and all the furniture, cooks, confectioners, &c. retained in the king's service. He moreover has the oversight and direction of the several officers of the king's chambers, and all the officers of the revenue of the crown, and he is al.so the chief officer of the court of exchequer, of North-Wales, and Chester, of the city of London, &c. in which cases this officer is generally the receiver of all rents and revenues belonging to the place whereof he is chamberlain.

In the exchequer there are two chamberlains, who keep a controlment of the pells of receipts and receipts, and have certain keys of the treasury, records, &c.

Chamberlain of London keeps the city money, which is laid up in the chamber of London: He also presides over the affairs of masters and apprentices, and makes free of the city, &c. His office lasts only one year; but the custom usually obtains to re-chuse the same person, unless charged with any misdemeanour in his office.

Chamberlayne, (Edward) descended from an ancient family, was born in Gloucestershire 1616, and made the tour of Europe during the distractions of the civil war. After the restoration he went as secretary with the earl of Carlisle, who carried the order of the Garter to the king of Sweden; was appointed tutor to the duke of Grafton, natural son of Charles II. and was afterwards pitched on to instruct prince George of Denmark in the English tongue. He died in 1703, and was buried in a vault in Chelsea church.
Chamberlayne, (John) son to the author of "The Present State of England," and continuator of that useful work, was admitted into Trinity College, Oxford, 1635; but it doth not appear that he took any degree. Before the Continuation was mentioned, he was author of "Discourses historical, critical, theological, and moral, on the most memorable events of the Old and New Testaments, with Chronological Tables;" one vol. folio; and translated a variety of works from the French, Dutch, and other languages. He likewise was F. R. S. and communicated some pieces, inserted in the Philosophical Transactions. It was said of him that he understood sixteen languages; but it is certain that he was master of the Greek, Latin, French, High and Low Dutch, Portuguese, and Italian. Though he was qualified for employment, he had none but that of Gentleman-Usher to George Prince of Denmark. After a useful and long, or short (as you please), he died in the year 1724. He was a very pious and good man, and earnest in promoting the advancement of religion, and the interest of true Christianity; for which purpose he kept a large correspondence abroad.

CHAMBERLAIN, a considerate and populous town of Italy, in Savoy, with a castle. It is capital of the duchy, and well built, but has no fortifications. It is watered by seven streams, which have their sources in St Martin's-hill, and run through several of the streets. There are piazzas under most part of the houses, where people may walk dry in the worst weather. It hath large and handsome suburbs; and in the centre of the town is the royal palace. The parliament meet here, which is composed of four presidents, and a pretty large number of senators, being the supreme tribunal of the whole duchy. The principal church is St Leger, and the Jesuits college is the most magnificent of all the monasteries. E. Long. 5. 50. N. Lat. 45. 35.

CHAMBERS, (David) a Scots historian, priest, and lawyer, was born in the shire of Rox's, about the year 1530, and educated in the university of Aberdeen. From thence he went to France and Italy, where he continued some time, particularly at Boulogne, where, in 1556, he was a pupil of Marianus Sozenus. After his return to Scotland, he was appointed, by queen Mary, parson of Sandy and chancellor of Rox's. He was soon after employed in digesting the laws of Scotland, and was principally concerned in publishing the acts of parliament of that kingdom by authority in 1566. He was also appointed one of the lords of seisin, and continued her majesty's faithful servant till her declining fortune obliged her adherents to seek for refuge in other kingdoms. Chambers went first to Spain, where he was graciously received by king Philip; and thence travelled to Paris, where he was no less kindly received by Charles IX. of that kingdom, to whom, in 1572, he presented his History of Scotland, &c. He died at Paris in the year 1592, much regretted (says MacKenzie) by all who knew him. His writings were chiefly calculated to assist Chambers his royal mistress, and to extol the wisdom of the Scots nation.

CHAMBERS, (Ephraim) author of the scientific Dictionary which goes under his name, was born at Milton, in the county of Wiltshire. His parents were dissenters of the Presbyterian persuasion; and his education was the same as that common one which is intended to qualify a youth for trade and commerce. When he became of a proper age, he was put apprentice to Mr Senex the globe-maker, a business which is connected with literature, and especially with astronomy and geography. It was during Mr Chambers's residence with this skilful mechanic, that he contracted that taste for science and learning which accompanied him through life, and directed all his pursuits. It was even at this time that he formed the design of his grand work, the "Cyclopaedia;" and some of the first articles of it were written behind the counter. Having conceived the idea of so great an undertaking, he justly concluded that the execution of it would not confit with the avocations of trade; and therefore he quitted Mr Senex, and took chambers at Gray's-Inn, where he chiefly resided during the rest of his days. The first edition of the Cyclopaedia, which was the result of many years intense application, appeared in 1728, in two vols. folio. It was published by subscription, the price being 4l. 4s. and the list of subscribers was very respectable. The dedication, which was to the king, is dated October 15, 1727. The reputation that Mr Chambers acquired by his execution of this undertaking, procured him the honour of being elected F. R. S. Nov. 6, 1729. In less than ten years time a second edition became necessary; which accordingly was printed, with corrections and additions, in 1738; and was followed by a third the very next year.

Although the Cyclopaedia was the grand business of Mr Chambers's life, and may be regarded as almost the sole foundation of his fame, his attention was not wholly confined to this undertaking. He was concerned in a periodical publication intitled, "The Literary Magazine," which was begun in 1735. In this work he wrote a variety of articles, and particularly a review of Morgan's "Moral Philosopher." He was engaged, likewise, in conjunction with Mr John Martyn, F. R. S. and professor of botany at Cambridge, in preparing for the press a translation and abridgement of the "Philosophical History and Memoirs of the Royal Academy of Sciences at Paris, or an Abrigation of all the Papers relating to Natural Philosophy which have been published by the Members of that illustrious Society." This undertaking, when completed, was compiled in five volumes 8vo, which did not appear till 1742, some time after our author's decease, when they were published in the joint names of Mr Martyn and Mr Chambers. Mr Martyn, in a subsequent publication, hath passed a severe cenure, upon the share which his fellow-labourer had in the abridgement of the Parisian papers. The only work besides, that we find ascribed to Mr Chambers, is a translation of the Jesuit's Perspective, from the French; which was printed in 4to, and hath gone through several editions. Mr Chambers's close and unremitting attention to his studies at length impaired his health.
health, and obliged him occasionally to take a lodge-
ing at Canonbury-house, Illington. This not having,
greatly contributed to his recovery, he made an excur-
sion to the south of France, but did not reap that be-
nefit from it which he had himself hoped, and his
friends wished. Returning to England, he died at
Canonbury-house, and was buried at Welfinminer;
where the following inscription, written by himself, is
placed on the north side of the cloysters of the Abbey:

Multis pervalgatus,
Pauci notus;
Qui vitam, inter lucem & umbram,
Nec eruditos, nec idiota,
Litteris deditos, transtigis; fed at homo
Qui homuni nihil a se alienum putat.
Vita simil, & laboribus funtus.
In requiem cœrere volueri,
EPHRAM CHAMBERS, R. S. S.
Obit xii Mai, mcccxxi.

After the author's death, two more editions of his
Cyclopædia were published. The proprietors after-
wards procured a supplement to be compiled, which
extended to two volumes more: And in the year 1778
began to be published in weekly numbers, an edition
of both, improved, and incorporated into one alphabet,
by Dr Rees, which has been lately completed in four
volumes folio, and forms a very valuable work.

CHAMBER, (Martin Cureau de la) physician in
ordinary to the French king, was distinguished by his
knowledge in medicine, philosophy, and polite learning.
He was born at Mons; and was received into the
French academy in 1635, and afterwards into the
academy of sciences. He wrote a great number of works,
the principal of which are, 1. The characters of the
passions. 2. The art of knowing men. 3. On the
knowledge of beasts, &c. He died at Paris in 1669.

CHAMELEON. See Lacerta.

CHAMFERING, in architecture, a phrase used
for cutting any thing above on the under side.

CHAMIER, (Daniel) an eminent protestant di-
vine born in Dauphine. He was many years preach-
er at Montbazon, from where he was called to
Montauon, to be professor of divinity in that city,
and was killed by a cannon-ball during the siege in
1621. The most considerable of his works is his Pan-
fratia Catholica, or “ Wars of the Lord,” in four vo-
olumes folio, in which he treats very learnedly of the
controversies between the Protetants and Roman Catholics.

CHAMOIS, or CHAMOIS-GOAT, in zoology. See
Capra.

CHAMOMILE. See Anthemis.

CHAMOS, or CHEMOS, the idol or god of the
Moabites.

The name of chamos comes from a root which, in
Arabic, signifies to make haste; for which reason many
believe chamos to be the sun, whose precipitate course
might well procure it the name of swift or speedy.
Others have confounded chamos with the god Hammon,
adored not only in Libya and Egypt, but also in A-
rabia, Ethiopia, and the Indies. Macrobius shows
that Hammon was the sun; and the horses, with which
he was represented, denoted his rays. Calmet is of
opinion, that the god Hammon, and Apollo Chomos,
mentioned by Strabo and Ammianus Marcellinus, was
the very same as chamos or the sun. These deities
were worshipped in many of the eastern provinces.

Some who go upon the resemblance of the Hebrew
term chamos, to that of the Greek comos, have believed
chamos to signify the god Bacchus the god of drunk-
enesses, according to the signification of the Greek
comos. St Jerome, and with him most other interpre-
ters, take Chamos and Peor for the same deity. But
it seems that Baal-Peor was the name of Tammuz or
Adonis; so that Chamos must be the god whom the
heathens call the Sun.

CHAMOUNI, one of the elevated valleys of the
Alps situated at the foot of Mount Blanc. See Alps
and Blanc.

The first strangers whom a curiosity to visit the glac-
ers drew to Chamouni (M. Suisse observes), certainly
considered this valley as a den of robbers; for they
came armed cap-a-pie, attended with a troop of dom-
estic multis armed in the same manner: they would not
venture into any house; they lived in tents which they
had brought along with them; fires were kept burning,
and sentinels on guard the whole night over. It was
in the year 1741 that the celebrated traveller Pocock,
and another English gentleman called Wyndham, un-
dertook this interesting journey. It is remembered by
the old men of Chamouni, and they tell laugh at the
fears of the travellers, and at their unnecessary precau-
tions. For 20 or 25 years after this period, the journey
was made but seldom, and then chiefly by English-
men, who lodged with the curate: for when I was
there in 1760, and even for four or five year after-
wards, there was no habitable house except one or two
miserable inns, like those in villages that are little fre-
cuented. But now that this expedition has gradually
become so fashionable, three large and good inns, which
have been successively built, are hardly sufficient to con-
tain the travellers that come during the summer from all
quarters.

This concourse of strangers, and the money they
leave behind them at Chamouni, have somewhat affect-
ed the ancient simplicity of the inhabitants, and even
the purity of their manners. Nobody, however, has
any thing to fear from them: the moral inviolability
is observed with respect to travellers; they are only
exposed to a few important solicitations, and some
small articles, dictated by the extreme eagerness with
which the inhabitants offer their services as guides.

The hope of obtaining this employment brings to-
gether round a traveller, almost all the men in every
village through which he passes, and makes him believe
that there are a great many in the valley; but there
are very few at Chamouni in summer. Curiosity, or
the hope of making money, draws many to Paris and
into Germany: besides, as the shepherds of Chamouni
have the reputation of excelling in the making of
cheeses, they are in great request in the Tartars, in
the valley of Aoste, and even at greater dilferences; and
they receive there, for four or five months in summer,
very considerable wages. Thus the labours of the field
devolve almost entirely on the women, even such as in
other countries fall solely on the men; as mowing,
cutting of wood and threshing; even the animals of
the same sex are not spared, for the cows there are yoked
in the plough.

The
The only labours that belong exclusively to the men are the seeking for rock crystal, and the chase. Happily they are now less employed than formerly in the first of these occupations. I say happily, for many of them perished in this pursuit. The hope of enriching themselves quickly by the discovery of a cavern filled with fine crystals, was so powerful a motive, that they exposed themselves in the search to the most alarming dangers; and hardly a year passed without one of them perishing in the snows, or among the precipices.

The principal indication of the grotos, or crystal ovens, as they are here called, are veins of quartz, which appear on the outside of the rocks of granite, or of the laminated rock. These white veins are seen at a distance, and often at great heights, on vertical indaccessible places. The adventurers endeavour to arrive at these, either by fabricating a road across the rocks, or by letting themselves down from above suspended by ropes. When they reach the place, they gently strike the rock; and if the stone returns a hollow sound, they endeavour to open it with a hammer, or to blow it up with powder. This is the principal method of searching: but young people, and even children, often go in quest of these crystals over the glaciers, where the rocks have lately fallen down. But whether they consider these mountains as nearly exhausted, or that the quantity of crystal found at Madagascar has too much lowered the price of this foil, there are now but few people that go in search of it, and perhaps there is not a single person at Chamouni that makes it his only occupation. They go however occasionally, as to a party of pleasure.

But the chase of the Chamois goat, as dangerous, and perhaps more so than the seeking for crystal, still occupies many inhabitants of the mountains, and carries off, in the flower of their age, many men whose lives are most valuable to their families. And when we are informed how this chase is carried on, we will be astonished that a course of life, at once so laborious and perilous, should have irresistible attractions for those who have been accustomed to it.

The Chamois hunter generally sets out in the night, that he may reach by break of day the most elevated pastures where the goats come to feed, before they arrive. As soon as he discovers the place where he hopes to find them, he surveys it with his glass. If he finds some of them there, he proceeds always ascending: whenever he defaries any, he endeavours to get above them, either by stealing along some gully, or getting behind some rock or eminence. When he is near enough to distinguish their horns, which is the mark by which he judges of the distance, he redds his piece on a rock, takes his aim with great composure, and rarely miffes. This piece is a rifle-barrelled carabine, into which the ball is thrust, and these carabines often contain two charges, though they have but one barrel; the charges are put one above another, and are fired in succession. If he has wounded the chamois, he runs to his prey, and for security he hamtrings it; then he considers his way home: if the road is difficult, he skims the chamois, and leaves the carcass: but, if it is practicable, he throws the animal on his shoulders, and bears him to his village, though at a great distance, and often over frightful precipices: he feeds his family with the flesh, which is excellent, especially when the creature is young, and he dries the skins for Chamouni sale.

But if, as is the most common case, the vigilant chamois perceives the approach of the hunter, he immediately takes flight among the glaciers, through the snows, and over the most precipitous rocks. It is particularly difficult to get near these animals when there are several together; for then one of them, while the rest are feeding, stands as a sentinel on the point of some rock that commands a view of the avenues leading to the pasture; and as soon as he perceives any object of alarm, he utters a fort of his, at which the others instantly gather round him to judge for themselves of the nature of the danger: if it is a wild beast, or a hunter, the most experienced puts himself at the head of the flock; and away they fly, ranged in a line, to the most inaccessible retreats.

It is here that the fatigues of the hunter begin; intrigued by his passion for the chase, he is insensible to danger; he passes over snows, without thinking of the horrid precipices they conceal; he entangles himself among the most dangerous paths, and bounds from rock to rock, without knowing how he is to return. Night often surprises him in the midst of his pursuit; but he does not for that reason abandon it; he hopes that the fame cause will arrest the flight of the chamois, and that he will next morning overtake them. Thus he passes the night, not at the foot of a tree, like the hunter of the plain; not in a grotto, softly reclined on a bed of moss, but at the foot of a rock, and often on the bare points of shattered fragments, without the smallest shelter. There, all alone, without fire, without light, he draws from his bag a bit of cheese, with a morcel of oatens bread, which make his common food: bread so dry, that he is sometimes obliged to break it between two stones, or with the hatchet he carries with him to cut out steps in the ice. Having thus made his solitary and frugal repast, he puts a stone below his head for a pillow, and goes to sleep, dreaming on the road which the chamois may have taken. But soon he is awakened by the freshness of the morning; he gets up, beeminded with cold; surveys the precipices which he must traverse in order to overtake his game: drinks a little brandy, of which he always provides himself with a small portion, and sets out to encounter new dangers. Hunters sometimes remain in these solitudes for several days together, during which time their families, their unhappy wives in particular, experience a state of the most dreadful anxiety: they dare not go to rest for fear of seeing their husbands appear to them in a dream; for it is a received opinion in the country, that when a man has perished, either in the snow, or on some unknown rock, he appears by night to the person he held dearest, describes the place that proved fatal to him, and requests the performance of the last duties to his corpse.

"After this picture of the life which the chamois hunters lead, could one imagine that this chase dans les Alpes, par Mr de Favre..."
Chamonix will have no other; yet if you should offer to make my fortune on condition of abandoning the chase of the chamois, I could not consent. I made some excursions on the Alps with this man: his strength and address were astonishing: but his temerity was greater than his strength; and I have heard, that, two years afterwards, he missed a step on the brink of a precipice, and met with the fate he had expected.

"The few who have grown old in this employment bear upon their faces the marks of the life they have led. A savage look, something in it haggard and wild, makes them be known in the midst of a crowd, even when they are not in their hunting drees. And undoubtedly it is this ill look which makes some superstitious peasants believe that they are forcers, that they have dealings with the devil in their solitudes, and that it is he who throws them down the rocks. What then can be the passions the indulgence to this course of life? It is not avarice, at least it is not an avarice composed with reason: the most beautiful chamois is never worth more to the perfon that kills it than a dozen of francs, even including the value of its flesh; and now that the number is so much diminished, the time lost before one can be taken is much more than its value. But it is the very dangers that attend the pursuit, those alternations of hope and fear, the continual agitation and exercise which these emotions produce in the mind, that infligate the hunter: they animate him as they do the gambler, the warrior, the fiator, and even to a certain degree, the naturalist of the Alps: whose life, in some measure, pretty much resembles that of the hunter whose manners we have described."

But there is another kind of hunting, which is neither dangerous nor laborious, nor fatal to any one but to the poor animals that are the objects of it.—These are the marmots, animals that inhabit the high mountains; where in summer they scoop out holes, which they line with hay, and retire to at the beginning of autumn: here they grow torpid with the cold, and remain in a sort of lethargy, till the warmth of the spring returns to quicken their languid blood, and to recall them to life. When it is supposed that they have reposed in their winter abode, and before the snow has covered the high pahuses where their holes are made, people go to unharbour them. They are found from 10 to 12 in the same hole, heaped upon one another, and buried in the hay. Their sleep is so profound, that the hunter often puts them into his bag, and carries them home without their awaking. The flesh of the young is good, though it tastes of oil, and smells somewhat of muck; the fat is used in the cure of rheumatisms and pains, being rubbed on the parts affected; but the skin is of little value, and is sold for no more than five or six sols. Notwithstanding the little benefit they reap from it, the people of Chamonix go in quest of this animal with great eagerness, and its numbers accordingly diminish very sensibly.

It has been said, that marmots, in order to transport the hay into their holes, use one of their number laid on his back as a cart; but this is fabulous, for they are seen carrying the hay in their mouths. Nor is it for food that they gather it, but for a bed, and in order to thrust out the cold, and to guard the avenues of their retreat from enemies. When they are taken in autumn, their bowels are quite empty, and even as clean as if they had been washed with water; which proves that their torpidity is preceded by a fast, and even by an evacuation; a wife contrivance of Nature for preventing their accumulated feces from growing putrid, or too dry, in the long lethargy they are exposed to. They also continue a few days after their revival without eating, probably to allow the circulation and digressive power to recover their activity. At first, leaving their holes, they appear stupid and dazzled with the light: they are at this time killed with fists, as they do not endeavour to fly; and their bowels are then also quite empty. They are not very lean when they awake, but grow more so for a few days after they first come abroad. Their blood is never congealed, however profound their sleep may be; for at the time that it is deepest, if they are bled, the blood flows as if they were awake.

In these countries the period is so short between the dissolution of the snow and its return, that grain has hardly time to come to maturity. Mr. Saffire mentions a very useful and ingenious practice, invented by mountaineers of the Argentiere, for enlarging this period. "I observed (says he), in the middle of the valley, several large spaces where the surface of the snow exhibited a singular appearance, somewhat resembling a piece of white cloth spotted with black. While I was endeavouring to divine the cause of this phenomenon, I discovered several women walking with measured pace, and sowing something in handfuls that was black; and which being scattered, regularly diverging, on the surface of the snow, formed that spotted appearance that I had been admiring. I could not conceive what seed should be sown on snow fix feet deep; but my guide, astonished at my ignorance, informed me, that it was black earth spread on the snow to accelerate its melting; and thus to anticipate, by a fortnight or three weeks, the time of labouring the fields and sowing. I was struck with the elegant simplicity of a practice so useful, the effects of which I already saw very evidently in places which had not been thus treated above three months."

"As to the inhabitants of Chamouni, the men, like those of most high valleys, are neither well-made nor tall: but they are nervous and strong, as are also the women. They do not attain to a great age: men of 80 are very rare. Inflammatorv diseases are the most fatal to them; proceeding, no doubt, from obstructed perspiration, to which the inconstant temperature of the climate exposes them."

"They are in general honest, faithful, and diligent in the practice of religious duties. It would, for instance, be in vain to persuade them to go any where on a holiday before hearing mass. They are economical, but charitable. There are among them neither hospitals nor foundations for the poor: but orphans and old people, who have no means of subsistence, are entertained by every inhabitant of a parish in his turn. If a man is prevented by age or infirmities from taking charge of his affairs, his neighbours join among themselves and do it for him."

"Their mind is active and lively, their temper gay, with an inclination to raillery: they observe, with singular acuteness, the ridiculous in strangers, and turn
CHAMPAGNE, a considerable province of France, about 162 miles in width, and 122 in breadth, bounded on the north by Hainault and Luxemburg, on the east by Lorrain and the Franche-Comté, on the south by Burgundy, and on the west by the isle of France and Soissons. It has a great number of rivers, the principal of which are the Meuse, the Seine, the Marne, and Seine-Main. "Abomineable, in excellent wine, all sorts of corn, linen cloth, woollen stuffs, cattle, and sheep. It is also divided into the higher and lower, and Troyes is the capital town. Its sub-divisions are Champagne Proper, and Rheimois, the Retzels, the Pernois, the Vallerage, Baugy, the Sennois, and the Brie Champenois.

CHAMPAGNE Proper, is one of the eight parts of Champagne, which comprehends the towns of Troyes, Chalons, St. Menehould, Epernay, and Verzy.

CHAMPAIN, or Point Champain, in heraldry, a mark of dishonour in the coat of arms of him who kills a prisoner of war after he has cried quarter.

CHAMPERTRY, in law, a species of maintenance, and punished in the same manner; being a bargain with the plaintiff or defendant campum paritire, "to divide the land," or other matter sued for between them, if they prevail at law; whereupon the champertror is to carry on the party's suit at his own expense. Thus Champart, in the French law, signifies a familiar division of profits, being a part of the crop annually due to the landlord by bargain or custom. In our fene of the word, it signifies the purchasing of a suit, or right of suing; a practice so much abhorred by our law, that it is one main reason why a champion in action, or thing of which one hath the right but not the possession, is not assignable in common law; because no man should purchase any pretence to sue in another's right. These pests of civil society, that are perpetually endeavouring to disturb the repose of their neighbours, and officiously interfering in other men's quarrels, even at the hazard of their own fortunes, were severely animadverted on by the Roman law; and were punished by the forfeiture of a third part of their goods and perpetual infamy. Hitherto also must be referred the provision of the statute 32 Henry VIII. c. 9. that no one shall sell or purchase any pretended right or title to land, unless the vendor hath received the profits thereof for one whole year before such grant, or hath been in actual possession of the land, or of the reversion or remainder; on pain that both purchaser and vendor shall each forfeit the value of such land to the king and the protector.

CHAMPION, a person who undertakes a combat in the place or quarrel of another; and sometimes the word is used for him who fights in his own cause.

It appears that champions, in the just fenfe of the word, were persons who fought instead of those that, by custom, were obliged to accept the blow; but had a just excuse for dispensing with it, as being too old, infirm, or being ecclesiastics, and the like. Such causes as could not be decided by the course of com-

ion law, were often tried by single combat; and he who had the good fortune to conquer, was always reputed to have justice on his side. See the article BATTLE.

CHAMPION of the King, (campio regis), is an ancient officer, whose office is, at the coronation of British kings, when the king is at dinner, to ride armed cap-a-pie, into Westminster-Hall, and by the proclamation of an herald make a challenge, "That if any man shall deny the king's title to the crown, he is there ready to defend it in single combat, &c." which being done, the king drinks to him, and sends him a gilt cup with a cover full of wine, which the champion drinks, and hath the cup for his fee. This office, at the coronation of king Richard II. when Baldwin Freville exhibited his petition for it, was adjudged from him to his competitor Sir John Dymoke (both claiming from Marmon), and hath continued ever since in the family of the Dymockes; who hold the manor of Sinvelby in Lincolnshire, hereditary from the Marmons by grand serjeantry, viz. that the lord thereof shall be the king's champion as aforesaid. Accordingly Sir Edward Dymoke performed this office at the coronation of king Charles II. a person of the name of Dymoke performed at the coronation of his present majesty George the third.

CHAMPLAIN, (Samuel de) a celebrated French navigator, the founder of the colony of New France, or Canada. He built Quebec; and was the first governor of the colony in 1603. Died after 1649. See QUEBEC.

CHANANAEI, (anc. geog.) the name of the ancient inhabitants of Canaan in general, descendants of Canaan; but peculiarly appropriated to some one branch, though uncertain which branch or son of Canaan it was, or how it happened that they preferred the common gentiligious name to one more appropriated as descendants of one of the sons of Canaan: unleas from their course of life, as being in the mercantile way, the import of the name Canaan; and for which their situation was greatly adapted, they living on the sea and about Jordan, and thus occupying the greater part of the Land of Promise.

CHANCE, a term we apply to events, to denote that they happen without any necessary or foreknown cause. See CAUSE.

Our aim is, to ascribe those things to chance, which are not necessarily produced as the natural effects of any proper cause; but our ignorance and precipitancy lead us to attribute effects to chance, which have a necessary and determinate cause.

When we say a thing happens by chance, we really mean no more than that its cause is unknown to us: not, as some vainly imagine, that chance itself can be the cause of any thing.

The case of the painter, who, unable to exprefs the foam at the mouth of a horse he had painted, threw his sponge in despair at the piece, and, by chance, did that which he could not before do by design, is an eminent instance of the force of chance; yet, it is obvious, all we here mean by chance, is, the painter was unaware of the effect that in him he did not throw the sponge with such a view: not but that he actually did every thing necessary to produce the effect; infomuch, that, considering the direction wherein
wherein he threw his sponge, together with its form, specific gravity, the colours wherewith it was smeared, and the distance of the hand from the piece, it was impossible, on the present system of things, the effect should not follow.

Chance is frequently personified, and cast into a critical being, whom we conceive as acting arbitrarily, and producing all the effects whose real causes do not appear to us in which fende the word coincides with the τυχη, fortune, of the ancients.

Chance is also used for the manner of deciding things, the conduct or direction whereof is left at large, and not reducible to any determinate rules or measures; or where there is no ground for preference: as at cards, dice, lotteries, &c.

For the Laws of Chance, or the proportion of Hazard in Gaming, see GAME.

The ancient sortilege, or chance, M. Placette observes, was instituted by God himself; and in the Old Testament we find several flanding laws and express commands which prescribed its use on certain occasions. Hence it is that the Scripturje says, "The lot or chance fell on Matthias," when it was in question who should fill Judas's place in the apostolate.

Hence also arose the sortes fataepeum; or method of determining things, among the ancient Christians, by opening some of the sacred books, and pitching on the first verse they cast their eye on, as a sure prognostic of what was to befal them. The sortes Homericæ, Virgiliane, Prancetina, &c. used by the heathens, were with the same view, and in the same manner. See Sortes.

St. Augustine seems to approve of this method of determining things future, and owns that he had practised it himself: grounded on this supposition, that God presides over chance; and on Prov. xvi. 33.

Many among the modern divines hold chance to be conducted in a particular manner by Providence; and esteem it an extraordinary way which God ufes to declare his will, and a kind of immediate revelation.

Chance-Medley, in law, is where one is doing a lawful act, and a person is killed by chance thereby; for if the act be unlawful, it is felony. If a person casts, not intending harm, a stone, which happens to hit one, whereas he dies; or shoots an arrow in a highway, and another that passeth by is killed therewith; or if a workman, in throwing down rubbish from a house after warning to take care, kills a person; or a schoolmaster in correcting his scholar, a matter his servant, or an officer in whipping a criminal in a reasonable manner, happens to occasion his death; it is chance-medley and mischief. But if a man throw stones in a highway where persons usually pass; or shoot an arrow, &c. in a market-place among a great many people; or if a workman cast down rubbish from a house in cities and towns where people are continually passing; or a schoolmaster, &c. correct his servant or scholar, &c. exceeding the bounds of moderation; it is manslaughter; and if with an improper instrument of correction, as with a sword or iron bar, or by kicking, flaming, &c. in a cruel manner, it is murder. If a man whips his horse in a street to make him gallop, and the horse runs over a child and kills it, it is manslaughter; but if another whips the horse, it is manslaughter in him, and chance-medley in the rider. And if two are fighting, and a third person coming to part them is killed by one of them without any evil intent, yet this is murder in him, and not manslaughter by chance-medley or mischief. In chance-medley, the offender forfeits his goods; but in a pardon of course.

Chancel, is properly that part of the choir of a church, between the altar or communion-table and the balustrade or railing that incloses it, where the minister is placed at the celebration of the communion. The word comes from the Latin cancellus, which in the lower Latin is used in the same sense, from cancelli, "lattices or cross bars," therewith the chancels were anciently encompassed, as they now are with rails. The right of a feast and a benefice in the chancels is one of the privileges of founders.

Chancellor, was at first only a chief notary or scribe under the emperors; and was called cancellarius, because he sat behind a lattice (in Latin cancellus) to avoid being crowded by the people; though some derive the word from cancellare, to cancel. (See Chancery.) This office was afterwards invested with several judicial powers, and a general superintendency over the rest of the officers of the prince. From the Roman empire it passed to the Roman church, ever emulous of imperial state: and hence every bishop has to this day his chancellor, the principal judge of his curtiory. And when the modern kingdoms of Europe were established upon the ruins of the empire, almost every state preferred its chancellor with different jurisdictions and dignities, according to their different constitutions. But in all of them he seems to have had the superintendence of all charters, letters, and each other public instruments of the crown as were authenticated in the most solemn manner; and therefore, when feals came in use, he had always the custody of the king's great seal.

Lord High Chancellor of Great Britain, or Lord Keeper of the Great Seal, is the highest honour of the long robe, being created by the mere delivery of the king's great seal into his custody; whereby he becomes, without write or patent, an officer of the greatest weight and power of any now subsisting in that kingdom. He is a privy counsellor by his office; and, according to Lord Chancellor Elfremente, proctor of the house of lords by prebension. To him belongs the appointment of all the justices of the peace throughout the kingdom. Being in former times commonly an ecclesiastic (for none else were then capable of an office so convefant in writing), and presiding over the royal chapel, he became keeper of the king's conscience; victor, in right of the king, of all hospitals and colleges of the king's foundation; and patron of all the king's livings under the value of £20 per annum in the king's books. He is the general guardian of all infants, ideots, and lunatics; and has the general supervision and interference of all charitable uses in the kingdom. And all this over and above the vast extensive jurisdiction which he exercises in his judicial capacity in the court of chancery. He takes precedence of every temporal lord except the royal family, and of all others except the archbishop of Canterbury. See Chancery.

Chancellor, in Scotland, was the chief in matters of justice. In the laws of King Malcolm II. he is placed
The chancellor of Oxford is usually one of the prime nobility, chosen by the students themselves in convocation. He is their chief magistrate; his office is, during vita, to govern the university, preserve and defend its rights and privileges, convene assemblies, and do justice among the members under his jurisdiction.

Under the chancellor is the vice-chancellor, who is chosen annually, being nominated by the chancellor, and elected by the university in convocation. He is always the head of some college, and in holy orders. His proper office is to execute the chancellor's power, to govern the university according to her statutes, to see that officers and students do their duty, that courts be duly called, &c. When he enters upon his office, he chooses four pro-vice-chancellors out of the heads of the colleges, to execute his power in his absence.

The chancellor of Cambridge is also usually one of the prime nobility, and in most respects the same as that in Oxford; only he does not hold his office during vita, but may be elected every three years. Under the chancellor there is a commissary, who holds a court of record for all privileged persons and scholars under the degree of master of arts, where all causes are tried and determined by the civil and statute law, and by the custom of the university.

The vice-chancellor of Cambridge is chosen annually by the faculty, out of two persons nominated by the heads of the several colleges and halls.

**Chancellor's Court.** See University Courts.

**Chanceron,** in natural history, a name given by the French writers to the small caterpillar that eats the corn, and does vast mischief in their granaries. See the article Corn-Butterfly.

**Chancery,** the highest court of justice in Britain next to the parliament, and of very ancient institution. It has its name chancery (cancellaria) from the judge who presides here, the lord chancellor, or cancellarius; who, according to Sir Edward Coke, is so termed a cancellandi, from cancelling the king's letters patent when granted contrary to law, which is the highest point of his jurisdiction. In chancery there are two distinct tribunals; the ordinary, being a court of common law; the other extraordinary, being a court of equity.

1. The ordinary legal court holds pleas of recognizances acknowledged in the chancery, writs of habeas corpus, for release of prisoners, writs of partition, &c. and also of all personal actions by or against any officer of the court. Sometimes a supersedeas, or writ in ai is, of privilege, hath been here granted to discharge a person out of prison; one from hence may have a habeas corpus prohibition, &c. in the vacation; and here a scire facias may be had to force winnles to appear in other courts, when they have no power to call them, &c. in prosecuting causes, if the parties elect to abide this court cannot try it by jury, but the lord chancellor delivers the record into the king's bench to be tried there; and after trial had, it is to be remanded into the chancery, and there judgment given: thus if there be a demurrer in this court, it shall be argued in this court.

In this court is also kept the officina justitiae; out of which all original writs that pass under the great seal, all commissions of charitable uses, severs, bankruptcy, &c. given in the university.

**Vol. IV.**
Chancery.

idiotic, lunacy, and the like, do issue; and for which it is always open to the subject, who may there at any time demand and have, ex debito jussitiae, any writ that his occasions may call for. These writs, relating to the business of the subject, and the returns of them, were, according to the simplicity of ancient times, originally kept in a hamper, in hanaperio; and the others (relating to such matters wherein the crown is mediately or immediately concerned) where preferred in a little sack or bag, in parra baga: and hence hath arisen the distinction of the hanaper office, and the petty-bag office, which both belong to the common law-court in chancery.

2. The extraordinary court, or court of equity, proceeds by the rules of equity and confidence; and moderates the rigour of the common law, considering the intention rather than the words of the law. It gives relief for and against infants notwithstanding their minority, and for and against married women notwithstanding their coverture. All frauds and deceits for which there is no redress at common law; all breaches of trust and confidence; and accidents, as to relieve obligors, mortgagees, and against penalties and forfeitures, where the intent was to pay the debt, are here remedied: for in chancery, a forfeiture, &c. shall not bind, where a thing may be done after or compensation made for it. Also this court will give relief against the extremity of unreasonable engagements entered into without consideration; oblige creditors that are unreasonable to compound with an unfortunate debtor; and make executors, &c. give security and pay interest for money that is to lie long in their hands. This court may confirm title to lands, though one hath lost his writings; and render conveyances, defective through mistake, &c. good and perfect. In chancery, copy-holders may be relieved against the ill usage of their lords; inclosures of lands that are common be decreed; and this court may decree money or lands given to charitable uses, oblige men to account with each other, &c. But in all cases where the plaintiff can have his remedy at law, he ought not to be relieved in chancery; and a thing which may be tried by a jury is not triable in this court.

The proceedings in chancery are, first to file the bill of complaint, signed by some counsel, setting forth the fraud or injury done, or wrong sustained, and praying relief; after the bill is filed, process of subpoe nas is to compel the defendant to appear; and when the defendant appears, he puts in his answer to the bill of complaint, if there be no cause for the plea to the jurisdiction of the court, in difability of the person, or bar, &c. Then the plaintiff brings his replication, unless he files exceptions against the answer as insufficient, referring it to a master to report whether it be sufficient or not; to which report exceptions may also be made. The answer, replication, rejoinder, &c. being framed, and the parties come to issue, witnesses are to be examined upon interrogatories, either in court, or by commission in the country, wherein the parties usually join; and when the plaintiff and defendant have examined their witnesses, publication is to be made of the depositions, and the cause is to be set down for hearing; after which follows the decree. But it is now usual to appeal to the house of lords; which appeals are to be signed by two noted counsel, and exhibited by way of petition; the petition or appeal is lodged with the Chanceller clerk of the house of lords, and read in the house, wherein the appeal is ordered to put in his answer, and a day fixed for hearing the cause; and after counsel heard, and evidence given on both sides, the lords will affirm or reverse the decree of the chancery, and finally determine the cause by a majority of votes, &c.

CHANDLER, in fortification, a kind of moveable parapet, consisting of a wooden frame, made of two upright flakes, about six feet high, with crofs planks between them; serving to support falvines to cover the pioners.

CHANDERNAGORE, a French settlement in the kingdom of Bengal in the East-Indies. It lies on the river Ganges, two leagues and a half above Calcutta. The district is hardly a league in circumference, and has the disadvantage of being somewhat exposed on the western side; but its harbour is excellent, and the air is as pure as it can be on the banks of the Ganges. When any building is undertaken that requires strength, it must here, as well as in all other parts of Bengal, be built upon piles; it being impossible to dig three or four feet without coming at water.

CHANDLER, (Mary) distinguished by her talent for poetry, was the daughter of a dissenting minister at Bath; and was born at Malmesbury in Wilts, in 1687. She was bred a milliner; but from her childhood had a turn for poetry, and in her riper years applied herself to the study of the poets. Her poems, for which she was complimented by Mr Pope, breathed the spirit of piety and philosophy. She had the misfortune to be deformed, which determined her to live single; though she had great sweetness of countenance, and was solicited to marry. She died in 1745, aged 58.

CHANDLER, (Dr Samuel) a learned and respectable dissenting minister, descended from ancestors heartily engaged in the cause of religious liberty, and sufferers for the sake of conscience and nonconformity; was born at Hungerford in Berks, where his father was a minister of considerable worth and abilities. Being by his literary turn deftined to the ministry, he was at first placed at an academy at Bridgewater, and from thence removed to Gloucester under Mr Samuel Jones. Among the pupils of Mr Jones were Mr Joseph Butler, afterwards bishop of Durham, and Mr Thomas Secker, afterwards archbishop of Canterbury. With these eminent persons he contracted a friendship that continued to the end of their lives, notwithstanding the different views by which their conduct was afterwards directed, and the different situations in which they were placed.

Mr Chandler having finished his academical studies, began to preach about July 1714; and being soon distinguished by his talents in the pulpit, he was chosen in 1716 minister of the Presbyterian congregation at Peckham near London, in which station he continued some years. Here he entered in the matrimonial state, and began to have an increasing family, when, by the fatal South-sea scheme of 1720, he unfortunately lost the whole fortune which he had received with his wife. His circumstances being thereby embarrassed, and his income as a minister being inadequate to his expences, he engaged in the trade of a bookeller, and kept a shop in the Poultry, London, for about two or three
Chandler, years, still continuing to discharge the duties of the pastoral office. He also officiated as joint preacher with the learned Dr Lardner of a winter weekly evening lecure at the meeting-house in the Old Jewry, London: in which meeting he was established assistant preacher about the year 1725, and then as the pastor. Here he ministered to the religious improvement of a very respectable congregation for 40 years with the greatest applause; and with what diligence and application he improved the vacancies of time from his pastoral duties, apparent to the religious improvement of a very respectable congregation for 40 years with the greatest applause; and with what diligence and application he improved the vacancies of time from his pastoral duties, improved the vacancies of time from his pastoral duties, improving himself and benefiting the world, will appear from his many writings on a variety of important subjects. While he was thus laboriously employed, not only the universities of Edinburgh and Aberdeen gave him, without any application, testimonies of their esteem in diplomas, conferring on him the degree of D. D. but he also received offers of preferment from some of the governors of the established church, which he nobly declined. He had likewise the honour of being afterwards elected F. R. and A. SS.

On the death of George II. in 1760, Dr Chandler published a sermon on that event, in which he compared that prince to King David. This gave rise to a pamphlet, which was printed in the year 1761, intitled "The History of the Man after God’s own Heart;" wherein the author ventured to exhibit King David as an example of perfidy, luft, and cruelty; fit only to be ranked with a Nero or a Caligula; and complained of the infult that had been offered to the memory of the late British monarch by Dr Chandler’s parallel between him and the king of Israel. This attack occasioned Dr Chandler to publish in the following year "A Review of the History of the Man after God’s own Heart; in which the Falsehoods and Misrepresentations of the Historian are exposed and corrected." He also prepared the press a more elaborate work, which was afterwards published in two volumes 8vo, under the following title: "A Critical History of the Life of David: in which the principal Events are ranged in Order of time; the chief Objections of Mr Bayle and others against the Character of this Prince, and the Scripture Account of him, and the Occurrences of his Reign, are examined and refuted; and the Psalms which refer to him explained." As this was the last, it was likewise one of the best, of Dr Chandler’s productions.

The greatest part of this work was printed off at the time of our author’s death, which happened May 8th 1766, aged 72. During the last year of his life, he was visited with frequent returns of a very painful disorder, which he endured with great resignation and Christian fortitude. He was interred in the burying-ground at Bunhill-fields on the 16th of the month; and his funeral was very honourably attended by ministers and other gentlemen. He expressly desired, by his last will, that no delineation of his character might be given in his funeral sermon, which was preached by Dr Amory. He had several children; two sons and a daughter who died before him, and three daughters who survived him; two of whom are yet living, and both married, one of them to the Rev. Dr Harwood.

Dr Chandler was a man of very extensive learning and eminent abilities; his apprehension was quick and his judgment penetrating; he had a warm and vigorous imagination; he was a very instructive and animated preacher; and histalents in the pulpit and as a writer procured him very great and general esteem, not only among the dissenters, but among large numbers of the established church. He was principally instrumental in the establishment of the fund for relieving the widows and orphans of poor Protestant dissenting ministers: the plan of it was first formed by him; and it was by his interest and application to his friends that many of the subscriptions for its support were procured.

In 1768, four volumes of our author’s sermons were published by Dr Amory, according to his own directions in his last will; to which was prefixed a neat engraving of him, from an excellent portrait by Mr Chamberlin. He also expressed a desire to have some of his principal pieces reprinted in four volumes 8vo: proposals were accordingly published for that purpose, but did not meet with sufficient encouragement. But in 1777, another work of our author was published in one volume 4to, under the following title: "A paraphrase and Notes on the Epistles of St Paul to the Galatians and Ephesians, with doctrinal and practical Observations: together with a critical and practical Commentary on the two Epistles of St Paul to the Thessalonians." Dr Chandler also left, in his interleaved Bible, a large number of critical notes, chiefly in Latin, which are now the property of Dr Hippius, Mr Farmer, Dr Price, and Dr Savage, and which have been intended to be published; but the design has not yet been executed. A complete list of Dr Chandler’s works is given in the Biographia Britannica, vol. III. p. 435.

CHANG-TONG, a province of China, bounded on the east by Petcheli and part of Honan, on the south by Kiang-nan, on the east by the sea, and on the north by the sea and part of Petcheli. The country is well watered by lakes, streams, and rivers; but is nevertheless liable to suffer from drought, as rain falls here but seldom. The locusts also sometimes make great devastation. However, it abounds greatly in game; and there is perhaps no country where quails, partridges, and pheasants, are sold cheaper, the inhabitants of this province being reckoned the keenest sportsmen in the empire. The province is greatly enriched by the river Yen, called the Grand Imperial Canal, through which all the canals bound to Pekin must pass in their way thither. The duties on this canal alone amount to more than L. 450,000 annually. The canal itself is greatly admired by European travellers on account of its strong and long dikes, the banks decorated with cut stone, the ingenious mechanism of its locks, and the great number of natural obstacles which have been overcome in the execution of the work.—The province produces silk of the ordinary kind; and, besides this, another from a sort of insect resembling our caterpillar. It is coarser than the ordinary silk, but much stronger and more durable; so that the stuffs made from it have a very extensive sale throughout the empire.

Chang-tong is remarkable for being the birth-place of the celebrated philosopher and lawgiver Confucius. His native city is called K’o-feii, where there are several monuments erected in honour of this great man. The province is divided into six districts, which contain six cities of the first class, and 114 of the second.
and third. Along the coast, also, are 15 or 16 villages of considerable importance on account of their commerce; there are likewise a number of small islands, most of which have harbors very convenient for the Chinefe junk trade that passes from thence to Corea or Laos.

The most remarkable cities are 1. Tu-nan-fou, the capital, which stands on the river Tungbo or T6. It is large and populous; but chiefly celebrated for having been the residence of a long series of kings, whose tombs, rising on the neighbouring mountains, afford a beautiful prospect. 2. Yen-chen-fou, the second city of the province, situated between two rivers, and in a mild and temperate climate. Great quantities of gold are said to have been formerly collected in its neighborhood. 3. Lin-teu-fu, situated on the great canal, is much frequented by ships, and may be called a general magazine for every kind of交换, there are likewise a number of small islands, most of which have harbors very convenient for the Chinefe junk trade that passes from thence to Corea or Laos.

CHANGES, in arithmetic, &c. the permutations or variations of any number of quantities; with regard to their position, order, &c. See COMBINATION.

To find all the possible Changes of any Number of Quantities, or how oft their order may be varied.] Suppose two quantities a and b. Since they may be either abc or cab, it is evident their changes are 2 = 2!. Suppose three quantities abc: their changes will be as in the margin; as is evident by combining a first with a b, then with b a; and hence they are the number of changes ares 3. 2. 1 = 6. If the quantities be 4, each may be combined four

changes with each order of the other three; and hence the number of changes ares 6. 4 = 6. b c a 3. 2. 1 = 24. Whereof, if the number of b c a quantities be supposed n, the number of changes will be n. n-1. n-2. n-3. n-4. &c. If the same quantity occurs twice, the changes of two will be found 5. 6 = 30, of four, 6. 5. 4 = 120, &c. And thus the number of changes in the first case will be = (2. 1) = 2. 1; in the second, 3 = (3. 2. 1) = 2. 1. In the third, 4 = (3. 2. 1) = 2. 1.

If a fifth letter be added, in each series of four quantities, it will beget five changes, whence the number of all the changes will be = (5. 4. 3. 2. 1) = 2. 1. Hence if the number of quantities be n, the number of changes will be = (n. n-1. n-2. n-3. n-4. &c.) = (n-1).
Continental and an island. Such are the British channel, St George's channel, the channel of Constantinople, &c.

Channel of a Ship. See Chain-Wall.

CHANT or SONG. The first is the Ambrosian, established by St Ambrose. The second, the Gregorian chant, introduced by Pope Gregory the great, who established schools of chanters, and corrected the church-song. This is still retained in the church under the name of plain song: at first it was called the Roman song. The plain or Gregorian chant, is where the choir and people sing in unison, or all together in the same manner.

CHANTILLY, a village in France, about seven leagues from Paris, where there is a magnificent palace and fine forest belonging to the duke of Bourbon.

CHANTOR, a singer of a choir in a cathedral. The words are almost grown obsolete, chorister or singing-man being commonly used instead of it. All great chappels have chantors and chaplains to afflict the canons, and officiate in their absence.

CHANTER is used by way of excellence for the preceptor matter of the choir, which is one of the first dignities of the chapter. At St David's in Wales, there is no dean, he is next in dignity to the bishop. The ancients called the chantor primicerius cantorum. To him belonged the direction of the deacons and other inferior officers.

Chantors, in the temple of Jerusalem, were a number of Levites employed in singing the prayers of God, and playing upon instruments before his altar. They had no habits distinct from the rest of the people; yet in the ceremony of removing the ark to Solomon's temple, the chantors appeared drest in tunics of byllis or fine linen. 2 Chron. v. 12.

CHANTRY, or CHAUNTRY, was anciently a church or chapel endowed with lands, or other yearly revenue, for the maintenance of one or more priests, daily saying or singing Mass for the souls of the donors, and such others as they appointed. Hence chantry-rents are rents paid to the crown by the tenants or purchasers of chantry lands.

CHAUNTRY, a village in France, about seven leagues from Paris, where there is a magnificent palace and fine forest belonging to the duke of Bourbon.

CHAUNTRY-rents are rents paid to the crown by the tenants or purchasers of chantry lands.

CHAOLOGY the history or description of the chaos.

See CHAOS.

Orpheus, in his chaology, sets forth the different alterations, secretions, and divers forms which matter went through till it became habitable, which amounts to the same with what we otherwise call cosmogony. Dr Burnet, in his theory of the earth represents the chaos as it was at first, entire, undivided, and universally rude and deformed: or the teha baha; then shews how it came to be divided into its respective regions; how the homogeneous matter gathered itself apart from all of a contrary principle; and lastly, how it hardened and became a solid habitable globe. See EARTH.

CHAOS, that confusion in which matter lay when newly produced out of nothing at the beginning of the world, before God, by his almighty word, had put it into the order and condition wherein it was after the six days creation. See EARTH.

Chaos is represented by the ancients as the first principle, ovum, or seed of nature and the world. All philosophers, sages, naturalists, philosophers, theologues, and poets, held that chaos was the eldest and first principle, as Epius was to Homer, the Barbarians, Phcenicians, Egyptians, Persians, &c. all refer the origin of the world to a rude, mixed, confused mass of matter. The Greeks, Orpheus, Hesiod, Menander, Aristophanes, Euripides, and the writers of the Cyclic Poems, all speak
CHAPEL, a place of divine worship, so called. The word is derived from the Latin *capella*. In former times when the kings of France were engaged in war they always carried St. Martin's hat into the field, which was kept in a tent as a precious relic from whence the place was called *capella*; and the prieux, who had the custody of the tent, *capellani*. Afterwards the word *capella* became applied to private oratories.

In Britain there are several sorts of chapels. 1. Parochial chapels: these differ from parish-churches only in name; they are generally small, and the inhabitants within the district few. If there be a presentation *ad ecclesiam*, instead of *capellam*, and an admission and institution upon it, it is no longer a chapel, but a church. 2. Chapels, which adjoin to, and are part of the church; such were formerly built by honourable persons, as burying-places for themselves and their families. 3. Chapels of ease; there are usually built in very large parishes, where all the people do not conveniently repair to the mother-church. 4. Free chapels; such as were founded by kings of England. They are free from all episcopal jurisdiction, and only to be visited by the founder and his successors; which is done by the lord chancellor; yet the king may license any subject to build and endow a chapel, and by letters patent exempt it from the visitation of the ordinary. 5. Chapels in the universities, belonging to particular colleges. 6. Domestic chapels, built by noblemen or gentlemen for the private service of God in their families.

See CHAPLAIN.

CHAPEL is also a name given to a printer's workshop; because, according to some authors, printing was first actually performed in chapels or churches, or, according to others, because Caxton, an early printer, exercised the art in one of the chapels at Westminster Abbey. In this sense they say, *the orders or laws of the chapel, the secrets of the chapel*, &c.

Knights of the CHAPEL, called also *Poor knights of Windsor*, were instituted by Henry VIII. in his testament. Their number was at first thirteen, but has been since augmented to twenty-six. They afflict in the funeral services of the kings of England: they are subject to the office of the canons of Windsor, and live on pensions assigned them by the order of the garter. They bear a blue or red cloak, with the arms of St. George on the left shoulder.

CHAPLAIN, (James) an eminent French poet born at Paris in 1595, and often mentioned in the works of Balzac, Menage, and other learned men. He wrote several works, and at length dittified himself by a heroic poem called *La Pucelle*, *ou France Délivrée*, which employed him several years; and which, raising the expectation of the public, was as much desired by some as extolled by others. He was one of the king's counsellors; and died in 1674, very rich, but was very covetous and forlorn.

CHAPELET, in the manage, a couple of flurrup-leathers, mounted each of them with a flurrup, and joined at top in a fort of leather buckle, called the *head of the chapletia*, by which they are made fast to the pummel of the saddle, after being adjusted to the rider's length and bore. They are used both to avoid the trouble of taking up or letting down the flurrups every time that the gentleman mounts on a different horse and
Chapelle,... vicei,... ancienly worn both by men and women, the nobles... horses with their other... doctors,... parliament.-According for... mouths, and all others that are not... delivered by the mouth of the... devices, placed on the foreheads of the horses that... devices were originally fastened on the... chaperonnes, or... coverings... were originally faftened on the... Chaperon, Chaperonne, or Chaperoon, properly signifies a sort of hood or covering of the head... men and women, the nobles and the populace, and afterwards appropriated to the doctors, and licentiates in colleges, &c. Hence the name passed to certain little helmets, and other funeral devices, placed on the foreheads of the horses that drew the hearses in pompous funerals, and which are still called chaperons, or houppons; because such devices... wore by those horses with their other coverings of state.

Chaperon of a bit-mouth, in the manege, is only used for catch-months, and all others that are not cannon-months, signifying the end of the bit that joins to the branch just by the banquet. In catch-months the chaperon is round, but in others it is oval: and the same part that in catch and other mouths is called chaperon, is in cannon-months called froncou.

Chapiters, in architecture, the same with capitals.

Chapters, in law, formerly signified a summary of such matters as were inquired of, or presented before justices in eyre, justices of assize, &c. Hence the priets that had the care of them, were... and licentiates in colleges, &c. Hence the... chaplets, &c.

In England there are 43 chaplains to the king, who wait four each month, preach in the chapel, read the service to the family, and to the king in his private oratory, and say grace in the absence of the clerk of the cloister. While in waiting they have a table, and attendance, but no salary. In Scotland the king has six chaplains, with a salary of £. 50 each, three of them having in addition the deanship of the chapel-royal divided between them, making up above £. 100 to each. Their only duty at present is to say prayers at the elevation of preachers for Scotland to sit in parliament. According to a statute of Henry VIII. the persons vested with a power of retaining chaplains, together with the number each is allowed to qualify, is as follows: An archbishop, eight; a duke or bishop, six; marquis or earl, five; viscount, four; baron, knight of the garter, or lord chancellor three; a duchess, marchioness, countess, baroness, the treasurer and comptroller of the king's houfe, clerk of the cloister, the king's secretary, dean of the chapel, almoner, and master of the rolls, each of them two; chief justice of the kings bench, and warden of the cinqueparts, each one. All these chaplains may purchase a... deferences, and take two benefits with... care of fools. A chaplain must be retained by... testimonial nut hand and seal; for it is not sufficient that he served as chaplain in the family.

The first chaplains are said to have been those instituted by the ancient kings of France, for preferring the chape, or cape, with the other relics of St Martin, which the kings kept in their palace, and carried out with them to the war. The first chaplain is said to have been Gul. de Mefmes, chaplain to St Louis.

Chaplain in the order of Malta, is used for the second rank, or class, in that order; otherwise called diano. The knights make the first class, and the chaplains the second.

Chaplains of the Pope, are the auditors, or judges of causes in the sacred palace; so called, because the pope... cases sent from the several parts of Christendom. He hither summoned as affessors the most learned lawyers of his time; and they hence acquired the appellation of capellani, chaplains. It is from the decrees formerly given by thefe, that the body of decreals is composed: their number pope Sixtus IV. reduced to twelve.

Some say, the shrines of relics were covered with a kind of... cape, or capella, i.e. little cape; and that hence the priets that had the care of them, were called chaplains. In time these reliefs where reposed in a little church, either contiguous to a larger, or separate from it; and the same name, capella, which was given to the cover, was also given to the place where it was lodged: and hence the priest who superintended it came to be called chaplain.

Chaplet, an ancient ornament for the head, like a garland or wreath; but this word is frequently used to signify the circle of a crown. There are infufcences of its being borne in a coat of arms, as well as for crests; the paternal arms for Lascelles are argent, three chaplets, gules.

Chaplet also denotes a string of beads used by the Roman Catholics, to count the number of their prayers. The invention of it is ascribed to Peter the hermit, who probably learned it of the Turks, as they owe it to the East-Indians.

Chaplets are sometimes called pater-nocters; and are made of coral, of diamonds, of wood, &c. The common chaplet contains fifty ave-marias, and five pater-nocters. There is also a chaplet of our Saviour, consisting of 33 beads, in honour of his 33 years living on earth, instituted by father Michael the Camaldulian.

The Orientals have a kind of chaplets which they call chains, and which they use in their prayers, rehearsing one of the perfections of God on each link or head. The great Mogul is said to have 18 of these chains, all precious stones; some diamonds, others rubies, pearls, &c. The Turks have likewise chaplets, which they bear in the hand, or hang it at the girdle; but father Dandini observes, they differ from those used by the Romanists, in that they are all of the same insigns, and have not that distinction into decades: though they consist of six decades, or 60 beads. He adds, that the muflimans run over the chaplet almoft in an instant, the prayers being extremely short, as containing only these words, "praise to God," or "glory..."
Chapter

“glory to God,” for each bead. Besides the common chaplet they have likewise a larger one consisting of 100 beads, where there is some distinction, as being divided by little threads into three parts; on one of which they repeat 30 times: “soubban Allah, i.e. “God is worthy to be praised;” on another, “elamuth Allah, “glory be to God;” and on the third, “Allah ebeer, “God is great.” These 33 times making only 99; to complete the number 100, they add other prayers for the beginning of the chaplet.—He adds, that the Mahometan chaplet appears to have had its rise from the monastic divination, which we find in their prayer-books; the Jews are obliged to repeat 90; the Christians to 30 times; while the Moslems repeat 30 thrice thirty times; and as the number 100 is neither male calyx nor corolla; and the androecium is placed under the germin, the female calyx is tetraphyllous; no corolla; the stigma quinquefid, with one roundish seed.

CHARABON, a sea-port town on the northern coast of the island of Java in the East-Indies; E. Long. 10° 30. S. Lat. 6°

CHARACENE, the most southern part of Susiana, a province of Persia, lying on the Persian gulf, between the Tigris and the Eulœbus. It was so named from the city of Chorax, called first Alexandria, from its founder Alexander the Great; afterwards Antioch, from Antiochus V. king of Syria, who repaired and beautified it; and lastly, Charax Spasinus, or Panemone, that is the Mole of the Spaniards, an Arabian king of that name having secured it against the overflowing of the Tigris, by a high bank or mole extending three miles, which served as a fence to all that country. Dionysius Periegetes, and Idibus, author of the Parthian Manusones, were both natives of this city. The small district of Characene was feized by Panines, the son of Sogdones, king of the neighbouring Arabs, during the troubles of Syria, and erected into a kingdom. Lucian calls him Hypapanes, and adds, that he ruled over the Charseneni and the neighbouring people; he died in the 85th year of his age. The other kings of this country we find mentioned by the ancients, as Turans, who died in the 92d year of his age, and after him Arababazus the seventh, as Lucian informs us, who was driven from the throne by his own subjects, but restored by the Parthians. And this is all we find in the ancients relating to the kings of Characene.

CHARACTER, in a general sense, signifies a mark or figure, drawn on paper, metals, stones, or other matter, with a pen, graver, chisel, or other instrument, to signify or denote any thing. The word is Greek, charaktēr, formed from the verb, charaktis, insculptus, “to engrave, impress,” &c. The various kinds of characters may be reduced to three heads, viz. Literal Characters, Numerical Characters, and Abbreviations.

1. Literal Character is a letter of the alphabet, serving to indicate some articulate sound, expressive of some idea or conception of the mind. See Alphabet.

2. Literal Characters may be again divided, with regard to their nature and use, into Nominal Characters, or those we properly call letters; which serve to express the names of things: See Letter. Real Characters: those that instead of names express things and ideas: See Idea, &c. Emblematical or Symbolical Characters: which have this in common with real ones, that they express the things themselves; but have this further, that they in some measure personate them, and exhibit their form; such are the hieroglyphics of the ancient Egyptians. See Hieroglyphic, Symbol, &c.
Characters, regard to their invention and use, into particular and general or universal.

Particular characters, are those peculiar to this or that nation. Such are the Roman, Italic, Greek, Hebrew, Arabic, Gothic, Chinese, &c. characters. See Hebrew, Gothic, Chinese, &c.

Universal characters, are also real characters, and make what some authors call a philosophical language.

That diversity of characters used by the several nations to express the same idea, is found the chief obstacle to the advancement of learning: to remove this, several authors have taken occasion to propose plans of characters that should be universal, and which each people should read in their own language. The character here is to be real, not nominal; to express things and notions; not as the common ones, letters or sounds: yet to be mute like letters, and arbitrary; not emblematical like hieroglyphics.

Thus, every nation should retain its own language, yet every one understand that of each other, without learning it; only by seeing a real or universal character, which should signify the same things to all people, by what sounds forever each expresses in their particular idiom. For instance, by seeing the character defined to signify to drink, an Englishman should read to drink: a Frenchman, boire; a Latin, bibere; a Greek, μια; a Jew, ט; a German trinken; and so of the rest: in the same manner as seeing a horse, each people expresses it after their own manner; but all mean the same animal.

This real character is no chimera: the Chinese and Japoneses have already something like it. They have a common character which each of these nations understand alike in their several languages; though they pronounce them with such different sounds, that they do not understand one another in speaking.

The first and most considerable attempts for a real character, or philosophical language, in Europe, are those of bishop Wilkins and Dalgarme: but these, with how much art ever they were contrived, have yet failed.

M. Leibnitz had some thoughts the same way: he thinks those great men did not hit the right method. It was probable, indeed, that by their means, people, who do not understand one another, might easily have a commerce together; but they have not hit on true real characters.

According to him, the characters should resemble those used in Algebra: which, in effect, are very simple, yet very expressive, without any thing superfluous or equivocal; and contain all the varieties required.

The real character of bishop Wilkins has its just applause: Dr Hook recommends it on his own knowledge and experience as a most excellent scheme; and to engage the world to the study thereof, publishes some fine inventions of his own therein.

M. Leibnitz tells us, he had under consideration an alphabet of human thoughts; in order to a new philosophical language, on his own scheme; but his death prevented its being brought to maturity.

M. Łódwie, in the English philosophical transactions, gives us a plan of an universal alphabet or character of another kind: this was to contain an enumeration of all such single sounds, or letters, as are used in any language: characters by means whereof, people should be enabled to pronounce truly and readily any language: to describe the pronunciation of any language that shall be pronounced in their hearing, so as others accustomed to this language, though they had never heard the language pronounced, shall at first be able truly to pronounce it: and, lastly, this character to serve as a standard to perpetuate the sounds of any language.

In the Journal Litterature, an. 1720, we have a very ingenious project for an universal character. The author, after obviating the objections that might be made against the feasibleness of such schemes in the general, proposes his own: his characters are to be the common Arabic, or numeral figures. The combinations of these nine are sufficient to express distinctly an incredible quantity of numbers, much more than we shall need terms to signify our actions, goods, evils, duties, passions, &c. Thus is all the trouble of framing and learning any new character at once saved; the Arabic figures having already all the universality required.

The advantages are immense. For, 100, We have here a fitable, faithful interpreter; never to be corrupted or changed, as the popular languages continually are. 200, Whereas the difficulty of pronouncing a foreign language is such as usually gives the learner the greatest trouble, and there are even some founds which foreigners never attain to; in the character here proposed, this difficulty has no place: every nation is to pronounce them according to the particular pronunciation that already obtains among them. All the difficulty is, the accustomed the pen and the eye to affix certain notions to characters that do not, at first sight, exhibit them. But this trouble is no more than we find in the study of any language whatever.

The inflections of words are here to be expressed by the common letters. For instance the same character shall express a silly or a colt, a horse or a mare, an old horse or an old mare, as accompanied with this or that distinctive letter, which shall show the sex, youth, maturity, or old age: a letter also to express the bigness or smallness of things; thus, &c., a man with this or that letter, to signify a great or a little, &c.

The use of these letters belongs to the grammar; which, once well understood, would abridge the vocabulary exceedingly. An advantage of this grammar is, that it would only have one declension and one conjugation: those numerous anomalies of grammarians are exceeding troublesome; and arise hence, that the common languages are governed by the populace, who never reason on what is best: but in the character here proposed, men of sense having the introduction of it, would have a new ground whereon to build regularly.

But the difficulty is not in inventing the most simple, easy, and commodious character, but in engaging the several nations to use it; there being nothing they agree less in, than the understanding and purposing their common interest.

3. Literal characters may again be divided, with respect to the nations among whom they have been invented, into Greek characters, Roman characters, Hebrew characters, &c. The Latin character now used through all Europe, was formed from the Greek, as the Greek was from the Phoenician; and the Phoenician, as
Characters as well as the Chaldee, Syriac, and Arabic characters, were formed from the ancient Hebrew, which suffered till the Babylonish captivity; for after that event the character of the Assyrians, which is the square Hebrew now in use, prevailed, the ancient being only found on some Hebrew medals, commonly called Samaritan medals. It was in 1601, that the Gothic characters, invented by Ulfilas, were abolished, and the Latin ones established in their room.

Medallists observe, that the Greek character, consisting only of majuscule letters, has preserved its uniformity on all medals, as low as the time of Gallienus, from which time it appears somewhat weaker and rounder; from the time of Constantine to Michael we find only Latin characters; after Michael, the Greek characters recommence; but from that time they began to alter with the language, which was a mixture of Greek and Latin. The Latin medals preserve both their character and language as low as the translation of the feast of the empire to Constantinople; towards the time of Decius the character began to lose its majuscule form; some time after it reappeared, and finished tolerably till the time of Julius, when it degenerated gradually into the Gothic. The rounder, then, and better formed a character is upon a medal, the fairer pretence it has to antiquity.

II. Numerical Characters, are characters used to express numbers, are either letters or figures.

The Arabic character, called also the common one, because it is used almost throughout Europe in all sorts of calculations, consists of these ten digits: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0.

The Roman numeral character consists of seven majuscule letters of the Roman alphabet, viz. I, V, X, L, C, D, M. The I denotes one, V five, X ten, L fifty, C a hundred, D five hundred, and M a thousand. The I repeated twice makes two, or M diminishes each by a hundred. The number LX denotes forty, XC ninety, and LX fifty. The C before D or M diminishes each by a hundred. The number five hundred is sometimes expressed by an I before a C inverted thus, CI, and instead of M, which signifies a thousand, an I is sometimes used between two C's, the one direct, and the other inverted, thus CI. The addition of C and I before or after raises CI by tens, thus, CCCCI expresses ten thousand. CCCXCI a hundred thousand. The Romans also expressed any number of thousands by a line drawn over any number of letters or a thousand; thus V denotes five thousand, IX, sixty thousand: if likewise M is one million, MM is two millions, &c.

The Greeks had three ways of expressing numbers: 1. Every letter, according to its place in the alphabet, denoted a number, from a, one, to o, twenty-four. 2. The alphabet was divided into eight units, one, two, three, &c.; into eight tens, a ten, a twenty, a thirty, &c.; and eight hundreds, one hundred, two hundred, three hundred, &c. 3. 1 stood for one, II five, A ten, H a hundred, X a thousand, M ten thousand; and when the letter II enclosed any of these, except I, it showed the enclosed letter to be five times greater.

The French Character is used in the chamber of accounts, and by persons concerned in the management of the revenue, is, properly speaking, nothing else than the Roman numerals, in letters that are not majuscule; thus, instead of expressing fifty-six by LVI, they denote it by smaller characters lv.

III. Characters of Abbreviations, &c. In several of the arts, are symbols contrived for the more concise and immediate conveyance of the knowledge of things. For the

Characters used in Algebra. See Algebra, Introduction.

Characters used in Astronomy, viz.

Of the Planets. See Plate LXII. fig. 19.

Of the Signs. Plate LXXXVI. fig. 158. & LXXXV. fig. 204.

Of the Signs.

\[ \begin{align*}
\theta & = \text{Trine} \\
\Sigma & = \text{Biquinule} \\
\chi & = \text{V} \\
\Psi & = \text{Quincuncx} \\
\eta & = \text{Opposition} \\
\Xi & = \text{Dragon's head} \\
\tau & = \text{Draco's tail}
\end{align*} \]

Of time.

A. M. ante meridiem, before the sun comes upon the meridian.

O. or N. noon.

P. M. post meridiem, when the sun is past the meridian.

Characters in Commerce.

\[ \begin{align*}
\text{D} & = \text{ditto, the same} \\
\text{N} & = \text{numeros, or number} \\
\text{F} & = \text{folio, or page}
\end{align*} \]

Characters in Chemistry.

See Pl. CXXXII. & CXXXIII.

Characters in Geometry and Trigonometry.

1. The character of or is equiangular, or similar rallellim.

\[ \begin{align*}

X. P. a character found in the catacombs, about the meaning of which authors are not agreed.

Characters used in Music, and of Musical Notes with their proportions, are as follows.

H character of a large crotchet
⅛ a long quaver
⅛ a breve semiquaver
⅛ a femibreve demisemiquaver
⅛ a minim

* character of a sharp note: this character at the beginning of a line or space, denotes that all the notes in that line are to be taken a semitone higher than in the natural series; and the same affects all the divas above and below, though not marked: but when prefixed to any particular note it shows that note alone to be taken a semitone higher than it would be without such character.

b or † character of a flat note: this is the contrary to the other above; that is, a semitone lower.

⅛ character of a natural note: when in a line or series of artificial notes, marked at the beginning b or †, the natural note happens to be required, it is denoted by this character

⅛ character of a treble cliff.
⅛ character of the mean cliff.
⅛ bass cliff.
⅛ or ⅛ characters of common duple time, signifying the measure of two croquettes to be equal to two notes, of which four make a semibreve.

C C D, characters that distinguish the movements of common time, the first implying flow, the second character quick, and the third very quick.

⅛, ⅛, ⅛, ⅛ characters of simple triple time, the measure of which is equal to three semibreves, or to three minims.

⅛, ⅛, ⅛, ⅛ or ⅛, characters of a mixed triple time, where the measure is equal to six croquettes, or six quavers.

⅛, ⅛, ⅛, ⅛ or ⅛, characters of that species of triple time called the measure of twelve times.

Character, in human life, that which is peculiar in the manners of any person, and distinguishes him from all others.

Good Character is particularly applied to that conduct which is regulated by virtue and religion; in an inferior but very common sense, it is understood of mere honesty of dealing between man and man. The importance of a good character in the commerce of life seems to be universally acknowledged. To those who are to make their own way either to wealth or honours, a good character is usually not less necessary than address and abilities. To transform the observation of an elegant morality: Though human nature is degenerate, and corrupts itself still more by its own inventions; yet it usually retains to the last an effect for excellence. But even if we are arrived at such an extreme degree of depravity as to have lost our native reverence for virtue; yet a regard to our own interest and safety, which we seldom lose, will lead us to apply for aid, in all important transactions, to men whose integrity is unimpeached. When we choose an alumnus, a partner, a servant, or first enquiry is concerning his character. When we have occasion for a counsellor or attorney, a physician or apothecary, whatever we may be ourselves, we always choose to trust our property and per sons to men of the best character. When we fix on the tradesmen who are to supply us with necessaries, we are not determined by the sign of the lamb, or the wolf, or the fox; nor by a shop fitted up in the most elegant taste, but by the fairest reputation. Look into a daily newspaper, and you will see, from the highest to the lowest rank, how important the characters of the employed appear to the employers. After the advertisement has enumerated the qualities required in the person wanted, there commonly follows, that none need apply who cannot bring an undeniable character. Offer yourself as a candidate for a seat in the legislature, be promoted to honour and emolument, or in any respect attract the attention of mankind upon yourself, and, if you are vulnerable in your character, you will be deeply wounded. This is a general testimony in favour of honesty, which no writings and no practices can possibly refute.

Young men, therefore, whose characters are yet unfixed, and who, consequentely, may render them just such as they will, ought to pay great attention to the first steps which they take on entrance into life. They are usually careless and inattentive to this object. They pursue their own plans with ardour, and neglect the opinions which others entertain of them. By some thoughtless action or expression, they suffer a mark to be impressed upon them, which scarcely any subsequent merit can entirely erase. Every man will find some person,
Character, fons, who, though they are not professed enemies, yet view him with an envious or a jealous eye, and who will gladly revive any tale to which truth has given the slightest foundation.

In this turbulent and confused scene, where our words and actions are often misunderstood, and too often misrepresented, it is indeed difficult even for innocence and integrity to avoid reproach, abuse, contempt, and hatred. These not only hurt our interest and impede our advancement in life, but also affect the feelings of a tender and delicate mind. It is then the part of wisdom first to do every thing in our power to preserve an irreproachable character, and then to let our happiness depend chiefly on the approbation of our own conceptions, and on the advancement of our interest in a world where liars shall not be believed, and where slanderers shall receive countenance from none but him who, in Greece, is called, by way of eminence, Diadoumén, or the calumniator.

Character, in poetry, particularly the epos and drama, is the result of the manners or peculiarities by which each person is distinguished from others.

The poetical character, says Mr. Boso, is not properly any particular virtue or quality, but a composition of several which are mixed together, in a different degree, according to the necessity of the tale and the unity of the action: there must be one, however, to reign over all the parts; and this must be found, in some degree, in every part. The first quality in Achilles, is valour; in Ulysses, dissimulation; and in Aeneas, mildness: but as these characters cannot be alone, they must be accompanied with others to embellish them, as far as they are capable, either by hiding their defects, as in the anger of Achilles, which is palliated by extraordinary valor; or by making them centre in some solid virtue, as in Ulysses, whose dissimulation makes a part of his prudence; and in Aeneas, whose mildness is employed in a submission to the will of the gods. In the making up of which union, it is to be observed, the poets have joined together such qualities as are by nature the most contrary to one another, valor with anger, prudence with dissimulation. The fable required prudence in Ulysses, and piety in Aeneas; in this, therefore, the poets were not left to their choice: but Homer might have made Achilles a coward without abating any thing from the justness of his fable: so that it was the necessity of adorning his character that obliged him to make him valiant: the character, then, of a hero in the epic poem, is compounded of three sorts of qualities; the first essential to the fable; the second, embellishments of the first; and valor, which supports the other two, makes the third.

Unity of character is as necessary as the unity of the fable. For this purpose a person should be the same from the beginning to the end: not that he is always to betray the fame sentiments, or one passion; but that he should never speak nor act inconsistently with his fundamental character. For instance, the weak may sometimes fall into a warmth, and the breath of the passionate be calm, a change which often introduces in the drama a very affecting variety; but if the natural disposition of the former was to be represented as boisterous, and that of the latter mild and soft, they would both act out of character, and contradict their persons.

True characters are such as we truly and really see in men, or may exist without any contradiction to nature: no man questions but there have been men as generous and as good as Aeneas, as passionate and as violent as Achilles, as prudent and wise as Ulysses, as impious and atheistical as Mezentius, and as amorous and passionate as Dido; all these characters, therefore, are true, and nothing but just imitations of nature. On the contrary, a character is false when an author so feigns it, that one can see nothing like it in the order of nature wherein he designs it shall stand: these characters should be wholly excluded from a poem, because transcending the bounds of probability and reason, they meet with no belief from the readers; they are fictions of the poet's brain, not imitations of nature; and yet all poetry consists in an imitation of nature.

Character is also used for certain visible qualities, which claim respect or reverence to those vested therewith.—The majesty of kings gives them a character which procures respect from the people. A bishop should sustain his character by learning and solid piety, rather than by worldly lustre, &c. The law of nations secures the character of an ambassador from all insult.

Character, among naturalists, is synonymous with the definition of the genera of animals, plants, &c.

Characteristic, in the general, is that which characterizes a thing or person, i.e. constitutes its character, whereby it is distinguished. See Character.

Characteristic is peculiarly used in grammar, for the principal letter of a word: which is preferred in most of its tenses and moods, its derivatives and compounds.

Characteristic of a Logarithm, is its index or exponent. See Logarithm.

Characteristic Triangle of a Curve, in the higher geometry, is a rectilinear right-angled triangle, whose hypotenuse makes a part of the curve, not feemingly different from a right-line. It is so called, because curve lines are used to be distinguished hereby. See Curve.

Charade, the name of a new species of composition or literary amusement. It owes its name to the idler who invented it. Its subject must be a word of two syllables, each forming a distinct word; and these two syllables are to be concealed in an enigmatical description, first separately, and then together. The exercise of charades, if not greatly instructive, is at least innocent and amusing. At all events, as it has made its way into every fashionable circle, and has employed even Garrick, it will scarcely be deemed unworthy of attention. The fillinies indeed of most that have appeared in the papers under this title, are not only delitute of all pleasantery in the stating, but are formed in general of words utterly unfit for the purpose. They have therefore been treated with the contempt they deserved. In trifles of this nature, inaccuracy is without excuse. The following examples therefore are at least free from this blemish.

I.

My first, however here abused,
Delights the sex alone;
In Cambria, such is cumb’s pow’r,
’Tis Jenkin, John, or Joan.
frequent our shores in the summer, but are not numerous. They lay four eggs, of a dull whitish colour, sparingly sprinkled with black: at the approach of winter they disappear.

2. The Alexandrinus, or Alexandrian Dotterel, is of a brownish colour, with the forehead, collar, and belly white; the prime tail-feathers on both sides are white; and the legs are black. It is about the size of a lark, and lives upon insects.

3. The Vociferous, or Noisy Plover of Cateby, has black streaks on the breast, neck, forehead, and cheeks; and the feet are yellow. It is a native of North America.

4. The Egypcia, has a black streak on the breast, white eye-brows, the prime tail-feathers streaked with black at the points, and bluish legs. It is found in the plains of Egypt, and feeds on insects.

5. The Morinellus has an iron-coloured breast, a small white streak on the breast and eye-brows, and black legs. It is the Dotterel of Ray, and a native of Europe. They are found in Cambridge-shire, Lincolnshire, and Derbyshire; on Lincoln-heath, and on the moors of Derbyshire, they are migratory; appearing there in small flocks of eight or ten only in the latter end of April, and stay there all May and part of June, during which time they are very fat, and much esteemed for their delicate flavour. In the months of April and September, they are taken on the Wiltshire and Berkshire downs; they are also found in the beginning of the former month on the sea-side at Measles in Lancashire, and continue there about three weeks, attending the barley fallows: from thence they remove northward to a place called Leyton Haws, and stay there about a fortnight; but where they breed, or where they refuse during the winter, we have not been able to discover. They are reckoned very foolish birds, so that a dull fellow is proverbially flyled a dotterel. They were also believed to mimic the action of theowler, stretching out a wing when he stretches out an arm, &c., continuing their imitation, regardless of the net that is spreading for them.

6. The Apriarius has a black belly; the body is brown, and variegated with white and yellow spots; and the legs are ash-coloured. It is the spotted Plover of Edwards, and a native of Canada.

7. The Pluvialis is black above, with green spots, white underneath, and the feet are ash-coloured. It is the green plover of Ray, and is a native of Europe. They lay four eggs, sharply pointed at the shorter end, of a dirty white colour, and irregularly marked, especially at the thicker end, with blotches and spots. It breeds on several unfrequented mountains of Scotland; and is very common on these of the Isle of Rum, and others of the loftier Hebrides. They make a thrilling whistling noise; and may be enticed within a shot by a skilful imitator of the note.

8. The Torquatus has a black breast, and a white front; the top of the head and the collar is black; and the beak and feet are bluish. It is a native of St Domingo.

9. The Calidris has black feet, and a black bill; the rump is greyish; and the body is pure white below. It frequents the shores of Europe.

10. The Oedicmenus or Stone-curlew of Ray, is of a grey-colour, with two of the prime wing-feathers black, but white in the middle: it has a sharp bill, and
and as the other Jews are remarkable for their eyes, so are those for their large noses, which run through all the families of this feet. These are the ancient Ephenes. They strictly observe the five books of Moses, according to the letter; and receive no written traditions. It is said that the other Jews would join the Charaimis; but those not having obeyed the exact rules of the law with regard to divorcements, these think they live in adultery.

CHARANTIA, in botany. See MOMORDICA.

CHARBON, in the manage, that little black spot or mark which remains after a large spot in the cavity of the corner teeth of a horse; about the seventh or eighth year, when the cavity fills up, the tooth being smooth and equal, it is said to be rafed.

CHARCAS, the southern division of Peru in South America, remarkable for the silver mines of Potosi.

CHARCOAL, a sort of artificial coal, or fuel, consisting of wood half burnt; chiefly used where a clear strong fire, without smoke, is required; the humidity of the wood being here moistly dissipated, and exhaled in the fire wherein it is prepared.

The microscope discovers a surprising number of pores in charcoal; they are disposed in order, and traverse it lengthwise; so that there is no piece of charcoal, how long forever, but may be easily blown through. If a piece be broken pretty short, it may be seen through with a microscope. In a range the 18th part of an inch long, Dr Hook reckoned 150 pores; whence he concludes, that in a charcoal of an inch diameter, there are no less than 5,724,000 pores. It is to this prodigious number of pores, that the blackness of charcoal is owing; for the rays of light striking on the charcoal, are received and absorbed in its pores, instead of being reflected; whence the body must of necessity appear black, blackness in a body being no more than a want of reflection. Charcoal was anciently used to distinguish the bounds of estates and inheritances; as being incorruptible, when let very deep within ground. In effect, it preserves itself so long, that there are many pieces found entire in the ancient tombs of the northern nations. M. Dodart says, there is charcoal made of corn, probably as old as the days of Cæsar: he adds, that it has kept so well, that the wheat may be still distinguished from the rye; which he looks on as proof of its incorruptibility.

The operation of charring wood, is performed in the following manner: The wood intended for this purpose is cut into proper lengths, and piled up in heaps near the place where the charcoal is intended to be made: when a sufficient quantity of wood is thus prepared, they begin constructing their stacks, for which there are three methods. The first is this: They level a proper spot of ground, of about twelve or fifteen feet in diameter, near the piles of wood; in the centre of this area a large billet of wood, split across at one end and pointed at the other, is fixed with its pointed extremity in the earth, and two pieces of wood inserted through the clefts of the other end, forming four right angles; against these crofs pieces four other billets of wood are placed, one end on the ground, and the other leaning against the angles. This being finished, a number of large and straight billets
Charcoal. billets are laid on the ground to form a floor, each being as it were the radius of the circular area; on this floor a proper quantity of bruish or small wood is strewn, in order to fill up the interstices, when the floor will be complete; and in order to keep the billets in the same order and position in which they were first arranged, pegs or slumps are driven into the ground in the circumference of the circle, about a foot distant from one another: upon this floor a flage is built with billets set upon one end, but something inclining towards the central billet; and on the tops of these another floor is laid in a horizontal direction, but of shorter billets, as the whole is, when finished, to form a cone.

The second method of building the stacks for making charcoal is performed in this manner: A long pole is erected in the centre of the area above described, and several small billets ranged round the pole on their ends: the interstices between these billets and the pole is filled with dry bruish-wood, then a floor is laid, on that a flage in a reclining position, and on that a fourth floor, &c. in the same manner as described above; but in the lower floor there is a billet larger and longer than the rest, extending from the central pole to some distance beyond the circumference of the circle.

The third method is this: A chimney, or aperture of a square form, is built with billets in the centre, from the bottom to the top; and round these, floors and inclined stages are erected, in the same manner as in the stacks above described, except that the base of this instead of being circular like the others, is square; and the whole stack, when completed, forms a pyramid.

The stack of either form being thus finished, is coated over with turf, and the surface plastered with a mixture of earth and charcoal-dust, well tempered together.

The next operation is the setting the stack on fire. In order to this, if it be formed according to the first construction, the central billet in the upper stage is drawn out, and some pieces of very dry and combustible wood are placed in the void space, called, by workmen, the chimney, and fire set to these pieces. If the stack be built according to the second construction, the central pole is drawn out, together with the large horizontal billet above described; and the void space occupied by the latter being filled with pieces of very dry combustible wood, the fire is applied to it at the base of the stack. With regard to the third construction, the square aperture or chimney is filled with small pieces of very dry wood, and the fire applied to it at the top or apex of the pyramidal stack. When the stack is set on fire, either at the top or bottom, the greatest attention is necessary in the workman; for in the proper management of the fire the chief difficulty attending the art of making good charcoal consists. In order to this, care is taken, as soon as the flame begins to issue some height above the chimney, that the aperture be covered with a piece of turf, but not so close as to hinder the smoke from passing out; and when the fire in a reclining position first appears to rise up out of the interstices that are formed at any part of the pile, the aperture must be covered with a mixture of earth and charcoal dust. At the same time, as it is necessary that every part of the stack should be equally burnt, it will be requisite for the workman to open vents in one part and shut them in another. In this manner the fire must be kept up till the charcoal be sufficiently burnt, which will happen in about two days and a half, if the wood be dry; but if green the operation will not be finished in less than three days. When the charcoal is thought to be sufficiently burnt, which is easily known from the appearance of the smoke, and the flames no longer issuing with impetuosity through the vents; all the apertures are to be closed up very carefully with a mixture of earth and charcoal-dust, which by excluding all access of the external air, prevents the coals from being any further consumed, and the fire goes out of itself. In this condition it is suffered to remain, till the whole is sufficiently cooled; when the cover is removed and the charcoal is taken away. If the whole process is skilfully managed, the coals will exactly retain the figure of the pieces of wood: some are said to have been so dexterous as to char an arrow without altering even the figure of the fletching.

There are considerable differences in the coals of different vegetables, in regard to their habit to fire: the very light coals of linen, cotton, some fungi, &c. readily catch fire from a spark, and soon burn out; but of the dene ones of woods and roots are set on fire more difficulty, and burn more slowly: the coals of the black berry-bearing alder, of the hazel, the willow, and the lime-tree, are said to answer best for the making of gunpowder and other pyrotechnical compositions, perhaps from their being easily inflammable: for the reduction of metallic calces those of the heavier woods, as the oak and the beech, are preferable, these seeming to contain a larger proportion of the phlogistic principle, and that perhaps, in more fixed states: considered as common fuel, those of the heavy woods give the greatest heat, and require the most plentiful supply of air to keep them burning; those of the light woods preserve a glowing heat, without much draught of air, till the coals themselves are consumed; the bark commonly crackles and flies about in burning, which the coal of the wood itself very seldom does.

Mathematical instrument makers, engravers, &c. find charcoal of great use to polish their brass and copper-plates after they have been rubbed clean with powdered pumice-stone. Plates of horn are polished in the same way, and a gloss may be afterwards given with tripoli.

The coals of different substances are also used as pigments; hence the bone-black, ivory-black, &c. of the floups. Most of the paints of this kind, besides their incorruptibility, have the advantage of a full colour, and work freely in all the forms in which powdery pigments are applied; provided they have been carefully prepared, by thoroughly burning the subject in a close vessel, and afterwards grinding the coal into a powder of due fineness. Pieces of charcoal are used also in their entire state for tracing the outlines of drawing &c. in which intention they have an excellence, that their mark is easily wiped out. For these purposes, either the finer pieces of common charcoal are picked out and cut to a proper shape; or the pencils are formed of wood, and afterwards burnt into charcoal in a proper vessel well covered. The artists commonly make choice of the smaller branches of the tree freed from the bark and pitch; and the willow and vine
Charcoal. 

vines are preferred to all others. This choice is confirmed by the experiments of Dr Lewis who has found that the wood of the trunks of trees produces charcoal of a harder nature than their small twigs or branches; and the hard woods, such as box and guaiacum, produced coals very feebly harder than the softer woods. Willow he prefers to all others. The shells and bones of fruits yielded coals so hard that they would scarce mark on paper at all; while the coals of the kernels of fruits were quite soft and mellow. The several coals produced by the doctor's experiments were levigated into fine powder, mixed both with gum-water and oil, and applied as paints both thin and thick, and diluted with different degrees of white. All of them, when laid on thick, appeared of a strong full black, nor could it be judged that one was of a finer colour than another; diluted with white, or when spread thin, they had all somewhat of a bluish cast.

Horns and the bones both of fishes and land-animals, gave coals rather glossier and deeper-coloured than vegetables; and which, in general were very hard, so as difficulty, or not at all, to stain paper. Here also the hardness of the coal seemed to depend on that of the subject from whence it was prepared; for silky, woolen, leather, blood, and the flesh parts of animals, yielded soft coals, some of these differed from others very feebly in colour; that of ivory is superior to all the rest, and indubitably the finest of all the charcoal blacks. The animal coals had much less of the bluish cast in them than the vegetable, many of them inclining rather to a brown. Charred pit-coal, on the other hand, seemed to have this blueness in a greater degree.

Charcoal is not soluble in any of the acids; but may be dissolved in considerable quantities by a solution of *hepar fulphuris*, to which it communicates a green colour. Melted with colourless fruits or glases, it gives a pale yellow, dark yellow, reddish, brownish, or blackish colour, according as the inflammable matter is in greater or less proportion; the phlogiston, or inflammable matter of the coal seeming to be the direct tinging substance. When the phlogistic matter is thus diffused through glases, it is no more affected by continued strong fire than charcoal is when excluded from the air.

The vapour of burning charcoal is found to be highly noxious, being no other than fixd air. How this affects the animal system is explained under the article Blood.

From some late experiments it appears, that charcoal poisons many extraordinary properties altogether unsupected by former chemists. It has particularly a great attraction for what is called the phlogiston, or rather for any kind of oily matter with which other substances may be allied; so that it now promises to be very useful in the arts in various ways never thought of before. M. Lowitz has found that it is useful in preparing crystals of tartar of a very white colour; and that the marine and nitrous acids are decomposed by being distilled upon it; the red juices of vegetable fruits are discoloured, without losing any of their acidity; brown rancid oils are rendered sweet and clear by agitating them for some days with charcoal in powder; it changes the smell of putrid vegetables to that of a pure volatile alkali, and it produces the same effect on fresh meat. On boiling in powder with honey, the pure saccharine parts of the latter are laid to be separated, and the honey to become a well-tasted sugar; the purification of real sugar is also laid to be facilitated by the same method. Thus also the mother-water of the Protian alkali and of the tartaraceous acid are made to crystallize easily; terra folia tartari may be made white without calcination, by previously diffusing the vinegar from coals. Vinegar concentrated by freezing, and diffused from a large proportion of powdered coal, is extremely strong, pure, and fragrant. Corn spirit merely shaken with coal loses its bad flavour; and if honey is added, it becomes a sweet and pleasant liquor. Even when ardent spirits are impregnated with any vegetable oils, the flavour is destroyed in this way; and if the spirit be distilled the residuum is said not to be brown; so that if the distillation is carried too far, no inconvenience ensues. With Peruvian bark, a clear decoction was formed, and the residuum was a salt, in taste like digestive salt. These effects were produced by every kind of coal, whether fol­filed or charred vegetable substances.

Charcoal has lately been separated from the pure spirit of wine in the process for making ether*, and by M. Lavoisier is supposed to be of the confi­tulent parts or elements of that very volatile liquid. But the most extraordinary modern discovery concerning this substance is that of Dr Priestley, who has found that several of the metals may be converted into charcoal by passing the steam of spirit of wine over them when red-hot; and this, by way of distillation, he calls the charcoal of metals.

This surprising discovery was made accidentally, while the Doctor was repeating the experiments by which Mr Lavoisier imagined water might be converted into air. Having transmitted the steam of water through a copper tube, on which it had no effect, he was willing to try the effects of that of other fluids; and for this purpose made choice of spirit of wine, having before procured inflammable air by sending the same steam through a red-hot tobacco-pipe. No sooner had the vapour of this fluid, however, touched the red-hot copper, than he was astonished at the rapid production of air from it, which resembled the blowing of a pair of bellows; and before four ounces of the spirit were expended, the tube was found to be perforated in two or three places. In a moment afterwards it was so far destroyed, that it fell to pieces on attempting to remove it from the fire; the inside being filled with a black matter resembling lamp-black. Having now recourse to earthen tubes, the Doctor found that, by melting copper and other metals in them, and transmitting the vapour of spirit of wine in contact with them while in a state of ignition, different substances were formed according to the metals employed. On sending three ounce-measures of spirit of wine over two ounces of copper, the metal lost 28 grains of its weight, and 446 grains of charcoal were procured, chiefly in the form of powder, though some of it was in large flakes several inches long; having separated at once from the surface of the melted metal. These pieces were almost quite black, and bore handling without any danger of being broken. In another experiment 138 grains of charcoal were obtained from 10 grains of copper; but here the metal had been previously re­duced
Charcoal was indisputable by any other means than burning in an open fire, though of late it is found totally dissilable and convertible into inflammable air, by the heat of a burning lens in vacuo, at least with the sufficiency of a small quantity of water. By burning in dephlogisticated air, it is found to convert almost the whole of it into fixed air. See *Aerology*, p. 110—113, 129, 131. From the experiments there related, it is now evident, that charcoal as such, and without any decomposition, is an ingredient in both those aerial fluids, and is indeed the phlogiston of Stahl so long sought in vain. This discovery, however, has not by any means put an end to the disputes between the Phlogistians and Antiphlogistians, though it certainly ought to have done so, and must assuredly do so in a short time. The experiments of Dr Priestley are not doubted; and charcoal, the gravitating matter of light inflammable air, and phlogiston, are allowed to be the same by the Antiphlogistians as well as by the opposite party. "The present controversy (says Mr Higgins) among the philosophers depends upon the following questions: 1. Whether water be or be not composed of dephlogisticated and light inflammable phlogiston? 2. Whether or no the condensation of dephlogisticated air, or its union to different bodies, does not depend upon one principle, common to all combustible bodies? or, in other words, whether or no all bodies which burn or calcine, such as sulphur, phosphorus, charcoal, oils, metals, phlogisticated air, &c. contain the matter of light inflammable air as one of their constituent principles? One should suppose, if these substances were composed of two principles, namely a peculiar basis, and the matter of light inflammable air or phlogiston, that it would be possible to resolve them into these principles; more especially when we consider the great attraction of the matter of light inflammable air to fire; but the maintainers of phlogiston have not as yet been able to do this," &c.

The limits of this work will not allow us to enter on a full discussion of this controversy, nor can we pretend to be able to settle the disputes on the subject. It nevertheless seems somewhat unnatural to call iron, lead, copper, sulphur, phosphorus, &c. simple and unchangeable bodies, or if we please elements; as thus the number of elementary bodies might be increased without number, and water, which has generally been reckoned a simple one, supposed to be almost the only compound body in nature. It is also certain, that Dr Priestley has made some very striking and apparently decisive experiments on the subject of metals, to which no proper reply has ever been made. In order to see the force of these experiments, however, we must still observe, that, according to the Phlogistians, the calces of metals are reduced, on the addition of charcoal, not only by emitting the dephlogisticated air which adheres to them when in the form of calces, but by the admission of a quantity of the charcoal itself into their substance. This the Antiphlogistians deny; and though they admit the necessity of charcoal in the operation, yet they affirm that it acts only by attracting the dephlogisticated air contained in the calx, with which it forms fixed air; and hence they must say, that in all metallic reductions a quantity of fixed air is produced, equivalent not only to the weight of the charcoal employed, but also to that of the dephlogisticated air.
Charcoal, contained in the calx. The decisive experiment therefore would be, to expel from a metallic calx all the air it contained, to weigh it exactly in that state, and then observe whether it gained any thing in weight by being reduced to a metal. This, however, has not been done; and the Antiphlogistians complain that their adverse faction has not been able to produce a metallic calx free from all kind of aerial vapour. But though it is not pretended that any such calx has yet been produced, if the Phlogistians can show the possibility of reducing a calx without the production of fixed air, it would seem to be equally destructive of the antiphlogistic doctrine. This appears to have been done by Dr Priestley in the experiments above alluded to; and it is even doubtful whether he did not obtain the so much defir’d calx, viz. one perfectly free from air altogether. I put (says he) upon a piece of broken crucible, which could yield no air, a quantity of minium, out of which all air had been extricated; and placing it upon a convenient stand, introduced it into a large receiver filled with inflammable air confined by water. As soon as the minium was dry, by means of the heat thrown upon it, I observed that it became black, and then ran in the form of flame, which I began the production of minium, all the more directly. To judge of its degree of inflammability, I converted into fixable air by the electric spark. Hence we may conclude, that not a particle of charcoal entered into the constitution of the revived lead, but must have been wholly converted into fixable air.

To this experiment, however, the Phlogistians will reply, that so far from being decisive on the subject, no conclusion whatever can be drawn from it, on account of its enormous inaccuracy. The quantity of matter put into the retort was 7680 or 7200 grains, and the whole produce was 3883 + 384 + 8.704 + 0.911 = 4330.615 grains: a deficiency therefore of no less than 346.385 grains is to be accounted for; and of this we hear not one word; so that we are at liberty to suppose that the vitrified litharge had perforated the retort in such a manner as to admit the fresh and phlogisiticated air to without, as Dr Priestley found earthen retorts pervious to air from without; and this, though coated, might by a corrosion of the glass (if it was a glass one) be reduced to a similar fitation.

We do not mean that this should be reckoned a formal answer to Dr Higgins’s experiment; all we intend here, is to state the arguments fairly on both sides, so that the reader who has not an opportunity of making experiments himself, may be able to judge on which side the truth lies. Dr Priestley informs us, that in his experiment, the calx of lead absorbed a quantity of inflammable air without the extrication of fixed air, or any thing else that could be perceived. Whether or not we have reason to conclude from thence, that
that the gravitating, solid, or coaly, part of the inflammable air was received into the calx, and became part of the revived metal? In Dr Higgins's experiment a quantity of elastic fluid was produced, and a quantity of lead revived; but we neither know how much of the calx went to this lead, how much the li- 

charge had originally attracted from the air, nor whether the elastic fluids were certainly produced; or indeed whether any of them, the small quantity of dephlogi- 
ficited air alone excepted, came from the materials or not. From such a state of the cafe, then, have we

reason to "conclude, that not a particle of charcoal entered into the constitution of the lead?"

We shall next consider an experiment made by Mr Higgins himself, and which he likewise considers as decisive against the Phlogistians. I introduced (says he) some iron nails, free from rust, into strong volatile vitriolic acid; when it stood for a few minutes, it acquired a milky appearance, and the solution went on without ebullition or extraction of air. On standing for a few hours, the solution acquired a darkish colour, and a black powder was precipitated. This powder, when collected and washed, put on red hot iron, burned partly like sulphur and partly like charcoal dust, and the incombustible residuum was of a purplish colour. The filtered solution was perfectly neutralized, and free from the leaf sulphureous pun- 
gency. Its taste was strongly chalybeate, but not so disagreeable as that of the solution of iron in the perfect vitriolic acid, or in any of the mineral acids. Nitrous acid dropped into the solution instantly produced a cloud, which immediately disappeared without e-
bullition, though volatile sulphureous acid was exi-

ticated in its ursuof degree of pungency. The vitri-
olic, marine, and acetic acids, decomposed this solu-
tion, but caufed no turbidnefs, nor was any inflammable air produced.

In order to know whether the sulphur was dis-
engaged from the volatile sulphureous acid or the iron, I poured marine acid on the fame nails, when light inflammable air and hepatic air were copiously produ-
ced, and likewise sulphur was produced in its crude flate. When I used vitriolic or the nitrous acid, no sulphur was produced. I tried different nails, and likewise in its fliings, with the fame reftult. These facts convinced me that the sulphur came from the iron; but that all forts of iron contain sulphur is what I cannot pretend to know, as I have not tried fteel, or va-

rieties enough of malleable iron. However, I have 

strong reasons to fuppofe, that sulphur has more to do in the different properties of iron than we are aware of. That iron should contain sulphur, notwithstanding the different proceedes it muft necessarily undergo before it acquires malleability, confidering the volatility of sul-
phur, points out the force of their attraction to one another; and the separation of this again by volatile sulphureous acid, shows likewise the greater attraction of iron to sulphur and dephlogi- 
ficited air jointly. That volatile sulphureous acid fhould diflolve iron without the extraction of inflammable air or phlogi-

fion, is a very strong inftance of the falsity of the phlogiftic doctrine. A small quantity of inflammable air is produced, but it is fo trifling comparatively to what should be produced from the quantity of iron dif- 

olved, that it is hardly worth noticing; and in my opinion proceeds from a portion of perfect vitriolic acid, which is generally infeeparable from the volatile acid. If volatile vitriolic acid were a compound of phlogifon, a certain basis, and dephlogi- 

cificated air, a greater quantity of inflammable air fhould have been difengaged during the folution of iron in this acid than when the perfect vitriolic acid is used. Let us even fuppofe volatile sulphureous acid to be compofed of the basis of sulphur, phlogifon, and dephlogi-
cificated air, which is the opinion of all the phlogiftians, though they differ with refpect to the modification of the fteer three principles; and likewise iron to be compofed of a certain basis and phlogifon; I would ask the Phlo-

giftians, What becomes of the phlogifon of the iron during its folution?"

But however much Mr Higgins may be convinced, from this experiment, of the fallacy of the phlogiftic doctrine, his adversaries instead of being fcelenized, will urge his own experiment againft him. He owns, that during the folution something was feparated of a black colour, and which burned like charcoal dust. Unless therefore Mr Higgins fhall prove the contrary, they will fay that this was the real phlogifon or charcoal which entered into the fubfance of the metal; and that it appeared in its native form, because the volatile vitriolic acid had not specific or latent heat fufficient to convert it into inflammable air. At any rate, it was incumbent on Mr Higgins to have accounted for the coaly part of his residue as well as the sulphureous one; yet he has been at considerable pains to deduce the latter from the iron, without speaking a word about the former. Indeed whether he deduced this from the iron or the vitriolic acid, it will make equally againft him; for his principles do not allow that the volatile vitriolic acid contains any charcoal. That the latter really does so, however, appears from an experiment of Dr Priestley, in which he reduced a calx of lead by means of vitriolic acid air, the fame with the vitriolic or volatile sulphureous acid. It is true, that only a small quantity of metal was then procured; but however small this was, the Antiphlogiftians do not pretend that metals can be reduced to their metallic flate in any quantity, except by the mediation of char-
}

coal. Thus it appears, that with regard to metals the dif-

pute is as yet far enough from being decided in fa-

vour of the Antiphlogiftians. Their caufe is equally doubtfull with regard to sulphur and phosphorus, both of which Dr Priestley has produced by heating vitri-
olic and phlogifonic acid in inflammable air. Indeed, by two experiments one of which I gave more particular attention, fix ounce-meafures and an half of the dephlogi- 
ficated air were reduced to about two ounce-meafures, and one-fifth of this was fixed air." Now, though the Doctor inferred from this, that fixed air was compofed of phlogifon and dephlogi-
cificated air, on the supposition of sulphur containing phlogifon; yet admitting from other proofs, that fixed air is compofed of these two principles, the experi-

ment
In the Chemie of Mr. Cavendish, charcoal, in a certain extent of the veifel, which he found, after expounding them, that the product of water fell far short of the weight of both airs, and he observed a dense vapour after every explosion, which soon condensed, and adhered in a solid flat to the sides of the vessel, which he found afterwards to be the nitrous acid. To this Mr Higgins adds, that the airs ought to have been accurately weighed after abstracting the water from them, when (he supposes) the weight of water produced would have equalled them. This indeed ought to have been done; but Mr Higgins, or some Antiphlogiſt, ought to have done it before he decided positively in favour of the opposite doctrine. At any rate, it cannot be pretended, that in any experiment, let the circumstances of it be what they would, the quantity of water produced ever equalled that of the two airs. It is evident, therefore, that till this shall have some how or other be cleared up, the matter must remain uncertain. That the pureft water we can obtain always contains phlogiſtion, is what no Phlogiſt denies; that it essentially belongs to it is doubtful, though indeed it must be probable, that it does fo until experiments shew the contrary. Mr Cavendish supposes that dephlogiſicated air and dephlogiſicated water may be the fame; and indeed this would seem to be almoſt certain, were it not for a circumstance taken notice of by Mr Higgins, viz. that in the firing of iron in dephlogiſicated air the latter appears to be totally absorbed; though it is certain, that a quantity of undecompoſed water enters into its composition.

How far this circumstance throws any obfcurity on the matter the reader muft determine. For a more full investigation of the subject, however, we muft refer to the article Water; and in the mean time we fhall difmit the article with a few obervations on the composition of charcoal.

From the days of Stahl till very lately, the component parts of this Subftance have been reckoned a certain kind of earth combined with what was called phlogiſtion. The late experiments of Dr Prieflley have shown, that this doctrine is erroneous, and that charcoal is wholly difpofable into vapour. "On the whole, says the translator of Wiegľeb's Chemie, charcoal appears from the experiments of Lavoifier and Barhollet, to be an oil depraved of its inflammable gas. But coal of wood (or common charcoal) likewife contains fixed alkali, which the foot (or the coal of oil) does not, but instead of this exhibits volatile alkali. The fixed alkali of the former proceeds from the plant itself, and this, in the cafe of foot, is joined with inflammable gas, and forms volatile alkali, the earthly part being left behind, as happens when this latter is prepared from fixed alkali. Genuine charcoal, therefore, consists of this vegetable principle, united with a little fixed alkali and part of the phlogiſtion that constituted the oil of the plant of which it is made; for some of this principle is carried off, together with the hydrophlogie (a), in the form of inflammable gas, if diftilled in clofe veifels; but if burned in the open air, the hydrophlogie unites with the pure part of the air, and forms water. From these obervations, as well as from the experiments and obervations of M. Berthollet, in the Mem. de l'Acad. des Sciences pour 1780, p. 33. et seq. it appears, that common charcoal consists of the vegetable principle, some phlogiſtion, fixed alkali, and no inflammable gas."

Comparative Phier., P. 3.

On this article AEROLOGY, n° 81., we have quoted Dr Prieflley as favouring the doctrine of the decomposition of water; and in Mr Higgins's work we find him quoted as opposing it. "Dr Prieflley (says he) supposes that the water produced by the condensation of inflammable and dephlogiſicated air, is only what was suspended and attached to them in their effufion, which foon condenſed, and adhered in a folid flat to the sides of the veifel, which he found afterwards to be the nitrous acid. To this Mr Higgins adds, that the airs ought to have been accurately weighed after abstracting the water from them, when (he supposes) the weight of water produced would have equalled them. This indeed ought to have been done; but Mr Higgins, or some Antiphlogiſt, ought to have done it before he decided positively in favour of the opposite doctrine. At any rate, it cannot be pretended, that in any experiment, let the circumstances of it be what they would, the quantity of water produced ever equalled that of the two airs. It is evident, therefore, that till this shall have some how or other be cleared up, the matter must remain uncertain. That the pureft water we can obtain always contains phlogiſtion, is what no Phlogiſt denies; that it essentially belongs to it is doubtful, though indeed it must be probable, that it does fo until experiments shew the contrary. Mr Cavendish supposes that dephlogiſicated air and dephlogiſicated water may be the same; and indeed this would seem to be almost certain, were it not for a circumstance taken notice of by Mr Higgins, viz. that in the firing of iron in dephlogiſicated air the latter appears to be totally absorbed; though it is certain, that a quantity of undecompoſed water enters into its composition.

How far this circumstance throws any obscurity on the matter the reader must determine. For a more full investigation of the subject, however, we must refer to the article Water; and in the mean time we shall dismiss the article with a few observations on the composition of charcoal.

From the days of Stahl till very lately, the component parts of this substance have been reckoned a certain kind of earth combined with what was called phlogiſtion. The late experiments of Dr Prieflley have shown, that this doctrine is erroneous, and that charcoal is wholly dispoſable into vapour. "On the whole, says the translator of Wiegľeb's Chemie, charcoal appears from the experiments of Lavoifier and Barhollet, to be an oil deprived of its inflammable gas. But coal of wood (or common charcoal) likewise contains fixed alkali, which the foot (or the coal of oil) does not, but instead of this exhibits volatile alkali. The fixed alkali of the former proceeds from the plant itself, and this, in the case of foot, is joined with inflammable gas, and forms volatile alkali, the earthly part being left behind, as happens when this latter is prepared from fixed alkali. Genuine charcoal, therefore, consists of this vegetable principle, united with a little fixed alkali and part of the phlogiſtion that constituted the oil of the plant of which it is made; for some of this principle is carried off, together with the hydrophlogie (a), in the form of inflammable gas, if distilled in close vessels; but if burned in the open air, the hydrophlogie unites with the pure part of the air, and forms water. From these considerations, as well as from the experiments and observations of M. Berthollet, in the Mem. de l'Acad. des Sciences pour 1780, p. 33. et seq. it appears, that common charcoal consists of the vegetable principle, some phlogiſtion, fixed alkali, and no inflammable gas."

On this occasion indeed he acknowledges, that some very minute particles of ashes were observed, which could not have amounted to a single grain from many pounds of wood. Even these, according to what he observes in the same place, may be supposed to have come from the small quantity of air in the receiver; and it is to be wished that the Doctor would repeat the experiment in one of those perfect vacuums through which the electric fluid cannot be made to pass. From undisputed experiments, however, it appears, that charcoal cannot be decomposed by mere heat; as in vacuo it is dispoſed into inflammable air; and

(a) See Engel. Vol. I. p. 160, col. 1. where, in lines 18, 19, from the top, read precipitate for charcoal.

(b) A word used by Mr Wiegľeb, as far as we can comprehend the author's meaning, for one of the component parts of water. See his General System of Chemie, translated by Hopfon, p. 59.
Charcoal, and this, on presenting a proper substance to attract the gild part again discover itself, by its blackness, to be real charcoal. As little does it appear destructible by burning in the open air; for though some ashes are left, it appears probable that those differ from the coal itself in nothing but having a quantity of air attached to them. By far the greatest part of it, even in the common way of burning, is converted into fixed air; and from that it may again be separated by taking the electric spark in that fluid, when it is resolved into very pure dephlogisticated and inflammable air. The same separation may be effected by merely heating iron in fixed air; in which case the dephlogisticated part will unite to the iron, and the coal part, together with part of the phlogiston of the metal, are converted into inflammable air. From all these, and other considerations, a suspicion is induced, that the matter of charcoal is not different from the element of earth itself; and that, according to the different modifications of this substance, it either appears as coal, ashes, earth of various kinds, or even metals. This receives some confirmation from the following experiments of Mr Watt, related in the 74th volume of the Philosophical Transactions: "I dissolved (says he) magnesia alba, calcareous earth, and minimum, in nitrous acid dephlogisticated by boiling, and diluted with proper proportions of water. I made use of glass retorts coated with clay; and I received the air in glass vessels, whose mouths wereimmered in a glazed earthen bason containing the smallest quantity of water that could be used for the purpose. As soon as the retort was heated a little above the degree of boiling water, the solutions began to distil watery vapours containing nitrous acid. Soon after these vapours ceased, yellow fumes, and, in some of the cafes, dark red fumes, began to appear in the neck of the retort; and, at the same time, there was a production of dephlogisticated air, which was greater in quantity from some of these mixtures than from others, but continued in all of them until the substances were reduced to dryness. I found in the receiving water, &c. very near the whole of the nitrous acid used for their solution, but highly dephlogisticated, so as to emit nitrous air by the application of heat; and there is reason to believe, that with more precaution the whole might have been obtained. As the quantity of dephlogisticated air produced by these procedures did not form a sufficient part of the whole weight to enable me to judge whether any of the real acid entered into the composition of the air I obtained, I ceased to pursue them further, having learned from them the fact, that however much the acid and the earths were dephlogisticated before the solution, the acid always became highly dephlogisticated in the process.

In order to examine whether this phlogiston was furnished by the earths, some dephlogisticated nitrous acid was distilled from minimum till no more air or acid came over. More of the same acid was added to the minimum as soon as it was cold, and the distillation repeated, which produced the same appearances of red fumes and dephlogisticated air. This operation was repeated a third time on the same minimum, without any sensible variation in the phenomena. The process should have been still farther repeated, but the retort broke about the end of the third distillation; the quantity of minimum used was 120 grains, and the quantity of nitrous acid added each time was 240 grains, of such strength that it could dissolve half its weight of mercury by means of heat. It appears from this experiment, that unless minimum be fopposed principally to consist of phlogiston, the source of the phlogiston thus obtained, was either the nitrous acid itself, or the water with which it was diluted; or else that it came through the retort with the light; for the retort was in this case red hot before any air was produced. Yet this latter conclusion does not appear very satisfactory, when it is considered, that in the process wherein the earth made use of was magnesia, the retort was not red hot, or very obscurely so, in any part of the process, and by no means luminous when the yellow and red fumes first made their appearance."

To these experiments, however, the Antiphlogistians will not doubt reply, that there was no phlogiston in the cafe, and that the nitrous acid was only decomposed; and indeed the decisive experiment here would be, the entire disintegration of a quantity of earth into some kind of air, as may be done with charcoal; but to do this in the way of distillation must be attended with incredible labour, though, as finally deciding this point, it seems to be well worth pursuing.

A pretty strong proof of the identity of metallic calces with charcoal, is their conversion into it in the manner already related. Experiments, however, are yet wanting on the subject; though it seems probable from what Dr Price has already done, that they may thus be entirely disintegrated into air as well as common charcoal.

CHARDIN, (Sir John) a celebrated traveller, was born at Paris, 1643. His father, who was a jeweller, had him educated in the Protestant religion; after which he travelled into Persia and India. He traded in jewels, and died at London in 1713. The account he wrote of his travels is much esteemed.

CHARENTON, the name of two towns of France, the one upon the Marmaude in the Bourbonnais; the other in the ile of France, near the confluence of the Marne with the Seine.

CHARES the Lydian, a celebrated famiary, was the disciple of Lyippos; and made the famous Colossus of the sun in the city of Rhodes. Flourished 288 years before Christ.

CHARGE, in gunnery, the quantity of powder and ball whereby a gun is loaded for execution.

The rules for charging large pieces in warfare, that the piece be first cleaned or scourd withinide: that the proper quantity of powder be next driven in and ramméd down; care, however, being taken, that the powder, in ramming, be not bruised, because that weakens its effect: that a little quantity of paper, hay, lint, or the like, be rammed over it; and that the ball or shot be intruded. If the ball be red hot, a topHon, or treoucher of green wood, is to be driven in before it. The common allowance for a charge of powder of a piece of ordnance is half the weight of the ball. In the British Navy, the allowance for 32 pounders is but seven-sixteenths of the weight of the ball. But a Robin's, Proc. late author is of opinion, that if the powder in all ships had been reduced to one-third weight of the ball, or even less, it would be of considerabe ad. vantage, not only by saving ammunition, but by keep.
Every chariot carried two men, who were probably the warrior and the charioteer; and we read of several men of note and valor employed in driving the chariot. When the warriors came to encounter in close flight; they alighted out of the chariot, and fought on foot; but when they were weary, which often happened by reason of their armour, they retired into their chariot, and thence annoyed their enemies with darts and missile weapons. These chariots were made so strong, that they lasted for several generations.

Besides this fort, we find frequent mention of the currus falcati, or those chariots armed with hooks, or fists, with which whole ranks of soldiers were cut off together, if they had not the art of avoiding the danger; these were not only used by the Persians, Syrians, Egyptians, &c. but we find them among the ancient Britons; and notwithstanding the imperfect state of some of the most necessary arts among that nation before the invasion of the Romans, it is certain that they had war-chariots in great abundance. By the Greek and Roman historians, these chariots are described by the six following names; viz Benna, Petoritum, Carrus or Carrus Covinus, Efedum, and Rheda. The benna seems to have been a chariot designed rather for traveling than war. It contained two persons, who were called con vehemens, from their sitting together in the same machine. The petoritum seems to have derived its name from the British word petoritum, signifying four; this kind of carriage having four wheels. The carrus or carrus was the common cart or wagon. This kind of chariot was used by the ancient Britons, in times of peace, for the purposes of agriculture and merchandise; and in times of war, for carrying their baggage, and wives and children, who commonly followed the armies of all the Celtic nations. The covinus was a war-chariot, and a very terrible instrument of destruction; being armed with sharp fists and hooks for cutting and tearing all who were so unhappy as to come within its reach. This kind of chariot was made very light, and had few or no men in it besides the charioteer; being designed to drive with great force and rapidity, and to do execution chiefly with its hooks and fists. The esedum and rheda were also war-chariots, probably of a larger size, and stronger made than the covinus, designed for containing a charioteer for driving it, and one or two warriors for fighting. The far greatest number of the British war-chariots seem to have been of this kind. These chariots, as already observed, were to be found in great numbers among the Britons; infomuch that Caesar relates that Cassibelanus, after dismiling all his other forces, retained no fewer than 4000 of these war-chariots about his person. The same author relates, that, by continual experience, they had at last arrived at such perfection, in the management of these chariots, that "in the most steep and difficult places they could throw their horses upon full stretch, turn them which way they pleased, whatever might be the narrowness of the road, and throw themselves back into their chariots, with incredible dexterity."
CHARITY, among divines, one of the three grand theological virtues, consisting in the love of God and of our neighbour, or the habit and disposition of loving God with all our heart, and our neighbour as ourselves.

Charity is also used for the effect of a moral virtue, which consists in supplying the necessities of others, whether with money, counsel, assistance, or the like.

As pecuniary relief is generally the most efficacious, Charity and at the same time that from which we are most apt to excuse ourselves, this branch of the duty merits particular illustration; and a better cannot be offered than what is contained in the following extract (if we may be permitted to make them) from the elegant Moral System of Archdeacon Paley.

Whether pity be an infirmity or a habit, it is in fact a property of our nature, which God appointed; and the final cause for which it was appointed, is to afford to the miserable, in the compulsion of their fellow creatures, a remedy for those inequalities and diftresses which God foreknew that many must be exposed to, under every general rule for the distribution of property.

The Christian scriptures are more copious and explicit upon this duty than almost any other. The description which Christ has left us of the proceedings of the last day, establishes the obligation of bounty beyond controversy. When the Son of Man shall come in his glory, and all the holy angels with him, then shall he sit upon the throne of his glory, and before him shall be gathered all nations; and he shall separate them one from another. Then shall the king say unto them on his right hand, Come ye blessed of my father, inherit the kingdom prepared for you from the foundation of the world: For I was an hungered, and ye gave me meat; I was a stranger, and ye took me in; naked, and ye clothed me; I was sick, and ye visited me; I was in prison, and ye came unto me. And as much as ye have done it to one of the least of these my brethren, ye have done it unto me.” It is not necessary to understand this passage as a literal account of what will actually pass on that day. Supposing it only a fictitious description of the rules and principles by which the Supreme Arbiter of our destiny will regulate his decisions, it conveys the same lesson to us; it equally demonstrates how great value and importance these duties in the sight of God are, and what effects will be laid upon them. The apostles also describe this virtue as propitious to the divine favour in an eminent degree. And these recommendations have produced their effect. It does not appear that before the times of Christiandom, an infirmary, hospital, or public charity of any kind, existed in the world; whereas most countries in Christendom have long been bounded with these institutions. To which may be added, that a spirit of private liberality seems to flourish amidst the decay of many other virtues: not to mention the legal provision for the poor, which obtains in some countries, and which was unknown and unthought of by the most polished nations of antiquity.

St Paul adds upon the subject an excellent direction: and which is practicable by all who have any thing to give. “Upon the first day of the week (or any other fasted time) let every one of you lay by in store, as God hath prospered him.” By which the apostle may be understood to recommend what is the very thing wanting with most men, the being charitable upon a plan; that is, from a deliberate comparison of our fortunes with the reasonable expenses and expectations of our families, to compute what we can spare, and to lay by so much for charitable purposes, in some mode or other. The mode will be a consideration afterwards.

The
Charity. The effect, which Christianity produced upon some of its converts, was such as might be looked for from a divine religion coming with full force and miraculous evidence upon the confinences of mankind. It overwhelmed all worldly considerations in the expectation of a more important existence. "And the multitude of them that believed were of one heart and of one soul; neither said any of them that ought of the things which he possessed, was his own; but they had all things in common.—Neither was there any among them that lacked; for as many as were possessors of lands or houses sold them, and brought the prices of the things that were sold, and laid them down at the apostle's feet; and distribution was made unto every man, according as he had need." Acts iv. 32.

Nevertheless, this community of goods, however it manifested the sincere zeal of the primitive Christians, is no precedent for our imitation. It was confined to the church at Jerusalem; continued not long there; was never enjoined upon any (Acts v. 4); and, although it might suit with the particular circumstances of a small and select society, is altogether impracticable in a large and mixed community.

The conduct of the apostles upon the occasion deserves to be noticed. Their followers laid down their fortunes at their feet: but so far were they from taking advantage of this unlimited confidence to enrich themselves or establish their authority, that they soon after got rid of this business as inconsistent with the main object of their mission, and transferred the custody and management of the public funds to deacons, elected to that office by the people at large. (Acts vi.)

There are three kinds of charity, our author observes, which prefer a claim to attention.

1. The first, and apparently one of the best, is to give stated and considerable sums, by way of pension or annuity to individuals or families, with whose behaviour and distresses ourselves are acquainted. In speaking of considerable sums, it is meant only, that five pounds, or any other sum, given at once, or divided amongst five or fewer families, will do more good than the same sum distributed amongst a greater number in shillings or half crowns; and that, because it is more likely to be properly applied by the persons who receive it. A poor fellow, who can find no better use for a shilling than to drink his benefactor's health, and purchase half an hour's recreation for himself, would hardly break into a guinea for any such purpose, or be so provident as not to lay it by for an occasion of importance, for his rent, his clothing, fuel, or flock of winter's provision. It is a still greater recommendation of this kind of charity, that pensions and annuities, which are paid regularly, and can be expected at the time, are the only way by which we can prevent one part of a poor man's sufferings, the dread of which may pervert by such a conduct. Men are sometimes overtaken by distresses, for which all other relief would come too late. Besides which, resolutions of this kind compel us to offer such violence to our humanity, as may go near, in a little while, to suffocate the principle itself; which is a very serious consideration. A good man, if he do not surrender himself to his feelings without reserve, will at least lend an ear to importunities which come accompanied with outward attestations of distress; and after a patient hearing of the complaint, will direct himself by the circumstances and credibility of the account that he receives.

There are other species of charity well contrived to make the money expended go far, such as keeping down the price of fuel or provision in case of a monopoly or temporary scarcity, by purchasing the articles at the best market, and retailing them at prime cost, or at a small loss; or the adding a bounty to a particular species of labour, when the price is accidentally depressed.

The proprietors of large estates have it in their power to facilitate the maintenance, and thereby encourage the establishment of families (which is one of the noblest purposes to which the rich and great can convert their endeavours), by building cottages, splitting farms, erecting manufactories, cultivating waifs, embanking the sea, draining marshes, and other expedients, which the situation of each estate points out. If the profits of these undertakings do not repay the expense, let the authors of them place the difference to the account of charity. It is true of almost all such projects, that the public is a gainer by them, whatever the owner be. And where the loss can be spared, this consideration is sufficient.

It is become a question of some importance. Under what circumstances works of charity ought to be done in private, and when they may be made public without detracting from the merit of the action; if indeed they ever may, the Author of our religion having delivered a rule upon this subject, which seems to enjoin universal observance. "When thou doest alms, let not thy left hand know what thy right hand doth; that thy alms may be in secret, and thy Father which seeth in secret, himself shall reward thee openly." (Matt. vi. 3, 4.) From the preamble to this prohibition, it is plain that our Saviour's sole design was to forbid ostentation, and all publishing of good works which proceeds from that motive. Take heed that ye do not your alms before men, to be seen of them; otherwise ye have no reward of your Father, which is in heaven: therefore, when thou doest thy alms, do not look upon a trumpet before thee, as the hypocrites do in the synagogues and in the streets, that they may have glory of men.
There are motives for the doing our duties in public beside those of ostentation: with which therefore our Saviour's rule has no concern; such as to testify our approbation of some particular species of charity, and to recommend it to others; to take off the prejudice which the want, or, which is the same thing, the inflammation of our name in the list of contributors, might excite against the charity or against ourselves. And, so long as these motives are free from any mixture of vanity, they are in no danger of invading our Saviour's prohibition: they rather seem to comply with another direction which he has left us: "Let your light shine before men, that they may see your good works, and glorify your father which is in heaven."

If it be necessary to propose a precise distinction upon the subject, there can be none better than the following: When our bounty is beyond our fortune or station, that is, when it is more than could be expected from us, our charity should be private, if privacy be practicable; when it is not more than might be expected, it may be public: for we cannot hope to influence others to the imitation of extraordinary generosity, if we want, in the former case, the only justifiable reason for making it public.

The pretences by which men excuse themselves from giving to the poor, are various; as,

1. "That they have nothing to spare;" i.e. nothing, for which they have not some other use; nothing which their plan of expence, together with the savings they have resolved to lay by, will not exhaust; never reflecting whether it be in their power, or that it is their duty, to retrench their expences, and correct their plan, "that they may have to give to them that need;" or rather that this ought to have been part of their plan originally.

2. "That they have families of their own, and that charity begins at home." A father is no doubt bound to adjust his economy with a view to the reasonable demands of his family upon his fortune; and until a sufficiency for these is acquired, or in due time probably will be acquired (for in human affairs probability is enough), he is justified in declining expensive liberality; for to take from those who want, in order to give to those who want, adds nothing to the stock of public happiness. Thus far, therefore, and no farther, the plea in question, is an excuse for parsimony, and an answer to those who solicit our bounty.

3. "That charity does not consist in giving money, but in benevolence, philanthropy, love to all mankind, goodwill of hearts," &c. Hear St. James: "If a brother or sister be naked, and destitute of daily food, and one of you say unto them, depart in peace, be ye warmed and filled, notwithstanding ye give them not those things which are needful to the body, what doth it profit?" (James ii. 15, 16.)

4. "That giving to the poor is not mentioned in St. Paul's description of charity, in the 13th chapter of his first epistle to the Corinthians." This is not a description of charity, but of good nature; and it is not necessary that every duty be mentioned in every place.

5. "That they pay the poor-rates." They might as well allege that they pay their debts; for the poor have the same right to that proportion of a man's property, which the laws assign them, that the man himself has to the remainder.

6. "That they employ many poor persons;"—for their own sake, not the poor's—otherwise it is a good pick.

7. "That the poor do not suffer so much as we imagine; that education and habit have reconciled them to the evils of their condition, and made them easy under it." Habit can never reconcile human nature to the extremities of cold, hunger, and thirst, any more than it can reconcile the hand to the touch of a red-hot iron; besides, the question is not, how unhappy any one is, but how much more happy we can make him.

8. "That these people, give them what you will, will never thank you, or think of you for it." In the first place, this is not true: in the second place, it was not for the sake of their thanks that you relieved them.

9. "That we are so liable to be imposed upon." If a due enquiry be made, our motive and merit is the fame: besides that, the diffidence is generally real, whatever has been the cause of it.

10. "That they should apply to their parishes." This is not always practicable; to which we may add, that there are many requisites to a comfortable subsistence, which parish-relief does not always supply; and that there are some who would suffer almost as much from receiving parish-relief as by the want of it: and lastly, that there are many modes of charity, to which this answer does not relate at all.

11. "That giving money encourages idleness and vagrancy." This is true only of injudicious and indiscriminate generosity.

12. "That we have too many objects of charity at home to bestow any thing upon strangers; so that there are other charities which are more useful, or stand in greater need." The value of this excuse depends entirely upon the fault, whether we actually relieve those neighbouring objects, and contribute to those other charities.

Besides all these excuses, pride, or prudery, or delicacy, or love of ease, keep one half of the world from doing good to the other half of it.

Charity Schools, are schools erected and maintained in various parishes by the voluntary contributions of the inhabitants, for teaching poor children to read, write, and other necessary parts of education. See School.

Brothers of Charity, a sort of religious hospitalizers, founded about the year 1297, since denominated Billetists. They took the third order of St Francis, and the capuchin, making three usual vows, but without begging.

Brothers of Charity, also denote an order of hospitalizers still subsisting in Romish countries, whose business it is to attend the sick poor, and minister to them both spiritual and temporal succour.

They are all laymen, except a few priests, for administering the sacraments to the sick in their hospitals. The brothers of charity usually cultivate botany, pharmacy, surgery, and chemistry, which they practise with success.

They were first founded at Granada, by St John de Y y Dieu;
Dieu; and a second establishment was made at Madrid in the year 1553: the order was confirmed by Gregory XIII. in 1572; Gregory XIV. forbade them to take holy orders; but by leave of Paul V. in 1609, a few of the brothers might be admitted to orders. In 1619 they were exempted from the jurisdiction of the bishop. Those of Spain are separated from the rest; and they, as well as the brothers of France, Germany, Poland, and Italy, have their distinct generals, who reside at Rome. They were first introduced into France by Mary of Medicis in 1601, and have since built a fine hospital in the Faubourg St. Germain.

Charity of St. Hippolytus, a religious congregation founded about the end of the 14th century, by one Bernardin Alvarez, a Mexican, in honour of St. Hippolytus the martyr, patron of the city of Mexico; and approved by Pope Gregory XIII.

Charity of our Lady, in church-history, a religious order in France, which though charity was the principal motive of their union, grew in length of time to disorderly and irregular, that their order dwindled, and at last became extinct.

There is still at Paris a religious order of women, called nun[s] hospitaliers of the charity of our lady. The religious of this hospital are by vow obliged to administer to the necessities of the poor and the sick, but those only women.

Charlatan, or Charleton, signifies an empiric or quack, who retails his medicines on a public stage, and draws people about him with his buffooneries, feats of activity, &c. The word according to Calpinus, comes from the Italian ceretano; or Cretum, a town near Spoleto in Italy, where these impitors are said to have first riven. Menage derives it from carlatano, and that from circularorius, of circulator, a quack.

Charlemagne, or Charles the Great, king of France by succession, and emperor of the west by conquest in 800, which laid the foundation of the dynasty of the western Franks, who ruled the empire 472 years till the time of Rudolphus Auspurgenlis, the founder of the house of Austria). Charlemagne was as illustrious in the cabinet as in the field; and though he could not write his name, was the patron of men of letters, the restorer of learning, and a wise legislator: he wanted only the virtue of humanity to render him the most accomplished of men; but when we read of his beheading 4500 Saxons, solely for their loyalty to their prince, in opposing his conquests, we cannot think he merits the extravagant encomiums bestowed on him by some historians. He died in 814, in the 74th year of his age, and 47th of his reign.

France had nine sovereigns of his name, of whom Charles V. merited the title of the wife (crowned in 1564, died in 1580): and Charles VIII. signalized himself in the field by rapid victories in Italy; crowned 1483, died in 1498. The rest do not deserve particular mention in this place. See (History of) France.

Charlemont, a town of the province of Namur in the Austrian Netherlands, about 18 miles south of Namur. E. Long. 4° 40′ N. Lat. 15° 10′.

Charlemont is also the name of a town of Ireland, situated on the river Blackwater, in the county of Armagh, and province of Ulster, about six miles south-east of Dungannon. W. Long. 6° 50′ N. Lat. 50° 16′.

Charleroy, a strong town in the province of Namur, in the Austrian Netherlands, situated on the river Sambre, about 19 miles west of Namur. E. Long. 4° 20′ N. Lat. 50° 30′.

Charles Martel, a renowned conqueror in the early annals of France. He deposed and restored Chilperic king of France; and had the entire government of the kingdom, once with the title of mayor of the palace and afterwards as duke of France; but he would not accept the crown. He died, regretted, in 741.

Charles le Gros, emperor of the west in 881, king of Italy and Suabia, memorable for his reverence of fortune, being dethroned at a diet held near Mentz, by the French, the Italians, and the Germans, in 887: after which he was obliged to fubmit on the bounty of the archbishop of Mentz. He died in 888.

Charles V. (emperor and king of Spain), was son of Philip I. archduke of Austria, and of Janye queen of Castile. He was born at Ghent, February 24, 1500, and succeeded to the crown of Spain in 1517. Two years afterwards he was chosen emperor at Frankfort after the death of Maximilian his grandfather. He was a great warrior and politician; and his ambition was not satisfied with the many kingdoms and provinces he possessed; for he is supposed, with reason, to have aspired at universal empire. He is said to have fought 60 battles in most of which he was victorious.

He took the king of France (Francis I.) prisoner, and sold him his liberty on very hard terms; yet afterwards, when the people of Ghent revolted, he asked leave to pass through his dominions; and though the generous king thus had him in his power, and had an opportunity of revenging his ill-treatment, yet he received and attended him with all pomp and magnificence. He sacked Rome, and took the Pope prisoner; and the cruelties which his army exercised there are said to have exceeded those of the northern barbarians.

Yet the pious emperor went into mourning on account of this conquest: forbade the ringing of bells; commanded proceedings to be made, and prayers to be offered up for the deliverance of the Pope his prisoner; yet did not inflict the least punishment on those who treated the holy father and the holy see with such inhumanity. He is accused by some Romish writers of favouring the Lutheran principles, which he might easily have extinguished. But the truth is, he found his account in the divisions which that sect occasioned; and he for ever denied his advantage of them, sometimes against the Pope, sometimes against France, and at other times against the empire itself. He was a great traveller, and made 50 different journeys into Germany, Spain, Italy, Flanders, France, England, and Africa. Though he had been successful in many unjust enterprises, yet his last attempt on Metz, which he besieged with an army of 100,000 men, was very just and very unsuccessful.

Vexed at the reverse of fortune which seemed to attend his latter days, and oppressed by fickness, which unforced him any longer from holding the reins of government with steadiness, or to guide them with ad-
drew, he resigned his dominions to his brother Ferdinand and his son Philip; and retired to the monastery of St. Justus near Placentia in Estramadura.

When Charles entered this retreat, he formed such a plan of life for himself as would have suited a private gentleman of moderate fortune. His table was neat, but plain; his domestics few; his intercourse with them familiar; all the ceremonious forms of attendance on his person were entirely abolished, as destructive of that social ease and tranquillity which he courted in order to root the remainder of his days. As the mists of the climate, together with his deliverance from the burdens and cares of government procured him at first a considerable remission from the acute pains of the gout, with which he had been long tormented, he enjoyed perhaps more complete satisfaction in this humble solitude than all his grandeur had ever yielded him. The ambitious thoughts and projects which had so long engaged and disquieted him, were quite effaced from his mind.

He relieved his mind at first by studying mechanical principles, and in fashioning puppets, which, by the means of internal springs, mimicked the actions of men, to the admiration of the monks, who, beholding movements which such a man perfectly disengaged from the affairs of this present life, and standing on the confines of a four-square world, either in innocent amusements which soothed his pains, and relieved a mind worn out with exiguous application to business; or in devout occupations, which he deemed necessary in preparing for another state.

But, about six months before his death, the gout, after a longer intermission than usual, returned with a proportionate increase of violence. His shattered constitution had not strength enough remaining to withstand such a shock. It enfeebled his mind as much as his body; and from this period we hardly discern any traces of that sound and masculine understanding which distinguished Charles among his contemporaries. An illiberal and timid superstitious depressed his spirit. He had no relish for amusements of any kind. He endeavored to conform, in his manner of living, to all the rigour of monastic austerity. He defined no other society than that of monks, and was almost continually employed in chanting with them the hymns of the misfàl. As an expiation for his sins, he gave himself the discipline in secret with such severity, that the whip of cords which he employed as the instrument of his punishment, was found, after his decease, tinged with his blood. Nor was he satisfied with these acts of mortification, which, however severe, were not unexampled. The timorous and distrustful solicitude which always accompanies superstition, still continued to disquiet him, and depreciating all that he had done, prompted him to aim at something extraordinary, at some new and singular act of piety, that would display his zeal, and merit the favour of heaven. The act on which he fixed was as wild and uncommon as any that superstition ever suggested to a disordered fancy. He resolved to celebrate his own obsequies before his death. He ordered his tomb to be erected in the chapel of the monastery. His domestics marched thither in funeral procession, with black tapers in their hands. He himself followed in his shroud. He was laid in his coffin with much solemnity: The service for the dead was chanted; and the attendants shed, as if they had been celebrating a real funeral. The ceremony closed with sprinkling holy water on the coffin in the usual form, and, all the assistants retiring, the doors of the chapel were shut. Then Charles rose out of the coffin, and withdrew to his apartment, full of those awful sentiments which such a singular solemnity was calculated to inspire. But either the fatiguing length of the ceremony,
Charles. remonstrance, or the impression which this image of death left on his mind, affected him so much, that next day he was seized with a fever. His feeble frame could not long resist the violence; and he expired on the 21st of September, after a life of 58 years, six months and 21 days.

Charles I. Kings of Britain. See Britain.

Charles XII. king of Sweden, was born in 1682. By his father's will, the administration was lodged in the hands of the queen-dowager Eleonora with five senators till the young prince was 18; but he was declared major at 15, by the states convened at Stockholm. The beginning of his administration raised no favourable ideas of him, as he was thought both by Swedes and foreigners to be a perfon of mean capacity. But the difficulties that gathered round him soon afforded him an opportunity to display his real character. Three powerful princes, Frederic king of Denmark, Augustus king of Poland, and Peter the Great czar of Muscovy, premising on his youth, conferred his ruin almost at the same instant. Their measures alarming the council, they were for diverting the storm by negotiations; but Charles, with a grave resolution that "defection war," resolved to make his letter, that Narva, where Count Horne was governor, was lost. When this haughty answer was brought to Peter, he said, "My brother Charles still affects at the Alexander, but I flatter myself, felf he will not in me find a Darins." The event justified him: for the Muscovites, already beaten into discipline, and under a prince of such talents as Peter, entirely destroyed the Swedifh army at the memorable battle of Pultowa, July 8, 1709, on which decisive day, Charles lost the fruits of nine years labour, and of almost 100 battles! The king, with a small troop, pursued by the Muscovites, passed the Borifhenes to Oczakow in the Turkish territories: and from thence through desart countries, arrived at Bender; where the Sultan, when informed of his arrival, sent orders for accommodating him in the best manner, and appointed him a guard. Near Bender Charles built a house, and intrenched himself; and had with him 1,800 men, who were all clothed and fed, with their horses, at the expense of the Grand Signior. Here he formed a design of turning the Ottoman arms upon his enemies; and is said to have had a promise from the Vizir of being sent into Muscovy with 200,000 men. While he remained here, he infeftively acquired a taste for books: he read the tragedies of Corneille and Racine, with the works of Delfpreaux, whose fairies he relished, but did not much admire his other works. When he read that passage in which the author represents Alexander as a fool and a madman, he tore out the leaf. He would sometimes play at chefs: but when he recovered of his wounds, he renewed his fatigue in exercising his men; he tired three horses a day; and those who courted his favour were all day in their boots. To dissipe the Ottoman Porte to this war, he detached about 800 Poles and Cofques of his retinue, with orders to pass the Neifer, that runs by Bender, and to observe what passed on the frontiers of Poland. The Muscovite troops, dispersed in those quarters, fell immediately upon this little company, and pursued them even to the territories of the Grand Signior. This was what the king expected. His ministers at the Porte excited the Turks to vengeance; but the Czar's money removed all difficulties, and Charles found himself in a manner prisoner among the Tartars. He imagined the Sultan was ignorant of the intrigues of his Grand Vizir. Poniatofky undertook to make his complaints to the Grand Signior. The Sultan, in answer, some days after, sent Charles five Arabian horses, one of which was covered with a saddle and housings of great riches; with an obliging letter, but couched in such general terms, as gave reason to suppose that the minister had done nothing without the Sultan's consent: Charles therefore refuted them. Poniatofky had the courage to form a design of deposing the Grand Vizir; who
who accordingly was deprived of his dignity and wealth, and banished. The seal of the empire was given to Noonan Cnapoughly; who persuaded his master, that the law forbid him to invade the Czar, who had done him no injury; but to succour the king of Sweden as an unfortunate prince in his dominions. He sent his majesty 800 purses, every one of which amounted to 500 crowns, and advised him to return peaceably to his own dominions. Charles rejected this advice, threatening to hang up the bailiffs, and shave the beards of any Janissaries who brought him such messages; and sent word that he should depend upon the Grand Signior's promise, and hoped to re-enter Poland as a conqueror with an army of Turks. After various intrigues at the Porte, an order was sent to attack this head of iron, as he was called, and to take him either alive or dead. He fixed a siege in his house, with forty domestics, against the Turkish army; killed no less than 20 Janissaries with his own hand; and performed prodigies of valor on a very unnecessary and unwarrantable occasion. But the house being set on fire, and himself wounded, he was at last taken prisoner, and sent to Adrianople; where the Grand Signior gave him audience, and promised to make good all the damages he had sustained. At last, after a stay of about five years, he left Turkey; and, having disguised himself, traversed Wallachia, Transylvania, Hungary, and Germany, attended only by one person; and in 16 days riding, during which time he never went to bed, came to Stralsund at midnight, November 21, 1714. His boots were cut from his swollen legs, and he was put to bed; where, when he had slept some hours, the first thing he did was to review his troops, and examine the state of the fortifications. He sent out orders that very day, to renew the war with more vigour than ever. But affairs were now much changed: Augustus had recovered the throne of Poland; Sweden had lost many of its provinces, and was without money, trade, credit, or troops. The kings of Denmark and Prussia feized the island of Rugen; and besieged him in Stralsund, which surrendered; but Charles escaped to Carlshroom. When his country was threatened with invasion by so many princes, he, to the surprise of all Europe, marched into Norway with 20,000 men. A very few Danes might have stopped the Swedish army; but such a quick invasion they could not foresee. Europe was yet more at a loss to find the Czar so quiet, and not making a descent upon Sweden, as he had before agreed with his allies. This inaction was the consequence of one of the greatest designs, and at the same time the most difficult of any that were ever formed by the imagination of man. In short, a scheme was set on foot for a reconciliation with the Czar; for replacing Stanislaus on the throne of Poland; and setting James the second's son upon that of England, besides restoring the duke of Holstein to his dominions. Charles was pleased with these grand ideas, though without building much upon them, and gave his minister leave to act at large. In the mean time, Charles was going to make a second attempt upon Norway in 1718; and he flattered himself with being master of that kingdom in six months; but while he was examining the works at Frederikshall, a place of great strength and importance, which is reckoned to be the key of that kingdom, he was killed by a shot from the enemy, as has been generally believed; though it has been also reported that he fell by the treachery of one of his own officers, who had been bribed for that purpose. This prince experienced the extremes of prosperity and of adversity, without being softened by the one, or disturbed for a moment at the other; but was a man rather extraordinary than great, and fitter to be admired than imitated. He was honoured by the Turks for his rigid abstinence from wine, and his regularity in attending public devotion. As to his person, he was tall and of a noble mien, had a fine open forehead, large blue eyes, flaxen hair, fair complexion, an handsome nose, but little beard, and a laugh not agreeable. His manners were harsh and sbufere, not to say savage; and as to his religion, he was indiffident towards all, though externally a Lutheran, and a strong believer in predestination. A few anecdotes will illustrate his character. No dangers, however great, made the least impression upon him. When a horfe or two were killed under him at the battle of Narva in 1700, he leaped nimbly upon fresh ones, saying, "these people find me exerciseful." One day, when he was dictating letters to a secretary, a bomb fell through the roof into the next room of the house, where they were sitting. The secretary, terrified at the house should come down upon them, let his pen drop out of his hand; "What is the matter," says the king calmly. The secretary could only reply, "Ah, Sir, the bomb." "The bomb (says the king) what has the bomb to do with what I am dictating to you? Go on." He preferred more humanity than is usually found among conquerors. Once, in the middle of an action, finding a young Swedish officer wounded and unable to march, he obliged the officer to take his horse, and continued to command his infantry on foot. The prince Lubomirski, who was very much in the interest of good graces of Augustus, falling by accident into the hands of one of his officers, he ordered her to be set at liberty; saying, "that he did not make war with women." One day, near Leipzig, a peasant threw himself at his feet, with a complaint against a grenadier, that he had robbed him of certain estable provision for himself and his family. "Is it true," (said Charles sternly), that you have robbed this man?" The soldier replied, "Sir, I have not done so much harm to this man as your majesty has done to his matter; for you have taken from Augustus a kingdom, whereas I have only taken from this poor fellow a dinner." Charles made the peasant amends, and pardoned the soldier for his firmness: "However, my friend (says he to him), you will do well to recollect, that if I took a kingdom from Augustus, I did not take it for myself." Though Charles lived hardly himself, a soldier did not fear to remonstrate to him against some bread, which was very black and mouldy, and which yet was the only provision the troops had. Charles called for a piece of it, and calmly eat it up; saying, "that it was indeed not good, but that it might be eaten." From the danger he was in in Poland, when he beat
the Saxon troops in 1702, a comedy was exhibited at Marlenburg, where the combat was represented to the disadvantage of the Swedes. "Oh! (says Charles, hearing of it), I am far from envying them in this pleasure. Let them beat me upon the theatres as long as they will, provided I do but beat them in the field." He wrote some observations on war, and on his own campaigns from 1700 to 1709; but the MS. was lost at the unfortunate battle of Pultowa.

CHARLES'S-CAP, a promontory of Virginia, in North-America, forming the northern head-land of the strait that enters the bay of Chesapeake.

CHARLES'S-Fort, a fortress in the county of Cork, and province of Munster, in Ireland, situated at the mouth of Kinville harbour. W. Long. 8° 20', and N. Lat. 51° 21'.

CHARLESTON, the capital of the state of South-Carolina, is the only considerable town in that state. It is situated on the tongue of land which is formed by the confluence of Ashley and Cooper rivers, which are large and navigable. These rivers mingle their waters immediately below the town, and form a spacious and convenient harbour, which communicates with the ocean at Sullivan's island, seven miles south-east of the town. In these rivers the tide rises, in common, about five feet. The continued agitation which this occasions in the waters which almost surround Charleston, and the refreshing sea breezes which are regularly felt, render Charleston more healthy than any part of the low country in the southern states. On this account: it is the resort of great numbers of gentle- men, invalids from the Weft-India islands, and of the rich planters from the country, who come here to spend the sickly months, as they are called, in quest of health and of the social enjoyments which the city affords. And in no part of America are the social blemishes enjoyed more rationally and liberally than in Charleston. Unaffected hospitality—affability—care in manners and address—and a disposition to make their guests welcome, easy and pleasant to themselves, are characterstics of the respectable people in Charleston.

The land on which the town is built is flat and low, and the water brackish and unwholesome. The inha.bitants are obliged to raise banks of earth as barriers to defend themselves against the higher floods of the sea. The streets from east to west extend from river to river, and running in a straight line, not only open beautiful prospectts each way, but afford excellent opportunities, by means of subterranean drains, for removing all nuisances and keeping the city clean and healthy. These streets are intersected by others, nearly at right angles, and throw the town into a number of squares, with dwelling houses in front, and office houses and little gardens behind. Some of the streets are conveniently wide, but most of them are much too narrow, especially for a populous a city, in so warm a climate. From their confined situation, they have been found extremely inconvenient in case of fires, the destructive effects of which have been frequently felt in this city. The houses, which have been lately built, are brick, with tiled roofs. Some of the buildings in Charleston are elegant, and most of them are neat, airy, and well furnished. The public buildings are an exchange, state-house, armoury, poor-house, two large churches for Episcopallians, two for Congregationalists or Independents, one for Scotch Presbyterians, two for Baptists, one for the German Lutherans, one for the Methodists, one for French Protestants—besides a meeting house for Quakers, and two Jewish synagogues, one for the Portuguese, the other for the German Jews. There are upwards of a thousand Roman Catholics in Charleston, but they have no public building for worship.

In 1787, there were 1,600 houses in this city, and 9,600 white inhabitants, and 5,400 negroes: and what evinces the healthiness of the place, upwards of 200 of the white inhabitants were above sixty years of age.

Charleston was incorporated in 1782, and divided into 13 wards, who choose as many wardens, who, from among themselves, elect an intendant of the city. The intendant and wardens form the city council, who have power to make and enforce bye-laws for the regulation of the city. W. Long. 79° o. and N. Lat. 32° 30'.

CHARLES'S-Wain, in astronomy, seven flars in the constellation called ura major, or the Great Bear.

CHARLETON, an island at the bottom of Hodson's-bay, in North-America, subject to Great-Britain. W. Long. 80° o. and N. Lat. 32° 30'.

CHARLETON, (Walter) a learned English physician born in 1679, was physician in ordinary to Charles I. and Charles II. one of the first members of the royal society, and president of the college of physicians. He wrote on various subjects; but at last his narrow circumstances obliged him to retire to the island of Jersey, where he died in 1707.

CHARLOCK, the English name of the Raphanus; it is a very troublesome weed among corn, being more frequent than almost any other. There are two principal kinds of it; the one with a yellow flower, the other with a white. Some fields are particularly subject to be over-run with it, especially those which have been manured with cow-dung only, that being a manure very favourable to the growth of it. The farmers in some places are so sensible of this, that they always mix horse-dung with their cow-dung, when they use it for arable land. When barley, as is often the case, is infested with this weed to such a degree as to endanger the crop, it is a very good method to mow down the charlock in May, when it is in flower, cutting it so low as just to take off the tops of the leaves of barley with it: by this means the barley will get up above the weed; and people have got four quarters of grain from an acre of such land as would have scarce yielded anything without this expedient. Where any land is particularly subject to this weed, the best method is to sow it with grass seed, and make a pasture of it; for then the plant will not be troublesome, it never growing where there is a coat of grass upon the ground.

Queen CHARLOTTE'S ISLAND, an island in the South Sea, first discovered by captain Wallis in the Dolphin, in 1767, who took possession of it in the name of King George III. Here is good water, and plenty of cocoa-nuts, palm-nuts, and invariably-grasf. The inhabitants are of a middle stature, and dark complexion, with long hair hanging over their shoulders; the
the men are well made, and the women handsome; their clothing is a kind of coarse cloth, or matting, which they fallen about their middle.

Queen Charlotte's Islands, a cluster of South-sea islands discovered in 1767 by captain Carteret. He counted seven, and there were supposed to be many more. The inhabitants of these islands are described as extremely nimble and vigorous, and almost as well qualified to live in the water as upon land: they are very warlike; and, on a quarrel with some of captain Carteret's people, they attacked them with great resolution; mortally wounded the master and three of the sailors; were not at all intimidated by the arms; and at last, notwithstanding the averton of captain Carteret to shed blood, he was obliged to secure the watering places by firing grape-shot into the woods, which destroyed many of the inhabitants. These islands lie in S. Lat. 11°. E. Long. 164°. They are supposed to be the Santa Cruz of Mandana, who lived there in 1595.

Charm, a term derived from the Latin carmen, a "verse;" and used to denote a magic power, or spell, by which, with the assistance of the devil, forcerers and witches, were supposed to do wonderful things, far surpassing the power of nature.

Charnel, or Charnel-house, a kind of portico or gallery, usually in or near a church-yard, over which were anciently laid the bones of the dead, after the flesh was wholly consumed. Charnel-houses are now usually adjoining to the church.

Charon, in fabulous history, the son of Erebus and Nix, whose office was to ferry the souls of the deceased over the river Acheron, for which each deceased person was to pay a piece of money. For this reason the Pagans had a custom of putting a piece of money into the mouth of the dead, in order that they might have something to pay Charon for their passage.

Charondas, a celebrated legislator of the Thuriens, and a native of Catanea in Sicily, flourished 446 before Christ. He forbade any person's appearing armed in the public assemblies of the nation; but one day going thither in haste, without thinking of his sword, he was no sooner made to observe his mistake than he ran it through his body.

Charost, a town of France, in Berry, with the title of a duchy. It is situated on the river Arnon. E. Long. 3°. 15'. N. Lat. 46°. 56'.

Charoux, a town of France, in the Bourbonnois, seated on an eminence, near the river Sioule. It has two parishes, which are in different dioceses. E. Long. 3°. 15'. N. Lat. 46°. 10'.

Charpentier, (Francis) dean of the French academy, was born in 1620. His early capacity inclined his friends to educate him for the bar: but he was much more delighted with the study of languages and antiquity than of the law; and preferred repose to tumult. M. Colbert made use of him in establishing his new academy of medals and inscriptions; and no person of that learned society contributed more than himself toward that noble series of medals which were struck on the considerable events that distinguished the reign of Louis XIV. He published several works, which were all well received; and died in 1702.
This charter may be said to derive its origin from king Edward the Confessor, who granted several privileges to the church and state by charter: these liberties and privileges were also granted and confirmed by king Henry I. by a celebrated great charter now lost; but which was confirmed or re-enacted by king Henry II. and king John. Henry III. the successor of this last prince, after having caused 12 men make inquiry into the liberties of England, and placed his seal on a new charter, which was the same as the present magna charta. This he several times confirmed, and as often broke; till, in the 27th year of his reign, he went to Westminster-hall, and there, in presence of the nobility and bishops, who held lighted candles in their hands, magna charta was read, the king all the time holding his hand to his breast, and at last solemnly swearing faithfully and inviolably to observe all the things therein contained, &c. Then the bishops extinguished the candles, and throwing them on the ground, they all cried out, “Thus let him be extinguished, and flink in hell, who violates this charter.”

It is observed, that, notwithstanding the solemnity of this confirmation, king Henry, the very next year, again invaded the rights of his people, till the barons entered into a war against him; when, after various successes, he confirmed this charter, and the charter of the forefet, in the 32d year of his reign.

This charter confirmed many liberties of the church, and red lined many grievances incidental to feodal tenures, of no small moment at the time; tho’ now, unless considered attentively and with this retrospect, they seem but of trifling concern. But, besides these feodal provisions, care was also taken therein to protect the subject against other oppressions, then frequently arising from unreasonable amercements, from illegal differrals, or other process for debts or services due to the crown, and from the tyrannical abuse of the prerogative of purveyance and pre-emption. It fixed the forfeiture of lands for felony in the same manner as it still remains; prohibited for the future the grants of exclusive fisheries; and the erection of new bridges so as to oppress the neighbourhood. With respect to private rights, it established the testamentary power of the subject over part of his personal estate, the rest being distributed among his wife and children; it laid down the law of dower, as it hath continued ever since; and prohibited the appeals of women, unless after the death of their husbands. In matters of public policy and national concern, it enjoined an uniformity of weights and measures; gave new encouragements to commerce, by the protection of merchant-strangers; and forbade the alienation of lands in mortmain. With regard to the administration of justice: besides prohibiting all denials or delays of it, it fixed the court of common-pleas at Westminster, that the suitors might no longer be harassed with following the king’s person in all his progresses; and at the same time brought the trial of suits home to the very doors of the freeholders, by directing affizes to be taken in the proper counties, and establishing annual circuits: it also corrected some abuses then incident to the trials by wager of law and of battle, directed the regular awarding of inquests for life or member; prohibited the king’s inferior ministers from holding pleas of the crown, or trying any criminal charge, whereby many forfeitures might otherwise have unjustly accrued to the exchequer; and regulated the time and place of holding the inferior tribunals of justice, the county-court, sheriff’s term, and court leet. It confirmed and established the liberties of the city of London, and all other cities, boroughs, towns, and ports of the kingdom. And lastly (which alone would have merited the sign of fluorescence), it protected every individual of the nation in the free enjoyment of his life, his liberty, and his property, unless declared to be forfeited by the judgment of his peers, or the law of the land.

This excellent charter, so equitable, and beneficial to the subject, is the most ancient written law in the kingdom. By the 25th Edward I. it is ordained, that it shall be taken as the common law; and by the 43d Edward III. all statutes made against it are declared to be void.

CHARTER, in law, a written instrument, or evidence of things acted between one person and another. The word charter comes from the Latin charta, anciently used for a public and authentic act, a donation, contract, or the like; from the Greek χαρτής, “thick paper” or “passeboard,” whereon public acts were wont to be written. Britton divides charters into those of the king, and those of private persons. 1. Charters of the king, are those whereby the king grants any grant to any person or body politic, as a charter of exemption of privilege, &c.; charter of pardon, whereby a man is forgiven a felony, or other offence committed against the king’s crown and dignity; charter of the forest, wherein the laws of the forest are compiled, such as the charter of Canute, &c. 2. Charters of private persons, are deeds and instruments for the conveyance of lands, &c. And the purchaser of lands shall have all the charters, deeds, and evidences, as incident to the same, and for the maintenance of his title.

CHARTER-Governments in America. See COLONY. CHARTER-Land, such land as a person holds by charter; that is, by evidence in writing, otherwise called freehold.

CHARTERPARTY, in commerce, denotes the instrument of freightage, or articles of agreement for the hire of a vessel. See FREIGHT, &c.

The charterparty is to be in writing; and to be signed both by the proprietor or the master of the ship, and the merchant who freights it. It is to contain the name and the burden of the vessel; the names of the master and the freighter; the price or rate of freight; and the time of loading and unloading; and the other conditions agreed on. It is properly a deed, or policy, whereby the master or proprietor of the vessel engages to furnish immediately a right sound vessel, well equipped, caulked, and stopped, provided with anchors, sails, cordage, and all other furniture to make the voyage required, as equipment, hands, victuals, and other munitions; in consideration of a certain sum to be paid by the merchant for the freight. Lastly, the ship with all its furniture, and the cargo, are respectively subjected to the conditions of the charterparty. The charterparty differs from a bill of lading, in that the first is for the entire freight or lading, and that
both for going and returning; whereas the latter is only for a part of the freight, or at most only for the voyage one way.

The present Boyer says, the word comes from hence, that per medium charta incidebat, et sic fiat charta partita; because, in the time when notaries were few common, there was only one instrument made for both parties: this they cut in two, and gave each his proportion; joining them together at their return, to know if each had done his part. This he observes to have been practised in his time; agreeable to the method of the Romans, who, in their stipulations, used to break a staff, each party retaining a moiety thereof as a mark.

CHARTOPHYLAX, the name of an officer of the church of Constantinople, who attends at the door of the rails when the sacrament is administered, and gives notice to the priests to come to the holy table. He represents the patriarch upon the bench, tries all the confessions of the bishops, and presides in the feast of the solemnity, and likewise all other subordinate clergy. This office resembles in some shape that of the 

CHARTREUSE-GRAND, a large city of France, in the province of Orleans, situated on the river Eure, in E. Long. 1. 32. N. Lat. 48. 47. It is a bishop's see.

CHARTREUSE, or CHARTREUSE-GRAND, a celebrated monastery, the capital of all the convenits of the Carthusian monks, situated on a steep rock in the middle of a large forest of fir-trees, about seven miles north-east of Grenoble, in the province of Dauphine in France: E. Long. 5. 5. N. Lat. 45. 20. See CARThUSIANS.

From this mother-convent, all the others of the same order take their name; among which was the Chartreuse of London, corruptly called the chartermouse, now converted into a hospital, and endowed with a revenue of 600l. per annum.

Here are maintained 50 decayed gentlemen, not under 50 years of age: also forty boys are educated and fitted either for the university or trades. These sent to the university, have an exhibition of 20 l. a year for eight years; and have an immediate title to nine church livings in the gift of the governors of the hospital, who are sixteen in number, all persons of the first distinction, and take their turns in the nomination of pensioners and scholars.

CHARTULARY, CHARTULARIUS, a title given to an ancient officer in the Latin church, who had the care of charters and papers relating to public affairs. The chartulary presided in ecclesiastical judgments, in lieu of the pope. In the Greek church the chartulary was called chartophylax; but his office was there much more considerable; and some even distinguished the chartulary from the chartophylax in the Greek church. See CHARTOPHYLAX.

CHARYBDIS, (anc. geog.) a whirlpool in the straits of Messina, according to the poets; near Sicily, and opposite to Scylla, a rock on the coast of Italy. Thucydides makes it to be only a strong flux and reflux; a violent division of the tide, especially if the winds doth part. But on diving into the Charybdis, there are found vast gulphs and whirlpools below, which produce all the commotion on the surface of the water.

Charybdis is used by Horace to denote a rapacious profiteer.

CHASE, or CHACE, in law, is used for a driving of cattle to or from any place; as to a duftris, or fortet, &c.

CHASE, or Chace, is also a place of retreat for deer and wild beasts; of a middle kind between a forest and a park, being usually less than a forest, and not possessed of so many privileges; but wanting, v. z. courts of assessment, swinemore, and justice-fee. Yet it is of a large extent, and fenced both with a greater diversity of wild beasts or game, and more keepers than a park. Crompton observes, that a forest cannot be in the hands of a subject, but it forthwith loses its name, and becomes a chase; in regard all those courts lose their nature when they come into the hands of a subject; and that none but a king can make a lord chief justice in eyre of the forest. See JUSTICE in Eyre.

"When our barons began to form a power, they claimed a vast, but more limited, tract for a diversion that the English were always fond of. They were very jealous of any encroachments on their respective bounds, which were often the cause of deadly feuds: such a one gave cause to the fatal day of Chevy-chase; a fact which, though recorded only in a ballad, may, from what we know of the manners of the times, be founded on truth: not that it was attended with all the circumstances which the author of that natural heroic composition hath given it; for, on that day, neither a Percy nor a Douglas fell; here the poet seems to have claimed his privilege, and mixed with this frail some of the events of the battle of Otterburn:" See Justice in Eyre.

CHASE, in the sea-language, is to pursue a ship; which is also called giving chase.

Sterne CHASE, is when the chaser follows the chased after directly upon the same point of the compass.

To lie with a ship's fore-foot in a CHASE, is to fail and meet with her the nearest distance; and fo to crofs her in her way, or to come across her fore-foot.

A ship is said to have a good chase, when she is so built forward on, or a stern, that she can carry many guns to shoot forwards or backwards; according to which she is said to have a good foremost, or good stern chase.

CHASE-Guns, are such whose ports are either in the head (and then they are used in chasing of others); or in the stern, which are only useful when they are pursued or chased by any other ship.

CHASE of a Gun, is the whole bore or length of a piece taken within-side.

Wild-goose CHASE, a term used to express a sort of racing on horseback used formerly, which resembled the flying of wild-geese; those birds generally going in a train one after another, not in confused flocks as other birds do. In this sort of race the two horse, after running twelve score yards, had liberty, which horse sooner could take the leading, to ride what ground the jockey pleased, the hindmost horse being bound to follow him within a certain distance agreed on by the articles, or else to be whipped in by the tryers and judges who rode by; and whichever horse could distil the other, won the race. This sort of racing was not long in common use; for it was found

inhuman
inhuman, and destructive to good horses, when two such were matched together. For in this case neither was able to distance the other till they were both ready to sink under their riders; and often two very good horses were both spoiled, and the wagers forced to be drawn at last. The mischief of this fort of racing soon brought in the method now in use, of running only for a certain quantity of ground, and determining the plate or wager by the coming in first at the post.

Grasino of Gold, Silver, &c. See Enchasing.

Chastity. See Vitex.

Chastity: purity of the body, or freedom from obscenity.—The Roman law justifies homicide in defence of chastity either of one's self or relations; and so also, according to Selden, the law in the Jewish republic. Our law likewise justifies a woman for killing a man who attempts to ravish her. So the husband or father may justly kill a man who attempts a rape upon his wife or daughter; but nor if he takes them in adultery by consent: for the one is forcible and felonious, but the other is not.

Chastity is a virtue universally celebrated. There is indeed no charm in the female sex that can supply woman for killing a man who attempts to ravish her. She received her last visit, and employed the plate or wager by the coming in first at the post. Chasing, or rather cruel foe, offered me violence, and reaped a joy fatal to me; but, if you are men, it will be more fatal to him.”

All promised to revenge her; and, at the same time, tried to comfort her with representing, “That the mind only fins, not the body; and where the heart is wanting, there can be no guilt.” “What Sextus deserves,” replies Lucretia, “leave you to judge; but for me, though I declare myself innocent of the crime, I exempt not myself from punishment. No immodest woman shall plead Lucretia's example to outrage her dishonours.” Thus saying, she plunged into her breast a dagger she had concealed under her robe, and expired at their feet. Lucretia's tragic death has been praised and extolled by Pagan writers, as the highest and most noble act of heroism. The gospel thinks not so: it is murder, even according to Lucretia's own principles, since she punished with death an innocent person, at least acknowledged as such by herself. She was ignorant that our life is not in our own power, but in his disposition from whom we receive it. St Aultin, who carefully examines, in his book De Civitate Dei, what we are to think of Lucretia's death, considers it not as a courageous action, flowing from
CHATEAU-Neuf, a town of Lorraine, in the

CHATEAU-Briant, a town of France in Brit-

tany, with an old castle. W. Long. 1. 20. N. Lat. 47. 40.

CHATEAU-Dauphin, a very strong castle of Pied-

mont in Italy, and in the marquisate of Saluces, belonging

to the king of Sardinia. It was taken by the com-

bined army of France and Spain in 1744, and was re-

formed by the treaty of Aix-la-Chapelle.

CHATEAU-du-Loir, a town of France in the Maine,

famous for sustaining a siege of seven years against the

Court of Mans. It is seated on the river Loir, in E. Long. 0. 25. N. Lat. 47. 40.

CHATEAU-Dieu, an ancient town of France, and ca-
pital of the Dunois, with a castle and rich monastery;

feated on an eminence near the river Loir, in E. Long. 1. 26. N. Lat. 48. 0.

CHATEAU-Neuf, the name of several towns of France,

designed one in Perche; another in Angoumois, on the

river Charente, near Angouleme; a third in Berry,

feated on the river Cher; and several other small

places.

CHATEAU-Porten, a town of France, in Champagne,

and in a district called Portien, with a castle built on

a rock, near the river Aire. E. Long. 4. 43. N.

Lat. 49. 35.

CHATEAU-Reaulx, a town of France, in the Gate-

nois, where clothes are made for the army, and where

there is a trade in saffron. E. Long. 2. 25. N. Lat. 48. 0. This is also the name of a town of Touraine,

in France, with the title of a marquise. E. Long.

2. 41. N. Lat. 47. 22.

CHATEAU-Rouix, a town of France, in Berry, with

the title of a duchy. It has a cloth-manufac-

ture, and is seated in a very large plain on the river

Indre. in E. Long. 1. 47. N. Lat. 46. 40.

CHATEAU-Thibie, a town of France, in Champa-

gne, with the title of a duchy, and a handsome castle on an

eminence, seated on the river Maine, in E. Long. 3.

23. N. Lat. 49. 12.

CHATEAU-Vilain, a town of France, in Champagne,

with a castle, and the title of a duchy; seated on the

river Anjou. E. Long. 2. 59. N. Lat. 48. 0.

CHATEL, or CHATE, a town of Lorraine, in the

Vosge, seated on the river Mofelle, eight miles from

Mirecourt.

CHATEL-Aillon, a maritime town of France, in Saint-

tongue, five miles from Rochelle; formerly very con-

siderable, but is now greatly decayed.

CHATEL-Cholon, a town of France, in Franche

Comte, remarkable for its abbey of benedictine nuns.

E. Long. 5. 25. N. Lat. 46. 50.

CHATELET, a town of the Netherlands, in Na-

mur, seated on the Sambre, in the bishopric of Leige,

E. Long. 4. 28. N. Lat. 50. 25.

CHATELET, the name of certain courts of justice

established in several cities in France. The grand

chatelet at Paris is the place where the prefidial or

ordinary court of justice of the provoif of Paris is kept;

constituting of a prefidial, a civil chamber, a criminal

chamber, and a chamber of policy. The little chatelet

is an old fort, now serving as a prison.

CHATELLERAULT, a town of France, in Pois-

Z. 2 103.
CHATHAM, a town of Kent, in England, adjoining to Rochester, and seated on the river Medway. It is the principal station of the royal navy; and the yards and magazines are furnished with all kinds of naval stores, as well as materials for building and rigging the largest men of war. The entrance into the river Medway is defended by Sheerness and other forts; notwithstanding which, the Dutch fleet burnt several ships of war here in the reign of Charles II. after the peace of Breda had been agreed upon. In the year 1757, by direction of the Duke of Cumberland, several additional fortifications were begun at Chatham; so that now the ships are in no danger of an inmutual either by land or water. It has a church, a chapel of ease, and a ship used as a church for the sailors. It has likewise about 300 houses, mostly low, and built with brick; the streets are narrow, and paved; and it contains about 3000 inhabitants. The principal employment of the labouring hands is ship-building in the king’s yard and private docks. This town gave title of Earl to that great statesman William Pitt in the reigns of George II. and III. E. Long. 40. N. Lat. 51. 24.

CHATIGAN, a town of Aia, in the kingdom of Bengal, on the most easterly branch of the river Ganges. It is but a poor place, though it was the first the Portuguese settled at in these parts, and who still keep a fort of poiffeiion. It has but a few cotton manufactures; but affords the best timber for building of any place about it. The inhabitants are so capable of each other, that they always go armed with a sword, piltol, and blunderbuss, not excepting the priests. It is subject to the great Mogul. E. Long. 91. 10. N. Lat. 23. 6.

CHATILLON-SUR-SEINE, a town of France, in Burgundy, divided into two by the river Seine. It is 12 miles from Langres, and 30 from Dijon; and has iron works in its neighbourhood. E. Long. 4. 33. N. Lat. 47. 45.

CHATRE, a town of France, in Berry, seated on the river Indres, 37 miles from Bourges. It carries on a considerable trade in cattle. E. Long. 1. 55. N. Lat. 46. 35.

CHATTELS, a Norman term, under which were anciently comprehended all moveable goods; those immovable being termed feft, or ffe.

CHATTELS, in the modern leflne of the word, are all sorts of goods, moveable or immovable, except such as are in the nature of freehold.

CHATTERER, in ornithology. See AMPHIS. CHATTERTON, (Thomas) a late unfortunate author is not known. In the Town and Country Magazine for March 1769, are two letters, probably from him, as they are dated from Bristol, and subscribed with his usually signature, D. B. that is, Dunelmias Britollenenis. The former contains short extracts from two MSS., written 300 years ago by one Rowley a monk, concerning drefs in the age of Henry II.; the latter, “Ethelgar, a Saxon poem,” in bombast prose. In the same magazine for May 1769, are three communications from Bristol, with the same signature D. B. one of them intitled “Observations upon Saxon Heraldy, with drawings of Saxon Achievements;” and in the subsequent months of 1769 and 1770, there are several other pieces in the same magazine, which are undoubtedly of his composition.

In April 1770, he left Bristol, disguised with his profession, and irreconcilable to the line of life in which he was placed; and going to London in hopes of advancing his fortune by his pen, he sunk at once from the sublimity of his views to an absolute dependence on the patronage of booksellers. Things, however, soon took a more favorable turn. He was sent to write on both sides, that he was soon reduced to the extremest indigence, but still continued to write with the same spirit, and with the same applause from his former patrons at Bristol. As to Mr. *, Mr. *, Mr. *, &c. &c. they rate literary lumber so low, that I believe an author, in their estimation, must be poor indeed, but here matters are otherwise. Had Rowley been a Londoner instead of a Bristolian, he could have lived by copying his works.” In a letter to his father, May 30, he informs her that he is to be employed in writing a voluminous History of London, to appear in numbers the beginning of next winter. Meanwhile, he had written something in praise of Beckford, then lord mayor, which had procured him the honour of being presented to his lordship; and, in the letter just mentioned, he gives the following account of his reception, with certain observations upon political writing. The lord mayor received me as politely as a citizen could; but the devil of the matter is, there is no money to be got on this side of the question.—However, he is a poor author who cannot write on both sides.—Essays on the patriotic side will fetch no more than what the copy is fold for. As the patriots themselves are searching for places, they have no gratuity to spare.—On the other hand, popular essays will not even be accepted, and you must pay to have them printed: but then you sell them by half, as courtiers are so sensible of their deficiency in merit, that they generously reward all who know how to dupe them with the appearance of it.” He continued to write incessantly in various periodical publications. July 11th, he tells his father that he had pieces last month in several magazines; in The Gofpel Magazine, The town and country, The Court and City, The London, The Political Register, &c. But all these exertions of his genius brought in so little profit, that he was soon reduced to the extremest indigence; so that at last, oppressed with poverty and also disease, in a fit of despair he put an end to his existence, Aug. 1770, with a dose of poison. This unfortunate person, though certainly a most extraordinary genius, seems yet to have been a most ungracious composition. He was violent and impetuous to a strange degree.
From the first of the above-cited letters, he seems to have had a portion of ill-humour and spleen more than enough for a lad of 17; and the editor of his Miscellany records, "that he poofled all the voices and irregularities of youth, and that his proficiency was at least as conspicuous as his abilities."

In 1777 were published, in one volume 8vo, "Poems, fappoed to have been written at Bristol, by Thomas Rowley and others, in the 15th century: the greatest part now first published from the most authentic copies, with an engraved specimen of one of the MSS. To which are added, a Preface, an introductory Account of the several Pieces, and a Glossary." And, in 1778, were published, in one volume 8vo, "Miscellanies in Prose and Verse, by Thomas Chatterton, the sappoed author of the Poems published under the names of Rowley, &c."

Of Rowley's Poems, we have the following account in the preface, given in the words of Mr George Catcot of Bristol, to whom, it is said, the public is indebted for them. "The first discovery of certain MSS. having been deposited in Redcliff church above three centuries ago, was made in the year 1768, at the time of opening the new bridge at Bristol; and was owing to a publication in Farley's Weekly Journal, Oct. 1st, containing an account of the ceremonies observed at the opening of the old bridge, taken, as it was said, from a very ancient MS. This excited the curiosity of some person to enquire after the original. The printer, Mr Farley, could give no account of it, or of the person who brought the copy; but after much inquiry it was discovered, that this person was a youth between 15 and 16 years of age, whose name was Thomas Chatterton, and whose family had been debted for them.

The poems in question. Mr Walpole also obliged the world with a Chaucer Letter on Chatterton, from his prens at strawberry-hill. On the other hand have appeared, "Observations" upon these poems, "in which their authenticity is afolemned, by Jacob Bryant, Esq. 1781, 2 vols 8vo; and another edition of the "Poems, with a comment, in which their Antiquityisconsidered and defended, by Jeremiah Milles, D. D. Dean of Exeter, 1782," 4to. In answer to these twoworks, we have had three pamphlets: 1. "Curiofy Observations on the Poems, and Remarks on the Commentaries of Mr Bryant and Dr Mflies; with a satu­tary proposall addressed to the friends of those gentle­men." 2. "An Archaeological Epistle to Dean Miles, editor of a superb edition of Rowley's Poems, &c." 3. "An Inquiry into the Authenticity of the Poems attributed to Thomas Rowley, in which the Arguments of the Dean of Exeter and Mr Bryant are examined, by Thomas Warton; and other pieces in the public prints and magazines: All preparatory to the completestatement of the buifiness in "A Vindication of the Appendix to the Poems called Rowley's", in reply to the Anwers of the Dean of Exeter, by Jacob Bryant, Esq; and a third Anonymous Writer; with some fur­ther Observations upon those Poems, and an Examination of the Evidence which has been produced in sup­port of their Authenticity. By Thomas Tyrwhitt, 1782," 8vo.

CHAUCER, (Sir Geoffry) an eminent English poet in the 14th century, born at London in 1328. After he left the university, he travelled into Holland, France, and other countries. Upon his return he entered himself in the Inner-temple, where he studied the municipal laws of England. His first station at court was page to Edward III. and he had a pension granted him by that prince till he could otherwise provide for him. Soon after we find him gentleman of the king's privy chamber; next year, shield-bearer to the king. Esteemed and honoured, he spent his younger days in the service of Richard, Duke of Lancaster, next year, lord chancellor of England. He was the author of the "Canterbury Tales," "The Prioress's Tale," "The Miller's Tale," and several other poems, which are supposed to be his. Among his other works are "The Wife of Bath's Prologue," "The Wife of Bath's Tale," "The Nun's Priest's Tale," "The Clerk's Tale," "The Reeve's Tale," "The Squire's Tale," "The Summoner's Tale," "The Lady of the.International," and "The Merchant's Tale." He died in 1386, and was buried in the church of St. Dunstan in the West.
A CHAt... [366] CHA

Chaucer. million to treat with the French; and in the begin-
ning of King Richard's reign, he was in some degree
of favour at court.

The Duke of Lancaster at last finding his views
checked, began to abandon Wickliff's party: upon
which Chaucer likewise, how much soever he had
deposited that divine's opinion, thought it prudent to
conceal them more than he had done. With the
Duke's interest that of Chaucer entirely funk; and
the former passing over sea, his friends felt all the malice
of the opposite party. These misfortunes occasioned
his writing that excellent treatise The Testament of Love,
in imitation of Boethius on the confolation of
philosophy. Being much reduced he retired to Woodlock,
to comfort himself with study, which produced his ad-
mirable treatise of the Afsfrades.

The Duke of Lancaster at last furmounting his trou-
bles, married Lady Catherine Swynford, sister to
Chaucer's wife; so that Thomas Chaucer, our poet's son,
became allied to most of the nobility, and to several of
the king's of England. Now the fun began to thine
upon Chaucer with an evening ray; for, by the influ-
ence of the Duke's marriage, he again grew to a con-
siderable share of wealth. But being now 70, he
retired to Dunnington-calle near Newbury. He had not
enjoyed this retirement long before Henry IV. son
of the Duke of Lancaster, assumed the crown, and in
the first year of his reign gave our poet marks of his
favour. But however pleasing the change of affairs
might be to him at first, he afterwards found no small
inconveniences from it. The measures and grants
of the late king were annulled; and Chaucer, in or-
der to procure fresh grants of his pensions, left his re-
tirement, and applied to court, where, though he
had gained a confirmation of some grants, yet the fatigue
of attendance, and his great age, prevented him from
enjoying them. He fell sick at London; and ended his
days in the 72d year of his age, leaving the world
as though he despised it, as appears from his song of
Flie, his poems in general possess every kind of excel-
sion of measure; defects which are to be attributed
to the imperfect state of the English language, and
the infancy of the art in that kingdom at the time when
he wrote. "As he is the father of English poetry (says
Mr Dryden), so I hold him in the same degree of venera-
tion as the Grecians held Homer, or the Romans Vir-
gil. He is a perpetual fountain of good sense, learned
in all fictitious, and therefore speaks properly on all sub-
jects. As he knew what to say, so he knew also when
to leave off; a continence which is practised by few
writers, and scarcely by any of the ancients, except
Virgil and Horace." This character Chaucer cer-
tainly deserved. He had read a great deal; and was
a man of the world, and of sound judgment. He
was the first English poet who wrote poetically, as Dr
Johnson observes in his preface to his Dictionary, and
(he might have added) who wrote like a gentleman.
He had also the merit of improving the language con-
siderably, by the introduction and naturalization of
words from the Provençal, at that time the most pol-
lished dialect in Europe.

CHACUS, (anc. geog.) the country of the Chau-
ci, a people of Germany; divided into the Minores,
now East Frieseland and the county of Oldenburg; and
into the Maiores, now the duchy of Brunswick and a part
of Lauenburg.

CHAUD-MEDLEY, in law, is of much the same im-
port with CHANCE-Medley. The former in its ety-
морology signifies an affray in the heat of blood or paflion;
the latter, a casual affray. The latter is in common
speech too often erroneously applied to any manner of
homicide by misadventure; whereas it appears by the
stat. 24 Hen. VIII. c. 5. and ancient books (Staundf.
P. C. 16.), that it is properly applied to such killing as
happens in self-defence upon sudden encounter.

CHAL, a town of the East Indies, on the coast of
Malabar, in the province of Blagana, and kingdom of
Vipapur. Its river affords a good harbour for small
vessels. The town is fortified, and is the island on
the south side of the harbour. It had formerly a good
trade, but is now miserably poor. It was taken by the
Portuguese in 1507, to whom it still belongs. It is
15 miles north of Bombay, and five miles from the sea.
E. Long. 72. 45. N. Lat. 18. 30.

CHAILIEU, (William Amfry de) abbé d'Amale,
one of the most polite and ingenious of the French
poets, was born in 1629, and died at the age of 84.
The most complete edition of his poems is that printed
in 2 vols 8vo in 1753.

CHAUMONT, a town of France, in Champagne,
and in the district of Bassigny, of which it is the capital.
It is seated on a mountain near the river Marne. E.
Long. 5. 15. N. Lat. 48. 6.

CHAUNE, a town of France, in Picardy, and
in the district of Santerre, with the title of a duchy. E.
Long. 2. 55. N. Lat. 49. 45.

CHAUNTRY Sec CHAUNTRY.

CHAUNY, a town of France, in Picardy, seated
on the river Oise, in Chauny. E. Long. 5. 17. N.
Lat. 40. 17.

CHAVIN, (Stephen) a celebrated minister of the
reformed religion, born at Nîmes, left France at the
revocation of the edict of Nantes, and retired to
Rotterdam, where he began a new Journal des Scavants;
and afterwards removing to Berlin, continued it there
three years. At this last place, he was made profes-
sor of philosophy, and discharged that office with much
honour and reputation. His principal work is a phi-
losophical dictionary, in Latin, which he published
at Rotterdam in 1692; and gave a new edition of it much
augmented, at Lewarden, in 1712, folio. He died in
1725, aged 85.

CHAVEZ, a strong town of Trales-Montes in Por-
tugal, is seated at the foot of a mountain on the river
Tamega. It has two suburbs, and as many forts; one
CHA [ 367 ]

CHAZELLES, (John Matthew) a celebrated French mathematician, and engineer, was born at Lyons in 1657. M. du Hamel, with whom he got acquainted, finding his genius inclined towards astronomy, presented him to M. Cassini, who employed him in his observatory. In 1683, the Duke of Mortemar made use of Chazelles to teach him mathematics; and, the year after, procured him the preferment of hydrography professor for the galleys of Marseille, where he set up a school for young pilots designed to serve aboard the galleys. In 1686, the galleys made four little campaigns, or rather four intended, and also that the galleys. In 1686, the galleys made what they wanted concerning the four cardinal points, naturally concluded this profession all the century. They were lodged with the ministers of the Palatinate, to extort money or goods by false pretences, or of sending threatening letters in order to extort money or goods, may be punished with a fine or imprisonment, or by pillory, whipping, or transportation.

CHEBRECHIN, a town of Poland, in the province of Russia and Palatinate of Belkow. It is seated on the declivity of a hill, and the river Wierpi waters its walls, and afterwards falls into the river Bog. The Jews there are very rich. E. Long. 23. 31. N. Lat. 50. 35.

CHECAYA, in Turkish affairs, the second officer of the Janizaries, who commands them under the aga, and is otherwise called protoporo.

There is also a checaya of the treasury, stables, kitchen, &c. the word signifying as much as lieutenant, or the second in any office.

CHECK, or Ckeck-Roll, a roll or book, wherein are contained the names of such persons as are attendants and in the pay of kings, or other great personages, as their household servants.
C E

CHEEK

Clerk of the Check in the king’s household, in Britain, has the check and controlment of the yeomen of the guard, and all the others belonging to the royal family, allowing their absence or defects in attendance, or diminishing their wages for the same, &c. He also, by himself or deputy, takes the view of those that are to watch in the court, and has the setting of the watch, &c.

Clerk of the Check in the royal dock-yards, in Britain, an officer who keeps a muster or register of all the men employed aboard his majesty’s ships and vessels, and also all the artificers and others in the service of the navy at the port where he is fitted.

Cheeks, in falcurry, a term used of a hawk, when she forakes her proper game, to fly at pyes, crows, rooks, or the like, that crofs her in her flight.

Checky, in heraldry, is when the shield, or a bordure, &c. is chequered, or divided in chequers or figures, in the manner of a chess-board.

This is one of the most noble and most ancient figures used in armoury; and a certain author faith, that it ought to be given to none but great warriors, in token of their bravery: for the chess-board represents a field of battle, and the pawns placed on both sides represent the soldiers of the two armies, which move, attack, advance, or retire, according to the will of the gamesters, who are generals.

This figure is always composed of metal and colour. But some authors would have it reckoned among the several sorts of arms.

Cheek, in anatomy, that part of the face situated below the eyes on each side.

Cheeks, a general name among mechanics, for almost all those pieces of their machines and instruments, that are double, and perfectly unlike. Thus, the cheeks of a printing-press are its two principal pieces: they are placed perpendicular, and parallel to each other; serving to hold the three formers, viz., the head, shelves, and winter, which bear the spindle, and other parts of the machine. See Printing-Press.

The cheeks of a turner’s lathe, are two long pieces of wood, between which are placed the puppets, which are either pointed or otherwise, serving to support the work and the mandrills of the workman. These two pieces are placed parallel to the horizon, separated from one another by the thickens of the tail of the puppets, and joined with tenons to two other pieces of wood placed perpendicularly, called the legs of the lathe.

Cheeks of the glazier’s vice, are two pieces of iron joined parallel at top and bottom; in which are the axis, or spindles, little wheel, cushions, &c. whereof the machine is composed.

The cheeks of a mortar, or the brackets, in artillery, are made of strong planks of wood, bound with thick plates of iron, and are fixed to the bed by four bolts; they rife on each side of the mortar, and to serve to keep her at what elevation is given her, by the help of strong bolts of iron which go through both cheeks, both under and behind the mortar, beliaw which are driven coins of wood; these bolts are called the brackets, and the bolts which are put one in each end of the bed, are the traverse-bolts. Because with handspikes the mortar is by these traversed to the right or left.

Cheeks, in ship-building, are two pieces of timber, fitted on each side of the mast at the top, serving to strengthen the masts there. The uppermost ball or piece of timber in the beak of a ship, is called the check. The knees which falten the beak-head to the ship, are called checks; and the sides of any block, or the sides of a ship’s carriage of a gun, are called checks.

CHEESE, a sort of food prepared of curdled milk purged from the serum or whey, and afterwards dried for use.

Cheese differs in quality according as it is made from new or skimmed milk, from the curd which separates spontaneously upon standing, or that which is more speedily produced by the addition of rennet. Cream also affords a kind of cheese, but quite fat and butyrous, and which does not keep long. Analyzed chemically, cheese appears to partake much more of an animal nature than butter, or the milk from which it was made. It is insoluble in every liquid except spirit of nitre, and caustic alkaline ley. Shaved thin, and properly treated with hot water, it forms a very strong cement if mixed with quicklime. When prepared with hot water, it is recommended in the Swedish memoirs to be used by sailors as a biscuit; it may be made into any form, is not softened by the cold water, and the slices are fond of it. As a food, physicians condemn the too free use of cheese. When new, it is extremely difficult of digestion: when old, it becomes acid and hot; and, from Dr Percival’s experiments, is evidently of a sceptical nature. It is a common opinion that old cheese digests every thing, yet is left undigested itself; but this is without any solid foundation. Cheese made from the milk of sheep digests sooner than that from the milk of cows, but is less nourishing; that from the milk of goats digests sooner than either, but is also the least nourishing. In general, it is a kind of food fit only for the laborious, or whose organs of digestion are strong.

Every country has places noted for this commodity; thus Chester and Gloucester cheese are famous in England; and the Parmesan cheese is in no lesse repute abroad, especially in France. This sort of cheese is entirely made of sweet cow-milk: but at Rochefort in Languedoc, they make it of ewe’s milk; and in other places it is usual to add goat or ewe’s milk in a certain proportion to that of the cow. There is likewise a kind of medicated cheese made by intimately mixing the expressed juice of certain herbs, as sage, balm, mint, &c. with the curd before it is fashioned into a cheese.—The Laplanders make a sort of cheese of the milk of their rein-deer; which is not only of great service to them as food, but on many other occasions. It is a very common thing in these climates to have a limb numbed and frozen with the cold: their remedy for this is the heating an iron red hot, and thrusting it through the middle of one of these cheeses; they catch what drops out, and with this anoint the limb, which soon recovers. They are subject also to coughs and diseases of the lungs, and these they cure by the fame sort of medicine: they boil a large quantity of the cheese in the fresh deer’s milk, and drink the decction in large draughts warm several times a-day. They make a lesf strong decoction of the same kind also, which they use as their common drink, for three or four days together, at several times of the year. They do...
CHEESE [ 369 ]

Cheese. do this to prevent the mischief they are liable to from their water, which is otherwise their constant drink, and is not good.

The hundred weight of cheese pays on importation into Britain 15. 3s. d. and draws back on exportation 15. 1d. at the rate of 6s. 8d.

Best methods of making cheese in England. The double Gloucester is a cheese that pleases almost every palate. The best of this kind is made from new, or (as it is called in that and the adjoining counties) covered milk. An inferior fort is made from what is called half-covered milk; though when any of these cheeses turn out to be good, people are deceived, and often purchase them for the best covered milk cheeses: but farmers who are honest have them stamped with a piece of wood made in the shape of a heart, so that any person may know them.

It will be every farmer's interest (if he has a sufficient number of cows) to make a large cheese from one meal's milk. This, when brought in warm, will be easily changed or turned with the rennet; but if the morning or night's milk be to be mixed with that which is fresh from the cow, it will be a longer time before it turns, nor will it change sometimes without being heated over the fire, by which it often gets duff or foot, or smoke, which will give the cheese a very disagreeable flavour.

When the milk is turned, the whey should be carefully strained from the curd. The curd should be broken small with the hands; and when it is equally broken, it must be put by little at a time into the vat, carefully breaking it as it is put in. The vat should be filled an inch or more above the brim, that when the whey is pressed out it may not shrink below the brim; if it does, the cheese will be worth very little. But first, before the curd is put in, a cheese-cloth or strainer should be laid at the bottom of the vat; and this should be so large, that when the vat is filled with the curd, the ends of the cloth may turn again over the top of it. When this is done, it should be taken to the press, and there remain for the space of two hours; when it should be turned and have a clean cloth put under it, and turned over as before. It must then be pressed again, and remain in the press six or eight hours; when it should again be turned and rubbed on each side with salt. After this it must be pressed again for the space of 12 or 14 hours more; when, if any of the edges project, they should be pared off: it may then be put on a dry board, where it should be regularly turned every day. It is a good way to have three or four holes bored round the lower part of the vat, that the whey may drain so perfectly from the cheese as not the least particle of it may remain.

The prevailing opinion of the people of Gloucestershire and the neighbouring counties is, that the cheeses will spoil if they do not scrape and wash them when they are found to be mouldy. But others think that suffering the mould to remain, mellows them, provided they are turned every day. Tho', however, who will have the mould off, should cause it to be removed with a clean dry funnel, as the washing the cheeses is only a means of making the mould (which is a species of fungus rooted in the coat) grow again immediately.

Some people call the curd: but this is a bad and mercenary practice; it robs the cheese of its fattens, and can only be done with a view to raise a greater quantity of whey butter, or to bring the cheeses forward for sale, by making them appear older than they really are.

As most people like to purchase high-coloured cheese, it may be right to mix a little annatto with the milk before it is turned. No cheese will look yellow without it; and though it does not in the least add to the good taste, it is perfectly innocent in its nature and effects. The whey is pressed out it may not change; but if the cheese be well wrought, it will not be good. When this is fit for the purpose, three pints or two quarts of soft water (clean and sweet) should be mixed with salt, wherein should be put sweet-briar, rose leaves and flowers, cinnamon, mace, cloves, and, in short, almost every sort of spice and aromatic that can be procured; and if these are put into two quarts of water, they must boil gently till the liquor is reduced to three pints, and care should be taken that this liquor is not finked. It should be strained clean from the spices, &c. and when found to be not warmer than milk from the cow, it should be poured upon the yell or maw. A lemon may then be sliced into it; when it may remain a day or two: After which it should be strained again, and put in a bottle; where, if well corked, it will keep good for twelve months or more. It will smell like a perfume; and a small quantity of it will turn the milk, and give the cheese a pleasing flavour. After this, if the yell be salted, and dried for a week or two near the fire, it will do for the purpose again almost as well as before.

Cheddar cheese is held in high esteem; but its goodnes is said to be chiefly owing to the land whereon the cows feed, as the method of making it is the same as is pursued throughout Somersetshire, and the adjoining counties.

Cheshire cheese is much admired; yet no people take the least pains with the rennet than the Cheshire farmers. But their cheeses are so large as often to exceed one hundred pounds weight each; to this (and the age they are kept, the richness of the land and the keeping such a number of cows as to make such a cheese without adding a second meal's milk) their excellence may be attributed. Indeed they falt the curd (which may make a difference), and keep the cheeses in a damp place after they are made, and are very careful to turn them daily.

But of all the cheese England produces, none is more highly esteemed than the Stilton, which is called the Parmesan of England, and (except faulty) is never sold for less than 15. or 15. 2d. per pound.

The Stilton Cheeses are usually made in square vats, and weigh from six to twelve pounds each cheese. Immediately after they are made, it is necessary to put them into square boxes made exactly to fit them; they being so extremely rich, that except this precaution be taken they are apt to bulge out and break abever. They should be continually and daily turned in these boxes, and must be kept two years before they are properly mellowed for sale.

Some make them in a net, somewhat like a cabbage net; so that they appear, when made, not unlike an a
CHEESE [ 370 ]

Cheeses.—But these are never so good as the other, having a thicker coat, and wanting all that rich flavour and mellowness which make them so pleasing.

It is proper to mention that the making of these cheeses is not confined to the Stilton farmers, as many others in Huntingdonshire (not forgetting Rutland and Northamptonshires) make a similar sort, sell them for the same price, and give all of them the name of Stilton Cheeses.

Though these farmers are remarked for cleanliness, they take very little pains with the rennet, as they in general only cut pieces from the vell or maw, which they put into the milk, and move gently about with hand, by which means it breaks or turns so, that they easily obtain the curd. But if the method above described for making rennet were put in practice, they would make their cheese still better; at least they would not have so many faulty and unfound cheeses; for notwithstanding their cheeses bear such a name and price, they often find them so bad as not to be saleable; which is probably owing to their being so careless about the rennet.

It has been alleged, that as good cheese might be made in other counties, if people would adhere to the Stilton plan, which is this:—They make a cheese every morning; and to this meal of new milk they add the cream taken from that which is milked the night before. This, and the age of their cheeses, have been supposed the only reasons why they are preferred to others; for from the nicest observation, it does not appear that their land is in any respect superior to that of other counties.

Excellent cream cheeses are made in Lincolnshire, by adding the cream of one meal's milk to milk which comes immediately from the cow; these are prefixed gently two or three times, turned for a few days, and are then disposed of at the rate of 1s. per pound, to be eaten while new with radishes, fallad, &c.

Many people give skimmed milk to pigs, but the whey will do equally as well after cheeses are made from this milk; such cheeses will always sell for at least 2d. per pound, which will amount to a large sum annually where they make much butter. The peasants and many of the farmers in the north of England never eat any better cheese; and though they appear harder, experience hath proved them to be much easer of digestion than any new milk cheeses. A good market may always be found for the sale of them at Bristol.

Account of the making of Parmesan Cheese: by Mr Zappa of Milan, in answer to queries from Arthur Young, Esq.

"Are the cows regularly fed in stables?"—From the middle of April, or sooner if possible, the cows are sent to pasture in the meadows till the end of November usually.

"Or only fed in stables in winter?"—When the season is past, and snow comes, they are put into stables for the whole winter, and fed with hay.

"Do they remain in the pasture from morning till night? or only in hot weather?"—Between nine and ten in the morning the cows are sent to water, and then to the pastures, where they remain four or five hours at morn, and at three or four o'clock are driven to the stables if the season is fresh, or under porches if hot; where, for the night, a convenient quantity of hay is given them.

"In what months are they kept at pasture the whole day?"—Mostly answered already; but it might be said, that no owner will leave his cattle, without great care, in uncovered places at night. It happens only to the shepherds from the Alps, when they pass, because it is impossible to find stables for all their cattle.

"What is the opinion in the Loddefan, on the best conduc for profit in the management of meadows?"—For a dairy farm of 100 cows, which yields daily a cheese weighing 70 to 75 lb. of 28 ounces, are wanted 1000 perticas of land. Of these about 800 are standing meadows, the other 200 are in the cultivation for corn and grass fields in rotation.

"Do you milk the cows morning and evening?"—Those that are in milk are milked morning and evening, with exception of such as are near calving.

"One hundred cows being wanted to make a Loddefan each day, it is supposed that it is made with the milk of the evening and the following morning; or of the morning and evening of the same day: how is it?"—The 100 cows form a dairy farm of a good large cheese; it is reckoned that 80 are in milk, and 20 with calves fucking, or near calving. They reckon one with the other about 32 boccalis of 32 oz. of milk. Such is the quantity for a cheese about 70 lb. of 28 ounces. They join the evening with the morning milk, because so it is frether than if it was that of the morning and evening of the same day. The morning milk would be 24 hours old when the next morning the cheese should be made.

"Do they skim or not the milk to make butter before they make the cheese?"—From the evening milk all the cream possible is taken away for butter, mascarporni (cream-cheese), &c. The milk of the morning ought to be skimmed slightly; but every one skim as much as he can. The butter is sold off on the spot immediately at 24 sous; the cheese at about 28 sous. The butter loses nothing in weight; the cheese loses one-third of it, is subject to heat, and requires expenses of service, attention, warehouses, &c. before it is sold; and a man in two hours makes 45 to 50 lb. of butter that is sold directly. However, it is not possible to leave much cream in the milk to make Loddefan cheese, called grated cheeses; because if it is too rich, it does not last long, and it is necessary to confume it while young and found.

"Is Parmesan or Loddefan cheese made every day in the year or not?"—With 100 cows it is. In winter, however, the milk being less in quantity, the cheese is of lesser weight, but certainly more delicate.

"After gathering or uniting the milk, either skimmed or not, what is exactly the whole operation?"—The morning of the 3d of March 1786, I have seen the whole operation, having gone on purpose to the spot to see the whole work from beginning to end. At 16 Italian hours, or ten in the morning, according to the northern way to account hours, the skimming of that morning's milk, gathered only two hours before, was finished. I did, meanwhile, examine the boiler or pot. At the top it was eight feet (English) diameter, or thereabout; and about five feet three inches deep,
Cheese. made like a bell, and narrowing towards the bottom to about two one-half feet. They joined the cream produced that morning with the other produced by the milk of the evening before. That produced by this last milk was double in quantity to that of the morning milk, because it had the whole night to unite, and that of the morning had only two hours to do it, in which it could not separate much. Of the cream some was destined to make macarporns (cream-cheese), and they put the rest into the machine for making butter. Out of the milk of the evening before and of that morning that was all put together after skimming, they took and put into the boiler 272 boccali, and they put under it two faggots of wood; which being burnt, were sufficient to give the milk a warmth a little superior to lukewarm. Then the boiler being withdrawn from the fire, the foreman put into it the rennet, which they prepare in small balls of one ounce each, turning the ball in his hand always kept in the milk entirely covered; and after it was perfectly dissolved, he covered the boiler to keep the milk defended, that it might not suffer from the coldness of the feaon, in particular as it was a windy day. I went to look on the morning that was making macarporns, &c. and then we went twice to examine if the milk was sufficiently coagulated. At the 18 hours, according to the Italian clocks, or noon, the true manufactory of cheese began. The milk was coagulated in a manner to be taken from the boiler in pieces from the surface. The foreman, with a stick that had 18 points, or rather nine small pieces of wood fixed by their middle in the end of it, and forming nine points in each side, began to break exactly all the coagulated milk, and did continue to do so for more than half an hour, from time to time examining it to see its state. He ordered to renew the fire, and four faggots of willow branches were used all at once; he turned the boiler that the fire might act; and then the underman began to work in the milk with a flick like the above, but with only four smaller sticks at the top, forming eight points, four at each side, a span long each point. In a quarter of an hour the foreman mixed in the boiler the proper quantity of sawfron, and the milk was all in knobs, and finer grained than before, by the effect of turning and breaking the coagulation, or curd, continually. Every moment the fire was renewed or fed; but with a faggot only at a time, to continue it regular. The milk was never heated much, nor does it hinder to keep the hand in it to know the fineness of the grain, which refines continually by the flick-work of the underman. It is of the greatest consequence to mind when the grain begins to take a consistence. When it comes to this state, the boiler is turned from the fire, and the underman immediately takes out the whey, putting it into proper receivers. In that manner the grain subfides to the bottom of the boiler; and leaving only in it whey enough to keep the grain covered a little, the foreman extending himself as much as he can over and in the boiler, unites with his hands the grained milk, making like a body of paste of it. Then a large piece of linen is run by him under that paste, while another man keeps the four corners of it, and the whey is directly put again into the boiler, by which is facilitated the means of raising that paste that is taken out of the boiler, and put for one quarter of an hour into the receiver where the whey was put before, in the same linen it was taken from the boiler, which boiler is turned again directly on the fire, to extract the macarporn (whey-cheese); and is a second product, eaten by poor people. After the pate remained for a quarter of an hour in that receiver, it was taken out and turned into the white cream called fajfons, without anything else made than the roundity, having neither top or bottom. Immediately after having turned it into that round wooden form, they put a piece of wood like a cheese on it, putting and increasing gradually weights on it, which serve to force out the remnant of whey; and in the evening the cheese so formed is carried into the warehouse, where, after 24 hours, they begin to give the salt. It remains in that warehouse for 15 or 20 days; but in summer only from 8 to 12 days. Meanwhile the air and salt form the crust to it; and then it is carried into another warehouse for a different service. In the second warehouse they turn every day all the cheese that are not older than fix months; and afterwards it is enough if they are only turned every 48 or 60 hours, keeping them clean, in particular of that bloom which is inevitable to them, and which, if neglected, turns them nasty, and causes the cheese to acquire a bad smell. This Lodefan, because it has a great deal of meadows, and abounds with cows, its product being mostly in cheese, butter, &c. However, the province of Pavia makes a great deal of that cheese; and we Milanese do likewise the fame from the side of Porte Tofo, Romana, Ticinene, and Ver­cillina, because we have fine meadows and dairy farms.

Cheese-Rennet. See Gallium and Runnet.

Chegro, or Nigua, the Indian name of an insect common in Mexico, and also found in other hot countries where it is called pique, is an exceeding small animal, not very unlike a flea, and is bred in the dust. It fixes upon the feet, and breaking insensibly the cuticle, it penetrates between that and the true skin, which also, unless it is immediately taken out, it breaks; and piercing that at last to the flesh, multiplying with a rapidity almost incredible. It is seldom discovered until it pierces the true skin, when it causes an intolerable itching. These insects, with their astonishing multiplication, would soon displease those countries, were it not easy to avoid them, or were the inhabitants less dexterous in getting them out before they begin to spread. On the other hand, nature, in order to lessen the evil, has not only denied them wings, but even that formation of the legs and those strong muscles which are given to the flea for leaping. The poor, however, who are in some measure doomed to live in the dust, and to a habitual neglect of their persons, suffer these insects sometimes to multiply so far as to make large holes in their flesh, and even to occasion dangerous wounds.

Cheiranthus, Stock-gillyflower, or Wallflower: A genus of the 39th natural order, Silique­se; and belonging to the tetradyynamia class of plants. The germin is marked with a glandulous denticle on each side; the calyx is close, with two of its leaves gibbous at the base; the seeds plane. The species are 13; but the following three are most worthy of notice.

1. The cheri, or common wall-flower, with ligeous, long, tough roots; an upright, woody, abiding stalk, divided into many erect angular branches, forming a bulky head from one to two feet high, closely garnished with spear.
spire-shaped, acute, smooth leaves, and all the branches terminating in long erect spikes of numerous flowers, which in different varieties are yellow, bloody, white, etc. 2. The incanus, or hoary cheiranthus, with lig- neous, long, naked, white roots; and upright, strong, woody, abiding item from one to three feet high, branchy from one to two or three feet long, of different colours in different varieties. 3. The annus, or ten-weeks-flock, with an upright, woody, smooth stalk, divided into a branchy head, 12 or 15 inches high, garnished with spire-shaped, blunt, hoary leaves, a little indented, and all the branches terminated by erect spikes of numerous flowers of different colours in different varieties. — The two first sorts are very hard everlasting biennials or perennials; but the las is an annual plant, to must be continued by seed sown every year; and even the two first, notwithstanding their being perennial, degenerate so much in their flowers after the first year, that it will be proper also to raise an annual supply of them. The seeds are to be sown only from the plants with single flowers; for the double ones bring no seeds to perfection. The seeds are to be chosen from such flowers as have five, fix, or more petals, or from such as grow near to the double ones. They may be sown in the full ground in the spring, and may be afterwards transplanted. When fine doubles of the two first kinds are obtained, they may be multiplied by slips from the old plants. CHEKA, in natural his tory, the name of an eart found in many parts of the East Indies, and sometimes used by the Chinese in their porcelain manufacturies. It is a hard and stony earth; and the manner of using it is this: they first calcine it in an open furnace, and then beat it to a fine powder. This powder they mix with large quantities of water: then stirring the whole together, they let the coarser part fall to; and pouring off the rest, yet thick as cream, they leave it to settle, and use the matter which is found at the bottom in form of a soft paste, and will retain that humidity a long time. This supplies the place of the earth called bouche, in the making of that elegant sort of china-ware which is all white, and has flowers which seem formed by a mere vapour with its surface. The manner of their using it is this: they first make the vessel of the common matter of the manufacture; when this is almost dry, they paint upon it the flowers, or whatever other figures they please, with a pencil dipt in this preparation of the chekao; when this is thoroughly dry, they cover the whole vessel with the varnish in the common way, and bake it as usual. The consequence is, that the whole is white: but the body of the vessel, the figures, and the varnish, being three different substances, each has its own particular white; and the flowers being painted in the finest white of all, are distinctly seen through the varnish upon the vessel, and seem as if traced by a vapour only. The hoacho does this as well as the chcekao; but besides the quality of serving for making the porcelain ware either alone, or in the place of kaolin: the chekao has not this property, nor any other substance besides this hoacho, which appears to be the same with the flaeites or soap-rock. CHEKE, (Sir John) a celebrated statesman, gram-
The air is pure and healthful, and the soil fertile, being watered by a number of rivers and canals, as well as springs and lakes. The chief produce is silk; a vast quantity of which is cultivated here, and for which the whole country is covered with mulberry trees. These are particularly cultivated in their growth by the natives, experience having taught them, that the leaves of the smallest trees produce the best silk. The stuff made in this province, which are embroidered with gold and silver, are reckoned the best in the empire, and notwithstanding a vast exportation to the Japanese and Philippine islands, as well as to every part of China, and to Europe, such an abundance is left in the province, that a complete suit of silk may be bought here as cheap as one of the coarsest woolens in France.

This province is also remarkable for a particular species of mushrooms, which is exported to every part of the empire. They are pickled, and then dried; when they will keep good for a whole year. When eaten they must be soaked in water, which renders them as fresh as at first. Here also the tallow tree is met with; and the province affords excellent hams, and those small gold-fishes with which the ponds are usually stocked.

Che-kyang contains 11 cities of the first class, 72 of the third, and 18 fortrresses, which, in Europe, would be accounted large cities. The principal of these are, 1. Hang-tcheou-fou, the metropolis, accounted by the Chinese to be the paradise of the earth. It is four leagues in circumference, exclusive of the suburbs; and the number of its inhabitants is computed at more than a million, and 10,000 workmen are supposed to be employed within its walls in manufacturing of silk. Its principal beauty is a small lake, close to the walls on the western side, the water of which is pure and limpid, and the banks almost everywhere covered with flowers. Its banks are likewise adorned with halls and open galleries supported by pillars, and paved with large flag-stones for the convenience of those who are fond of walking; and the lake itself is intersected with causeways cased with cut-stones, openings covered with bridges being left in them for the passage of boats. In the middle are two islands with a temple and several pleasure-houses, and the emperor has a small palace in the neighbourhood. The city is garrisoned by 5000 Chinese and as many Tartars, and has under its jurisdiction seven cities of the third class. 2. Hou-tcheou-fou is also situated on a lake, and manufactures an incredible quantity of silk, inomuch that the tribute of a city under its jurisdiction amounts to more than 500,000 ounces of silver. 3. Ning-po, by Europeans called Liamo, is an excellent port, opposite to Japan. Eighteen or twenty leagues from it is an island called Tcheou-chan, where the English first landed on their arrival at China. 4. Ning-po is remarkable for the silk manufactured there, which is much esteemed in foreign countries, especially Japan, where it is exchanged for gold, silver, and copper. 5. Chao-hing-fou, situated in an extensive and fertile plain, is remarkable for a tomb about half a league distant, which is said to be that of Y’he-ming-fou. The people of this province are said to be the most vered in chicanery of any in China. 6. Tchou-tcheou-fou is remarkable for having in its neighbourhood pines of an extraordinary size, capable of containing 40 men in their trunks. The inhabitants are ingenious, polite, and courteous to strangers, but very superstitious.

CHELIDONIAS, according to Pliny, an anniver-sary wind, blowing at the appearance of the swallows; otherwise the Favonius, or Zephyrus.

CHELIDONIUM, Celandine, and Horner or prickly poppy: A genus of the monogyynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 27th order, Rhoeadaceae. The corolla is tetrapetalous, the calyx diphylous, the filixa unilocular and linear. There are five species, none of which are remarkable for their beauty; but one of them, viz. the majus, is an article in the materia medica. It grows on old walls, among rubbish, and in waste shady places. The herb is of a bluish green colour; the root of a deep red; and both contain a gold-coloured juice: their smell is disagreeable, the taste somewhat bitterish, very acrid, burning and biting the mouth; the root is the most acrid. The juice takes off warts; cures terrors, ring-worms, and the itch; and, diluted with milk, it confumes opaque white spots on the eye. - Hories, cows, goats, and swine, refuse to eat the herb.

CHELIDONIUM LAPIS, in natural history, a stone said by the ancients to be found in the stomachs of young swallows, and greatly cried up for its virtues in the falling-licknefs; but, from their description, it appears to be only a species of lycodontes, or bufontes. See Lycodontes, and Bufonite.

CHELM, a town of Poland, capital of a palatinate of the same name. It is situated in the province of Red Russia. F. Long. 23°. 50'. N. Lat. 51°. 25'.

CHELMSFORD, the county town of Essex, situated on the river Chelmer, in F. Long. 0°. 30'. N. Lat. 51°. 40'. It sends two members to parliament.

CHELONE, in botany: A genus of the angiospermium order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, Peronaceae. The calyx is quinquepartite; the rudiment of a fifth filament among the highest flamina, the capsula bicostate. There are three species, viz. the Glabra, the Hirsuta, and the Penterguson. They are natives of North America; and are herbaceous flowery perennials, with upright stalks two feet high, decorated with spear-shaped leaves, and beautiful spikes of monocotyledonous, ringent flowers, red, rose-coloured, blue, and purple. They flower from September to November, and are sometimes succeeded by ripe seeds in Britain. They are very hardy plants, and may be propagated by seeds sown in any soil or situation; but the two first multiply by falt by their creeping roots, that the seeds are seldom regarded.

CHELSEA, a fine village situated on the northern bank of the river Thames, a mile westward of Westminster, remarkable for a magnificent hospital of invalids and old decrepit soldiers; and a pleasure-house, called Ranelagh, to which a great deal of fine company resort in summer; and a noble botanical garden belonging to the company of apothecaries. The royal hospital of invalids was begun by Charles II. carried on by James II. and finished by king William. It consists of a vast range of buildings, that form three large squares, in which there is an uncommon air of neatness and elegance observed. It is under the direction of commissioners, who confit generally of 11...

CHE [ 374 ]

CHELTEMHAM, or CHILTEMPHAM, a market town of Gloucestershire, seven miles north-east of Gloucester. W. Long. 2. 10. N. Lat. 51. 50. It is chiefly remarkable for its mineral waters, of the same kind with those of Scarborough. See Scarborough.

CHEMISE, in fortification, the wall with which a baffle, or any other bulwark of earth, is lined for its greater support and strength: or it is the solidity of the wall from the talus to the flone-row.

Fire-CHEMISE, a piece of linen cloth, steeped in a composition of oil of petrol, camphor, and other combustible matters, used at sea, to let fire to an enemy’s vessel.

CHEMISTRY

1. Definition. May be defined, The study of such phenomena or properties of bodies as are discovered by variously mixing them together, and by exposing them to different degrees of heat, alone, or in mixture, with a view to the enlargement of our knowledge in nature, and to the improvement of the useful arts: or, it is the study of the effects of heat and mixture upon all bodies, whether natural or artificial, with a view to the improvement of arts and natural knowledge.
