## GOB

 CObBO (Pietro Paolo Cortonese,focalled), a celebrated painter of fruit and landfcapes, was born at Cortona in 1580 , and learned the principlos of defign from his father ; but was afterwards the difciple of one Crefcentio at Rome, and perfected himfelf in the moft effential parts of his profeffion, by fudying after nature, with judgment and accuracy. His merit foon recommended him to the notice and efteem of the moft able judges at Rome; and as he excelled equally in painting fruit and landfcape, he found a generous patron in cardinal Borghefe, who employed him to adorn his palace. The fruit which he painted had fo true and expreflive an imitation of nature, that nothing could polfibly be more exact ; and by his thorough knowledge of the chiaro- fcuro, he gave an extraordinary roundnefs and relief to every object. But his greateft excellence confifted in his colouring; for in defign he was not remarkably fuperior to others. He died in 1640.GOBELIN (Giles), a famous French dyer, in the reign of Francis I. difcovered a merhod of dying a beautiful fcarlet, and his name has been given ever fince to the fineft French fcarlets. His houfe, in the fuburb of St Marcel at Paris, and the river he made ufe of, are fill called the Gobolins. An academy for drawing, and a manufactory of fine tapeftries, were erected in this quarter in 1666 ; for which reafon the tapeftries are called the Gobetins.
GOBIUS, in ichthyology, a genus of finhes belonging to the order of thoracici. They have two holes between the eyes, four rays in the membrane of the gills, and the belly-fins are united in an oval form. There are eight fpecies, principally diftinguifhed by the number of rays in their fins.
GOBLET, or Gobelet, a kind of drinking cup, or bowl, ordinarily of a round figure, and withont either foot or handle. The word is French, gobelet; which Salmafius, and others, derive from the barbarous Latin cupa. Budeus deduces it from the Greek zuт $\frac{1}{2}<0$, a fort of cup.

GOD, one of the many names of the Supreme Being. See Christianity, Metaphysics,Moral Philosophy, and Theology.

God is alfo ufed in fpeaking of the falfe deities of the heathens, many of which were only creatures to which divine honours and workhip were fuperftitioully paid.

The Greeks and Latins, it is obferveable, did not mean by the name God, an all-perfect being, whereof eternity, infinity, omniprefence, \&c. were eflential atVol. VIII.

## GOD

tributes: with them, the word only implied an excelent and fuperior nature; and accordingly they gave the appellation gods to all beings of a rank or clafs higher and more perfeet than that of men; and efpecially to thofe who were inferior agents in the divine adminiftration, all fubject to the one Supreme. Thus men themfelves, according to their fyftem, might become gods after death ; inafmuch as their fouls might attain to a degree of excellence fuperior to what they were capable of in life.
The firt divines, father Boffu obferves, were the poets: the two functions, though now feparated, were originally combined; or, rather, were one and the fame thing.

Now the great variety of attributes in God, that is, the number of relations, capacities, and circumftances, wherein they had occafion to confider him, put thefe poets, \&c. under a neceflity of making a partition, and of feparating the divine attributes intofeveral perfons; becaufe the weaknefs of the human mind could not conceive fo much power and action in the fimplicity of one fingle divine nature. Thas the omnipotence of God came to be reprefented under the perfon and appellation of Jupiter ; the wifdom of God, under that of Minerva ; the juftice of God under that of Juno.

The firt idols or falfe gods that are faid to have been adored, were the ftars, fun, moon, \&c. on acceunt of the light, heat, and other benefits, which we derive from them. Afterwards the earth came to be deffied, for furnifling fruits neceffary for the fabfiftence of men and animals; then fire and water became objects of divine worfhip, for their ufefulnefs to human life. In procefs of time, and by degrees gods became multiplied to infinity; and there was fcarce any thing but the weaknefs or caprice of fome devotee or other elevated into the rank of deity ; things ufelefs or even deftructive not excepted. See Mythoiogy.

GODALMING, a town of England, in the county of Surry, on the river Wey, 35 miles from London. It is a corporation; by whofe charter their chief magiftrate isa warden chofen y early, who has 8 brethren his affiftants. The parifh is divided into 9 tithings. Its river abounds with good filh ; and drives a griftmill, two paper-mills, and three corn-mills ; over which river a new bridge was begun July 22 d I 783 . Here is a manufactory of mixed and blue kerfeys, alfo a manufactory of ftockings; and the place is alfo famous for liquorice, and fore of peat that burns better than pit-coal : but a woman of this town (Mary Tofts) in 1726 endeavoured to render itinfamous, by a pretend-

## GOD $\quad\left[\begin{array}{ll}2\end{array}\right] \quad G O D$

Goddard ed delivery of rabbets; by which, however, the for 1 fome time puzzled fome noted phyficians, anatomifts, $\underbrace{\text { Godfathers }} \& \mathrm{cc}$. In 1739 , the fmall-pox carried off above 500 perfons here in 3 months, which was more than a third of the inhabitants.

GODDARD (Jonathan), an eminent phyfician and chemift, and one of the firft promoters of the Royal Society, was born about the year 1617. He was clected a fellow of the college of phyficians in 1646 , and appointed reader of the anatomical lecture in that college in 1647 . As he took part againft Charles I. accepted the wardenflip of Merton-college, Oxford, from Oliver Cromwell when chancellor, and fat fole reprefentative of that univerfity in Cromiwell's parliament, he was removed from his wardenhip in a manner difgraceful to him by Charles II. He was however then profeffor of phyfic at Grefham college, to which he retired, and continued to attend thofe meetings that gave birth to the Koyal Society ; upon the firfteflablifunent of which, he was nominated one of the council. Being fuily, perfuaded that the preparation of medicines was no lefs the phyfician's duty than the prefcribing them, he conftantly prepared his own; and in 1668 publified a treatile recommending his example to general practice. He died of an apoplectic fit in 1674 ; and his memory was preferved by the drops that bore his name, otherwife called $G u t t a$ Anglicuna, the fecret of which he fold to Charles II. for 50001 and which Dr Lifter affures us was only the volatile fpirit of raw filk rectified with oil of cinnamon or fome other effential oil. But he claims more particular regard, if what bifhop Seth Ward fays be true, that he was the firft Engliliman who made that noble aftronomical inftrument, the telefcope.

GODDESS, a heathen deity of the female fex.
The ancients had almoft as many goddeffes as gods : fuch were, Juno the goddefs of air, Diana the goddefs of woods, \&c. and under this character were reprefented the virtues, graces, and principal advantages of life ; truth, juftice, piety, liberty, fortune, victory, \&c.

It was the peculiar privilege of the goddeffes to be reprefented naked on medals; for it was fuppofed that the im.gination muft be awed and reftrained by the confideration of the divine character.

GODEAU (Anthony), bihhop of Graffe and Vence in France, was born at Dreux in 1605. He was a very voluminous writer, both in profe and verfe; but This principal works are, 1. An ecclefiaffical hiftory, 3 vols. folio, containing the firft eight centuries only, as he never finifhed more. 2. Tran fation of the F falms into French verfe; which was fo well approved, that even thofe of the reformed religion preferred it to that of Marat. He died in 167 r .

GODFATHERS and Godmothers,perfons who, at the baptifm of infants, anfwer for their future condact, and folemnly promife that they will renounce the devil and all his works, and follow a life of piety and virtue; and by this means lay themfelves under an indifpenfable obligation to infruct them, and watch over their conduct.

This cuftom is of great antiquity in the Chrifian church; and was probably infituted to prevent children being brought up in idolatry, in cafe their parents died before they arrived at the years of difcrecion.

The number of godfathers and godmothers is re-
duced to two, in the church of Rome; and three, in the church of England; but formerly they had as many as they plealed.

GODFREY (of Bouillon), prince of Lorrain, a molt celebrated crufader, and victorious general. He was chofen genetal of the expedition which the Chrifians undertook for the recovery of the Holy Land, and fold his dakedom to prepare for the war. He took Jerufalem from the Turks in 1099 ; but his piety, as hiftorians relate, would not permit him to wear a diadem of gold in the city where his "Saviour had been crowned with thorns. The fultan of Egypt afterwards fent a terrible army againft him ; which he defeated, with the flaughter of about 100,000 of the enemy. He died in il6o.

GODMANCHESTER, a town of HuntingdonShire, 16 miles from Cambridge, and 57 from London. It has a bridge on the Oufe, oppofite to Huntingdon; was formerly a Roman citý, by the name of Durofiponte, where many Roman coins have been of cen dug up ; and according to old writers, in the time of the Saxons it was the fee of a bifhop, and had a caftle buiit by one Gorman a Danifh king, from which the town was called Gormanchefter. It is reckoned one of the largeft villages in England, and is feated in a fertile foil, abounding with corr. It is faid that no town in England kept more ploughs at work than tbis has done. The inhabitants boaft they formerly received the kings as they made a progreefs this way, with nine fcore ploughs at a time, finely adorned with their trappings, \&c. James I. made it a corporation by the name of two bailiffs, 12 affiftants, and the commonalty of the borough of Godmanchefter. Here is a fchool, called the Free Grammar-School of queen Elizabeth. On the wen fide of the town is a noble though ancient feat of the Earl of Sandwich. Near this place, in the London road between Huntingdon and Caxton, is a tree well known to travellers by the name of Beggar'sBufh.

GODOLPHIN (John), an eminent Englifh civilian, was born in the inand of Scilly in 1617 , and educated at Oxford. In 1642-3, he was created doctor of civil law; in 1653 , he was appointed one of the judges of the admiralty; and at the Reftoration, he was made one of his majefty's advocates. He was efteemed as great a mafter of divinity as of his own faculty; and publifhed, I. The holy limbeck. 2. The holy arbour. 3. A view of the admiral's jurifdiction. 4. The orphan's legacy. 5. Repertorium canonicum, \&c. He died in 1678.

GODSTOW, a place northweft of Oxford, in a fore of illand formed by the divided freams of the Ifis after being joined by the Evenlode. It is noted for catching of fiṇ and drefling them; but more fo for the ruins of that numnery which fair Rofanond quitted for the embraces of Henry II. The people fhow a great hole in the earth here, where they fay is a fabterraneous paffage, which goes under the river to Woodftock, by which the ufed to pafs and repafs. Litule more remains at prefent than ragged walls, fcattered over a confiderable extent of ground. An arched gateway, and another venerable ruin, pare of the tower of the conventual church, are ftill ftanding. Near the altar in this church fair Rofamond was buried, but the body was afterwards removed by order of a bihhop of

Godiwin Lincoln, the vifitor. The only entire part is fmall, formerly a private chapel. Not many years lince a ftone coffin, faid to have been Rofamond's, who perhaps was removed from the church to this place, was to be feen here. The building has been put to various ulec, and at prefent ferves occafionally for a ftable.

GODWIN (Francis), fucceffively bifhop of Landaff and Hereiord, was born in 1567 . He was eminent for his learning and abilities; being a good mathematician, an excellent philofopher, a pure Latinift, and an accurate hiltorian. He underftood the true theory of the moon's motion a century before it was generally known. He firlt ftarted thofe hints afierwards purfued by bihop Wilkins, in his " Secret and fwift meffenger;" and publifhed "A catalogue of the lives of Englifh bifhops." He has neverthelefs been accufed as a great fimoniac, for omitting no opportunity of difpofing of preferments in order to provide for his children. He died in $\mathbf{1} 648$.

Gobwin (Thomas), a learned Englifh writer born in 1517 , was malter of the free-fchool at Abington in Berkfhire; where he educated a great many youths, who became eminent both in church and ftate. His works fhow him to have been a man of great learning: fuch as, Hiftorice Romane anthologia, Synorfis antiquitatum Hebraicarum, Mofes Es Aaton, Florilegium Pbraficon, $\underbrace{\circ} c$. He died in 1642 .

Godwin, or Goodruin Sands, famous fand banks off the coalt of Kent, lying between the N. and S. Foreland; and as they run parallel with the coalt for three leagues together, at about two leagues and a half diftant from it, they add to the fecurity of that capacious road, the Downs: for while the land helters fhips with the wind from fouth-welt to north-welt only, thefe fands break all the force of the fea when the wind is at eaft fouth-ealt. The molt dangerous wind, when blowing hard on the Downs, is the fouth fouth-welt. Thefe fands occupy the face that was formerly a large tract of low ground belonging to Godwyn earl of Kelit, father of King Harold; and which being afterward given to the monaltery of St Augutin at Canterbury, the abbot neglecting to keep in repair the wall that defended it from the fea, the whole tract was drowned, according to Salmon, in the year 1100 , leaving thefe fands, upon which fo many thips have fince been wrecked.

GODWIT, in ornithology. See Scolopax.
GOG and Magoc, two names generally joined together in fcripture, (Ezek. xxxviii. 2. 3. \&c. xxxix. 1, 2, \&c. Rev. xx. 8.) Mofes fpeaks of Magog the fon of Japhet, but fays nothing of Gog, (Gen. x. 2. 1. Chr. i. 5.) Gog was prince of Magog, according to Ezekiel. Magrog fignifies the country or people, and Gog the king of that country. The generality of the ancients made Mageg the father of the Scythians and Tartars; and feveral interpreters difcovered many footfteps of their name in the provinces of Great Tartary. Others have been of opinion that the Perfians were the defcendants of Magog; and fome have imagined that the Goths were defcended from Gog and Magog; and that the wars defcribed by Ezekiel, and undertaken by Gog againft the faints, are no other than thofe which the Goths carried on in the fifth age againit the Roman empire.

Bochart has placed Gog in the neighbourhood of Caucafus. He derives the name of this celebrated
mountain from the Hebrew Ggg clafin, is the fortrefs of Gog." He maintains that Prometheus, faid to be chained to Caucafus by Jupiter, is Gog, and no other. $\qquad$
Golconda There is a province in Iberia, called the Gogarene.

Laftly, the generality believe, that Gorg and Magog, mentioned in Ezekiel and the Revelations, are to be taken in an allegorical fenfe, for fuch princes as were enemies to the charch and faints. Thus many by Gogr in Ezekiel underitand Antiochus Epiphanes, the perfecutor of thofe Jews who were firm to their religion; and by the perfon of the fame name in the Revelations, they fuppofe Antichrift to be meant; the great enemy of the church and taithful. Some have endeavoured to prove that Gog, fpoken of in Ezckiel, and Cambyles king of Perfia, were one and the lame per. fon ; and that Gog and Magog in the Revelations denote all the enemies of the church, who thould be perfecutors of it to the confummation of ages.

GOGGLES, in furgery, are inftruments ufed for curing fquinting, or that diftortion of the eyes which occafions this diforder. They are fhort conical tubes, compofed of ivory ftained black, with a thin plate of the fame ivory fixed in the tubes near their anterior extremities. Through the centre of each of theie plates is a fmall circular hole, about the fize of the pupil of the eye, for the tranfmifion of the rays of light. Thefe goggles muit be continually worn in the daytime, till the mufcles of the eye are brought to act regularly and uniformly, fo as to direet the pupil fraight forwards; and by thefe means the cure will be fooner or later effected.

GOGMAGOG-Hills, are hills fo called, three miles from Cambridge, remarkable for the intrenchments and other works calt up there: whence fome fuppofe it was a Roman camp ; and others, that it was the work of the Danes.

GOGUET (Antony-Yves), a French writer, and author of a celebrated work, inticled, L'Origine des Loix, des Arts, des Sciences, $\circlearrowleft$ de leur Progres chex les anciens Peuples, 1758, 3 vols. 4to. His father was an advocate, and he was born at Paris in 1716. He was very unpromifing as to abilities, and reckoned even dull in his early years; but his underitanding developing itfelf, he applied to letters, and at length produced the above work. The reputation he gained by it was great ; but he enjoyed it a very fhort time; dying the fame year of the fmall pox; which diforder, it feems, he always dreaded. It is remarkable, that Conrad Fugere, to whom he left his library and his MiSS, was fo deeply affected with the death of his friend, as to die himfelf three days after him. The above work has been tranflated into Englifh, and publifhed in 3 vols. 8vo.

GOLCONDA, a kingdom of Afia, in the penin fula on this fide the Ganges. It is bounded on the north by that of Orixa, on the weft by that of Balagate, on the fouth by Bifnagar, and on the eaft by the gulph of Bengal. It abounds in corn, rice, and cattle ; but that which renders it moit remarkable, are the diamond-mines, they being the moft confiderable in the world: they are ufually purchafed of the black merchants, who buy parcels of ground to fearch for thefe precious fones in. They fometimes fail in meeting with any, and in others they find im. menfe riches. They have alfo mines of falt, fine iron for fword-blades, and curious callicoes and chintzes. It A 2 is
nold.
is fulject to the Great Mogul; and has a town of the fame sume, feated at the foot of a mountain, being one of the largeft in the Ealt Indies. It is about fix miles in circumference; and was formerly the refidence of the kings, till it was conquered by the Great Mogul. It is now much frequented by the European merchants. E. Long. 70. 10. N. Lit. I6. 30.

GOLD, the moft valuable of all the metals, is of a bright yellow colour when pure, but becomes more or lefs white in proportion as it is alloyed with other metais. It is the heavieft of all known bodies, platina only excepted, its fecific gravity being to that of diftilled water as 19.640 to 1000 . It melts in a low white heat; requiring, according to Mr Wedgewood's calculation, 5237 degrees of Fahrenheit's, or 32 of his own, thermometer for its fufion; a heat greatly fuperior to that which melts filver or copper ; the former requiring only 47 I 7 , and the latter 4587 of Fahrenheit. Other metallurgifts, however, have differed, and affert that copper requires for its fufion a greater degree of heat than either gold or filver.

Gold is by far the moft tough and ductile, as well as the moft malleable of all metals. According to Cronftedt; one grain of it may be ftretched out fo as to cover 98 Swedifh ells, equal to 63.66 Englifh yards of filver wire; but Wallerius afferts, that a grain of gold may be ftretched in fuch a mamer as to cover 500 ells of wire. At any rate, the extenfion is prodigious; for, according to the lealt of thefe calculations, the millionth part of a grain of gold may be made vifible to the naked eye. Nor is its malleability inferior to its ductility. Boyle, quoted by Apligny in his Treatife of Colours, fays, that one grain and an half of gold may be beaten into 50 leaves of one inch fquare, which, if interfected by parallel lines drawn at right angles to each other, and diftant only the roodth part of an inch from each other, will produce 25 millions of little fquares, each very eafily difcernible by the naked eye. Mr Magellan tells us, that its furface may be extended by the hammer 159092 times. "I am infurmed (fays he) by an intelligent gold-beater in England, that the finelt gold leaf is that made in new flins, and muft have an alloy of three grains of copper to the ounce troy of pure gold, or elfe it would be too foft to pafs over the irregularities of the kins. He affirms, hat 80 books, or 2000 leaves of gold, each meafuring $3 \cdot 3$ fquare inches, viz. each leaf containiog 10.89 iquare inches, weigh lefs than 384 grains. Each book, oherefore, or 25 leaves, $=272.23$ inches, weighs lefs than 48 grains; fo that each grain of the metal will produce 56.718 fquare inches." From further calculations it may be made to appear, that the thicknefs of thefe leaves is lefs than $\frac{1}{8^{20}}=$ th of an inch; and that 16 ounces of gold would be fufficient to gild a filver wire equal in leng th to the whole circumference of the globe.

Guid is more elaftic than lead or tin, but lefs fo than iron, or even copper. It grows hard and brittle by ! ammering, but refumes its ductility on being flowly leated. Geld leaf. exhibits a fine green colour on being interpofed beiween the eye and the beams of the fun or any other luminous body. When expofed for fome time to a frong heat, it becomes ignited, and at latt melts, affuming at the fame time a fine bluilh-green colour; and, when cold, cryltallizes into quadrilateral py ramids. This bluifh-green colour, according to Mr

Magellan, as well as the former, when a thin film of the metal is interpofed betwixt the cye and the luminous body, is owing to tranfmitted light. "The green light (fays he) is tranfmitted in both cafes, fince all reflested colours are produced by the tranfmiffion of light, as the ingenious philoropher Mr Delaval has latcly difcovered and demonftrated in his very elaborate treatife on this fubject, inferted in the fecond volume of the memoirs publithed in 1785 by the Philofophical Society of Manchefter." Sir Ifaac Newton, in his Optics (page 162, edition of 1730), accounts for that phenomenon, faying, that " gold foliated, and held between the eyes and the light, looks of a greenith blue; and therefore (fays he) mafly gold lets into its body the blue rays to be reflected to and fro within it, till they be ftopped and ftifled; while it reflects the yellow outwards, and therefore looks yellow." It is therefore, in the two above cafes, that fome of the blue rays are tranfmitted along with the yellow ones; and both together appear of a bluilh-green. If gold be ex* pofed to the joined rays of light, excepting only the yellow ones, which we fuppofe ftopped after they were feparated by a prifm, it only looks white like filver; "' which fhows (fays Sir Ifaac Newton) that its yel. lownefs arifes from the excefs of intercepted rays tinging that whitenefs with their colour when they are let to pafs. It is a pleafing obfervation to look with a deep magnifier on various pieces of gold, filver, and Dutch (copper) leaves between the eye and the funfhine. The particles of filver are feen in the form of oblong dark lumps, with fome interftices, like net-work, between them: thofe of the copper-leaf are more numerous and more regularly diftributed; but the particles of the gold. leaf appear like little green femitranfparent and fimilar particles, uniting between themfelves by nearly diaphanous joints, as if they were forced to flatten in their edges, rather than they would break their mutual cohetion with one another."

Gold is more generally found native than any other metal; though Bergman informs us, that he does not know an inftance of its ever being found perfectly free of alloy. Kirwan fays it is feldom found fo.; being generally alloyed with filver, copper, or iron, and fome. times with all the three. According to Wallerius, native gold is found, I . In folid maffes, in Hungary, Traniylvania, and Peru. 2. In grains in the Spanifh Weft Indies. 3. In a vegetable form like the branches, or twigs of plants. 4. In a druffc figure, as if compofed of groups or clufters of fmall particles united together, found in Hungary. 5. Compofed of thin plates, or thin pellicles, covering other bodies, found in Siberia. 6. In a cryftalline form in Hungary.

The fame author informs us, that gold, in its regu* line ftate, is formed either into angular cryftals compofed of yellow octaedrons, or into yellow irregular maffes, which flow a grain-like texture. Brunnich fays, that the native gold found in leaves is always cryitallized on the furface; and with a magnifier they may be feen of a triangular pyramidal form. He informs us alfo, that in Tranfylvania he procured a fpecimen of cubic native gold, but never faw it any where elfe.

Gold is alfo found in the form of thick folid pieces. It is in general more frequently imbedded in quartz, and mixed with it, than with any other fone; and the quartz in which the gold is found in the Hungarian

## G O L

 garian mines, Mr Magellan tells us, is of a peculiar mild appearance. Sometintes, however, it is found in limeftone, or in hornblende, \&c.Europe is principally fupplied with gold from Chili and Peru in South America. A fmall quantity is likewife imported from China and the coaft of Africa. The principal gold mines of Europe are thofe of Hungary, and next to them the mines of Saltzburg. The mines of Adelfors in Smaland are likewife worked to advantage; and the veins of metal appear to be diffufed over a great tract of land. Some gold from four to feven grains in the mark is alfo faid to be extracted from the filver of the mines of Ofterfil varberget in the province of Dalarne. Native gold has alfo been found in Lapland above Tornea, and in Weft. manland. In Peru it is found mixed with a ftony natter not well known, from which it is extracted by amalgamation. Mr Pallas mentions three gold mines that are worked there, near the river Pyfchma, in which 500 men are employeci. The metal is found in a powdery form, and alfo thin plates or leaves. Sometimes kernels or lumps of a fpongy texture, and very light, are met with which contain a good quantity of geld duft. This gold-duft or wafl-gold is ufually wafhed out of fands wherein it lies in the form of loofe grains or lumps. It is diftinguilhed by the varioully coloured fubftances wherewith it is mixed. The motal is alfo found feparate from any matrix in lumps or vifible grains mixed with fands. Thus it is met with in many rivers of Europe as well as the other quarters of the world. It is alfo vifibly difperfed through maffes of fand, particularly fuch as is of a yellowifh-red or violet-colour; and in this fate it is fo univerfally diffufed through every kind of earth, that Mr Bergman thinks it the molt common of all the metals, iron alone excepted. If 100 pounds of fand contain 24 grains of gold, the feparation is faid to be worth attending to. In Africa 5 pounds of fand often yield 63 grains of gold, or even more; and the heavieft fand, which is often black or red, contains the moft. In Hungary, however, only 10 or 12 grains of gold are contained in Io,000 pounds of fand; and even this trifling quantity it has been extracted, though with lofs.

Gold is brought down with moft of the large rivers ; even thofe which do not take their rife in mountains where gold is found. In Tranfylvania the river of Avanyos affords fubliftence to upwards of 700 Gipfey farilies, who collect the gold from it. In Brafil it is found in fuch abundance, that their torrents are often turned with great labour and expence into new beds, in order to gather the gold there depofited by the running waters.-It is alfo found there mingled with the earth in various hapes and forms.-It is likewife faid to be fometimes found in veins running through beds of coals.

Gold is faid to be mineralized, when it is mixed with fome other fubftance in fuch a manner as not to be acted upon by aqua regia. In this manner gold is mineralized.

1. By Sulphur. Many have infifted, that as gold and fulphur are not fonnd to have any chemical attraction for one another, it is impoffible that marcafite can contain any of the metal, or indeed that it can be found in any ore containing fulphur: but fince we
know by experience, that gold can be melted out of thefe ores, even after they have been digelted in aqua regia, and that gold likewife enters into their fulphurated regulus, there is the greateft reafon to believe, that fome third fubftance, probably a metal, has by its admixture enabled the fulphur to unite with a certain quantity of gold. Marcalites, however, contain, at any rate, only a fmall quantity of the precious metal; and none is to be expected from them in places where no gold is in the neighbourhood. "I am not perfectly clear (fays Cronftedt) whether the gold is really diffolved and indurated, or, if I may fo exprefis my felf, vitrified in the fobirls; provided by this mineral body, we mean a garnet fubftance. But I have feen a piece of what is called fhirl, whofe texture was exactly like the Scheinnitz blende; and in this cafe it might perhaps hold the fame contents."
2. With Sulphur by means of Iron: Gold pyrites, or marcafitical gold ore. This is a clofe and compaet fubftance of a bright yellow colour. Here the gold is faid to be mineralized by fulphur by means of iron, becaufe it cannot be extracted by aqua regid or by amalgamation. A kind of gold pyrites is found at Adelfors in the province of Smaland, which contains an ounce or lefs of gold in an hundred weight of the ore. T'he Tranfylvania gold pyrites, according to Brunnich, in which no gold can be perceived by the naked eye, contain from 50 to 100 and 110 ounces and upwards in an hundred weight. Thofe where the gold appears in the pyrites like frewed Spanifh fruff, hold 250 ounces, but they are very farce. The mountain of Faczebaye, near Zalathna, is remarkable for gold pyrites; and here they feem alfo to contain femi-metallic parts.

The following is M. Magellan's method of accounting for the union of gold with this kind of pyrites. "It is well known, that gold may be diffolved by liver of fulphur. The procefs given for this purpofe by M. Apligny, p. 156 of his Treatife on Colours, is as follows. Reduce to powder four pounds of vegetable alkali (falt of tartar), and as many of fulphur, with one of leaves of gold. Melt the mixture in a crucible with its cover ; pour the fufed matter out on a marble ftone; pound it again when cold, and put the whole in a matrafs with hot water; which being filtrated is of a greenifh yellow colour, containing the gold diffolved. Now, as we know that hepar fulphuris has been found in feveral pyrites, and Mafcagni fays that he found it in thofe lagoons near Sienna in Italy; is it not very natural to conclude, that this noble metal may be really mineralized in the auriferous pyrites?"
3. Auriferous Cinnabar, in which the metal is mineralized by means of quickfilver, faid to be found in Hungary. Mr Sage ppeaks of a fpecimen of gold from Hungary, now in the French king's cabinet at Paris, which is cryftalized into quadrangular prifms of a grey yellowih colour and a brittle confiftency, which he fuppofes to be the refult of a mercurial amalgam of native gold.
5. The Schemnitz Blende, in which the gold is mineralized by means of zinc and iron. Cronftedt informs us, that the ores of zinc at Schemnitz in Hungary contain a great deal of tilver, and that this filver is very rich in gold. Profeffor Brunnich enmmerates the following varieties of this ore. I. Where the metal
F

[^0]

 is mincralized by means of a cubic lead-ore, containing filver found in the mines of Michaeli and fome places in Tranfylvania. 2. By a copper pyrites with filver. This kind of ore is called gilf in Hungary : it has a compact furface of a pale yellow colour ; but muft not for that reafon be confounded with the auriferous pyrites. 3. The Cremnitz-ores in which the metal is mineralized by means of red gilder-ore. 4. By means of antimony, in which it fometimes appears. This kind is found at the foot of the Carpathian mountains. 5. By cubic lead-ore, iron, and fome unknown volatile parts. This ore, as defcribed by Scopoli, is of a black colour; the richeft pieces are lamellated almoft like an iron-glimmer, with a degree of flexibility. The vein is quartz, which is fometimes loore, and the metal fcattered very minutely in it. It is found in Tranfylvania. 6. Native gold, with black-lead (or molybdæna), has been found near Rimezembat in Upper Hungary; but our author (Profeffor Brunnich) has not had any opportunity of examining whether it is mineralized by it or not. In all the above fpecies, the gold is either entirely native, but fo minutely divided, and fo loofely fcattered, that it can only be feen through microfcopes, and often cannot be feen at all before it is feparated by various proceffes: or it may not be in the form of native gold, but the metal as it were in embryo; in which cafe fire is neceffary to bring the conftituent parts together, and to add thofe that are wanting; in that cafe likewife it is never without filver."To thefe (fays Mr Magellan) may be added the following ores. I. Gold, with arfenical pyrites, is found alfo at Saltzberg in Tyrol, in mountains of quartz and fchiftus. It contains only 25 grains in the quintal; neverthelefs it affords a profit of L. 500 per annum. 2. With a white, red, or vitreous filver-ore, near Cremnitz and Schemnitz in Hungary. 3. With a fulphurated ore of filver, iron, lead, and manganefe, at Nagaya in Tranfylvania. Its fpecific gravity is 4.043 , and it is faid to afford ro ounces per quintal. 4. With fulphurated iron, copper, and manganefe, at Nagaya."

The ftrongeft heat of any furnace does not change the metallic properties of gold. Kunckel and Boyle made the experiment by expqfing gold for feveral months to the fire of a glafs-houfe. It appears, however, that, by the violent heat of the fun-beams collected in the focus of a burning -glafs, fome alteration may be produced in it. Homberg obferved that gold, when expofed to the lens of Tfchirhaufen, formed, was volatilized, and even vitrified: and Macquer found, that the metal, when expofed to the lens of Mr Trudaine, exhaled a fume which gilded filver, and was therefore gold in a volatile ftate : the globule of melted gold was agitated with a rapid circular motion, and became covered with a dull and as it were calciform pellicle; and laftly, that a violet vitrification was formed on the middle of the globule. This vitrification gradually extended, and produced a kind of button, flatter, or of a larger curva'ure, than that of the globule, and which ftuck upon it as the tranfparent cornea appears on the fclerotica of the eye. This glafs increafed in fize, while the gold itfelf continually diminifhed : the fupport always appeared tinged with a purple colour, feemingly produced by the abforption
of part of the glafs. Time did not permit him to vitrify a quantity of gold entirely. He oblerves, that it is a necellary condition that the violet glafs fhould be reduced with combuftible matters, in order to juftify the affertion that it is the calx of that perfeet metal, which would evidently appear to be the cafe if it became revived into gold. But however this may be, Mr Fourcroy is of opinion that this onght to be confidered as a true vitrified calx of gold; and this with the greater probability, as in many operations with this metal the purple colour is conftantly produced, and many preparations of gold are employed to give that colour to enamel and porcelain. "Gold (fays he) is therefore calcinable like the other metals; and only requires, as likewife does filver, a ftronger heat, and a longer time to unite with the bafe of air than other metallic fubftances." Mr Kirwan, on the other hand, tell us, that "gold expofed to the utmolt heat of Mr. Parker's lens for fome hours, loft no fenfible part of its weight ; yet, when in contact with earthy matters, it communicated a blue or purpling tinge to them ; fo that he believes an exceeding fmall portion of it might be dephlogifticated."

This experiment with the lens of Mr Parker does not invalidate that of Macquer: for either Trudaine's lens may be more powerful than Mr Parker's; or the air in France being more clear than in England, the action of the fun muft be ftronger. We are affured, however, that by means of the electric fire gold may be inftantaneoully calcined and even vitrified : whence we mult conclude, not orily that gold is really calcinable, but that the electric fire is almoft infinitely more powerful than any other; as by its means we may in a moment accomplifh what either cannot be done otherwife at all, or very imperfectly, even by the fierceft fire we can raife. The flame of a lamp blown by dephlogifticated air is alfo found fufficient to volatilize gold.

Gold being thus indeftractible by the common operations of fire, equally refifts its flow action in the atmofphere. It is altogether exempted from rufting; and though its furface becomes tarnifhed by expofure to the air, it is merely in confequence of the depofition of foreign bodies upon it. Water produces no change, fays Mr Fourcroy; though, according to the experiments of Lagaraye, it feems capable of dividing it nearly in the fame manner as it does iron.

Gold combines with various metals; and is commonly alloyed in a certain proportion with copper, which gives it a red colour and greater firmnefs than it poffefes when very pure, at the fame time that it is thus rendered more fufible. In this ftate it is ufed for money, plate, and toys of different kinds. It is fometimes alfo alloyed with filver, which deprives it of its colour, and renders it very pale : this alloy, however, is not made without fome difficulty, on account of the very different fpecific gravities of the two metals, as Homberg obferved, who faw them feparate during their fuion. The alloy of gold with filver forms the green gold of the jewellers and gold-beaters.

As gold has been rendered, by the univerfal confent of mankind, the moft valuable fubftance in the world, it is of great confequence to be able to difco-. ver its degree of purity, in order to prevent the adul. terations which would naturally be practifed, and to

## G O L

## $7] \quad$ GOL

that one cubic foot (French meafure) of gold is worth
Gold. 2,153,000 liveres tournoifes, or 89, 708 guineas and feven thillings, fuppofing the Louts d'Or to be equal to the guinea; and that the refpective value of the fame cubic foot of gold is equal to 25.6 cubic feet of tilver; each of this laft metal being reckoned worth about 84,000 French livres, or 3503 guineas and eight fhillings : fo that if we fuppofe the monied fpecie in France to be but two milliards of French livres, according to the citimation of Mr Neckar in his Treatife upon the Commerce of Corn, the whole amount hould make but a folid cube of gold lefs than 10 feet on each fide. So trifling is the phyfical object that excites the activity of 22 millions of the human fpecies, the number that is faid to be that of the inhabitants of France.

We fhall clofe this article with fome obfervations by M. Magellan on the ftate in which gold is found in the bowels of the earth, and confequently of the origin of gold ores. "As to the natural exiftence of gold in the bowels of the earth (fays he), there have been two opinions among mineralogifts; fome pretending that it is only found in its metallic or native form; and others, that it is fomerimes found mineralized in an intimate union with other fubftances. M. Kirwan holds the former, and the celebrated Bergman the latter. But, fays Mr Kirwan, 'though Mr Bergman inclines to the opinion of the mineralization, yet he is candid enough to own, that the gold, when extracted from this ore, is of a granular or angular form. It is therefore very doubtful, whether it was not rather mixed, than truly combined with the fulphur and iron : and its proportion being exceedingly fmall fo that 100 pounds of the pyrites fcarcely contain an ounce of gold, it is not a wonder that it hould efcape the action of aqua regia; more efpecially as the nitrousacid becomes fo phlogifticated by acting on the pyrites, as not to be able to dephlogifticate the marine. Likewife mercury, by reafon of the gold particles being enveloped in the fulphureous iron, can have no accefs to ir.'
" Thefe arguments (fays M. Magellan) againft the true mineralization of gold, are fully anfwered by the facts already mentioned. Befides, it is well known. that gold can be combined and calcined, via ficca, by the liver of fulphur and femimetals. This being acknowledged on both fides of the queftion, why fhould we infift on denying this mineralization, when it is out of doubt, among mineralogifts of rank, that volcanic fires have had a great fhare in the convulfions and revolutions of this globe, of which every one has the moft convincing proofs almoft every where. The account given by Mr Hacquet of the gold mines at Nagy-ag in Tranfylvania, the ancient Dacia, which lies abont $45^{\circ}$ latitude, offers the moft convincing proofs of this affertion. The country all round thefe mines bears an inconteftible appearance of being a volcanic one; and among various other metals, there are at leaft 13 kinds of gold ores, moft of them mineralized. Thefe are, i. Gold mincralized by fulphur, zinc, and arfenic, in a grey-yellowifn volcanic ore, which is called cottoners, or cotton ore, on account of its lightnefs and texture. 2. By iron and arfenic, formed by frata; one containing black filver ore, then fpatum, galena, quartz, and grey gold ore : it yields about half an onnce in the 100 pounds. 3. By fulphur, antimo-

## G OL

ny, zinc, fome arfenic, and fometimes iron: this is a grey gold ore mixed with fome quartz. 4. In the form of crooked threads mixed with quartz and gypfeous fpath ; a poor mine. 5. Dendritiform, like the mocho fone, or the agate from Aberftein in the Palatinate; but thefe black dendrites are in a reddifh fone. 6. Amorphous, very compact, in fmall grains, with fpath and quartz. A quintal of it yields two ounces of gold, and more of filver. 7. By fulphur, grear part of zinc, and a little antimony and arfenic; not rich. 8. Of a black or dark-reddifh colour, contain ing an auriferous pyrites; not rich. 9. Of a bluidh colour, mineralized by fulphur, antimony, iron, and a little arfenic mixed with filver; very rich in gold. 10. Partly laminated with needles of a blackifh yellow colour: this gives 66 ounces of gold per $\frac{\circ}{\circ}$ of gold, according to Scopoli. tr. Foliated with gypfeous fpath and yellow pyrites. 12. In irregular lamina, on a greyif argille. The gold looks like filver, and is furrounded by ipars of a pale rofy colour. 13. In cryfallized laminæ from two to four lines diameter, of an hexangular form, and very much refembling molybdana. The vein was loft for fome time, but lately found again on mining for letting ont water from the main. This ore is very rare, and has given 372 ounces per 응 of a mixed metal; five of which were gold, and one filver.

Method of Recovering Gold from Gilt Works. The folubility of gold, and the indiffolubility of filver, in aqua regia, affords a principle on which gold may be feparated from the furface of filver; and, on this foundation, different proceffes have been contrived, of which the two following appear to be the beft. Some powdered fal ammoniac, moiftened with aquafortis into the confiftence of a patte, is fpread upon the gilt filver, and the piece heated till the matter fmokes and becomes nearly dry : being then thrown into water, it is rubbed with a fcratch brufh compofed of fine brafs-wire bound together, by which the gold eafily comes off. The other way is, by putting the gilt filver into common aqua regia, kept fo hot as nearly to boil, and zurning the metal frequently till it becomes all over black: it is then to be wafhed with a little water, and rabbed with the fcratch brufl, to get off what gold the aqua regia may have lefr. This laft method appears preferable to the other; as the fame aqua regia may be uade to ferve repeatedly till it becomes faturated with the gold, after which the gold may be recovered pure by precipitation with folution of vitriol, as direfted under the article Metaliurgy.

For feparating gold from gilt copper, fome direct 2 folution of borax to be applied on the gilt parts, but nowhere elfe, with a pencil, and a little powdered fulphur to be fprinkled on the places thus moittened; the nrincipal ufe of the folution of borax feems to be to make the fulphur adhere; the piece being then made red hot, and quenched in water, the gold is faid to be fo far loofened, as to be wiped off with a brufh. Others mix the fulphur with nitre and tartar, and form the mixture with vinegar into a pafte, which is fpread upon the gilt parts.

Schlutter recommends mechanical means, as being generally the leaft expenfive, for feparating gold from the furface both of filver and copper. If the gilt veffel is round, the gold is conveniently got off by turaing
it in a lathe, and applying a proper tool, a fkin being placed underneath for receiving the Chavings: he fays it is eafy to collect into two ounces of lhavings all the gold of a gilt veffel weighing thrice as many pounds. Where the figure of the piece does not admit of this method, it is to be properly fixed, and fcrapers applied of different kinds according to its fize and figure; fome large, and furnifhed with two handles, one at each end; others fmall and narrow, for pene. trating into depreffed parts. If the gold cannot be got off by either of thefe ways, the file muft be had recourfe to, which takes off more of the metal underneath than the turning tool or the fcraper, particularly than the former. The gold fcrapings or filings may be purified from the filver or copper they contain, by the methods defcribed under the article Metallurgy.

The editors of the Encyclopèdie give a method of recovering the gold from wood that has been gilt on a water-fize : this account is extracted from a memoir on the fame fubject, prefented to the Academy of Sciences by M. de Montany. The gilt wood is fteeped for a quarter of an hour in a quanity of water fufficient to cover it, made very hot : the fize being thus foftened, the wood is taken out, and fcrubbed, piece by piece, in a little warm water, with fhorr fiff briftle brufhes of different fizes, fome fmall for penetrating into the carvings, and others large for the greater difpatch in finf pieces. The whole mixture of water, fize, gold, \&c. is to be boiled to drynefs, the dry matter made red hot in a crucible to burn off the fize, and the remainder ground with mercury, either in a mortar, or, where the quantity is large, in a mill.

Gold-Goaff. See Guinea.
GoLD-Wire, a cylindrical ingot of filver, fuperficially gilt or covered with gold at the fire, and afterwards drawn fucceffively through a great number of little round holes, of a wire-drawing iron, each lefs than the other, till it be fometimes no bigger than a hair of the head. See Wire-Drawing.

It may be oblerved that, before the wire be reduced to this exceffive finenefs, it is drawn throngh above 140 different holes; and that each time they draw it, it is rubbed afrefh over with new wax, both to facilitate its paffage, and to prevent the filver's appearing through it.

Gold-Wire flatted, is the former wire flatted between two rollers of polifhed fteel, to fit it to be fpun on a ftick, or to be ufed flat, as it is, without fpinning, in certain ftuffs, laces, embroideries, \&c. See Stuff, \&c.

Gozd-Thread, or Spun-gold, is flatted gold, wrapped or laid over a thread of filk, by fwifting it with wheel and iron-bobbins.

To difpofe the wire to be fpun on Gilk, they pafs it between two rollers of a little mill : thefe rollers are of nicely poliffied fteel, and about three inches in diameter. They are fet very clofe to each other, and turned by means of a handle faftened to one of them, which gives motion to the other. The gold wire in paffing between the two is rendered quite flat, but without lofing any thing of its gilding; and is rendered fo exceedingly thin and flexible, that it is eafily fpun on filkthread, by means of a hand-wheel, and fo wound on a fpuol or bobbin: See Wire-Drawing.

## GOL $\quad 19$

They are ufially taken about Michaelmas, and foon Goldew. become tame; but they differ very much in their fong. -They frequently breed in the upper part of plumtrees, making their nefts of the mofs that grows upon apple-trces, and of wool; quiling the infide will all forts of hairs they find upon the ground. They breed three times a-year ; and the young are to be taken with the neft at about ten days old, and fed as follows:Pound fome hemp-feed very finein a mortar ; then lift it through a fieve, and add to it as much wheat-bread as hemp-feed; and likewife a little flour of canaryfeeds : then with a fmall ftick or quill take up as much as the bignefs of a white-pea, and give them Keveral times a-day. This ought to be made frefk every day : for if it is fuffered to four, it will fpoil their fomachs, caufing them to caft up their meat; which if they do, it is very probable that they will die.-Thefe young birds muft be carefully kept warm till they can feed themfelves, for they are very tender. In feeding, be fure to make your bird clean his bill and mouth. If any of the meat falls upon his feathers, take it off, or elfe he will not thrive. Such as eat hemp-feed, to purge them, fhould have the feeds of melons, fuccory, and mercury ; or elfe let them have lettuce and plantane for that purpofe. When there is no need of purging, give them two or three times a-week a little fugar or loam in their meat, or at the bottom of the cage; for all feeds have an oilinefs, fo that if they have not fomething to abforb it, in length of time it fouls their ftomachs, and brings on them a flux, which is very dangerous.

Gold-Fijh. See Cyprinus.
GOLDEN, fomething that has a relation to gold, or confifts of gold.

GOLDEN-Calf, was a figure of a calf, which the Ifraelites caf in that metal, and fet up in the wildernefs to worthip duringMofes's abfence into the mount; and which that legilator at his return burnt, grinded to powder, and mixed with the water the people were to drink of; as related in Exod. xxxii. The commentators have been divided on this article: the pulverizing of gold, and rendering it potable, is a very difficult operation in chemiftry. Miany therefore, fuppofe it done by a miracle : and the reft, who allow of nothing fupernatural in it, advance nothing but conjectures as to the manner of the procefs. Mofes could not have done it by fimple calcination, nor amalgamation, nor antimony, nor calcination; nor is there one of thofe operations that quadrates with the text.
M. Stahl has endeavoured to remove this difficulty. The method Mofes made ufe of, according to this author, was by difolving the metal with hepar fulphuris; only, inftead of the vegetable alkali, he made ufe of the Egyptian natron, which is common encigh throughout the eaft. See Chemistry, $\mathrm{n}^{\circ}$ II 27.

Golden-Fleece, in the ancient mythology, was the kkin or fleece of the ram upon which Phryxus and Hella are fuppofed to have fwam over the fea to Colchis; and which being facrificed to Japiter, was hang upon a tree in the grove of Mars, guarded by two bra-zen-hoof'd bulls, and a monftrous dragon that never alept ; but was taken and carried off by Jafon and the Argonauts.

Many authors have endeavoured to fhow that this fable is an allegorical reprefentation of fome real hif-

Gellen tory, particularly of the philofopher's ftone. Others Idmith have explained it by the profit of the wool-trade to Cilchis, or the gold which they commonly gathered there with fleeces in the rivers. See Argonauts.

Grder of the Golden Fleece, is a military order infituted by Philip the Good, duke of Burgundy, in $3_{429}$ It took its denomination from a reprefentation of the golden fleece, borne by the knights on their collars, which confifted of flints and fteels. The king of Spain is now grand mafter of the order, in quality of duke of Burgundy : the number of knights is fixed to thirty-one.

It is ufually faid to have been inftituted on oceafion of an immenfe profit which that prince made by wool; though others will have a chemical inyftery couched under it, as under that famous one of the ancients, whicl the adepts contend to be no other than the fecret of the elixir, wrote on the fleece of a fheep.

Oliver de la Marche writes, that he had fuggefted to Philip I. archduke of Auftria, that the order was inftituted by his grandfather Philip the Good duke of Burgundy, with a view to that of Jafon; and that John Germain bihop of Chalons, chancellor of the order, upon this oceation made him change his opinion, and affured the young prince that the order had been: inftituted with a view to the fleece of Gideon. William bifhop of Tournay, chancellor likewife of the order, pretends that the duke of Bargundy had in view both the golden fleece of Jafon and Jacob's fleece, i. e. the fpeckled fheep belonging to this patriarch, according to agreement made with his father-in-law Laban. Which fentiment gave birth to a great work of this prelate, in two parts: in the firft, under the fymbol of the fleece of Jafon, is reprefented the virtue of magnanimity, which a knight ought to porfefs; and under the fymbol of the fleece of Jacob he reprefents the virtue of juftice.

Paradin is of the fame mind; and tells us, that the duke deligned to infinuate that the fabulous conqueft which Jafon is faid to have made of the golden fleece in Colchis, was nothing clle but the conqueft of virtue, which gains a victory over thofe horrible monfters vice and our evil inclinations.

Golden Number, in chronology, a number fhowing what year of the moon's cycle any given year is. See Chronology, $\mathrm{n}^{\circ}$ 27-30.

Golden Rod, in botany. See Solidago.
Golden Rofe. The pope annually confecrates a golden rofe on the fourth Surday in Lent, which is fent to princeffes, or to fome church, as a mark of his peculiar affection.

Golden Rale, in ariihmetic, a rule or praxis, of great ufe and extent in the art of numbers; whereby we find a fourth proportional to three quantities given.

The golden rule is alfo called the Rule of Three and Rule of Proportion. See its mature and ufe under the article of ARITHMETIC, $\mathrm{n}^{\circ} \mathrm{I} 3$.

GOLDENGEN, a tewn of Poland in the duchy of Courland, with a handfome caftle, feated on the river Weia, in E. Long. 22. 3I. N. Lat. 56. 48.

GOLDSMITH, or, as fome choofe to exprefs it, filverfinith, an artift who makes veffels, utenfils, and ornaments, in gold and filver.

The goldfmith's work is either performed in the
mould, or beat out with the hammer or other engine. Goldfmith. All works that have raifed figures are caft in a mould, and afterwards polifhed and finifhed: plates or difhes, of filver or gold, are beat ont from thin flat plates; and tankards, and other veffels of that kind, are formed of plates foldered together, and their mouldings are beat, not caft. The bufinefs of the gold. fmiths formerly required much more labour than it does at prefent; for they were obliged to hammer the metal from the ingot to the thinnefs they wanted: but thereare now invented flatting-mills, which reduce metals to the thinnefs that is required, at a very fmall expence. The goldfmith is to make his own moulds; and for that reafon ought to be a good defigner, and have a tafte in fculprure : he ought alfo to know enough of metallurgy to be able to affay mixed metals, and to mix the alloy.

The goldfmiths in London employ feveral hands under them for the various articles of their trade: fuch are the jeweller, the fnuff-box and toy maker, the filver-turner, the gilder, the burnifher, the chafer; the refiner, and the gold-beater.

Goldfiniths are fuperior tradefmen: their wares mult be alfayed by the wardens of the company of this name in London, and marked; and gold is to be of a certain touch. No goldfmith may take above one fhilling the ounce of gold, befides what he has for the fathioning, more thain the buyer may be allowed for it at the king's exchange; and here any falfe metal thall be feized and forfeited to the king. The cities of York, Exeter, Briftol, \&c. are places appointed for the affaying wrought-plate of goldfmiths; alfo a duty is granted on filver-plate of fixpence an ounce, \&c. Plate made by goldfmiths fhall be of a particular finenefs, on pain of forfeiting 101 . ; and if any parcel of plate fent to the affayers is difcovered to be of a coarfer alloy than the refpective ftandards, it may be broken and defaced; and the fees for affaying are particularly limited.

Goldsmith (Oliver), a celebrated Englifh writer, was born at Rofcommon in Ireland in the year 173 r . His father, who poffeffed a fmall eftate in that county, had nine fons, of whom Oliver was the third. He was originally intended for the church; and with that view, after being well inftructed in the claffics, was, with his brother the Rev. Henry Goldfmith, placed in Trinity-college, Dublin, about the latter end of the year r 749. In this feminary of learning he continued a few years, when he took a bachelor's degree: but his brother not being able to obtain any preferment after he left the college, Oliver, by the advice of Dean Goldfimith of Cork, turned his thoughts to the ftudy of phyfic ; and, after attending fome courfes of anatomy in Dublin, proceeded to Edinburgh in the year 1751, where he ftudied the feveral branches of medicine under the different profeffors in that univerfity. His beneficent difpofition foon involved him in unexpected difficulties; and he was obliged precipitately to leave Scotland, in confequence of engaging himfelf to pay a confiderable fam of money for a fellow-ftudent.

A few days after, about the beginning of the year 1754, he arrived at Sunderland, near Newcaftle, where he was arrefted at the fuit of a taylor in Edinburgh; to whom he had given fecurity for his friend.

## G O L

Goldmith By the good offices of Laughlin Maclanc, Efq; and Dr. Sleigh, who were then in the college, he was foon delivered out of the hands of the bailiff; and took his paffage on board a Dutch hhip to Rotcerdam, where, after a fhort ftay, he proceeded to Bruffels: he then vifited great part of Flanders; and after paffing fome time at Strafburg and Louvain, where he obtained a degree of batchelor of phyfic, he accompanied an Englilh gentleman to Berne and Geneva.

It is undoubtedly fact, that this ingenious unfortunate man travelled on foot moft part of his tour. He had left England with very little money; and being of a philofophical turn, and at that time poffefling a body capable of fuftaining every fatigue, anda heart not eatily terrified at danger, he became an enthetiaft to the defign he had formed of feeing the manners of different countries. He had fome knowledge of the French language and of mufic, and he played tolerably well on the German flute; which, from an amufement, became at fome times the means of fubfiftence. His learning produced him a hofpitable reception at mon of the religious houfes; and his mufic made him welcome to the peafants of Flanders and other parts of Germany. "Whenever I approached," he ufed to fay, "a peafant's houfe towards night-fall, I played one of my moft merry tunes; and that procured me not only a lodging, but fubfiftence for the next day : but in trath (his conftant expreffion) I muft own, whenever I attempted to entertain perfons of a higher rank, they always thought my performance odious, and never made me any return for my endeavours to pleafe them."

On Mr Goldfmith's arrival at Geneva, he wras recommended as a proper perfon for a travelling tutor to a young man, who had been unexpectedly left a confiderable fum of money by his uncle MrS .-, formerly an eminent pawnbroker near Holborn. This youth, who had been articled to an attorney, on recript of his fortune determined to fee the world; and on his engaging with his preceptor, made a provifo that he hould be permitted to govern himfelf; and Goldfmith foon found his pupil underfood the art of diretting in money-concerns extwemely well, as avarice was his prevailing paffion. His queftions were ufually how money might be faved, and which was the leaft expenfive courfe of travel ; whether any thing could be bought that would turn to account when difpofed of again in London? Such curiofities on the way as could be feen for nothing he was ready enough to look at; but if the fight of them was to be paid for, he ufually afferted that he had been told they were not worth feeing. He never paid a bill that he would not obferve how amazingly expenfive travelling was; and all this, though he was not yet twenty-one. During Goldfmith's continuance in Switzerland, he afliduoully cultivated his poetical talent, of which he had given fome friking proofs while at the college of Edinburgh. It was here he fent the firft fketch of his delightful poem called the Traveller to his brother the clergyman in Ireland, who, givirg up fame and fortune, had retired with an amiable wife to happinefs and obfcurity; on an income of only $40 l$. a-year.

From Geneva Mr Goldfinith and nis pupil vifited the fouth of France; where the young man, upon
fome difagreement with his preceptor, paid him the rioldimith fmall part of his falary which was due, and embarked at Marfeilles for England. Our wanderer was left once nore upon the world at large, and paffed through 2 variety of difficulties in traverfing the greateft part of France. At length his curiofity being fatiated, he bent his courfe towards England, and arrived at Dover the beginning of the winter 1758 . When he came to London, his ftock of cafh did not amount to two livres. An entire ftranger in this metropolis, his mind was filled with the moft gloomy refiections on his embarraffed fituation. With fome difficulty he difcovered that part of the town in which his old acquaintance Dr Sleigh refided. This gentleman received him with the warmeft affection, and liberally invied him to fhare his purfetill fome eftablifhment could be procured for him. Goldfnith, unwilling to be a burden to his friend, a fhort time after eagerly embraced an offer which was made him to allift the late Rev. Dr Milner in inftructing the young gentlemen at the academy at Peckham; and acquitted himfelf greatly to the Doctor's farisfaction for a fhort time: but having obtained fome reputation by the criticifm he had written in the Monthly Review, Mr Griffith, the propric tor, engaged him in the compilation of it; and, refolving to purfue the profeffion of writing, he returned to London, as the mart where abilities of every kind were fure of meeting diftitiction and reward. As his finances were by no means in a good fate, he determined to adopt a plan of the fricteft economy; and took lodgings in an obfcure court in the Old Baily, where he wrote feveral ingenious little pieces. The late Mr Newberry, who at that time gave great encouragement to men of literary abilities, became a kind of patron to our young author ; and introduced him as one of the writers in the Public Ledger, in which his Citizen of the World originally appeared, under the title of Cbinefe Letters.
Fortune now feemed to take fome notice of a man fhe had long neglected. The fimplicity of his character, the integrity of his heart, and the merit of his productions, made his company very acceptable to a number of refpectable families; and he emerged from his fhabby apartnents in the Old Baily to the politer air of the Temple, where he took handfome chambers, and lived in a genteel ftyle. The publication of his Traveller, and his Vicar of Wakefield, was followed by the performance of his comedy of the Good-natured Man at Covent-Garden theatre, and placed him in the firft rank of the poets of the prefent age.

Among many other perfons of diftinction who were defirous to know him, was the duke of Northumberland; and the circumftances that attended his intraduction to that nobleman is worthy of being related, in order to fhow a ftriking trait of his character. "I was invited," faid the Doctor (as he was then univerfally called) " by my friend Mr Piercy, to wair upon the duke, in confequence of the fatisfaction he had received from the perufal of one of my productions. 1 dreffed my\{elf in the beft manner I could; and, after fudying fome compliments I thought neceffary on fuch an occalion, proceeded to Northamberlandhoufe, and acquainted the fervants that I had particular bufinefs wi.h his Grace. They howed me into an antichamber; where, after waiting fome time, a
. 3.2
gentleman

Col!fnith.
gentleman very gente ely dreffed made his appearance. laling hin for the duke, 1 delivered all the fine things I had compofed in order to compliment him on the honour he had doneme: when, to my great aftoniflment, he told me I had miftaken him for his marter, who would fee me immediately. At that inftant the duke came into the apartment; and I was fo confufed on the occafion, that I wanted words barely fufficient to exprefs the fenfe I entertained of the duke's politenefs, and went away extremely chagrined at the blunder I had committed."

Another feature of his character we cannot help laying before the reader. Previous to the publication of his Deferted Village, the bookfeller had given him a nore for one hundred guineas for the copy, which the Doctor mentioned a few hours after to one of his friends: who obferved, it was a very great fum for fo Short a performance. "In truth," replied Goldfmith, "I think fo too; I have not been eafy fince 1 received it; therefore I will go back and recurn him his note:" which he abfolutely did; and left it entirely to the bookfeller to pay him according to the profits produced by the fale of the piece, which turned out very confiderable.

During the laft rehearfal of his comedy intitled She Stoops to Conquer, which Mr Coleman had no opinion would fucceed, on the Doctor's objecting to the repetition of one of Tony Lumpkin's feeeches, being apprehenfive it might injure the play, the manager with great keemefs replied, "Piha my dear Dotor, do nol be fearful of fquibs, when we have been fitting almoft thele two hours upon a barrel of gunpowder." The piece, however, contrary to Mr Coleman's expectation, was received with uncommon applaufe by the audience; and Goldfmith's pride was fo hurt by the feverity of the above obfervation, that it entirely put an end to his friendfip for the gentleman that made it.

Notwithftanding the great fuccefs of his pieces, by fome of which it is afferted, upon good authority, he cleared 1800 . in one year, his circumftances were by nomeans in a profperons fituation; which was partly owing to the liberality of his difpofition, and partly to an unfortunate habit he had contracted of gaming; the arts of which he knew very lirtle of, and confeguently became the prey of thofe who were unprincipled enongh to take advantage of his implicity.

Juft before his death he had formed a defign for exccuting an Univerfal Dictionary of Arts and Sciences, the profpectus of which he actally publifhed. In this work feveral of his literary friends (particalarly Sir Johwa Reynolds, Dr Johnfon, Mr Beauclerc, and Mr Garrick) had undertaken to furnith him with articles upondifferent fabjects. He had catertained the moft fanguine expectations from the faccefs of it. The uncertaking, however, did not meet with that encouragement from the bookfellers which he had imagined it would undoubredly receive ; and he ufed to lament this circumfance almoft to the laft hour of his exiftence.

He had been for fome years afficted. at different times, with a violent ftrangury, which contributed not a little to embitter the latter part of his life ; and which, united with the vexations which he fuffered upon other occafions, brought on a kind of habitual
defpondency. In this unhappy condition he vas at- Goldrmith, tacked by a nervous fever, which, being improperly treated, terminated in his diffolution on the ath of April 1774.

As to his character, it is ftrongly illuftrated by Mr Pope's line,

In wit a man, fimplicity a child.
The learned leifure he loved to enjoy was too often interrupted by diftreffes which arofe from the liberality of his temper, and which fometimes threw him into loud fits of paffion: but this impetuofity was corrected upon a moment's reflection; and his fervants have been known, upon thefe occafions, purpofely to throw themfelves in his way, that they mighe profit by it immediately after; for he who had the good fortune to be reproved, was certain of being rewarded for it. The univerfd efteem in which bis poems were held, and the repeated pleafure they give in the perufal, is a friking teft of their merit. He was a fudious and and correct obferver of nature, happy in the felec. tion of his images, in the choice of his fubjects, and in the harmony of his verfification; and, thongh his embarraffed fituation prevented him from putting the laft hand to many of his productions, his Hermit, his Traveller, and his Deferted Village, bid fair to claim a place among the moft finifled pieces in the Englint language.

Befides the works already mentioned, he wrote, I . Hiftory of the Earth and Animated Nature, 6 vols 8 vo. 2. Hiftory of England, 4 vols 8 vo. 3. Hiftory of Rome, 2 vols. 4. Abridgements of the two laft, for the ufe of fchools. 5. A view of experimental philofophy, 3 vols 8 vo. ; a pofthumous work, not efteemed. 6. Mifcellanies, \&c.

GOLF, the name of a certain game among the Scots, and faid to be peculiar to their country. Among them it has been very ancient; for there are fatutes prohibiting it as early as theyear 1457 , left it hould interfere with the fport of archery. It is commonly played on rugged broken ground, covered with fhort grafs, in the neighbourhood of the feafhore. A field of this fort is in Scotland called tianks. The game is generally played in parties of one or two on each fide. Each party has an exceeding hard ball, fomewhat larger than a hen's egg. This they frike with a fender and elaftic club, of about four feet long, crooked in the head, and having lead run into it, to make it heavy. The ball being flruck with this club, will fly to the diftance of 200 yards, and the gane is gained by the party who puts his ball into the hole with the feweft frokes. But the game does not depend folely upon the ftriking of the longeft ball, but alfo upon meafuring the frength of the ftroke, and applying it in fuch direction as to lay the ball in fmooth ground, whence it may be eafily moved at the next froke. Toencourage this amufement, the city of Edinburgh, A.D. 1744, gave to the company of golfers a filver ciub, to be played for annually by the company, the vietor to append a gold or filver piece to the prize. It has been played for every year fince, except the years 1746 , 1747 . For their better accommodation, 22 members of the company fubfcribed L. 30 each in the year 1768 , for building a houfe, where their meetings might be held. The fpot chofen for this purpofe was the fouthweft corner of Leith links, where

GOLIUS (James), a celebrated profeffor of Ara bic and the mathematics at Leyden, was defeended from a very honourable family, and born at the Hague in the year 1596. He was put to the univerfity of Leyden, where he ftudied under Erpinius; and having made himfelf mafter of all the learned languages, applied himfelf to the mathematics, phylic, and divinity. He afterwards travelled into Africa and Afia; and became greatly efteened by the king of Morocco, and the fultan of the Turks. He at length retarned to Leyden, loaded with manuferipts; and in 1624 , fucceeded Erpinius in the Arabic chair. As he had been an eye-witnefs of the wretched fate of Chriftianity in the Mahometan countries, he was filled with the compaffion of a fellow chriftian; and none ever folicited for a place of honour and profit with greater cagernefs, than he for procuring a new edition of the New Teftament, in the original language, with a rranflation into the vulgar Greek, by an Archimandrite; and as there are fome of thefe Cliriftians who ufe the Arabic tongue in divine fervice, he alfo took care to have difperfed among them an Arabic tranllation of the Confeffion of the Proteftants, together with the Catechifin and Li:urgy. In 1626, he was alfo chofen profeffor of mathematics; and difcharged the functions of both profelforfhips with the greatef applaufe during 40 years. He was likewife appointed interpreter in ordinary to the ftates for the Arabic, Turkifh, Perfian, and other eaftern languages, for which he had an annual penfion, and a prefent of a gold chain, with a very beautiful medal, which he wore as a badge of his office. He publilhed, 1 . The life of Tamerlane, written in Arabic. 2. The hiftory of the Saracens, writien by Elmacin. 3. Alferganus's clements of Aftronomy, with a new vertion, and learned commentaries. 4. An excellent Arabic lexicon. 5. A Perfian Digionary. He died in 1667.
GOLTZIUS (Henry), a famons engraver and painter, born in 1558 , at Mulbreck in the duchy of Juliers. He was taught the art of engraving by Theodore Curenhert; and fucceeded very wonderfully in it, notwithftanding the difadvantage of a lame hand, which was occalioned by his falling into the fire whilft young. He was firt employed by his matter, and afterwards he worked for Philip Galle. Domeftic troubles and ill health occafioned him to travel. He went through Germany into Italy; and paffed under a feigned name, that his ftudies might nor be interrupred. He vifited Bologna, Florence; Naples, and Venice, conftantlyapplying himfelf to drawing from the antique flatues, and the works of the great mafters. At Rome he refided the longeft; and there he produced feveral excellent engravings from Politoro Raphael; and other eminent painters. On his return to his native coumtry he eftablifhed himfelf at Haerlem, where he engraved many of the drawings whicht lre had made during his abode in Italy. He died at Haerlem in 1617, aged 59. He is faid to have been forty years old before he began to paint: yet his pictures are fpoken of with the greateft commendation; but as he did not produce any great number of them, they are of courfe but rarely to be nuet with. As an engraver, he de-
ferves the higheft commendation. No man ever fur- Goltziug, pafled, and few have equalled, him in the command of Gombauld. the graver and freedom of execution. He copied the ftyle of Albert Durer, Lucas of Leyden, and orher old mafters, with aftonifhing exactnefs. Sometimes his engravings are neat in the extreme; at other times they are performed in a bold open manner, without the leaft reftraint. He alfo engraved feveral of his own defigns on wood, in that manner which is diftinguifhed by the application of chiaro-fcuro. Of his prints, which are very numerous, it may here fuffice to fpecify two or three of the mont celebrated: i. Six large upright plates, known by the name of his mufterpieces. Thefe, it is faid, he engraved to convince the public that he was perfectly capable of imitating the ftyles of Albert Durer, Lucas Van Leyden, and other matters, whofe works were then held in higher eftimation than his own : for he had adopted a new manner, which he purfued becaufe he thought it fuperior, and not becaufe he was incapable of following the otbers. It is reported that with one of them, the circumcifion, which he fmoked to give it the more plautible air of antiquity, he actually deceived fome of the moft capital connoiffeurs of the day; by one of whom it was bought for an original engraving of Albert Durer. The fubjects of thefe plates are, The Annunciation of the Virgin; the Meeting of the Virgin with Elizabeth, called the Vifitation; the Nativity of Chrift; the Circumcifion of Chrift; the Adoration of the wife Men; the holy Family. 2. The Judgment of Midas, a large plate lengthwife. 3. The Venetian Ball, a large plate lengthwife, from Theodore Bernard. 4. The Boy and Dog, a middling fized upright plate, from a defign of his own; an admirable print. 5. The Necromancer, a middling fized upright oval print, in chiaro-feuro. 6. Night in her Chariot, the fame.

Goltzius (Hubert), a learned German, born at Venlo in the duchy of Gueldres in 1526 . His father was a painter, and himfelf was bred to the art: under Lambert Lombard: :' but he did little at painting, or at leaft his pictures are very fcarce; for having a peculiar turn to antrquities, he devoted himfelf to the ftudy of medals. He travelled through Germany, France, and Italy, to make collections, as well as to draw from thence all the lights he could towards clearing up ancient hiftory: he was the anthor of feveral excellent works, in which he was fo accurate and nice, that he had them printed at his own houfe, under hisown correction, and even engraved the plates and medals with his own hand. His veneration for Roman antiquities was fo great, that he gave all his children Roman names : and married, for his fecond wife, the widow of the antiquarian Martinus Smetius; probably more for the fake of Snretius's medals and inferiptions, than for her own fake, and was punithed accordingly by her plaguing him all his life, if fhe did not horten it: He dieci in 1583 .

GOMBAULD (John Ogier de), one of the beft French poets in the i 7 th century, and one of the firft members of the French Academy, was born at St Juit de Luffac. He acquired the efteem of Mary de Medicis, and of the wits of his time. He was a Protertant,' and died in a very advanced age. He wrote

## GOM

Gombroon. wany works in verfe and profe. His epigrams, and fome of his fonnets, are particularly efteemed.

GOMBROON, by the natives called -Bander $A$ baff, a city of Periia, hituated in N. Lat. 27. 40. E. Long. 55. $3^{\circ}$. The name of Gombroon, or Comerongr Captain Hamilton tells us, it had from the Portuguefe; becaufe it was remarkable for the number of prawns and flarinps caught on its coafts, by them called comzerong. This ciry owes its wealth and grandeur to the demolition of Ormus, and the downfal of the Portuguefe empire in the Eaft Indies. It is now juftly accounted one of the greatelt marts in the Eaft, was built by the great hah Abas, and from him, as fome think, obtained the name of Bander Abaff, which fignifies the court of Abas. It ftands on a bay about nine leagues to the northward of the eaft end of the ifland of Kinminh, and three leagues from the famous Ormus. The Englifh began to fettle here about the year 163 m , when, in confideration of their fervices againt the Portuguefe, flah Abas granted them half the cuftoms of that port. This was confirmed by a phirmaund, and duly regarded, till the Englifh began to neglect the fervices they had ftipulated. Whether the company has any emolument from the cuftoms at prefent, is what we cannot pretend to afcertain. The town is large, but its fituation bad; wanting almoft every thing that contributes to the happinefs and even fupport of life. Towards the land it is encompaffed by a fort of wall; and towards the fea are feveral fmall forts, with a platform, and a cafle or citadel, mounted with cannon to fecure it and the road from the attempts of an enemy by fea. The houfes in moft of the flreets are fo out of repair, fome half down, others in a heap of rubbifh, that a ftranger would imagine the town had been facked and ravaged by a barbarous people; not a veftige of the wealth really contained in the place appearing in view. The bazars and fhops round them are kept, for the moft part, by Banians, whofe houfes are generally in good order. Moft of the houfes are built with earth and lime, but fome of the beft with ftone. Many of them have a fort of ventilators at top, which contribute greatly to the health of the inhabitants in the hor feafons of the year. The moft fickly months here are April, May, September, and October. With fifh and mutton the in habitants are well fupplied. Rice is imported from India; and wheat is fo plenty, that the poor fubfirt chiefly on bread and dates. The country hereabouts abounds in the moft delicions fruits, as apricots, peaches, pomegranates, pears, mangoes, grapes, quavas, plums, fiweet quinces, and water-melons. The apricots, however, are fmall, and extremely dangerous if eaten to excefs.

Thofe conveniences are more than overbalanced by the fcarcity of frell water, with which the inhabitants are fupplied from Affeen, a place feven miles diftant, there not being a fpring or well in the town. Perfons of condition keep a camel conftantly employed in bringing frefh and wholefome water. Captain Hamilton gives it as his opinion, that one caufe of the unwholefomenefs of this city is the reflection of the rays of light from a high mountain to the north of it. He fays, that when the beams are reflected from this anountain, they almoft fire the air, and, for two or

1A」 G O M
three months in the year, render the fituation into- Gombroen lerable. For this reafon the people of condition retire into the country, to pars the heats of June, July, and Gomiprrah, Auguft. The very fea, during this feafon, is affected, infomuch that the ftench is no lefs difagreeable than that of putrid carcafes ; and this is increafed by the quantitics of flell-fifh left on the flore, from which an exhalation arifes that carnifhes gold and filver, and is lefs tolerable than the bilge-water of a tight fhip. At Affeen the Englifh factory have a country-houfe and gardens, to which they retire occafionally. Here they have whole groves of Seville orange-trees, which though not natural to the country, thirive very well, and are always verdant, bearing ripe and green-fruit, with bloffoms, all at the fame time. They have likewife tanks and ponds of fine frefh-water, with every thing elfe that can moderate the heat of the climate, and render life agreeable and elegant. About ten miles from Affeen is a place called Minoa, where are cold and hot natural baths, reckoned infallible in the cure of all fcrophulons diforders, rheumatifms, and other difeafes, by bathing.
Gombroon is extremely populous, on account of the commerce carried on by the Dutch and Englifa factories, as well as the natives. The Englidh factory is clofe by the fea, at fome diftance from the Dutch, which is a commodious and fine new building. A great part of the company's profits arifes from freights. As the natives have not one good hip of their own, and are extremely ignorant of navigation, they freight their goods for Surat, and other Indian marts, in Englifh and Dutch bottoms, at an exorbitant rate. The commodities of the Gombroon market are, fine wines of different kinds, raifins, almonds, kifh-mifhes, prunellas, dates, piftachio-nuts, ginger, filks, carpets, leather, tutty, galbanum, ammoniac, afa-fæ.: tida, tragacanth, with other gums, and a variety of fhop medicines. Thefe are in a great meafure the produce of Carmania, which they bring to Gombroon in caravans. The Englifh company had once a fmall factory in the province of Carmania, chiefly for the fake of a fine wool produced there, and ufed by the hatters. The faid company had once a project of carrying a breed of the Perfian goats to St Helena; but whether it was executed, or what fuccefs it met with, we cannot fay. Although the company pay no cuftoms, yet they ufually make a prefent to the fhabander, to avoid the trouble he has it in his power to give them. All private traders with the company's paffes, enjoy the fame privileges, on paying two per cent. to the company, one to the agent, and one to the broker. All priyate trade, either by European or country hips, has long been engroffed by the company's fervants.
GOMERA, one of the Canary inlands lying between Ferro and Teneriffe. It has one good town of the fame name, with an excellent harbour, where the Spanifh fleet often take in refrefhments. They have corn fufficient to fupply the inhabitants, with one fugarwork, and great plenty of wine and fruits. It is fubject to the Spaniards, who conquered it in 1445 . W. Long. 17. 10. N. Lat. 28. 0.
GOMORRAH (anc. geog.), one of the cities of the plain or of the vale of Siddim in Judæa, deftroyed

## GON. [ 15 ] GON

Gomusia together with Sodom by fire from heaven, an account of the wickednefs of the people. To determince its particular fituation at prefent is impofible.

GOMOZIA, in botany: A gemes of the digynia order, belonging to the tetrandria clafs of plants. The corolla is campanulated, quadrifid above; there is no calyx; the berry bilocular.

GOMPHOSIS, in anatomy, that kind of articnlation by which the teeth are fixed in the jaw-bone. See Anatomy, $n^{0} 2$.

GOMPHR压A, chobe amaranth, in botany : A genus of the digynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 54 th order, Mifcellanea. The calyx is coloured; the exterior one triphyllous, or diphyllous, with two carinated connivent leaflets; the nectarium cylindrical, with ten teeth; the capfule monofpermous. There are feven fpecies; but only one of them is commonly cultivated in our gardens, viz. the globofa. It hath an upright ftalk branching all round, two or three feet high, garnifhed with oval, lanccolare, and oppofite leaves; and every branch and fide-fhoot terminated by a clofe globular head of flowers, compofed of numerous, very fmall ftarry florets, clofely covered with dry fcaly calices placed imbricatim, perfiftent, and beautifully coloured purple, white, red, or ftriped and variegated. The flowers themfelves arefo fmall, and clofely covered with the fcaly calices, that they foarcely appear. The numerous clofely placed fcaly coverings being of a dry, firm, confiftence, coloured and glittering, collected into a compact round head, about the lize of an ordinary cherry, make a fine appearance. They are annual plants, natives of India; and require artificial heat to raife and forward them to a proper growth, fo that they may flower in perfection, and produce ripe feed. They flower from June to November; and if the flowers are gatbered when at full growth, and placed out of the fin, they will retain their beauty feveral months.

GONAQUA, the name of a nation inhabiting ahout the Cape, and fuppofed by Dr Sparman to be a mixture of Hottentots and Caffres. Sce Hottenтотs.

GONDAR, the capital of Abyffinia; fitaated, according to Mr Brace's obferyations, in Lat. $\mathrm{J}_{2}$. 34. 30. and Long. 37 33. O. E. from Grẹenwich. It lies upon the top of a inill of confiderable height, and confifts of about 10,000 families in the timeof peace. The houfes are chiefly of clay, with roofs thatched in rhe form of cones. At the weft end of the town is the king's palace ; formerly, as Mr Brace informs us, a fructure of confiderable coufequence, being a large fquare building four fories high, flanked with fquare towers, and affording from the top of it a magnificent view of all the comntry fouthward to the lake Tzina. It was built in the time of Facilidas, by mafons from India, and by fuch Abyffinians as had been inftructed in ar hitecture by the. Jefuits before their expulfion. Great part of it is now in ruins, having been burnt at different times; but there is ftillample lodging in the two loweff floors, the audience chamber being above 120 feet long. By the fide of this ftructure, there have becn built by different kings apartments of clay only in the faihion of their own country. The palace, with all its conriguous buildings, is furrounded by a double
ftone wall thirty feet high and a mile and a half in circumference, with battlements upon the outer wall, and a parapet roof between the outer and inner, by which you can go along the whole and look into the ftreet. The hill on which the town is built rifes in the middle of a deep valley; through which run two rivers: one of which, the Kakha, coming from the Mountain of the Sun, flanks all the fonth of the town; while the other, called the Angrab, falling from the Mountain Waggora, compafles it on the north and north-eaft ; and both rivers unite at the bottom of the hill about a quarter of a mile fouth of the town. U pon the bank oppofite to Gondar, on the orher fide of the river, is a large town of Mahometans; a great part of whom are employed in taking care of the king's and nobility's equipage both when they take the field and when they return from it. They are formed into a body under proper officers; but never fight on either fide, being entirely confined to the occupation juft mentioned, in which by their care and dexterity in pitching and friking the tents, and in leading and conducting the baggage-waggons, they are of great fervice.-The valley of Gondar is defcribed as having three outlets; one fouth, to Dembea, Matfha, and the Agows; another on the north.weft; towards Sennaar, over the Mountain of the Sun; and the third north, leading to Waggora over the high mountain Lamalman, and fo on through Tigre to the Red Sea.

GONDI (John Francis Paul), Cardinal de Retz, was the fon of Philip Emmanuel de Gondi, Count de Joigny, lientenant-general, \&e. and was born in 1613. From a doctor of the Sorbonne, he firft became coadjutor to his uncle John Francis de Condi, whom he fucceeded in 1654 as archbifhop of Paris; and was finally made a cardinal. This extraordinary perfon has drawn his own character in his memoirs with impartiality. He was a man, who from the greateft degree of debauchery, and ftill languifhing under its confequences, made himfelf adored by the people as a preacher. At the age of 23 , he was at the head of a confpiracy againft the life of Cardinal Richlieu; he precipitated the parliament into cabals, and the people into fedition; he was (fays M. Voltaire) the firft bifhop who carried on a civil war without the mafk of religion. However, his intrigues and fchemes turned out foill, that he was obliged to quit France ; and he lived the life of a vagrant exile for five or fix years, till the death of his great enemy Cardinal Mazarin when he returned on certain flipulated conditions. After aflifting in the conclave at Rome, which chofe Clement IX. he retired from the world, and ended his life like a philofopher in 1679; which made Voltaire fay, that in his youth he lived like Catiline, andlike Atticus in his old age. He wrote his Memoirs in his retirement; the beft edition of which is that of Amfterdam; 4 vols 12 mo . 1719

GONDOLA, a flat boat, very long and narrow, chiefly ufed at Venice to row on the canals. The word is Italian, gondolia. Du Cange derives it from ? the vulgar Greek rouytenas; "a bark," or "little fhip;"Lancelot deduces it from govou, a term in Athe. . næus for a fort of vafe.
The middle-fized gondolas are upwards of thirty feet long and four broad: they always terminate at :

Gondi,
Gendola.

## GOO [16] GOO

Gondula each endin a very fharppoint, which is raifed perpendicularly to the full height of a man.

The addrefs of the Venetian gondoliers, in pafing along their narrow canals, is very remarkable : there are ufually two to each gondola, and they row by pulhing before them. The fore-man refts his oar on the left fide of the gondola : the hind man is placed on the Itern, that he may fee the head over the tilt or covering of the gondola, and refts hisoar, which is very long, on the right fice of the gondola.

Gondela is alfo the name of a paffage, boat of fix or eight oars, ufed in other parts of the coaft of Italy.

GONORRHङA, an efflux of white, greenifh, or differcinly-coloured, matter from the urethra; molt commonly owing tovenereal infection. See Midicine and Surgery.

GONZAGA (Lucretia), was one of the moft illuftrions ladies of the 16 th century ; and much celebrated for her wit, her learning, and her delicate ftyle. Hortenfio Lando wrote a beautiful panegyric upon her, and dedicated to her his dialugue of moderating the paffions. Her beantiful letters have been collected .with the greateft care. We learn from thefe, that her marriage with John Panl Manfrone was unhappy. She was married to him when fhe was not 14 years of age, and his conduct afterwards gave her infinite un.eafinefs. He engaged in a confpiracy againft the duke of Ferrara; was detected and imprifoned by him; but, though condemned by the judges, not put to death. She did all in her power to obtain his enlargement, but in vain; for he died in prifon, having hown fuch impatience under his misfortunes, as made it imagined he had loft his fenfes. She never would liften afterwards to any propofals of marriage, though Several were made to her. All that came from her pen was fo mach efteemed, that a collection was made even of the notes fhe writ to her fervants; feveral of which are to be met with in the edition of her letters.

GOOD, in general, whatever is apt to encreafe pleafure, to diminifh pain in us; or, which amounts to the fame, whatever is able to procure or preferve to us the poffeffion of agrecable fenfations, and remove thofe of an oppolite nature.

Moral GQOD denotes the right conduct of the feveral fenfes and paffions, or their juit proportion and accommodation to their refpetive objects and relations. See Morals.

Good Abearing, (bonusgeftus,) fignifies an exact carriage or behaviour of a finbject towards the king and the people, whereunto fome perfons upon their mifbehaviour are bound: and he that is bound to this, is faid to be more ftrigly bound than to the peace; becaule where the peace is not broken, the furety de bono gefta may be forfeited by the number of a man's company, or by their weapons.

Good Behaviour, in law, an exact carriage and behaviour to the king and his people.

A juftice of rhe peace in Britain may, at the requeft of another, or where he fees caufe, demand furety for the good behaviour ; and to that.end the juntice may iffue out his warrant againft any perfons whatfoever, below the degree of nobility ; but when it is a mobleman, complaint is to be made in the court of chancery, or king's bench, where fuch nobleman may
be bound to kecp the peace. Infants and feme-coverts, who oug the to find furety by their friends, may be bound over to their good behaviour ; as allolunatics, that have fometimes lucid intervals, and all others who break the peace, or being fufpected to do it by affrays, affaults, battery, wounding, fighting, quarrelling, threatening, \&c. A perfon may be likewife bound to his good behaviour for a fcandalous way of living, keeping bawdy-houfes, gaming-houfes, \&c. and fo may common drunkards, whoremongers, common whores, cheats, libellers, \&c. He who demands furety for the peace, on any violence offered, malt take an oath before the juftice, that he goes in fear of his life, or fome bodily harm, \&c. and that it is not out of malice, but from a regard to his own fafety.

Good-Breeding. Sec Good-Manntrs.
Good-Friday, a faft of the Chriftian church, in me* mory of the fufferings and death of Jefus Chrift. It is obferved on the Friday in boly or paffion week; and it is called, by way of eminence, good, becaufe of the bleffed effects of our Saviour's fufterings, which were a propitiatory or expiating facrifice for the fins of the world. The commemoration of our Saviour's fufferings has been kepr from the very firft ages of Chriftianity, and was al ways obferved as aday of the ftricteft fafting and humiliation. Among the Saxons it was called Long Friday; but for what reafon, except on account of the long faftings and offices then ufed, is uncertain. On Good-Friday the pope fits on a plain form ; and, after fervice is ended, when the cardinals wait on him back to his chamber, they are obliged to keep a deep. filence, as a teftimony of their forrow. In the night of Good-Friday, the Greeks perform the obfequies of our Saviour round a great crncifix, laid on a bed of fate, adorned with flowers; thefe the bifhops diftribute among the affiftants when the office is ended. The Armenians, on this day, fet open a holy fepulchre, in imitation of that of monnt Calvary.

Good-Hope, or Cape of Good Hope, a promontory of Africa, where the Dutch have built a good town and fort. It is fitnated in the country of the Hottentots; for an account of whom, and of the country at large, with its firft difcovery, fee the article Hсtientots.

The Cape of Guod-Hope has been generally efteemed the molt foutherly point of Africa, though it is not truly fo. In Pbillip's Voyage to Botany Bay*, we are told, that the land which projects fartheft to the fouth is a point to the eall of it, called by the Engliih Cape Lagullus; 2 name corrupted from the original Portuguefe das Agulhas, which, as well as the French appellation des Aiguilles, is defcriptive of its form, and would rightly be trannated Needle Cape.

On approaching the Cape, a very remarkable eminence mayin clear weather be difcovered at a confider. able diftance; and is called the Table-mosutain from its appearance, as it terminates in a flat horizontal furface, from which the face of the rock defcends almoft perpendicularly. In the mild or fummer feafon, which conmences in Scptember, and continues till March, the Table Land or Mountain, is fometimes finddenly capped with a white cloud, by fome called the $\int$ preading the of Table-cloth. When this cloud feems to roll down the fleep face of the mountain, it is a fure indication of an approaching gale of wind from the foutheaft; which generally blows with great violence, and

## GOO

Good.
fometimes continues a day or more, but in common is of thort duration. On the firlt appearance of this cloud, the fhips in Table Bay begin to prepare for it, by friking yards and top-mafts, and making every thing as fnug as poffible.-A little to the weftward of the Table Land, divided by a fimall valley, ftands on the right hand fide of Table Bay a round hill, called the Sugar Loaf; and by many the Lion's Head, as there is a continnance from it contiguous to the fea, called the Lion's Runp; and when you take a gencral view of the whole, it very much refembles that animal with his head erect. The Sugar Loaf or Lion's Head, and the Lion's Rump, have each a flag-ftaff on them, by which the approach of fhips is made known to the governor, particularifing their number, nation, and the quarter from which they came. To the eaftward, fcparated by a fimall chafm from the Table Land, fands Charles's Mount, well known by the appellation of the Devil's Tower, or Devil's Head; and fo called from the violent guits of wind fuppofed to iffue from it when it partakes of the cap that covers the Table Land, though thefe gufts are nothing more than a degree of force the wind acquires in coming through the chafm. When this phenomenon appears in the norning, which is by no means fo frequent as in the evening, the failors have a faying, as the Devil's Tower is almoft contiguous to the Table Land, that the old gentleman is going to breakfaft; if in the middle of the day, that he is going to dinner; and if in the evening, that the cloth is fpread for fupper. Table-mountain arifes about 3567 feet above the level of the fea; the Devil's Tower, about 3368 ; and the Lion's Head, 2764. In the neighbourhood of the latter lies Conftan$t i a$, a diftrict confifting of two farms, wherein the famous wines of that name are produced.

The above defcribed high lands form a kind of amphitheatre about the Table-valley, where the Capetown ftands. This is fituated at the bottom of the middle heisht, or Table-mountain ; and almoft in the centre of the Table Bay, fo called from that moun-tain.-This bay, it is obferved in Pbillip's Voyage, "cannot properly be called a port, being by no means a fation of fecurity; it is expofed to all the violence of the winds which fet into it from the fea; and is far from fufficiently fecured from thofe which blow from the land. The gufts which defcend from the fummit of Table-mountain are fufficient to force fhips from their anchors, and even violently to annoy perfons on the fhore, by deftroying any tents or other temporary edifices which may be erected, and raifing. clouds of fine duft, which produce very troublefome effects. A gale of this kind, from the fouth-eaft, blew for three days fucceffively when Captain Cook lay here in his firf voyage; at which time, he informs us, the Refolution was the only fhip in the harbour that had not dragged her anchors. The ftorms from the fea are ftill more formidable: fo much fo, that fhips have frequently been driven by them from their anchorage, and wrecked at the head of the bay. But thefe accidents happen chiefly in the quaade mouffon, or winter months, from May 14, to the fame day of Auguft ; during which time few hips venture to anchor here. The Brition fleet arriving later, lay perfectly unmolefted as long as it was neceffary for it to remain in this Vol. VIII.

## $17] \quad$ GOO

fation.-Falfe Bay, on the fouth-eaft fide of the Cape, Good. is more fecure than Table Bay during the prevalence of the north-weft winds, but ftillefs fo in frong gales from the fouth-eaft. It is, however, lefs frequented, being 24 miles of very heavy road diftant from Cape Town, whence almoft all necefiaries muft be procured. The mott fleltered part of Falfe Bay is a recefs on the weft fide, called Simon's Bay."

Thelatertand moft particularaswell as apparently the mott juft account of the Cape Towin, concerning which voyagers have differed very much from one another in their reprefentations, is that given by Mr White in his Fournal of a voyage to New South Wales. From the Nhipping, he obferves $\dagger$, the town appears pleafantly fituated, $\dagger$ P. 8\%. but atthe fame time finall; a deception that arifes from its being built in a valley with fuch fupendous mountains directly behind it. On landing, however, you are furprifed, and agreeably difappointed, to find it not only extenfive, but well built, and in a good flyle; the freets fpacious, and interfecting each other atright angles with great precifion. This exactnefs in the formation of the ftreets, when viewed from the Table Land, isobferved to be very great. The houfes in general are built of ftone, cemented together with a glutinous kind of earth. which ferves as mortar, and afterwards neatly plaftered and whitewafhed with lime. As to their height they do not in common exceed two ftories, on account of the violence of the wind, which at fome feafons of the yearblows. with great ftrength and fury. For the fame reaton thatch has been ufually preferred to tiles or hingles; but the bad effects that have proceeded from this mode when fires happen, has induced the inhabitants in all their new buildings to give the preference to flates and tiles. The lower parts of the houfes, according to the cuftom of the Dutch nation, are not only uncommonly neat and clean in appearance, but they are really fo; and the furniture is rather rich than elegant. But this is by no means the cafe with the bed-rooms or upper apartments; which are very barely and ill furnithed. The ftreets are rough, uneven, and unpaved. But many of the houfes have a fpace flagged before the door; and others have trees planted before them, which form a pleafant fhade, and give an agreeable air to the frreets.

The only landing place is at the eaft end of the town, where there is a wooden quay running fome paces into the fea, with feveral cranes on it for the convenicnce of loading and unloading the fcoots that come along fide. To this place excellent water is conveyed by pipes, which makes the watering of fhips eafy and expeditious. Clofe to the quay, on the left hand, ftands the caftle and principal fortrefs; a ftrong extenfive work, having excellent accommodations for the troops, and for many of the civil officers belonging to the company. Within the gates, the company have their principal fores; which are fpacious as well as convenient. This fort covers and defends the caft part of the town and harbour, as Amfterdam fort does the weft part. The latter, which has been built lince commodorc Johnfon's expedition, and whereon both French and Dutch judgment have been united to render it effectual and ftrong, is admirably planned and calculated to annoy and harais hlips coming into the bay. Some fmaller detached fortifications extend along the codft, both to the eaft and tieft, and make landing, which was not

## GOO

Good. the cafe before the late war, hazardous and difficult. In a word, Cape Town is at this time fortified with ftrength, regularity, and judgment.

The governor's looufe is delightfully fituated, nearly in the centre of an extenfive garden, the property of the Dutch Eaft India company, ufefully planted, and at the fame time elegantly laid out. The governor's family make what ufe they pleafe of the produce of the garden, which is various and abundant; but the original intention of the company in appropriating fo extenfive a piece of ground to this purpofe was, that their hofpital which is generally pretty full when their fhips arrive after long voyoges, may be well fupplied with fruits and vegetables, and likewife that their fhips may receive a finilar fapply. This garden is as public as St James's park; and for its handfome, pleafant, and well-fhaded walks, is much frequented by perfons of every defcription, but particularly by the faihionable and gay. At the upper end of the principal walk is a fmall fpace walled in for the purpofe of confining fome large oftriches and a few deer; and a little to the right of this is a fmall menagery, in which the company have half a dozen wild animals and about the fame number of curious birds.

There are two churches in the town; one large, plain, and unadorned, for the Calvinifts, the prevailing fect ; and a fimaller one for the Lutherans. The hofpital, which is large and extenfive, is fituated at the upper end of the town, clofe to the company's garden; where the convalefcents reap the benefit of a wholefome pure air, perfumed with the exhalations of a great variety of rich fruit trees, aromatic hrubs, and odorous plants and flowers; and likewife have the ufe of every production of it.

Befides their horpital, the Dutch Eaft India company have feveral other public buildings, which tend to improve the appearance of the town. The two principal of thefe are, the ftables and a houre for their dlaves. The former is a handrome range of buildings, capable of containing an incredible number of horfes. Thofe they have at the cape are fmall, fpirited, and full of life. The latter is a building of confiderable extent, where the flaves, both male and female, have feparate apartments, in a very comfortable ftyle, to refide in after the fatigues and toil of the day; and there are feveral officers placed over them, who have commodious apartments, and treat them humanely.

The inhabitants of the Cape, though in their perfons large, font, and athletic, havenot all that phlegm about them which is the characteriftic of Dutchmen in general. The phyficalinfluence of climate may in fome degree account for this; for it is well known that in all fouthern latitudes the temper and difpofition of the people are more gay, and that they are more inclined to luxury and amufements of every kind, than the inhabitants of the northern hemifphere. The ladies are lively, good-natured, and familiar ; and from a peculiar gay turn, they admit of liberties that would be thought reprehenfible in England, though perhaps they as feldom overleap the bounds of virtue as the women of other countries.

The heavy draft work abont the Cape is moftly performed by oxen; which are here brought to an uncommon degree of ufefulnefs and docility. It is not uncommon to fee 14,16 , and fometimes 18 , in one of
their teams; when the roads are heavy, they fometimes, though rarely, yoke 20; all which the Hottentots, Malays, and Cape flaves, have in the moft perfect fubjection and obedience. One of thefe fellows places himfelf on the fore part of the waggon, or, when loaded, on the top of the load, and with a tremendous long whip, which from its lize he is obliged to hold in both his hands, manages thefe creatures with inexpreffible addrefs. W hen he finds expedition needful, he can make them keep whatever pace he choofes, either trot or gallop (a gait performed or kept up with difficulty by Eurapean oxen), and that with as much eafe as if he was driving horfes. They likewife manage. horfes with the fame dexterity; and to fee one of them driving three, four, five, and fometimes fix pair, in hand, with one of thefe long whips, would make the moft complete mafter of the whip in England cut a defpicable figure. Carriages are not very numerous at the Cape, as the inhabitants in general travel in covered waggons, which better fuit the roughnefs of the country. The governor and fome few of the principal people keep coaches, which are a good deal in the Englifh fyle, and always drawn by fix horfes.

Good Manners. Sce Manners.
GOODINGS, in fea-language, are clamps of iron bolted on the ftern-pof of a flip, whereon to hang the rudder and keep it fteady ; for which purpofe there is a hole in each of them, to receive a correfpondent fpindle bolted on the back of the rudder, which turns thereby as upon hinges.

GOOSE, in ornithology. See Anas. The goofe was held in great efteem anongft the Romans, for having faved the Capital from the invafion of the Gauls by cackling and clapping its wings. Geefe were kept in the temple of Juno ; and the cenfors, when they ent tered upon their office, provided meat for them. There was alfo an annual feaft at Rome, at which they carried a filver image of a goofe in ftate; and hanged a dog, to punifh that animal becaufe he did not bark at the arrival of the Gauls.

Goose-Ander, in ornithology. See Mergus.
Coose-Berry, in botany. See Ribes.
Coose-Neck, in a flip, a piece of iron fixed on the one end of the tiller, to which the laniard of the whip-ftaff or the wheel-rope comes, for fleering the fhip.
Coose-Wing, in the fea-language. When a fhip fails before, or with a quarter-wind on a frefh gale, to make the more hafte, they lanch out a boom and fail on the lee-fide; and a fail fo fitted, is called a goofe-wing.

GORCUM, a town of the United Provinces, in South Holland, which carries on a confiderable trade in cheefe and butter. It is fitnated on the rivers Ligne and Maefe, in E. Long. 4. 55. N. Lat. 5I. 49.
GORDIANUS I. (a Roman general), was for his valour and virtues chofen emperor by the army in the reign of Maximinus, A. D. 237; but his fon, whom he had affociated with himfelf in the throne, being flain by Capellian, the governor of Mauritania for Maximinus, Gordianus killed himfelf the fame year. See Rome.

Gordianus III. (grandfon of the former), a renowned warrior, was styled The guardian of the Roman

Gordian, commonzuealth. He was treacheroully affafinated by Gordius. Philippus, an Arabian, one of his generals; who, to the eternal difgrace of the Romans of that cra, fucceeded him in the empire, A. D. 244. Sce Rome.

GORDIAN-knot, in antiquity, a knot made in the leathers or harnefs of the chariot of Gordius king of Phrygia, fo very intricate, that there was no finding where it began or ended. The inhabitants had a tradition, that the oracle had declared, that he who untied this knot hould be mafter of Aifa. Alexander having undertaken it, was unable to accomplifh it; when fearing left his not untying it fhould be deemed an ill augury, and prove a check in the way of his conquefts, he cut it afunder with his fword, and thus either accomplifhed or eluded the oracle.

GORDIUS, the hair-worm, a genus of infects belonging to the clafs of vermes inteftena. There are feveral fpecies, I. The aquaticus, or water hair-worm, is 10 or 12 inches in length, and of about the thicknefs of a horfe hair: its 1 kin is finooth and fomewhat gloffy, without furrows; its colour pale yellowifh white allover, except the head and tail, which are black and gloffy. The body is rounded, and very flender in proportion to its length : the mouth is fmall, and placed horizontally; the jaws are both of the fame length, and obtufe at their extremities. This fpecies is common in frefh waters, more efpecially in clay, through which it paffes as a fifh does through the water, and is the author of many fprings. This is the worm that in Guinea and in fome orher of the hot countries gets into the flefh of the natives, and occafions great mifchief; with us, though frequent enough in water where people bathe, it never attempts this.-2. The argillaceus, or clay hair-worm, is only a variation of the preceding one in colour, being yellowifh at the extremities. It chiefly inhabits the clay; and Linnæus calls that its proper element, from its being generally dug out of it.- 3 . The medinenfis, or mufcular lair-worm, is all over of a pale yellowifh colour. It is a native of both Indies; frequegnt in the morning dew, from whence it enters the naked feet of the flaves, and occafions a difeafe much known in thofe countries, and to which children are very liable: it creates the moft troublefome itchings, and too often excites a fever and inflammation. It particularly infefts the mufcles of the arms and legs, from whence it may be drawn out by means of a piece of filk or thread tied round the head: but the greateft caution is neceffary in this fimple operation, left the animal, by being ftrained too much, fhould break; for if any part remains under the 1 kin, it quickly grows with redoubled vigour, and becomes a cruel and fometimes fatal enemy, to the poor flaves in particular. Baths with infufions of bitter plants, and all vermifuges, deftroy it.-4. The marinus, or fea hair-worm, is filiform, twifted fpirally, and lying flat, about half an inch in length; of a whitifh colour, fmooth, and farcely diminiming at the head. It is as great a tormenter of herrings, bleaks, and various other fifh, as the gordius medinenfis is of man. The fifh when infefted with thefe animals rife to the furface, and tumble about as if in great agony.

Gordius, king of Phrygia, and father of Midas, was a poor hurbandman, with two yokes of oxen, wherewith he plonghed his land and drew his wain. An eagle fitting a long while upon one of his oxen,
he confulted the footlifayers; a virgin bid him facrifice Gordon. to Jupiter in the capacity of king. He married the virgin, who brought forth Midas. The Perfians inftructed by the oracle to fer the firft perfon they met in a wain upon the throne, mer Gordius, and made him king. Midas for this good fortune dedicated to Jupiter his father's cart. The knot of the yoke, they lay, was fo well twifted, that he who could unloofe it was promifed the empire of Afia; hence the proverb of the Gurdian knot had its original. See Gordian Knot.

GORDON (Alexander), an excellent draughtfman and a good Grecian, who refided many years in Italy, vifited moft parts of that comntry, and had alfo travelled into France, Germany, \&c. was fecretary to the Society for Encouragement of Learning; and afterwards to the Egyptian Club, compofed of gentlemen who had vifited Egypt (viz. lord Sandwich, Dr Shaw, Dr Pococke, \&c.) He fucceeded Dr Stukely as fecretary to the Antiquarian Society, which office he refigned in 1741 to Mr Jofeph Ames. He went to Carolina with governor Glen, where, befides a grant of land, he had feveral offices, fuch as regifter of the province, \&c. and died a juftice of the peace, leaving a handfome eftate to his family. He publifhed 1. Itinerarium Septentrionale, or a Journey through moft parts of the Counties of Scotland, in two parts, with 66 copperplates, 1726 , folio. 2. Supplement to the Itinerarium, 1732, folio. 3. The Lives of Pope Alexander VI. and his fon Cæfar Borgia. 4. A complete Hiftory of the ancient Amphitheatres, 1730 , 8vo. afterwards enlarged in a fecond cdition. 5. An Eflay towards explaining the hieroglyphical figures on the coffin of the ancient Mummy belonging to Capt. William Lethieuller, ${ }^{1737 \text {, folio, with cuts. 6. Twenty-five }}$ Plates of all the Egyptian Mummies and other Egyptian Antiquities in England, 1739 , folio.

Gordon (Thomas), noted for his tranflations and political writings, was born at Kirkudbright in North Britain. He came young to London; where he fupported himfelf by teaching languages, until he procured employment under the earl of Oxford in queen Ame's time, but in what capacity is not now known. He firft diftinguifhed himfelf in the defence of Dr Hoadley in the Bangorian controverfy; which recommended him to Mr Trenchard, in conjunction with whom he wrote the well-known Cato's Letters, upon a variety of important public fubjects. Thefe were followed by another periodical paper, under the title of the Independent Whig; which was continued fome years after Mr Trenchard's death, by Gordon alone, againft the hierarchy of the church; but with nore acrimony than was flown in Cato's Letters. At length Sir Robert Walpole retained him to defend his adminiftration, to which end he wrote feveral pamphlets. At the time of his death, July 28th 1750, he was firft commiffioner of the wine licences, an office which he lad enjoyed many years. He was twice married. His fecond wife was the widow of his great friend Trenchard, by whom he had children.- He publifhed Enlifh tranflations of Salluft and Tacitus, with àdditional difcourfes to each author, which contain much good matter. Alfo, two collections of his tracts have been preferved: the firft intitled, A Cordial for Lowfpirits, in three volumes; and the fecond, The Pillars of Priefteraft and Orthodoxy fhaken, in two voC 2 lumes.

## GOR $\quad[20] \quad$ GOR

Cordonia lumes. But thefe, like many other pofthumous things, \# Gorged. had better have been fupprefled. In his tranflations as well as his other works he places the verbs at the ends of fentences, according to the Latin idiom, in a very fiff and affected manner.

GORDONIA, in botany : A genus of the polyandria order, belonging to the monadelphia clafs of plants. The calyx is imple; the style five-cornered, with the ftigmaquinquefid; the capfule quinquelocular; the feeds two-fold with a leafy wing. This is a tall and very ftraight tree, with a regular pyramidal head. Its leaves are fhaped like thofe of the common bay, the ferrated. It begins to bloffom in May, and continues bringing forth its fowers the greateft part of the fumacr. The flowers are fixed to foot-ftalks, tour or five inches long; are monopetalous, divided into five fegments, encompalfing a tuft of famina headed with yellow apices; which flowers, in November, are fucceded by a conic capfula having a divided calyx. The capfula, when ripe, opens, and divides into five fections, difclofing many fmall half-winged feeds. This tree retains its leaves all the year, and grows only in wet places, and ufually in water. The wood is fomewhat foft; yet Mr Catefby mentions his having feen fome beautiful tables made of it. It grows in Carolina, but not in any of the more northerly ftates.

GORE, in heraldry, one of the abatements, which, according to Guillim, denotes a coward. It is a figure confifting of two arch lines drawn one from the finifter chief, and the other from the finifter bafe, both meeting in an acate angle in the middle of the fefs point. See Meralery.

COREE, a fmall inland of Africa, near Cape de "crd, fubject to the French. It is a fmall fpot not exceeding two miles in circumfercuce, but its importance arifes from its fituation for trade fo near Cape V eid, and it has been therefore a bone of contention between European nations. It was firlt poffelied by the Dutch, from whom, in 1663 , it was taken by the $f$ nglifh; but in 1665 it was retaken by the Dutch, and in 1677 fubdued by the French, in whofe polfeffion it remained till the year 1759, when the Britifh aras were every where triumphant ; and it was reduced by commodore Keppel, but reftored to the French at the rready of peace in 1763 . It was retaken by the Englifh in the laft war, but again reftored at the peace of 1783 . W. Long. 17.20 . N. Lat. I4. 43.

Goree, the capital town of an ifland of the fame name in Holland, eight miles fouth of Briel. Loug. 3. 50. N. Lat. 5 I. 55.

GOREY, a borongh, fair, and poft town in the county of Wexford, province of Leinfter, otherwife called Newborough. It ftands about 18 miles north of Wexford town, and 45 from Dublin. N. Lat. 52. 40. W. Long. 6. 30 . It fends two members to parliament ; patronage in the family of Ram.

GORGE, in architecture, the narroweit part of the Tufcan and Doric capitals, lying between the aftragal, above the thaft of the pillar, and the annulets.
Gorge, in fortification, the entrance of the platform of any work. Sce Fortification.

GORGED, in heraldry, the bearing of a crown, coronet, or the like, about the neck of a lion, a fwan, sec. and in that cafe it is faid, the lion or cygnet is gorged with a ducal coronet, \&c.

Gorged is alfo ufed when the gorge or neck of a peacock, liwan, or the like bird, is of a different colour or metal from the reft.

GORGET, a kind of breaft-plate like a half moon, with the arms of the prince thereon; worn by the officcrs of foot. They are to be either gilt or filver, according to the colour of the buttons on the uniforms.

Gorget, or Gorgeret, in furgery, is the name which the French give to the concave or cannulated conductor, afed in lithotomy. Sec Surgery.

GORGONA, a fmall illand of Italy, in the fea of Tufcany, and near that of Corfica, about eight miles in circumference; remarkable for the large quantity of anchovies taken near it. E. Long. ro. o. N. Lat. 43.22.

Gorgona, a fmall illand of the South Sea, 12 miles weft of the coaft of Peru, in America. It is indifferent high land, very woody, and fome of the trees are very tall and large, and proper for maits. It is about $o$ miles in circumference, and has feveral fprings and rivulets of excellent water, but is fubject to conftant rains. W. Long. 79. 3. S. Lat. 3. 30.

GORGONIA, in natural biftory, a genus of zoophytes, which formerly were called ceratophytons, and are known in Englifh by the names of fea-fans, feafeathers, and fea-qubips. Linnæus and Dr Pallas confider them as of a mixed nature in their growth, between animals and vegetables; but Mr Ellis hows them to be true animals of the polype kind, growing up in a branched form refembling a fhrub, and in no part vegetable. They differ from the frefh water polype in many of their qualitics, and particularly in prodacing from their own fubftance a hard and folid lupport, ferving many of the purpofes of the bone in other animals. This is formed by a concretin!, juice thrown out from a peculiar fer of longitudinal parallel tabes, running along the internal furface of the flefly part: in the coats of thefe tubes are a number of inall orifices, through which the offeous liquor exfudes, and concreting, forms the layers of that bard part of the annular circles, which fome, judging from lie conintence rather than the texture, have croneonly denominated ruond. The furface of the gorgonia is compofed of a kind of fcales, fo well adapted to each other as to ferve for defence from external injuries: and the fleff, or, as fome have called it, the bark or cortex, conlifts of Proper mufcles and tendons for extending the openings of their cells; for fending forth fron thence their polype fuckers in fearch of food; and for drawing them in fuddenly, and contracting the fphincter mufcles of thefe farry cells, in order to fecure thefe tender parts from danger ; and alfo of proper fecretory dugts, to furnifh and depofite the offeous matter that forms the ftem and branches as well as the bafe of the bone. Mr Ellis affirms, that there are ovaries in thefe animals, and thinks it very probable that many of them are viviparous. See Corallines.

GORGONS, in antiquity and mythology. Authors are not agreed in the account they give of the Gorgons. The poets reprefent them as three fifters, whofe names were Stheno, Euryate, and Medu/a; the latter of whom was mortal, and, having been deflowered by Neptune, was killed by Perfeus; the two former were fubject neither to age nor death. They are defcribed with wings on their fhualders, with ferpents

## GOS

round their heads, their hands wore of brafs, and their teeth of a prodigions fize, fo that they were objects of terror to mankind. After the death of Medufa. her fifters, according to Virgil, were appointed to kecp the gate of the palace of Pluto.

## Multaque praterea variarmm monfra firarkinCorgonls, Hurpyieque-

Diodorus Siculus will have the Gorgons and A mazons to have been two warlike nstions of women, who inhabited that part of Libya which lay on the lake Triapidis. The exrermination of tlefe female nations was not effected till Hercules undertook and performed it.

Paufanias fays, the Gorgons were the daughters of Phorbus; after whofe death Medufa, his daughter, reigned over the people dwelling near the lake Tritonidjs. The queen was pafionately fond of hunting and war, fo that the laid the neighbouring countries quite wafte. At laft, Perfeus having made war on then, and killed the quecn herfelf, when he came to take a view of the field of battle, he found the queen's sorple fo extremely beantiful, that he ordered her head to be cut off, which he carried with him to how his countrymen the Greeks, who conld not behold it without being fruck with aftonifhment.

Others reprefent them as a kind of monftrous women, covered with hair, who lived in woods and forefts. Others, again, make them animals refembling wildfleep, whofe eyes had a poifonous and fatal in. fluence.

GORITIA, or Goritz, a ftrong town of Germany, in the circle of Aufria, and duchy of Carniola, with a caftle; feated on the river Lizonzo, 20 miles north-eaft of Aquileia, and 70 north-eaft of Venice. E. Long. 13. 43. N. Lat. 46. 12.

GORLAUS (Abrafam), an eminent antiquary, was born at Antwerp, and gained a reputation by collecting medals and other antiques. He was chiefly fond of the rings and feals of the ancients, of which he publifhed a prodigious number in 1601 , under this title, Dattyliotheca; five Annuloram Sigillarium, quarum apud prifoos tamGracos quan Romanos ufusex ferro, are, argento, et auro, Fromptuarium. Thiswas the firft part of the work : the fecond was intituled, Variarum Gemmarum, quibus antiquitas inn fignandoutifolita foulptura. This work has undergone feveral editions, the beft of which is that of Lcyden, 1695 : for it not only contains a valt number of cuts, but alfo a fhort explication of them by Gronovius. In ateo8, he publifhed a collection of medals: which, however, if we may believe the Scaligerana, it is not fafe always to truft. Gorlæus pitched upon Delft for the place of his refidence, and died there in 1609. His collections of antiques were fold by his heirs to the prince of Wales.

GORLITZ, a town of Germany, in Upper Lufatia, lubject to the elector of Saxony. It is a handfome ftrong place, and feated on the river Neiffe, in E. Long. 15. 15.N. Lat 51. 10.

GORTERIA, in botany: A genus of the polygamia fraftanea order, belonging to the fyngenefiaclafs of plants; and in the natural method ranking under the 49 th order, Compofitae. The receptacle is naked; the pappus woolly; the florets of the radius ligulated or plane; the calyx imbrinated with finous fales.

GOSHAWK. See Falco.
GOSAEN (anc. geog.), a canton of Egypt, which

## $21]$ <br> GOS

Joieph procured for his father and brethren when they came to dwell in Egypt. It was the moft fruitful part of the country : and its name feems to be derived from the Hebrew, Ge/hem, which fignifies "rain;" becaufe this province lying very near the Mediterranean, was expofed to rains, which were very rare in other cantons, and more efpecially in Upper Egypt. Calmet does not queftion but that Goflen, which Jomua (x. 41. xi. IG. xv. 51.) makes part of the tribe of Judah, is the fame as the land of Gofnen, which was given to Jacob and his fons by Pharaoh king of E. gypt: (Gen. xlvi. 28). It is certain that this country lay between Paleftine and the city of Tanais, and that the allotment of the Hebrews reached fouthward as far as the Nile, (Jofh. xiii. 3.)

GOSLAR, a large and ancient town of Lower Saxony, and in the territory of Brunfwick; it is a free imperial city, and it was here that gunpowder was firft invented, by a monk as is generally fuppofed. It is a large place, but the buildings are in the ancient tafte. In 1728, 280 houfes, and St Stephen's fine church, were reduced to afhes. It is feated on a mountain, near the river Gofe, and ncar it are rich mines of iron. The inhabitants are famous for brewing excellent becr. E. Long. 3. 37.N. Lat. 5 I. 55 .

GOSPEL, the hiftory of the life, actions, death, refurrection, afcenfion, and doetrine of Jefus Chrift.The word is Saxon, and of the fame import with the Latin term evangelium, which fignifies glad tidings, or good news.

This hiftory is contained in the writings of St Matthew, St Mark, St Luke, and St John; who from thence are called evangeliffs.. The Clirifian church never acknowledged any more than thefe four gofpels as canonical;notwithftanding which.feveral apocryphal gofpels are handed down to us, and others are entirely luft.

GOSPORT, a town of Hamphire, 79 miles from London, in the parifh of Alverttock. It has a ferry over the mouth of the harbour to Portfinouth, and is a large town and of great trade, efpecially in time of war. Travellers choofe to lodge here, where every thing is cheaper and more commodious for them than at Portfmouth. The mouth of the harbour, which is not fo broad here as the Thames at Weftminfter, is fecured on this fide by four forts, and a platform of above 20 cannon level with the water. Here is a noble hofpital built for the cure of the fick and wounded failors in the fervice of the navy; befides a free fchool.

GOSSAMER is the name of a fine filmy fubftance, like cobwebs, which is feen to float in the air, in clear days in autumn, and is more obfervable in fubblefields, and apon furze and other low bufhes. This is probably formed by the flying fider, which in traverfing the air for food, fhoots out thefe threads from its anus, which are borne down by the dew, \&c.

GOSSYPIUM, or Cotton : A genus of the polyandria order, belonging to the monadelphia clafs of plants; and in the natural method ranking under the 37th order, Columnifera. The calyx is double, the exterior one trifid; the capfule quadrilocular ; the feeds wrapt in cotton-wool. There are four fp:cies, all of them natives of warm climates. I. The herbaceum, or common herbaceons cotion, hath an herbaceous fmooth ftalk two feethigh, braaching apwards;
five-

## GOS

Gofypium. five-lobed finooth leaves; and yellow flowers from the ends of the branches, fucceeded by roundifh capfules full of feed and cotton. 2. The hirfutum, or hairy Anerican cotton, hath hairy ftalks branching laterally two or three feet high: palmated, three and five lobed hairy leayes; and yellow flowers, fucceeded by large oval pods furnifhed with feeds and cotton. 3. The batbadenfe, or Barbadoes fhrubby cotton, hath a hhrubby ftalk branching four or five feet high, three-lobed fmooth leaves, glandulous underneath ; and yellow flowers fucceeded by oval pods, containing feeds and cotton. 4. The arboreum, or tree cotton, hath an upright woody perennial ftalk, branching fix or eight feet high ; palmated, four or five lobed fmooth leaves ; and yellow flawers, fucceeded by large pods filled with feeds and cotton.

The firft three fpecies are annual, but the fourth is perennial both in root and ftalk. In warm countries there plants are cultivated in great quantities in the fields for the fake of the cotton they produce ; but the firft fpecies is moft generally cultivated. The pods are fometimes as large as middling-fized apples, clofely filled with the cotton furrounding the feed. When thefe plants are raifed in Britain, they muft be continually kept in a warm fove, where they will produce feeds and cotton. They are propagated by feeds. See Cotton.

The American Inands produce cotton hrubs of various fizes, which rife and grow up without any culture; efpecially in low and marfhy grounds. Their produce is of a pale red ; fome paler than others ; but fo thort that it cannot be fpun. None of this is brought to Europe, though it might be ufefully employed in making of hats. The little that is picked up, ferves to make matreffes and pillows.

The cotton - fhrubs that fupplies our manufactures, requires a dry and ftony foil, and thrives beft in grounds that have already been tilled. Not but that the plant appears more flourifhing in freh lands than in thofe which are exhaufted; but while it produces more wood, it bears lefs fruit.

A weftern expofire is fitteft for it. The culture of it begins in March and April, and continues during the firft fpring-rains. Holes are made at feven or eight feet diftance from each other, and a few feeds thrown in. When they are grown to the height of five or fix inches, all the fems are pulled up, except two or three of the frongeft. Thefe are cropped twice before the end of Auguft. This precaution is the more neceffary, as the wood bears no fruit till after the fecond pruning; and, if the fhrub was fuffered to grow noore than four feet high, the crop would not be the greater, nor the fruit fo eafily gathered. The fame method is purfued for three years; for fo long the flarnb may continue, if it cannot conveniently be renewed oftener with the profpet of an a antage that will compenfate the trouble.

This ufeful plant will not thrive if great attention is not paid to pluck up the weeds that grow about it. Frequent rains will promote its growth; but they munt not be inceflant. Dry weather isparticularly neceflary. in the months of March and April, which is the time of gathering the cotton, to prevent it from being difcoloured and fpotted.

When it is all gathered in, the feeds muft be picked

22 ] GOTT
out from the wool with which they are naturally mixed. This is done by ine ans of a cotton-mill ; which is an engine compofed of two rods of hard wood, about 18 feet long, 18 lines in circumfercnce, and fluted two lines deep. They are confined at both ends, fo as to leave no more diftance between them than is neceffary for the feed to flip through. At one end is a kind of litule milliftone, which, being put in motion with the foot, turns the rods in contrary directions. They feparate the cotton, and throw out the feed contained in it.

GOTHA, a town of Germany, in the circle of Upper Saxony, and capital of the duchy of Saxe-Gotha, in E: Long. 10. 36. N. Lat. 5I. Some fancy this town had its name from the Goths, and that they fortified it in their march to Italy; but ir was only a village till fur . rounded with walls by the bifhop of Mentz in 964 . It is fituated in a fine plain on the river Leina, well built and ftrongly fortified. Here are two handfome churches and a very good hofpital. Its chief trade is in dyers wood, of which they have three crops, but the third grows wild. The neighbouring country produces a vaft deal of corn. The caftle or ducal palace of Gotha was rebuilt in the , 6 th century by duke Erneft, furnamed the Pions, who caufed both that and the town to be encompaffed with ditches and ramparts ; and gave it the name of Friedenflein, or the Cafle of Peace, in oppofition toits ancient name of Grimmerffein, or the Caftle of the Furies. It is fituated on a neighbouring eminence, from whence there is a vaft profpect of a fruitful plain. In one of the apartments there is a collection of valuable rarities, and a noble library.

The dukedom of Saxe-Gotha is about 30 miles long, and 12 broad. The reigning dake is Lewis Erneft, born in 1745, and married to the princefs Maria Charlotte of Saxe Meningen, by whom he has iffue. He is the head of the Erneftine line of Saxony, defcended from the elector John Frederic the Magnanimous, who was deprived of the electorate by the emperor Charles V. in 1574 ; fince which the youngeft branch called the Albertine has enjoyed it. He has feveral other principalities befides that of Saxe-Gotha; and his revenues are computed at L.200,000 a year, with which he maintains abour 3000 regular troops. As he is the moft powerful of all the Saxon princes of the Erneftine branch ; fo of all the courts of Saxony, next to that of Drefden, he has the moft numerons and the moft magnificent. His guards are well clothed, hisliveries rich, and his tables ferved with more elegance than profufion. And yet by the prudent management of his public finances, his fubjects are the leaft burdened with taxes of any flate in Germany. The religion is Lutheran.

GOTHARD, one of the highef mountains of Switzerland; and from the top, where there is a hofpital for monks, is one of the fineft profpects in the world. It is eight,miles from Aldorf.

GOTHEBORG, or Gothenburg, or Gottenburg. See Gottenburg.

GOTHIC, in general, whatever has any relation to the Goths: thus we fay, Gothic cuftoms, Gothic architecture, \&c. See Architecture.

GOTHLAND, the moft fouthern province of Sweden, being a peninfula, encompaffed on three fides by the Baltic Sea, or the channel at the entrace of it.

## GOT

Goths:
It is divided into feveral parts, which are, Eaft Gothland, Weft Gothland, Smaland, Halland, Bleaking, and Schonen. It wás a long time in the polfeffion of the kings of Denmark, but was ceded to Sweden in 1654. The principal towns of Gothland are Calmar, Landfcroon, Chriftianople, Daleburg, Gothenburg, Helmftat, Lunden, Malmone, and Vexio.

GOTHS, a yarlike nation, and above all others famous in the Roman hiftory, came originally out of Scandinavia (the name by which the ancients diftinguifhed the prefent countries of Sweden, Norway, Lapland, and Finmark). According to the moft probable accounts, they were the firft inhabitants of thole countries; and from thence fent colonies into the illands of the Baltic, the Cimbrian Cherfonefus, and the adjacent places yet deftitute of inhabitants. The time of their firf fettling in Scandinavia, and the time when they firf peopled with their colonies the abovementioned iflands and Cherfonefus, are equally uncertain; tho' the Gothic amnals fuppofe the latter to have happened in the time of Serug the great grandfather of Abraham. This firft migration of the Goths is faid to have been conducted by their king Eric; in which all the ancient Gothic chronicles, as well as the Danifh and Swedifh ones, agree. Their fecond migration is fuppofed to have happened many ages after; when, the abovementioned countries being overfocked with people, Berig, at that time king of the Goths, went out with a fleet in queft of new fettlements. He landed in the country of the Ulmerugians, now Pomerania, drove out the ancient inhabitants, and divided their lands among his followers. He fell next upon the Vandals, whofe country bordered on that of the Ulmerugians, and overcame them; but inftead of forcing: them to abandon their country, he only made them fhare their poffeffions with the Goths.

The Goths who had fettled in Pomerania and the adjacent parts of Germany being greatly increafed infomuch that the country could no longer contain them, they undertook a third migration in great numbers, under Filimer furnamed the Great, their fifth prince after leaving Scandinavia; and taking their romie eaftward, entered Scythia, advanced to the Cimmerian Bofphorus, and, driving out the Cimmerians, fettled in the neighbourhood of the Palus Mæotis. Thence in procefs of time, being greatly increafed in Scythia, they refolved to feek new fettlements; and, accordingly taking their route eaftward, they traverfed feveral countries, and at length returned into Germany.

Their leader in this expedition was the celebrated Woden, called alfo Voden, Othen, Oden, Godan, and Gaudan. Of this Woden many wonderful things are related in the Sueo-gothic chronicles. He was king of the Afgardians, whom the northern writers will have to be the fame with a people called A/purgians mentioned by Strabo and Ptolemy. By Strabo they are placed near the Cimmerian Bofphorns. Afpurgia was the metropolis of a province which Strabo calls $A / i a ;$ and Woden and his followers are ftyled by the ancient Gothic writers $A / a$, Afiance, and $A$ fiota. The kings of Afpurgia werc mafters of all that part of Scythia which lay to the weftward of Imaus, and was by the Latins called Scythia intra Inaum, or "Scythia within Imaus."

At what time Woden reigned in this country, is quite uncertain ; but all hiftorians agree, that he went out in queft of new fettlements with incredible numbers of people following him. He firft entered Roxolania, comprehending the countries of Pruffia, Livonia, and great part of Mufcovy. From thence he went by fea into the north parts of Germany ; and having reduced Saxony and Jutland, he at laft fettled in Sweden, where he reigned till his death, and became fo famons that his name reached all countries, and he was by the northern nations worthipped as a god. He is fuppofed to have brought with him the Runic characters out of Afia, and to have tanght the northern nations the art of poetry; whence he is ftyled the father of the Scaldi or Scaldri, their poets, who defcribed in verfe the exploits of the great men of their nation, as the bards did among the Gauls and Britons.

The Romans diftinguighed the Goths into two claffes; the Oftrogoths and Vifigoths. Thefe names they received before they left Scandinavia, the Vifigoths being foftened by the Latins from Wefterogoths, or thofe who inhabited the weftern part of Scandinavia, as the Oftrogoths were thofe who inhabited the eaftern part of that country. Their hiftory affords nothing of moment till the time of their quarrelling with the Romans, which happened under the reign of the emperor Caracalla, fon to Severus. After that time their hiftory becomes fo clofely interwoven with that of the Romans, that for the moft remarkable particulars of it we muft refer to the article Rome. After the deftruction of the Roman empire by the Heruli, the Oftrogoths, under their king Theodoric, became mafters of the greateft part of Italy, having overcome and put to death Odoacer king of the Heruli in 494. They retained their dominion in this country till the year 553; when they were finally conquered by Narfes, the emperor Juftinian's general: See (Hiftory of) Italy. The Vifigoths fettled in Spain in the time of the emperor Honorius, where they founded a kingdom which continued till the country was fubdued by the Saracens; fee the article Spain.

The Goths were famous for their hofpitality and kindnefs to ftrangers, even before they embraced the Chriftian religion. Nay, it is faid, that from their being eminently good, they were called Coths, by the neighbouring nations; that name, according to Grotius and moft other writers, being derived from the German word goten, which fignifies "good." They encouraged, fays Dio, the ftudy of philofophy above all other barbarous or foreign nations, and often chofe kings from among their philofophers. Polygamy was not only allowed but countenanced among them; every one being valued or refpected according to the number of his wives. By fo many wives they had an incredible number of children, of whom they kept but one. at home, fending out the reft in queft of new fettlements; and hence thofe fwarms of people which overran fo many countries. With them adultery was a capital crime, and irremiffibly punifhed with death. This feverity, and likewife polygamy, prevailed among them when they were known to the Romans only by the name of Getes (their moft ancient name); as appears from the poet Menander, who was himfelf one of that nation ; and from Horace, who greatly commends the chaftity of their women, Their laws fell little thort of thofe

Goths.

# $\mathrm{GOT} \quad[24] \quad \mathrm{G} \mathrm{O} \mathrm{T}$ 

Guthofred, thofe of the ancient Romans. Their government was Gotten- monarchical ; their religion was mucli the fame with burg. that of the ancient Germans or Celtes; and their drefs is defcribed by Apollinaris Sidonius in the following words: "c They are flod (fays he) with high fhoes made of hair, and reaching up to their ankles; their knees, thighs, and legs, are without any covering; their garments of various colours fcarce reaching to the knee; their lleeves only cover the top of their arms; they wear green caffocks with ared border ; their belts hang on their houlder ; their ears are covered with twifted locks; they ufe hooked lances and miflile weapons." ${ }^{2}$

GOTHOFRED, or Godfrey, (Dennis or Dionyfius), an eminent civil lawyer, born of an illuftrious honfe at Paris, in 1549 . Finding his comentry involved in the confufion of the leaguers, he accepted of a profeffor's chair at Geneva, until he was patronized and employed by Henry IV.; but being afterwards ftripped of his employments as a huguenot, he at length retired to Heidelburg, from whence no offers were able to detach hinn. He was, however, difappointed of his intention to end his days there; for the difturbances that broke out in the Palatinate obliged him, in 1621, to take refuge in Strafburg, where he died the following year. He wrote a great number of books; but his principal work is the Corpus furis Ci vilis cotenn notis.

Gothofred (Theodore), a fon of the former, was born at Geneva in 1580. As foon as he had finifhed his fudies, he went to Paris; where he conformed to the Romifhreligion, and applied with indefatigable induftry to the fundy of hiftory, that of France particularly, wherein he became very emintent, as appears by his works. In 1632, the king made him one of his hiftoriographers, with a ftipend of 3000 livres; and, in 1636, he was fent to Cologn, to affift at the treaty of peace negociating there, on the part of France, by the cardinal of Lyons. This treaty being removed to Manter, Gothofred was fent thicher, where he drew up Memoirs on the fubject; and continued in that city, in the king's fervice, to his death in 1649 . His princlpal work is his "Account of the Ceremonial of the kings of France."

GOTHOFRED (James), brother of the preceding, was born at Geneva in 1587 . Applying himfelf to the fudy of the law, he obtained the protetror's chair there, was made counfellor of the city, and was feveral times employed in France, Germany, Picdmont, and Switzerland, to negociate their affairs in tine name of the republic. He died in 1562; and his chief work is his Godex Theodofianus, cum perpetuis commentariis, \&c.

Gothofred (Deninis), a fon of Theodore abovementioned, was born at Paris in 16 15. He ftudied hiftory after his father's example ; became as eminent in that department of knowledge ; and obtained the reverion of his father's place of hiftoriographer royal, from Louis XIII. when he was but 25 years of age. He publifhed his father's Ceremonial of France; finifhed his Memòirs of Philip de Commines; and was preparing a Hiftory of Charles VIII. when he died in r681. It was publifhed by his eldeft fon, Dennis, in 1684.

GOTTENBURG, a rich and frong town of $W^{r} \mathrm{eft}$ Gothland, in Sweden, with a good harbour, at the
mouth of the river Gothelba ; which is the befteftated for foreign trade of any in Sweden, as it lies wichout the Sound. It occupies the fite of an ancient town, named Lodefe, which was built by Guitavus Vaia; and being endowed with contiderable privileges, foon became the great emporium for the trade of the weftern provinces. Charles IX. when duke of Gothland, having in 1604 laid the foundation of a new town in the illand of Hifingen at no great diftance from Lodefe, called it Gothiborg (fince corrupted into Gottenburg), in honour of his ducliy. Upon hisacceffion to the throne, he erected in his new town a trading company; drew thither many foreigners, particularly the Dutch, to whom he allowed an exemption from all duties of export and import during 20 years; a corps of Englifh and Scotch troops, under the command of William Stcwart; and granted to the Calvinifts eftablifhed therein the free exercife of their religion, the firft place in Sweden where thistaleration was permitted. The town, being in I6II reduced to afles by the Danes; was rebuilt in the reign of Guftavas Adolphus in its prefent fituation, and obtained a confirmation of its ancient rights, with the grant of feveral additional privileges,-It is built in a very ingular fituation. At a imall diftance from the fea is a marfhy plain, fcarcely more than half a mile in breadth, watered by the rivers Gotha and Moldal, and almoft entirely inclofed with high ridges of rocks, fo bare and rugged, that they farcely produce a fingle blade of grafs, and exhibit as barren an appearance as the fummits of the loftieft Alps. Gottenburg fands partly upor the ridges, and partly in the plain; and is divided from thefe different fiturations into the Upper and Lower Towin. The latter is entirely level, interfected by feveral canals in the manner of the Dutch towns; and its houfes are all conftrueted upon piles: the upper part hangs upon the declivities; and rows of buildings rife one above the other like the feats of an amphiteatre. The whole is regularly fertified; and its circumference is near three miles, exclufive of the fuburbs, called Haga, which lie towards the harbour. The ftreets are all uniformly ftraight : a few of the houfes are of brick; but the generality are confructed with wood painted red. The harbour is formed by two chains of rocks, and is about a quarter of a mile in breadth. lts entrance is defended by the fort of New Elfsborg, which ftands upon a fmall rocky ifland, and contains a garrifon of 250 men . There has heen lately eftablifhed at Gottenburgh a Royal Society of Sciences and Literature, upon the plan of that of Upfala.- Mr Coxe was informed by a merchant who had refided 22 years at Gottenburg, that, during that period, its popudation had increafed confiderably, and that it now contained about 30,000 inhabitants. This flourifhing ftate is attributed to the extenfion of its commerce, particularly its Eaft India Company, and the Fuecefs of the herring finhery. An Englifh conful and feveral merchants of that nation refide at Gottenburg: and a chapel, with a regular chaplain, is appropriated to their we. E. Long. Ir. 50. N. Lat. 57. 44.

GOTTINGEN, a confiderable town of Lower Saxony in Germany, and in the duchy of Brunfwick; formerly free and imperial, but now fubject to the elector of Hannover. Here hislate Majefty George II, founded an univerlity. It is feated on the river Leine, in E. Long. Io. 5. N. Lat. 51. 32.

Gotten-
burg,
Gottiagen.

## GOU

Cottorp GOTTORP, a town of the duchy of Hefwic, in 1 Denmark, and capital of the duchy of Holftein GotGoudt. rorp, where the duke has a very fine palace.
GOUANIA, in botany: A genus of the moncecia order, belonging to the polygamia clafs of plants. The calyx of the hermaphrodite is quinquefid; there is no corolla; there are five antherx covered with an elaftic calyptra or hood; the fiyle trifid; the fruir, inferior to the receptacle of the Hower, divifible into three feeds. The male is like the hermaphrodite, but wanting ftigma and germen.

GOUDA, or Turcow, a confiderable town of South Holland, in the United Provinces, remarkable for its ftately church. It is feated on the river Iffel, in E. Long. 4. 37. N. Lat. 52. 2.

GOUDT (Henry), ufually called Count Coudt, was born of a noble family at Utrechr, in 1750 ; and was a knight of the Palatinate. Being paffionately fond of the arts, particularly painting and engraving, and defirous of engaging in them, he applied himfelf diligently to drawing, and made a great proficiency therein. He went to Rome, to examine the works of the great mafters in that city. Here he contracted an intimacy with that excellent artint Adam Elheimer ; fudied his manner of penciling, defigning, and colouring ; and made his works models for his own imitation. He pre-engaged all the pictures that his friend and favourite could finifl, and even paid liberally for them before-hand; by which means he found himfelf in poffeffion of a moft defirable treafure. Thofe pic* tures which Goudr himfelf painted were nearly and delicately touched, in colour and pencil refembling ElSheimer, though they were in no degree equal to the paintíngs of that admirable mafter. On his return to his native country, a young woman who was in love with him, and defirous of fixing his affections upon her gave him in his drink a love philtre : which, however, terminated in a very melancholy mauner, by depriving him totally of hisfenfes; and in the dreadful ftate of idiotifm he dragged on a miferable life to the age of 69 , his death happening in 1639 . It is remarkable, that though lof to every other fubject, when painting was fpoken of he would difcourfe upon it in a very rational manner.

Goudt practifed engraving as well as painting, and made feven beautiful prints after the pictures of Eilheimer, which are well known to the curious, and are to be met with in moft choice collectious. He worked with the graver only, in a very neat ftyle; and produced a moft powerful effect, not by ftrengthening the ftrokes, according to the ufual method, but by croffing them with additional ftrokes, equally neat, and that five or fix times, one over another, in the deep fhadows. Confidering the precifion with which he executed his engravings, the freedom of handling the graver which may be difcovered in them, is very aftonifhing. The weeds and other parts of the fore-ground in that admirable print of the Ceres,are veryfinely exprefied. The heads of the figures are correctly drawn, and the other extremities are managed in a judicious manner. The feven prints done by him, from Elfheimer, mentioned above, are, I. Ceres drinking from a pitcher. An old woman appears holding a candle at the door of the cottage, and a boy naked fanding by her is laughing and pointing at the godefs; for which contempt he Vor. VIIl.

## 25 GOU

was metamorphofed by her into a frog. Theqowerfil Goveraand friking effect of this engraving cannot be properly defcribed. This print is diftinguilhed alfo by the nime of the forcery. 2. The flight into Egypt: A nightfcene, in which the moon and flars are intraduced with great fuccefs. 3. The angel with Tubit, who is drawing a fifh by his fide. The back-ground is a landfcape; the weeds in the foreground, and the branches of the trees in front, as wellas the foliage and weeds hang: ing from them, are beautifully expreffed. 4. The angel with Tobit, croffing a fream of water: The background, a landfcape. 5. Baucis and Philemon entertaining Jupiter and Mercury. 6. A landfcape, called the Aurora, reprefenting the dawn of day. The effect is very beautiful. 7. The beheading of St John in prifon, a very fmall upright oval print, which is by far the farceft.
GOVERNMENT, in general, is the polity of a flate, or an orderly power conftituted for the public good.

Civil government was inftituted for the prefervation and advancement of mens civil interefts, and for the better fecurity of theirlives, liberties, and properties. The ufe and neceflity of government is fuch, that there never was an age or country without fome fort of civil authority: but as men are feldom unanimous in the means of attaining their ends, fo their differences ia opinion in relation to government has produced a variety of forms of it. To enumerate them would be to recapitulate the hiftory of the whole earth. But, according to Montefquieu, and moft other writers, they may in general be rediced to onc of thefe three kinds. 1. The republican. 2. The monarchical. 3. The defpotic.- The firt is that, where the people in a body, or only a part of the people, have the fovereign power ; the fecond, where one alone goverts, but by fixed and eftablifhed laws; but in the defpotic govern** ment, one perfon alone, without law and without rule, directs every thing by his own will and caprice. See the article Law, $\mathrm{n}^{\circ} \mathbf{1}$. 3-10.-On the fubject of government at large, fee Montefquieu's L'E/prit des Loix, 1. 2. c. i.; Locke, ii. 129, \&cc. quarto edition, 1768 ; Sidney on Government; Sir Thomas Smith de Repub. Angl. and Acherly's Britannic Confitution.As to the Gothic government, its original and faults, \&c. fee Montefquien's $L$ ' $E / p$ rit des $L_{o i x}$, I. II. c. 8.With refpect to the feudal policy, how it limited government ; fee Feodal Syffem.
Government is alfo a poft or office, which gives a perfon the power or right to rule over a place, a city, or a province, either fupremely or by deputation.
Government is likewife ufed for the city, country, or place to which the power of governing is ex-
tended.
GOUGE, an infrument ufed by divers artificers, being a fort of round hollow chiffel ; ferving to cut holes, channels, grooves, \&c. in wood, tone, \&c.
GOULART (Simon), a famous ininitter of Geneva, was born at Senlis in 1543; and was one of the moft indefatigable writers of his time. He made confiderable additions to the Catalogue of witnefies of the truth, compofad by Higricus; and acquired a great reputation by his works; the principal of which are, 1. A tranflation of Seteca. 2. A collection of memorable hiftories. 3. Atranflation of St Cyprian De

Gourd lapfis. 4. Several devorional and moral treatifes. He died at Geneva in 1628.

GOURD, in botany. See Cucurbita.
GOURGUES (Dominique de), an illuftrious French patriot, a private gentleman of Gafcony. The Spaniards having inhumanly maffacred a colony of Frenchmen who had fettled in Florida, Gourgues took a fevere revenge on them, an account of which is given under the article Florida. On his return, he was received with acclamâtions by his countrymen, but was forbid to appear at court. Queen Elizabeth invited him to command an Englifh fleet againf the Spaniards in 1593; but he died at Tours in his way to England.

GOURNAY, a town of France, in the duchy of Normandy and territory of Bray, celebrated for its butter market. It is fituated on the river Ept, in E. Long. 0. 33. N. Lat. 49. 25.

Gournay (Mary de Jars de), a lady celebratel for her learning, was the daughter of William de Jars, lord of Neufvi and Gournay. After the death of her father, fhe was protesed by Montaigne and Cardinal Richelieu. To the daughter of the former the dedicated her Nofegay of Pindus; and compoled feveral other works, the moft confiderable of which is Les Avis, She died at Paris in 1685, aged 80. The critics are divided concerning the repatation of 1 bis lady: by fome fhe is ftyled the Syren of France; others fay her works fhould have been buried with her.

GOUT. See (Index fubjoined to) Medicine.
GOWER (John), one of the moft ancient Englifh poets, was cotemporary with Chaucer, and his intimate friend. Of what family, or in what county he was born, is uncertain. He fludied the law, and was fome time a member of the fociety of Lincoln's-inn, whe his acquaintance with Chancer began. Some have afferted that he was a judge; but this is by no means certain. In the firft year of Henry IV. he became blind; a misforrune which he laments in one of his Latin poems. He died in the year 1402; and was buried in St Mary Overie, which church he had rebuilt chiefly at his own expence, fo that he mul have lived in affluent circum ftanges. His tomb was magnificent, aud curioully ornamented. It fill remains, but hath been repaired in later times. From the collar of SS round the neck of his effigirs, which lies upon the tonb, it is conjectured that he had been knighted. As to his character as a man, it is impoffible, at this diftance of time, to fay any thing with certainty. With regard to his poetical talents, he was undonbt. edly admired at the time when he wrote, though a modern reader may find it difficult to difoover much harmony or genius in any of his compofitions. He wrote, I. Sepecubum meditantis, in French, in ten books. There are two copies of this in the Bodleian library. 2. Vox clamantis, in Latin verfe, in feven books. Preferved alfo in the Bodleian library, and in that of AllSouls. It is a chronicle of the infurrection of the commons in the reign of Richard II. 3. Confeffio amantis; printed at Weftminfter by Caxton in 1493. Lond. 1532, 1554. It is a fort of poetical fytem of morality, interfperfed with a variety of moral tales. 4. De rege Henrico 1V. Printed in Chaucer's works. There are likewife feveral hiftorical trafts, in manufript, written by our author, which are to be found
in different libraries; alfo fome fhort poems printed in. Chaucer's works.

GOWN, robe, a long upper garment, worn by lawyers, divines, and other graduates; who are hence called men of the gown, or gownmen.

The gown is an ample fort of garment, worn over the ordinary cloaths, hanging down to the feet.-It is fainioned differently for ecclefiaftics and for laymen.

At Rome they gave the name "virile gown," toga virilis, to a plain kind of gown which their youth affumed when arrived at puberty. This they paricularly denominated pratexta. See Toca, Prftexta, ${ }_{3}^{2} \mathrm{c}$.
"The remarkable drefs of our Britifh anceftors ( Mr Whitaker obferves)which continued very nearly Mifarybeforer, the fame to the commencemenr of the laft century i. 302. among the natives of Ireland, and has actually defcended to the prefent among the mountaineers of Scotland, and is therefore rendered very familiar to our ideas, carried in it an aftonifhing appearance to the Romans. And it feems to have been equaliy the drefs of the men and women among the nobles of Britain. But in a few years after the erection of the Roman-Britifh towns in the north, and in the progrefs of refinement among them, this ancient habit began to be difefteemed by the chiefs of the cities, and looked upon as the badge of ancient barbarifm. And the growing prejudices were foon fo greatly improved, that within 20 years only after the conftruction of the towns, the Britifh fagum was actually refigned, and the Roman toga or gown affumed by many of them.
"The gown, however, never becane univerfal in Britain: and it feems to have been adopted only by the barons of the cities and the officers of the crown; and has therefore been tranfmitted to us as the robe of reverence, the enfign of literature, and the mantle of magiftracy. The woollen and plaided garments of the chiefs having naturally fuperfeded the leathern veftures of their clients, the former were ftill wore by the generality of the Britons; and they were retained by the genulemen of the country, and by the commonalty both in couniry and city. That this was the cafe, appears evident from the correfpondent conduct of the Gauls and Britons ; who kept their Virgata Sagula to the laft, and communicated them to the Franks and Saxons. The plaided drapery of the Britons fill appeared general in the fircets of Manchefter ; and munt have formed a friking contraft to the gown of the chicf, the dark mantle of Italy : and it and the ornamented buttons on the fhoulder are preferved among us even to the prefent moment, in the parti-coloured cloathing and the taffelled fhoulder-knots of our footmen."

In fome univerfities phyficians weara fearlet gown. In the Sorbenne, the doctors are always in gowns and caps. Beadles, \&c. wear gowns of two or more colours.
Among the French officers, \&c. they diftinguilh thofe of the /hort gown or robe; which are fuch as have not been regularly examined. They have alfo barbers of the fort gown, who are fuch as are obliged to practife in an inferior way to thofe of the long robe.

Gownis alfo taken in the general for civil magiftrature, or the profeffion oppofite to that of arms. In this fenfe it was that Cicero faid cedant arma toga.

GOWRAN,

## G R A

GOWRAN, a borongh, fair, and pof town, in the county of Kilkenny and province of Leinfter, Ireland. N. Lat. 52.34. W. Long. 7. o. It is governed by a portrie ve, recorder, and town clerk. Here are the ruins of an old charch, alfo the handfone feat of the late Lord Clifden; and three miles beyond Gowran the ruins of Ballinabola caftle.
GOYEN (John Van), painter of landfcapes, cattle, and fea-pieces, was born at Leyden in 1596; and was for fome time inflructed by Iface Nicholai, who was reputed a grood painter; but afterwards he became the difiple of Efiias Vandervelde, the moft celebrated landfape painter of his time. Van Goyen very foon role into general elteem ; and his worls are more univerfilly feread throwh all Europe than the works of any oilher matien, for he polfefled an uncommon readinefs of hand and freedom of pencil. It was his confant pleafure and practice to fketch the views of villages and twwis fituated on the baaks of rivers or canals; of the fed-ports in the Low Connuries; and fometimes of inland viliages, where the feenes aroand them appeared to him pleating or pisturefque. Thofe he afterwards ufed as fubjects for his fature landfcapes; enriching them with cattle, boats, and figures in character, juft as the livelinefs of his imagination directed. He undertood perfpective extremely well, andalfo the principles of the chairo-fcuro ; which branches of knowledge enabled him to give his pictures a ftrong and agreeable effect. He died in 1656 , aged 60 .- His ufual fubjects were fea pieces, or landfeapes with vicws of rivers, enlivened with figures of peafants either ferrying over cattle, drawing theirnets in fill water, or going to or returning from market. Sometimes he reprefented huts of boots on the banks of rivers, with overhanging trees, and a beautiful reffection of their branches from the tranfparent furface of the waters. Thefe were the fubjects of his beft time, which he generally marked with his name and the year; and the high finifhed pi\&tures of Van Goyen will be for ever eftimable. But as he painted abundance of pictures, fome are fight, fome too yellow, and fome negligently finithed; thongh all of them have inerit, being marked with a free, expeditious, and eafy pencil, and a light iouch. His pictures frequently have a greyifh caft; which did not arife from any mifmanagement of the tints, or any want of the fkill in laying on the colours; but was occafioned by his ufing a colour called Hacrlent bue, much approved of at that time, though now entirely diffufed, becaufe the artifts found it apt.to fade into that. greyifh tint ; and it hath alfo tcadered the pictures of this mafter exceedingly difficult to be cleaned without injuring the fincer touches of the finifling. His beft works are valued fo highly in moft parts of Europe, and efpecially in the Low Countries, that they defervedly afford large prices, being ranked in Holland wihh the pictures of Teniers; and at this time are not eaflly procured, particularly if they are undamaged, though his flighter performances are fufficiently corumon.

GRAAF (Regnier de), a celebrated phyfician, born at Schoonlaven, in Holland, in 1641. He fundied phylic at Prufia. He was educated in Leyden, where he acquired great honour by publifning a treatife De Stcce Pancreatico. He alfo pablified three pieces upon the organs of generation, both male and female; upon which fabject he had a controverfy with

Swammerdam. He died young, in 1673; and his works, with his life prefixed, were publifhed at Leyden in 1677 , in 8 vo.
GRABE (John Erneft), a very learned writer in the beginning of the r8th century, a native of Koning fberg in Pruffia. He was educated in the Lutheran religion; but the icading of the fathers led him into doubts. He prefented to the electoral confiftory at Sambia in Pruffia a memorial containing his doubts. The elector gave orders to three eminent divines to anfiver them. Theiranfwers fhook himalithe in his refolution of embracing the Roman Catholic Religion; and one of them, Spener, advifed him to goto England. He went; and kingWilliam gave him a penfion, which was continued by queen Anne. He was ordained a prief of the church of England, and honoured with the degree of doctor of divinity by the univerfity of Oxford; upon which occafion Dr GeorgeSmalridge pronounced two Latin orations which were afterwards printed. He wrote, I. Spicelegium S.S. Patrum, ut et Hercticorum faculi poft Cibrif hum natum, 8 vo . 2. An edition of the Septuagint, from the Alexandrian manufcript in St James's tibrary. 3. Notes on Juftin, \&c. ; and other works, which are efteemed by the learned.

GRACCHUS (Tiberius), elected tribune of the Roman people demanded in the fenate, in their wame, the execution of the Agrarian law; by which all perfons polfeffing above 200 acres of land were to be deprived of the furplus, for the benefir of the poor citizens, amongeft whom an equal diftribution of them was to be made. Having carried his plan into execution by violent meafures, he fella victim to his zeal, being alfalfinated by his own party, 133 B.C. Caius his brether purfuing the fame fleps, was killed by the coufful Opimins, 12 I B. C. Sec (hiftory of) Rome.

GRACE, among divines, is taken, I. For the free love and favour of God, which is the fpring and fource of all the benefits we receive from him. 2 . For the work of the Spirit renewing the foul after the image of God; and continually guiding and ftrengthen. ing the believer to obey his will, to refift and mortify fin, and overcome it.

Grace is alfo ufed, in a peculiar fenfe, for a fhort praycr faid before and after meat.

The proofs of the moral obligation of this ceremony, drawn from different paffages of the New Teftament, are fo well kuown, that it is needlefs to infift on them here. Some others, drawn from the practice of different nations, and of very remote antiquity, may not be difagreeable to our readers.
I. Athenæus tells us, in his Deipnofoph. lib. ii. that in the fanous regulation made by Amphityon king of Athens with refpect to the ufe of wine, borh in facrifices and at home, be required that the name of fupiter the Suffainer flould be decently and reverently prononnced. The fame writer, in lib. iv. p. 149; quotes Hermeias, an author extant in his time, who informs us of a people in Egypt, inhabitants of tl $e$ city of Naucratis, whofe cuftom it was on certain occafions, after they had placed themfelves in the ufual pofture of eating at the table, to rife ag.in and kneel; when the prieft or precentor to the folemnity begain to chant a grace, according to a flated form amongt them; and when that was over, they joined in the meal in a folemn facrificial manner. Heliodorus has a pafiage in his Ethiopics to the fame purpofe, that is D 2

## GRA

Was the coftom of the Egyptian philofophers to pour out libations and put ap ejaculations before they fat down to meals. Porplyyry, in his treatife De abftin. lib. iv. p. 408. gives a great character of the Samnean gymnofophifts in Egypt for the ftrictnefs of their life : as one article in their favour, he obferves, that at the founding of a bell before their meals, which confifted only of rice, bread, fruits, and herbs, they went to prayers; which being ended, and not before, the bell fonnded again, and they fat down to eating. In general this was a religious ufage or rite amongit the ancient Greeks; and derived from yet older ages, if Clement of Alexandria rightly informs us. He mentions, that thefe people, when they met together to refrefh themfelves with the juice of the grape, fung a piece of mufic, in imitation of the Hebrew Pfalms, which they called a fcholion. Livy, lib. xxxix. fpeaks of it as a fettied cuftom among the old Romans, that they offered facrifice and prayer to the gods at their meals and compotations. But one of the falleft teftimonies to our purpofe is given by Quintilian, Declam. 301. Adifimenfam, fayshe, adquam cumvenire copimus, Deos invocamus; "We approached the table (at fupper together), and then invoked the gods."

The Jefuit Trigautius, in his very elegant and inAructive narrative of the Chriftian expedition of their miffionaries into China, book i. p. 69. gives this acconnt of the people there in the particular now under confideration. ". Before they place themfelves for partaking of an entertainment, the perfon who makes it fets a veffel, either of gold, or filver, or marble, or fome fuch valuable material, in a charger full of wine, which he holds with borh his hands, and then makes a. low bow to the perfon of chief quality or character at the table. Then, from the hall or dining-room, he goes into the ponch or entry, where he again makes. a very low bow, and turning his face to the fouth, pours out this wine upon the ground as 2 thankful oblation to the Lord of heaven. After this, repeating his reverential obeifance, he returns into the hall," \&c.

The Turks pray for a blefing on their meat; andin many more inftances might be produced of infidels who have conftantly obferved the like cuftom in fome way or other.
2. The fact, therefore, with refpect to the heathen world, being thus evident, we proceed to the fentiments and behaviour of the Jews in this particular. Their celebrated hiftorian Jofephas, giving a detail of the rites and cuftoms of the Effenes, who were confeffedly the ftricteft and moft pious profeffors of the Jewifh religion, has thisremarkable paffage to the prefent purpofe: "The prieft," fays he, "sbegsa bleffing before they prefume to take any nourimment; and it is looked upon as a great fin to take or tafte before." Then follows the thankfiving before meat: and "t when the moal," proceeds he, " is over, the prieft prays again; and the company with him blefs and praife God as their preferver, and the donor of their life and nourimment."

Pbilo, in his book De vita Contemplativa, gives an account of a body of men and women Atricter than even the-Efenes themfelves. He diftinguifhes them by do particular name; though his relation is very accufate and circumftantial; namely, that on certain fpe-

28 」 G R A
cial occafions, before "they took their meals, they Grace. placed themfelves in a proper decent order; when, lifting up their hands and cyes to heaven, they prayed to God that he would be pleafed to be propitious to them in the ufe of thefe his good creatures."

From the Hebrew ritual it appears, that the Jews had their hymns and pfalms of thankfiving, not only after eating their paflover, but on a variety ofother occafions, at and after meals, and even between ther feveral courfes and difhes; as when the beft of their wine was brought upon the table, or their aromatic confections, or the fruit of the garden, \&c. On the day of the paffover was fung Pfalm cxiv. "When Ifrael came out of Egypt," \&c.

Arifteus has a paflage full on the prefent fubject. "Mofes," fays he, "commands, that when the Jews are going to eat or drink, the company fhould inmediately join in facrifice or prayer.' Where Rabbi tleazar (upon that author) met with this fentence, has been controverted. But fuppofing it not to be found infcriptis, it is fufficient for us to know that the Jews did conftantly practife this cuftom, upon the foundation of an ancient and general tradition and ufage. That the prophet Daniel gave thanks before meat, is evident from the Apocryphal book concerning Bel and the Dragon, where, ver.38, 39, we find, that "Daniel faid, Thon haft remembered me, O God! neither haft thou forfiken them who feek thee and love thee. So Daniel arofe, and did eat." Of this text Prudentius. takes notice in Cathemirin, hymn iv.

> His fumptis Danielis excitavit In caslum faciem, ciboque fortis
> Amen reddidit, allelujab dixit.
"The much-beloved took the repaft, And up to heav'n his eyes he calt; By which refrefh'd, he fung aloud, Amen and Allelujah to his:God.
Where, by the way, it may be obferved, that the poct is a little miftaken in making the prophet give thanks. after meat; whereas, according to the text, he did ir before.

Grace, orgracefulnefs, in the lioman character; an agreeable attribute, infeparable from motion as oppofed to reft, and as comprehending feeech, looks, gefture, and loco-motion.

As fome motions are homely, the oppofite to grace. ful ; it is to be inquired, with what motions is this. attribute connected? No man appears graceful in a maks; and therefore, laying atide the expreffions of the countenance; the other motions may be genteel, may be elegant, but of themfelves never are graceful. A motion adjufted in the moft perfect manner to anfwer irs end; is elegant; but ftill fomewhat more is required to complete our idea of grace or gracefulnefs.

What this unknown more may be, is the nice point. One thing is clear from what is faid, that this more muft arife from the expreffions of the countenance : and from what exproffions fo naturally as from thofe which indicate mental qualities, fach as fweetnels, benevolence, elevation, dignity? This promifes to be a fair anaky fis; becaufe of all objects mental qualities affec: us the moft ; and the impreffion made by graceful ap. pearance upon every fectator of tafte, is too deep. for any caufe purely corporeal.

The next ftep is, to examine what are the mental qualities,

Grace, qualitics, that, in conjunction with elegance of motion, produce a graceful appearance. Sweetnefs, cheerfulnefs, affability, are not feparately fufficient, nor even in conjunction. Dignity alone, with elegant motion, produce a graceful appearance, but fill more graceful with the aid of other qualities, thofe efpecially that are the moft exalted. See Dienity.

But this is not all. The moft exalted virtues may be the lot of a perfon whofe countenance has little expreffion: fuch a perfon cannot be graceful. Therefore to produce this appearance, we muft add another circumfance, viz. an expreffive countenance, difplaying to every fpectator of tafte, with life and energy, every thing that paffes in the mind.

Collecting thefe circumftances together, grace may be defined "that agreeable appearance which arifes from elegance of motion and from a countenance expreffive of dignity." Expreffions of other mental qualities are not effential to that appearance, but they heighten it greatly.

Of all external objects, a graceful perfon is the moft agreeable.

Dancing affords great opportunity for difplaying grace, and haranguing ftill more. See Dancing, Deciamation, and Oratory.

But in vain will a perfonattempt to be graceful who is deficient in amiable qualities. A man, it is true, may form an idea of qualities he is deftitute of, and, by means of that idea, may endeavour to exprefs thefe qualities by looks and geftures: but fuch ftudied expreffion will be too faint and obfcure to be gracetul.
$A C Z$ of $G_{R A C E}$, the appellation given to the act of parliament 1696, c. 32 . which allows prifoners for civil debts to be fet at liberty, upon making oath that they have not wherewithal to fupport themfelves in prifon, unlefs they are alimented by the creditors on whofe diligences they were imprifoned, within ten days after intimation made for that purpofe.

Days of GRACE, three days immediately following the term of payment of a bill, within which the creditor muft proteft if payment is not obtained, in order to intitle him to recourfe againft the drawer.

Grace is alfo a title of dignity given to dukes, archbifhops, and in Germany to barons and other inferior princes.

GKACES, Gratife, Charites, in the heathen theo. logy, were fabulous deities, three in number, who attended on Venus. Their names are, Aglia, Thalia, and. Euphrofyne ; i.e. fhining, flouriming, and gay; or, according to fome authors, Pafithea, Euphrofyne, and Ægiale. They were fuppofed by fome to be the daughters of Jupiter and Eurynome the daughter of Oceanus; and. by others, to be the daughters of Bacclus and Venus.

Some will have the Graces to have been four ; and make them the fame with the Horee "hours," or rather with the four feafons of the year. A marble in the king of Pruffia's cabinet reprefents the three Graces. in the ufual manner, with a fourth feated and covered with a large veil, with the words underneath, Ad So. rores IIII. But this groupe we may underftand to be the three Graces, and Venus, who was their fifter, as being daughter of Jupiter and Dione.

The Graces are always fuppofed to have hold of each other's hands, and never parted. They were
painted naked, to fhow that the Graces borrow nothing from art, and that they have no other beautics than what are natural.

Yet in the firlt ages they were not reprefented naked, as appears from Paufanias, lib. vi. and lib. ix. who defcribes their temples and ftatues. They were of wood, all but their head, feet, and hands, which were white marble. Their robe or gown was gilt ; one of them held in her hand a rofe, another a dye, and the the third a fprig of myrcle.

GRACILIS, a mufcle of the leg, thus called from its ीender hape. See Anatomy, Table of the $M_{u}$ fcles.

GRACULA, the Grakle, in ornithology, a genus belonging to the order picæ. The bill is convex, cultrated, and bare at the point; the tongue is not cloven, but is flefhy and harpilh; it has three toes before and one behind. 8. The religiofa, leffer grakle, or Indian flare, is about the fize of a blackbird, the bill an incl and a half long, and of an orange colour. The general colour of the plumage is black, gloffed with violet, purple, and green, in different reflections of light; on the quills is a bar of white : the feathers and legs are orange yellow, and the claws of a pale brown. The fpecies, which is found in feveral parts of the Eaft Indies, in the Ihe of Hanian, and almoft every ille beyond the Ganges, is remarkable for whiftling, linging, and talking well, much better than any of the parrot genus, and in particular very diftinct. Its food is of the vegetable kind. Thofe kept in this climate are obferved to be very fond of cherries and grapes : if cherries are offered to one, and it does not inmediately get them, it cries and whines like a young child, till it has obtained its defire. It is a very tame and farailiar bird. 2. The barita, or boar tailed: grakle, is about the lize of a cuckow. The bill is fharp, black, and an inch and a half in length; the general colour of the plumage is black, with a glofs. of purple, efpecially on the upper parts; the legs and claws are black, the latter hooked. There is a lingularity inthe folding up of the tail-feathers, which, inftead of forming. a plain furface at top, fink into a hollow like a.deep gutter. It always carries its tail expanded when on the ground, folding it up in the above fingular manner only when perched or flying. It inhabits Jamaica; and it feeds on maize, beetles, and other infects, as well as on the fruit of the banana. It is likewife common in: North America, keeping company with the flocks of the maize-thieves, and red winged oriole. Thefe breed in the fwamps, and migrate in September, after which none are feen. 3.The quifcula, purple-jackdaw, or Barbadoes blackbird, is about the fize of a blackbird; the whole bird is black, but moft beautifully and richly gloffed with purple, efpecially on the head and neck. Thie female is wholly of a brown colour, deepeft on the wings and tail. This fpecies inhabits Canolina, Mexico, and other parts of North America, alfo Jamaica, Thefe birds for the molt part feed on maize, whence the name of maize thieves has been given them; but this is not their only food, for they are known alfo to feed on many other things. In fpring, foon after the maize feed is put into the ground, they fcratch it up again; and as foon as the leaf comes ont, they take it up with their bills, root and all; but when it is ripe they do ftill more damage,

Eracilo Gracula;

Plate CCXXII.

## G R A

Graculus for at that time they come in troops of thoufands, and ||. Grevius. are co bold, that if difturbed in one part of a field they only go to another. In New Jerfey and Pennfylvania three peace per dozen was unce given for the dead birds, and by means of this premium they were nearly extirpated in 1750 ; when the perfecution of them was abated on account of the great increafe of worms which had taken place in the meadows, and which in the preceding year had left fo little hay in New England as to occalion an importation from other parts. The grakles were therefore again tolerated, as it was obfervedthat they fod on thefe worms tillthe maize was ripe. Thefe birds build in trees. They are faid to pafs the winter in fwamps, which are quite overgrown with wood, from thence only appearing in mild weather ; and after the maize is got in, are content to feed on other things, as the aquatic tare-grafs, and if preffed - by hunger, buck-wheat and oats, \&c. they are faid alfo to deftroy that pernicious infect the brachus pifi. Their note is pretty and agreeable; but their flefli is not good to eat. 4. The criftatella, or Chinefe far--ling, is a little bigger than a blackbird. The bill is yellow or orange; and the general colour of the plumage blackilh, with a tinge of blue: the legs are of a dull yeldow. Thefe birds, which are faid totalk and whiftle very :well, are common in China, where they are very much efteemed, and the figures of them are feen frequently rin Chinefe paintings. Their food is rice, infects, worms, and fuch like. They are feldom brought to England alive, requiring the greateft care in the paf--fage.-There are cight other fpecies of Gracula.

GRACULUS, in ornithology. See Corvus.
GRADATION, in general, the afcending ftep by ftep, or in a regular and uniform manner.

Gradation, in logic, a form of reafoning, otherwife crlled Sorites.

Gradation, in painting, a gradual and infenfible change of colour, by the diminution of the teints and finades.

Gradation, in rhetoric, the fame with Cefmax.
GRADISKA, a ftrong town of Hungary in Sclavunia, on the frontiers of Croatia, taken by the Turks in 1691: It is feated on the river Save, in E. Long. 17. 55. N. Lat. $45 \cdot 38$.

Gradiska, a ftrong town of Italy, in a fmall ifland of the fame name on the frontiers of Friuli, in $E$. Long. 13. 37. N. Lat. 46. 6. It is fubject to the houfe of Auftria.

GRADO, a ftrong town of Italy, in a fmall ifland of the fame name, on the coaft of Friuli, and in the territory of Venice. E. Long. 13. 35. N. Lat. 45. 52 .

GRADUATE, a perfon who has taken a degree in the univerfity. See Degree.
 learned writers in the 17 th century. In the 24 th year of his age, the elector of Brandenburg made him profeffor at Doifbourg. In 1658, he was invited to Deventer to fucceed his former mafter Gronovius. In 166r, he was appointed profeffor of eloquence at Utrecht; and 12 years after he had the profefformip of politics and hiftory conferred on him. 'He fixed His thoughts here, and refufed feveral advantageous wffers. He had, however, the fatisfaction to be fought
after by divers princes, and to fee feveral of them come Grafting. from Germany to ftudy under him. He died in 1703 , aged 71. His Thefaurus antiquitatum et hifloriarum Italice, \&c. and ocher works, are well known.

GRAFTING, or Engrafting, in gardening, is the taking a hoot from one tree, and inferting it into another, in fuch a manner that both may unite clofely and become one tree. By the ancient writers on hufbandry and gardening, this operation is called incifion, to diltinguilh it from inocalation or budding, which they call inferere oculos.

Grafting hath been practifed from the moft remote antiquity; bat its origin and invention is differently related by naturalifts. Theophraftus telisus, that a bird havitg f wallowed a fruit whole, caft it forth into a cleft or cavity of a rotten tree; where mixing with fome of the putrified parts of the wool, aid being walhed with the rains, it budded, and produced within this tree another tree of a different kind. This led the huibandman to certain reflections, from which foon afterwards arofe the art of engratting.
. Pliny fets the fame thing in a different light: a conntryman heving a mind to make a pallifade in his grounds, that it might endure the longer, he bethought himfelf to fill up and ftrongthen the bottom of the pallifadr, by runing or wattling it with the trunks of ivy. The effect of this was, that the ftakes of the pallifades taking root, became engrafted into the tranks, and produced large trees; which fuggefted to the hufbandman the art of engrafting.

The ufe of grafting is to propagate any curious forts of fruits fo as to be certain of the kinds; which cannot be done by any other method: for as all the good fruits have been accidentally obtained from feeds, fo the feeds of thefe, when fown, will many of them degenerate, and produce fuch fruit as is not worth the cultivating : but when floots are taken from fuch trees as produce good fruit, thefe will neveralter from their kind, whatever be their fock or tree on which they are grafted.

The reafon or philofophy of engrafting is romewhat obfcure ; and had not accident given the Grft hint, all our knowledge of nature would never have led us to it. The effect is ordinarily attributed to the diverfity. of the pores or ducts of the graft from thofe of the ftock, which change the figure of the particles of the juices in paffing through them to the reft of the tree.

Mr Bradley, on occafion of foune obfervations of Agricola, fuggefts fomething new on this head. The fock grafted on, he thinks, is only to be confidered as a fund of vegerable matter, which is to be filtered through the cyon, and digefted, and brought to maturity, as the time of growtli in the veffele of the cyon directs. A cyon, therefore, of one kind, grafted on a tree of another, may be rather faid to take root in the tree it is grafted in, than to unite itfelf with it : for it is vifible that the cyon preferves its natural purity and intent, though it be fed and nourifled with a mere crab; which is, withont doubt, occafioned by the difference of the veffels in the cyon from thofe of the ftock : fo that grafting may be juftly compared to planting.

In profecution of this view of that ingenious author, we add, that the natural juices of the earth, by their fecretion

## G R A

Grafting. fecration and comminution in paffing through the roots, \&c. before they arrive at the cyon, muft donitlefs arrive there half elaborated and concocted; and fo difpofed for a more eafy, plentiful, and perfect affimilation and nutrition ; whence the cyon maft neceffarily grow and thrive better and fafter than if it were put immediately in the gromad, there to live on coarfe diet and harder of digettion : and the fruit produced by this further preparation in the cyon, maft be finer and further exalted than if fed immediately from the more imperfectly prepared and altered juices of the ftock.

Many have talked of changing of fpecies, or producing mixed fruits, by engrafting one tree on another of the fame class; but as the graft carries the juices from the flock to the pulp of the fruit, there is little hope of fucceeding in fuch an expectation by ever fo many repeated gratis: but if, after changing the graft and liock feveral fucceffive times, you fet the feed of the fruit produced on the graft in a good mould, it is poffible that a change may happen, and a new mixed plant may be produced. Thus the al mond and peach may, by many changes in the graftings, and by interrations of the fones of the peaches, and of the thells of the almonds, and by teribrations of the ftem of the root here and these, alter their nature fo much, that the coat or pulp of the almond may approach to the nature of the peach, and the peach may have irs kernel enlarged into a kind of almond; and on the fane principle, the curious gardener may prodnce many fuch mixed kinds of things.

Mr Du Hamel has obferved, that, in grafting of trees, there is always fotind at the infertion of the graft, a change in the directions of fibres, and a fort of twiftingor turning about of the veffels, which greatly imitates that in the formation of certain glands in animal bodies: and from thence he infers, that a new fort of vifus being formed by this means, the fruit may very naturally be fo far influenced by it, as to be meliorated on the new branch; but that no fuch fudden and effential charges can be effected by thoie means, as too many of the writers on agriculture pre: tend. He obferves, however, that this anatomical obfervation would not have been fufficient to convince him of the fallity of too many of thefe relations, had not experiment juined to confirm him in this opinion. He tried many grafts on different trees; and, for fear of error, repeated every experiment of confequence feveral times: but all ferved only to convince him of the truth of what he at firft fulpected. He grafted in the common way the peach upon the almond, the plum upon the appricot, the pear upon the apple, the quince, and the white thorn; one fpecies of plum on other very different fipecies, and upon the peach, the apricot and the almond. All thefe fucceeded alike: the fpecies of the fruit was never altered; and in thofe which would not come to fruit, the leaves, the wood, and the flowers, were all the fame with thofe of the tree from whence the graft was taken.

Authors on agriculture have alfo mentioned a very different fort of grafting ; namely, the fetting grafts of one tree upon flocks of a different genus; fach as the grafting the pear upon the oak, the elm, the maple, or the plum, \&c. Mr Du Hamel tried a great number of thofe experiments carcfully, and found
every one of them unfuccefsfal; and the nataral con- Grating. clufion from this was, that there muft be fome natural alliance berween the focks and their grafts, otherwife the latter will either never grow at all or very foon perilh.

Notwithfanding the facility with which grafts generally take on good focks, there are many accidents and uncertainties attending them in thir different periods. Some perifh immediately; fome, after apperring bealthy for many months, and fome cven for years. Of thefe laft fone die without the fock fuffering any thing; others perith together with the ftocks. It is very certain, that the greater part of grafted trees do not live fo long as they would have done in their natural ftate; yet this is no unexceptionable rule : for there are fome which evidently live the longer for this practice; nay, there are inftances of grafts which, being placed on ftocks naturally of fhort duration, live longer than when placed on thofe which are more robuft and lafting. Thefe irregularities have been but little coutidered hitherto, though they might be made produtive of confiderable advantages.- One great requilite for the fucceeding of any graft is, that it be in its own unture capable of fo clofe and intimate an union with the fubtance of the flock, that it becomes as it were a natural branch of it. If all trees refembled one another in their ftructure and juices, the fize and elafticity of their veffels, \&c. probably the grafts of all trees $w$ uld fucceed upon one another ; but this is by no means the cafe.

Trees are well known to be compofed of numerous arrangements of hollow fibres, and thefe are different and unequal in cvery fpecies of tree. In order to the flacceeding of a graft, it is plain that there mult be a conformicy in its veffels and juices with thofe of the ftock; and the more nearly they agree in this, probably the better they fucceed; and the farther they differ, the worfe.-If there be, however, fome difference in the folid parts of trees, there are evidently many more in the juices. The fap in fome trees is white as milk, in others it is reddifh, and in fone as clear and limpid as water. In fome, it is thin and very Auid; in others, thick and vifcous. In the tafte and fimell of the juices there are alfo not lefs differences: fome are fweet, fome infipid, fome bitter, fome acrid, and fome fetid : the quality of the fap thus makes a very great difference in the nature of trees; but its quantity, and derivation to the parts, is \{carce lefs obferveable. Of this we have faniliar inftances in the willow and the box; one of which will produce longer fhoots in one year than the other in twenty.

Another difference yet more ftriking, and indeed more effential in regard to the growth of grafts than all thefe, is the different feafon of the year at which trees fhoot out their leaves, or ripen their flowers. The almond-tree is in flower before orher trees in general have opened their earlieft buds; and when other trees are in flower, this is full of leaves, and has its fruit fet before the mulberry begins to pulh out its earlieft buttons. When we confider all thefe differences in trees, we cannot but wonder how it is poffible for a branch of one to live upon another ; and it becomes a much more perplexing queftion how any graft can fucceed, than how fuch numbers come to mifcarry. Agraft of one pear upon another thall be

## GRA [ 3 : 1 GRA

Erafting. feen to fucceed prefently as if upon its own tree; and in a fortnight will gain fix inches in length, and fo of fome others.-This mult be owing to the great fimilarity between the ftock and the graft in all refpects; and a great contrariety or difference in ftructure of parts will make as remarkable a difference on the other hand. An inftance of this may be obferved in the plum and the elft ; which no art can $\epsilon$ ver make to fucceed upon one another, whether the plum be grafted on the elm, or the elm upon the plum fock. Thefe are examples of the extremes of ealy growth, and of abfolite decay; but there are many conjunc. tious of trees which feem of a middle nature between the two, and neither immediately perifh, nor totally Tucceed. Of thelfe, ruch as were grafted in autumn. ufually remain green the whole winter without puihing; and thofe which are grafted in fpring remain green a month or longer, but ftill without hooting. Some particular ones have alfo been known to make a few hoots the firf, or even the fecond fap feafon after the operation ; but all perifl at the end of thefe times. Of this kind are the grafts of the pear-tree upon the elm, the maple, and the hornbeam, and the tnulberry upon the elm and fig, with many others.

When we come to inquire into the caufe of this, we find that thefe grafts, thongh unnatural, have yet had a communication with the ftock by meatis of a few fmall veffels, which has been fufficient to keep them green, or even to make them fhoot a little, during the great afcent of the fap: But the far greater number of the fibres have had all the while no com: munication, and are found putrified, dried up, or covered with a putrid juice. This has evidently happened by means of the difproportion in lize between the veffels of the ftock and of the graft, and the great difference between their natural juices, which are obftacles abundantly fufficient to prevent either an unicin of the fibres or the introduction of new fap.

The grafts of the almond on the plum, and of the plum on the almond, always grow very vigoroully for the firft year, and give all the appearances imaginable of fucceeding entirely; yet they always periftim the fecond or third year. The almond graft upon the plum-ftock always puifhes our very vigorouly at firft; but the part of the ftock immediately under the graft grows fmaller and perifhes, the graft abrorbing too much of the juices, and the graft neceffarily perifhes with it. The decay of the whole generally happens early in the fpring : and that plainly from the different feafon of the natural fhoting of the two trees, the almond pufhíng very vigotouny, and confequently draíning the ftock of its juices, at a time when, according ro its nature, the juices are but in fmall quantity in it, and the fap does not begin to afcend. The grafts of the plum on the almond are, from the fame caufe, furinifhed with an abundance of fap which they have at that time no occafion for; and confequently they as certainly perifl of repletion, as the other of inanition.

The peach grafted on the plum fucceeds excellently, and lives longer than it would have done in a natural flate ; the reafon feems to be, that the peach is a tender tree, fhoots with great vivacity, and produces more branches than the root is able to maintain. Thus the peach trees are ufaally full of dead wood; and often
their large branches perifh, and fometimes their whole Grafting. trunk. On this occafion the plum, being a flow hooting tree, communicates its virtue to the graft; and the peach confequently fends out thoots which are more robult and frong, and are no more in number than the root is able to fupply with nourifhment, and confequently the tree is the more lafting.
The grafts, or cyons, with which the grafting is eftected, are young fhoots of laft fummer's growth, for they mult not be more than one year, and fuch as grow on the outfide branches, and robult but moderate hooters; fuch alfo as are firm and well ripened, fhould always be chofen from healthful trees: obferving, that the middle part of each thoot is always the beft graft, cut at the time of grafting to five or fix inches in length, or fo as to have four or five good eyes or buds ; but floould be preferved at full length ill grafting time, and then prepared as hereafter directed.

They fhould be collected or cut from the trees in February, in mild weather, before their buds begin to fwell, or advance much for fhooting: in collecting them, choofe fuch as have not made lateral or fide fioots; cut them off at full length; and if they are not to be ufed as foon as they are collected, lay their lower ends in fone dry earth in a warni border till grafting time, and, if fevere weather fhould happen, cover them witli dry litter.

The proper tools and other materials ufed in grafting, are, i. A frong knife for cutting off the heads of the focks, previous to the infertion of the graft ; alfo a fmall hand-faw for occafional ufe in cutting off the heads of large focks. 2. A common grafting-knife, or ftrong fharp pen-knife, for cutting and flaping the grafts ready for infertion; alfo to flope and form the ftocks for the reception of the grafts. 3. A hat graft-ing-chifel and fmall mallet for clefting large ftocks, in cleft-grafting, for the reception of the graft. 4. A quantity of new bafs-ftrings for bandages, for tying the grafted parts clofe, to fecure the grafts, and promote their fpeedy union with the ftock. And, 5. A quantity of grafting clay, for claying clofely round the grafts after their infertion and binding, to defend the parts frotn being dried by the fun and winds, of too much liquified by wet, or pinched by cold ; for thefe parts ought to be clofely furrounded with a coat of clay in fuch a manner as effectually to guard them from all weathers, which would prove injurious to young grafts, and deftroy their cementing property, fo as to prevent the junction : therefore, a kind of ftiff loamy mortar mait be prepared of ftrong fat loam, or, in default thereof, any fort of tough binding clay, either of which fhould be laid in an heap, adding thereto about a fourth of freft horfe dung free from litter, and a portion of cut hay, mixing the whole well together, and adding a little water : then let the whole be well beaten with a ftick upon a floor, or other hard fubftance; and as it becomes too dry, apply more water, at every beating turning it over, always continuing to beat it well at top till it becomes flat ; which mult be repeated more or lefs according to the nature of the clay, but fhould be feveral times done the firft day : next morning repeat the beating, fill moift ening it with water; and by thus repeating the beating fix or eight times every day for two or three days, or every other day at leaft, for a week, it will be in pro.

Grafting. per order for ufe; obferving, it fhould be prepared a weck at leaft before it is ufed, but if a month, the better.

The feafon for performing the operation of grafting is February and March : though, when the work is performed in February, it for the general part proves the moft fuccefsful, more efpecially for cherries, plumbs, and pears; and March grafting is well adapted for apples.

There are different methods of grafting in practice, termedWhip-grafting-Cleft-grafting--Crown-graft-ing-Cheek-grafting--Side-grafting-Root-graft-ing-and Grafting by approach or Inarching: but Whip-grafting and Cleft-grafting are moft commonly ufed; and Whip-grafting molt of all, as being the moft expeditious and fuccefsful of any.

Whip-grafting.-. This being the moft fuccefsful method of grafting is the moft commonly practifed in all the nurferies; it is always performed upon fmall ftocks, from about the fize of a goofe-quill to half an inch or a little more or lefs in diameter, but the nearer the ftock and graft approach in fize the better; and is called whip-grafting, becaufe the grafts and focks being nearly of a fize, are floped on one fide, fo as to fit each other, and tied together in the manner of whips, or joints of angling rods, \&c. and the method is as follows. Having the cyons or grafts, knife, bandages, and

Mawe's
Dict. of
Gardening clay ready, then begin the work by cutting off the head of the flock at fome clear fmooth part thereof; this done, cut one fide floping upward, about an inch and half or near two inches in length, and make a notch or fmall flit near the upper part of the flope downward about half an inch long, to receive the tongue of the cyon; then prepare the cyon, curting it to five or fix inchesin length, forming the lower end alfoin a floping manner, foas exactly to fit the floped part of the ftock, as if cut from the fame place, that the rinds of both may join evenly in every part; and make a flit fo as to form a fort of tongue to fit the lit made in the flope of the ftock; then place the graft, inferting the tongue of it into the lit of the fock, applying the parts as evenly and clofe as poffible; and immediately tie the parts clofe together with a Atring of bafs, bringing it in a neat manner feveral times round the fock and graft; then clay the whole over near an inch thick on every fide, from about half an inch or more below the bottom of the graft, to an inch over the top of the ftock, finifling the whole coat of clay in a kind of oval globular form, tather longwife, up and down, clofing it effectually about the cyon, and every part, fo as no fun, wind, nor wet may penetrate, to prevent which is the whole intention of claying; obferving to examine it now and then, to fee if it any where cracks or falls off, and if it does it muft be inftantly repaired with frefh clay. This fort of grafting may alfo be performed, if neceffary, upon the young thoots' of any bearing tree, if intended to alter the forts of fruits, or have more than one fort on the fame tree. By the middle or latter end of May, the grafts will be well united with the fock, as will be evident by the fhooting of the graft ; then the clay fhould be wholly taken away; but fuffer the bafs bandage to remain fome time longer until the united parts feem to fwell and be too much confined by the ligature, then take the tyag wholly off. Their farther culture is directed under Vol. VIII.
the refpective articles, whether defigned for dwarfs Giafting. or ftandards, \&c.

Cleft-grafting.-This is focalled, becaufe the fock being too large for whip-grafting is cleft or flit down the middle for the reception of the graft; and is performed upon ftocks from about one to two inches diameter. Firft, with a ftrong knife cut off the head of the ftock; or if the ftock is very large, it maybe headedwith a faw; and cut one fide floping upwards about an inch and half to the top; then proceed with a ftrong knife or chifel, to cleave the ftock at top, crofs-way the lope, fixing the knife or chifel towards the back of the flope, and with your mallet ftrike it, fo as to cleave the ftack about two inches, or long enough to admit the graft, keeping it open open with the chifel; this done, prepare the cyon, cutting it to fuch length as to leave four or five eyes, the lower part of which being floped on each fide, wedge-faflion, an inch and half or two inches long, making one fide to a thin edge, the other much thicker, leaving the rind thereon, which fide muft, be placed outward in the ftock; the cyon being thus formcd, and the cleft in the flock being made and kept open with the chifel, place the graft therein at the back of the ftock the thickeft fide outward, placing the whole cut part down into the cleft of the ftock, making the rind of the ftock and graft join exactly ; then removing the grafting chifel, each fide of the cleft will clofely fqueeze the graft, fo as to hold it faft; it is then to be bound with a ligature of bafs, and clayed over, asobfervedinwhip-grafting, leaving three or four eyes of the cyons uncovered. If intended to graft any pretty large ftocks or branches by this method, two or more grafts may be inferted in each; in this cafe the head muft be cut off horizontally, making no flope on the fide, but finooth the top, then cleave it quite acrofs, and place a graft on each fide, as the ftock may be cleft in two places, and infert two grafts in each cleft; they are thus to be tied and clayed as in the other methods. This method of grafring may be performed upon the branches of bearing trees, when intended either to renew the wood or change the fort of fruit. Towards the latter end of May, or the beginning of June, the junction of the graft and fock in either method will be effectrally formed, and the graft begin to fhoot, when the clay may be taken off, and in a formight or three weeks after take off alfo the bandages.

Crown-Crafting.-This kind of grafting is commonly practifed upon fuch focks as are too large tọ cleave, and is often performed upon the large branches of apple and pear trees, \&c. that already bear fruit, when it is intended to change the forts, or renew the tree with frefh-bearing wood. It is termed crowngrafting, becaufe the fock or branch being headed down, feveral grafts are inferted at top all around be" twixt the wood and bark, fo as to give it a crown-like appearance: obferving, that this kindof grafting floould not be performed until March or early in April ; for then the fap being in motion, renders the bark and wood of the fock much cafier to be feparated for the admiffion of the graft.-.-The manner of performing this fort of grafting is as follows: Firft, cut off the head of the ftock or branch with a fawhorizontally, and pare the top fmooth, then having the grafts, cut one dide of each flat, and fomewhat floping, an inch and

## G R A [ 34 ] G R A

Grafting. a half, forming a fort of houlder at top of the flope to reft upon the crown of the ftock; and then raifing the rind of the ftock with a wedge, fo asto admit the cyon between that and the wood two inches down, place the grafts with the flat fide next the wood, thruftingit down far enough for the fhoulder to reft upon the top of the fock; and in this manner may be put three, four, five, or more grafts in one large ftock or branch. When the grafts are all thus inferted, let the whole be tied tight and well clayed: obferving to leave two or three cyes of each graft uncovered, but railing the clay an iinch above the top of the fock, fo as to throw the wet quickly off, without lodging about the grafted parts, which would ruin the whole sork. Crown-grafting may alfo be performed, by making feveral clefts in the crown of the ftock, and inferting the grafts round the top of the clefts. The grafts will be pretty well united with the ftock, and exhibit a ftate of growth, by the end of May or beginning of June, and the clay may then be taken away. The trees grafted by this method will fucceed extremely well; but, for the firft two or three years, have this inconvenience attending them, of being liable to be blown out of the ftock by violent winds; which muft be remedied by tying long fticks to the body of the ftock or branch, and each gratt tied upon one of the flicks.

Cheek-grafting.-Cut the head of the ftock off, hosizontally, and pare the top fmooth; then cut one fide floping an inch and half or two inches deep, and cut the lower part of the graft lloping the fame length, making a fort of fhoulder at top of the floped part; it is then to be placed upon the floped part of the ftock, refting the fhoulder upon the crown of it; bind it with bafs, and finifh with a covering of clay as in the other methods.

Side-grafting. - This is done by inferting grafts into the fides of the branches without heading them down ; and may be practifed upon trees to fill up any vacancy, or for the purpofe of variety, to have feveral forts of apples, pears, plams, \&c. upon the fame tree. It is performed thus. Fix uponfuch parts of the branches wherc wood is wanted to furnifh the head or any part of the tree; there flope off the bark and a Iittle of the wood, and cut the lower end of the grafts to fit the part as near as poffible; then join them to the branch, and tie them with bafs and clay them over.

R'ot-grafting-This is done bywhip-grafting cyons bpon pieces of the root of any tree of the fame genus, and planting the root where it is to remain; it will take root, draw nourifhment, and feed the graft.

Grafting by approach, or Inarching.-This fort of grafting is, when the ftocks defigned to be grafted, and the tree from which you intend to take the graft, cither grow fonear, or can be placed fo near together, that the branch or graft may be made approach the ftock, without feparating it from the tree, till afrer its union or junction with the fock; fo that the branch or graft being bent to the ftock, they together form a fort of arch; whence it is called Grafting by Approach, or Inarching. Being a fure method, it is commonly practifed upon fuch trees as are with difficulty made to fucceed by any of the former ways of grafting. When intended to propagate any kind of arec or furub by this method of grafting, if the tree, \&c.
is of the hardy kind, and growing in the fall ground, Grafting. a proper quantity of young plants for focks mult be fet round it ; and when grown of a proper height, the work of inarching muft be performed; or, if the branches of the tree you defign to graft from is too high for the ftocks, in that cafe focks muft be planted in pots, and a light ftage muft be erected around the tree, of due height to reach the branches, and the pots containing the ftocks mult be placed upon the ftage. As to the method of performing the work: Obferve, that in this method of grafting, it is fometimes performed with the head of the ftock cut off, and fometimes with the head left on till the graft is united with the ftock; though by previoully heading the ftock, the work is much eafier performed ; and having no top, its whole effort will be directed to the nourifhment of the graft ; having, however, the ftocks properly placed, either planted in the ground, or in pots around the tree to be propagated; then make the moft convenient branches approach the ftock, and mark on the body of the branches the parts where they will moft eafily join to the fock, and in thofe parts of each branch pare away the bark and part of the wood two or three inches in length, and in the fame manner pare theftock in the proper place for the junction of the graft; then make a flit upwards in the branch, fo as to form a fort of tongue, and make a flit downwards in the fock to admit it; let the parts be then joined, flipping the tongue of the graft into the flit of the ftock, making the whole join in an exact manner, and tie them clofely together with bafs, and afterwards cover the whole with a due quantity of clay, as before directed in the other methods. After this, let a fout ftake be fixed, if poffible, for the fupport of each graft; to which let that part of the ftock and graft be faftened, which is neceflary to prevent their being disjoined by the wind. The operation being performed in fring, let them remain in that pofition about four months, whein they will be united, and the graft may then be feparated from the mother-tree. In doing this, be careful to perform it with a fteady hand, fo as not too loofen or break out the graft, lloping it off downwards clofe to the fock; and if the head of the fock was not cut down at the time of grafting, it muft now be done clofe to the graft, and all the old clay and bandage muft alfo be cleared away, and replaced with new, to remain a few weeks longer. Obferve, however, that if you fhall think the grafts are not firmly united with the fock in the period of time abovementioned, let them remain another year till autumn, before you feparate the grafts from the parent-tree. By this kind of grafting, you may raife almoft any kind of tree or fhrub, which is often done by way of curiofity, to ingraft a fruitbearing branch of a fruit-tree upon any common fock of the fame fraternity or genus, whereby a new tree bearing fruit is raifed in few months. This is fometimes practifed upon orange and lemon trees, \&c. by: grafting bearing-branches upon focks raifed from the kernels of any of the fame kind of fruit, or into, branches of each other, fo as to have oranges, lemons, and citrons, all on the fame tree.

An anonymous author has given us in a treatife, publifhed at Hamburgh, under the title Amoenitates Hortenfes Nover, a new method of grafting trees, fo

Grafting, as to have very beantiful pyramids of fruit upon them, Graham. which will exceed in beauty, flavour, and quantity, all that can be otherwife produced. This, he fays, he had long experienced, and gives the following method of doing it. The trees are to be tranfplanted in autumn, and all their branches cat off. Early in the following fummer the young fhoots are to be pulled off, and the buds are then to be ingrafted into them in an inverted direction. This, he fays, adds not only to the beanty of the pyramids, but alfo makes the branches more fruifful. Thefe are to be clofely connected to the trunk, and to be faftered in with the common ligature : they are to be placed circularly round the tree, three buds in each circle, and thefe circles at fix inches diftance from one another. The old trees may be grafted in this manner, the fuccefs having been found very good in thofe of twenty years ftanding ; but the moft eligible trees are thofe which are young, vigorous, and full of juice, and are not above a finger or two thick. When thefe young trees are tranflanted, they muft be fenced round with pales to defend them from the violence of the wind; and there mult be no dang put to them till they are thoroughly rooted, for fear of rotting them before the fibres ftrike. The buds ingrafted muft be fmall, that the wounds made in the bark to receive them, not being very large, may heal the fooner; and if the buds do notfucceed, which will be perceived in a fortnight, there muft be others put in their place. The wound made to receive thefe buds muft be a ftraight cut, paraliel to the horizon; and the piece of bark taken out muft be downward, that the rain may not get in at the wound. In the autumn of the fame year, this will be a green and flourifhing pyramid; and the next fummer it will flower, and ripen its fruit in autumn.

GRAHAM (James), Marquis of Montrofe, was comparable to the greatef heroes of antiquity. He undertook, againft almoft every obftacle that could terrify a lefs enterprifing genius, to reduce the kingdom of Scotland to the obedience of the king; and his fuccefs was anfwerable to the greatnefs of the undertaking. By valour, he in a few months almoft effectuated his defign ; but, for want of fupplies, was forced to abandon his conquefts. After the death of Charles I. he, with a few men, made a fecond attempt, but was inmediately defeated by a numerous army. As he was leaving the kingdom in difguife, he was betrayed into the hands of his enemy, by the Lord Afton, his intimate friend. He was carried to his execution with every circumftance of indignity that wanton cruelty could invent; and hanged upon a gibbet 30 feet high, with the book of his exploits appended to his neck. He bore this reverfe of fortune with his ufual greatnefs of mind, and expreffed a juft fcorn at the rage and the infult of his enemies. We meet with many inflances of valour in this active reign; but Montrofe is the only inftance of heroifm. He was executed May 2 ift, 1650 . See Britain, no 137 , 138, 143, 165.

Graham (Sir Richard), lord vifcount Prefton, eldeft fon of Sir George Graham of Netherby, in Cumberland, Bart. was born in 1648. He was fentambaffador by Charles II. to Louis XIV. and was mafter of the wardrobe and fecretary of flate under James II. But when the Revolution took place, he was tried
and condemned, on an accufation of attempting the reftoration of that prince ; though he obtained a pardon by thequeen's interceffion. He fpent the remainder of his days in retirement, and publifhed an elegant crandation of "Boethits on the confulation of philofophy." He died in 1695.

Graham (George), clock and watch maker, the moft ingenious and accurate artift in his time, was born in 1675. After his apprenticefhip, Mr Tompion received him into his family, purely on account of his merit; and treated him with a kind of parental affection as long as he lived. Befide his univerfally acknowledged 1 kill in his profeffion, he was a complete mechanic and aftronomer; the great mural arch in the obfervatory at Greenwich was made for Dr Halley, under his immediate infpection, and divided by his own hand: and from this incomparable original, the beft foreign infruments of the kind are copies made by Englifh artifts. The fector by which Dr Bradley firft difcovered two new motions in the fixed ftars, was of his invention and fabric: and when the French academicians were fent to the north to afcertain the figure of the earth, Mr Graham was thought the fitteft perfon in Europe to fupply them with inftruments ; thofe who went to the fouth were not fo well furnifhed. He was for many years a member of the Royal Society, to which he communicated feveral ingenious and important difcoveries; and regarded the advancement of fcience more than the accumulation of wealth. He died in $\mathbf{1 7 5 1}$.

Graham's Dyke. See Antoninus's Wali.
GRAIN, corn of all forts, as barley, oats, rye, \&c. See Corn, Wheat, \&c.

Grain is alfo the name of a finall weight, the twentieth part of a fcruple in apothecaries weight, and the twenty-fourth of a penny-weight troy.

A grain-weight of gold-bullion is worth two-pence, and that of filver but half a farthing fterling.

Grainalfodenotes the component particles of fones and metals, the veins of wood, \&c. Hence crofsgrained, or againft the grain, means contrary to the fibres, of wood, \&c.

Grain (Baptift le), mafter of the requefts in ordinary to Mary de Medicis queen of France's houfehold, wrose TheHiftory of Henry the Great, and of Louis XIII. from the beginning of his reign to the death of the marflal d'Ancre in 16I7. This hiftory is reckoned to be written with impartiality, and the firit of a true patriot ; and contains many things not to be found any where elfe. He vigoroully afferts the edict that had been granted to the reformed.

GRALLÆ, in ornithology, is an order of birds analogous to the bruta in the clafs of mammalia, in the Linnæan fyftem. See Zoology and Ornithology. GRAMina, Grasses; one of the feven tribes or natural families, into which all vegetables are diftributed by Linnæus in his Pbilofophia Botanica. They are defined to be plants which have very fimple leaves, a jointed ftem, a huiky calyx termed gluma, and a fingle feed. This defcription includes the feveral forts of corn as well as grafles. In Tournefort they conftitute a part of the fifteenth clais, termed apetali; and in Linuxus's fexual method, they are moftly contained in the fecond order of the third clafs, called triandria digynia.

Gramina.

## G R A [ $\begin{array}{lll}36 & ]\end{array} \quad$ G R A

Gramina. This numerous and natural family of the graffes has engaged the attention and refearches of feveral eminent botanifts. The principal of thefe are, Ray, Monti, Micheli, and Linnæus.
M. Monti, in his Catalogus/tirpium agri Bononionfis gramina ac bujus modi affinia complectens, printed at Bononia in 1719 , divides the graffes from the difpofition of their flowers, as, Theophraftus and Ray had divided them before him into three fections or orders. Thefe are, i. Gralfes having flowers collected in a fpike. 2. Graffes having their flowers collected in a panicle or loofe fpike. 3. Plants that in their habit and external appearance are allied to the graffes.

This clafs would have been natural if the author had not improperly introduced fweet -rufh, juncus, and ar-row-headed grafs, into the third fection. Monti enamerates about 306 fpecies of the graffes, which he reduces under Tournefort's genera; to thele he has added three new genera.

Scheuchzer, in his Ariffographia, publifhed likewife in 1719 , divides the graffes, as Monti, from the difpofition of their flowers, into the five following fec. tions: 1. Graffes with flowers in a fike, as phalaris, anthoxanthum, and frumentum. 2. Irregular graffes, as fchonanchus and cornucopiæ. 3. Graffes with flowers growing in a fimple panicle or loofe fipike, as reed and millet. 4. Grafles with flowers growing in
a compound panicle, or diffufed fpike, as oats and Graminai poa. 5. Plants by their habit nearly allied to the gralies, as cyprefs-grafs, fcirpus, linagroftis, ruif, and fcheuchzeria.

Scheuchzer has enumerated about four hundred fpecies, which he defcribes with amazing exactnefs.

Micheli has divided the graffes into fix fections, which contain in all 44 genera, and are arranged from the fituation and number of the flowers.

Gramina, the nanie of the fourth orderinLinnæus's Fragments of a Natural Methed, confilting of the numerous and natural family of the grafles, viz. agroftis, aira, alopecurus or fox-tail grafs, anthoxanthum or vernal grafs, ariftida arundo or reed, avena or oats, bobartia, briza, bromus, cinina, cornncopiæ or horn of plenty grafs, cynofurus, dactylis, elymus, feftuca or fefcue-grafs, hordeum or barley, lagurus or hare's tail grafs, lolium or darnel, lygeam or hooded matweed, melica, mileum or millet, nardus, oryza or rice, panicum or panic-grafs, pafpalum, phalaris, or canary-grafs, phleum, poa, faccharum or fugar-cane, fecale or rye, ftipa or winged fike-grafs, triticum or wheat, uniola or fea-fide oats of Carolina, coix or Job's tears, olyra, pharus, tripfacum,zea, Indian Turkey wheat or Indian corn, zizania, ægilops or wild fefcue-gràfs, and ropogon, apluda, cenchrus, holcus or Indian millet, ifchæmum. See Botany, p. 458, col. 2. and Grassis.

Definition, I.RAMMAR is the art of Jpeaking or of writing any language with propriety; and the purpofe of language is to communicate our thoughts.
2. Grammar, confidered as an art, neceflarily fuppofes the previous exiftence of language; and as its defign is to teach any language to thofe who are ignorant of it, it mult be adapted to the genius of that particular language of which it treats. A juft method of grammar, therefore, without attempting any alterations in a language already introduced, furnifhes certainobfervations called rules, to which the methods of fpeaking ufed in that language may be reduced; and this collection of rules is called the grammar of that particular language. For the greater diftinctnefs with regard to thefe rules, grammarianshave ufually divided this fubject into four diftinct heads, viz. Ortho graPHY , or the art of combining letters into fyllables, and fyllables into words; ETYMOLOGY, or the art of dedu-

## UNIVERSAL

THE origin of language is a fubject which has employed much learned inveftigation, and about which there is fill a diverfity of opinion. The defign of fpeech is to communicate to others the thoughts and perceptions of the mind of the fpeaker: but it is obvious, that between an internal idea and any external
cing one word from another, and the various modifications by which the fenfe of any word can be diverfified confiflentiy with its original neaning or its relation to the theme whence it is derived; Syntax, or what relates to the conflruction or due diffofition of the words of a language into fentences or phrafes; and Prosody, or that which treats of the quantities and accents of fyllables, and the art of making verfes.
3. But grammar, confidered as a fcience, views lan- Or univesguage only as it is fignificant of thought. Neglecting fal. particular and arbitrary modifications introduced for the fake of beauty or elegance, it examines the analogy and relation between words andideas; diftinguifhes between thofe particulars which are effential to language and thofe which are only accidental; and thus furnifhes a certain ftandard, by which different languages may be compared, and their feveral excellencies or defects pointed out. This is what is called $\mathrm{P}_{\text {hilosophic or }}$

## GRAMMAR.

 found there is no natural relation; that the word fire, for inftance, might have denominated the fubftance which we call ice, and that the word ice might have fignified fire. Some of the moft acute feelings of man,as well as of every other animal, are indeed expreffed by fimple inarticulate founds, which as they tend to the prefervation of the individual or the continnance of the fpecies, and invariably indicate either pain or pleafure, are univerfally underfood: but thefe inarticulate and fignificant founds are very few in number; and if they can with any propriety be faid to conftitute a natural and univerfal language, it is a language of which man as a mere fenfitive being partakes in common with other animals.
5. Man is endowed not only with fenfation, but alio with the faculty of reafoning; and fimple inarticulate founds are infufficient for expreining all the various modifications of thought, for commanicating to others a chain of argumentation, or even or dittinguilhing between the different ficnfations either of pain or of pleafure : a man forched with fire or unexpectedly plunged among ice, might utter the cry naturally indicative of fudden and violent pain; the cry would be the fame, or nearly the fame, but the fenfations of cold and heat are wilely different. Articulation, by which thofe fimple foundsare moditied, and a particular meaning fixed to each modification, is therefore ablolutely neccuiury to fuch a bing as man, and forms the language which difiuguithes him from allother animals, and enables him to communicate with facility al that diverity of ideas with which his mind is Itored, to make known his particular wants, and to dittinguilh wirh accuracy all his various fenfations. Thofe bouds rhus modified are called words; and as words have confeffedly no natural relation to the ideds and perceptions of which they are iignificant, the ufe of them mult either have been the refult of human fagacity, or have been fuggefted to the firft man by the Author of nature.
6. Wherher language be of divine or haman origin, is a queftion upon which, though it might perhaps be foon refolved, it is not neceifary here to enter. U pon cither fuppofition, the firft language, compared with thofe which fucceeded it, or even with itfelf as afterwards enlarged, muft have been extremely rude and narrow. If it was of buman contrivance, this will be readily granted; for what art was ever invented and brought to a fate of perfection by illiterate favages? If it was taught by God, which is at leaft the more probable fappolition, we cannot imagime that it wonld be more comprehenfive than the ideas of thofe for whofe immediate ufe it was intended; that the firft men fhould have been tanght to exprefs pains or pleafures which they never felt, or utter founds that Should be afterwards fignificant of ideas which at the time of utterance had not occurred to the mind of the fpeaker : man, taught the elements of language, would be able himfelf to improve and enlarge it as his future occafions thould require.
7. As all language is compofed of fignificant words varioully combined, a knowledge of them is neceffary previous to our acquiring an adequate idea of language as conftracted into fentences and phrafes. But as it is by words that we exprefs the various ideas which occur to the mind, it is neceffary to examine how ideas themfelves are fuggefted, before we can afcertain the various clafles into which words may be diftributed. It is the province of $\log i c$ to trace our ideas from their
origin, as well as to teach the art of reafoning: batit is neceflary at prefent to obferve, that our carlieft ideas arc all ideas of fenfation, excited by the impreffions that are made upon our organs of fenfe by the varions objects witl which we are furrounded. Let as there. forc fuppofic a reafon:ble being, devoid of every polible propoliedion, pla dupon this globe; and it is obvious, that his attention would in the firft place be disected to the various ubjews which he faw exifting around him. Thefe he would naturally endeavour to diftinguilh from oue another; and if he were either learning or inventing a language, his firft cftort would be togive them naines, by nicans of which the ideas of them might be recalled when the objects themfelves fhould be abiem. This is one copious fource of words; and forms a natural clafs which mant be common ta evory lunguage, and which is ditinguithed by the name of nouns: dud as thefi nouns are the names of the feveral fubftances which exift, they have likewife been called substantives.
8. It would likewife be early difcovered, that cvery one of thefe fubtances was endowed with cerrain qualities or aunibutes; to exprefs which another clafs of of attriwords would be requifice, fince it is only ly their qua- batives. lities that fuoflances themfelves can attract our attention. Thus, to be weighty, is a quality of matter; to think, is an attribute of man. Therefore in every language words have been invented to exprefs the known qualities or attributes of the feverul objects which exift. Thefe may all be comprehended under the general denomination of attributives.
9. Nouns and attributives muft comprehend all that is effential to language (A); for every thing which exifts, or of which we can form an idea, muft be either a fubftance or the attribute of fome fubftance; and therefore thofe two clafles which denominate fubftances and attributes, muft compreliend all the words that are neceffary to communicate to the hearer the ideas which are prefent to the mind of the fpeaker. If any orher words occur, they can only have been invented for the fake of difpatch, or introduced for the purpofes of eafe and ornament, to avoid tedious circumlocations or difagreeable tatologies. There are indeed grammarians of great name, who have confidered as effential to language an order of words, of which the ufe is to connect the nouns and aitributives, and which are faid to have no fignification of themfeloes, but to become fignificant by relation. Henceall words which can polfibly be invented are by thefe men divided into two general claffes : thofe which are signtricant of themselves and thofe which are not. Words fignificant of themfelves are either expreffive of the names of fubfances, and therefore called substantives; or
(A) This is the doctrine of many writers on the theory of language, for whofe judgment we have the higheft refpect: yet it is not eafy to conceive mankind fo far advanced in the art of abftraction as to view attributes by themfelves independent of particular fub/fances, and to give one general name to each attribute wherefoever it may be found, without having at the fame words exprelive of affrmation. We never talk of any attribute, a colour for inttance, without effirming fomething concerning it; as, either that it is bright or faint, or that it is the colour of fome fubftance. It will be feen afterwards, that to denote affirmation is the proper office of what is called the fubftantive verb; as, "Milk is white." That verb therefore appears to be as neceffary to the communication of thought as any fpecies of words whatever; and if we muft range words under a few general clalles we fhould be inclined so fay, that nouns, attributives, and affrazatives, comprehend all that is cffential to language.
of attributes, and therefore called attributives. Words which are not fignificant of themfelves, muft acquire a meaning either as defining or conneçting others; and are therefore arranged under the two claffes of definitives and connectives.
10. That in any language there can be words which of themfelves have no fignification, is a fuppofition which a man free from prejudice will not readily admit ; for to what purpofe fhould they have been invented? as they are fignificant of no ideas, they cannot facilitate the communication of thought, and muft therefore be only an incumbrance to the language in which they are found. But in anfwer to this it has been faid, that thefe words, though devoid of fignification themfelves, acquire a fort of in eaning when joined with others, and thatthoy are as neceffary to the ftructare of a fentence as cement is to the fructure of an edifice: for as ftones cannot be arranged into a regular building without a cement to bind and connect them, fo the original words fignificant of fubftances and attributes, cannot be made to exprefs all the variety of our ideas without being defined and connected by thofe words which of themfelves fignify nothing. -It is wonderful, that he who firft fuggefted this fimile did not perceive that it tends to overthrow the doctrine which it is meant to illuftrate : for furely the cement is as much the matter of the building as the flones themfelves; it is equally folid and equally extended. By being united with the fones, it neither acquires nor lofes any one of the qualities effential to matter; it neither communicates its own foftnefs, nor acquires their hardnefs. By this mode of reafoning therefore it would appear, that the words called definitives and connectives, fo far from having of themfelves no fignification, are equally effen. tial to language and equally fignificant with thofe which are denominated fubftantives-and attributives; and upon inveftigation it will be found that this is the truth. For whatever is meant by the definition or connection of the words which all men confefs to be fignificant, that meaning muft be the fenfe of the words of which the purpofe is to define and connect; and as there can be no meaning where there are noideas, every one of thefe definitives and connectives muft be fignificant of fome idea, although it may not be always eafy or even poffible to exprefs that idea by another word.
II. Thefe different modes of dividing the parts of fpeech we have juft mentioned, becaufe they have been largely treated of by grammarians of high fame. But it does not appear to us, that any man can feel himfelf much the wifer for having learned that all words are either substantives or attributives, definitives orconnectives. The divifion of words into thofe which are significant of themselves, and thofe which aresignificant by relation, is abfolute nonfenfe, and has been productive of much error and much my ftery in fome of the moft celebrated treatifes on grammar. It is indeed probable, that any attempt to eftablifh a different claffification of the parts of feech from that which is commonly received, will be found of little utility either in prattice or in fpecu. lation. As far as the former is concerned, the vulgar divifion feems fufficiehtly commodious; for every man who knows any thing, knows when he ufes a noun and when a verb. With refpect to the latter, not to mention that all the grammarians from Aristotie to

Horne Tooke, have differed on the fubject, it fhould feem to be of more importance, after having afcertained with precifion the nature of each fpecies of words, to determine in what circumftances they differ than in what they agree.
12. In moft languages, probably in all cultivated lan guages, grammarians diftinguih the following parts of fpeech : Noun, pronoun, verb,participle, adverb, prepofition, conjunction. The Latin and Engli/h grammarians admit the interjection among the parts of fpeech, although it is confeffedly not neceffary to the conftruc- per tion of the fentence, being only thrown in to exprefs the affection of the fpeaker ; and in the Greek and Englifh tongues there is the article prefixed to nouns, when they fignify the common names of things, to point them out, and to fhow how far their fignification extends. In the method of arrangement commonly followed in grammars, adjectives are claffed with fub. flantives, and both are denominated nouns; but it is certain that, when examined philofophically, an effential difference is difcovered between the fubftavtive and the adjective; and therefore fome writers of eminence when treating of this fubject, have lately given the following claffification of words, which we liall adopt: The article, noun, pronoun, verb, participle, ADJECTIVE,ADVERB, PREPOSITION,CONJUNCTION, interjection. All thefe words are to be found in the Englighlanguage; and therefore we fhall examine each clafs, endeavour to afcertain its precife import, and fhow in what refpects it differs from everyother clafs. It is impoffible to inveftigate the principles of grammar without confining the inveftigation in a great meafure to fome particular language from which the illuftrations muft be produced; and that we flould prefer the Englißlanguage for this purpofe can excite no wonder, as it is a preference which to every tongue is due from thofe by whom it is fpoken. We truft, however, that the principles which we fhall eftablifh will be found to apply univerfally; and that our inquiry, tho' principally illuftrated from the Englifh language, will be an enquiry into philofophical or univerfal grammar.

## CHAPTERI.

## Of tbe Noun or Substantive.

13. Nouns are all thofe words by which objects or fubftances are denominated, and which diftinguifh them from one a nother, witbout marking either quantity, quality, action, or relation. The fubftantive or noun is the The name of the thing fpoken of, and in Greek and Latin definen, is called name; for it is oroudin the one, and nomen in the other ; and if in Englifh we had calledit the name rather than the nouns the appellation would perhaps have been more proper, as this laft word being ufed only in grammar, is more liable to be mifunderftood than the other, which is in conflant and familiar ufe. That nouns or the names of things muft make a part of every language, and that they muft have been the words firft fuggefted to the human mind, will not be difputed. Men could not fpeak of themfelves or of any thing elfe, without having names for themfelves and the various objects with which they are furrounded. Now, as all the objects which exift mult be either in the fame fate in which they were prodaced by nature, or changed from their original ftate by $a r t$, or abftract.
$\qquad$

$\qquad$

Chap. I.
12 Different kinds of nouns
ed from fubftances by the powers of inagination, and conceived by the mind as having at leaft the capacity of being cliaracterized by qualities; this naturally fuggefts a divifion of nouns into natural, as man vegetable, tree, \&c. ARTIHICIAL, as houfe, fhip, watch, \&c. and AbSTRACT, as whitenefs, motion, temperance, \&c.
14. But the diverfity of objects is fo great, that had each individual a diffinet and proper name, it would be impoffible for the moft tenacious memory, during the courfe of the longeft life, to retain even the nouns of the narroweft language. It has therefore been found expedient, when a number of things refemble each other in fome important particulars, to arrange them all under one fpecies; to which is given a name that belongs equally tothe whole /pecies, and to each individual comprehended under it. Thus the word man denotes a fpecies of animals, and is equally applicable to every human being: The word horfe denotes another fpecies of animals, and is equally applicable to every individual of that fpecies of quadrupeds; but it cannot be applied to the fpecies of men, or to any individual comprehended under that fpecies. We find, however, that there are fome qualities in which feveral fpecies refemble each other ; and therefore we refer them to a higher order called a genus, to which we give a name that is equally applicable to every /pecies and every individual comprehended under it. Thus, men and horfes and all living things on earth refemble each other in this refpect, that they have life. We refer them therefore to the genus called animal; and this word belongs to every fpecies of animals, and to each individual animal. The fame cladification is made both of artificial and abftraEt fubftances; of each of which there are genera, /pecies, and individuals.Thus in natural fubftances, animal, vegetable, and foffle, denute genera; man, horfe, tree, metal, are spegies; and Alexander, Bucephalus, oak, gold, are individuals. In artificial fubftances, edifice is a Genus; boufe, church, tower, are species; and the Vatican, St Paul's, and the Tower of Loudon, are individuals. In abftract fubstances, motion and virtue are g Ener ; fight and temperanceare species; the fight of Mabomet and temperance in wire are INDIVIdUAIs. By arranging fubftances in this manner, and giving a name to each genus and fpecies, the nouns neceffary to any language are comparatively few and eafily acquired: and when we meer with an object unknown to us, we have only to examine it with attention; and comparing it with other objects, to refer it to the genus or fpecies which it moft nearly refembles. By this contrivance we fupply the want of a proper name for the individual; and fo far as the refemblance is complete between it and the Jpecies to which it is referred, and of which we have given it the name, we may converfe and reafon about it without danger of error: whereas had each individual in nature a diffinct and proper name, words would be innumerable and incomprehenfible ; and to employ our labours in language, wonld be as idle as that ftudy of numberlefs written fymbols which has been attributed to the Ghinefe.
15. Altho' nouns are thus adapted to exprefs not the individuals but the genera or fpecies into which fubftances are claffed; yet, in fpeaking of thefe fubstances, whether natural, artificial, or abftract, all men mult have occafion to mention fometimes one of a kind, and fometimes mor than one. In everylanguage, therefore, nouns must admit of fome variation in their form, to denote
wnity and plurality; and this variation is called number. Thus in the Englifh language, when we fpeak of a fingle place of habitation, we call it a houfe; but if of more, we call them boufes. In the firf of thefe cafes the noun is faid to be in the fingular, in the laft cafe it is in the plural, number. Greek nouns have alfo a dual number to exprefs two individuals, as have likewife fome Hebrew nouns: but this variation is evidently not effential to language; and it is perhaps. doubtful whether it ought to be confidered as an elegance or a deformity.
16. But although number be a natural accident of of nouns, it can only be confidered as effential to thote which denote genera or feecies. Thus we may have occafion to Speak of one animal or of many animals, of one man or of many neen; and therefore the nouns animal and man muft be capable of expreffing plurality as well as unity. But this is not the cafe with refpect to the proper names of indiziduals: for we can only fay Xenophon, Ariftotle, Plato,\&c. in the fingular; as, were any one of thefe names to aftume a plural form, it would ceafe to be the proper name of an individual, and become the common name of a fpecies. Of this, indeed, we have fome examples in cvery language. When a proper name is confidered as a general appellative under which many others are arranged, it is then no longer the name of an individual but of a $/ p e c i e s$, and as fuch admits of a plural; as the Cafars, the Howards, the Pelhanzs, the Montagues, \&c. but Socrates can never become plural, folong as we know of no more than. one man of that name. The reafon of all this will be obvious, if we confider, that every gerus may be found whole and entire in each of its /pecies; for mant, horfe, and $d o g$, are each of them an entire and complete animal: and every fpecies may be found whole and entire in each of its individuals : for Socrates, Plato, and Xenophon, are each of them completely and entirely a man. Hence it is, that every genus, though owe, is multiplied into many; and every fpecies, thongh ONE, is alfo multiplied into many, by reference to thefe beings which are their fubordinates: But as no individual has any fuch fubordinates, it can never in ftrictnefs be confidered as MANY; and fo, as well in nature as in name, is truly an IndIvidual which: cannot admit of number.
17. Befides number, another charaft eriftic, vifible in fubftances, is that of SEX. Every fubftance is either male or female; or both male and female; or neither one nor the other. So that with refpect to fexes and their negation, all fubftances conceivable are comprehended underthis fourfold confideration, which language would be very imperfect if it could not exprefs. Now the exiftence of hermap hrodites being rare, if not doub: ful, and language being framed to anfwer the ordinary occations of life, no provition is made, in any of the tongues with which we are acquainted, for expreffing, otherwife than by a name made on purpofe, or by a peri-: phrafis, duplicity of fex. With regard to this great natural. charact eriftic, grammarians have madeonly a threefold diftinction of nouns: thofe which denote males are faid to be of the mafculine gender; thofe which denote females, of the feminine; and thofe which denote fubftances that admit not of $f_{c} x$, are faid to be neuter or of neithergender. All animals havef x ; and the refore the names of all animals hould have gender. But the fex. of all is not equally obvions, nor equally worthy of attention. In thofe fecies that are mof common, or

15
f gender.
of which the male and the femate are, by their fize, form, colour, or other outward circumftances, eminently difin, guifsed, the male is fonetimes called by one name, which is mafculine; and the female by a different name, which is feminine. Thus in Englifl we fay, hufband, wife; king, queen; father, mother; fon, daughter, \&c. In others of fimilar diftinction, the name of the male is applied to the female only by prefixing a fyllable or by altering the termination; as man, woman; lion, lioness; emperor, empre/s, anciently emperefs; mafter, miffrefs, anciently maflerefs, \&cc. When the fox of any animal is not obvious, or not material to be known, the fame name, in fome languages, is applied, without variation, to all the fpecies, and that name is faid to be of the common gender. Thus in Latin bos albus is a white ox, and bos alba a white cow. Diminutive infects, though they are doubtlefs male and female, feem to be confidered in the Englifh language as if they were really creeping things. No man, fpeaking of a worm, would fay be creeps, but it creeps, upon the ground. But although the origin of genders is thus clear and obvious; yet the Englifh is the only language, with which we are acquainted, that deviates not, except in this fingle inflance of infects, from the order of nature. Greek and Latin, and many of the modern tongnes, have nouns, fome mafculine, fome feminine, which denore fub. ftances where fex never had exiftence. Nay, fome languages are fo particularly defective in this refpect, as to clafs every object, inanimate as well as animate, under cither the mafouline or the feminine gender, as they have no neuter gender for thofe which are of nicither fex. This is the cafe with Hebrew, French, Italian, and Spani/h. But the Englifh, fricly following the order of nature, pats every noun which denotes a male animal, and no other, in the mafouline gender ; every name of a female animal, in the feminine; and every animal whore fex is not obvious or known, as well as every inanimate object whatever, in the nenter gender. And this gives our language an advantage above mont others in the poetical and rhetorical fyle : for when nouns naturally neuter are converted into mafculine and feminine, the perfonifcationismore difinctly and more forcibly marked. (See Personification.) Some verylearned and ingenions men have endeavoured, by what they call a nore fabtle kind of reafoning, to difcern even in things quithout fex a diftant analogy to that naturac distinction, and to account for the names of inanimate fubftances being, in Greek and Latin, mafouline and feminine. But fuch fpeculations are wholly fanciful; and the principles upon which they procced are overurned by an appeal to facts. Many of the fubftances, that, in one language, have maf. culine names, have in others names that are feminine; which could not be the cafe were this matter regulated by reaforn or neture. Indeed for this, as well as many other anomalies in language, no other reafon can be artigned than that ciaflowi-
. Quem penes arbitrium eft, et jus, et norma, loquendi.
18. It has been already obferved that moft nompare the names, not of individuals, but of whole claffes of objects termed genera and $/$ pecies ( B ). In claffing a num-
ber of individualsunder one fpecies, we contemplate only thofe qualities which appear to be important, and in which the fevcral individuals are found to agree, abfracting the mind from the confideration of all thofe which appear to be lefs effential, and which in one individual may be fuch as have nothing exactly fimilar in any other individual upon earth. Thus, in claffing the individuals which are comprehended under the $\int p e-$ cies denominated borfe, we pay no regard to their colour or their $f i z e$; becaufe experience teaches us, that no particular colour or fize is effential to that individual living creature, and that there are not perhaps upon earth two hor fes whofe colour and fize are exactly alike. But the qualities which in this procefs we take into view, are the general /hape, the /y mmetry, and proportion of the parts; and in fhort every thing which appears evidently effential to the life of the individual and the propagationof the race. All thefe qualities are frikingly fimilar in all the individuals which we call horfes, and as ftrikingly diffinilar from the correfponding qualities of every other individual animal. The colour of a borfe is often the fame with that of an ox; but the fhape of cle one animal, the fymmetryand proportion of his parts, are totally different from thofe of the other; nor could any man be led to clafs the two individuals under the famefpecies. It is by a fimilar procefs that we afcend from one/pecies to anether, and through all the fpecies to the higheft $g e-$ nus. In each fpecies or genus in the afcending feries fewer particular qualities are attended to than were confidered as effential to the genus or fpecies immediately below it ; and our conceptions become more and moregeneral as the particular qualities, which are the objects of them, become fewer in number. The ufe of a general term, therefore, can recal to the mind only the common qualities of the clafs, the genus or fpecies which it reprefents. But we have frequent occafion to fyeak of individual objects. In doing this, we annex to the generalterm certain words fignificant of particular qualities, which difcriminate the object of which we fpeak, from every other individual of the clafs to which it belongs, and of which the general term is the common name. For inftance, in advertifing a thief, we are obliged to mention his beight, complexion, gait, and whatever may ferve to diflinguifh him from all other men.

The procefs of the mind in rendering her conceptions particular, is indeed exactly the reverfe of that by which fie generalizes them. For as in the procefs of generalization, fhe abftracts from herideas of any number of fpecies certain qualicies in which they differ from each other, and of the remaining qualities in which they agree, confitutes the firft genus in the af. cending feries; fo when the wifhes to make her conceptions more particular, he annexes to her idea of any genus thofe qualities or circumftances which were before abftracted frem it; and the genus, with this annexation, conflitutes the firt /pecies in the defcending feries. In like manner, when the wifhes to defcend from any fpecies to an individual, fhe has on1y to annex to the idea of the Species thofe particulur qualities which difcriminate the individual intended from the other individual of the fame kind.

This
(B) It is almof needlefs to obferve, that the words genus and fpecies, and the phrafeshigher genus and lower fpecies, are taken here in the logical fenfe; and not as the words genus, fpecies, order, clafs, are often employed by naturalifts. For a farther account of the mental procefs of generalization, fee Logicand Metaphysics.

# Chap. I. $\begin{array}{lllllll}\mathbf{G} & \mathbf{R} & \mathbf{A} & \mathbf{M} & \mathbf{M} & \mathbf{A} & \mathbf{R} \text {. }\end{array}$ <br> Thisparticularizing operation of the inind points out <br> The datize an accufative cafes appear to have nearly 

the mamner of applying the general terms of language for the purpofe of expreffing particular ideas. For as the mind, to limit a general idoa, conneês that idea with the id of of fome particular circumffance; fo language, as we have already obferved, in order to limit a general term, conneets that term, with the word denoting the particular circumftance. Thus, in order to particularize the idea of horfe, the mind connectsthat general idea with the circumftance, fuppofe, of whitenefs; and in order to particularize the word horfe, language connects that word with the term white; and fo in other inftan-ces.-Annexation, therefore, or the connecting of general words or terms in language, fits it for expreffing particular conceptions; and this muft hold alike good in all languages. But the methods of denoting this annexation are various in various tongues. In Englifh and moft modern languages we commonly ufe for this purpofe little words, which we have chofen to ftyle particles: and in the Greek and Latin languages, the cafes of nouns anfwer the fame end.
19. Cafos, therefore, though they are accidents of notus not abfolutely neceffary, have been often confidered as fuch ; and they are certainly worthy of our examination, fince there is perhaps no language in which Some cares are not to be found, as indeed without them. or their various powers no language could readily anfwer the purpores of life.

All the oblique cafes of nouns (if we accept the vocative) are merely marks of annexation; but as the conuections or relations fubfifting among objects are very various, fome cafes denote one kind of relation, and fome another. We thall endeavour to inveftigate the connection which each cafe denotes, beginning with the genitive.-This is the moff general of all the cafes, and gives notice that $\int$ ome connection indeed fubfifts between two objects, but does not point ont the particular kind of conneetion. That we nuft infer, not from the sature or termination of the genitive itfelf, but from our preuious knowledge of the objects connected. That the genitive denotes merely relation in general, might be proved by adducing innumerable examples, in which the relations exprefied by this cafe are different; but we fhall content ourfelves with one obfervation, from which the truth of our opinion will appear beyond difpute. If an expreffion be ufed in which are, connected by the genitive cafe, two words fignificant of objects between which a twofold relation may fubfift, it will be found impoffible, from the expreffion, to determine which of thefe two relations is the true one, which muft be gathered wholly from the context. Thus, for example, from the phrafe injuria regis, no man can know whether the injury mentioned be an injury fuffered or an injury $/ u f$ ficted by the king: but if the genitive cafe notified any particular relation, no fuch ambiguity could exift. This cafe therefore gives notice, that two objects are, fomehow or other (c), connected, but it marks not the payticular fort of connection. Hence it may be trandated by our particle of, which will be feen afterwards to be of a fignification equally general.

Vol. VIli.
the fame meaning; each of them denoting appofition, or the junction of one object with another. Thus when any one fays, Comparo Virgilium Homero, Homer and Virgil are conceived to be placed befide one another, in order to their being compared; and tbisfort of connection is denoted by the datiae cafe. In like manner, when it is faid latus humeros, breadth is conceived as joined to or comnected in appofition with fhoulders; and the exprefion may be tranilated " broad at the fhoulders."
This appofition of two objects may happen either w thout previous motion, or in confequence of it. In the foregoing inflances no motion is prefuppofed; but if one fay, Mifit aliquos fubfidio eorum, the appofition is there in confequence of motion. In like manner, when itis faid, Profecius eft Romain, his appofition with Rome is conceived as the effect of his motion thither.
From this idea of the accufative, the reafon is obvious why the object after the active verb is often put in that cafe; it is becaufe the action is fuppofed to proceed from the agent to the patient. But the fame thing happens with refpect to the dative cafe, and for the fame reafon. Thus, Antonius la fit Ciceronem, and Antonius nocuit Ciceroni, are expreffions of the fame import, and in each the action of hurting is conceived as proceeding from Antony to Cicero; which is finely illuftrated by the paffive form of fuch expreffions, where the procedure abovementioned is exprefisly marked by the prepofition ab: Cicero nocetur, Cicero leditur AB Antonio. It is thercfore not true, that " the accufative is that cafe, at leaft the only cafe, which to an efficient nominative and a verb of action fubjoins either the effect or the paflive fubject; nor is the dative the only cafe which is formed to exprefs relations tending to itfelf." The only thing effential to thefe two cafes is to denote the appofition or junction of one object withanother; and this they do nearly, if not altogether, in the fame manner, although from the cuftom of language they may not be indifferently fubjoined to the fanie verb.
The Greek language has no ablative cafe; but in 20 the Latin, where it is ufed, it denotes concomntancy, or lative cafe. that one thing accompanies another. From this concomitancy we fometimes draw an inference, and fometimes not. For example, when it is faid, Teyplum clamore petebant, clamour isreprefented as concomitant with their going to the temple ; and here no inference is drawn : but from the phrafe palleo metu, although nothing more is exprefed than that palenefs is a concowzitant of the fear, yet we inftantly infer that it is alfo the effect of it. In moft inftances where the ablative is ufed, an inference is drawn, of which the foundation is fome natural connection obferved to fublift between the objects thus connected in language. When thisinference is not meant to be drawn, the prepofition is commonly added : as, interfectus eft cum gladio, " he was flain with a fword about him;" interfectus eft gladio, "he was flain with a fword as the inftrument of his death."
The remaining cafes, which have not been noticed, of the noare the nominative and the vocative. Thefe are in moft minative inftances alike in termination, which makes it probable and vocaF
(c) The Greek grammarians feem to have been aware of the nature of this cafe when they called it $\tau$ rwoos resxn, or the general cafe: of which name the Latin grammarians evidently miftook the meaning when they tranflated it cafis genitivus, or the generative cafe; a name totally foreign from its nature.
that they were originally one and the fame cafe. The foundation of this conjecture will appear from confidering the $u f_{e}$ to which each of thefe cafes is applied. The nominative is employed to call up the idea of any object in the mind of the hearer. But when a man liears his own name mentioned, his attention is inftantly ronfed, and he is naturally led to liften to what is to be faid. Hence, when a man meant particularly to folicit one's attention, he would naturally pronounce the perfon's name; and thus the nominative cafe would pafs into a vocative, of which the ufe is always to folicit

22
The inport of the Greek and Latin cafes, commonly expreffed in Englifh by prepofitions. atterition (D).
20. The Greek and Latin among the antcient, and the German among the modern languages, exprefs different connections or relations of one thing with another by cafes. In Englifh this is done for the moft part by prepofitions; but the Englifh, being derived from the fame origin as the German, that is, from the Teutonic, has at leaft one variation of the fubftantive to anfwer the fame purpofe. For inftance, the relation of poffeflion, or belonging, is often expreffed by a different ending of the fubftantive, which may be well called a a cafe. This cafe anfwers nearly to the ginitrue cafe in Latin; but as that is not a denomination fignificant of the nature of the cafe in any language, it may perhaps in Englifh be more properly called the poffe five cafe. Thus, God's grace, anciently Godis grace, is the grace belonging to or in the poffeflion of God: and may be likewife expreffed by means of the prepofition : thus, -the grace of God.

Although the word Goris is as evidently an inflexion of the noun $G o d$ as the word $D e i$ is an inflexion of $D_{e}$ $u s$, there are grammarians who have denied that in $E n$ glafh there is any true inflexion of the original noun, and who have faid that the nooin with the addition of that fyllable, which we confider as the fign of a cafe, ceafes to be a noun, and becomes a definitive; a word which with them is devoid of fignification. Thus, in the expreffion Alexander's boufe, the word Alexander's ftands not as a notun, but as an article or definitive, ferving to afcertain and point out the individuality of the houfe. But this is a palpable miftake : the word Alexander's ferves not to point out the individuality of the - houfe, but to fhow to whom the houfe belongs; and is therefore, beyond difpute, not an article but a noun in the polfeflive cafe. Again, when we fay St Peter's at Rome and St Paul's at London, the words St Peter's and St Paul's are neither articles, nor, as has been abfurdly iniagined, the proper names of edifices, like the Rotundo or the Gircus; but they are in the polfeffere cafe, the names of the two apoftles to whom the churches were dedicated, and to whom they are fuppofed to belong.

But that this, which we have called the polfe five cafe, is really $n 0 t$ fo, muft be evident, it is faid, becaufe there are certain circumftances in which it cannot be fubftituted for the noun with the prepolition prefixed. Thus, though a man may fay, I fpeak of Alexander, I write of Cafar, 1 think or Pompey; he cannot fay, I fpeak Alexander's, I write Cafar's, or I think Pompey's. This
is indeed true, but it is nothing to to the purpofe; for though I may fay, Loquor DE Alexandro, Scribo DE Cafare, Cogito DE Pompeio; 1 cannot fay, Lovvor Alexandri, Scribo Cafaris, or Cogito Pompeit: and therefore all that can be inferred from this argament is, that as the Latin genitive is not always of the fame import with the prepofition de, fo the Engliih polfefive is not $a /$ ways of the fame import with the prepofition of. Upon the whole, then, we may conclude, that Englifh nouns admit of one inflexion; and that though cafes are not fo effential to nouns as gender and number, no language can be wholly without them or their various powers.

## CHAPTER II.

## Of Articles or Definitives.

21. The intention of language is to communicate thought, or to exprefs thofe ideas which are fuggefted to us by our fenfes external and internal. The ideas firft fuggefted to us are thofe of pain and pleafure, and of the objects with which we are furrounded; and therefore the words firfl learned mult be nouns, or the names of objects natural, artificial, and abftract. Every object about which the human mind can be converfant is ftrictly and properly fpeaking particular; for all things in nature differ from one another in numberlefs refpects, which, not to mention the idea of feparate exiftence, fo circumftance and individuate them, that no one thing can be faid to be another. Now the ufe of language being to exprefs our ideas or conceptions of thefe objects, it might naturally be expected that every object flould be diftinguifled by a proper name. This would indeed be agrecable to the truth of things, but we have already feen that it is altogether impracticable. Objects have therefore been clalfed intogenera and $/ p$ pecies; and names given, not to each individuat, but o eachgenus and /pecies. By this contrivance of language we are enabled to afcertain in fome meafure any individual that may occur, and of which we know not the proper name, only by referring it to the genus or/pecies to which it belongs, and calling it by the general or Specific name; but as there is frequent occalion to diftinguifh indixiduals of the fame fpecies from one another, it became neceffary to fall upon fome expedient to mark this diftinction. In many languages general and /pecific terms are modified and reftricted by three orders of words; the article, the adjective, and the obligue cases of nouns. The cafes of notns we The necef-
have already confidered : the adjective will employ our fity and ufe attention afterwards: at prefent our obfervations are of the arconfined to the article; a word fo very neceflary, ticle. that without it or fome equivalent invention, men could not employ nouns to any of the purpofes of life, or indeed communicate their thoughts at all. As the bufinefs of articles is to enable us, upon occafion, to emp: ployg generalterms to denoteparticular objects, they mult be confidered, in combination with the general terms, as. merely fubfitutes for proper names. They have, however, been commonly called definitives; becaufe they
ferve
(D) The chief objection to this conjecture, that the nominative and vocative were originally the fame cafe, is saken from the Latin tongue, in which the nouns of the fecond declenfion ending in us terminate their voca-: tive in $e$. But this is ealily accounted for. The $s$ in fuch words was often dropt, as appears from the fcanning. of old Latin poetry; and when this was done, the $u$ being fhort, would naturally in pronunciation pafs into $e_{2}$. maike fhort vowel; and thus, in the vocative cafe $e_{k} e$ would in time be written inftead of $u$.
Chap. II. G $\quad$ R $\quad$ A $\quad$ M $\quad$ M $\quad$ A $\quad$ R.
ferve to define and afcertain any particular object, fo as to diftinguifh it from the other objects of the general clals to which it belongs, and, of courfe, to denote its individuali. $t y$. Of words framed for this purpofe, whether they have by grammarians been termed articles or not, we know of no language that is wholly deftitute. The nature of them may be explained as follows.
22. An object occurs with which, as an individual, we are totally unacquainted; it has a head and limbs, and appears to poflefs the power of felf-motion and fenfation : we therefore refer it to its proper $/ p e c i e s$, and call it a dog, a horfe, a lion, or the like. If it belongs to none of the fpecies with which we are acquainted, it cannot be called by any of their names; we then refer it to the genus, and call it an animal.

But this is not enough. The object at which we are looking, and which we want to diftinguifh, is not a $/$ pecies or a genus, but an individual. Of what kind ? known or unknown? Seen now for the firft time, or feen before and now remembered? This is one of the inflances in which we fhall difcover the ufe of the two articles a and the: for, in the cafe fuppofed, the article a refpects our primary perception, and denotes an individual as unknown; whereas THE refpects our fecondary perception, and denotes individuals as known. To explain this by an example: I fee an object pafs by which I never faw till now: What do I fay? There goes a beggar with a long beard. The man departs, and returns a week after : What do I then fay ? There goes THE beggar with THE long beard. Here the article only is changed, the reft remains unaltered. Yet mark the force of this apparently minute change. The individual once vague is now recognifed as fomething known; and that merely by the efficacy of this latter article, which tacitly infinuates a kind of previous acquaintance, by referring a prefent perception to a like perception already paft.

This is the explanation of the articles a and the as given by the learned Mr Harris, and thus far what he fays on the fubject is certainly juft ; but it is not true that the article THE always infinuates a previous acquaintance, or refers a prefent perception to a like perception already paft.-I Iam in a room crowded with company, of which the greater part is to me totally unknown. I feel it difficult to breathe from the groffnefs of the inclofed atmofphere; and looking towards the window, I fee in it a perfon whom I never faw before. I inftantly fend my compliments to the gentleman in the winaspy, and requeft, that if it be not inconvenient, he will have che goodnefs to let into the room a little frefh air. Of this gentleman I have no previous acquaintance; my prefent perception of him is my primary perception, and yet it would have been extremely improper to fend my compliments, \&c. to a gentleman in the window.-Again, there would be no impropriety in faying-"A man whom I faw yefterday exhibiting a fhow to the rabble, was this morning committed to jail charged with the crime of houfebreaking." Notwithftanding the authority, therefore, of Mr. Harris and his mafter Apollonitus, we may venture to affirm, that it is not effential to the article a to refpect a primary perception, or tothe article the to indicate a preeftablifhed acquaintance. Such may indeed be the manner in which thefe words are moft frequently ufed; but we Lee that there are inftances in which they may be ufed
differently. What then, it may be afked, is the import of each article, and in what refpects do they differ?
23. We anfwer, that the articles a and the are both of them definitives, as by being prefixed to the names of genera and fpecies they fo circumfcribe the latitude of thofe names as to make them for the moft part denote individuals. A soun or fubflantive, without any article to limit it, is taken in its wideft fenfe. Thus, the word man means all mankind;
"The proper Audy of mankind is man :" where mankind and man may change places without making any alteration in the fenfe. But let sither of the articles of which we are treating be prefixed to the word man, and that word is immediately reduced from the name of a whole genus to denote only a fingle individual; and inftead of the noble truth which this line afferts, the poet will be made to fay, that the proper ftudy of mankind is not the common nature which is diffufed through the whole human race, but the manners and caprice of one indivedual. Thus far therefore the two articles agree: but they differ in this, that though they both limit the fpecific name to fome individual, the article a leaves the individual itfelf unufcertained; whereas the articleтне afcertainsthe individual alfo, and can be prefixed to the fpecific name only 26 when an individual is intended, of which fomething may The indebe predicated that diftinguifhes it from the other indi- finite and viduals of the fpecies. Thus, if I fay-A man is fit for thedefinite. treafons, my affertion may appear ftrange and vague; but the fentence is complete, and wants nothing to make it intelligible: but if I fay-THE man is fit for treafons, I feak nonfenfe; for as the article the fhows that I mean fome particular man, it will be impoffible to difcover my meaning till I complete the fentence, and predicate fomething of the individual intended to diftinguifh him from other individuals.

```
"The man that bath not muffc in Dimfelf, scc.
"Is fit for treafons."
```

A man, therefore, means fome one or other of the human race indefinitely; THE man means, definitely, that particular man who is fpoken of : the former is called the indefinite, the latter the definite, article.

The two articles differ likewife in this refpect, that The difas the article a ferves only to feparate one individualob-ference heject from the general clafs to which it belongs, it cannot tween there be applied to plurals. It has indced the fame fignifi-two. cation nearly with the numerical word one; and in French and Italian, the fame word that denotes unity is alfo the article of which we now treat. But the effence of the article the being to define objects, by pointing them out as thofe of which fomething is affirmed or denied which is not affirmed or denied of the other objects of the fame clafs, it is equally applicable te both numbers; for things may be predicated of one SET of men, as well as of a fingle man, which cannot be predicated of other men. The ufe and import of each article will appear from the following example : " Man was made for fociety, and onght to extend his goodwill to all men; but a man will narurally entertain a more particular regard for the man with whom he has the moft frequent intercourfe, and enter into a ftill clofer union with the man whofe temper and difpofition fuit beft with his own."

We have faid, that the article a cannot be applied F 2
to plurals, becaufe it denotes unity : but to this rule there is apparently a remarkable exception in the ufe of the adjectives few and many (the latter chiefly with the word great before it), which, though joined with plural fubflantives, yet admit of the fingular article A; as, a few men, a great many men. The reafon of this is manifeft from the effect which the article has in thefe phrafes: it means a fmall or a great number collectively taken, to which it gives the idea of a whole, that is, of tunity. Thuslikewife a hundred, a thoufand, is one whole number, an aggregate of many collectively taken, and therefore ftill retains the article A, though joined as an adjective to a plural fubftantive; as, a bundréd years. The exception therefore is only apparent; and we may affirm, that the article a univerfat$4 y$ denotes $u n i t y$.
24. Theindefinite article is much lefs ufeful than the other ; and therefore the Greek and Hebrew languages have it not, though they both have a definite article. In languages of which the nouns, adjectives, and vorbs, have inflexion, no miftake can arife from the want of the indefinite article; becaufe it can always be known by the tersinations of the noun and the verb, and by the circumftances predicated of the noun, whether a whole fpecies or one individual be intended. But this is not the cafe in Englifh. In that language, the adjectives having no variation with refpect to gender or number, and the tenfes of the verbs being for the moft part the fame in both numbers, it might be often doubtful, had we not the indefinite article, whether the Specific name was intended to exprefs the whole fpecies or only one individual. Thus if we fay in Englifh, "Man was born fent from God,' we mult be underftood to mean that the birth of every man is from God, becaufe to the fpecific term the indefinite article is not prefixed. Yet
 no fuch meaning to any perfon acquainted with the Greck language ; as the word av $90 \omega \pi 0$, without any article, is rettricted to an individual by its concord with the verb and the participle; and the fenfe of the paffage is, a man was born (or exifted) fent from God. But though the Greeks have no article correfpondent to the article $A$, yet nothing can be more nearly rela-
 To dwpov-т he gift. In one refpect, indeed, the Greek and Englifharticles differ. The former is varied according to the gender and number of the noun with which it is affociated, being:-mafculins, nं-feminine, $\pi 0-$ neuter; and oi, ai, $\tau a$, in the piurul number: whereasthe Englifh article fuffers no change, beirg invariably тне before nouns of every gender and in both numbers. There are, however, fome modern languages which, in imitation of the Greek, admit of a variation of their article which relates to gender; but this cannot be confidered as effential to this fpecies of words, and it may be queftioned whether it be any improvement to the language. In tongues of which the nouns have no inflexion, it A greater fents a particular idea of $\int 6 x$ where in many cafes it is number of not neceffary.
25. The articles already mentioned are allowed to the Englifh be ftrictly and properly fuch by every grammarian; language . but there are fome words, fuch as this, that, any, fome, thas is comnonly fuppored:
all, other, \&c. which are gencrally faid to be fometimesurticles and fometimes pronouns, according to the
different modes of ufing them. That words fhould change their natrere in this manner, fo as to belong fometimes to one part of fpeech, and fometimes to another, muft to every unprejudiced perfon appear very extraordinary ; and if it were a fact, language would be a thing fo equivocal, that all inquiries into its nature upon principles of fcience and reafon would be vain. But we cannot perccive any fuch fuctuation in any word whatever ; though we know it to be a general charge brought againft words of almoft every denomination, of which we have already feen one inftance in the poffeffive cafe of nouns, and fhall now fee another in thofe words which are commonly called pronominal articles.

If it be true, as we acknowledge it to be, that the genuine pronoun always fands by itfelf, affuming the power of a noun, and fupplying its place, then is it certain that the words this, that, any, fome, \&c. can never be pronouns. We are indeed told, that when we fay THIS is virtue; give me тhat, the words this and that are pronouns; but that when we fay, this habit is virtue, That man defrauded wie, then are they articles or definitives. This, however, is evidently a miftake occafioned by overlooking thofe abbreviations in conftruction which are frequent in every language, and which, on account of that very frequency, have perhaps efcaped the attention of grammarians whofe fagacity has been fuccefsfully employed on matters lefs obvious.-When we fay this is virtue, it is evident that we communicate no intelligence till we add a fubftantive to the word this, and declare tohat is virtue. The word this can therefore in no inftance affume the power of a noun, fince the noon to whicli it relates, though for the fake of difparchit may be onitted in writing or converfation, muft always be fupplied -by the mind of the reader or hearer, to make the fentence intelligible, or this itfelf of any importance."When we have viewed fpeechanalyfed, we may then confider it as compounded. And here, in the firft place, we may contemplate that finthefis, which by combining fimple ternis produces a truth; then hy combining two truths produces a third; and thas others and others in continued demonftration, till we are led, as by a road, into the regions of fcience. Now this is that fuperior and moft excellent fynthefis which alone applies itfelf to our intellect or reafon, and which to conduct according to rule conftitutes the art of logic. After this we may turn to thofe inferior compofitions which are productive of the pathetic," \&c.-Here, if any where, the word this may be thought to fland by itfelf, and to affume the power. of a noun; but let any man complete the conftruction of each fentence, and he will perceive that this is no more than a definite article. Thus,-"we may contemplate that fynthefis which by combining fimple terms produces a truth; then by combining two truths produces a third truth; and thus other truths and other truth: in continned demonfration, till we are lead, as by a road, into the regions of fcience. Now this combination of truths is that fuperior and moft excellent fynthefis which alone applies itfelf to our intellect or reafon, and which to conduct according to rulc conftitutes the art of logic. After we have contemplated T Hisart, we may turn," "\&c.

The word тhat is generally confidered as ftill more equivocal than this; for it is faid to be fometimes an
article,

Chap II. $G \quad \mathrm{~K} \quad \mathrm{~A} \quad \mathrm{M} \quad \mathrm{M} \quad \mathrm{A} \quad \mathrm{R}$.
article, fometimes a pronour, and fometimes a conjuntion. In the following extract it appears in all thefe capacities : and yer, upon refolving the paffage into parts and completing the confruction, it will be found to be invariably a definite article.-"It is neceffary to that perfection, of which our prefent fatc is capable, that the mind and body fhould both be kept in action ; that reither the faculties of the one ner of the other be fuffered to grow lax or torpid for want of ufe: but aeither fhould health be purchafed by voluntary fabmifion to ignorance, nor foould knowledge be cultivated at the expence of health; for that maft enable it either to give pleafure to its poffeffor, or aflintance to others." If this long fentence be refolved into its conftituenc parts, and the words be fupplied which complete the conftrution, we fhall fee the import of the word that to be precifely the fame in each claufe. "The mind and body fhould both be kept in action; that action is neceffary to THAT perfection of which our prefent ftate is capable: neither the faculties of the one nor of the other fhould be fuffered to grow lax or torpid for want of ufe; the degree of aftion proper to prevent THAT taxnefs is neceflary : but neither fhould health be purchafed by volamtary fubmilion to ignorance, nor finould knowledge be cultivatedat the expence of health; for that bealth muft enable it either to give pleafure to its polfeffor, or affiftance to others." Again,
"He that's unkkilful will not tofs a ball:"
"A man unfkilfal (he is that) will not tofs a ball." Here the word that, though fubstituted for what is called the redative pronoun ( $\varepsilon$ ), ftill preferves unchanged its definitive import; and in every inftance except where it may be ufed very improperly, it will be found to be neither more nor lefs than a definite article.
26. It appears then, that if the effence of an article be to define and afcertain, the words this and tbat, as well as ainy, fome, all, \&c. which are commonly called pronominal articles, are much more properly articles than any thing elfe, and as fach thould be confidered in univerfat grammar. Thus when we fay, rhis picture Iapprove, but that Idelike; what do we perform by the help of the words this and that, but bring down the common appellative to denote two indiyiduals; the one as the nore near, the other as the more diftant? So when we fay, some men are virtuous, but all men are nortal; what is the natural effect of this all and some, but to define that univerfality and particularity which would remain indefinite were we to take them away? The fame is evident in fuch fentences as, some fubfances have fenfation, others want it; Choofe any way of acting, and some men will find fault,
\&c.: for here some, OTHER, and ANY, ferve all of them to deftwe different parts of a given whole ; some, to denote any indeterminate part; any, to denote an indefinate mode of acfing, no matter what; and OTHER, to denote remaining part, when a part has been afiumed already.
27. We have faid that the article is a part of fpeech fo very neceffary, that withoust it, or fome equivalent
invention ( $F$ ), mankind could not communicate their thoughts ; and that of words falling under this defcription, we know of no language which is wholly deftiture. We are aware that thefe pofitions may be controverted; and that the Latin may be inftanced as a language which, withont articles, is not only capable of communicating the ordinary thoughts of the fpeaker to the mind of the hearer ; but which, in the hands of Cicero, Virgul and Lucretius, was made to ferve all the purpofes of the moft profound philofopher, the moft impaffoned orator, and the fublimeft poet. That the Latin has been made to ferve all thefe purpofes cannot be denied, although Lucretius and Cicero both complain, that on the fubject of philo ophy, where the ufe of articles is moft conf(picuous, it is a deficient language. Bat hould we grant what cannot be demanded, that thofe two great men were unacquainted with the powers of their native tongue, our pofitions would ftill remain unfhaken; for we deny that the Latin is wholly without articles. It has indced no word of precifely the fame import with our the or the Greek $\boldsymbol{o}_{\text {; }}$ but the place of the indefinite article a might be always fupplied, if neceffary, with the numerical word zunus. It may be fo even in Englifh; for we believe there is not a fingleinftance where the words one man, one borfe, one vortue, might not be finbftituted for the words a man, a borfe, a virtue, \&c. without in the nighreft degree altering the fenfe of the paffage where fuch words occur. This fubftitation, however, can be but very feldom if ever necellary in the Latin tongue, of which the precifion is much greater than that of the Englifh would be without articles; becaufe the oblique cafes of the Latin nouns, and the inflexion of its verbs, will almoft always enable the reader to determine whether an appellative reprefents a whole fuecies or a fingle individual.- The want of the definite article тне feems to be a greater defect; yet there are few inftances in which its place might not be fupplied by this or by тнat without obfcuring the fenfe; and the Latin tongue is by no means deficient of articles correfponding to thefe two. Let us fubititute the words one and that for a and the in fome of the foregoing examples, and we fhall find, though the found may be uncouth, the fenfe will remain. Thus,
"Tuat man who hath not mufic in himielf, \&sc.
"Is fit for treafons,"--
conveys to the mind of the reader the very fame fentiment which the poet expreffes by the words " $\mathrm{T}_{\mathrm{HE}}$ man that hath not mufic," \&c. Again, "Man was made for fociety, and ought to extend his good-will to all men; but one man will naturally entertain a more particular regard for thofo men with whom he has the moft frequent intercourfe, and enter into a fill clofer union wilh that nan whofe temper and difpofition frit beft with his own." Now the words Hic and ILIE being exactly of the fame import with the words this and тнat; it follows, that wherever the place of the article the may in Engli/b be fupplied by this or by that, it may in Latin befupplied by hic or by ille. This

(E) See more of this afterwards.
(F) As in the Perfian and other eaftern languages, in which the place of our indefinite articke is fapplied by a termination to thofe nouns which are meant to be particularized.
is the cafe with refpect to Nathan's reproof of Da. vid, where the definite article is indeed moft emphatical. The original words might have been tranflated into Englifh, "thou art that man,"' as well as "thou art the man;" and in Latin they may with the utmolt propricty be rendered, "Tu es ille homo." Indeed the words hic and ilfe, and we might inftance many more, though they are commonly called pronouns, are in truth nothing but definite articles: H IC is evidently oxe; and llle is moft probably derived from the Hebrew word al, in the plural ale; which may be tranflated indifferently, either the or that. But what proves beyond difpute that thefe two words are not pronouns but articles, is, that in no fingle inftance will they be found to ftand by themfelves and affume the power of nouns. For the fake of difpatch, or to avoid difagreeable repetitions, the noun may indeed be often omitted; but it is always fupplied by the reader or hearer, when hic and ille appear in their proper place, and are feen to be invariably definite articles. We fhall give an example of the ufe of each word, and difmifs the fubject.

In the firft oration againft Catiline, Cicero begins with addreffing himfelf in a very impaffioned ftyle to the traitor, who was prefent in the fenate-houfe. He then exclaims pathetically againft the manners of the age, and procéedsin thefe words: Senatus hac intelligit, confulvidet; HIC tamenvivit. Vivit? immovere etian in fenatumvenit: fit publici confliiiparticeps. In thispaffage hic cannot be a pronoun; for from the beginning of
cord and thofe which are not, thefe variations of the article have their ufe; but in Englifh they are of no importance. Were it not that the cuftom of the lan-guage-the forma loquendi, as Horace calls it-has determined otherwife, there would be no more impro* priety in faying this or that men, than in faying fone men or the men.
29. As articles are by their nature definitives, it with what follows of courfe, that they cannot be united with fuch words arwords as are in their own nature as definite as they may ticles canbe: nor with fuch words as, being undefinable, cannot.pro- not be une. perly bs made otherwife; but only with thofe words ted. which, though indefinite, are yet capable through the articte of becoming definite. Hence the reafon why it is abfurd to fay, тheI, or тнет T ои; becaufe nothing, as will be feen afterwards, can make thefe pronouns more definite than they are of themfelves; and the fame may be faid of proper names. Neither can we fay, тне вотн, becaufe the word вотн is in its own nature perfectly defined. Thus, if it be faid-"I have read both poets,"-this plainly indicates a definite pair, of whom fome mention has been made already. On the contrary, if it be faid, "I have read two poets," this may mean any pair out of all that ever exifted. And hence this numeral being in this fenfe indefinite (as indeed are all others as well as itfelf), is forced to affume the article whenever it would become definite. Hence alfo it is, that as rwo, when taken alone, has reference to fome primary and indefinite perception, while the article the has reference to fome perception fecondary and definite, it is bad language to fay, Two THE MEN, as this would be blending of incompatibles, that is, it would be reprefenting two men as defined and undefined at the fame time. On the contrary, to fay вотн The MEN is good language ; becaufe the fubftantive cannot poffibly* be lefs apt by being defined, to coalefce with a numeral adjective which is defined as well as itfelf. So likewife it is correct to fay, the two men, these two MEN, or thosetwomen; becaufe herethe articlebeing placed at the beginning, extends its power, as well through the numeral adjective as the fubftantive, and tends equally to define them both.
30. As fome of the above words admit of no article, becaufe they are by nature as definite as niay be; fo there are others which admit it not, becaufe they are not to be defined at all. Of this fortare allinterrogatives. If we queftion about fubftances, we cannot fay, the who is this, but whoisthis? And thefame as to qualities and both quantities: for we fay, without an article what sort of, how many, how great ? Thereafon is, the article т HE refpects'beings of which we can predicate fomething: but interrogatives refpect beings about which we are ignorant, and of which we can thereforepredicate nothing; for as to what we know, interrogation is fuperfluous. In a word, the natural affociatorswith articles are ALl THOSE COMMON APPEL With what latives which denote the several genera words they AND SPECIES OF BEINGS: and it may be queftioned affociate whether, in ftrictnefs of fpeech, they are ever affociated with any other words.
31. We have faid that proper names admit not of the article, being, in their own nature, definitc. This is true, whilft eacliname is confined to one individual; but as different perfons often go by the fame name, it is neceffary to diftinguifh thefe from one another, to prevent

## Chap. II.

 G $\quad \mathrm{R} \quad \mathrm{A} \quad \mathrm{M} \quad \mathrm{M} \quad \mathrm{A} \quad \mathrm{R}$.prevent the ambiguity which this identity of name would otherwife occalion. For this parpofe we are obliged to have recourfe to adjectives or epithets. For example, there were two Grecian chiefs who bore the name of Ajax ; and it was not without reafon that Mneftheus ufed epithets when his intention was to diftinguifh the one from the other: "If both Ajaxes cannot be fared (faid he), at leaftlet mighty Telamonian Ajax come." But as epithets are diffufed through various fubjects, in as much as the fame adjective may be referred to many fubftantives, it has been faid to be neceffary, in order to render both parts of feeech equally definite, that the adjective itfelf affume an article before it, which may indicate a reference to fome fingle perfon only. It is thus we fay-Trypho the Grammarian; Apollodorus the Cyrenian, \&c. This is the doctrine of Mr Harris; from which, though we have the higheft refpect for the learning of the author, we feel ourfelves obliged to diffent. In the example given, the article тне is certainly not affociated with the words Granmarian and Cyrenian, in the fame manner in which it is affociated with the word man in the fentence-" The man that hath not mufic in himfelf," \&c. When we fay Apollodorus the Cyrenian, we may, without folly or impertinence, be akked-the Cyrenian, $W_{H a t}(\mathrm{G})$ ? And the moment this queftion is anfwered, it will be feen that the article defines not an adjective but a fubftantive. If the anfwer be the Cyrenian philofopher, the article тHE is affociated with the word philofopher, and the phrafe Apollodorusthe Cyrenian, is an abbreviation of Apollodorustrie philofopher of Cyrene. In like manner, Trypho тнegrammarian, is Tryphothe grammarian writer, or Trypho THe writer of grammar. Such abbreviations are very common. We familiarly fay THE SPEAKER, and are underftood to mean a high offiser in the congrefs or parliament; yet as/peaker is a name common to many men, we may, without impropriery, be afked, what fpeaker we mean? and if fo, we muft reply, the fpeaker of the houfe of reprefentatives. But that which is eminent is fuppofed to be generally known; and therefore, in common language, THE SPEAKER is deemed a fufficient defignation of him who prefides over the houfe of reprefentatives. Hence, by an eafy tranfition, the definite article, from denoting reference, comes to denote eminence alfo; that is to fay, from implying an ordinary pre-acquaintance, to prefume a kind of $g e$ neral and univerfal notoriety. Thus a king is any king; but the king is that perfon who is acknowledged for a fovereign by any nation, as, the king of Great Britain. In Greek too, as in Englifh, the article is often a mark of eminence; for the poet meant Homer, and the stagyrite meant $A$ ififote; not but that there were many poets befides Homer, and many flagyrites befides Ariffotle, but none equally illuftrious.
The great 32 . Before we dimils the Articie, we hall proutility of duce one example to how the utility of this fpecies of this fpecies words; which, although they may feem to be of fmall of words.
importance, yet, when properly applied, ferve to make a few general terms fufficient for expreffing, with accuracy, all the variousobjects about which mankind can have occafion to converfe. Let man be the general term, which I have occafion to employ for the purpofe
of denoting fome particular. Let it be required to exprefs this particular as unknown; 1 fay $A$ man:Known; I faythe man :-Definite; ACERTAIN man:Indefinite : ANr mian:-Prefent, andnear; this man:Prefent, and at fome diftance ; THat man:-Like to fome other: SUCH a man :-Different from fome other; anoTHER man:-An indefinite multitude; Maň men:-Adefinite multitude; a THOUSAND men:-The ones of a multitude, taken throughout; EVERY man: -The fame onestaken with diftinction; each man:-Taken inorder; FIRST man, sEcond man, \&c. : The whole multitude of particklars taken collectively; aLL men:-The negation of that multitude; no man:-A number of particulars prefent and near; THESE men:-At fome dijlance, or oppofed to others; тнOSE men:-A number of individuals feparated from another number; orHER men:-A fmall indefnite number; few men:-Aproportionally greater number; MORE Men:- A maller number: FEWER men:-And fo on we might go almoft to infinitude. But not to dwell longer upon this fubject, we fhall only remark, "that minute changes in PRiNCiPles lead to mighty changes in effects; fo that Principles are well intitled to regard, however trivial they may appear."

## CHAPTER ILI.

## Of Pronouns, or Substantives of the fecond order.

33. To men who are neither intoxicated with their own abilities, nor ambitious of the honour of building new fyftems, little pleafure can accrue from differing upon points of fience from writers of great and deferved reputation. In fuch circamftances a man of modefty, althongh he will not upon the authority of a celebrated name adopt an opinion of which he perceives not the truth, muft always advance his own notions with fome degree of diffidence, as being confcious that the truth which he cannot perceive, may be vifible to a keener and more perfpicacions eye. In thefe circumftances we feel ourfelves with regard to fome of the moft celebrated writers on grammar, from whom, concerning one or two points, comparatively indeed of but little importance, we have already been compclled re. luctantly to differ. In treating of pronouns we are likely to deviate ftill farther from the beaten track; but that we may not be accufed of acting the part of dogmatifts in literature, and of claiming from others that implicit confidence which we refufe to give, we fhall ftate with fairnefs the commonly received opinions, point out in what refpects we think them erroneous, affign our reafons for calling them in queftion, and leave our readers to judge for them民elves. The moft celebrated writer in Englith who has treated of pronouns, and whom, fince the publication of his Hermes, moft other writers have implicitly followed, is Mr Harris, who, after a fhortintroduction proceeds thus:
34. "All converfation paffes between individuals ${ }_{3} 2 \pi$ who willoften happen to be till that inftant uracquainted monly fupwit's each other. What then is to be done? How fhall pofed imthe fpeaker addrefs the other, when he knows not his port of the: name? or how explain himfelt by his own name, of perional which the other is wholly ignorant? Nouns, as they pronoms.
have been defcribed，cannot anfwer this pirpofe．The firft expedient tupoin this occafion feems to have been point ing，or indication by the finget or hand；fome traves of which are ftill to be obferved，as a partof that action which naturally attends our fpeaking．Bit the an－ thors of language were not content with this：they invented a race of words to fupply this pointing；which words，as they always flood for fubflantives or nowns were characterized by the name of pronouns．Thefe alfo they diftinguifhed into three feveral forts，calling them pronouns of the firft，the fecond，and the third perfon，with a view to certain diftinctions，which may be explained as follows．
＂Suppofe the parties converfing to be wholly unac－ quainted，neither name nor countenance on either fide known，and the fubject of the converfation to be the fpeaker bimefelf．Here to fupply the place of pointing， by a word of equal power，the inventors of language furnifhed the fpeaker with the pronown I；I write，I fay，I defire，\＆cc．：and as the fpeaker is always prin－ cipal with refpect to his own difcourfe，this they called，for that reafon，whe pronoun of the firft per－ fon．
＂Again，fuppore the fubject of the converfation to be the party addreffed．Here，for fimilar reafons，they invented the pronoun тнOU；THOU writeft，THOU walkeft，\＆c．：and as the party addreffed is next in dig－ nity to the fpeaker，or at leaft comes next with refer－ ence to the difcourfe，this pronoun they therefore call－ ed the pronoun of the fecond perfon．
＂Laftly，fuppofe the fubject of converfation neither thie fpeaker nor the party addreffed，but fome third ob－ ject different from both．Here they provided another pronoun，he，＇SHE，orit；which，in diftinction to the two former，was called the pionoun of the third perfon： And thus it was that prontouns came to be diftinguifhed by their refpective persons．＂

36．The defcription of the different persons here given is taken，we are told，from Priscian，who took it from Apollonfus．But whatever be the deference due to thefe ancient mafters，their learned pupil，though －guided by them，feems not to have litit upon the true and diftinguifhing characteriftic of the perfonal promouns． He fuppofes，that when the names of two perfons converfing together are known to each other，they． may，by the ufe of thele names，exprefs all that the perfonal pronouns exprefs：but this is certainly not true．To us，at leaft，there appears to be a very ma－ terial difference between faying，＂George did this，＂ and＂I did this；＂nor do we think that the power of the pronoun would be completely fupplied by the name， even with the additional aid of indication by the band． So when one man fays to another，with whom he is converfing，＂7ames did fo and fo；＂it is furely not equivalent to his laying，＂you did fo and fo．＂If fuch were the cafe，one might pertinently afk，when both perfons are known to each other，Why do they ufe the perfonal pronozns？Mr Harris tells us，that ＂when the fubject of converfation is the fpeaker him－ felf，he ufes I；and when it is the party addreffed，he ufes тно⿱日，＂But in fact the nature of the perfonalpro－ neuns has no fort of connection with the fubject of con－ verfation，whether that converfation relate to the fpeaker， the party addrelfed，or a Greek book．In this fentence， ＂I fay that the three angles of every triangle are equal to two right angles，＂＇the fpeaker is furely not the firb．
jict of the difcourfe：nor is the party addreffed，but the trath of his alferticas，the jublject of difcourle in the follow－ ung Sentence；－＂Yozy ay that Horne Tooke＇s Diserlions of Furley is the moft mafterly treatife on grammar，fo far as it goes，that you have ever feen．＂Alr Hairis ufesthe pluafe，becoming the fubject of conver fation，in no other fenfe than that when the fpeator has occafion to mention himself，he ufes $I$ ；when the party addreffed， THOU；and when fome other perfon or thang， $\mathrm{HE}, \mathrm{SHE}$ ，or IT ：but we know that he may ufe other words，by $n 0$ means equivalent to the two firff of thefe pronouns，which will fufficiently mark himfelf，and the party addreffed； and that he may ufe indifferently，and without the fmalleft injury to the fenfe，either the third promoun，or the word for which it is merely a fubftutute．A man who bears various characters，may defign himself by any one of them．Thus $M_{R}$ Pitt may feeak of him－ felf as firft tord of the treafury，chancellor of the exche－ quer，or member for the univerfity of Cambridge；and in each cafe he wrould be what Mr Harris calls the fubjeCZ of converfations：yet every one feels that none of thefe de－ Gignations is equivalent to $I$ ．What thea is the force of the perfonal pronouns？

37．It appears to be limply this：The farft denotes The real the／peaker，ascharacterized by thepresent act import of of speaking，in contradiffindtion toevery other character them． which he may bear．The facond denotes the party ad－ dreffed，as characterized by the present cir－ CUMSTANCE OF BEING ADPRESSED，in contradifinc－ tion to every other character，\＆c．：And what is called the perfon of the third pronoun is merely anegation OFTHEOTHER TWO，as the neuter gender is a negation of the mafouline and fensinine．It this accomut of the perfonal pronouns be true，and we flatter ourfelves that its truth will be obvious to every body，there is but one way of exprefling by other words the force of the pro－ nouns of the firfl and fecond perfon．Thus，＂The perfon who now fpeaks to you did fo and fo，＂is equiva－ lent to＂ 1 did fo－and fo；＂and＂The perfon to whom I now addrefs myfelf＇did fo and fo，＂is equivalent to ＂You did fo and fo．＂

Hence we fee why it is improper to fay the 1 or the тнOU ；for each of thefe pronouns has of it $/ \int$ elf the force of a noun with the definite article prefixed，and denotes a perfon of whonk $\int$ omething is predicated，which diffinguifh－ es him from all other perfons．I is the perfon who now Speaks，тноU is the perfon who is now addreffed by the Speaker．Hence too we fee the reafon why the pronoun I is faid to be of the firfl，and the pronoun тноU of the fecond perfon．Thefe pronouns can have place only in converfation，or whon a man，in the character of a public fpeaker，addreffes himfelf to an andience；but it is obvious that there muf be a fpeaker before there can be a bearer；and therefore，that the pronouns may fol－ low the order of nature， 1 ，which denotes the perfon of the fpeaker，muft take place of $T H ロ U$ ，which denotes the perfon of the bearer．Now the fpeaker and the bearer being the only perfons engaged in converfation or declamation，$I$ is with great propriety called the pronoun of the firft，and THOU the pronoun of the fe－ cond perfon．We have faid，that，with refpect to pro－ nouns，the third perfon，as it is called，is merely a nega－ tion of the othertwo．This is evident from the flighteft attention to the import of thofe words which are call－ ed pronouns of the third perfon．HE，SHE，orit，denotes not the perfon either of the Speaker or of the hearer；

## Chap. HI. $\quad \mathbf{G} \quad \mathrm{R} \quad \mathrm{A} \quad \mathrm{M} \quad \mathrm{M} \quad \mathbf{A} \quad$ R.

and, as we have juf obferved, no other perfon can have a thare in converfation or declamation. An abfent perfon or an abfent thing may be the fubject of converfation, but cannot be the fpiaker or the perfon addreffed. He, she, and it, hou ever, as they find by themfices, and affume the powir of nouns, are very properly denominated prunouns; but they are nut pergonal pronouns in any other fenfe than as the negation of fex is the ucuter gender.
38. We have already feen that nouns admit of num ber; pronotn"s, which are their fubntitutes, likewife admit of number. There may be many fpeakers at once of the fame fentiment, as well as one, who including himfelf, fpeaks the fentiment of many : fpeech may Tikewife be addreffed to many at a time, as well as to ONE; and the fubject of the difcourfe may likewife be many. The pronoun, therefore, of every one of the perfons mult admit of number to exprefs the fing uflarity or plurality. Hence the pronoun of the firft perfon $I$, has the plural we; that of the fecond perfon thou has the plural ye or you; and that of the third perfon he, she, or it, has the plural they, which is equally applied to all the three genders.

The Greeks and Romans, when addreffing one perfon, ufed the pronoun in the fingular number thou; whereas, in the polite and even in the familiar tyle,
34 We, and many orher modern nations, ufe the plural The fecond you. Although in this cafe we apply you to a fingle perfonal perfon, yet the verb muft agree with it in the plural pronoun number; it muft necefarily be, you have, not you haft. uled in the You was--the fecond perfonpluralof the pronoun placed pluralnum- in agreement with the firft or third perfon fingular of ber when the verb, is an enormous, though common, folecifm, perfon is which ought to be carefullyavoided. In very folemn addreffed. Ayle, as when we addrefs the fuprene Being, we ufe тhou-perhaps to indicate that be is Cod alinne, and that there is none like unto him; and we fometimes ufe the fame form of the pronoun int contemptuous or very familiar language, to intimate that the perfon to whom we fpeak is the meaneft of human beings, or the deareff and moft fumiliar of our friends. A king, exerting his authorjty on a folemn occafion, adepts the plural of the firft perfon, "we frictly command and charge;" meaning, that he aets by the advice of counfellors, or rather as the reprefentative of a whole people. But in all cafes in which the ufe of the pronoun deviates from the nature of things, the verb in concord deviates with it; for, as will be feen afterwards, thefe two words univerfally agree in number and perfon.
39. But though all thefe pronouns have number, neither in Greek, Latin, or any modern langnage, do nouns of the firt thond of the $f r f f$ and fecond perfon carry the diftinctions fecond per- of fex. The reafon is obvious( H ), namely, that fex and fons have Vol. VIII.
all other properties and attributes whatever, exaept thole mentioned above as defcriptive of the natizre of thefe pronouns, are foreign from the intention of the fieaker, who, when he ufes the pronoin $I$, means the person who now speaks, -no matter whether man or woman: and when the pronoun thou-Theper-son-no matter whether man or woman---то whom he now addresses himself-and nothing more. In thig re But the pronoun of the third perfon denoting neither fpect the the fpeaker nor the bearer, but the fubject of the dif- pronoun of courfe, and being merely the fubftitute of a noun which may be either mafculine, feminine, or neuter, mult differsfrom of neceffity agree with the noun which it reprefents, the fint and and admit of a triple diftipction fignificant of gen-fecond. der. In Englih, which allows its adjectives no genders, this pronoun is HE in the mafculine, SHE in the feminine, and IT in the neuter; the utility of which diftinction may be better found in fuppoling it away. Suppofe, for example, that we fhonld in hiftory read thofe words : He caufed bim to deflruy bimand were informed that the pronoun, which is here thrice repeated, ftood each time for fomething different ; that is to fay, for a man, for a woman, and for a city, whofe names were Alexander, Thais, and Ferfepolis. Taking the pronoun in this manner-divefted of its gender-how would it appear which was defroyed, which the deftroyer, and which the caufe that moved to the deftruction? But there is no ambignity when we hear the genders dittinguifhed: when we are told, with the proper diflinctions, that SHE caufed him to deflroy It, we know with certainty, that the pronoter was the woman; that her inflrument was the bero; and that the fubject of their cruelty was the unfortunate city:-From this example we would be furprifed how the Italians, French, and Spaniards, could exprefs themfelves with precifion or elegance with no more than two variations of this pronoun.
40. Although, in every language with which we are The cafes facinted, there is but one pronoun for each of the of profirft and fecond perfons; and although it is obvious nouns. from the nature and import of thofe words, that no more can be neceflary ; yet the mere $E_{n g} / 2 / b$ reader may perhaps be puzzled with finding three difinet words applied to each; I, MINE, and ME, for the firft perfon; thou, thine, and thee, for the fecond. The learned reader will fee at once that the words mine andme, THINE andTHFE, are equivalent tothe genitive and accufative cafes of the Latin pronouns of the firft and fecond perfons. That mine is a pronoun in the poffeffive cafe, is obvious; for if I were afked " whofe book is that before me?" I hould reply"It is mine ( 1 );" meaning that it belongs to me.
( H ) The reafon affigned by Mr-Harfis and his followers, is, that " the fpeaker and hearer being generally prefent to each other, it would have been fuperflous to have marked a diftinetion by art, which from nature and even drefs was rommonly apparent on both fides." This is perhaps the beft reafon which their defcription of the perfonal pronouns admits, but it is not fatisfactory; for the fpeaker and hearer may meet in the dark, when different dreffes cannot be diftinguilhed.
(I) If we miftake not, Dr Johnfon has fomewhere affected to ridicule Bifhop Lowth for confidering the word mine as the poffefive cafe of the pronoun of the firf perfon. According to the Boctor, mine is the fame word with the prononinal adjegtive my ; and was anciently ufed before a vowel, as my was before a confonant. This is net faid with the great Lexicographer's ufual precilion. That mine was anciently ufed before a vowel is certain ; but it does not therefore follow, that it is the fame word with my. If it were, we might on every

That the word ME is the fame pronoun in the safe which the Latin grammarians call the accufative, is evident from the import of that word in the fentence HE ADMIRES me, where the admiration is fuppofed to proceed from ( K ) the perfois fooken of to the perfon who $\mathrm{fp}: a \mathrm{ks}$. It appears therefore, that though Englifh nouns have only two cafis, the nominative and poffeflive, the pronauns of that language have three, as $I$, MINE, ME; THOU, THINE,THEE; HE, HIS, HIM, \&c. That thefe are cafes, can be queftioned by no man who admits that mei, misi, mue, are cafes of the Latin pronouns eco. Bothpronouins, the Latin and the Englifh, are irregularly inflected : and perhaps thofe words which are called the oblique cafes of each may have originally been derived from nominatives different from EGO and I; but there nominatives are now loft, and neei and minehave, beyond all difpute, the effect of the genitives of the Latin and Englifh pronouns of the firft perfon. Thefe variations, however, cannot be looked upon as an effential part of language, but only as a particular refinement invented to prevent the difagreeable repetition of the pronoun, which muft frequently have happened without fach a contrivance. This feems to have been the only reafon why pronouns have been endowed with a greater variety of calfes than zouns. Noitzs are in themfelves greatly diverfified. Every genus and every /pecies of objects has a diftinct name, and therefore the famenefs of found does not fo often occur among them as it would among the pronouns without cafes, where the fame, 1, thou HE, SHE, or IT, allfwers for every object which occurs in nature: but by this diverfity in the form of the words, the cacophonia, which would be otherwife difgufting; is in a great meafure avoided. It is probabiy, for the fame reafon, that the plural of each of thefe pronouns is fovery different from the fingular. Thas from I, MINE, ME, in the fingular, is formed, in the plural, we, ours, us; from thou, thine, andthee, yeor you, yours, you; and from he, She, it, his, hers, its, him, her, it, in the fingular, they, theirs, them, in the plural. In all of which there is not the leaft refemblance between the fingular and the plural of any one word : and exceptinthe, his, him; it,its; they, Theirs, тнем; there is not any fimilarity between the different cafes of the fame word in the fame number.

## The firit

 and fecond perfonal pronouns coalefce with the third.lefence of the pronouns of the firft and fecond perfons is likewife impoffible.
42. 1, THOU,HE,SHE, and IT, are all that are ufually called perfonal pronouns. There is another ciafs of words, which are called fometimes pronominal adjectives, fometimes adjective pronouns, fometimes polfe five pronouns; and by one writer of grammar they have been moft abfurdly termed pronominal articles. It is not worth while to difpute about a name; but the wordsin queftion are MY,THY, HER, YOUR, OUR,THEIR. Thefe words are evidently in form of adjectives: for, like other Englifh adjectiyes, they have no variation to indicate either $\dot{g} e$ edder, $n u m b e r$, or cafe; and yet theyare put in concord with nouns of every gender and bothnumbers, as my wife, my son, my book-her husband, HERSONS, HERDAUGHTERS, \&c. But though intheform of adjectives, they have the power of the porfonal pronouns in the polfeflive cafe: MY buok is the book of ME, or the book of him Who Now SPEAKS; OUR HOUSE is the houfe of us, or the boufeoccupied bythe PERSONS WHO NOW SPEAK; HER HUSBAND, is the bufband of a wönan who can be known only from fomethinig preceding in the difcour $\int$ e; and THEIR PROPERTY is theproperty of them-of any perfons, whether mes or women, or both who have been previonflymentioned. Words which have the form of adjectives, with the power of pronouns, may withoutimpropriety, be called pronominal atjectives; and fuch is the name by which we fhall hencciorth diftinguin them. To thefe pronominal adjectives, as well as to the perfonal pronouns, are fubjoinedine words own and felf-in the plural felves; in which cafe they are emphatical, and imply a filent contrariety or oppofition. Thus, 1 live in my own houfe; that is, not in a bired boufc. This I did with my ownhand; that is, not by proxy. This was done by mydolf; rhat is, not by another. The word feff fuljoined to a perfonal pronoun forms alfo the reciprocal pronom; as, we bart ourfelves by vain rage; he blamed himfelffor his misfortune. Himfelf, itfelf, themfelves, are fuppofed by $W$ allis to be put, by corruption, for bis felf, its felf, their felves; fo that felf is always a fubftantive or noun, and not a pronoun. This feems to be a juft obfervacion : for we fay, the man came himfelf; they went thenfelves; where the words bimfelf and themfelves cannot be acculatives but. nominatives, and were anciently written his felf, their felves

There are other words whicli are ufually ranked under the clafs of pronouns; as who, which, what. Thefe, when employed in alking queftions, are called interrogative pronouns; though a name more characteriftic might furely be found for them. Their import, however, will be more eafily afcertained after we have confidered another fpecies of pronouns, which have been denominated relatives, and with which they are intimately connected.
43. The pronouns already mentioned may be called The relaprepofitive, as may indeed all fubftantives, becaufe tive prothey are capable of introducing or leading a fentence: noun,
but
cafion fubftitute either of thefe for the other, withont offending againgrammar, however we might injure the found ; but we apprehend that this is not the cafe. "That book is mine," is good Englifh; bat "that book is my," would be a grofs folecifm: the reafon is, that mINE is a genuine pronoun, and ftands by itfelf with the power of a noun; but my , being an adjective, cannot ftand by itfelf.
(r) See Chap. I. 19. on the Cafes of Noms.
but there is another pronoun which has a character peculiar to itfelf; and which, as it is never employed but to connect fentences, and muft therefore have always a reference to fomething preceding, is called the fubjunctive or relative pronoun. This pronoun is in Greek, is, $u, \dot{\delta}$; in Latin, QUe, QUov; and in Englifh, who, which, that.
44. In order to determine with precifion the nature and import of the relative pronown, it will be neceffary to afcertain the powers which it contains, or the parts of feeech into which it is capable of being refolved. Reprefents Now, it is obvious, that there is not a fingle noun, or any noun or prepoGitive promoun; prepofitive tronoun, which the relative is not capable of reprefenting: for we fay, I, who faw hint yefterday, cannot be miffaken: you, who did not fee him, may bave been mifinformed; THEY, wHO neither faw nor beard, can know wothing of the matter; the things, which he exhibited, were wonderful. From thefe examples it is apparent, in the firft place, that the relative contains in itfelf the force of any other pronoun; but it contains fomething more.
45. If from any fentence in which there is a relative, that relative be taken away, and the prepofitive pronoun, which it reprefents, be fubftituted in its ftead, the fentence will lofe its bond of union, and ftand quite loofe and unconnected. Thus, if inftead of faying the mantis wife who Jpeaks little, we fhould fay the man is wife нe fpeaks little, the fentence would be refolved into two ; and what is affirmed of the man's wifdom, would have no connection with the circomftance of his /peaking little. Hence it is evident, in the fecond place, that the relative contains the force of a connective as well as of the prepofitive pronoun. What kind of connection it denotes, is next to be afcertained.
46. It may be laid down as a general principle, "that, by means of the relative pronoun, a claufe of a fentence, in which there is a verb, is converted into the nature of an adjective, and made to denote fome attribute of a fubfance, or fome property or circumflaisé belong. ing to the antecedent noun." Thus, when it is faid, homo qui prudentia praditus eft, the relative claufequi prudentia praditus eft, expreffes nothing more than the quality of prudence in concrete with the fubject homo, which might have been equally well ex. preffed by theadjective prudens. In like manner, when we fay, vir fapit qui pauca loquitur, the relative claufe expreffes the property of fpeaking little as belonging to the man, and as being that quality which condi-
tates, or from which we infer, his wifdom; butif there were fuch a word as pauciloquens, that quality might very properly be expreffed by it, and the phrafe vir fapit pauciloquens would exprefs the fame affertion with vir fapit qui pauca loquitur.

Now if a relative claufe expreffes that which might be exprefled by an adjective, the prefumption is, that it may be refolvedinto the fame conftituent parts. But every adjective contains the powers of an abffract fubAantive, together with an exprefion of connection; and may be refolved into the genitive cafe of that fubftantive, or into the nominative with the particle of prefixed, which, in Englifh, correfponds to the termination of the genitive in the ancient languages. That the member of a fentence, in which there is a relative, may, in every inftance, be analy fed in the fame manner, will be apparent from the following examples. Vir quifapit, vir fapiens, and vir lapientioe; " a man who is wife, a wife man, and a man of wifdom;" are certainly phrafes of the fame import. Again, homu, cui ingratus efl animus, malus fit amicus, may be tranflated
 into Englifh, "the man of ingratitude is a bad friend."
47. Thus then it appears, that the relative pronoun contains in itfelf the force of the prepofitive pronoun, together with that connection implied in Englifh by the prepofition of, and in the ancient languages by the genitive cafe. When one fays, virfapit qui pauca loquitur, the relative claufe qui pauca loquitur expreffes that attribute of the man from which his wifdom is inferred : it is conceived by the mind, as ftript of its propofitional form, and ftanding in the place of a fubftantive noun governed in the genitive cafe by $\begin{aligned} \\ \text { r. The }\end{aligned}$ whole fentence might be thos tranfated, of the man of little fpeaking is wife;" or did the ufe of the Englifh language admit of it, "the man of be fpeaks little is wife." In like manner, when it is faid, "Man who is born of a woman is of few days and full of trouble;" -the relative claufe is equivalent to an abftract roun in the genitive cafe, and the whole might be expreffed in the following manner, "man of he is bork of a woman is of fcw days and full of trouble."

We are fenfible, that thefe expreffions into which, in the inftances adduced, we have refolved the relative claufes, will appear extremely uncouth and offenfive ; but we mean not to recommend them as common modes of phrafeology. Againtt their being employed as fuch, prefent ufe loudly remonftrates (i). They are introduced only with a view to fhow the true import of the
relative

## 44

 Of therame import with the Englith prepolition of.relative pronoun; and for that purpofe they are well adapted. That pronoun feems to be of ufe only when there is a deficiency of adjectives or fubftantives to denote fone complex attribute by which we want to limit a general term or exprefion. Wheresuch adjectives or fubftantives exift in language, we may indeed ufe ohe relative or not at pleafure. Thas we may fay homoqui grandia loquitur, or bomo grandiloquus; becaufe the adjective and the relative claufe are precifely of the fame meaning. But if the Latins were called upon to tranllate aveporos autodifan tes, we believe they mult have made ufe of the relative pronoun, as we know not any correfpondent adjective in their language.

45 ${ }^{3}$ Mr HarTis's miftake on thi fubject.
48. The learned and ingenious Mr Harris has, in his Treatife on Univerfal Grammar, given an analyfis of the relative pronounvery different from that which has been given us. The refult of his enquiry is, that the relative is equivalent to another pronoun, together with an expreflion of connection of that kind which is denoted by the particle and. This analyfis he exemplifies, and endeavours to confirm by the following fentence $: *$ Light is a body which moves with great celerity." "N Now, fays he, inftead of which fubftitute the words and it, and in their united powers you fee the force and character of the pronoun here ireated. But let any one attentively confider thefe two:expreffions, - "c Light is a body which moves with great ce-lerity,"-and "Lighris-a body and it moves with great celerity;" and he will find that they are not precifely equivalent. For to fpeak in the language of logic, there is in the fir $f t$ but one propodition, of which the fubject is light, and the predicate a complexterm exprefled by the words-body which moves with great celerity. In the fecond there are two propolitions; or two predications concerning light ;-firft, that it is a body; and fecondly, that it moves with great celerity. The relative claufe, in the firft cale, expreffes a property of the antecedent body, which with that property is predicated of the fubjeet light; in the fecond cafe; this property is removed from the predicate of which it was ais effential part, and is improperly converted into a
new predication of the fubject. The fentence may be refolved upon our principles, and its precife import preferved; as-"s Light is a body of it moves with great celerity ;" the claufe - "it moves with great celerity," is.conceived by the mind as having the force of an ab. ftrait fubfantive, and is conneted with the antecedent body by the prepofition of; anfwering to the termination of the genitive cafe. This abrtract fubitantive thus connected expreffes a quality of the body light. But by this example Mr Harris's doctrine is not exhibited in all its abfurdity : ler us try it by another.

Suppofe the following aflertion to be true; "Charles XII. was the only monarch who conquered kingdoms to beftow them on his friends." Hereit is evident there is bat one propotition, of which the predicate is exprefled by the words-" "only monarch who conquered kingdoms to beftow them on his friends;" fo that the relative claufe is a necelfary part of the predicate, and has, like an abftract nown in the genitive cafe; the effect of modifying the general term monarch. Refolve this fentence on Mr Harris's prin ciples, and you have two propofitions, of which the firlt is a notorious falfehood:-" Charles XII. was the only monarch; and he conquered kingdoms to befow them on his friends." Butinftead of and fubftitute of-faying, "Charles XII, was the only monarch of he conquered kingdoms to beftow them on his friends," and you preferve the true import of the expreffion ( M ).
49. Are there no cafes, then, in which the relative may be refolved into the connective and with a prepofitive pronoun ? Undoubtedly there are, arid we hall now endeavour to afcertain them.

Adjectives in language have two different effects In fome upon the fubftantives to which they belong, according cafes Mr to the nature of the atribute which they exprefs. If the attribute expreffed by the adjective be competent to all the fpecies of which the fubtantive is the fpecific name, it is plain that the adjective does not mod!fy or limit the fubftantive, for this obvious reafon, that nothing can madify which is not difcriminative. Thus, when
objects-man and little fpeaking; only in the one it is prefixtd to a houn, in the other to an affertory claufe of a fentence, the import of which is to be taken as a noun. Cuftom hath indeed dc.ermined that prepofitions thall more frequently govern a noun than a nominative and a verb; but they are, in their own nature, equally well adapted to anfwer both purpofes.

But, as the pronoun of the third perfon is metely the fubftitute of fome noun, an objector may afk, What noun is here reprefented by be? "The man of be $\int p e a k s$ little is wife!" Who is meant by the pronoun be? We anfwer, the man who is declared to be wife. The objection. proceeds from inattention to the radical fignification of the word of, which a late ingenious writer has hown to be the fragment of a Gu hic or AngloSaxon word, fignifying confequence or offspring. If this be admitted, and, after the proofs which he has given, we think ic cannot be denied, the uncouth phrafe, "The man of be fpeakslittle is wife," may be thus refolved, "The man, a confequence (of his mind) be fpeaks little, is wife;" or, in other words, "The man, in confequence of his fpeaking little, is wife." The fame acute writer, Mr Horne Tooke, has fhown, that of and for, though of differentradical meanings, may often be fubftituted the one for the other without injury to the fenfe. Let this fabfitution be made in the prefent inflance, and the propriety of the phrafe will be apparent; "The man is wife, for he fpeaks little." Jt muft be remembered, however, that fuch a fubftitution cannor be made in every infance, becaufe for fignifies caufe, and of fignifies confequence.
(м) Mr. Harris was probably led iuto his opinion, from confidering the Latin qui or quis as compounded of que and is (fee Hermes, p. 81, 82. edit. 3d.) But the notion of Perizonius is perhaps better founded, who in his notes ad Sai.ct. Minerv. confiders it as immediately taken from the Greek ris, which in the Doric made His; and in the Latin $q$ uis. For it feems highly probable, as fome ingenious writers have endeavoured to fhov, that the Latin is a dialect of the Greek. Of this at leaft we are certain, that many words in the former are immediately adopsed from the latter.
when Horace fays, "Prata canis albicant pruinis," the adjective canis denotes a quality common to all boarfroft; and therefore cannot modify the fitbfantive, becautic it adds nothing to Ehe conception of which chat fubfantive is the name. But when the attribute exprelled by the adjective is competent ro fome individuals only of the fpecies of which the fubftantive is the name, the adjective has then the effect of modifying or limiting the fubftantive. Thus, when one fays vir bomus, he makes ufe of an adjective which modifies the fubftantive vir, becaufe it expreffes a quality or attribute which does not belong to allmen.

The claufe of a fentence, in which there is a relative, as it is in every other refpect, fo is it in this, equivalent toan adjective; it either modifies, or does not modify, the antecedent, according as the attribute which it expreffes is or is not characteriftic of the fpecies to which the antecedent belongs. Thus, when it is faid, "Man, who is boru of a woman, is of few days'and full of troubde," the relative claufe-who is born of a zoman, exprefles an attribute common to all men, and therefore cannotinodify. In like manner, when we fay -" Socrates, who tanght moral philofophy, was virtuons,"-the claufe, who taught morat philofophy, does not modify. In both thefe inflances the relative claufe might be omitted; and it might be faid with equal truth, "Man is of few days and fall of trou-ble,"-and " Socrates was virtuous."

But if it be faid, vir fapit qui pauca loquitur, the relative claufe-quipanca loquitur, modifes the antecedent vir ; for it is not affirinied of every man, that he is wife, but only of fuch men as $/ p$ pak $: 1 i t t l e$. So-"Charles XII. was the only monarch who conquered king toms to beftow them on his friends;" and, " the man that endureth to the end fhall be faved;" with many more examples that will occur to every reader.
Now it will be found, that it is only when the relacafes are. tive claufe expreffes fuch a property or circumfance of the antecedent as does not limit its fignification, that the relative pronoun can be refolvediuto a prepofitioe pronoun with the conjunction and, and that in thefe cafes the relative clatfe itfelf is of very little importanse. Thus in the afferion,-" Charles XII, was the only monarch who conquered kingdoms to beflow them on his friends,"-where the relative claufe is reffrittive, the who cannot be refolvedinto and be confiftently with truth or common fenfe. But in the expreffion, "Man, who is born of a woman, is of few days and full of trouble," the relative who may be fo refolved, at leaft without violating truth;-" Man is of few days and full of trouble, akd he is born of a woman." The only difference between the fentence with the relative' who, and the fame fentence thus refotved,-is-that, in the former cafe, it contains but one predication; in the latter two, and thefe but loofely connected.
50. Thus then it appears that the general analyfis of the relative pronotin is into the particle of, and a prepofitive pronoun ; but that there are alfo occafions on which it may be refolved into a prepofitive pronoun and the particle and, without materially altering the fenfe. Now what is the reafon of this diftingtion?

If the relative clanfe be equivalent to an adjective, or to an abftract fubflantive in the genitive cafe, it is eafy to fee that the relative itfelf may, in every inflance be,
refolved into another pronoun anid the particte of'; bat it will not perhaps be quite fo evident how it hould in any inflance be refolved by and. This laft analy lis has its foundation in the nature of the particles of and and; or, to fpeak more properly, in the nature of the attribute which the relative claufe cxpreffes. Both the particles of and and are ufed to link or join conceptions together ; but with this difference, that of has the effect of making the conceptions it connects figure in the mind as one object; whereas the conceptions comnected by and are ftill conccived Separately as before. To explain ourfelves by an example: fappofe we take two words, man and virtue, which denote two diflinct ideas or conceptions, and join them together by the particle of, faying nan of virtue; the mind no longer views them fepara ely as fignificant of two conceptioins, but of one. Take the fame words, and join thein together by the particle and, faying man and virtue. the conceptions denoted by man anid virtue are fill viewed feparately as two ; notice is only given that they are collaterally connected.

This being the cafe, it follows, that when the relative modifies the antecedent, or, in other words, when the relative claufe and the antecedent denote but one conception, the relative mult then be refolved by of, in order to preferve this unity of conception. But when the relative does not modify the antecedent; that is, when its claufe does not exprefs any neceffary part of a complex conception; then the conceptions or ideas denoted by the relative claufe and the antecedent may be viewed feparatily as two ; and therefore the relative may be refolved into the correfponding prepoiitive pronoun and the particle and.

To flate this reafoning in a light fomewhat different. As every relative claufe, which expreffes an attribute that is not applicable to a wubole genus or fpecies, muft neceflarily modify foine generalterm, that is, reflrict its fignification; and as that general term muft belong either to the jubject or to the predicate of a propofition ; it is evident, that every fuich relative claufe is a neceffary part of that fubject or predicate in which its antecedent flands. If therefore a relative claufe, which modifes, be taken aiway either from the fubject of the predicate of a propolition; or if that connettion, in confequence of which it modifies, be diffotved (which is always done when the relative is refolved by and) ; the propofition itfelf will not hold true. The reafon is, that the futject or the $p$ prdicate becomes then too general: for, in the one cale, fomething is predicated of a whole genus or/pecies, which can be predicated only of fome individuals of that genus or fpecies : and in the other, a general predication is made where only a particular one can be applied. Thus, if it be faid, "All men who tranfgrefs the laws are deferving of punifhment;" the fubject of the propofition is expreffed by the words, "all men who tranfgrefs the laws." Take the claufe of the relative "who tranfgrefs the laws"-away, and fay, " all men are deferving of punilhment;" and you have a propofition which is not true, becaufe that is affirmed of the whole-Species which can be affirmed only of fome individudts. Retaining now the claufe of the relative, but refolving it by and, you have the fame propofition as before ; and together with it, in this inflance, another which is equally falfe :-"All men, andthey tranf.
grefs the laws, are deferving of punifhment ;'that is, " all men are deferving of punihment, and all men trangrefs the laws.'

But when the attribute expreffed by the claufe of the relarive is charasterittic of the genus or /pecies of the antecedent, and confequently applicable to every individual which that genus or fpecies comprehends, therelative claufe may be entircly omitted without affeeting the truth of the propofition, which is already as general as it can be. As in this cafe the import of the relative claufe is not reftrictive of the fignification of the antecedent, it is of little confequence whether the attribure be reprefented by the connective part of the relative, as of, the antecedent, or be affirmed to belong to the antecedent in a feparate alfertion. Thus it matters not much, whether we fay, " Man, who is fubject to death, ought not to be too much elated;' that is, according to our analy fis,_-" Man of he is fubject to death, ought not to be too much elated; " or, forming the relative claufe into a feparate afertion, and connecting the two by the particle and, we fay, "Man, and he is fubject to death, ought not to be too much elated." In the one fentence, indeed, the reafon is implied why man fhould not be too much elated, viz. his being fubject to death : in the other no reafon is aftigned for this; we only affirm that man is fubject to death, and likewife that he fhould not be too much elated : but as both affirmations are equally true and evident, it is of little confequence, in fuch a cafe as this, whether the reafon

48
-Conclufion refpecting therelative pronoun. upon which either is founded be implied or not.

51 . From the whole of this tedious inveftigation, we flatter ourfelves that the following conclufions are deduced and fufficiently eftablifhed : ift, That the relative pronoun contains in itfelf the united powers of a connective and another pronoun. 2dly, That of is the connective of which, together with another pronoun, it contains the powers, as in every poffible inftance it may be refolved into thefe conftituent parts, and the import of the fentence in which it has place remain unaltered. 3dly, That the relative claufe of a fentence has the import of an abftract fubftantive, in the ancient languages, in the genitive cafe; in Englith, with the particle of prefixed. 4thly, That the relative pronoun is of necelfary $u \int e$ only where there is a deficiency of adjectives or fubflantives to denote fome complex attribute, by which we want to limit a generalterm or expreffion; but that where fuch adjectives or fubftantives exift inlanguage, we may ufe the relative or not at pleafure. And, 5 thly, That though, in cales where the relative cialfs does not $l i-$ mita general term, the relative pronoun may, without violating truth, be analyfed by and; yet fuch analy fis is never proper, as it gives two predicates to the fame fubject, which, in the original propofition, had but one predicate.
52. If the claufe of the relative be equivalent to an adjective, as in every inftance it feems to be, it will naturally occur, that, in the ancient languages, the relative'hould agreewith its antecedent ingender, numter, and cafe. They do agree for the moft part in gender and number; in cafe they cannot often, becaufe the very intention of introducing a relative into lan-
guage is to reprefent the antecedent in a different cafe. Whenever we have occalion to ufe a fubftantive or notn in a claufe of a fentence, and afterwards to exprefs by another claufe, in which there is a verb, an attribute of the object denoted by that fubftantive, we then employ the relative pronoury. Now it feldom happens that the two claufes admit of the fame regimen; and hence the cafe of the rèlative is often neceffarily different from that of the antecedent, as the cafe of each mult be accommodated to the claufe in which it is found. 'Thus we cannot fay, "Deusqui colimus bonus eft;" But, "Deus quem colimus bonus eft;" becaufe the regimen of the verb colo is always the accufative.

This fhows the neceflity of introducing a relative into thofe languages which give inflexions to their nouns, to thofe languages which give inflexions to their nouns, relative is
Were all the nouns of a language indeclinable, there more ufewould be little occafion for a relative; and accordingly ful in the in Englifh it is often omitted. Examples are frequent in our beft authors. Suffice it to quote the following.
"For I have bufinefs would employ an age."
"I hane shore.
"I had feveral men died in my fhip of calentures." Swift.
"They who affect to guefs at the objent they cannot fec." Bolingbroke.
We are not ignorant that our moft eminent grammarians confider fuch expreffions as chargeable with impropriety : and we are far from recommending then in any dignified or folemn compofition. But in the inftances adduced there is not the fmalleft degree of ob/curity; at leaft there is none occafioned by the omiffion of the relative: The reafon feems to be, that the mind can eafily, by an effort of its own, make the antecedent unite, firft with the one claufe, and then with the other. Thus when it is faid- "I have bufinefs would employ an age ;' the mind can, without any difficulty, as the word bufinefs has no inflexions, confider it firft as the objective cafe after have, and then as the nominative to would employ: but this cannot be fo cafily done in the ancient languages, where the termination of the noun is changed by the variation of ins cafes.
53. Both in the learned and in the living languages the relative has different forms, correfponding to the different genders of nouns; and by thefe it gives notice whether it is applied to perfons, or to things without life. Thus in the Englifh language we fay, The man or the woman who went to Rome; The tree which flands on yonder plain. It admits likewife, when applied to males or females, a variation of cafes fimilar to that of the perfonal pronouns. Thus we fay, The man wheSE book is now before me; The man or woman whom 1 faw yefter. day: but the neuter admits of no fach diftinction ( $N$ ); as we fay the tree which I faw, as well as the tree wHICH flands on yonder plain. In modern languages the relative admits nor of any diftinction to denote number : for we fay, The MAN or the MEN who came yefterday; The MAN or the MEN of whom I/peak.
54. In Englifh the word that, which by fome has 30 been called a demonftrative pronoun, by others a pronomi- The word nal article, and by us a definite arlicle, is often ufed in- fupplies the ftead of the relative, as in the following examples: place of
${ }^{1} \mathrm{He}$ this pronoun,
(N) "Wbore is by fome authors made the poffeflive cafe of which, and applied to things as well as perfons I think, improperly." Lawth.

or He is the fame man that I faw yefterday：－He was the ableft prince that ever filled a throne．＂With regard to the principle upon which this acceptation of the word that depends，we offer the following con－
jecture．
51
In Englin，from the cool and phlegmatic arrange ment of the language，occafioned by the want of in－ flexions and conjugations，the place of every part of a fentence is almolt uniformly determined，and very little variety is allowed in the collocation of the words．The adjective is almoft always placed in appofition with its fubftantive，and the nominative wirh its verb．In confe－ quence of this uniformity in the collocation of the words，the mind acquires a habit of connecting in idea any kind of word with the place in which it is ufed to fland；and is naturally led to confider every word that ftands in fuch a place as belonging to fuoh a clafs．Hence it is，we imagine，that the definitive that paffes into the nature of the relative pronoun；as in thofe inftances in which it occupies the place of the relative，it was natural to confider it as having the fame import．Yet the word that has undoubtedly in irfelf no more the force of the relative pronoun than the or this，or any other definitive whatever．In fuch expreffions as the foregoing，it is not improbable that originally the claufe of the definitive that，which we now call the relative claufe，was thrown in as a kind of modifying circumftance in the following manner：＂The book （I read that）is elegant；＂where the feaker，finding the word book too general for his purpofe，rhrows in a claufe to qualify and reftrict it，or to confine his affir－ mation to that particular book which he is then read－ ing．We can eafily fuppoie，that through tine the definitive that in fuch an expreffion might be tranfpo－ fed or removed from its own place to that of the rela－ tive：fo that che expreffion would run thus，＂The book that I read is elegant：＂which would be confi－ dered as precifely equivalent to＂The book which I read is elegant．＂This opinion is not a little confirm－ ed by a fimilar ufe of the article in Greek，which， though undoubtedly a definitive like the Englifh the， is often ufed inftead of the relative pronoun．Num－ berlefs examples may be found in Homer and Herodoius， efpecially in the latter，who feldom ufes what is pro－ perly called the relative．We fhall produce one in－ ftance from each．

52 Interroga－ tive pro－ swons

55．We have faid that the interrogative pronouns，as they are called，who，which，what，are intimately con－ nected with relatives；we now affirm，that the two firf
in the feweft words poffible：henceit follows，that words are often omitted which are neceffary to complete the conftruction of the fentence；and this no where hap－ pens more frequently than in the ufe of who and which． In fentences where thefe words are confeffedly rela－ tives，we often find them without an antecedent；as，
＂Wb．fteals my purfe，fteals trafh．＂Sbakefpeare．
＂Which who would learn，as foon may tell the fands．＂
Dryden．
＂Qui Buvium non odit，amet tua sarmina，Mavi．Virg， That is，＂$H e$ who fteals my purfe，\＆c．；＂＂Which he who wouldlearn as foon，\＆c．；＂and＂llle qui Bavium non odit，＂\＆c．Such abbreviations occafion no obfeuri－ ty，becaufe from previous circumftances the hearer knows the mind of the feaker and theperfons to whom he refers．But it is not with refpect to the relative and antecedent only that fuch abbreviations have place：in fentences of a different form，whole claufes are fome－ times omitted，while the meaning of the fpeaker is made fufficiently plain．Thus when king Richard III． having loft his horfe in battle，exclaims，
＂A horfe！a horfe！my kingdom for a horfe！＂
there is no complete thought expreffed；but the cir－ cumfances in which the king then was，enabled thofe about him to underftand that he wanted a horfe．Ac－ cordingly Carefby anfwers him，
＂Withdraw，nyy lord，l＇ll help you to a horfe．＂
In like manner when a perfon afks a queftion，his expreflion is frequently incomplete；but the tone of his voice，or fome other circumftance，enables us to afcertain his meaning，and to fupply，if we pleafe，the words that are omitted．Thus when it is faid，An fe－ ciftis nothing more is expreffed than；If you did it（the Latin an being nothing elle but the Greek ar；$f i$ ）；but fome circumftance enables the perfon who hears it to know that the meaning is，＂Say if you did it．＂Let us apply thefe obfervations to the words who and which．If thefe words be relatives，and if our analyfis of the relative be jult，it is obvions，that no complete meaning can be contained in the clatue，＂Who is your principal friend ？＂for that claule contains nothing morethan the circamfance ofbeing yourprincipal friend predicated of fome naknown perton；＂of he is your principal friend．＂That this is indeed the cafe，every man may be convinced，by afking himfelf what he 53 means by the interrogative who in fuch a fentence；；rememerely for he will find it impolfible to affix to it any meanir $g$ and without fupplying an antecedent claufe，by which that which is called an interrogative will be immediately converted into the relative pronoun．The cuftom，how－ ever，of language，and the tone of voice with which the relative claufe is uttered，intimates，without the help of the antecedent，the wifh of the fpeaker to be in－ formed by the perfon addreffed of the name and de． fignation of his principal friend；and we know that the fentence when completed is；＂Tell me the name and defignation of the perfon who is your principal friend．＂ Again，when the prophet fays，＂6 Who is this that cometh from Edom，with dyed garments from Boz－ rah ？＂he utters but part of a fentence，which when completed will run thus：＂Defcribe the perfon who cometh from Edom（this is that perfon），with dyed garments from Bozrah．＂He fees a perfon coming from Edom，of whofe name and defignation he is ig－ norant；he calls upon fome one for information con－ of thefe words are nothing but relatives，and that the laff contains in itfelf the united powers of a relative and definitive．With refpect to cafes，number，and gender， the words who and which，when employed as interroga－ tives，differ not from the fame words when employed as relatives；and we hold it as a maxim，without which fcience could not be applied to the fubject of language， that the fame word has always the fame radical import in whatever different fituations it may be placed．To underftand this，it is neceffary to oblerve，that all men have a natural propenfity to communicate their thoughts
cerning thefe particulars; and that there may be no miftake, he defcribes the unknown perfon as having dyed garments from Bozrah; but left even that defription fhould not be fufficiently accurate, he throws in the definitive claufe, this is ibat perfon, pointing at him, we may fappofe, with his finger.-Which, ufed as an interrogative, indicates a wifl of knowing a particular perfon or thing out of more than one mentioned ; as, " Which of the two did it?" that is," Tell me the one of the two which did it ?'' for in old Englifh which as a relative is often ufed, where in modern Englifh we hould fay who; and that mode of fpeech is ntill retained when the antecedent is omitted, and the relative claufe employed to indicate fuch a wifh as that before us. What includes in itfelf the fignification of a definitive and a relative pronoun; as, "from wobat has gone before, what follows may eafily be gueffed," where the word what is equivalent to that which. When therefore we fay, "What rude fellow is that,?" our meaning is, "Deforibe that perfon who 54 is that rade fellow." Upon the whole, then, it is evi-Interroga- dent, that the words called interragatives are merely tive fentences relative claufes. relativepronouns; and that the interrogative fentences are relative claufes uttered in fuch circumfances as to enable the hearer to fupply the antecedents neceffary
to complete the meaning.
56. To conclude: We have feen that substantives are either primary or fecondary; or, in other words, nouns or Pronouns. Nouns denote fubfances, and thofe éther natural, artificial, or abffact. They moreover denote things either general, or $\int$ pecial, or particular; and a general or fpecific name is made to denote an individual by means of words called articles or definitives. Pronouns are the fublitutes of nouns, and are either prepofitive or fubjunctive. The prepositive is diftinguilhed into three orders, called the firft, the fecond, and the third perfon. The subjunctive, otherwife called the relative, includes the powers of all thofe three, having fuperadded as of its own the peculiar force of a comntctive.

## CHAPTER IV.

$$
\text { Of } \mathrm{V} \text { ERes. }
$$

57. The words which we have hitherto confidered are commonly called fubffantives primary or fecondary, and definitives; becaufe nouns are fignificant of fubfiances; pronouns are the fubstitutes of nouns; and the ar: sicle ferves to afcertain the extent of the noun, and to determine whether on anyoccation it be fignificant of a whole clafs of fabftances, or only of one individual. But
fubftances are of importance to mankind only on account of their various qualities or atte ributes; for their internal texture is a thing of which we are profoundly ignorant, and with which we have no manner of concern. Thus, experience teaches us, that certain vege-; tables are pleafant to the tafte, and wholefome food; whilft others are unpleafant and poifonous. The former kinds are valuable only for their qualities or attributes; and they are the qualities or attributes of the latter that make them wrthlefs or huriful. A horfe is ftrong, and fwift, and docile; and may be trained to carry a man on a journey, or to drag a plough. It is for his ftrength, fwiftnefs, and docility, that he is the moft valuable of all quadrupeds. One man is brave,
another learned, and another eloquent ; and by pofferfing thefe different qualities or attributes, each is fitted for a different flation in fociety. It is plain the refore, that in contemplating fublances, our attention muft be There is a principally bettowed upon their qualities, and that the clafs of words which ferve to denote thefe qualities mult be an words. calleffential part of language. Such words are in general ed attricalled attributives; and are of three forts, Verbs, Participles, and Adjettives.
58: Of all the conftituent parts of fpeech nonc ticiphes, and has given the grammarians greater troublo than the adjerives, verb. The valt variety of circumftances which it blends fogether in one word, throws very confiderable difficulties in the way of him who attempts to analyre it and afcertain its nature; at the fame time, that by Tha diffits eminent ufe in language, it is entitled to all the at culty of aftention which can be beftowed upon it. To the dif- certaining cuffion of the verb, Mr Harris, whofe notions of this the nature as of the other parts of fpeech have been generally of the verb. adopted by the fubfequent writers on grammar, has dedicated a large proportion of his book, in which he has thrown out many excellent obfervations, mixed, as it appears to us, with feveral etrors. We have already obler ved, that no man is ignorant, when he ufes what is cailed a verband when a noun. Every fchool boy knows that the words is, loveth, walketh, standeth, in Englijb; andest,amat, amatur, ambulat, stat, in Latin, are verbs : he knows likewife that they are of different kinds; that fome of them are faid to be afive, fome pafive, and fome neuter. But it fhould feem, that the firft object of our inverfigation ought to be the characterificic of the verb, or that which all thefe words have in common, and which conftitutes them VERBS, diftinguiihing them from every ather species of 58 words. Now it is obvious to the flighteft attention, The chathat every verb, whether active, paffive, or neuter, may racteritic be refolved into the fubfiantive-verb is, and another of the verb. attributive : for love the is of the fame import with is loving; wal keth, witli is walking; and amat, with amans est. But leving, walking, andamans, are not verbs: whence it follows, that the charateriffic of the verb, that which conflitutes it what it is, and cannot be expreffed by other words, muft be that which is fignified by the word us; and to us that appears to be neither more nor lefs than affertion.

ASSERTION therefore, or PREDICATION, is certainly the very essence of the verb, as being that part of its office, and that part only, which cannnot be difcharged by other kinds of words. Eyery other circumflance which the verbincludes, fuch as attribute, mode, time, \&c. It may be poffible to exprefs by adjectives, participles, and $\dot{a} d v e r b s$; but withont a verb it is impoffible to predicate, to a ffirm or deny, any one thing of any other thing. The office of the VERB, then, whenfript of all accidentol circumftances, feems to be merely this, "To join together the fubject and predicate of a propofition ;" its powers are analogous to thofe of the fign + in Algebra, which does not affect the feparate value of the quantiries between which it is placed, but only indicates their union or coalefcence. To explain by an example: When we fay, Cicero eloguens, Cicerivife; thefe are imperfect fentences, though they denote a fubftance and an attribute. The reafon is, that they want an afertion, to fhow that fuch an attribute appertains to fuch a fubtance. But when we infert the word was,
we join the fubftance and attribute together ; we give notice that the wifdom and eloquence are applied to Cicero, and we do nothing more; we neither increafe the wifdom nor diminifh it, we neither make it real nor imaginary; for it was fuppofed in all its extent when the words Cicero and wife ftood independent of each other. We may indeed ufe the verb in a form which implies not an affertion only, but likewife an attribute; as when we fay George writeth, or George watketh: But as whitenefs or any other particular colour is not of the effence of a horfe, an animal which is found of all colours; fo in the phrafes quoted, the attribute, though implied, is not of the effence of the verb; for it may be equally well expreffed by other words: George is writing, and Gcorge is walking, are phraies of the very fame import with George writeth, and George walketh.
59. In refolving every verb, whether active, paffive, or neuter, into the fubftantive-verb is and another attributive, we have the honour to agree with all the grammarians; but to the word is itfelf the learned author of Hermes has given a meaning which, as a verb, it does not admit. He obferves, that before any thing can be the fubject of a propolition, it muft exift: that all exiftence is tither abfolute or qualiffed, mutable or immutable : that the word is can by itfelf exprefs abfolute exiftence, but never the qualifed, without fubjoining the particular form ; and that it fignifes both mutable and immutable exiftence, having in thefe cafes different meanings; altho' the fentences which he gives as examples are evidently conftructed in the fame manner and confint of the fame parts of fpeech. His examples are: of abfolute exiftence, B is; of qualified, B is an animal; of mutable, This orange is ripe; of immutable, The diameter of the Square is inconmenffurable with its fide. But if predication be the effence of verb, all this is nothing to the purpofe, and part of it is not true. It is not true that the verb is ever varies its fignification; for it hath as verb no connection with exiftence of any kind. All fuch circumftances are fuperadded to its verbal nature ; or, to fpeak more accurately, we infer fuch circumftances from our previous knowledge of the objects concerning which the predication is made. When we fay "this orange is ripe," we do indeed mean, as Mr Harris obferves, that it is fo now at this prefent in oppofition to paft and future time : but it is not the verb is, but the definitive THis, which fixes the time of maturity, as well as the place of the orange; for had we faid, oranges are ripe, we might have been properly alked, When and where are they ripe ? although the fame verb is ufed in both fentences. Even in the fentence "B is," abfolute exiftence (the moft fimple of all) is inferred, and not expre(fed, by the verb; and the inference is made from this obvious principle, "That when one utters a mark of predication, we naturally conclude that he means to predicate fomething of the fubject." If he adds no fpecific predication, as B is Vor. VIII.
round, we apply to B the mof general that we can ; and what other fpecies is fo general as exiffence?

That the idea of exiftence, confidered as mutable or immutable, is not contained in the verb is itfelf, but is derived from our knowledge of the objects coacerning which the predication is made, appears manifeftly from this: That if a perfon be fuppofed ignorant of the meaning of the words God and man, whilft he knows that of is ; the nttering of the two propofitions, $G$ ad is bappy, and this man is bappy, will give himno noticc of exiftence confidered as mutable or imunutable, tempurary or oternal (o). His conclufion with refpect to thefo modes of exiftence, if any fuch conclufion be drawio at all, muft be derived entirely from his previous knowledge of the nature of $C$ od and the nature of man.

Some of our readers may poflibly think this notion of verb too abftract and metaphyfical; yet what other circumftance than mere predication is effential to that fpecies of words? We fay elfential ; for we are here inquiring, not what is exprefled by each individual verb, but what it is which is equally expreffed by all verbs, and which diftinguifhes them from the other parts of fpeech. And if it be true, that every thing which the verb implies, predication alone excepted, may be expreffcd by other parts of epeech, and that 10 other part of fpeech can predicate; then we think our felves warranted to affirm, that /imple predication is the effential characte: riffic of VERB, that every word which predicates is a VERB, and that nothing is fo which does not predicate.

It muft not, however, be concealed, that a doctrine an ${ }^{5 \$}$ very different from this has been lately maintained by tio objeea writer of diftinguifhed abilities. "We have entergy theory: expreffed," fays Dr Gregory ( P ), " and of courfe a verb conftituted, without affirmation, when we wifh or command; without command, when we affirm or with; without $w i / h$, when we command or affirm : yet in all thefe cafes we have equally and indifputably a verb."

That in all thefe cafes we have a verb, is indeed indifputable ; but we hold it to be equally indifputable, that in all thefe cafes we have affrmation. The inge nious author has given no direct example of a wifb or command uttred without affirmation; and a feeling or fentiment which is not uttered has nothing to do with language : but he has given a fentence in which there are three verbs, that in his opinion denote no affirmation, but a very plain fuppofition. If a fuppofition can be expreffed withour affirmation, we flall very readily allow that a wifh or command may be fo expreffed likewife. The Doctor's fuppofition is thus exprefled: "Had any punifhment ever overtaken you for your broken vows; were but one of your teeth growing black, or even were but one of your nails growing lefs beautiful, I thould believe you." It is almoft fuper: fluous to obierve, that to every verb not in the infinitive mode there mult be a nominative, and to every active verb an object, whatever be the arrangement of the fentence in which fuch verbs are found. Thefe
(o) The truth of, this obfervation may be proved by experiment, by uttering to a man of good commoi renfe thefe two propofitions, taking care to exprefs the words God and man in a language which he does not underftand. Thus, Deus is happy, and bic bomo is happy, uttered to a man totally unaequainted with the Latin tonguc, will convey no notice of exiftence confidered as mutable or immutable, \&c.
( p ) Theory of the Moods of $V$ erbs, publimed in Vol. II of the Transactions of the Ronaz Soctety of Edinburgh.
are truths known to every fchoolboy ; the reafons of them thall be given afterwards. It is likewife undeniable, that in the fentence before us, the nominative to had is any punifhment; to the firft were, one of your tecth; and to the fecond, one of your nails. But the fentence arranged in grammatical order, with the feveral nominatives before their refpective verbs, is ev:dently elliptical; and the conjunction if muft be fupovertaken you; if but one of yeur teeth were growing black, or even if but one of your nails were growing lefs beautiful, I fhould believe you." Now it has lately been proved, by fuch evidence asleaves no room for doubt, that $i f$, though called a conjunction, is in fact a verb in the imperative mode, of the fame import with give; fo that we may fubftitute the one for the other without in the fmalleft degree altering the fenfe. The fentence will then run thus: "Give any punifment had ever overtaken you ; give but one of your teeth were growing black, \&c. I flould believe you." It is therefore fo far from being true, that had and were, when the fentence is completed, cxprefs no affirmation; that it is only upon granting the truth of the affirmation which they denote, that the fpeaker fays "I fhould believe you." "Any punifhment had ever overtaken you," is plainly an affirmation ; if, give that affirmation, admit its truth, "I fhould believe you." But it cannot be fuppofed that had and were change their fignifications by a mere change of place, or that by being removed from the middle to the beginning of a claufe, they lofe their or iginal import, and come to dénote fomething entirely different. Were this the cafe, every attempt to afcertain and fix the general principles of grammar would be as ridiculons as an attenpt to arreft the courfe of time. For what purpofe then, it may be afked, if the verb alvays denotes affirmation, is it removed from the middle to the beginning of the claufe, when fuppofition is inplied as in the prefent inftance? We anfwer, that fuppofition is neither more nor lefs than conditional a firmation; that when fuch affirmation is completefy expreffed, the verb is not removed to the beginning of the claufe; and that fuch a removal takes place only whea the claufe is elliptical, being merely an artificial contrivance in larguage, to fhow the reader or hearer that fome fuch word as if, demanding the truth of the affirmation, is omztted for the fake of difpatch. This is evident; for when the word rcquiring the affirmation to be granted is fupplied, the verb muft be reftored to its place in the middle of the claufe. Such abbreviations, and fuch contrivances to mark them, are frequentin all languages, as will be feen more clearly when we come to treat of modes. Upon
the whole, notwithfanding the deference which we willingly pay to this very matterly writer, we are conpelled reluctantly to differ from him, and ftill to think that fimple predicution is the very effence of the VERB.
Should we be required to exemplify our theory by The theory language, and to produce inftances of this fimplified ittelf exemverb in practice, we might anfwer, that the not being plified: able to produce fuch inftances would be no good argument againft the truth of our principles. It is the nature of language to exprefs many circumfances by the fame word, all of which however are not effential to diftinguifh the Jpectes to which that word belongs from the other Species of words; and it is the nature of man to infer from difcourfe many things which are not altually expreffed. Perhaps, however, fomething nearly approaching to an exemplification of our idea of a fimple verb will be found in the following propofition: "The three angles of every plane triangle are equal to two right angles." What other office the verb are here performs than fimply to join the fubject and predicate, it is difficule to perceive. It does not give notice of time; or fuch notice, if given, is an imperfection ; for the truth of the propofition is independent on time. Neither ought it to imply exiftence ; for the prapofition would be true, were there neither a triaugle nor a right angle in nature.
This idea of verb, when it is well confidered, we hope will be found juft ; but fhould any of our readers fufpect it of novelty, and on that account be difpofed to condemn it, we have only to requeft that he will refraia his cenfure till he has examined the writings of others, and nicely obferved the feveral poftures of his owit mind in difcourfe ; for meditation may perhaps fhow him that our thcory is not falfe, and inquiry will farisfy hin that it is not novel (e).

62
60. But although it is certain that affertion, and af- The greatfertion only, is effential to the verb, yet the greater part er part of of that fpecies of words which grammarians call verbs verbs deare ufed to denote an attribute as well as an alfertion; or, in the language of logic, they exprefs both the co- tribute pula and the predicate of a propofition : thus, he liveth, $h e$ with an afo writeth, he walketh, are plrafes equivalentin all refpects fertion. to-he is living, he is writing, he is walking. Now, of attributes, fonme have their effence in motion, as walking; fome in the privation of mizotion, as reffing; and others have nothing to do with either motion or its privation, as white and black. But all motion and all privation of motionimply time as their concomitant; and a fibftance may have an attribute to day which it had not yefler day, and will not have to morrow. This is felf-evident; for a man may be at reft to-day who yefferday was walking, and to morrow will be on horfeback; and a fheet of paper may have been white yefterday, which to-day is lback,
(e) "Befides words, which are names of ideas in the mind, there are a great m:ny others that are made ufe of, to fignify the connection that the mind gives to ideas or propofitions one with another. The mind in communicating its thonghts to others, does not only need figns of the ideas it has then before it, but otbers alfo, to fhow or intimate fome particular action of its own at that time relating to thofe ideas. This it does feveral ways; as is and is not are the general marks of the mind affirming or denying." Locke on Human Underftanding.
" Verbum eft pars orationis variabilis, aliquid de re aliqua dici feu affirmari fignificans. Vulgaris verbi definitio eft, quod fit pars orationis, que agere, pati, aut effe fignificet: Sed noftra accuratior, magifque ex ipfa verhi cujnfvis natura petita videtur. Cæterum ro affrmari laxiore hic fenfu accipimus, pro eo quod prædicari Dialectici appellant, quo non modo affirmationes frictins fic distx, fed negationes etiam interrogationefque.includuntur." # Chap. IV. $\quad$ G $\quad \mathbf{R} \quad \mathbf{A} \quad \mathbf{M} \quad$ M $\quad \mathbf{A} \quad$ R. 

black, and at fome future time will be of a different colour. As, therefore, all motions and their privation, imply time; and as a propofition may be true one time, which is not true at another; all verbs, as well thofe which denote both an ättribute and an alfertion, as thofe which

64

## All time

 pall, prefent, or fu ture; hence she tenfes of verbs are threefold.65 Different gramina. rians have enumerared different sumbers of ten fes. an affertion only, come to denote xime Hence the origin and ufe of tenfes, which are fo many different forms alfigned to each verb, to how, without altering its principal fignification, the various times in which the affertion expreffed by it may be true. Whether thefe various forms of the verb be elfential to language, it is vain to difpute. They have place in every language with which we are acquainted; and as the ufe of the verb is to affirm one thing of another, it is abfolutely neceffary that the time, when fuch or fach an affirmation is true, be marked by tenfes, or fome other contrivance. Concerning tenfes, therefore, we thall throw together fome obfervations equally applicable to every language, after premifing a general remark or two which feem neceffary in order to proceed with precifion.
61. Time, although its effence confifts in facceffion continued and unbroken, may yet be confidered by the mind as divided into an infinite number of parts. There is, however, one grand divifion which neceffarily occurs, and to which the different tenfis of verbs are in all languages adapted.-Computing from fome portion conceived to be prefent, all time is either paft or to come. Hence the tenfes of verbs are threefold; fome denoting time prefent, fome time paft, and others time future.

Again, from the very nature of time, it mult be obvions, that all its parts are relative; i. e. that no portion of it can be afcertained by any thing inherent in itfelf, but only by referring it to fome other portion, with refpect to which it is paft, prefent, or to come. In this refpect time is perfectly analogons to /pace: for as the folace in which any object exifts, cannot be defcribed but by fating its relation to fome other fpace; fo ncither can the time of any attribute or action be determined but by ftating its relation to fome other time. When, therefore, we would mark the time of any action or event, we mult previoully fix upon fome point to which we may refer it. If this point be known, the time referred to it will be known alfo; but if the former be not known, neither will the latter.

Laftly, in contemplating an action, we may have occafion to confider it as going on, or as firifbed. This diftinction is likewife denoted by the different tenfes of verbs. In treating therefore of the tenfes, there are two things to which attention ought principally to be turned ;-the relation which the feveral tenfes have to one anotherin refpect of time; and the notice which they give of an action's being completed or not completed.
62. Having premifed thofe remarks, we proceed now to the tenfes themfelves; of which Mr Harris has enumerated no fewer than twelve. Of this enumeration we can by no means approve ; for, without entering into a minute examination of it, nothing can be more obvious, than that hisinceptive present- $I$ am going to write-is a futuretense; and his comPLETIVE PRESENT-I have written-a past tenfe. But, as was before obferved of the clafification of words, we cannot he! p being of opinion, that, to take the tenfes as they are commonly received, and endeavour to afcertain their nature and their differences, is a much more ufeful exercife, as. well as more proper for a work
of this kind, than to raife, as might eafily be done, new and hyporhetical theories on the fubject.

It lias been already obferved, that all the tenfes mult neceffarily mark relative time. In one fenfe, this is extremely obvious. The prefent tenfe is ufed in contradiftinction to both the paft and future, and marks an attribute or action as exifting in neither. The pafl and the future are in like manner ufed in contradiftinction to the prefent; and mark an attribute or action which exifts not nown, but which in the one cafe has exifted formerly, in the other will exift at fome time coming. But befides this relation of contradiftinftion fubfifting among the tenfes, there is mother of co-exiftence, as we may call it, to which it is of great confequence to attendefpecially in examining the nature of the prefent.
63. Therresent tenserefers notonly to fomething of the prewhich is paft or future, but alfo to fomething with fent tenfe. which the attribute or action of the verb is contemporary. This reference is neceffarily implied in its very name; for we cannot fay of any thing that it is prefent, without implying at the fame time that there is fomething elfe with which it is prefent. Hence it appears with how little reafon Mr Harris andothers have given us an aorift of the prefent, as marking prefent time indefinitely in contradiftinction to OTHER prefents, which have been called inceptive, extended, and completioe prefents. For from what has been faid it follows, that the prefent tenfe is neceffarily and from its very nature perfectly indefinite, and can of itfelf give notice of no precife or determinate portion or point of time whatever. A thing may have been prefent fifty years ago, may be prefent now, or at any future period. This tenfe implies the relation of co-exiffence between two or more things; but, without fome auxiliary circumftance, it cannot inany language mark the particular portion of time in which thofe things exiff. The indefinite nature of this tenfe is indeed moft clearly feen in that ufe of it in which Mr Harris has ftyled it the aori/f of the prefent; that is, in cafes where it is employed to denote the repetition of an altion which the agent is accuftomed frequently to perform, or to exprefs propofitions of which the truth is evinced by general experience; as in the following examples:
" Hypocrify-the only evil that zoalds
"Invifible, except to God alune."
"Ad panitendum properat qui cito judicat," \&c.
In thefe inftances it is plain there is no particular time pointed out : the propofitions are true, or apprebended as true, at all times. Although the actions, therefore, of walking and haftening are expreffed as prefent, it is impoffible from the expreffions to determine any precife point of time when they are prefent.

But if the prefent tenfe be thus indefinite, how, it may be afked, are we to afcertain the particular time which is intended? We anfwer, it is to be afcertained, either by flating the action of the verb as exifting in fome time already known, or by inference. If, for example, we fay,-" Millions of fpiritual creatures walk the earth unfeen,"-the propofition is general, and the time of walking undetermined. But if we add-coboth when we wake and when we feep,"-the time is by this addition afcertained and fpecified; for if the $t i n e$ when men wake and lleep be known, the time when thefe firits walk the earth is known alfo.-When no fpecifying claufe is given by which to determine the time of the prefent tenfe, it is very commonly determined by in-
feresace. Thus, if one nfe fuch an expreflion as-" He fleeps while I am fpeaking to bim,"-the time of his fleefting is afcertained by the fubfequent claufe of the fentence; but if it be faid fimply-"he fleeps"- without affigning any data from which it may be concluded who, his fleeping is prefent, we very naturally infer that in is at the inf ant we receive the $i$, formation of his fleeping. Such inferences as this are common in language. The mind is defirous to obtain complete information cin every fubject ; and therefore frequently fupplies to itfolf what is not expreffed in the fpeech of others.

Both thefe ways of afcertaining the precife time of the prefent tenfe, are excellently illuftrated by the ufe of the word prefent as applied to $/ p a c e$. Take a familiar example:-" His brother and he were prefent when I read the letter." It is at firf fight evident that this expreflion is perfectly indefinite. But if it be faid"His brother and he were prefent at your houfe when I read the letter,"-the place of action is then determijued, by being referved to a portion of $\int$ pace which is knowin. If no fuch reference be made, the perfon who hears the fpeech uttered muft either remain ignorant of the place intended, or he mult afcertain it to himfelf by anference; and he will probably infer it to be that in which the fpeaker is at the time of his uttering the indefinite fentence. This leads us to obferve, that finch inferences are not often made without fufficient foundation. Various circumftances may affift the reader or hearer in making them, and prevent all danger of miftake. He may have the evidence of fenfe, or of fomething preceding in the difcourfe, and a number of other particulars, to juftify and warrant his conclufion. Thus, if when fitting by a large fire, one pronounce the words -"I am too warm;" thofe to whom he addreffes his fpeech are authorifed to conclude, that he is too warm at the time of fpeaking, unlefs he exprefsly prevent the drawing of that conclufion by adding fome fuch claufe as-" when I wear a great coat."

It is ftrictly demonftrable, and hath by Mr Harris been in fact demonftrated, that there is no fuch thing as prefent time. Yet do we not only conceive time as prefent andexifing, but frequently asextended to a very great degree. We fpeak not only of the prefent inftant, or the prefent day, but alfo of the prefent year, and even of the prefent ceniary. This manner of conceiving time is indeed loofe and unphilofophical; but it is fufficient for the ordinary purpofes of language. To exprefs time as it really is, we ought to lay, the paffing day, the pafing year, and the paffing century; but in common difcourfe we denominate any portion of time prefent, in which the prefent now or inftant is included, althongh it is obvious that part of that portion is paft, and the remainder of it fisture. From the very nature of time thus conceived to be prefent, the tenfe now under confideration muft reprefent the action of the verb as commenced, and not finijhed: for as time is in continued fucceffion, and accompanies every action; when any action is not commenced, it exifts not in any time, though it may exift hereafter in time which is now future; and when it is finifhed, it exifts no longer in time prefent, but in time paff. Hence the abfurdity of introducing into a theory of the tenfes an inceptive prefent and a completive prefent ; for thefe terms imply each a direct contradiction.
64. After having faid fo much of the prefent tenfe, 67 we fhall have but little to fay of the PRETER-Imper- The praFECT. It flates an action in refpect of time, as $p$ aft ; ter-imperand in refpect of $p$ rogrefs, as rulfinifbed. Leg:bun-If fect. was reading at fonke palt time, but my reading was then incomplete; I had not fininhed the book or the letter. We muft here obferve, however, as we did with refpect to the prefent tenfe, that although the prater-imperfect reprefents the action as paff, it does not inform us in what precife portion of paft time the unfinifhed action was going on: this circumftance muft either be given in feparate words, or be inferred by the hearer. If one fay fimply-Legebann, the perfon to whom he addreffes his fpeech will conclude, that the time of his reading is $p$ aft with refpect to the prefent time of his /peaking. But if he fay,-Legebam antequamu veniffi, he exprefsly ftates the action of reading as paft with refpect to the time in which his hearer came to the place where they both are at the time of/peaking. The time of the prater-imper. fect is -always paft with refpect to the prefent inftant when the imperfect is ufed, and of this the tenfo itfelf gives notice; but it may allo be paft with refpect to fome other time, and of this it conveys no information.
If we join two prater-imperfects together, the expreffion will ftate the co-exiftence of two progreffive actions, both of which were going on at a time paft in refpect of fome determinatetinte given or fuppofed."Cum tu icribebas ego legebam ;" "when you were writing 1 was reading." Hence the preter-imperfeet has by fome grammarians been called the relative prefent; a name which, however, is by no means exclufively applicable to this tenfe. When the pratsr-imp erfect is by the conjunction and joined in the fame fentence with a plufquam-perfect, the two tenfes exprefs two actions, both prior to the time of fpeaking; but the one as having continued after the other was fini/hed. Thus, Eneas fpeaking of the deftruction of Troy, fays, that after laving efcaped with his father and followers, he returned to the city in queft of his wife, and went directly to his own houfe; but there, continues he, "irruerant Danai, et tectum omne tenebant:"-" the Greeks had rufbed in," that action was over and completed before his arrival; but the act of "poffeffing the the whole houfe," tenebant was not ojer, but filll contizuzing.
65. But it is neceffary that the verb demote actions The aorith which were complete or perfect in paff time, as well as and praxthofe which were incomplete or imperfect. For this pur- ter-perfes. pofe, Greek and Engtijbverbs have an aoriff, a preterperfert, and a pluiguam-perfect. Of thefe the Latin las only the two laft. The prater-perfect in that language foftains a twofold character: it performs the office of the Greck and Englifh aorift, as well as of the prater-perfect properly fo called; that is, it denotes a finined action at fome indefinite paft time, as well as at fome time which is both paft and definite.

In attempting to analyfe the fignification of complex terms, by which we here mean words that include in their fignification a variety of particulars, it is of great advantage to have thefe particulars $/$ eparately expreffed by different words in another language. Now the Englifh has refolved the tenfes, which in the Greek and Latin languages are denominated the aorift and the prater-perfoct, by means of what are commonly called auxiliary verbs, expreffing the former by the verb did, and the latter by the verb have. In examining there-
fore the aorift and prater-perfect, it will be of ufe to inquire into the import of thefe verbs.

Did is evidently the aoriff of the verb to do; a verb of the moft general fignification, as it denotes aftion of svery kind. It exprellesthe fini/hed performance of fome aftion, the completion of which muft of courfe have taken place in fome portion of paft time. "I Did write or I wrote (thefe expreffions being equivalent) yefterday, a month, a year ago," \&c. But the import of小id being fo very general, it can convey no determinate meaning without being limited by the addition of fome particular action; and this addition, however expreffed is to be confidered in the fame light as an accufative cafe, governed by the active verb did; for it produces exactly the fame effect. 'e eqpaqe, foripfi, I did write; that is, "at fome palt time I performed the action of writing, and finifod it."

The verb have, which is included in the prater-perfect, is plainly a verb of the prefent tenfe denoting polfoffion. But a man may poffefs one thing as well as another; and therefore have requires limuitation, for the very fame reafon that did requires it, namely, becaufe its fignification is perfectly general. Now this limitation, whatever it is, muft be conceived as the thing polfelfed; and in inftances where have is limited by a nown, this is obvious, and univerfally acknowledged: "s I have a gold watch," is, "I polfefs a gold watch." But to annex the fame meaning to the word have, when ufed as an auxiliary verb, is an idea we believe not common, and which may perhaps be thought whimfical ; yet what other meaning can be affixed to it ? To fuppofe that words have not each a radical and determinate fignification, is to duppofe language a fubject incapable of philofophical invertigation; and to fuppofe, with Mr Harris, that there are words entirely devoid of fignification, is at once to render all inquiries after the principles of grammar nugatory and ridiculotas. We conceive, then, that each of the phrafes, razpaquatisonnv, fcripflepiftolam, I Have written a letter is equivalent to the phrafe, "I poffefs at prefent the $f i$ ni/bed action of writing a letter." Such an expreffion may found har $/ \mathrm{h}$ to the car, becaufe it is not in ufe: but we often employ exprefions, to the precife and froper meaning of which we do not attend; and if the above be attentively confidered, however aukward it may at firft appear, nothing will be found in it either improper or abfurd.

The aorif, then, we conceive to fate an action as performed and finifhed in fome paft portion of time; whilft the prater-perfect reprefents the paft performance and completion of that action as now poffeffed. And here we may hazard a conjecture why have, when ufed as an auxiliary verb, is always joined with a paft participle; whereas did is joined to a word exprefing the fimple attion of the verb, or, as it is called, the prefent infinitive. Of the expreffion, "I have written a letter," as one part, viz. the verb have, denotes prefent time; the other part, viz. writien, mult denote paft time, to give nutice that the action is performed and finifhed. Did, on the other hand, implying paft time, has nooccafion for the paff part of another verb to give notice of this circumftance; for "I did wRITE a letter" is equivalent to, " at fome paft time I performzed and finined the fimple action-of writing a letter."

The principal diftinction in practice between the 69 aorift and prater-perfect (for the difference feems little The prin: in their real import) confifts in the tome by which the cipal diperformance of the action admits of being particularly finction specified. The proter-perfiet is always joined with a between portion of time which inclades the prefent now or $2 n-$ fes. flant; for otherwife it conld not fignify, as it always does, the prefint poffeffion of the finffing of an action. But the aorift, which fignifies no fuch poffefion, is as conftantly joined with a portion of pafl time which excludes the prefent now or inflant. Thus we fay, "I have written a letter this day, this week," \&c.; but, " 1 wrote a letter yefterday, laft week," \&c.; and to interchange thefe expreffions of time in Creek and Englifh where the aorift and prater-perfect havedifferent forms, would be improper. In Latin, indeed, where they have bat one form, the impropriety does not appear.
66. Befides the tenfes already examined, which are The plufexpreflive of pafl tims, in moft languages the verb has quam perznother tenfe called the $p$ lufquam-perfeet, in which how- fect. ever no difficulty occurs to detain our attention." What the prater-imperfect is to the prefent tenfe, that the plufquam-perfect is to the preter-perfect. The veřb bad by which it is refolved in Englifh, being evidently the paft time of have, fufficiently explains its meaning and relation to the other tenfes: "I had written a letter," is equivalent to the phrafc, "I polfelfed at fome $p$ aft time the finifled action of writing a letter."

It is juftly obferved by Dr Beattie, that the imperfect and plufquam-perfect are very ufeful, and may be the fources of much elegant expreffion; and that if one were not taight to diftinguifh, in refpect of meaning as well as of form, thefe tenfes from each other, and the præterite from both, one could not pretend to underftand far lefs to tranflate, any good claffic author.
67. Having confidered the tenfes which imply pre 71 fent and paft time, it now remsins that we examine fes. the import of thofe which are expreffive of time fututr: In Latin and Englifh there are two tenfes for this purpofe; of which the firft reprefents an action in point of tome as not yet exiffing, bur as about to exift at fonte period to come; but it does not bring the coniplition of the action into view. The other afferts the futurity of an action together with its completion. Seriban, "I flall be writing," denotes future time and incomplete action; for it does not fay whether I am to write for a long or for a fhort time, or whether I flall fini $\beta$ what I promife to begin. This part of the verb, therefore, to which the Greek zpaqu correfponds, is an iniperferf future, and likewife an aorift. The futurity of any action, it fhould feem, may always be computed from the time of fpeaking: for every action muft befuture with refpect to the time at which its futurity is declared: but the time of its futurity may be more precifely fpecised by fixing on fome other future time to which to refer it: " $\mathbf{I}$ thall be writing after he fhall have departed." Shall or will refers to future time indefinitely; and write or writing refers to an action which is indecd to begin and fo far to proceed, but of which nothing is faid concerning the completion.

On the other hand, /cripfero, "I hall have written," is a perfect future denoting complete action : for $/$ hall denotes furure time; written, finifhed action; and bave profeut poffeflion. So that the meaning of the whole aflertion
is that" at fome future period of time I flall poffefs the finifhed action of writing. The completion of the action, together with the polfelfion of it, is always future with refpect to the time of alfertion; but, with refpect to fome other time expreffed or underftood, the completion of the action is to be paff: Promittis te foripturum firogave. ro," you promife to write if I hall haveaiked you." In this fentence the action of afking is future with relation to the time of promifing, but it is paft with relation to that of writing. Thistenfe the Latingrammarians call the tuture of the fubjunctive mode; but very improperly. The notice which it communicates, relpects not the power or liberty of acting, which, as will be feen by and bye, is the characteriftic of that mode; but the action itfelf. It ought therefore to be ranked among the tenfes of the indicative mode; for fcripfero is, in every fenfe, as really indicative as foribann or fcripturus ero.
68. Thefe are all the tenfes, effentially different from each other, which have place in the indicative mode of any language with which we are acquainted( R ) ; but as there are tenfes in the mode called /ubjunctive, which bear the fame names with thofc already examined, and which have yet a different import, it will be neceffary to confider them before we difmifs the fubject of tenfes.

Of modes in general fomething muft be faid hereafter; at prefent we fhall only obferve, that the mode with which we are now concerned, is not very properly diftinguifhed by the name afligned to it by the Latin grammarians. They call it the fubjunctive, becaufe it is often fubjoined to another verb, and forms the fecondary claufe of a fentence : but the mode called indicative frequently appears in the fame circumftances. The differences between thefe two modes appears to us to confift in this, that the indicative afferts fomething directly concerning the attion; the fubjunctive, fomething concerning the power or liberty of the agent to perform it: for that the latter alferts as well as the former, admits not of difpute.
69. The prefent tenfe of the fubjunctive mode, in the lëarned languages, anfwers to the Englifh auxiliaries may and cart. Let us confider thefe a little.-May is evidently a verb of the prefent tenfe denoting liberty. When I affert that I may write, I give notice that " I am under no compulfion to abfain from writing;" that there is no impediment from without by which I am reffrained from writing. Canis alfo a verb of the prefent
tenfe, expreflive of internal pover or gill. "I can write" is equivalent to-" There is nothing in myfelf which incapacitates me for performing the operation of writing." This verb feems originally to have denoted knowledge or $/$ kill, and to have been afterwards extended to fignify power or ability of any kind. There is little doubt of its being the fame with the old Englifh verb to con, which fignifies to know. The difference between the import of thefe two verbs may and can will be beft perceived in a familiar example. Suppofe we fay to one of our tranfcribers, "Yon may write a treatife on grammar," to which hereturns for anfwer "I cannot:" our affertion evidently fuppofes him at liberty to write the treatife ; his anfwer implies, that he is unable or unfkilled to do it. We may conclude, then, that the preSent tenfe of this mode contains a declaration of prefent liberty, ability, or Jkill; and its other tenfes will be found to have reference to the fame capacities.
The obfervation is lhere to be repeated which was enlarged upon under the prefent of the indicative. The liberty or ability fignified by this tenfe is always reprefented as prefent; but the time of this prefence is indefinite. If no particular time be $\int$ pecifed; we generally refer it to the time of fpeaking; but another point may be given from which we are to compute. "When he fhall have finifhed, you may then proceed as you propofe." Here the liberty of proceeding is ftated as prefent, not at the time of fpeaking, but at the time of his fini/hing, which is future to the time of fpeaking. But though the liberty, ability, or fill, denoted by this tenfe, be reprefented as prefent, the action itfelf is ftated as contingent; for it is not neceffary that a man fhould perform an action becaufe he has the capacity to perform it.

From this idea of the prefent of the conjunctive fome of its moft peculiar ufes feem capableof being explain-ed.-And, in the firft place, it appears to have a near affinity with the future of the indicative; infomuch that in many inftances they may be ufed promifcuoufly. Without materially altering the effect of the expreffion, we may fay, " Dico me facturum effe quæ imperet," or "qux imperabit." The reafon of this, perhaps, may be, that with refpect to us, futurity and contingency are in moft cafes nearly the fame, both being involved in equal obfcurity; and therefore it is often of little confequence which mode of expreffion we employ.

Secondly, The prefent of the conjunctive isufed to de-
(r) On this point we fubferibe to the opinion of the elegant and ingenious $D_{r}$ Beattie.-" It will perhaps occur (fays he), that there are two Greektenfes, of which I have given no account; namely, the /econd aoriff, and the fecond future. The truth is, that I confider them as unneceffary. Their place, for any thing I know to the contrary, might at all times be fupplied by the firft aoriff and the firf future. Some grammarians are of opinion, that ihe firft aoriff fignifies time paft in general, and the $\int$ econd, indefinite time $p a f$; and that the firffuture denotes a nearer, and the fecond a more remote futurity. But this, I Iapprehend, is mere conjecture, unfupported by proof: and therefore I incline rather to the fentiments of thofe who teach, that the fecond fyture and the fecond
 fect of fome abfolute theme of the verb, and, whell the other theme came into wif, happened to be retained for the fake of variety perlaps, or by accident, with a preter:te and future fignification. Be this as it will, as thefe tenfes are peculiar to the Greek, and have nothing correfponding to them in other tongucs, we need not fcruple to overlook them as fuperfluous." - The Theory of Language, Part II. Chap. ii.

To thefe judicious obfervations we have nothing to add, but that they acquire no fmall degree of confirmation from this circumftance, that there are many Greek verbs which have no fecond future, and which are yet employed to denote every poffible modification of futuretime. Of the paulo-pofl-futurtun of the Greeks we have
taken

Chap. IV. $G \quad R \quad A \quad M \quad M \quad A \quad R$.
note the right of which a perfon is poffeffed. "I may or I can, fell this book." This application, which Dr Pricflley conliders as the primary fignification of the tenfe, is eafily deduced, or rather followsimmediately, from the foregoing account of its import. For if one be under no reftraint, either external or internal, to prevent him trom performing an action, he has furely a right to perform it.

Thirdly, The prefent of the fubjunctive is often ufed to fignify cominand or requeft; as when one fays, "You may give my compliments to fuch a perfon." This ufe of the tenfe under confideration feems to have arifen from a defire to foften the barfbnefs of a command, by avoiding the appearance of claiming fuperiority. When a man utiers the above fentence, he certainly utters no command, but only afferts that the perfon to whom he fpeaks has liberty or power to do him a favour. This affertion, however, may contain no new information; and therefore the perfon addret $\int$ ed, reflecting upon the intention of the fpeaker in makingit, infers that it indicates a wifh to defire that " his compliments fhould be made to fuch a perfon."
74 70. Of the fubjunctive as well as of the indicative, the The pro- prater-imperfect is evidently the paft time of the prefent. ter-imper- As the latter afferts liberty, or ability, to perform fome fect. action, as exifting at prefent, the former afferts the fame liberty or ability to have exifted in time paft; but the precife portion of time paft, in which thefe capacities exifted, muft be feecified by other words, or it will remain unknown. Thus in the following fentence, "Dixi me facturum effe quæ imperaret," the time of imperaret is referred to that of dixi : the perfon having the right to command, is fuppofed to have had it at the time when the other faid that he would obey. This tenfe, as well as the prefent, ftates the action as going on and incomplete; and allo as future with refpect to the liberty or ability to perform it. It is rendered into Englijh by the verbs could or nigght; of which the firft is the paft time of can, the fecond of may.

From the near affinity which the prefent of the fubjunctive has to the future of the indicative, the tenfe now under confideration appears, in many inftances, as the paft time of the latter as well as the former. Thus Dixi me fucturum qua imperaret, may be rendered "I faid that I would do whatever he might, or whatever he Bould, command."
71. Of the prater-perfect, it is fufficient to obferve, that as the prefent ftates the agent as at liberty to be performing an unfinijhed action; fo thistenfe ftates him as at liberty to perform an action confidered as fini/bed. "I may be writing a letter when you come," i.c. "I am at liberty to be writing a letter when you come," "I may have written a letter when you come," i. e. "I am at liberty to be in polfeffion of the finifbed altion of writing a letter when you come."

It is a common mode of expreffion to fay," I may have done fuch or fuch a thing in my time," when he who fpeaks can have little doubt whether he has done the thing or not. In that cafe, the words may have done, cannot be confidered as the preter-perfect of the

Subjunctive of the verb do; for it is nonfenie to talk of liberty, with refpect to the performance of an action, which, at the time of fpeaking, is fuppofed to be paft and completed. What then is the import of the phrafe? We are perfuaded that it is elliptical, and that the word fay or aftirm is underftood: "I may (fay that I) have done fuch or fuch a thing in my time ;" for liberty or contingency can relate to actions only as they are conceived to be prefent or future.
72. Of all the tenfes, the moft complex is the pluf-quam-perfect of this mode. It combines a pafl and a fu-quam-per-quam-perfect of this mode. It combines a paff and a fuas the paft time both of the perfect future and of the preeter perfect of the fubjunctive: for it reprefents an action, future and contingent at fome paft time, as finifhed before another period Specified; which period therefore, tho' paft at the time offpeaking, was itfelf future withrefpect to the time when the futurity or contingency of the aftion exifted. "Promififti te fcripturum fuiffe fir rogaffem;" "You promifed that you wrould write, if I hould lave afked you." Here the futurity of the action of afking, which is reprefented as complete and $f$ ni/bed, is fated as co-exifting with the paft promife; but the action itfelf muft be pofferior to that promife : it is however fuppofed to be paft with refpect to the action of writing, which is alfo pofferior to the promife.
73. Before we difmifs the fubject of tenfes, it may of number not be improper juft to mention number and perfon; for and perfon. thefe have place in every tenfe of the verb in the learned languages, and in many tenfes even of the Englifh verb. They cannot, however, be deemed effential to the verb; for affirmation is the fame, whether it be made by you, by me, or by a third perfon, or whether it be made by one man or by a thoufand. The moft that can be faid is, that verbs in the more elegant languages are provided with a variety of terminations which refpect the number and perfon of every fubflantive, that we may know with more precifion, in a complex fentence, each particular fubftance with its attendant verbal attributes. The fame may be faid of fex with refpect to adjectives. They have terminations which vary as they refpect beings male or female, though it is paft difpute that fubftances alone are fufçeptible of fex. We therefore pafs overthefe matters, and alloflike kind, as being rather among the elegancies of particular languages, and therefore to be learned from the particular gramwzar of each tongue, than among the effentials of language; which effentials alouze are the fubject of inquiry in a treatife on univerfal grammar.
74. Befidestenfes, number, and perfon, in every tonguc of modes, with which we are acquainted, verbs are fubject to another variation, which grammarians have agreed to call Modes. Of modes, as of tenfes, it has been warmly difputed whether or not they be effential to language. The truth feems to be, that the only part of the verb alfolutely neceffary for the purpofe of communicating thought is the indicative mode; for all the others, as has been well obferved by Dr Gregory, are refolvable, by means of additional verbs and a word denoting the action of the primary verb, into circuitons exprefions
taken no notice, becaufe it is found only in the paffive voice; to which if it were neceffary, it is obvious that it ... would be neceffary in all voices, as a man may be about to alf as well as to fuffer immediately.
which fully convey their meaning (s). But fuch expreffions continually repeated would make language very prolix and wholly inanimated; for which realon, the import of each of the commonly received modes is a fubject worthy of the philologift's inventigation. About the number of modes, whether neceflary or only expedient, as well as about the import of each, the wrimodes. ters on granmar have differed in opinion. Mr Hartis, one of the moft celebrated of thofe writers, has enumerated four modes of the verb, befides the infinitive; viz. The indicative or declarative, to affert what we think certain; the potential or subjunctive, for
the purpofes of whatever we think contingent; the INTERrogative, whenwe are doubtful, to procureusinformation; and the kequISITIVE , to affift us inn the gratification of our volitions. The requifire too, according to him, appears under two diftinct fpecies ; either as it is cmperative to inferiors, or precative to fuperiors.

For eftablifhing fuch a variety of modes as this, no fart of foundation whatever appears. The fame reafoning which induced the anthor to give us an interrogative and requifitive mode, might have made him give us a bortative, a dilfuafive, a volative, and innumerable other modes, with which no language is acquainted. But befides perplexing his reader with ufelefs diftinctions, we cannot help thinking that Mr Harris has fallen into fome miftakes with regard to the import of thofe modes which are univerfally acknowledged. According to him, alfertion is the characteriftic of the indicutive, and that which diftinguifhes it from the fubjunctive or potential: but this is certainly not true, for with,out an affertion, the verb cannot be ufed in any mode. Of this the learned anthor, indeed, feems to have been aware, when he oblerved of the fubjunctive mode, that it is employed " when we do not $/ f$ rictly affert," and that "it implies but a dubiousand conjecturalafertion." The
truth is, that the affertion implied in this mode, tho it is not concerning the fame thing, is equally pofitive and abfolute with that conveyed by the indicative. An example quoted by himfelt thould have fet him right as to this matter :

## Sod tafitus pafaify poffet corves, hazeret

Plus dapis, $\mathrm{T}_{6 .}$
Who does not feel that the affertion contained in ha: beret, is as abfolute and pofitive as any alfertion whatever?
75. Perlaps we may be afked to define what we mean by a mode. We know not that we can define it to univerfal fatisfaction. Thus much, however, feems to be obvious, that thofe variations which are called modes do notimply different modifications of the action of the verb. Anso, Anem, Ama, do not fignify modes of loying; for modes of loving arc, loving much, loving little, loving iong, \&c. Shall we then get over the difficulty by faying, with Mr Harris, that "modes exhibit fome way or other the foul and its affections? This is certainly true: but it is nothing to the purpofe; for it does not diftinguifh the meaning of mode from the object of language in general, all languages being intended to exhibit the joul and its affections:

Grammatical modes of verbs have been defined by Mode deDr Gregory to be "concife modes of expreffing fome ot fined, thote combinations of thoughts which occur moft fre-quently, and are moft important and friking." This is a juft obfervation; but perhaps he would have given a more complete definition had he faid, that grammatical modes of verbs are concife modes of exprefing Jome of thofe combinations of thoughts which occur mofl frequently and of which ASSERTION is an elfential part ( T ). This indeed feems to be the real account of the mattcr, efpecially if our notion of the nature of verb be well. founded;
(s) The imperative, for inftance, may be refolved into a verb of commanding in the firft perfon of the prefent of the indicative, and a word denoting the aftion of the primary verb, commonly called the infinitive mode of that verb. Thus, Inunc et verfus tecum, maditare canoros, and "fubeo te nunc ire et tecum meditari," \&c. are fentences of the very fame import. The fubjunftive may be refolved in the fame mannar by means of a verb. denoting power or capacity; for credam, and poffum oredere, may be often ufed indifferently. The indicative node, however, is not thus convertible with another verb of affirming in the firft perfon of the prifeut of the indicative and a word denoting the action of the primary verb; for Titius. fcribit, "Titius writes," is not of the fame import with dico Titiunhfribere, quodTitius foribat, "I fay that Titius writes." The firf of thefe fentences, as has been already hown, contains but one affertion; the fecond obvioufly contains two. Titius urites is equivalent to Titius is writing; I fay that Titius writes, is equivalent to I am faying that Titius is writing. The reafon why the imperative and fubjunctive are refolvable into expreffions into which the indicative cannot be refolved, will be feen when the import of each of thofe modes is afcertained.
( T ) Every verb, excepr the fimple verb am, art, is, \&c. expreffes without modes a combination of thoughts, viz. affirriation and an attribute. The affirmation, however, alone is effential to the verb, for the atribute may be exprefled by other words. It is indeed extremely probable, that in the earlicft ages of the world, the, affirmation and attribute were always expreffed by different words; and that afterwards, for the fake of concifenefs, one word, compounded perhaps of thefe two, was made to exprefs both the affirmation and the attribute : hence arofe the various claffes of verbs, aftive, paflive, and neuter. Of a procefs of this kind there are evident figns in the Greek and fome other congues. But the improvers of language did not ftop here. The fame love of conciferefs induced them to modify the compound verb itfelf, that it might exprefs various combinations of thonght ftill more complex : but in all thefe combinations alfertion was of neceflity included; for if the word had ceafed to affert, it would have ceafed to be a verb of any kind.

Soon after this fhort note was written, and the whole article finimed for the prefs, we accidently met with Pickbourn's Differtation on the Englifh Verb. Of that work it belongs not to us to give a character. Such of our readers as hall perufe it, will fee that on many points we differ widely in opinion from the author ; but we, have no painful apprehenfion of any comparifon which may be made. It gives us pleafure, however, to find,
founded,-that itse(fence confiftsin affirnation. And in this opinion we are to be more confirmed, from a conviction that no man cuir employs language on any occafion but for the purpofe of affrming fomething. The fpeaker may affirm fomething directly of the ation itfelf; fomething of the agent's power or capacity to perform it ; or fomething of his own defire that it hoonld be performed, \&c.-but ttill he muft affrm.

## 8I

All modes equally indicative.

If this be fo, then are all the modes equally indicative. Some may be indicative of perceptions, and ochers of volitions ; but ftill they all contain indications. On this idea the three foregoing modes of amo will be thus diftinguifhed. When a man indicates his prefent feeling of the paffion of love, he ufes the firlt; when he indicates his prefent eapacity of feeling it, he ufes the fecond; and when he indicates his prefent defire that the perfon to whom he is fpeaking would entertain that palfion, he ufes the third.
76. As to what Mr Harris calls the interrogative mode, he himfelf obferves that it has a near affinity to the indicative. It has in fact not only a near affinity to it, but, as far as language is concerned, there is not between the one and the other the fighteft difference. For in writtenlanguage, take away the mark of interrogation and, in/poken language, the peculiar tone of voice, and the interrogative and indicative mode appear precifely the fame. That fuch hould be the cafe is extremely natural.

To illuftrate this, let us for once fpeak in the finVol. VIII.
galar number, and conceive one of our readers to be prefent. I alfert a thing, taking the truth of it for granted; but if you know me to be wrong, I prefume that you will fet me right: in this cafe, affertion produces the fame effectasinterrogation. Inftances perpetually occur in common converfation. An acquaintance fays to me-." You took a ride this norning: " I anfwer yos or no according to the cafe; and the fame effect. is produced as if he had laid-" Did you take a ride this morning?" In this way, at firft, would fimple affertion: be employed to procure information wanted. Fecifti-you did fuch a thing; fecifti no-you did it not:-either wonld produce the proper reply, and the information wanted would be gained (v). This being obferved as language improved, men would accompany fuch a fentence with a peculiar tone of voicc, or other marks, to fignify more unequivocally that the wanted information, or that fuch information wins the ouly object of their fpeech. Farther progreis in refinement would lead them to alter the poption of tioo words of a fentence when they meant to a/k a quefion, as we do in $E n g l e f h$, faying (when we affert), " $Y_{012}$ have read Euripides;", (when we interrogate), "Have you read Euripides?"

In Greek and Latin, queftions are akked commonly enough by the particles $\varepsilon$, and $a n$. Thefe particles we know to be exactly equivalent to the Englinh particle if, at leaft to the fenfe in which that particle is commonly taken. An fecifti is "If you did it;" and the fen-

I
tence
that his notions refpecting theorigin of fuch yerbsas exprefsat once affertion and an attribute, are the fame witin thofe which had occurred to ourfelves.
"The copula is appears (fays Mr Pickbourn) to have been coeval with language irfelf. But we have not the fame evidence to convince us, that that muft neceffarily have been the cafe with any other finite verb; for the copula is, containing only an affirmation, is much more fimple than a verb which unites in one word both an atribute and an affirmation. Since therefore people, in their firf attempts to exprefs their ideas by words, would fcarcely think of any thing more than what was abfolutely neceffary, it is probable they would be fome time before they invented any other word containing in itfelf an alfertion or affirmation; for they would not very early think of contriving words fo complex in their nature as to include in them both the name of an altion and ant alfertion.
"I conjecture, that the firf mode of expreffing actions or paffions; wonld be by participles or verbal nouns,i.e. words fignifying the names of the aftions or paffions they wanted to defcribe; and thefe words, connected with their fubject hy the copula is, might in thofe rude begininings of language tolerably well fupply the place of verbs : e.g. from obferving the operations of nature, fuch words as rain or raining, thunder or thundering, would foon be invented; and by adding the copula is, they would fay thundertng or thunder is or is not, rainingor rain is; which by the rapidity of pronunciation, might in time form the verbs rains, thunders, \&c. The obfervation of their own actions, or the aftions of the animals around them, would foon increafe their fock of ideas, and put them upon contriving fuitable expreffions for them. Hence might arife fuch words as thefe; Aeep or leeping, fland or flanding, run or running, bite or biting, hurt or burting : and by joining thefe to fubftastives by meansof the copula is, they might form fuch Centences as thele, -Lion is leeping, or perhaps lion feep is, fland is, \&c. whicin would foon be contracted into lion feeps, ftands, runs, bites, burts, \&c. Thus our little infulated family might become poifeffed of verbs including an attribute and an affirmation in one word."

This account of the origin of active, paffive, and neuter verbs, is certainly ingenious; and, in our opinion, it is not more ingenious than juft when applied to the Greek and other ancient languages, though it is not applicable to the Englifh; but it feems to be quite irreconcileable with the difinition of verb, which the author has adopted from Bifhop Lowth; and indeed with every other definition except that which makes the effence of a ver' to confift in fimple afirnation.
(u) Of a queftion put in the form of an affertion we have a remarkable inftance in the Gofpel of St Matthew. When Chrift food before Pilate, the governor afked him, faying, $\Sigma v \varepsilon \varepsilon \circ$ Barineus tor loudaran. That this fentence was pronounced with a view to obtain fome anfwer, is evident from the context; yet it is as plainly an affirmation, though uttered probably in a fooffing tone, as the ferious confeffion of Nathaniel, $\sum \cup$ \& 0 Bagineus rou lspani. Had not the queftion been put in this form, which afferts Chrift to be the king of the Jews, the reply conld not have been $\Sigma u$ vege:s; for without an alfertion the governor vould have faid norhing. See Dr Campbell's Tranfation of the Go/pels, where the form ufd in the original is with great propriety retaincd in the verfion.
tence may either be an abbreviation for dic an feciffi, "tell me if you did it;"or an may perhaps be, as if certainly is, the inperative mode of fome obfolete verb equivalent to give; and in that cafe, anfeciffi will be a complete interrogative fentence fignifying, "you did it, give that." - But of the interrogative mode of Mr Hartis we have faid enough; perhaps, our readers will think, too much, fince it is a ufelefs diftinction not found in any language. It will, however, be proper to fay fomething of liis precative mode, as far as it is the fame with the optative mode of the Greek grammarians. And,

82
77. Nothing, we think, can be clearer, than that the Greek optative conftitutes no diflinct mode of the verb, whatever meaning be annexed to the word mode. The different tenfes of the optative are evidently nothing but the paff times of the correfponding tenfes of the fiblunctive. Præf. fub. тuтta, I may frike. Pref. opt. тvлтоиц, I might ftrike, \&c. This is proved to be indubitably the cafe by the uniform practice of the Greek writers. Examples might be found without number were one to read in fearch of them. The following fentence will illuftrate our meaning: 'EpXovras 'A Anverot ive Eon日art tois Apretors, "the Athenians come that they may affif the Argives." Herc the leading verb spxoy ar being of the prefent tenfe, the dependent verb $\beta$ ontwor is the prefent fubjunctive. But change the former to the paff time, and the latter mult alfo be
 " the Athenians came that they might alfff the Argives." Here it is plain that $\beta \operatorname{con} \theta$ or $\varepsilon$, the prefent of the optatize, is the paft time of Bontwrt, the prefent of the ficbjunctive; and the fame in other inftances.

It is almoft unneceffary to add, that when this mode is employed to denote a wi/h, the wifh is not expreffed by the verb, but is underffood. Such abbreviated exprcffions to denote a wifh are common in all languages. Thus, in Greck,
fignifics, "The gods might give yon (or, as we fay in Englifh, changing the polition of the verb, might the gods give you) to deftroy," \&c. So in Latin, Ut te omnes dii dexque perdant, "That all the gods and goddeffes may curfe you!" Again, in Englifh, "O that my head were waters!" \&c. In all thefe, and fuch like fentences, the words equivalent to $I$ wi $/ / h, I$ pray, are underftood. In Greek a wi/h is fometimes introduced by the particle $\approx$ or $\varepsilon \tau \tau$, if; as in Homer,
 "If it had been your fate not to be born, or to die unmarried!" The fupplement is, "It would have been happy for your country," or fome fuch thing. In like manner, a poor perfon not uncommonly intreats a favour by faying, "Sir, if you would be fo good!" Here he flops; but the completion of his fentence is, "It would make me happy." In all thefe cafes a wifh
is not formally expreffed by the fpeaker, but inferred by the hearer. They are therefore inftances of that tendency which mankind univerfally difcover to abbreviate their language, efpecially in cafes where the paifions or feelings are intcrefted.
78. The interrogative and optative modes being fet afide as fuperfluous, it would appear from our inveftigation, that the real diffint inodes of the verb, which are found in the moft copious and varied language, are only three; the indicatioe, the fubjunctive, and the imperative: and that thefe are all that can be coniidered as neceffary; the $f i r f f$ to indicate the fpeaker's $f=e l i n g$ or acting, the fecond to indicate his capacity of feeling or acting, and the third to indicate his defire that the perfon to whom he fpeaks hbould feel or act.

Here again we have the misfortune to find ourfelves differ in opinion with Dr Gregory; who feems to think that a greater number of modes, if not abfolutely neceffary, would, however be highly ufeful. His words are: " All languages, I believe, are defective in refpect of that variety and accuracy of combination and of diftinction, which we know with infallible certainty take place in thought. Nor do I know of any particular in which language is more deficient than in the exprefling of thofe energies or nodifications of thought ; fone of which always are, and all of which might be expreffed by the grammatical modes of verbs. Of this there cannot be a clearer proof than the wellknown fact, that we are obliged to exprefs by the farme mood very different modifications or energies of thought. As, for inftance, in the cafe of the grammatical mood called the imperative, by which we exprefs occafionally prayer to God, command to a flave, requeft to a fupcrior, advice to an equal or to auly one, order as from an officer to his fubaltern, fupplication to one whom we cannot refift." - If thefe be, as the author calls them, Specific differences of thought, he will not furely object to their being all ranked under one gonus, which maybe called defire ( x ). That the internal feelings which prompt us te pray to God, to command a llave, to requeft a fuperior, to advife an equal, to give an order to an inferior, and to fupplicate one whom we cannot refift, are all different in degree, cannot be denied. Each of them, however, is defire ; and the predication, by which the defire is made. known to the perfon whom we addrefs, is the fame in all, when we utter a prayer as when we utter a command, when we requeft as when we fupplicate. But predication alone is that which conftitutes the verb: for defire by itfelf, however modified, can be expreffed only by an abffract noun; and the mereenergy of defire, when not applied to a particular cnergifer, can be expreffed only by a participle, or by what is conmonly, though improperly called the infinitive azode. Now it is certainly conceivable, that a few bades of meaning, or a few ( Y ) degress of one gener al energy, might be marked

## 83

 Only three modes neceflary, the indicative, fubjunctive, and imperative.by correfponding variations of fuch verbs as combine energy with predication; and there could be no great impropriety in calling thofe variations modes, or rather modes of modes : but that fuch a multiplication of modes would be an improvement in language, is by no means evident. The verb, with the modes and tenfes which it has in all languages, is already a very complex part of fpeech; which few are able, and fill fewer inclined, to analyze : and it would furely be of no advantage to make it more complex by the introduction of new modes, efpecially when thofe degrees of energy which could be marked by them are with equal and perhaps greater precifion marked, in the living /peech, by the different tones of voice adapted to them by nature; and, in written language, by the reader's general knowledge of the fubject, and of the perfons who may be occafionally introduced. If there be any particular delicacy of fentiment, or energy, which cannot thus be made known, it is better to exprefs it by a name appropriated to itfelf, together with the fimple and original verb of affirmation, than to clog the compound verb with fuch a multiplicity of variations as would render the acquifition of every language as difficult as is faid to be that of the Chinefe written characters. The indicative, fubjunctive, and imperative, are there-
fore all the modes of the verb which to us appear to be in any degree neceffary or expedient; and they are in fact all the modes that are really found in any language with which we are acquainted.

For the infinitive, as has been already obferved, The infinifeems on every account to be improperly flyled a tive no mode. To that name it has no title which we can mode of perceive, except thatits termination fometimes (for even the verb this is not trne univerfally) differs in the learned languages from the terminations of the other parts of the verb. Nay, if affirmation be, as it has been proved to be, the very effence of a verb, it will follow, that the infinitive is no part of the verb at all; for it exprefles $n a$ affirmation. It forms no complete fentence by it $i f / l f$, nor even when joined to a noun, unlefs it be aided by fome real part of a verb either expreffed or underftood. Scribo, fcribebam, fcripfi, foripferam, fcribanı, fcripfero; "I am writing, I was writing, I have written, 1 had written, I fhall write, I fhall have written,'" do each of them contain an afirmation, and conftitute a complete fentence: but foribere "to write" fcripfife " to have written," affirm nothing, and are not more applicable to any one perfon than to another. In a word, the infinitive is nothing more than an abfract uoun ( z ), denoting the fimple ENERGT of the verb, in conjunction
"Afirming (fays he), denying, tefifying, foretelling, afking, anfwering, wi/bing, hoping, expecting, believing, knowing, doubting, fuppofing, fipulating, being able, commanding, praying, requefting, fupplicating, loving, hating, fearing, defpairing, being accuftomed, wondering, admiring, wavering, fwearing, advifing, refufing, exhorting, difuiading, encourraging, promifing, threatening, \&c. all admit very readily of being combined with the general import of a verb." He adds, that "if every one of them had been expreffed in all languages by variations as ftriking as thofe of $\tau u \pi \tau \omega$, $\tau u \pi \tau o r \mu$, and $\tau u \pi \tau \varepsilon$, they muff have been acknowledged as diftinct moods of the verb."

If all thefe words denote different energies of thought, which, however, may be doubted, and if all thofe different energies, with many others for which, as the author jufly obferves, it is not eafy to find names, could, like capacity and defire, be combined with the general action or energy of one vert; and if thofe combinations could be marked by correfponding variations of that verb; we fhould indeed acknowledge fuch variations to be diftinct modes, or modes of modes, of the verb. Bat we doubt much if all this bé poffiblc. We are certain that it would be no improvement : for it feems to be evident, either that, in fome of the modes, the radical letters of the original verb muft be changed, and then it would ceafe to be the fame verb; or that many of the modes muft be expreffed by words of very unmanageable length ; not to mention that the additional complication introduced by fo many minute diftinctions into a part of fpeech already exceedingly complex, would render the import of the verb abfolutely unintelligible to nine-tenths even of thofe who are juftly fyled the learned.
(z) In our idea of the infinitive, we have the honour to agree with the learned and excellent Ruddiman: whofe words are, "Non ineptè hic modus a veteribus quiburdam verbi nomen eft appellatum. Eft cnim (fic non verè ac femper, quod nonnulli volunt, nomen fubftantivum) fignificatione certè ei maximè affinis; cjufque vices fuftinet pro omnes cafus. Et quidem manifefte fubttantivum videtur, cum adjectivunn ei additur neutrius generis : ut, Gic. Att. xiii. 28. Gumvivere ipfum turpc fit nobis.-Perf. v. 53 . Velle fuum cuique eft.-Cic. Fin. i. I. Totum boc dijplicet philo Fopheri-Petron. c. 52. Meum intelligere nullä pecunia vendo. Item, abfque adjectivo: ut, Ovid Met. ii. $4^{83}$. Poffeloqui eripitur, i. e. poteftas loquendr.—Plaut. Bacch. i. 2. 50. Hic veriri perdidit, i. e. verecundiam.-Cic. Tufc. v. 38. Loquor de docto honine et erudito, cui vivere eft cogitare, i. e. cujus vita eff cogitatio. [Grammaticat Latine linstitutiones: Parsfecunda, lib. i. cap. 2. where the reader will find examples of the infinitive ufed by the beft Roman writers as a fubftantive noun in every cafe.]
This opinion of Ruddiman and his ancient grammarians has been lately controverted with much ingenuity by $D_{r}$ Gregory; who feems to think, that in the infinitive alone we fhoold look for the effonce of the verb divefted of every accidental circumftance, time only excepted. If this be indeed the cafe, alnoft every thing which we have faid of the verb, its tenfes, and its modes, is erroneous; and he who takes his principles of grammar from the Encyclopadia, will fill his head with a farrago of abfurdities. The writer of the article, hovever, has been at much pains to acquire correct notions of the fibject: he has fudied the writings of others; he

Whth tiene; and is not a $n i d c, a$. ion as we can conceive, of any thing. I hus, Scirc tum monilaft, is the fame, with sicicntia tua nibil efl; and, "Death is certain," with "To die is certain."
79. Before we difmifs the fubject of modes, it may not be improper to take notice of the connection which Mr Harri., after Apollonius, has found between commanding and futurity. "Intreating and commanding (he fays) have a neceffaty refpect to the fiture only. For nhat have they to do vith the prefent and the paff, the natures of which are immutable and neceffary." This is furely confounding comsmands with the execrtion of commands. But the learned writer proceeds to inform us, that " it is from the comnection of futurity with commands, that the future of the indicative is fometimes ufed for the interative mode." The connextion, of which he fpeaks, appears to us entirely imaginary ; for futurity has nothing to do with commands, though it may
with the execution of them. The prefent time is the time of commanding, the future of obeying. But fuppofing the connection real, it would not account for the future tenfes being ufed imperatively. For although it were true, as it is evidently falfe, that commands are future, it wonld not follow that the relation is convertible, or that employing the future hould imply a command. Theprinciple upon which fuch expretfions as, Thou shalt not kiri, come to have the force of a command, feems to be this. When a perfon, efpecially one poffeffed of authority, afferts that an attion, depending on the will of a free agent, and therefore in its own nature contingest, fhall or fhall not actually take place; what are we to corclude from fuch an affertion ? Why furely it is natural to conclude, that it is his will, his command, that his affertion be verified. The Englifh word $\mathrm{\beta}$ all, if we be well informed, denoted originally obligation; a fenfe in which its paft tenfe fould is
has confulted feveral perfons of undoubted learning, who have devoted a great part of their time to grammatical inveftigations; and he is extremely unwilling to fuppofe, that all his inquiries refpecting the moft important part of feech have ended in error. He trufts, therefore, that he fhall not be deemed a petulant caviller, though he examine with fome feverity the principal obfervations and arguments upon which the Doctor has built his theory. Upon that examination he enters with diffidence : for the learned Profeflor's knowledge of the various powers of the mind appears, even in this effay, to be fuch as eminently qualifies him for afcertaining the precife import of every fpecies of words employed for the purpofe of communicating thonght; and with fuch a man the prefent writer would be much happier to agree than to differ in opinion.

The Doctor acknowledges (Tranfact. of the Royal Society, Edinburgh, Vol. II. lit. clafs, p. 195), that the infinitive is moft improperly called a made : and on that account he thinks we ought to turn our thoughts exclufively to it, "when we endeavour to inventigate the general import of the verb with a view to afcertain the accident which it denotes; and be led, ftep by ftep, to form a diftinet notion of what is common in the ascidents of all verbs, and what is peculiar in the accidents of the feveral claffes of them, and thereby be enabled to give good definitions, fpecifying the effence of the verb," \&c. It may be true, that to the infinitive exclufively we fhould turn our attention, when we wifh to afcertain the accident denoted by a particular verb or clafs of verbs; i. e. the kind of attion, palfion, or flate of being, of which, fuperadded to affirmation, that verb or clafs of verbs is expreflive : but in accidents of this kind, it may be doubted if there be any thing that with propriety can be faid to be common to all verbs. There feems indeed to be nothing common to all verbs, but that which: is 'elfential to them, and by which they are diftinguifhed from every other part of fpeech; but every kind of action, palfion, and flate of being, may be completely expreffed by participlesand akffruft nouns; and therefore infuch. accidents we cannot find the effence of the verb, becaufe fuch accidents diftinguifh it not from other parts of fpeech. Were a man called upon to fpecify the eflence of verfe or metre, he would not fay, that it confifts in the meaning of the words, or in the ufing of thefe verbs according to the rules of fyntax. In every kind of verfe where words are ufed they have indeed a meaning, and in all gaod verfes they are grammatically conftructed; but this is likewife the cafe in profe, and cherefore it cannot be the effence of verfe. The effence of verfe muft confilt in fomething which is not to be found in profe, viz. a certain harmonic fucceffion of founds and number of fyllables: and the effince of the verb muft likewife confift in fomething which is not to be found in any other part of fpeeah; and that, we are perfuaded, is nothing but affirmation. But if affirmation be the very effence of the verb, it would furely be improper, when we endeavour to afcertain the general import of that part of feeech, to turn our theughts exclufively to a word which implies no affirmation; for what does not affirm, cannot in ftrictnefs of truth be either a verb or the mode of a verb.

In the fame page it is faid, that "the indefinite denotes that kind of thought or combination of thoughts: which is common to all the other modes." In what fenfe this is rrue, we are nable to conceive : it denotes indeed the fane accident, but certainly not the fame thought or conibination of thoughts. In the examples. quoted, Non eft vavere fed ualere vita, \&c. the infinitives have evidently the effect of abfract nouns, and not: of verbs; for though vivere and'valere exprefs the fame flates of being with vivo and valeo, they by no means. exprefs the fame combination of thoughts. Vivo and valeo affirm that $I_{\text {AM }}$ living, and that $I_{\text {AM }}$ well; and he who utters thefe words muft think not of life and health in the abftract, but of life and bealth as belonging to hinzfelf. Vivere and valere, on the orlier hand, affrm nothing; and he who utters them thinks only of the: faxtes of ivving and of being in bealth, withont applying them to any particular perfon.

The exquifitely learined author of The Origin and Frogrefs of L anguage, having faid that the inflitive is ufed either as a noun, or that it ferves to connect the verb with another verb or a noun, and fo is ufeful in fyntax. the Dofor combats this opinion, and infers the infunitive to be truly a verb; becaule "the thought expreffed
fill commonly employcd. In Englifh, therefore, the foregoing procefs of inferring a command from an affertion of futurity, feems to have been reverfed; and the word jhall, from denoting a command or obligation, has come to denote futurity fimply.
80. Having confidered the verb in its effence, its tenSes, and its modes, we might feem to have exhaufted the fubject; but there is ftill fomething more to be done. Grammarians have diftinguifhed verbs into feveral/pecies; and it remains with us to enquire upon what principle in nature this diftinction is made, and how far it proceeds. Now it nuft be obvious, that if predication be the effence of a verb, all verbs, as fuch, muft be of the fame $\int p e c t e s$; for predication is the fame in every propofition, under every polfible circumftance, and by whomfoever. it is made. But the greater part of verbs contain the predicate as well as the predication of a pro-
pofition; or, to fpeak in common language, they denote an attribute as well as an affirmation. Thus, lego is "I an reading ;" anbulo, "I am walking ;" $J$ lo, "Iam flanding;" verbero, "I am ftriking ;" verberor, "I am fricken." But the attributes expreffed by thefe verbs are evidently of different kinds; fome confifting in action, fome in fuffering, and fome in a ftate of being, which is neither affive nor paffive. Hence the diftinction of verbs, according to the attributes which they denote, into active, palfive, and neuter. Lego, which is an affertion that I am employed in the aft of reading, is an altive verb; verberor, which is an allertion that I an fuffering under the rod, is a paffive verb, becaufe it denotes a $p a f f 10 n$; and $f t o$, which is an affertion that I am flanding fill, is faid to be a neuter verb, becanfe it denotes neither action nor paffon. But it is felf-evident that there cannot be action without an agent, nor palfions without
by means of it, may be expreffed in fynonymous and convertible phrafes, in different languages, by means of other parts or moods of the verb."' Of thefe fynonymous and convertible phrafes he gives feveral examples, of which the firft is taken from Hamlet's foliloquy. "To be or not to be, that is the queftion," he thinks equivalent in meaning to, "The queftion is, whether we fhall be or fhall not be?" But we are perfuaded he is miftaken. "Whether we fhall be or fhall not be," is a queftion afking, whether we flall exift at fome future and indefinite time? but the fubject of Hamlet's debate with himfelf was not, Whether, if his confcious exiftence fhould be interrupted, it would be afterwards at fome future and indefinite time reftored $?$ but whether it was to continue uninterrupted by his exit from this world? This, we, think, mult be felf-evident to every reader of the Soliloquy. It is likewife very obvions, that the word queftion in this fentence does not fignify interrogatory, bus fubject of debate or affair to be examined; and that the word that ferves for no other purpofe than to complete the verfe, and give additional emphafis, perhaps, to an inquiry fo important. "To be or not to be, that is the queftion," is therefore equivalent in all refpects to "The continuance or non-continuance of my exiftence, is the matter to be examined ;" and the indefinite is here indifputably ufed as an abfract nom in the nominative cafe. Should it be faid, that the Doctor may have taken the fentence by itfelf, unconnested with the fubject of Hamlet's foliloquy; we beg leave to reply that the fappofition is impofible; for, independent of the circumftances with which they are connected, the words "To be or not to be" have no perfect meaning. Were it not for the fubject of the foliloquy, from which every reader fupplies what is wanting to complete the fenfe, it might be afked, "To be or not to be"-What s A coward, a murderer, a king, or a dead man! Queftions. all equally reafonable, and which in that cafe could not be anfwered.

With the fame view, to prove the infinitive to be truly a verb, the Doctor proceeds to remark upon the following phrafes, Dico, credo, puto, Titium exiflere, valere, jacere, cecidiffe, procubui(fe, projeciffe Mavium, pro. jectumfuilfe a Mavio; which, hefays, have the very fame meaning with dico, \&c. quod Titizus exiflat, quod jaceat, quod ceciderit, \&c. He adds, that "the infinitives, as thus ufed, acquire not any further meaning, in addition to the radical import of the verb with tenfe, like the proper moods; but the fubjunctives after quod lofe their peculiar meaning as moods, and fignify no more than bare infinitives." In the fenfe in which this obfervation is made by the author; the very reverfe of it feems to be the truth. The infinitives, as thus ufed, acquire, at lealt in the mind of the reader, fomething like the power of affirnation, which they certainly have not when ftanding by themfelves whereas, the fubjundives neither lofe nor acquire any meaning by being placed after quod. Dico, credo, put, Titium exiflere, valere, jacere, \&c. when tran latedliterally, fignify, 1 fay, believe, think, Titius to exift, to be well; to lie along; a mode of fpeaking which, thongh now not elegant, was common with; the beft writers in the days of Shakefpeare, and is frequently to be found in the writings of Warburton at the prefent day. Dico, credo, puto, quodTitius exiftat, quod jaceat, \&c. fignifies literally, Ifay, believe, think, that Titius may exiff, may lie along, \& c . Remove the verbs in the indicative mode from the former fet of phrafes, and it will be found that the infinitives had acquired a meaning, when conjoined with them, which they bave not. when left by themfelves; for Titium exiftere, jacere; "'Titius to exift, to lie along," have no complcte meaning, becaufe they affirm nothing. On the other hand, when the indicative verbs are removed, together with the wonder-working quod, from the latter fet of phrafes, the meaning of the fribjundives remains in all refpects as, it was before the removal; for Titius exiffat, jacteat, \&c. fignify, Titius may exift, may lie along, as well when they ftand by themfelves as when they make the final claufes of a compound fentence. Every one knows, that quod, though often called a conjunctien, is always in fait the relative pronoun. Dico, oredo, puty, quod Titius exiffat, muft therefore be conftrued thus: Titius exiftat (eft id) quod dico, credo, \&c. "Titius may exift is that thing, that propofition, which I fay, believe, think." In the former let of phrafes, the infinitives are ufed as. abftract nouns in the accufative cafe, denoting, in conjunction with Titium, one complex conception, the exiffence, \&c. of Titius : Dico, credo, puto; "I fay, believe, think;" and the objeff of my fpeech, belief, thought,
is, Titium exiftare, "the exittence of Titius."
withour a palfive being; neither can we make apredica-
tion of any kind, though it denote neither action nor pafflon1, without predicating fomething. All verbs, therefore, whether active, pafive, or neuter, have a neceffary reference to fome noun expreffive of the fubflance, of which the attribute, denoted by the verb, is predicated. This noun, which in all languages muft be in the nominative cafe, is faid to be the nominative of the verb; and in thofe langaages in which the verb has perfon and number, it muft in thefe refpects agrec with its nominative.

Ot action, and confequently of verbs denoting action, there areobvioully two kinds. There is an action which paffes from the agent to fome fubject, upon which he is employed; and there is an action which refpects no objeet beyond the agent himfelf. Thus lego and antouloare verbs which equally denote attion: but the action of legorefers to fome exterizalobject as well as to the agent; for when a man is reading, he muft be reading fomething, a book, a newfpaper, or a letter, \&c. whereas, the action of ambulo is confined wholly to the agent; for when a man is walking, he is employed upon nothing be:ond himself,--his action produces no effect upon any thing external. Thefe two fpecies of verbs have been denominated tranfilive and intranfitive; a defignation extremely proper, as the diftinction which gave rife to it is philofophically juft. Verbs of both fpecies are active;
but the action of thefe only which are called tranfitive, 89 refpects an externalobject : and therefore, in thofe lan- The forguages of which the nouns have cafes, it is only after mer only verbs which are tranfitive as well as active, that the govern noun denoting the fubject of the action is put in the ac- nouns in cufative or objective cafe. Verbs which are intranfitive, fative cafe. though they be really aftive, are in the ftructure of fentences confidered as neuter, and govern no cafe.

And fo much for that moft important of all words the verb. We proceed now to the confideration of participles, adjectives, and adverbs; which, as they have a near relation to one another, we fhall treat of in the fame chapter.

## CHAPTER V.

## Of Participles, Adjectives, and Adverbs.

## Segt. I. Of Participles.

81. The nature of verbs being underftood, that of participl 90 participles is not of dificult comprehenfion. Every denote an verb, except that which is called the fubftantive verb is attribute exprefliveof an attribute, oftime, and of an affertion. Now conbined if we take away the affertion, and thus deftroy the verb, with time. there will remain the attribute and the time; and thefe combined make the effence of that fpecies of words call-

In confirmation of the fame idea, that the infinitive is truly a verb, the author quotes from Horace a paffage, which, had we thought quotations neceffary, we fhould have urged in fupport of our own opinion:

> Nec quicquam tibi prodeft
> Aërias tentasse domos, animoque rotundum
> Percurrisse polum, morituro.

To our apprehenfion, nothing can be clearer than that tentasseandrercurrisse are here ufedas nouns; for if they be not, where fhall we find a nominative to the verb prodeff? It was certainly what is fignified by tentasse aerias domos, animoque rotundum Percurrisse folum, that is faid to have been of no advantage to Archytas at his death. This indeed, if there could be any doubt about it, would be made evident by the two profe verfions, which the profeffor fubjoins to thefe beautiful lines. The firft of which is as follws t Nee quiequam tibi prodeft quod aërias domos tentaveris, et animo percurreris polums; which muft be thus conftued: Tentaveris aërias domos, et PERCURRERIS animo poltem (eft id) quod nec quicquam tibiprodeft. This verfion, however, is not perfectly accurate; for it contains two propofitions, while Horace's lines contain but one. The fecond, which, though it may be a crabbed inelegant fentence, expteffes the peet's fenfe with more precifion, is in thefe words : Nec quicquantibi prodeft morituro tua tentatio domuumaër riatum et cursus tuus circapolum. Havingobferved, with truth, that this fentence bas the very fame meaning with the lines of Horace, Dr Gregary afks, "Why are not tentatio and curfius reckoned verbs as weli as tentuffe and percurriffe"' Let thofe anfwer this queftion who believe that any of thefe werds are truly verbs; for they are furely as he adds, all very near akin; indeed fo near, that the mind, when contemplating the import of each, cannot perceive the difference. Mean while, we beg leave in our turn to ak, Why are not tenual $\int e$ and percurriffe reckored abftrati nouns as well as tentatio and curfus: To this queftion it is not eafy to conceive what anfwer can be returned npore the Doctor's principles. In his theory there is nothing fatisfactory; and what has not been done by himfelf, we expect not from his followers. On the other hand, our principles furnifh a very obvious reafon for excluding tentatio and curfus from the clafs of verbs; it is, becaufe thefe words exprefs no predication. Tentaffe and percterrif $\left(\frac{1}{}\right.$ indeed denote predication no more than tentatio and curfus; and therefore upon the fame principle we exclude them likewife from a clafs to which, if words are to be arranged according to their imporr, they certainly do not belong.

Should the reader be inclined to think that we have dwelt too long on this point, we beg him to reflect, that if our ideas of the effence of the verb and of the nature of the infinitive be erroneons, every thing which we have faid of modes and tenfes is erroneous likewife. We were therefore willing to try the folidity of thofe principles which hotd the effence of the verb to confift in energy : and we felected Dr Gregory's theory for the fubject of examination, not from any difrefpect to the author, whom the writer of this article never faw i but becaufe we believe his abilities to be fuch, that

> - Si Pergama dextrâ
> Defendi polfent, etiam hac defenfa fuiflent.
edparticiples. Thus, take, away the affertion from the verb reapea writeth, and their remains the participle apacail writing; which, without the alfertion, denotes the fame attribute and the fome time. After the fame mamer, by withdrawing the affertion, we difcover
 reap:s flate tewitims. This is Mr Harris's doctrine refpecting participles; which, in our opinion, is equally elegant, perfpicuous, and juft. It has, however, been controverted by an author, whofe rankin the republic of letters is fuch, that we fhould be wanting in refpect to him, and in duty to our readers, were we to pafishis objections umnoticed.
82. it is acknowledged by $\operatorname{Dr}$ Beattie, that this, which we havetaken, is the moft convenient light in which the participle can be confidered in univerfal grammar: and yet he affirms that prefent participles do not always exprefsprefent time, nor preterite parliciples paft time; nay, that participles have often no connection with time at all. Hethusexemplifies his affertion, in Greck, in Latin, and in Englifh.
" When Cebes favs, Eturqavopev Tepstarouvtisav tw tou xpoveu :apew, 'We WERE Walking in the temple of Saturn,' the participle of the prefent, walking, is by means of the verb WERE, applied to time paft; and therefore of itfelf cannot be underftood to fignify any fort of time." Again, after obferving, that in Englifh we have but two fimple participles, fuch as writing and arittor, of which the former is generally confidered as the prefent and the latter as the paft, the Doctor adds, But " the participle writing, joined to a verb of diferent tenfes, may denote either pafl or future action; for we may fay not only, I ant writing, but alfo, $I$ was writing yefterday, and I Shall be writing tomorrow;" whence he infers that no time whatever is denoted by the prefent participle. But furely this is a hafty inference, drawn from the doctrine of ab ohute time and a deftute prefent, which we havealready fhown to be groundlefs and contradictory. When we fpeak fimply of an action as prefent, we maft mean that it is prefent with refpect to fomething befides itfelf, or we fpeak a jargon which is unintelligible, but we do not afeertain the time of its prefence. From the very nature of time, an action may be prefent now, it may have been prefent formerly, or it may be prefent at fome future period; but the precife time of its prefence cannot be afcertained even by the prefent of the indicative of the verbitfelf; yet who ever fuppofed that the prefent of the indicative denotes notinne? The participle of the prefent reprefents the action of the verb as going on; but an action cannot be going on without being prefent in timise with fomething. When, therefore, Cebes fays, "We were walking in the temple of Saturn," he reprefents the action of the verb walk as prefent with fomething; but by uling the verb expreflive of his alfertion in a paft tenfe he gives us to underftand that the attion was not prefent with anytining at the period of his /peaking, but at fome portion of time prior to that period : what that portion of time was, muft be collected from the fubfequent parts of his difcourfe. The fane is to be faid of the phrafes I was writingy:fterday, and I fhall be writing to morrow. They indicate, that the action of the verb wRITE was prefent with me yefterday, and willagain be prefent with me to. morrow. The aftion, and the time of action, are denoted by the participle; that astion is afirmed to belong to me by
means of the verb; and the time at which it belonged to me is pointed out by the tenfes of that verb am, was, and fhall be. All this is fo plain, that it could not have efcaped Dr Beattie's penetration, had he not haftily adopted the ablurd and contradictory notion of a definite prefent.

Of the truthof his affertion refpecting paft participles he gives a Greek and a Latin example. The former is
 latter is that which is commonly called the perfect future of the pallive verb amor, amatus fuero. In the firft inftance, he fays that the participle, though belonging to the aorift of the paft time mult be rendered either by the indefinite prefent, "he who believeth; or by the future, he who will believe; and the reafor which he gives for this rendering of the word is, that "the believing here fpoken of is confidered as pofterior in time to the cnunciation of the promife." This is indeed true, but it is not to the purpofe; for with the emenctation of the promife, the time of the participle lias no manner of concern. The time of $\pi เ \sigma \tau \varepsilon v \sigma a s$ depends entirely upon the time of $\sigma \omega^{\text {fingerat}}$, with refpect to which it muft undeniably be paft. Our Lord is not here afferting, that he who fball believe at the day of final retribution, Shall be faved; but that he who thall on that day be found to have believed in time paft, flall be faved: and if the participle had not been expreliive of a finifhed action and a paft time, the whole fentence woald have convcyed a meaning not triendly to the interefts of the gofpel. In like manner, the time of amatus is reforred, not to the time of /jeaking, but to the time of fuero, with refpect to which, who fees not that it is paft? The two words, taken together, contain a declaration, that he who utters them fball, at fome time pofterior to that of fpeaking, have BEEN loved; fhall have been loved denotes twa times, both future with refpect to the time of fpeaking; but when the time, denoted by foull have, comes to be prefent, that of the participle loved mut be paft, for it is declared that the action of it thall then be complete and fuifhed.

We conclude, then, that it is effential to a participle to exprefs both an attribute and time; and that fuch words as denote no time, though they may be in the form of participles, as doctus "learned," eioquens"eloquent," \&c. belong to another part offpeech, which we now procced to confider

## Sect. II. Of Adjectives.

83. The nature of verbs and participles being under- Adjective ftood, that of ADJECTIVEs becomes eafy. A verb im-denote atplies (as we have faid) an attribute, time, and an affer- tributes as tion; a participlo implies only an attribute and time ; and belonging an ADJECTIVE implies only an attribute as belonging to to fome fubflance. In other words, an ADJECTIVE has no alfertion, and it denotes only fuch an attribute as has not its effence either in mution or its privation. Thus, in gencral, the attributes of quantity, quality, and relation, fuch as many, few, great, little, black, white, good, bad, double, treble, \&c. are all denoted by ADJEctives.
84. To underftand the import and the ufe of this They 92 pecies of words, it muft be obferved that every adjective the import is refolvable into a fubftantive and an expreffion of connec- of abftract tion cquivalent to of. Thus, a good man is a man of nourns, togoodnefs; where we fee the attribute denoted by the ad- getherwith jeitive fully expreffed by an abllract nown. But it is of a conevident nective.
evident that the noungoodnefs does not exprefs the whole meaning of the adjoctive good; for every adjective expreffes not only an attribute, but alfo the connection bctivecn the attribute and its fubfance; whereas in the abjtralt nown, the attribute is confidered as a fubftance unconneifed with any other fubstance.

In the next place, it is to be obferved, that the connection exprefled by adjectioes, like that expreffed by of, is of a nature fo general and indefinite, that the particularkind of connection muft, in fome languages, be inferred from our previous knowledge of the objects between which it fublifts, or it will for ever remain unknown. This might be proved by a variety of examples, but will perhaps be fafficiently evident from the following. Color fithobris fignifies colour that indicates health; axcercifatiofalubris, exercife that preferveshealth; vistus falubris, food that improves health; medicina falubris, medicine that reflores health. In all thefe examples the connection expreffed by the adjective form of falubris is diffcrent ; and though it may be known from previous experience, there is nothing in any of the expreffions themfelves by which it can be afcertained. Thus, adjectives are each fignificant of an attribute and connection ; but the particular kind of connection is afcertained by experience. -The ufual effect of adjectives in language, is to modify or particularife a gener al term,

93 The ufual effect of ad jectives is to modify a general term.
by adding fome quality or circumftance which may diftinguifh the object meant by that term, from the other objectsof the fame fpecies. I haveoccation, for example, to fpeak of a particular man, of whofe name I am ignorant. The word man is too general for my purpole, it being applicable to every individual of the human fpecies. In what way then do I proceed, in order to particularize it, fo as to make it denote that very man whom I mean to /pecify? I annex or conjoin to it fuch words as are fignificant of objects and qualities with which he is connected, and which are not equally applicable to others from whom I mean to diffinguijh him. Thus I can fay, a man of prudence or a prudent man, a wife man, a good man, a brave man, \&c. By thefe additions the general term man is limited, or modified and can be applied only to certain men to whom belong the att):butes expreffed by the adjectives prudent, wife, good and brave. If it be ftill too general for my purpofe, I can add to it other qualities and circumftances, till I male it fo particular as to be applicable to but one individual man in the univerfe.
85. Thisis the way in which adjectives, are commonly ufed, but it is not the only way. Inftead of being craployed to modify a fubftantive, they fometimes appear as the principal words in the fentence, when the fole ufe of the fubftartive feems to be to modify the abflatituoun, contained under the adjective to which that fubftantive is joized. In order to underftand this, it will be neceffary to attend to the following obfervations.

It may be laid down as a general propofition, that when any term or phrafe is employed to denote a compiex conceptior, the mind has a power of confidering, inwhat order it pleafes, the fimple id as of which the complex conc. $f^{i z} \%$ is compofed. To illuftrate this obferva-- tion by an example: The word eques in Latin, denotes a conjl:a coneeption, of which the conflituent fimple ideas are chofe of a man and a hurfe; with this connection fubfinting between them, that the wan is conceived as on
the back of the borfe. In the ufe of this word, it is well known that the idea frff in order, as being the principalfubject of the propotition, is commonly the maN on the back of the horfe; but it is not fo always, for the mind may confider the horse as the principal object. Thus when Virgil fays,

Frana Pelethyonii Lapitha gyrofqus dedere,
Impofiti dorfo; atque EQUITEM docucra fub armis
Insultare golo, et gressus glomerare fuperbosthe energies attributed to the object fignified by EQUITEM, make it evident that the horfe and not the man is meant; for it is not the property of a man, infultare folo, et greffus glonierare fuperbos.

The fame obfervation holds true where the complex: object is denoted by two or more words; an adjective, for inftance, and a fubfantive. Thus in the phrafe fummus mons fe inter uubila condit, the words fummus mons reprefent a complex couception, of which the confituentideas are thofe of beight and mountaiw, connected together by the adjective form of fummus. Either of thefe ideas may be the fubject of the propofition; and the expreflion will accordingly admit of two different fignifications. If mons be made the fubject of the propofition, the meaning will be, "t the higheft mountain hides itfelf among the clouds." If the fubftantive included in the radical part of fummus be made the fubject of che propofition, the expreffion will fignify, " the fummit, or higheft part of the mountain, hides itfelf among the clouds." The latter is the true import of the fentence.
86. From thefe obfervations and examples, we thall be enabled to underftand the $t w o u f e s$ of the adjective. Two ufes It is either employed, as has been already obferved, of the adto reftrict or modify a general term; or the abftract jective. fubfantive contained in the adjective is modified by the noun, with which, in the concrete or adjective form, that abftract fubftantive is joined. The firft may be called the direct, the fecond the inver $\int e$, acceptation of adjectives.

The inverfe acceptation of adjectives and partioiples (for both are ufed in the fame manner) has not, except in a very few inftances, been noticed by any grammarian; yet the principle is of great extentin language. In order to explain it, we fhall produce a fow examples; which on any other principle it is impoffible to underftand.

Livy, fpeaking of the abolition of the regal authority at Rome, fays Regnatumeft Rome ab URBE CONDITA ad liberatam annos ducentos quadraginta quatuor, " Monarchy fubfifted at Rome, not from the city built (which would convey no meaning), but from the building of the city, to its deliverance," \&c. Both the participles condita and liberatan are here nfed inverfely; that is, the abftraft fubftantives contained in condita and liberatam are modified or reftricted by the fubitantives urbe and urbem, with which they unite, Again, Owid, fpeaking of the conteft between Ajax and Ulyffes for the arms of Achilles, has thefe lines:

## Qui, licct eloquio fidum quoque Nefiera vincat, Haud tamen efficiet, DEEERTOMut Nestora crimen Nullum effe rear,

Here alfo the adjective or participle Desertum is taken inverfely, and the general notion of defertion contained in it is modified or rendered particular by being joined -With the fubitantive nestora. The meaning of rhe
paffage ís, "I will never be induced to believe that the defertion of $N e f t o r$ was not a crime." Were defertum to be taken derectly as an adjective modifying its fubftantive, the fentence muft be tranflated, "I cannot believe that Neflor deferted was not a crime." But it is evident that this is nonfenfe; as Nestor, whether deferted or not deferted, could not be a crime.

It were eafy to produce many more examples of adjectives taken inverfely; but thefe may fuffice to illuftrate the general principle, and to fhow, that without attending to it, it is impofible to underftand the ancient authors. We fhall adduce one infance of it from Shakefpeare, to evince that it is not confined to the ancient languages, though in thefe it is certainly more frequent than in the modern:
" Freeze, freeze, thou bitter iky;
"Thou canf not bite fo nigh
"As benefits foryot:
" Though thou the waters watp,

* Thy fing is not fo harp

As friends remember'd not."
Here it is evident, that the adjective forgor is taken inverfely ; for it is not a benefit, but the forgetting of a benefit, which bites more than the bitter Aky : and therefore, in this paffage, the adjective ferves not to modify the noun; but the noun benifits is employed to modify the abftract fubflantive contained in the adjective forgot, which is the fubject of the propofition', and the principal word in the fentence.

Had Mr Harris attended to this principle, and reflected upon what he could not but know, that all adjectives denotefubftances; not indced fubfifting by themfelves, asthofe expreffed by nouns, but concretely, as the attributes of other fubftances; he would not have clafled adjectives with verbs, or have paffed fo fevere a cenfure upon the graminarians for claffing them with nouns. It matters very little how adjectives are claffed, provided their nature and effect be underftood; but they bave at leaft as good a title to be ranked with nouns as with verbs, and in our opinion a better. To adopt Mr Harris's language, they are homogencous with refpect to zouns, as both denotefubftances; they are beterogeneous with refpect to verbs, as they never do denote alfertion. 87. Befides original adjectives there is another clafs, which is formed from fubftantives. Thus, when we fay, the party of Pornpey, the-fiyle of Cicero, the philofophy of Socrates; in thefecafes, the party, the fylle, and the philofophy fooken of, receive a ftamp and character from the perfons whom they refpect: Thofe perfons, therefore, perform the part of attributes. Hence they atfually pafs into attributives, and affume as fuch the form of adjectives. It is thus we fay, the Pompeiar party, the Ciceronian fiyle, and the Socratic philofophy. In like manner, for a trumper of brafs, we fay a brazen trumpet, and for a crown of gold, a yolden crown, \&c. Even pronominal fubftantives admitthelike mutation. Thus, inftead of faying, the book of nee, and of thee, we fay my book, and thy book; and inftead of faying, the comatry of us, and of you, we fay our country, and your country. \&Thefe words my, thy, our, your, \&c. have therefore been properly called promominal adjectives.

Vol. Vili.
88. It has been already obferved, and maft be obvious to all, that fubftances alone are fufceptible of $\int x$; and that therefore firbfantive nouns alone would have diftinctions refpecting gender. The fame is true with Arjeetives refpert to number and perfon. An attrabute admits from their of no change in its nature, whether it belong to you nature or to ME, to a man or a woman, to one man or to MANY; and therefore the words exprefive of attributes, ought on all occafions, and in every lituation, to be note fex, black and white, are the fame, whether they be applied perfor. to a man or a woman, to many or to few; fo the word which expreffes any one of thefe attributes ought in frictnefs to admit of no alteration with whatever fubflantive it may be joined. Such is the order of nature : and that order, on this as on other occalions, the Englifh language moft ftrictly obferves: for we fay equally, a good man or a good woman; good men or good women; a good houfe or good houfes. In fome languages, indeed, fuch as Greek and Latin, of which the nouns admit of cafes, and the fentences of an inverted /tructure, it has been found neceffary to endow adjectives with the threefold difinction of gender, number, and perfon; but as this is only an accidental variation, occafioned by particular circumftances, and not in the leaft effential to language, it belongs not to our fubject, but to the particular grammars of thefe tongues.

There is, however, one variation of the adjective, They have, which has place in all languages, is founded in the na- however, ture of things, and properly belongs to univerfal gram- owe variamar. It is occafioned by comparing the attribute of one fubitance with a finitar attribute of another, and falls naturally to be explained under the next fection.
Sect. III. OfADVERbs, and the Comparifon of AdJECTIVES.
89. As adjectives denote the attributes of fubftances, fo there is an inferior clafs of words which denote the mondifications of thefe attributes. Thus, when we fay " Gi - Theimport cero and Pliny were both of them eloquent; Statius and of adverbs. Virgil both of them wrote;" the attributes expreffed by the words eloquent and quote are immediately referred to Gicero, Virgil, \&c. ; and as denoting the artributes of fubftiances, thefe words, the one an adjective and the other averb, have been both called attributives of the first order. But when we fay, "Pliny was moderately eloquent, but Cicero exceedingly cloquent; Statius wrote indifferently, but Virgii, wrote admurably; the words moderately, exceedingly, indifferently, and admirably, are not referable to fublantives, fur to other attributes; that is, to the words eloquent and worce, the fignification of which they modifj. Such words, therefore, having the fame effect upon adjectives that adjectives have upon fubftantives, hawe been called attributives of the second order. By gram- The rea marians they have been called adverbs; and, if of their we take the word VERB in its moft coniprobenfive fig- name. nification ( $A$ ), as including not only verbs properily fo coll:d, but alio every fpecies of words, which, whether effentially or accidentally, are fignificant of the attributes of fubftances, we fhall find the name ADVERE K
(A) Ariftotle and his followers called every word a verb, whic denotes the predicate of a propofition. This claflification was certainly abfard; for it confound not only adjectives and participles, but even fubfautives, with verbs: but the authority of Ariftotle was great ; and hence the name of adverb, though that word attaches itfelf only to an adjective or participle, or a verb fignificant of an attribute; it does not attach itfelf to the pare cert,
to be a very juft appellation, as denoting a part of SPEECH, THENATURAL APPENDAGE OF SUCHVERFS. So great is this dependence in grammatical fyntax, that an adoerb can no more fubfift without its verb, i. e. vithout fome word fignificant of an attribute, than a verb or adjective can fubfift without its fubftantive. It is the fame here as in certain natural fubjects. Every colour, for its exiftence, as much requires a fuperficies, as the fuperficies for its exiftence requires a folid body. 90. Among the attributes of fubftances are reckoned quantity and quality : thus we fay a white garment, a high mountain, \&c. Now fome of thefe quantities and qualitiesare capableof intenfion or remifion; or, in other words, one fubflance may have them in a greater or lifs degree than another. Thus we fay, a garment exceedively white, a mountain tolerfibly or moderately bigh. Hence, then, one copious fource of fecondary attribnives or $A D V A B$, to denote thefe two, that is, interfion and $r$ romifion; fuch as greatly, tolerably, vafly, extremely, indifferenily, \&c.
103
Attributes But where there are different intenfions of the fame of the fame attribute, they may be compared together: Thus, if kind compared by ineans of fuch adverbs. the garment $A$ be eXCREDINGLY white, and the garment
B be moderatelr white, we may fay, the garment $A$ is moke white than the garment B. This paper is white, and /row is white; but fnow is MORE white than this paper. In thefe inftances, the adverb more not only denotes intenfion, but riative intenfion: nay, we ftop not here, as we notonly denote intenfion merely relative, but riatoe iutenfion than which there isnone greater. Thus we fay, Sophocles was wife, Sucrates was More wife than he, but Soromion was the most wife of men. Even verbs, properly focalled, which denote an attribute as well as an a $\iint$ ertion, mult admit both of finiple and allo of comparatwe intenfions; but the fimple verd to BE admits of neither the one nor the other. Thus, in the following example, rums be loveTh MORe than riches; but virtue of all things he loveth must; the words more and most denote th different comparative intenfions of the attribute included under the verb loveth; but the affertion itfelf, which is the effontial part of the ver $b$, admits neitherof intenfion nor remiffon, but is the fame in all poffible propofitions.

91 . From this circumftance of quantities and quali-

104 The comThe comadjectives, either by adverbs, tues being capable of intenfion and remiffion, arife the comparison of adjectives, and its different degrees, which cannot well be more than the two fecies abovementioned ; one to denote fimple excefs, andone to denote fuperlative. Were we indeed to introduce more degrees that there, we ought perhaps to introduce infinite, which is abfurd. For why ftop at a limited number, when, in all fubjects fufceptible of intenfion, the intermediate exceffes are in a manner infinite? Between the firft fimple white and the fuperlative whiteft, there are infinite degrees of more white; and the fame may be faid of more great, more ftrong, more minute, \&c. The doctrine of grammarians about three fuch degrees of comparifon, which they call the pofitive, the comparative, and the fuperlative, mult be abfiurd; both becaufe in their pofitive therc isno comparifon at all, and becaufe their fuperlative is a comparative as much as their comparative itfelf. Examples to evince this may be met with every where: Socrates was the MOST wISE of all the Athenians; Homer was the most st'blyule of all poets, \&c. In,
this fentence Socrates is evidently compared with the Athenians, and Honer with all other poets. Again, if it be faid that Socrates was more wise than any other. Athenian, but that Souomon was the MuST wist of mens; is not a comparifon of Solomon with mankiad in general, as plainly implied in the laft claufe of the fentence, as a comparifon of Socrates with the other Athenians in the firft?

But if both imply comparifon, it may be afked, In what confints the difference between the comparative and fuperlative? Does the fuperlative always exprefs a greaterexce/s than the comparative ? No: for through socrates was the moft wife of the Athenians, yet is Solononaffirmed to have been more wife than he; fo that here a higher fuperiority is denoted by the comparative more than by the fuperlative moft. Is this then the difference between thefe two degrees', that the fuperlativeimplies a comparifon of one with many, while the comparative implies only a comparifon of one with one? No: this is not always the cafeneither. The Pfalmif fays, that "he is wifer (or more wife) than all histeachers;" where, though the comparative is ufed, there is a comparifon of one with many. The real difference between thefe two degrees of comparifon may be explaincd thus:

When we ufe the fuperlative, it is in confequence of having compared individuals with the fpecies to which they belong, or one or more fpecies with the genus under which they are comprehended. Thus, Socrates was the most wisk of the Athenians, and the Athenians were the most enlught ened of ancient nations. In the firft claufe of this fentence, Socrates, although compared with the Athenians, is at the fame time confidered as one of them; and in the laft, the Athenians, although compared with ancient nations, are yet confidered as one of thofe nations. Hence it is that in Engli/b the fuperlative is followed by the prepofition of, and in Greek and Latin by the genituve cafe of the plural number; to flow, that the object which has the pre-eminence is confidered as belonging to that clafs of things with which it is compared.

But when we ufe the comparative degree, the objects compared are fet in direct oppofition; and the one is confidered not as a part of the other, or as comprebended under it, but as fomething altogether difinct and belonging to a different clafs. Thus, were one to fay, "Cicero was more eloquent than the Romans,"'he would fpeak abfurdly; becaufe every body knows, that of the clafs of men expreffed by the word Romans Cicero was one, and fuch a fentence would affirm that orator to have been more eloquent than himfelf. But when it is faid that "Cicero was more eloquent than all the other Romans, or than any other Roman," the language is proper, and the affirmation true: for though the perfons fpoken of were all of the fame clafs or city, yet Cicero is here fet in contradiftinction to thereft of his countrymen, and is not confidered'as one of the perfons with whom he is compared. It is for this reafon that in Englifh the comparative degree is followed by a noun goveined by the word of contradiftinction than, and in Latin by a noun in the ablative cafe governed by the prepofition pra (B) either expreffed or underfood. We have already oliferved, that the ablative cafo denotes concomitancy: and therefure when

[^2](в) See Ruddimanini Grammatica Inftitutignes, Parsfecunda, lib. i. cap. $\mathbf{2}$.

Although it is certainly true, that when we ufe the fuperlative $e_{2}$ we ought in propriety to confider the things

Chap. V.
$G \quad R \quad A \quad M \quad M \quad A \quad R$.
an adjective in the comparative degree is prefixed to a noun, that noun is put in the ablative cafe, to denote that two things are compared together in company; but by means of the prepofition, expreffed or underftood, that which is denoted by the comparative adjective is feen to be preferred bcfor that which is denoted by the
92. We have hiitherto confidered comparatives as expreffed by the words more and moft; but the authors, or improvers of language, have contrived a method to retrench the ufe of the fe aduerbs, by expreffing their force by an inflection of the adjective. Thas inftead of more fair, they fay FAIRER ; initead of moft fair, FAIREST : and the fame method of comparifon takes place both in the Greek and Latin Languages; with this difference, however, between the genius of thefe languages and ours, that we are at liberty to form the comparifon either in the one method or in the other ; whereas in thofe languages the comparifon is feldom if ever formed by the affiftance of the adverb, but always by the inflection of the adjective. Hence this inflection is by the Greek and Latin grammarians confidered as a neceffary accident of the adjective; but it has reached no farther than to adjectives, and participles fharing the nature of adjectives. The attributes expreffed by verbs are as fufceptible of comparifon as thofe exprefled by adjectives; but they are always compared by means of adverbs the verb being too much diverfified already to admit of more variation without perplexity.
93. It muit be confeffed that comparatives, as well the fimple as the fuperlative, fcem fometimes to part with their relative nature, and to retain only their intenfive. Thus in the degree denoting fimple excefs: Tarsmior, et lacrynis ooulosfufiffa nitentes. Virg. Trifior means nothing more than that Venus was very fad. In the degree called the fuperiative this is more ufual. Phrafes extremely cominon are, Vir doctifimus; yir fortifimus, rs a moft learned man, a moft brave man ;" i. e. not the braveft and moft learned man that ever exifted, but a man poffeffing thofe qualities in an eminent degree. In Englif, when we intimate that a certain quality is pofferfed in an eminent degree, without makingany direct comparifon berween it and a fimilar quality, we do it by the intenfive word very, more commonly than by moft: as, Cicero was very eloquent; the mind of fohnfon was very vigorous. The mode of expreffion has been called the fuperlativeof eminence, to diftinguifh it from the other fuperlative, which is fuperlative upon comparifon. Yet it may be faid, that even in
the fuperlative of eminence fomething of comparifon muft be remotely or indirectly intinated, as we cannot reafonably call a man very eloquent without comparing his eloguence with the eloquence of other men. This is indeed true ; but we cannot therefore affirm that contparifon is more clearly intimated in this fuperlative than in the fimple adjective eloqusut: for when we fay that a man is eloquent, we mark between his eloquence and that of other men a diftinction of the fame kind, though not in the fame degree, as when we fay that he is very eloquent.

In Englifh we diftinguifh the two fuperlatives, by prefixing to the one the definite article the, to how that fomething is predicated of the object expreffed by it, which cannot be predicated of any other object; and by fubjoining the prepofition of, to thow that the objects with which it is compared are of the fame clafs with itfelf: as, "Solomon was the wifeft of men; Hector was the moft valiant of the Trojans." To the other (c) fuperlative we only prefix the indifinite article $a$ : as, "he was a very good man : he was a moft valiant foldier."
94. As there are fome qualities which admit of comparifon, fothere are others which admit of none: fuch, for example, arethofe which denote that quality of bodies arifing from thair figure; as when we fay, a circular. table, a quadrangular court, a conical piece of metal, $\& c$. The reafon is, that a million of things participating the fame figure, participate it equally, if they do it at all. To fay, therefore, fhat while A and B are both quadrangular, $A$ is more or lefs quadrangular than $B$, is abfurd. The fame holds true in all attributives denoting definite quantities of whatever nature: for as there can be no comparifon withont intenfion or remiffion, and as there can be nointenfion orremifion in things always definite, therefore thefe attributives can admit of no comparifon. By the fame method of reafoning, we difcover the caufe why no fubflantive is fufceptible of thefe degrees of comparifon. A montistain cannot be faid more to se or to ex xist than a mole-hill; but the more or lefs muft be fought for in their quan. tities. In like manner, when we refer many indivi- * duals to one fpecies; the lion A cannot be called more a Lion than the lion B (D) ; but if more any thing, he is more fierce, more fwift, or exceeding in fome fuch atribute. So again, in referring many fpecies to one ge:nus, a crocodile is not more an animal than a lizard; nor a tiger more than a cat: but, if any thing, the crocodile and tyger are more bulky, more ftrong, \& c . than K 2 the
compared as of the fame clafs; and when we ufe the comparative, as of different claffes; yet is not this difi $n$ :tion always attended to by the beft writers in any language. In Latin and Greek the comparative is ichetimesufed, where in Englilh we flould ufe the fuperlative; as dextera eft fortior manuum; andin the Goipeli, is faic, that "a grain of muftard-feed is the finaller (ereporepos) of all feeds, but when grown up it is the greater ( $\mu u \zeta(\omega)$ ) of herbs." Even in Englifh, the cuftom of the language permits us not to fay " he is the talieft of the two," it muft be the taller of the two; but we cannot fay "he is the taller of the three, it malt be the talleft. For thefe and other deviations from the general rule no reafon is to be found in the nature of things; they are crrors made proper by ufe.
(c) In Englifh, the termination off is peculiar to the fuperlative of comparifon, to which the definite article is prefixed. Thus we may fay, "Homer was the fublimeft of pocts;" but we cannot fay, "Homer was a fuhlimeft poet,", Again, we may fay, "Homer was a very fublime poet;" but not, "Homer was the very fublime poet."
(D) When Pope fays of a certain perfon, that he is ct a tradefman, meek, and mach a liar; the laft phrafe is the fame with nuch given to lying, the word liar having the effect of an attibutive.
the animals with which theyare compared; the excefs, as before, being derived from their attributes.
95. Of the adverbs or fecondary attributives already mentioned, thofe denoting intenfion and remiffon may be called adveribs of quantity continuous, as greatly, vaftly, tolerably, \&c. once, twice, thrice, \&c. (E) are adverbs of quantity discrete; more and moft, lefs and leff, to which may be added equally, proportionally, \&cc.are adverbs of relation. There areothers of cuality: as when we fay, honestlxindufrious, prumDENTLY brave; they fought BRAVELT, he painted FINELY.

And here it may be worth while to obferve, how the fame thing, participating the fame effence, affumes different grammatical forms trom its different relations. For example, fuppofe it dhould be afked, How differ boneft, honeftly, and bonefly? The anfwer: is, They are in effence the fane: but they differ in as much as boneft is the attrributive of a noun; honeftly,of a verb or adjective; and honefty being divefted of thefe its attributive relations aflumes the power of a noun or fubflan. tive, fo as to ftand by itfelf.
96. The adverbs hitherto mentioned are common to verbs ofevery $\int$ Pecies; but thereare fome which are confined to verbs properly fo called, that is, to fuch verbs as denote notions or energies wirl their privationis. All motion and reft imply time and place as a kind of neceffary coincidence. Hence, when we would exprefs the place or time of either, we have recourfe to adverbs formed for this purpofe; of place, as when we fay be floond thene, he went HENCE, he canue HITHER; of time, as when we fay, he food Jhen, he went afterwards, he travelled formerlt. To thefe may beadded the adverbs which denote the intenfions and remiffions peculiar to notron, liuch as/peedtly, baftily, fuiftly, flowly, \&c.; as allo adverbs of place made out of prepafitions, fuch as upward and downward from up and down. It may, however, be doubted whether fome of thefe words, as well as many orhers, which do not fo properly modify attributes, as mark fome remote circumflance attendingan attribute or our way of conceiving it, are truly adjerbs, though fo called by the grammarians. The fimple affirmative and negative y ES and No are called adverbs, though they furcly do not fignify that which ive hold to be the very effence of the adyerb, a modification of attributes. "Is helearned ? No." "Is he brave ? Yes." Here the two adverbs, as they are called, fignify not any modification of the atrributes brave and learned, but a total negation of the attribute in the one cafe, and in the other a declaration that the atrribute belongs to the perfon fpoken of.

- Adverbs are indeed applied to many purpofes; and their general naturemay be better underftood by reading a lift of them, and attending to their etymology, than by any general deficription or definition. Many of them feem to have been introduced into language in order to exprefs by one word the meaning of two or three; and are mere abbreviations of nouns, verbs, and adjectives. Thus, the import of the phrafe, in what place, is expreffed by the fingle word WHERE; to what place, by WHITHER ; from this place, by HENCE; in a direction afcending, by upwards; atthe prefentime, by

NOW; at what tinue, by WaEn; at that time, by THEN; many times, by OFTEN; not many timef, by SELDOM, \&c.
97. Mr Horne Tooke has, with great induftry and accuracy, traced many of the Englilh adverbs from their origin in the ancient Saxon and other northern tongues, and foown them to be either corruptions of other words or abbreviations of phrafes and fentences. He obferves, that " all adverbs ending in I. y , the proft prolific branch of the family, are fufficienty underftood : the termination being only the word like corrupted ; and the corruption fo much the more eafily and certainly difcovered, as the termination remains more pare and diftinguifhable in the orher fifter languages, in which it is written lick, 1 yk , lig, ligen. ${ }^{2}$ He might have added, that in Scotland the word like is, at this day, frequently ufed inftead of the Engligh termination $l y$; as for a goodly figure, the common people fay a good like figure. Upon this principle the greater part of adverbs are refolved into thofe parts of fpeech which we have already confidered, as bonefly inco boneft-like, vafty intovaft-like, \&c. fo that when we fay of a man he is bonefly induflrious, we affirm that he is honeft-like induftrious, or that his induftry has the appearance of being honeft. Adverbs of a different termination the fance acute writer refolves thas: AGHAST into the paft participle AGAZED;
" The French exclaimed,-the devil was in arms
All the whole army ftood agazed on him." Sbakefpeare: Ago, into the paft participleagone or cone. AsunDek he drives from asunder, feparated: the paft participle of the Anglo Saxon verbafundrianz: a word which, in all its varicties, is to be found, he fays, in all the northern tongues; and is originally from fond, i. e. fand. To wit, from wittan to know; as videlicet and fcilicet, in Latin, are abbreviations of viderealicet and foire licet. NEEDS, he refolves into NEED IS, ufed parenthetically; as, "I muft needs do fach a thing," "I muft (need is) do fuch a thing;" i. e. "I mulf do it, there is need of it." Anon, which our old authors ufe for immediately, inflantly, means, he fays. in one; i. c. in one inftant, moment, minute. As,
"And right anow withouten more abode."
" $A$ wom in all the hafte I can."
Azone and only are refolvedinto all one, and onexike. In the Dutch, een is one and alleeen alone; and all-een-like, only, anciently alonely. Alive is. on live, or inliff. Thus,
"Chrift eterne en live."
Chaucor.
Aught or ought; A whit or Owhit; o being for: merly written for the article $A$, or for the numeral ONE ; and whit or hiwit, In Saxon, fignifying a fmall thing, a point or jut. Awhile, which is ufually claffed with adverbs, is evidently a noun with the indefmite artiche prefixed; a while, i. e. a time. Whilst, anciently and more properly whiles, is plainly the Saxon hwile-es, tique that. Aioft was formerly written on-Loft: As,
" And ye, ny mother, my foveregne pleafance
"Over al thing, out take Chrift on lofte." Chaucer.
Now, fays Mr Horne Tooke, lyft, in the Anglo Saxon,
(E) Thefewords were anciently written one's, twie's thrie's; and are merely the genitives of one, two, three, the fubftantive time or turn being omitted. Thus How oftea didyou write? Anfwer Once, i. e. one's time. Sea Horne Tooke's Diverfions of Psrley.
is the aif or the elouds, as 1 NLYFTE OUMMENDE, coniting iusthe eluuds, f St Luke. In the Danifh, luft is air ; and 4rat feronge i huften,'" to blow up into the air, or aloort. So in the Dutch, de loef bebben, to fail before the wind; Loeytu, eo ply to windward; loof, the weather gage, \&c. From the fame root are our other words: Loft, lofty, to luff, lee, leward, luft, \&c. It would be needlefs, as the ingenions author obferves, to notice fuch adverbs as afoot, adoys, afhore, aftray, aflope, aright, abed, ahack, abreaft, afloat, aloud, afide, afield; agronnd, aland, \&c. Thefe are at firlt view feen for what they are. Nor fhall we follow him through the analyfis which he has given of many other adverbs, of which the origin is not fo obvious as of thefe. Of the trath of his principles we are fatisfied; and have not a doubt, but that upon thofo principles a man converfant with our earlieft writers, and thoroughly fkilled in the prefent languages, may trace every Englith (s) adverb to its fource, and how that it is no part of fpeech feparate from thofe which we have already confidered. The adverbs, however, of affirmation and negation, are of too much importance to be thus paffed over; and as we have never fech an account of them at all fatisfactory, except that which las been given by Horne Tooke, we fhall tranforibe the fubftance of what he fays concerning aye, yea, yes, and no. Tous thefe words have always appeared improperly claffed with aduerbs upon every definition which has been given of that part of feech. Accordinglys our author fays, that aye or yeais the imperative of a verb of northern extraction; and means, bave, polfefs, enjay. And yes is a contraction of ay-es, have, poffefs, enjoy, that. Thus, when it is akked, whether a man be learned, if the anfwer be by the word yes, it is equivalent to have that, enjoy that, belief or that propofition. (See what was faid of the nature of interrogation, Chap. IV. $\mathrm{n}^{\circ} 76$.

The northern verb of which yea is the imperative, is in Danifh ejer, te polfefs, have, enjoy. Eja, aye or yea; EJE, polfsffion; EJER, polfelfor. In Swedifh it is ega, topolfe $f$; of which the imperative is Ja, aye, yea: Egare, polfeffor. In German, ja fignifies aye or yea; eigener, polfelfor, owner; eigen, own. In Dutch, Eigenen is to polfefs; ja, aye, yea.

Greenwood derives nor and its abbreviate no from the Latin; Minflew, from the Hebrew; and Junius, from the Greek. Our author very properly obferyes, that the inhabitants of the North could not wait for a word expreffive of diffent till the eftablifhment of thofe nations and languages: and adds, that we need not be inquifitive nor doubtful concerning the origin and fignification of not and no; fince we find that, in the

Danih, nedic, in the Swedin, nobig, and in the Dutch, NQODE , NODE, and No, mean averfe, untuillis:s. So that when it is afked whether a man be brayc, il the anfver be no, it is a declaration that he who makes it is averfe fram, or unwilling to admit that propofition.
98. Mef writers on grammar have memoned a fpeies of adverbs, which they call adverbs of interrogation; fuch as where, whence, whither, bow, \&c. But the truth is, that there is no part of Speech, which, of itfelf, denotes interrogation. A queftion is never afked otherwife than by abbreviation, by a fingle word, whether that word be a noun, a promoun, a verb, or an adereb. The word WHERE is cquivalent to-in what place; Whence to-fromz what place; and how to-in what manner, \$c. In thefe phrafes, in what place, f в om what place, and in what manner, the only word that can be fuppofed to have the force of an izterrogative, is what, which is refolvable into that which: But we have already explained, in the chapter of Pronouns, the principles upon which the relative is made to denote interrogation, and the fame reafoning will accoumt for the adverbs where, wukence, whither, bow, \&c. being employed as interrogatives. Whey we fay, where wero you yeflerday? whence bave you come? whither are jou guing? bow do you perform your journey? We merely ufe fo many abbreviations for the following fentence; tell us, or defcribe to us, THE PLACE where (or in which) you were yeflerday; THEPLACE whence (or from which) you have come; THEPLACE to which you are going ; THE MANNER in whichyou perform your journey. And fomucle for adverbs. We nows proceed to thofe parts of feecch which are ufually called prepofitions and conjunctions, and of which the ufe is to connet the orther words of a fentence, and to combine two or more fimple fentences into one compound fentence.

## CHAPTER VJ.

## Of Prepositions, Conjunctions, and InterJECTIONS

99. It las been obferyed, that a man while awake 111 is confcious of a continued train of perceptions and and of ideas paffing in his mind, which depends little upon courfe his own will ; that he cannot to the train add a new ideas linidea; and that he can but very feldom break its con- ked togenection. To the flighteft reflecrion thefo truths muft ther. be apparent. Our firft ideas are 1 hofe which we derive from external objects making impreffions on the fenfes ; but all the externalobjects which fall under our obfervation are linked together in fuch a manner as indicates them to be parts of one great and regular
fyftem.
(s) The fame refolution might probably be made of the Greek and Latin adverbs, were we as intimately acquainted with the fources of thofe tongues as Mr Horne Tooke is with the fources of the Englifh language. "S Many of the Latin adverbs (fays the learned Ruddiman) are nothing elfe but adjetive notus or pronouns, having the prepofition and fibffantive underfood; as quo, eo, eodem, for ad qua, ea, eadem, (loca), or cui, ei, eidinu (ioco); for of old thefe datives ended in 0 . Thus, qua, hac, illac, \&c. are plainly adjectives in the abl. firg. femin. the word via "a way," and the prepofition in, being underfood. Many of them are compounds; as, quomodo, i. e. quo modo; quemadnodum, i. e. ad quem modum; quamobrem, i. e. ob quan rem; quare, i. e. (pro) quare; quorfum, i. e. verfus quem (locum); fcilicet, i. e. fcire licet; videlicet, i. e. videre licet; ilic.t, i. e. ire licet; illics, i. e. in loco; magnopere, i. e. magno opere; nimirum, i. e. ni (eft) mirum; hodie, i. e. boc die; poftridee, i. e poflarodie; pridie, i. e. pradie. Profefte, certe, fane, male, bene, plane, are obvioully adjcctives. Forte is the ablative of fors; and if we had leifure to purfue the fubject, and were mafters of all the languages from which the Latin is deriyed, we donbt not but we mould be able to refolve every adyerk into a fubftantive or adjerfives.
fyftuin. When we take a view of the things by which we are furrounded, and which are the archetypes of our ideas, their inherent qualities are not more remarkable than the various relations by which they are comnected. Caufe and effect, eontiguity in time or in place, bigh and low, prior and pofteriur, refemblance and
contraff, with a thoufand other relations, connect things together without end. There is not a lingle thing which appears folitary and altogether devoid of connection. The only difference is, that fome are intimately and fome flightly connected, fome nearly and fome at a diftance. That the relations by which external objects are thus tinked together nult have great infloence in directing the train of human thought, fo that not one perception or idea can appear to the mind wholly unconnected with all other perceptions or ideas, will be admitted by every man who believes that his fenfes and intellect reprefent things as they are.

Tliis being the cafe, it is neceffary, if the purpofe of language be to conmunicate thought, that the Speaker be fursifited with words, not only to exprefs the ideas of fubftances and attributes which he may have in his mind, but alfo to indicate the order in which he views them, and to point out the various relations by which they are connected. In many inftances all this may be done by the parts of fpeech which we have already confidered. The clofeft connection which we can conceive is that which fubfifts between a fubflance and its qualities; and in every language with which we are acquainted, that connection is indicated by the immediate coabefcence of the adjective with the fubfantive; as we fay, a good man, a learned Nuan; vir bonus, vir doctus. Again, there is a connection equally intimate, though not fo permanent, between an ugent and his action; for the action is really an attribute of the agent; and therefore we fay, the boy reads, the man writes; the nown coalefcing with the verb to naturally, that no other word is requifite to unite them. Moreover, an action and that which is neted upon being contiguous in nature, and mutually affeating each other, the words which denote them thould in language be mutually attractive, and capable of coalefcing without external aid; as, he reads a book, he buit'd's a buafe, he breaks a fone. Further : becaufe an attribute and its modifications are infeparably united, an adjective or a verb is naturally connected with the adver $b$ which illutrates or modifes its fignification; and therefore, when we fay, he walks fowly, he is prudently brave, it is plain that no other word is neceffary to promote the coalefcence of the attributes walking and liravery with their modifications of fownefs and prudence. The agreement between the terms of any propofition which conftitutes truth is abfolutely perfect; but as sither of the terms may agree with many other things belides its correlate, fome word is requifite in every propofition to conneet the particular predicate with the particular $f_{16 j e c t}$; and that is the office of the finple verb to be ; as the thres angles of every rectiliveal triangle are equal to two right angles.

This we fee, that many of the relations fubfifing between our ideas may be clearly expreffed by means of nouns, adjectives, verbs, and adverbs; and in thofe languages of which the nouns have cafes, there is perhaps no rclation-of much importance which might not be thus pointed out, without being under the neceffity of employing the aid of any additional part of fpecch.

In Englifl, however, the cafecis otherwife ; for were we to fay, "He rode Edinburgh, went the parliamenthoufe, walked his council the court met," we fhonld fpeak unintclligibly ; as in thefe expreflions there is either a total want of connection, or fuch a connec. tion as produces falfehood and nonfenfe. In order to give meaning to the paffage, the feveral gaps muft be filled up by words fignificant of the various relations by which the differentideas are connected in the mind; as, "he rode to Edinburgh, went to the parlianent- Fixpreffed houfe, and walked with his counfel til/ the court net." by prepaid Of thefe connecting words, то and with are called $p r e-$ tions and pofitions, A ND and THI are ufally called conjunctions. conjuacAlthough thefe prepofitions and conjus, thions are not fo abfolutely neceffary in Greek and Latin as they are in Eirglifh; yet as there is no language wholly without them, nor any language in which it is not of importance to under ftand their force, they well deferve a place. in univerfal grammar.

## 114

100. The fole ufe of conjuntions and prepofitionsin lan. Thefe conguage is to connect either fentences or ofhor words; but neal either the theory of thefe connectives cliemfelves has certainly fentences never been undertood, unlef́s Horne Tooke have at or worde. laft hit upon the truth. Mr Harris writes about th:m and ahout them, quoting paflages from Greek and Latin authors, and produces at laft no information. His definitions of both, as parts of fpeech void of fignification; are highly abfurd; and even the principal difth, Ction which he makes between them feems not to be well founded. Prepofitions and conjunctions denote the reld. tions fublifting between the ideas expreffed by thofe words or fentences which they ferve to connect; and as relations are convemplated by the mind as well as po-. fitive ideas themfelves, the zoords which denote thoferelations cannot be infignificant. The effential difference betwcen the conjur:tzion and prepof:ition, according to the fame author, conlifts in this, that the former connects fentences, and the latter words: but the fact- is often otherwife. An obvions example occurs where the conjurction and connects not fentencess but words. "A man of wisDom and virtue is a perfest charater." Here it is not meant to be afferted, "that the man of wispom is a perfect character, and that the man of virtue is a perfect character :" both thefe affe tions would be falle. This fentence therefore (and many fuch will occur) is not refolvable into two : whence it follows, that the conjunction AND does not always connect /entences; and the fame is frequently the cafe with other conjuntions.

Horne Tocke's idea of prepofitions and conjunctions is, that they do not form difinctit claffes of words, but are merely abbr eviations of nouns and verbs: and with refpect to the Engli/b langu.ge, he has been remarkably fuccessful in proving his pofition. But though fuch be undeniably the cafe in Englifh, it would be ralh to conclude a priori that it is fo ill all other tongues. To eftablifh this general conclufion would require a long and tedious deduction in each particalar language : and how much learning, leifure, induftry, and acatenefs, fuch an undertaking would require, even in one tongue, it is not eafy to determine. In the languages with which we are beft acquainted, many conjunctions, and moft prepofitions have the appearance at leaft of original words: and though this moft acute grammarian, from his knowledge of the northern tongues, has been able to träce the noft important of thofe in Englifh to

## Chap. VI.

$G \quad R \quad A \quad M \quad M \quad R \quad$.
very platuble foarces, the fane thing would be diffcult in other languages of which the fources are obfcure, and abfolutely impofible in thofe of which they are wholly unknown it is, however, a ftrong prefumption in favour of his opinion, that graminarians have never been able to afligh any general characteriftic of thofe fpecies of words; which; did they conftitute difiinct parts of fpeech, oile would think could not have fo long remained undifcoverèd. It is a farther prefumption in his favour, that many words in Greek and Latin, as well as in Englifh, which have been called conjunctions, are obvioullyrefolvable upon his principles, and indeed difcover their meaning and origin upon mere infpection. We fhall. therefore content ourfelves with retailing the common,doctrine refpeting thefe parts of fpecch fo far as it is intelligible ; fubjoining at the botom of the page the analyfis given by Horne Tooke of the moft important Engligh conjunctions and prepofitions; and requefting our readers, who would underftand the fibject, to attend more to the relations between their various ideas, than to the frivolous diftinctions which, in compliance with cuftom, we are compelled to lay before them. We fhall treat firft of the comjunction.

## Sect. I. Of Conjunctions.

## 115

Definition f injor A conjun its of conjunc-name indicates, the ufe is to comnetf either two or more tions. words ina fontence, or to make of two fimple fentences one compound fentence. It is ufually faid, that conjunctions never connect woods, but fentences only; and that this is the circumftance which difinguifhes them from prepofitions. We have already given one example which proves this diftinction to be ill founded; we fhall now give from Horzte Tooke one or two more, which will place its abfurdity in a ftill clearer light: "T wo and two are four: Jobn avd fane are a handfome couple; AB and BC and CA form a triangle. Are two four? Is John a coupleind fane a couple? Does one ftraight line form a triautgle? From the fubjoined note it appears, that AND (G) may connect any two things which can be connected, as it fignifies addition.
Which are Conjunctions connecting fentences, fometimes connect either con- their meaning, and fometimes not. For example, let us junctive or disjunctive take thefe two fentences, Rome was enfaved, Cafar was ambitious, and connect them together by the conjunction because; Rome was enflaved because Copfar was ambitious. Here the meanings, as well as the fentences, appear to he conneited by that natural relation which fubfifts between an effect and its caufe; for the enflaving of Rome was the effect of Cæfar's ambition. That particular relation therefore is that which is
denoted by the conjunction because ( H ), which would be improperly uled to connect two fentences between which the relation of an effect toits caufeexifts not. But if it be faid, mennuers nuft be reformed, or liberty willbe loft; here the conjunction or, though it joiin the fentences, yet as to their meaning is a perfect disjunctive. Between the refo, mation of munners and the lofs of liberty there is certainly a natural relation; hut it is not the relation of contiguity or finilitude, or of caufe and eftect, but of contrariety. The relationo of contrariety the efore is the fignification of the word or ( 1 ) : And thus it appears, that though all conjunctions may combine fentences, yet, with refpect to the fenfe, fome areconjunctive and others are disjunctive.
102. Thofe congunctions which conjoing both fentences Conjuscand their meanings are either COPULATIVES or CONTE- tions either nuatives. The principal copulative in Ehglij $\beta$ is copulative AND, which we have already confidered. The conti- or continunuatives are much more numerois; if an, because ative. therefore, wherefore, hence, \&c. The difference between them is this: The copulative does no more than barely couple words or fentences, and is therefore applicable to all fubjects of which the natures are not incompatible ( k ). Therelation which it denotes is that of juxtapofition or of one thing added to another. Continuatives, on the contrary, by a more intimate connection, confolidate fentences into one cintinuars whbile; and are therefore applicable only to fubjects which have an elfential relation to each other, fuch as thaz of an of. fect to its caufe, or of a catefe to its effect. For cxample, it. is no way improper to fay, Lyfippus was a flatuary, AND Prifcian agrammarian; the fun /hineth, AND the fley is clear; becaufe thefe are things that may coexift, and yet imply no abfurdity. But it would be abfurd to fay, Lyfippus was a flatuary bectose Prifcian was a a grammarian; though not to fay, the fun fhineth because the fky is clear. With redpoct to the firlt, the reafon is; that the word because denotes the relation which an effect bears to its catye : but the fkill of Prifcian in graninzar could not pollibly be the caufe of Lyfippus's fkill in flatuary; the coincidence between the fkill of the one and that of the other, in arts fo very different, was merely aocidental. With refpect to the Jhining of the fun and the clearnefs of the Jky, the cale is widely different; for the clearmefs of the kg g is the caUse of the fun's Jining, at leaft fo as to be feen by us.

As to the continuatzoes, they are either surpositive, 118 fuch asif an, or positive fuch asbecauf therefors, \&c ake examples of each : You will live happily yf you ther fupp dive honeflly ; you live happily BECAUSE you live boneflly; fitive or you live bonefly, THEREFORE you live hafpily. The diffe; pofitive. rence between thefe continuatives is this: The fuppofi. tives denote connedion, but do not affert aftual ex. iftence:
(G) And is a Saxon word, being (according to Mr H. Tooke) an abbreviation of anAD, the imperative of the verb ananad, to add to, or heap up. So that when we fay two and two are four, we only declare that two ADDED TO two ars four.
(h) Because is compounded of the Saxon BE-by, and caufe; and by fome of our mof ancient authors it was written by cause. Rome was en $\Omega_{\text {aved, }}$ because Cafar was ambitious, is therefore equivalent to, Rome was emflaved by the caufe CesAR was ambitiovs; taking thie phrafe, Cafar was ambitious as an abftract noun in concord with the other noun carzfe.
(I) $O_{R}$ feems to be a mere contraction of the Saxon ODER, which fignifies obher, i. e. fomething different and often contrary, So that the conjunction or muft always denote diverfity, and very often contrariety.
(к) As day and night, heat and cold: for we cannot fay of the fame portion of time, it is day and it is night; or of the fame body, it is both bot and cold.
iftence; the pofitives imply both the one and the as, therefore, wherefore, \&c. The difference bctween 118 other ( x ).

Pofitives, The pofitives abovementioned are either causal ; either cau- fuch as, becaufe, fince, as ( m ), \&ce.: Or collective; fuch fal or collective:
$\mathrm{t}^{\prime}$ ' efe is this: The caufals fubjoin caufès to effects; as, the fun es in eclipfe, because the moon intervenes: The colle tives fubjoin effects to caufes; as, the szoonintervenes, there-
( 1 ) The reafon of all this will be apparent from the analyfis given by Horne Tooke of thofe words which we have called fuppofitive conjunctions. If and an may be ufed matually and indifferently to fupply each other's place; for they are both verbs, and of the fame import. If is merely the imperative of the Gothic and AngloSaxon verb gifan, to give; and in thofe languages, as well as in the Englifh formerly, this fuppofed conjunction was pronounced and written as the common imperative Gif. Thus,

> " My largeffe
" Hath lotted her to be your brother's miftreffe,
"Gif thee can be reclaimed; Gif not, his prey." Sad Shepherd, Act H. Scene rft. Gawin Doughafs almodt always ufes grf forif, as the common people in fome counties of Scotland do even at this day; and it is obvious, that our if has always the fignification of the Englifh imperative give, and no other. So that the refolution of the confruction in the fentence, If you lize boneftly you will dize bappily, is fimply this, GIVE you live honeftly (taking you live honeftly as an abofract noun) you ruill live happily. Your living houpily is declared to depend upon your living honeftly as the conditiox; but give that, and your happinefs is pofitively afferted. In like manner may fuch fentefices be refolved as,
"I wonder he can move! that he's not fixed!
"If that his feelings be the fame with mine."
Thus, "His feelings be the fame with mine, give that, I wonder he can move," \&c. And here we cammot forbear giving our aflent to the truth of Mr Tooke's obfervation, that when the datum upon which ang couclufion depends is a fentence, the article that, if not expreffed, may always be inferted. We do not, however, think the infertion at all times abfolutely zeceffary to complete the fyntax; for active verbs govern whole fentences and clarfis of fentences as well as fubstantive zouns. Infances of this occur fo frequently in the Lat in claffics, that they can have efcaped no man's notice, who has ever read Horace or Virgil with attertion. We agree likewife with our moft ingenions author, that where the datum is not a fentence, but fome noun governed by the verb if or give, the article that can never be inferted. For example, if we be afked, how the weather will difpofe of us to-morrow? we cannot fay: " If that fair, it will fend us abroad; lf that foul, it will keep us at home;" but "tr fair, it will fend us abroad," \&c. The reafon is obvious: the verb in this cafe directly governs the noun; and the refolved conftruction is, "GIve fair weather, it will fend us abroad; GIVE foul weather, it will keep us at home."

An, the other fuppofitive conjonetion mentioned, is nothing elfe than the imperative of the Anglo-Saxon verbanan, which likewife means to gize or to grant. As, "An you had an eye behind you, you might fee more detraction at your heels than fortunes before you;" that is, "Grant you had an eye behind you, you might fee," \&c. This account of the two conditional conjunctions in Englifh is fo rational and fatisfactory, that we are ftrongly inclined to believe that all thofe words which are fo called, are in all languages to be accounted for in the fame manner. Not indeed that they muft all mean precifely to give or grant, but fome word equivalent; fuch as, be it, fuppofe, allow, permit, \&ce. ; which meaning is to be fought for in the particular etymology of each refpective language.
(m) Of the caufal conjunctions mentioned in the text, because hasbeen already confidered; and fome accomat muft now be given of the two words since and as. The former of thefe, according to Mr H. Toake, is a very corrupt abbreviation, confounding together different words and different combinations of words. To us it appears to be compounded of SEAND, feeing; and es, that or it; or of Sin, feen, and es. Seand and sin anc the prefent and paft participles of the Anglo Saxon verb seon, to fee. In modern Englidh since is ufed foar ways; two as a preposition affecting words, and two as aconjunctionaffecting fentences. When ufed as a prepofition, it has always the fignification of the paft participle SEEN joined to THENCE (i. e. feen and thenceforzard), or clfe the fignification of the paft participle SEEN only. When ufed as a conjunction, it has fomerimes the fignification of the prefent participle seeing, or seeing that; and fometimes the fignification of the paft participleseen, or seenthat. We thall gave examples of all thefe fignifications. Ift, As a prepofition fignifying seen and thenceforward: "A more aniable fr, vereign than George III. has not fwayed the Englifl fceptre SIAcE the conqueff." That is, "The conquefl feen (or at the completion of the fight of the conqueft), and thenceforward, a more amiable fovereign than George III. has not fwayed the Englifh fceptre." Since, taker in this fenfe, fecms rather to bea corraption of Siththan or sithence, than a compond ofseandandes. adly, As a prepofition fignifying seen fimply: "Did George III. veign before or since that example?" 3dly, As a conjunction, sINCE means feeing that: as, "If I fhould labour for any other fatisfaction but that of my own mind, it would be an effect of phrenzy in me, not of hope; SINCE (or fecing that) it is not truth bat opinion that can travel through the world without a pafport. 4thly, It means seen that, or Timat Seen; as, "Since death in the cud takes from all whatfoever fortune or force takes from any one, it were a foolifh madnefs in the fhipwreck of worldly things, when all finks but the forrow, to fave that:" i. e.- " Death in the end takes from all whatfoever fortune or force takes from any one; THAT SEEN, it were a foolifh madnefs," \&c.

As', the other caufol conjunction mentioned in the text, is an article meaning always IT, or IMAT, orwaich. Take the following example:
"She glides away under the foamy feas
"As §wift as darts or feather'd arrows fly."
That

Chap. VI.
G $\quad$ R $A \quad M \quad M \quad$ A $\quad$.
thenefora $(N)$ the fun is in colipfe. We therefore ufe caufals in thofe inftances where, the effect being confpicuous, we feek for its caufe; and collectives, in demonftration and fcience, properly fo called, where the caufe being firf known, by its help we difcern effects. an there is no one of the four pecies of caufes which kinds of they are not capable of denoting. For example, the caufes. material caufe; The trumpet founds because it is made of metal. The formal; The toumpet founds because. it is lung and hollow. The efficient; The trumpet founds blecause an artift blows it. The final; The trumpet founds that it may raife our courage. It is worth obrerving, that the three firf caufes are exprefled by the frongeft affirmation; becaufe if the affect actually be, thefe muft be alfo. But this is not the cafe with refpect to the laft, which is only affirmed as a thing that may happere. The reaton is obvious: for whatever may be the end which fet the artift firft to work, that end it may ftill be beyond his power to obtain; as, like all other contingents, it may either happen or not. Hence alfo it is connected by a particular conjunction, that ( 0 ), abfolutely contined to this caufe.
103. We come now to the DISJUNCTIVE CONJUNCVol. VIII.
rions: a fecies of words which bear this contradictory name, becaule while they conforn the jentences, they disjorn the fenfe; or, to fpeak a language more intelligible, they denote relations of DIVERSITY or opposition.

That there fhould be fach words, whether called conjunctionsor not, is extremely natural. For as there is a principle of enion diffufed through all things, by which this whole is kept together and preferved from difiparian; fo is there in like manner a principle of DI $\dot{\nabla}$ ERSIT Y diffufcd through all, the fource of diffinc. tion, of number, and of order. Now it is to exprefs in fome degree the modifications of this diverfity, that thofe words called disjunctive conjunctions are employed.

Of thefe disjunctives, fome are simple and fome adversative: Simple; as when we fay, erither it is day or it is nigit.: Adverfative; as when we fay, it is not day but it is night. The difference between thefe is, that the fimple exprefs nothing more than a relation of DJVERSITY; the adverfative exprefs arelation not barely of diverfity, but alfo of opposition. Add to this that the adver fatives are DEFINITE, the fimple INDEFINITE. Thus when we fay, the number three is not an even number, BUT (P) an odd; we not only disjoin two opppolite attributes, but we definitely affirm the one to belong to

L
the
That is, "She glides away (with) thá fwiftnefs (with) wiich darts or feathered arrows fly," In German, where as ftill retains its original fignfication and ufe, it is written es. So is another conjunction of the fame import with as, being evidently the Gothic article sa or so, which fignifies it or that.
( n ) As Mr Harris has called therefore, wherefore, \&c. collective conjuzitions, we have retained the denomination, though perhaps a more proper might be found. It is indeed of little confequence by what name any clafs of words be called, provided the import of the words themfelves be underfood. Wherefore and THEREFORE evidently denote the relation of a caufe to its effects. They are compounds of the Saxon words HWZR and THER with FOR or vOOR; and lignify, for which, for thofe or that. It is worthy of romark, that in fome parts of Scotland the common jeople even at this day ufe thir for the e.
(o) We have already confidered the word Thar, and feen that it is never a conjunction, but uniformly a definite article. "The trumpet founds (for) тнat it may raife our courage;" taking the claufe it may raife our courage as an abftract noun in concord with that and governed by for. Or the fentence may be refolved thus: "The trumpet may raife our courage (for) that (purpofe) it founds."
( p ) Mr Horne Tooke has favoured us with fome ingenious remarks on the two different derivations of the word but, when ufed in the two acceptations that are ufually annexed to it, viz. that which it bears in the beginning of a fentence, and that which it has in the middle. He has given it as his opinion, that this word, when employed in the former way, is corruptly put for вот, the imperative of the Saxon verb boxad, to boot, to fuperadd, to fupply, \&c. and that when ufed in the latter, it is a contraction of be-utan, the imperative of beon-utan, to be out. Our ancient writers made the proper diftinction between the orthography of the one word and that of the other. Gawin Douglafs in particular, although he frequently confounds the two words, and ufes them improperly, does yet abound with many inftances of their proper ufe; and fo contrafted, as to awaken, fays our author, the moft inattentive reader. Of the many examples quoted by him, we fhall content ourfelves with the two following:

> "Bor thy worke fhall endure in laide and glorie,
> "BƯT fpot or fault condigne eterne memorie." ——BOt gif the fates, But pleid,
> "At my pleafure fiffier it mie life to leid." *** Book 4.

If this derivation of the word but from sorns, to fuperadd, be juft, the fentence in the text, "the number three is not an even number BUT an odd," will be equivalent to, "the number three is not an even number, fuperadd (it is) an odd number;" and if fo, the oppofition is not marked (at leaft directly) by the woid but, but by the adjectives EVEN and ODD, which denote attributes in theirown nature oppofite. It is only when buthas thisfenfe that it anfwers to fed in Latin, or to mais in French. In the fecond line of the quotation from Gawin Douglafs's Preface, the word But is evidentlya contraction of BE-UTAN, and has a fenfe very different fiom that of bot in the preceding line. The meaning of the couplet is, "Superadd (to fomething faid or fuppofed to be faid before) thy work thall endure in latide and glorie, be out (i. e. without) fpot or fault, \&c. In the following paffage from DONNE, the word BUT, although writren in the fame manner," is ufed in both its meanings : "You muft anfwer, that the was brought very near the fire, and as good as thrown in or elfe, that fhe was provoked to it by a divine infpiration. But that another divine infpiration moved the beholders to belieye that the did therein a noble act, this act of her's might have been calumniated." That
the fubject, and deny the other. But when we fay, the number of the flars is EITHER (Q)even OR odd; though we affert one attribute to $b e$, and the other not to be, yet the alternative is notwithftanding left indefinite.

As to adverfative conjunctions, it has been already faid, after Mr Harris, that they imply oprosition : but the truth fecms to be, that they only unite in the fame fentence words or phrafes of opppofite meanings. Now it is obvious, that oppofite attributes cannot belong to the fame fubject: as when we fay, Nereus was beautiful, we cannot SUPERADD to this fentence, that he was ugly; we cannot fay, he was beautiful sut ugly. When there is oppofition, it muft be either of the fame attribute in different fubjects; as when we fay, "Brutus was a patriot, sut Cafar was not:" Or of different attributes in the fame fubject; as when we fay Gorgius was a fophift, but not aphilofopher:" Or of different attributes in different fubjects; as when we fay, "Plato was a philofopher, but Hippias was a fophifl." The conjunctions ufed for all thefe purpofes have been called abfolute adverfatives, we think improperly, as the oppofition is not marked by the conjunctions, but by the words or fentences which they ferve to connect. Mr Locke, fpeaking of the word BUT, fays, that "it fometimes intimates a flop of the mind, in the courfe it was going, before it came to the end of it :'" to which Mr 'Tooke replies with truth, that butitfelf is the fartheft of any word in the language from intimating a flop. On the contrary, it always intimates fomething to follow ; infomuch, that when any man in difcourfe finiftes his words with but, inftead of fuppofing him to have flopped, we always ank, sur what:

Befidesthe adverfatives already mentioned, there are two other fpecies, of which the moft important are UN-
iess and although. For example, "Troy will be taken, uniess the palladum be preferved; Truy will be taken, although Hector defend it." The nature of thefe adverfatives may be thus explained. As every event is naturally allied to its caufe; fo by parity of reafon it is oppofed to its preventive; and as every. caufe is either adequate or inadequate (inadequate when it endeavours without being eftectual) fo in like manner is every preventive. Now adequate preventivesare expreffed by fuch adverfatives as Uniess: "Troy will be taken, UNLESS the patladium be preferved;" that is, this alone is fufficient to prevent it. The inadequate are expreffed by fuch adverfatives as although: "Troy will be taken althoue h HeCtor defend it;" that is, Hector"s defence will prove ineffectual. Thefemay be called adverfatives adeevate andinade quate.

Such is the doctrine of Mr Harris; which, although we can difcover in it no determinate meaning, we have ventured with others to retail, in refpect to our readers, who may be more perfpicacious than ourfelves. The author was a man of great learning; and the fubject, as he has treated it, appears to be intricate. But whatever fenfe or nonfenfe there may be in what he fays of caufes and preventives, adequate and inadequate, we have no hefitation to affirm that he has totally miftaken the import of the words uniess and alithough. From thefe being called both preventives, the one adequate and the other inadequate, an unwary reader might beled to infer, that they denote the fame idea or the fame relation; and that the whole difference berween them is, that the expreflion of the one is more forcible than that of the other. Nothing, however, can be further than this from the truth. The meaning of undess is directly oppofite to that of although. Unless (r) and thoughe
is, "You muft anfwer, that fhe was brought very neare the fire, \&c. "Superadd (to that anfwer) be out (or unless or without; for, as will be feen by and by, all thofe words are of the fame import) that another divine infpiration moved," \&c. To thefe remarks and examples it may be worth while to add, that cven now but is often ufed by the illiterate Scotch for wirhout; as nothing is more common than to hear a clown fay "He came from home but his breakfaft."

Having mentioned without as a word of the fame import with but when diftinguifhed from bot, it may not be improper to confider that word here; for though in modern Englifh it is entirely confined to the office of a prepofition, it was formerly ufed indifferently either as a prepofition or a conjunction. Without then is nothing but the imperative wyrthan-utan, from the Anglo-Saxon and Gothic verb weorthan withan; which in the Anglo-Saxon language is incorporated with the verb $B E O N$, effe. According to this derivation, which is Horne Tooke's, the word wit hout, whether called conjunction or prepofition, is the fame as be out; and fuch will be its import, fhould it after all be nothing more than a compound of wyth, which fignifies to join and fometimes to be, and UTE, out.
(Q) EITHER is nothing more than the diftributive pronoun, which every body underftands; and or we have already explained.
(r) So low down as in the reign of queen Elizabeth (fays Horne Tooke) this conjunction was fometimes written oneles or oneleffe; but more anciently it was written onles and fometimes onlesse. Thus, in the trial of Sir John Oldcaftle in 1413, "It was not poffible for them to make whole Chriftes cote without feme, onLesse certeyn great men were brought out of the way." So, in "The image of governance," by Sir T. Elliot, 154 I , "Men do fere to approache unto their foveregne Lord, oneles they be called. So again, int "A neceffary doctrine and erudition for any Chriftian man, fet furthe by the kinge's majeftie of England," 1543, "Onles ye believe, ye fhall not underftande." "No man thall be crowned, onles he lawfully fight." "The foul waxeth feeble, oniesse the fame be cherifhed." "It cannot be begynne, onelesse by the grace of God." Now, onles is the imperative of the Anglo-Saxon verb onlesan, to difmifs, or remove.

Les, the imperative of IESAN (which has the fame meaning aS ONLESAN), is likewife ufed fometimes by old writers inftead of uniess. Inftances might be given in abundance from $G$. Douglas and Ben. Fohnfon; but perhaps it may be of more importance to remark, that it is this fame imperative Les, which, placed at the end of nouns and coalefcing with them, has given to our language fuch adjectives as hopelefs, reftlefs, deathlefs, motionle/s, \&c. i. e. difmifs hope, reft, death, motion, \&c.

Mr Tooke obferves, that all the languages which have a conjunction correfponding to les or unless, as
are both aerbs in the imperative mode；the former fig－ nifying take avay or difmifs；the latter，allow，permit， grant，givid，affent．This being the cafe，＂Troy will be taken undess the pailadiam be preferved，＂is a fen－ t ence equivalent to＂Remove the palladiumbe profer－ ved（taking the palladium be preferved as an abftract noun，the prefervation of the palladisem）Troy will beta－ ken．＂Again，＂Troy will be taken，Although Hec－ tor defendit，＂is the fame as＂Troy will be taken al－ Low Hector（to）defend it．＂The idea，therefore， expreffed by unless is that of the removal of one thing to make way for another；the idea expreffed by although（s）is that of allowing one thing to co－ exist with another，with which if is arparentiy in－ compatible．

104．Before we take leave of this fubject，we might treat，as others have ireated，of adverbial conjunctions， and conjunctions（ T ）of various other denominations． But of multiplying fubdivifions there is no end；and fyftems，ia which they abound，convey for the moft part no information．The nature of conjunctions can be thoroughly underftood only by tracing each to its original in fome parent or cognate tongue；and when
that hall be done in other languages with as moch fuc－ cefs as it has lately been done by Mr Horne Tooke in Englifl，then，and not till then，may we hope to fee a rational，comprehenfive，and confiftent theory of this part of feech．Then too thall we get rid of all that farrago of ufelefs diftinctions into conjunctive，adjunc－ tive，disjunctive，fubdisjuntlive，copulative，continua． tive，fubcontinuative，pofitive，fubpofitive，caufal，collec－ tive，proventive adequate and inadequate，adverjative， conditional，illative，\＆c．\＆c．；which explain nothing，Whish and which ferve only to veil ignorance and perplex fo Which and which ferve only to veil ignorance and perplex fa－ gacity．

That Mr Tooke＇s principles will apply exactly to the conjunctions of every language both dead and living，is what our limited knowledge of thefe languages does not authorife us politively to affirm．It is however a ftrong prefumption in favonr of his opinion，that illi－ terate favages，the firft cultivators of language，are little likely to have fent out their faculties in queft of words to denote the abftraft relations fublitting among their ideas，when we have fuch evidence as his book affords， that thenames of the moft comimonfubftances and qualities could anfwer that and every other purpofe，which in the L 2 ordinary
well as the manner in which the place of thefe words is fupplied in the languages which have not a conjunction correfpondent to them，ftrongly juftıfy his derivation which we have adopted．The Greek eten，the Latin $n i f i$ ，the Italian fe non，the Spanifl fino，the French fi non，all mean be it not．And in the fame manner do we fometimes fupply its place in Englifh by but，without，be it not，but if，\＆cc．It may be proper juft to add，that， according to the fame author，the conjunction LEST is a contraction of LESED，the paft participle of LESEN；and that LEST，with the article that，either expreffed or underftood，means no more than hoc dimiffo or quo dimiffo．
（s）Although is compounded of al or all，and tho＇though，THAH，or，as the valgar more purely pronounce it，thap，thayf，and thof．Now thaforthaufis evidently the imperativethaf orthafig of the verb thafian or thafigan，to allow，permit，grant，yield，affent；and thafig becomes thah，though，thoug（and thoch，as G．Douglas and other Scotch authors write it）by a tranfition of the fame fort，and at leaft as eafy as that by which hafuc becomes bawk．It is no finall confirmation of this etymology，that anciently they often ufed all be，albeit，all had，all were，all give，inftead of AITHOUGH；and that as the Latin si（if）means be it， and NISI and SINE（unlefs and without）mean be not，fo ETSI（although）means and be it．
（ T ）In a work of this kind，which profeffes to treat of univerfal grammar，it would be impertinent to wafte our own and our readers time on a minute analylis of each conjunction which may occur in any one particular language．We fhall therefore purfue the fubject no farther；but hall fubjoin Mr Horne Tooke＇s table of the Englifh conjunctions，referring thofe who are defrous of fuller fatisfaction to his ingenious work intitled． The Diverfions of Purley．

That is the article or pronomethat．
As is es，a German article，meaning it，that，or which．And
So is $s A$ or SO，a Gothic article of the fame import with $A S$ ，
ordinary intercourfe of life can be anfwered by the faculty of feech. It is a farther prefunption in his favour, that in the rudent langudges there are few it any conjunctions; and that even in others which are the moft highly polified, fuch as Greek and Latin as well as Engligh, many of thofe words which have been called conjunctions are obvioufly refolvable into other partsof fpeech. Thus A $\lambda \lambda \alpha$, tranllated $b u t$, is evidently the nenter gender of either the nominative or accufative $p$ hural of ainos annother; and when ufed as a conjunction, it iutimates that you are going to add foyething to what you have already faid. Cateruit has the fame meaning, and is nothing but xal evepoo. Mars (but in French) is the Latin majus; ut, uti, or, quod, is the relativepronoun. Of quocirca, quid, praterea, antequant, quanquan, quampis, quantumvis, quanlibet, \&c. therefolution is too obvious torequire being mentioned. Where fuch refolutions as thefe can be made, or when the conjenctions of any particular tongue can be traced to their oFigin in any other, there needs be no difpute about their true import: but when the cafe is otherwife, and the conjunction either appears to be an original word, or is derived from a fource to which it cannot be traced, we would advife fach of out readers as wifh to fpeak or write correctly, to difmifs from their minds all confideration of copulatives, continuatives, caufals and difjunctives, with the reft of that jargon which we have already mentioned; and to inquire diligently in what manner and for what purpofe the conjunction in queftion isufed by the beft.writers, both ancientand modern, of the particular language which they are itudying. This will indeedibe found a work of labour: but it appears to us to be the only: means left of difcovering the preciferelations which fuch conjunetions were intended to exprefs; and, by confequence, of knowing what words or fentences they are fitted to connect, fo as to produce a ftyle at once accurate and perfícuous.
themfelves," is indeed true ; and this union it effects, not by having no fignification of its own, but by fignify ing By fignifythe relation by which the things exprefled by the united ing the rewords are comnected in nature. Frepofitions are to be lation beaccounted for in much the fame manrier as the cafes of tween nouns. The neceflity of $\tau$ bis fpecies of words, or of fome equivalent invention, follows from the impoflibility of having in language a diftinct complex term for each diftinct collection of ideas which we may have occafion to put together in difcourfe. The addition or fubtraction of any one idea, to or from a collection of ideas, makes it a different collection; and if, after either of thefe operations, it were to be expreffed by the fame wurd as before, nothing could cufine but mifreprefentation and falfeliood. Now, to ufe in language a differgnt and diffintE complex terne for each difirerent and diftinct collection of ideas, is equally impoffible, as to ufe a diftinct particutar term for each particular and individualidea. To fupply, therefore, the place of the complex terms which are wanting in a language, are the cafes of nours and prepofitions employed; by the aid of . which, complex and gensral terms are prevented from being infinite or too numerous, and are ufed only for thofe collections of ideas which we have moft frequent occation to mention in difcourfe. By means of prepofitions this end is obtained in the moft fimple man-: ner. For, having occafion to mention a collection of ideas for which there is no fingle cowoplex term in the language, we either take that complex term which inctudes the greateft number, though not all of the ideas we would communicate; or elfe we take that complex term which includes all, and the feweft ideas more than thofe we fhould commusicate; and then, by the help of the prepofition, we either make up the deficiency in the one cafe, or retrench the fuperfluity in the other. For inftance, having occafion to mention a houfe of a particular defcription, and knowing that the term honfo is too general for our purpofe, and that the building we have in view has no appropriate name, we fay, perhaps, a boufe with a party-wall, or a boufo withuer a roof.-In the firft inftance, the complex term houf $f$ is deffient, and the prepofition directs to add what is wanting.-In the fecond inftance, the complexterm is redundant as it denotes a complete bouife; the prepofition, therefore, directs to take away what is fuperfuous.

Now, confidering prepofitions in this the moft fimple light, as ferving only to limit or modity general terms, it is abfolutely neceffary that they fhould have meanings of theirown; for otherwife, how could we, in the initances before us, make known by them our intention, whether of adding to or retrenching from, the fame general term boufe. If, to a difciple of Mr HarRIs, we fhould fay, a houfe jorn ; he wouldreply, Join what? But he would not contend that join is an indeclinable word which has no meaning of its own, becaure he knows that it is the imperative of a ver $b$, of which the other parts are ftill in ufe; and its own meaning is clear, though the fentence it not completed. If, inftead of Join, we fhould fay to him, a houfe with; he wonld fill afk the fame queftion, with what? But if we were to difcourfe with him concerning the word with, he would probably tell us, that with is aperpofition, an indeclinable word, which is itfelf devoid of fignification, but fo formed as to unite two words that are fignificant. And yet it would be evident by hisqueftion, that he felt it had a meaning of its own; which

## Chap. VI. $\quad$ G $\quad$ R $\quad$ A $\quad$ M $\quad$ M $\quad$ A $\quad$ R.

is in reali.y the fane as roin (u). Indeed, fo far has always been plainly perceived, that wirn and wirnout are direstly oppolite and contradictory; and it would puzzle the moft acute plilolopher to difcover oppofition and contradiction in two words where netther of them had any fimnification. Wilkins, therefore has well expreffed their meaning, where he fays, that with is a prepofition "relating to the notion of focial, or circumftance of fociety Atrirmed ; and that withour is a prepolition relating to the gme notion of focial, or circumitance of fociety DENIED."
rob. But to denote the relation of adaing and taking awid, are not the only purpofes for which pepofitions are employed. They all indeed ferve to modify fome generalterm or generalafirnation, bur not procifely in the fame way as with and wirfout. It has been already obferved, that words fignificant of thofe things which coincide in nature, coalefce with one another in fyntax, without being beholden to any anxiliary tie. Forinftance, an adjective coalcfces withits fubftantive, a verb with its nominative; a noun expreffing an object acted upon, with a verb denoting action, and an adverb with its verb. Take the following example: The splendid sun gentally warmeth the fertile eartia. But fuppofe we were defirous to modify thisalfirmation by the addition of otherfubltantives, Air, forinftance, and beams; how would thefe coincidewith theother wordsof the fentence, or under what character could
thay beintroduced ? Not as nominativero: acifatioes ios the verb, for both theie places are already filled; the nominative by the fubfance, sun, which is certainly the agcat in this operation; the acomiative by the fabffaccerarth, which is as certainly the object aeted upion. Not as qualities of the sun and eakia; for qualities inhering in their fubfances can only be $6 x$ proflicd by adjectives, and the words air and biams are both fubftantives. Here then we muft have recourfe to prepofitions; but we can employ only fuch preportion:, aspoint out the relations which the air and the beams have to the fun warming the earth. In Englifle we flotild fay, the fplended fun with bis beanns genially warmeth 7 HRCUGH the air the fertile earth. The fentence, as before, remains entire andone; the fubfantives requircd are both introduced; and not a word which was there before is detruded from its proper place. The import of with we have already difcovered; it directs to unite the beams to the fun, as fointly with him performing the operation. But the AIR has no other connection with thisoperation, than as the medrem or passage between the sun and the earth: and therefore the prepofition throvgh ( $x$ ) muft denote that relation whicla fubfiftsbetween an objest in motion, and the medium in which it moves; nor could a prepofition of a different import have been employed, without altering the meaning of the whole fentence $(\mathrm{y})$.
107. Mr Harris is of opinion that moft, if not all,
pre-
(0) This account of prepofitions is taken from Horne Tooke; who adds, that the only difference between the two words with and join, is, that the other parts of the Gothic and Anglo-Saxon verbwithan, to join, (of which with is the imperative), have ceafed to be employed in the language. As with means join, fo the correfpondent French prepolition AVEC means, and have that, or, have that atfo. But though with, as theimpezative of withan, meallsjoin, it has fonetimes a very different fignification. Mr Ty, wit in lis Glofary has truly oblerved, that WITH and BY are often fynonymous. They certainly are fo: but then with fecms to be an abbreviation of the imperative of writhan to be; as without is of wrthan-UTAN tobe out. This being the cafe, our two inftances in the text will ftand thus: a houfe Join afarty wall; a boufe be-out a roof. Nor let any one be furprifed that we make no difference between the conjunction without and the prepofition without. The word is the fame, whether it be employed to unite words or fontences. Prepofitions were urivinally, and for a long time, clafled with conjunctions; and when firft feparated from them, they were only diftingiihed by the name of prepofitive conjunctions. They aregenerally ufed to unite words, but not always; for we may fay indifferently, I cante after HIS DEPARTURE, or Icame after he DEPARTED. By the greater partof grammarians indeed, ayter, when employed as in the firft fentence, is clafled with the prepofitions; when employed as in the fecond, it isclaffed with the conjunctions. The word, however, is the fame in both fentences; its meaning is the fame, and its effect precifely the fame. The only circumfance of difcrimination is, that in the firft example it is prefixed to a noun, bis departure; in the fecond, it is prefixed to a nominative and a verb be departed. But even the nominative and the verb, thus applied, exprefs no more than a fpecifying circumftance annexed to the other propofition, I came; and whenever they are rightly apprehended by the mind, they are ftript of their prepolitionary form, and confideredabftractly under a new phafis, his departure. Thus then, the two fentencesare fynonymous in every refpect, excepting the apparent grammatical nature of the words bis departire, and he departed; and even thefe are reduced to one grammatic form in the mind, whenever the import of the prepofitions is rightly apprehended. WITHOUT, and many other prepofitions, efpecially in the leamed latiguages, are ufed exactly as after is ufed in the two inftances which we have given. Home Tooke, quotes Lord Mansfield for faying, "It cannot be read without the Attorney General confents to it." This, in modern Englifh, is not the common phrafeology; but it offends not againft any principle of grammar. The nonsinative and the verb are here, as in the former inftance, conidered as an abfraft noun; "it camot be read without the conient of the Attorney General."
(x) Thorough, thourough, thorow, through, or thro', is no other, fays Horne Tooke, than the Gothic fubfantive dauro, or the Tentonic fubfantive tutrun, and, like them, means door, gate, palfege. So that the fentence in the text, refolved upon his principles, fands thas: "The fplenditfan-jorn his beams -genially warmeth-passage the air, (or, the air being the paffage or nedium) -rhe fertile earti." And in the fame manner may we tranflate the perpofition throvgh in every infance where throush is ufed in Englih, or its cquivalent prepolition in any language; as from the Latin and Italian riod forta, (in Spanich puerta and in French ports), have come the Latin and Italian prepolition per, the French par and the Spanill por.
(y) If, for inftance, wewere to fablitute with or of inftead of through, we fhould in the one cafe alter the
12.8 Prepofitinns originally de noted the various relations of body:
prepofitions were originally formed to denote the relations of PLACE. For this opinion we fee not fufficient evidence. If indeed we could fuppofe the inventorsor earlicft improvers of language to haveat all concerned themfelves with retations as abftractedfrom the objectsrelated, we mutt believe that thofe which firft attracted their attention were the relations fublifting among themfelves, and the various bodies with which they are furrounded. We muft likewife agree with our author, that place is the grand relation which bodies or natural fubftances maintain at all times to one another ; but we do not therefore think that it would attract the earlueft notice of untaught barbarians. On the contrary, we are of opinion that mankind muft have made very confiderable progrefs in fcience before they attempted to abftract place from body; an attempt which, according to fome of the moft profound philofophers $(z)$, is not only difficult, but abfolutely impracticable. But whatever be in this, the relations of caufe and effect, of duration and notion, are in themfelves as obvious, and as likely to arreft the attention and obtain names, as thofe of place. Among men totally illiterate they are evidently more fo; for pain and $p l e a f u r e$ would fuggeft fome ideaof caufe and effectas matters of importance. There is, however, no probability
129 And were at firf either verbs or nouns. that the inventors of any language had the leaft idea of abftract relations. They doubtlefs expreffed complex conceptions by nouns and verbs, fignificant at once of the particular ideas and of the various relations by which they viewed thofe ideas as combinedrogether in acomplex. conception. Afterwards, when men's minds became enlarged, and when, from the fluctuation infeparable from a living language, objects or ideas received new names, the old words, whether nouns or verbs, which wercoriginally employed to exprefs a particular complex
conception, of which certainparticular RELATIONS made a part, might be retained for the purpofe of denating thofe and all fimilat relations; and thus verbs and nouns would degenerate into particles bearing the names of prepofitions and conjunctions. For inftance, one Auglo-Saxon being defirous to communicate to another his own conception of a boufe with a party-wall, and having (we thall fuppofe) no fuch word in his tongue as a prepofition, would naturally utter the word boufe, defiring his friend, at the fame time, to add to that well known found another found (uttering it) fignificant of the particular circumftance wanting to complete his complex conception; - $A$ houfe with (i. $\epsilon$. Join) a party wall. The word with, as the imperative of a verb, denotes of courfe three ideas combined together, viz. a command or wifh, an affirmation, and the idea of junction. But when the verb withan was difiniffed from the Englifh language, the imperative with was fill retained; but lofing its verbal and modal nature, it was thenceforth employed to denote only one of the three ideas for whica it originally ftood, viz. the idea of junction. And thus it is, that verbs, and alfo nouns and adjectives, in paffing from one language to another, inay become prepofitions (A) and conjunctions. Thus too it is, that fome of thofe prepofitions come to denote the contiguous, and fome the detached relation of body. The contiguous, as when we fay, Caius walked with a flaff; i. e. Caius, Join a flaff, walkect; the flatue flood UPON (B) a pedeftat, i. e. the flatue frood (the place of its ftanding) the higher part of a pedeflal; the river ran over a fand, i. e. the river ran (the place of its running) the HIGHER part of a fand. The detached relation, as when we fay, He is going тo (c) Italy, i. e. He is going, the END
meaning, and in the other fpeak nonfenfe. "The fun warmeth wita the air the fertile earth," is an affirmation that the fun warneth BOTH THEAIRANDTHE EARTH; whereas the original fentenceaffirmed nothing more than that he warmeth the earth. "The fun warmeth of the air the fertile earth," is nonfenfe, as it makes the earth apart, or a confequence, of the air. So neceffary is it that prepofitions have a meaning, and that the meaning of each be attended to.
(z) The Bifhops Berkeley and Law, with the very learned and ingenious Principal Campbell of Aberdeen. See The Principles of Human Knowledge, Law's Notes on King's Origin of Evil, and The Philofophy of Rhetoric.
(A) As the Italian fubftantive casa, a houfe, race, family, nation, \&rc. in paffing to the French, becomes the prepofition chez, to which there is not, fo far as we know, a prepofition of precifely the fame import in any language. Senza or senze in Italian becomes sans in French, and means abfence. Nor is it neceffary that verbsand nouns fhould always pafs from onelanguage to another, in order to be converted into prepefitions: The Greek prepofition $\chi$ wpis is evidently the corrupted imperative of $\chi$ wpostr to fever, to disjain, to feparate. The Latinsine is sit ne, be uot. The German Sonder is the imperative of Sondern, which has the fame. meaning as $\chi$ coprsery.
(b) Up, upon, over, bove above, have all, fays Horne Tooke, one common origin and figuification. In the Anglo-Saxon, ufa, ufera, ufemest, are the adjeftives altus, altior, altissimus. Ufa or ufan, $u p$; comparative ufera, ofere or ofer, over or upper; fuperlative ufemast, upmoft or uppermoff. Be-UFAN, bufan, on-bufan, bove, above. If this be a juft account of the origin of thefe words, the fentences. in the text, where upon, over, and above, occur, will run thus: The ftatue ftood on high a pedeftal;" "the river ran higherra fand ;" "the fun is rifen on $\operatorname{Highthe~hills."~And~here~we~may~obferve,~that~the~mere~}$ relation between ftanding, running, \&c. and place, is rather inferredfrom the verbitfelf, than bxpreffed by a feparate word; and the reafon is obvious. For if a ftatue fland, every one knows that it muft ftand onfome thing: as well as at fome time. There is therefore no nece fity, whatever elegance there may be in it, for employing any word to denote that relation, which is commonly believed to be fignified by on; but it is necelfary to infert, between the verb and pedeftal, a word fignificant of place, that pedeftal may not be miftaken, by an ignorant perfon, for a portion of time, or any thing elfe connccted with the flanding of the flatue.
(c) That $\boldsymbol{r} \boldsymbol{o}$ is fugnificant of detached relation, is the language of Mr Harris, which, though it may be alo lowed in a loofe and valgar fenfe, is certainly not philofophically jult. The prepofition to (in Dutch written TOE and TO ) is the Gothic fubftantive; taul or TAUH Ts fignifying act, effert, refult, or confummation; which Gothic fubitantive is itfelf no other than the paft participle tauid or tauids of the verb tavgan agere. And

END (of his journey) Italy; the fun is rifen Above the bills, i. e. the fun is rifen (the place) THE TOP of the bills; thefe figs cante from Turkey, i. c. thefe figs came beginning (their journey at) Turkey.

Befides the detached relation of body, Mr Harris is of opinion that the prepofition From denotes two other relations not lefs different than thofe of motion and reft. Thus if we fay, "That lamp hangs from the cieling, the prepofition FR om affumes a character of quiefcence.

But if we fay, That lamp is falling FROM the cieling, the prepofition in fuch cafe affumes a character of motion:" But this is evidently a miftake : the detached relationin the former inftance of the figs, as well as the motion and reff in the prefent inftances, are expreffed not by the prepofition, but by the verbs came, falls, hangs. The word from has as clear, as precife, and at all times as uniform and unequivocal a meaning, as any wordin the language, From means merely beginning, and nothing
it is obvious, that what is done is terminated, ended, finifhed. In the Teutonic, this verb is written tuan or tuon ; whence the modern German thun, and its propofition tu. In the Anglo-Saxon, the verb isteogan, and the prepofition to. Do, the auxiliary verb, as it has been called, is derived from the fame root, and is indeed the fame word as то. The difference between a T and a D is fo very fmall, that an etymologift knows by the practice of languages, and an anatomift by the reafon of that practice, that in the derivation of words it is fcarce worth regarding. To fupport this etymon of to, Mr Horne Tooke gives a fimilar inftance in the Latin tongue. The prepofition $A D$, he fays is merely the paft participle of $A G E R E$, which paft participle is likewife employed as a Latin fubftantive. He exhibits the derivation of $A D$ thus:

$$
\text { Agitun-agtum } \begin{cases}A G D U M & \text { or } \\ A C D U M & \text { or } \\ \text { ACT } & \text { or } \\ \text { AT }\end{cases}
$$

The moft fuperficial reader of Latin verfe (he obferves), knows howreadily the Romans dropped their final um. And a little confideration of theorgans and practiccof fpeech will convincehimhow eafily AGD or act wouldbecome AD or at ; as indeed this prepofition was indifferently written either way by the ancients. By the later writers of Rome, the prepofition was written AD with $D$ only, in order to diftinguifh it from the other corrupt word called the conjunction at ; which for the famereafon was written with the tonly, though that likewife had anciently been written, as the prepofition, either ad or at. The prepofition to and the conjunction too in Englinh, are both in fyntax and in meeaning hfed exactly as the prepofition ad and the conjunction at in Latin. From the fpecimens̀ prefixed to Johnfon's dictionary, as a hiftory of our language, it appears that, as late as the reign of Elizabeth, the prepofition and conjunction were both written with one o. And it has becr hown in the firft volume of the Tranfactions of the Royal Society of Edinburgh, that To and too, as well as ad and at, are precifely of the fame import. The only difference, in either language, between the prepofition and the conjunction, is, that the former directs, as a modification of fome previous propofition the addition of fome fubftantive or nounn; the latter, fometimes a fentence a claufe of a fentence confidered abftractly as a noun; and that, when the former is ufed, the prepofition, to which the modifying circumftance is to be added, is formally expreffed, - but onitted when the latter is employed. Thus Dendam fays,

> "Wifdom he has, and, тo his wifdom courage ;
> " Temper ro that, and, unto all, fuccefs."

In this example, every fucceeding circumftance is by the prepofition то marked as an addition to the preceding. "Wifdom he has, and courage additional to his wifdom." But Denham might with equal propriety have omitted the objects which тo governs, or to which it directs fomething to be added, though he muft then, from the cuftom of the language, have employed the conjunction inftead of the prepofition. As,
"Wifdom he has, and courage too," \&c.
This mode of expreffion would have been more concife, and as intelligible as the other, "Wifdom he has, and courage to bis wifdon," \&c.

Not only is the object governed by to omitted, when it is reprefented by afubfantive in the context, but alfo when it is involved in a prepofition; and then the conjunction, as it is called, is always ufed. Thus, " " The daring crime, behold the vengeance тоо."
So, " He made him prifoner, and killed him too." In the one example, the circumftance of beholding the vengeance is fated as an addition to the viewing of the crime; and in the other, the killing bim is ftated as an addition to the naking him a prifoner. In both examples, the object governed by too is the amount of the preceding propofition taken abftractly as a noun or fubftantive. Thus then it appears, that to and too, though claffed the one with the prepoitions, and the other with the conjunctions, are really one and the fame word. The fame is true of AD and AT. Thus, "AD hoc, promiffa barba et capilli efferaverant fpeciem oris," fignifies, "Additional to this, his long beard and hair had given a wildnefs to his afpect." But when the object governed by $A D$ is not formally ftated, AD itfelf is claffed with the conjunctions, and written differently, at. Thus Terence, "Ph. Fac ita ut juffi, deducanturifti. Pa. Faciam. Ph. At diligenter. Pa Fiet, $P_{H}$. At mature." By the means of at, the circumftances of difigence and bafte are fuperadded to the action commanded. " $\mathrm{P}_{\mathrm{H}}$. It is not enough that you do it, you muft do it carefully Too . $\mathrm{P}_{\mathrm{A}}$. Well, it flall be carefully done. PH. In good time roo." AT, taken in this fenfe, is moft commonly employed, like the Englifh BUT, to mark the unexpected union of incongruous objects: As, "Aulam tyrannifreqrientabat, AT patriam amabat;" literally, "He frequented the court of the tyrant ; joined EvEN TO that he loved his country." He was a courtier and a patriot too." But if ad and at in Latin, and to and too in Englihh, be derived from verbs which fignify to do or act, it may be alked how they come themfeves to denote addition. The anfwer is obrious.
thing elle. It is fimply the Auglo-Saxon and Guthic noun FROM , begznnug, origin, fource, fountain, author (D). Now if this meaning be applied to Mr Harris's infances, from will fpeak clearly for itfelf, without the affiftance of the interpreting verbs, which are fuppofed by him to vary its character.
" Thele figs came from Turkey."
" That lamp falls from the cieling.'
" That lamp bangs from the cieling."
Came is a complex term for one fpecies of motion; falls is a complex term for another fpecies of motion; and hangs is a complex ( E ) term for a fpecies of attachment. Have we occafion to communicate or mention thecommencement urbeginning of thefe motions, and of this attachment, and alfo the place where they. conmence or begin? To have complex terms for each occalion of this fort is abfolutely impoffible; and therefore nothing can be more naturalor more fimple than to add the figns of thofe ideas, viz. the word beginning (which will remain always the fame) and the NAME of the place (which will perpetually vary). Thus,
"Thefe figs came-bhginning Turkey."
"That lamp falls-BEGINNXNG c.eling.","
"That lamp hangs-BEGINAIAC cicling." That is,
" Turkey the place of beginning to come."
" Cieling the place of beGinning to fall."
"Cieling the place of beginning to hang." It has been faid by no lefs a man than bifhop Wilkins, that from refers primarily to place, and fecondarily to time. But the truth is, that from relates to every thing to which beginning relates, and to nothing elfe. " From morn till night the eternal larum rang. That is, "The larum rang beginning morning (or morning being the timue of its BEGINNING) tillnight."

As fron always denotes beginnith, fo to and till always denote the end. There is, however, this difference between them, that ro denotes the end of any this.g; tine the end only of timue. We may fay inditferently - "From morn тo night," or "from morn TiLL night, the eternal larum rang ;" but we cannot fay-" Thefe figs came from Turkey till England."

2

That Till can, with propriety, beoppofed to from only when we are talking of time, is evident; for it is a word compounded of to and while, i. e. time. And as the coalefcence of thefe two words ro-while, took place in the language long before the prefent fuperfluous ufe of the article rHE , the phrafe-"From morn till night', is neither more nor lefs than- From morn то тime night. When we fay, "from morn to night," the word time is omitted as uneceffary.
Befides from, MrHarris mentions over as fignificant, fometimes of mo:ion, and fometimes of reft; and quotes, as inftances, the two following paffages from Milton.

## Over The To fupport uneafy feps <br> Over tbe burning marle.

Here, fays he, over denotes motion. Again, Hung over bere quith Looks cordial leve Hung over ber chamoured.
Here over denotes reff. But the truth is, that over denotes neither motion nor $r e f t$ in either of the paffages. In the firf quotation, indeed, motron is $i$,aplied $:$ but it is implied in the word STEPS; and not in OVER, which denotes only that the place of the fteps was the top of the burning marle. In the fecond quotation, reff is implied, and that too a particular fpecies of reft; buc it is implied or rather exprefled by the verb HuNC, and over denotes the place of that fpecies of reft.
108. But though the original ufe of prepofitions was to denote the relations of body, they could not be confined to this office only. They by degrees extended themfelves to fubjects incorporeal; ant came to denoterelations, as well intellectual as lacal. Thus, becaufe by degrees extended to in place he, who is above, has commonly the advantage fubjeds inover him whois below, hence we transfer OVER and UN- corporeal. ner (F) to dominion and obedience. Of a king, we fay, he ruled over hispeople; of a foldier, he ferved UNDER bisgeneral. So too we fay, withthonght: without attention; thinking over a fubject;under anxicty; from fear; through jealoufy, \&c. All which inftances, with many others of like kind, fhow, that the firft words of men, like their frft idsas, had an immediatereference to fonfible objctts; and chat in after days, when they began to difcern with their intellect; they took thofe words which they

If a man hould utter a fentence, and to the end of it fubjoin the very general word Do, the perfon to whom he fpoke, would naturally afk, Do what? and this queftion would, of courfe, produce an additional fentence or claufe, of a fentence. Befides, it is to be obferved, that agere, from which the Latin prepofition is derived, as well as the Gothic verb, which is the fource of the Englifh particles, means not only to do, but alfo to adduce or bring; fo that when we fay, "he is going to Italy," we do nothing more than affirm that "he is going," and defire the perfon to whom we fpeak, to "ADD Italy to the journey."

From this derivation of the prepofition то, it will be feen at once upon what principle it is employed to mark the infinitive mode. In the learned languages that mode is generally known by its termination ; but in Englith it would be impoffible, withont the aid of to or of fome other word fignificant of action, to diftinguifh the verb love from the noun or fibfiantive.
(D) This derivation is Mr Horne T'ooke's; and he fupports it by the following fentence; Nerfed cese the on frumman worthe, he worhte wepman and wifmen; which is Anglo-Saxon of St Matt. xix. 4. "Annon legiftis, quod qui eos in principio creavit, creavit eos marem et feminam."
(E) Thefe are complex terms becaufe they are verbs. Each denotes an affrmation and time; and combincd witi: there, came and falls denote motion, and hangs denotes reft.
(f) UNDER and beneath, though by the found they feem to have little connection, are yet in fact almont the fame word, and may very well fupply each other's plaç. UndER is nothing but on-NEDER, and bENEATH. is compounded of the imperative be and the noun neath. Neath uncompomded having lipped away from our language, would perhaps be unintelligible, had not the nouns NETHER and NETHERMOST fill continucd in commoilu'e. Neath; Anglo-Saxon, neothan, neothe; Dutch, neden; Danif, ned; German, niepre; and Swedifh, NEDRE and NEDER; is undoubtedly as much a fubftantive, and has the fame meaning, as the word wADIR. In common language it denotes the beitom.
they found already made, and transferred them by metaphor to intellectual conceptions.

Among the relations which may be confidered rather as intellectual than corporeal, are thofc of caufe and confequence; and for the denoting of thefe we have two prepofitions, which fometimes appear in direct oppofition to one another, and at other times may exchange places without injury to the fenfe.
"Well! 'tis e'en fo! I have got the London difeafe they call love. I am fick of my hurband, and ror ny gallant." Wychertey's Country Wifo.

Here of and for feem almoft placed in oppofition; at leaft their effects in the fentence appear to be very different ; for, by the help of thefe two prepofitions alone, and without the affiltance of any other words, the exprefles the two contrary affections of loathing and defire. The truth, however, is, that the author, if it had pleafed him, might have ufed of where he has employed for, and for where he has put of. This is evident from the following quotation :
" Marian. Come, Amie, you'll go with us."
" Amie. I am not well.,"
"Lionel. She's fick of the young Jhepherd that bekift her."

Sad Shepherd.
In the fame manner we may, with equal propriety, fay-" We are fick of hunger ;" or-"We are fick for hunger." And in both cafes we hall have expreffed precifely the fame thing, with only this difference, that, in the former fentence, we declare ficknefs to be a CONSEQUENCE; in the latter, we declare hunger to be a CAUSE. But to return to the poor country wife; that poor lady feems to have had a complication of diftempers; fhe had, at leaft, two diforders-a ficknefs of loathing, and a ficknefs of love. She was fick for difguft, and fick for love. She was

Sick or dijguft For her bufband;
Sick of love for her gallast.
Sick FOR difguft of her hulband.
Sick for lovie of her gallant.
In the firft fentence, as thus ftated, ficknefs is declared to be the CONSEQUENCE of difguft, of which her hufband is declared to be the cadies. In the lecond, fickne/s is declared to be the consequence of love, of which her gallant is declared to be the cause. In the third fentence, disgust is declared to be the cause of ber ficknefs, and the consequence or offspring of her hu/band. In the fourth, love is declared to be the cause of her ficknefs, and the consequence or offspring of her gallant.

Thus, then, it appears, that though the two fir $f$ of thefe fentences, taken entire, convey the very fame meaning with the two laff, yet the import of the prepofition FOR is as different from that of of, as CAUSE is from consequence (G). When two words or fentences are linked together by the former of thefe prepofitions, the object expreffed by the laft word or fentence is declared to be the cause of that which is exprefled by the preceding; when two words or fentences are linked toge-

Vol. VIII.
ther by the latter prepofition, the abjett exprefled by lic firft word or fentence is declared to be the conseQUENCE OF, or to PROCEED FROM, the object cxpreffed by the fecond. It is thereforc a matter of perfect indifference to the fenfe, whether we fay ficknefs of hunger, or ficknofs forbunger; The man,or befpeakstittle, ;s wife, or the man is wift, for be fpeaks little. By means of the prepofition or, we declare ficknefs to be the conseQUENCE proceeding from bunger, and wifdom to be the CONSEQUENCE We infer from the man's speaking little; by means of FOR we declare bunger to be the CAUSE of fickne/s, and the circumftance of fpeaking little to be the cause from which we infer the man's quifdom. In the one fentence, of is to be confidered as a noun in appofition to ficknefs; in the other, as a noun in appofitions to the man is wife taken abliractly as a noun. In the onc fentence, FOR (i. e. CAUSE) is to be confidered as a noun in appofition to bunger; in the other, as the fame noun in appofition to he fpeaks little, taken abftractly as zounz. 109. In the foregoing ufe of prepolitions, we liave feen how they are applied by way of juxta-pofition; feen how they are applied by way of juxta-pcfition; tions com-
that is to fay, where they are perfixed to a word with- pounded out becoming a part of it. But they are ufed alfo by with way of compofition; that is, they are perfixed to other other words fo as to become real parts of them. Thus in words. Greek we have $\varepsilon_{\pi} \pi \sigma \tau \alpha \sigma \theta \alpha r$; in Latin, intelligere; and in Englifh underftand. So alfo, to foretel, to overact, to undervalue, to ourgo, \&c.; and in Greek and Latin other inftances innumerable. In this cafe the prepofitions commonly transfufe fomething of their own meaning into the word with which they are compounded For example, if we fuppofe fome givell fpace, E and Ex Transfufe fignify out of that fpace; PER, through it ; IN, within if; fomething sUB, under it. Hence E and PER , in compofition augment, of their Enormis is fomething not fimply big, but big in excefs; own meaxfomething got out of the rute, and beyond the neeafure. Dico," to fpeak;" edico, " to fpeak out ;" whence Edictum "an edict," fomerhing fo effectually fpoken as all are fuppofed to hear and all to obey.-On the contrary, in and sub diminifh and leffen. INiuftus INiquus,"" unjuft, in equitable;" fomething thatlies within juftice and equity, that reaches not fo far, that falls Short of them. Subniger, "blackinh;" subrubicundus, "reddifh:" tending to black, and tending to red ; but yet under the ftandard, and below perfection,
ino. Before we difmifs this part of our fubject, we 133 thall make the fame difere Their real we formerly made on conjunctions; viz. that ihe pracife how to be import of each can with certainty be known only by difcovered, tracing it to its fource in fome word of $k n e w n$ and de. terminate meaning, either in the language where the prepofition itfelf has place, or in fome parent or cognate tongue. And it may be laid down as an infallible rule, that where different languages ufc the fame or a fimilar particle, that language ought to be confidered as its legitimate parent, in which the true meaning of the word can be found, and where its ufe is as common and faniliar as luat of any other verbs and fub: M
ftantives.

[^3]ftantives. When prepofitions can be traced to fuch

- fources as thefe, no room can be left for difputes concerning their meaning. In carrying on this etymological purfuit, we find advantages in the nature of prepofitions which conjunctions do not afford us. With and without, from and to, with many other words belonging to this clafs, have meanings directly oppofite and contradictory to each other. If, then, by the total or partial extinction of an original language, the root of any one prepofition be loft, whilft that of its oppofite remains, the philofopher ought to be fatisfied with reafoning from contrariety; as nothing is more evident, than that the meaning of a word is known when we know with precifion the meaning of its oppofite. When we meet, however, with a lucklefs prepofition of which no root is left to be dug up, and which has itfelf no direct oppofite in the language, nothing remains but that we inquire for what purpofe it is ufed by the beft writers both ancient and modern; and if we can fix upon one meaning which will apply, however aukwardly, to all the places where it occurs, or to the greater part of them, the probability is; that we have difcovered the true and original ( H ) meaning of the prepoition; and by keeping that meaning conftantly in view, we fhall ourfelves be enabled to ufe the word with perfpicuiry and precifion.

## Sect. III. Of Interjections.

134
The interjection not properly amy part of fipech.
mir. Befides the above parts of fpeech, there is another acknowledged in all the languages of Europe, called the interjection; a word which cannot be comprehended under any of the foregoing clafles. The genuine interjections are very few in number, and of very little importance, as they are thrown into a fentence without altering its form either in $f y$ ntax or in fignification, In the words of Horne Tooke, the brutifh inarticulate interjection has nothing to do with fpeech, and is only the miferable refuge of the fpeechleis. The dominion of fpeech, according to the fame author, is erected on the downfall of interjections. Without the artful contrivances of language, mankind would have nothing but interjections with which to communicate orally any of their feelings. "The neighing of a horfe, the lowing of a cow, the barking of a dog, the purring of a cat, fineezing, conghing, groaning, hhrieking, and every other involuntary convulfion with oral found, have almoft as good a title to be called parts of fpeech as interjecticns. In the intercourfe of language interjections are employed only when the fuddennefs or vehemence of fome affection or paffion returns men to their natural fate, and makes them for a moment forget the ufe of feeech; or when, from fome circumflance, the fhortnefs of time will not permit them to exercife it." The genuine interjection, which is always expreffive of fome very ftrong fenfation, fuch as, Ah! when we feel pain, does not.owe its characterifti-
cal expreffion to the arbitrary form of articulation, but derives its whole force from the tone of voice and modification of countenance and gefture. Of confequence, thefe tones and geftures exprefs the fame meaning, without any relation to the articulation which they may affume ; and are therefore univerfally underftood by all mankind. Votuntary interjections, are ufed in books only for embellifhment, and to mark forcibly a frong emotion. But where fpeech can be employed, they are totally ufelefs; and are always infufficient for the purpofe of comnunicating thought. Dr Beattieranks frange,prodigious, amazing, wonderful, Odear, dear me, \&c. when ufed alone, and without apparent grammatical fyntax, among the interjections : but he might with as much propriety have confidered hardly, truly, really, and even many Latin verbs, as interjections; for thefe too are often ufed alone to fupply the place of whole fentences. The truth is, that all men, when fuddenly and violently agitated, have a ftrong tendency to fhorten their difcourfe by employing a fingle word to exprefs a fentiment. In fuch cafes, the word employed, whether noun, adjective, or verb, would be the principal word of the fentence, if that fentence were completed; and the agitation of the fpeaker is fuch, and the caufe of it fo obvious, that the hearer is in no danger of miftaking the fenfe, and can himfelf fupply the words that are wanting. Thus if a perfon, after liftening to a romantic narrative, were to exclaim, frange! would any man of conimon fenfe fuppofe, that the word ftrange, becaufe uttered alone, had loft the power of an adjective and became an interjection? No, furely: Every one fees, that the exclamation is equivalent to, That is STRANGE, or That is a STRANG fory. Real interjections are never employed to convey trutb of ally kind. They are not to be found amongft laves, in books of civilinftitutions, in biffory, or in any treatife of ufeful arts or fciences; but in rhetoric and poetry, in novels,plays, and romunces, whiere in Englifh, fo far from giving pathos to the ftyle, they have generally an effect that is difgufting or ridiculous.
Havinc now analyfed every part of feech which can be neceflary for the communication of thought, or which is acknowledged in any language with which we are acquainted; we fhall difmifs the article of Grammar, after annexing a Table, which may prefent at one view the feveral claffes and fubdivifions of words. Of the different modes of dividing the parts of fpeech, as well as of the little importance of fyfe ematic claffifications, we have already declared our decided opinion: but for the fake of thofe who may think differently from us, we fhall in the annexed Table adopt Mr Har, is's claffification as far as it is intelligible; after informing our readers that Mr Horne Tooke admits only three parts of fpeech, the article, the noun, and the verb, and confiders all other words as corruptions or abbreviations of the two laft of thefe.

> GRAM-
(h) For inftance, let us fuppofe that Horne Tooke's derivation of for, from the Gothic fubftantive fairina, is fanciful and ill-founded ; yet there can be litule doubt but caUSE is its true and original meaning, when it is foand, that of fixteen examples brought by Greenwood, and forty-fix by $70 h n f o n$, of different fignifications of the word FOR, there is not one where the noun CAUSE may not be fulbitituted inftead of the prepofition FOR: fometimes indeed ankwardly eriough, but always without injury to the fenfe. Even where for feems to be loco alterius, which Lowth afferts to be its primary fenfe, it will be found to be cause, and nothing elfe : Thus, He made confliderable progrefs in the Aludy of the law before he quitted that profefion ros this of poetry; i. e. before be quitted that profeffion, this of poetry being the cavse of his quitting it.

## G R A

Grammarian ,

GRAMMRIAN, one that is fkilled in or teaches grammar.

Anciently the name grammarian was a tille of honour, literature, and erudition, being given to perfons accounted learned in any art or faculty whatever. But it is otherwife now, being frequently ufed as a term of reproach, to fignify a dry ploding perfon, employed about words and phrafes, but inattentive to the trae beauties of expreflion and delicacy of fentiment. The ancient grammarians, called alfo philologers, muft not be confounded with the prammatifts, whofe fole bufinefs was to teach children the firft elements of language: Varro, Cicero, Meffala, and even Jultus Cæfar, thought it no difhonour to be ranked as grammarians, who had many privileges granted to them by the Roman emperors.

GRAMONT, a town of France, in the Limofine remarkable for its abbey, which is the chief of the order. E. Long. 133. N. Lat 45.56.

GRAMPIAN-hiles; a chain of high mountains in Scotland, which run from eaft to weft almoft the whole breadth of the kingdom. See (Sottifh) Alps and Scotland.-They take their name from only a fingle hill, the Mons Grampius of Tacitus, where Galgacus waited the approach of Agricola, and where the battle was fought fo fatal to the brave Caledonians.

GRAMPOUND, a town of Cornwall in England, feated on the river Valle, over which there is here a bridge. W. Long. 5. 25. N. Lat. 50. 20. The inhabitants have a confiderable manufacture of gloves; and the town fends two members to parliament. Some think that this town is the Voluba of the ancients becaufe it ftands on the fame river; and that on the building of the bridge, the name was changed into Grandpont. It was made a borough in the reign of Edward III. by whofe charter it was endowed with large privileges, particularly freedom from toll through all Cornwall;, a market on Saturday, and three fairs in the year ; which the burgeffes hold of the duchy of Cornwall in fec-farm, at the rent of about 12 guineas. Its privileges were confirmed by King Henry VIII. but it did not fend members to parliament till the reign of Edward VI. It is a corporation with a mayor, 8 magiftrates, a recorder, and town-clerk. The mayor is chofen annally the Tuefday before Michaelmas, and the members by the majority of the magiftrates and freemen, who are fuch of the inhabitants as pay foot and lot. There is a chapel of eafe in the town to the parifh-church, which is at Creed, about a quarter of a mile off.

GRAMPUS, in ichthyology ; a fpecies of delphinus. See Delphinus,

GRANADA, a province of Spain, which for a long time was a kingdom diftinct from the reft of that country. See the article Spain.-It made a part of the ancient Bætica; and was inhabited by the Baftuli, the Sexitani, \&c. At prefent it is fometimes called Upper Andalufia. It is bonnded to the fouth and eaft by the Mediterranean, to the weft and north by Lower Andalufia, and to the north-eaft by Marcia. Its extent from weft to eaft is two hundred and ten miles; but its greateft breadth exceeds not eighty. The air here is temperate and healthy; and though there are many mountains in the province, and fome of them very high, yet they are almoft cvefy where
covered with vines and fruit-trees, together with lau: Granada, rel, myrtle, fweet-bafil, thyme, lavender, marjoram, and other aromatic herbs, which give an exquifite tafte to the flefh of their theep and cattle. A great deal of filk and fugar, flax and hemp, honey and wax is alfo produced here; befides dates and acorns, fupcrior to the fineft nuts; good fone for building ; feveral forts of gems; fumach, ufed in drefling goatikins; and galls, of which a dye is made for leather. The valleys, with which the mountains are interfperfed, are extremely beautiful and fertile. The inhabitants of fome of the higheft mountains are faid to be defcendants of the Moors; and, though they are become Ro-man-catholics, retain, in a great meafure, their ancient cuftoms, manners, and language. The principal rivers in the province are the Genil, or Xenil, and Gaudalantin, befides which there are many leffer ftreams. Abundance of falt is made in this province; which, though neither fo populous nor fo well-cultivated as when fubject to the Moors, yet is as much fo as any in Spain. It was the laft of the kingdom pofleffed by the Moors, and was not reduced and annexed to the crown of Caftile until 1492.

Granada, the capital of the above province, is fituated at the foot of the Siérra Nevada, or the Snowy Mountain, in a wholefome air and fruitful comntry, an hundred and eighty miles fouth of Madrid, in W. Long. 2. 30. N. Lat. 36. 56. It ftands upon two hills feparated by the Darro. The Genil runs under the walls, and thefe two rivers are formed from the melting of the fnow with which the mountain is conftantly covered. The Darro is faid to carry with it fmall particles of gold; and its name, derived from dat aurum, may be alleged as a proof of this: the Genil, in like manner, rolls with its fream little pieces of filver. When Charles V. came to Granada, in 1526 , with the emprefs Ifabella, the city prefented him with a crown madc of gold gathered from the Darro. The city is large and magnificent, containing a great number of very handfome public and private buildings. Its walls, which are adorned with many towers at equal diftances, are faid to be ten miles in compafs. Here are tivo caltles; the one built by the Moors, and the other by Charles V. and Philip II. They both command a very fine profpect; and the firf is fo large, that it looks like a city by itfelf, and, it is faid, has room enough to accommodate forty thoufand people, exclufive of the royal palace, and the convent of St Francis. Here is alfo a court of inquifition; a royal tribunal; and an univerfity, founded in 153 r ; with the fee of an archbifhop, who has a revenne of forty thoufand ducats per annum. A great many noblemen, clergymen, and wealthy citizens, refide in this city, of which the filk trade and manufacture is very great, and the arferal is faid to be the beft furnifhed of any in Spain. The inhabitants, who are partly defcended of the Moors, are well fupplied with water. There are feveral fine fquares, particularly that called the Bivaramba or Plaça Mayor, where the bull-fights are held; and without the city is a large plain, full of towns and villages, called La Vega de Granada.

The Moors are faid to regret nothing but Granada, amongft all the loffes they have fuftained in Spain ; they mention it in all their evening prayers, and fupplicate
heaven

## GRA [ 100$]$ G R A

Granada. heaven to reftore it to their poffeffion. The laft Moorill ambaffador who came into Spain obtained permiffion of the king to fee Granada; he fhed tears on entering the Alhambra, and could not refrain from exclaiming, that the folly of his anceftors had deprived them and their pofterity of that delightful country.

Granada had formerly twenty gates : the firft, that of Elvira, which fill remains; the fecond, that of Bibalmazar, or of conference, becaufe, with the Moors, it was a kind of place of refort where they convericd on affairs; the third, Vivarambla, fo called from itsleading to a grand fquare which fill bears the fame name; the fourth, Bib Racha, or of provifions; the fifth, Bitataubin, or the gate of the hermits, which led to different folitudes, the abodes of dervifes; the fixth, Bibmitre, or Biblacha, the firft gate; the feventh, the mill gate ; the eighth, that of the fum, becaufe it opened to the eaft: the ninth, the gate of the Alhambra, called by the Moors Bib Luxar; the tenth, Bib Adam, or the gate of the boncs of Adam; the twelfth, Bib Ciedra, the gate of the nobles; the Moors kept this gate fhut for a long time, becaufe it had been predicted that the enemies which foonld one day take the city, wonld enter by that gate; the thirteenth, is that of Faxalanza, or of the hill of almond trees; the fourteenth, the lion gate, in Arabic, Bib Elecei; the fifteenth, the coaft gate, called by the Moors Alacabar; the fixteenth, Bib Albonut, or the gate of the Banners, at prefent the magdalen gate; the feventeenth, that of the Darro; the eighteenth, that of the Mofayca; the mineteenth, that called the gate of Ecce Honto; the twentieth, that by the fide of the Alhambra.

The Moors have left more monuments in Granada than in any other city in Spain. From the great number of infcriptions in and about the city, and the fine edifices of the Alhambra and the Gencralif, it might be fuppoicd thefe people intended to Make Granada the great depofitory of their religion, manners, cuftoms, and magnificence. There is not a wall which does not bear fome marks of their power ; but, notwithftanding this abundance of monuments, the reign of the Moors in Spain is fill buried in confotion and obfcurity. The ignorance of the Spaniards, their fuperftition, and the hatred they bore the Moors, have much contributed to this darknefs; they have either deftroyed, or fuffered to be efficed by time, every thing which bore the mark of mahometanifm, inftead of preferving the monuments of antiquity, which at the fame time were thofe of their own glory; and it may be faid, that chance alone, and the folidity of their conftruction, much more than curiofity or a love of the arts, has preferved thofe which ftill exift, although daily going to ruin.

An account of the Alhambra has been already given under its name in the order of the alpliabet. From the hall of Comares there mentioned, there is a modern little ftair-cafe ; the old one, which correfponded to the beauty of the edifice, having been deftroyed. At the top of the ftair- cafe is a gallery, a part of which is inclofed with an iron railing; this kind of cage is called the prifon of the queen. It was here the wife of the Jaft king of Granada was imprifoncd. The Gomels and Legris, two families of diftiction, bore falfe witnefs againft her virtue, and occafioned the deftruction of the greateft part of the Abencerrages, another
powerful and numerous family of Granada of whom Granada. they were jealous. The hiftory of this event is given as follows.

In the year 149r, Abdali, furnamed the Little, ftill reigned in Granada; but this city was upon the brink of ruin, for the principal families were divided againft each other. The Moors had carried their arms againft Jaen, and had been bravely repulfed. Abdali was confoling himfelf in one of his pleafure houfes for the ill fuccefs of his enterprife, when the Zegris, wholong had been the fecret enemies of the Abencerrages, took the opportunity of this defeat to reprefent them to the king as rebellious fubjects, who employed their immenfe riches to gain the favour of the people and dethrone their fovereigns. They accufed Albin Hamet the moft rich and powerful among them, of having an adulterous commerce with the queen, and produced witneffes who afferred they had on a certain feftival feen, at Generalif, under a bower of rofe trees, Albin Hamet in the arms of that princefs. The fury of Abdali may eafly be imagined; he fwore the de* ftraction of the Abencerrages. But the Zegris, toopradent to let his anger break forth, advifed him to diffimnlate, and not to fuffer it to be known to that numerous and powerful family that he was informed of their perfidy. It will be better, faid they, to entice them into the fnare, and, before they can unite and put themfelves into a ftate of defence, revenge upon their heads the infult offered to the crown. This advice was followed : Abdali went to the Alhambra, having ordered thirty of his guards to arm themfelves, and the executioner to attend. The Abencerrages were fent for one by one, and beheaded as foon as they entered the hall of the lions, where there is ftill a large vafe of alabafter, which was quickly filled. with blood and the heads of expiring bodies. Thirty-five heads had already been ftruck off, and all the Abencerrages. would have died in the fame manner, had not a page, who had followed his mafter, and remained unperceived in the hurry of the execution, taken an opportunity of withdrawing and giving information to the reft of the unhappy family of what had paffed. Thefe immediately alfembled their friends in arms, crying out through the city of Granada, "Treafon! treafon.! Let the king die ! he unjuftly puts to death the Abencerrages!" The people, with whom they were favourites, did not hefitate in affifting them : fourteen thonfand men were foan found in arms, and immediately proceeded towards the Alhambra, fhouting all the way, Let the king die ! Abdali, furprifed his fecret fhould have been fo foon difcovered, and feverely repenting of having followed the pernicious counfels lie had received, ordcred the caftle gates to be fhut ; but they were prefently: fet on fire. Muley Hacen, who had been forced to abdicate the throne in favour of his fon, hearing the tumult of the people, had one gate opened, and prefented himfelf to appeafe the rage of the citizens; but lie no fooner appeared, than he was lifted up by the multitude neareft the gate, who cried out "Behold our king, we will have no other, long live Muley Hacen;" and leaving him furrounded by a ftrong guard, the Abencerrages, and other nobles, entered the caftle, accompanied by upwards of an hundred foldiers. But they found the queen only, with her wonten, and in the utmon confternation at the fudden

## G R A <br> 10I

the foundation of Granada; and that in the place where the Alhambra now ftands, there was a temple dedicated to Nativala. The date of the foundation of Granada is faid to be 2808 years before Chrift. We know that in the time of the Romans it was a municipal colony.-A defcription in Latin of Granada, fuch as it was, in 1560 , written by a merchant at Antwerp, named George Hofnahel, who travelled into Spain, is to be found in the work, intitled Civitates orbis terrarum, printed at Cologne in 1576 . This book allo contains a good plan of the city of Granada.

Granada, or $G_{\text {RENADA, }}$, one of the Caribbee inlands. See Grenada.

Granada, a town of America, in the province of Nicaragua, and in the audience of Guatimala, feated on the lake Nicaragua, 70 miles from the S. Sea. It was taken twice by the French buccaneers, and pillaged. The inhabitants carry on a great trade by means of the lake, which communicates with the N. Sea. W. Long. 85. 10. N. Lat. 11. 8.

Granada, New, a province of South America, in Terra Firma, about 75 miles in length, and as much in breadth. It is bounded on the north by Carthagena and St Martha, on the eaft by Venezuela, on the fouth by Popayan, and on the weft by Darien. It contains mines of gold, copper, and iron; horfes, mules, good paftures, corn, and fruits. It belongs. to the Spaniards, and Santa-Fe-de-Bagota is the capital town.

GRANADILLOES, the name of fome iflands of the Caribbees, in America, having St Vincent to the north and Granada to the fouth. They are fo inconfiderable that they are quite neglected; but were ceded to England by the treaty of peace in 1763 .

GRANADIER, a foldier armed with a fword, a firelock, a bayonet, and a pouch full of hand-granadoes. They wear high caps, are generally the talleft and brikeft fellows, and are always the firft upon all attacks.

Every battalion of foot has generally a company of granadiers belonging to it; or elfe four or five granadiers belong to each company of the battalion, which, on occafion, are drawn out, and form a company of themfelves. Thefe always take the right of the battalion.

GRANADO or Grenade, in the art of var, a hollow ball or thell of iron or other metal, of about $2 \frac{1}{2}$ inches,diameter, which being filled with fine powder, is fet on fire by means of a fmall fufe driven into the fufe-hole, made of well-feafoned beech-wood', and thrown by the grenadiers into thofe places where the men ftand thick, particularly into the trenches and other lodgements made by the enemy. As foon as the compolition within the fufe gets to the powder in the grenado, it burfts into many pieces, greatly to the damage of all who happen to be in its way. Granadoes were invented about the year 1594. The author of the Military Dictionary has the followingremark on the: ufe of granadoes. "Grenades have unaccountably funk into difufe; but $I$ an perfuaded there is. nom thing more proper than to have grenades to throw among the enemy who have jumped into the ditch. During the figge of Caffel under the Count de La. Lippe, in the gampaign of 5752 , a young engincer
in thed for the king; and being informed he was in the hall of the lions, entered it furioully, and found iefs defended by the Zegris and the Gomels, and in them. Abdali had the good fortune to efcape. The bodies of the beheaded Abencerrages were laid upon black cloth, and carried to the city. Muza, brother to Abdali, and who by his great actions had gained the favour of the people, feeing the Abencerrages were revenged, found means to appeafe them; and having learned that the king had taken refuge in a mofque near the mountain now called Saint Helena, went and brought him back to the caftle of the Alhambra. For feveral days nothing but fighs and groans were heard throughout the city. Abdali fhat himfelf up in the caftie, and refufed to fee the queen. Thofe who had accufed her of adultery, however, perfifted in their falfe accinfation, and faid, they would maintain, with arms in their hands, againft all who fhould contradict them, that the queen was guilty. The unhappy princels was imprifoned, and the day arriving on which he was to perilh by the hands of the executioner, when none among the Moors offering to defend her, the was adwifed to commit her caufe to fome Chriftian knights, who prefented themfelves at the time appointed, and conquered her falfe accufers, fo that the was immediately fet at liberty. The taking of Granada foon followed this combat; Muza and the Abencerrages having, it is faid, facilitated the conqueft of it by Ferdinand and Ifabella.

From the Alhambra you enter the Generalif by a low gate, which favoured the efcape of Abdali when Ferdinand took Granada. Generalif is faid to fignify , in Arabic, the houfe of love, of dance, of pleafure. It was built by a prince of the name of Omar, who was fo fond of mufic, that he retired to this palace, entirely to give himfelf up to that amufement. The Generalif is the moft pleafing fituation in the environs of Granada. It is built upon a very high mountain whence waters rufh from every fide, which efcape in torrents, and fall in beautiful cafcades in the courts, gardens, and halls of that ancient palace. The gardens form an amphitheatre, and are full of trees, venerable from their antiquity. Two cypreffes in particular are noted, called the Cypreffes of the queen, becaufe it was near them the perfidious Gomel impeached the virtuc of that princefs and the honour of the Abencerrages. Of this place, travellers obferve, that the writers of romances have never imagined a fcene equal to it.

Granada was formerly called lliberia, and founded, if we will believe fome writers, by Liberia, a great grand-daughter of Hercules, daughter of Hifpan, and wife to Hefperus, a Grecian prince, and brother to Atalanta. Others, who fupport their affertions by proofs to the full as fatisfactory, maintain that it was founded by Iberus, grandfon of Tubal, and that it took the name of Granada, or Garnata, from Nata the daughter of Liberia; this word being compofed of Gar (which in the language of the time firnified grot3o) and Nata; that is, "the grotto of Nata," becaufe that princefs ftudied aftrology and natural hiftory, and delighted in the country. It is certain that fuch a perion as Nata, or Natayde, exifted in the firftages of

## GRA

Granard, undertook to carry one of the outworks with a much Granary, finaller detachment than one which had been repulfed, and fucceeded with eafe from the ufe of grenades; which is a proof that they fhould not be neglected, either in the attack or defence of pofts."-The word Granado takes its rife from hence, that the fhell is filled with grains of powder, as a pomegranate is with kernels.

GRANARD, a borough, market, fair, and poft town in the county of Longford, province of Leinfter ; it gives title of earl to the family of Forbes; fituated 52 miles from Dublin, and about 16 north eaft of Longford. N. Lat. 53.44. W. Long. 7. 30. Here is a remarkable hill or mount, called the Moat of Granard, thought to be artificial, and a fite of a Danifh caftle or fort; which commands from its fummit a moft extenfive profpect into fix or feven adjoining counties. In this town have lately been given annual prizes to the beft performers on the Irifh harp. Granard has a barrack for a company of foot; and returns two members to parliament ; patronage in the families of Macartney and Greville. Fairs held 3d May and ift October. This place takes its name from Grianard, or "t the height of the fun," and was formerly the refidence of the chiefs of north Teffia. It is fometimes written Grenard.

GRANARY, a building to lay or fore corn in, especially that defigned to be kept a confiderable time.

Sir Henry Wotton advifes to make it look towards the north, becaufe that quarter is the cooleft and moft remperate. Mr Worlidge obferves, that the beft granaries are built of brick, with quarters of timber wronght in the infide, to which the boards may be nailed, with which the infide of the granary muft be lined fo clofe to the bricks, that there may not be any room left for vermin to fhelter themfelves. There may be many ftories one above another, which fhould be near the one to the other; becaufe the fhallower the corn lies, it is the better; and more eafily turned.

The two great cautions to be obferved in the erecting of granaries are, to make them fufficiently ftrong, and to expofe them to the moft drying winds. The ordering of the corn in many parts of England, particularly in Kent, is thus : To feparate it from dult and other impurities after it is thrafhed, they tofs it with thovels from one end to the other of a long and large room; the lighter fubftances fall down in the middle of the room, and the corn only is carried from fide to fide, or end to end of it. After this they fereen the corn, and then bringing it into the granaries, it is fpread about half a foot thick, and turned from time to time about twice in a week; once a week sley allo repeat the fcreening it. This fort of management they continue about two months, and after that they lay it a foot thick for two months more; and in thistime they turn it once a week, or twice if the feafon be damp, and now and then fcreen it again. After about five or fix months they raife it to two feet thicknefs in the heaps, and then they turn it once or twice in a month, and freen it now and then. After a year, they lay it two and a half or three feet deep, and turn it once in three weeks or a month, and fcreen it proportionably. When it has lain two years or more; they tarn it once in two months, and fcreen it once a quarter; and how long foever it is kept, the oftener the tarn-
ing and freening is repeated, the better the grain will Granary. be found to keep.-It is proper to leave an area of a yard wide on every fide of the heap of corn, and other empty fpaces, into which they turn and tofs the corn. as often as they find occafion. In Kent they make two fquare holes at each end of the floor, and one round in the middle, by means of which they throw the corn out of the upper into the lower rooms, and fo up again, to turn and air it the better. Their fcreens are made with two partitions, to feparate the duft from the corn, which falls into a bag, and when fufficiently full this is thrown away, the pure and good corn remaining behind. Corn has by thefe means been kept in granaries 30 years; and it is obferved, that the longer it is kept the more flower it yields in proportion to the corn, and the purer and whiter the bread is, the fuperfluous humidity only evaporating in the keeping. At Zurich in Swifferland, they keep corn 80 years, or longer, by the fame fort of me-: thods.

The public granaries at Dantzick are feven, eight, or nine ftories high, having a funnel in the midft of every floor to let down the corn from one to another. They are built fo fecurely, that though every way furrounded with water the corn contracts no damp, and the veffels have the convenience of coming up to the walls for their lading. The Ruflians preferve their corn in fubterranean granaries of the figure of a fugarloaf, wide below and narrow at top: the fides are well plaftered, and the top covered with ftones. They are very careful to have the corn well dried bcfore it is laid into thefe ftorehoufes, and often dry it by means of ovens; the fummer dry weather being too fhort to effect it fufficiently.-Dantzick is the grand ftorehoufe or repofitory of all the fruitful kingdom of Poland. The wheat, barley, and rye, of a great part of the country, are there laid up in parcels of 20,30 , or 60 lafts in a chamber, according to the fize of the room; and this they keep turning every day or two, to keep it fweet and fit for flipping. A thunder ftorm has fometimes been of very terrible confequences to thefe ftores. All the corn of the growth of former years having been found fo much altered by one night's thunder, that though over night it was dry, fit for fhipping or keeping, and proper for ufes of any fort, yet in the morning it was found clammy and fticking. In this cafe there is no remedy but the turning of all fuch corn three or four times a day for two months or longer; in which time it will fometimes come to itfelf, though fometimes not. This effect of thunder and lightning is only obferved to take place in fuch corn as is not a year old, or has not fweated thoroughly in the ftraw before it was threfhed out. The latter inconvenience is eafily prevented by a timely care; but as to the former, all that can be done is carefully to examine all ftores of the laft year's corn after every thunder ftorm, that if any of this have been fo affected, it may be cured in time; for a neglect of turning will certainly atterly deftroy it.

According to Vitruvins's rules, a granary hould always be at the top of a houfe, and have its openings only to the north or eaft, that the corn may not be expofed to the damp winds from the fouth and weft, which are very deftructive to it ; whereas the contrary ones are very necelfary and wholefome to it, ferving

## GRA

Granary. to cool and dry it from all external humidity, from whatever caufe. There muft alfo be openings in the roof to be fet open in dry weather, partly to let in frefh air, and partly to let out the warm eflluvia which are often emitted by the corn. The covering of the roofs fhould always be of tiles, becanie in the worft feafons, when the other openings cannot be fafe, there will always be a confiderable inlet for frefh air, and a way out for the vapours by their joinings, which are never clofe. If there happen to be any windows to the fouth, great care muft be taken to fhat them up in moift weather, and in the time of the hot fouthern winds. There niuft never be a cellar, or any other damp place under a granary, nor fhould it ever be built over ftables; for in cither of thefe cafes the corn will certainly fuffer by the vapours and be made damp in one, and ill-tafted in the other.
M. Du Hamel and Dr Hales recommend various contrivances for ventilating or blowing frefh air through corn laid up in granaries or flips, in order to preferve it fweet and dry, and to prevent its being devoured by weevils or other infects. This may be done by nailing wooden bars or laths on the floor of the granary about an inch diftant from each other, when they are covered with hair-cloth only; or at the diftance of two or three inches, when coarfe wire-work, or bafket-work of ofier is laid under the hair-cloth, or when an iron plate full of holes is laid upon them. Thefe laths may be laid acrofs other laths, nailed at the diftance of 15 inches, and two or more deep, that there may be a free paflage for the air under them. The under laths muft come about fix inches fhort of the wall of the granary at one end of them; on which end a board is to be fet edgeways, and floping againft the wall: by this difpofition a large air-pipe is formed. which having an open communication with all the interflices between and under the bars, will admit the paffage of air below forcibly through a hole at the extremity of it, into all the corn in the granary, that will confequently carry off the moift extalations of the corn. The ventilators for fupplying frefh air may be fixed againft the wall, on the infide or outfide of the granary, or under the floor, or in the cieling; but wherever they are fixed, the handle of the lever that works them muft be out of the granary, otherwife the perfon who works them would be in danger of fuffocation, when the corn is fumed with burning brimftone, as is fometimes done for deftroying weevils. Small moveable ventilators will anfwer the purpofe for ventilating corn in large bins in granaries, and may be eafily moved from one bin to another. If the granary or corn fhip be very long, the main air-pipe may pafs lengthwife along the middle of it, and convey air, on both fides, under the corn. In large granaries, large double ventilators, laid on each other, may be fixed at the middle and near the top of the granary, that they may be worked by a wind-mill fixed on the roof of the building, or by a water-mill. The air is to be conveyed from the ventilators through a large trunk or trunks, reaching down through the feveral floors to the bottom of the granary, with branching trunks to each floor, by medins of which the air may be made to pafs into a large trunk along the adjoining crofs walls: from thefe trunks feveral leffer trunks, about four inches wide, are to brauch off, at the diftance of three or

## $103] \quad G R A$

four feet from each other, which are to reach through Granary. the whole length of the granary, and their farther
 to be left open at the four joinings of the boards, where they are nailed together, that the air may pafs through them into the corn. In fome of thefe leffer trunks there may be fliding fhutters, in order to ftop the paffage of the air through thofe trunks which are not covered with corn; or to ventilate one part of the granary more brifkly than others, as there may be occafion. There muft alfo be wooden flutters, hang on hinges at their upper part, fo as to fhut clofe of themfelves; thefe muft be fixed to the openings in the walls of the granary on their outfide: by thefe means they will readily open to give a free paffage for the ventilating air, which afcends through the corn, to pafs off, but will inftantly flut when the ventilation ceafes, and thereby prevent any dampnefs of the external air from entering: to prevent this, the ventilation fhould be made only in the middle of dry days, unlefs the corn, when firft put in, is cold and damp.

In leffer granaries, where the ventilators muft be worked by hand, if thefe granaries ftand on ftaddles, fo as to have their loweft floor at fone diftance from the ground, the ventilators may be fixed under the loweft floor, between the ftaddles, fo as to be worked by men flanding on the ground, without or within the granary. A very commodious and cheap ventilator may be made for fmall granaries, by making a ventilator of the door of the granary; which may be eafily done by miaking a circular fcreen, of the fize of a quarter of a circle, behind the door: but in order to this, the door muft be open, not inwards bat outwards of the graniary, fo that as it falls back, it may be worked to and fro in the fcreen; which muft be exactly adapted to it in all parts of the circular fide of the fcreen as well as at the top and bottom. But there muft be a ftop at about eight or ten inches diftance fiom the wall, to prevent the door's falling back farther; that there may be room for a valve in the fcreen to fupply it with air ; which air will be driven in by the door, through a hole made in the wall near the floor, into the main air-trunk, in which there muft. be another valve over the hole in the wall, to prevent the return of the air.
To deftroy weevils and other infects with wobich $\mathrm{Gram}_{\mathrm{R}}$ naries are apt to be infeffed. - The prefervation of grain from the ravages of infects may he beft effected by timely and frequent fcreening, and ventilation; as. little or no inconvenience will follow corn or malt lodged dry, but what evidently refults from a neglect of the fe precautions. For, whether the obvious damage arife from the weevil, the moth, or the beetle, that damage has ceafed at the time the vermin make their appearance under either of thefe feecies, they being, when in this laft fate of exiftence, only propagators of their refpective kinds of vermiculi; which, while they continue in that form, do the mifchief.
In this laft, or infect flate, they eat little, their principal bulinefs being to depolit their ova (egg), which unerring inftinct prompts then to do where large collections of grain furnifh food for their fucceffors while in a vermicular ftatc. It is therefore the bufinefs of induftry toprevent future generations of the fe ravagers, by deftroying the eggs previous to their hatcling; and

## GRA $\quad \begin{array}{lll}104 & \text { GRA }\end{array}$

iranary. this is beft accomplithed by frequent fcreening, and expofiure to draughts of wind or freih air. By frequently ftirring the grain, the cohefion of their ova is broken, and the nidus of thofe minure worms is deftroyed, which on hatching collect togerfer, and fpin or weave numerons nefts of a cobweb-fike fubftance for their fecurity. To thefe nefts they attach, by an infinity of fmall threads, many grains of corn together, firt for their protection, and then for their food. When their habitations are broken and feparated by the fcreeni, they fall through its fmallinterfices, and may be eafily removed from the granary with the duft. Thofe that efcape an early fcreening will be deftroyed by fubfequent ones, while the grain is but little injured; and the corn will acquire thereby a fuperior purity. But by inattention to this, and fometimes by receiving grain already infected iito the granary, thefe vermin, particularly the weevit, will in a fhort time fpread them felvès in that fate every where upon its furface, and darken even the walls by their number. Under fuch circumftances $a$ hen or hens, with new hatched chickens, if turned on the heap, will traverfe, without feeding (or very fiparingly fo) on the corn, wherever they fpread; and are feemingly infatiable in the purfuit of thefe infects. When the number is reduced within reach, a hen will fly up againft the walls; and brufh them down with her wings, while her chickens feize them with the greateft avidity. This being repeated as often as they want food, the whole fpecies will in a day or two be dentroyed. Of the phalæna (moth), and the fmall bectle, they feem equally voracious : on which account they may be deemed the moft ufeful inftruments in nature for eradicating thefe noxious and deftructive vermin.

GRANATE, or Garnet : a genus of foffils ranked among the filiceous earths; bur, according to M . Magellan, analogous to gems, all of them being compofed of the filiceous, argillaceous, and calcareous earths, with a greater or lefs proportion of iron. The opaque and black garnets contain about a fifth part of iron; but the diaphanous ones only $\frac{7}{5}$ th, according to Bergman. The garnets, properly fo called, contain a greater quantity of filiceons earth than the fhirls, and both are now juftly ranked with the filiceous earths. The general properties of the garnet, according to Cronftedt, arc as follow: I. It is more fufible as it contains lefs metallic matter, and is more tranfparent or glaffy in its texture. 2. Mixed with falt of kelp, it may, on a piece of charcoal, be converted into glafs by the blow-pipe, which cannot be done with a fint. 3. The moft tranfparent garnet may, without any addition, be brought to a black opaque flag by the fame means. 4. It is never, as far as is hitherto known, found pure, or without fome mixture of metal, efipccially iron, which may be extracted by thie common methods. 5. The garnet matter, during the cryftallization, has either been formed in fmall detached quantities, or clfe has had the power of fhooting into cryftals, though clofely confined in different fubfances: fince garnets are generally found difperfed in other folid ftones, and oftentimes in the harder ones, fuch as quartz and chert. Fabroni informs us, that the garnet is eafily melted by means of borax or the vegetable alkali. Its fpecific gravity is greater than that of the precious ftones; viz. from 3600, and even from 4400
to 5000. According to Brunich, moft of the garnets Granary; ftrike fire with ftecl.

Cronftedt obferves, that the metallic calces, when mixed with other earthy fubftances, make great alteration in their fufibility ; iron, for inftance, in the argillaceous and micaceous earths, renders them fufible, tho ${ }^{\circ}$ otherwife they are not fo. Hence there may be fome reafons for confidering the garnet as a quartz impregnated with iron; yet on the whole he thinks it will be better to call the garnet a fone of a different order, until we have experiments fufficient to warrant us to reduce the number of earths. The garnet carth is never found but in an indurated ftate; and is divided into the garnet properly fo called, and Giirl or cockle ; though this perhaps is owing more to the figure of their cryftals than any thing elfe. The fpecies are,
r. The granatus, or coarfe-grained garnet ; a heavy hard ftone, cryftallizing in form of polygonal balls, moftly of a red or reddifh brown colour. It is found of a reddifh brown and whitifi or pale yellow, in different parts of Sweden.
2. The granatus cryftallizatus, or cryftallized garnet, is reckoned among the precions fones, but varying in its colour and form of its cryftal more than any of them. Sometimes it is of a deepand dark red colour; fometimes, yellowiih or purplifh; fometimes brown, black, or opaque. It is inferior both in luftre and hardnefs to the other gemis, yielding to the file, although it will ftrike fire with fteel. The cryftals are fometimes irregular, but frequently affume rhomboidal, tetradecahedral, and almoft all other regular forms.

WaHerius makes the fpecific gravity of the garnet from 3600 to 3900 , and even 4400 ; Briffen makes it 4100 ; and Cotes fays that the garnets of Bohemia are 4360, thofe of Sweden being 3978. The molt efteemed is the Syrian gamet ; which is of a fine red, inclining to purple, very tranfparent; but lefs beautiful than the oriental amethyft. This, according to Magellan, is the amethyftizontas of Pliny; and is found in Syria, Calcutta, Cananor, Camboya, and Ethiopia. The foranus of the ancients was another kind of garnet of 'a red colour inclining to yellow, called vermeille by the French, and giacinto guarnacino by the Italians; the former having the name of rubino di rocca among the laft mentioned people. The name Soranus comes from Sorian or Surian, a town of Pegu, from whence thefe gems are brought.
Sometimes the garnets have a yellow colour, in which cafe they obtain the name of byacinths. Like other gems, they are divided into oriental and occidental; but this means in fact no more than more or $\mathrm{l} / \mathrm{f}$ valuable ; the fineft fones being always called oriental, wherever they come from. Some very fine ones are found in Bohemia ; they are alfo met with in Hungary, at Pyrna in Silefia, S. Sapho in the canton of Berne in Switzerland, in Spain, and in Norway. Their colour is fuppofed to proceed from iron; and, according to M. Sauffure, even the fineft oriental garnets attract the magnetic needle at a fmall diftance. In the focus of a good burning-glafs the garnet melts into a brown mafs, which is attracted by the magnet ; which fhows that iron enters into its compofition in a confiderable proportion. Some garnets, however, contain a little gold; and fome, called by the Germans zingraupen, contain tin. M. Magellan is of opinion, that

## GRA [105] GRA

Granate t]: lapis alabandicus of Pliny, andanotiner gem which he mentions of a deep purpic, were boh true garnets.
3. The cockle or hirl. See Cockle.

The garnets abound fo much with iron that they are fomecimes worked with profir as ures of that metal; in which cafe no notice is taken of the natural character of the fone, in the fame manner as is done with clays and jafpers that contain iron; for in thefe the quantity of metal is gradually augmented, until at laft they acquire the appearance of iron itfelf. The greateft part of this genus, however, contain only from fix to twelve per cent. of iron, which is too poor to be worked any where with advantage as an ore of that metal. When any of the garnet kind are to be tried for the metal they contain, the iron ought to be melted out of them by the common procefs; and if the garnet at the fame time contains tin or lead, thefe will likewife be included in the iron. They may be extracted out of it, however, by a heat gradually augmented; the lead and tis fweating out in form of drops, though always fomewhat mixed with iron. None of the garnet kind have yet been found in the form of an earth properly fo called; though at Swappawari in Lapland, there is found a bole which has the fame figure with the garnet; and the horneblende of the Swedes, which is fomewhat harder than this bole, has often the appearance of a cockle.

## Granate-Pafte. See Garnet.

GRAND, a term rather French than Englifh, tho' afed on many occafions in our language. It has the fame import with great, being formed of the Latin grandis. In this fenfe we fay, the grand-mafter of an order, the grand-mafter of Malta, of the free-mafons, \&c. So alfo the grand-fignor, the grand-vifir, \&c. grand-father, grand-mother, \&c.

In the French polity and cuftoms there are feveral officers thus denominated, which we frequently retain in Englih; as grand almoner, grand ecuyer, grand chambellan, grand voyer, \&c.
$G_{\text {RAND-Afize. }}$ See Assise.
Grand Diftrefs (diftrictio magna), in Englith law, a writ of diftreis, fo called on account of its extent, which reaches to all the goods and chattels of the party within the county. This writ lies in two cafes : either when the tenant or defendant is attached and appears not, but makes default; or where the tenant or defendant hath once appeared, and after makes default. On fuch occafions, this writ lies by common law, in lieu of a petit cape.

Grind Guflo, among painters, a term ufed to exprefs that there is fomething in the picture very great and extraordinary, calculated to furprife, pleafe, and inftruct.-Where this is found, they fay, the painter was a man of grand gufto; and they ufe the words fublime and marvellous, when they fpeak of a picture, in much the fame fenfe.

Grand Fury, larceny, fergeanty, \&c. See Jury, \&c.
GRANDEE, is underftood of a lord of the firf rank or prime quality.

In Spain, theterm grandees is ufed abfolutely to denote the prime lords of the court, to whom the king has once given leave to be covered in his prefence: there are fome grandees for life only; made by the king's faying fimply, Be covered. Others are grandees Vol. VIII.
by defcent; made by the king's faying, Be covered Grandeurfor thylelf and heirs. Thefe laft are reputed far above the former.
i here are fome who bave three or four grandeehips in their family.

GRANDEUR and Sublimity. Thefe terins Doublefighave a double fignification : they commonly fignify the nification. quality or circumftance in obje ${ }^{\text {a }}$ s by which the emotions of grandeur and fublimity are produced ; fometimes the emotions themfelves.

In handing the prefent fubject, it is neceffary that the impreffion made on the nind by the magnitude of an object, abftracting from its other qualities, fhould be afcertained. And becaufe abftraction is a mental operatiou of fome difficulty, the fafeft method of jadging is, to choofe a plain ol.ject that is neither beautiful nor deformed, if fuch a one can be found The plaineft that occurs, is a hage mafs of rubbilh, the ruins perhaps of fome extenfive building; or a large heap of ftones, fuch as are collected together for keeping ia memory a battle or other remarkable event. Such an object, which in miniature would be perfectly indifferent, makes an impreffion by its magnitude, and appears agreeable. And fuppofing it folarge as to fill the eye, and to prevent the attention from wandering up. on other objects, the impreffion it makes will be fo mach the deeper. See Attention.

But though a plain ohject of that kind be agreeable, it is not termed grand: it is not entitled to that character, unlefs, together with its fize, it be polfeffed of other qualities that contribute to beauty, fach as regularity, proportion, order, or colour : and according to the number of fuch qualities combined with magniude, it is more or lefs grand. Thus St Peter's church at Rome, the great pyramid of Egypt, the Alps towering above the clouds, a great arm of the fea, and above all a clear and ferene $\mathfrak{k y}$, are grand; becaufe, befide their fize, they are beautiful in an eminent degree. On the other hand, an overgrown whale, having adifagreeable appearance, is not grand. A large builuing agreeablč by its regularity and proportions, is grand; and yet a much larger building deftitute of regularity, has not the lealt tincture of grandeur. A fingle regiment in battly array, makes a grand appearance; which the furrounding crowd does not, though perhaps ten for one in number. And aregiment where the men are all in one livery, and the horfes of one colour, makes a grander appearance, and confequently ftrikes more terror, than where there is confution of colour and drefs. Thus greatnefs or magnitude is the circumftance that Grandeu: diftinguifhes grandeur from beauty : agrecablenefs is diftinguifhthe gents, of which beauty and grandeur are fpecies. ed from

The emotion of grandeur, duly examined, will be beauiy. found an additional proof of the foregoing doctrine. That this emotion is pleafant in a high degree, requires no other evidence but once to have feen a grand object: and if an emotion of grandeur be pleafant, its canfe or object, as obferved above; muft infallibly be agreeable in proportion.

- The qualities of grandeur and beanty are not more diftinct, than the emotions are which thefe qualities produce in a fpeeator. It is obferved in the article Beauty, that all the various emotions of beauty have one common charafter, that of fweetnefs and gaiety. The enotion of grandeur has a different cha.
racter:

4
Qualitics contributing to grandeur.

Brandeur racter: a large objett that is agreeable, occupies the and Sublinity.

3 Sernands not ftrict regularity. whole attention, and fwells the heart into a vivid emotion, which, though extremely pleafant, is rather ferious than gay. And this affords a good renfon for diftinguifhing in language the different emotions. The emotions raifed by colour, by regularity, by proportion, and by order, have fuch a refemblance to each other, as readily to come under one general term, viz. the emotion of beauty; but the emotion of grandeur is fo different from thefe mentioned, as to merit a peculiar name.

Thongh regularity, proportion, order and colour, coneribute to grandeur as well as to beauty, yet thefe qualities are not by far fo effential to the former as to the latter. To make out that propofition, fome preliminaries are requifite. In the firft place, the mind, not being totally occupied with a fmall object, can give its aitention at the fame time to every minute part; but in a great or extenfive object, the mind, being totally occupied with the capital and ftriking parts, has no attention left for thofe that are little or indifferent. In the next place, two fimilar objects appear not fimilar when viewed at different diftances : the fimilar parts of a very large object, cannot be feen but at different ciftances; and for that reafon, its regularity, and the proportion of its parts, are in fome meafure loft to the eye; neither are the irregularities of a very large objeet fo confpicuoas as of one that is fmall. Hence it Is, that a large object is not fo agreeable by its regularity, as a fmall object; nor fo difagreeable by its irregularities.

Thefe confiderations make it evident, that grandeur is fatisfied with a lefs degree of regularity, and of the other qualities mentioned, than is requifite for beatty; which may be illuftrated by the following experimeur. Approaching to a fmall conical hill, we take an accurate furvey of every part, and are fenfible of the nighteft deviation from regularity and proportion. Suppoling the hili to be conliderably enlarged, fo as to make us lefs fenfible of its regularity, it will upon that account appear lefs beautiful. It will not, however, appear lefs agreeable, becaufe fome fight emotion of grandeur comes in place of what is loft in beauty. And at laft, when the hill is enlarged to a great mountain, the fmall degree of beauty that is left, is funk in its grandeur. Hence it is, that a towering hill is delightful, if it have but the flighteft refemblance of a cone; and a chain of mountains not lefs fo, though deficient in the accuracy of order and proportion. We require a fmall furface to be fmooth; but in an extenfive plain, condiderable in equalities are overlooked. In a word, regularity, proportion, order, and colour, contribute to grandeur as well as to beauty; but with a remarkable difference, that in paffing from fmall to great, they are not required in the fame degree of perfection. This remark ferves to explain the extreme delight we have in viewing the face of nature, when fufficiently enriched and diverfified with objects. The bulk of the objects in a natural landfcape are beautiful, and fome of them grand: a flowing river, a fpreading oak, a round hill, an extended plain, are delightful; and even a rugged rock, or barren heath, though in themfelves difagreeable, contribute by contraft to the beauty of the whole; joining to thefe the verdure of the fields, the mixture of light and fhade,
and the fublime canopy fpread over all ; it will not Grandeur appear wonderful, that fo extenfive a group of fplen- and did objects flould fwell the heart to its utmon bounds, $\underbrace{\text { Sublimity. }}$ and raife the frongef emotion of grandeur. The fpectator is confcious of an enthufiafm which cannot bear confinement, nor the ftrietnefs of regularity and order : he loves to range at large ; and is fo enchanted with magnificent objects, as to overlook flight beauties or deformities.

The fame obfervarion is applicable in fome meafure sublimity: to works of art. In a fmall building, the fighteft irregularity is difagreeable : but in a magnificent palace, or a large Gothic church, irregularities are lefs regarded. In an epic poem, we pardon many negligences that would not be permitted in a fonnet or epigram. Notwithftanding fuch exceptions, it may be juftly laid down for a rule, That in works of art, order and regularity ought to be governing principles; and hence the obrervation of Longinus, "In works " of art we have regard to exact proportion; in thofe " of nature, to grandeur and magnificence""

The fame reflections are in a good meafure applicable to fublimity: particularly that, like grandeur, it is a fpecies of agreeablenefs; that a beautiful object placed high, appearing more agreeable than formerly, produces in the fpectator a new emotion, termed the emotion of fublimity; and that the perfection of order, regularity, and proportion, is lefs required in: objects placed high, or at a diftauce, than at hand.

The pleafant emotion raifed by large objects, has not elcaped the poets :

## __ He doth beftride the narrow world

Like a Colloffus: and we petty men
Walk under his huge legs.

The defcription of Paradife in the fourth book of Paradifè

## $G R A \quad[107]$ G A

Grandeur Paradife $L_{0 f}$, is a fine illuftration of the inpreffion and made by elevated objects :
tublimity; So on he fares, and to the border comes
Of Eden, where delicious Paradife,
Now nearer, crowns with her inclefure green,
As'with a rural mound, the champain head
With a fleep wildernefs; whofe hairy fides
Of thicket overgrown, grotefque and wild,
Accefs deny'd; and over head up grew
Infuperable height of loftieft thade,
Cedar, and pine, and fir, and branching palm,
A fylvan fcene; and as the ranks afcend,
Shade above fhade, a woordy theatre
Of ftatelieft view. Yet higher than their tops
The verd'rous wall of Paradife up fprung;
Which to our general fire gave profpect large
Into his nether empire, neighb'ring round.
And higher than that wall a circling row
Of goodiceft trees, loaden with faireft fruit,
Bloffoms and fruits at once of $g$ :lden hue,
Appear'd, with gay enamell'd cooours mix'd. l. If I .
Though a grand object is agreeable, we muft not infer that a little object is difagreeable; which would be unhappy for man, confidering that he is furrounded with fo many objeets of that kind. The fame holds with refpect to place: a body placed high is agreeable; but the fame body placed low, is not by that ciroumfance rendered difagreeable. Littlenefs and lownefs of place are precifely fimilar in the following particular, that they neither give pleafure nor pain. And in this may vifibly be difcovered peculiar attention in fitting the internal conftitution of man to his external circumfances. Were littlenefs and lownefs of place agreeable, greatnefs and clevation could not be fo: were littlenefs and lownefs of place difagreeable, they would occafion uninterrupted uneafinefs.'

The difference between great and little with refpect to agreeablenefs, is remarkably felt in a feries when -we pafs gradually from the one extreme to the other. A mental progrefs from the capital to the kingdom, from that to Europe- to the whole earth-to the planetary fyftem, to the univerfe, is extremely pleafant: the heart fwells, and the mind is dilated at every ftep. The returning in an oppofite direction is not pofitively painful, though our pleafure leffens at every ftep, till it vanifh into indifference: fuch a progrefs may fometimes produce pleafore of a different fort, which arifes from taking a narrower and narrower infpection. The fame obfervation holds in a progrefs upward and downward. Afcent is pleafant becaufe it elevates us ; but defcent is never painful: it is for the moft part pleafant from a different caule, that it is according to the order of nature. The fall of a fone from any height, is extremely agrecable by its accelerated motion. We feel it pleafant to defcend from a mountain, becaufe the defcent is natural and eafy. Neither is looking downward painful ; on the contrary, to look down upon objects, makes part of the pleafure of elevation: looking down becomes then only painful when the object is fo far below as to create dizzinefs; and even when that is the cafe, we feel a fort of pleafure mixed with the pain: witnefs Shakefpearest defeription of Bover cliffs:

- How fearful

And dizzy 'tis, to caft one's eye fo low!
The crows and choughs, that wing the midway air,
Show fcarce fo grofs as beetles. Half-way down
Hangs one that gathers famphire; dreadful trade!
Methinks he feems no bigger than his head.

The f fhermen that walk upon the beach
Appear like mice; and yon tall anchoring back
Dinninif'd to her cook; her cock, a buoy
Almoft too fmall for fight The murm'ring furge,
That on the unnumber'didle pebbles chafes,
Cannot be heard fo high. I'll look no more,
Left my brain turn, and the deficient fight
Topple down headlong. King Lear, act 4.fe. 6.

Grandeur

A remark is made above, that the emotions of grandeur and fublimity are nearly allied. And hence it is, that the one term is frequently put for the other: an increafing feries of numbers, for example, producing an emotion fimilar to that of mounting upward, is commonly termed an afcending feries: a feries of numbers gradually decreafing, producing an emotion fimilar to that of going downward, is commonly termed a defcending feries: we talk familiarly of going up to the capital, and of going down to the country : from a leffer kingdom we talk of going $u p$ to a greater ; whence the anabafis in the Greek language, when one travels from Greece to Perfia. We difcover the fame way of fpeaking in the language even of Japan; and its univerfality proves it the offspriag of a natural feeling.
The foregoing obfervation leads us to confider grandeur and fublimity in a figurative fenfe, and as applicable to the fine arts. Hitherto thefe terms have been taken in their proper fenfe as applicable to objects of fight only : and it was of importance to beflow fome pains upon that article; becaufe, generally fpeaking, the figurative fenfe of a word is derived from its proper fenfe, which holds remarkably at prefent. Beauty, in its original fignification, is confined to ob. jects of fight; but as many other objects, intelleftual as well as moral, raife emotions refembling that of beauty, the refemblance of the effects prompts us to extend the term beauty to thefe objects. This equally accounts for the terms.grandeur and fublimity taken in a figurative fenfe. Every emotion, from whatever caufe proceeding, that refembles an emotion of grandeur or elevation, is called by the fame name : thos generofity is faid to be an elevated emoion, as well as great courage ; and that firmnefs of foul which is fuperior to misfortunes obtains the peculiar nane of magnanimity. On the other hand, every emotion that contracts the mind, and fixeth it upon things trivial or of no importance, is termed low, by its refemblance to an emotion produced by a little or low object of fight: thus an appetite for trifling amurements is called a lows tafte. The fame terms are applied to characters and actions : we talk familiarly of an elevated genius, of great man, and equally fo of litilenefs of mind: fome actions are great and elevated, and others are litlle and groveling. Sentiments, and even exprefions, are characterifed in the fame manner : an expreffion or fentiment that raifes the mind is denominated great or clevated; and hence the SUBLIME in poetry. In fuch figurative terms, we lofe the difincion between great and elerrated in their proper fenfe; for the refemblance is not fo entire as to preferve thefe terms diftinet in their figurative application. We carry this figure fill farther. Elevation, in its proper fenfe, imports fuperiority of place; and lownefs, inferiority of place: and hence a man of fuperior talents, of fipherior rank; of inferior parts, of inferior tafte, and fuch like. The veneration we have for ouranceftors, and fortheancients in general, being fimilar to the emotion produced by an

## G R A

Grandeur and
elevated object of fight, juftifiesthe figurative exprefion of the ancients being raifed above us, or poffefling a fuperior place. The notes of the gamut, proceeding regularly from the blunter or groffer founds to the more acute and pjercing, produce in the hearer a feeling fomewhat dimilar to what is produced by mountingup. ward ; and this gives occafion to the fgurative expreffions a high note, a low note.
Such is the refemblance in feeling between real and figurative grandenr, that among the nations on the eaft coalt of Africa, who are directed purely by nature, the officers of ftate are, with refpect to rank, diftinguighed by the length of the batoon each carries in his hand; and in Japan, princes and great lords Show their rank by the length and fize of their fedanpoles. Again, it is a rule in painting, that figures of a fmall fize are proper for grotefque pieces; but that an hiftorical fubject, grand and impertant, requires figures as great as the life. The refemblance of thefe feelings is in reality fo frong, that elevation in a figurative fenfe is obferved to have the fame effect, even externally, with real clevation :
K. Henry:. This day is call'd the feaft of Crifpian. He that outlives this day and comes fafe home,
Will fand a-tip toe when this day is nam'd,
And roufe him at the name of Crifpian,

$$
H_{\text {Penry }} V, \text { act } 4, \mathrm{fc} ; 8 .
$$

The refemblance in fecling between realand figurative grandeur is humoroully illuftrated by Additon in
 method of making an hero is to clap a hage plame of feathers upon his head, which rifes fo high, that there is often a greater length from his chin to the top of his head than to the fole of his foot. One would belicve, that we thought a great man and a tall man the fane thing. As thefe fuperfloous ornaments upon the head make a great man, a princefs generally receives her grandeur from thofe additional incumbrances that fall into her tail: I mean the broad fweeping train that follows her in all her motions; and finds conftant employment for a boy who fands behind her to open and fpread it to advantage." The Scythians, impreffed with the fame of Alexander, were aftonifhed when they found him a little mąn.

A gradual progrefs from fmall to great is not lefs remarkable in figurative than inseal grandeur or elevation. Every one muft have obferved the delightful effect of a number of thoughts or fentiments, artfully difpofed like an afcending feries, and making imprelfions deeper and deeper: fuch difpofition of members in a period is termed a climax.

Within certain limits grandent and fublimity produce their ftrongeft effects, which leffen by excefs as well as by defect. This is remarkable in grandeur and fublimity taken in their proper fenfe; the grandeft emotion that can be raifed by a vifible object is where the object can be taken in at one view; if fo immenfe as not to be comprehended bat in parts, it
tends rather to diftract than fatisfy the mind (A) : in Grandear like manner, the ftrongeft emotion produced by elevation is where the object is feen diftinctly; a greater elevation leffens in appearance the object, till it vanifh out of light with its pleafant cmotions. The fame is equally remarkable in figurative grandeur and Figurative elevation; which fhall be handled together, becaufe, as grandeur. obferved above, they are fcarce dilinguifhable. Sentiments may be fo ftrained as to become obfcure, or to exceed the capacity of the human mind: againft fuch licence of imagination, every good writer will be upon his guard. And therefore it is of greater importance to obferve, that even the true fublime may be carried beyond that pitch which produces the higheft entertainment. We are undoubredly fufceptible of a greater elevation than can be infjired by human actions the moft heroic and magnanimous ; wituefs what we feel from Milton's defcription of fuperior beings: yet every man mult be fenigile of a more conftant and fweet elevation when the hiftory of his own fpecies is the fubject: he enjoys an elevation equal to that of the greatef hero, of an Alexander or a Cæfar, of a Brutas or an Epaminondas: he accompanies thefe heroes in their fublimeft fentiments and moft hazardous exploits, with a magnamity equal to theirs; and finds it no ftretch to preferve the fame tone of mind for hours together without linking. The cafe is not the fame in defcribing the actions or qualities of fuperior beings: the reader's imagination cannotkeep pace with that of the poet ; the mind, unable to fupport itfelf in a ftrained elevation, falls as from a height; and the fall is immoderate like the elevation : where that effect is not felr, it muft be prevented by fome obfcurity in the conception, which frequently attends the defcriptions of unknown objects. Hence the St Francifes, St Dominics, and other tutelary faints among the Roman Catholics. A mind mable to raife itfelf to the Supreme Being felf-exiftent and eternal, or to fupport itfelf in a frained elevation, finds itfelf more at eafe in ufing the interceffion of fome faint whofe piety and penances while on earth are fuppofed to have made him a favourite in heaven.

A frained elevation is attended with another inconvenience, that the author is apt to fall fuddenly as well as the reader; becanfe it is not a little difficult to defcend, fweetly and eafily, from fuch elevation to the ordinary tone of the fulject. The following paffage is a good illuftration of that obfervation : Sæpe etiam immenfun coelo venit agmen aquarum, Et foedam glomerant tempeftatem imbribus atris Conlectx ex alto nabes. Ruit arduis wther, Et pluvia ingenti lata lata boumque labores
Diluit. Inplentur foffe, et cava flumina crefcunt Cum fonifu, fervetque fretis fpirantibus aquor. Tpie Pater, media nimborum in nocte, corufca Fulmina molitur dextra. Quo maxuma motu Terra tremit : fugere Serie, et mortalia corda Per gentes humilis ftravit pavor. IIfe flagranti Aut Atho, aut Rhodopen, aut alta Ceraunia telo Dejicit : ingeminant Auffri, et detfifimus imber.

Firg. Georg. L. $x$.
(A) It is juftly obferved by Addifon, that perhaps a man would have been more anonifned with the ma. ju (tic air that appeared in one of Lyfippos's fatues of Alexander, though no bigger than the life, than he might have been with Mount Athos, bad it been cut into the figure of the hero, according to the propofal of Phidias, wibh a river in one hand and a city in the other. Speltat,r, $\mathrm{N}^{\circ} 415$.

## G R A <br> 109 ] GRA

Grandeur

In the defcription of a form, to figure Jupiter throwing down huge mountains with his thunderbolts, is hyperbolically fublime, if we may ufe the expreffion: the tone of mind produced by that image is is fo diftant from the tone produced by a thick hower of rain, that the fudden tranfition mult be unpleafant.
Objects of fight that are not remarkably great nor high, fcarce raife any emotion of grandeur or of fublimity: and the fame holds in other objects; for we often find the mind ronfed and animated; withont being carried to that height. This difference may be difcerned in many forts of mufic, as well as in fome mufical inftruments: a kettle-drum roufes, and a hautboy is animating ; but neither of them infpires an emotion of fublimity: revenge animates the mind in a conliderable degree ; but it never prodaceth an emotion that can be termed grinat or fubleme ; and perhaps no difagreeable paffion ever has that effect.

No defire is inore univerfal than to be exalted and honoured; and upon that account, chiefly, are we ambitious of power, riches, titles, fame, which would fuddenly lofe their relifh did they not raile us above others, and command fubmiffion and deference : and it may be thought, that our attachment to things grand and lofty, proceeds from their connection with our favourite pallion. This connection has undonbtedIy an effect ; but that the preference given to things grand and lofty muft have a deeper root in human nature, will appear from confidering, that many beflow their time upon low and trifing amufements, without having the leaft tincture of this favourite paffion: yet thefe very perfons talk the fame language with the reft of mankind; and prefer the more elevated pleafures: they acknowledge a more refined tafte, and are alhamed of their own as low and groveling. This fentiment, conftant and univerfal, muft be the work of nature; and it plainly indicates an original attach ment in hunan nature to every object that elevates the mind : fome men may have a greater relifh for an object not of the higheit rank; but they are confcious of the preference given by mankind in general to things grand and fublime, and they are fenfible that their peculiar tafte ought to yield to the general tafte.

What is faid above fuggets a capital rule for reaching the fablime in fuch works of art as are fufcepti-

10
Grandeur © manner.

- Spectator

No. 415 . ble of it ; and that is, to prefent thofe parts or circumftances only which make the greateft figure, keeping out of view every thing low or trivial; for the mind, elevated by an important object, cannot, without reluctance, be forced down to beftow any fhare of its attention upon triffes. Such judicious felection of capital circumftances, is by an eminent critic fyled grandeur of manner*. In none of the fine arts is there fo great fcope for that rule as in poetry; which, by that means, enjoysa remarkable power of beftowing upon objects and events an air of grandeur : when we are fpectators, every minute object prefents itfelf in its order : but in deferibing at fecond hand, thefe are laid afide, and the capital objects are brought clofe rogether. A judicions tate in thus felecting the mott interefting incilents, to give them an uxited force, accounts for a fagt that may appear furprifing; which is, that we are more moved by fuirited nartative at
fecond hand, than by being \{pectators of the event it- Grandeur felf, in all its circumftances.

Longinus texemplifies the foregoing rule by a com- $\underbrace{\text { Sublimity. }}$ parifon of two paffages:

Ye pow'rs, what madnefs ! how on thips fo frail
(Tremendous thought!) can thoughtlefs morrals fail ?
For flormy feas they quit the plealing plain,
Plant woods in waves, and dwell amidf the main,
Far o'er the deep (a tracklefs path) they go,
And wander oceans in purfuit of wo.
No eafe their hearts, no reft their cyes can find, On heaven their looks, and on the waves their mind ; Sunk are their fipirits, while their arns they rear, And gods are wearied with their fraitlefs prayer.

Aristave。
Burf as a wave that from the clond impends,
And fwell'd with tempefts on the fhip defcents
White are the decks with foam : the winds aloud Howl o'er the mafts, and fing through every fhroud. Pale, trembling, tir'd, the failors freeze with fears, And inftant death on every wave appears. Homer.
In the latter paflage, the moff friking circumftances are felected to fill the mind with terror and aftonifhment. The former is a collection of minute and low circumftances, which fcatter the thought, and make no impreffion; it is at the fame time full of verbal antithefes and low conceit, extremely improper in a fcene of diftrefs.

The following defcription of a battle is remarkably fublime, by collecting together in the feweft words, thofe circumfances which make the greatef figure.
"Like antumn's dark florms pouring from two echoing hills, towards each other approached the heroes; as two dark freams from high rocks meet and roar on the plain, loud, rough, and dark in battle, meet Lochlin and Inisfail. Chief mixes his ftrokes with chicf, and man with man : fteel founds on fteel, and helmets are cleft on high: blood burfts and fmokes around : flrings murmur on the polifh'd yew : darts rufl along the fky: fpears fall like fparks of flame that gild the forny face of night.
"As the noife of the troubled ocean when roll the waves on high, as the laft peal of thunderiug heaven, fuch is the noife of batte. Though Carmac's hundred bards were there, feeble were the voice of a hundred bards to fend the deaths to future times ; for many were the deaths of the heroes, and wide poured the blood of the valiant." Fingal.

The following palifage in the 4 th book of the Hiad is a defcription of a battle wonderfully ardent, " When now.gathered on either fide, the hofls plunged togerter in fight ; fhield is harfly laid to thield; \{pears crafh on the brazen corflets; bofly buckler with buckler meets; lond tumult rages over all ; groans are mixed with boafts of men; the lain and flayer join in noife ; the earth is floating round with blood. As when two rufhing ftreams from two mountains come roaring down, and throw together their rapid waters below, they roar along the gulphy vale; the ftartled thepherd hears the found as he ftalks o'er the diftant hills: fo, as they mixed in fight, from both armies clamour with loud terror arofe." But fuch general defcriptions are not frequent in Homer. Even his fingle combats are rare. The fifth book is the longetz account of a battle that is in the lliad; and yet contains nothing biu a long catalogue of chiefs killing

## GRA [ iro $] \quad$ GRA

Brandeur and Sublimity.
chiefs, not in fingle combat neither, but at a diftance with an arrow or a javelin; and thefe chiefs named for the firt time and the laft. The fame feene is conti. nued through a great part of the fixth book. There is at the fame time a minate defcription of every wound, which for accuracy may do honour to an anatomift, but in an epic poem is tirefome and fatiguing. There is no relief from horrid languor but the beantiful Greek language and melody of Homer's verification.

In the twenty-firft book of the Oydfey, there is a paffage which deviates widely from the rule above laid down: it concerns that part of the hiftory of Penelope and her fuitors, in which fhe is made to declare in favour of him who fhonld prove the moft dexterous in flooting with the bow of Ulyfles:

> Now gently winding up the fair afcent
> By many an eafy ftep the matron went:
> Then o'er the pavement glides with grace divine
> (With polim'd oak the level pavements fhine.)
> The folding gates a dazzling light difplay'd,
> With pomp of various architrave o'erlaid.
> The bolt, obedient to the filken Aring,
> Forfakes the ftaple as fhe pulls the ring;
> The wards refpondent to the key turn'd round ;
> The bars fall back; the flying valves refound.
> Loud as a bull makes hill and valley ring,
> So roar'd the lock when it releas'd the fpring. She moves majeftic through the wealthy room,
> Where treafiur'd garments calt a rich perfume :
> There, from the column where aloft it hung,
> Keach'd, in its fplendid cafe, the bow unftrung.

Virgil fometimes errs againft this rule : in the following paflages minutecircumftances are brought into full view; and what is fill worfe, they are defcribed with all the pomp of poetical diction, Eneid, L. i. 1. 214 , to 219 . L. vi.1. 176, to 182 . L. vi. I. 212 , to 231: and the laft, which defcribes a funeral is the lefs excufable, as the man whofe funeral it is makes no figure in the poem.
*Az 3. The fpeech of Clytemneftra, defcending from her a number of common and trivial circumftances.

But of all writers, Lucan in this article is the moft injudicious: the fea-fight between the Romans and
parterres fplit into a thoufand fmall parts in the fliff- Grandeur eft regularity of figure. The moft eminent architects and have governed themfelves by the fame rule in all their Sublimity. works.

Another rulechiefly regards the fublime, though it General is applicable to every fort of literary performance in- terms tended for amufement ; and that is, to avoid as much ought to be as poffible abftract and general terms. Such terms, avoided fimilar to mathemarical figns, are contrived to exprefs where fub our thoughts in a concife manner ; but images which intended are the life of poetry, cannot be raifed in any perfection bat by introducing particular objects. General terms, that comprehend a number of individuals, muft be excepted from that rule: our kindred, our clan, our country, and words of the like import, though they fcarce raife any image, nave, however, a wonderful power over the paffions: the greatnels of the complex object overbalances the obfcurity of the image.
Grandeur, being an extreme vivid emotion, is not readily prodaced in perfection but by reiterated impreffions. The effect of a fingle impreffion can be but momentary; and if one feel fuddenly fomewhat like a fwelling or exaltation of mind, the emotion vanifheth as foon as felt. Siagle thoughts or fentiments are often cited as examples of the fublime; but their effeet is far inferior to that of a grand fubject difplayed in its capital parts. We fhall give a few examples, that the reader may judge for himfelf. In the famous action of Thermopyla, where Leonidas the Spartan king, with his chofen band, fighting for their country, were cut off to the laft man, a faying is reported of Dieneces, one of the band, which, exprefling cheerful and undifturbed bravery, is well intitled to the firft place in examples of that kind: talking of the number of their enemies, it was obferved, that the arrows fhot by fuch a multitude would intercept the light of the fun; "So much the better (fays he), for we then Herodot. fhall in fight the flade."

Somerfet, Ah! Warwick, Warwick, wert thou as we are, We might recover all our lofs again.
The Queen from France has brought a puiffant powers Ev'n now we heard the news, Ah! could'it thou fly!

Warvick. Why, I then would not fly.

$$
\text { Tbird part, Henry } V I, \text { act. } 5 . \text { fc. } 3 .
$$

Such a fentiment from a man expiring of his wounds, is truly heroic; and muft elevate the mind to the greateft height that can be done by a fingle expreffion : It will not fuffer in a comparifon with the famous fentiment Qu'il mourut of Corneille : the latter is a fentiment of indignation merely, the former of firm and cheerful courage.

To cite in oppofition many a fublime paffage, enriched with the fineftimages, and dreffed in the moft nervous expreffions, would fcarce be fair. We fhall produce but one inflance, from Shakefpeare, which fets a few objects before the eye, without mach pomp of language : it operates its effect by reprefenting thefe objects in a climax, raifing the mind higher and higher till it feel the emotion of grandeur in perfection:

The cload-capt tow'rs, the gorgeous palaces,
The folemn temples, the great globe itfelf,
Yea, all which it inherit, flall diffolve, \&c.
The cloud-capt tow'rs produce an elevating emotion, heightened by the gorgeous palaces; and the mind is carried fill higher and higher by the images that follow.

## G R A

Grandeur low. Succeffive images, making thes fronger and and Sublimity. 12 (terandeur and fublimity employed indiredtly to fink the mind. gle intage can do.

As, on the one hand, no means directly applied have nore induence to raife the mind that grandeur and fublimity; fo, on the other, no means indirectly applieu have mor influence to fink and deprefs it : for in a fate of clevation, the artful introduction of an humbling object, makes the fall great in proportion to the elevation. Ot this obfervation Shakefpeare

* Boileau and Huet. gives a beautiful example in the paffage laft quoted:

The cloud-capt tow'rs, the gorgeous palaecs,
The fulemn temples, the great glabe itfelf,
Yea, all which it inherit, Qall diflolve,
And like the bafelefs fabric of a vifion
Leave not a wreck behind- Tempef, aft 4.fc. 4.
The elevation of the mind in the former part of this beauiful paffage, makes the fall great in proportion, when the moft humbling of all images is introduced, that of an utter diffolution of the earth and its inhabitants. The mind, when warmed, is more fufceptible of impreffions than in a cool fate ; and a depreffing or melancholy object liftened to, makes the ftrongeit impreffion when it reaches the mind in its higheft date of elevation or cheerfulnefs.

But a humbling image is not always neceffary to produce that effect: a remark is made above, that in defcribing fuperior beings, the reader's imagination, unable to fupport itfelf in a ftrained elevation, falls often as from a height, and finks even below its ordinary tone. The following inftance comes luckily in view ; for a better cannot be given: "God faid, Let there be light, and there was light." Longinus quotes this paffage from Mofes as a fining example of the fublime; and it is fcarce polfible, in fewer words, to convey fo clear an image of the infinite power of the Deity: but then it belongs to the prefent fubject to remark, that the emotion of fublimity raifed by this image is but momentary ; and that the mind, unable to fupport itfelf in an elevation fo much above nature, immediately finks down into humility and vencration for a Being fo far exalted above groveling mortals. Every one is acquainted with a difpute about that paffage between two French critics *, the one pofitively affirming it to be fublime, the other as pofitively denying. What has been remarked, fhows, that both of them have reached the truth, but neither of them the whole truth : the primary effect of the paffage is undoubtedly an emotion of grandeur ; which fo far juftifies Boileau : but then every one mult be fenfible, that the emotion is merely a flafh, which, vanifhing inftantaneoully, gives way to humility and veneration. That indirect effect of fublimity juftifies Huet, on the other band, who being a man of true piety, and probably not mach carried by imagination, felt the bumbling paffions more fenfibly than his antagonift did. And laying alide difference of character, Huet's opinion may perhaps be defended as the more folid; becaufe, in fuch images, the depreffing emotions are the more fenfibly felt, and have the longer endurance.

The fraining an elevated fubjec beyond due bounds, and beyond the reach of an ordinary conception, is not a vice fo frequent as to require the correction of criticifm. But falfe fublime is a rock that writers of
more fire than judgment commonly fplit on; and Grandeur therefore a collection of examples may be of ufe as a beacon to future adventurers. One fpecies of falfe fublime, known by the name of bombaft, is common a. mong writers of a mean genius: it is a ferious endeavour, by ftrained defcription, to raife a low or familiar fubject above its rank; which, inftead of being fublime, fails not to be ridiculous. The mind, indeed, is extremely prone, in fome aninating paffions, to mag. nify its objects beyond natural bounds: but fucn hyperbolical defcription has its limits : and when carried beyond the impulfe of the propenfity, it degenerates into burkfque. Take the following examples: Sejanus.-_-Great and high
The world knows only two, that's Rome and I.
My roof receives me not : 'tis air I trcad,
And at each flep I feel niy advanc'd head
Knock out a flar in heav'n, Sejanus, Ben Yobnfon, act g. A writer who has no natural elevation of mind deviates readily into bombaft: he flrains above his natural powers; and the violent effort carries him beyond the bounds of propriety.

Guilford. Give way, and let the guhing torrent come; Behold the tears we bring to fwell the deluge, Till the flood rife upon the guilty world, And make the ruin common.
Eady Fane Grey, act 4. near the end.

Another fpecies of falfe fublime is fill more faulty than bomban; and that is, to force elevation by initroducing imaginary beings withont preferving any propriety in their actions; as if it were lawful to afcribe every extravagance and inconfiftence to beings of the poet's creation. No writers are more licentious in that article than Johnfon and Dryden:

## Methinks 1 fee Death and the Furies waiting

- What we will do, and all the heavens at leifure

For the great fpectacle. Draw then your fwords:
And if our deftiny envy our virtue
The honour of she day, yet let us care
To fell ourfelves at fuch a price, as may
Undo the world to buy us, and make Fate,
While the tempts ours, to fear her own eftate

$$
\text { Catiline, act } 5
$$

## The Furies ftood on hills

Circling the plact, and trembled to fee men Do more than they : whillt Piety left the field, Griev'd for that fide, that in fo bad a canfe They knew not what a crime their valour was, The Sun flood ftill, and was, behind the cloud The battle made, feen fweating to drive up His frighted horfe, whom till the noife drove backward. Ibid' acf 5 ,
Ofmyn. While we indulge our common happinefs; He is forgot by whom we all poffefs,
The brave Almanzor, to whofe arms we owe All that we did, and all that we fhall do; Who like a tempeft that outrides the wind, Made a juft battle ere the bodies join"d.

Abdalla, His victories we fearce could keep in view, Or polifh 'em fo fatt as he rough drew.
Abdemelech. Fate after hin below with pain did move, And Vietory could fcarce leeep pace above. Death did at length fo many ilain forget.
And loilt the take, and took ${ }^{\prime} \mathrm{em}$ by the great. Conguef of Granada, act 2. at beginning.
An actor on the flage may be guilty of bombaft as well as an author in his clofet : a certain manner of acting, which is grand when fupported by dignity in the fentiment and force in the expreffion, is ridiculous where the fentiment is mean and the expreffion flat.

## G R A $\quad\left[\begin{array}{ll}1 i 2\end{array}\right] \quad G R A$

Grandgor GRANDGOR is ufed in Scotland for the pox. In II. The Philofophical Tranfactions, no 469. fect. 5. we have a proclamation of king James IV. of 'Scotland, ordering all who had this difeafe, or who had artended others under it, forthwith to repair so an ifland in the Frith of Forth. If the grandgor was the pox, and this diftemper came into Europe at the fiege of Naples in 1495 , it muft have made a very quick progrefs to caufe fuch an alarm at Edinburgh in 1497.

GRANGE, an ancient term for a barn or place wherein to lay up and threfl corn. The word is formed of the Latin granea; or of granum, " grain, corn," \&c. Hence alfogranger or grangier", "a grangekeeper or farmer."

Grange is alfoufed, in a more extenfive fenfe, for a whole farm, with all the appendages of ftables for horfes, ftalls for cattle, \&c. and for an inn.

GRANI, in our ancient Writers, muftachoes or whikers of a beard. The word feems formed from the ancient Britifh or Irilh greann, "a beard." It is given for a reafon why the cup is refufed to the laity, Quia barbati, b prolixos habent granos, dumpoculum inter epulas fumunt, prius liquore pilos inficiunt, quam ori infundient.

GRANICUS, a fmall river near the Hellefpont in Leffer Afia, remarkable for the firft victory gained by Alexander the Great over the armies of Barius.Authors difagree very much about the number of the Perfians, though all agree that they were vaftly more numerous than the Greeks. Juftin and Orofius rell us, that the Perfian army confifted of 600,000 foot and 20,000 horfe; Arrian makes the foot amount to 200,000; But Diodorus tells us, that they were not more than $\mathrm{J} C 0,000$ foot and 10,000 horfe. The Macedonian army did not exceed 30,000 foot and 5000 horfe. The Perfian cavalry lined the banks of the Granicus, in order to oppofe Alexander wherever he fhould attempt a paffage ; and the foot were pofted behind the cavalry on an eafy afcent. Parmenio would have had Alexander to allow his troops fome time to refrefh themfelves; but he replied, that, after having croffed the Hellefpont, it would be a difgrace to him and his troops to be ftopped by a rivulet. Accordingly a proper place for croffing the river was no fooner found, that he commanded a frong detachment of horfe to enter ; he himfelf followed with the right wing, which be commanded in perfon; the trumpets in the mean time founding, and lond thouts of joy beingheard through the whole army. The Perfianslet Ay fich fhowers of arrows againft the detachment of Macedonian horfe, as càufed fome confufion; feveral of their horfes being killed or wonnded. As they drew near the bank a moft bloody engagement enfued; the Macedonians attempting to land, and the Perfians pulhing them back into the river. Alexander, who obferved the confulion they were in, took the command of them himfelf; and landing in fpite of all oppofition, oliliged the Perfian cavalry, after an obftinate refiftance, to give groinnd. However, Spithrobates, governor of Ionia, and fon-in-law to Darins, ftill maintained his ground, and did all that lay in his power to bring them back to the charge. Alexander advanced full gallop to engage him; neither did he decline the combat, and both were flightly wounded at
the firf encounter. Spithrobates having thrown lis javelin without effect, advanced fword in hand to meet his antagonift, who ran him through with his pike as he raifed his arm to difcharge a blow with his fcymitar. But Rofaces, brother to Spithrobates, at the fame time gave Alexander fuch a furious blow on the head with his battle-ax, that he beat off his plume, and nightly wounded him through the helmet. As he was ready to repeat the blow, Clitus with one froke of his fcymitar cut off Rofaces's head, and thus in all probability faved the life of his fovercign. The Macedonians then, animated by the example of their king, attacked the Perfians with new vigour, who foon after betook themfelves to flight. Alexander did not purfue them ; but immediately charged the enemy's foot with all h is forces, who lad now paffed the river. The Perfians, dilheartenedat the defear of their cavalry, made no great f fiftance. The Greek mercenaries retired in good order to a neighbouring hill; whence they fent deputies to Alexander defiring leave to march off unmolefted. But be, inftead of coming to a parley with them, rumed furioufly into the middle of this fmall body; where his horfe was killed under him, and he himfelf in great danger of being cut in pieces. The Greeks defended thenfelves with incredible valour for a long time, but were at laft almoft entirely cut off. In this battle the Perfians are faid to have loft 20,000 foot and 2500 horfe, and the Macedonians only 55 foot and 60 horfe.

GRANITE, in natural hiftory, a diftinct genus of ftones, compored of feparate and very large concretions rudely compached together ; of great hardnefs, giving fire with fteel, not fermenting with acids, and flowly and imperfectly calcinable in a great fire.

- Of this genus there are threo fpecies: 1. Thehard white granite, with black fpots, commonly called moorftone. This is a very valuable kind, confliting of a beautiful congeries of very varioully conftrueted and differently coloured particles, not diffufed amongor running into one another, but each pure and diftinet, though firmly adthering to whichever of the others it comes in contact with, and forming a very firm mais. It is much ufed in London tor the fteps of public buildings, and on other occafions where great ftrength and hardnefs are required. 2. The hard red granite variegated with black and white, and common in Egypt and Arabia. 3. The pale whitifh granite, variegated with black and yellow. This is fometimes found in ftrata, but more frequently in loofe nodules, and is ufed for paving the ftreets.

Some of thefe kinds of fones are found in almoft every countty, and in many places they are found of immenfe bignefs. The largent mafs of this kind in the known world, lying as an unconnected ftone, is found near the Cape of Good Hope in Africa, and of which we have the following defcription in the Philofoph. Tranfact. vol. 68. p. 102, given by Mr.Anderfon in a letter to Sir John Pringle. "The fone is formarkable, that it is called by the people here the Tower of Babcl, and by fome the Pearl Diamond. It either takes the laft name from a place near which ir is fituated, or it gives names to the tract of cultivated land called the Pearl. It lies upon the top of a ridge of low hills $\boldsymbol{g}^{\text {b }}$ beyond a.large plain, at

## GRA [ If3] GRA

Granite. the diftance of about thirty miles from the Cape Town; beyond which, at a little diftance, is a ratige of hills of a much greater height. It is of an oblong fhape, and lies north and fouth. The fouth end is higheft; the eaft and weft fides are ftecp and high; but the top is rounded, and flopes away gradually to the north end, fo that you can afcend it by that way, and enjoy a moft extenfive profpect of the whole country. I could not precifely determine its circumference, but it took us above half an hour to walk round it ; and by making every allowance for the rugged way, and ftopping a little, l think the noft moderate computation muft make it exceed half a mile. The fame difficulty occurred with refpect to knowing its height : but I think, that, at the fouth end, it is nearly equal to half its length : or, were I to compare it to an object you are acquainted with, I fhould fay it equalled the dome of St Paul's church.
"I am uncertain whether it ought to be confidered as the top of the hill, or a detached tone, becaufe there is no politive proof of either, unlefs we were to dig about its bafe; but it would certainly imprefs every beholder, at firft fight, with the idea of its being one ftone, not only from its figure, but becaufe it is really one folid uniform mafs from top to bottom, without any interruption ; which is contrary to the general character of the high hills of this comntry, they being commonly divided, or compofed of different ftrata, at leaft if we may judge from the rows of plants or thrubs which grow ou the fic: $s$ of the fteepeft, and, as I fuppofe, are produced from the fmall quantity of earth interpofed between them. It has indeed a few fiffures, or rather impreffions, which do not reach deeper than fuur or five feet ; and near its north end a ftratum of a more compact ftone runs acrofs, which is not above twelve or fourteen inches thick, with its furface divided into little fquares, or oblongs, difpofed obliquely. This ftratum is perpendicular; but wherher it cuts the other to its bafe, or is fuperficial, I cannot determine. Its furface is alfo fo fmooth that, it does not appear to have formerly been joined to, or feparated frem, any other part by violence, as is the cafe with many other large fragments; but enjoys the exaft fituation where it was originally placed, and has undergone little change from being expofed for fo many fuccelfive ages to the calcining power of a very hot climate."-A part of this fone being examined by Sir William Hamilton, he determined it to be a granite, and of the fame nature with the tops of fome of the Alps; and fuppofes both of them to have been clevated by volcanic explofions.

Granite, a genus of ftones of the order of petre, belonging to the clafs of faxa. The principal conftituent parts of this fone are felt-fpar or rhombic quartz, mica, and quartz. Thefe ingredients conftitute the hardeft fort of granite, and that moft anciently known. That into which fchoerl enters is more fubject to decompofition. They never have any particular texture orregular form, but confift of enormou, fhapelefs maffes extremely hard. In the finer granites the quartz is tranfparent; in others generally white or grey, violet or brown. The felt-fpar is generally the moft copious ingredient, and of a white, yellow, red, black, or brown colour. The mica is alfo grey, brown, yellow, green, red, violet, or black ; and commonly the leaft Vol. VIII.
copious. The hoorl is generally black, and abounds Granitcllo in the granites that contain it. Hence the colome of the granites depends principally on that of the far or fchoerl. The red granites condift commonly of white quartz, red fclt-fpar, and grey mica; the grey ones of white quartz, grey or violet felt-fpar, and black mica. The black granites commonly contain fchoerl inftead of felt-fpar ; and the green ufuallycontain green quartz.

On expofing granite to the flame of a blow-pipe, the component ingredients feparate frome one another. Mr Gerbard having melted fome in a crucible, found the felt-fpar run into a tranfparent glafs; below it the mica lay in form of black flag, the quartz remaining unaltered. It melted fomewhat better when all the three were powdered and mixed together; though even then the quartz was ftill difcernible by a maguifying glafs. Hence we may explain the reafon why grains of a white colour are fometimes found in volcanic lavas. The mixture of mica prevents the filex or quartz from fplitting or cracking; and hence its infufibility and ufe in furnace-building.

Granites are feldom flaty or laminated. In thofe which are of a clofe texture, the quartz and fchoerl predominate. They take a good polifh; for which reafon the Egyptians formerly, and the Italians ftill work them into large pieces of ornamental architecture, for which they are extremely fit, as not being liable to decay in the air. Farber, in his letters from Italy, mentions a kind of fone named granitone, compofed of felt-1par and mica: a fubtance of this kind, which moulders in the air, is found in Finland; which is faid to contain falt-petre, and fometimes common falt. In that country it is called rapakiri. Wallerius defcribes i8 feecies of granites, befides many others akin to this genus. Thofe deferibed by Cronftedt are, 1. Loofe or friable, which comes from France, and is ufed at the brafs-works for cafting that metal in. 2. Hard or compact, of which there are two varieties, red and grey. The former is met with of two kinds : viz. fine-grained from Swappari in Lapland, or coarlegrained from the province of Dalarne in Sweden. The grey, with other colours, is met with on the coaft round Stockholm and Norland in Sweden.

GRANITELLO, a genus of ftones of the order of petre, belonging to the clafs of faxa. There are two fpecies, I. That compofed of diftinct particles, found in feveral of the mountainous parts of Sweden. In fome of thefe there is a predominance of quartzofe particles, in others of micaceous; in which laft cafe the fone is flaty, and eafily fplit. 2. Granitello, compofed of convoluted particles. This is metwith of different colours, as whitifh grey, greenith, and reddih.

Both thefe kinds of foneare ufed in building furnaces, on account of the powerful refiftance they make to the fire ; but the latter is preferable to the other, on account of its containing a little of a refractory clayifh fubftance. It is likewife of great ufe in mills, where the fellow is a coarfe fand-ftone.

GRANIVOROUS, an appellation given to animals which feed on corn or feeds. Thefe are principally of the bird kind.

GRANT, in law, a conveyance in writing of fuch things as cannot pafs or be conveyed by word only; fuch are rents, reverfions, fervices, \&c.

Granr (Francis), Lord Cullen, an eminent law0

Grine.

## GRA $\quad$ [ II4 ] GRA

Graut. yer and judge in Scotland, was defcended from a younger branch of the family of the Grants of Grant in that kingdom, and was born about the year 1660. When he commenced advocate, he made a diftinguiflied figure at the revolution, by oppofing the opinion of the old lawyers, who warmly argued on the inability of the convention of eftates to make any difpofition of the crown. The abilities he fhowed in favour of the revolution recommended him to an extenfive practice; in which he acquired fo much honour, that when the union between the two kingdoms was in agitation, queen Anne unexpectedly, and without application, created him a baronet, with a view of fecuring his intereft in that meafure; and upon the fame principle, fhe foon after creared him a judge, or one of the lords of feffion. From this time, according to the cuftom of Scotland, he was fyled from the name of his eftate, Lord Cullen; and the fame good qualities that recommended him to this honourable office, were very confpicuous in the difcharge of it; which he continued for 20 years with the higheft reputation, when a period was put to his life by an illners which lafted but three days. He expired without any agony on March 16th 1726.——His character is drawn to great advantage in the Biographia Britannica; where it is obferved, among other remarks to his honour, "That as an advocate he was indefatigable in the management of bufinefs; but at the fame time that he fpared no pains, he would ufe no craft. He had fo high an idea of the dignity of his profeffion, that he held it equally criminal to neglect any honeft means of coming at juftice, or to make ufe of any arts to elude it. In refpect to fortune, though he was modeft and frugal, and had a large practice, yet he was far from being avaricious. His private charities were very confiderable, and grew in the fame proportion with his profits. He was, befides, very fcrupulous in many points; he would not fuffer a juft caufe to be loft through a client's want of money. He was fuch an enemy to oppreffion, that he never denied his affiftance to fuch as laboured under it; and with refpect to the clergy of all profeffions (in Scotland,) his confcience obliged him to ferve them without a fee. When his merit had raifed him to the bench, he thought himfelf accountable to God and man for his conduct in that high office; and that deep fenfe of his duty, at the fame time that it kept him ftrictly to it, encouraged and fupported him in the performance. Whenever he fat as lord ordinary; the paper of caufes was remarkably full, for his reputation being equally eftablifhed for knowledge and integrity, there were none, who had a good opinion of their own pretenfions, but were defirous of bringing them before him, and not many who did not fit down fatis. fied with his decifion. This prevailed more efpecially after it was found that few of his femtences were reverfed; and when they were, it was commonly owing to himfelf: for if, upon mature reflection, or upon new reafons offered at the re-hearing, he faw any juft ground for altering his judgment, he made no feruple of declaring it; being perfuaded, that it was more manly, as well as more juft, to follow truth, than to fapport opinion: and his conduct in this refpect had a right effect; for inftead of lefiening, it raifed his reputation. He Fould not ${ }_{2}$ however, with all this great fock of know-
ledge, experience, and probity, truft himfelf in matters Grantham, of blood, or venture to decide in criminal cales on the Granville. lives of his fellow-creatures; which was the reafon that, though often folicited, he could never be prevail. ed upon to accept of a feat in the judiciary court.In his private character he was as amiable as he was refpectable in his pablic. He was charitable without oftentation, difinterefted in his friendihips, and beneficent to all who had any thing to do with him. He was not only ftrictly juft ; but fo free from any fpecies of avarice, that his lady, who was a woman of great prudence and difcretion, finding him more intent on the bufinefs committed to him by others than on his own, took upon herfelf the care of placing out his money; and to prevent his poftponing, as he was apt to do, fuch kind of affairs, when fecurities offered, fhe caufed the circumftances of them to be fated in the form of cafes, and fo procured his opinion upon his own concerns as if they had been thofe of a client. He was fo true a lover of learning, and was fo much addicted to his ftudies, that, notwithfanding the multiplicity of his bufinefs while at the bar, and his great attention to his charge when a judge, he neverthelefs found time to write various treatifes on very different and important fubjects : Some political, which were remarkably well-timed, and highly ferviceable to the government: others of a more extenfive nature, fuch as his effays on law, religion, and education, which were dedicated to George II. when prince of Wales; by whofe command, his then fecretary, Mr Samuel Molyneux, wrote him a letter of thanks, in which were many gracious expreffions, as well in relation to the piece as to its author. He compofed, befides thefe many difcourfes on literary fubjects, for the exercife of his own thoughts, and for the better difcovery of trath; which went no farther than his own clofet, and from a principle of modefty were not communicated even to his moft intimate friends."

GRANTHAM, a town of Lincolnfhire, 1 Io miles from London. It is a neat populous town, with abundance of very good inns of grear refort, on the north road, and fituated on the river Witham. It is fuppofed to have been a Roman town by the remains of a caftle which have been formerly dug up here. It is governed by an alderman and 12 juftices of the peace, a recorder, as coroner, an efcheater, 12 fecond-twelve men, who are of the common council, and 12 conftables to attend the court. Here is a fine large church with a ftone fpire, one of the loftieft in England, being 288 feet high, and, by the deception of the fight, feems to ftand awry, which, by the church being fituated fo low, appears to a very great difadvantage. Here is a good free-fchool, where Sir Ifaac Newton received his firft education, befides two charityfchools. On the neighboaring courfe are frequent horfe-races.

GRANVILLE (George), lord Landidowne, was defcended from a very ancient family, derived from Rollo the firft dake of Normandy. At cleven years of age he was fent to Trinity College in Cambridge, where he remained five years: but at the age of 13 was admitted to the degree of mafter of arts; having, before he was 12 , fpoken a copy of verfes of his own compofttion to the dutchefs of York at his college, when fhe paid a vilit to the Univerfity of Cam.

## GRA [ 115 ] GRA

Granulated Cambridge. In 1696 , his comedy called the She-gatlants was acted at the theatre-royal in Lincolns-inn-Grapho- ficlds, as his tragedy called Heroic Love was in the meter. year 1698 . In 1702 he tranflated into Englifln the fecond Olyuthian of $D$ emofthenes. He was member for the county of Cornwall in the parliament which met in 1710; was afterwards fecretary of war, comptroller of the houfehold, then treafurer, and fworn one of the privy-council. The year following he was created baron Lanfdowne. On the acceffion of king George I. in 1714, he was removed from his treafurer's place; and the next year entered his proteft againft the bills for attainting lord Bolingbroke and the duke of Ormond. He entered deeply into the fcheme for raifing an infurrection in the weft of England; and being feized as a fufpected perfon, was committed to the Tower, where he continued two years. In i719, he made a fpeech in the houfe of Lords, againft the bill to prevent occafional conformity. In 1722 , he withdrew to France, and continued abroad almoft ten years. At his return in 1732, he publifhed a fine edition of his works in 2 vols quarto. He died in 1735, leaving no male iflue.

Granvilee, a fea-port town of France, in Lower Normandy, partly feated on a rock and partly on a plain. It gave the title to an Englifh earl, now extinet. W. Long. I. 32. N. Lat. 48. 58.

GRANULATED, fomething that has undergone granulation. See the next article.

GRANULATION, in chemiftry, an operation by which metallic fubftances are reduced into fmall grains, or roundifl particles; the ufe of which is, to facilitate their combination with other fubftances.-This operation is very fimple; it confifts only in pouring a melted metal flowly into a veffel filled with water, which is in the mean time to be agitated with a broom. With melted copper, however, which is apt to explode with great violence on the contact of water, Come precautions are to be obferved, of which an account is given under the articleChemistry, $\mathrm{H}^{\circ} \mathrm{II} 48$. Lead or tin may be granulated by pouring them when melted into a box; the internal furface of which is to be rubbed with powdered chalk, and the box ftrongly flaken till the lead has become folid. Metals are granulated, becaufe their ductility renders them incapable of being pounded, and becaufe filing is long and tedious, and might render the metal impure by an admixture of iron from the file.

GRAPE, the fruit of the vine. See Vine and Wine. Sec alfo Currants and Raisins.
$G_{\text {RAPE-Shot, }}$ in artillery, is a combination of fmall Shot, put into a thick canvas bag, and corded ftrongly together, fo as to form a kind of cylinder, whofe diameter is equal to that of the ball adapted to the cannon. The number of fhot in a grape varies according ra the fervice or fize of the gans: in fea-fervice nine is always the number; but by land it is increafed to any number or fize, from an ounce and a quarter in weight to three or four pounds. In fea-fervice the bottoms and pins are made of iron, whereas thofe ufed by land are of wood.

Grapes, in the manege, a term ufed to fignify the arrefts or mangy tumours that happen in the horfe's legs.

GRAPHOMETER, a mathematical inftrument,
otherwife called a Semicircle; the ufe of which is to obferveany angle whofe vertex is at the centre of the

Grapnel Graís. inftrument in any plane (though it is mof commonly horizontal, or nearly fo), and to find how many degrees it cont.ins. See Geometry, p. 674,prop.xi.\&c.

GRAPNEL, or Grappling, a fort of fmall anchor, fitted with four or five flukes or claws, and commonly ufed to ride a boat or other fmall veffel.

Fire-Crappling, an infrument nearly refembling the former, but differing in the conitruction of its flukes, which are furnifhed with ftrong barbs on their points. Thefe machines are ufually fixed on the yard-arms of a hip, in order to grapple any adverfary whom the intends to board. They are, however, more particularly ufeful in FIRE-Ships for the purpofes defcribed in that article.

GRASS, in botany, is defined to be a plant having fimple leaves, a ftem generally jointed and tubular, a hufky calyx (called giuma), and the feed fingle. Hence whear, oats, barley,\&c. are properly graffes, according to the definition given; while clover and fome other fimilar plants are not graffes, though fo frequently called by that name.-Of grafs, the leaves are food for cattle, the fmall feeds for birds, and the larger grain chiefly for man. And it is obfervable, that nature has fo provided, that cattle (in grazing) feldom eat the flower intended to produce feed, unlefs compelled by hunger.

For the culture of the different forts of grain, fee Agriculture, $\mathrm{n}^{0}$ 122. $\sigma$ feq.; and for that of the graffes commonly fo called, fee the fame article, $\mathrm{n}^{\circ}$ 175, r feq. and the references below.

Culmiferous graffes might be divided into two general claffes for the purpofes of the farmer, that it might be of ufe for him to attend to, viz. Ift, Thofe which, like the common annual kinds of corn, run chiefly to feed-ftalks; the leaves gradually decaying as thefe advance towards perfection, and becoming totally withered or falling off entirely when the feeds are ripe. Rye-grafs belongs to this clafs in the ftricteft fenfe. To it likewife may be affigned the vernalgrafs, dog's-tail grafs, and fine bent-grafs. 2dly, Thofe whofe leaves continue to advance even after the feed. ftalks are formed, and retain their verdure and fucculence during the whole feafon, as is the cafe with the feícue and poa tribes of graffes, whofe leaves are as green and fucculent when the feeds are ripe and the flower-ftalks fading, as at any other time.
" It is wonderful, Mr Stillingflect * remarks, to fee * Trafts re how long mankind have neglected to make a proper ad- lating to vantage of plants of fuch importance, and which, in Nat. Hiff. almoft every country, are the chief food of cattle. \&c. The farmer, for want of diftinguifhing and felecting graffes for feed, fills his paflures either with weeds or bad or improper graffes; when, by making a right choice, after fome trials, he might be fure of the beft grafs, and in the greateft abundance that his land admits of. At prefent, if a farmer wants to lay down his land to grafs, what does he do? he either takes his feeds indifcriminately from his own foul hay-rick, or fends to his next neighbour for a fupply. By this means, befides a certain mixture of all forts of rubbill, which muft neceffarily happen, if he chances to have a large proportion of good feeds, it is not unlikely but that what he intends for dry land may come from moift,
where

Grafs. where it grew naturally, and the contrary. This is fuch a novenly method of proceeding, as one would think conld not poffibly prevail univerfally : yet this is the cafe as to all grafles except the darnel-grafs, and what is known in fome few counties by the name of the Suffolk•grafs; and this latter inftance is owing, I believe, more to the foil than any care of the hulbandman. Now, would the farmer be at the pains of fepayating once in his life half a pint or a pint of the different kinds of grafs-feeds, and take care to fow them feparately, in a very little time he would have wherewithal to ftock his farm properly, according to the nature of each foil, and might at the fame time fpread theie feeds feparately over the country, by fupplying the feed-hops. The number of graffes fit for the farmer is, I believe, fmall, perhaps half a dozen or half a fcore are all he need to cultivate; and how fimall the trouble would be of fuch a takk, and how great the benefit, muft be obvious to cvery one at firft fight. Would not any one be looked on as wild who fhould fow wheat, barley, oats, rye, peafe, beans, vetches, buck-wheat, turnips, and weeds of all forts together? yet how is it much lefs abfurd to do what is equivalent in relation to graffes? Does it not import the farmer to have good hay and grafs in plenty? and will cattle thrive equally on all forts of food? We know the contrary. Horfes will fcarcely eat hay that will do well enough for oxen and cows. Sheep are particularly fond of one fort of grafs, and fatten upon it fafter than any other, in Sweden, if we may give credit to Linnæus. And may they not do the fame in other countries? How fhall we know till we have tried?"

As the generality of farmers know fcarce any of the graffes by name, and as without fuch knowledge little improvement can be made in this branch of hufbandry, we have on Plate CCXXIII. given figures of thofe forts which have been recommended as the moft profitable, viz.
I. Hordeum murinum, Rye-grass vulgo. [Ryegrafs propriè is the secale villofume. Perennial darnel, lollium perenne, is alfo, in fonte counties of England, improperly called rye-grafs.] See Agriculture, $n^{\circ} 179$.
2. Feftuca rubra, Purple Fescue-grass. See Agriculture, $\mathrm{m}^{\circ} 54$.
3. Feftuca ovina, Steeps dito. See Agriculture, $n^{\circ} 56-58$. This is perhaps the moft valuable grafs of all. It is obferved to grow and thrive onlands of all qualities and in all fituations, from the drieft upland paftares to the very moilt parts of meadows. It does not part with its feeds till fome time after they are ripe, and even quite dry. It makes the thickeft and clofeft pile of any of them, and fends up but few flower-ftalks in proportion to its leaves. It flowers in June, and is ripe in July.
4. Holcus lanatus, Creeping Soft-grass. See Agriculture, no 59.
5. Allopecurus bulbofus, Bulbous Foxtait-grass, Arriculture, 5 tor ficulterms chiefly, he obferves, to delight in a moift foil, and therefore promifes to be only fit for a meadow pallure grafs. The quality that firf recommended it to his notice, was the unufual firmnefs that its matted
roots gave to the furface of the ground, naturally foft and moitt, in which it grew; which feemed to promife that it might be of ufe upon fuch foils, chietly in preventing them from being much poached by the feet of cattle which might palture upon them. Mofly foils efpecially are fo much hurt by poaching, that any thing that promifes to be of ufe in preventing it deferves to be attended to.
6. Poapratenfis, Great Meadow grass, feems to approach in many refpects to the nature of the purple. fefcue; only that its leavesare broader, and not nearfo long; being only about a foot or 16 inches at their greateft length. Like it, it produces few feed-ftalks and many leaves, and is an abiding plant. It affects chiefly the dry parts of meadows, though it is to be found on moft good paftures. It is very retentive of its feeds, and may therefore be fuffered to remain till the ftalks are quite dry. It bloffoms the beginning of June, and it feeds are ripe in July.
7. Poa compreffa, Creeping Meadow-grass, according to Dr Anderfon, feems to be the moft valuable grafs of any of this genus. Its leaves are firm and fucculent, of a dark Saxon-green colour; and grow fo clofe upon one another, as to form the richeft pile of paf-ture-grafs. The flower-ftaiks, if fuffered to grow, appear in fufficient quantities; but the growth of thefe does not prevent the growth of the leaves, both advancing together during the whole fummer; and when the ftalks fade, the leaves continue as green as before. Its leaves are much larger and more abundant than the comnon meadow-grafs, poa trivialis; and therefore it better deferves to be cultivated.
8. Anthoxanthumodoratum, Vernal grass, grows very commonly on dry hills, and likewife on found rich meadow-land. It is one of the earlieft graffes we have; and from its being found on fuch kinds of paftures as theep are fond of, and from whence excellent mutton comes, it is moft likely to be a good grafs for fheep-paftures. It gives a grateful odour to hay. In one refpect, it is very eafy to gather, as it fheds its feeds upon the leaft rubbing. A correfpondent of the Bath Society, however, mentions a difficulty that occurs in collecting them, owing to its being furrounded with taller graffes at the time of its ripening, and being almort hid among them. If it be not carefully watched when nearly ripe, he obferves, and gathered within a few days after it comes to maturity, great part of the feed will be loft. The twifted elaftic awns, which adhere to the feed, lift them out of their receptacles with the leaft motion from the wind, even while the ftraw and ear remain quite erect. It is found montly in the moift parts of meadows; very little of it on dry paftures. It flowers about the beginning of May, and is ripe about the middle of June.
9. Gynofuruscriftatus, Crested Dog's-tail Grass. Mr Stillingfleet imagines this grafs to be proper for parks, from his having known one, where it abounds, that is famous for excellent venifon. He recommends it alfo, from experience, as good for theep; the beft mution he ever tafted, next to that which comes from hills where the purple and fieeps fefcue, the fine bent and the filver hair graffes abound, having been from Theep fed with ir. He adds, that it makes a very fine turf upon dry fandy or chalky foils: but unleis fwept over with the fcythe, its flowering-ftems will look

Grals.

## GRA [ 117 ] GRA

Grafs,
brown; which is the cale of all grancs when are nos fed on by variety of animals. For that fome animals will eat the flowering-ftems is evident by commons, where farcely any parts of graffes appear but the radical leaves. This grafs is taid to be the eafieft of the whole groupe to collect a quantity of feed from. It flowers in June, and is ripe in July.
10. Stipa pennata, Cock's-tail or Feather Grass.
11. Agroflis capillaris, Fine Bent, is recommended by Mr Stillingfleet, from his having always found it in great plenty on the beft fheep paftures, in the different counties of England that are remarkable for good mutton. Ihis grafs flowers and ripens its feed the latelt of them all. It feems to be lolt the former part of the year, but vegetates luxuriantly towards the autumn. It appears to be fond of moilt ground. It retains its feed till full ripe; flowers the latter end of July, and is ripe the latter end of Auguft.
12. Areira flexuofa, Mountain Hatr.
13.-caryophillea, Silver Hair.

The fame may be faid of thefe two graffes as of the preceding one.
14. Feftuca fuitans, Flote Fescue. In a piece publifhed in the Amœenitates Academicæ, vol. 3. intitled Plantee Efculente, we are informed, that "the feeds of this grafs are gathered yearly in Poland, and from thence carriedinto Germany; and fometimes into Sweden, and fold under the name of manna feeds. Thefe are much ufed at the tables of the great, on account of their nourihing quality and agreeable talte. It is wonderful (adds the aurhor), that amongit us thefe feeds have hitherto been neglected, lince they are fo eafily collected and cleanfed." There is a clamminefs on the ear of the flote-fefcue, when the feeds are ripe, that taftes like honey; and for this reafon perhaps they are called manna feeds.

Linnæus (Flor. Seuc. art. 95.) fays that the bran of this grafs will cure horfes troubled with botts, if kept from drinking for fome hours.

Concerning this grafs we have the following information by MrStillingfleet. "Mr Dean, a very fenfible farmer at Rufcomb, Berkfhire, affured me that a field, always lying under water, of about four acres, that was occupied by his father when he was a boy, was covered with a kind of grafs, that maintained five farm-horfes in good heart from April to the end of harveft, withoul giving them any other kind of food, and that it yielded more than they could eat. He, at my defire, brought me fome of the grafs, which proved to be the flote-fefcue with a mixture of the marhbent; whether this laft contributes much towards furnifhing fo good pafture for horfes, I cannot fay. They both throw out rooots at the joints of the falks, and therefore are likely to grow to a great length. In the index of dubious plants at the end of Ray's Synop. fis, there is mention made of a grafs mender the name of gramen caninum fupinum longiflimum, growing not far from Salifbury, 24 feet long. This mult by its length be a grafs with a creeping ftalk; and that there is a grafs in Wilthire growing in watery meadows, fo valuable, that an acre of it lets from to to 12 pounds, $I$ have been informed by feveral perfons. Thefecircumfances incline me think it mult be the flote-fefcue;
but whatever grafs it be, it certainly mul deferve to be inquired afecr."
15. Alopecurrepratenfis, Meadow Foxtail. Linnæus fays that this is a proper grafs to fow on grounds that have been drained.-Mr Stillingfleet was informed, that the beft hay which comes to London is from the meadows where this grafs abounds. It is fearce in many parts of England, particularly Herefordinire, Berkfhire, and Norfolk. It might be gathered at almott any time of the year from hay ricks, as it does not ghed its feeds without rubbing, which is the cafe of but few graffes. It is anongit the molt grateful of all graffes to cattle. It is ripe about the latter end of June.
16. Poa annua, Annual Meadow Grass. 'This grals (fays Mr Stillingfleet) makes the fineft of turfs. It grows every where by way tides, and on rich found commons. It is called in fome parts the $S_{u f f}$ oik grafs . I have feen whole fields of it in High Sutiolk without any mixture of other graffes; and as fome of the beft falt-butter we have in London comes from that county, it is moft likely to be the beft grafs for the dairg. I have feen a whole park in Suffolk covered with this grafs; but whether it affords good venifon, I cannot tell, having nevertafted of any from it. I fhould rather think not, and that the beft pafture for heepis alfo the beft for deer. However, this wants trial. Ircmarked on Malvern-hill fomething particular in relation to this grafs. A walk that was made there for the convenience of the water drinkers, in lefs than a year was covered in many places with it, though $I$ could not find one fingle plant of it befides in any part of the hill. This was no doubt owing to the frequent treading, which above all things makes this grafs flourin ; and therefore it is evident that rolling muft be very ferviceable to it. It has been objected, that this grafs is not free from bents, by which word is meant the flow-cring-ftems. I anfwer, that this is mof certainly true, and that there is no grafs without them. But the flowers and ftems do not grow fo foon brown as thofe of other graffes; and being much fhorter, they do not cover the radical leaves fo much ; and therefore this grafs affords a more agreeable turf without mowing, than any other whatever that I know of."-The feeds of this fpecies drop off before they are dry, and, to appearance, before they are ripe. The utmoft care is therefore neceffary ingathering the blades, without which, very few of the feeds will be faved. It ripens from the middle of April, to folate, it is believed, as the end of October; but moftly difappears in the middle of the fummer. It grows in any foil and fituation, but rather affects the fhade.
17. A new grafs from America (named Agroftis cornucopies) was fome time ago much advertifed and extolled, as poffefling the moft wonderful qualities, and the feeds of it were fold at the enormous rate of L. 68 the bullel. But we have not heard that it has at all anfwered expectation. On the contrary, we are informed by Dr Anderfon in his new publication $\dagger$, that "it has upon trial been found to be good for nothing. Of the feeds fown, few of them ever germinated : but enow of plants made their appearance, to afcertain, that the grafs, in refpect of quality, is among the pooreft of the tribe; and that it is an annual plant, and altogecher unprofitable to the farmer."
$+T b e$ Bee, vol, i.p. $3^{88}$.

GRASS-

## GRA [ 118 ] GRA

$G_{\text {RASS }}$ Walks are made, for the moft part, not by fowing grafs feeds, but by laying turis; and indeed the turfs froma fine common or down are much preferable to fown grafs: but if walks or plats are to be made by fowing, the beft way is to procure the feed from thofe paftures where the grafs is aturclly fine and clear ; or elfe the trouble of keeping it from fpiry or benty grafs will be very great, and it will fcarce ever look handfome.

In order to fow grafs walks, the ground muft be firft dug; and when it has been dreffed and laid even, it mult be very carefully raked over, and all the clods and ftones taken off, and then covered over an inch thick with good mould.

This being done, the feed is to be fown pretty thick, that it may come up clufe and fhort; it muft then be raked over again, to cover the feed, that if the weather fhould happen to be windy, it may not be blown away. It ought alfo to be obferved, that where grafs is fown in gardens, either for lawns or walks, there fhould always be a good quantity of the white trefoil or Dutch clover fown with it ; for this will make a fine turf much fooner than any other fown grafs, and will continue a better verdure than any other of the grafstribe.

Inorder to keep grafs-plats or walks handfome, and in good order, you may fow in autumn frefh feed over any places that are not well filled, or where the grafs is dead: but nothing improves grafs fo much as mowing and conftant rolling.

When turf is laid in gardens, it is a general practice to cover the furface of the ground under the turf, either with fand or very poor earth : the defign of this is to keep the grais fine, by preventing its growing too rank. This is proper enough for very rich ground: but it is not fo for fuch land as is middling, or but poor ; for when this is practifed in fucl places, the grafs will foon wear out and decay in patches.

When turf is taken from a common or down, fuch ought to be chofen as is free from weeds: and when it is defigned to remain for years without renewing, a dreffing hould be laid upon it every other year, either of very rotten dung, afhes, or, where it can be eafily procured, very rotten tan; but thefe dreffings fhould be laid on carly in the winter, that the rain may wafl them into the ground, otherwife they will occafion the grafs to burn, when the warmth of the fummer begins.

When grafs is fodreffed, and well rolled and nowed, it may be keptovery beantiful for many years; but where it is not dreffed, or fed with theep, it will rarely continue handfome more than eight or ten years.

GRASSHOPPER, in zoology, a fpecies of gryllus. See Grylius.

GRATAROLUS (William), a learned phyfician in the i6th century, was born at Bergamo in Italy; and tanght phyfic with reputation at Padua: but having embraced the Proteftant religion, he retired to Switzerland; where he was made profeffor of phyfic. He died at Bafil in 1568, aged 52. He wrote feveral curious works in Latin; amongf which are, r. The manner of preferving and improving the memory. 2. Of preferving in health travellers, men of letters, magiftrates, and ftudious perfons, \&c.

GRATES for Fires, are compofed of ribs of iron
placed at fimall diftances from one another, fo that the airmay have fufficient accelsso the fuel, and the accumulation of the afhes, which would choke the fire, may be prevented.-Grates feem peculiarly adapted to the ufe of pit-coal, which requires a greater quantity of air to make it burn freely than other kinds of fuel. The hearths of the Britons feem to have been fixed in the centre of their halls, as is yet practifed in fome parts of Scotland, where the fire is nearly in the middle of the houfe, and the family fit all around it. Their fire place was perhaps nothing more than a large ftone, depreffed a little below the level of the ground, and thereby adapted to receive the afhes. About a century ago, it was only the floor of the room, with the addition of a bauk or hob of clay. But it was now. changed among the gentlemen for a portable firepan, raifed upon low fupporters, and fitted with a circular grating of bars. Such were in ufe among the Gauls in the firft century, and among the Wellh in the tenth.

GRATIAN, the fon of Valentinian I. by his firft wife, was declared Auguftus by his father at the city of Amiens in 365 , and fucceeded him in 367 ; a prince equally extolled for his wit, eloquence, modetty, chafity, and zeal againft heretics. He affociated Theodofius with him in the empire, and advanced the poet Aufoaius to the confulate. He made a great flaughter of the Germans at Strafburg *, and hence was furnamed Alentannicus. He was the firft emperor who refufed the title of Pontifex Maximus, upon the fcore of its being a Pagan dignity. He was affaflinated by Andragathius in 375, in the 24th year of his age.

Gratian, a famous Beriedictine monk, inthe 12 th century, was born at Chiufi, and employed near twenty four years in compoling a work, intitled Decretum, or Concordantia Difcordantium Canonum, becaufe he there endeavoured to reconcile the canons which feemed contradictory to each other. This work he publifhed in II 51. As he is frequently miftaken, in taking one canon of one council, or one paffage of one father, for another, and has often cited falfe decretals, feveral authors have endeavoured to correct his faults; and chiefly Anthony Auguftine, in his excellent work, intitled, De emendatione Gratiani. To the decretals of Gratian, the popes principally owed the great authority they exercifed in the thirteenth and following centuries.

GRATINGS, in a fhip, are fmall edges of fawed plank, framed one into another like a lattice or prifon grate, lying on the upper deck, between the mainmaft and fore-maft, ferving for a defence in a clofe fight, and alfo for the coolnefs, light, and conveniency of the fhip's company.

GRATIOLA, HEDGE Hyssop: A genus of the monogynia order, belonging to the diandria clafs of plants. The corolla is irregular ; there are two barren ftamina; the capfule is bilocular ; the calyx has feven leaves, with the two exterior ones patulous. There are four fpecies; the moft remarkable of which is the officinalis, or common hedge-hyfop. This grows naturally on the Alps and other mountainous parts of Europe. It hath a thick, flefhy, fibrous, creeping root, which propagates very much, when planted in a proper foil and fituation. From this arife feveral upright fquare ftalks, garnifhed with
narrow

* See Ar. gentora. :

Gratiola, narrow fpear-fhaped leaves, placed oppofite. The $\underbrace{\text { Gratitude. }}$ flowers are produced on the fide of the ftalks at each joint ; they are fhaped like thofe of the fox-glove, but are fmall, and of a pale yellowith colour.-This herb has an emetic and purgative virtue; to anfwer which intentions, it was formerly ufed by the common people in England, but was never much prefcribed by the phyficians, and at laft fell totally into difufe. Of late however, it has been the fubject of a differtation by Dr James Koftrzewfki of Warfaw, in Poland; who gives fome remarkable accounts of its effects in mania andobttinate venereal cafes. It was given in powder, or in extract, to the quantity of half a drachm of the firft, and a whole drachm of the fecond, at each dofe. From the cafes related in his differtation, the author draws the following conclufions: 1 . The gratiola may be given with fafety both to male and female patients. 2. In all diforders proceeding from a fuperabundance of ferum in the fluids, it appears to be a moft effectual remedy. 3. In confequence of this, it is had recourfe to with very great advantage in melancholy and mania ariling from that fate of the fyftem. 4. It powerfully promotes purging, vomiting, fweat, and urine ; and is therefore much fuperior to any of the ufual evacuating medicines, moft of which prove only active in promoting one of thefe difcharges at once. 5. The moft obitinate cafes of gonorrhœa, fluor albus, and venereal ulcers, are cured by the powder.-In fome inftances it has induced falivation; but whether or not it can always be made to produce that effect, is not as yet altoget her certain. 6. The powder of gratiola prepared from the extract, and exhibited with fugar, does not induce vomiting; and, on the contrary, the powder of the root always promotes that evacuation.

GRATITUDE, in ethics, a virtue difpofing the mind to an inward fenfe and outward ackno wledgment of benefits received.

Examples of ingratitude, Mr Paley obferves, check and difcourage voluntary beneficence; hence the cultivation of a grateful temper is a confideration of publicimportance. A fecond reafon for cultivating in ourfelves that temper is: That the fame principle which is touched with the kindnefs of a human benefactor, is capable of being affected by the divine goodnefs, and of becoming, under the influence of that affection, a fource of the pureft and moft exalted virtue. The love of God is the fublimeft gratitude. It is a miftake therefore, to imagine, that this virtue is omitted in the Scriptures; for every precept, which commands us 'to love God becaufe he firft loved us,' prefappofes the principie of gratitude, and directs it to its proper object.

It is impoffible to particularize the feveral expreffions of gratitude, which vary with the character and fituation of the benefactor, and with the opportunities of the perfon obliged; for this varicty admits of no bounds. It may be obferved, however, that on one part gratitude can never oblige a nan to do what is wrong, and what by confequence he is previoully obliged not to do: On the other part, it argues a total want of every generous principle, as well as of moral probity, to take advantage of that afcendency, which the conferring of benefits juftly creates, to draw or drive
thofe whom we have obliged into mean or difhoneft Gratitude. compliances.
The following pleafing example of genuine gratitude is extracted from Hackwel's Apol. 1. 14. c. 10. p. 436. -Francis Frefcobald, a Florentine merchant defcended of a noble family in Italy, had gained a plentiful fortune, of which he was liberal handed to all in neceffity; which being well known to others, though concealed by himfelf, a young ftranger applied to him for charity. Signior Frefcobald, feeing fomething in his counrenance more than ordinary, overlooked his tattered clothes; and compaffionating his circumftances, afked him "What he was, and of what country ?" "I am (anfwered the young man) a native of England; my name is Thomas Cromwell, and my father-in-law is a poor heer-man. I left my country to feek my fortune; came with the French army that were routed at Gatylion, where I was a page to a footman, and carried his pike and burgonet after him." Frefcobald commiferating his neceffities, and having a particular refpect for the Englifh nation, clothed him genteelly; took him into his houfe till he had recovered ftrength by better diet; and, at his taking leave, mounted him upon a good horfe, with 16 ducats of gold in his pockers. Cromwell expreffed his thankfulnefs in a very fenfible manner, and returned by land towards England; where, being arrived, he was preferred into the fervice of Cardinal Woolley. After the Cardinal's death, he worked himfelf fo effectually into the favour of King Henry VIII. that his majefty made him a baron, vifcount, earl of Effex, and at laft made him lord high chancellor of England. In the mean time, Signior Frefcobald, by repeated loffes at fea and land, was reduced to poverty ; and calling to mind (without ever thinking of Cromwell), that fome Englifh merchants were indebted to him in the fum of 15,000 ducats, he came to London to procure payment. Travelling in purfuit of this affair, he fortunately met with the lord chancellor as he was riding to court; who thinking him to be the fame gentleman that had done him fuch great kindnefs in Italy, he immediately alighted, embraced him, and with tears of joy afked him, If he was not Signior Francis Frefcobald, a Florentine merchant? "Yes, Sir (faid he), and your moft humble fervant." "My fervant! (faid the Chancellor) No ; you are my frecial friend, that relieved me in my wants, laid the foundation of my greatnefs, and, as fuch, I receive you; and, fince the affairs of my fovereign will not now permit a longer conference, I beg you will oblige me this day with your company at my houfe to dinner with me." Signior Frefcobald was furprifed and aftonithed with admiration who this great man fhould be that acknowledged fuch obligations, and fo paffionately expreffed a kindnefs for him : but, contemplating a while his voice, his mein, and carriage ; he concludes it to be Cromwell, whom he had relieved at Florence; and therefore not a lictle overjoyed, goes to his houfe, and attended his coming. His lor. hhip came foon after; and immediately taking his friend by the hand, turns to the lord high admiral and other noblemen in his company, faying, "Don't your lordfhips wonder that I am fo glad to fee this gentleman? This is he who firf contributed to my advancement," He

## GRA

Gratituce. then told them the whole fory ; and, holding him fill by the hand, led him into the dining-room, and placed him next himfelf at table. The company being gone, the Chancellor made ufe of this opportuaity to know what affair had brought him into England. Frefcobald in a few words gave him the true flate of his circumftances: To which Cromwell replied, "I am forry for your misfortunes, and I will make them as eafy to you as I can ; but, becaufe men ought to be juft before they are kind, it is fit I hould repay the debr I owe you." Then leading him into his clofet, he locked the door ; and opening a coffer, firft took out 6 ducats, delivering them to Frefcobald, and faid, "My friend, here is the money you lent me at Florence, with ten pieces you laid out for my apparel, and ten more you paid for my horfe; but confidering you are a merchant, and might have made fome advantage by this money in the way of trade, take-thefe four bags, in every one of which is 400 ducats, and enjoy them as the free gift of your friend." Thefe the modefty of Frefcobald would have refufed, but the other forced them upon him. He next caufed him to give him the names of all his debtors, and the fums they owed: which account he tranfinitted to one of his fervants, with a charge to find out the men, and oblige them to pay him in 15 days under the penalty of his difpleafure; and the fervant fo well difcharged his duty, that in a flort time the entire fum was paid. All this time Signior Frefcobald lodged in the Chancellor's houfe, where he was entertained according to his merits, with repeated perfuafions for his continuance in Eng. rani, and an offer of the loan of 60,000 ducats for four years if he would trade here: but he defired to return to Florence, which he did, with extraordinary favours from the Lord Cromwell.
There is a fpecies of grateful remorfe, which fometimes has been known to operate forcibly on the minds of the moft hardened in impudence. Of this Mr Andrews, who makes the remark, gives an inftance in the following anecdote, faid to have been a favourite one with the late Dr Campbell. "Towards the beginning of this century, an actor, celebrated for mimicry, was to have been employed by a comic author, to take off the perfon, the manner, and the fingularly aukward delivery of the celebrated Dr Woodward, who was intended to be introduced on the ftage in a laughable character, (viz. in that of Dr Foffle, in Three Hours after Marriage). The mimic drefled himfelf as a country man, and waited on the Doctor with a long catalogue of ailments, which he faid attended on his wife. The phyfician heard with amazement difeafes and pains of the moft oppofite nature, repeated and redoubled on the wretclied patient. For, fince the actor's greateft wilh was to keep Dr Woodward in his company as long as poffible, that he might make the more obfervations on his geftures, he loaded his poor imaginary fpoufe with every infirmity which had any probable chance of prolonging the interview. At length, being become completely matter of hiserrand, he drew from his purfe a gainea, and, with a fcrape, made an uncouth offer of it. 'Put up thy moncy, poor fellow' (cried the Doetor); 'thou haft need of all thy cafh and all thy patience too, with fuch a bundle of difeafes ti id to thy back.' The actor returned to his employer, and recounted the whole converfation,
with fuch true feeling of the phyfician's character, that the author fcreamed with approbation. His raptures were foon checked; for the mimic told him, with the emphafis of fenfibility, that he would fooner die than proftitute his talents to the rendering fuch genuine humanity a public laughing ftock. The player's name was Griffin."

GRATZ, a handfome ftrong town of Germany, and capital of Styria, with a caftle feated on a rock, and an univerfity. The Jefuits have a college here; and there are a great number of handfome palaces, and a fine arfenal. The cafte flands on a very lofty hill, and communicates with the river by means of a deep well. The emprefs-dowager was obliged to retire hither during the war of I 74 I and 1742 . It is feated on the river Muer, in E. Long. 16.25. N. Lat. 47. 4.

GRATIUS, a Latin poet, cotemporary with Ovid, the author of a poem intitled Gynegeticon, or the Manner of hunting with dogs; the beft edition of which is that of Leyden, 12 mo , with the learned notes of Janus Ulitius.
GRAVE, in granımar, a fpecies of accent oppofite to acute. The grave accent is expreffed thus ('); and flows, that the voice is to be depreffed, and the fyllable over which it is placed pronounced in a low deep tone.
Girave, in mufic, is applied to a found which is in a low or deep tone. The thicker the chord or Atring, the more grave the tone or note, and the fmaller the acuter. Notes are fuppofed to be the more grave, in proportion as the vibrations of the chord are lefs quick.
Grave, in the Italian mufic, ferves to denote the floweft mevement.
Grave is alfo ufed for a tomb, wherein a perfon defanct is interred.

Graves, among the Jews, were generally out of the city, though we meet with inftances of their interring the dead in towns. Frequent mention is made of graves upon mountains, in highways, in gardens, and private honfes. So that nothing on this head feems to have been determined. The fame may be obferved with refpect to the Greeks. The Thebans had a law that every perfon who built an houfe fhould provide a burial ground. Men who had diftinguilhed themfelves were frequently buried in the pablic foram. The moft general cuftom was, however, to bury out of the city, chiefly by the highway fide. The Romans were forbidden by the law of the 12 tables to bury or to burn the dead in the city; but fome we find had their fepulchres in Rome, though they paid a fine for the indulgence.
Grave, $^{\text {a very ftrong town of the Netherlands, in }}$ Dutch Brabant, feated on the river Maefe, beyond which there is a fort. E. Long. 5. 4I. N. Lat. 5 r . 46.

GRAVEL, in natural hiftory and gardening, a congeries of pebbles, which, mixed with a fliff loam, makes lafting and elegant gravel-walks; an ornament peculiar to Britifl gardens, and which gives them an advantage over thofe of other nations.
Gravel, in medicine. See the Index fubjoined to that article; and fee Alkali, nc 17.
Graves Walks. To make thefe properly, the boto tom fhould be laid with lime-rubbifh, large flint-ftones,

## GRA

Gravel or any other hard matter, for eight or ten inches thick, II to keep weeds from growing through, and over this Gravefande. the gravel is to be laid fix or eight inches thick. This ntould be laid rounding up in the middlé, by which
means the larger flones will run off to the fides, and may be raked away; for the gravel fhould never be fereened before it is laid on. It is a common miftake to lay thefe walks too round, which not only makes them uneafy to walk upon, but takes off from their apparent breadth. One inch in five feet is fufficient proportion for the rife in the middle; fo that $\mathbf{2}$ walk of 20 feet wide fhould be four inches higher at the middle than at the edges, and fo in proportion. As foon as the gravel is laid, it fhould be raked, and the large fones thrown back again : then the whole ffould be rolled both length wife and croffifife; and the perfon who draws the roller fhould wear fhoes with flat hecls, that he may make no holes; becaufe holes made in a new walk are not eafily remedied. The walks fhould always be rolled three or four times in very hard howers, after which they will bind more firmly than otherwife they could ever be made to do.

Gravel, with fome loam among it, binds more firmly than the rawer kinds; and when gravel is naturally very harfh and fharp, it is proper to add a mixture of loam to it. The beft gravel for walks is fuch as abounds with finooth round pebbles, which, being mixed with a little loam, are bound fo firmly together, that they are never afterwardsinjured either by wet or dry weather. Thefe are not fo liable to be turned up by the feet in walking, as the more irregularly fhaped pebbles, and remain much more firmly in their places after rolling.

GRAVELINES, a very ftrong fea-port town of the Netherlandsin French Flanders, with a caftle and harbour. It was ceded to France by the treaty of the Pyrenees, and is feated in a marfly country on the river Aa, near the fea, in E. Long. 2.13. N. Lat. 50.59 .

GRAVELLY IAND, or soll, that abounding with gravel or fand, which eafily admits of heat and moifture; and the more foney fuch lands are, the more barren they prove.

GRAVENAC, a town of Germany, in the circle of Suabia, and capital of a county of the fame name. E. Long. 8. 1 5. N. Lat. 48.22.

GRAVER, in the art of engraving, a tool by which all the lines, fcratches, and flades, are cut in copper, \&c. See Engraving.

GRAVESANDE (William James), was born of an ancient and honourable family at Delft in Holland, in 1688. He fludied the civil law at Leyden, but mathematical learning was his favourite amufement. When hehad taken his doctor's degree in 1 707, he fettled at the Hague, and practifed at the bar, in which fituation he cultivated ani acquaintance with learned men; with a fociety of whom, he publifhed a periodical review intitled Le fournal Litteraire, which was continued without interruption from the year 1713 to the year 1722, when he died. The moft confiderable of his works are, "A treatife on perfpective: An introduction to the Newtonian philofophy, or a treatife on the elements of phy fics confirmed by experiments; A treatife on the clements of algebra, for the ufe of young fudents;" and "A courfe of logic and meVoz. VIII.
taphyfics." He had intended to have prefented the Gravefend, public with a fyftem of morality, but his death pre- Giravina. vented the execution. The minifters of the republic confulted him on all occafions wherein his talents were requifite ; and his fkill in calculation was often of fervice to them ; as was his addrefs in decyphering, for detecting the fecret correfpondence of their enemies. As profeffor of mathematics and aftronomy at Leyden, none ever applied the powers of nature with more fuccefs, or to more ufeful purpofes.
GRAVESEND, a town of Kent in England, fituated on the banks of the Thames. It is 23 miles from London ; and has a blockhoufe well mounted with cannon, to command the fhips and river, directly oppofite to Tilbury fort in Effex. The town was plundered and burnt by the French and Spaniards in the reign of Richard II. to compenfate which, the king, at the requeft of the abbot of St Mary le-Grace of Tower-hill, to whom he had granted a manor there called Parrocks, vefted it and Milton with the fole privilege of carrying paffengers by water from hence to London at 4 s . the whole fare, or 2d. a head; which was confirmed by Henry VIII.; but now the fare is 9d. a head in the tilt-boat, and is. in the wherry. The former mult not take in above 40 paffengers, the latter no more than 8 . Coaches ply here at the landing of people from London, \&c. to carry them to Rochefter, at is. 6d. each. This town and Milton were incorporated by queen Elizabeth by the name of the portreeve (now the mayor), jurats, and inhabitants of Gravefend and Milton: And, as Gravefend is the place where moftpaflengers throughKent from foreign parts take boat for London, that queen, in order to fhow the grandeur of the metropolis of her kingdom, ordered the lord mayor, aldermen, and city companies, to receive all ambaffadors and eminent ftrangers here in their formalitics, and to attend them to London in barges if by water; or if they choofe to come by land, they were to meet them on horfeback on Blackheath in their livery-gowns. The towns for feveral miles round are fu pplied from hence with garden ftuffs; of which great quantities are alfo fent to London, where the afparagus of Gravefend is preferred to that of Batterfea. All outward-bound hips are obliged to anchor in this road till they lave been vifited by the cuftom-houfe officers; and for this purpofe a centinel at the block-houfe fires a mufket: but the homewardbonnd all pafs by without notice, unlefs it be to put waiters on board, if they are not fupplied before. As the outward-bound generally take in provifions here, the place is full of feamen, who are all in a harry. The whole town being burnt down in 1727,50001. was granted by the parliament in 173 r for rebuilding its church, as one of the 50 new ones. In I624, one Mr Pinnock gave 2I dwelling-houfes here, befides one for a mafter-weaver, to employ the poor ; and here is a charity-fchool for 24 boys, who are boch taught and cloathed. The town-houfe was erected in 1764 ; and in 1772 an act of parliament empowered the inhabitants to pave and light their ftreets.

GRAVINA, a town of Italy, in the kingdom of Naples, and Terra di Bori, with a bilhop's fee, and the title of a duchy. E. Long. 17. N, Lat. 4I.

Gravina (John Vincent), an eminent fcholar, and illuftrious lawyer of Italy, born at Roggiana in P

## G R A [ 122 ] R A

1054. He was profeffor of the canon law in the college of Sapienziat Rome; and though many foreign miniverfities made propofals to draw him to them, he never quitted that city, but died there in 1718 . His works are both curions and ufeful ; the greateft of them is-De ortu et progreffu faris Civilis. A collection of his works was printed in 4 to at Leipfic in 1737, with the notes of Mafcovius.

Gravina (Peter), an Italian poet, much efteemed by the great general Gonfalvo, and Profper Colonna. He wrote, in a pure Roman ftyle, Difcourfes on Matters relating to the Law and to the Belles Lettres, as well as Poems. He died in 1527.

GRAVITATION, in natural philofophy, is fometimes diftinguifhed from gravity. Thus M. Maupertuis takes grawity for that force whereby a body would fall to the earth; but gravitation for the fame diminifhed by the centrifugal force. See Newtonian Pbilofopby.

GRAVITY, or Gravitation (for the words are moft commonly ufed fynonymoully), fignifies either the force by which bodies are preffed towards the furface of the earth, or the manifeft effect of that force; in which laft fenfe the word has the fame fignification with weight or heavinefs.

Concerning gravity in the firft fenfe of the word, or that ative power by which all bodies are impelled towards the earth, there have been great difputes. Many eminent philofophers, and among the reft Sir Ifaac Newton himfelf, have confidered it as the firft of all fecond caufes; an incorporeal or fpiritual fubftance, which never can be perceived any other way than by its cffeets; an univerfal property of matter, \&c. Others have attempied to explain the phenomena of gravitation by the action of a very fubtile etherial fluid; and to this explanation Sir lfaac, in the latter part of his life, feens not to have been averfe. He hath even given a conjecture concerning the matter in which this fluid might occafion thefe phenomena. But for a full account of the difcoveries of this great philofopher concerning the laws of gravitation, the conjectures made byhim andothers concerning its caufe, the various objections that have been made to his doctrine, and the fate of the difpute at prefent, fee the articles Nelutonian Philefophy Astronomy, Atmosfhere, Earth, Eiectricity, Fire, Light, Attragtion, Repuision, Plenum, Vacuum, \&c.

Specific $G_{\text {RaVItr }}$, denotes the weight belonging to an equal bulk of every different fubftance. Thas the exact weight of a cubic inch of gold, compared with a cubic inch of water, tin, lead, \&e. is called its /pecific gravity: See Hydrostatics.

GRAUNT (Johni), anthor of a curious and celebrated book, intitled, Natural and Polizical Obfervaticns made upon the Bills of Mortality. He was a haberdafher of fmall wares; but laid down histrade, and all public employments, on account of his religion. He was educated a puritan; afterwards profeffed himfelf a Socinian ; yet in the latter part of his life declared himfelf of the Roman Catholic religion. He was a member of the royal fociety, and died in 1674.
. GRAY, or Grey, a mixed colour partaking of the two extremes, black and white. See BLACK, $n^{\circ} 8$, 9, 10. and Dyeing, no 82, and 90 .

In the manege they make feveral forts of grays;
as the branded or blackened grey, which has fpots Gray. quite black difperfed here and there. The dappled gray, which has fpots of a darker colour than the reft of the body. The light or filver gray, wherein there is but a fmall mixture of black hairs. The fad or iron gray, which has but a fmall mixture of white. And the brownif or fandy-coloured gray, where there are bay-coloured hairs mixed with the black.

Gray, a town of France, in the Franche Compte, and capital of the bailiwick of Amont. It is a trading place, and feated on the river Saone, in E. in Long. 5 . 41. N. Lat. 47. 30.

Gray (Lady Jane). See Grey.
Gray (Thomas), an admired Englifh poet, was the youngeft and only farviving fon of a reputable citizen of London, and was born in Cornhill in 1716 . He was educated at Eton, where he contracted a friendhip with MrHorace Walpole, and with Mr Richard Weft fon of the lord chancellor of Ireland. Mr Wen and Mr Gray were both intended for the bar ; but the former died early in life, and the latter was diverted from that purfuit by an invitation to accompany Mr Walpole in his travels; which he accepted without any determined plan for his future life. During Mr Gray's travels, he wrote a variety of letters to Mr Weft and to his parents, which are printed with his poems; and when he returned, finding himfelf in narrow circumftances, yet with a mind indifpofed for active employment, he retired to Cambridge, and devoted himfelf to ftudy. Soon after his retarn, his friend Weft died: and the melancholy impreffed on him by this eventmay be rraced in his admired " Elegy written in a country churchyard;" which is thought to have been begun, if not finifhed, at this time: though the conclution, as it ftands at prefent, is certainly different from what it was in the firft manufcript copy. The firf impulfe of his forrow for the death of his friend gave birth to a very tender fonnet in Englifh, on the Petrarchian model ; and alfo to a fublime apoftrophe in hexameters, written in the genuine ftrain of claffical majefty, with which he intended to begin one of his books De Principiis cogitandi.

From the winter of the year 1742 , to the day of his death, his principal refidence was at Cambridge : from which he was feldom abfent any confiderable time, except between the years 1759 and 1762 ; when, on the opening of the Britinh Mufeum, he took lodgings in Southampton-row, in order to have recourfe to the Harleian and other manuferipts there depofited, from which he made feveral curious extracts, amounting in all to a tolerable-fized folio, at prefent in the hands of Mr Walpole.

About the year 1747, Mr Mafon, the editor of Mr Gray's poems, was introduced to him. The former had written, a year or two before, fome imitations of Milton's juvenile poems, viz. A Monody on the death of Mr Pope, and two pieces-intitled Il Bellicofo and Il Pacifico on the peace of Aix-la-Chapelle; and the latter revifed them, at the requeft of a friend. This laid the foundation of an intimacy which continued without interruption to the death of Mr Gray.

About the year 1750, Mr Gray had pat his laft hand to his celebrated Elegy written in a country church-yard, and had communicated it to his friend Mr Walpole, whofe good tafte was too much charmed

## GRA

with it to fuffer him to with-hold the fight of it from his acquaintance. Accordingly it was thown about for fome time in manufcript, and received with all the applaufe it fo juftly merited. At laft the publifler of one of the magazines having obrained a furreptitious copy of it, Mr Gray wrote to Mr Walpole, defiring that he would put his own manufeript into the hands of Mr Dodiley, andorder him to print it immediately. This was the moft popular of all our author's publications. It ran through eleven editions in a very fhort fpace of time; was finely tranflated into Latin by by Meffrs Anlly and Roberts; and in the fame year by Mr Lloyd.

From July 1659 to the year 1762 , he generally refidedia London, with a view, as we have already obferved, of having recourfe to the Britifh Mufenm. In July 1758 , his grace the duke of Grafton wrote him a polite letter, informing him, that his majefty had been pleafed to offer to him the profeflorhip of Modern Hiftory in the univerfity of Cambridge, then vacant by the death of Mr Laurence Brocket. This place was valuable in itfelf, the falary being 400 l . ayear; but what rendered it particularly acceptable to Mr Gray was its being given him without any folicitation. He was indeed remarkably difinterefted in all his purfuits. Though his income, before this addition, was very fmall, he never read or wrote with a view of making his labours ufeful to himfelf. He may be faid to have been one of thofe few perfonages in the annals of literature, efpecially in the poetical clafs, who are devoid of felf intereft, and at the fame time attentive to econony; and alfo was among mankind in general one of thofe very few economifts, who porfefs that talent, untinctured with the flighteft ftain of avarice. When his circumftances were at the loweft, he gave away fuch fums in private charity, as would have done credit to an ampler purfe. But what chiefJy deterred him from feeking any advantage by his literary purfuits, was a certain degree of pride, which led him to defpife the idea of being thought an author by profeffion.

However, it is probable, that early in life he had an intention of publifling an edition of Strabo; for his papers contain a great number of notes and geographical difquifitions on that author, particularly with refpect to that part of Afia which comprehends Perfia and India. The indefatigable pains which he took with the writitings of Plato, and the quantity of critical as well as explanatory obfervations which he has left upon almoft every part of his works, plainly indicate, that no man in Europe was better prepared to republifh and illuftrate that philofopher than Mr Gray. Another work, on which he beftowed uncommon labour, was the Anthologia. In an interleaved copy of that collection of Greek epigrams, he has tranferibed feveral additional ones, which he felected in his extenfive reading; has inferted a great number of crisical notes and emendations, and fubjoined a copions index. But whether he intended this performance for the prefs or not, is uncertain. The only work which be meditated upon with this direct view from the beginning was a hiftory of Englifh poetry, upon a plan Sketched out by Mr Pope. He has mentioned this himfelf in an advertifement to thofe three fine imitations of Norfe and Welch poetry, which he gave the
world in the laft edition of his poems. But after he had made fome conliderable preparations for the cxecation of this delign, and Mr Mafon had offered him his affiftance, he was informed, that Mr Warton, of Trinity College, Oxford, was engaged in a work of the fame kind. The underaking was therefore relinquifhed, by mutal confent; and foon after, on thist gentleman's defiring a fight of the plan, our author readily fent him a copy of it.

Among other fciences, Mr Gray had acquired a grear knowledge of Gothic archicecture. He had feei: and accurately ftudied in his yonth, while abroad, the Roman proportions on the fpot, both in auciert times, and in the works of Palladio. In his later years he applied himfelf to confider thofe ftupendous firucture: of more modern date that adorned his own country ; which, if they have not the fame grace, have cisdoubtedly equal dignity. He endeavoured to tace thin mode of building from the time it commenced through its various changes, till it arrived at its perfection it: the reign of Henry VIII. and ended in that of Eliza beth. For this purpofe, he did not fo much depend upon written accounts, as that intermal evidence which the buildings themfelves give of their refpeetive antiquity ; fince they conftantly furnifh to the wellinformed eye, arms, ornaments, and other marks, by which their feveral ages may be afcertained. On this account he applied himfelf to the ftudy of heraldry as a preparatory fcience; and has left behind him a number of genealogical papers, more than fufficient to prove him a complete mafter of it. By thefe means he arrived at fo very extraordinary a pitch of fagacity, as to be enabled to pronounce, at firft fight, on the precife tinte when every particular part of any cathedral was erected. But the favourite ftudy of Mr Gray for the laft ten years of his life was natural hiftory, which he then rather refumed than began; as by the inftructions of his uncle Antrobus, he was a confiderable botanift at 15 . The marginal notes which he has left on Linnæus and other writers on the vegetable, animal, and foffile kingdoms, are very numerous: but the molt confiderable are on Hudfon's Flora Anglica, and the tenth edition of the Syftema Natura; which latter he interleaved and filled almoft entirely. While employed on zoology, he read Arifotle's treatife on that fub. ject with great care, and explained many difficult paffages of that obfcure ancient by the lights he had received from modern naturalifts. In a word, excepting pure mathematics, and the ftudies dependent on that fcience, there was hardly any part of human learning in which he had not acquired a competent fkill, and in moft of them a confummate maftery. To this account of his literary character we may add. that be had a fine tafte in painting, prints, gardening, and mufic; and was moreover a man of good-breeding, virtue, and humanity.

He died in 1771 ; and an edition of his poems, with memoirs of his life and writings, were publifled in 4to, in 1775 , by Mr Mafon. This gentleman, however, inftead of employing his own penin drawing Mr Gray's character, has adopted one drawn by the Rev. Mr'Temple, rector of Mamhead in Devonflire, inaletter to Mr Bofwell; to whom the public are indebted for communicating it. "Perhaps (fays Mr Temple) he was the moftlearned man in Europe. He was equally acquainzed

## $G R A \quad[124] \quad G R A$

with the elegant and profound parts of fcience, and that not fuperficiaily but thoroughly. He knew every branch of biftory, boln natural and civil; had read all the original hiftortans of England, rrance, and Italy: and was a great dmiquariain. Criticifm, metaphylics, morals, politics, made a principal part of his plan of ftudy ; voyages and travels of all forts were his favonrite amufement; and he had a fine tafte in painting, prints, architecture, and gardening. With fuch a fund of knowledge, his cunverfation mut have been equally inftructing and entertaining ; but he was allo a good man, a well-bred man, a man of virtue and humanity. There is no character without fome fpeck, fome imperfection; and I think the greateft defect in his was an affectation in delicacy, or rather effeminacy, and a vifible faftidioufnefs, or contempt and difdain of his inferiors in fcience. He alfo had, in fome degree, that weaknefs which difgufted Voltaire fo much in Congreve : though he feemed to value others chiefly according to the pregrefs they had made in knowledge, yet he could not bear to be confidered himfelf merely as a man of letters; and though without birth, or fortune, or ftation, his defire was to be looked upon as a private independent gentleman, who read for his amufement. Perkaps, it may be faid, What lignifies fo much knowledge, when it produces fo little ? Is it worth taking fo much pains to leave no memorial but a few poems? But let it be confidered, that Mr Gray was, to others, at leaft innocently employed: to himfelf, certainly beneficially. His time paffed agreeably; he was every day making fome new acquifiion in fcience ; his mind was enlarged, his heart foftened, and his virtue ftrengthened; the world and mankind were fhown to him without a matk; and he was taught to confider every thing as tritiling, and unworthy the attention of a wife man, except the purfuit of knowledge, and the practice of virtue in that ftate wherein God hath placed us."

GRAYLING, in ornitbology, a fpecies of Saimo.
In angling for this filh your hook muft be armed npon the fhanks with a very narrow plate oflead, which flould be fiendereft at the bent of the hook, that the bait (which is to be a large grahopper, the uppermoft wing of which muft be pulled off) may come over to it the more eafily. At the point let there be a cadbait in a continual motion. The jag-tail, which is a worm of a pale flefh-colour, with a yellow tag on its. tail, is an excellent bair for the grayling in March and April.
GREASE, a fwelking and gourdinefs of the legs of a horfé. See Farriery, §xxvi.

GREAT, a Eerm of comparifon, denoting a thing to have more extention that fome other to which it is referred. Thus we fay, a great fpace, a great diftance, a great figure, a great body, \&c.

Great is likewife ufed figuratively in matters of morality, \&c. to fignify ample, noble, ele vated, extraordinary, important, \&ic. Thus we fay, Shakefpeare was a great genius, Da Vinci a great painter, Gälileo a great philofopher, Boffu a great crilic, \&c.

Great is alfo a title or quality appropriated to certain princes and other illuftrious perfonages. Thus we fay, the great Turk, the great Mogul, the great. cham of Tartary, the great duke of Florence, \&c.

Great is alfo a farmame beftowed on feveral kings.
and emperors. Thus we fay, Alexander the geent ; Cyrus the great ; Charles the great, or Charlemagne; Henry the great of France, \& c.

Great is alfo applied to feveral officers who have pre-eminence ever others. Thus we fay, the lord great chamberlain; the great marlhal of Poland, \&c.

GREATER tone, in mufic. Sec Tone.
GREAVES (John), an eminent phyfician and antiquary, was the eldeft fon of John Greaves rector of Colemore, near Alresford in Hamphire, and born in 1602. He was educated in Baliol College in Oxford, from which he removed to Merton. He was afterwards, on the foot of his great merit, chofen geometry profeffor of Grefham College. His ardent thirft of kuowledge foon carried him into feveral parts of Europe, where he eagerly feized every opportanity of improving it. His liext voyage was into the eaftern countries; where nothing remarkable in the heavens, earth, or even fubterraneous places, feems to have efcaped his nice obfervation. He, with indefatigable induftry, and even at the peril of his life ${ }_{2}$, collected a confiderable number of Arabic, Perfic, and Greek, manufcripts, for archbilhop Laud. Of thefe he well knew the value, as he was a matter of the languages in which they were written. He alfo collected for that prelate many oriental gems and ceins. He took a more accurate furvey of the pyramids than any traveller who went before him. On his return from the Eaft, he vilited feveral parts of Italy a fecond time. During his ftay at Rome, he made a particular inquiry into the true fate of the ancient weights and meafures. Soon after he had finifled his fecond voyage, he was chofen Savilian profeffior of aftronomy ar Oxford. He was eminently qualified for his proteflorthip, as the works of ancient and modern aftronomers were famin liar to him. His books relating to oriental learning, his Pyramidographza, or a defription of the pyramide in Egypt, his Epocha Celebriores, and other curious and ufeful pieces, of which Mr Ward has given us a catalogue, flow him to have been a great man. Thofe which he intended to publifh would have thown him to be a greater ; but he was ftopped in his, great career by death in 1642 .

GREBE, in ornithology. Sec Colymbus.
GREECE, the prefent Romelia, and in many refpects one of the moft defervedy celebrated countries in the world, was anciently buanded on the north by Macedonia and the river Strymon; on the weft by the Ionian fea; on the fouth by the Mediterranean; on the caft by the Egean fea and Archipelago. It extended from the Scrymon, by which it was parted from Thrace, to the promontory of Tenarus, the fouthmoft point of Peloponnefins, now the Morea, about $6^{\circ} 20^{\prime}$ of latitude, or nearly 440 Englifh miles, and in breath from eaf to weft about 359 miles.

The general names by which the inhabitants of this country were known to the ancients were thofe of Graioi, or Graicoi, from whence the name of Creece is plainly derived. Thefe names are thought to come from Grexus, the father, or (accurding to fome) the fon, of Theffalus, who gave name to Theffaly ; but fome modern critics choofe to derive it from Ragat, the fane with Reu, the fon of Peleg, by the tranfpolition of a letter to foften the found.- Thefe names were afterwards changed for Abheia and Hellenes; the firft, as is fappofed,

## GRE <br> GRE

Greece. fuppoied, from Acheus, the fon of Xuthus, the fon of Hellen, and father of Ion ; or, according to the fable, the fon of Jupiter: the other from Hellen, abovementioned, the fon of Deucalion, and father of Dorus, from whom came the Dores, afterwards a famous nation among the Greeks.-A Another name by which the Greeks were known in fome parts of the country, was that of Pelafgi, which the Arcadians, the moft ancient people in Greece, daduced from their pretended founder Pelafyus; who is faid to have got fuch footing in Peloponnefus, that the whole peninfula from him was called Pelafgia. But the moft ancient name of all is univerfally allowed to have been that of Iones, which the Greeks themfelves derived from Ion the fon of Xuthus; or, as the fable hath it, of Apollo, by Creufa the daughter of Erichtheus the grandfon of Deucalion. Jofephus, however, affirms, that their original is of much older date ; and that Javan, the fon of Japher, and grandfon of Noah, was the firft who peopled thefe countries; which Bochart hath alfo rendered very probable. It is true, indeed, that among the Greeks themfelves, only the Athenians, and fuch colonies as fprung from them, were called Iones; but it is alfo plain bejond exception, that other nations gave this name to all the inhabitants of Greece.

The inhabitants of Greece in the firft ages, even by the confeffion of their own hiftorians, appear to have been favages fcarce a degree remoyed from brutes. They lived indifferently on every fruir, herb, or root that cance in their way ; and lay either in the open fields, or at beft fheltered themfelves in dens, caves, and hollow trees; the country itfelf in the mean time remaining one continued uncultivated defart.-The firft improvement they made in their way of living, was the exchanging of their old food for the more wholefome acorns, building huts for themfelves to Heep in, and covering their bodics with the $\mathbb{k}$ ins of beatts. For all this it feems, they were beholden to Pelafgius abovementioned (fuppofed by fome to be Peleg fpoken of in Scripture), and who was highly reverenced by them on that account. -This reformation in their way of life, however, it feems wrought none in their manners. On the contrary, they who had nothing to fight for but a hole to fleep in, began now to envy and rob one another of thefe flender acquifitions. This, in procefs of time, put them under a neceffity of joining themfelves into companies under fome head, that they mighteither more fafely plunder their neigh. bours, or preferve what they had got. Laws they had none, except that of the fword : fo that thofe only lived in fafety who inhabited the moft barren and craggy places; and hence Greece for a long time had no fettled inhabitants, the weakeft being always curned out by the ftrongeft. Their gigantic fize and frength, if we may belicve Plutarch added fo much to their infolence and cruelty, that they feemed to glory in committing the greateft acts of violence and barbarity on thofe that unhappily fell into their hands.

The next advance towayds civilization, was their forming themfelves into regular focieties, to cultivate the lands, and build themfelves towns and cities for their fafety. Their original barbarity and mutual violences againft each other naturally prevented them from uniting as one nation, or even into any confiderable community: and hence the great number of
ftates into which Greece was originally divided. The moft remarkable of thefe fmall principalities mentioned in hiftory are the following: In Peloponnefus were thofe of Sicyon, Argos, and Meffenia, Achaia Propria, Arcadia, and Laconia. In Grecia Propria (that part of Greece which lay without Peloponnefus), were thofe of Attica, Megara, Bœotia, Locris, Epichnemidia, Doris, Phocis, Locris, Ozolæa, and Erolia. In Epirus were the Moloffi, Amphilochi, Cafliopæi, Dræopes, Chaoces, Threfpotii, Almeni, and Acarnani. In Theffaly were thofe of Theffaliotis, Eftiotis, Pelafgiotis, Magnefia, and Phthia.-All thefe have at one time or other been feverally governed by kings of their own, though we only find the names of many of them mentioned in the hiftories of the more confiderable kingdoms of Sparta, Attica, Thebes, \&c. -The erection of thefe kingdoms, however, for fome time, did not much alter the cafe; the inhabitants of the new kingdoms plundered and deftroyed one another without mercy. Attica was the only place in any degree free from thefe incurfions, becaufe it was naturally defitute of every thing that could invite a plundering enemy ; but thofe cities fared much worfe which werie fituated on the fea-coalts ; becaufe they were in continual danger of being plundered either by fea or land : for pirates at that time did not lefs infeft all thofe feas than robbers did the land. And this was one main caufe why moft of the ancient cities of Greece were fituated at fome confiderable diftance from the fhore ; but even in thefe, as all their fafety confifted in the refiftance they could make againft an invader, their inhabitants were under a neceffity of going conftantly armed, and being ever on their guard.

Another mifchief arifing from thefe continual piracies and robberies was, that they occalioned the far greater part of the-lands to lie uncultivated, fo that the people only planted and fowed as much as was barely neceflary for their prefent fupport; and where there was fuch an univerfal neglect of agriculture, there could be as little room for any difcoveries in other ufeful arts and trades. Hence, when other nations, as the Jews, Egyptians, Midianites, Phoenicians, \&c. had improved themfelves to a very high degree, the Greeks feem to have been utter Arangers to every ufeful art.

During this period of favage barbarity, the nof renouned Grecian heroes, as Hercules, Thefeus, \&c. performedtheir exploits; which, however exaggerated by poetic fiction, no doubt had a foundation in trath. Some indeed are of opinion that the Grecian heroes are entirely fictitious, and their exploits derived from thofe of the Hebrew worthies, fuch as Samfon, Gideon, \&c. Yet, confidering the extreme degree of barbarity which at that time prevailed throughout Greece, it feems not at all improbable that fome perfons of extraordinary ftrength and courage might undertake the caufe of the opprefed, and travel about like the more modern knights-errant in queft of adventares.

The firft expedition in which we find the Greeks united, was that againft Troy, the particulars of which are recited under the article Trov. Their fuccels here (which happened about $1184 \mathrm{~B} . \mathrm{C}$.) coft them very dear ; vaft numbers of their braveft warriors being flain; great numbers of the furvivors being caft

Greece.
 -

Greece. away in their rcturn; and many of thofe who had the good luck to get back again, being foon after murdered, or driven out of their country. It is probable, however, that their having ftaid for fuch a long time in Afia, might contribute to civilize the Greeks fomewhat fooner than what they otherwife would have been ; and accordiugly from this time, we find their hiftory fomewhat lefs obfcure, and as it were begining to emerge out of darknefs. The continual wars, indeed, in which they were engaged among themfelves, no doubt, for along time, prevented them from making any confiderable progrefs in thofe arts in which they afterwards made fo great progtefs. Thefe wars, which indeed never ceafed as long as the Greeks preferved their liberty, rendered them brave, and killed in the military art, above all cther nations; but at the fame time they effectuallyprevented them from making permanent conquefts, and confined them within the bounds of theirown country; while the different ftates were one way or other fo equally balanced, that fcarce one of them was able perfectly to fubdue another. The Spartans, however, having, with great difficulty, reduced the kingdom of Meffene, and added its territories to their own, became the leading people in Greece. Their fuperiority was long difputed by Athens; but the Petoponnetian war at laft determined that point in favour of the Spartans, when the city of Athens was taken, and its walls demolithed by Lyfander the Spartangeneral. See Attica, no i64.-By the battle of Leuctra, the Spartans lolt that fuperiority which they had maintained for 500 years, and which now devolved on the Thebans. After the death of Epaminondas, the celebrated Theban general, however, as no perfon was found poffeffed of his abilities, the Thebans were again obliged to yleld the fuperiority to the Spartans. But by this time the Greeks had become acquainted with the luxuries and elegancies of life; and all the rigour of their original laws could not prevent theim from valuing thefe as highly as other people. This did not indeed abate their valour, but heightened their matual animolities; at the fame time that, for the fake of a more eafy and comfortable life, they became more difpofed to fubmit to a mafter. The Perfians, whofe power they had long dreaded, and who were unable to refift them by force of arms, at laft found out (by the advice of Alcibiades) the proper method of reducing the Grecian power ; namely, by affifting them by turns, and fapplying one fate with money to fight againft another, till they fhould all be fo much reduced, that they might become an eafy prey. Thus the Greeks were weakened, though the Perfians did not reap any benefit from their weaknels. Philip of Macedon entered into the fame political views; and partly by intrigue, partly by force, got himfelf declared Generalifimo of Greece. His fucceflor Alexander the Great completed their fubjection; and by deftroying the city of Thebes, and exterminating its inhabitants, ftrack fach terror throughout Greece, that he was as fulJy obeyed by all the fates as by any of the reft of his fribjects. During his abfence in Perfia, however, they attempted to thake off the Macedonian yoke, but were quelled by his general Antipater. The news of Alexander's death was to them a matter of the utmoft joy; but their mutual animofties prevented them
from joining in any folid plan for the recevery of their liberties, and hence they continued to be oppreffed by Alexander's fucceffors, or other tyrants, ill Aratus, an Achran, about 268. B. C. formed a defign of fetting his country free from thefe oppreflors. He perfuaded a number of the finall republics to enter into a league for their own defence, which was called the Achean league; and notwithftanding that the repoblics, taken fingly, had very liitle ftrength, they not only maintained their independency, but foon became formidable when united. This aflociation continued to become daily more and more powerful ; but received a fevere check from Cleomenes, king of Sparta, which obliged them to call in Antigonus to their afliftance. This prince overcame Cleomenes at the battle of Sellafia, and afterwards made himfelf mafter of Sparta. Thus he became a more formidable enemy than the one he had conquered, and the recovery of the Grecian liberties was incomplete.

Soon after this, the Greeks began to feel the weight of a power more formidable than any which they had yet experienced; namely, that of the Romans. That infidious and haughty republic firft intermeddled witli the Grecian affairs, under pretence of fetting them at liberty from the oppreffion of Philip of Macedon. This, by a proper union among themfelves, they might have accomplifhed: but in this they acted as though they had been infaruated; receiving with the utmoft joy the decree of the Roman conful, who declared them free; without confidering, that he who had thus given them liberty, might take it away at his pleafure. This leffon, however, they were foon taught, by the total reduction of their country to a Roman province; yet this can farce be called a misfortune, when we look back to their hiftory, and confider their outrages upon one another : nor can we fympathife with them for the lofs of that liberty which they only made ufe of to fill their country with flaughter and bloodthed. After their conqueft by the Romans, they made no united effort to recover their liberty. They continued in quitt fabjection till the beginning of the 15 th century. About that time, they began to fuffer under the tyranny of the Turks, and their fufferings were completed by the taking of Conftantinople in 1453. Since that tine, they have groaned under the yoke of a moft defpotic government; fo that alltraces of their former valour, ingenuity, and learning, are now in a manner totally extinet.

Modern Greece comprehends Macedonia; Albania, now called Arnaut; Epirius; Theffaly, now Jana; Achaia, now Livadia; the Peloponnefus, now Morea; together with the iflands on its coaft, and in the Archipelago. The continent of Greece is feated betwixt the 36 th and 43 d degrees of north latitude; and between the igth and 27 th degrees of longitude, ealt of London. To the north it is bounded, by Bulgaria and Servia, from which it is divided by a ridge of mountains; to the fou: $h$, by the Mediterrancanfea; to the eaft, by Romania and the Archipelago; and to the weft, by the Adriatic, or gulph of Venice. Its length is faid to be about 400 miles, and its utmoft breadth about 350 miles. The air is extremely temperate and healthy : and the foil fruitful, though badly cultivated ; yielding corn, wine, delicious fruits, and abounding with catrle, fowls, and venifon. As to re-
ligion,

## G R E

Greece, ligion, Chriftianity was planted in Greece foon after Greek, the death of our Saviour, and flourifhed there for many
ages in great purity; but fince the Greeks became fubject to the Turkifh yoke, they have link into the moft deplorable ignorance, in confequence of the flavery and thraldom under which they groan, and their religion is now greatly corrupted. It is indeed little better than a heap of ridiculous ceremonies and abfurdities. The head of the Greek church is the patriarch of Conftantinople; who is chofen by the neighbouring archbinops and Metropolitans, and confirmed by the emperor or grand vifir. He is a perfon of great dignity, being the head and director of the eaftern church. The other patriarchs are thofe of Jerufalem, Antioch, and Alexandria. Mr Tournefort tells us, that the patriarchates are now generally fet to fale, and beftowed upon thofe whoare the higheft bidders. The patriarchs, metropolitans, archbihops, and bihops, are alwayschofen from among the Caloyers or Greek monks. Before the patriarchs receive their patents and the caftan, which is a velt of linfey-woolfey, or fome otherftuff, prefented by the grand fignior to a mbaffadors and otherperfons newly invefted with fome confiderable dignity, they are obliged to make large prefents to the vilir, \&c. The income of the patriarch of Conftaninople is faid to amount to no lefs than one hundred and twenty thoufand guilders, of which he pays the one half by way of annual tribute to the Ottoman Porte, adding fix thoufand guilders belides as a prefent at the fealt of Bairam. The next perfon to a bifhop among the clergy is an archimandrite; who is the director of one or more convents, which are called mandren; then come the abbot, the arch-prieft, the prieft, the deacon, the under-deacon, the chanter, and the lecturer. The fecular clergy are fubjected to no rules, and never rife higher than high-prieft. They are allowed to marry once; but it muft be with a virgin, and before they are ordained. They have neither glebe nor tythes, but depend on the perquifites that arife from their office; and they feldom presch but in Lent. The Greeks have few nunneries; but a great many convents of monks, who are all pricfts, and, itudents excepted, obliged to follow fome handicraft employment, and lead a very auftere life. The Greeks deny the fuprenacy of the pope, and abhor the worfhip of images; but have a multitude of pictures of faints in their churches, whom they pray to as mediators. Their fafts are very fevere. They believe alfo in the doctrine of tranfubitantiation, and that the Holy Ghof does not proceed from the Son. They admit not of purgatory, fays Mr Thevenot: but yet they allow a third place, where they fay the bleffed remain, in expectation of the day of judgment. At mafs they confecrate with leavened bread; and communicate under both kinds, as well laics as priefts, and as well women and children as men. When they carry the facrament to the fick, they do not proftrate themfelves before it, nor expofe it to be adored; neither do they carry it in proceffion, or have any particular feaft in honour of it. Baptifm is performed among them by plunging the whole body of the child thrice into water. Immediately after baptifin, they give it confirmation and the communion; and feven days after that, it undergoes the ceremony of ablution. When a prieft is married, among other ce-

## 127 ] <br> G R E

remonies, the bridegroom and bride drink each two Greece, glaffes of wine; then the glafs is given to the prieft, who merrily drinks off the reft of the wine, and breaking the glafs, fays, So may the bridegroom break the virginity of the bride. As to the character of the modern Greeks, they are faid to be very covetous, hy pocritical, treacherous, great pederafts, and at the fame time revengeful to the higheft degree ; but very fuperftitious. They are fo much defpifed by the Turks, that thefe do not value even a Greek who turns Mahometan. The Turks are remarkable for their taci. turnity, they never ufe any unneceffary words; but the Greeks, on the contrary, are very talkative and lively. The Turks generally practife what their religion enjoins, but the Greeks do not ; and their mifery puts them upon a thoufand mean hifts and fcandalous practices, authorized by bad example, and perpetuated from father to fon. The Greck woment have fine features and beautiful complexions : their countenances fill very much refemble thofe of the ancient Greek ftatues.

GREEK, or Grecian, any thing belonging to ancient Greece.

The Greek language, as preferved in the writings of the celcbrated authors of antiquity, as Homer, Hefiod, Demoltheues, Arifotle, Plato, Xenephon, \&c. has a great variety of terms and expreffions, fuitable to the genius and occations of a polite and learned people, who bad a talte for arts and fciences. In it; proper names are figurative; which is the reafon that the modern languages borrow fo many terms from it. When any new invention, inftrument, machine, or the like, is difcovered, recourfe is generally had to the Greek for a name to it ; the facility wherewith words. are there compounded, affording fuch as will be expreffive of its ufe : fuch are, barometer, hygrometer, microfcope, telefcope, thermometer, \&c. But of all fciences, medicine mon abounds with fuch terms; as. diaphoretic, diagnolis, diarrhœa, hæmorrhage, bydrophobia, phthifis, atropiny, \&c. Befides the copioufnefs and lignificancy of the Greek, wherein it excels moft, if not all, other languages, it has alfo three numbers, viz. a fingular, dual, and plural : alfo abundance of tenfes in its verbs, which makes a variety in difcourfe, prevents a certain drynefs that always accompanies too great an uniformity, and renders that language peculiarly proper for all kinds of verfe. The ufe of the participles, of the aorift and preterite, toge. ther with the compound words already mentioned, give it a peculiar force and brevity without taking any thing from its perfpicuity.

It is no eafy matter to aflign the precife difference between the modern and ancient Greek ; which confifts in the terminations of the nouns, pronouns, verbs, \&c. not unlike what obtains between fome of the dialects of the Italian or Spanifh. There are alfo in the modern Greek many new words, not to be met with in the ancient. We may therefore diftinguifh three ages of the Greek tongue : the firft of which ends at the time when Conftantinople became the capital of the Roman empire; the fecond lafted from that period to the taking of Conftantinople by the Turks; and the third from that time to this.

Green-
houle.
which is eftablifhed in Greece; extending likewife to fome other parts of Iurkey. See Greece.-It is thus called in Europe, Afia, and Africa, in contradibinction from the Latin or Romifh church; as alfo the Eaftern church, in diftinction from the Weftern.

The Romanilts call the Greek church the Greek fchifm; becaule the Grecks do not allow the authority of the pope, but depend wholly, as to matters of religion, on their own patriarchs. They have treated them as fchifmatics ever fince the revolt, as they call it, of the patriarch Photius.

GREEK Alonks and Nuns, of whateverorder, confider St Badil as their founder and common father, and efteem it the higheft crime to deviate in the leaft from his conftitutions. There are feveral beautiful convents with churches, in which the monks perform divine fervice day and night. Some of the monks are canobites, or live together, wear the fame habit, eat at the fame table, and perform the fame exercifes and employments.

GrEEK Orders, in architecture, are the Doric, Ionic and Corinthian; in contradiftinction to the two Latin orders, the Tufcan and Compofite. See Order.

GREEN, one of the orignal prifmatic colours, exhibited by the refraction of the rays of light. See Chromatics and Cofour.

Green, among painters and dyers. See ColourMaking, $\mathrm{n}^{\circ}$ 27. and Dyeing, $\mathrm{n}^{\circ} 93$ - 95.

GREEN. Gloth, a board or court of juftice held in the compting-houfe, of the Britich king's houfehold, compofed of the Lord Steward and officers under him, who fit daily. To this court is committed the charge and overfight of the king's houfehold in matters of juftice, and government, with a power to correct all offenders, and to maintain the peace of theverge, or jurifdiction of the court-royal; which is every way about 200 yards from the laft gate of the palace where his majefty refides.

It takes its name, board of green cloth, from a green cloth. fpread over the board where they fit.

Without a warrant firft obtained from this court, none of the king's fervants can be arrefted for debt.

Clexks of the Green Cloth were two officers of the board of green cloth, who appointed the diet of the king and his houfehold ; and kept all records, legers, and papers relating thereto; make up bills, parcels, and debentures for falaries, and provifions and neceffaries for the officers of the buttery, pantry, cellar, \&c. They alfo waited upon foreign princes when entertained by his majefty. But this has been lately abolithed.

GREEN Finch, in ornithology, the Englifh name of the greenifh fringilla, with the wings and tail variegated with yellow. See Fringilia.

GreEs-Houfe, or Confervatory, a houfe in a Garden, contrived for heltering and preferving the moft curious and tender exotic planus, which in our climate will not bear to be expofed to the open air, efpecially during the winter feafon. Thefe are generally largeand beautiful ftructures, equally ornamental and ofefol.

The length of greenhoufes muft be proportioned to the namber of plants intended tobe preferved in them, and cannot therefore be redaced to rule : but their depth fhould never be greater than their height in the clear; which, in fmall or middling houfes, may be 16 or I8 feet, but in large ones from 20 to 24 feet; and
the length of the windows fhould reach from about one foot and a half aluve the pavement, and within the fame diftance of the cieling, which will admit of a corniche round the buildingover the heads of the windows. Their breadth cannot be in proportion to their length; for if in the largeit building they are more than feven or feven feet and ahalf broad, they will be extremely heavy and inconvenient. The piers between the windows muft be as narrow as may be to fupport the building; for which reafon they fhould either be of ftone or hard burnt bricks. If the piers are made of ftone, they fhould be 30 inches wide in front, and floped off behind to about 18 inches, by which means there will be no corners to take off the rays of the fun. If they are of brick, they will require to be at leaft three feet in front; but they fhould be in the fame manner floped off behind. Over the greenhoufe may be rooms for drying and preferving feeds, roots, \&c. and behind it a place for tools and other purpofes; and both thefe behind, and the rooms above, will be of great ufe in keeping off the frofts, fo that the wall between thefe need not be of more than two bricks and a half in thicknefs.

The floor of the greenhoufe, which fiould be laid either with Bremen fquares, Purbeck ftone, or flat tiles, muft be raifed two feet above the furface of the adjoining ground, or if the fituation be damp, at leaf, three feet; and if the whole is arched with low brick arches under the floor, they will be of great fervice in preventing damps; and under the floor, about two feet from the front, it will be very advifeable to make a flue of ten inches wide and two feer deep; this fhould be carried the whole length of the houfe, and then returned back along the hinder part, and there be carried up into funnels adjoining to the tool-houfe, by which the fmoke may be carried off. The fire-place may be contrived at one end of the houfe, and the door at which the fuel is put in, as alfo the afh-gate, may be contrived to open into the tool-houre, and the fuel being laid in the fame place, the whole will be out of fight. Bradley advifes, that the front of greenhoufes, in the colder parts of England, be built in a fweep or femicircle, fo that one part or other of it may receive the fun's rays all day. The nfe of fires muft, however, be very fyaring in this place; and it is not one winter in three or four that will require them in any part, only when the weather is very fevere, and the froft cannot well be kept out any other way, this is an expedient that is good to have in readinefs, as it may fave a whole houfe of plants. Withinfide of the windows, in front of the greenhoufe, there fhonld be good ftrong fhutters, made with hinges, to fold back clofe to the piers, that they may not obftruct the rays of the fun. The back part of the houfe thould be either laid over with ftucco or platered with mortar, and whitewathed, in order to prevent the frofty air from penetrating through the walls. When the greenhoule is wainfcorted, the walls fonld be plaftered with lime and hair behind the wainfoot, to keep out the colds and the wainfcot, as well as the ceiling, and every part within the houfe, thould be painted white, for the reffection of the fun's rays. There muft be a nnmber of treffels with forms of wood upon them, to fupport the pots of plants; the talleft to be placed hindmoft, thelaweft within four feet of the windows: and

Greenhoufle.

## GRE

Oreen. the rows of plants flould rife gradually, fo that the heads of the fecond row thould be eatirely above the firft; and behiad them there fhould be a fpace of at leaft five feet, for the convenience of watering the plants, and for a free circulation of air. It has been obferved, that the placing of the euphorbinms, cereufes, and other fucculent plants among orange-trecs, and other common greenhoufe-plants, is al ways deftructive of them, by making them receive an improper fort of efllavia, which plants of that kind imbibe very freely. They fhould therefore be placed in two wings luilt at each end of the greenhoufe; which, if well contrived, will be a great beauty as well as ufe to the building. Thefe wings may be made capable of a greater warmth alfo by more flués, and may be made to contain a hot-bed of tanners bark for the raifing many of the tender plants, natives of warm climates.

Whilf the front of the greenhoufe is exactly fouth, one of the wings may be made to face the fouth eaft and the other the fouth-weft. By this difpofition the heat of the fun is reflected from one part of the building to the other all day, and the front of the main greenhoufe is guarded from the cold winds. Thefe two wings may be fo contrived as to maintain plants of different degrees of hardinefs, which may be eafily effected by the fituation and extent of the fire-place, and the manner of condacting the flues: the wing facing the fouth-eaft is evidently the moft proper for the warmeft fove; this may be divided in the middle by a partition of glafs, with glafs-doors opening from one divifion to the other. In each of thefe there fhould be a fire-place, with flues carried ap againft the back-wall, through which the finoke hould be made to pais as many times the length of the houfe as the height will admit of the number of flues; for the langer the fimoke is in paffing, the more heat will be given to the houfe with a lefs quantity of fuel. The other wing, facing the fouth-weft, fhould be divided and furnifhed with flues in the fame manner; and thus different degrees of heat may be obtained, according to the feafons and the particular forts of plants that are to be preferved. If there are no fheds behind thefe wings, the walls should not be lefs than three bricks thick; and the back part, having floping roofs, which are covered with tiles or flates, fhould be lined with reeds, \&c. under the covering. The floping glaffes of thefe houfes thould be made to fide and take off, fo that they may be drawn down more or lefs in warm weather to admit air to the plants; and the upright glafes in front may be fo contrived as that every other may open as doors upon hinges, and the alternate glates may be divided into two : the upper part of each fhould be fo contrived as to be drawn down like fafhes, fo that either of them may be ufed to admit air in a greater or lefs quantity as there may be occafion.
As to the management of the plants herein, Mortimer recommends the opening of the mould about them from time to time, and fprinkling a little frefh mould in them, and a little warm dung on that; as alfo to water them when the leaves begin to wither and curl, and not oftener, which would make them fade and be fickly; and to take off fuch leaves as wither and grow dry.
Green-Sicknefs (Cblorofis). See Index fabjoined to Medicine.

Vol. Vili.
$G_{\text {REEN }}$ Silver, the name of an ancient cuftom within Grentats: the manor of Writtel in the county of Effex in England; which is, that every tenant whofe fore-door opens to Greenbury flaall pay an half-penny yearly to the lord, by the name of green-filver.
$G_{\text {REEN }}-W a x$, is ufcd wherc eftates are delivered to the fheriffs out of the exchequer, under the feal of that court, made in green wax, to be levied inthe feveral counties. This word is mentioned the 43d ftat. Ed. III. c. g. and 7 Hen. IV. c. 4 .
GREENLAND, a general name by which are denoted the moft eafterly parts of America, fretching towards the north pole, and likewife fome illands to the northward of the continent of Europe, lying in very high latitudes.
This country is divided into Weft and Eat Greenland. -Weft Grcenland is now determined liy the laten Wcft maps to be a part of the continent of America, though Grcenlani upon what authority is not wery clear. That part of defribedir which the Eurapeans have any knowledge of is bounded on the weft by Baffin's Bay, on the fouth by Davis's Straits, and on the eaft by the northern part of the Atlantic Ocean. It is a very mountainous country, and fome parts of it fo high that they may be difcerned 30 leagues off at fea. The inland monntains, hills, and rocks, are covered with perpetual fnow ; but the low lands on the fea-fide are clothed with verdure ir the fummer feafon. The coaft abounds with inlets, bays, and large rivers; and is furrounded with a valt number of illands of different dimenfions. In a great many places, however, on the eaftern coalt efpecially, the fhore is inaccefible by reafon of the floating mountains of ice. The principal river, called $B$ aal, falls into the fea in the 64th degree of lationde, where the firft Danifh lodge was built 7 72I; and has been navigated above 40 miles up the comntry.

Weft Greenland was firft peopled by Europeans in the eighth century. At that time a company of Icelanders, headed by one Ericke Rande, were by accident driven on the coaft. On his return he repreiented the country in fuch a favourable light, that fome families Peupled by again followed him thither, where they foon became a a colony thriving colony, and beftowed on their new habitation from Icethe name of Groenland, or Greenland, on account of its land, verdant appearance. This colony was converted to Chriftianity by a miffionary from Norway, fent thither by the celebrated Olaf, the firft Norwegian monarch who embraced the true religion. The Grecnland fettlement continued to increafe and thrive under his protection; and in a little time the country was provided with many towns, churches, convents, bifhops, \&c. under the jurifdiction of the archbifiop of Drontheim. A confiderable commerce was carried on between Greenland and Norway; and a regular intercourfe maintained between the two countries till the year 1406, when the laft bifhop was fent over. From that time all correfpondence was cut off, and all know- fpondence ledge of Greenland has been buried in ollivion.

This ftrange and abrupt ceffation of all trade and denly cut intercourfe has been attributed to various caufes; but off. the moft probable is the following. The colony, from its firft fettlement, had been haraffed by the natives, a barbarous and favage people ; agrecing in cuftoms, garb, and appearance, with the Efquimaux found about Hudfon's Bay. This nation, called Schrellings, Q

## G R E

Greenland. at length prevailed againft the Iceland fettlers who inhabited the weftern diftriet, and exterminated them in the 1 4th century : infomuch, that when their brethren

## Colony

 fuppofed to be exterminated. of the , eaftern diftrict came to their affiftance, they found nothing alive but fome cattle and flocks of fheep running wild about the country. Perhaps they themfelves afterwards experienced the fame fate, and were totally deftroyed by thefe Schrellings, whofe defcenants ftill inhabit the weftern parts of Greeńland, and from tradition confirm this conjecture. They affirm that the houfes and villages, whofe ruins fill appear, were inhabited by a nation of ftrangers, whom their anceftors deftroyed. There are reafons, however, for believing that there may be ftill fome defcendants of the ancient Iceland colony remaining in the eaftern diftrict, though they cannot be vifited by land, on account of the ftupendous mountains, perpetually covered with fnow, which divide the two parts of Green. land; while they have been rendered inacceflible by fea, by the vaft quantity of ice driven from Spitzbergen, or Eaft Greenland. One would imagine that there muft have been fome confiderable alteration in the northern parts of the world fince the 15 th century, fo that the coaft of Greenland is now become almoft totally inacceflible, though formerly vifited with very little difficulty. It is alfo natural to aik, By what means the people of the eaftern colony furmonned the abovementioned obitacles when they went to the affiftance of their weftern friends; how they returned to their own country; and in what manner hiftorians learned the fuccefs or their expedition? Concerning5 all this we have very little fatisfactory information. Account of All that can be learned from the moft authentic rethe colony. çords is, that Greenland was divided into two diftricts, called Wefl Bygd and Eaft Bygd: that the weftern divifion contained four parifhes and 100 villages: that the eaftern diftrict was fill more flourifhing, as being nearer to Iceland, fooner fettled, and more frequented by hipping from Norway. There are alfo many accounts, though moft of them romantic and fightly attefted, which render it probable that part of the eaftern colony fill fublifts, who, at fome time or other, may have given the imperfect relation abovementioned. This colony, in ancient times, certainly comprehended twelve extenfive parifhes, one hundred and ninety villages; a biffop's fee, and two monafteries. The prefent inhabitants of the weftern diftrict are entirely ignorant of this part, from which they are divided by rocks, mountains, and deferts, and ftill more effectually by their apprehenfion: for they believe the eaftern Greenlanders to be a cruel, barbarous nation, that deftroy and eat all ftrangers who fall into their hands. About a century afterall intercourfe between Norway and Greenland had ceafed, foveral flips were fent fuccelfively by the kings of Demmark in order to

6 Attempts to redificover the zountry. difcover the eaftern diftrict ; but all of them mifcarried. Among thefe adventurers, Mogens Heinfon, after having furmounted many difficulties and dangers, got fight of the land; which, however, he conld not approach. At his return, he pretended that the fhip was arrefted in the middle of her courfe by certain

## 130 ] G R E

rocks of loadftone at the bottom of the fea. The Greenland. fame year, 1576 , in which this attempt was made, has been rendered remarkable by the voyage of Captain Martin Frobifher, fent upon the fame errand by Queen Elizabeth. He likewife defcribed the land; but conld not reach it, and therefore returned to England; yet not before he had failed fixty leagues in the ftrait which ftill retains his name, and landed on feveral iflands, where he had fome communication with the natives. He had likewife taken poffeflion of the country in the name of Queen Elizabeth; and brought away fome pieces of heavy black ftone, from which the refiners of London extracted a certain proportion of gold. In the enfaing fyring he undertook a fecond voyage, at the head of a fmall fquadron, equipped at the expence of the public ; entered the ftraits a fecond time; difcovered upon an ifland a gold and filver mine; beftowed names upon different bays, illands, and headlands; and brought away a lading of ore, together with two natives, a male and a female, whom the Englifh kidnapped.

Such was the fuccefs of this voyage, that another armament was fitted out under the aufices of Admiral Frobifher, confifting of 15 fail, inclading a conliderable number of foldiers, miners, fmelters, carpenters, and bakers, to remain all the winter near the mines in a wooden fort, the different pieces of which they carried out in the tranfports. They met with boifterous weather, impenetrable fogs, and violent currents upon the coaft of Greenland, which retarded their operations until the $f t$ afon was far advanced. Part of their wooden fort was loft at fea; and they had neither provifion nor fuel fufficient tor the winter. The admiral therefore determined to return with as much ore as he could procure: of this they obtained large quantities out of a new mine, to which they gave the name of the Countefs of Suffex. They likewife built an houfe of fone and lime, provided with ovens; and here, with a view to conciliate the affection of the natives, they left a quantity of fraall morrice-bells, knives, beads, look-ing-glaffes, leaden pictures, and other toys, together with feveral loaves of bread. They buried the timber of the fort where it could be eafily found next year ; and fowed corn, peafe, and other grain, by way of experiment, to know what the country would produce. Having taken thefe precautions, they failed from thence in the beginning of September; and after a month's ftormy paffage, arrived in England: but this noble defign was never profecuted.

Chriftian IV. king of Denmark, being defirous of difcovering the old Greenland fettlement, fent three fhips thither, under the command of Captain Godike Lindenow; who is faid to have reached the eaft coaft of Greenland, where he traded with the favage inhabitants, fuch as they are fill found in the weftern difrict, but faw no figns of a civilized people. Had he actually landed in the eaftern divifion, he muft have perceived fome remains of the ancient colony, even in the ruins of their convents and villages. Lindenow kidnapped two of the natives, who were conveyed to Copenhagen; and the fame cruel fraud (A) was practifed
(A) Nething can be more inhoman and repugnant to the dicates of common juftice than this practice af tearing away poor creatures from their country, their families, and connections: unlefs we fappofe them alto-

## GRE [ 131$] \quad$ GRE

Greenland. tifed by other two Ghips which failed into Davis's Straights, wherethey difcovered divers fine harbours, and delightful meadows covered with verdure. in fome places they are faid to have found a conliderable quantity of ore, every hundred pounds of which yielded twenty-fix ounces of filver. The fame Admiral Lindenuw made another voyage to the coalt of Greenland in the year 1606, directing his courfe to the weftward of Cape-Farewell. He coafted along the ftraits of Davis; and having made fome obfervations on the face of the country, the harbours and iflands, returned to Dcumark. Carften Richards, being detached with two hiips on the fame difcovery, deferied the high land on the eaftern fide af Greenland; but was hindered by the ice from approaching the flore.
Other expeditions of the fame nature have been planned and executed with the fame bad fuccefs, under the aufpices of a Danifh company of merchants. Two hips recurned from the weftern part of Greenland loaded with a kind of yellow fand, fuppofed to contain a large proportion of gold. This being affayed by the goldfmiths of Copenhagen, was condemned as ufelefs, and thrown overboard; but from a fmall quantity of this fand, which was referved as a curiofity, an expert chemift afterwards extracted a quantity of pure gold. The captain, who brought home this adventure, was fo chagrined at his difappointment, that he died of grief, without having left any directions concerning the place where the fand had been difcovered. In the year 1654, Henry Moller, a rich Dane, equipped a yeffel under the command of David de Nelles, who failed to the weft coaft of Greenland, from which he carried off threc women of the country. Other efforts have been made, under the encouragement of the Danifh king, for the difcovery and recovery of the old Iceland colony in Greenland; but all of them mifcarried, and people began to look upon fuch expeditions as wild and chimerical. At length the Greenland company at Bergen in Norway, tranfported a colony to the weftern coaft, about the 64th degree of latitude; and thefe Norwegians failed in the year 1712, accompanied by the Reverend Hans Egede, to whofe care, ability, and precifion, we owe the beft and moft authentic account of modern Greenland. This gentlman endeavoured to reach the eaftern diftrict: by coafting fouthwards, and advanced as far as the States Promontory; but the feafon of the year, and continual ftorms, obliged him to return ; and as he could not even find the Strait of Forbifher, he con-
cluded that no fuch place ever exifted. In the ycar cirenlanit. 1724, a fhip being equipped by the company, failed on this difcovery, with a view to land on caft hide oppofite to Iceland; but the vaft fhoals of ice, which barricadoed that part of the coalt, rendered this fcheme impracticable. His Danifh majefty, in the year 1728 , caufed horfes to be tranfported to Grecnland, in hope that the fettlers might by their means travel over land to the eaftern ditrict; but the icy mountains were found impaffable. Finally, licutenant Richards, in a fhip which had wintered near the new Danifh colony, attempted, in his return to Denmark, to land on the eaftern fhore; but all his endeavours proved abortive.

Mr Egede is of opinion, that the only practicable method of reaching that part of the country, will be to coalt north-about in fmall veffels, between the great flakes of ice and the fhore; as the Greenlanders have declared, that the currents continually rufhing from the bays and inlets, and running fouth-weftwards along the fhore, hinder the ice from adhering to the land; fo that there is always a channel open, through which veffels of finall burden might pafs, efpecially if lodges were built at convenient diftances on the fhore,for the convenience and direction of the adventurers.

That part of the country which is now vifited and MrEgede's fettled by the Danes and Norwegians, lies between account of the 64 th and 68 th degrees of north latitude; and thus the counfar it is faid the climate is temperate. In the fum- try. mer, which continues from the end of May to the middle of September, the weather is warm and comforttortable, while the wind blows eafterly; though even at this time forms frequently happen, which rage with incredible violence; and the fea coafts are infefted with fogs that are equally difagreeable and unhealthy. Near the fhore, and in the bays and inlets, the low land is clothed with the moft charming verdure: but the inland mountains are perpetually covered with ice and fnow. To the northward of the 68th degree of latitude the cold is prodigioufly intenfe ; and towards the end of Auguft all the coalt is covered with ice, which never thaws till April or May, and fomotimes not till the latter end of June. Nothing can exhibit a more dreadful, and at the fame time more dazzling appearance, than thofe prodigious maffes of ice that furround the whole coaft in various forms, reflecting a multitude of colours from the fun-beams, and calling to mind the enchanted fcenes of romance. Such profpects they yield in calm weather; but when the wind Q2
begins
gether deftitute of natural affection ; and that this was not the cafe with thofe poor Greenlanders, fome of whom were brought alive to Copenhagen, appears from the whole tenor of their conduct, upon their firft capture, and during their confinement in Denmark. When firft captivated, they rent the air with their cries and lamentations : they even leaped into the fea; and, when taken on board, for fome time refufed all fuftenance. Their eyes were continually turned towards their dear country, and their faces always bathed in tears. Even the countenance of his Danifh majefty, and the careffes of the court and people, could not alleviate their grief. One of them was perceived to thed tears always when he faw an infant in the mother's arms; a tircum ftance from whence it was naturally concluded, that he had left his wife with a young child in Greenland. Two of them went to fea in their little canoes in hope of reaching Greenland; but one of them was retaken. Other two made the fame attempt; but were driven by a form on the coaft of Schonen, where they were apprehended by the peafants, and reconveyed to Copenhagen. One of them afterwards died of a fever, caught in 'fifhing pearl, daring the winter, for the governor of Kolding. The reft lived fome years in Den nark; but at length feeing no profpect of being able to revifit their native country, they funk into a kind of melancholy diforder, and expired.

## GRE $\left[\begin{array}{cc}132 & ]\end{array}\right]$ G R E

Greenland. begins to blow, and the waves to rife in vaft billows, the violent fhocksof thofe pieces of ice dafling againft one anotherfill the mind with horror--Greenland is feldonn vilted with thunder andlightning, but the $A u$ rora Borealis is very frequent and bright. At the time of new and full moon, the tide rifes and falls upon this coaft about three fathoms; and it is remarka le, that the fprings and fountains on fhore rife and tall with the flux and reflux of the ocean.

The foil of Greenland varies like that of all other mountainons countries. The hills are very barren, being indeed frozen throughout the whole year ; but the valleys and low grounds, efpecially near the fea, are rich and fruifful. The ancient Norwegian chronicles inform us, that Greenland formerly produced a great number of cattle; and that confiderable quantitities of butter and cheefe were exported to Norway; and, on account of their peculiar excellency,fet apart for the king's.ufe. The fame hiftories inform us, that fome parts of the country yielded excellent wheat; and that large oaks were found here, which carried acorns as big as apples. Some of thefe oaks ftill remain in the fouthern parts, and in many places the marks of ploughed land are eafily perceived. At prefent, however, the country is deftitute of corn and cattle, though in many places it produces excellent pafture; and if properly cultivated, would probably yield grain alfo. Mr Egede fowed fome barley in a bay adjoining to the Danifl colony. It fprang up fo faft, that by the latter end of July it was in the full ear ; but being nipped by a night-froft, it never arrived at maturity. This feed was brought from Bergen; where the fummer is of greater heat and duration than in Greenland; but in all probability the corn which grows in the northern parts of Norway would alfo thrive here. Turnips and coleworts of an excellent tafte and flavour are alfo produced here. The fides of the mountains near the bays are clothed with wild thyme, which diffufes its fragrance to a great difance. The herb tormentil is very common in this country, and likewife many others not defcribed by the botanifts. Among the fruits of Greenland we number juniper-berries, blue-berries, bil-berries, and brambleberries.

Greenland is thought to contain many mines of metal though none of then are wrought. To the fouthward of the Danilh colony are fome appearances of a mine of copper. Mr Egede once received a lunp of ore from one of the natives; and here he found calamine of a yellow colour. He once fent a conliderable quantity of fand of a y yllow colour, intermixed with ftreaks of vernilion, to the Bergen company. They probably found their account in this prêfent; for they defired him by a letter to procure as much of that fand as poffible: but he was never able to find the place where he faw the firf fpecimen. It was one of the fmalleft among a great number of iflands; and the mark he had fet up was blown down by a violent ftorm. Poffibly this might be the fame mineral of which Captain Frolifher brought fo much to England. This country produces rock-cryftals borh red and white, and whole mountains of the afbeftos or incombuftible flax. Around the colony, which is known by the name of Good Hope, they find a kind of baftard marble of varions colours, which the natives form into
bowls, lamps, pots, \&c. All that has been faid of Greenland: the fertility of Greenland, however, maft be underftood only of that part which lies between the 6oth and 65 thr degrees of latitude. The moft northern parts are totally deftitute of herbs and plants. The wretched inhabitants, cannot find grafs in fufficient qualities to fluff into their hoes to keep their feet warm, but are obliged to buy it from thofe who inhabit the more fouthern parts.

The animals which abound moft in Greenland are, rein-deer, foxes, hares, dogs and white bears. The hares are of a white colour, and very fat; the foxes are of different colours, white, greyifh, and bluifh; and fmaller than thofe of Denmark and Norway. The natives keep a great number of dogs, which are large, white, or fpeckled, and rough, with ears flanding upright, as is the cafe with all the dogs peculiar to cold climates. They are tinorous and ftupid; and neither bay nor bark, but fometimes howl difmally. In the northern parts the natives yoke them in fledges; which, though heaven laden, they will draw on the ice at the rate of 70 miles in a fhort winter's day. Thefe poor animals are very ill rewarded for their fervice; being left to provide tor themfelves, except when their mafters happpen to catch a great number of feals. On thefe occafions the dogs are regaled with the blood and entrails'; at other times they fubfift, like wild beafts, upon mufcles and berries، Here alfo are found great numbers of ravens, eagles of a prodigious fize, falcons, and other birds of prey ; and likewife a kind ${ }^{\text {. }}$ of linner, which warbles very melodioully. Whales, fword-fifh, porpoifes, \&c. abound on the coafts; alfo holybut, turbot, cod, haddock, \&c. The more dubious animals alfo, called mermaids, fea-ferpents, and krakens, faid to be found on the coaft of Norway, are faid likewife to dwell in thefe feas. Mr Egede affares us, that in the year 1734, the fea-ferpent was feen off the new Danifh colony, and raifed its head mart high above the furface of the water. See Kraken, Mermaid, and Sea-Serpents.

The people who now inhabit the weftern coaft of Account of Greenland, and who, without doubt, are the defcen- the inhabidants of the ancient Schrellings, who exterminated the ${ }^{\text {tants. }}$ firft Iceland colony, bear a near refemblance to the Samoiedes and Laplanders in their perfons, complexions, and way of life. They are horr, brawny, and inclined to corpulency; with broad faces, flat nofes, thick lips, black liair and eyes, and a yellowintawney complexion. They are for the moft pare vigorous and healthy, but remarkably fhort-lived; few of them reaching the grand climacteric ; and many dying in their infancy, and in the prime of youth. They are fabject to a weaknefs in the eyes, occafioned by the piercing winds and the glare of the fnow in the wintertime. The leprofy is known among them, but is not contagious. Thofe that dwell in the northern parts are miferably tormented with dyfenteries, rheums, and. pulmonary diforders, boils, and epilepfy. The fmallpox being imported among them from Copenhagen in the year 1734, made terriole havoc among thefe poor people, who are utterly deflitute of any knowledge of the medicinal art, and depend entirely for affiftance upon the angekuts or conjurers. In their difpofitions the Grecnlanders are cold, phlegmatic, indolent, and flow of apprehenfion; but very quier, orderly, and

Greenland. good-natured. They live peaceably together ; and have every thing in common, without ftrife, envying, or animofity. They are civil and hofpitable, but fovenly to a degree almoft beyond the Hottentots themfelves. They never walh themfelves with water ; but lick their paws like the cat, and then rub their faces with them. They eat after their dogs without wafhing their difhes; devour the lice which devour them; and even lick the fweat, which they fcrape off from their faces with their knives. The women walh themfelves with their own urine, which they imagine makes their hair grow; and in the winter-time go out immediately atter, to let the liquor freeze upon their fkin. They will often eat their victuals off the dirty ground, without any veffel to hold them in ; and devour rotten flefl with the greateft avidity. In times of fearcity they will fubbift on pieces of old fkin, reeds, fea-weed, and a root called tugloronet, dreffed with trail-oil and fat. The dung of rein-deer taken from the inteftines, the entrails of partridges, and all forts of offals, are counted dainties anong thefo favages; and of the fcrapings of feals 1 kins they make delicate pan-cakes. At firft they could not tafte the Danifh provifions without abhorrence; but now they are become extremely fond of bread and butter, though they ftill retain an averfion to tobacco and firitituous liquors ; in which particular they differ from almoft all favages on the face of the earth.

The Greeenlanders commonly content themfelves with one wife; who is condemned, as among orher favage nations, to do all the drudgery, and may be corrected, or even divorced, by the hufband at pleafure. Heroes, however, and extraordinary perfonages, are indulged with a plarality of wives. Their young women are generally chafte and baffful; but at fome of their fealts, in the midft of their jollity, a man retires with his neighbour's wife belind a curtain made of fkins ; and all the guefts, thus coupled, retire in their turns. The women think themfelves happy if an angekut or prophet will thas honour them with his carefles. Thefe people never marry within the prohibited degrees of confanguinity, nor is it counted decent in a couple to marry who have been educated in the fame family.-They have a number of ridiculous and fuperfitious cuftoms; among which the two following are the moft remarkable. While a woman is in labour, the goflips hold a chamber-pot over her head, as a charm to haften the delivery. When the child is a year old, the mother licks and flabbers it all over, to render it, as the imagines, more ftrong and hardy.

All the Greenlanders hithertoknown fpeak the fame language, though different dialects prevail in different parts of the country. It abounds with donbie confonants; and is fo guttural, that the pronnciationof many words is not to be learned except by thofe who have been accuftomed to it from their infancy. The letters C, D, F, Q, and X, are not known in their alphabet. Like the North Americans, and inhabitants of Kamfchatka, they have a great number of long polyfyllables. Their words, nouns as well as verbs, are inflected at the end by varying the terminations without the help of articles; but their language being found defeative, they have adopted a good many words from the Norwegian dialect. Notwithflanding the endeavours of the Danif mifionaries,
they have no great reafon to boaft of the profelytes Grceniand. they have made of the natives of Greenland. Thefe favages pay great deference and refpect to the Danes, whom indeed they obey as their mafters, and hear the traths of the Chriftian religion expounded with: out doubting the veracity of their teachers; but at the fame time they liften with the moft mortifying indifference, without being in the leaft influenced by what they have heard. They believe in the immortality of the fool, and the exiftence of a fpirit whom they call Torngarfuk; but of whom they have formed the mof ridiculous notions. The Angekuts, who are fuppofed to be his immediate minifters, differ concerning the principles of his exiftence; fome affirming that he is without form or thape; others, that he has the fhape of a bear; others, that he has a large haman body with only one arm; while others affirm that he is no larger than a man's finger, with many other abfurdities of a fimilar kind. They have alfo a peculiar kind of mythology, by which they believe all the elements to be full of firits, from among which every one of their prophets is fupplied with a familiar which they name Torngack, and who is always ready when fuminoned to his affiftance.

The Greenlanders are employed all the year round either in fifhing or hunting. At fea they purfue the whales, morfes, feals, fifl for eating, and fea-fowl. On fhore they hunt the rein-deer in different parts of the country. They drive thefe animals, which feed in large herds, into a narrow circle or defile, where they are eafily flain with arrows. Their bow is made of fir-tree, wound about with the twifted finews of animals: the ftring is compofed of the fame ftuff, or of feal dkin: the arrow is a good fathom in length, pointed with a bearded iron, or a tharp bone; bur thofe with which they kill birds are blant, that they may not tear the flefh. Sea-fowls they kill with lances, which they throw to a great diftance with furprifing dexterity. Their manner of catching whales: is quite different from that practifed by the Europeans. About 50 perfons, men and women, fet out in one long boat, which is called a kone-boat, frome kone a 'woman,' bésaufe it is rowed by females only. When they find a whale, they frike him with harpoons, to which are faftened with long lines fome feals fkins blown up like bladders. Thefe, by fioating on the furface, not only difcover the back of the whate, bur hinder him from diving under water for any length of time. They continue to purfie him until he lofes. ftrength, when they pierce him with fpears and lancestill he expires. On this occalion they are clad in their fpring coats confifting of one piece, with gloves, boots, caps made of feal fkin for clofely laced and fewed that they keep out water. Thus accoutred, they letp into the fea; and begin to lice off the fat, even under water, before the whale is dead. - They have many different ways of killing feals; namely, by fticking them with a fmall harpoon equipped arfo. with an air-bag; by watching them when they come to breathe at the air-holes in the ice, and friking them with fpears; by approacbing them in the difouife of their own fpecies, that is, covered with a feal-fkin, creeping upon the ice, and moving the head from fide to fide as the feals are accuromed to do. By this framtagen the Greenlander moves towards the mufur.

## G R E

Greendand. pecting feal, and kills him with a fpear. The Greenlanders angle with lines nade of whale-bone cut very finall, by means of which they fucceed wonderfully. The Greenland canoe, like that ufed in Nova Zembla and Hudfon's bay, is about three fathoms in length, pointed at both ends, and three quarters of a yard in breadth. It is compofed of thin rafts faftened together with the finews of animals. It is covered with dreffed feal-fkins both below and above, in fuch a manner that only a circular hole is left in the middle, large enough to admit the body of one man. Into this the Greenlander thrufts himfelf up to the waint, and faftens the fkin fo tight about him that no water can enter. Thus' fecured, and armed with a paddle broad at both ends, he will venture out to fea in the moft flormy weather to catch feals and fea-fowl ; and if he is overfet, he can eafily raife himfelf by means of his paddle. A Greenlander in one of thefe canoes, which was brought with him to Copenhagen, outfripped a pinnace of 16 oars, manned with choice mariners.-The kone-boat is made of the fame materials, but more durable; and fo large, that it will contain 50 perfons with all their tackle, baggage, and provifions. She is fitted with a maft, which carries a triangular fail made of the membranes and entrails of feals, and is managed without the help of braces and bowlings. Thefe kones are flat bottomed, and fometimes 60 feet in length. The men think it beneath them to take charge of them; and therefore they are left to the conduat of the women, who indeed are obliged to do all the drudgery, including even the building and repairing their houfes, while the men employ themfelves wholly in preparing their hunting implements and fiffing tackle.

This country is but thinly inhabited. In the winater time the people dwell in huts built of fone or turf: on the one fide are the windows, covered with the fkins of feals or rein-decr. Several families live in one of thefe houfes, poffeffing each a feparate apartment, before which is a hearth with a great lamp placed on a trevit, over which hangs their kettle : above is a rack or thelf on which their wet clothes are dried. They burn train-oil in their lamps; and inftead of wick, they ufe a kind of mofs, which fully anfwers the parpofe. Thefe fires are not only fufficient to boil their vietuals; but likewife produce fuch a heat, that the whole houfe is like a bagnio. The door is very low, that as little cold air as poffible may be admitted. The houfe within is lined with old fkins, and furrounded with benches for the conveniency of Arangers. In the fummer-time they dwell in tents made of long poles fixed in a conical form, covered in the infide with deer-fkins, and on the outfide with feals ikins, dreffed fo that the rain cannot pierce them.
Eaft Eaft Greenland was for along time confidered as a Grenland. part.of the continentrof Weft Greenland, but is now difcovered tobe an affemblage of illands lying between $76^{\circ} 4^{6 \prime}$ and $80^{\circ} 30^{\prime}$ of north latitude, and between $9^{\circ}$ and $20^{\circ}$ of eaft longitude. It was difcovered by Sir Hugh Willoughby in the 1553 , who called it Groenland; fuppoling it to be a part of the weftern continent. In 1595; it was again vifited by William Barentz and John Cornelius, twe Dutchmen, who pre-

## I 34 ] G R E

tended to be the original difcoverers, and called the Greenland. country Spitzbergen, or Sharp Mountains, from the many fharp-pointed and rocky mountains with which it abounds. They alleged that the coan difcovered by Sir Hugh Willoughby was fome other country ; which accordingly the Hollanders delineated on their maps and charts by the name of Willoughby Land; whereas in fact no fuch land ever exifted; and long before the voyage of thefe Dutchmen, Stephen Barrows, an Engliih hipruafter, had coafted along a defolate country from N. Lat $78^{\circ}$ to $80^{\circ} 11^{\prime}$, which was undoubtedly Spitzbergen. The fea in the neighbourhood of the inands of Spitzbergen abounds very much with whales, and is the common refort of the whale-fifhing fhips from different countries, and the country itfelf is frequently vifited by thefe fhips; but till the late voyage of the Hon.Capt.Phipps, by order of his Britannic majefty, the fituation of it was erroneoully laid down. It was imagined that the land ftretched to the northward as far as $82^{\circ}$ of north latitude; butCapt. Phipps foupd the moft northerly point of land, called Seven I/lands, not to exceed $80^{\circ} 30^{\prime \prime}$ of latitude. Towards the eaft he faw other lands lying at a diftance, fo that the Spitzbergen plainly appeared to be furrounded by water on that fide, and not joined to the continent of Alia, as former navigators had fuppofed. The north and weft coafts allo he explored, but was prevented by the ice from failing fo far to the northward as he wifhed. The coaft appeared neither habitable nor acceffible. It is formed of high, barren, black rocks, without the leaft marks of vegetation; in many places bare and pointed; in others covered with fnow, appearing even above the clouds. The valleys between the high cliffs were filled with fnow and ice. "This profpect," fays Capt. Phipłs, "would have fuggefted the idea of perpetual winter, had not the mildnefs of the weather, the fmooth water, bright fun-fhine, and conftant day-light, given a cheerfulnefs and novelty to the whole of this romantic. feene." The current ran along this coaft half a knot an hour, north. The height of one mountain feen here was found by geometrical menfuration to be at one time $1503^{\frac{3}{8}}$ feet, at another $1503_{\frac{3}{50}}^{\frac{3}{6}}$ feet. By a barometer conftructed after De Luc's method, the height was found to be $1588 \frac{1}{\mathrm{t}}$ feet. On this occafion Captain Phipps has the following remarks. "I cannot account for the great difference between the geometrical meafure and the barometrical according to M. de Luc's calculation, which amounts to 84.7 feet. I have no reafon to doubt the accuracy of Dr Irving's obfervations, which were made with great care. As to the geometrical meafure, the agreement of fo many triangles, each of which nuft have difcovered even the fmalleft error, is the moft fatisfactory proof of its correctnefs. Since my return I have tried both the theodolite and barometer, to difcover whether there was any fault in either ; and find them, upon trial, as I had always done before, very accurate."

There is good anchorage in Schmeerenburgh harbour, lying in N. Lat. $74^{\circ} 44^{\prime}$ E. Long. $9^{\circ} 50^{\prime} 45^{\prime \prime}$, in 13 fathon, fandy bottom, not far from the fhore, and well fheltered from all winds. Clofe to this harbour is an inland called Amflerdam I/fand, where the Dutch ufed formerly to boil their whale-oil; and the remains of fome conveniency erected by them for that purpofe

## GRE [ 135 ] $\quad$ RE

Greenland pupofe are fill vifible. The Duch fhips ftill refort to this place for the latter feafon of the whale-filhery. -The ftone about this place is chiefly a kind of marble, which diffolves eafily in the marine acid. There were no appearances of minerals of any kind, nor any figns of ancient and modern volcanoes. No infects, or any fpecies of reptiles, were feen, nor even the com. mon earth-worm. There were no fprings or rivers; but great plenty of water was produced from the fnow which melted on the mountains.

The moft remarkable views which thefe dreary regions prefent are thofe called lcebergs. They are large bodies of ice filling the valleys between the high mountains. Their face towards the fea is nearly perpendicular, and of a very lively light-green colour. One was abont 300 feet high, with a caf cade of water iffuing from it. The black mountains on each fide, the white fnow, and greenifh coloured ice, compored a very beautiful and romantic picture. Large pieces frequently broke off from the icebergs, and fell with great noife into the water. One piece was obferved to have floated out into the bay, and grounded in 24 fathoms; it was 50 feet high above the furface of the water, and of the fame beautiful colour with the iccberg from which it had feparated.

Thefe inlands are totally uninhabited, thougn it doth not appear but that human creatures conld fubfift on them, notwith ftanding their vicinity to the pole. Eight Englifh failors, who were accidentally left here by a whale-filhing fhip, furvived the winter, and were brought home next feafon. The Dutch then attempted to fettle a colony on Amfterdam ifland abovementioned; but all the people perihed, not through the feverity of the climate, but of the fcurvy, owing to the want of thofe remedies which are now happily difcovered, and which are found to be fo effectual in preventing and curing that dreadful difeafe.-The late acccount alfo of fix Ruffian failors who faid four years in this inhofpitable country, affords a decifive proof, that a colony might be fetiled on Eaft Greenland, provided the doing fo could aniwer any good purpofe.

Creenland Company. A joint fock of $40,000 \mathrm{l}$ was by ftatute to be raifed by fubferibers, who were incorporated for 14 years from the firft of October 1693, and the company to ufe the trade of catching whales, \&c. into and from Greenland, and the Greenland feas; they may make bye.laws for the government of the perfons employed in their hhips, \&c. Stat. 4 and 5 W. III. cap. 17. This company was farther encouraged by parliament in 1696 ; but partly by unikilful management, and partly by real loffes, it was under a neceflity of entirely breaking up, before the expiration of the term affigned to it, ending in 1 707. But any perfon who will adventure to Greenland for whale-fifhing, fhall have all privileges granted to the Greenland company, by i Anne, cap. 16. and thus the trade was again laid open. Any fubjects may import whale-fins, oil, \&c. of fifl caught in the Greenland feas, without paying any caftoms, \&c. ftat. Io George 1. cap. 16. And thips employed in the Green-land-fifhery are to be of fuch burden, provided with boats, fo many men, fifhing-lines, harping-irons, \&'c. and be licenfed to proceed; and on their return thall be paid 20 per ton bounty, for whale-fins, \&c. imported; 6 Geo. II. cap. 33. The bounty was afterwards increafed; but has been lately diminifhed, and
fince this diminution the trade has increafed. See Greenock, Whale-Fisherr.

GREENOCK, a fea-port town in Scoiland, and une of the ports of the city of Glafgow. It is diftant 22 miles from that city; and was formerly called the $B$ ay of St Laurence. The Frith of Clyde here expands into a fine bafon four miles wide, and is landlocked on all fides. Greenock is a burgh of barony, and the beft built town on all the coaft. It is the chief refort of the herring fifhery, and otherwife a place of great trade and very populous.-The harbour was made by Sir John Shaw of Greenock, whofe anceftor built the church; and the family had here a caftle.

GREENWICH, a town of the county of Kent, in England, pleafantly fituated on the bank of the Thames, about five miles eaft from London. Here was formerly a royal palace, built by Humphry duke of Gloucefter, enlarged by Henry VII. and completed by Henry VIII. The latter often chofe this town for his place of refidence; as did alfo the queens Mary and Elizabeth, who were born in it. The fame duke Humphry began a tower on the top of the fteep hill in the park, which was finifhed by Henry VII. but afterwards demolifhed, and a royal obfervatory erected in its place by Charles II. furnifhed with mathematical inftruments for aftronomical obfervations, and a deep dry well for obferving the fars in the day time. The palace being afterwards much neglected, king Charles II. (who had enlarged the park; walled it about and planted it), pulled it down, and began another, of which he lived to fee the firft wing magnificently finithed. But king William 1II. in 1694, granted it, with nine acres of ground thereto belong. ing, to be converted into a royal hofpital for old and difabled feamen, the widows and children of thofe who loft their lives in the fervice, and for the encouragement of navigation. The wing, which coft king Charles 36,0001 . is now the firft wing of the hofpital towards London. The front to the Thames confints of two ranges of ftone buildings, with the ranger's houfe in the centre of the area, but detached from any part of the hofpital. Thefe buildings perfectly correfpond with each other, and have their tops crowned with a fone balluftrade. The buildings which are facing the area, correfpond with them, though in a finer and more elegant ftyle; and have domes at their ends, which are 120 feet high, fupported on coupled columns. Under one of thefe is the hall, which is finely painted by Sir James Thornhill, and contains many royal portraits; and under the other the chàpel, which by accident was deftroyed by fire. This fire broke ont in the hofpital on the fecond of January 1779 , and torally confumed the dome at the S. E. quarrer of the building, with the chapel which was the mert ele. gant in the world, the great dining-hall, and eight : wards containing the lodgings of near 600 penfioners. The dome was rebuilt about the year 178.5 ; but the reparation of the whole damage is not yet couspleted. On the fides of the grate which open to thefe buildings from the park, are placed a large terreftrial and celeftial globe, in which the ftars are gilt; and in the centre of the area is a flatue of George II. . About 2000 old difabled feamen are maintained in this hofpital. Befides private benefactions, to the amount of near L. 60,000 (which appear in tables hung up at the entrance of the hall), the parliament, in the year

Greenwich 1732 , fettled uponit the earl of Derwent water's eftate, to the valuc of L. 6000 per annum. All Arangers who fee it, pay twopence each ; and this income is applied to the fapport of the mathematical fchool for the fons of failors. For the better fupport of which, every feaman in the royal navy, and, in the merchant fervice, pays fixpence a month, fopped out of their pay, and delivered in at the fix-penny receiver's office in Towerhill. On this account, a feaman, who can produce an authentic certificate of his being difabled, and rendered unfit for fervice, by defending any fhip belonging to his Majefty's Britifh fubjects, or in taking any fip from the enemy, may be admitted into this hofpital, and receive the fame benefit from it as if he had been in his Majefty's immediate fervice. Befides the feamen and widows abovementioned, about 100 boys, the fons of feamen, are bred up for the fervice of the royal navy; but there are no out-penfioners as at Chelfea. Each of the mariners has a weekly allowance of feven loaves, weighing 16 ounces each; three pounds of beef, two of mutton, a pint of peafe, a pound and a quarter of cheefe, two ounces of butter, fourteen quarts of beer, and one fhilling a-week tobacco money: the tobac-co-money of the boatfwains is two Chillings and fixpence a-week each, that of their mates one fhiliing and fixpence, and that of the other officers in proportion to their rank : befides which, each common penfioner receives once in two years, a fuit of blue cloathes, a hat, three pair of fockings, two pair of Choes, five neckcloths, three hirts, and two night caps. Out of all that is given for fhowing the hall, only three-pence in the flilling is allowed to the perfon that fhows them ; the reft makes an excellent fund for the yearly maintenance of not lefs than 20 poor boys, who are the fons of mariners that have been either flain or difabled in the fervice of their country. The park is well ftocked with deer, and affords as much variety, in proportion ro its fize, as any in the kingdom : but the views from the Obfervatory and the One-tree hill are beautiful beyond imagination, particularly the former. The projection of thefe hills is fo bold, that you do not look down upon a gradually falling flope or flat inclofures, but at once upon the tops of branching trees, which grow in knots and clumps out of deep hollows and imbrowned dells. The cattle which feed on the lawns, which appear in breaks among them, feem moving in a region of fairy land. A thoufand natural openings anong the branches of the trees break upon little picturefque views of the fwelling turf, which, when illumined by the fun, have an effect pleafing beyond the power of fancy to paint. This is the foreground of the landfcape: a little farther, the eye falls on that noble ftructure the hofpital, in the midft of an amphitheatre of wood; then the two reaches of the river make that beautiful ferpentine which forms the llle of Dogs, and prefent the floatirg millions of the Thames. To the left appears a fine tract of country, leading to the capital, which there finifhes the profpect. The pa-rifh-church of Green wich, rebuilt by the commiffioners for crecting the 50 new churches, is a very handfome flructure, dedicated to St Alphage, archbifhop of Canterbury, who is faid to have been flain by the Danesin the year 1012 on the fpot where the church now flands. There is a college at the end of the town, fronting the Thames, for the maintenance of 20 decayed old houfe-keepers, 12 out of Greenwich, and
eight who are to be alternately chofen from Snottifham Gregarions and Canle-Rifing in Norfolk. This is called the duke of Norfolk's Gollege, though it was founded and endow. ed in 1613 by Henry earl of Northampton the duke of Narfolk's brother, and by him committed to the care of the Mercers company. To this college be.longs a chapel, in which the earl's body is laid; which, as well as his monument, was removed hither a few years ago from the chapel of Dover caftle. The penfioners, befides meat, drink, and lodging, are allowed one fhilling and fixpence a week, with a gown every year, linen once in two years, and hats once in four years. In 1560, Mr Lambard, author of the Perambulation of Kent, alfo built an hofpital, called queen Elizabeth's college, faid to be the firft crected by an EnglighiProtentant. There arelikewife rwo charityfchools in this parifh. The river Thames is here very broad, and the channel deep; and at fome very high tides the water is falt. This is the chief harbour for the king's yachts. The town contains about 1500 houfes; and a market on Wednefday and Saturday was erected here in 1737; the direction of which is in the governors of the royal hofpital, to which the profits arifing from it were to be appropriated.

GREGARIOUS, among zoologifts, a term applied to fuch animals as do not live folitary, but affociate in herds or flocks.

GREGORIAN calendar, that which fhows the new and full moon, with the time of Eafter, and the moveable feafts depending thereon, by means of epacts difpofed through the feveral months of the Gregorian year. See Chronology, $n^{\circ} 24$.

Ciregrian $^{\text {Telefcope. See Optics, (Index.) }}$
Gregorlan Year. See Chronology, $\mathrm{n}^{\circ} 24$.
GREGORY the Great, was born at Rome, of a patrician family. He difcovered finch abilities in the exercife of the fenatorial employments, that the emperor Juftin the younger appointed him prefect of Rome. Pope Pelafgius II. fent him nuncio to Conftantinople, to demand fuccours againft the Lombards. When he thought of enjoying a folitary life, he was elected pope by the clergy, the fenate, and the people of Rome. Befides his learning and diligence in inftructing the church, both by wirting and preaching, he had a very happy talent in winning over princes in favonr of the temporal as well as firitual intereft of religion. He undertook the converfion of the Englifh, and fent over fome monks of his order, under the direction of Auguftin their abbot. His morality with refpect to the chaftity of churchmen was very rigid, afferting that a man who had ever known a woman ought not to be admitted to the priefthood; and he always caufed the candidates for it to be examined upon that point. He likewife vigoroufly exerted himfelf againft fuch as were found guilty of calumny. However, he flattered the emperor Phocas, while his hands were yet reeking with the blood of Mauritins, and of his three children, who had been butchered in his fight. He likewife flattered Brunehaut, a very wicked queen of France. He is accufed of deftroying the noble monuments of ancient Roman magnificence, that thofe who vifited the city might not attend more to the triumphal arches than to holy things; and burnt a multitude of heathen books, Livy in particular. He died in 604.

Gregory of Nazianzen, firnamed the Divint, was

## G R E

 He was made birek Conftantiuople in 379 ; but finding his election contefted by Timotheus archbifhop of Alexandria, he voluntarily refigned his dignity about 382 , in the general conncil of Conitantinople. His works are ex. tant, in two volumes, printed at Paris in 1602. His boyle is faid to be equal to that of the molt celebrated orators of ancient Greece.Gregory (Theodorus), furnaned Thaumaturgas on account of his miracles, was the fcholar of Origen; and was clected bifhop of Neocæfarea, the place of his birth, about the year 240 , during his abrence. He affifted at the council of Antioch, in 255, againft Paulus Samofetanus; and died in 270 . He had the fatisfaction of leaving only feventeen idolaters in his diocele, where there were but feventeen Chriftians when he was ordained. There is fill extant of his, A gratalatory oration to Origen, A canonical epittle, and lome other works.

Gregory, bilhop of Nyffa, one of the fathers of the church, and author of the Nicene creed, was born in Cappadocia, about the year 331. He was chofen bifhop of Nyfa in 372, and banihned by the emperor Valens for adhering to the council of Nice. He was neverthelefs afterwards employed by the bifhops in feveral important affairs, and died in 396. He wrote Commentaries on the Scriptures; Sermons on the myfteries; Moral difcourfes; Dogmatical treatifes ; Panegyrics on the faints ; fome letters on church-difcipline; and other works. His ftyle is very allegorical and affected.

Gregory of Tours, or Geargius Florentius Gregorius, one of the moft illuftrious bifhops and celebrated writers of the fixth century, was defcended from a noble family in Auvergne. He waseducated by his uncle Gallus, bifhop of Clermont ; and diftinguifhed himfelf fo much by his learning and virtue, that in 572 he was chofen bilhop of Tours. He afterwards went to Rome to vifit the tomb of the apofles, where he contracted a friendfhip with Gregory the Great, and died in 595 . This anthor was extremely credulous with regard to miracles. He wrote, I. The hiftory of France. 2. The lives of the faints; and other works. The beft edition is that publified by Father Rumart, 1699.

Gregory (James), one of the moft eminent mathematicians of the laft century, was a fon of the Rev. Mr John Gregory minifter of Drumoak in the county of Aberdeen, and was born at Aberdeen in 1638 . His mother was a daughter of Mr David Anderfon of Finzaugh, a gentleman who poffeffed a fingular turn for mathematical and mechanical knowledge. This mathematical genius was hereditary in the family of the Anderfons, and from them feems to have been tranfmitted to their defcendants of the name of Gregory. Alexander Anderfon, coufin german of the abovementioned David, was profeffor of mathematics at Paris in the beginning of the 17 th century, and publithed there in i6i2, Supplementum Apollonii redivivi, drc. The mother of James Gregory inherited the genius of her family; and obferving in her fon, while yet a child, a ftrong propenfity to mathematics, fhe influcted him herfelf in the elements of that fcience. He received his education in the languages at the

Voi. VIII.

From Memoirs of the Gregories, prefix ed to the new edition of the Works of Dr "ames Gregory, in 4 vols.
grammar fchool of Aberdeen, and went through the Gregnty. ufual courfe of academical fudien in the Marifchal college.
At the age of 24 he publifhed his treatire, intitled Optica Promota, feu abdita radiorum reflexorum et refractorum myferia, geometrice enucleata; cui fubnectitur appendix fubtilifimoruns aftronomia problematon re folutioneme exhibens, London 1663: a work of great genius, in which he gave the world an invention of his own, and one of the moft valuable of the moder: difcoverics, the confruction of the reflecting telefcope, This difcovery immediately attracted the attention of the mathematicians, both of Britain and other countries, who were foon convinced of its great impertance to the fciences of optics and altronomy. The manner of placing the two fpecula upon the fane axis appearing to Sir Ifaac Newton to be atkended with the difadvantage of lofing the central rays of the larger fpeculum, he propofed an improvement on the infrument, by giving an oblique pofition to the fmaller fpecplum, and placing the eye-glafs in the inde of the tube. But it is worth remarking, that the Newtonian conftruction of that inftrument was long abandoned for the original or Gregorian, which is at this day univerfally employed where the inftrument is of a moderate fize; though Mr Herfchel has preferred the Newtonian form of the conftruction of thofe immenfe telefcopes, which of late years he has fo fuccefsfully employed in obferving the heavens.

The univerfity of Padua being at that time in high reputation for mathematical fudies, James Gregory went thither foon after the publication of his firft work; and fixing his refidence there for fome years, he publifhed, in $\mathbf{1 6 6 7}$, VeraCirculi et Hyperboles quadratura; in which he propounded another difcovery of his own, the invention of an infinitely converging feries for the areas of the circle and hyperbole. To this treatife, when republified in 1668, he added a new work, intitled, Geometria pars univeryatis, inferviens quantitatum curvarum tranfmutationi et mettfurce; in which he is allowed to have fhown, for the firft time, a method for the tranfmutation of curves. Thefe works engaged the notice, and procured Mr Gregory. the correfpondence, of the greatelt mathematicians of the age, Newton, Huygens, Halley, and Wallis; and their author being foon after chofen a fellow of the royal fociety of London, contributed to enrich the Philofophical Tranfactions at that time by many excellent papers. Through this channel, in particular, he carried on a difpute with Mr Huygens, upon the occafion of his treatife on the quadrature of the circle and hyperbole, to which that able mathematician had ftarted fome objections. Of this controverfy, it is unneceffary to enter into particulars. It is fufficient to fay, that, in the opinion of Leibnitz, who allows Mr Gregory the higheft merit for his genius and difcoveries, Mr Huygens has pointed out, though not errors, fome confiderable deficiencies in the treatife above mentioned, and fhown a much fimpler method of attaining the end in view.

In I668, Mr James Gregory publihed at London another work, intitled Exercitationes Geometrica, which contributed ftill to extend his reputation. About this time he was elected profefor of mathematics in the univerfity of St Andrew's; an office which he held for

Gregory. fix years. During his refidence there, he married, in r669, Mary, the daughter of George Jamefon the ceitbrated painter, whom Mr Walpole has termed the Vandyke of Scotland, and who was fellow-difciple with that great artift in the fchool of Rubens at Antwerp.

In 1674, he was called to Edinburgh, to fill the chair of mathematics in that univerfity. This place he had held for little more than a year, when, in October. 1675, being employed in thowing the fatellites of Jupiter through a telefcope to fome of his pupils, he was fuddenly ftruck with total blindnefs, and died a few days after, at the carly age of 37 .

He was a man of an acute and penetrating genius. His temper feems to have been warm, as appears from ohe conduct of his difpate with Mr Huygens; and, confcious perhaps of his own merits as a difcoverer, he feems to have been jealous of lofing any portion of his reputarion by the improvements of others "upon his inventions.

Gregory (David), Savilian profeffor of aftronomy at Oxford, whom DrSmith has termed fübtilifinuingenui nathematicus, was the eldeft fon of Mr Gregory of Kinnairdy, brother of the abovementioned Mr James Gregory, He was born at Aberdeen in 1661, and received the earlier parts of his education in that city. He compleced his ftudies at Edinburgh ; and, being poffeffed of the mathematical papers of his uncle, foon diftinguifhed himfelf likewife as the heir of his genius. In the 23 d year of his age, he was elected profeffor of mathematics in the univerfity of Edinburgh ; and publifhed, in the fame year, Exercitatio Geometrica de dimenfione figurarum, five fpecimenonethodigeneralis dimetiendi quafvis figuras, Edinburgh, 1684, 4to. He faw very early the excellence of the Newtonian philofophy; and had the merit of being the firft who introduced it into the fchools by his public lectures at Edinburgh.

## * Memoirs

 He had (fays Mr Whifton*) already caufed feveral of his fcholars to keep acts, as we call them, upon feveral branches of the Newtonian philufophy; while we at Cambridge, poor wretches, were ignominioully fudying the fictitious hypochefis of the Cartefian."In 1691, on the report of Dr Bernard's intention of refigning the Savilian profefforflip of aftronomy at Oxford, David Gregory went to London; and being patronifed by:Sir Ifaac Newton, and warmly befriended by Mr Flamftead the aftronomer royal, he obtained the vacant profefforhip, for which Dr Halley was a competitor. This rivallhip, however, inftead of animolity, laid the foundation of friendhip between thefe eminent men; and Halley foon after became the colleague of Gregory, by obtaining the profefforfip of geometry in the fame univertity. Soun after his arrival in London, Mr Gregory had been elected a fellow of the royal fociety; and, previoully to his election in.
to the Savilian profefforthip, had the degree of doctor of phylic conferred on him by the univerfity of Ox-

Gregery. ford (a).

In 1693 he publifhed in the Philofophical Tranfactions a refolution of the Florentine problem de Tiffudine veliformi quadribili; and he continued to commu. nicate to the public, from time to time, many ingenious mathematical papers by the fane channel. In 1695, he printed at Oxford Catoptrica t Dioptricae Sphericre Elementa; a work which, as he informs us in his preface, contains the fubftance of fome of his public lectures read, eleven years before, at Edinburgh. This valuable treatife was republifhed firft with additions by Dr William Brown, with the recommendation of Mr Jones and Dr Defaguliers; and afterwards by the latter of thefe gentlemen, with an appendix containing an account of the Gregorian and Newtonian telefcopes, together with Mr Hadley's tahles for the conftruction of both thofe inftruments. It is not unworthy of remark, that, in the end of this treatife, there is an obfervation which fhows, that what is gene. rally believed to be a difcovery of a much later date, the conftruction of achromatic telefcopes, which has been carried to great perfection by Mr Dollond and Mr Ramfden, had fuggefted itifelf to the mind of David Gregory, from the reflection on the admirable contrivance of nature in combining the different humours of the eye. The paffage is as follows: "Quod fi ob difficultates phyficas in fpeculis idoneis torno ciaborandis et poliendis, etiamnum lentibus utioporteat, fortaffis media diverfæe denfitatis ad lentam objectivanm componendam adhibere utile foret, ut a natura factum obfervamus in oculi fabrica, ubi crinallinus humor (fere ejuifdem cum vitro virtutis ad radios lucis refringendos) aqueo et vitreo (aquæ quoad refractionem haud abfimilibus) conjungitur, ad imaginem quam diftincte fieri poterit, a natura nihil fruftra moliente, in oculi fundo depingendam." Catopt. et Diopt. Sphaèr. Elem. Oxon. 1695 , p. 98.

In 1702 our aurhor publifhed at Oxford, Aftrononize Fhyfica et Geomotrice Elementa; a work which is accounted his mafter-piece. It is founded on the Newtonian doctrines, and was efeemed by Sir Iface Newton himfelf as a moft excellent explanation and defence of his philofophy. In the following year he gave to the world an edition in folio of the works of Euclid in Greek and Latin; in profecution of a defign of his predeceffor Dr Bernard, of printing the works of all the ancient mathematicians. In this work, afthough it contains all the treatifes attributed to Euclid, Dr Gregory has been careful to point out fuch as he found reafon, from internal evidence, to believe to be the productions of fome inferior geometrician. In profecution of Dr Bernard's plan, Dr Gregory engaged, foon after; with his colleague Halley,
(A) On obtaining the above profefforfhip, he was fucceeded in the mathematical chair at Edinburgh by his brother James, likewife an eminent mathematician ; who held that office for thirty-three years, and retiring in 1725 was fucceeded by the celebrated Maclaurin. A danghter of this profeflor James Gregory, a young lady of great beauty and accomplifhments, was the victim of an unfortunate attachment, which fur: nifred the fubject of Mallet's well known ballad of William and Margaret.

Another brother, Charles, was created profeffor of marhematics at St Andrew's by queen Anne in 1707. This office he held with reputation and ability for thirty-two years; and, refigning in 1739 , was fucceeded by his fon, who eminently inherited the talents of his family, and died in 1763.
ritegory. in the publication of the Conics of Apollonitus; but he had proceeded but a little way in this undertaking when he died, in the 49 th year of his age, at Maidenhead in Berkhire, A. D. 1710 . To the genius and abilities of David Gregory, the molt celebrated mathematicians of the age, Sir lfaac Newron, Dr Halley, and Dr Keill, have given ampleteftimonies. Be-

- fides thofe works publifhel in his lifetime, he left in manufcript, A Short Treatife of the Nature and Arithmetic of Logarithms, which is printed at the end of Dr Keill's tranfation of Commandine's Eaclid; and a Treatife of Practical Geometry which was afterwards tranllated, and publifhed in 1745 , by Mr Maclaurin.

Dr David Gregory married, in 1695 , Elizabeth, the daughter of Mr Oliphant of Langtown in Scotland. By this lady he had four fons, of whom, the cldeft, David, was appointed regius profeffor of modern hiftory at Oxford by king George I. and died in 1767 , in an advanced age, after enjoying for many years the dignity of dean of Chrift church in that univerlity.

Gregory (Dr Jobn), profeffor of medicine in the univerlity of Edinbargh, was the fon of Dr James Gregory profeffor of medicine in King's college Aberdeen, and grandfon of James the inventor of the Gregorian telefcope. His father was firft married to Catharine Forbes, daughter of Sir John Forbes of Monymulk; by whom he had fix children, moft of whom
intimate companion, was a member of the fame inti- Gregory. tution.

In the year 1745 our author went to Leyden, and attended the lectures of thofe celebrated profeffors Gaubius, Albinus, and Van Royen. While at this place he had the honour of receiving from the King's college of Aberdeen, his alma mater, whoregarded him as a favourite fon, an unfolicited degree of doctor of medicine: and foon after, on his return thither from Hollind, he was elected profeffor of philofophy in the fame univerfity. In this capacity he read lectures during the years 1747,1748 , and 1749 , on the mathematics; on experimental philofophy, and on moral philofophy. In the end of 1749 , however, he chofe to refign his profellorlhip of philofophy, his views being turned chiefly to the practice of phyfic, with which he apprehended the duties of this profefforfhip, occupying a great portion of his time, too much interfered. Previoufly, however, to his fettling as a phyfician at Aberdeen, he went for a few months to the Continent; a tour, of which the chief motive was probably amufement, though, to a mind like his, certainly not without its profit in the enlargement of ideas, and an increafed knowledge of mankind.

Some time after his return to Scotland, Dr Gregory married, in 1752 , Elifabeth danghter of William Lord Forbes; a young lady who, to the exterior endowments of great beauty and engaging manners, joined a very fuperior underftanding, and an uncommon fharc of wit. With her he received a handfome addition of fortune; and during the whole period of their union, which was but for the fpace of nine years, enjoyed the ligheft portion of domeftic happinefs. Of her character it is enough to fay, that her hufband, in that admired little work, A father's Legacy to his Daughters, the laft proofs of his affection for them, declares, that, "shile he endeavours to point out what they fhonld be, he draws but a very faint and imperfect picture of what their mother was." The field of medical practice at Aberdeen being at that time in a great meafure pre-occupied by his elder brother Dr James Gregory, and others of fome note in their profefion, our author determined to try his fortune in London. Thither accordingly he went in 1754 ; and being already known by reputation as a man of genius, he found an eafy introduction to many perfons of diftinction bork in the literary and polite world. The late George Lord Lyttleton was his friend and patron. An ăttachment, which was founded on a ftriking fimilarity of manners, of taftes, and of difpofitions, grew up into a firm and permanent friendhip; and to that nobleman, to whom Dr Gregory was wont to communicate all his literary productions, the world is indebted for the publication of the Comparative View of the State and Faculties of Man, which made him firf known as an author. Dr Gregory likewife enjoyed the friendhip of the late Edward Montague, Efq; and of his lady, the celebrated champion of the Fame of Shakefpeare againft the cavils and calumnies of Voltaire. At her affemblies, or converfazione, the refort of tafte and genius, ont author had an opporturity of cultivating an acquaintance with many of the moft diftinguined literary characters of the prefent times.

In I 754 Dr Gregory was chofen fellow of the roy:R 2

## GRE <br> 140 <br> G R E

Greyory. al fociety of London; and, daily advancing in the public efleem, it is not to be doubted, that, had he continued his refidence in that metropolis, his profeffional talents would have found their reward in a very extenfive practice. But the death of his brother, Dr James Gregory, in November 1755, occafioniag a vacancy in the profefforthip of phyfic in king's college, Abcrdeen, which he was folicited to fill, he returned to his native country in the beginning of the following year, and took upon him the duties of that office to which he had been elected in his abfence.

Here our author remained till the end of the year 1764, when, urged by a very laudable ambition, and prefuming on the reputation he had acquired as affording a reafonable profpect of fuccefs in a more extenfive field of practice, he changed his place of refidence for Edinburgh. His friends in that metropolis had reprefented to him the fituation of the college of medicine as favourable to his views of filling a profefforial chair in that univerfity; which accordingly he obtained in 1766, on the refignation of Dr Ruitherford profeffor of the practice of phyfic. In the fame year he had the honour of being appointed firt phyfician to his majefty for Scotland on the death of Dr Whytt.

On his eftablifhment in the univerfity of Ediaburgh, Dr Gregory gave lectures on the practice of phy fic during the years 1767,1768 , and 1769 . Afterwards, by agreement with Dr Cullen, profeffor of the theory of phyfic, thefe two eminent men gave alternate courfes of the theor $y$ and of the practice-As a public 「jeaker, Dr. Gregory's manner was limple, natural, and animated. Without the graces of oratory, which the fubject he had to treat in a great degree precluded, he expreffed his ideas with uncommon perfpicuity, and in a ftyle happily attempered between the formality of ftudied compofition and the eate of converfation. It was his cuftom to premeditate, for a fiort time before encering the college, the fubject of his lecture, confulting thofe authors to whom he had occafion to refer, and marking in fhort notes the arrangement of his intended difcourfe : then fully mafter of his fubject, and confident of his own powers, he trufted to his natural facility of expreffion to convey thofe opinions which he had matarely deliberated. The only lectures which he committed fully to writing, were thofe introductory difcourfes which he read at the beginning of his annual conree, and which are piblithed in thefe volumes under the title of Lectures on the Duties and Qualifications of a Phyfician. Of thefe, which were written with no view to publication, many copies were taken by his pupils, and fome from the 0 . riginal manufcript, which he freely lent for their perufal. On hearing that a copy had been offered for fale to a bookfelfer, it became neceffary to anticipate a fraudulent, and perhaps a mutilated publication, by authorifing an impreffion from a corrected copy, of which he gave the profits to a favourite pupil. Thefe lectures were firft publiffed: in 1770, and afterwards in an enlarged and more perfect form in 1772.

In the fame year, 1722 , Dr Gregory publifhed Elements of the Frallice of Phy fic, for the ufe of findents; a work intended folely for his own pupils, and to be ufed by himfelf as a text-book to be commented upon in his courfe of lectures. In an advertifement prefixed.
to this work, he fignified his intention of comprehend. ing in it the whole feries of difeafes of which he treated in his lectures on the Practice of Phyfic; but this intention he did not live to accomplifh, having brought down the work no further than to the end of the clafs of Febrile Difeafes.-In his acadenrical lec. tures Dr. Gregory never attempted to millead the ftudent by flattering views of the perfection of the fcience; but was, on the contrary, anxious to point our its defects; wifely judging, that a thorough fenfe of the imperfection of an art or fcience is the firf ftep towards its improvement. In this view he was careful to expofe the fallacioufnefs of the feveral theories and hypothefes which have had the moft extenfive currency, and perpetually inculcated the danger of fyfematizing with limited experience, or an imperfect knowledge of facts. Yet in the work laft mentioned it will appear, from the order in which he has treated of the feveral difeafes, that he did not entirely neglect the fyftematic arrangements of other authors. Thefe, however, he warned his pupils, that he had not adopted from any conviction of the rectitude of thofe theories to which they referred, but only as affording that degree of method, and regularity of plan, which is found to be the bef help to the Itudy of any fcience. Confidering a rational theory of phyfic to be as yet a defideratum, it was his object to communicate to his pupils the greateft portion of practical knowledge, as the only bafis on which fuch a theory could ever be reared. His method, in treating of the feveral difeafes, was firlt to mention thofe fymptoms which are underfood among phyficians to characterife or define a difeafe; proceeding from the general to the more particular feries of fymptoms and their oceafional varicties; to point out accurately the diagnolic fymptoms, or thofe by which one difeafe is effentially diftinguiged from others that refemble it, and to mark likeiwife the prognoltics by which a phyfician is enabled to conjecture of the probable event of a difeafe, whether favourable or otherwife. He then proceeded to fpecify the various caufes, predifpofing, occafional, and proximate; accounting as far as he thought could be done on juft principles, for the appearance of the feveral fymptoms; and, finally, he pointed out the general plan of cure, the particular remedies to be employed, and the cautions requifite in the adminiftration of them. Thus defirous of eftabilithing the fcience of médicine upon the folid foundation of practice and experience; and knowing that many things afferted as facts by mèdical writers have been affumed on a very carelefs obfervation, while confirning a favourite theory; and that, on the othcr hand, many real and important facts have, from the fame fpirit of fyftem, been explained away and difcredited; he conftantly endcavoured, both by his precept and example, to inculcate to his pupils the neceflity of extreme caution either in admitting or in denying medical facts, or what are commonly given as fuch. To.the defire of enforcing this neceflary caution is owing that multitude of queries refpecting matters of fact, as well as matters of opinion, which occurs in the Elements of the Praftice of Phyfic.

Dr Gregory, foon after the deatio of his wife, and, as he himfelf fays, "for the amufement of his folitary hours,"

GRE

## $141]$

GRE
Grearory. hours," employed himfelf in the compofition of that admirable tract, intitled, $A$ Father's Legacy to his Daughters; a work which, though certainly never intended by its author for the public eye, it would have been an unwarrantable diminution of his fame, and a capricions refufal of a general benefit to mankind, to have limited to the fole purpofe for which it was originally deligned. It was, therefore, with great propriety, publifhed after the author's death by his eldeft fon. This work is a moft amiable difplay of the piety and goodnefs of his heart, and his confunmate knowledge of human nature and of the world. It manifefts fuch folicitude for their welfare, as ftrongly recommends the advice which he gives. He fpeaks of the female fex in the moft honourable terms, and labours to increafe its eflimation, whilf he plainly, yet genteelly and tenderly, points out the errors into which young ladies are prone to fall. It is particularly obfervable, in what high and-honourable terms he fpeaks of the Holy Scriptures, of Chriftian worhip, and faithful minifters; how warmly he recommends to his daughters the ferious and devout worfhip of God in public and private. He dwells largely on that temper and behavour, which were particularly fuited to their education, rank, and circumftances; and recommenist that gentlenefs, benevolence, and modefty, which adorn the character of the ladies, and do particular honour to their fex. His advices, with regard to love, coarthip, and marriage, are peculiarly wife, and interefting to them. They flow what careful obfervation he had made on female domeftic conduct, and on the different effects of poffeffing or wanting the virtues and qualitics which he recommends. There is fomething peculiarly curious, animated, and ufeful, in his directions to them, how to judge of, and manifeft an honourable paffion in, and towards the other fex, and in the very accurate and ufeful diftinction which he makes between true and falfe delicacy. Nothing can be more friking and affecting, nothing more likely to give his paternal advices their defired effect, than the refpectful and affectionate manner in which he mentions his lady their mother, and the irreparable lofs which he and they fultained by her early death. In thort, in this tract, the profeffor fhines with peculiar luftre as a hufband and father, and it is admirably adapted to promote domeftic happinefs.

Thefe letters to his daughters were evidently written under the impreflion of an early death, which Dr Gregory had reafon to apprehend from a conftiturion fubject to the gout, which had begun to fhow itfelf at irregular intervals even from the 18th year of his age. His mother, from whom heinherited thar difeafe, died fuddenly in 1770 , while fiting at table. Dr Gregory had prognofticated for himfelf a fimilar death; an event of which, among his friends, he often talked, but had no apprehenfion of the nearnefs of its approach. In the beginning of the year $\mathrm{I}_{73}$, in converfation with his fon the prefent Dr James Gregory, the latter temarking, that having for the three preceding years had no return of a fit, he might make his account with a pretiy fevere atiack at that feafon; he reccived the obfervation with fone degree of anger, as he felt himfelf then in his ufual tate of health. The prediction, however, was too truc: for having gove to bed on the 9th of February 1773, with no
apparent diforder, he was found dead in the morning. His death had been inftantancous, and probably in his neep; for there was not the fmalleft difcompofure of limb or of feature, -a perfect Euthatiafia.

Dr Gregory, in perfon, was confiderably above the middle fize. His frame of body was compacted with fymmetry, but not with clegance. His limbs were not active; he fooped fomewhat in his gait; and his countenance, from a fullnefs of feature and a heavinefs of eye, gave no external indication of fuperior power of mind or abilitics. It was otherwife when engaged in converfation. His features then became animated, and his eye molt expreflive. He had a warnith of tone and of gefture which gave a pleafing intereft to every thing which he uttered: But, united with this animation, there was in him a gentlenefs and fimplici ty of manner, which, with little attention to the extcrior and regulated forms of politenefs, was more engaging than the moft finifhed addrefs. His converfation flowed with eafe; and, when in company with literary men, without affecting a difplay of knowledge, he was liberal of the fores of his mind. He poifeffed a large fhare of the focial and benevolent affections, which, in the exercife of his profefion, manifefted themfelves in many namelefs, butimportant, attentions to thofe ander his care; attentions which, proceeding in him from an extended principle of humanity, were not fquared to the circumitances or rank of the patient, but ever beftowed moft liberally where they were moft requifite. In the care of his pupils, he was not: fatisfied with a faichful difcharge of his public duties. To many of thefe, ftrangers in the country, and far removed from all who had a natural intereit in their concerns, it was matter of no frall importance to enjoy the acquaintance and countenance of one fo univerfally refpected and efleemed. Through him they found an eafy introduction to an enlarged and clegant fociety, and, what to them was fillmore valuable, they. experienced in him a friend who was ever ealy of accefs, and ready to affit them to the utmof with his counfel and paronage.-.The fame fpirit of philanthropy endeared himin a particular manner to his intimate friends; among whom may be ranked moft of the Scotilh literati of his time. - Some time after his death, the profefforflip of the Theory of Medicine was beftowed upon his eldeft fon the prefent Dr James Gregory ; who has fince fucceeded to the Practical Chair, lately filled by that other moft eminent profeffor Dr Cullen.

GRE-hound. See Canis.-Among a litter of gre-hound pappies, the beft are always thofe which are lightef. Thefe will make the nimbleft dogs as they grow up. The gre-hound is beft for open countries where there is little covert. In thefe places there will fometimes be a courfe after a hare of two or three miles or more, and both the doss and the gane in fight all the while. It is generally fuppofed that the grehound bitch will beat the dog in running : but this feems to be an error; for the dog is both longer made, and confiderably flronger, than the bitch of the fame kind. In breeding thele dogs, the bitch is principally to be regarded; for it is found by experience, that the beft dog and a bad bitch uill not get fo good puppies as an indifferent dog with a good bitch. The dog and bitch hould be as nearly as may be of the
fame.

## $G R E \quad[142] \quad G R E$

Gre-
houad, Grenada.
fame age ; and for the breeding of fine and perfect dogs, they flould not be more than four years old. An old bitch may be ufed with a young dog, bot the puppies of a young bitch and antold dog will never bè good for any thing.

The general food for a gre-hound ought to be chippings or rafpings of bread, with foft bones and griftles ; and thofe chippings onght always to be foaked in beef or mutton broth.

The proper exercife for a gre-hound is courfing him three times a-week, and rewardiner him with blood; which will animate him in the highelt degree, and encourage him to profecute his game. Bur the hare alfo hould ever have fair play. She flonid have the law, as it is called ; that is, have leave to run about twelve fore yards before the dog is flipped at her; that he may have fome difficulty in the courfe, and not pick up the game too eatily. If he kills the hare, he mun never be fuffered to tear her; but the mult be taken from him, his mouth cleaned of the wool, and the liver and lights given him by. way of encouragement. Then he is to be led home, and his feet walhed with butier and beer, and about an hour after he is to be fed.

When the dog is to be taken out to conrfe, he fhould have nothing in the morning but a toaft and butter, and then he is to be kemelled till taken out to the field. The kennelling thefe dogs is of great ufe, always giving them firit and nimblenefs when they are let loofe : and the beft way of managing a fine gre-hound, is never to let him ftir out of the kennel, except at the times of feeding, walking, or courfing.

GRENADA, one of the Caribbee illands, lying in. W. Long. 61. 40. N. Lat. 12. O. It is the laft of the Windward Caribbees; and lies 30 leagues north of new. Andalufia, on the continent. According to fome it is 24 leagues in compafs; according to others, only 22 ; and it is faid to be 20 miles in length, and in fome places 15 in breadth. The chief port, formerly called Lout is, now St Giorge's ftands on the weft fide of. the ifland, in the middle of a large bay, with a fandy botfom. It is pretended that 1000 barks, from 300 to 400 tons, may ride fecure from forms ; and that roo hips, of 1000 tons each, may be moored in the harbour. A large round bafon, which is parted from it by a bank of fand, would contain a confiderable number of fhips, if the bank was cut through : bat by reafon of it the large fhips are obliged to pals within 80 paces of one of the mountains lying at the mouth of the harbour ; the other mountain lying about half a mile diftant. The ifland abounds with wild game and fiff, it produces alfo very fine timber, but the cocoa-tree is obferved not to thrive here fo well as in the other iflands. A lake on a high mountain, about the middle of the ifland, fupplies it with frefl-water freams. Several bays and harbours lie round the illand, fome of which might be fortified to great advantage ; fo that it is very convenient for fhipping, not being fubject to hurricanes. The foil is capable of producing tobacco, fugar, indigo, peafe, and millet.

In $163^{8}$, M. Poincy, a Frenchman, attempted to make a fettlement in Grenada; but was driven off by the Caribbeans, who reforted to this iland in greater numbers than to the neighbouring ones, probably on
account of the grame with which it abounded. In 650 , Monf. Parquet, goverior of Martinico, earricd over from that inland 200 men, furniched with prefents to reconcile the favages to them ; but with arms to fubdue them, in cafe they thould prove intractable. The favages are faid to have been frightened into fubmiffion by the number of the Frenchmen : but, according to fore French writers, the chief not only welcomed the new-comers; but, in confideration of fome knives, hatchets, fciffrs, and oiher toys, yielded to Parquet' the fovereignty of the ifland, referving to themfelves their own habitations. The Abbe Rayial informs us, that thefe firft French colonifts, imagining they had purchafed the inland by thefe triffes, allimed the fovereignty, and foon acted as tyrants. The caribbs, unable to contend with them by force, took their ufual method of murdering all thofe whom they found in a defencelefs ftate. This produced a war; and the French fetrlers having received a reinforcement of $30^{\circ}$ men from Martinico, forced the favages to retire to a mountain; from whence, sfter exhaufting all their arrows, they rolled down great logs of wood on their enemies. Here they were joined by other favages from the neighbouring illands, and again attacked the French, but were defeated antw ; and were at laft driven to fuch defperation, that 40 of them, who had efcaped from the fenghter, jumped from a precipice into the fea, where they all perified, rather than fall into the hands of their implacable enemies. From thence the rock was called la moorne des fauturs, or "the hill of the leapcrs;" which name it ftill retains. The French then deftroyed the habitations and all the provifions of the favages; but frefh fupplies of Carib. beans arriving, the war was renewed with great vigour and great numbers of the French were killed. Upon this they refolved totally to exterminate the natives; and having accordingly attacked the favages unawares; they inlumanly put to death the women and children, as well as the men; burning all their boats and canoes, to cut off all communication between the. few furvivors and the neighbouring illands. Notwithftanding all thefe barbarous precautions, however, the Caribbees proved the irreconcileable enemies of the French; and their frequent infurrections at laft obliged Parquet to fell all his property in the illand to the Count de Cerillacin 1657 . The new proprietor, whr purchafed Parquet's property for 30,000 crowns, fent thither a perfon of brutal manners to govern the ifland. He behaved ${ }^{\text {f }}$ with fuch infupportable tyranny, that moft of the colonifts retired to Martinico ; and the few who remained condemned him to dearh after a formal trial. In the whole court of juttice that tried this mifcreant, there was only one man (called Archangeli) who could write. A farricr was the perfon who impeached: and he, inftead of the fignatures, fealed with a horfe-floe ; and Archangeli, who performed the office of clerk, wrote round it thefe words in French, " Mark of Mr de la Brie, counfel for the court."

It was apprehended that the court of France would not ratify a fentence paffed with fuch unufual formalities; and therefore moft of the judges of the governor's crime, and witneffes of his execution, difappeared. Only thofe remained whofe obfcurity fcreened them from the purfuit of the laws. By an eftimate,
taketi

## GRE

Grenada. taken in 1700, there were at Grenada no more than 25 r white people, 53 free favages or mulattoes, and 525 laves. The ufeful animals were reduced to 64 horfes and $56 y$ head of horned cattle. The whole culture confifted of 3 plantations of fugar and 52 of indi-go.-The ifland had been fold in 1664 to the French Weft India company for 100,000 liveres.

This unfacourable ftate of the affairs of Grenada was changed in 1714 . The change was owing to the fourifhing condition of Martinico. The richeft of the fhips from that ifland were fent to the Spanifh coafts, and in their way touched at Grenada to take in refrefhments. The trading privateers, who undertook this navigation, taught the people of that iland the value of their foil, which only required cultivation. Some traders furnifhed the inhabitants with faves and utenfils to erect fugar plantations. An open account was eitablifhedbetwen the two colonies. Grenada was clearing its debts gradually by its rich produce; and the balance was on the point of being clofed, when the war in 1744 interrupted the communication between the two inlands, and at the fame time ftopped the progrefs of the fugar-plantations. This lofs was fapplied by the culture of coffee, which was purfued during the hoftilities with all the activity and eagernefs that induftry could infpire. -The peace of 1748 revived all the labours, and opened all the former fources of wealth. In 1753 the population of Grenada confifted of 1262 white people, 175 free negroes, and Ir,991 flaves. The cattle amounted to $229^{8}$ horfes or mules, 2456 head of horned cattle, 3278 fheep, 902 goats, and 33r hogs. The cultivation rofe to 83 fugar plantations, 2,725,600 coffece-trees, I50,300 cocoa-trees, and 800 cotion-plants. The provifions confifted of $5,740,450$ trenches of caffada, 933,596 banana trees, and 143 fquares of potatoes and yams. The colony made a rapid progrefs, in proportion to the excellence of its foil; but in the courfe of the laft war but one, the ifland was taken by the Britifh. At this time one of the mount.ins at the fide of St George's harbour was frongly fortified, and might have made a good defence, but furrendered without firing a gun; and by the treaty concluded in 1763 the illand was ceded to Britain. On this ceffion, and the management of the colony after that event, the Abbe Raynal has the following remarks.-_s'This long train of evils [the ambition and mifmanagement of his countrymen] has thrown Greuada into the hands of the Englift, who are in poffeffion of this conqueft by the treaty of 1763 . But how long will they keep this colony? Or, will it neveragain be reftored to France?-England has not made a fortunate beginning. In the firft enthufiafin raifed by an acquifition, of which the higheftopinion had been previoully: formed, every one was eager to purchafe eftates there. They fold for much more than their real value. This caprice, by expelling old colonifts who were inured to the climate, has fent about L.1,553,000 out of the mo-ther-country. This imprudence has been followed by another. The new proprietors, mifled, no doubt, by national pride, have fubftitured new methods to thofe of their predeceffors. They have attempted to alter the mode of living among their flaves. The negroes, who from their very ignorance are more attached to their caftoms than othermen, have revolted. It hath been.

## 143 ] <br> (i R E

found neceffary to fend out troops, and to med blond. Grenada. The whole colony was filled with fufpicions. The mafters who had laid themfelves under a neceffity of ufing violent methods, twere afraid of being burnt ou: maflacred in their own plantations. The labours have declined, or been totally interrupted. Tranquillity has at length been reftored. The mumber of llaves has been increafed as far as 40,000 , and the produce has been raifed to the treble of what it was under the French government. The plantations will fill be improved by the neighbourhood of a dozen of illands, called the Grenadines or Grenadilloes, that are dependent on the colony. They are from three to eight leagnes in circumference, but do not afford a fingle fpring of water. The air is wholefome. The ground, covered only with thin buthes, has not been fereened from the fun. It exhales none of thofe noxious vapours which are fatal to the hufbandman. Cariacou, the only one of the Grenadines, which the French have occupied, was at firft frequented by turtle fifhermen ; who, in the leifure afforded them by fo eafy an occupation, employed themfelves in clearing the ground ${ }^{2}$ In procefs of time, their fmal number was increafed. by the acceffion of fome of the inhabitants of Guada- * loupe; who, finding that their plantations were deftroyed by a paricular fort of ants, removed to Cariacou. The illand flourifled from the liberty that was enjoyed. there. The inhabitauts collected about 1200 ilaves, by whole labours they riade themfelves a revenue of near 20,0001. a-year in cotton.--The other Grenadines do not afford a profpect of the fame advantages, though the plantation of fugar is began there. It has fitcceeded remarkably well at Becouya, the largeft and moft fertile of thefe inands, whichis no more than two leagues diftant from St Vincent."

In the year 1779 the conqueft of this inand was accomplified by D'Eftaign the French admiral, who had been prevented from attempting it before by his euterprife againft St Vincent. Immediately after his conqueft of StLacia, huwever, being reinforced by a fquadron under M. de la Motte, he fet fail for Grenada with a fleet of 26 fail of the line and 12 frigates, having on board 10,000 land forces. Here he arrived on the fecond of July; and landed 3000 troops, chietty, Irifh, being part of the brigade compofed of natives of Ireland in the fervice of France. Thefe were conducted by Count Dillon, who difpofed them in fuch a manner as to furround the hill that overlooks and commands George's Town, together with the fort and harbour. To oppofe thefe, Lord M.Cartuey, the governor, had only about is0 regulars, and 300 or 400 armed inhabitants; but though all refiftance was evidently vain, he determined neverthelefs to make an honourable and gallant defence. The preparationshe made were fuch as induced D'Eftaign himfelf tobeprefent at the attack; and, even with his valt fuperiority of force, the firft attack on the entrenchments proved unfuecefsful.: The fecond contirued two hours; when the garrifon were obliged to yield to the immenfe dif. parity of numbers who affanited them, after having. killed or wounded 300 of their anragonifts. Having: thus made themfelves mafters of the intrenchments on the hill, the French turned the cannon of them towards the fort which lay under tt; on which the governor demanded a capitulation. The terms, however,

## GRE $\quad\left[\begin{array}{ll}144 \\ \text { GRE }\end{array}\right.$

Gremada. were fo extraordinary and unprecedented, that bath the governor and inhabitants agreed in rejecting then: and determined rather to furrender without any conditions at all than apon thofe which appeared fo extravagant. On this occafion D'Eftaign is faid to have behaved in a very haughty and fevere manner ; indulging his foldiers alfo in the moft unwarrantable liberties, and in which they would have proceeded much farther had they notbeen reftrained by the Irim troops in the French fervice.

In the mean time admiral Byron, who had been conveying the homeward-bond Weft India fleet, haftened to St Vincent, in hopes of recovering it; but being informed, by the way, that a defcent had been made on Grenada, he changed his courfe, hoping that Lord M•Cartney would be able to hold out till his arrival. On the fixth of July he came in fight of the French fleet; and without regarding D'Eftaign's fuperiority of fix thips of the line and as many frigates, determined if polfible to force him to a clofe engagement. The French commander, however, was not fo confident of his own prowefs as to run the rifk of an encounter of this kind; and having already atchieved his sonqueft, had no other view than to preferve it. His deligns were facilitated by the good condition of his heet; which being more lately come out of port than that of the Britilh, failed fafter, fo that he was thus enabled to keep at what diftance he pleafed. The engagement began about eight in the morning, when admiral Barrington with his own and two other hips got up to the van of the enemy, which they attacked with the greateft fpirit. As the other fhips of his divifion, however, were not able to get up to his affiftance, thefe three fhips were neceffarily obliged to encounter a valt fuperiority, and of confequence fuffered exceedingly. The battle was carried on from beginning to end in the fame unequal manner; nor were the Britifh commanders, though they ufed their utmoft efforts for this purpole, able to bring the French to a clofe engagement. Thus captains Collingwood, Edwards, and Cornwallis, food the fire of the whole French fleet for fome time. Capt. Fandhaw of the Monrnouth, a 64 gun-mip, threw himfelf lingly in the way of the enemy's van ; and admiral Rowley and Captain Butchart fought at the fame difadvantage: fo that finding it impoffible to continae the engagement with any probebility of fuccefs, a general ceffation of firing took place about noon. It recommenced in the fame manner about two in the afternoon; and lafted, with different interruptions, till the evening. During this action fome of the Britilh hlips had forced their way into St George's harbour, not imagining that the enensy were already in poffeflion of the fland. They were foon undeceived, however, by perceiving the French colours flying ahore, and the guns and batteries firing at them. This difcovery put an end to the defign which had brought on the engagement; and as it was now high time to think of providing for the fafety of the Britifh troops, which were in danger from the number of the enemy's frigates, the engagement was finally difcominued. During this action fome of admiral Byron's hips had fuffered extremely. The Lion of 64 guns, captain Cornwallis, was found incapable of rejoining the fleet which were plying to windward; and was therefore obliged to
bear away alone before the wind. Two other Mipslay Grenada. far aftern in a very diftreffed fituation ; but no attempr was made to capture them, nor did the French admiral liow the tealt inclination to renew the engagement.

Grenada was reftored to Great Britain by the late treaty of peace.-George's town, or St George's, is the refidence of the governor; and the prefent governor, general Matthew, made a prefent to the citizens of a clock and bells in the fpring of 1790 . The garrifon confitted at that time of artillery, two regiments of Europeans, and one of blacks. As there are feveral fmall illands fubjest to the laws enacted in Grenada, they each eleet a perfon to reprefent them in the geral aflembly, which is always held in St George's. As none of the Grenadines have a harbour fit for large veffels, the produce of them is conveyed in fmall veffels to St George's, from whence it is exported to the different places of Europe, Africa, America, \&c. From the number of veffels that arrive yearly from different places, and from its being the feat of the legillature, it has become fo populous, that two news papers are pablifhed in it. On occafion of the late profpect of a war with Spain, an act was paffed hercin February 1790, obliging every gentleman to give in upon oath the value of his eftate, and the number of blacks upon it, in order that the general affembly night afcertain the namber of flaves each fhould fend to work upon the fortifications on Richmond-hill, near St George's.

GRENADINES, or Grenadilios. See the preceding article.-It is there mentioned that the Grenadines do not afford a fingle drop of frefh water. A fmall fpring however has been lately difcovered in the principal ifland Cariacou, by digging ; but being of great value, it is kept locked by the proprictor Mr Mayes. The capital of that illand is called Hiliborough, in which there is a fmall church.
GRENAILLE, a name given by the French writers to a preparation of copper, which the Chinefe ufe as a red colour in fome of their fineft china, particularly for that colour which is called oil-red, or red in oil. The china-ware coloured with this is very dear. The manner in which they procure the preparation is thus: they have in China no fach thing as filver-coined money, but they ufe in commerce bars or maffes of filver; thefe they pay and receive in large bargains; and among a nation fo full of fraud as the Chinefe, it is no wonder that thefe are too often adulterated with too great an alloy of copper. They pafs, however, in this ftate in the common payments. There are fome occafions, however, fuch as the paying the taxes and contributions, on which they mult have their filver pure and fine: on this occalion they have recourfe to certain people, whofe fole bufinefs it is to refine the filver, and feparate it from the copper and the lead it contains. This they do in furnaces made for the purpofe, and with very convenient veffels. While the copper is in fufion, they take a fnall brufh, and dip the end of it into water; then friking the handle of the brum, they fprinkle the water by degrees upon the melted copper ; a fort of pellicle forms itfelf by this means on the furface of the matter, which they take off while hot with pincers of iron, and immediately throwing it into a large veffel of coln water, it forme that red powder which is called the grenaille ; they re-

## GRE [ 145$] \quad$ G R E

- Grenoble, peat the operation every time they in this manner feGrefham. parate the copper; and this furnifhes them with as much of the grenaille as they haveoccalion for in their china works.
GRENOBLE, a large, populous, and ancient town of Dauphiny in France, with a bifhop's fee. It contains a great number of handiome ftructures, particularly the churches and convents. The leather and gloves that are made here are highly efteemed. It is feated on the river Ifere, over which there are two bridges to pals into that part called Perriere, a large Atreet on the other fide of the river. E. Long. 5. 49. N. Lat. 45. 12.

GRESHAM (Sir Thomas), an opulent merchant of London, defcended from an ancient and honourable family of Norfolk, was born in 1519. He was, as his father had been before him, appointed king's agent at Antwerp, for taking up money of the merchants; and in 155 I , he removed to that city with his family. This employment was fufpended on the acceffion of queen Mary : but on proper reprefentations, was reftored to him again. Queen Elizabeth conferred the honour of knighthood upon him, and made him her agent in foreign parts. It was at this time he thought proper to provide himfelf with a manfion-houle in the city, fuitable to his ftation and dignity; with which intention he built a large houfe on the weft fide of Bifhopfgate-ftreet, afterwards known by the name of Crefham-College. His father had propofed building a houfe or exchange for the merchants to meet in, inftead of walking in the open ftreet; but this defign remained for the fon to accomplith. Sir Thomas went beyond his father: he offered, if the citizens would provide a proper piece of ground, to build a houfe at his own expence; which being accepted, he fulfilled his promife after the plan of the exchange at Antwerp. When the new edifice was opened, the queen (Jan.29.1570) came and dined with the founder; and caufed a herald with a trumpet to proclaim it by the name of the Royal Exchange. In purfuance allo of a promife to endow a college for the profeffion of the feven liberal fciences, he made a teftamentary difpofition of his houfe in London for that purpofe; leaving one moiety of the royal exchange to the corporation of London, and the other to the mercers company, for the falaries of feven lecturers in divinity, law, phyfic, aftronomy, geometry, mufic, and rhetoric, at 501 . each per atnum. He left feveral other confiderable benefactions, and died in 1579 . As to the college, it has been pulled down within thefe 14 or 15 years, in confequence of an application to parliament from the city, and the excife-office erected in its place. The lectures, are read, or rather hurried through, in a chamber over the Royal Exchange.Thofe who have drawn Sir Thomas's character obferve, that he had the happinefs of a mind every way fuited to his fortune, generous and benign : ready to perform any good actions, and encourage them in others. He was a great friend and patron of the celebrated martyrologift John Fox. He was well acquainted with the ancient and feveral modern languages; he had a very comprehenfive knowledge of all affairs relating to commerce, whether foreign or domeftic; and his faccefs was not lefs, being in his time efteemed the higheft commoner in England. He Vod, VIII.
tranfacted queen Elizabeth's mercantile affairs fo con- Grevilie. ftantly, that he was called the royal merchant; and his houfe was fometimes appointed for the reception of foreign princes upon their firt arrival at London.

GREVILLE (Fulke), lord Brook, of Beauchamp's Court in Warwick hire, a poet and mifcellaneous writer, was born in the year 1554 , and defcended from the noble families of Beauchamps of Powick and Willoughby de Brook. In company with his coulin Sjr Philip Sidney, he began his education at a fchool in Shrewfbury: thence he went to Oxford, where he remained for fome time a gentleman commoner, and then removed to Trinity-College in Cambridge. Having left the univerfity; he vifited foreign courts, and thus added to his knowledge of the ancient languages a perfect knowledge of the modern. On his return to England he was introduced to queen Elizabeth by his uncle Robert Greville, at that time in her ma. jefty's fervice; and by means of Sir Henry Sidney, lord prefident of Wales, was nominated to fome lucrative employments in that principality.

In the year 158 I , when the Frencl commiffioners who came to treat about the quecin's marriage with the dake of Anjou were fumptuoully entertained with tilts and tournaments, Mr Greville, who was one of the challengers, fo fignalized himfelf, as to " winthe reputation of a moft valiant knight." He continued a conftant attendant at court, and a favourite with the queen to the end of her reign; during which he obtained the office of treafurer of marine caufes, alfo a grant of the manor of Wedgnock, and likewife the honour of knighthood. In this reign be was feveral times elected member for the county of Warwick; and from the journals of the houfe feems to have been 2 man of bufinefs, as his name frequently appears in committees.

On the acceffion of king James I. he was inftalled knight of the Bath; and foon after obtained a grant of the ruinous cattles of Warwick, which he repaired at a confiderable expence, and where he probably refided during the former part of this reign; but in the year 1614 y the twelfth of James $I$. he was made un-der-treafurer, and chancellor of the exchequer, one of the privy-council, and gentleman of the bed-chamber; and in the year 1620, was raifed to the dignity of a baron by the title of lord Brook of Beauchamp's Court. He was alfo privy-counfellor to king Charles I. in the beginning of whofe reign he founded a hiftory-lecture in Cambridge.

Having thus attained the age of 74, through a life of continued profperity, univerfally admired as a gentleman and a fcholar, he fell by the hand of an affafin, one of his own domeftics, who immediately fabbed himfelf with the fame weapon with which he had murdered his mafter. This fellow's name was Haywood; and the caufe is faid to have been a very fevere reprimand for his prefumption in upbraiding his mafter for not providing for him after his death. It feems he had been witnefs to Lord Brook's will, and knew the contents. Some fay he ftabbed him with a knife in the back, others with a fword. This affair happened at Brook-houfe in Holborne.-Lord Brook was buried with great pomp in St Mary's church at Warwick, in his own vault, over which he bad erected a monument of black and white marble, ordering at his death S

Grevins the following infcription to be engraved upon the tomb: "Fulke Greville, fervant to queen Elizabeth,

## Srewia.

counfellor to king James, and friend oo Sir PhilipSid-
ney. Trophreum Peccati." He wrote feveral works both in verfe and profe; among which are, I. Two tragedies, Alaham and Muftapha. 2. Treatife of Human Learning, \&c. in verfe, folio. 3. The Life of Sir Philip Sidney. 4. An inquifition upon Fame and Honour, in 86 Ctanzas. 6. Cacilia, a collection of rog fongs. 7. His remains, confifting of political and philofophical poems.

GREVIUS. See Grievius.
GKEW (Nehemiah), a learned Englifh writer, in the ith century, had a confiderable practice as a phyfician in London, and fucceeded Mr Oldenbugh in the office of fecretary to the reyal fociety. In this capacity purfuant to an order of council, he drew up a caralogue of the natural and artificial rarities belonging to the fociety, under the title of $N W u$ fatm $R$ egalis Societatis, \&c. 1681. He alfo wrote, befides feveral pieces in the Philofophical Tranfactions, I . The Comparative Antatony of the Stomach and Guts, folio. 2. The Anatomy of Plants, folio. 3. Tratifatus de falis Cathartici natura et uffu. 4. Cofnologia Sacra, or a Difceurfe of the Univerfe as it is the Creature and Kingdom of God, folio. He died fuddenly in 1721 .

GREWIA, in botany: A genus of the polyandria order, belonging to the gynandria clafs of plants; and in the natural method ranking under the 37 th order, Columnifera. The calyx is pentaphyllous; there are five petals, each with a nectariferous fcale at the bafe; the berry is quadrilocular.

Species. 1. The occidentalis, with oval crenated leaves, has long been preferved in many curious gardens borh in England and Holland. It is a native of the Cape of Good Hope; and grows to the height of 10 or 12 feet. The ftem and branches greatly refemble thofe of the fmall leaved elm, the bark being frooth, and of the fame colour with that when young. The leaves are alfo very like thofe of the elm, and fall off in autumn. The flowers are produced fingly along the young branches from the wings of the leaves, and are of a bright purple colour. 2. The Africana, with oval fpear-fhaped ferrated leaves, is a native of Sencgal in Africa, fron whence its feeds were brought by Mr Adanfon. In Britain it rifes with a flarubby falk five or fix feet high, fending out many lateral branches, with a brown hairy bark, and garnifhed with fpear-fhaped ferrated leaves; but the plants bave not flowered in Britain.

Gulture and ufes. The firf fort, though a native of a warm climate, will bear the open air in Britain; only requiring to be flettered in a green-houfe during the winter-time. It may be propagated by cuttings or layers planted in pots filled with foft loamy earth. The fecond fort is tender, and muft be kept conftanuly in a warm bark-flove. In fummer, they require a large thare of the free air to be adniited to them, and fhould have water three or four times aweek in warm weather; but in the winter they muft be fparingly wate ced. - The negroes of Senegal high. ly value a decoction of the bark of this laffececies, and ufe it as a never-failing remedy againft venereal complaints.

GREY, or Gray colour. See Gray. GREY (Lady Jane), a moft illuftrious and unfortunate lady, defcended of the blood-royal of England by both parents, was the eldeft daughter of Henry Grey marquis of Dorfet and Frainces the daughter of Charles Brandon lord Suffolk, by Mary the dowager of Lonis XII. king of France, who was the youngent daughter of Henry VII. king of England. She was born in the year 1537, at Broadgate, her father's fear in Leicefterihire. She difcovered an early propenfity to all kinds of good literature; and having a fine genius improved under the tuition of Mr Elmer, fhe made a moft furprifing progrefs in the languages, arts, and fciences. She underftood perfectly both kinds of philofophy, and could exprefs herfelf very properly at leaft in the Latin and Greek tongues; and we are informed by Sir Thomas Chaloner (in.Strype's Memorials, Vol. III.P.93.), that fhe was well verfed in Hcbrew, Chaldee, Arabic, French, and Italian; "and (he adds) fhe played well on inftrumental mafic, writ a curious hand, and was excellent at the needle." Chaloner alfo tells us, that fhe accompanied her mufical inftruments with a voice exquifitely fweet in it felf affited by all the graces that art could beftow.

In the year 1553, the dakes of Suffolk and Northumberland, who were now, after the fall of Somerfet, arrived at the height of power, began, on the decline of the king's health, to think how to prevent that reverfe of fortune which, as things then ftood, they forefaw muft bappen upon Edward's death. To obtain this end, no other remedy was judged fufficient but a change in the fucceffion of the crown, and transferring it into their own families, by rendering Lady Jane queen. Thofe moft excellent and amiable qualities which had rendered her dear to all who had -the happinefs to know her, joined to her near affinity to the king, fubjected her to become the chief tool of , an ambition fo notorioufy not her own. Upon this very account fhe was married to lord Guilford Dudley, fourth fon of the duke of Northumberland, without difcovering to her the real defign of the match; which was celebrated with great pomp in the latter end of May, fo much to the king's fatisfaction, that he contributed bounteoully to the expence of it from the royal wardrobe. The young king Edward VI died in July following; and our fair fcholar, with infinite reluctance, overpowered by the folicitations of her ambitions friends, allowed herfelf to be proclaimed queen of England, on the firength of a deed of fettlement extorted from that prince by her father-inlaw the duke of Northumberland, which fet afide the fucceffion of queen Mary, queen Elizabeth, and Mary queen of Scots. Her regal pageantry continued but a few days. Qieen Mary's undoubted right peevail. ed; and the unfortunate Lady Jane Grey and her hufband were committed to the Tower, and on the 13th of November arraigned and found guily of high treafon. On the 12th of February following they - were both beheaded on Tower-hill. Her magnaininity in this dreadful cataftrophe was aftonilling. hanmediately before her execution, he addreffed herfelf to the weeping mulitude with, amazing compofure and coherency: She acknowledged the juiiise of the law, and died in charity with that wretched world which fhe had fo much reafon to execrase. Thus

## GRI [ 147$] \quad$ GR I

did the pious Mary begin her reign with the murder of an innocent young creature of 18 ; who for fimplicity of manners, purity of heart, and extenfive learning, was hardly ever equalled in any age or country. But, alas! Jane was an obftinate heretic.-A few days before her execution, Fleckenham, the queen's chaplain, with a pious intention to refcue her poor foul from eternal mifery, paid her frequent vifits in the Tower, and ufed every argument in his power to convert her to the Poping religion : but he found her fo much his fuperior in argument, that he gave up the conteft; religning her body to the block, and her foul to the devil.

Her writings are, I. Four Latin Epiftles; three to Bullenger, and one to her fifter lady Catharine. The laft was written, the night before her execution, in a blank leaf of a Greek Teftament. Printed in a book intitled Epiffola Helvetica Reformatoribus, vel ad eos foripta, \&c. Tiguri, 1742, 8 vo. 2. Her conference with Fleckenham. (Ballard). 3. A letter to Dr Harding, her father's chaplain. Printed in the Phoenix, vol. ii. p. 28. 4. A Prayer for her own ufe during her confinement. In Fox's akts and monuments. 5. Four Latin verfes; written in prifon with a pin. they are as follows:

Non aliena putes, homini quæ obtingere poffunt: Sors hodierna mihi, tunc erit illa tibi,

Fane Dudley:
Deo juvante, uil nocet livor malus;
Et non juvante, nil juvat lahor gravis.
Doft tenebras fero lucem.
6. Her fpeech on the fcaffold. (Ballard). It began thus: ‘My Lords, and you good Chriftian people who come to fee me die; I am under a law, and by that law, as a never-erring judge, I am condemned to die: not for any thing I have offended the queen's majefty ; for I will wafh my hands guiltlefs thereof, and deliver to my God a foul as pure from fuch trefpals as innocence from injultice; but only for that I confented to the thing I was enforced unto, conftraint making the law believe I did that which I never underttood," \&c.-Hollinfhed, Sir Richard Baker, Bale, and Fox, tell us that fhe wrote feveral other things, but do not mention where they are to be found.

Grex-Hound. See Gre-Hound.
GRIAS, in botany: A genus of the monogynia order, belonging to the polyandria clafs of plants; and in the natural method ranking with thofe of which the order is doubful. The corolla is tetrapetalous; the calyx quadrifid; the figma feffile and craciform; the fruit is a plum with an eight furrowed kernel. There is but one fpecies, the cauliflora or anchovypear, a native of Jamaica. The leaves are nearly oval, and about three feet long. It has a ftraight ftem, upon the upper part of which come forth the flowers. The fruit is large, and contains a ftone with eight furrows. Thefe fruits are eaten by the inhabitants.

GRIBALDUS (Matthew), a learned civilian of Padua, left Italy in the $\ddagger 6$ th century, in order to make a pablic profeflion of the Proteftant religion. After havitg been for fome time profeffor of the civil law at Tubingen, he was obliged to make his effape to avoid the punimment he would have incurred had he been convicted of differing from Calvin with refpect to
the doctrine of the Trinity : but he was feized at Berne, whenre he would have met with very fevere treatment had he not pretended to renounce his opinions; but as he relapfed again, he would certainly have been put to death, had he not died of the plague in 1664. He wrote De methodo ac ratione ftudendi in jure civili; and feveralotherworks which are efteemed.

GRIBNER (Michael Henry), a learned civilian of Germany, was born at Leipfic in 1682 . After writing fome time in the journal of Leipfic, he was made profeffor of Law at Wittemberg: whence he paffed to Drefden, and was at laft rećalled to Leipfic to fucceed M. Mencke. He died in 1734 . Befides feveral academical differtations, he wrote, r. Principia procelfus judiciarii; 2. Principia jurifprudentia naturalis, a fmall work much efteemed; 3.O.pufcula juris publici oi privati.

GRIEF, or Sorrow. The influence of this palfion on the body is very great. Its effects refemble in feveral inftances thofe of fear, with, however, fome variations, owing perhaps to its being in general of longer duration. Grief diminifhes the bodily frength in general, and particularly the force of the heart and circulation; as appears by the frequent fighs and deep , refpirations which attend it, which feem to be necef.fary exertions, in order to promote the paffage of the blood through the lungs. It dininifhes perfpiration, obftructs the menftrual difcharge, produces palenefs of the fkin, and œdematous complaints, and fchirrus of the glandular parts. It aggravates the fourvy, and the malignity of putrid and contagious diftempers, and renders people more apt to receive the infection of them. When it comes on fuddenly, and in a great degree, it caufes a palpitation of the heart, and renders the pulfe irregular. Blindnefs, gangrene, and fudden death, have followed the excefs of chis fenfation. Its effects of changing the colour of the hair are well known. Opiates, if not given in large dofes, are good cordials in this cafe.

GRIELUM, in botany : A genus of the pentagynia order, belonging to the decandria clafs of plants. The calyx is quinquefid; there are five petals; the filaments perfifting; and there are five monofpermous feed cafes.

GRIERSON (Conftantia), born of poor parents in the county of Kilkenny in Ireland, was one of the moft learned women on record, though fhe died at the age of 27, in 1733. She was an excellent Greek and Latin fcholar ; and underftood hiltory, divinity, philofophy, and mathematics. She proved her 1 kill in Latin by her dedication of the Dublin edition of Tacitus to lord Carteret, and by that of Terence to his fon; to whom the alfo addreffed a Greek epigram. She wrote many elegant Englifh poems, feveral of which were inferted by Mrs Barber among her own. When lord Carteret was lord lieutenant of Ireland, he obtained a patent for Mr Grierfon to be the king's printer; and to re. ward the uncommon merit of his wife, caufed her life to be included in it.

GRIFFON (Gryphus, rauq), in the natural hiftory of the ancients, the name of an imaginary bird of prey, of the eagle kind. They reprefented it with four legs, wings, and a beak; the upper part reprefenting an eagle, and the lower a lion : they fappofed it to watch over gold mines, hidden treafures, \&c.

## G R I [ 148 ] GRI

Grifiea, The animal was confecrated to the fun; and the anGrimaldi. cient painters reprefented the chariot of the fun as
drawn hy griffons. M. Spanheim obferves the fame of thofe of Jupiter and Nemefis.

The griffon in Scripture is that fpecies of the eagle called in Latin ofliftaga, the "ofprey ;" and of the verb פדם, paras, " to break."

The griffon is frequently feen on ancient medals; and is ftill borne in coat-armour. Guilim blazons it rampant; alleging, that any very fierce animal may be fo blazoned as well as the lion. Sylvefter, Morgan, and others, ufe the terms fegreiant inftead of rampant.

This is alfo an ornament of arehitecture in conftant ufe among the Greeks, and was copied from them, with the other elegancies of architectural enrichments, by the Romans. See Sphynx.

GRIFLEA, in botany: A genus of the monogynia order, belonging to the octandriaclafs of plants; and in the natural method ranking under the 17 th order, Calycanthente. The calyx is quadrifid; and there are four petals, one from each incifore of it. The filaments are very loing, afcending or turning upwards; the capfule is globofe, fuperior, unilocular, and polyfpermous.

GRIMALDI (Francifco), an eminent painter, generally known by the appellation of Bologne/e, was born at Bologna in 1606, where he became a difciple of Annibal Caracci, and proved an honour to that illuftrious mafter. From the fchool of Annibal he went to complete his ftudies at Rome, and improved himfelf daily, by copying the works of thofe artifts in which he obferved the greateft excellence, until his fuperior talents recommended him to the favour of Innocent $X$. who afforded him immediate opportuniries of exerting his genius in the gallery of his palace at Monte Ca vallo, and alfo in the Vatican. The merit of his performances very foon engaged the attention and ap: plaufe of the poblic, and increafed the number of his admirers and friends; among whom were the prince Pamphilio, and many of the principal nobility of Rome. His reputation reached cardinal Mazarine at Paris, who fent for him, fettled a large penfion on him, and employed him for three years in embellifhing his palace and the Louvre, by the order of Louis XIII. The tronbles of the flate, and the clamours raifed againft the cardinal, whofe party he warmly efponfed, put him fo much in danger, that his friends advifed him to retire among the Jefuits. He did fo, and was of ufe to them; for he painted them a decoration for the expofition of the facrament during the holy days, according to the cuftom of Rome. This piece was mightily relifhcd at Paris : the king honoured it with two vifits, and commanded him te paint fuch another for his chapel at the Louvre. Grimaldi after that returned to Italy; and at his arrival at Rome found his great patron Innocent $X$. dead : but his two fuccefors Alexander VII. and Clement IX. honoured him equally with their friendfip, and found him variety of employment. Grimaldi was amiable in his manners, as well as fkilful in his profeffion : he was generous without profufion, refpectfal to the great without meannefs, and charitable to the poor. The following inftance of his benevolence may ferve to characterife the man. A Sicilian gentleman, who had retired from Meffina with his
daughter during the troubles of that country, was reduced to the mifery of wanting bread. As he lived over-againft him, Grimaldi was foon informed of it; and in the dufk of the evening, knocking at the Sicilian's door, without making himfelf known, toffed in money and retired. The thing happening more than once, raifed the Sicilian's curiofity to know his benefactor; who finding him out, by hiding himfelf behind the door, fell down on his knees to thank the hand that had relieved him. Grimaldi remained confufed, offered him his houre, and continued his friend till his death. He died of a dropfy at Rome in 1680 , and left a confiderable fortune among fix children. The genius of Grimaldi directed him chiefly to landfcape, which he executed moft happily. His colouring is ftrong ; his touch light and delicate; his fituations are uncommonly pleafing; and the leafing of his trees is admirable. Sometimes, indeed, his colouring appears rather too green: but thofe landfcapes, which he painted in the manner of the Caracci, may lerve as models for all thofe whoadmire the fyle of that fchool; and he defigned his figures in an elegant tafte. The pictures of this mafter are very unfrequent, efpecially thofe of his beft time; and whenever they are to be purchafed, they afford large prices. Of his children abovementioned, the youngeft, named Alexander, proved a good painter, in the fame ftyle and tafte with his father, though very far inferior to him: fome of the pictures of Alexander, however, are either artfully, or injudicioufly, afcribed to Francifco.

GRIMSBY, a large fea-port town of Lincolnfhire in England, 169 miles from London; and faid to be the fecond, if not the firft, corporation in England. It had anciently three convents and a caftle. It is governed by a mayor, higli feeward, recorder, twelve aldermen, twelve common councilmen, two bailiffs, two coroners, a town clerk, and three ferjeants at mace. The mayor holds a court here on Tuefday, and the: bailiffs on Friday. Here are feveral freets of good houfes, and a church that looks like a cathedral. It was a place of great trade before its harbour was choaked up; yet the road before it is a good ftation for: fhips that wait for a wind to get out to fea. Its chief trade is in coals and falt brought by the Humber.

GRINDING, or Trituration, the act of break. ing or comminuting a folid body, and reducing it into powder. See Pulverization and Levigation.

The painters colours are grinded on a marble or porphyry, either with oil or gum-water.
Grinding is alfo uited for rubbing or wearing off the irregular parts of the furface of a body, and reducing it to the deftined figure, whether that be flat, concave, or the like.

The grinding and polihing of glafs is a confiderableart; for which fee $G_{\text {Lass }}$-Grinding. For the grinding. of optical glaffes, fee Optics, the Mechanical Part.

GRINSTED, EASt and West ; two towns near Salifbury in Wilifhire.

Grinsted, Eaft, a town 29 miles from London, feated on a hill, near the borders of Surry, near Afhdown foreft. It has a handfome church, which was rebuilt after being burnt down 1683 . On November 12, 1785 , the beantiful tower having lately fallen to decay, fell down, and part lighting on the charch very confiderably damaged it. An hofpital in the reign of

## GRI $\quad\left[\begin{array}{ll}149 & ]\end{array} \quad\right.$ GR I

Grinfted king James I. for 31 poor people of this town was built and endowed with 3301. a year, It is a borough by prefcription, governed by a bailiff and his
brethren; has fent burgefles to parliament ever fince the firlt of Edward II. who are elected by about 35 burgage holders; had a charter for a monthly market from Henry VII. and is generally the place for the affizes. The returning officer here is the bailiff, who is chofen by a jury of burgage holders. Its market is on Thurfday, and its fairs, which are well frequented, are July 13 and December II; which laft is a great one for Wellh runts, that are bought up here by the Kentifh and Suffex farmers and for fat hogs and other cattle.
Grinsted, Weft, in Suffex, a town above 10 miles to the fouth-weft of Eaft-Grinfted.

GRIPES, in medicine, a fort of cholic or painful diforder of the lower belly, occafioned by fome fharp pungent matters vellicating the parts, or by wind pent up in the inteftines. See Index fubjoined to MedicINE.
GRIPSWALD, a ftrong and confiderable town of Pomerania in Germany; formerly imperial, but now fubject to the Swedes, with a good harbour and univerfity. E. Long. 13. 53. N. Lat. 54. I2.

GRISGRIS, a fuperftition greatly in vogue among the negroes in the interior parts of Africa. The grifgris, according to Le Maire, are certain Arabic characters mixed with magical figures drawn by the Marabuts or priefts upon paper. Labat affirms, that they are nothing elfe than fcraps of the alcoran in Arabic; but this is denied by Barbot, who brought over one of thefe grifgris to Europe, and howed it to a number of perfons deeply fkilled in oriental learning. None of thefe could find the leaft trace of any character they underftood. Yet, after all, this might be owing to the badnefs of the hand-writing; and the words are probably of the Mandingo language, though the characters are an attempt to imitate the Arabic. The pooreft negro never"goes to war without the grifgris, as a charm againft wounds; and if it proves ineffectual, the prieft transfers the blame on the immorality of his conduct. Thefe prieftsinvent grifgris am gainft all kinds of dangers, and in favour of all defires and appetites; by virtue of which the poffeffors may obtain or avoid whatever they like or diflike. They defend them from forms, enemics, difeafes, pains, and misfortunes; and preferve health, long life, wealth, honour, and merit, according to the Marabuts. No clergy in the world are more honoured and revered by the people than thefe impoftors are by the negroes; nor are any people in the world more impoverifhed by their priefts than thefe negroes are, a grifgris being frequently fold at three flaves and four or five oxen. The grifgris intended for the head is made in the form of a crofs, reaching from the forehead to the neck behind, and from ear to ear; nor are the arms and fhoulders neglected. Sometimes they are planted in their bonnets in the form of horns; at other times, they are made like ferpents, lizards, or fome other animals, cut out of a kind of patteboard, \&c. There are not wanting Europeans, and otherwife intelligent feamen and merchants, who are in fome degree infected with this weaknefs of the conatry, and believe that the negro forcerers have an actual communication
with the devil, and that they are filled with the malignant influence of that evil fpirit, when they fee them diftort their features and mufcles, make horrid grimaces, and at laft imitate all the appearance of epileptics.

GRISONS, a people fituated ainong the Alps, and allies of the Swifs. Their country is bounded on the north by the counties of Surgans and Bludenz, the canton of Glaris, and the principality of Lichtenttein; on the fouth by the canton's Italian bailiwics, the county of Chavenne, and the Valteline; on the eaft by the territories of Venice and Milan; and on the weft by fome of the Italian bailiwics, and the canton of Uri. It is divided into three leagues, viz. the Grifon or grey league, the league of the boufe of God, and that of the ten jurij/dittions; which unite and form one republic. The two firf lie towards the foutla, and the third towards the north. The length of the whole is above 70 miles, and the breadth about 60 . The inhabitants are faid to have had the name of Grifons from the grey coats they wore in former times. This conntry, lying among the Alps, is very mountainous; but the mountains yield good pafture for cattle, heep, and goats, with fome rye and barley : in the valleys there is plenty of grain, pulfe, fruits, and wine. This country alfo abounds with hogs and wild-fowl; but there is a fcarcity of fifh and falt, and their horfes are moftiy purchafed of foreigners. The principal rivers are the Rhine, the Inn, and the Adda. Here are alfo feveral lakes, moft of which lie on the tops of the hills. Tho language of the Grifons is either a corrupt Italian or the German. Each of the leagues is fubdivided into feveral leffer communities, which are fo many democracies; every male above 16 having a thare in the government of the community, and a vote in the election of magiftrates. Deputies from the feveral communities conftitute the general diet of the Grifon leagues, which meets annually, and alternately at the capital of each league; but they can conclude nothing without the confent of their conftituents. This country was auciently a part of Rhetia. After the extinction of the Roman empire in the weft, it was fome time fub; ject to its own dukes, or thofe of Swabia. Then the bihop of Coire, and other petty princes, dependent on the emperors of Germany, became matters of great part of it: at laft, by the extinction of fome, purchafe, voluntary grants, and force, it got rid of all its. lords, and erected itfelf into three ditinct republics, each of which, as we obferved ahready, is fubsivided into a certain number of communities, which are a fort. of republics, exercifing every branch of fovereignty, except that of making peace or war, fending embafiies, concluding alliances, and enacting laws relating to thewhole country, which belong to the provincial diets of the feveral leagues. The communities may be compared to the cities of Holland, and the diets of the feve-. ralleagues to the provincial ftates. The particular diers are compored of a deputy from each community; and both in them and the communities every thing is determined by a majority of votes. In the communities, every male above i6 has a vote. Befides the annual. provincial diets for choofing the chiefs and other offcers, and deliberating on the affairs of the refpective: leagues, there are general diets for what concernsall. the three leagues or whole body. In both thefe, the

## CRI [150] GRI

Grifons. reprelentatives can do nothing of themfelves, but are tied down to the inftructions of their principals. There is a general feal for all the three leagues ; and each particular league has a feparate feal. Befides the ftated times of meeting, extraordinary diets are fomeuimes funmoned, when either the domeftic affairs of the ftate or any foreign minifter require it. In the general diets, the Grey League has 28 votes; that of the Houfe of God, 23 ; and that of the Ten Jurifdictions, 15 . Thefe leagues, at different times, have entered into clofe alliances with the neighbouring cantons and their affociates. The bailiwics belonging in common to the three leagues are thofe of the Valteline, Chieavene, Bormio, Meyeufeld, Malans, and Jennins; the officers of which are nominated fucceffively by the feveral communities every two years. The yearly revenue arifing to the Grifons from their bailiwics is faid to amount to about 13,500 florins. The public revenuesaltogether are but fmall, though there are many private perfons in the country that are rich. However, in cafe of any extraordinary emergency, they tax themfelves in proportion to the neceflity of the fervice and the people's abilities. They have no regular troops, but a well-difciplined militia; and upon occafion, it is faid, can bring a body of 30,000 fighting men into the field : but their chief fecurity arifes from the narrow paffes and high mountains by which they are furrounded.

Of the jurifprudence, religion, \&c. of the Grifons, the following account is given ly Mr Coxe in his travels in Switzerland. Throughout the three leagues the Roman law prevails, modified by the municipal cuffoms. The courts of juftice in each community are compofed of the chief magittrate, whe prefides, and a certain number of jurymen, chofen by the people: they have no regular falaries, but receive for their attendance a fmall fum, arifing in fome communities from the expences of the procefs, which are defrayed by the criminals; in others from a fhareof the fines. They enjoy the power of pardoning or diminifhing the penalty, and of receiving a compofition in money. This mode of proceeding fuppofes what is as abfurd in theory as it is contrary to experience, that judges will incline to mercy when it is their intereft to conviet ; or will impartially inflict punifhment, even when injurious to their own private advantage. -The prifoners are examined in private; frequenty tortured for the purpofe of forcing confeffion, when the judges either divide the fines, or remit the punifhent for a compofition. In fome diftricts a criminal trial is a kind of feftival to the judges, for whom a good repaft is provided at the expence of the prifoner if convicted; and thus the following allufion, in Garth's Difpenfary, applied with more wit than truth to our courts of juftice, is literally fulfilled:-
'And wretches hang, that jurymet may dthe.'
Capital punifhments, however, are extremely rare; a circumftance arifing not from a want of feverity in the penal ftatutes, or from a propenfity to mercy in the judges: but becaufe the latter draw more advantages from fining than exccuting an offender. In a word, to ufe the expreffion of Burnet, which is as true at prefent as it was in his time, "Many crimes go unpunithed, if the perfons who commit them have either great credit or much money." It is remarkable, that
torture is more frequently applied, and for fmaller dew Griforr. linquencies, in thefe indeperdent republics, than in the fubject provinces. The infliction of it depends entirely upon the arbitrary will of the judges; a majority of whom may order it for an offence which is not capital, nor even puniihable by corporal penalties. Thus it is not uncommon, in thofe communities where fines are divided among the judges, to torture women of loofe conduct, for the purpofe of compelling them to confefs with whom they have been connected; for as fuch offences are punifhable by fines, the more perfons are convicted, the larger hhare of money is diftributed among the judges for the trouble of their attendance. Even in the diffritts where the fines are paid to the community, torture is often no lefs wantonly inflicted, becaufe, when the prifoner is not found guilty; the expences of the procefs fall tipon the public, and the judges receive little emolument. Even in the civil courts moft caufes are decided by bribing the judges; and appeals in thofe communities; wherein they are admitted, fcarcely ferve any other end than to enlarge the fphere of corruption; Coire, and a few other places, are excepted from this general reflection.

The religion of the Grifons is divided into catholic and reformed. The doctrines of the reformation were firft preached about the year 1524, and received at Flæfch a fmall village in the Ten Jurifdictions upon the confines of Sargans ; from thence they were extonded to Mayenfeld and Malantz, and foon afterwards through the whole valley of Pretigaü. The new opinions fpread with fuch celerity, that before the end of the 16 th century they were embraced by the whole league of the Ten Jurifdictions (excepting part of the community of Alvenew), the greateft part of the Houfe of God, and a few communities in the Grey League. The difference of religion nearly excited a civil war between the two fects, as well at the firf introduction of the reformation as at the beginning of the troubles in the Valteline. In the latter inftance, the two parties rofe in arms ; but the Catholics being overpowered by the Proteftants, matters were amicably adjufted. Since that peried all religious concerns have been regulated with perfect cordiality. According to the general confent of the three leagues, each community being abfolute within its little territory, has the power of appointing its own particular worthip, and the inhabitants are free to follow either the Catholic or Reformed perfuafion. In the adminiftration of civil affairs religion has no interference: the deputies of the general diet may be members of either communion, as chofen by the communities which they reprefent. By this moderate and tolerating principle, all religious diffenfions have been fuppreffed as much as poffible; and the moft perfeet amity fubfifts between the two feets.
In firitual concerns, the Catholics for the moft part are under the jurifdiation of the bilhop of Coire. For the affairs of the Reformed churches, each league is divided into a certain number of diftriets, the minifters whereof affemble twice every year: thefe affemblies are called colloquia. Each colloquium has its prefident, and each league a fuperintendant called a decan. The fupreme authority in firitual concerns is vefted in the fynod, which is compofed of the three deans, and the clergy of each league; the fynod affembles every year alternately in each of the three leagues. Candidates

## G R O

for holy orders are examined before the fynod. The neceffary qualifications for admiffion into the church ought to be the knowledge of Hebrew, Greek, and Latin ; but this rule is not ftrictly adhered to; many being ordained without the leaft acquaintance with either of thole languages. Formerly Latin was folely ufed, as well in the debates of the fynod as for the purpofe of examining the candidates; but at prefent that tongue grows more and more into difule, and German is employed in its ftead.

The number of reformed parifhes in the whole three leagues amounts to 135, in the following proportion: -Inthe Grey League 46, in that of God's Houfe 53, and in the League of Ten Juriddictions 36. The minifters of thefe churches enjoy but very fmall falaries. The richeft benefices do not perhaps yield more than L. 20, or at moft L. 25 per annum, and the pooreft fometimes fcarcely L.6. This fcanty income is attended with many inconveniences. It obliges the clergy who have families to follow fome branch of traffic, to the neglect of their ecclefiaftical ftudies, and to the degredation of their profeffional character. Another inconvenience is fuptradded to the narrownefs of their income. In moft communities the minifters, though confirmed by the fynod, are chofen by the people of the parifh, and are folely dependent on their bounty. For thefe reafons, the candidates for holy orders are generally extremely ignorant. They cannot fupport that expence which is requifite to purfue their ftudies; they are not animated with the expectation of a decent competence; and, from the dependent mode of their election, are not encouraged to deferve their promotion by a confiftent dignity of character.

GRIST, in country affairs, denotes corn ground, or ready for grinding.

GRIT (argillaceous), a genus of argillaceous earch. Its texture is more or lefs porons, equable, and rough to the tonch. It does not give fire with fteel, nor effervefee with acids. When freh broken and breathed upon, it exhales an earthy fmell. Mr Kirwan mentions two kinds; one from Hollingion near Utoxeter, of a yellowifh or whitill grey, and about the fpecific gravity of 2288. Another, from Kneperly in Staffordhire, is of the fpecific gravity of 2568 ; and fo unfufible as to be ufed for fire ftones. According to Fabroni the grit-ftone is of greater or lefs hardnefs, moflly of a grey, and fometimes of a yellowifh colour, compored of a filiceous and micaceous fand, but rarely of a fparry kind; with greater or fmaller particles clofely compacted by an argillaceous cement. It gives fome fparks with fteel, is indiffoluble for the mont part in acids, and vitrifiable in a ftrongfire. It is ufed for millfones and whetfenes; and fometimes for filtering flones and for building.

GROAT, an Englif money of account, equal to four pence. Other nations, as the Dutch, Polanders, Saxons, Bohemians, French, \&c. have likewife their groats, groots, groches, gros, \&c. In the Saxon times, no filver coin bigger than a penny was fruck in England, nor after the conqueft, till Edward III. who, about the year 135 r , coined groffes, i. e. groats, or great pieces, which went for 4 d . a-piece: and fo the matter ftood till the reign of Henry VIIl. who, in 1504 , firf coined faillings.

Groats, in country affairs, oats after the hulls are off, or great oat-meal.

GROCERS, anciently were fuch perfons as engroffed all merchandize that was vendible; but now they are incorporated, and make one of the companies of the city of London, which deals in fugar, foreign fruits, fpices, \&c.
GROENLAND, or Spitzbergen. SeeGrefnLand.

GROGRAM, 2 kind of ftuff made of filk and mohair.
GROIN, that part of the belly next the thigh.In the Philofophical Tranfactions we have an account of a remarkable cafe, where a peg of wood was extracted from the groin of a young woman of 21 , after it had remained i6 yearsin the ftomach and inteftines, having been accidentally fwallowed when fhe was about five years of age. Vide Vol. LXVII. p. 459.

Groin, among builders, is the angular curve made by the interfection of two femi-cylinders or arches; and is either regular or irregular.-A regular groin is when the interfecting arches, whether femicircular or femieliptical, are of the fame diameters and heights. An irregular groin is where one of the arches is femicircular and the other femieliptical.

GROMWELL, in botany. See Lithosperм UM.
GRONINGEN, the mof northerly of the Seven United Provinces, is bounded on the north by the German ocean; on the fouth, by the county of Drenthe ; on the eaft, by the bifhopric of Munfter, and the principality of Eaft-Friefeland; and on the weft by the province of Friefeland, from which it is parted by the river Lawers. Its greateft length from fouth-ealt to north-weft is about 47 miles; hut its breadth is very unequal, the greaten being about 33 miles. Here are rich paftures, large herds of great and fmall cattle, plenty of fea and river fifh, and of turf, with fome forefts and corn-land. There are feveral rivers in the province, of which the principal is the Hunfe; and a great number of canals and dykes. The ftates confift of the deputies of the town of Groningen, and the Ommeland, or circumjacent country ; and held their affemblies always in the town of Groningen. The province had anciently governers, under the title of burgraves; but their power being limited, the people enjeyed great privileges. Afterwards it became fubject to the bihop of Utrecht; but hook of his yoke at laft, and recovered its liberty. In 1536 it fubmitted to Charles V. and in 1579 acceded to the union of Utrecht. The colleges are much the fame here as in the other provinces, viz. the provincial ftates, council of ftate, provincial tribunal, and chamber of accounts. Six deputies are fent from hence to the fates-general. Of the eftablifhed clergy there are 160 minifters, which form feven claffes, whofe annual fynod is held, by turns, at Groningen and Appingedam.
Groningen, the capital of the province of that natre, is fituated about 12 miles from the neareft fhone of the German ocean, at the conflux of feveral rivulets, which form the Hunferand Fivel. Ships of confiderable bur den can come up to the city, in cenfequence of which it enjoys a pretty good trade. It was formeily very firong, but its fortifications ane now mah ne teet d.

## $G R O$

Gronovia The univerfity here was founded in 1615 , and is well endowed out of the revenues of the ancient monafteries. The town, which was formerly one of the

Hanfe, and has fill great privileges, is large and populous, being the feat of the high colleges, and containing three fpacious market-places, and 27 ftreets, in which are many fine houfes, befides churches and other public ftructures. By the river Fivel and the Eems, it has a communication with Weltphalia. In 5672 it made fuch a gallant refiftance againft the bithop of Munfter, that he is faid to have loft 10,000 men before it. Rodolphus Agricola and Vefelius, two of the moft learned men of the age in which they lived, were born here. Under the juridiction of this city is a confiderable diftrict, called the Gorecht. E. Long. 6. 25. N. Lat. 53. 10.

GRONOVIA, in botany : a genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 34th order, Cucurbitacea. There are five petals and ftamina inferted into a campanulated calyx ; the berry is dry, monofpermous, and inferior.

GRONOVIUS (John Frederic), a very learned critic, was born at Hamburgh in 1613 ; and having travelled through Germany, Italy, and France, was made profetlor of polite learning at Deventer, and afterwards at Leyden, where he died in 1671. He publihhed, 1. Diatribe in Statii, \&c. 2. Defeflertiis. 3. Correct cditions of Seneca, Statius, T. Livy, Pliny's Natural Hiftory, Tacitus, Aulus Gellius, Phædrus's Fables, \&c. with notes; and other works.

Gronovius (James), fon of the preceding, and a very learned man, was educated firft at Leyden, then went over to England, where he vifited the univerfities, confulted the curious MSS. and formed an acquaintance with feveral learned men. He was chofen by the grand duke to be profeffor at Pifa, with a confiderable ftipend. He returned into Holland, after he had refided two years in Tufcany, and confulted the MSS. in the Medicean library. In 1679, he was invited by thecurators of the univerfity to a profefforChip; and his inaugural differtion was fo highly approved of, that the curators added 400 florins to his fipend, and this augmentation continued to his death in 1716 . He refufed feveral honourable and advantageons offers. His principal works are, The treafure of Greek antiquities, in 13 vols. folio; and a rreat number of differtations, and editions of ancient wuthors. He was compared to Schioppus for the virulence of his ftyle ; and the feverity with which he treated other great men who differed from him, expofed him to juft cenfure.

GROOM, a name particularly applied to feveral fuperior officers belonging to the king's houfehold, as groom of the chamber, groom of the ftole. See Stone, and Wardrobe.

Groom is more particularly ufed for a fervant appointed to attend on horfes in the ftable. - The word is formed from the Flemifh grom, "a boy."

GROOVE, among miners, is the fhaft or pit funk into the earth, fometimes in the vein, and fometimes not.

Groove, among joiners, the channel made by their plough in the edge of a monlding; fyle, or rail, to put their pannels in, in wainfcotting.

GROSS, a foreign moncy, in divers countries, anfwering to the Englih groat.

Gross is ufed among us for the quantity of twelve dozen.

Gross weight, is the weight of merchandizes and goods, with their daft and drofs, as alfo of the bag, cafk, cheft. \&c. wherein they are contained; out of which grofs weight, allowance is to be made of tare and tret.

GROSS, or Grossus, in our ancient law writers, denotes a thing abfolute, and not depending on another. Thus, villain in grofs, villanus in grolfo, was a fervant, who did not belong to the land, but immediately to the perfon of the lord; or a fervile perfon not appendant or annexed to the-lard or manor, and to go along with the tenures as appurtenant to it ; but like other perfonal goods and chattels of his lond, at his lord's pleafure and difpufal.

Gross, advcwfomin. See Advowson.
Gross-bean, in zeology, a name by which we commonly call the coccothrauftes, called alfo at other times the haw-finch. This is the Loxid coccothraufles in the Linnæan fyftem.

Gross-beak, in ornithology; afpecies of Loxia. GROSSULARIA. SceRifes.
GROTESQUE, or Grotesk, in fcuipture and painting, fomething whimfical, extravagant, and mon--ftrous; confifting either of things that are merely imaginary, and have no exiftence in nature; or of -things fo diftorted, as to raife furprife and ridicule. The name arifes hence, that figures of this kind were -anciently much ufed to adorn the groftos wherein the tombs of eminent perfons or families were inclofed. Such was that of Oyid, whofe grotto was difcovered near Rome about one hundred years ago.

GROTIUS (Hugo), or more properly Hugo de Groot; one of the geeatef menim Europe, was born at Delft in 1583 . He made fo sapid a progrefs in his fudies, that at the age of 5 he had attained a great knowledge in philofophy, divinity, and civil law; and a yet greater proficiency in polite literature, as appeared by the commentary he had made at that age on Martianus Capella. In $59^{8}$, he accompanied the Dutch ambaffador into France, and was honoured with feveral marks of efteem by-Henry IV. He took his degree of ductor of laws in that kingdom; and at his return to his native country, devoted himfelf to the bar, and pleaded before he was 17 years of age. He was not 24 when he was appointed attorney-general. In 1613 he fettled in Rotrerdam, and was nominated fyndic of that city; but did not accept of the office, till a promife was made him that he flould not be removed from it. This prudent precaution he took from his forefeeing, that the quarrels of the divines on the doctrine of grace, which had already given rife to manty factions in the fitate, would occafion revolutions in the chief cities. The fame year he was fent into England, on account of the divifions that reigncd between the traders of the two nations, on the right of filhing in the northern feas; but he could obzain nofatisfaction. He was afterwards fent to England, as it is thought, to perfuade the king and the principal divines to favour the Arminians; and he had feveral conferences with king Jaines on that fubject., On his return to Holland, his attachment to Barnevelt in-

## GRO

Grotius volved him in great trouble; for he was leized, and fentenced to perpetual imprifonment in 1619, and to forfeit all his goods and chattels. But after having been treated with great rigour for above a year and a half in his confinement, he was delivered by the advice and artifice of his wife, who having oblerved that his keep. ers had often fatigued themfelves with fearching and examining a great trunk-fall of foul-linen which ufed to be wafhed at Gorkum, but now let it pafs without opening it, fhe advifed him to bore holes in it to prevent his being ftitled, and then to getinto it. He complied with this advice, and was carried to a friend's houfe in Gorkum; where dreffing himfelf like a mafon, and taking a rule and trowel, be paffed through the market-place, and fepping into a boat went to Valvet in Brabant. Here he made himfelf known to fome Arminians, and hired a carriage to Antwerp. At firft there was a defign of profecuting his wife, who ftaid in the prifon; and fome judges were of opinion that The ought to be kept there in her hufband's ftead: however, fhe was releafed by a plurality of voices, and univerfally applauded for her behaviour. He now retired into France, where he met with a gracious recep. tion from that court, and Louis XIII. fettled a penfion upon him. Having refided there eleven years, he returned to Holland, on his receiving a very kind letter from Frederic Henry prince of Orange : but his enemies renewing their perfecution, he went to Hamburgh; where in 1635, Queen Chriftina of Sweden made him her counfellor, and fent him ambaffador into France. After having difcharged the duties of this office above eleven years, he returned, in order to give an account to Queen Chriftina of his embafy; when he took Holland in his way, and received many honours at Amfterdam. He was introduced to her Swedifh majefty at Stockholm ; and there begged that the would grant his difmifion, in order that he night return to Holland. This he obtained with difficulty; and the queen gave him many marks of her efteem, though he had many enemies at this court. As he was recurning, the thip in which he embarked was caft away on the coaft of Pomerania; and being now fick, he continaed his journey by land; but was forced to ftop at Roftock, where he died, on the 28th of Auguft 1645. His body was carried to Delft, to be iuterred in the fepulchre of his anceflors. Notwithftanding the embafles in which he was employed, he compofed a great number of excellent works; the principal of which are, I. A treatife De jure belli et pacis, which is efteemed a mafter-piece. 2. A treatife on the truth of the Chriftian religion. 3. Commentaries on the holy feriptures. 4. The Hiftory and Annals of Holland. 5. A great number of letters. All which are written in Latin.

GROTSCAW, a town of Turkey in Europe, in the province of Servia, where a battle was fought between the Germans and Turks, in the year i 739 , in which the Germans were forced to retreat with lofs. E. Long. 21 O. N. Lat. 45. o.

GROTSKA W, a ftrong town of Germavy, capital of a province of the fame name in Silefia. It is very agrec ibly feated in a fruiful plain. E. Long. 77.35. N. Lat. 50.42.

GROTTO, or Grotta, a large deep cavern or VGl. VIII.
den in a mountain or rock. The word is Italian, grotta, formed, according to Menage, \&c. from the Latin crypta. Du cange oblerves, that grotta was ufed in the fame fenfe in the corrupt Latin.

The ancient anchorites retired into dens and grottos, to apply themfelves the nore attentively to medi. tation.

Okey-hole, Flden-hole, Pcake's-hole, and Pool'shole are famous among the natural caverns or grottos of Brituin.

The entrance to Okey-hole, on the fouth fide of Mendip-hills, is in the fall of thofehills, which is befet all about with rocks, and has near it a precipitate defcent of near twelve fathoms deep, at the bottom of which there continually iffues from the rocks a confiderable current of water. The naked rocks above the entrance dhow themfelves about 30 fathoms high, and the whole afcent of the hill above is about a mile, and is very fteep. As you pafs into this vault, you go a: firftupon a level, but advancing farther, the way is found to be rocky and uneven, fometimes afcending, and fometimes defcending. The roof of this cavern, in the higheft part, is about eight fathoms from the ground, but in many particular places it is folow, that a man muft floop to get along. The breadth is not lefs various than the height, for in fome places it is five or fix fathoms wide, and in others not more than one or two. It extends itfelf in length about two hundred yards. People talk mach of certain ftones in it, refembling men and women, and other things; but there is little matter of curiofity in thefe, being only flapelefs lumps of a common fpar. At the fartheft part of the cavern there is a good ftream of water, large enough to drive a mill, which paffes all along one fide of the cavern, and at length flides down about fix or eight fathons among the rocks, and then prefling through the cleits of them, difcharges itfelf into the valley. The river within the cavern is wall fored with eels, and has fome trouts in it ; and thefe cannot have come from without, there being fo great a fall near the entrance. In dry fummers, a great number of frogs are feen allalong this cavern, even to the fartheft part of it; and on the roof of it, at certain places, hang vaft numbers of bats, as they do in almoft all caverns, the entrance of which is either level, or but fightly afcending or defcending ; and even in the more perpendicular ones they are fometimes found, provided they are not too narrow, and are fufficiently high. The catrle that feed in the paftures through which this river runs, have been known to die fuddenly fometimes after a flood; this is probably owing to the waters having been impregnated, cither naturally or accidentally, with Iead ore.

Elden-hole is a huge profound perpendicular chafm, three miles from Buxton, ranked among the natural wonders of the Peak. Its depth is unknown, and is pretended to be unfathomable. Cotton tells us he founded 884 yards; yet the plammet fill drew. But he might eafily be deceived, unlefs his plummet was very heavy; the weight of a rope of that lemgh might wall make the landing of the plammet farce perceivable.

Peake's-hole, and Pool's hole, called alfo the Devil A-Si, are two remarkable horizontal fprings under mountains ; the one uear Cafteton, the other juf by Buxten. They feem to have owed their origin to the

Grotko.

## G R O

Springs which have their current through them ; when the water had forced its way through the horizontal filfures of the ftrata, and had carried the loofe earth away with it, the loofe fones mult fall down of courfe; and where the ftrata had few or no fiflures, they remained entire; and fo formed thefe very irregular arches, which are now fo much wondered at. The water which paffesthrough Pool's-hole is impregnated with particles of lime-itone, and has incrufted the whole cavern in fuch a manner that it appears as one folid rock.

In grottos are frequently found cryftals of the rock, ftalactites, and other natural conglaciations, and thofe often of an amazing beauty. M. Homberg conjectures, from feveral circumftances, that the marble pillars in the grotto of Antiparos vegetate or grow. That author looks on this grotto as a garden, whereof the pieces of marble are the plants; and endeavours to fhow, that they could only be produced by fome vegetative principle. See Antiparos.

At Foligno in Italy is another grotto confifting of pillars and orders of architecture of marble, with their ornaments, \&c. fcarely inferior to thofe of art ; but they all grow downwards : fo that if this too be a garden, the plants are turned upfide down.

Grot to del Cani, a little cavern near Pozzuoli, four leagues from Naples, the fteams whercof are of a mephitical or noxious quality; whence alfo it is called bocca venenofa, the poifonous mouth. See Mephitis.
" Two miles from Naples (fays Dr Mead), juft by the Lago de Agnano, is a celebrated mofeta, commonly called la Grotta del Cani, and equally deftructive to all within the reach of its vapours. It is a fmall grotto about eight feet high, twelve long, and fix broad; from the ground arifes a thin, fubtile, warm fume, vifible enough to a difcerning eye, which does not fpring up in little parcels here and there, but in one continued ftream, covering the whole furface of the bottom of the cave; having this remarkable difference from common vapours, that it does not like fmoke difperfe itfelf into the air, but quickly after its rife falls back again, and returns to the earth; the colour of the fides of the grotto being the meafure of itsafcent : for fo far it is of a darkifh-green, but higher only common earth. And as I my felf found no inconveniency by ftanding in it, fo no animal, if its head be above this mark, is in the leaft injured. But when, as the manner is, a dog, or any other creatare, is forcibly kept below it ; or, by reafon of its fmallnefs, cannot hold its head above it, it prefently lofes all motion, falls down as dead, or in a fwoon; the limbs convalfed and trembling, till at laft no more figns of life appear than a very weak and almof infenfible beating of the heart and arteries; which, if the animal be left a little longer, quickly ceafes too, and then the cafe is irrecoverable: but if it be fnatched out, and laid in theopen air, it foon comes to life again, and fooner if thrown into the adjacent lake." The fumes of the grotto, the fame author argues, are no real poifon, but act chiefly by their gravity; elfe the creatures could not recover fo foon, or if they did, fome fymptoms, as faintnefs, \&c. would be the confequence of it. He adds, "that in creatares killed therewith, when diffected, no marks of infection appear ; and that the attack proceeds from a want of air, by
which the circulation tends to an entire ftoppage; and this fo much the more, as the animal infpires a fluid of a quite different nature from the air, and fo in no refpect fit to fupply its place. Taking the animal out, while yet alive, and throwing it into the neighbouring lake, it recovers : this is owing to the coldnefs of the water, which promotes the contraction of the fibres, and fo affifts the retarded circulation othe fmall portion of air which remains in the veficulæ, after every expiration, may be fufficient to drive out the noxious fluid. After the fame manner, cold water acts in a detiquium animi: the lake of Agnano has no greater virtue in it than others."

The feam arifing in this grotto was for a long time reckoned to be of a poifonous nature, and thotght to fuffocate the animals which breathed it. Dr Hales imagined that it deftroyed the elafticity of the air, caufed the veficles of the lungs to collapfe, and thus occafioned fudden death.-It is now, however, found that this fteam is nothing elfe than fixed air, which from time immemorial hath iffued out of the earth in that place in very great quantity, the caufes of which cannot yet be inveftigated from any of the modern difcoveries concerning that fpecies of air. It proves pernicious when breathed in too great quantity, by rarefying the blood too much; and hence the beit method of recovering perfons apparently killed by fixed air, is to apply a great degree of cold all over their bodies, in order to condenfe the blood as much as poffible. This is the reafon why the dogs recover when thrown into the lake Agnano, as abovementioned. See the articles Blood and Damps.

Grotta del Serpi, is a fubterratreous cavern near the village of Saffa, eight miles from the city of Braccano in Italy, defcribed by Kircher thus: "The grotta del ferpi is big enough to hold two perfons. It is perforated with feveral fiftular apertures, fomewhat in manner of a fieve; out of which, at the beginning of the fpring feafon, iffues a numerous brood of young frakes of divers colours, but all free from any particular poifonous quality. In this cave they expofe their lepers, paralytics, arthritics, and elephantiac patients, quite naked; where, the warmth of the fubterraneous fteams refolving them into a fweat, and the ferpents clinging varioully all around, licking and fucking them, they become fo thoroughly freed of all their vitious humours, that, upon repeating the operation for fome time, they become perfectly reftored."

This cave Kircher vilited himfelf; and found it warm, and every way agreeable to the defcription given of it. He faw the holes, and heard a murmuring hiffing noife in them. Though he miffed feeing the ferpents, it not being the feafon of their creeping ont; yet he faw a great number of their exuvire, or foughs, and an elm growing hard by laden with them.

The difcovery of this cave was by the cure of a le- Mufeuma per going from Rome to fome baths near this place. Worm. Lofing his way, and being benighted, he happened upon this cave. Finding it very warm, he pulled off his clothes; and being weary and fleepy, had the good fortune not to feel the ferpents about him till they had wrought his cure.

Milky Cortro, Grypta Latiea, a mile diftant from

## GRO $[155] \quad G R R O$

Grotto, the ancient village of Bethlehem, is faid to have been thus denominated on occalion of the bleffed Virgin,
who let fall fome drops of milk in giving fuck to Jefus in this grotto. And hence it has been commonly fuppofed, that the earth of this cavern has the virtue of reftoring milk to women that are grown dry, and even of curing fevers. Accordingly, they are always digging in it, and the earth is fold at a good rate to fuch as have faich enough to give credit to the fable. An altar has been built on the place, and a church juit by it.

Grotto is alfo ufed for a little artificial edifice made in a garden, in imitation of a natural grotto. The outfides of thofe grottos are ufually adorned with ruftic architecture, and their infide with hell-work, foffils, \&c. finifhed likewife with jets d'eau or fountains, \&c.

A cement for artificial grottos may be made thus : Take two parts of white rofin, melt it clear, and add to it four parts of bees wax; when melted together, add two or three parts of the powder of the ftone you defign to cement, or fo much as will give the cement the colour of the fone; to this add one part of flower of fulphur: incorporate all together over a gentle fire, and afterwards knead them with your hands in warn water. With this cement the fones, thells, \&c. after being well dried before the fire, may be cemented.

Artificial red coral branches, for the embelliflment of grottos, may be made in the following manner : Take clear rofin, diffolve it in a brafs-pan ; to every ounce of which add two drams of the fineft vermilion: when you have firred them well togerher, and have chofen your twigs and branches, peeled and dried, take a pencil and paint the branches all over whilft the compofition is warm; afterwards hape them in imitation of natural coral. This done, hold the branches over a gentle coal-fire, till all is fmooth and even as if polified. In the fame manner white coral may be prepared with white lead, and black coral with lamp-black.

A grotto may be built with little expence, of glafs, cinders, pebbles, pieces of large flint, fhells, mofs, ftones, counterfeit coral, pieces of chalk, \&c. all bound or cemented together with the above deferibed cesent.

GROVE, in gardening, a fmall wood impervious to the rays of the fun.

Groves have been in all ages held in great veneration. The profeuche, and high-places of the Jews, whither they reforted for the purpofes of devotion, were probably fituated in groves: See Johnah xxiv. 26. The profeuchæ in Alexandria, mentioned by Philo, had groves about then, becaufe he complains that the Alexandrians, in a tumult againft the Jews, cut down the trees of their profeuchæ.
The ancient Romans had a fort of groves near feveral of their temples, which were confecrated to fome god, and called luci, by Antiphrafis, a non lucendo, as being flaty and dark. The veneration which the ancient druids had for groves is well known.
Moderit groves are not only great ornaments to gardens ; but are alfo the greateft relief againft the violent heat of the fun, affording fhade to walk under in the hotteft parts of the day, when the other parts
of the garden are ufelefs; fo that every garden is defective which has not hade.

Groves are of two forts, viz. either open or clofe. Open groves are fuch as have large flady trees, which ftand at fuch diftances, as that their branches approach fo near to each other as to prevent the rays of the fun from penetrating through them.

Clofe groveshave frequently large trees ftanding in them; but the ground under thele are filled with fhrubs or underwood: fo that the walks which are in them are private, and fcreened from winds; by whiclı means they are rendered agreeable for walking, at thofe times when the air is either too hot or too cold in the more expofed parts of the garden. Thefe are often contrived fo as to bound the open groves, and frequently to hide the walls or other inclofures of the garden : and when they are properly laid out, with dry walks winding through them, and on the fides of thefe fweet-fmelling firubs and flowers irregularly planted, they have a charming effect.

Grove (Henry), a learned and ingenious Prefbyterian divine, was born at Taunton in Somerfethire, in 1683 . Having obtained a fufficient ftock of claffical literature, he went through a courfe of academical learning, under the Rev. Mr Warren of Taunton, who had a flourifhing academy. He then removed to London, and ftudied fome time under the reverend Mr Rowe, to whom he was nearly related. Here he contracted a friendflip with feveral perfons of merit, and particularly with Dr Watts, which continued till his death, though they were of different opinions in feveral points warmly controverted among divines. After two years fpent under Mr Rowe, he returned into the country, and began to preach with great reputation ; when an exact judgment, a lively imagination, and a rational and amiable reprefentation of Chriftianity, delivered in a fweet and well governed voice, rendered him generally admired; and the firit of devotion which prevailed in his fermons procured him the efteem and friendfhip of Mrs Singer, afterwards Mrs Rowe, which fhe expreffed in a fine ode on death, addreffed to Mr Grove. Soon after his beginning to preach, he married; and on the death of Mr Warren, was chofen to fucceed him in the academyat Taunton. This obliging him to refide there, he preached for 18 years to two fmall congregations in the neighbourhood; and though his falary from both was lefs than twenty pounds a-year, and he had a growing family, he went through it cheerfully. In 1708 , he publifhed a piece, intitled, The Regulation of Diver:fons, drawn up for the ufe of his pupils. About the fame time, he entered into a private difpute by letter with Dr Samuel Clarke: but they not being able to convince each other, the debate was dropped with expreffions of great mutual efteem. He next wrote feveral papers printed in the Spectator, viz. Numbers 588. 601. 626.635. The laft was republifhed, by the direction of Dr Gibfon bifhop of London, in the Evidences of the Chriftian Religion, by Jofeph Addifon, Efq: In $1725, \mathrm{Mr}$ James, his partner in the acaderay, dying, he fucceeded him in his paftoral charge at Fulwood, near Taunton, and engaged his nephew to undertake the other parts of Mr James's work as tutor; and in this fituation Mr Grove continaed till his death, which happened in I 738 . His great con-

## GRO $\quad\left[\begin{array}{ll}156\end{array}\right] \quad$ GRO

cern with his pupils, was to infpire and cherifh:in them a prevailing love of truth, virtue, liberty, and genuine religion, without violent attachments or prejudices in favour of any party of Chriftians: He reprefented tuth and virtue in a moft engaging light ; and though his income, botn as a tutor and a minitter, was infufficient to fupport his family, without breaking into his paternal eltate, he knew not how torefufe the call of charity. Befides the above pieces, he wrote, 1. An Eifay towards a Demonfration of the Soul's Imnortality. 2. An Eflay on the Terms of Chriftian Commanion. 3. The Evidence of our Saviour's Refurrection conlidered. 4. Some Thonghts concerning the Proof of a Fiuture State from Reafon. 5. A Difconrfe concerning the Nature and Defign of the Lord's Supper. 6. Wifdom the firft fpring of Aetion in the Deity. 7. A Difcourfe on Saving Fiaith. 8. Mifcellanies in profe and verfe. 9. Many Sermons, \&c. After his deceafe, this pofthumous works were publifhed by fubfcription, in four volumes octavo, with the names of near 700 fubfcribers, among whom were fome of the beft judges of merit in the eftablifhed church.

GROUND, in painting, the furface upon which the figures and other objects are reprefented.

The ground is properly underfood of fuch parts of the piece, as have nothing painted on them, but retain the original colour upon which the other colours are applied to make the reprefentations.

A building is faid to ferve as a ground to a figure when the figure is painted on the building.

The ground behind a picture in miniature, is commonly blue or crimfon, imitating a curtain of fatin or velvet.

Ground, in etching, denotes a gummous compofition fineared over the furface of the metal to be etched, to prevent the aquafortis from eating, except in fuch places where this ground is cut through with the point of a needle. See the article Etching.
$C_{\text {ritind-Angling, filhing undar water without a }}$ float, only with a plumb of lead, or a bullet, placed about nine inches from the hook; which is better, becanfe it will roll on the ground. This method of filhing is moft proper in cold weather, when the fifh fivim very low.

The morning and evening are the chief feafons for the ground-line in filhing for trout; but if the day prove cloudy, or the water muddy, you may fifh at ground all day.

Ground-Tackle, a hip's anchors, cables, \&c. and in general whatever is neceflary to make her ride fafe at anchor.

Grund-Ivy, in botany. See Giechoma.
Ground-Fine, in botany. See Teucrium.
GROUNDSEL. See Senecio.
GROUP, in painting and fcolpture, is an affemhlage of two or more figures of men, beafts, fruits, or the like, which have fome apparent relation to each other. See Painting.-The word is formed of the italian groppo, a kiogt.

The Gruups, a clufter of iflands lately difcovered in the Sonth Sea. They lie in about S. Lat. 8 . in 2. and W. Long. 142. 42. They are long narrow lips of land, ranging in all directions, forne of them ten milles or upwads in lenget, but not more than a quar.
cer of a mile broad. They abound in trees, particu- Groufe, larly thofe of the cocoa-nut. They are inhabited by Grouthead. well-made people, of a brown complexion: Moft of them carried in their hands a flender pole about 14 fett in lengeth, pointed like a fear ; they had likewife fomething thaped like a paddle, about four feet long. Their canoes were of different lizes, carrying from three to lix or'feven people, and fome of them hoifted a fail.

GRouse, or Growse. See Tetrao.
GROUTHEAD, or Greathed (Robert), alearned and famous binop of Lincoln, was born at Stow in Lincolnfhire, or (according to others) at Stradbrook in Suffolk, in the latter part of the twelfth century. His parents were fo poof, that when a boy he was reduced to do the meaneft offices, and even to beg his bread ; till the mayor of Lincoln, ftruck with his appearance and the quicknefs of his anfwers to certain queftions, took him into his family, and put him to fcboel. Here his ardent love of learning, and admirable capacity for acquiring it, foon appeared, and procured him many patrons, by whofe affiftance he was enabled to profecute his ftudies, firft at Cambridge, afterwards at Oxford, and at laft at Paris. In theie three famous feats of learning, hefpent many years in the moft indefatigable purfait of knowledge, and became one of the beft and moft univerfal fcholars of the age. He was a great mafter not only of the French and Latin, but allo of the Greek and Hebrew languages, which was a very rare accomplifhment in thofe times. We are affured by Roger Bacon, who was intimately acquainted with him, that he fent much of his time for almoft forty years in the ftudy of geometry, aftronomy, optics, and other branches of mathematical learning, in all which he very much excelled. T heology was his favourite ftudy, in which he read lectures at Oxford with great applaufe. In the mean time, he obtained feveral preferments in the church, and was at length elected and confecrated bimop of Lincoln, A. D. 1235. In this ftation he foon became very famous, by the purity of his manners, the popularity of his preaching, the rigour of his difcipline, and the boldnefs with which he reproved the vices and oppofed the arbitrary mandates of the court of Rome; of this laft it may be proper to give one example. Pope Innocent IV. had granted to one of his own nephews named Frederick, who was but a child, a provilion to the firft canon's place in the church of Lincoln that fhould become vacant ; and fent a bull to the archbifhop of Canterbury, and Innocent, then papal legate in England, commanding them to fee the provilion made effectual ; which they tranfmitted to the bifhop of Lincoln. But that brave and virtuous prelate boldy, refufed to obey this unreafonable mandate, and fent an anfwer to the papal bull containing the following fevere reproaches againft his holinefs for abuling his power: "If we except the fins of Lucifer and Antichrif, there neither is nor can be a greater crime, nor any thing more contrary to the doctrine of the gofpel, or more odious and abominable in the fight of Jefus Chrift, than to ruin and deftroy the fouls of men, by depriving them of the fpiritual aid and miniftry of their paftors: This crime is committed by thofe who command the benefices intended for the fupport of able paftors, to be beftowed on thofe who are incapable of

## GR O

Grouthead, performing the daties of the patoral office. It is imGrowth. pollible therefore that the holy apoftolic fee, which
reccived its authority from the Lord Jefus Chrift, for edification, and not for deftruction, can be guilty of fuch a crime, or any thing approaching to fuch a crime, fo hateful to God and fo hurtful to men. For this would be a molt manifelt corruption and abufe of its authority, which would forfeit all its glory, and plunge it into the pains of hell." Upon hearing this letter, his hollnefs became frantic with rage, poured forth a torrent of abufe againft the good bilhop, and threatened to make hin an object of terror and aftonithment to the whole world. "How dare (faid he) this old, deaf, doating fool, difubey my commands? Is not his mafter the king of England my fubject, or sather my flave? Cannot he calt him into prifon, and crulh him in a moment?" But the cardinals by degrees brougbt the pope to think more calmly, and to take no notice of this letter. " Let us not (faid they raife a tumult in the church without neceffity, and precipitate that revolt and feparation from us, which we know mult one day take place." Remarkable words, when we reflect when and by whon they were fpoken! The bifhop did not long furvive this noble ftand againft the grofs corruptions and tyramy of the church of Rome: for he fell fick at his calle of Bugden that fame year; and when he became fenfible that his death was drawing near, he called his clergy into his aparment, and made a long difcourfe to them, to prove that the reigning Pope Innocent lV. was Antichrift. With this exertion his frength and firits were fo much exhaufed, that he expired foon after, October 9. 1253. A cotemporary hiftorian, who was perfectly well acquainted with him, hath drawn his character in the following manner. "He was a free and bold reprimander of the pope and the king; an admonifher of the prelates; a corrector of the motiks; an intructor of the clergy; a fupporter of the fudious; a cenfurer of the incontinent; a fcourge and terror to the court of Rome; a diligent fearcher of the fcriptures; and a frequent preacher to the people. At his table he was hofpitable, polite; and cheerful. In the church he was contrite, devout, and folemn; and in performing all the duties of his office he was venerable, active, and indefatigable. The illuftrious Roger Bacon, who was moft capable, and had the beft opportunities of forming a true judgment of the extent of his learning, by perufing his works, and by frequently converfing with him, hath given this honourable teftimony in his favour. "c Robert Grouthead bifhop of Lincoln, and his friend friar Adam de Marifco, are the two moft learned men in the world, and excel all the reft of mankind both in divine and human knowledge." This moft excellent and learned prelate was a very voluminous writer, and compofed a prodigious number of treatifes on a great variety of fubjects in philofophy and divinity, a catalogue of which is given by Bale.

GROWTH, the gradual increafe of bulk and fature that takes place in animals a $r$ vegetables, to a certain period.-The increafe of bulk in fuch bodies as have no life, owing to fermentations excited in their fub. ftance, or to other caufts, is called Expansion, Sweiling, \&c.

The frowth of animals, nay cven of the human fpe-

157 ] GRO
cies, is fubject to great variations. A remarkable in- Growth. ftance in the laft was obferved in France in the year 1729. At this time the Academy of Sciences examined a boy who was then only feven years old, and who meafured four feet eight inches and four lines high without his moes. His mother obferved the figns of puberty on him at two years old, which continued to increafe very quick, and foon arrived at the ufual ftandard. At four years old he was able to lift and tofs the common bundles of hay in ftables into the horfes racks; and at fix years old could lift as much as a fturdy fellow of twenty. But though he thas increafed in bodily frength, his underftanding was no greater than is ufual with children of his age, and their play things were alfo his favourite amufements.

Another boy, a native of the bamlet of Bouzanquet, in the diocefe of Alais, though of a ftrong conititution, appeared to be knit and ftiff in his joints till he was about four years and a half old. During this time nothing farther was remarkable of him than an extraordinary apperite, which was fatisfied no otherwife than by giving him plenty of the common aliments of the inhabitants of the country, confifting of rye-bread, chefnuts, bacon, and water; but his limbs foon becoming fupple and pliable, and his body beginning to expand itfelf, he grew up in fo extraordinary a manner, that at the age of five years he meafured four feet three inches; fome months after, he was four fect eleven inches; and at fix, five feet, and bulky in proportion. His growth was fo rapid, that one might fancy he faw him grow: every month, his cloaths required to be made longer and wider; and what was ftill very extraordirey in his growth, it was not preceded by any licknefs, nor abcompanied with any pain in the groin or elfewhere. At the age of five years his voice clanged, his beard began to appear, and at lix he had as much as a man of thirty; in hort, all the unqueftionable marks of paberty were vilible in him. It was mot doubted in the country but this child was, at five years old, or five and a half, in a condition of begetting other children; which induced the rector of the parith to recommend to his motber, that the would keep him from too famin liar a converfation with childrea if the other fex. Though his wit was riper than is commonly obfervable at the age of five or fix years, yet its progrefs was not in proportion to that of his body. His air and manner ftill retained fomething childifh, though by his bulk and ftature he refembled a complete man, which at firft fight produced a very fingular contraft. His voice was ftrong and manly, and his great ftrength rendered himalready fit for the labours of the country. At the age of five years, he could carry to a good diftance three meafures of rys, weighing 84 pounds; when turned of fix; he could lift up ealily on his fhoulders and carry loads of 150 pounds weight a good way off: and thefe exercifes were exhibited by him as often as the curious engaged him thereto by fome liberality. Such beginnings made people think that he would foon thoot up into a giant. A mountebank was already foliciting his parents for him, and flattering them with hopes of putting him in a way of making a great fortuhe. E.t all thefe hopes fuddenly vanifhed. His legs became crooked, his body fluruak, his frength dinimifled, his voice grew fen-

## 

Grub fibly weaker, and he at laft funk into a total imbe-
cillity.

In the Paris Memoirs alfo there is an account of a girl who had her menfes at three months of age. When four years old, fhe was four feet fix inches in height, and had her limbs well proportioned to that height, her breafts large and plump, and the parts of generation like thofe of a girl of eighteen ; fo that there is no doubt but that fhe was marriageable at that time, and capable of being a mother of children. Thefe things are more fingular and marvellous in the northern than in the fouthern climates, where the females come fooner to maturity. In fome places of the Eaft Indies, the girls have children at nine years of age.

Many other inftances of extraordinary growth might be brought, but the particulars are not remarkably different from thofe already related.-It is at firft fight aftonilhing that children of fuch early and prodigious growth do not become giants: but when we confider, that the figns of puberty appear fo much fooner than they ought, it feems evident that the whole is only a more than ufually rapid expantion of the parts, as in hot climates; and accordingly it is obferved, that fuch children, inftead of becoming giants, always decay and die apparently of old age, long before the natural term of haman life.

GRUB, in zoology, the Englifh name of the hex: apode worms, produced from the eggs of bectles, and which at length are transformed into winged infects of the fame fpecies with their parents.

GRUBBING, in agriculture, the digging or pulling up of the ftubs ard roots of trees.

When the roots are large, this is a very troublefome and laborious talk; but Mr Mortimer hath fhown how it may be accompliflied in fuch a manner as to fave great expence by a very fimple and eafy method. He propofes a ftrong iron hook to be made about two feet four inches long, with a large ironring faftened to the upper part of it. This hook mult be put into a hole in the fide of the root, to which it muft be faftened; and a lever being put into the ring, three men, by means of this lever, may wring out the root, and twift the fap-roots afunder. Stubs of trees may alfo be taken up with the fame hook, in which work it will fave a great deal of labour, though not fo much as in the other; becaufe the fubs muit be firft cleft with wedges, before the hook can enter the fides of them, to wrench them out by pieces.

GRUBENHAGEN, a town and caftle of the duchy of Bronfwic, in Lower Saxony, remarkable for its mines of filver, copper, iron, and lead. E. Long. 9. 36. N. Lat. 51. 45.

GRUINALES (from gros, "a crane"), the name of the fourteenth order in Linnæus's Fragments of a Natural Method, conlifting of geranium, and a few other genera which the author confiders as allied to it in their habit and external ftructure.

GRUME, in medicine, denotes a concreted clot of blood, milk, or other fubftance. Hence grumous blood is that which approaches to the nature of grome, and by its vifcidity and ftagnating in the capillary veffels produces feveral diforders.

GRUPPO, or Turned $S_{H A K E}$, a mulical grace, de.
fined by Playford to confift in the alternate prolation of two tones in juxta-pofition to each other, with a clofe on the note immediately beneath the lower of them. See Shake.

GRUS, in antiquity, a dance performed yearly by the young Athenians around the temple of Apollo, on the day of the Delia. The motions and figures of this dance were very intricate, and varioufly interwoven; fome of them being intended to exprefs the windings of the labyrinth wherein the minotaur was killed by Thefeus.

Grus, in aftronomy, a fouthern conftellation, not vifible in our latitude. The number of ftars in this conftellation, according to Mr Sharp's Catalogne, is 13 .

Grus, in ornithology. See Ardea.
GRUTER (James), a learned philologer, and one of the moft laborions writers of his time, was born at Antwerp in 1560. He was but a child when his father and mother, being perfecuted for the Proteftant religion by the duchefs of Parma, governefs of the Ne therlands, carried him into England. He imbibed the elements of learning from his mother, who was one of the moft learned women of the age, and befides French, Italian, and Englifh, was a complete miftrefs of Latin, and well fkilled in Greek. He fpent fome years in the univerfity of Cambridge; after which he went to that of Leyden to fudy the civil law; but at laft applied himfelf wholly to polite literature. After travelling much, be became profeffor in the univerfity of Heidelburgh; near which city he died, ir 1627. He wrote many works; the molt confiderable of which are, I. A large collection of ancient infcriptions. 2. Thefaurus criticus. 3. Delicice poetarum Gallorum, Italorum, \& Betgarum, \&c.

GRUYERS, a town of Swifferland, in the canton of Friburgh, with a pretty good caftle. It is famous for its cheefe, which is all its riches. E. Long. 7.23. N. Lat. 46. 35.

GRY, a meafure containing one tenth of a line.
A line is one-tenth of a digit, and a digit one-tenth of a foot, and a philofophical foot one-third of a pendulum, whofe diadromes, or vibrations, in the latitude of 45 degrees, are each equal to one-fecond of time, or one-fixtieth of a minute.

GRYLLUS, in zoology, the name of the cricket and locuft kinds, which, together with the grasshoppers, make only one genus of infects, belonging to the order of hemiptera. The general characters of the genus are thefe: The head is inflected, armed with jaws, and furnifhed with palpi: The antennæ in fome of the fpecies are fetaccous, in others filiform: The wings are deflected towards and wrapped round the fides of the body ; the under ones are folded up, fo as to be concealed under the elytra. All the feet are armed with two nails; and the hind ones are formed for leaping. The genus is fubdivided into five different fections, or families, as follows:
I. The Acrid x, Truxalides of Fabricius, or Cricket family properly fo called; of which the characters are: Their head is of a conical form, and longer than the thorax; and their antennæ are enfiform, or fword-fhaped. Of this family there are eight fpecies, none of them found in Britain.
II. The Bulaf, or Acrydia of Fabricius: Thefe

## GRY

Gryllus. are diftinguifhed by a kind of creft or elevation on the thorax: their antennæ are fhorter than the thorax, and filiform ; and their palpi are equal.-The gryllus bulla-bipunctatus is of a dark-brown colour; fometimes befprinkled with fpots of a bigher hue. But the chief and moft obvious diftinction of this fpecies is the form of its thorax, which is prolonged, covering the whole body, and decreafes to the extremity of the abdomen. This prolongation of the thorax ftands inftead of elytra, of which this infect is dentitute. It has only wings under this projection of the thorax. Linnæus mentions a fpor in the thorax; which, however, is often wanting. This feecies is every where to be met with, in the fields, in woods, \&c. There are 10 or 11 other fpecies, inhabitants of Earope and America.
III. The third family, called Achete, arc diftinguifhed by two briftes, fituated above the extremity of their abdomen; by having three femmata; and by the tarfi being compofed of three articulations. This family is in many places called Cricket, on account of the found which the infect makes. There are 28 fpecies cnumerated in the new edition of the Syferva natura; of which the moft remarkable are,
I. The gryllus domefticus, or the domefticus and caninpeftris, the domeftic and the field gryllus being one and the fame fpecies; only that the former is paler and has more of the yellow caft, and the latter more of a brown. The antennæ are as 几ender as a thread, and nearly equal to the body in length. The head is large, and round, with two large eyes, and three fmaller ones of a light yellow colour, placed higher on the edge of the depreffion, from the centre of which originate the antenne: The thorax is broad and flort. In the males, the elytra are longer than the body, veined, as it were rampled on the upper part, croffed one over the other, and enfolding part of the abdemen, with a projecting angle on the fides: They have alfo at their bafe a pale coloured band. In the females, the elytra leave one-third of the abdomen uncovered, and farcely crofs each other ; and they are all over of one celour, veined and not rumpled; nor do they wrap round fo much of the abdomen underneath. The female, moreover, carries at the extremity of its body a hard fpine, almoft as long as the abdomen, thicker at the end, compofed of two fheaths, which encompafs two lami$n æ$ : This implement ferves the infect to fink and depofit its eggs in the groand. Both the male and female have two pointed foft appendices at the extrenity of the abdomen. Their hinder feet are much larger and longer than the reft, and ferve them for leaping.

Towards funfet is the time the field gryllus, or cricket as it is often called, likes beft to appear out of its fubterraneous habitation. In White's Natural Hiffory
$\dagger$ Eet, 46, of Selbourne $\dagger$, a very pleafing account is given of the manners and economy of thefe infects; which, however, are fo fhy and cautious, he obferves, that it is no eafy matter to get a fight of them; for, feeling a perfon's footfteps as he advances, they fop fhort in the midft of their fong, and retire backwards nimbly into their burrows, where they lurk till all fufpicion of danger is over. At firf it was attempted to dig them our with a fpade, but without any great fuccefs; for either the bottom of the hole was inacceffible from its terminating under a great fone; or elfe, in breaking

## $159]$ <br> G R Y

up the ground, the poor infect was inadvertently fquee- Gryllus. zed to death. Out of one fo bruifed a multitude of eggs were taken, which were long and narrow, of a yellow colour, and covered with a very tough fkin. More gentle means were then ufed, and proved fuccefsful: " a pliant ftalk of grafs, gently infinuated into the caverns, will probe their windings to the bottom, and quickly bring out the inhabitant; and thus the humane inquirer may gratify his curiofity without injuring the object of it. It is remarkable, that though thefe infeets are furnifhed with long legs behind, and brawny thighs forleaping, like grafshoppers ; yet when driven from their holes they fhow no activity, but crawl along in a fhiftlefs manner, fo as eafily to be taken : and again, tho' provided with a curious apparatus of wings, yet they never exert them when there feems to be the greateft occafion. The males only make that fhrilling noife perhaps out of rivalry and emulation, as is the cafe with many animals which exert fome fprightly note during their breeding time : it is raifed by a brifk friction of one wing againft the other- They are folitary beings, living fingly male or female, each as it may happen; but there muit be a time when the fexes have fome intercourfe, and then the wings may be ufeful perhaps during the hours of night. When the males meet they will fight fiercely, as our author found by fome which he putinto the crevices of a dry ftone wall, where he wanted to have made them fettle. For tho' they feemed diffreffed by being taken out of their knowledge, yet the firft that got poffefion of the chinks would feize on any that were obtruded upon them with a vaft row of ferrated fangs. With their frong jaws, toothed like the fhears of alobfter's claws, they perforate and round their curious regular cells, having no fore-claws to dig, like the mole-cricket. When taken in the hand, they never offer to defend themfelves, tho' armed with fuch formidable weapons. Of fuch herbs as grow before the mouths of their barrows they eat indifriminately; and on a little platform, which they make juft by, they drop their dung; and never, in the day time, feem toftir more than two or three inches from home. Sitting in the entrance of their caverns they chirp all night as well as day from the middle of the month of May to the middle of July: in hot wearher, when they are moft vigorons, they make the hills echo; and in the filler hours of darknefs, may be heard to a confiderable diftance. In the beginning of the feafon their notes are more faint and inward; but become louder as the fummer advances, and fo die away again by degrees.-Sounds do not always give us pleafure according to their fweetnefs and melody ; nor do harfh founds always difpleafe. We are more apt to be captivated or difgufted with the affociations which they promote, than with the notes themfelves. Thus the flailling of the feld-cricket, though flarp and ftridulous, yer marvelloufly delights fome hearers, filling their minds with a train of fummer ideas of cyery thing that is rural, verdurous, and joyous. About the tenth of March the crickets appear at the nourbs of their cells, which they then open and bore, and flape very elegantly. All that ever I have feen at that feafon were in their pupa fate, and had only the rudiments of wings, lying under a fkin or coat, which muft be caft before the infect can arrive at its perfect flate; froin whence I hould fuppofe that the

## G R Y $\quad\left[\begin{array}{ll}160 & ]\end{array} \quad\right.$ GR Y

Grylhs. old ones of laft year do not always furvive the winter. In Auguft their holes begin to be obliterated, and the infects are Yeen no more till fpring.-Not many fummers ago I endeavoured to tranfplant a colony to the terrace in my garden, by boring deep holes in the floping turf. The new inhabitants ftaid fome time, and fed and fung; but wandered away by degrees, and wiere heard at a farther diftance every morning; fothat it appears, that on this emergency they made ufe of their wings in attempting to return to the fpot from which they were taken.-One of thefe crickets, when confined in a paper cage and fet in the fun, and fupplied with plants moiftened with water, will feed and thrive, and become fo merry and lond as to be irkfome in the fame room where a perfon is fitting : if the plants are not wetted, it will die.".

The domeffic gry:lus, or hearth-cricket, as it is called, does not require to be fought after abroad for examination, nor is fhy like the other fort: it refides altogether within our dwellings, intruding itfelf upon our notice whether we will or no. It delights in new built houfes; being, like the fpider, pleafed with the moitture of the watls; and befides, the foftnefs of the mortar enables them to burrow and mine between the joints of the bricks or flones, and to open eommunnications from one room to another. They are particularly fond of kitchens and bakers ovens, on account of their perperual warmth. "Tender infects that live abroad eirher enjoy only the fhort period of one fummer, or clfe doze away the cold uncomfortable months in profound flumbers; but thefe (our author obferves), refiding as it were in a torrid zone, are always alert and merry: a good Chriftmas fire is to them like the heats of the dog-days. Thongh they are frequently heard by day, yet is their natural time of motion only in the night. As foon as it grows dufk, the clirping increafes, and they come running forth, and are from the lize of a flea to that of their full flature. As one fhould fuppofe, from the burning atmofphere which they inhabit, they are a thirlty race, and fhow a great propenlity for liquids, being found frequently druwned in pans of water, milk, broth, or the like. Whatever is moift they affect; and therefore often gnaw holes in wet woollen flockings and aprons that are hang to the fire. Thefe crickets are not only very thirfty, but very voracious; for they will eat the fcummings of pots; yeaft, falt, and crumbs of bread; and any litchen offal or fweepings. In the fummer we have obferved them to fly, when it became dufk, out of the windows, and over the neighbouring roofs. This feat of activity accounts for the fudden manner in which they often leave their haunts, as it does for the method by which they come to houfes where they were not known before. It is remarkable, that ${ }^{2}$ many forts of infects feem never to ufe their wings but when they have a mind to flift their quarters and fettle new colonies. When in the air they move 'volatu und:fo,' in waves or curves, like wood-peckers, opening and fhuting the ir wings at every froke, and fo-are always rifing or finking.-When they increafe to a great degree, as they did once in the houfe where I am now writing, they become noifome pefts, flying into the candles, and dahing into people's faces; but may be blafted by gun-powder difcharged into their crevices and crannies. In families, at fuch times, they are, like

Pharaoh's plague of frogs,-_ in their bedchambers, and upoa their beds, and in their nvens, and in their kneading-troughs:' Their fhrilling noife is occalioned by a brifk attrition of their wings. Cats catch hearthcrickets, and playing with them as they do with mice, devour them. Crickets may be deftroyed, like wafps, by phials half filled with beer, or any liquid, and fet in their haunts; for being always cager to drink, they will crowd in till the bottles are full." A popular prejudice, however, frequently preventstheir being driven away and deftroyed : the common people imagine that their prefence brings a kind of luck to the houfe while they are in it, and think it would be hazardow. to deftroy them.
2. Gryllus gryllotalpa, or mole cricker, is of a very

## Gryllas.

Gryllus. There were many caverns and winding paffages leading to a kind of chamber, neatly fimoothed and rounded, and abont the fize of a moderate fnuff-box. Within this fecret nurfery were depofited near roo eggs of a dirty yellow colour, and enveloped in a tough $\mathbb{1}$ in, but too lately excluded to contain any rudiments of young, being full of a vifcous fubftance. The eggs lay but fhallow, and within the influence of the fun, juft under a little heap of frefh-moved mould, like that which is raifed by ants.-- When mole-cricketsfly, they nove "curfu undofo" rifing and falling in curves, like the other Ípecies mentioned before. In different parts of this kingdom people call them fen-crickets, churrzuorms, and eve churrs, ali very appofite names."
IV. The Tettigonie, Grasshoppers, or Lecufts armed at the tail: The females of this family are diftinguilhed by a tubular dart at the extremity of their abdomen: in both fexes the antenne are fetaceous, and longer than the abdomen; and the tarfi compofed of four articulations. Of thefe infects there are 69 fpecies enumerated in the Syffema Naturc. They leap by the help of their hinder legs, which are frong and much longer than the fore ones. Their watk is heavy, but they fly tolerably well. Their females depofit their eggs in the ground, by means of the appendices which they carry in their tail, which confin of two la$\min x$, and penetrate the ground. They lay a great number of eggs at a time; and thofe eggs, unitedin a thin membrane, form a kind of group. The little larve that fpring from them are wholly like the perfect infects, excepting in fize, and the ir lhaving neither wings nor elytra, but only a kind of knobs, four in number, which contain both, but undifplayed. The unfolding of then only takes place at the time of the metamorphofis, when the infect has attained its full growth. In thefe infects, when examined internally, befides the gullet, we difcover a fraall fomach; and behind that a very large one, wrinkled and furrowed within-fide. Lower down, thare is fitll a third: fo that it is thought, and with fome probability, that all the animals of this genus chew the cud, as they fo much refemble ruminant animals in their internal conformation.
V. Locuste (the Grylli of Fabricius), or Lacuffs unarmed at the tail. This family is diftinguifhed by having the tail purple, without the feræ of the Acheta, or the tube of the Tettigonia: their antennæ are filiform, and one half florter than the abdomen: they have three ftemmata, and three joints to the tarfi. To part of this defcription, however, there is an exception in the gryllus locufta-groflus, the antenne of which are of a cylindrical form. According to Mr Barbutt, " few feecies vary fo much in fize and colour. Some of thefe infects are twice as long as others; the antenno in moft are filiform, but in this particular fpecies cylindrical, compofed of about 24 articulations, and but one forrth of the length of the body. As to colour, the fmallindividuals are nearly quite red fpotted with black, with the under part of the body only of a greenifh yellow. The larger fubjects are all over of a greenifl huc, the under part being of a deeper yellow; colly the infide of the hinder chighs is red. But what characterifes this 1pecies is, the form of the thorax, which has, above, a longitudinal elevation, attended by one on each fide, the middle whereof drawing nigh

Vol. VIII.
to the firf, forms a kind of X. Moreover, between Gryllus. the claws that terminate the feet there are finall fpunges, but larger in this fpecies than the reft. This fpecies is to be met with every where in the country. The larvæ of caterpillars very much refemble the perfeet infects, and commonly dwell under ground." Of this tribe, ir 8 other fecies are enumerated in the $S y$ flema Natura, natives of different parts of the globe; befides a confiderable number noted as unafcertained with regard to their being difinet fpecies or only fynonymes or varieties of fome of the ochers.

All the Grybit, except the firft family which feed upon other infects, live upon plants; the acheta chiefly uponthe roots, the tettigonice and loculfe upon the leaves.

The diftinction of Lacuftsinto families (IV.V.), as above characterifed, is extremely proper; and the diffcrence of organifation upon which it is founded has been obferved to be adapted to the mode and the places in which the infeets lay their eggs. But by taking the wings into confideration, there inight have been formed three tribes or divifions, inftead of two , upon the fame natural foundation. Thus according to the obfervations of the Abbe Pouet $\dagger$, thofe which have their + Fourn. de abdomen furnifhed with the tube or dart abovemention- Pbyfique ed, lay their eggs in a fifff fort of earth which that in . pour 1787. frument perforates. During the operation, the dart ${ }^{A} \mathrm{pr}$. opens ; and, being hollow and grooved on each fide ${ }^{\text {P. } 224}$ within, the egg fides down along the grooves, and is depofited in the hole. Of thofe which have the tail fimple, i.e. which have no dart, fome have long wings, and fome very fhort. The long-winged fort lay their eggs on the bare ground, and have no ufe for a perforaring inffrument ; but they cover them with a glatinous fubtance, which fixes them to the foil, and prevents their being injured either by wind or wetnefs. Thofe, again, which have thort wings depofit their eggs in the fand : and to make the holes for this purpofe, they have the power of elongating and retracting their abdominal rings, and can turn their body as on a pivot; in which operation long wings would have been a material impediment.

The annals of moft of the warm countries are filled with accounts of the devaftations prodaced by locufts, which fometimes make their appearance in clouds of vaft extent. They feldom vifit Europe in fuch fwarms as formerly; yet in the warmer parts of it are ftill formidable.-Thofe which have at uncertain intervals vifited Europe in our memory, are fuppofed to have come from Africa: they are a large fpecies about three inches long. The head and horns are of $\grave{a}$ brownifl colour; it is blee about the nrouth, as alfo on the infide of the larger legs. The flield which covers the back is greenill: and the upper fide of the body brown, fposted black, and the under fite purplet. The upper wings are brown, with fmall dufky fpots and one larger f pot at the tips. The under wings are more tranfparent, and of a fight brown tinctured with green, but there is a dark cloud of fpots near the tips: -Thefe infects are bred in the warm parts of Afia and Africa, from whence they have often taken their flight into Europe, where they committed terrible devaltations. They multiply fafter than any other animat in the creation, and are truly terrible in the countries where they breed. Some of them were feen in different

## $G R Y \quad[162] \quad G R Y$

Gryllus, parts of Britain in the year 1748 , and great mifchiefs were apprebended: but happily for that country, the coldnefs of the climate, and the humidity of the foil, are very unfavourable to their production; fo that, as they are only animals of a year's continuation, they all perifh without leaving a young generation to fucceed them.

When the locufts take the field, it is faid they bave a leader at their head, whofe tlight they obferve, and pay a ftrict regard to all his motions. They appear at a diftance like a black cloud, which, as it approaches, gathers upon the horizon, and alinoft hides the light of day. It often happens, that the hufbandman fees this imminent calamity pafs away without doing him any mifchief; and the whole fwarm proceceds onward to fettle upon fome lefs fortunate country. In thofe places, however, where they alight, they deftroy every greenthing, fripping the trees of their leaves, as well as devouring the corn and grafs. In the tropical clinates they are not fo pernicious as in the more fouthern parts of Europe. In the firf, the power of vegeta. tion is fo frong, that an interval of three or four days repairs the damage; but in Europethis cannot be done till next year. Befides, in their long fiights to this part of the wolld, they are famithed by the length of their journey, and are therefore more voracious whereever they happen to fettle. But as much danage is occafioned by what they deftroy, as by what they devour. Their bite is thought to contaminate the plant, and either to deftroy or greatly to weaken its vegetation. To afe the expreffion of the hafbandmen, they burn wherever they tonch, and leave the marks of their devaftation for three or four years enfuing. When dead, they infect the air in fuch a manner that the ftench is infupportable.-Orofius tells us, that in the year of the world 3800 , Africa was infefted with a multitude of locults. After having eaten upevery thing that was green, they few off and were drowned in the fea; where they caufed fuch a ftench as could not have been equalled by the putrefying carcales of r-00,000 men.

In the year 1650 , a clond of locufts was feen to enter Rufia in three different places, and from thence they fpread themfelves over Poland and Lithuania in fuchaftonifhing multitudes, that the air was darkened and the earth covered with their numbers. In fome places they were feen lying dead, heaped upon each other to the depth of four feet; in others, they covered the furface like a black cloth; the trees bent with their weight, and the damage which the country fuftained exceeded computation.

In Barbary, their numbers are formidable; and Dr Shaw was a witnefs of their devaftations there in 1724. Their firft appearance was in the latter end of March when the wind had been foutherly for fome time. In the beginning of April, their nambers were fo vaftly increafed, that, in the heat of the day, they formed tonemfelves into large fwarmsthat appeared like clouds, and darkened the fun. In the middle of May they began to difappear, retiring into the plains to depofit their eggs. In June the young brood began to make their appearance, forming many compact bodies of feveral bundred yards fquare; which afterwards marching forward, climbed the trees, walls, and houfes, eating every thing that was green in their way. The in-
halitants, to frop their progrefs, laid trenches all over GryHus. their fields and gardens, which they filled with water. Some placed large quantities of heath, ftabble, and fuch like combulible matter, in rows, and fet them on fire on the approach of the locufts. But all this was to no purpofe; for the trenches were quickly filled up, and the fires put out by the great numbers of fwarms that fucceeded each other. A day or two after one of thefe was in motion, others that were juit hatcher came to glean after them, gnawing off the young branches, and the verybark of the trees. Having lived near a month in this manner, theyarrived at their full growth, and threw off their worm-like ftate, by calting their finins. To prepare themfelves for this change, they fixed their hinder part to fome bufh or twig, or cor: ner of a ftone, when immediately, by an undulating motion ufed on this occafion, their heads would firt appear, and foon after the reft of their bodies. The whole transformation was performed in feven or eight minutes time, after which they remained for a little while in a languifhing condition; but as foon as the fun and air had hardened their wings, and dried up the moifture that remained after cafting off their former flough, they returned to their former grcedinefs, with an addition both of ftrength and agility. But they did not long continue in this fate before they were entirely difperfed. After laying their eggs, they directed their courfe northward, and probably periflied in the fea.-In that country, however, the amazing fertility of the foil and warmnefs of the climate generally render the depredations of thefe infects of little confequence; befides that many circumftances concur to diminifh their number. Though naturally herbivorous, they often fight with each other, and the victor devours the vanquifhed. They are the prey, too, of ferpents, lizards, frogs, and the carnivorous birds. They have been found in the ftomachs of the eagle and different kinds of fowls. They are alfo ufed as food by the Moors; who go to hunt them, fry them in oil or butter, and fell them publicly at Tunis and other places.

In 1754, 1755, 1756, and 1757, great devaftations were committed in Spain by a fuecies of locufts, of which we have the following defcription by Don Guillermo Bowles, publifhed in Dilion's-Trsvels through that country. "The locufts are continually feen in the fouthern parts of Spain, particularly in the paftures and remote uncultivated diftricts of Eftramadura, but in general are not taken notice of, if not very numerous, as they commonly feed upon wild herbs, without preying upon gardens and cultivated lands, or making their way into houfes. The peafants look at them with indifference while they are frifking about in the field, negleeting any meafure to deftroy them till the danger is immediate and the favourable moment to remedy the evil is elapfed. Their yearly number is not very confiderable, as the males are far more numerous than the females. If an equal proportion were allowed only for ten years, their numbers would be fo great as to deftroy the whole vegetative fyftem. Beafts and birds would farve for want of fubfiftence, and even mankind would become a prey to their ravenous appetites. In 1754, their increafe was fogreat from the multitude of females, that all La Mancha and Portugal were covered with them and totally ravaged. The horrors of famine were fpread even farther, and affailed

## GRY [ 163 ] GR Y

Gryllus. the fruitful provinces of Andalafia, Murcia, and Valencia.
" The amours of thefe creatures are objects of furprife and afonifhment, and their union is fuch that it is difficult to feparate them. When this feparation is voluntary, after having lafted fome hours, they are fo exhaulted, that the male retires immediately to the water for refreflment, where, lofing the ufe of his limbs, he foon perifhes, and becomes an eafy prey to the fill ; having given life to his offspring at the expence of his own. The female, difembarralled, tho' not without violent Itruggles, fpends the remainder of her days in fome folitary place, bufy in forming a retreat under ground, where the can fecure her eggs, of which the generally lays about 40 , fcreening them by her fagacity from the intemperature of the air, as well as the more immendiate danger of the plough or the fpade, one fatal blow of which would deftroy all the hopes of a rifing generation.
" The manner of her building this cell is equally furprifing. In the hinder part of her body, nature hasprovided her with a round fmooth inftrument, eight lines in length, which at its head is as big as a writing quill, diminifhing to a hard fharp point, hollow within like the tooth of a viper, but only to be feen with a lens. At the root of this vehicle there is a cavity, with a kind of bladder, containing a glutinous matter, of the fame colour, but without the confiftency or tenacity of that of the filk-worm, as I found by an experiment, made for the purpofe, by an infufion in vinegar, for feveral days, without any effect. The orifice of the bladder correfponds exactly with the inftrument which ferves to eject the gluainous matter. It is hid under the fkin of the belly, and its interior furface is united to the moveable parts of the belly, and can partake of its motions, forming the moft admirable contexture for every part of its operations, as the can difpofe of this ingredient at pleafure, and eject the fluid, which has three very effential properties : firft, being indiffoluble in water, it prevents its young from being drowned; next, it refifts the heat of the fan, otherwife the fructure would give way and deftroy its inhabitants; laftly, it is proof againft the froft of winter, fo as to preferve a neceffary warmth within. For greater fecurity, this retreat is always contrived in a folitary place : for tho' a million of locufts were to light upon a cultivated field, not one would depofit her eggs there; but wherever they meet a barren and lonefome fituation, there they are fure to repair and lay their eggs.
"Thefe locufts feem to devour, not fo much from a ravenous appetite, as from a rage of deftroying every thing that comes in their way. It is not furprifing, that they fhould be fond of the moft juicy plants and fruits, fuch as melons, and all manner of garden fruits and herbs, and feed alfo upon aromatic plants, fuch as lavender, thyme, rofemary, \&c. which are fo common in Spain, that they ferve to heat ovens: but it is very fingular, that they equally eat muftard feed, onions, and garlic; nay even hemlock; and the moftrank and poifonous plants, fuch as the thorn apple and deadly night-hade. They will even prey upon crowfoot, whofe caufticity burns the very hides of beafts; and fuch is their univerfal tafte, that they do not prefer the innocent mallow to the bitter furze, or rue to wormwood, confuming all alike, without predilection or favour, with this remarkable circumftance, that during
the four years they committed fuch havoc in Eftrema- Gryllua. dura, the love-apple, or lycoperficon folannm of Linnæus, was the only plant that efcaped their rapacious tooth, and claimed a refpeet to its root, leaves, flowers, and fruit. Naturailfts may fearch for their motives, which 1 am at a lofs to difcover; the more as 1 faw millions of them light on a field near Almaden, and devour the woollen andlinen garments of the peafants, which were lying to dry on the ground. The carate of the village: a man of veracity, at whofe houle I was, aflured me; that a tremendous body of them entered the church, and devoured the filk garments that adornedthe images of the faints, not fparing even the varnih on the altars. The better to difcover the nature of fuch a phenomenon, I examined the fomach of the locult, but only found one thin and foft membrane, with which, and the liquor it contains, it deftroys and diffolves all kind of fubftances, equally with the molt cauftic and venomous plants; extracting from them a fufficient and falutary nourifhment.
" Out of curiofity to know the nature of to formidable a creature, I was urged to examine all its parts with the utmoft exactnefs : its head is of the fize of a pea, though longer, its forehead pointing downwards like the handfome Andalufian horfe, its mouth large and open, its eyes black and rolling, added to a timid afpect not unlike a hare. With fuch a daftardly countenance who would imagine this creature to be the fcourge of mankind ! In its two jaws it has four incifive teeth, whofe fharp points traverfe each other like fciffars, their mechanifm being fuch as to gripe or to cut. Thus armed, what ean relift a legion of fuch enemies? After devouring the vegetable kingdom, were they, in proportion to their ftrength and numbers, to become carnivorous like wafps, they would be able to deftry whole flocks of fieep, even to the dogs and fhepherds ; juft as we are told of ants in America, that will overcome the fiercef ferpents.
"The locult fpends the months of April, May, and Jane, in the place of its birth: at the end of June its wings have 2 fine rofe colour, aud its body is ftrong. Being then in their prime, they affemble for the laft time, and burn with a defire to propagate their fpecies: this is obferved by their motions, which are unequal in the two fexes. The male is reftlefs and folicitous, the female is coy, and eager after food, flying the approaches of the male, fo that the morning is fpent in the courthip of the one and the retreat of the other. About ten o'clock, when the warmth of the fun has cleared their wings from the dampnefs of the night, the females feem unealy at the forwardnefs of the males, who continuing their purfuit, they rife together 500 feet high, forming a black cloud that darkens the rays of the fun. The clear atmofphere of Spain becomes gloomy, and the fineft fummer day of Eftremadura more difmal than the winter of Holland. The rufting of fo many millions of wings in the air, fecms like the trees of a foreft agitated by the wind. The firf direction of this formidable column is always againt the wind, which if not too frong, the column will extend abont a couple of leagues. The locufts then make ahalt, when the moft dreadful havoc begins; their fenfe of fmell being fo delicate, they can find at that diftance a corn field or a garden, and after demolihing it, rife again in purfuit of another : this may be faid to he done in an inftant. Each feems to have, as it were,

## GR Y [ 164$] \quad$ G U A

four arms and two feet : the males climb up the plants, as failors do the fhrouds of a hlip, and nip off the tenderelt buds, which fall to the females below.
" Many old people affured me, when fo much mifchief was done in r 754, it was the third time in their remembrance, and that they always are found in the pafture grounds of Eftramadura, from whence they pread into the other provinces of Spain. They are certainly indigenous, being of a different fhape from thofe of the North or the Levant, as is evident in comparing them with fuch in the cabinets of natural hiftory. The locuft of Spain is the only one that has rofe-coloured wings: befides, it is impoffible they can come from any other part. From the north it is clear they do not, by the oblervation of fomany ages; from the fouth they cannor, without croffing the fea, which is hardly poffible by the fhortnefs of their flight : and like birds of paffage, they would be known. I once faw a cloud of them pafs over Malaga, and move towards the fea, and go ovcr it, for about a quarter of a league, to the great joy of the inhabitants, who concluded they would foon be drowned; but, to their difappointment, they fuddenly veered about towards the coaft, and pitched upon an uncultivated face furrounded with vineyards, which they foon after quitted. When once they appear, let the number demolihed be ever fo great, the proportion remaining is ftill too confiderable: therefore, the only way to put an end to fuch a calamity, is to attack them beforehand, and deftroy their eggs, by which means they might be totally extirpated." See Plate CCXXI.

GRYN压US (Simon), fon to a peafant of Suabia, born in "1493, was Greek profeflor at Heidelberg, in 1523. He took a tour into England, and rectived great civility from the lord chancellor Sir Thomas More, to whom Erafinus had recommended him. He was a learned and laborious man, and did great fervice to the commonwealth of letters. He was the firf who publifhed the Almageft of Ptolemy in Greek. He alfo publifhed a Greek Eaclid, and Plato's works, with fome commentaries of Proclus.

GRYPHIUS (Sebaftian), a celebrated printer of Lyons in France, was a German, and born at Suabia near Augfturg in 3 494. He reftored the art of printing at Lyons, which was before exceedingly corrupted; and the great number of books printed by him are valued by the connoiffears. He printed many books in Hebrew, Greek, and Latin, with new and very beautifultypes; and his editions are no lefs accurate than bedutiful. The reafon is, that he was a very learned man, and perfectly verfed in the languages of fuch books as he undertook to print. Thusa certain epigrammatift has obferved, that Robert Stephens was a very good corrector, Colinæus a very good printer, but that Gryphius was both an able printer and corrector. This is the epigram:

> "Intgr tot norunt litros qui cudere, tres funt
> "Infgnes : languet catera turba fama
> * Cafigat Stephanus, fulpit Colineus, utrumque
> * Grypbius edocka mante manuque facit."

He died 5556 , in his 63 d year : and his trade was carried on honourably in the fame city by his fon, Anthony Gryphius. One of the moft beautiful books of Sebaftian Gryplius is a Latin Bible: it was printed 1550 ,
with the largeft types that had then been feen, in 2 Gryphites vols folio.

GRYPHITES, in natural hiftory, in Englifh crow's Guadalupe. stone, an oblong foffile fhell, very narrow at the head, and becoming gradually wider to the extremity, where it ends in a circular limb; the head or beak of this is very hooked or bent inward.

They are frequently found in gravel or clay-pits in many countries. There are three or four diftinct fpecies of them; fome are extremely rounded and convex on the back, others lefs fo; and the plates of which they are compofed, are in fome fmaller and thinner, in others thicker and larger, in fpecimens of the fame bignefs.

GUADALAjARA, or Guadalaxara, a town of Spain, in New-Caftile, and diftrict of Alcala, feated on the river Herares. W. Long. 2. 45. N. Lat. 40.36 .

Guadalajara, a confiderable town of North America, and capital of a rich and fertile province of the fame name, with a bifhop's fee. W. Long. II4. 59. N. Lat. 20. 20.

GUADALAVIAR, a river of Spain, which rifes on the confines of Arragon and New Caftile, and, running by Turvel in Arragon, crofles the kingdom of Valencia, pafles by the town of the fame name, and foon after falls into the Mediterranean fea, a little below Valencia.

GUADALQUIVER, one of the moft famous rivers of Spain, rifes in Andalufia, near the confines of Granada, and ronning quite through Andalufia, by the towns of Baiza, Andaxar, Cordoya, Seville, and St Lucar, falls at laft into the Bay of Cadiz.

GUADALOUPE, a handfome town in Spain, in EAtramadura, with a celebrated convent, whofe ftructure is magnificent, and is immenfely rich. It is feated on a rivulet of the fame name. E. Long. 3. 50. N. Lat. 39. 15.

Guadalupe, one of the Caribbee iflands, belonging to the French, the middle of which is feated in about N. Lat. 16. 30. W. Long. 6i. 20.

This illand, which is of anirregular figure, may be abour 80 leagues in circumference. It is divided into two parts by a fmall arm of the rea, which is not above two leagues long, and from 15 to 40 fathoms broad. This canal, known by the name of the Salt River, is navigable, but will only carry veffels of 50 tons burden.

That part of the ifland which gives its name to the whole colony is, towards the centre, full of craggy rocks, where the cold is fo intenfe, that nothing will grow upon them but fern, and fome ufelefs hrubs covered with mofs. On the top of thefe rocks, a mountain called la Souphriere, or the Brimftone Mountain, rifes to an immenfe height. It exhales, through various openings, a thick black fmoke, intermixed with fparks that are vifible by night. From all thefe hills flow numberlefs fprings, which fertilize the plains below, and maderate the burning heat of the climate by a refreining ftream, fo celebrated, that the galleons which formerly ufed to touch at the Windward Iflands, had orders to renew their provifion with this pure and falubrious water. Such is that part of the illand properly called Guadalupe. That which is commonly called

## GUA [ $\left.\mathfrak{1} \sigma_{5}\right] \quad$ G U A

Guadalupe. Crand Terre, has not been fo much favoured by nature. It is indeed lefs rugged; but it wants fprings and rivers. The foil is not fo.fertile, or the climate fo wholefome or fo pleafant.

No European nation lad yet taken poffeffion of this ifland, when 550 Frenchmen, led on by two genulemen named Loline and Dupleflis, arrived there from Dieppe on the 28th of June 1635 . They had been very impridentin their preparations. Their provilions were foill chofen, that they were fpoiled in the paffage, and they had flipped fo few, that they were exhaufted in two months. They were fapplied with more from the morher-country. St Chriftopher's, whether from farcity or defign, refufed to fpare them any; and the firlt attempts in hufbandry they made in the country, could not as yet afford any thing. No refource was left for the colony but from the favages; but the fuperfluities of a people, who cultivate but little, and therefore had never laid up any fores, could not be very confiderable. The new comers, net content with what the favages might freely and voluntarily bring, came to a refolution to plunder them ; and hoftilities commenced on the r6th of January 1636 .

The Caribbs, not thinking themfelvesin a condition openly to refitt an enemy who had fo much the advantage from the fuperiority of their arms, deftroyed their own provilions and plantations, and retired to Grand Terre, or to the neighbouring iflands. From thence the moft defperate came over to the illand from which they had been driven, and concealed themfelves in the thickeft parts of the forefts. In the day time, they fhot with their poifoned arrows, or knocked down with their clubs, all the Frenchmen who were fcattered about for hunting or fifling. In the night, they burned the houfes and deftroyed the plantations of their unjuft fpoilers.

A dreadful famine was the confequence of this kind of war. The colonifts were reduced to graze in the fields, to eat their uwn excrements, and to dig up dead bodies for their fubfiftence. Many who had been llaves $2 t$ Algiers, held in abhorrence the hands that had broken their fetters; and all of them curfed their exiftence. It was in this manner that they atoned for the crime of their invation, till the government of Aubert brought a peace with the favages at the end of the year 1640. The remembtance, however, of hardhips endured in an invaded ifland, proved a powerful incitement to the cultivation of all articles of immediate neceffity; which afterwards inducedan attention to thofe of luxury confumed in the mother-country. The few inhabitants who had efcaped the calamities they had drawn upon themfelves, were foon joined by fome difcontented colonifts from St Chriftopher's, by Europeans fond of novelty, by failors tired of navigation, and by fome fea-captains, who prodently chofe to commit to the care of a grateful foil the treafures they had faved from the dangers of the fea. But fill the profperity of Guadalupe was ftopped or impeded by obftacles arifing from its fituation.

The facility with which the pirates from the neighbouring iflands could carry off their cattle, their llaves, their very crops, frequently brought them into a defperate fituation. Inteltine broils, arifing from jealoufies of authority, often difturbed the quiet of the planters. The adventurers who went over to the wind-
ward iflands, difdaining a land that was fitter for Guadalupe. agriculture than for naval expeditions, were eafily drawn to Martinico by the convenient roads it abounds with. The protection of thofe intrepid pirates brought to that ifland all the traders who flattered themfelves that they might buy up the fpoils of the enemy at a low price, and all the planters who thought they might fafely give themfelves up to peacefal labours. This quick population could not fail of introducing the civil and military government of the Caribbee iflands into Martinico. From that time the French miniftry attended more ferioully to this than to the other colonies, which were not fo immediately under their direction; and hearing chiefly of this illand, they turned all their encouragements that way.

It was in confequence of this preference, that in 1700 the number of inhabitants in Guadalupe amounted only to 3825 white people, 325 favages, free negroes, mulattoes, and 6725 llaves, many of whom were Caribbs. Her cultures were reduced to 60 fmall plantations of fugar, 66 of indigo, a little cocoa, and a confiderable quantity of cotton. The cattle amounted to 1620 horfes and mules, and 3699 head of horned cattle. This was the fruit of 60 years labour. But her future progrefs was as rapid as her firft atttempts had been flow.

At the end of the year 1755 , the colony was peopled with 9643 whites, 41,140 flaves of all ages and of both fexes. Her faleable commodities were the produce of 334 fugar-plantations, 15 plots of indigo, 46,840 ftems of cocoa, 11,700 of tobacco, 2,257,725 of coffee, $12,748,447$ of cotton. For her provilions Ghe had 29 iquares of rice or maize, and 1219 of potatoes or yams, $2,028,520$ banana trees, and 32,577,950 trenches of caffava. The catnle of Guadalupe confifted of 4946 horfes, 2924 mules, 125 affes, 13,716 head of horned cattle, II, 162 fheep or goats, 2444 hogs. Such was the ftate of Guadalupe when it was conquacred by the Britilh in the month of April 1759.

France lamented this lofs; but the colony had reafon to comfort themfelves for this difgrace. During a fiege of three months, they had feen their plantations deftroyed, the buildings that ferved to carry on their works burnt down, and fome of their flaves carried off. Had the enemy been forced to retreat after all thefe devaftations, the ifland was ruined. Deprived of all affiftance from the mother-country, which was not able to fend her any fuccours; and expecting nothing from the Dutch (who, on account of their neutrality, came into her roads), becaufe fle had nothing to offer them in exchange; the could never have fubfifted till the enfuing harveft.

The conquerors delivered them from thefe apprehenfions. The Britifh, indeed, are no merchants in their colonies. The proprietors of Iands, who moftly refide in Eurape, fend to their reprefentatives whatever they want, and draw the whole produce of the eftate by the return of their fhips. An agent fettled in fome fea-port of Great Britain is intrulted with the furnifhing the plantation and receiving the produce. This was impracticable at Guadalupe ; and the conquerors in this refpect were obliged to adopt the cuftom of the conquered. The Britifh, informed of the advantage the French made of their trade with the cotonies,

Guadalupe, colonies, haftened, in imitation of them, to fend their Guadiana. hips to the conquered ifland; and fo multiplied their expeditions, that they overftocked the market, and funk the price of all European commodities. The colonifts boaght them at a very low price ; and, in confequence of this plenty, obtained long delays for the payment.

To this credit, which was neceffary, was foon added another ariling from fpeculation, which enabled the colony to fulfil its engagements. A great number of negroes were carried thither, to haften the growth and enlance the value of the plantations. It has been faid in various memorials, all copied from each other, that the Englifh had ftocked Guadalupe uith 30,000 daring the four years and three months that they remained mafters of the illand. The regifters of the cuftom-houfes, which may be depended on, as there could be no inducement for an impofition, atteft that the number was no more than 18,721 . This was fufficient to give the nation well-grounded hopes of reaping great advantages from their new conquef. But their hopes were fruftrated; and the colony, with its dependencies, was reftored to its former poffeffors by the rreaty of the peace in July 1763.

By the furvey taken in 1767 , this ifland, including the fmaller illands, Defeada, St Bartholomew, Marigalante, and the Saints ; dependent upon it, contains I 1,863 white people of all ages and of both fexes, 752 free blacks and mulattoes, 72,76y laves; which makes in all a population of 85,376 fouls. The cattle confifts of 5060 horfes, 4854 mules, 111 affes, 17,378 head of horned cattle, 14,895 heep or goats, and 2669 hogs. The provifion is $30,476,188$ trenches of caffava, $2,819,262$ banna trees, 2118 fquares of land planted with yams and potatoes. The plantations contain 72 arnotio trees, 327 of caffia, $\mathrm{r} 3,292$ of cocoa, $5,88 \mathrm{I}, 176$ of coffee, $12,156,769$ of cotton, $2 \mathrm{I}, 474$ fqures of land planted with fugar-canes. The woods occupy 22,097 fquares of land. Thereare 20,247 in meadows, and 6405 are uncultivated or forfaken. Only 1582 plantations grow cotton, coffee, and provifions. Sugar is made but in 401 . Thefe fugar works employ 140 water-mills, 263 turned by oxen, and rer wind-mills.

The produce of Guadalupe, including what is poured in from the fmalliflands under her dominion, ought to be very confiderable. But in 1768 it yielded to the mother-country no more than 140,418 quintals of fine fugar, 23,603 quintals of raw fugar, 34,205 quintals of coffee, 11,955 quintals of cotton, 456 quintals of cocua, 1884 quintals of ginger, 2529 quintals of logwood, 24 chefts of fweetmeats, 165 chefts of liquors, 3.4 calks of rum, and 1202 undreffed fkins. All thefe commodities were fold in the colony only for 310,7921 . 18s. 3 d . and the merchandife it has received from France has coft but r97,9rgl. 18s. 6d.fterling.

GUADIANA, a large river of Spain, having its source in New Caftile, and, paffing crofs the high mountains, falls down to the lakes called Ojos of Cuadiana; from whence it runs to Calatrava, Medelin, Merida, and Badajox in Eftremadura of Spain; and after having run for foine time in Alentejo in Portugal, it palies on to leparate the kingdom of Algarve from

Andalufia, and falls into the bay or gulph of Cadiz between Caftro Marino and Agramonte.

GUADIX, a town of Spain, in the kingdom of Granada, with a biihop's fee. It-was taken from the Moors in 1253, who afterwards retook it, but the Spaniards again got poffeffion of it in 1489 . It is feated in a fertile country, in W. Long. 2. 12.N. Lat. 37.5.

GUAJACUM, Lignum Vite, or Pockwood: A genus of the monogynia order, belonging to the decandria clafs of plants; and in the natural method ranking under the 1 th order, Gruinales. The calyx is quinquefid and unequal ; the petais five, and inferted into the calyx; the capfule is angulated, and trilocular or quinquelocular.

Species. 1. The officinale, or common lignum vita ufed in medicine, is a native of the Weft India Illands and the warmer parts of America. There it becomes a large tree, having a hard, brittle, brownih bark, not very thick. The wood is firm, folid, ponderous, very refinous, of a blackilh yellow colour in the middle, and of a hot aromatic tafte. The fmaller branches have an afh-coloured bark, and are garnifhed with leaves divided by pairs of a bright green colonr. The flowers are produced in cluflers at the end of the branches, and are compofed of oval concave petals of a fine blue colour. 2. The fanctum, with many pairs of obtufe lobes, hath many fmall lobes placed along the mid-rib by pairs of a darker green colour than thofe of the foregoing fort. The flowers are prodaced in loofe bunches towards the end of the branches, and are of a fine blue colour, with petals fringed on the edges. This fpecies is alfo a native of the Wert India illands, where it is called baftard lignum vita. 3. The Afrum, with many bluntpointed leaves, is a native of the Cape of Good Hope. The plants retain their leaves all the year, but have never yet flowered in Britain.

Gulture. The firft fpecies can only be propagated by feeds, which muft be procured from the countries where it naturally grows. They mult be fown frefl in pots, and planged into a good hot-bed, where they will come up in fix or eight weeks. While young, they may be kept in a hot-bed of tan-bark under a frame during the fummer; but in autumn they muft be removed into the bark-ftove, where they Should conftantly remain. The fecond fort may be propagated the fame way; but the third is to be propagated by layers, and will live all the winter in a good green-houfe.

Ufes. The wood of the firft fecies is of very conGderable ufe both in medicine and in the mechanical arts. It is fo compag and heavy as to tink in water. The outer part is often of a pale yellowih colour; but the deart is blacker, or of a deep brown. Sometimes it is marbled with different colours. It is fo hard as to break the tools which are employed in felling it; and is therefore feldom ufed as fircwood, but is of great ufe to the fagar-planters for making wheels and cogs to the fugar-mill. It is alfo frequently wrought into bowls, mortars, and other utenfils. It is brought over hither in large pieces of four or five hundred weight each; and from its hardnefs and beauty is in great demand for various articles of turnery ware.

The wood, gum, bark, fruit, and even the flowers

## GUA $[167] \quad$ GUA

Guajacum. of this tree, have been found to poffefs medicinal virtues; bat it is only the three firft, and more particularly the wood and refin, which are now in general ufe in Europe. The wood has little or no fmell, except when heated, or while rafping, and then a light aromatic one is perceived. When chewed, it impreffes a mild acrimony, biting the palate and fauces. Its pungency refides in its refinotas matter, which it gives out in fome degree to water by boiling, but firit extracts it wholly.

Of, the bark there are two kinds; one fmooth, the other unequal on the furface: they are both of them weaker than the wood; though, while in a recent State, they are ftrongly cathartic.

The gum, or rather gummy refin, is obtained by wounding the bark in different parts of the body of the rree, or by what has been called jagging. It exfudes copioully from the wounds, thongh gradually; and when a quantity is found accumulated upon the feveral wounded trees, hardened by expofure to the fun, it is gathered and packed in fmall kegs for exportation. This refin is of a friable texture, of a deep greenilh colour, and fometimes of a reddifh bue; it has a pangent acrid tafte but little or no finell, unlefs heated. The tree alfo yields a fpontaneous exfudation from the bark, which is called the natire gum, and is brought to us in fmall irregular pieces, of a bright femipellucid appearance, and differs from the former in being much purer.

In the choice of the wood, that which is the frefheft, moft ponderous, and of the darkeft colour, is the beft ; the largeft pieces are to be preferred too; and the beft method is to rafp them as wanted, for the finer parts are apt to exhale when the rafpings or chips are kept a while.

In choofing the refin, prefer thofe pieces which have fips of the bark adhering to them, and that eafily. feparate therefrom by a quick blow. The refin is fometimes fophifticated by the negroes with the gum of the manchineal tree; but this is eafily detected by diffolving a little in fpirit of wine or ram. The true gum imparts a whinifh or milky tinge, but the manchineal gives a greenifh caft. Möuch advifes a few drops of $\sqrt[f]{\mathrm{p}}$ itit. nitri dulc. to be added to the firituous folntion, and then to be dilated with water, by which the gum is to be precipitated in a blue powder; but the adulteration will appear floating in white ftriæ, \&c.

Guaiacum was firft introduced inte Europe as a remedy for the venereal difeafe; and appears to have been ufed in Spain fo early as 1508 . The great fuccefs attending its adminiftration before the proper ufe of mercury was known, brought it into fuch repute, that it is faid to have been fold for feven old crowns apound. It did not, however, continue to maintain its reputation; but was found fo generally to fail where the difeafe was deep-rooted, and was at length fuperfeded by mercury, to which it now only ferves occalionally as an adjuvant in the decoctum lignorum, of which guaiacum is the chief ingredient.

The general virtues of guaiacum are thofe of a warm ftimulating medicine ; ftrengthening the ftomach and other vifcera, and remarkably promoting the urinary and cuticular difcharges : hence, in cutaneons defedations, and other diforders proceeding from obftructions of the excretory glands, and where fluggifh ferous hu-
mours abound, they are eminently ufcful; rheumatic Guajacum. and other pains have often been relicved by them. Gualeor., They are alfo laxative. The refin is the moft active of thefe drugs, and the efficacy of the others depends upon the quantity of this part containedin them. The refin is extracted from the wood in part by watery li. quors, but much more perfectly by firituous ones. The watery extract of this wood, kept in the fhops, proves not only lefs in quantity, but conliderably weaker than one made with fpirit. This laft extract is of the fame quality with the native refin, and differs from that brought to us only in being purer. The gum or extracts are given from a few grains to a fcruple or half a dram, which laft dofe proves for the moft part confiderably purgative. The officinal preparations of guaiacum are, an extract of the wood, a folution of the gum in rectified fpirit of wine and a folation in volatile fpirit, and an empyreumatic oil diftilled from the wood. The refin diffolved in rum, or combined with water, by means of mucilage or the yolks of eggs, or in form of the volatile tincture or elixir, is much employed in gout and chronic rheumatifm. The rincture or elixir has been given to the extent of half an ounce twice a-day, and is fometimes ufefully combined with landanam.

GUALEOR, GuAlior, or Gowalier, a large town of Indoftan in Afia, and capital of a province of the fame name, with an ancient and celebrated fortref: of great ftrength. It is fituated in the very heart of Hindoftan Proper, being about 80 miles to the fouth of Agra, the ancient capital of the empire, and 130 from the neareft part of the Ganges. From Calcutta it is, by the neareft rout, upwards of 800 miles, and 910 by the ordinary one; and about 280 from the Britifh frontiers. Its latitude is 26.14 . and longitude 78. 26. from Greenwich.

In the ancient divifion of the empire it is claffed in the Soubah of Agra, and is often mentioned in hiftory. In the year 1008 , and daring the two following: centuries, it was thrice redaced by famine. It is probable that it muft in all ages have been decmed a military poft of the utmoft confequence, both from its fituation in refpect to the capital, and from the pecnliarity of its fite, which was generally deemed impregnable. With refpect to its relative polition, it muft be confidered that it fands on the principal road leading from : Agra to Malwa, Guzerat, and the Decan; and that too near the place where it enters the hilly tract which advances from Bundelcund, Malwa, and Agimere, to a parallel with the river Jumnih, throughout the greateft part of its courfe. And from all thefe circumftances of general and particalar firation, together with its natural and acquired advantages as a fortrefs, the poffeflion of it was deemed as neceffary to the ra. ling emperors of Hindoftan as Dover-caftemighr have been to the Saxon and Norman kings of England. Its palace was afed as a fate prifon as early as I 317 , and continued to be fuch until the downal of the em-pire.-On the final difmemberment of the empire, Gualeor appears to have fallen to the lot of a rajah of the Jat tribe; who affamed the government of the di. ftrict in which it is immediately fituated, under the title of Rana of Gohud or Gohd. Since that period it has changed mafters more than once ; the Mahrat-: tas, whefe dominions extend to the neiglnbourhood of

## GUA [168] GUA

Gualenr. it having fometimes polfeffed it, and at other times the Rana : but the meanis of transfer were always either famine or treachery, nothing like a fiege having ever been attempted.

Gualeor was in the poffeffion of Madajee Scindia, a Mahratta chief, in 1779, at the clofe of which year the council-general of Bengal concluded an alliance with the Rana; in confequence of which, four battalions of fepoys of 500 men each, and fome pieces of artillery, were fent to his affiftance, his diftrict being over-run by the Mahrattas, and himfelf almoft thut up in his fort of Gohud. The grand object of his alliance was to penerrate inte Scindia's comintry, and finally to draw Scindia himfelf from the wefteru fide of India, where he was attending the motions of general Goddard, who was then employed in the reduction of Gu zerat ; it being Mr Haftings's idea, that when Scindia found his own dominions in danger, he would detach himfelf from the confederacy, of which he was the principal member, and thus leave matters open for an acccommodation with the court of Peonah. It fell out exactly as Mr. Haßings predicted. Major Willian Popham was appointed to the command of the little army fent to the Rana's affiftance; and was very fuccefsful as well inclearing his country of the enemy, as in driving them out of one of their own moft valuable diffricts, and keeping poffeffion of it: and $\mathrm{Mr} \mathrm{Ha}-$ ftings, who juftly concluded that the capture of Gualeor, if practicable, would not only open the way into Scindia's country, but would alfo add to the reputation of our arms in a degree much beyond the rifk and expence of the undertaking, repeatedy expreffed his opinion to major Popham, together with a wilh that it might be attempted; and founding his hopes of fuccefs on the confidence that the garrifon would probably have in the natural ftrength of the place. It was accordingly undertaken; and the following account of the place, and the manner of getting pofferfion of it, was written by captain Jonathan Scott, at that time Perfian interpreter to major Popham, to his brother major John Scott.
"The fortrefs of Gualeor ftands on a vaft rock of about four miles in length, but narrow, and of unequal breadth, and nearly flat at the top. The fides are fo fleep as to appear almoft perpendicular in every part; for where it was not naturally fo, it has been fcraped away; and the height from the plain below is from 200 to 300 feet. The rampart conforms to the edge of the precipice all around; and the only entrance to it is by fteps running up the fide of the rock, defended on the fide next the country by a wall and balions, and farther guarded by feven foone gateways, at certain diftances from each other. The area within is full of noble buildings, refervoirs of water, wells, and cultivated land; fo that it is really a little diftrict in itfelf. At the north-weft foot of the mountain is the town, pretty large, and well built ; the houfes all of ftone. To have befieged this place would be vain, for nothing but a furprife or blockade could have carried it.
"A tribe of banditti from the diftrict of the Rana had been accuftomed to rob about this town, and once in the dead of night had climbed up the rock and got into the fort. This intelligence they bad communicated to the Rana, who often thought of availing himfelf
of it, but was fearful of undertaking an enterprize of Guateort fuch moment with his own troops. At length he informed major Popham of it, who fent a party of the robbers to conduct fome of his own fipies to the fpot. They accordingly climbed up in the night, and found that the guards generally went to lleep after their raunds. Popham now ordered ladders to be made; but with fo much fecrecy, that until the night of farprife only my felf and a few others knew it. On the 3d of Auguft, in the evening, a party was ordered to be in readinefs to march under the command of captain William Bruce ; and Popham put himfelf at the head of two battalions, which were immediately to follow the florming party. To prevent as much as poffible any noife in approaching or afcending the rock, a kind of floes of woollen cloth were made for the fepoys, and fuffed with cotton. At eleven o'clock the whole delachment marched from the camp at Reypour, eight miles from Gualeor, through unfrequented paths, and reached it a little before day-break. Juft as captain Bruce arrived at the foot of the rock, he faw the lights which accompanied the rounds moving along the rampart, and heard the fentinels cough (the mode of fignifying that all is well in the Indian camp or garrifon), which might have damped the fipirit of many men, but ferved only to infpire him with more confidence, as the moment for action, that is, the interval between the pafling the rounds, was now afcertained. Accordingly when the lights were gone, the wooden ladders were placed againft the rock, one of the robbers firft mounted, and returned with an account that the guard was retired to fleep. Lieutenant Cameron, our engineer, next mounted, and tied a rope-ladder to the battlements of the wall ; this kind of ladder being the only ono adapted to the purpore of fcaling the wall in a body (the wooden ones only ferving to afcend from crag to crag of the rock, and to affitt in fixing the rope-ladders). When all was ready, captain Brace, with 20 fepoys, grenadiers, afcended without being difcovered, and fquatted down under the parapet; but before a reinforcement arrived, three of the party had fo little recollection as to fire on fome of the garrifon who happened to be lying afleep near them. This had nearly ruined the whole plan; the garrifon were of courfe alarmed, and ran in great numbers towards the place; but ignorant of the ftrength of the affailants (as the men fired on had been killed outright), they fuffered themfelves to be ftopped by the warm fire kept up by the fmall party of the grenadiers, until major Poplam himfelf, with a confiderable reinforcement, cane to their aid. The garrifon then retreated to the inner buildings, and difcharged a few rockets, but foon afterwards retreated precipitatcly through the gate; whilf the principal officers, thus deferred, affembled together in one houfe, and hung out a flag. Major Popham fent an officer to give them affurance of quarter and protection; and thus, in the fpace of two hours, this important and aftoninging fortrefs was completely in our poffeffion. We bad only 20 men wounded and $x$ killed. On the fide of the encmy, Bapogee the governor was killed, and moft of the principal officers wounded."
Thus fell the ftrongeft fortrefs in Hindoftan, garrifoned by a chofen body of 1200 men , on Auguft 4. 1730 ;

\end{array}\right.
$$

1780; and which, before the capture of it by the Bridilh, was pronounced by the princes of Hindoftan, as far as their knowledge in the military art extended, to be impregnable. In 1783 Madajee Scindia befieged this fortrefs, then poffeffed by the Rana of Gohud, with an army of $70,000 \mathrm{men}$, and effected the reduction by the treachery of one of the Rana's officers, who formed the plan of admifion of a party of Scindia's troops; thefe were immediately fupported by another party; who attacked an oppofite quarter, and got admiffion alfo.

GUAM, the largeft of the Ladrone iflands in the South Sea, being about 40 leagues in circumference. It is the only one among the innumerable iflands that lie fcattered in the immenfe South Sea which has a town built in the European ftyle, with a regular fort, a charch, and civilized inhabitants. The air is excellent, the water good, the garden fuffs and fruits are exquilite, the flocks of buffaloes innumerable, as are thofe of goats and hogs, and all kinds of poultry abound in an aftonifhing degree. There is no port in which worn-out failors can be more fpeedily reftored, or find better or more plentiful refrefhments, than in this.

But Guam did not formerly enjoy this fate of abundance. When it was firt difcovered by Magellan in 152 I , with the other eight principal illands that lie north of it, which, with a multitude of fmaller ones, form together that archipelago known by the name of the Ladrones, they were all crowded with inhabitants, but afforded no refrefliments to navigators except fifh, bananas, cocoa-nuts, and bread fruit; and even thefe could not be procured but by force, amidft fhowers of the arrows and lances of the natives. The Spaniards carried thither from America the firft ftock of cattle, of fowls, of plants, and feeds, and fruirs, as well as garden ftuffs, which are all now found in fuch abundance.

The Ladrone iflands, and Guam in particular, were covered with inhabitants when they were difcovered: It is faid that Guan alone contained upon its coafts more than 20,000 people. Thefe men were ferocious ravages and bold thieves, as all the illanders in the fouth feas are, undoubtedly becaufe they were unacquainted with the rights of property ; but they were fo favage, fo incapable of fupporting the yoke of civilization, that the Spaniards, who undertook to bring them under the regulations of law and order, have feen their numbers almof annihilated within the fpace of two centuries. Under the government of their miffionaries, thefe fierce illanders, after having long defended, by cruel wars, the right of living like wild beafts under the guidance of inftinet, being at laft obliged to yield to the fuperiority of the Spanifh arms, gave themfelves up to defpair: they took the refolution of adminiftering potions to their women, in order to procure abortions, and to render them fterile, that they might not bring into the word, and leave behind them, beings that were not free, according to the ideas that they had of liberty. A refolution fo violent, and fo contrary to the views and intentions of nature, was perfifted in with fo much obftinacy in the nine Ladrone illands, that their population, which at the time of the difcovery confifted of more than 60,000 fouls, does not now exceed 800 or 900 in the whole

Voz. VIII.
extent of the archipelago. About 20 or 30 years ago, the fcattered fragments of the original natives were collected and eftablifined in the illand of Guam, where they now begin to recover by the wife precautions, and prudent, though tardy, exertions of a government nore adapted to the climate of thefe illands and to the genius of their inhabitauts.

The principal fettlement, which the Spaniards call the town of Agana, is fituated about four leagues north-eaft of the landing-place, on the fea-fhore, and at the foot of fome hills not very high, in a beautiful well-watered country. Befides this, there are 21 fmaller fettlements of Indians round the illand, all on the fea-hore, compofed of five or fix families, who cultivate fruits and grain, and employ themfelves in filhing.

The centre of the illand is fill uncleared. The trees are not very tall, but they are fit for the building of houfes and of boats. The forefts are in general very thick. The Spaniards at firft cleared certain portions of land to turn them into favannahs for the feeding of cattle. The formation of favannabs confifts in multiplying within the forefts fmall cleared fpots feparated only by thickets and rows of trees, and kept clean from hrubs of every kind. The Spaniards fow thefe fpots with grafs feeds, and other indigenous plants that are fit for pafturage. Thefe meadows, being effectually fhaded on every quarter, preferve their frefhnefs, and afford the flocks and herds a thelter from the fun and the great heat of noon. The cattle that were formerly brought to the favannahs of Guan from America have multiplied aftonifhingly: they are become wild, and muft be fhot when wanted, or taken by ftratagem.

The woods are likewife full of goats, of hogs, and fowls, which wereall originally brought thither by the Spaniards, and are now wild. The flefh of all thefe animals is excellent. In the favannahs, and even in the heart of the forefts, there is a valt multitude of pigeons, of parroquets, of thrufhes, and of blackbirds.

Among the indigenous trees of the country, the mof remarkable are, the cocoa-nut tree and the breadfruit tree. The woods are alfo filled with guavas, bananas, or plantanes of many varieties, citrons, lemons, and oranges, both fweet and bitter; and the fmall dwarf thorny china-orange with red fruit. The caper-bulh abounds in all the Ladrone iflands; and as it is conftantly in flower, as well as the citron and orange-flurubs, with many other of the indigenous plants, they perfume the air with the moft agreeable fmells, and delight the eye with the richeft colours.

The rivers of Guam, which are either rivulets or torrents, abound in filh of an excellent quality: the Indians, however, eat none of them, but prefer the inhabitants of the fea. The turtle, which grow here as large as thofe in the illand of Afcenfion, are not eaten either by the Indians or Spaniards.

The cultivated crops lately introduced are, the rice, the maize, the indigo, the cotton, the cocoa, the fu-gar-cane, which have all fucceeded. That of the maize, efpecially, is of aftonifhing fertility: it is common to find in the fields where this grain is cultivated plants of twelve feet high, bearing eight or ten fpikes from nine to ten inchesin length, fet round with well* filled feeds. The gardens are fored with mangoes

Guam.

Granaisa and pine-apples. The former is one of the fineft fruits inaginable : it was brought from Manilla, and may be caten in great quantity without any bad confequen-ces.--Horfes have leen brought to Guam from Manille, and affes and mules from Acapulco. The Indians have been taught to tame and domefticate the ox, and to employ him in the draught.

This ifland, the land of which rifes gradually from the fea-fhore towards the centre by a gentle acclivity, is not very mountainous. The inhabitants fay, that its foilis equally rich and fertile over the whole illand, cxcept in the northern part, which forms a peninfula almoft deflitute of water. But in the reft, you cannot go a league without meeting a rivulet. Upon penctrating a little way into the interior part of the conarry, to the eaft and the fouth of Agana, many fprings of fine water are found, forming at little diftances, bafons of pure water, which, being thaded by thick trees, preferve a moft agreeable coolnefs in Spite of the heat of the climate.

The indigeneus inhabitants are fuch as they were defcribed by Magellan ; of fmall ftature, fufficiently ugly, black, and in general dirty, though they are continually in the water. The women are for the moft part handfome, well made, and of a reddifh colour. Both fexes have long hair. This fcanty people have become by civilization gentle, honeft, and hofpitable. They have, however, at the fame time acquired a vice that was unknown to their favage anceftors. The men are a little addicted to drunkennefs, for they drink freely of the wine of the cocoa-nut. They love mufic and dancing much, but labour little. They are paffionately fond of cock-fighting. On Sundays and holidays they gather together in crowds after the ferVice, at the door of the church; where each Indian brings his cock to match him with that of his neighbour, and each bets upon his own.-The miffion of Guam is now in-the hands of the Auguftine friars, who have fupplanted the Jefuits. E. Long. 539.25. N. Lat. 30. 26.

GUAMANGA, a confiderable tnwn of South America, and capital of a province of the fame name in Peru, and in the audience of Lima, with a bifhop's fee. It is remarkable for its fweermeats, manufactures, and mines of gold, filver, loadftone, and quickfilver, W. Long. 74. 50 . S. Lat. 13. 0.

GUANUCO, a rich and handfome town of South America, and capital of a diftrict of the fame name in the audience of Lima. W. Long. 72. 55. S. Lat. 9. 55.

GUANZAVELCA, a town of South America, in Peru, and in the audience of Lima. It abounds in mines of quickfilver. W. Long. 71. 59. S. Lat. 12. 40.

GUARANTEE, or WARRANTEE, in law, a term relative to a warrant or x arranter, properly fignifying him whom the warranter undertakes to indemnify or fecure from damage.

Guarantee is more frequently ufed for a warranter, or a perfon who undertakes and obliges himfelf to fee a fecond perfon perform what he has ftipulated to the third. See Warranty.

GUARANTY, in matters of polity, the engagement of mediatorial or neutral ftates, whereby they
plight their faith that certain treaties fhall be inviolably obferved, or that they will make war againft the aggreffor.

GUARD, in a general fenfe, fignifies the defence or prefervation of any thing; the act of obferving what paffes, in order to prevent furprife; or the care, precaution, and attention, we make ufe of to prevent any thing from happening contrary to our intentions or inclinations.
Guard, in the military art, is a duty performed by a body of men, to fecure an army or place frem be-
ing furprifed by an enemy. In garrifon the guards ing furprifed by an enemy. In garrifon the guards are relieved every day: hence it comes that every foldier mounts guard once every three or four days in foldier mounts guard once every three or four days in
time of peace, and much oftener in time of war. See HoNours. Advanced GUARD, is a party of either horfe or foot,
that marches before a more confiderable body, to give Advanced GUaRD, is a party of either horfe or foot,
that marches before a more confiderable body, to give notice of any approaching danger. Thefe guards are either made ftronger or weaker, according to fituation, the danger to be apprebended from the enemy, or the nature of the conntry.

Van Guard. See Advanced Guard.
Artillery Guard, is a detachment from the army to fecure the artillery when in the field. Their corps de garde is in the front of the artillery park, and their
centries difperfed round the fame. This is generally de garde is in the front of the artillery park, and their
centries difperfed round the fame. This is generally a 48 -hours guard; and upon a march, this guard marches in the front and rear of the artillery, and marches in the front and rear of the artillery, and
mutt be fure to leave nothing behind: if a gun or waggon breaks down, the officer that commands the waggon breaks down, the oftucer that commands the
guard is to leave a fufficient number of men to affift the gunners and matroffes in getting it up again.

Artillery Quarter-CUARD, is frequently a non-commiffioned officer's guard from the royal regiment of artillery, whofe corps de garde is always in the front of their encampment.
Artillery Rear-GuARD, confifts in a corporal and fix men , polted in the rear of tie park.

Corps de GarDE, are foldiers entrufted with the
Corps de GARDE, are foldiers entrufted with the
guard of a poft, under the command of one or more officers. This word alfo fignifies the place where the guard mounts.

Grand GUARD ; three or four fquadrons of horfe, commanded by a field-officer, pofted at about a mile commanded by a field-officer, polted at about a mile
or a mile and a half from the camp, on the right and left wings, towards the enemy, for the better fecurity of the camp.
Forage CUARD, a detachment fent out to fecure the foragers, and who are pofted at all places, where either the eneny's party may come to difturb the foragers, or where they may be fpread too near the
cnemy, fo as to be in danger of being taken. This ragers, or where they may be fpread too near the
enemy, fo as to be in danger of being taken. This guard confifts both of horfe and foot, and muft re-
main on their pofts till the foragers are all come off guard confifts both of horfe and foot, and muft re-
main on their pofts till the foragers are all come off the ground.
Main Guard, is that from which all other guards are detached. Thofe who are for mounting guard affemble at their refpective captain's quarters, and march from thence to the parade, in good order; where, after the whole guard is drawn np, the fmall guards are detached to their refpective pofts: then the fubalterns throw lots for their guards, who are all

Guard.
$\qquad$

 under

Guard. under the command of the captain of the main guard. This guard mounts in garrifon at different hours, according as the governor pleafes.
Piguet-Guard, a good number of horfe and foot, always in readinefs in cafe of an alarm: the horfes are generally faddled all the time, and the riders booted.

The foot draw up at the head of the battalion, frequently at the beating of the tat-too; but afterwards return to their tents, where they hold themfelves in readinefs to march upon any fudden alarm. This guard is to make refiftance in cafe of an attack, until the army can get ready.

Baggage-Civand, is always an officer's guard, who has the care of the baggage on a march. The waggons fhould be numbered by companies, and follow one another regularly: vigilance and attention in the paffage of hollow ways, woods, and thickets, mult be Arictly oblerved by this guard.

Quarter CUARD, is a fmall guard commanded by a fubaltern officer, pofted in the front of each battalion, $2 t 222$ feet before the front of the regiment.

Rear Guard, that part of the army which brings up the rear on a march, generally compofed of all the old grand guards of the camp. The rear-guard of a party is frequently eight or ten horfe, about 500 paces behind the party. Hence the advance guard going out upon a party, form the rear-guard in their retreat.

Rear Guard, is alfo a corporal's guard placed in the rear of a regiment, to keep good order in that part of the camp.

Stundard Guard, a rmall guard under a corporal, out of each regiment of horfe, who mount on foot in the front of each regiment, at the diftance of 20 feet from the ftreets, oppofite the main-ftreet.

Trench GUard; only mounts in the time of a fiege, and fometimes confifts of three, four, or fix battalions, according to the importance of the fiege. This guard muft oppofe the befieged when they fally out, protect the workmen, \&c.

Provofl Guard, is always an officer's guard that attends the provoft in his rounds, either to prevent de. fertion, marauding, rioting, \&c. See Provost.

GUARD, in fencing, implies a pofture proper to defend the body from the fword of the antagonift.

Ordinary Guards, fuch as are fixed during the campaign, and relieved daily.

Extraordinary Guards, or detachments, which are only commanded on particular occafions; either for the further fecurity of the camp, to cover the foragers, or for convoys, efcorts, or expeditions.

Guards, alfo imply the troops kept to guard the king's perfon, and confift both of horfe and foot.

Horfe Guards, in England, are gentlemen chofen for their bravery, to be entrufted with the guard of the king's perfon; and were divided into four troops, called the $1 / t, 2 d, 3 d$, and 4 th troop of bor $\int$-guards. The firft troop was raifed in the year 1660, and the command given to lord Gerard; the fecond in 1661, and the command given to Sir Philip Howard; the third in 1693, and the command given to earl FeverGham; the fourth in 1692, and the command given to earl Newburgh. Each troop had one colonel, two lieutenant-colonels, one corraet and major, one guidon
and major, four exempts and captains, four brigadiers and lieutenants, one adjutant, four fub-brigadiers and cornets, and 60 private men. Bat the four troops are now turned into two regiments of life-guards.
Horfe-Grenadier Cuards, are divided into two troops, called tbe $\mathrm{I} / \mathrm{t}$ and 2 d troops of horfe-grenadier guards. The firft troop was raifed in 1693 , and the command given to licutenant-general Cholmondeley; the fecond in 1 702, and the command given to lord Forbes. Each troop has one colonel, one lieutenant-colonel, one guidon or major, three exempts and captains, three lietilieutenants, one adjutant, three cornets, and 60 private men.

Teonwen of the GUard, firft raifed by Henry VII. in the year 1485 . They are a kind of pompous footguards to the king's perfon ; and are generally called by a nickname the Beef-Eaters. They were anciently 250 men of the firft rank under gentry; and of larger ftature than ordinary, each being required to be fix feet high. At prefent there are but 100 in confant duty, and 70 more not on daty; and when any one of the 100 dies, his place is fupplied out of the 70. They go dreffed after the manner of kiag Henry VIII's time. Their firft commander or captain wasthe earl of Oxford, and their pay is 2s. 6d. per day.

Foot-GUARDS are regiments of foot appointed for the guards of his majefty and his palace. There are three regiments of them, called the $1 / t, 2 d$, and $3 d$ regiments of foot-guards. They were raifed in the year 1660; and the command of the firft given to colonel Ruffel, that of the fecond to general Monk, and the third to the earl Linlithgow. The firft regiment is at prefent commanded by one colonel, one lieutenantcolonel, three majors, 23 captains, one captain-licutenant, 3 r lieutenants, and 24 enfigns; and contains three battalions. The fecond regiment has one co. lonel, one lieutenant-colonel, two majors, 14 captains, one captain-lieutenant, 88 lieutenants, 16 enfigns; and contains only two battalions: The third regiment is the fame as the fecond.
The French Cuards are divided into thofe within, and thofe without, the palace. -The firft are the gardes du carps, or body-guards; which confift of four companies, the firft of which companies was anciently Scots. The Scots Guards, infra.

The guards without are the Gens d'Armes, lighthorfe; mufqueteers, and two other regiments, the one of which is French and the other Swifs.

New arrangements, however, have taken place in this department as well as others fince the late revolution.
$S_{\text {cots }}$ GUARDS, a celebrated band, which formed the Girft company of the ancient gardes du corps of France.

It happened from the ancient intercourfe between France and Scotland, that the natives of the latter kingdom had often diftinguifhed themfelves in the fervice of the former. On this foundation the company of Scots guardes, and the company of Scots gendarmes, were inftituted. - Both of them owed their inftitution to Charles VII. of France, by whom the firt fanding: army in Europe was formed, anno 1454; and their fates cannot but be interefting to Scorfmen. See Gendarmes.

Valour, honour, and fidelity, muft have been very confpicuous features of the national character of the

## G U A <br> $172]$ <br> G U A

Guard. Scots, when fo great and civilized a people as the Freneh could be induced to choofe a body of them, foreigners as they were, for guarding the perfons of their fovereigns.-Of the particular occafion and reafons of this predilection, we have a recital by Louis XII. a fucceeding monarch. After fetting forth the fervice which the Scots had performed for Charles VII. in expelling the Englifh out of France, and reducing the kingdom to his obedience, he adds-" Since which reduction and for the fervice of the Scots upon that occafion, and for the great loyalty and virue which he found in them, he felected 200 of them for the guard of his perfon, of whom he made an hundred men at arms, and an hundred life-guards: And the hundred men at arms are the hundred lances of our ancient ordinances; and the life-guard men are thofe of our gaard, whoftill are near and about our perfon."-As to their fidelity in this honourable ftation, the hiftorian, fpeaking of Scotland, fays, "The French have foancient a friendihip and alliance with the Scots, that of 400 men appointed for the king's life-guard, there are an hundred of the faid nation who are the neareft to his perfon, and in the night keep the keys of the apartment where he neeps. There are, moreover, an hundred complete laṇes and two hundred yeomen of the faid nation, befides feveral that are difperfed thro' the companies : and for folong a time as they have ferved in France, never hath there been one of them found that hath committed or done any fault againt the kings or their flate; and they make ufe of them as of their own fubjects."

The ancient rights and privilges of the Scotifh life-guards were very honourable; efpecially of the twenty-four firft. The author of the Ancient Alliance fays, "On high holidays, at the ceremony of the royal touch, the erection of knights of the king's order, the reception of extraordinary ambaffadors, and the public entries of cities, there muft be fix of their number next to the king's. perfon, three on each fide: and the body of the king mult be carried by thefe only, wherefoever ceremony requires. They have the keeping of the keys of the king's lodging at night, the kecping of the choir of the clapel, the keeping the boats where the king paffes the rivers; and they have the honour of bearing the white filk fringe in their arms, which in France is the coronne coleur. The keys of all the eities where the king makes his entry afe given to their captain in waiting or out of waiting. He has the privilege, in waiting or out of waiting, at ceremonies, fuch as coronations, marriages, and funerals of the kings, and at the baptifn and marriage of their children, to take duty upon him. The coro-nation-robe belongs to him: and this company, by the death or change of a captain, never changes its rank, as do the three others."

This company's firft commander, who is recorded as a perfon of great valour and military accomplifh. ments, was Robert Patillock, a native of Dundee; and the band, ever ardent to diftinguigh itfelf, continued in great reputation till the year 1578 . From that period, the Scots guards were lefs attended to, and their privileges came to be invaded. In the year 1612, they remonftrated to Loais XIII. on the fubject of the injuftice they had fuffered, and fet before him the fervices they had rendered to the crown of

France. Attempts were made to re-eftablifh them Guard. on their ancient foundation ; but no negociation for Guardians. this purpofe was effectual. The troops of France grew jealous of the honours paid them: the death of Francis II. and the return of Mary to Scotland, at a time when they had much to hope, were unfortunate circumitances to them: the change of religion in Scotland, was an additional blow : and the acceffion of James VI. to the throne of England, difunited aitogether the interefts of France and Scotland. The Scots guards of France had therefore, latterly, no connection with Scotland but the name.

Cuard-Boat, a boat appointed to row the rounds amongft the flips of war which are laid up in any harbour, \&c. to obferve that their officers keep a good looking out, calling to the guard-boat as fhe paffes, and net fuftering her crew to come on board, without having previoully communicated the watch-word of the night.
$G_{U A R D-S h i p,}$ a veffel of war appointed to fuperintend the marine affairs in a harbour or river, and to fee that the fhips which are not commiffioned have their proper watchward kept duly, by fending her guard-boats around them every night. She is alfo to receive feamen who are imprefled in the time of war.

GU ARDIAN, in law, a perfon who has the charge of any thing ; but more commonly it fignifies one who has the cuftody and education of fuch perfons as have not fuftcient difcretion to take care of themfelves and their own affairs, as children and ideots.

Their bufinefs is to take the profits of the minor's lands to his ufe, and to account for the fame: they ought to fell all moveables within a reafonable time, and to convert them into land or money, except the minor is near of age, and may want fuch things him. felf; and they are to pay intereft for the money in their hands, that might have been fo placed out; in which cafe ir will be prefumed that the guardians made ufe of it themfelves. They are to fuftain the lands of the heir, without making deftruction of any thing thereon, and to keep it fafely for him: if they commit wafte on the lands, it is a forfeiture of the guardian flip, 3 Edw.I. And where perfons, as guardians, hold over any land, without the confent of the perfon who is next intilled, they fhall be adjudged trefpaffers, and fhall be accountable ; 6 Ann. cap. xviii.

Guardian,or Warden, of the Cinque-ports, is an officer who has the jurifdiction of the cinque-ports, with all the power that the admiral of England has in other places.

Camden relates, that the Romans, after they had fetted themfelves and their empire in Britain, ap. pointed a magiftrate, or governor, over the eaft parts, where the cinque-ports lie, with the title of comes litoris Saxonici per Britanniam; having another, who bore the like title, on the oppofite fide of the fea. Their bufinefs was to ftrengthen the fea-coaft with munition, againft the cutrages and robberies of the barbarians; and that antiquary takes the warden of the Cinqueports to have been erected in imitation thereof. The wardenfhip is a place of value, fuppofed worth 70001. per annum.

Guardian of the Spiritualities, the perfon to whom the fpiritual jurifdiftion of any diocefe is committed, during the time the fee is vacant. A guardian of the

Guarea fpiritualities may likewife be either fuch in law, as the archbilhop is of any diocefe within his province; or by delegation, as he whom the archbifhop or vicargeneral for the time appoints. Any fuch guardian has power to hold courts, grant licences, difpenfations, probates of wills, \&c.

GUAREA, in botany : A genus of the monogynia order, belonging to the octandria clafs of plants. The calyx is quadrifid; the petals four ; the nectarium cylindric, having the antheræ in its mouth; the capfule is quadrilocular and quadrivalvular; the feeds folitary.

GUARINI (Battifta), a celebrated Italian poet, born at Ferrara, in 1538 . He was great-grandfon to Guarino of Verona, and was fecretary to Alphonfo Duke of Ferrara, whe intrufted him with feveral important commiffions. After the death of that prince, he was fucceffively fecretary to Vincenzio de Gonzaga, to Ferdinand de Medicis grand duke of Tufcany, and to Francis Maria de Feltri duke of Urbino. But the only advantages he reaped under thefe various mafters, were great encomiums on his wit and compofitions. He was well acquainted with polite literature ; and acquired immortal reputation by his Italian poems, efpecially by his Paftor Fido, the moft known and admired of all his works, and of which there have been innumerable editions and uranflations. He died in 1612.
GUARDIA, or Guarda, a town of Portugal, in the province of Beira, with a bifhop's fee. It contains about 2300 inhabitants, is fortified both by art and nature, and has a fately cathedral. W. Long. 5. 17. N. Lat. 40. 20.

Guardis-Alferez, a town of Italy, in the kingdom of Naples, and in the Contado-di-Molife, with a bifhop's fee. E. Long. 15. 53. N. Lat. 5I. 50.

GUARGALA, or GUERGUELA, a town of Africa, and capital of a fmall kingdom of the fame name, in Biledulgerid, to the fouth of Mount Atlas. E. Long. 9.55. N. Lat. 28. O.

GUARIBA, in natural hifory, the name of a fecies of monkey found in the Weft Indies. See Simita.
GUASTALLA, a ftrong town of Italy, in the dushy of Mantua, with the title of a duchy, remarkable for a battle between the French and Imperialifts in 1734. It was ceded to the duke of Parma in $174^{8}$, by the treaty of Aix-la-Chapelle. It is feated near the river $P_{0}$, in E. Long. 10.33. N. Lat. 44. 45.

GUATIMALA, the AUDIEnce of, in North America, and in New Spain, is above 750 miles in length, and 450 in breadth. It abounds in chocolate, which they make ufe of inftead of money. It has 12 pro. vinces under it: and the native Americans, under the dominions of Spain, profefs Chriftianity; but it is mixed with a great many of their own fuperftitions. There is a great chain of high mountains, which run acrofs it from E. to W. and it is fulject to earthquakes and ftorms. It is howe ver very fertile ; and produces, befides chocolate, great quantities of cochineal and cotton.

Guatimala, a province of North America, in New Spain, and in the rindience of the fame name; bounded on the W. by Soconjufco, on the N. by Verapaz and Honduras, on the E. by Nicaragua, and on the S. by the fouth rea. St Jago de Guatimala is the capital of the whole audience.

Guatimala, a large and rich town of North A-
merica, in New Spain; and capital of a government Guatimal: of the fame name, with a bifhop's fee, and an univerfity. It earries on a great trade, efpecially in choco$\underbrace{\text { Gudgeon }}$ late. W. Long. 9I. 30 . N. Lat. $14^{\circ} 0$.

Gautimala(the Volcano of), is a mountain; which throws out fire and fmoke. St Jago de Gautimala was almoft ruined by it in 154 I . It was afterwards rebuilt at a good diftance from this dreadful mountain. A few years ago, however, it was again deftroyed, with circumftances more terrible perhaps than any mentioned in hiftory.

GUAVA, in betany. See Psidiunt.
GUAXACA, a province of North America, in New Spain, which is very fertile in wheat, Indian corn, cochineal, and caflia. It is bounded by the gulph of Mexico on the north, and by the fourh fea on the fouth. It contains mines of gold, filver, and cryftal. Guaxaca is the capital town.

Guaxaca, a town of North America, in the Audence of Mexico, and capital of the province of the fame name, with a binhop's fee. It is without walls, and does not contain above 2000 inhabitants; but it. is rich, and they make very fine fweet meats and chocolate. It has feveral rich convents, both formen and women. W. Long. IoO. N. Lat. 17. 45 .

GUAYRA, a diftrict of the province of La Plata, in South America, having Brafil on the eaft, and Paraguay on the weft.
GUBEN, a handfome town of Germany, in Lower Lufatia, feated on the river Neiffe, and belonging to the houfe of Sax-Merfenburg. E. 14. 59. N. Lat. 51. 55 .

GUBER, a kingdom of Africa, in Negroland. It is furrounded with high mountains; and the villages, which are many, are inhabited by people who are employed in taking care of their cattle and cheep. There are alfo abundance of artificers, and linen-weavers, who fend their commodities to Tombuto. The whole country is overflowed every yearby the inundations of the Niger, and at that time the inhabitants fow their rice. There is one town which contains $t$ moft 6000 families, among whom are many merchants.

GUBIO, a town of ltaly, in the territory of the church, and in the duchy of Urbino, with a bihop's fee. E. Long. 12.4I. N. Lat. 43. 18.

GUDGEON, in ichthyology ; a fpecies of cypri. mus. See Cyprinus.

This fifh, though fmall, is of fo pleafant à tafte, that it is very litte inferior to fmelt. They pawn twice in the fum, ner-feafon; and their feeding is much like the barbels in ftıeams and on gravel, flighting all manner of flies : but they are eafily taken with a fmall red worm, fifhing near the ground; and being a leathermouthed filh, will not eafily get off the hook when ftruck.-The gudgeon may be fifhed for with float, the hook being on the ground; or by hand, with a running line on the ground, without cork or float. But although the fmall red worm abovementioned is the beft bait for this fifh, yetwafps, gentles, and cadbaits will do very well. You may alfo fifh for gudgeons with two or three hooks at once, and find very pleafant fport, where they rife any thing large. When you angle for them; ftir up the fand or graval with a long pole; this will make them gather to that place, bite fafter, and with more eagernefs.

GUELPHS, or GUElfs, a celebraced fation in Italy, antagonifts of the Gibelins. Sec Gibelins.

The Guelphs and Gibelins filled Italy with blood and carnage for many years. The Guelphs ftood for the Pope, againft the emperor. Their rife is referred .by fome to the time of Conrad III. in the twelfth century; by others, to that of Frederic I. ; and by others, to that of his fucceffor Frederic II. in the thirteenth century.

The name of Guelph is commonly faid to have been formed from ${ }^{W}$ elfe, or $W e$ elfo, on the following occalionn : the emperor Conrad lil. having taken the duchy of Bavaria from Welfe VI. brother of Henry duke of Bavaria, Welfe, affifted by the forces of Roger king of Sicily, made war on Conrad, and thus gave birth to the faction of the Guelfs.

Others derive the name Cuelfs from the Gernan Wolf,on account of the grievous evils committed by that cruel faction: others deduce the denomination from that of a German called Guelfe, who lived at Pifloye; adding, that his brother, named Gibel, gave his name to the Gibelins: See the article Gibelins.

GUELDERLAND, one of the united provinces, bounded on the W. by Utrecht and Holland, on the E. by the bilhopric of Munfter and the duchy of Cleves, on the N. by the Zuyder fea and Overyffel, and on the $S$. it is feparated from Brabant by the Maes. Its greateft extent from N . to S . is about 47 miles, and from W. to E. near as much; but its figure is very irregular. The air here is much healthier and clearer than in the maritime provinces, the land lying thigher. Excepting fome part of what is called the $V$ eluwe, the foil is fruitful. It is watered by the Rhine, and its three branches, the Wahal, the Yffel, and the Leck, befides leffer ftreams. In Io79, it was raifed to a county by the emperor Henry IV. and in 1339 to a duchy by the emperor Lonis of Bavaria. It had dukes of its own till 1528, when it was yielded up to the emperor Charles V. In 1579, it acceded to the union of Utrecht. It is divided into three diffricts, each of which has its frates and diets. Thofe for the whole province are held twice a-year at the capital towns. The province fends 19 deputies to the fatesgeneral. Here are computed 285 Calvinift minifhers, I4 Koman Catholic congregations, 4 of the Lutheran perfuafion, befides 3 others of Remonftrants and Anabaptifts. The places of moft note are Nimeguen, Zutphen, Arnheim, Harderwyk, Loo, \&c.

GUELDRES, a ftrong town of the Netherlands, in the duchy of the fame name. It was ceded to the king of Pruffia by the peace of Utrecht, and is feated among marhes. E. Long. 6. 21. N. Lat. 51. jo.
gUERCINO. See Barbieri.
GUERICKE, or GUERIChE, (Otho), the moft celebrated mathematician of his time, was born in 1602. He was the inventor of the air pump; and author of feveral works in natural philofophy, the chief of which is Experimenta Magdeburgica. He died in 1686.

GUERNSEY, an ifland in the Englih channel, on the coaft of Normaridy, fabject to Britain ; but (as well as the adjacent inands) governed by its own laws. See Jersey. It extends from eaft to weft in the form of a harg, and is thirteen miles and a half fron the
fouth-weft to north-eaft, and twelve atd a half, where Gurtarin, broadeft, from eafl to weft. The air is very healthy, Guana. and the foil naturally more rich and fertile than that of Jerfey; but the inhabitants neglect the cultivation of the land for the fake of commerce : they are, however, fufficiently fupplied with corn and cattle, both for their own ule and that of their fhips. The illand is well fortified by nature with a ridge of rocks, one of which abounds with emery; ufed by lapidaries in the polifhing of fones, and by various other artificers. Here is a better harbour than any in Jerfey, which occafions its being more reforted to by merchants; and on the fouth fide the flore bends in the form of a crefcent, enclofing a bay capable of receiving very large thips. The illand is full of gardens and orchards ; whence cyder is fo plentiful, that the common people ufe it inttead of fnall-beer, but the more wealthy drink French wine.

GUETTARDA, in botany: A genus of the heptandria order, belonging to the noneecia clafs of plants; and in the natural method ranking under the 38th order, Tricocca. The male calyx is cylindrical; the corolla cleft into feven parts, and funnel-fhaped. The female calyx cylindrical ; the corolla cleft into feven parts; one pilitil, and the fruit a dry plum.
GUIANA, a large country of South America, is bounded on the eaft and north by the Atlantic ocean, and the river Oroonoko; on the fouth, by the river of the Amazons ; and on the weft, by the provinces of Grenada and New-Andalufia, in Terra-Firma, from which it is feparated both on the weft and north by the river Oroonoko. It extends above 1200 miles from the north-eaft to the fouth-weft, that is, from the mouth of the river Oroonoko to the mouth of the river of Amazons, and near 600 in the contrary direction.

Moft geographers divide it into two parts, calling the country along the coaft Carribbeano Proper, and the interior country Guiana Proper: the laft is alfo ftyled El Dorddo by the Spaniards, on account of the immenfe quantity of gold it is fappofed to contain.

The Portuguefe, French, and Dutch, bave all fettlementsalong the coaft. What lies fouth of Cape North belongs to the firft of thefe nations; the coaft between Cape North and Cape Orange is poffefled by the natives ; French Guiana, Old Cayenne, or Equinoctial France, extends from Cape Orange, about 240 miles along the coaft, to the river Marani; where the Dutch territory begins, and extends to the mouth of the Oroonoko.

Along the coaft, the land is low, marfly, and fubject to inundations in the rainy feafon, from a multitude of rivers which defcend from the inland nooutains. Hence it is, that the atmofphere is fuffocating, hot, moift, and unhealchful, efpecially where the woods have not been cleared away. Indeed, the Europeans are forced to live in the moft difagreeable fituations, and fix their colonies at the mouths of the rivers, amidft ftinking marthes, and the putrid ooze of falt moraffes, for the conveniency of exportation and importation.
"Dutch Guiana (according to an account lately publifhed by a gentleman who refided feveral years at Surinam as a phyfician) was firf difcovered by Columbus in 1498 . It lies between the $7^{\circ}$ of north

## G U I

Guiana. and the $5^{\circ}$ of fonth latitude, and between the $53^{\circ}$ and 60 of longitude weft from Londen. It is bounded on the north and eaft, by the Atlantic; on the weft, by the rivers Oroonoko and Negro; and on the fouth, by the river of Amazons.
" It is now divided between the Spaniards, Dutch, French, and Portuguefe; but, except its fea-coaft, and lands adjacent to its rivers, it has hitherto remained unknown to all but its original natives; and even of thefe, it is only the Dutch territories that foreigners have any knowledge of; for thofe of the Spaniards, French, and Portuguefe, are inacceffible to them.
" This country, on account of the diverfity and fertility of its foil, and of its vicinity to the equator, which paffes through it, affords almoft all the productions of the different American countries between the tropics, befides a variety peculiar to itfelf."

Dutch Guiana was formerly the property of the Englifh, who made fettlements at Surinam, where a kind of corrupt Englifh is Itill fpoken by the negroes. The Dutch tookit in the reign of Charles the Second; and it was ceded to them by a treaty in 1674, in exchange for what they had poffeffed in the province. now flate of New-York.

The land for 50 miles up the country from the feacoaft is flat; and during the rainy feafons, covered twe feet high with water. This renders it inconceivably fertile; the earth, for 12 inches deep, being a ftratum of perfect manure : an attempt was once made to carry fome of it to Barbadoes ; but the wood-ants fo much injured the veffel, that it never was repcated. The exceffive richnefs of the foil is a difadvantage, for the cancs are too luxuriant to make good fugar ; and therefore, during the firft and fecond crop; are converted into rum.

There are fome trees on this part; bat they are fmall and low, confifting chiefly of a fmall fpecies of palm, intermixed with a leaf near 30 feet long and three feet wide, which grows in clufters, called a Troclie; and, at the edges of running-water, with mangroves.

Farther inward, the country rifes; and the foil, though fill fertile, is lefs durable. It is covered wirh forefts of valuable timber, that are always green; and there are fome fandy hills, though no mountains; in the French territories, however, there are mountains, according to the report of the Indians, for they have never been vifited by any other people.

In this commtry the heat is feldom difagreeable : the trade-winds by day, the land breezes in the evening, and the invariable length of the nights, with gentle dews, refrefh the air, and render it temperate and falubrious. There are two wet feafons and two dry, of threc months each, in every year ; and, during more than a month in each wet feafon, the rain is inceflant. The dry feafons cummence fix weeks before the equinoxes, and continue fix weeks after. The wet feafons are more wholefome than the dry, becaufe the rains keep the waters that cover the low lands, next the fea, frefl and in motion; but during the dry feafon it ftagnates, and, as it waftes, becomes putrid, fending up very unwholefome exhalations. Bloffoms, green and ripe fruit, are to be found upon the fame tree in every part of the year. There are
fome fine white and red agates in Guiana, which remain untouched; and mines of gold and filver, which the Dutch will not fuffer to be wrought.

The inhabitants of Guiana are either natives, who are of a reddifh brown; or negroes and Europeans; or a mixed progeny of thefe in various combinations. The natives are divided into different tribes; more or lefs enlightened and polifhed, as they are more or lefs remote from the fettlement of the Europeans. They allow polygamy, and have no divifion of lands. The men go to war, hunt, and fifh ; and the women look after demeftic concerns, fpin, weave in their fafhion, and manage the planting of caffava and manive, the only things which in this country are cultivated by the natives. Their arms are bows and arrows; fharp poifoned arrows, blown through a reed, which they ufe in hunting; and clubs made of a heavy wood called Iron-wood. They eat the dead bodies of thofe that are flain in war; and fell for llaves thofe they take prifoners; their wars being chiefly undertaken to furnifh the European plantations. All the different tribes go naked. On particular occafions they weas caps of feathers; but, as cold is wholly unknown, they cover no part but that which diftinguifhes the fex. They are cheerful; humane, and friendly; but timid; except when heated by liquor, and drukenuefs is a very common vice among them.

Their houfes confift of four ftakes fet up in a quadrangular form, with crofs poles, bound together by fit nibbees, and covered with the large leaves called trocelics. Their life is ambulatory; and their houfe, which is put up and taken down in a few hours, is all they have to carry with them. When they remove from place to place, which, as they inhabit the banks of rivers, they go by water in fmall canoes; a few veffels of clay made by the women, a flat ftone on which they bake their bread, and a rough fone on which they grate the roots of the caffava, a hammock and a hatchet, are all their furniture and utenfils; molt of them, however, have a bit of a looking-glafs framed in paper, and a comb.

Their poifoned arrows are made of fplinters of a hard heavy wood, called cacario; they are about 12 inches long, and fomewhat thicker than a coarfeknitting needle: one end is formed into a fharp point; round the other is wound fome cotton, to make it fit the bore of the reed through which it is to be blown. They will blow thefe arrows 40 yards wirh abfolnte certainty of hitting the mark, and with torce enongh to draw blood, which is certain and immediate death. Againft this poifon no antidote is known. The Indians never ufe thefe poifoned arrows in war, but!in hunting only, and chiefy againft the monkies; the flefh of an animal thus killed may be fafely eaten, and even the poifon itfelf fwallowed with impunity.

GUIAQUIL, a town, bay, and harbour of South America, in Peru, and capital of an audience of the fame name. W. Long. $76 \div 55$. S. Lat. 2 . 0.

GUIARA, a fea-port town of Sonth-America, and on the Caracca coaft. The Englim attempted to take it in 1739 and 1743 ; but they were repulfed both times. W. Long. 66. 5. N. Lat. 10. 35 .

GUICCIARDINI (Francifco), a celebrated hiftorian, born at Florence in 1482 . He profeffed the civil law with reputation, and was employed in feve-

## G U I [ $\left.176{ }^{\circ}\right]$

Guicciar- yal embaffies. Leo $X$. gave him the government of dimi

Modena and Reggio, and Clement VII. that of Romagna and Bologna. Guicciardini was alfo lieute-nant-general of the pope's army, and diftinguifhed
himfelf by his bravery on feveral occafions; but Paul III. having taken from him the government of Bologua, he retired to Florence, where he was made counfellor of ftate, and was of great fervice to the houfe of Medicis. He at length retired into the country to write the hiftory of Italy, which he compofed in Italian, and which comprehends what paffed from the year 1494 to 1532 . This hiftory is greatly ef. teemed; and was continued by John Baptift Adriani, his friend. He died in 1540 .

Guicciardini (Lewis), his nephew, compofed a biftory of the Low Countries, and memoirs of the affairs of Europe, from 1530 to 1560 . He wrote with great firit againh the perfecution of the duke D'Alva, for which he imprifoned him. Died in 1583.

GUIDES, in military language, are ufually the country people in the neighbourhood of an encampment; who give the army intelligence concerning the country, the roads by which they are to march, and the probable route of the enemy.

GUIDI (Alexander), an eminent Italian poet, born at Pavia in 1650 . Having a defire to fee Rome, he there attracted the notice of queen Chriltina of Sweden, who retained him at her court ; he befide obtained a confiderable benefice from pope Innocent XI. and a pention from the duke of Parma. For a good office he did the ftate of Milan with prince Eugene, he was enrolled among the nobles and decurions of that cown; and died in 1712 . Nature had been kinder to his intellects than to his exterior form; his body was fimall and crooked, his head was large, and he was blind of this right eye. A collection of his works was publifhed at Verona in 1726.

GUIDO Aretin.-See Aretin.
Guido (Reni), an illuftrious Italian painter, born at Bologna in 1595 . In his early age he was the difciple of Dennis Calvert, a Flemifh mafter of good reputation; but afterwards entered himfelf in the fchool of the Carraci. He firit imitated Ludovico Carracci ; but fixed at laft in a peculiar ftyle of his own, that fecured him the applanfe of his own time and the admiration of posterity. He was much hohoured, and lived in fplendor: but an unhappy attachment to gaming ruined his circumftances; the refiection of which brought on a languihing diforder, that put an end to his life in 1642 . There are feveral defigns of this great mafter in print, etched by himself.

GUIDON, a fort of flag or ftandard borne by the king's life-guard; being broad at one extreme, and almoft pointed at the other, and flit or divided into two. The guidon is the enfign or flag of a troop of horfeguards. See Guard.

Guidon alfo denotes the office who bears the gaidons. The guidon is that in the horfe-guards which the enfign is in the foot. The guidon of a troop of horfe takes place next below the cornet.

Guidons, guidones, or fchola guidonum was a company of pricfts eftablifhed by Charlemagne, at Rome, to conduct aud guide pilgrims to Jerufalem, to vifit
the holy places: they were alfo to affift them in cafe they fell fick, and to perform the laft offices to them in cafe they died.

GUIENNE, the largeft province of France, bound ed on the north by Saintogne, Angoumois, and Limolin ; on the eaft by Limofin, Auvergne, and Languedoc; on the fouth by the Pyrences, Lower NaVarre, and Bearn ; and on the weft by the ocean. It is about 225 miles in length, and 200 in breadth. It is divided into the Upper and Lower. The Upper comprehends Querci, Rouergue, Armagnac, the territory of Comminges, and the county of Bigorre. The Lower contains Bourdelois, Perigord, Agenois, Condomois, Bazadois, the Lander, Proper Gafcony, and the diftrict of Labour. The principal rivers are, the Garonne, the Adour, the Tarn, the Aveiron, and the Lot. Bourdeaux is the capital town.

GUILANDINA, the nickar tree: A genus of the monygynia order, belonging to the decafdria clafs of plants; and in the natural method ranking under the 33d order, Lomentacere. The calyx is monophyllous and falver-hhaped; the petals, inferted into the neck of the calyx, nearly equal. The feed-veffel a legumen.

Species. 1. The bonduc, or yellow nickar. 2. The bonducella, or gray nickar. Thefe are climbing plants, natives of theW eft-Indies, where they rife to the height of twelve or fourteen feet: the flowers come out at the wings of the ftalks; and are compored of five concave yellow petals. They are fucceeded by pods about three inches long and two broad, clofely armed with flender fpines, opening with two valves, each inclofing two hard feeds about the fize of childrens marbles, of a yellowifh colour. 3. The moringa, or morunga nickar, is a native of the ifland of Ceylon, and fome places on the Malabar coaft. It rifes to the height of 25 or 30 feet, having flowers produced in loofe bunches from the fide of the branches, and cormpored of an unequal number of petals.

Culture and UJis. Thefe plants being natives of warm climates, require to be kept through the winter in a ftove in this country. They are propagated by feeds; but thofe of the firft fort are fo hard, that unlefs they are foaked two or three days in water before they are put into the ground, or placed under the pots in the tan-bed to foften their covers, they will remain for years without vegetaring.-The roots of the third fort are fcraped when young, and ufed by the inhabitants of Ceylon and Malabar as thofe of horfe-radihh are in Europe. The wood dyes a beautiful blue colour. It is the lignum rephriticusn, or nephritic wood, of the difpenfatories; and is brought over in large, compac, ponderons pieces, withour knots, of a whitifh or pale yellow colour on the outfide, and dark coloured or reddifh within ; the bark is ufually rejected. This wood imparts to water or re\&ified fpirit a deep tincture; appearing, when placed between the eye and the light, of a golden colour ; in other fituations blue : pieces of another wood are fometimes mixed with it, which give only a yellow colour to water. The nephritic wood has fcarce any fmell, and verylittle tafte. It ftands recommended in difficulty of urine, nephritic complaints, and all diforders of the kidneys and urinary palages; and is faid to have this peculiar

Guild advantage, that it does not, like the warmer diuretics, heat or offend the parts. Practitioners, however, have not found thefe virtues warranted by experience.

GUILD, (from the Saxon guildan, to "pay"), fignifies a fraternity or company, becaufe every one was gildare, i. e. to pay fomething towards the charge and fupport of the company. As to the original of there guilds or companies: It was a law among the Saxons, that every freeman of fourteen years of age flould find fureties to keep the peace, or be committed : upon which certain neighbours, confifting of ten families, enter into an affociation, and become bound for each other, either to produce him who committed an offence, or to make fatisfacion to the injured party : that they might the better do this, they rafed a fum of money among themfelves, which they put into a common ftock; and when one of their pledges had committed an offence, and was fled, then the other nine made fatisfaction out of this fock, by payment of money according to the offence. Becaufe this affociation confifted of ten families, it was called a decennary: and from hence came out later kinds of fraternities. But as to the precife time when the fe guilds had their origin in England, there is nothing of certainty to be found ; lince they were in ufe long before any formal licence was granted to them for fuch meetings. It feems to have been about the clofe of the eleventh century, fays Anderion, in his Hiftory of Commerce, vol.i. p. 70, that merchant-guilds, or fraternities, which were afterwards ftyled corporations, came firft intogeneral ufe in many parts of Europe. Mr Madox, in his Firma Burgi, chap. i. § 9. thinks, they were hardly known to our Saxon progenitors, and that they might be probably brought into England by the Normans; although they do not feem to have been very numerous in thofe days. The French and Normans might probably borrow them from the free cities of Italy, where trade and manufactures were much earlier propagated, and uhere poffibly fuch communities were firft in ufe. Thefe guilds are now companies joined together, with laws and orders made by themfelves, by the licence of the prince.

Guild, in the royal boroughs of Scotland, is fill ufed for a company of merchants, who are freemen of the borough. See Borough.

Every royal borough has a dean of guild, who is the next magiftrate below the bailiff. He judges of controverfies among men concerning trade; difputes between inhabitants toaching buildings, lights, wa-ter-courfes, and nuifances; calls courts, at which his brethren of the guild are bound to attend; manages the common ftock of the guild; and amerces and collects fines.

Guidid, Gild, or Geld, is alfo ufed among ancient writers, for a compenfation or mulf, for a fault committed.

Guild-Hall, or Gild. Hall, the great court of judicature for the city of London. In it are kept the mayor's court, the fheriff's court, the court of hultings, court of confcience, court of common-council, chamberlain's court, \&c. Here alfo the judges fit upon nifi prius, \&c.

GUILDFORD, or GUideford, a borough-town of Surry, fituated on the river Wye, thirty one miles fouth-welt of London. Near it are the ruinous walls Vox. VIII.
of an old cafle, this having been in the Saxon times 'Guildford a royal villa, where many of the kings ufed to pals the feftivals. Here is a cerporation contifting of a mayor, Guinca. recorder, aldermen, \&c. which fent members to parliament ever fince parliament had a being. The great road from London to Chichefter and Portfinouth lies through this town, which has always been famous for good inns, the cleaneft of linen, and other excellent accomodations; and the affizes are often held herc. Its manufactory formerly was cloth, of which there are ftill fome fmall remains. Here is a fchool founded by king Edward VI. alfo an almhoufe endowed with lands worth 3001 . a.year, of which rool. to be employed in fetting the poor at work, and the other 200 l . for the maintenance of a manter, 12 brethren, and 8 fifters, who are to have 2s. 6d. a-week. There are, befides, two charity fchools for 30 boys and 20 girls. There were three churches in this town, but one at then fell down in April 1 740. There is a fine circu* lar courfe for horfe-matches, which begin when the Newmarket races are ended. King William III. founded a plate of 100 guineas to be run for here every May, and ufed to honour the race with kis prefence, as did once king George I. The riverWey is made navigable to the town, and by it a great quantity of timber is carried to London, not only from this neighbourhood, but from Suffex and Hampflire woods, above 30 miles off, from whence it is brought hither in the fumner by land carriage. This navigation is alfo of great fupport to Farnhain market, corn bought there being lirought to the mills on this river within feven miles diftance, and, after being ground and dreffed, is fent down in barges to London. The road from hence to Farnham is very remarkable, for it runs along upon the ridge of a high chalky hill, called St Catharine's, no wider than the road itfelf, from whence there is an extenfive profpect, viz. to the N. and N. W. over Baghot-Heath, and the other way intu Suffex, and almof to the South Down. The town fends two members to parliament; and gives title of earl to the North family.

GUILLEMOT, in ornithology. See Colymbus.
GUILLIM, (John), of Wellh extraction, was born in Herefordhire, about the year 1565 . Having completed his education at Brazen-nofe college, Oxford, he became a member of the college of arms in London; and was made rouge croix purfuivant, in which port he died in 1621. He publifhed, in 1610, a celebrated work, intitled t's Difplay of Heraldry, folio, which has gone through maty editions. Tothe fifth, which came out in 1679, was added A treatife of honor civil and military, by captain John Loggan.

GUINEA, a large traet of country lying on the weff fide of the contine wit of Africa, extends along the coaft three or four thoufand miles, beginning at the river Senegal, fituated about the 17 th degree of north latitude (being the neareft par of Guinea as well to Europe as to North-America). From that river to the river Gambia, and in a foutherl courfe to Cape Sierra Leona, is comprehended a coaft of about 700 miles; being the fame traet for which Queen Elizabeth granted charters to the firft traders to that coaft. From Sierra Leona, the land of Guinea takes a turn to the eaftward, extending that courfe about 1500 miles, including thofe feveral divifions known by the names of the Grain Coaft, the Ivory Coaft, the Gold Coaff, and the

Y
Slave

## G U I [ 178 ] G U I

Guinea. Slave Coaft, with the large kingdom of Benin. From thence the land runs fouthward along the coaft about 1200 miles, which contains the kingdoms of Congo and Angola; where the trade for flaves ends. From which to the fouthermolt cape of Africa, called the Cape of Good Hope, the councry is fettled by Caffres and Hottentots, who have never been concerned in the making or felling flaves.

1. Of the parts which are abovementioned, the firft is that fituated on the great river Senegal, which is faid to be navigable more than 1000 miles, and is by travellers defcribed to be very agreeable and fruitful. Mr Brue, principal factor for the French African company, who lived 16 years in that country, after defcribing irs fruitfulnefs and plenty near the fea, adds*, "The farther you go from the fea, the country on the river feems the more fruitful and well improved, abounding with Indian corn, pulfe, frait, \&c. Here are valt meadows, which feed large herds of great and fmall catte, and poultry numerous : the villages that lie thick on the river, flow the country is well peopled." The fame author, in the account of a voyage he made up the river Gambia, the mouth of which lies about 300 miles fouth of the Senegal, and is navigable about 600 miles up the country, fays, "that he was furprized to fee the land fo well cultivated; farce a fpot lay unimproved; the low lands divided by fmall canals were all fowed with rice, \&c. the higher ground planted with millet, Indian corn, and peafe of different forts; their beef excellent; poultry plenty and very cheap, as well as all other neceffaries of life." Mr Moor, who was fent from England about the year 1735, in the fervice of the African company, and refided at James Fort on the river Gambia, or in other factories on that river, about five years, confirms the above account of the fruiffulnefs of the country. Captain Smith, who was fent in the year 1726 by the African company to furvey their fettlements throughout the whole coalt of Guinea, fayst, "the country about the Gambiais pleafant and fruifful; provifions of all kinds being plenty and exceeding cheap." The country on and between the two abovementioned rivers is large and extenfive, in- babited principally by thofe three negroe nations known by the name of Falofs, Fulis and Mandingos. The jalofs pofefs the middle of the country. The Fulis principal fettlement is on both fides of the Senegal: great numbers of thefe people are alfo mixed with the Mandingos, which laft are mofly fettled on both fides the Gambia. The government of the Jalofs is reprefented as ouder a better regulation than can be expected from the common opinion we entertain of the negroes. We are told in Aftley's Collection, "That the king has under him feveral minifters of ftate, who affint him in the exercife of juftice. The grand Jerafo is the chief juftice through all the king's dominions, and goes in circuit from time to time to hear complaints and determine controverfies. The king's treafurer exercifes the fame employment, and has under him alkairs, who are governors of towns or villages. That the kondi, or viccroy, goes the circuit with the chief juftice, both to hear caufes and infpect into the behaviour of the alkadi, or chief magiftrate of every village in their feveral diffricts." Vafconcelas, an author mentioned in the Collection, fays,
"the ancienteft are preierred to be the prince's coum" fellors, who keep always about his perfon; and the men of mont judgment and experience are the judges." The Fulis are fettled on both fides of the river Senegal: their country which is very fruitful and populoas, extends near 400 miles from eaft to welt. They are generally of a deep tawney complexion, appearing to bear fome affinity to the Moors, whofe country they join on the north: they are good farmers, and make great harvelts of corn, cotton, tobacco, \&c. and breed great numbers of cattle of all kinds. But the moft particular account we have of thefe people is from Moore, who fays*, "Some of thefe Fuli blacks, * Travels who dwell on both fides the river Gambia, are in fub- into difant jection to the Mandingos, amongft whom they dwell, parts of having been probably driven out of their country by Africa, war or famine. They liave chiefs of their own, wha $\mathbf{p}$. 198. rule with much moderation. Few of them will drink brandy, or any thing ftronger than water and fugar, being ftrict Mahometans. Their form of government goes on eafy, becaufe the people are of a good quier difpolition, and fo well inftructed in what is right, that a man who does ill is the abomination of all, and none will fupport him againft the chief. In thefe countries the natives are not covetons of land, defiring no more than what they ufe; and as they do not plough with horfes and cattle, they can ufe but very little; therefore the kings are willing to give the Fulis leave to live in their country and cultivate their lands. If any of their people are known to be made flaves, all the Fulis will join to redeem them; they alfo fapport the old, the blind, and lame, amongft themfelves; and as far as their abilities go, they fupply the neceffities of the Mandingos, great numbers of whom they have maintained in famine." The author, from his own obfervations, fays, "They were rarely angry, and that he never heard them abufe one another."

The Mandingos are faid by Mr Brue before mentioned, " to be the moft numerous nation on the Gambia, befides which, numbers of them are difperfed over all thefe countries; being the moft rigid Mahometans amongft the negroes, they drink neither wine nor brandy, and are politer than the other negroes. The chief of the trade goes through their hands. Many are induftrious and laborious, keeping their ground well cultivated, and breeding a good fock of cattle $\dagger$. Every town has an alkadi, or governor, $\dagger$ Afley's: who has great power; for moft of them having two Colleeg. common fields of clear ground, one for curn, and the p. 296: other for rice, the alkadi appoints the labour of all the people. The men work the corn ground, and the women and girls the rice ground ; and as they all equally labour, fo he equally divides the corn amongf them; and in cafe any are in want, the others fupply them. This alkadi decides all quarrels, and has the firft voice in all conferences in town affairs." Some of thefe Mandingos, who are fettled at Galem, far up the river Senegal, can read and write Arabic tolerably; and are a good hofpitable people, who carry on a trade with the inland nations. "They are extremely populous in thofe parts, their women being fruitful, and they not fuffering any perfon amongit them, but fach as are guilty of crimes, to be made ilaves." We are told from Jobfon, "That the Mahometan Negroes fay their prayers thrice a day. Each village

## G U I

Guinea. has a prieft who calls them to their duty. It is furprizing (fays the author), as well as commendable, to fee the modefty, attention, and reverence they obferve during their worfhip. He alked fome of their prietts the purport of their prayers and ceremonies; their anfwer always was, "that they adored God by proftrating themelves before him : that by humbling themfelves, they acknowledged their own infignificancy, and farther intreated him to forgive their faults, and to grant them all good and neceifary things, as well as deliverance from evil." Jobfon takes notice of feveral good qualities in thefe negro priefts, "particularly their great fobriety. They gain their livelihood by keeping fchool for the education of the children. The boys are taught to read and write. They not only teach fchool, but rove about the country, teaching and inftructing, for which the whole country is open to them; and they have a free courfe through all places, though the kings may be at war with one another.

The three fore-mentioned nations pracife feveral trades, as fmiths, potters, fadlers, and weavers. Their fmiths particularly work neatly in gold and filver, and make knives, hatchets, reaping hooks, fpades, and fhares to cut iron, \&c. Their potters make neat tobacco pipes, and pots to boil their food. Some authors fay that weaving is their principal trade : this is done by the women and girls, who fpin and weave very fine cotton cleth, which they dye blue or black. Moore fays, the Jalofs particularly make great quantities of the cotton cloth; their pieces are generally 27 yards long, and about nine inches broad, their looms being very narrow; thefe they few neatly together, fo as to fupply the ufe of broad cloth.

It was in thefe parts of Guinea that M. Adanfon, correfpondent of the Royal Academy of Sciences at Paris, was employed from the year 1749 to the year 1753, wholly in making natural and philofophical obfervations on the country about the rivers Senegal and Gambia. Speaking of the great heats in Senegal,
$\ddagger$ Voyage to he fay $\ddagger \ddagger$, "it is to them that they are partly indebt-
Senegal, \&c. ed for the fertility of their lands : which is fo great, p. 308.
that, with little labour and care, there is no fruit nor grain but grows in great plenty."

Of the foil on the Gambia, he fays, "it is rich and deep, and amazingly fertile ; it produces fontaneoufly, and almoft without cultivation, all the neceffaries of life, grain, fruit, herbs, and roots. Every thing matures to perfection, and is excellent in its kind." One thing which always furprized him, was the prodigions rapidity with which the fap of trees repairs any lofs they may happen to fuftain in that country ; "And I was never (fays he) more aftonifhed, thanwhen landing four days after the locufts had devoured all the fruits and leaves, and even the buds of the trees, to find the trees covered with new leaves, and they did not feem to me to have fuffered much." "It was then (fays the fame author) the fifh feafon; you might fee them in hoals approaching towards land. Some of thofe floals were 50 fathoms fquare, and the fifh crowded together in fuch a manner, as to roll upon one another, without being able to fwim. As foon as the negroes perceive them coming towards land, they jump into the water with a baiket in one hand, and fwim with the other. They need only to plunge
and to lift up their bafket, and they are fure to return Guinea. loaded with fifh." Speaking of the appearance of the country, and of the difpofition of the people, he fays, " which way foever I turned mine eyes on this pleafant fpor, I beheld a perfect image of pure nature ; an agreeable folitude, bounded on every fide by charming landfcapes; the rural fituation of cotrages in the midft of trees; the eafe and indolence of the negroes, reclined under the fade of their fpreading foilage, the fimplicity of their drefs and manners; the whole revived in my mind the idea of our firft parents, and 1 feemed to contemplate the world in its primitive fate. They are, generally fpeaking, very good-natured, fociable, and obliging. I was not a little pleafed with this my firf reception ; it convinced me, that there ought to be a confiderable abatement made in the accounts I had read and heard every where of the favage character of the Africans. I obferved, both in the negroes and Moors great humanily and fociablenefs, which gave me ftrong hopes that I fhould be very fare amongit them, and neet with the fuccers I defired in my inquiries after the curiolities of the country." He was agreeably amufed with the converfation of the negroes, their fables, dialogues, and witty fories with which they entertain each other alternately, according to their cuftom. Speaking of the remarks which the natives made to him with relation to the fars and planets, he fays, "it is amazing, that fuch a rude and illiterate people fhould reafon fo pertinently in regard to thofe heavenly bodies; there is no manner of doubt; but that with proper inftruments, and a good will, they would become excellent aftronomers."
2. That part of Guinea known by the name of the Grain and Ivory Coaft, extends about 500 miles. The foll is faid to be in general fertile, producing abundance of rice and roots, indigo and cotton thrive without cultivation, and tobacco would be excellent if carefully manufactured; they have fin in plenty; their flocks greatly increafe; and their trees are loaded with fruit. They make a cotton cloth, which fells well on the coaft. In a word, the country is rich, and the commerce advantageous, and might be greatly augmented by fuch as would cultivate the friendfhip of the natives. Thefe are reprefented by fome writers as a rude, treacherous people; whilft feveral other authors of credit give them a very different character, defrribing them as fenfible, courteous, and the faireft traders on the coaft of Guinea. In the Collection, they are faid + to be averfe to drinking to excefs, and fuch + Vol, iin as do are feverely punifhed by the king's order. On p. 560 . inquiry why there is fuch a difagreement in the chaacter given of thefe people, it appears, that tho' they are naturally inclined to be kind to ftrangers, with. whom they are fond of trading, yet the frequent injuries done them by Europeans have occafioned their being fufpicious and fhy : the fame caufe has been the occafion of the ill treat ment they have fometimes given to innocent ftrangers, who have attempted to trade with then. As the Europeans have no fettlement on this part of Gainea, the trade is carried on by fignals from the fhips, on the appearance of $x$ hich the natives ufually come on board in their canoes, bringing their gold-daft, ivory, \&c. which has given opportunity to fome villanous Europeans to carry them off with their effects, or retain them on board till a ran-

## G U I

Guinea.

fom is paid. It is noted by fome, that fince the European voydgers have carried away feveral of thefe people, their miftruft is fo great, that it is very difficult to prevail on them to come on board. Smith remarks, "As we paft along this coalt, we very often lay before a town, and fired a gun for the natives to come off; but no foul came near us: at length we learnt by fome hips that were trading down the coaft, that the natives came feldom on board an Englifh fhip, for fear of being detained or carried off: yet at laft fome ventured on board; but if thefe chanced to fpy any arms, they would all immediately take to their canoes, and make the beft of their way home. They had then in their poffeffion one Benjamin Crofs, the mate of an Englifh veffel, who was detained by them to make reprifals for fome of their men, who had formerly been carried away by fome Englifh veffel." In the Collection we are told, "This villanous cuftom is too often practifed, chiefly by the Briftol and Liverpool hips, and is a great detriment to the flave trade on the windward coaft." John Snock, mentioned in Bofman $\ddagger$, when on the coaft, wrote, "We caft anchor, but not one negro coming on board, I went on hore ; and after having ftaid a while on the ftrand, fome negroes came to me; and being defirous to be informed why they did not come on board, I was anfwered, that about two months before, the Englifh had been there with two large veffels, and had ravaged the country; deftroyed all their canoes, plundered their houfes, and earried off fome of their people, upon which the remainder fled to the inland country, where moft of them were at that time; fo that there being not much to be done by us, we were obliged to return on board. When I inquired after their wars with other countries, they told me they were not often troubled with them; but if any difference happened, they chofe rather to end the difpute amicably than to come to arms. $\dagger$ " He found the inkabitants civil and good na-
tured. Speaking of the king of Rio Seftro, lower down the coaft, he fays, "He was a very agreeable, oblig. ing man; and all his fubjects are civil, as well as very laborious in agriculture and the purfuits of trade." Marchais $\ddagger$ fays, " That though the country is very populous, yet none of the natives (except criminals) are fold for flaves." Valliant never heard of any fettlement being made by the Europeans on this part of Guinea; and Smith remarks§, "That there coafts, which are divided into feveral little kingdoms, and have feldom any wars, is the reafon the flave trade is not fo good here as on the Gold and Slave Coaft, where the Europeans have feveral forts and factories." A plain evidence this, that it is the intercourfe with the Europeans, and their fettlements on the coaft which gives life to the flave trade.
3. Next adjoining to the Ivory Coaft are thofe called the Gold Coaft and the Slave Ceaft; authors are not agreed about their bounds, but their extent together along the coaft may be about 500 miles. And as the policy, produce, and economy of thefe two kingdoms of Guinea are much the fame, they thall be defcribed together.

Here the Europeans have the greatef momber of forts and factories; from whence, by means of the negro factors, a trade is carried on above 700 miles back in the inland country; whereby greatnumbers of farcs
are procured, as well by means of the wars which arife amonght the negroes, or are fomented by the Europeans, as thofe brought from the back country. Here we find the natives more reconciled to the European manners and trade; but, at the fame time, much more inured to war, and ready to affift the European traders in procuring loadings for the great number of veffels which come yearly on thofe coalts for flaves. This part of Guinea is agreed by hiftorians to be in general, extraordinary fruitful and agreeable; producing (according to the difference of the foil) valt quantities of rice and other grain, plenty of fruit and roots, palm wine and oil, and filh in great abundance, with much tame and wild cattle. Bofman, principal factor for the Dutch at D'Elmina, "fpeaking of the country of Axin, which is fituated towards the beginning of the Gold Coaft, fays, "The Negro inhabitants are generally very rich, driving a great trade with the Europeans for gold : That they are indultrioufly employed either in trade, fifhing, or agricultare; but chiefly in the culture of rice, which grows here in an incredible abundance, and is tranfported hence all over the Gold Coatt : the inhabitants, in lien, returning full fraught with millet, jamms, potatoes, and palm oil." The fame author, fpeaking of the country of Ante, fays, "This country, as well as the Gold Coaft, abounds with hills, enriched with extraordinary high and beautiful trees; its valleys, betwixt the hills, are wide and extenfive, producing in great abundance very good rice, millet, jamms, potatoes, and other fruits, all good in their kind." He adds, "In hort, it is a land that yields its manurers as plentifula crop as they can wifh, with great quantities of palm wine and oil, befides being well furnifhed with all forts of tame as well as wild beafts; but that the laft fatal wars liad reduced it to a miferable condition, and ftrippedit of moft of its inhabitants:" The adjoining country of Fetu, he fays, "was formerly fo powerful and populous, that it ftruck terror into all the neighbouring nations ; but it is at prefent fo drained by continual wars, that it is entirely ruined; there does not remain inhabitants fufficient to till the country, though it is fo fruitful and pleafant that it may be compared to the country of Ante juft before defcribed ; frequently (fays our anthor), when walking through it before the latt war, I have feen it abound with fine well built and populous towns, agrecably enriched with vaft quantities of corn, cattle, palm wine, and oil. The inhabitants all applying themfelves without any diftinction to agriculture; fome fow corn, others prefs oil, and draw wine from palm trees, with both which it is plentifully ftored."

Smith gives much the fame account of the before. mentioned parts of the Gold Coalt; and adds, 's the country about D'Elmina and Cape Coaf, is much the fame for beauty and goodnefs, but more populous; and the nearer we come towards the Slave Coaft, the more delightful and rich all the countries are, producing all forts of trees, fruits, roots, and herbs, that grow within the torrid zone." Barbot alfo remarks*, with re- * Barbot's rpeet to the countries of Ance and Adom, "That the Defriptoion foil is very good and fruitful in corn and other pro- of Guinea, duce; which it affords in fuch plenty, that befides what P. 154 ferves for their own ufe, they always export great quantities for fale: they have a competent number of cattle, both tame and wild, and the rivers abundantly

Guinea. תored with fill; fo that nothing is wanting for the fupport of bife, and to make it eafy." In the Collection it is faid "That the inland people on that part of the coaft employ themfelves in tillige and trade, and fupply the market with corn, fruit, and palm wine; the country producing fuch valt plenty of Indian corn, that abundance is daily exported, as well by Europeans as blacks reforting thither from other parts." Thefe inland peopleare faid to live in great union and friendhip, being generally well tempered, civil, and tractable; not apt to thed human blood, except when much provoked; and ready to affift one another. In the Collection it is faid, "That the filhing bufinefs is efteemed on the Gold Coaft next to trading; that thofe who profefs it are more numerous than thofe of other employments. That the greatelt number of thefe are at Kommendo, Mina, and Kormantin; from each of which places, there go ont every morning (Tuefday excepted, which is the Fetilh day, or day of reft) five, fix, and fometimes eight hundred canoes, from 13 to 14 feet long, which fread themfelves two leagues at fea, each fifherman carrying in his canoe a fword, with bread, water, and a little fire on a large ftone to roalt fifh. Thus they labour till noon, when the fea breeze blowing frefh, they return on the fhore, generally laden with fifh; a quantity of which the inland inhabitants come down to buy, which they fell again at the country markets."

Smith fays, "The country about Acra, where the Englifh and Dutch have each a ftrong fort, is very delightful, and the natives courteous and civil to ftrangers." He adds, "That this place feldom fails of an extraordinary good trade from the inland country, efpecially for haves, whereof feveral are fuppored to come from very remote parts, becanfe it is not uncommon to find a Malayan or two amongft a parcel of other haves: The Malayan people are generally natives of Malacca, in the Ealt-Indies, fituated feveral thoufand miles from the Gold Coalt." They differ very much from Guinea negroes, being of a tawny complexion, with long black hair.

Moft parts of the flave coafts are reprefented as equally fertile and pleafant with the gold coaft. The kingdom of Whidah has been particularly noted by travellers. Smith and Borman agree, "That it is one of the molt delightful countries in the world. The great number and variety of tall, beantiful, and hady trees, which feem planted in groves; the verdant fields every where cultivated, and no otherwife divided than by thofe groves, and in fome places a fmall foot-path, together with a great number of villages, contribute to afford the moft delightful profpect; the whole country being a fine, eafy, and almoft imperceptible afcent for the fpace of 40 or 50 miles from the fea. That the farther you go from the fea, the more beautiful and populous the country appears. That the natives were kind and obliging, and fo induftrious, that no place which was thought fertile could efcape being planted, even within the hedges which inclofe their villages. And that the next day after they had reaped, they fowed again."

Snelgrave alfo fays, "The country appears full of towns and villages; and' being a rich foil, and well cultivated, looks like an entire garden." In the Collection, the hufbandry of the negroes is defcribed to be carried on with great regularity. "The rainy fea.
fon approaching, they go into the fields and woods, Guinea. to fix on a proper place for fowing; and as here is no property in ground, the king'slicence being obtained, the people go out in troops, and firft clear the ground from buthes and weeds, which they burn. The field thus cleared, they dig it up a foot deep, and foler it remain for eight or ten days, till the reft of their neighbours have difpofed their ground in the fame manner. They then confult about fowing, and for that end affemble at the king's court the next fetifh day. The king's grain mult be fown firf. They then go again to the field, and give the ground a fecond digging, and fow their feed. Whillt "the king or governor's land is fowing, he fends out wine and flelh, ready dreffed, enough to ferve the labourers. Afterwards, they in like manner fow the ground allotted for their neighbours as diligently as that of the king's, by whom they are alfo feafted; and lo continue to work in a body for the public benefit till every man's ground is tilled and fowed. None but the kings, and a few great men, are exempted from this labour. Their grain foon fprouts out of the ground. When it is about a man's height, and begins to ear, they raife a wooden houfe in the centre of the field, covered with ftraw, in which they fet their children to watch their corn, and fright away the birds."

Burman feaks in commendation of the civility, kindnefs, and great induftry of the natives of Whidah. This is confirmed by Smith, who fays, "The natives here feem to be the moft gentleman-like negroes in Guinea, abounding with good manners and ceremony to each other. The inferior pay the utmont deference and refpect to the fuperior, as do wives to their hufbands, and children to their parents. All here are naturally induftrious, and find conftant employment ; the men in agriculture, and the women in ipinning and weaving cotton. The men, whofe chief talent lies in hufbandry, are unacquainted with arms; otherwife, being a numerous people, they could have made a better defence againft the king of Dahome, who fubdued them without much trouble." According to the Collection, there are, throughont the gold coaft, regular markets in all villages, furnifhed with provifions and merchandife, held every day in the week except Tuefday, whence they fupply not only the inhabitants, but the European fhips. The negro women are very expert in buying and felling, and extremely induftrious; for they will repair daily to market from a conliderable diftance, loaded like packhorfes, with a child perhaps at their back, and a heavy burden on their heads. After felling their wares, they buy filh and other neceffaries, and return home loaded as they came. There is a market held at Sabi every fourth day, alfo a weekly one in the province of A pologua, which is fo reforted to, that there are ufually 5 or 6000 merchants. Their markets are fo well regulated and governed, that-feldom any diforder happens; each fpecies of merchandife and merchants have a feparate place allotted them by themfelves. The buyers may haggle as much as they will, but it muft be without noife or frand. To keep order, the king appoints a judge; who, with four officers well armed, infpect the markets, hears all complaints, and in a fummary way decides all differences; he has

## G U I

Guinea. power to feize, and fell as flaves, all who are catched in ftealing or difurbing the peace. In thefe markets are to be fold men, women, children, oxen, heep, goats, and fowls of all kinds; European cloths, linen and woollen; printed calicoes, filk, grocery ware, china, gold-duft, iron in bars, \&c. in a word, moft forts of European goods, as well as the produce of Africa and Alia. They have other markets, refembling our fairs once or twice a year, to which all the country repair ; for they take care to order the day fo in different governments as not to interfere with each other."

With refpect to government, Smith fays, * "that the gold coaft and llave coaft are divided into differentdiftrits, fome of which are governed by their chiefs or kings : the others, being more of the nature of a commonwealth, are governed by fome of the principal men, called Caboceros; who, Bofman fays, are properly denominated civilfathers, whofe province is to take care of the welfare of the city or village, and to appeafe tumults." But this order of government has been much broken fince the coming of the Europeans. Both Borman and Barbot mention murder and adultery to be feverely punifhed on the coaft, frequently by death; and robbery by a fine proportionable to the goods ftolen.

The income of fome of the kings is large. Bofinan fays, "that the king of Whidah's revenues and duties on things bought and fold are conliderable; he having the tithe of all things fold in the market, or imported into the country." Both the abovementioned authors fay, the tax on llaves laipped off in this king's dominions, in fome years, amounts to near L. 20,000.

Bofman tells us, the Whidah negroes have a faint idea of a true God, a fcribing to him the attributes of almighty power and omniprefence : but God, they fay, is too high to condefcend to think of mankind; wherefore he commits the government of the world to thofe inferior deities which they worlhip." Some authors fay, the wifeft of thefe negroes are fenfible of their miftake in this opinion; bot dare not forfake their own religion, for fear of the populace rifing and killing them. This is confirmed by Smith, whofays, "that all the natives of this coaft believed there is one true God, the author of them and all things ; that they have fome apprehenfion of a future ftate ; and that almoft every village has a grove, or public place of worfhip, to which the principal inhabitants, on a fet day, refort to make their offerings."

In the Collection it is remarked as an excellency in the Guinea government, "that however poor they may be in general, yet there are nobeggars to be found amongft them; which is owing to the care of their chief men, whofe province it is to take care of the welfare of the city or village, it being part of their office to fee that fuch people may earn their bread by their labour ; fome are fet to blow the fmith's bellows, others to prefs palm oil, or grind colvurs for their mats, and fell provifion in the markets. The young men are lifted to ferve as foldiers, fo that they fuffer no common beggar." Bofmau afcribes a fur-

## 82 ] G U I

fter fets him a fort of talk, which is not in the leaft
Cuinex: flavifl, being chiefly to defend his mafter on occafions, or in fowing time to work as much as himfelf pleafes."

Adjoining to the kingdom of Whidah are feveral fmall governments, as Coto, great and fmall Popo, Ardrah, \&c. all fituated on the flave coaft, where the chief trade for llaves is carried on. Thefe are governed by their refpective kings, and follow much the fame cuftoms with thofe of Whidah, except that their principal living. is on plunder and the flave trade.
4. Next adjoining to the Slave Coaft, is the kingdom of Benin, which, though it extends but about 170 miles on the fea, yet fpreads fofar inland as to be efteemed the noft potent kingdom in Guinea. By accounts, the foil and produce appear to be in a great meafure like thofe before deferibed, and the natives are reprefented as a reafonable good-ratured people. Artus fays*, " they are a fincere, inoffenfive people, : Collef. and do no injuftice either to one another or to ftran- vol. iii. gers." Smith confirms this account, and fays, "that p. 288. the inhabitants are generally very good-natured, and exceeding courteous and civil. When the Europeans make them prefents, which in their coming thither to trade they always do, they endeavour to return them doubly." Bofman tells us, "that his countrymen the Dutch, who were often obliged to truft them till they returned the next year, were fure to be honefly paid their whole debts."
There is in Benin a confiderable order in government; theft, murder, and adultery, being feverely punifhed. Smith fays, "their towns are governed by officers appointed by the king, who have power to decide in civil cafes, and to raife the public taxes; but in criminal cafes, they muft fend to the king's court, which is held at the town of Oedo or Great Benin. This town, which covers a large extent of ground, is about 60 miles from the fea." Barbot tells us, "that it contains 30 ftreets, 20 farhom wide, and almoft two miles long, commonly extending in a ftraight line from one gate to another; that the gates are guarded by foldiers; that in thefe ftreets markets are held every day, for cattle, ivory, cotton, and many forts of European goods. This large town is divided into feveral wards or diftricts, each governed by its refpective king of a freet, as they call them, to adminifter juftice, and to keep good order. The inhabitants are very civil and good natured, condefcendingto what the Europeans require of them in a civil way." The fame author confirms what has been faid by others of their juftice in the payment of their debts; and adds, "that they, above all other Guineans, are very honeft and juft in their dealings ; and they bave fuch an averfion for theft, that by the law of the country it is punifled with death." We are told by the fame author, "that the king of Benin is able upon occafion to maintain an arny of $100,000 \mathrm{men}$; but that, for the moft part, he does not keep 30,000 . See the article Benin.
5. The laft divifion of Guinea from which flaves are imported, are the kingdoms of Congo and Ango$l a$ : thefe lie to the fouth of Benin, extending with the intermediate land about 1200 miles on the coaft. Grear numbers of the natives of both thefe kingdoms profefs the Chriftian religion, which was long fince

## G U.I [ 183$] \quad$ GÜ I

Guinea. introduced by the Portuguefe, who made early fettlements in that country. See Congo and Angola.

In the Collection it is laid, that both in Congo and Angola, the foil is in general fruitful, producing great plenty of grain, Indian corn, and fuch quantities of rice, that it hardly bears any price, with iruits, roots, and palm oil in plenty. The natives are generally a quiet pcople, who difcover a good underftanding, and behave in a friendly manner to ftrangers, being of a mild converfation, affable, and eafily overcome with reafon. In the government of Congo, the king appoints a judge in every particular divilion, to hear and determine difputes and civil caufes; the judges imprifon and relcafe, or impofe fines, according to the rule of cuftom ; bur in weighty matters, every one may appeal to the king, before whom all criminal canfes are brought, in which he giveth fentence; but feldom condemneth to death. The town of Leango ftands in the midft of four lordfhips, which abound in corn, fruits, \&c. Here they make great quantities of cloth of divers kinds, very fine and curiuns; the inhabitants are feldom idle; they even make needle-work eaps as they walk in the freets. The flave trade is here principally managed by the Portuguefe, whocarry it far up into the inland countries. They are faid to fend off from thefe parts 15,000 llaves each year. At Angola, about the tenth degree of fouth latitade, ends the trade for flaves.

As all the fe countries lie between the tropics, the air is exceffively hot, efpecially from the beginning of September to the end of March; which, with the coolnefs of the nights, the frequent thick, ftinking, fulphureous mifts, and the periodical rains, when the flat country is overflowed, makes it very unhealthy, efpecially to Europeans. The natives, however, are little affected with the unwholefome air. According to Barbot, they keep much within doors in tempeftuous times; and when expofed to the weather, their fkins being fuppled and pores clofed by daily anointing with palm oil, the weather can make but little impreftion on them. They generally, therefore, enjoy a good ftate of health, and are able to procure to themfelves a comfortable fubfiltence, with much lefs care and toil than is neceffary in onr more northern climate; which laft advantage arifes not only from the warmth - of the climate, but alfo from the overflowing of the rivers, whereby the land is regularly moiftened and rendered extremely fertile, and being in many places improved by culture, abounds with grain and fruits, cattle, poultry, \&c. The earth yields all the year a freth fupply of food: Few clothes are requifite, and little art neceffary in making them, oris the contruction of their houfes, which are very fimple, principally calculated to defend them from the tempeftuous feafons and wild beafts; a few dry reeds covered with matts ferve for their beds. The other furniture, except what belongs to cookery, gives the women bat little trouble; the moveables of the greateft among them only amounting to a few earthen pots, fome wooden utenfils, and gourds or calabathes; from thefe laft, which grow almoft naturally over their huts, to which they afford an agreeable fhade, they are abundantly focked with good clean veffels for moft honfehold ufes, being of different fizes, from half a pint to feveral gallons.

The diftempers the Europeans are fubject to on
Guinea. this coalt, are fevers, fluxes, and colics, which are occafioned by indifferent water and bad air; their fellements lying near the coaft, where the fogs and fteams arifing from the ooze and falt marfhes, and the flinking filh the natives dry on the beach, corrupt the air, and render it fatal to the foreigners. The moft temperate men find it difficult to preferve their health; but a great many haften their death by their intemperance, or negligence, expofing themfelves to the cold air in the evening, after a very hot day. This fudden change, from one extreme to the other, has often very bad effects in hot climates.

Of mountains in Gainea, the moft remarkable are thofe of Sierra Leona. The principal capes are thofe of Cape Blanco, Cape Verd, Cape Leton, Cape St Ann's, Cape Palmas, and Cape Three-Poins, Cape Formofa, Cape Monte, Cape St John, Cape Lopas, Cape Lede, and Cape Negro. The chief bays are the Cyprian or Cintra Bay, and the Bite of Guinea. Of the rivers, the moft confiderable are thofe of Coanzo and Ambrifi, the Zaara, the Lunde, the Cameron, the Formofa, the Volta, the Sierra Lson, and the Sherbro. All thefe run from eafl to weft (except the Voita, which runs from north to fouth), and fall into the Atlantic.

Befides gold, ivory, and llaves, Guinea affords indigo, wax, gum-fenega, gum-tragacanth, and a variety of other gams and drugs:

The moft ancient account we have of the coantry Hiftory of of the negroes, particularly that part fituated on and the Guinea between the two great rivers of Senegal and Gambia, trade. is from the writings of two ancient authors, one an Arabian, and the other a Moor. The firft wrote in Arabic about the 12th century. His wurks, printed in that language at Rome, were afterwards tranllated into Latin, and printed at Paris under the patronage of the famous Thuanus chancellor of France, with the title of Ceographica Nubienfis, containing an account of all the nations lying on the Senegal and Gambia. The other was written by John Leo, a Moor, born at Granada in Spain, before the Moors were totally expelled from that kingdom. He refided in Africa; but being on a voyage from Tripoli to Tunis, was taken by fome Italian corfairs, who finding him poffeffed of fe. veral Arabian books, befides his own manufcripts, apprehended him to be a man of learning, and as fuch prefented him to Pope Leo X. This pope encouraging him, he embraced the Romilh religion, and his defcription of Africa was publifhed in Italian. From thefe writings we gather, that after the Mahometan religion had extended to the kingdom of Morocco, fome of the promoters of it crofing the fandy defarts of Numidia, which feparate that country from Guinea, found it inhabited by men, who, though under no regular government, and deftituce of that knowledge the Arabians were favoured with, lived in content and peace. The firft author particularly remarks, " that they never made war, or travelled abroad, but employed themfelves in tending their herds, or labouring in the ground." J. Leo fays, p. 65. "That they lived in common, having no property in land, no tyrant nor faperior lord, but fapported themfelves in an equal ftate, upon the natural produce of the country, which afforded plenty of roots, game, and honey.

Guinea. Thai ambition or avarice never drove them into forcign countries to fubdue or cheat their neighbours. Thus they lived withont toil or faperflaties." "The aucient inhabitants of Morocco, who wore coats of mail, and afed frerds and fpears headed with iron, coming amongtt thefe harmlefis and naked people, foon brought ihem under fubjection, and divided that part of Guinea which lics on the rivers Senegal and Gambia into 15 parts; thofe were the 15 kingdoms of the negroes, over which the Moors prefided, and the common people were negroes. Thefe Moorstaught the negroes, the Mahometan religion, and arts of life ; paricularly the uie of iron, before unknown to them. About the 14th century, a native negro, called Heli Ifchia, expelled the Moorif conquerors; but though the negroes threw off the yoke of a foreign nation, they only changed a Libyan for a megro mafter. Heli lfchia himfelf becoming kiag, led the negroes on to foreign wars, and eftablifind himfelf in power over a very large extent of country." Since Leo's time, the Europeans have had very little knowledge of thofe parts of Africa, nor do they know what became of this grea! empire. It is highly probable that it broke into pieces, and that the natives again refumed many of their ancient cuftoms; for in the account publifhed by Moore, in his travels on the river Gambia, we find a mixture of the Moorifh and Mahometan cuftoms, joined with the original fimplicity of the negroes. It appears by accounts of ancient voyages, collected by Hackluit, Purchas and others, that it was about 50 years before the difcovery of America, that the Portuguefe attempted to fail round Cape Bojador, which lies between their country and Guinea: this, after divers repulfes occafioned by the violent currents, they effected; when landing on the weftern coafts of Africa, they foon began to make incurfions into the country, and to feize and carry off the native in. habitants. As early as the year 1434, Alonzo Gonzales, the firft who is recorded to have met with the natives, being on that coart, purfued and attacked a number of them, when fome were wounded, as was alfo one of the Portuguefe; which the author records as the firft blood ipilt by Chrintians in thofe parts. Six years after, the fame Gonzales again attacked the natives, and took 12 prifoners, with whom he returned to his veffels: he afterwards put a woman on thore, in order to induce the natives to redeem the prifoners; but the next day 150 of the inhabitants appeared on horfes and camels, provoking the Portuguefe to land; which they not daring to veature, the natives difcharged a volley of fones at them, and went off. After this, the Portuguefe fill continued to fend veffels on the coaft of Africa: particularly we read of their falling on a village, whence the inhabitants fied, and, being purfued, 25 were taken; " he that ran belt (fays the author), taking the moft. In their way home they killed fome of the natives, and took 55 more prifoners. Afterwards Dinifanes Dagrama, with two other vefiets, landed on the illand Arguin, where they took 54 moors; then running along the coaft 80 leagues farther, they at feveral times took 50 flaves; but here feven of the Portuguefe were killed. Then being joined by feveral other veffels, Dinifanes propofed to deffroy the inand, to revenge the lofs of the feven Portuguefe; of which the Moors being apprifed,
fled, fo that no more than 12 were found, whereof Guinea. only four could be taken, the reft leing killed, as alfo one of the Portaguefe." Many more captures of this kind on the coaft of Barbary and Guinea are recorded to have been made in thofe early times by the Portuguefe; who, in the year 1481, erected their firft fort atD'Elmina on that coaft, from whence they foon opened a trade for flaves with the inland parts of Guinea.

From the foregoing accounts, it is undoubted, that the practice of making llaves of the negroes owes its origin to the early incurfions of the Portugefe on the coatt ofAfrica, folely from an inordinate defire of gain. This is clearly evidenced from their own hiftorians, particularly Cada Mofto, aboat the year 1455, who writes*, "That before the trade was fettled for pur-* Golle giom, chafing flaves from the Moors at Argain, fometimes vol. i. four, and fometimes morePortuguefe vefiels, were ufed p. $5 \% 6$. to come to that gulph, well armed ; and, landing by night, would furprife fome fifhermen's villages : that they even entered into the country, and carried off Arabs of both fexes, whom they fold in Portugal." And alfo, "That the Portuguefe and Spaniards, fet. led on four of the Canary illands, would go to the other illand by night, and feize fome of the natives of both fexes, whom they fent to be fold in Spain."
After the fetilement of America, thofe devaftations, and the captivating the miferableAfricans, greatly increafed.

Anderfon, in his Hiftory of Trade and Commerce, p. 336, fpeaking of what palfed in the year 1508, writes, "That the Spaniards had by this time found that the miferable Indian natives, whom they had made to work in their mines and fields, were not fo robuft and proper for thofe purpofes as negroes brought from Africa: wherefore they, about that time, began to import negroes for that end into Hifpaniola, from the Portuguefe fettlements on the Guinea coafts; and alfo afterwards for their fugar-works."

It was about the year $\times 55 \mathrm{~F}$, towards the latter end of the reign of Edward VI. when fome London merchants fent out the firft Englifh thip on a trading voyage to the coaft of Guinea. This was foon tollowed by feveral others to the fame parts; but the Englifh not having then any plantations in the Wef-Indies, and confequently no occafion for negroes, fuch hips tra. ded only for gold, elephants teeth, and Guinea pepper. This trade was carriedion at the hazard of lofing their flips and cargoes, if they had fallen into the hands of the Portuguefe, who claimed an exclufive right of trade, on account of the feveral fettlements they had made there. $\ln 1554$, we find captain Thomas Wind. ham trading along the coaft with 140 men , in three fhips, and tailing as far as Benin, which lies about 3000 miles down the coaft, to take in a load of pepper. Next year John Lock traded along the coaft of Guinea as far as D'Elmina, when he brought away confiderable quantities of gold and ivory. He fpeaks wellof the natives, and fays, "That whoever will deal with then mull behave civilly, for they will not traffic if ill ufed." In 1555 , William Towerfon traded in a peaceable manner with the natives, who made complaint to him of the Portuguefe, who were then fetled in their caftle at D'Elmina ; faying, " They were bad men; who made them llayes if they could take them, putting irons on their legs."

This

## G U I

Guinex. Collection, vol. i. p. 148.

This bad example of the Portugucle was foon followed by fome evil difpored Englithmen: for the fame captain Towerfon relates*, "That in the courfe of his voyage, he perceived the natives nea: D'Elminaunwilling to come to him, and that he was at latt attack: edby them; which he underftood was done in revenge fur the wrong done them the year before by one captain Gainifh, who had taken away the negru captain's fon and three others, with their gold, \&c. This caufed them to join the Portuguefe, notwithitanding theit hatred of them, againft the Englifh." The next year captain Towerfon bronght thefe menback again; whereupon the negroes thowed him much kindnefs. Quickly after this, another inftance of the fame kind occurred in the cafe of Captain George Fenner, who being on the coaft with three veffels, was alfo attacked by the negroes, who wounded feveral of his people, and violently carried three of his men to theit town. The captain fent a meifenger, offering any thing they defired for the ranfom of his men : but they refifed to deliver them; letting him know, "That three weeks before an Englilh hip, which came in the road, had carried off three of their people; and that till they were brought again, th: $y$ would not reftore his men, even though they thould give their three thips to releafe them." It was probably the evil conduct of thefe and foas other Englifhmen which was the occafion of what is mentionedia Hill's Naval Hiltory, viz. " That when captain Hawkins returned from his firft voyage to Africa, queen Elizabeth fent for him, when The expreffed her concern, left any of the African negroes hould be carried off without their free confent; which the declared would be deteltable, and would call down the vengeance of heaven upon the undertakers." Hawkins made great promiles, which neverthelefs he did not perform ; for his next voyage to the coaft appears to have been principally calctilated to procure negroe llaves, in order to fell them to the Spaniards in the Weft Indies; which occafioned the fame author to ufe thefe remarkable words: " Here began the horrid practice of forcing the Africans into flavery: an injuttice and barbarity, which, fo fure as there is vengeance in heaven for the worft of crimes, will fome time be the deftraction of all who adt or who encourage it." This captain Hawkins, afterwards Sir John Hawkins, feems to have been the firft Englifman who gave public countenance to this wicked traffic: for Anderfon, before mentioned, at p. 40r, fays, "That in the year 1562, captain Hawkins, affifted by finbfeription of fundry gentlemen, now fitted out three fhips ; and havinglearnt that negrces were a very good commodity in Hifpaniula, he failed to the coalt of Guinea, took in negroes; and failed with them for Hifpaniola, where he fold them, and his Euglifh commodities, and loaded his three veffels with hides, fagar, ginger, \&c. with which he retiarned homeanno 5563 , making a profperous voyage." As it proved a lucrative buliners, the trade was continued both by Hawkins and others, as appears from the Naval Chronicle, p. 55 ; where it is faid, "That on the 18 th of October $156_{4}$, captain John Hawkins, with two Chips of 700 and 540 tons, Gailed for Africa ; that on the 8 th of December they anchored to the South of Cape Vert, where the captain manned the boat, and fent 80 men in armour into they conntry, to fee if they could
-Vos.VHI.

## 1851

## G U I

take fome negroes; but the natives flying from them, Guinia. they returned to their thips, and procecded farther down the coaft. Here they ftaid certain days, fendingtheir men a flore, in auhor (as the author fays) to burn and fpoil their towns and take the inhabitants. The land they oblerved to be well cultivated, there being plenty of grain and fruic of feveral foits, and the towns prettily laid ont. On the 25 th, being informed by the Portuguefe of a town of negroes called Bymba, where there was not only a quantity of gold, but 140 inhabitants, they refolved to attack it, having the Portuguefe for their gaides; but by mifmanagement they took but ten negroes, having feven of their own men killed and 27 wounded. They then went farther down the coaft; when laving procured a number of negroes, they proceeded to the Weft Indies, where they fold them to the Spaniards." And in the fame Naval Chronicle, at p. 76, it is faid, "th 1 t in the year 1567, Francis Drake, before performiag his voyage round the world, went with Sir John Hawkins in his expedition to the coaft of Guinea, where taking in a cargo of llaves, they determined to fteer for the Caribbee illands." How queen Elifabeth fuffered fo grievous an infringement of the rights of mankind to be perpetrated by her fuijeets, and how he was perfuaded, about the 3oth year of her reign, to grant patents for carrying on a trade from the north part of the tiver Senegal to 100 leagues beyond Siera Leona, which gave rife to the Atrican Company $\dagger, \dagger$ See Comis hard to account for, any otherwife than that it pany, vol.v. arofe from the mifreprefentation made to her of the ${ }^{p-225,226}$. fituation of the negroes, and of the advantages it was pretended they would reap from being made acquainted with the Chriftian religion. This was the cafe of Louis XIII. of France : who, Labat, in his account of the illes of America, tells us, " was extremely uneafy at a law by which the negroes of his colonies were to be made laves; but it being ftrongly urged to him as the readieft means of their convertion to Ch rinianity, he acquiefced therewith." Neverthelefs, fome of the Chriftian powers did not fo eafily give way in this matter : for we find $\ddagger$, " that Cardinal Cibo, one of $\ddagger$ Cullestion, the pope's principal minifters of fare, wrote a letter vol. iii. on behalf of the college of cardinals, or great council p. 164. at Rome, to the miffionaries in Congo, complaining that the pernicious and abominable abufe of felling flaves was yet continued; requiring them to remedy the fame if polible; but this the miflionaries faw little hopes of accomplifhing, by reafon that the trade of the country lay wholly in flaves and ivory."

It has been urged in juitification of this trade, that by purchafing the captives taken in battle, they fave the lives of fo many human creatures, who orherwife would be facrificed to the implacable revenge of the victors. But this pretence has been refuted by an appeal to reafon and fact. For if the negroes apprehended they thould be cruelly put to death if they were not fent away; why, it is afked, do they manifeft fach reluctance and dread as they generally do, at being brought from their native country? Snith, in his Account, p. 28. fays, " The Gambians abhor flavery, and will attempt any thing, though ever fo defperate, to avoid it." And Thomas Philips, in his account of a voyage be performed to the coalt of Guinea, writes, "They (the negroes) are to loth to Z leave

## GU I [186] G U I

Erinca.
leave their own country, that they have often leaped out of the canoe, boat, or hij, into the fea, and kept under water till they were drowned, to avoid being taken up." But had the fact even been otherwife, the above plea is urged with an extreme bad grace, when it is notorious that the very wars faid to be productive of fuch cruelty were fomented by the infanous arts of the Europeans. From the foregoing accounts, 2s well as other authentic publications of this kind, it appears, that it was the unwarrantable luft of gain which firft ftimulated the Portuguefe, and afterwards other Europeans, to engage in this horrid traffic. By the moft unqueftionable relations of thofe early times, the natives were an inoffentive pcople, who, when civilly ufed, traded amicably with the Eurupeans. It is recorded of thore of Benin, the largeft kingdom in Guinea, that they were a gentle, loving, people; and Reynold fays, "They found more fincere proofs of love and good will from the natives, than they could find from the Spaniards and Portuguefe, even though, they had relieved them from the greateft mifery." And from the fame relations there is no reafon to think otherwife, but that they generally lived in peace annongt themfelves; there occurring no accounts of any wars at that early period, nor of any fale of captives taken in battle.

In fact it was long after the Portuguefe had made a practice of violently forcing the natives of Africa into havery, that we read of the different negro nations making war upon each other, and felling their capfives. And probably this was not the cafe, till thofe bordering on the coaft, who had been ufed to fupply the veffels with neceffaries, had become corrupted by their intercourfe with the Europeans, and were excited by drunkennefs and avarice to join them in carrying on thofe wicked fchemes, by which thofe unnatural wars were perpecrated; the inhabitants kept in continual alarms; the country laid wafte; and, as Moore expreffes it, "infin'te numbers fold into ylavery." But that the Europeans are the principal caufe of thefe devaftations, is particularly evidenced by one whofe connection with the trade would rather induce him to re refent it in the faireft colours, viz. Captain Smith, the perfon fent in the year 1726 by the African company to furvey their fettlements; who, from the information he received of one of the factors who had yefided ten years in that country, fays, "That the difcerning natives account it their greateft unhappi-

* Smitb, p. 266.
$\dagger$ Collecition,
vol. ii,
p. $9^{8 .}$
f p .3 F . nefs, that they were ever vifited by the Europeans*" "That we Chriftians introduced the traffic of flaves; and that before our coming they lived in peace."

In the accounts relating to the African trade, we find this melancholy truth farther afferted by fome of the principal directors in the different factories; particularly A. Bruefays $\dagger$, "That the Earopeans were far from defring to act as peace-makers amongtt the negroes; which would be acting contrary to their intereft, fince the greater the wars, the more flaves were procured." AndWilliamBofman alforemarks $\ddagger$, "That one of the former commanders gave large fums of money to the negrocs of one nation, to induce them to attack fome of the neighbouring nations: which occafioned a battle which was more bloody than the wars of the negroes ufually are." This is confirmed by J. Barbot, who fays, "That the country of D'El-
mina, which was formerly very fowerful and popalous, Guinea. was in his time fo much drained of its inhabitants by the incettine wars fomented amongft the negrocs by the Dutch, that there did not remain inhabitants enough to till the country."

It has alfo been advanced as an argument in favour of keeping the negroes in bondage, that there are flaves in Guinea, and that thofe amongit us might be fo in their own country. Not to dwell upon the inconfiftency of our giving any conntenance to flavery, becaufe the Africans, whom we efteem a barbarous and favage people, allow of it, and perhaps the more from our example; the very circumpance ftated, when inquired into, mult afford caufe of blubhing, rather than ferve as a palliation of fuch iniquitous conduct: for it will appear, rhat the flavery endured in Guinea is by no means fo grievous as that in the colonies. Captain Moore, fpeaking of the natives living on the river Gambia, fays, "That fome of the negroes have many houle flaves; which are their great glory; that thofe flaves live fo well and eafy, that it is fometimes a hard matter to know the flaves from their mafters or miftrefles. And that though in fome parts of Africa they fell their flaves born in the family, yet on the river Gambia they think it a very wicked thing." The author adds, " He never heard of but one that ever fold a family have, except for fuch crimes as they would have been fold for if they had been free." And in Aftley's Collection, fpeaking of the cuftoms of the negroes in that large extent of cuuntry further down the coaft, particularly denominated the Coaft of Guinea, it is faid, "They have not many llaves on the coatt; none but the king or nobles are permitted to buy or fell any; fo that they are allowed only what are neceffary for their families, or tilling the ground." The fame author adds, "That they gencrally ufe their flaves well, and feldom correct them."

From the foregoing account of the natural difpolstion of the negroes, and the fruitfulnefs of mont parts of Guinea, which are confirmed by authors of candour, who have written from their own knowledge, it may well be concluded, that the negroes acquaintance with the Europeans might have been a happinefs to them : but thefe forgetful of their duty as men and Chriftians, have conducted themfelves in fo iniquitous a manner, as muft neceflarily raife in the minds of the thoughtfiland well difpofed negroes the utmont fcorn and deteftation of the very name of Chriftians. All other confiderations have given way to an infatiable defire of gain, which has been the principal and moving caufe of the mof deteftable and barbarous feene that was perbaps ever acted upon the face of the earth; inftead of making ule of that fuperior knowledge with which the Almighty, the common Parent of mankind, had favoured them, to ferengthen the principle of peace and good will in the breafts of the incautious negroes, the Europeans have, by their bad example, led them into excefs of drunkennefs, debauchery, and avarice : whereby every paffion of corrupt nature be, ing inflamed, they have been eafily prevailed upon to make war and c: ptivate one another, as well to furnifl means for the exceffes they have been habituated 10, as to fatisfy the greedy defire of gain in their profligate employers; who to this intent have furnifted them with prodigious quantities of arms and ammunia

## G U I

Guinea. tion. Thas they have been hurried into confufion, diftrefs, and all the extremities of temporal mifery; every thing, even the power of their kings, has ucen made fublervient to this wicked pu: pofe; for intiead of being protectors of their fubjects, fome of thofe rulers, cortupted by the excefive love of firituous liquors, and the tempting baits laid before them by the factors, have invaded the liberties of their unbappy fubjects, and are become their oppreffors.

Here it may be necelfary to oblerve, that the accounts we have of the inhabitants of Guinea are chiefly given by perfons engaged in the trade, who, from felf intereftedviews, have defcribed them in fuch colours as were leatl likely to excite compaition and refpect, and endeavoured to reconcile fo manifent a violation of the rights of mankind to the minds of the purchafers; yet they cannot but allow the negroes to be poffefled of fome good qualities, though they contrive as nuch as poffible to calt a fhade over them. A particular inftance of this appears in Aftley's Collection, vel. ii. p. 73; where the author, fpeaking of the Mandingos fettled at Galem, which is fituated 900 miles up the Senegal, after faying that they carry on a commerce to all the neighbouring kingdoms, and amafs riches, adds, "That excepting the vices peculiar to the blacks, they are a good fort of people, honeft, hofpitable, jult to their word, laborious, indultrious, and very ready tolearn arts and fciences." Here it is difficult to imagine what vices can be peculiarly attendant on a people fo well difpofed as the author defcribes thefe to be. With refpect to the charge fome authors have brought againtt them, as being void of all natural affection, it is frequently contradicted by others. In vol. ii. of the Collection, p. 275 and 629. the negroes of North Guinea and the Gold Coaft are faid to be fond of their children, whom they love with tendernefs. And Bofman fays, p. 340 . "Not a few in his country (viz: Holland) fondly imagine, that parents here fell their children, men their wives, and one brother the other: but thofe who think fo, deceive themfelves; for this never happens on any other account but that of neceffity, or fome great crime." The fame is repeated by J. Barbot, p. 326, and alfo confirmed by Sir Hans Sloane in the introduction to his natural hiftory of Jamaica; where, fpeaking of the negroes, he fays, "they are ufually thought to be hatersof their own children; and therefore it is believed that they fell and difpofe of them to ftrangers for money: but this is not true; for the negroes of Guinea being divided into feven captainflips, as well as the Indians of America, have wars; and befides thofe flainin battle, pany prifoners are taken, who are fold as flaves, and brought thither : but the parenss kere, although their children are flaves for ever, yet have fo great love for them, that no mafters dare fell or give away one of their little ones, unlefs they care not whether their parents hang themfelves or no." J. Barbor, fpeaking of the occafion of the natives of Guinea being reprefented as a treacherous people, afcribes it to the Hollanders (and doubtlefs other Europeans) ufurping authority, and fomenting divifions between the negroes. At p. 110 , he fays, " it is well known that many of the European nations trading amongft thefe people, have very unjuftly and inbumanly, without any provocation, flolen away, from time to time,
abundance of the people, not only on this coaft, but almoft every where in Guinea; who have come on board their flips in a harmlefo and confiding manier: thefe they have in great numbers carried away, and fuld in the plantations, with other flaves which they had purchafed." And although fome of the negroes may be juftly charged with indolence and fupinenefs, yet many others are frequently mentioned by authors as a careful, induftrious, and even laborions people.

By an enquiry into the laws and cuftoms formerly in ufe, and fill in force anongtt the negroes, particularly on the Gold Coaft, it will be found, that provifion was made for the general peace, and for the lafety of individuals ; even in W. Borman's time, long after the Earopeans bad eftablifhed the flave-trade, the natives were not publicly enflaved, any otherwife than in pu. nifhment for crimes, when prifoners of war, or by a violent exertion of the power of their corrupted kings. Where any of the natives were folen in order to be fold to the Europeans, it was done fecretly, or at leaft only connived at by thofe in power : this appears from Barbot and Bofman's account of the marter, both agreeing that man-ftealing was not allowed on the Gold Coaft. The firft fays, "Kidnapping or fealing of human creatures is punifhed there, and even fometimes with death.' And Bofman, whole long relidence on the coaft enabled him to Speak with certainty, fays, "That the laws were fevere againft murder, thievery, and adultery;" and adds, "That man-ftealing was punilhed on the Gold Coaft with rigid feverity, and fometimes with death itfelf." H. nee it may be concluded, that the fale of the greateft part of the ne groes to the Europeaus is fupported by violence, in defiance of the laws, through the knavery of their principal men, who (as is too often the cafe with thofe in European countries), under pretence of encouraging trade, and increaling the public revenue, difregard the dictates of jutice, and trample upon thofe liberties which they are appointed to preferve.

Moore alfo meationsman-ftealing as being difcountenanced by the negre governments on the riverGambia; and fpeaks of the enflaving the peaceable inhabitants, as a violence which only happens under a corrupt adminiftration of juftice. He lays, "the kings of that country generally advife with their head men, fcarcely doing any thing of confequence without confulting them firf, except the king of Barfailay, who being fizbject to hard-drinking is very abfolute. It is to this king's infatiable thirft for brandy, that his fubjects freedoms and families are in fo precarious a fituation. Whenever this king wants goods or brandy, he fends a meffenger to the Englifh governor at Janes's Fort, to defire he would fend a floop there with a cargo: this news being not at allunwelcome, the governor fends accordingly; againft the arrival of the floop, the king goes and ranfacks fome of his enemies towns, feizing the people, and felling them for fuch commodities as he is in want of, which commonly are brandy, gans, powder, balls, piftols, and cutlaffes, for his attendants and foldiers; and coral and filver for his wives and concubines. In cafe he is not at war with any neighbouring king, he then falls upon one of his own towns, which are numerous, and ufes them in the fame manner. He often goes with fome of his troops by a town in the day time, and returning in the night, fets fire

## G U I

Guimea.
to three parts of it, and putting guards at the fourth, there feizes the people as they run out from the fire; he ties their arms behind them, and marches them either to Joar or Cohone, where he fells them to the Europeans."

Mr Brue, the French director, gives much the fame account, and fays*, "That having received goods, he wrore to the king, that if he had a fufficient number of llaves, he was ready to trade wilh him. This prince, as wellas the other negro monarchs, has always a fure way of fupplying his deficiencies, by felling bis own fuhjects, for which they feldom want a pretence. The king had recourfe to this method, by feizing 300 of his own people, and fent word to the director that he had the flaves ready to deliver for the goods." It feems the king wanted double the quantity of goods which the factur would give him for thefe 300 flaves; but the factor refuing to truit him as he was already in the company's debr, and perceiving ther this refufal had put the king much ont of temper, he propofed that he floould give him a licence for taking fo many more of his people as the goods he ftill wanted were worth : but this the king refufed, faying, It might ozcalion a difturbance amongt his fubjects." Except in the above inftance, and fome others, where the power of the negro kings is unlawfully exerted over their fubjects, the flave-trade is carried on in Guinea with fome regard to the laws of the country, which allow of none to be fold but prifoners taken in their national wars, or people adjudged to flavery in punithment for crimes; but the largenefs of the country, the number of kingdoms or commonwealths, and the great encouragement given by the Europeans, afford frequent pretences and opportunities to the bold defignfing protigates of one kingdom, to furprife and feize apon not only thofe of a neighbouring government, but alfo the weak and helplefs of their own; and the unhappy people, taken on thofe occalions, are, with impunity, fold to the Europeans. Thefe practices are doubtlefs difapproved of by the moft confiderate amongft the negroes; for Bofman acquaints us, that even their national wars are not agreeable to.fuch. He fays, "If the perfon who occafioned the beginning of the war be taken, they will not eafily admit him to ranfon, though his weight in gold hould be offered, for fear he fhould in future form fome new defign againf their refofe."

We fhallconclude this articke with the following account of the hooking methods ufed in the carrying on of the flave trade, as defcribed hy factors of different nations.
3. 28 :

Mr Moore $\dagger$, a factor for the Englifh African Company on the river Gambia, writes, "That there are a number of negrotraders, called joncoes, or merchants, who f.llow the fave-trade as a buninefs; their place of rcfidence is fo high up the country as to be fix weeks travel from James' Fort, which is fituated at the nouth of that river. Thefe merchants bring down elephants. teerh, and in fome years 2000 llaves, moft of which, they fay, are prifoners taken in war. They buy them from the different princes who take them ; many of them are Bumbrongs and Petcharies; nations who each of them have different languages, and are brought from a valt way inland. Their way of bringing them is tying them by the neck with leather thongs, at about

## 188 〕 <br> G U I

a yard diftant from each other, 30 or 40 in a fring Guinea, having generally a bandle of coriu or elephants teeth upon each of their heads. In their way from the mountains, they travel through very great woods, where they cannot for fome days get water; fo they carry in fkin bags enough to fupport them for a time. I cannot (adds Moore) be certain of the number of merciants who follow this trade, but there may, perhaps, be about 100 . who go up into the inland country with the goods which they buy from the white men, and with them purchale, in various countries, gold, glaves; and elephants teeth. Betides the nlaves which the merchants bring down, there are many bought along the river: Thefeare cither takeu in war, as the former are, or men condenned for crimes; or elfe people ftolen, which is very frequent.-Since the Glave-trade has been ufed, all punifhments are changed into flavery; there being an advantage on fuch condemnation, they ftrain for cyimes very hard, is: order to get the benefir of felling she criminal."

John Barbot, the French factor, in his account of the manner by which the flaves are procured, Luys, " The flaves fold by the negroes are for the moft part prifoners of war, or taken in the incurfions they make into their enemies territeries; others are ftolenaway by their neighbours, when found abroad on the road, cr in the woods; or elfe in the corn fields, at the time of the year when their parents keep them there all the day to fcare away the deveuring fmall birds." Speaking of the tranfactions on that part of Guinea called the Slave Coaft, where the Europeans have the moft factories, and from whence they bring away much the grearef namber of liaves, the fame author fays, "The inhabitants of Coto do much mifchief in ftealing thofe flaves they fell to the Europeans from the upland country. --That the inhabitants of Popo excell the former ; being endowed with a nulch larger limare of conrage, they rob more fuccefsfully, by which means they increafe their riches and trade." The author particularly remarks,"That they are encouraged in this practice by the Europeans: fometimes it happens, according to the faccefs of the inland excurtions, that they are able to furnifh 200 flaves, or more, in a few days." And he fays, "The llacks of Eida, or Whidah, are fo expeditions in trading for laves, that they can deliver 1000 every month." "Ift hiere happens to be no fock of flaves there, the factor muft traft the blacks with his goods, to the value of 1501 , or 200 l . which goods they earry up into the inland country to buy llaves at all markets for above 600 miles up the country, where they are kept like caute in Europe; the flaves fold there being generally prifoners of war, taken from the renemies like other booty, and perhaps fome few fold by their own countrymen, in extreme want, or upon a fanine, as alfo fome as a pumifment of heinous crimes." So far Barbot's account. That given by Borman is as follows: "Whenthe laves which are brought from the inland countries come to Whidah, they are put in prifon together; when we treat concerning buying them, they are all brought out togother in a large plain, where, by our fargeons, they are thoroughly examined, and that naked, both men and wamen, without the leaft diftinction or modefty. Thofe which are approved as good, are fet on one fide; in the mean while a burning i, on, with the armsor
nanc

## G U I

Günea.
name of the company, lies in the fire, with which ours are marked on the breaft. When we have agreed with the owners of the llaves, they are returned to their prifons; where, from that time forward, they are kept at our charge, and coft us two pence a day each flave, which ferves to fublift them like criminals ou bread and water ; fo chat to fave charges, we fend them on board our flips the very firlt opportunity: before which, their mathers frip them of all they have on their backs, fo that they come on board flark naked, as well women as men. In which condition they are obliged to contime, if the mafter of the hip is not fo charitable (which he commonly is) as to beftow fomething on them to cover their nakedneis. Six or feven huudred are fometimes put on board a velfel, where they lie as clofe together as it is polfible for them to be crowded."

When the great income which arifes to the negro kings on the Slave Coaft, from the flaves brought through their feveral governments to be fhipped on board the European veifels, is confidered, we have no caule to wonder that they give fo great a countenance to that trade. Bofman fays, "That each thip which cones to Whidah to trade, reckoning one with another, either by toll, trade, or cuftom, pays about 400 l . and fontetimes 50 fhips come hither in a year." Barbot confirms the fame, and adds, "That in the neighbouring kingdom of Ardah, the duty to the king is the value of 70 or 80 flaves for each trading fhip," which is near half as mach more as at Whidah. Nor can the Europeans concerned in the trade, with any degree of propriety, blame the African kings for countenancing it, while they continue to fend veifels on purpore to take in the flaves which are thus folen, and that they are permitted, under the fanction of national laws, to fell them to the colonies.
According to a late fenfible writer, Mr Ramfey, "the annual Britifl exports to thefe coafts are eftimated at 500,000 . including a conliderable quantity that is annually exchanged with American and other forcign traders there ; about 50,0001 . of this is returned in ivory, gold duft, gam, \&e. The greatelt part of the profits of the lave trade is raifed on the fugar plantations. If by etablifhing factories, and encouraging civilization on the coaft of Africa, and returning fome of our Weft-Indian faves to their original country, we tried to make up for our paft treachery to the natives, and inftrueted the inhabitants in the culture of tobacco, indigo, cotton, rice, \&c. to barter with us for our manufactures, and fapply us with thofe articles, our demand for which has been fo advantageous to America, great would be our profts. Were A frica civilized. and could we preoccupy the affections of the natives, and introduce graduallyour religion, manners, andlangnage among them, we Ghould open a market that wonld fully employ our manufacturers and feamen, mo. rally fpeaking, till the end of time. And while we enriched ourfelves, we fhould contribate to their happinefs. For Africa, in its higheit probable ftate of cultare, could not ponibly interfere with the faple of Britain, fo as to hinder an cxtenfive and mutnally advantagcous trade from being carried on between the cammeries. The great difference of climate and foil muft always diftinguifh the fupplies and wants of each:"
"The llave-trade indecd has been lone confidered as difgraceful to an enlightened age; and in this combry

2 fpirit is arilen which feems bent on annihilating it New-Guialtogether, or fo changing the nature of it as to blend nea. humanity with policy. Daring the feffion of 1788 , the philanthropy of parliament, fupported by that of the nation, \&paid a very particular attention to this odious branch of traffic. It was, however, a fubject of too comprebenfive a nature, and too materially connected with our African commerce at large and our Weit-Indian colonios to come to an immediate decifion upon it. Parliament, therefore, was obliged to content it felf for that time with a temporary bill to regulate the fhip ping and carrying llaves in Eitifh vellels from thofe coatts. but the public attemion has been fince kept awake by a great varicty of publications on both fides of the queftion; and the final arrangement of this impertant bufuncf, in which the honour of the Britifh commerceand the Britilh character, as well as the happinefs of mallions of our fable African brethren, is involved, is expected to take place during the prefent feffion 1791. -This traffic in human beings is not, howcver, without its advocates. But the mof feecious arguments of its ableft defenders reach no farther than political expediency, which cannever alter the real nature of things. That in queftion would not remain lefs an onjuft, cruel, and wicked rrade, in its very nature effentially and unalterably wrong. Its abolivion, therefore, not in a ralh, but in as gentle and equitable a way as circumfances will allow, is devoutly to be wihed, and it is hoped may be accomplinhed.'

Nowi Gunea, a long and narrow illand of the EaltIndies, very imperfectly known. It was fappoled to be connested with New-Holland, until Captain Cook difcovered the frait which feparates them. New Gininea, including Papua, its north-weitern part (which according to Bougainville's conjecture is fepatated from it by a ftrait), reaches from the equator to the $\mathbf{i t h}$ degree of fouth latitude, and from 131 to 150 degrees eaft longitude ; in one part it does nut appear to be above 50 miles broad. It was tirft vifited by an Euro. pean thip in 1529. Savedra, a Purtugucie, who made the difeovery of the north-weft part of this country, called it Terra de Papzas or Papos. Van Schoirten a Dutch difcoverer, afterwards gave the name of New-Guinea to its fouth-weftern parts. Admiral Roggewain alfe touched here; and before him Dampier, If January 1700. Captain Cook made the coaft of New-Guinea, in latitude 6 degrees i 5 minutes, longitude 138 eaft, on the 3 d of September, and landed in the pinnace, accompanied by Mr. Banks, Doctor Solander, nine of the flup's crew, and fervants well armed, and leaving two feamen to take care of the boat, advanced fome little way up the country; but coming to the fkirts of a thick wood, they judged it prodent to praceed no further, leaft they hould fallinto an ambufcade of the natives, and their retreat to the boat be cut off. Having advanced abont a quarter of a mile from the boat, three Indians rufhed out of the wood with a hidious hout; they drew their darts, and howed fuch a hofitie difpofition, that the party, to prevent the defruction of thefe people, returned to the boat, as they had no intention forcibly to invade their conntry, either to gratify their appetites or curiofity, and it was evident notbing could be done upon friendly terms. When they got on board the boat, they rowed along the fhore, and the number of indians at.

## GU I <br> 1901 <br> GU L

New-Gui- fembled feemed to be between 60 and roo. They
nea, Guife. made much the fame appearance as the New-Hollanders, being ftark naked and their hair cropped fhort.

All the while they were houting defiance, and throwing fomething out of their hand which burnt exactly like gun-powder, but made no report ; what thefe fires were, or for what purpofe intended, conld not be gued fed at; thofe who difcharged them had in their hands a hhort piece of flick, polfibly a hollow cane, which they fwung friewife from them, and immediately fire and fmoke iffued, exactly refembling the difcharge of a mulket, and of no longer duration. This wonderful phænomenon was obíeryed from the fhip; and the deception was fo great, that the people on board thought they had fire-arms; and even in the boat if they had not been fo near as that they muft have heard the report, if there had been any, they would have thought they had been firing volleys. After looking at them attentively for fome time, without taking any notice of theirflafhing and vociferation, the failors fired fome mufkets over their heads. Upon hearing the balls rattle among the trees, they walked leifurely away, and the boat returned to the fhip. Upon examining fome weapons which the natives had thrown, they were found to be light darts, about four feet long, very ill made, of a reed or bamboo cane, and pointed with hard wood, in which there were many barbs. They were difcharged with great force, for at boyards diftance they wenc beyond the party ; but in what manner they were thrown conld not beexadly feen. But the general opinion was, that they were thrown with a fick in the manner practifed by the New-Hollanders.

The land here is very low, as is every other part of the coaft; but it is covered with a luxuriance of wood and herbage that can fcarcely be conceived. Here the cocoa-nut, planain, and bread-fruit, flourifh in the higheft perfection.

Guinea, a gold coin, ftruck and current in Britain. The value or rate of guineas has varied : it was firft ftruck on the footing of 203. by the fcarcity of gold was afterwards advanced to 21 s .6 d . but it is now funk to 2 Is .

The pound weight troy of gold is cut into 44 parts and a half; each part makes a guinea.-This coin took its denomination guinea, becaufe the gold, whereof the firft was ftruck, was brought from that part of Africa called Guinea; for which reafon it likewife bore the imprefion of an elephant.

GUIPUSCOA, the north-eaft divifion of the province of Bifcay in Spain, fituated on the confines of Navarre.

GUISE, a fmall town of France in Picardy, and in Tierache, with a very ftrong caftle, and the title of a duchy. It is feated on the river Oufe, in E. Long. 3. 42. N. Lat. 49. 54.

Guise (Henry) of Lorrain, duke of Guife (eldeft fon of Francis of Lorrain duke of Guife), memorable in the hiftory of France as a gallant officer ; but an inmperions, turbulent, feditious fubject, who placed himfelf at the head of an armed force, and called his rebel
band, The Leiggue. The plan was formed by the cardinal, his younger brother ; and under the pretext of defending the Roman Catholic religion, the king Henry III. and the freedom of the gate, againft the defign of the Hugenots, or French Proteltants, they carried on a civil war, maffacred the Hugenots, and governed the king, who forbid his appearance at $\mathrm{Pa}_{\mathrm{a}}$ ris; but Guife now became an open rebel, entered the city againft the king's exprefs order, and put to the fword all whooppofed him ; the ftreets being barricaded to prevent his progrefs, this fatal day is called in the French hiftory, The day of the barricades. Mafters of Paris, the policy of the Guifes failed them: for they fuffered the king to efcape to Blois, though he was deferted in his palace at Paris by his very guards. At Blois, Henry convened an affembly of the ftates of France; the duke of Guife had the boldnefs to appear to a fummons fent to him for that purpofe; a forced reconciliation took place between him and the king, by the advice of this affembly; but it being accidentally difcovered, that Guife had formed a defign to de= throne the king, that weak monarch, inftead of refolutely bringing him to juftice, had him privately affaffinated, December 23, 1558 , in the 38 th year of his age. His brother the cardinal fhared the fame fate the next day.

GUITTAR, Guitarra, a mufical inftrument of the ftringed kind, with five donble rows of ftrings; of which thofe that are brafs are in the middle, except it be for the burden, an octave lower than the fourth. --This inftrument was firft ofed in Spain and by the Italians. In the former country it is ftill greatly in vogue. There are few of that nation who cannot play on the guittar ; and with this inftrument they ferenade their miftreffes at night. At Madrid, and other cities in that country, it is common to meet in the freets young men equipped with a guittar and a dark lanthorn, who, taking their fation under the windows, fing, and accompany their voices with this inftrument; and there is fcarce an artificer or day-labourer in any of the cities or principal towns who does not entertain himfelf with his guittar.

GULDENSTAEDT (John Anthony), was bori at Riga, April 26, 1745 ; received the rudiments of his education in that town; and in 1763 was admitted into the medical college of Berlin. He completed his ftudies at Frankfort upon the Oder, and in 1767 received the degree of M. D. in thar univerfity. On account of his knowledge of foreign languages, and the confiderable progref's he had made in natural hiftory, he was cunfidered as a fit perfon to engage in the expeditions which were planned by the imperial academy. Being invited to St Peterfbirg, he arrived in that city in I 768, was created adjunct of the academy, and afterwards, in i 770, member of that fociety, and profeffor of natural hiftory. In June 176 i he fet out upon his travels, and was abfent feven years. From Mofcow, where he continued till March $\mathbf{1 7 6 9}$, he pafsed to Voronetz, Tzaritzin, Aftracan, and Kiflar, a fortrefs upon the weftern fhore of the Cafpian, and clofe to the confines of Perfia. In 1770 he examined the diftricts watered by the river Terek, Sunfha, and Aikfai; in the eaftern extremity of Caucafus; and in the courfe of the enfuing year penetrated into Offeria, in the highelt part of the fame mountain ; where he col-

## GU L $[191] \quad G U M$

letted vocabularies of the languages fooken in thofe regions, made inquiries into the biftory of the people, and difcovered fome traces of Chriftianity among them. Having vifited Cabarda and the northern chain of the Caucafus, he proceeded to Georgia, and was admitted to an audience of prince. Heraclius, who was encamped about ten miles from Teflis. Having paffed the winter here, and in examining the adjacent conntry, he followed in fpring the prince to the province of $\mathrm{Ko}_{0}$ ketia, and explored the fouthern diftricts inhabited by the Turcoman Tartars in the company of a Gcorgian magnate, whom he had cured of a dangerous diforder. In July he paffed into Imeretia, a country which lies between the Cafpian and Black Seas, and is bounded on the eaft by Georgia, on the north by Offetia, on the weft by Mingrelia, and on the fouth by the Turkifh dominions. He penetrated into the middle chain of Mount Cancafus, vifited the confines of Mingrelia, Middle Georgia, and Eaftern and Lower Imeretia; and after efcaping many eminent dangers from the banditti of thofe parts, fortunately returned to Kiflar on the 18 th of November, where he paffed the winter, collesting varions information concerning the neighbouring Tartar tribes of Caucafus, and particularly the Lefgees. In the following fummer he joutneyed to Cabarda Major, continued his courfe to mount Befhton, the higheft point of the firft ridge of the Caucafus; infpected the mines of Madfhar, and went to Tcherkafh upon the Don. From thence he made expeditions to Azof and Taganrog, and then, along the new limits to the Dnieper, he finifhed this year's route at Krementhuk, in the government of New Rufia. In the enfuing fpring, he was proceeding to Crim Tartary; but receiving an order of recal, he returned through the Ukraine to Mofcow and St Peterfburg, where he arrived in the month of March 1775. Upon his return, he was employed in arranging his papers; but before he could finifh them for the prefs, was feized with a violent fever, which carried him to the grave in March 178 n . His writings which have been hitherto publithed confift of a number of curious treatifes, of which a lift is given in Cox's Travels, Vol.I. p. I62.

GULA, in anatomy, the œfophagus or gullet, that conduit by which animals take down food into the ftomach. See Anatomy, $n^{\circ} 92$.

GULE of August, the day of St Peter ad vincula, which is celebrated on the firlt of Auguft. It is called the gule of Auguft, from the Latin gula, "a throat," for this reafon, that one Quirinns, a tribne, having a dsughter that had a difeafe in her throat, went to Pope Alexander, the fixth from St Peter, and defired - of him to fee the chains, that St Peter was chained with under Nero; which requeft being granted, and fhe, kiffing the chains, was cured of her difeafe; whereupon the Pope inflituted this feaft in honour of St Perer; and, as before, this day was termed only the kalends of Auguf, it was on this occafion called indifferently either the day of St Peter ad vincula, from what wrought the miracle, or the gule of $A u$ $\dot{g} u f$, from that part of the virgin whereon it was wrought.

GULES, in heraldry, a corruption of the French word geules, which in this fcience fignifies "red."and
is reprefented in engraving by perpendicular lines. It may ferve of itfelf to denote martial prowefs, boldnefs, and hardinefs: for the ancients ufed this colour to make themfelves terrible to their enemies, to titir up magnanimity, and to prevent the fecing of blood, by the likenefs of the colours; for which reaion perhaps it is ufed by the Englifh. But, according to G. Leigh; if this tincture is compounded with

| Envy. |
| Ardour. |
| Strengrh. |
| Jultice. <br> Wearinefs. |

This colour is by the generality of the Englifh heralds ranked before azure; but French heralds, N. Upton and his followers, prefer azure to it.

GULL, in ichthyology. See Larus.
GULF, a broad and capacious bay comprehended between two promontories, and fometimes taking the name of a fea when it is very extenlive; but particularly when itonly communicates with the fea by means of a ftrait. Such are the Euxine or Black fea, otherwife called the Gulf of Conflantinople; the Adriatic Sea, called alfo the Gulf of Venire ; the gulf of Sidra near Barbary; and the gulph of Lions near France. All thefe gulfs are in the Mediterranean. There are, befides the gulf of Mexico, the gulf of St Lawrence, and the gulf of Califormia, which are in North-America. There are allo the gulf of Perfin, otherwife called the Red Ssa, between Perfia and Arabia; the gulf of Bengal in India; and the gulfs of Cochinchina and Kamifchacka, near the countries of the fame name.

The word comes from the French golfe, and that from the Italian golfo, which lignity the fame. Some deduce thefe further from the Greek $\operatorname{ro\lambda \pi } \pi$; which Guihart again derives from the Hebrew 9 gob. Du Cange derives them from the barbarous Latingulfum, or gulfus, which fignify the fane thing.

GULLET. See Guia.
GUM (Gummi), is a concrete vegetable juice, of no particular fmell or tafte, becoming vifcous and tenacious when moiftened with water ; totally diffolving in water into a liquid, more or lefs glurinous in proportion to the quantity of the gum; not diffolving in vinous fpirits or in oils; burning in the fire to a black coal, without melting or catching flame; fuffering mo diffipation in the heat of boiling water.

The true gums are gum arabic, gum tragacanth, gum fenega, the gum of cherry and plam trees, and fuch like. All elfe have more or lefs of retin in them.

Gum-Arabic is the produce of a fpecies of Mimosa; which fee.

The medical character of gum arabic is its glutinous quality, in confequence of which it ferves to incraffate and obtund thin acrid humours, fo proves ufeful in tickling coughs, alvine fluxes, hoarfeneffes, in fluxes of the belly with gripes, and where the mucus is abradeil from the bowels or from the urethra. In a dyfuria the true gum arabic is more cooling than the other fimple gums, fo thould be preferied.

One ounce of gum arabicrenders a pint of water confiderably glutinous: four ounces gives it a thick fyrupy:

## G U M

Yol. i.
p. 319, \& c
confiftence : but for macilage, one part gum to two parts water is required; and for fome purpoiss an equal proportion will be neceffary.

In Dr. Percival's Effays we have the following cufious account, by Mr Henry, of the faculty which this gum hath of diffolving and keeping fufpended in water not only refinous but alfo other fubftances, which hould feem not likely to be at all affected by is.
" One fcruple of ballan of collu, rubbed with half an ounce of diltilled rain-water, added gradually to it for 55 minutes, formed a mixture, which on ftanding aiout a minute fublided, but re-anited by fhaking: being fet by a few days, the balfam became a cuncrete mais, not again mifcible by fhaking up the bottle. The fame quantity required more trituration to mix it with common pump-water. One fcruple of the fame, rabbed with 15 grains of gum arabic, was nearly as long in perfectly uniting with half an ounce of diftilled water as that without the gum. This was perhaps owing to the latter piece being more refinous; however, though on long fanding there was a fmall fediment, it immediately reunited a week after by agitation. Fifteen grains of balfam capivi united very fmoothly with half an ounce of difilled water, by the mediun of three grains of gum arabic. Five grains of the gum were not fo effectual with pump-water. Balfam Peruten drops, with gum arabic three grains, difilled water half an ounce, formed a neat white emulfion, but with common water a very unequal mixture. Gum myrrh f powdered that there inight be no difference in the feveral quantities ufed), half a \{cruple, diffolved readily with gum arabic three grains, in both kinds of water, and even mixed with them by longer tritaration without any medium, but more eaflly with diftilled than common fpring water. Olibanum, maftich, gum guaiacum, and galbanum, may likewife be mixed with water by rubbing, without any gum arabic or egg. The fpring water made ule of in thefe experiments was very aluminous.
"In the making of all the faline preparations, when any confiderable quantities of water are ufed, dintiled or pure rain or river water is greatly to be preferred; for the calcarcous, aluminous, and felenitical matter, which fo much abounds in moft furing water, will render any falt diffolved in it very impure.
" The folution of crude mercury with mucilage of gum arabic being fo eafily accomplifhed, and it being very difagrecable to many paticnts, and to fome almoft impofible, to fwellow pilis, bolufes, or clectuaries, I was induced to try whether calomel, cinnabar, andthe other heavy and metalline bodies commonly adminiftered only under there forms, might not by the fame means be rendered mifcible with water, fo as to be given more agreeably in a liquid form. I acccordingly rubbed ten grains of cinnabar of amtimony and a feruple of gum arabic, with a fufficient quantity of diftilled water to form a mucilage, and added a drachm of timple fyrup and three drachms more of water. This makes ai agreeable lirtle dranght; and having food about half an hour without depofiting any fedinent, I added three drachms more of water to it; and notwithftanding the mucilage was rendered fo mach more dilate, very little of the cinnabar fublided even after it had ftood fome days.

Steel finply prepared, and prepared tin, were both
mixed with water by their own weight of gum arabic, and remained fufpended, except a very fmall portion of each, which was not reduced to a fufficiently fine powder.
"Five grains of çalomel were mixed with two drachms of diftilled water and half a drachm of fimple fyrup by means of five grains of gum arabic, which kept it iufficiently fufpenued: a double quantity of the gum preferved the mixture uniform fill longer. In this form it will be much more eafly given to children than in fyrups, conferves, \&c. as a great part of it is generally wafted, in forcing thofe vifcid vehicles into them; and it may be joined with fcammony and other refinous purgatives by the fame method, and of thefe perhaps the gumarabic would be the beft corrector.
"Gam arabic likewife greatly abates the difagree. able tafte of the corrolive fublimate, mixed with water inftead of brandy; and (from the few trials I have made) fits eafier on the fomach, and will not be fo apt to betray the patient by the fimell of the brandy.
" Mr Plenck, who firft inftructed us in the method of mixing quickfilver with mucilage, obferves (and expericnce confirms the truth of it), that this prepa. ration is not fo apt to bring on a fitring as the argent. viz. mixed by any other medium, or as the faline and other mercurial preparations. - How far the theory by which he accounts for it may be juft is not of much importance; but it may perhaps be worth while 10 inquire, whether it would not be equally effectual in preventing calomel, and the other pieparations of mercary, from affecting the mouth. - If fo, is it not improper, where a falivation is intended, to give emulfions with gum arabic and other mucilaginous liquors for the patient's common drink, as by that means the fpitting may be fetarded ? And, on the contrary, may it not be a ufeful medicine to diminifh the cifcharge when too copious?
"The following cafe may in fome meafure ferve to confirm the above obfervation.-A gentleman, always eafily affected by mercurials, having taken about 26 grains of calomel in dofes from 1 to 3 grains, notwithftanding he was purged cvery third day, was fuddenly feized with a falivation. He fpat plentifully, his breatl was very fetid, teeth loofe, and his gums, fances, and the margin of his tongue, greatly ulcerated and inflamed. He was directed to ufe the following gargle. B. Cum. arb. Sentunt. folve in agua font. bullicnt. Jelib. © adde mel. rofac.unc. unam, Ml.ft.gargar. And to drink freely of a prifan prepared with aq. bord. lib. ij.gum. arabic unc. $i j$. nitr. pur. drachm. ij. facchar.al6. unc. $j$. His purgative was repeated the fucceeding morning. The next day his gums were lefs inflamed, but the floughs on his tongue, \&c. were ftill as foul : his fpiting was much the fame : he had drank about a pincof the ptifan. Some fpt. vitrin/l was added to the gargle. From this day to the fourth he was purged every day without effect, his falivation fill continued, his mouth was no better, he had neglected the mucilaginous drink. This cvening he was perfuaded to drink about a pint of ir which remained, and he had it repeated, and drank very freely of icthat night. On the fifth morning the purgative was again repeated. Though it operated very litile, yet the change was very furprifing : his mouth was nearly well, and his ptyalifm greatly decreafed. The ptifan was repeated ;

## GUM

arim.
and on the fixth day, being quite well, he was permitted to go abroad."

In Mr Haffelquif's Travels we have an inftance of the extraordinary nutritive virtues of this guin. "The Abyfinians (fays he) make a journey every year to Cairo, to fell the products of their conntry. They muft travel over terrible defarts, and their journey depends as much on the weather as a voyage at fea: confequently they know as little as a feaman how long they muft be on their journey; and the neceffaries of life may chance to fail them when the journey lafts too long. This happened to the Abyffinian caravan in the year 1740, their provifions being confumed when they had fill two months to travel. They were then obliged to fearch for fomething among their merchandife wherewith they might fupport nature ; and found nothing more proper than gum arabic, of which they had carried a confiderable quantity along with them. This ferved to fupport above 1000 perfons for two months; and the caravan at laft arrived at Cairo without any great lofs of people either by hunger or difeales.

Gum Seneca, is a gum extremely refembling gum arabic. It is brought to us from the country through which the river Senega runs, in loofe or fingle drops: but thefe are much larger than thofe of the gum arabic ufually are ; fometimes it is of the bignefs of an egg, and fometimes mach larger : the furface is very round or wrinkled, and appears much lefs bright than the inner fubftance where the maffes are broken. It has no fmell, and fcarce any tafte. It is probably produced from a tree of the fame kind with the former. The virtues of it are the fame with the gum arabic ; but it is rarely ufed in medicine, unlefs as mixed with the gum arabic: the dyers and other artificers confume the great quantities of it that are annually imported hither. The negroes diffolve it in milk, and in that fate make it a principal ingredient in many of their difhes, and often feed on it thus alone.
GUMTragacanth, the gum of the tragacanth, a thorny bufh growing in Crete, Afia, and Greece. See A. stragalus.
Other fubftances known by the name of gums are as follow:
Gum Ammoniac. Sec Ammoniac.
Gum Elemi. See Amyris.
Gum Keno See Keno.
Gum Guaiacum. See Gualacum.
Guim Lacca. See Coccus and Lacca.
Gum, among gardeners, a kind of gangrene incident to fruit-trees of the ftone kind, arifing from a corruption of the fap, which, by its vifcidity, not being able to make its way through the fibres of the tree, is, by the protrufion of other juice, made to extravafate and ooze out upon the bark.

When the diftemper furrounds the branch, it admits of no remedy; but when only on one part of a bough; it fhould be taken off to the quick, and fome cowdung elapped on the wound, covered over with a linen cloth, and tied down. M. Quintinie directs to cut off the morbid branch two or three inches below the part affected.

GUMMA, a fort of venereal excrefcence on the perioftem of the bones.

GUMS, in anatomy, the hard fleflyy fubftance in Vol. VILI

## $193] \quad G \mathbb{N}$

either jaw, through which the teeth fpring from the Gunt jawbone. See Anatomy, $11^{\circ}$ io2.

The gums are apt to become fpongy, and to reparate from the teeth; but the caufe is frequently a ftouy kind of cruft, which forms itfelf therein, which when feparated, the gums foon return to their former ftate, efpecially if rubbed with a mixture of the infuffon of rofes four parts, and the tincture of myrrh one part.The feurvy is another diforder, which affects the gums. This diforder, when not manifeft in any other part, fometimes appeais in this: indeed, when a fcorbutic diforder invades the whole habit its firft fymptom is a putrid fate of the gums.

GUN, in the military art, a fire-arm, or weapon of offence, which forcibly difcharges a ball or other hard and folid matter through a cylindric tube, by means of inflamed gun-powder. See Gun-Powder.

The word gun now includes moft of the fpecies of fire-arms; piftols and mortars being almort the only ones excepted from this denomination. They are divided into great and fmall guns : the former including. all that we alfo call cannon, ordnance, or artillery; the latter includes mufquets, carabines, mufquetoons blunderbuffes, fowling-pieces, \&c.

It is not known at what time thefe weapons were firft invented. Though, comparatively fpeaking, the introdaction of guns into the weftern part of the world is but of a modern date ; yet it is certain that in fome parts of Afia they have been ufed, though in a very rude and imperfect manner, for many ages.-PhiloAtratus fyeaks of a city near the river Ayphafis in the Indies, which was faid to be impregnable, and that its inhabitants were relations of the gods, becaufe they threw thunder and lightning upon their enemies. Hence fome imagine that guns were ufed by the eaftern nations even in thetime of Alexander the Great; but however this may be, many of our modern travellers affert. that they were ufed in China as far back as the year of Chrift 85, and have continued in ufe ever fince.

The firlt lint of the invention of gons in Europe is in the works of Roger Bacon, who flourifhed in the 13th century. In a rreatife written by him about the year 1280, he propofes to apply the violent explofive force of gun-powder for the deftruction of armies. In 1320, Bartholomew Schwartz, a German monk, is commonly faid to have invented gun-powder, though it is certainly known that this compofition is defcribed by Bacon in fome of his treatifes long before the time of Schwartz. The following is faid to have been the manner in which Schwartz invented gun-powder. Having pounded the materials for it in a mortar, which he afterwards covered with a fone, a fpark of fire accidentally fell into the mortar and fet the mixture on fire ; upon which the explofion blew the ftone to a confiderable diftance. Hence it is probable that Schwartz might be taught the fimpleft method of applying it in war ; for Bacon feems rather to have conceived the manner of ufing it to be by the violent effort of the flama unconfined, and which is indeed capable of producing afonifhing effects*. The figure and name of mortar's given toa fecies of old artillery, and their employment (which was throwing great ftone-bullers at an elevation), very much corroborates this conjecture.

Soon after the time of Schwartz, we find guns commonly made ufe of as inftruments of war, Great A 2
guns
*See Guth poizdier.
guns were firft ufed. They were originally made of iron bars foldered together, and fortified with ftrong iron-hoops; fome of which areftill to be feen, viz. one in the Tower of London, two at Woolwich, and one in the royal arfenal at Lifbon. Orhers were made of thin theets of iron rolled up together and hooped; and on emergencies they were made of leather, with plates

- of iron or copper. Thefe pieces were made in a rude and imperfect manner, like the firft effays of many new inveations. Sone balls were thrown out of them, and a fmall quantity of powder ufed on account of their weaknefs. Thefe pieces had no ornaments, were placed on their carriages by rings, and were of a cylindrical form. When or by whon they were made is uncertain; the Venetians, however, ufed cannon at the fiege of Clandia Jeffa, now called Chioggia, in 1366 , which were brought thither by two Germans, with fome powder and leaden balls; as likewife in the wars with the Genoefe in 1379. King Edward III, made ufe of cannon at the battle of Crefly in $\mathbf{3 4 6}$, and at the fiege of Calais in 1347. Cannon were made ufe of by the Turks at the fiege of Conftantinople, then in poffer. fion of the Chriftians, in 1394, and in that of 1452, that threw a weight of 100 lb . but they generally burft cither the firft, fecond, or third fhot. Louis XII. had one caft at Tours, of the fame fize, which threw a tall from the Baftile to Charenton. One of thofe famous cannon was taken at the fiege of Dieu in 1546 , by Don John de Caftro; and is in the caftle of St JuiHiao da Barra, 10 miles from Lifbon : its length is 20 feet 7 inches, diaineter at the centre 6 feet 3 inches, and it difcharges a ball of 10016 . It has neith er dolphins, rings, nor button; is of a curious kind of metal; and has a large Indoftan infeription upon it $_{2}$ which fays it was caft in 1400.

Formerly the cannon were dignified with uncommon names; for, in 1503 , Louis XII. had 12 brafs cannon calt, of an extraordinary fize, called after the names of the 12 peers of France. The Spanifh and Portuguefe called them after their faints. The emperor Charles V. when he marched before Tunis, founded the 12 apofles. At milan there is a 70 pounder, called the Pimontelle; ; and one at Bois-le-duc, called the Devil. A 60 pounder at Dover-caftle, called Queen Elizabeth's pocket.pifol. An 80 pounder in the tower of London: (formeriy in Edinburgh-cafte), called Mounts-meg. An 80 pounder in the royal arfenal at Berlin, called the Thunderer. An 80 pounder at Ma. liggo, called the Terrible. Two curions 60 pounders in the arfenal at Bremen, called the Meffengers of bad news. And, laftly, an uncommon 70 pounder in the caftle of St Angelo at Rome, made of the nails, that faftened the copper-plates which covered the ancient Pantheon, with this infcription upon it : Exclavis trabalibus porticus Agrippa.

In the beginning of tine r 5 th century thefe uncommon names were generally abolifhed, and the following more aniverfal ones took place, wiz.

> Pound̉ers.

Moyens, which carried a ball of 10 or 20 ounces, \&c. Robiner, which carried a ball of $16^{\circ}$ ounces.

Thefe curious names of beafts and birds of prey were adopted on account of their fwiftnefs in motion or of their cruelty, as the falconet, falcon, facker, and culverin, \&c. for the fwiftnefs in flying; the bafilink, ferpentine, afpike, dragon, fyren, \&c. for their cruelty.

At prefent cannon take their namesfrom the weight of the ball they difcharge. Thas a piece that difcharges a ball of 24 pounds, is called a 24 pounder; one that carries a ball of 12 pounds, is called a 12 poun$d e r$; and fo of the reft, divided into the following foris, viz.

Sbip-guns, confifting in 42, 36, 32, 24, 18, 12; 9, 6, and 3 pounders.
Garrifon-guns, in $42,32,24,18,12,9$, and 6 pounders.

Battering-guns, in 24, 18, and 12 pounders.
Field-pieces, in 12, 9, 6, 3, 2, $1 \frac{1}{2}, 1$, and $\frac{\pi}{3}$ pounders.

Mortars are thought to have been fully as ancient as cannon. They were employed in the wars of Italy, to throw balls of red-hot iron, ftones, \&c. long before the invention of hells. Thefe laft are thought to be of German invention, and the ufe of them in war to have been taught by the following accident. A citizen of Venlo, at a certain feftival celebrated in honour of the duke of Cleves, threw a number of fhells, one of which fell on a houfe and fet fire to it, by which misfortune the greateft part of the town was reduced to alhes. The firft account of flells ufed for military purpofes is in 1435, when Naples was befieged by Charles VIII. Hiftory informs us with more certainty, that fhells were thrown out of mortars at the fiege of Wachtendonk, in Guelderland, in 1588; by the earl of Mansfield. Mr Maltar, an Englifh engineer, firf tanght the French the art of throwing. hells, which they practifed at the fiege of Motte in 1634 . The method of throwing red-hot balls out of the mortars was firft eertainly put in practice at the fiege of Siralfund in $\mathbf{r} 675$ by the elector of Brandenburgh; though fome fay in 1653 at the fiege of Bremen. For the proper dinuenfions of guns, their weight, the metal of which they are formed, \&c: fee the article Gunnery.

Mulkets were firf ufed at the fiege of Rhege in the year 152m. The Spaniards were the firt who armed part of their foot with thefe weapons. At firfthey were very heavy, and could not be ufed without a refl. They had match-locks, and did execution at a great diftance. On their march the foldiers carried only the refts and ammunition, and had boys to bear their mufkets after them. They were very flow in loading, not only by reafon of the unwieldinefs of thiir pieces,

## GUN [ 195$]$ GUN

cindelia, and becaufe they carried the powder and ball feparate, Gunellus. but from the time it took to prepare and adjuft the match; fo that their fire was not near fo brifk as ours is now. Afterwards a lighter matchlock muket came in ufe; and they carried their ammunition in bandeliers, to which were hung feveral little cafes of wood covered with leather, each containing a charge of powder. The balls were carried loofe in a pouch, and a priming-horn hanging by their fide. The mufkets with refts were ufed as late as the beginning of the civil wars in the time of Charles I. The lighter kind fucceeded them, and continued till the beginning of the prefent century, when they alfo were diffufed, and the troops throughout Europe armed with firelocks.

GUNDELIA, in botany : A genus of the polygamia fegregatæ order, belonging to the fyngenefia clafs of plants; and in the natural method ranking under the 49th order, Compofitie. There is fcarce any calyx, but quinqueflorous, with tubular hermaphrodite torets, the receptacle briftly, with fcarce any pappus.
guneluds, in itchthyology. See Biennius.

GUNNER, an officer appointed for the fervice of the cannon, or one fkilled'to fire the guns.

In the Tower of London, and other garrifons, as well as in the field, this officer carries a field ftaff, and a large powder-horn in a ftring over his left hooulder: he marches by the guns; and whon there is any apprehenfion of danger, his ficld flaff is armed with match. His bufinefs is to lay the gun to pais, and to hell to load and traverfe her.

Mafler Gunner, a patent-officer of we ordnance, who is appointed to teach all fuch as learn the art of gunnery, and to certify to the nafter-general the at:lity of any perfon recommended to be one of the king's gunners. To every fcholar he adminifters an oath not to ferve, without leave, any other prince or ftate; or teach any one the art of gunnery bui fuch as have taken the faid oath.

GUNNERA, in botany; a genus of the diandria order, belonging to the gynandria clafs of plants. The amentum condifts of uniflorous fcales there is neither calyx nor corolla; the germen is bidented, with two fyles and one feed.

## G U $\quad \mathrm{N} \quad \mathrm{N} \quad \mathrm{E} \quad \mathrm{R} \quad \mathrm{Y}$,

IS the art of charging, directing, and exploding firearms, as cannons, mortars, mukets, \&c. to the beft advantage.-As this art depends greatly on having the guns and fhot of a proper fize and figure, and well adapted to each other, it hence follows that the proper dimenfions, \&c. of cannons and fmall arms come properly to be confidered under the prefent article.

## Sect. I. Hiftory of Gunnery.

The ancients, who knew not the ufe of gunpowder and fire-arms, had notwithftanding machines which were capable of difcharging fones, darts, and arrows, with great force. Thefe were actuated chicfly by the elaftic force of ropes, or of ftrong fprings, and reuired a great number of men to work them; for which reafon, the explofion of gunpowder, as acting inftantaneounly, and feemingly with irrefiftible force, feemed to be a molt proper fuccedaneum for all the powers by which the military engines in former times were actuated. It foon appeared, however, that this force was not very eafily applied. Though the experiment of Bartholomew Schwartz, mentioned under the article Gun, had given a good hint towards this application in a fuccefsful manner, yet the violent reaction of the inflamed powder on the containing veffels rendered them very apt to burf, to the great danger of thofe who ftood near them. The gunpowder in thofe days, therefore was much weaker than it is now made, though this proved a very infufficient remedy for the inconvenience abovementioned. It was alfo foon difcovered, that iron bullets of much lefs weight than fone ones would be more efficacions if impelled by greater quantities of ftronger powder. This occafioned an alteration in the matter and form of the cannon, which were now caft of brafs. Thefe were lighter and more manageable than the former, at the fame time that they were ftronger in proportion to their bore: Thus they were capable of enduring greater charges of a better powder than what had been formerly ufed;
and their iron-bullets (which were from 40 or 60 pounds weight), being impelled with greater velocities were more effectual than the heavieft fones could ever prove. This change took place about the latter end of the 1 sth century.

By this means powder compounded in the manner now practifed over all Europe came firft in ufe. But the change of the proportion of materials was not the only improvement it received. The method of graining it is undoubtedly a confiderable advantage. At firft the powder was always in the form of fine meal, fuch as it was reduced to by grinding the materials together. It is doubtful whether the firt graining of powder was intended to increafe its ftrength, or only to render it more convenient for filling into fmall charges and the charging of fmall arms, to whick alone it was applied for many years, whillt meal powder was ftill made ufe for cannon. But at laft the additional frength which the grained powder was found to acquire from the free paffage of the air between the grains, occafioned the meal powder to be entirely laid afide.

For the laft two hundred years, the formation of cannon hath been very little improved: the beft pieces of modern artillery differing little in their proportions from thofe ufed in the time of Charles $V$. Indeed lighter and florter pieces have been often propofed and effayed; but though they have their advantages in particular cafes, yet it feems now to he agreed that they are altogether infufficient for general fervice. But though the proportions of the pieces have not been much varied within that period, yet their ufe and application have undergone confiderable alterations; the fame ends being now accomplifhed by inaller pieces than what were formerly thought necellary. Thus the battering cannon now univerfally approved of are thofe formerly called demi-cannons, carrying a ball of 24 pounds weight; it being found by experience, that their froke, though lefs violent than that
ftions hence arifing, and many difpucs on motion were fet on foot (efpecially in Italy), - which continued till the time of Galileo, and probably gave rife to his celebrated Dialogues on mation. Thefe were publifhed in the year 1638 ; but in this interval, and before Galileo's doctrine was thoroughly eftablifhed, many theories of the motion of military projectiles, and many tables of their comparative ranges at different elevations, were publifhed; all of them egregioufly fallacious, and utterly irreconcileable with the motions of thefe bodies. Very few of the ancients indeed refrained from indulging themfelves in feecalations concerning the difference betwixt natural, violent, and mixed motions; although fcarce any two of them could agree in their theories.

It is ftrange, however, that, during all thefe con- Experitefts, fo few of thofe who were intrufted with the ments by charge of artillery though it worth while to bring different thefe theories to the telt of experiment. Mr Robins $\begin{gathered}\text { perfons on } \\ \text { thanges }\end{gathered}$ informs us, in his Preface to the lew Principles of of artillery, Gunnery, that he had met with no more than four authors who had treated on this fubject. The firft of thefe is Collado, who has given the ranges of a falconet carrying a three-pound fhot to each point of the gunner's quadrant. But from his numbers it is manifeft, that the piece was not charged with its cufto. mary allotment of gun-powder. The refults of his trials were, that the point-blank fhor, or that in which the path of the ball did not fenfibly deviate from a right.line, extended 268 paces. At an elevation of one point (or $7^{\circ} \frac{1}{2}$ of the gunner's quadrant) the range was 594 paces; at an elevation of two points, 794 paces; at three points, 954 paces; at four, roio: at five, 1040 ; and at fix, 1053 paces. At the feventh point, the range fell between thofe of the third and fourth: at the eighth point, it fell between the ranges of the fecond and third; at the ninth point, it fell between the ranges of the firf and fecond; at the tenth point, it fell between the point-blank difance and that of the firft point: and at the eleventh point, it fell very near the piece.-The paces fpoke of by this author are not geometrical ones, but common fteps.

The year after Collado's treatife, another appeared on the fame fubject by one Bourne an Englifhman. His elevations were not regulated by the points of the gunner's quadrant, but by degrees; and lie afcertains the proportions between the ranges at different elevations and the extent of the point-blank fhot. According to him, if the extent of the point-blank fhot be reprefented by 1 , the range at $5^{\circ}$ elevation will be $2 \frac{2}{9}$, at $10^{\circ}$ it will be $3 \frac{1}{3}$, at $15^{\circ}$ it will be $4^{\frac{1}{3}}$, at $20^{\circ}$ it will be $4 \frac{3}{3}$, and the greateft random will be $5 \frac{1}{2}$. This laft, he tells us, is in a calm day when the piece is elevated to $42^{\circ}$; but according to the ftrength of the wind, and as it favours or oppofes the flight of the fhot, it may be from $45^{\circ}$ to $36^{\circ}$.-He hath not informed us with what piece he made his trials; though by his proportions it feems to have been a fmall one. This however ought to have been attended to, as the relation between the extent of different ranges varies extremely according to the velocity and denfity of the bullet.

After him Eldred and Anderfon, both Englifhmen, publifhed treatifes on this fubject. The firft pub-

Theory. lifhed his treatife in 1656, and has given the actual ranges of different pieces of artillery at fmall elevations all under ten degrees. His principles were not rigoroully true, though not liable to very confiderable errors; yet, in confequence of their deviation from the truth, he found it impoffible to make fome of his experiments agree with his principles.

In 1638, Galileo, printed his dialoguts on motion. In thefe he pointed out the general laws obferved by nature in the production and compofition of motion; and was the firft who defcribed the action and effects of gravity on falling bodies. On thefe principles he determined, that the flight of a cannon hot, or any other projectile, would be in the curve of a parabola, except in as far as it was diverted from that track by the refiftance of the air. He has alfo propofed the means of examining the inequalities which arife from thence, and of difcovering what fenfible effects that refiftance would produce in the motion of a bullet at fome given diftance from the piece.

Though Galileo had thus fhown, that independent of the refiftance of the air, all projectiles would, in their flight defcribe the curve of a parabola; yet thofe who came after him, feem never to have imagined that it was neceffary to confider how far the operations of gunnery were affected by this refiftance. The fubfequent writers indeed boldly afferted, without making the experiment, that no conliderable variation could arife from the refiftance of the air in the flight of fhells or cannon fhot. In this perfaafion they fupported themfelves chiefly by confidering the extreme rarity of the air, compared with thofe denfe and ponderous bodies ; and at laft it became an almoft generally eftabliflied maxim, that the flight of thefe boders was nearly in the curve of a parabola.

In 1674, Mr Anderfon, abovementioned publifhed his treatife on the nature and effects of the gun;- in which he proceeds on the principles of Galileo, and ftremoufly afferts, that the fight of all bullets is in the curve of a parabola; undertaking to anfwer all objections that could be brought to the contrary. The fame thing was alfo undertaken by Mr Blondel, in a treatife publifhed at Paris in 1683 ; where, after long difcuffion, the author concludes, that the variations from the air's refiftance are fo llight as fcarce merit notice. The fame fubject is treated of in the Philofophical Tranfactions, $\mathrm{N}^{\mathrm{Q}} 2$ 26. p. 68. by Dr Halley; and healfo, fwayed by the very great difproportion beween the denfity of the air and that of iron or lead, thinks it reafonable to believe, that the oppofition of the air to large metal-fhot is farcely difcernible; although in fmall and light fhot he owns that it muft be accounted for.

But though this hypothefis went on fmoothly in fpeculation: yet Anderfon, who made a great number of trials, found it impoffible to fupport it without fome new modification. For though it does not appear that he ever examined the comparative ranges of eirher cannon or muket fhot when fired with their ufual velocities, yet his experiments on the ranges of fhells thrown with fmall velocities (in comparifon of thofe abovementioned), convinced him that their whole tract was not parabolical. But inftead of making the proper inferences from hence, and concluding the xefiftance of the air to be of confiderable efficacy, he
framed a new hypothefis; which was, that the fhell or Theory. bullet, at its firlt difcharge, Hew to a certain diftance in a right line, from the end of which line only it began to defcribe a parabola. And this right line, which he calls the line of the impulfe of the fre, he fuppofes to be the fame in all elevations. Thus, by affigning a proper length to this line of impulfe, it was always in his power to reconcile any two thots made at different angles, let them differ as widely as we pleafe to fuppofe. But this he could nothave done with three fhots; nor indeed doth he ever tell us the event of his experiments when three ranges were tried at one time.

When Sir Iface Newton's Principia was publifhed, Laws of he particularly confidered the refiftance of the air to the air's reprojectiles which moved with fmall velocities; but as fiftance laid: he never had an opportunity of making experiments down by on thofe which move with fuch prodigious fwiftnefs, Newton. he did not imagine that a difference in velocity could make fuch differences in the refiftance as are now found to take place. Sir Ifaac found, that, in fmall velocities, the refiftance was increafed in the duplicate proportion of the fwiftnefs with which the body moved; that is, a body moving with twice the velocity of another of equal magnitude, would meet with four times as much refiftance as the firft, with thrice the velocity it would meet with nine times the refiftance, \&c.-This principle itfelf is now found to be erroneous with regard to military projectiles; though, if it had been properly attended to, the refiftance of the air might even from thence have been reckoned much more confiderable than was commonly done. So far, however, were thofe who treated this fubject fcientifically, from giving a proper allowance for the refiftance of the aimofphere, that their theories differed moft egregioully from the truth. Huygens alone feems to have attended to this principle; for, in the year 1690, he pablighed a treatife on Gravity, in which he gave an account of fome experiments tending to prove, that the track of all projectiles moving with very fwift motions was widely different from that of a parabola. All the reft of the learned acquiefced in the juftnefs of Galileo's doctrine, and very erroneons calculations concerning the ranges of cannon were accordingly given. Nor was any notice taken of thefe errors till the year 1716 . At that time Mr Reffons, a French officer of artillery, difting nifhed by the number of fieges at which hehad ferved by his high military rank theories by his abilities in his profeffion, gave a memoir widely dif. the Royal Acal the Royal Academy, of which he was a member, im- the truthe porting, that, 's although it was agreed, that theory joined with practice did conftitute the perfection of every art ; yet experience bad taught him, that theory was of very little fervice in the ufe of mortars: That the works of M. Blondel had jufly enough defcribed the feveral parabolic lines, according to the different degrees of the elevation of the piece; but that practice had convinced him, there was no theory in the effect of gunpowder; for having endeavoured, with the greateft precifion, to poin a mortar agrecabl to thefe calculations, he had never beell able to eftabiin any folid foundation upon them."

From the hiftory of the acalemy, it doth not appear that the fentiuents of Mr Refons wereac any ime controverted, or any reafon offered for the fatlure of

the theory of projectiles when applied to ufe. Nothing farther, however, was done till the time of Benjamin Robins, who in 1742 publifhed a treatife, intitled,

## ${ }_{\text {Robins }}$

 firft introduces a true theory. New Principlcs of Gumery, in which he hath created particularly not only of the refiftance of the atmoSphere, but almon every thing elfe relating to the flight of military projectiles, and indeed advanced the theury of gunnery much nearer perfection than ever it was 10 before.His method The firft thing confidered by Mr Robins, and which of determi- is indeed the foundation of al lother particulars relaning the tive to gunnery, is the explofive force of ganpowder: gun pow- This he determined to be owing to an elaftic fluid fider, milar to our atmofphere, having its elattic force greatly increafed by the heat. "If a red-hot iron (fays he) be included in a receiver, and the receiver be exhaulted, and gunpowder be thenlet fall on the iron, the powder will take fire, and the mercurial gage will fuddenly defcend upon the explofion; and though it immediately afcends again, it will never rife to the height it firf flood at, but will continie depreffed by a fpace proportioned to the quantity of powder which was let fall on the iron.-The fame production likewife takes place when gunpowder is fired in the air: for if a fmall quantity of powder is placed in the upper part of a glafs tube, the lower part of which is immerfed in water, and the flaid be made to rife fo near the top, that only a fimall portion of air is left in that part where the gunpowder is placed; if in this fitaution the communication of the upper part of the tube with the external air is clofed, and the gunpowder fired, which may be eafily done by means of a burning-glafs, the water will in this experiment defcend on the explofion, as the quickfilver did in the laft; and will always continue depreffed below the place at which it ftood before the explofion. The quantity of this depreffion will be greater if the quantity of powder be increafed, or the diameter of the tube be diminifhed.
*When any confiderable quantity of gunpowder is fired in an exbaufted receiver, by being let fall on a red-hot iron, the mercurial gage inftantly defcends upon the explofion, and as fuddenly arcends again. Afrer a few vibrations, none of which except the firft are of any great exient, it feemingly fixes at a point lower than where it ftood betore the explofion. But even when the gage has acquired this point of apparent reft, it ftill continues rifing for a confiderable time, alrhough by fuch imperceptible degrees, that it can only be difcovered by comparing its place at diftant intervals: however, it will not always continue to afcend; but will rife flower and flower, till at laft it will be abfolutely fixed at a point lower than where the mercury ftood before the explofion. The fame circumftances nearly happen, when powder is fired in the npper part of an unexhaufted tube, whofe lower part is immerfed in water.
" That the elafticity or preffure of the fluid produced by the firing of gunpowder is, cateris paribus, directiy as its denfity, may be proved from hence, that if in the fame receiver a double quantity of powder be let fall, the mercury will fubfide twice as much as in the firing of a fingle quantity. Alfo the defcents of the mercury, when equal quantities of powder are fired in different receivers, are reciprocally as the capacities of thofe reccivere, and confequently as the denfity of
produced fluid in each. But as, in the ufual method of trying this experiment, the quantities of powder are fo very fmall that it is difficult to afcettain thefe proportions with the requifite degree of exactnefs, I took a large receiver containing about 520 inches, and letting fall at once on the red-hot iron one drachm or the fixteenth part of an ounce avoirdupois of powder, the recciver being firft nearly exhaufted; the mercury, after the explofion, was fubfided two inches exactly, and all the power had taken fire. Then heating the iron a fecond time, and exhaufting the receiver as before, two drachms were let down at once, which funk the mercury three inches and three quarters; and a fmall part of the powder had fallen befide the iron, which (the bot tom of the receiver being wet) did not fire, and the quantity which thus efcaped did appear to be nearly fufficient, had it fallen on the iron, to have funk the mercury a quarter of an inch more; in which cafe the two defcents, viz. two inches and four inches, would have been accurately in the proportion of the refpec. tive quantities of powder; from which proportion, as it was, they very little varied.
"As different kinds of gunpowder produce different quantities of this fluid, in proportion to their different degrees of goodnefs, before any definite determination of this kind can take place, it is neceffary to afcertain the particular fpecies of powder that is propofed to be ufed. (Here Mr Robins determines in all his experiments to make ufe of government-powder, as confifting of a certain and invariable proportion of materials, and therefore preferable to fuch kinds as are made according to the fancy of private perfons.)
"This being fettled, we maft further premife thefe two principles : r . That the elafticity of this fluid increales by heat and diminifhes by cold, in the fame manner as that of the air ; 2. That the denfity of this fluid, and confequently its weight, is the fame with the weight of an equal bulk of air, having the fame elafticity and the fame temperature. Now, from the laft experiment it appears, that ${ }^{\frac{1}{6}}$ b of an ounce avoirdupois or about 27 grains Troy of powder, funk the gage, on its explofion, two inches; and the mercury in the barometer flanding at near 30 inches, $\frac{1}{7} \frac{5}{6}$ ths of an ounce avoirdupois, or 410 grains Troy, would have filled the receiver with a fluid whofe elafticity would have been equal to the whole preffure of the atmofphere, or the fame with the elafticity of the air we breathe; and the content of the receiver being about 520 cubic inches, it follows, that $\frac{5}{7} \frac{5}{6}$ the of an ounce of powder will produce 520 cubic inches of a fluid poffef. fing the fame degree of elafticity with the commonair: whence an ounce of powder will produce near $575 \mathrm{cl}-$ bic inches of fach a fluid.
" But in order to afcertain the denfity of this fluid, we muft confider what part of its elafticity, at the time of this determination, was owing to the heat it received from the included hot-iron and the warm receiver Now the general heat of the receiver being manifefly lefs than that of bailing water, which is known to in creafe the elafticity of the air to fomewhat more than $\frac{1}{4}$ of its augmented quantity; I collect from hence and other circumftances, that the augmentation of elafticity from this caufe was about $\frac{5}{5}$ of the whole : that is, if the fluid arifing from the explofion had been reduced to the temperature of the external air, the defcent of

Theory, the mercurial gage, inftead of two inches, would have been only ${ }_{3}{ }^{\prime}$ inch; whence 575 , reduced in the proportion of five to four, become 460 ; and this laft number reprefents the cubic inches of an elaftic fluid equal in denfity and elafticity with common air, which are produced from the explofion of 1 ounce avoirdupoife of ganpowder ; the weight of which quantity of flaid, according to the ufual eftimation of the weight of air, is 131 grains; whence the weight of this fluid is $\frac{1}{4} \frac{3}{3} \frac{3}{7}$ or $7_{7}^{3}$ th nearly of the weight of the generating powder. The ratio of the bulk of gunpowder to the bulk of this fluid may be determined from confidering that 17 drams avoirdupois of powder fill two cubic inches, if the powder be well hook together; therefore augmenting the number laft found in the proportion of 16 to 17 , the refulting term $488 \frac{3}{4}$ is the number of cubic inches of an elaftic fluid, equal in denfity with the air produced from two cubic inches of powder; whence the ratio of the refpective bulk of the powder, and of the fluid produced from it, is in round numbers as 1 to $244 .{ }^{\circ}$ This calculation was afterwards juftified by experiments.
" If this fluid, inftead of expanding when the pow. der was fired, had been confined inthe fame fpace which the powder filled before the explofion then it would have had, in that confined ftate, a degree of clafticity 244 times greater than that of common air; and this independent of the great augmentation this elafticity would receive from the action of the fire in that inflant.
" Hence, then, we are certain, that any quartity of powder, fired in a confined fpace, which it adequately fills, exerts, at the inftant of its explofion, againft the fides of the veffel containing it, and the bodies it impels before it, a force at lealt 244 times greater than the elafticity of the common air, or, which is the fame thing than the preffure of the atmofphere; and this without confidering the great addition which this force will receive from the violent degree of heat with which it is affected at that time.
" To determine how far the elafticity of air is aug-mented when heated to the extremelt degree of red. hot iron, I took a piece of a mukket-barrel about fix inches in length, and ordered one end to be clofed up entirely ; but the other end was drawn out conically, and finifhed in an aperture of about $\frac{x}{2}$ of an inch in diameter. The tube thus fitted, was heated to the extremity of a red heat in a fmith's forge; and was then immerfed with its aperture downwards in a bucket of water, and kept there till it was cool : after which it was taken out carefully, and the water which had entered it in cooling was exactly weighed. The heat given to the tube at each time, was the beginning of what workmen call a white heat; and to prevent the rufhing in of the aqueous vapour at the immerfion, which would otherwife drive out great part of the air, and render the experiment fallacious, I had an iron wire filed tapering, fo as to fit the aperture of the tube, and with this I always ftopped it up before it was taken from the fire, letting the wire remain in till the whole was cool, when, removing it, the due quantity of water would enter. The weight of the water thas taken in at three different trials was 610 grains, 595 grains, and 600 grains, refpectively. The content of the whole eavity of the tube was 796 grains of water; whence
the faces remaining unflled in thefe three experiment were 186, 201, and 196 graîs refpectively. Thefe fpaces undoubtedly contained all the air which, when the tube was red-hot, extended through its whole concavity; confequently the elafticity of the air, when heated to the extreme heat of red-hot iron, was to the elafticity of the fame air, when reduced to the temperature of the ambient atmorphere, as the whole capacity of the tube to the refpective fpaces taken up by the cooled air; that is, as 796 to 186, 201, 196: or taking the medium of thefe three trials, as 796 to $1944_{3}^{\frac{x}{3}}$.
"As air and this fluid appear to be equally affected by heat and cold, and confequemly have their clafticities equally augmented by the addition of equal degrees of heat to each ; if we fuppofe the heat with which the flame of fired powder is endowed to be the fame with that of the extreme heat of red-hot iron, then the elafticity of the generated fluid will be greater at the time of the explofion than afterwards, when it is reduced to the temperature of the ambient air, in the ratio of 796 to $194^{\frac{x}{3}}$ nearly. It being allowed then, (which furely is very reafonable), that the flame of gunpowder is not lefs hot than red-hot iron, and the elafticity of the air, and confequently of the fluid generated by the explofion, being augmented in the extremity of this heat in the ratio of $194 \frac{x}{3}$, to 796 , it follows, that if 244 be angmented in this ratio, the refulting number, which is $999_{\frac{1}{3}}$, will determine how many times the elafticity of the flame of fired powder exceeds the elafticity of common air, fuppofing it to be confined in the fame fpace which the powder filled before it was fired. Hence then the abiolute quantity of the preffure exerted by gunpowder at the moment of its explofion may be afligued; for, lince the fluid then generated has an elanticity of $9999^{\frac{1}{3}}$, or in round numbers 1000 times greater than that of the atmorphere, and fince common air by its elafticity exerts a preffare on any given furface equal to the weight of the incumbent armofphere with which it is in equilibrio, the preffure exerted by fired powder before it dilates itfelf is 1000 times greater than the preffure of the atmofphere: and confequently the quantity of this force, on a furface of an inch fquare, amounts to above fix ton weight; which force, however, diminithes as the fluid dilates it Celf.
of bur hough we have bere fuppored that the heat of gunpowder when fired in any confiderable quantity, is the fame with iron heated to the extremity of red hear, or to the beginning of a white heat, yct it cannot be doubted but that the fire produced in the explofon is fomewhat varied (like all other fires) by a greater or leffer quantity of fuel; and it may be prefumed, that, according to the quantity of powder fired together, the flame may have all the different degrees, from a languid red heat to that fufficient for: the vitrification of metals. But as the quantity of powder requifite for the production of his laft mentioned heat, is certainly greater than what is ever fired together for any military purpofe, we cannot be far from our foope, if we fuppofe the beat of fuch quantities as are ufually fired to be nearly the fame with that of red-hot iron; allowing a gradual augmentation to this heat in larger quantities and diminilhing it when the quantities are very fmall."

Theory.
12
Mr Ro.
bins's method of determining the, velocities of balls.

13 inftantaneous firing of powder.

Having thus determitited the force of the gunpowder, Mr Robins next proceeds to determine the velocity with which the ball is difcharged. The folution of this problem depends on the two following principles. I. That the action of the powder on the bullet ceafes as foon as the bullet is got out of the piece. 2. That all the powder of the charge is fired and converted into elaftic fluid before the bullet is fenfibly moved from its place.
"The firft of thefe (fays Mr Robins) will appear manifett, when it is confidered how fuddenly the flame will extend itfelf on every fide, by its own elafticity, when it is once got out of the mouth of the piece; for by this means its force will then be diflipated, and the ballet no longer fenfibly affeeted by it.
"The fecond principle is indeed lefs obvious, being contrary to the general opinion of almolt all writers on this fubject: $\mathrm{It}_{\text {; }}$ might however, be fufficient for the proof of this pofition; to obferve the prodigious compreffion of the flame in the chamber of the piece. Thofe who attend to this circumflance, and to the eafy parfage of the flame through the intervals of the grains, may foon fatisfy themieves, that no one grain contained in that chamber can continue for any time uninflamed, when thus furrounded and preffed by fuch an alive fire. However; not to rely on mere fipeculation in a matter of fo much confequence, I confidered, that if part only of the powder is fired, and that facceffively; then by laying a greater weight before the charge (fuppofe two or three bullets inftead of one), a greater quantity of powder would neceffarily be fired, fince a heavier weight would be a longer time in paffing through the barrel. Whence it hould follow, that two or three bullets would be impelled by a much greater force than one only. But the contrary to this appears by experiment; for firing one, two, and three bullets laid contiguous to each other with the fame charge refpectively, I have found that their velocities were not much different from the reciprocal of their fubdaplicate quantities of matter; that is, if a given charge would commonicate to one bullet a velocity of 1700 feet in a fecond, the fame charge would communicate to two bullets a velocity from 1250 to 1300 feet in a fecond, and to three bullets a velocity from 1050 to 1110 feet in the fame time. From hence it appears, that, whether a piece is loaded with a greater or lefs weight of bullet, the aetion is nearly the fame; fince all mathematicians know, that if bodies containing different quantities of matter are fucceffively impelled through the fame face by the fane power acting with a determined force at each point of that fpace; then the velocities given to thefe different bodies will be reciprocally in the fubduplicate ratio of their quantities of matter. The excefs of the velocities of the two and three bullets above what they ought to have been by this rule (which are that of 1200 and 980 feet in a fecond), undonbtedly arifes from the flame, which, efcaping by the fide of
" Now, this excefs has in many experiments been imperceptible, and the velocities have been reciprocally in the fubduplicate ratios of the number of bullets, to fufficient exactnels; and where this error has been greater, it has never axifen to an eighth part of
the whole: but if the common opinion was tiue, that Theory. a fmall parc only of the powder fires at firft, and other parts of it fucceffively as the ballet paffes through the barrel, and that a confiderable part of it is often blown out of the piece without firing at all; then the velocity which three bullets received from the explofion ough to have been much greater than we have found it to be.-But the truth of this fecond poftulate more fully appears from thofe experiments, by which it is fhown, that the velocities of bullers may be afcertained to the fame exactnefs when they are acted on through a barrel of four inches in length only, as when they are difo charged from one of four feer.
" With refpect to the grains of powder which are often blown out unfired, and which are always urged as a proof of the gradual firing of the charge, I believe Diego Uffano, a perfon of great experience in the art of gunnery, has given the true reafon for this accident; which is, that fome fmall part of the charge is often not rammed up with the reft, but is left in the piece before the wad, and is by this means expelled by the blaft of air before the fire can reach ir. I mult add, that, in the charging of cannon and fmall arms, efpecially after the firt time, this is fearcely to be avoided by any method I have yet feen praetifed. Perhaps, too, there may be fome few grains in the beft powder, of fuch an heterogencous compofition as to be lefs furfeeptible of firing; which, I think, I have myfelf obferved; and thefe, though they are furrounded by the flame, may be driven out unfired.
"Thefe poftulates being now allowed to be jaft, let ${ }^{15}$ $A B$ reprefent the axis of any piece of artillery, A the fration of breech, and B the mazzle; DC the diameter of its the force of bore, and DEGC a part of its cavity filled with pow- fired powder. Suppofe the ball that is to be impelled to lie ball with its hinder furface at the line GE; then the pref- Plate fure exerted at the explofion on the circle of which cexxve GE is the diameter, or, which is the fame thing, the fig, I. preffure exerted in the direction $F B$ on the furface of the ball, is eafily known from the known dimenfions of that circle. Draw any line FH perpendicular to FB, and AI parallel to FH ; and through the point H , to the afymptotes IA and AB, defcribe the hyperbola KHNQ; then, if FH reprefents the force impelling the ball at the point $F$, the force impelling the ball at any other point as at $M$, will be reprefented by the line M.N, the ordinate to the hyperbola at that point. For when the fluid impelling the body along has dilated itfelf to M , its denfity will be then to its original denfity in the face DEGC reciprocally as the fpaces through which it is extended; that is, as FA to MA, or as MN to FH: but it has been fhown, that the impelling force or elanicity of this fluid is directly as its denfity; therefore, if FH reprefents the force at the point $F$, $M N$ will reprefent the like force at the point M .
"Since the abfolute quantity of the force impelling the ball at the point $F$ is known, and the weight of the ball is alfo known, the proportion between the force with which the ball is impelled and its own gravity is known. In this proportion take FH to FL, and drawn LP parallel to FB ; then, MN the ordinate to the hyperbola in any point will be to its part MR, cut off by the line LP, as the impelling force of the powder in that point $M$ to the gravity of the ball; and
confequently the line LP will determine a line proportional to the uniform force of gravity in every point; whilft the hyperbola HNQ determines in like manner fuch ordinates as are proportional to the impelling force of the powder in every point; whence by the 39th Prop. of lib. r. of Sir Ifaac Newton's Principia, the areas FLPB and FHQB are in the duplicate proportion of the volocities which the ball would acquire when acted upon by its own gravity through the fíace FB, and when iurpelled through the fame fpace by the force of the powder. But fince the ratio of AF to AB and the ratio of FH to FL are known, the ratio of the area FLPB to the area FHOB is known; and thence its fubduplicate. And fince the line FB is given in magnitude, the velocity which a heavy body would acquire when impelled through this line by its own gravity is known; being no other than the velocity it would acquire by falling through a fpace equal to that line: find then another velocity to which this laft mentioned velocity bears the given ratio of the fabduplicate of the area FLPB to the area FHQB; and this velocity thus found is the velocity the ball will acquire when impelled through the fpace FB by the action of the inflamed powder.
" Now to give an example of this: Let us fuppofe AB , the length of the cylinder, to be 45 inches, its diameter DC, or rather the diameter of the ball, to be $\frac{3}{2}$ ths of an inch; and AF, the extent of the powder, to be $2 \frac{1}{5}$ th inches; to determine the velocity which will be communicated to a leaden bullet by the explofion, fuppofing the bullet to be laid at firf with its furface contiguous to the powder.
" By the theory we have laid down, it appears, that at the firft inftant of the explofion the fame will exert, on the bullet lying clofe to it, a force 1000 times greater than the prefure of the atmorphere. The medium preffure of the atmofphere is reckoned equal to a column of water 33 feet in height; whence, lead being to water as 11.345 to $\mathbf{I}$, this preffure will be equal to that of a column of lead 349 inches in height. Multiplying this by rooo, therefore, a column of lead 34900 inches (upwards of half a mile) in height, would produce a preffure on the bullet equal to what is exerted by the powder in the firft inftant of the explofion; and the leaden ball being $\frac{3}{4}$ ths of an inch in diameter, and confequently equal to a cylinder of lead of the fame bafe half an inch in height, the preffure at firft acting on it will be equal to $34900 \times 2$, or 69800 times its weight : whence FL to FH as I to 69800; and FB to FA as 45-25; or $42 \frac{3}{3}$ to $2 \frac{5}{8}$; that is, as 339 to 21 ; whence the rectangle FLPB is to the rectangle AFHS as 339 to $21 \times 69800$, that is, as I to 4324.-And from the known application of the logarithms to the menfuration of the hyperbolic fpaces it follows, that the rectangle AFHS is to the area FHOB as 43,429 , \&c. is to the tabular logarithm of $\frac{A B}{A F}$; that is of ${ }^{3} \times \mathrm{x} 9$ which is $\mathrm{r}, 2340579$; whence the ratio of the rectangle FLPB to the hyperbolic area FHOB is compounded of the ratios of I to 4324 --and of ,43499, \&c. to 1.2340579 ; which together make up the ratio of $I$ to 12263 , the fubduplicate of which is the ratio of Ito IIo, 7 ; and in this ratio is this velocity which the bullet would acquire by gravity in fallVor. VIII.
ing through a space equal to $\mathrm{F} B$, to the velocity the bullet will acquire from the action of the powder impelling it through FB. But the fpace FB being $42 \frac{3}{8}$ inches, the velocity a heavy body will acquire in falling through fach a fpace is known to be what would carry it nearly at the rate of 1507 feet in a fecond; whence the velocity to which this has the ratio of I to 110,7 is a velocity which will carry the ball at the rate of 1668 feet in one fecond. And this is the velocity which according to the theory, the bullet in the prefent circumftances would acquire from the action of the powder during the time of its dilatation.
${ }^{66}$ Now this velocity being once computed for one cafe, is eafily applied to any other; for if the cavity DEGC left behind the bullet be only in part filled with powder, then the line HF, and confequently the area FHQB will be diminifhed in the proportion of the whole cavity to the part filled. If the diameter of the bore be varied, the lengths $A B$ and $A F$ remaining the fame, then the cuantity of powder and the furface of the bullet which it acts on, will be varied in the duplicate proportion of the diameter, but the weight of the bullet will vary in the triplicate proportion of the diameter; wherefore the line FH , which is direetly as the abfolute impelling force of the powder, and reciprocally as the gravity of the bullet, will change in the reciprocal proportion of the diameter of the bullet. If AF, the height of the cavity left behind the bullet be increafed or diminifhed, the rectangle of the hyperbola, and confequently the area correfponding to ordinates in any given ratio, will he increafed or diminifhed in the fame proportion. From all which it follows, that the area FHQB, which is in the duplicate proportion of the velocity of the impelled body, will be directly as the logarithm $\frac{A B}{A F}$ (where $A B$ re. prefents the length of the barrel, and AF the length of the cavity left behind the bullet); alfo directly as the part of that cavity filled with powder; and in-
verfely as the diameter of the bore, or rather of the the part of that cavity filled with powder; and in-
verfely as the diameter of the bore, or rather of the bullet, likewife directly as AF, the height of the cavity
left behind the bullet. Confequently the velocity bebullet, likewife directly as AF, the height of the cavity
left behind the bullet. Confequently the velocity being computed as above, for a bullet of a determined diameter, placed in a piece of a given length, and
impelled by a given quantity of powder, occupying a diameter, placed in a piece of a given length, and
impelled by a given quantity of powder, occupying a given cavity behind the bullet; it follows, that by means
of thefe ratios, the velocity of any other bullet may of thefe ratios, the velocity of any other bullet may be thence deduced; the neceffary circumftances of its pofition, quantity of powder, \&c. being given. Where note, that in the inftance of this fuppofition, we have fuppofed the diameter of the ball to be $\frac{3}{\text { s.ths of an inch }}$;
whence the diameter of the bore will be fomething whence the diamecer of the bore will be fomething more, and the quantity of powder contained in the
fpace DEGC will amount exactly to i2 pennyweights, more, and the quantity of powder contained in the
fpace DEGC will amount exactly to i2 pennyweights, a fmall wad of tow included.
"In order to compare the velocities communicated to bullets by the explofion, with the velocities refulting from the theory by computation, it is neceffary that the actual velocities with which bullets move fhould be difcovered. Theonly merhods hitherto practifed for this purpofe, have been either by obferving the time of the flight of a fhot through a given fpace, or by meafuring the range of a fhot at a given elevation; and thence computing, on the parabolic hypaB b , on thefis, B b , on the parabolic thefis, a fmall wad of tow included. $\underbrace{\text { he ory: }}$
$\qquad$

$\qquad$

$\qquad$

$\qquad$

$\qquad$

thefis, what degree of velocity would produce this range. - The firft method labours under this infurmountable difficulty, that the velocities of there bodies are often fo fwift, and confequently the time obferved is fo Chort that an imperceptible error in that time may occafion an error in the velocity thus found of 2,3 , 4,5 , or 600 feet, in a fecond. The other method is fo fallacious, by reafon of the refiftance of the at. mofphere (to which inequality the firit is alfo liable), that the velocities thus affigned may not perhaps be the tenth part of the actual velocities fought.
" The fimpleft method of determining this velocity is by means of the inftrument reprefented fig. 2 . where $A B C D$ reprefents the body of the machine compofed of the three poles $B, C, D$, fpreading at bottom, and joining together at the top $A$; being the fame with what is vulgarly ufed in lifting and weighing very heavy bodies, and is called by workmen the triangles. On two of thefe poles, towards their tops, are forewed on the fockets RS; and on thefe fockets the pendulum EFGHIK is hung by means of its crofs-piece EF, which becomes its axis of furpenfion, and on which it mult be made to vibrate with great freedom. The body of this pendulum is made of iron, having a broad part at bottom, and its lower part is covered with a thick piece of wood GKIH, which is faftened to the iron by ferews. Something lower than the bottom of the pendulum there is a brace OP, joining the two poles to which the pendulum is fufpended; and to this brace there is faftened a contrivance MNU, made with two edges of fteel, bearing on each other in the line UN, fomething in the manner of a drawing-pen; the ftrength with which thefe edges prefs on each other being diminifhed or increafed at pleafure by means of a fcrew $\mathbf{Z}$ going through the upper piece. There is faftened to the bottom of the pendulum a narrow ribbon $L N$, which paffes between thefe fteel edges, and which afterwards, by means of an opening cut in the lower piece of fteel, hangs loofely down, as at W.
" This inftrument thas fitted, if the weight of the pendulum be known, and likewife the refpective diftances of its centre of gravity, and of its centre of ofcillation from its axis of fufpenfion, it will thence be known what motion will be communicated to this pendulum by the percuffion of a body of a known weight moving with a known degree of celerity, and friking it in a given point; that is, if the pendulum be fuppofed at reft before the percuffion, it will be known what vibration it ought to make in confequence of fuch a determined blow; and, on the contrary, if the pendulum, being at reft, is ftruck by a body of a known weight, and the vibratiof which the pendulum makes after the blow is known, the velocity of the ftriking body may from thence be determined.
" Hence then if a bullet of a known weight ftrikes the pendulum, and the vibration, which the pendulum makes in confequence of the ftroke, be afcertained; the velocity with which the ball moved is thence to be known.
"Now the extent of the vibration made bythe pendulum after the blow, may be meafured to great accuracy by the ribbon LN. For let the preffare of the edges UN on the ribbon be fo regulated by the forew $\mathbf{Z}$, that the motion of the ribbon between them may
be free and eafy, though with fome minute refiftance; Theory. then fettling the pendulum at reft, let the part LN between the pendulum and the edges be drawn ftrait, but not ftrained, and fix a pin in that part of the rib. bon which is then contiguous to the edges: let now a ball impinge on the pendulum; then the pendulum fwinging back will draw out the ribbon to the jult extent of its vibration, which will confequently be determined by the interval on the ribbon between the edges UN and the place of the pin.
" The weight of the whole pendulum, wood and all, was 56 lb .3 oz . its centre of gravity was 52 inches diftant from its axis of fufpenfion, and 200 of its fmall fwings were performed in the time of 253 feconds; whenceits centre of ofcillation (determined from hence) is $62 \frac{\circ}{3}$ inches diftant from that axis. The centre of the piece of wood GKIH is diftant from the fame axis 66 inches.
"In the compound ratio of 65 to $62 \frac{2}{3}$, and 66 to 52 , take the quantity of matter of the pendulum to a $4 t^{t h}$ quantity, which will be $42 \mathrm{lb} . \frac{\%}{0} \mathrm{oz}$. Now geometers will know, that if the blow be flruck on the centre of the piece of wood GKIH, the pendulum will refift to the ftroke in the fame manner as if this laft quantity of matter only (42lb. $\frac{x}{2} \mathrm{oz}$.) was concentrated in that point, and the reft of the pendulum was taken away : whence, ruppofing the weight of the bullet impinging in that point to be the ${ }_{T}{ }^{T}$ th of a pound, or the $\frac{\sigma_{5}}{5}-$ th of this quantity of matter nearly, the velocity of the point of ofcillation after the ftroke will, by the laws obferved in the congrefs of fuch bodies as rebound not from each other, be the ${ }_{3} \frac{\pi}{3}-5$ th of the velocity the bullet moved with before the ftroke; whence the velocity of this point of of cillation after the ftroke being afcertained, that muliplied by 505 will give the velocity with which the ball impinged.
" But the velocity of the point of ofillation after the ftroke is eafily deduced from the chord of the arch, through which it afcends by the blow; for it is a well known propofition, that all pendulons bodies afcend to the fame height by their vibratory motion as they would do, if they were projected directly upwards. from their loweft point, with the fame velocity they have in that point : wherefore, if the verfed fine of the afcending arch be found (which is eafily determined from the chord and radius being given), this verfed fine is the perpendicular height to which a body projected upwards with the velocity of the point of ofcillation would arife ; and confequently what that velocity is, can be eafily computed by the common theory of falling bodies.
"For inftance the chord of the arch, defcribed by the afcent of the pendulum after the froke meafured on the ribbon, has been fometimes $17 \frac{2}{4}$ inches; the diftance of the ribbon from the axis of fufpenfion is $71 \frac{1}{8}$ th inches; whence reducing $17_{8}^{\frac{1}{8}}$ th in the ratio of $71 \frac{1}{8}$ th to 66 , the refulting number, which is nearly 16 inches, will be the chord of the arch throngh which the centre of the board GKIH afcended after the froke; now the verfed fine of the arch, whofe chord is 16 inches, and its radius 66, is 1,93939 ; and the velocity which would carry a body to this height, or, which is the fame thing, the velocity which a body would acquire by defcending through this fpace, is nearly that of $3 \frac{1}{4}$ feet in $\mathbf{1}^{\prime \prime}$.

GY゙NNERY.

Thicetara cy follamer ic.
"To determine then the velocity with which the bullet impinged on the centre of the wood, when the chord of the arch defcribed by the afcent of the pendulum, in confequence of the blow, was $17 \frac{t}{t}$ th inches meafured on the ribbon, no more is neceffary than to multiply $3^{\text {t }}$ th by 505 , and the refulting number 1641 will be the teet which the bullet would defcribe in $\mathbf{1}^{\prime \prime}$, if it moved with the velocity it had at the moment of its percuflion : for the velocity of the point of the pendulum, on which the bullet fruck, we have juft now determined to be that of $3 \frac{1}{4}$ th feet in $\mathrm{I}^{\prime \prime}$; and we have before fhown, that this is the ${ }_{5} \frac{2}{\sigma} \frac{5}{5}$ th of the velocity of the bullet. If then a bullet weighing $\frac{r_{7}^{2}}{7}$ th of a pound frikes the pendulum in the centre of the wood GKIH, and the ribbon be drawnont $17 \frac{1}{4}$ th inches by the blow; the velocity of the bullet is that of 164 r feet in $1^{\prime \prime}$. And fince the length the ribbon is drawn is always nearly the chord of the arch defcribed by the afcent, (it being placed fo as to differ infenfibly from thofe chords whick mof frequently occur), and there chords are known to be in the proportion of the velocities of the pendulum acquired from the froke ; it follows, that the proportion berween the lengths of ribbon drawn out at different times, will be the fame with that of the velocities of the impinging bullets; and confequently, by the proportion of thefe lengths of ribbon to $17 \frac{t}{4}$ th, the proportion of the velocity with which the bullets impinge, to the known velocity of 164 r feet 8 in $I^{\prime \prime}$, will be determined.
Cautions to " Hence then is hown in general how the velocitics beobferved of bullets of all kinds may be found out by means of in making this inftrument; but that thofe who may be difpofed thefe expe- to try thefe experiments may not have unforfeen difriments. ficulties to ftruggle with, we fhath here fubjoin a few obfervations, which it will be neceffary for them to attend to, both to fecure fuccefs to their trials and fafety to their perfons.
" And firft, that they may not conceive the piece of wood GKIH to be an unneceffary part of the machine, we mutt inform them that if a bullet inpelled by a full charge of powder fhould frike directly on the iron, the buller would be beaten into fhivers by the ftroke, and thefe fhivers will rebound back with fuch violence, as to bury themfelves in any wood they chance to light on, as I have found by hazardous experience; and befides the danger, the pendulam will riot in this inflance afcertain the velocity of the bullet, becaufe the velocity with which the parts of it rebound is unknown.
" The weight of the pendulum, and the thicknefs of the wood, muft be in fome meafure proportioned to the fize of the bullets which are ufed. A pendulum of the weight here defcribed will do very well for all bullets under three or four ounces, if the thicknefs of the board be increafed to feven or eight inches for the heavieft bullets; beech is the tougheft and propereft wood for this purpofe.
"Itis hazardous ftanding on the fide of the pendalum, unlefs the board be fo thick, that the greatelt part of the bullet's force is loft before it comes at the iron; for if it frikes the iron with violence, the flivers of lead, which cannot return back through the wood, will force themfelves out between the wood and iron, and will ly to a confiderable diftance.
"As there is no effectual way of faftening the wood
to the iron but by fcrews, the heads of which muft Theory. come through the board; the bullets will fometimes light on thofe fcrews, from whence the hivers will difperfe themfelves on every fide.
"When in thefe experiments fo fmall a quantity of powder is ufed, as will not give to the bullet a velocity of more than 400 or 500 feet in $1^{11}$; the bullet will not flick in the wood, but will rebound from it entire, and (if the wood be of a very hard texture) with a very confiderable velocity. Indeed I have never examined any of the bullets which have thus rebounded, but I have found them indented by the bodies they have fruck againft in their rebound.
"To avoid then thefe dangers, to the braving of which in philofophical refearches no honour is annexed; it will be convenient to fix whatfoever barrel is ufed, on a ftrong heavy carriage, and to fire it with a little flow match. Let the barrel too be very well fortificd in all its length; for no barrel (I fpeak of mufket barrels) forged with the ufual dimenfions will bear many of the experiments without burfting. The barrel I have moft relied on, and which I procured to be made on purpofe, is nearly as thick at the muzzel as at the breech; that is, it has in each place nearly the diameter of its bore in thicknefs of metal.
"The powder ufed in thefe experiments fhould be exactly weighed : and that no. part of it be fcattered in the barrel, the piece muft be charged with a ladle in the fame manner as is practifed with cannon; the wad hould be of tow, of the fame weight each time, and no more than is juft neceffary to confine the powder in its proper place: the length of the cavity left behind the ball fhould be determined each time with exactnefs; for the increafing or diminifhing that fpace will vary the velocity of the fhot, although the buller and quantity of powder be not changed. The diftance of the mouth of the piece from the pendulum ought to be fuch, that the impulfe of the flame may not act on the pendulum ; this will be prevented in a conmon barrel charged with $\frac{1}{2}$ an ounce of powder, if it be at the diftance of 16 or 18 feet: in larger charges the impulfe is fenfible farther off; I have found it to extend to above 25 feet; however, between 25 and 18 feet is the diftance I have ufually chofen."

With this inftrument, or others fimilar to it, $\mathrm{Mr}_{\text {Account of }}^{\text {Ig }}$ Robins made a great number of experiments on bar- Mr Rorels of different lengths, and with different clarges of binss expowder. He hath given us the refults of 6 I of thefe; peri ments, and having compared the actual velocities with the computed ones, his theory appears to have come as near the truth as could well be expected. In feven of the experiments there was a perfect coincidence; the charges of powder being fix or twelve pennyweights; the barrels 45, 24.312, and 7.06 inches in length. The diameter of the firft ( $\operatorname{marked} A$ ) was $\frac{3}{4}$ ths of an inch ; of the fecond ( B ) was the fame; and of $\mathrm{D}, 83$ of an inchi. In the reft of the experiments, another barrel (C) was ufed, whofe length was 12.375 inches, and the diameter of its bore $\frac{8}{9}$ th inches.-In I4 more of the experiments, the difference between the length of the chord of the peadulum's arch fhown by the theory and the actual experiment was ${ }_{T_{i}-i}$ th of an inch over or under. This flowed an error in the theory varying according to the different lengths of the chord from $\frac{7}{7}$ to $\frac{2}{4}$ Of the whole; the charges of powder B b 2
were

were the fame as in the laft.-In 16 other experiments the error was ${ }^{2}{ }^{2}$ ths of an inch, varying from ${ }_{8}{ }^{5} 5$ to $\frac{r^{\prime}}{2} 5$ (f) the whole; the charges of powder were 6,8 , 9, or 12 pennyweights.-In feven other experiments, the error was $\frac{2}{10}$ ths of an inch, varying from ${ }_{6}{ }^{3} \pi$ to $r_{3}^{2}$ of the whole; the charges of powder fix or twelve pennyweights. In eight experiments, the difference was $\frac{4}{T_{0}}$ ths of an inch, indicating an error from $\frac{1}{42}$ to ${ }_{-\frac{2}{2}}^{5}$ of the whole ; the charges being 6, 9, 12, and 24 pennyweights of powder. In three experiments, the error was $\frac{5}{5}_{5}^{5}$ ths, varying from $\frac{-x}{3}$ th to ${ }_{7} \frac{1}{2}$ th of the whole; the charges 8 and 12 pennyweights of powder. In two experiments the crror was ${ }_{\mathrm{T}}^{6}$ ths, in one cafe amounting to fomething lefs than ${ }_{3} \frac{1}{2}$, in the other to $\pi^{3} \pi$ of the whole; the charges 12 and 36 pennyweights of powder. By one experiment the error was feven, and by another eight, tenths; the firft amounting to $T_{T}{ }^{\frac{7}{0} \text { th }}$ nearly, the latter to almoft $\frac{7}{9}$ th of the whole : the charges of powder $G$ or 12 pennyweights. The laft error, however, Mr Robins afcribes to the wind. The two remaining experiments varied from theory by I .3 inches, fomewhat more than $\frac{5}{9}$ th of the whole: the charges of powder were 12 penny. weights in each; and Mr Robins afcribes the error to the dampnefs of the powder. In another cafe, he afcribes an error of ${ }^{6}$ oth th the blatt of the powder on the pendulum.

From thefe experiments Mr Robins deduces the following conclufions. "The variecy of thefe experiments, and the accuracy with which they correfpond to the theory, leave us no room to doubt of its cer-tainty.-This theory, as here eftablifhed, fuppofes, that, in the firing of gunpowder, about ${ }_{T}^{3}{ }^{3}$ ths of its fubftance is converted by the fudden inflammation into a permanently elaftic fluid, whofe elafticity, in proportion to its heat and denfity, is the fame with that of common air in the like circumftances; it farther fappofes, that all the force exerted by gunpowder in its mof violent operations, is no more than the action of the elafticity of the fluid thus generated; and there principles enable us to determine the velocities of bullets impelled from fire-arms of all kinds; and are fully fufficient for all parpofes where the force of gunpowder is to be eftimated.
"From this theory many deductions may be made of the greatelt confequence to the practical part of gonnery. From hence the thicknefs of a piece, which will enable it to confine, without barfting, any given charge of powder, is eafily determined, fince the effort of the powder is known. From hence appears the inconclufivenefs of what fome modern authors have ad. vanced, relating to the advantages of particular forms of chambers for morrars and cannon; for all their laboured fpeculations on this head are evidently founded on very erroncous opinions about the action of fired pawder. From this theory too we are tanght the necefity of leaving the fame face behind the bullet when we would, by the fane quantity of powder, commanicate to it an equal degree of velocity; fince, on the principles already laid down, it follows, that the fame powder has a greater or defs degree of elafticity, according to the different facio it occupies. The method which I have always practifed for this purpofe has been by marking the rammer; and this is a maxim which ought not to be difpenfed with when
cannon are fired at an elevation, particularly in thole Theory, called by the French batteries ä ricochet.
"From the continued action of the powder, and its manner of expanding defcribed in this theory, and the length and weight of the piece, one of the moft effential circumftances in the well directing of artillery may be eafily afcertained. All practitioners are agreed, that no fhot can be depended on, unlefs the piece be placed on a folid platform : for if the platform fhakes with the firft impulle of the powder, it is impoffible but the piece moft alfo hake : which will alter its direction, and render the fhot uncertain. To prevent this accident, the platform is ufually made extremely firm to a confiderable depth backwards; fo that the piece is not only well fupported in the beginning of its motion, but likewife through a great part of its recoil. However, it is fufficiently obvious, that when the bullet is feparated from the piece, it can be no longer affected by the trembling of the piece or platform ; and, by a very ealy computation, it will be found, that the bullet will be out of the piece before the latter hath recoiled half an inch: whence, if the platform be fufficiently folid at the beginning of the recoil, the remaining part of it may be much flighter ; and hence a more compendious method of conftructing platforms may be found our.
"From this theory alfo it appears how greatly thefe authors have been miftaken, who have attributed the force of gunpowder, or at leaft a confiderable part of it, to the action of the air contained either in the powder or between the intervals of the grains: for they have fuppofed that air to exift in its natural elaftic tate, and to receive all its addition of foree from the heat of the explofion. But from what hath been already delivered concerning the increafe of the air's elafticity by heat, we may conclude that the heat of the explofion cannot augment this elafticity to five times its common quantity; confequently the force arifing from this caufe only cannot amount to more than the 200th part of the real force exerted on the occafion.
" If the whole fubftance of the powder was converted into an elaftic fluid at the inftant of the explofion, then from the known elafticity of this fluid affigned by our theory, and its known denfity, we conld eafily determine the velocity with which it would be. gin to expand, and could thence trace out its future augmentations in its progrefs through the barrel : but as we have fhown that the elaftic fluid, in which the activity of gunpowder confiats, is only $\frac{a}{T}$ ths of the fubftance of the powder, the remaining $\frac{7}{T}$ ths will, in the explofion, be mixed with the elaftic part, and will by its weight retard the activity of the explofion: and yet they will not be fo completely united as to move with one common motion; but the unelaftic part will be lefs accelerated than the reft, and fome will not even be carried out of the barrel, as appears by the confiderable quantity of unctuous matter which adheres to the infide of all fire-arms after they have been ufed.-Thefeinequalities in the expanfive motion of the flame oblige us to recur to experiments for its accurate determination.
" The experiments made ufe of for this purpofe were of two kinds. The firft was made by charging the barrel A with 12 pennyweights of powder, and a
fmall

Theory, fmall wad of tow only: and then placing its month

21
Experiments for determining the

- velocity of fired gun. fired gun
ig inches from the centre of the pendulum. On firing it in this fituation, the impulfe of the flame made it afcend through an arch whofe chord was 13.7 inches; whence, if the whole fubftance of the powder was fuppofed to ftrike againft the pendulum, and each part to frike with the fame velocity, that common velocity minft have been at the rate of about 2650 feet in a fecond. - But as fome part of the velocity of the flame was loft in paffing through 19 inches of air: I made the remaining experiments in a manner not liable to this inconvenience.

I fixed the barrel A on the pendulum, fo that its axis might be both horizontal and alfo perpendicular to the plane HK ; or, which is the fame thing, that it might be in the plane of the pendulum's vibration: the height of the axis of the piece above the centre of the pendulum was fix inches; and the weight of the piece, and of the iron that faftened it, \&c. was $12 \frac{1}{2} \mathrm{lb}$. The barrel in this fituation being charged with 12 penny-weights of powder, without either ball or wad, only put together with the rammer ; on the difcharge the pendulum afcended through an arch whofe chord was io inches, or reduced to an equivalent blow in the centre of the pendulum, fuppofing the barrel away, it would be 14.4 inches nearly.- The fame experiment being repeated, the chord of the afcending arch was 10.1 inches, which reduced to the centre, is $\mathbf{1} 4.6$ inches.
" To determine what difference of velocity there was in the different parts of the vapour, I loaded the piece again with 12 penny-weights of powder. and rammed it down with a wad of tow, weighing one penny-weight. Now, I conceived that this wad being very light, would prefently acquire that velocity with which the elaftic part of the fluid would expand itfelf when uncompreffed; and I accordingly found, that the chord of the afcending arch was by this means increafed to 12 inches, or at the centre to 17.3; whence, as the medium of the other two experiments is 4.5 , the pendulum afcended through an arch 2.8 inches longer, by thefadditional motion of one penny-weight of matter, moving with the velocity of the fwiftelt part of the vapour; and confequently the velocity with which this penny-weight of matter moved, was that of about 7000 feet in a fetcond.
" It will perhaps be objected to this determination, that the augmentation of the arch through which the pendulum vfbrated in this cafe was not all of it owing to the quantity of motion given to the wad, but part of it was produced by the confinement of the powder, and the greater quantity thereby fired. But if it were true that a part only of the powder fired when there was no wad, it would not happen that in firing different quantities of powder without a wad the chord would increafe and decreafe nearly in the ratio of thefe quantities; which yet I have found it to do: for with nine pennyweights that chord was 7.3 inches, which with 12 pennyweights we have feen was only 10 , and io. i inches; and even with three pennyweights the chord was two inches; deficient from this proportion by 5 only; for which defect too other valid reafons are to be affigned.
"And there is ftill a more convincing proof that
all the powder is fired, although no wad be placed be- Theory. fore the charge, which is, that the part of the recoil arifing from the expanfion of powder alone is found to be no greater when it inpels a leaden bullet before it, than when the fame quantity is fired without any wad to confine it. We have feen that the chord of the arch through which the pendulum rofe from the expanfive force of the powder alone is 10 , or 10.1 ; and the chord of that arch, when the piece was charged in the cuftomary manner with a bullet and wad, I found to be the firft time $22 \frac{7}{4}$, and the fecond $22 \frac{7}{8}$, or at a medium 22.56. Now the impulfe of the ball and wad, if they were fuppofed to ftrike the pendulum in the fame place in which the barrel was fafpended, with the velocity they had acquired at the mouth of the piece, would drive it through an arch whofe chord would be about 12.3 ; as is known from the weight of the pendulum, the weight and pofition of the barrel, and the velocity of the bullet determined by our former experiments: whence, fubtracting this number 12.3 from 22.56, the remainder 10.26 is nearly the chord of the arch which the pendulum would have afcended through from the expanfion of the powder alone with a bullet laid before it. And this number, 10.26, differs but little from IO.I, which we have a, bove found to the chord of the afcending arch, when the fame quantity of powder ex panded itfelf freely without either bullet or wad before it.
"Again, that this velocity of 7000 feet in a fecond is not much beyond what the moft active part of the flame acquires in expanding, is evinced from hence, that in fome experiments a ball has been found to be difcharged with a velocity of 2400 feet in a fecond: and yet it appeared not that the action of the powder was at all diminifhed on account of this immenfe celerity: confequently the degree of rwiftnefs with which in this inftance, the powder followed the ball without lofing any part of its preffure, mult have been much hort of what the powder alone would have cxpanded with, had not the ball been there.
"From thefe determinations may be deduced the force of petards; fince their action depends entirely on the impulfe of the flame: and it appears that a quantity of powder properly difpofed in fuch a machine, may produce as violent an effort as a bullet of twice its weight, moving with a velocity of 1400 or 1500 feet in a fecond.
"f In many of the experiments already recited, the ball was not laid immediately contiguous to the powder, but at a fmall diftance, amounting, at the utmoft, only to an inch and a half. In thefe cafes the theory agreed very well with the experiments. But if a bullet is placed at a greater diftance from the powder, fuppofe at 12,18 , or 24 inches, we cannot then apply to this ball the fame principles which may be applied to thofe laid in contae, or nearly fo, with the powder: for when the furface of the fired powder is not confined by a heavy body, the flame dilates it. felf with a velocity far exceeding that which it can communicate to a bullet by its continued preffure : confequently, as at the diftance of 12,18 , or 24 inches, the powder will have acquired a confiderable degree of this velocity of expanfion, the firf motion of the ball will not be produced by the continual preffure. of the powder, but by the actual percuffion of the
flame; and it will therefore begin to move with a quantity of motion proportioned to the quantity of this flame, and the velocities of its refpective parts.
" From hence then it follows, that the velocity of the bullet, laid at a confiderable diftance before the charge ought to be greater than what would be communicated to it by the presure of the powder acting in the manner already mentioned: and this deduction from our theory we have confirmed by manifold experience; by which we have found, that a ball laid in the barrel $A$, with its hinder part $1 I_{\frac{1}{4}}^{1}$ inches from its breech, and impelled by 12 pennyweights of powder, has acquired a velocity of about 1400 feet in a fecond; when, if it had been acted on by the preflure of the flame only, it would not have acquired a velocity of r 200 feet in a fecond. The fame we have found to hold true in all ocher greater diftances (and alfo in leffer, though not in the fame degree), and in all quantities of powder:, and we have likewife found, that thefe effects nearly correfpond with what has been already laid down about the velocity of expanfion and the elaftic and unelaftic parts of the flame.
" From hence too arifes another confideration of great confegnence in the practice of gunnery; which is, that no bullet fhould at any time be placed at a confiderable diftance before the charge, unlefs the piece is extremely well fortified : for a moderate charge of powder, when it has expanded itfelf through the vacant fpace, and reaches the ball, will, by the velocity each part has acquired, accumulate itfelf behind the ball, and thereby be condenfed prodigioully; whence if the barrel be not extremely firm in that part, it muft ly means of this reinforced elafticity, infallibly burf. The truth of this reafoning I bave experienced in an exceeding good Tower-maket, forged of very tough iron; for charging it with 12 pennyweights of powder, and placing the ball 16 inches from the breech, on firing it, the part of the barrel juft behind the bullet was fwelled out to double its diameter like a blown bladder, and two large pieces of two inches long were burft out of it.
"Having feen that the entire motion of a bullet laid at a confiderable diftance from the charge, is acquired by two different methods in which the powder aets on it ; the firf being the percuffion of the parts of the flame with the velocity they had refpectively acquired by expanding, the fecond the continued preffure of the flame through the remaining part of the barrel ; I endeavoured to feparate thefe different actions, and retain that only which arofe from the continued preffure of the flame. For this purpofe I no longer placed the powder at the breech, from whence it would have full fcope for its expanfion; but I fcattered it as uniformly as I could through the whole cavity left behind the bullet; imagining that by this means the progreffive velocity of the flame in each part would be prevented by the expanfion of the neighbouring parts; and I found, that the ball being laid ${ }_{I I}^{1} \frac{1}{7}$ inches from the breech, its velocity, inftead of J 400 feet in a fecond, which it acquired in the laft experiments, was now no more than 1100 feet in the fecond, which is roo feet fhort of what according to the theory fhould arife from the continued preflare of the powder only.
" The reafon of this deficiency, was doubtlefs, the
inteftine montion of the flame: for the afeenfion of the Theory, powder thus diftributed through fo much larger a fpace than it could fill, muft have produced many reverberations and pulfations of the flame ; and from thefe internal agitations of the fluid, its preffure on the containing furface will (as is the caufe of all other fluids) be confiderably diminifhed; and in order to avoid this irregularity, in all other experiments I took care to have the powder clofely confined in as fmall a fpace as poffible, even when the bullet lay at fome little diftance from it.
" With regard to the refiftance of the air, which fo remarkably affects all military projectiles, it is neceffary to premife, that the greateft part of authors have eftablifhed it as a certain rule, that while the fame body moves in the fame medium, it is always refifted in the duplicate proportion of its velocity; that is, if the refifted body move in one part of its track with three times the velocity with which it moved in fome other part, then its reliftance to the greater velocity will be nine times the refiftance to the leffer. If the velocity in one place be four times greater than in another, the refiffance of the fluid will be 16 times greater in the firft than in the fecond, \&c. This rale, however, though pretty near the truth when the velocities are confined within certain limits, is exceffively erroneous when applied to military projectiles, where fuch refiftances often occur as could fcarcely be effected, on the commonly received principles, even by 2 treble augmentation of its denfiy.
" By means of the machine already deferibed, I have it in my power to determine the velocity with which a ball moves in any part of its track, provided I can direct the piece in fuch a manner as to caufe the bullet to impinge on a pendulum placed in that part: and therefore charging a mulket-barrel three times fucceffively with a leaden ball $\frac{3}{4}$ of an inch in diameter, and about half its weight of powder; and taking fuch precaution in weighing of the powder and placing it, that I was affured by many previous trials, that the velocity of the ball could not differ by 20 feet in a fecond from its medium quantity; I fired it againt the pendulum placed at 25,75 , and 125 feet diftance from the month of the piece refpectively; and I found that it impinged againft the pendulum, in the firft cafe with a velocity; of 1670 feet in a fecond; in the fecond cafe, witha velocity of 1550 feet in a fecond; and in the third cafe, with a velocity of 1425 feet in a fecond; fo ihat, in paffing through 50 feet of air, the bullet loft a velocity of 120 or 125 feet in a fecond; and the time of its paffing through that fpace being about $\frac{4}{5} \pi{ }^{\frac{2}{2}}$ or $\frac{3}{3} \frac{3}{6}$ of a fecond, the medium quantity of refiftance muft, in thefe inflances, have been about 120 times the weight of the ball; which (as the ball was nearly ${ }_{T}{ }^{\frac{T}{2}}$ of a pound) amounts to about rolb. avoirdupoife.
" Now, if a compuration be made according to the method laid down for compreffed fluids in the 38th propofition of Newton's Principia, fuppofing the weight of water to that of air as 850 to $\mathbf{r}$, it will be found that the refiftance to a globe of $\frac{3}{4}$ of an inch diameter, moving with a velocity of about 1600 feet in a fecond, will not, on thefe principles amount to any more than $4 \frac{2}{6} \mathrm{lb}$. avoirdupoife; whence, as we know that the rules contained in that propofition are

Theory. very accurate with regard to flow motions, we may bence conclude, that the refiftance of the air in low motions is lefs than that in fwift motions, in the ratio of $4 \frac{\pi}{6}$ to 10 ; a proportion between that of x to 2 , and I to 3 . "Again, I charged the fame piece a number of times with equal quantities of powder, and balls of the fame weight, taking all poflible care to give to every fhot an equal velocity; and, firing three times againt the pendulum placedonly 25 feet from the mouth of the piece, the medium of the velocities with which the ball impinged was nearly that of 1690 feet in a fecond: then removing the piece 175 feet from the pendulum, I found, taking the medium of five fhors, that the velocity with which the ball impinged at this diftance was 1300 feet in a fecond; whence the ball, in paffing through 150 feet of air, loft a velocity of about 390 feet in a fecond; and the refiftance computed from thefe numbers comes out fomething more than in the preceding inftance, it amounting here to berween II and 12 pounds avoirduroife; whence, according to the fe experiments, the refifting power of the air to fwift motions is greater than to fow ones, in a ratio which approaches nearer to that of 3 to I than in the preceding experiments.
" Having thas examined the refiftance to a velocity of 1700 feet in a fecond, I next examined the refiftance to fmaller velocities: and for this purpofe, I charged the fame barrel with balls of the fame diameter, but, with lefs powder, and placing the pendulum at 25 feet diftance from the piece, I fired againf it five times with an equal charge each time: the medium velocity with which the ball impinged, was that of 1180 feet in a fecond; then removing the pendulum to the diftance of 250 feet, the medium velocity of five !hots, made at this diftance, was that of 950 feet in a fecond: whence the ball, in paffing through 225 feet of air, loft a velocity of 230 feet in a fecond : and as it paffed through that interval in about $\frac{3}{7} \frac{3}{4}$ of a fecond, the refiftance to the middle velocity will come out to be near $33^{\frac{3}{2}}$ times the gravity of the ball, or 21b. 10 oz . avoirdupoife. Now, the refiftance to the fame velocity, according to the laws obferved in flower motions, amounts to ${ }^{7}{ }^{7}$ of the fame quantity; whence, in a velocity of 1065 feet in a fecond, the refilling power of the air is augmented in no greater a proportion than that of 7 to 11 ; whereas we have feen in the former experiments, that to ftill greater degrees of velocity the augmentation approached very near the ratio of one to three.
" But farther, I fired three flot, of the fame fize and weight with thofe already mentioned, ofver a large piece of water; fo that their dropping into the water being very difcernible, both the diftance and time of their flight might be accurately afcertained. Each fhot was difcharged with a velocity of 400 feet in a fecond; and I had fatisfied myfelf by many previous trials of the fame charge with the pendulum, that I could rely on this velocity to ten feet in a fecond. The firft fhot flew 313 yards in four feconds and a quarter, the fecond flew 319 yards in four feconds, and the third 373 yards in five feconds and an half. According to the theory of refiftance eftablifhed for flow motions, the firft Chot ought to have fpent no more than 3.2 feconds in its flighr, the fecond 328 , and the the third 4 feconds: whence it is evident, that every thot was
retarded confiderably more than it ought to have been had that theory taken place in its motion: confequently the refiftance of the air is very fenfibly increafed, even in fuch a fmall velocity as that of 400 feet in a fecond.
" As no large fhot are ever projected in practice Plate with velocities exceeding that of 1700 feet in a fecond, CCXXV: it will be fufficient for the parpofes of a practical gun- fig. 3 . ner to determine the refiftance to all leffer velocities: which may be thus exbibited. Let AB be taken to $A C$, in the ratio of 1700 feet in a fecond to the given velocity to which the refifting power of the air is required. Continue the line $A B$ to $D$, fo that BD may be to AD , as the refifting power of the air to flow motions is to its refifting power to a velocity of 1700 feet in a fecond: then fhall CD be to AD as the refifting power of the air to flow motions is to its refifting power to the given velocity reprefented by AC.
" From the computations and experiments already mentioned, it plainly appears, that a leaden ball of $\frac{1}{4}$ of an inch diameter, and weighing nearly $2{ }_{3}^{\mathrm{s}} \mathrm{Oz}$. avoirdupoife, if it be fired from a barrel of 45 inches in length, with balf its weight of powder, will iffue from that picce with a velocity which, if it were uniformly continued, would carry it near 1700 feet in a fecond. -If, inftead of a leaden ball, an iron one, of an equal diameter, was placed in the fame fituation in the fame piece, and was impelled by an equal quantity of powder, the velocity of fuch an iron-bullet would be greater than that of the leaden one in the fubduplicate ratio of the fpecific gravities of lead and iron; and fuppoling that ratio to be as three to two, and computing on the principles already laid down, it will appear, that an iron bullet of 24 lb . weight, fhot from a piece of 10 feet in length, with 16 lb . of powder, will acquire from the explofion a velocity which, if uniformly continued, would carry it nearly 1650 feet in a fecond.
"This is the velocity which, according to our theory, a cannon-ball of 24 lb . weight is difcharged with when it is impelled by a full charge of powder; but if, inftead of a quantity of powder weighing twothirds of the ball, we fuppofe the charge to be only half the weight of it, then its velocity will on the fame priaciples be no more than 1490 feet in a fecond. The fame would be the velocities of every leffer bullet fired with the fame proportions of powder, if the lengths of all pieces were conftantly in the fame ratio with the diameters of their bore; and although according to the ufual dimenfions of the fmaller pieces of artillery, this proportion does not always hold, yet the difference is not great enough to occafion a very great variation from the velocities here affigned ; as will be obvious to any one who thall make a computation thereon. But in thefe determinations we fuppofe the windage to be no more than is juft fufficient for putting down the bullet eafily; whereas in real fervice, ejther through negligence or undilfulnefs, it often happens, that the diameter of the bore fo much exceeds the diameter of the bullet, that great part of the inflamed flaid efcapes by its fide; whence the velocity of the fhot in this cafe may be confiderably lefs than what we bave affigned. However, this periaps may be compenfated by the greater heat which in all probability attends the firing of thefe large quantities of powder.

Theory.

Solution of the difficul$t$ See $\mathrm{p}^{\circ} 5$.
byothefis $\dagger$. Here our author was deceived by his y concern- nor knowing how greatly the primitive velocity of the ing point- heavieft fhot is diminifhed in the courfe of its flight by blank thot. the refiftance of the air. And the received opinion of practical gunners is not more difficult to account for ; fince, when they agree that every fhot flies in a ftraight line to a certain diftance from the piece, which imaginary diftance they have called the extent of the pointblank Jhot, we need only fuppofe, that, within that diftance which they thus determine, the deviation of the path of the fhot from a ftraight line is not very perceptible in their method of pointing. Now, as a thot of 24 lb . fired with two-thirds of its weight of powder, will, at the diftance of 500 yards from the piece, be feparated from the line of its original direction by an angle of little more than half a degree; thofe' who are acquainted with the inaccurate methods often ufed in the directing of caunon will eafily allow, that fo finall an aberration may not be attended to by the generality of practitioners, and the path of the fhot may confequently be deemed a fraight line; efpecially as other caufes of error will often intervene much greater than what arifes from the incurvation of this 25 line by gravity.
"We have now determined the velocity of the hot both when fired with two-thirds of its weight and with half its weight of powder refpectively; and on this occafion I mult remark, that on the principles of our theory, the increafing the charge of powder will increafe the velocity of the fhot, till the powder arrives at a certain quantity; after which, if the powder be increafed the velocity of the fhot will diminifh. The quantity producing the greateft velocity, and the proportion between that greateft velocity and the velocity communicated by greater and leffer charges, may be thus affigned. Let AB reprefent the axis of the piece; draw AC perpendicular to it, and to the afymptotes $A C$ and $A B$ draw any hyperbola LF, and draw $B F$ parallel to $A C$; find out now the point $D$, where the rectangle ADEG is equal to the hyperbolic area $D E F B$; then will $A D$ reprefent that height of the charge which communicates the greateft velocity to the fhot: whence $A D$ being to $A B$ as $I$ to 2.71828 , as appears from the table of logarithms, from the length of the line AD thas determined, and the diameter of the bore, the quantity of powder contained in this charge is eafily known. If, inftead of this charge, any other filling the cylinder to the height AI be ufed, draw IH parallel to AC, and through the point $H$ to the fame afymptotes $A C$ and $A B$ defcribe the hyperbola HK; then the greateft velocity will be to the velocity communicated by the charge $A I$, in the fubduplicate proportion of the rectangle $A E$ to the fame
"From this great velocity of cannon-fhot we may clear up the difficulty concerning the point-blank fhot which oecafioned the invention of Anderfon's Atrange
as the furface of this laft bullet is more than 54 times greater than the furface of a bullet of $\frac{3}{4}$ of an inch diameter, and their velocities are nearly the fame, it follows, that the refiftance on the larger bullet will amount to more than 540 lb . which is near 23 times its own weight.
" The two laft propofitions are principally aimed againft thofe theorifts who have generally agreed in fuppofing the flight of thot and Chells to be nearly in the curve of a parabola. The reafon given by thofe authors for their opinion is the fuppofed inconfiderable refiftance of the air; fince, as it is agreed on all fides that the tract of projectiles would be a perfect parabo. la if there was no refiltance, it has from thence been too ralhly concluded, that the interruption which the ponderous bodies of fhells and bullets would receive from fuch a rare medium as air would be farcely fenfible, and confequently that their parabolic flight would be hereby fcarcely affected.
"Now the prodigious refiftance of the air to a bullet of 24 lb . weight, fuch as we have here eftablifhed it, fufficiently confures this reafoning; for how erroneous muft that hypothefis be, which neglects as inconfiderable a force amounting to more than 20 times the weight of the moving body ?" But here it is neceffary to affume a few particulars, the demonftrations of which, on the commonly received principles may be feen under the article Projectiles.
${ }^{6}$ I. If the refiftance of the air be fo fmall that the Common motion of a projected body is in the curve of a para- maxims. bola, then the axis of that parabola will be perpendi- concerning cular to the horizon, and confequently the part of the curve in which the body afcends will be equal and fimi- of pres. lar to that in which it defcends.
" 2. If the parabola in which the boay moves be terminated on a horizontal plane, then the vertex of the parabola will be equally diftant from its two extremities.
"3. Alfo the moving body will fall on that horizontal plane in the fame angle, and with the fame velocity with which it was firft projected.
© 4 . If a body be projected in different angles but with the fame velocity, then its greatef horizontal range will be when it is projected in an angle of 45 with the horizon.
" 5 . If the velocity with which the body is projected be known, then this greateft horizontal range may be thus found. Compute, according to the common theory of gravity, what fpace the projected body ought to fall through to acquire the velocity with which it is projected: then twice that fpace will be the greateft horizontal range, or the horizontal range when the body is projected in an angle of $45^{\circ}$ with the horizon.
" 6. The horizontal ranges of a body, when projected with the fame velocity at different angles, will be between themfelves as the fines of twice the angle in which the line of projection is inclined to the horizon.
7. "If a body is projected in the fame angle with the horizon but with different velocities, the horizontal ranges will be in the duplicate pıoportion of thofe velocities.
" Thefe poltulates which contain the principles of Prodigious the modern art of gunnery are all of them falle; for
the com-
it montheory.

Theory. it hath beeen already flewn, that a mufket-ball $\frac{3}{4}$ of an inch in diameter, fired with half its weight of powder, from a prece 45 mehes long, moves with a velocity of near 1700 feet in a lecond. Now, if this ball flew in the curve of a parabold, its horizontal range at $45^{\circ}$ would be found by the 5 th poltulate to be about 17 miles. But all the practical writers affure us, that this range is equally fhort of half a mile. Diego Ufano affigns to an arquebufs, four feet in length, and carrying a leaden ball of $1 \frac{1}{2}$ oz. weight (which is very near our dimentions), an horizontral range of 797 common paces, when it is elevated between 40 and 50 degrees, and charged with a quantity of fine powder equal in weight to the ball. Merfennus alfo tells us, that he found the horizontal range of an arquebuls at $45^{\circ}$ to be lefs than 400 fathom, or 800 yards; whence, as either of thefe ranges are hhort of half an Englifh mile, it follows, that a muiker hhot, when fired with a reafonable charge of powder at the elevation of $45^{\circ}$, flies not ${ }_{3}^{1}$ T part of the ditance it ought to do if it moved in a parabola. Nor is this great contraction of the horizontal range to be wondered at, when it is confidered that the refiftance of this bullet when it firft iffues from the piece amounts to 120 times its gravity, $2 s$ hath been experimentally demonftrated, $\mathrm{n}^{\circ} 23$.
"To prevent objections, our next inltance thall be in an iron bullet of 24 lb . weight, which is the heaviert in common ufe for land fervice. Such a bullet fired from a piece of the common dimenfions with its greateft allotment of powder hath a velocity of 1650 feet in a fecond, as already hown. Now, if the horizontal range of this fhot, at $45^{\circ}$, be compured on the parabolic hypothefis by the fifth poftulate, it will come out to be about 16 miles, which is between five and fix times it real quantity; for the practical writers all agree in making it lefs chan three miles.
"B But farther, ic is not only when projectiles move with thefe very great velocities that their flight fenfibly varies from the curve of a parabola; the fame aberration often takes place in fuch as move llow enough to have their morion traced ont by the cye: for there are few projectiles that can be thus examined, which do not vifibly difagree with the firft, fecond, and third poftulate; obvioully defcending thro' a curve, which is fhorter and lefs inclined to the horizon than that in which they afcended. Alio the highert point of their flight, or the vertex of the curve, is much nearer the place where they fall to the ground than to that from whence they were at firft difcharged.
"I have found too by experience, that the fifth, fixth, and feventh poftulates are exceffively erronenns when applied to the motions of bullers moving with finall velocities. A leaden bullet $\frac{3}{4}$ of an inch in dia. meter, difcharged with a velocity of about 400 feet in a fecond, and in an angle of $10^{\circ} 5^{\prime}$ with the horizon, ranged on the horizontal plane no more than 448 yards: whereas its greatef horizontal range being found by the fifth poftulate to be at lealt 1700 yards, the range at $19^{\circ} 5^{\prime}$ ought by the fixth poitulate to have been roso yards; whence, in this experiment, the range was not $\frac{3}{7}$ of what it mult have been had the commonly received theory been true."

From this and other experiments, it is clearly proved, that the track defcrived by the fight even of
the heavieft fhot, is neither a parabola, nor approaching to a parabola, except when they are projected with very fmall velocities. The nature of the curve really defcribed by them is explained under the article Pro. jectiles. But as a fpecimen of the great complication of that fubject, we fhall here infert an account of a very extraordinary circumfance which frequently takes place therein.
"As gravity acts perpendicularly to the horizon, it is evident, that if no other power but gravity deflected a projected body from its courfe, its motion would be conftantly performed in a plane perpendicular to the horizon, paffing through the line of its original direction; but we have found, that the body in its motion often deviates from this plane, fometimes to the right hand, and at other umes to the left; and this in an incurvated line which is convex towards that plane : fo that the motion of a buller is frequently in a line having a double curvature, it being bent towards the horizon by the force of gravity, and again bent out of its original direction to the right or left by fome other force: in this eafe no part of the motion of the bullet is performed in the fame plane, but its track will lie in the furface of a kind of cylinder, whofe axis is perpendicular to the horizon.
" This propofition may be indifputably proved by the experience of every one in the leaft converfant with the practice of gunnery. The fame piece which will carry its bullet within an inch of the intended mark at 10 yards diftance, cannot be relied on to 10 inches in 100 yards, much lefs to 30 inches in 300 yards. Now this inequality can only arife from the track of the bullet being incurvated fide ways as well as downwards: for by this means the diftance between that incurvated line and the line of direction will increafe in a mach greater ratio than that of the diftance; thele lines being coincident at the mouth of the piece, and afterwards feparating in the manner of a curve and its tangent, if the mouth of the piece be confidered as the point of contact. - To put this matter out of all doubt, however, I took a barrel carrying a ball $\frac{3}{4}$ of an inch diameter, and fixing it on a heavy carriage, I fatisfied myfelf of the fteadinefs and truth of its direction, by firing at a board $I_{7} \frac{1}{7}$ feet fquare, which was placed at 180 feet diftance; for I found, that in 16 facceffive fhots I miffed the mark but once. Now, the fame barrel being fixed on the fame carriage, and fired with a fmall quantity of powder, fo that the fhock on the difcharge would be much lefs, and confequently the direction lefs changed, I found, that at 760 yards diftance the ball flew fometimes 100 yards to the right of the line it was pointed on, and fometimes as much on the left. I found too, that its direction in the perpendicular line was not lefs uncertain, it falling one time above 200 yards hort of what it did at another; although by the niceft examination of the piece after the difcharge, it did not appear to have ftarted in the leaft from the pofition it was placed in.
"The reality of this double curvated tract being thus demonftrated, it may perhaps be anked, What car be the caufe of a notion to different from what has been hitherto fuppofed? And to this I anfwer, That the deflection in queftion muft be owing to fome power acting obliqualy to the progreffive motion of the
$C$ c body: Vol. VIII.
$\underbrace{\text { Theory, }}$ body; which power can be no other than the refiftance of the air. If it be farther afked, how the refiftance of the air can cuer core to be oblique to the progreffive motion of the body? I farther reply, that it may fonctimes arife from inequalities in the refifted furface; but that its general caufe is doubtlefs a whirling notion acquired by the bullet about its axis: for by this motion of rotation, combined with the progreffive motion, each part of the bullet'sfurface will ftrike the air very differently from what it would do if there was no fuch whirl; and the obliquity of the action of the air arifing from this caufe will be greater as the motion of the bullet is greater in proportion to its progreffive one.
"This whirling motion undoubtedly arifes frow the friction of the bullet againft the fide of the piece; and as the rotatory motion will in fome part of its reyolution confpire with the progreflive one, and another part be equally oppofed to it; the refiftance of the air on the fore part of the bullet will be hereby affected, and will be increafed in that part where the whirling motion confpires with the progreflive one, and diminithed where ir is oppofed to it: and by this means the whole effort of the refiftance, inftead of being oppofed to the direction of the body, will become oblique therero, and will produce thofe effects already mentioned. If it was poffible to predict the pofition of the axis round which the bullet fhould whirl, and if that axis was unchangeable during the whole flight of the bullet; then the aberration of the bullet by this oblique force would be in a given direction; and the incurvation prodaced thereby would re. gularly extend the fame way from one end of its track to the other. For inftance, if the axis of the whirl was perpendicular to the horizon, then the incurvation would be to the right orleft. If that axis was horizontal, and perpendicular to the direction of the bullet, then the incurvation would be upwards or downwards. But as the firt pofition of this axis is uncertain, and as it may perpetually fhift in the courfe of the bullet's flight; the deviation of the bullet is not neceffarily either in one certain direction, or tending to the fame fide in one part of its track that it does in another, but more ufually is continually changing the tendency of its deflection, as the axis round which it whirls muft frequently hift its pofition to the progreffive motion by many inevitable accidents.
" That a bullet generally acquires fuch a rotatory motion, as here defcribed, is, 1 think demonftrable: however, to leave no room for doubt or difpute, I confirmed it, as well as fome other parts of my theory, by the following experiments. machic to be made reprefented ing the air's able CO its axis, and fo adjufted by means of fricion refiftance.
globe $P$ ) ; and to prevent the arm GH from fwaying Theory. out of its horizontal pofition by the weight of the an. nexed body $P$, there is a brace, $A H$, of fine wire, $f a$. fened to the top of the cone which fupports the end of the arm.
" Round the barrel BCDE; there is wound a fine filk line, the turns of which appear in the figure : and after this line lath taken a fufficient number of turns, it is conducted nearly in a horizontal dircction to the pully $L$ over which it is paffed, and then a preper weight M is hung to ies extremity. If this weight be left at Jiberty, it is obvious that it will defcend by its own gravity, and will, by its defeent, turn round the barrel BCDE, together with the arm GH, and the body $P$ faftened to it. And whilft the refiftance on the $\operatorname{arm} G H$ and on the body $P$ is lefs than the weight M , that weight will accelerate its motion; and thereby the motion of GH and $P$ will increafe, and confequently their refiftance will increafe, till at laft this refiftance and the weight $M$ become nearly equal to each other. The motion with which M defcends, and with which $P$ revolves, will not then fenfibly differ from an equable one. Whence it is not difficult to conceive, that, by proper obfervations made with this niachine, the refiftance of the body $P$ may be determined. The moft natural method of proceeding in this inveftigation is as follows: Let the machine firt have acquired its equable motion, which it will ufually do in aboat five or fix turns from the beginning; and then let it be obferved, by connting a number of turns, what time is taken up by one revolution of the body $P$ : then taking off the body $P$ and the weight $M$, let it be examined what fmaller weight will make the arm GH revolve in the fame time as when P was fixed to it: this fmaller weight being taken from $M$, the remainder is obvioully equal in effort to the refiftance of the revolving body $P$; and this remainder being reduced in the ratio of the lengtl of the arm to the femi. diameter of the barrel, will then become equal to the abfolute quantity of the refiftance. And as the time of one revolution is known, and confequently the velocity of the revolving body, there is hereby difcovered the abfolute quantity of the refiftance to the given body $P$ moving with a given degrec of celerity.
"Here, to avoid all objections, I have generally chofe when the body $P$ was removed, to fix in its ftead a thin piece of lead of the fame weight, placed horizontally; fo that the weight which was to turn round the arm GH, without the body P , did alfo carry round this piece of lead. But the mathematicians will eatily allow that there was no neceffity for this precau-tion.-The diameter of the barrel BCDE, and of the filk ftring wound round it, was 2.06 inches. The length of the arm GH, meafured from the axis to the furface of the globe $P$, was 49.5 inches. The body $P$. the globe made ufe of, was of pafteboard; its furface very neatly coated with marbled paper. It was not much diftant from the fize of a 12 lb . fhot, being in diameter 4.5 inches, fo that the radius of the circle defcribed by the centre of the globe was 51.75 inches, When this globe was fixed at the end of the arm, and a weight of half a pound was hung at the end of the Aring at $M$, it was examined how foon the motion of the defcending weight $M$, and of the revolving body $P_{i}$ would become equable as to fenfe. With this view.
three

Sect. II.
Theory, three revolutions being fuffered to elaple, it was found that the next ro were performed in 273", 20 in lefs than $55^{\prime \prime}$, and 30 in $82^{\text {d }}$ l ; fo that the firft 10 were performed in $27_{4}^{3 \prime \prime}$, the fecond in $27_{4}^{\frac{1}{4}}$, and the third in 27 $7^{2} 1$.
"Thefe experiments fufficiently evince, that even with half a pound, the fmalleft weight made ufe of, the motion of the machine was fufficiently equable after the firft three revolutions.
"The globe abovementioned being now fixed at the end of the arm, there was hung on at M a weight of $3^{\frac{1}{4}} \mathrm{lb}$. ; and 10 revolucions being fuffered to elapfe, the fucceeding 20 were performed in $21 \frac{\pi}{2} \%$. Then the globe being taken off, and a thin plate of lead, equal to it in weight, placed in its room; it was found, that inftead of $3 \frac{1}{4} \mathrm{lb}$. a weight of one pound would make it revolve in lefs time than it did before; performing now 20 revolutions after 10 were elapfed in the face of 19 ".
" Hence then it follows, that from the $\hat{3}_{\underset{\alpha}{x}}^{\mathrm{x}} \mathrm{lb}$. fir $\AA$ hung on, there is lefs than I lb. to be deducted for the refiftance on the arm ; and confequently the refiftance on the globe itfelf is not lefs than the effort of $2 \frac{1}{4} \mathrm{lb}$. in the fituation M ; and it appearing from the former meafures, that the radius of the barrel is nearly $3^{\frac{x}{4}}$ of the radius of the circle, deferibed by the centre of the globe; it follows, that che abfolute refiftance of the globe, when it revolves 20 times in $2 \mathrm{I}_{\frac{1}{\prime}}^{\prime \prime}$, (about 25 feet in a fecond), is not lefs than the 5oth part of two pounds and a quarter, or of 36 ounces ; and this being confiderably more than half an ounce, and the globe nearly the fize of a twelve-pound hot, it irrefragably confirms a propofition 1 had formerly laid down from theory, that the refiftance of the air to a 12 lb . iron hot, moving with a velocity of 25 feet in 2 fecond, is not lefs than half an ounce.
" The reft of the experiments were made in order to confirm another propofition, namely, that the reGiftance of the air within certain limits is nearly in the duplicate proportion of the velocity of the refifted body. To inveftigate this point, there were fucceffively hung on at $M$, weights in the proportion of the numbers $1,4,9,16$; and letting 10 revolutions firft elapfe, the following obfervations were made on the reft.-With $\frac{1}{2} \mathrm{lb}$. the globe went 20 turns in $54 \frac{1}{2}$ ", with 2 Jb . it went 20 turns in $27_{\frac{1}{4} / \prime \prime}^{1}$, with $4 \frac{1}{7} \mathrm{lb}$. it went 30 turns in $27 \frac{1}{2}$, and with 8 lb . it went 40 turns in $27 \frac{1}{2}$.-Hence it appears, that no refiftances proportioned to the numbers $1,4,9,16$, there correfpond velocities of the refifted body in the proportion of the numbers 1, 2, 3, 4; which proves, wih great nicery, the propofition abovementioned.
" With regard to the rotatory motion, the firft experiment was to evince, that the whirling motion of a ball combining with its progreffive motion would produce fuch an oblique refiftance and deflective power as already mentioned. For this purpofe a wooden ball of $4 \frac{\pi}{2}$ inches diameter was fufpended by a double fring, about eight or nine feet long. Now, by turning round the ball and twifting the double ftring, the ball when left to itfelf would have a revolving motion given it from the untwifting of the fring again. And if, when the ftring was twifted, the ball was drawn to a coniflerable diftance from the perpendicular, and there let go; it would at firft, before it lad acquired
its revolving motion, vibrate fleadily enough in the fame vertical plane in which it firft began to move : but when, by the untwifting of the ftring, it had acquired a fufficient degree of its whirling motion, it conftantly deflected to the right or left of its firlt tract ; and fometimes proceeded fo far as to have its direction at right angles to that in which it began its motion; and this deviation was not produced by the ftring itfelf, but appeared to be entirely owing to the refintance being greater on the one part of the leading furface of the globe than the other. For the deviation continued when the ftring was tutally untwifted; and even during the time that the ftring, by the motion the globe had received, was twifting the contrary way. And it was always eafy to prediet, before the ball was let go, which way it would deflect, only by confidering on which fide the whirl would be combined with the progreflive motion ; for on that fide always the deflective power acted, as the refiftance was greater here than on the fide where the whirl and progreflive motion were oppofed to one another.'"

Though Mr Robins confidered this experiment as an inconteftable proof of the truth of his theory, he undertook to give ocalar demonftration of this deflection of morket-bullets even in the fhort fpace of 100 yards.
"As all projectiles," fays he, " in their flight, are acted upon by the power of gravity, the deflection of a bullet from its primary direction, fuppotes that deflection to be upwards or downwards in a vertical plane ; becaufe, in the vertical plane, the action of gravity is compounded and entangled with the deflective force. And for this reafon my experiments have been principally directed to the examination of that deffection which carries the bullet to the right or left of that plane in which it began to move. For it it appears at any time that the bullet has fhiffed from that vertical plane in which the motion began, this will be an inconteftable proof of what we have adyanced.-Now, by means of fereens of exceeding thin paper, placed parallel to each other at proper dittances, this deffection in queftion may be many ways inveltigated. For by firing bullets which hall traverfe the fereens, the flight of the bullet may be traced ; and it may eafily appear whether they do or do not keep invariably to one vertical plane. This examination may proceed on three different principles, which I thall here feparately explain.
"For firft, an exactly vertical plane may be traced out upon all thefe fcreens, by which the deviation of any fingle bullet may be more readily inveftigated, only by meafuring the borizontal diftance of its trace from the vertical plane thus delineated; and by this means the abfolute quantity of its aberration may be known. Or if the defcription of fuch a vertical plane thould be efteemed a matter of difficulty and nicety, a fecond method may be followed; which is that of refting the piece in fome fixed notch or focker, fo that though the piece may have fome little play to the rightand left, yet all the lines in which the bullet can be directed fhall interfect each other in the centre of that fixed focket: by this means, if two different hot are fired from the piece thus filuated, the horizontal diftances made by the two bullets on any two fcreens ought to be in the fame proportion to each other as

Theory. the refpective diftances of the fercens from the focket in which the picee was laid. And isthefe horizontal diftances differ from that proportion, then it is certain that one of the fhot at leaft hath deviated from a vertical plane, although the abfolute quantity of that deviation cannot hence be alfigned; becaufe it cannor be known what part of ir is to be imputed to one bullet, and what to the other.
"But if the conftant and invariable pofition of the notch or focket in which the piece was placed, be thought too hard an hypothetis in this very nice affair; the third method, and which is the fimpleft of all, requires no more than that two flot be fired through three fcreens withont any regard to the pofition of the piece each time; for in this cafe, if the fhots diverge from each other, and both keep to a vertical plane, then if the horizontal diftances of their traces on the firft fcreen be taken from the like horizontal diftances on the fecond and third, the two remainders will be in the fame proportion with the diftances of the fecond and third fcreen from the firft. And if they are not in this proportion, then it will be certain that one of them at leat bath been deflected from the vertical plane; though here, as in the laft cafe, the quantity of that deflection in each will not be known.
"All thefe three methods I have myfelf made ufe of at different times, and have ever found the fuccefs agreeable to my expectation. But the moft cligible method feemed to be a compound of the two laft. The apparatus was as follows.-.-Two fcreens were fet up in the larger walk in the charter-houfe garden; the firft of them at 251 feet diftance from the wall, which was to ferve for a third fereen; and the fecond 200 feet from the fame wall. At 50 feet before the firt fereen, or at 300 feet from the wall, there was placed a large block weighing about 200 lb . weight, and having fixed into it an iron bar with a focket at its extremity, in which the piece was tobe laid. The piece itfelf was of a common length, and bored for an ounce ball. It was each time loaded with a ball of 17 to the pound, fo that the windage was extremely fmall, and with a quarter of an ounce of good powder. The fcreens were made of the thinnelt iffue paper, and the refiftance they gave to the bullet (and confequently their probability of deflecting it) was fo fmall, that a bullet lighting one time near the extremity of one of the fcreens, left a fine thin fragment of it towards the edge entire, which was fo very weak that it was difficult to handle it without breaking. Thefe things thus piepared, five fhot were made with the piece refted in the notch abovementioned; and the horizontal diftanees between the firft hort, which was taken as a ftandard, and the four lucceeding ones, both on the firt and fecond fcreen and on the wall, and meafured in naches, were as follows:

|  | If Screen | ad Screen. | Wall. |
| ---: | :---: | ---: | ---: |
| 10 2 | $1,75 \mathrm{R}$. | $3,15 \mathrm{R}$. | $16,7 \mathrm{R}$. |
| 3 | 10 | L. | $15,6 \mathrm{~L}$. |
| 4 | $1,25 \mathrm{~L}$. | $4,5 \mathrm{~L}$. | $15,0 \mathrm{~L}$. |
| 5 | $2,15 \mathrm{~L}$. | $5, \mathrm{~L}$. | $19,0 \mathrm{~L}$. |

* Here the letrers $R$ and L , denote that the fhot in queftion went either to the right or left of the firf.
" If the pofition of the focket in which the piece was placed be fuppofed fixed, then the horizontal difrances meafared above on the firf and fecond fereen,
and on the wall, ought to be in proportion to the di- Theory, ftances of the firt fcreen, the fecond fcreen, and the wall from the focket. But by only looking over thefe: numbers, it appears, that none of themare in that proportion ; the herizontal diftance of the firt and third, for infance, on the wall being above ninefinches more than it thould be by this analogy.
"If, without fuppofing the invariable pofition of the focket, we examine the comprative horizontal diftances according to the third method defcribed above, we fhall in this cafe difoover divarications fitl more extraordinary ; for, by the numbers fet down, it appears, that the horizontal diftances of the fecond and third fhot on the two fcreens, and on the wall, are as under.

$$

\end{array}
$$

Here, if, according to the rule given above, the diflance on the firlt fcreen be taken from the diftances on the other two, the remainder will be 7, and 74.2 : and thefe numbers, if each hinot kept to a vertical plane, onglit to be in the proportion of 1 to 5 ; that being the proportion of the diftances of the fecond freeen, and of the wall from the firlt: but the laft number 74.2 exceeds what it ought to be by this analogy by $39-2$; fo that between them there is a deviation from the vertical plane of above 39 inches, and this too in a trangit of litile more than 80 yards.
"But fayther, to how that thefe irregularities do not depend on any accidental circumfance of the balls fittingor not fitting the piece, there were five fhots more made with the fame quantity of powder as before, but with imaller bulters, which ran much loofer in the piece. And the horizontal diftances being meafured in inches from the trace of the firlt bullet to each of the fucceeding ones, the numbers were as under.

1 to 2 I5.6R. 31.1 R . 9.4.0 R.

| 2 | 15 R. | 31.1 R. | 9.4 .0 R. |
| :--- | ---: | ---: | :--- | :--- |
| 3 | 6.4 L. | 12.75 L. | 23.0 L. |
| 4 | 4.7 R. | 8.5 R. | 15.5 R. |
| 5 | 12.6 R. | 240 R. | 63.5 R. |

Here, again, on the fuppofed fixed pofition of the piece, the harizontal diftance on the wall between the firft and third will be found above 15 inches lefs than it fhould be if each kept to a vertical plane; and like irregularities, thongh fmaller, occur in every other experiment. And if they are examined according to the third method fet down above, and the horizontal diftances of the third and fourth, for inflance, are compared, thote on the firft and fecond fereen, and on thewall, appear to be thus.

Wall.
38.5

And if the horizontal diftance on the firf fcreen be taken from the other two, the remainders will be ro. $\mathbf{I} 5$, and 27.4 ; where the leaft of them, inftead of being five times the firf, as it ought to be, is 23.35 hort of it ; fo that here is a deviation of 23 inches.
"Erom ald thefe experiments, the deflection in quefion feems to be inconteftably evinced. But to give fome farther light to this fubject, I took a barrel of the fame hore with that hitherto ufed; and bent it at about three or four inches from its muzzle to the left, the bend making an angle of three or four degrees.

Theory, with the axis of the picce. This piece thus bent was fired with a loofe ball, and the fane quantity of powder hifherto uled, the fcieens of the lait experiment being thill continued. It was natural to expect, that if this piece was pointed by the general direction of its axis, the ball would be canted to the left of that direction by the bend near its mouth. Bat as the bullet, in pafligg through the bent part, would, as I conceived, be forced to roll upon the right-hand lide of the barrel, and thereby its left fide would turn up againft the air, and would increafe the refiftance on that fide; I predicted to the company then prefent, that if the axis on which the bullet whirled, did not fhift its pofition after it was feparated from the piece; then, notwithftanding the bent of the piece to the left, the bullet itfelf might be expected to incurvate towards the right; and this, upon trial, did molt remarkably happen. For one of the bullets fired from this bent prece paffed through the firl foreen about $I_{7}^{\prime}$ inch ditant from the trace of one of the fhot fired from the ftraight piece in the laft fet of experiments. On the fecond foreen, the traces of the fame baliets were about three inches diftant; the bullet from the crooked piece paffing on both fereens to the left of the other: but comparing the place of thefe bullets on the wall, it appeared that the bullet from the crouked piece, though it diverged from the track on the two fereens, had now croffed that track, and was deflected conliderably to the right of it ; fo that it was obvious, that though the buller from the crooked piece night firlt be canted to the left, and had diverged from the track of the other bullet with which it was compared, yet by degrees it deviated again to the right, and a little beyond the fecond fcreen crofed that track from which it before diverged, and on the wall was deflected 14 inches, as I remember, on the contrary fide. And this experiment is not only the moft convincing proof of the reality of this deflection here contended for; but is likewife the ftrongeft confirmation that it is brought about in the very manner and by the very circamftances which we have all along defcribed.
"I have now only to add, that as I fufpected the confileration of the revolving motion of the bullet, compounded with its progrefive one, might be confidered as a fubject of mathematical fecculation, and that the reality of any deflecting force thence arifing might perhaps be denied by fome computifts upon the principles hitherto received of the action of fluids; I thought proper to annex a few experiments, with a view of evincing the Atrange deficiency of all theories of this fort bitherto eftablifined, and the unexpected and wonderful varieties which occur in thefe matters. The propolition which I advanced for this purpofe being, That two equal furfaces meeting the air with the fame degree of obliquity, may be fo differently refifted, that though in one of them the refifance is less than that of a perpendicular furface meeting the fame quantity of air, yet in another it hall be confulerably 32 greater.

[^17]breadth, and $5_{5}^{7}$ in length, which was equal to the Theory. furface of the pyramid, the globe $P$ was taken off from the machine, and the pyramid was tirft fixed on ; and 2 lb . being hung at $M$, and the pyramid fo fitted as to move with its vertex forwards, it performed 20 rc volucions after the firft ten were elapfed in $33^{\prime \prime}$. Then the pyramid being turned, fo that its bafe, which was a plane of four inches fquare, went foremoft, it now performed 20 revolutions with the fame weight in $33_{\frac{1}{4}}^{1 / 1}$.-Atter this, taking off the pyramid, and fixing on the parallelogram with its longer fide perpendicular to the arm, and placing its furface in an angle of $45^{\circ}$ with the horizon by a quadrant, the parallelogram, with the fame welght, performed 20 revolutions in $43^{\frac{1}{2}}{ }^{\prime \prime}$.
"Now here this parallelogram and the furface of the pyranid are eq ial to each other, and each of them met the air in an angle of $45^{\circ}$, and yet one of them made 20 revolutions in $33^{\prime \prime}$, whill the other took up $43 \frac{5}{4}$. And at the fame time it appears, that a flat furface, fuch as a bafe of a pyramid, which meets the fame quanticy of air perpendicularly, makes 20 revolutions in $38_{4}^{\prime \prime \prime}$, which is the medium between the other two.
" But to give another and filit more fimple proof of this principle; there was taken a parallelogram four inches broad and $8 \frac{\pi}{4}$ long This being fixed at the end of the arm, with its. long fide perpendicular thereto, and being placed in an angle of $45^{\circ}$ with the horizon, there was a weight hung on at M of $3 \frac{2}{2} \mathrm{lb}$. with which the parallelogram made 20 revolutions in $40 \frac{2}{4}$. But after this, the pofition of the parallelogram was fifted, and it was placed with its fharter fide perpendicular to the arm, though its furface was ftill inclined to an angle of $45^{\circ}$ with the horizon; and now, inftead of going flower, as might be expected from the greater extent of part of its furface from the axis of the machine, it went roand much fafter: for in this laft fituation it made 20 revolations in $35 \frac{3}{4}^{\prime \prime}$, fo that there were $5^{\prime \prime}$ difference in the time of 20 revolutions; and this from no other change of circumfance that as the larger or fhorter fide of the oblique plane was perpendicular to the line of its direction."

In the 73 d volume of the Philofophical Tranfactions, feveral experimens on this fubject, but upon a larger fcale, are related by Lovell Edgeworth, Efq. They confirm the truth of what Mr Robins advances, but nothing is faid to explain the reafon of it.

Thefe are the principal experiments made by Mr why the Robins in confirmation of his theory, and whicis not att of guna only far exceed every thing that had been formerly nery can done, but even bid fair for advancing the art of gan- not become nery to its ne plus ultra. It muft be obferved, how- perfect. ever, that if this att it is impoffible we thould ever arrive at abfolate perfection; that is, it san never be expected that a gunner, by any method of calculation whatever, could be enabled to point his guns in fuch a manner, that the fhot would hit the nark if placed any where withnits range. Aberrations, which can by no means be either forefeen or prevented, will take place from a great number of different caufes. A variation in the denfiry of the amofphere, in the dampnefs of the powder, or in the figure of the fhor, will cante variations in the range of the buller, which cannot by any means be reduced to rules, and confequently

Theory.
maft render the event of each hot very precarious. The refilance of the atmofiphere fimply confidered without any of thofe anomalies arifing from its denfity at different times, is a problem which, notwithftanding the labours of Mr Robins and others, hath not been complerely folved: and, indeed, if we comfider the matter in a phytical light, we fhall find, that without fome other data than thofe which are yet obtained, an exact folution of it is impolfible.

It is an objection that hath been made to the mathematical philofophy, and to which in many cafes it is moft certainly liable, that it confiders the refiffance of matter more than its capacity of giving motion to other matter. Hence, if in any cale matter acts both as a refifting and moving power, and the mathematician overlooks its effort towards motion, founding his demonftrations only upon its property of refifting, thefe demonftrations will certainly be falfe, though they fhonld be fupported by all the powers of geometry. It is to an error of this kind we are to attribute the great differences already taken notice of between the calculations of Sir Ifaac Newton, with regard to the refift ing force of fuids, and what actually takes place upon trial. Thefe calculations were made upon the fuppofition that the fluid through which a body moved could do nothing elfe but refift it ; yet it is certain, that the air (the fluid with which we have to do at prefent) proves a fource of motion, as well as refiftance, to all bodies which move in it.
Plate
ccxxv.
fig. 5.

To underftand this matter fully, let ABC. reprefent a crooked tube made of any folid matter, and $a, b$, two piftons which exactly fill the cavity. If the fpace between thefe piftons is full of air, it is plain they cannot come into contact with each other on account of the elaticity of the included air, but will remain at fome certain diftance as reprefented in the figure. If the pifon $b$ is drawn up, the air which preffes in the direction $\mathrm{C} b$ aets as a refifting power, and the pifton will not be drawn up with fuclieafe as if the whole was in vacuo. But though the colfomn of air prefling in the direction $\mathrm{C} b$ acts as a refifting power on the pifton $b$, the colunn preffing in the direction $A a$ will act as a moving power upon the pifton $a$. It is therefore plain, that if $b$ is moved upwards till it comes to the place marked $d$, the other will defeend to that marked $c$. Now, if we fuppofe the pifton a to be removed, it is plain, that when 6 is palled upwards to $d$, the air defeending through the leg Aa CB will prefs on the under fide of the pifton 6 , as ftrongly as it would have done upon the upper fide of the pifton $a$, had it been prefent. Therefore, though the air paffing down through the leg CB refifts the motion of the pifton $b$ when drawn upwards, the air preffing down through the $\operatorname{leg} A B$ forwards it as much : and accordingly the pifton $b$ ray be drawn up or puthed down at pleafure, and with very little trouble. But if the orifice at $A$ is fopyed, fo that the air can only exert its refifting power on the pilton $b$, it will require a confiderable degree of ftrength to move the pifion from $b$ to $d$.

If now we fuppofe the tube to be entirely removed (which indeed anfwers so other purpofe than to render the action of the air more evident), it is plain, that if the pifton is moved either up or down, or in any other direetion we can imagine, the air preffes as much upon the back part of it as it refifts it on the fore part ; and
of confequence, a ball moving through the air with any degree of velocity, ought to be as much accelera. ted by the action of the air behind, as it is retarded by the action of that before.-Here then it is natural to afk, If the air accelerates a moving body as much as it retards it, how comes it to make any reiftance at all ? yet certain it is, that this fluid doth refift, and that very confiderably: To this it may be anfwered, that the air is always kept in fome certain fate or conftitltion by another power which rules all its motions, and it is this power undoubtedly which gives the refiftance. It is not to our purpofe at prefent to inquire what that power is; but we fee that the air is often in very different ftates: one day, for inftance, its parts are vio. lently agitated by a form ; and another, perhaps, they are comparatively at reft in a calm. In the firft cafe; nobody hefitates to own, that the form is occafioned by fome caufe or other, which violently refifts any other power that would prevent the agitation of the air. In a calm, the cafe is the fame; for it would require the fame exertion of power to excite a tempeft in a calm day, as to allay a tempeft in a ftormy one. Now it is evident, that all projectiles, by their motion, agitate the atmofphere in an unnatural manner ; and confes quently are refifed by that power, whatever it is, which tends to reftore the equilibrium, or bring back the atmofphere to its former ftate.

If no other power befides that abovementioned acted upon projectiles, it is probable that all refiftance to their motion would be in the duplicate proportion of their velocities ; and accordingly, as long as the velocity is fmall, we find it generally is fo. But when the velocity comes to be exceedingly great, other fources of refiftance arife. One of thefe is a fubraction of part of the moving power; which though not properly a refiftance, oppoling another power to it, is an equivalent thereto. This fubtraction arifes from the following canfe. The air, as we have already obferved, preffes on the hinder part of the moving body by its gravity, as much as it refifts the forepart of it by the fame property. Neverthelefs, the velocity with which the air prefles upon any body by means of its gravity, is limited; and it is poffible that a body may change its place with fo great velocity that the air hath not time to rufh in upon the back part of it, in order to affift is progreflive motion. When this happens to be the cafe, there is in the firft place a deficiency of the moving power equivalent to 15 pounds on every fquare inch of furface; at the fame time that there is a pofitive refiftance of as much more on the forepart, owing to the gravity of the atmofphere, which muft be overcome before the body can move forward.

This deficiency of moving power, and increafe of reGiftance, do not only take place when the body moves with a very great degree of velocity, but in all motions whatever. It is not in all cafes perceptible, becaufe the velocity with which the body moves, frequently bears but a very fmall proportion to the velocity with which the air prefes in behind it. Thus, fuppofing the velocity with which the air rufies into a vacuum to be 1200 feet in a fecond; if a body moves with a velocity of 20,40 , or 50 feet in a fecond, the force with which the air preffes on the back part is but ${ }_{y_{5}^{\prime}}$ at the utmoftlefs than that which refils on the forepart of ir, which

Sect. II.
$\begin{array}{lllllll}\mathbf{G} & \mathbf{U} & \mathrm{N} & \mathrm{N} & \mathbf{E} & \mathbf{R} & \mathbf{Y} .\end{array}$

Theory. which will notbe perceptible ; but if, as in the cafe of bullets, the velocity of the projectile comes to have a confiderable proportion to the velocity wherewith the air rumes in behind it; then a very perceptible and otherwife unaccountable refiftance is obferved, as we have feen in the experiments already related by Mr Robins. Thus, if the air preffes in with a velocity of 1200 feet in a fecond, if the body changes its place with a velocity of 600 feet in the fame time, there is a refiftance of 15 pounds on the fore part, and a preffure of only $7 \frac{1}{x}$ on the back part. The refiftance therefore not only overcomes the moving power of the air by $7_{\frac{\pi}{2}}$ pounds, but there is a deficiency of other 7 pounds owing to the want of half the preffure of the atmofphere on the back part, and thus the whole lofs of the moving power is equivalent to 15 pounds; and hence the exceeding great increafe of refiftance oblerved by Mr Robins beyond what it it onght to be according to the common computations.- The velocity with which the air rufhes into a vactum is therefore a defideratum in gunnery. Mr Robins fuppofes that it is the fame with the velocity of found; and that when a bullet moves with a velocity greater than that of 1200 feet in a fecond, it leaves a perfect vacuum behind it. Hence he accounts for the great increafe of refiftance to bullets moving with fach velocities; but as he doth not rake notice of the lofs of the air's moving power, the anomalies of all leffer velocities are incxplicable on his principles. Nay, he even tells us, that Sir Ifaac Newton's rule for computing refiftances may be applied in all velocities lefs than Inoo or 1200 feet in a fecond, though this is exprefsly contradicted by his own experiments mentioned $n^{\circ} 23$.
refifts by Though for thefe reafons it is evident how great difits elafticity ficulties muft occur in attempting to calculate the refiftas well as ance of the air to military projectiles, we have not even gravity. yet difcovered all the fources of refiftance to thefe bodies when moving with immenfe velocities. Another power by which they are oppofed (and which at laft becomes greater than any of thofe hitherto mentioned), is the air's elafticity. This, however, will not begin to fhow itfelf in the way of refiftance till the velocity of the moving body becomes conliderably greater than that by which the air preffes into a vacunm. Having therefore firf afcertained this velocity, which we thall fuppofe be 1200 feet in a fecond, it is plain, that if a body moves with a velocity of 18 co feet in a fecond, it mult comprefs the air before it; becaufe the fluid hath neither time to expand itfelf in order to fill the vacuun left behind the moving body, nor to rufh in by its gravity. This compreffion it will refift by its elaftic power, which thus become a new fource of refiftance, increafing without any limit, in proportion to the velocity of the moving body. If now we fuppore the moving body to fet out with a velocity of 2400 feet in a fecond, it is plain that there is not only a vacuum left behind the body, but the air before it is compreffed into half its natural face. The lofs of motion in the projectile therefore is now very confl. derable. It firt lofes is pounds on every fquare inch of furface on account of the deficiency of the moving power of the air behind it; then it lofes 15 pounds more on account of the refiftance of the air before it; again it lofes 15 pounds on account of the elafticity of the compreffed air : and laftly another 15 pounds on ac-
count of the vacumm belind which takes off the weight Theory. of the atmofphere, that would have been equivalent to one half of the elafticity of the air before it. The whole refiftance therefore upon every fquare inch of furface moving with this velocity is 60 pounds, befides that which arifes from the power tending to preferve the general ftate of the atmofphere, and which increafes in the duplicate proportion of the velocity as already mentioned. If the body is fuppored to move with a velocity of 4800 feet in a fecond, the refiftance from the air's elafticity will then be quadrupled, or amount to 60 pounds on the fquare inch of furface; which added to the other caufes, produces a refiftance of 105 pounds apon the fquare inch; and thus would the refiftance from the elafticity of the air go on continually increafing, till at laft the motion of the projectile would be as cffectually fopped as if it was fired againt a wall. This obfacle therefore we are to confider as really infuperable by any art whatever, and therefore it is not advifable to ufe larger charges of powder than what will project the fhot with a velocity of 1200 fect in a fecond. To this velocity the elafticity of the air will not make great refiftance, it indeed it do make any at all : for though Mr Robins hath conjectured that air rufhes into a vacuum with the velocity of found, or between II and 1200 feet in a fecond; yet we have no decifive proof of the truth of this fuppofition. At this velocity indeed, according to Mr Robins a very fud. den increafe of refifance takes place: but this is denied by Mr Glenic *, who fuppofes that the refiftance pro. * Hif, of ceeds gradually; and indeed it feems to be pretty ob-Gunnery. vious, that the refiftance cannot very fuddenly increafe, $\mathrm{p} .48,50_{0}$ if the velocity is only increafed in a fmall degrce. Yet it is certain, that the fwifteft motions with which can-non-balls can be projected are very foon reduced to this ftandard; for Mr Robins acquaints us, that "r a 24-pound hot, when difcharged with a vclocity of 2000 feet in a fecond, will be reduced to that of 1200 feet in a fecond in a fight of little more than 500 yards."

In the 7ift volume of the Philofophical Tranfactions, Mr 1 homfon has propofed a new method of determining the velocities of bullets, by meafuring the force of the recoil of the piece. As in all cafes action and re-action are fuppofed to be equal to one another, it appears that the momentum of a gun, or the force of its recoil backwards, mult always be equivalent to the force of its charge; that is, the velocity wirh which the gun recoils, multiplied into its weight, is. equal to the velocity of the bullet multiplied into its. weight; for every particle of matter, whether folid or fluid, that iffues out of the mouth of a pitce mult be impelled by the action of fome power, which powr mult re-act with equal force againt the botion of the bore.-Even the fine invifible claftic fluid that is generated from the powder in its inflammation, cannot put itfelf in motion without reacting againft the gon at the fame time. Thus we fee pieces, when they are fired with powder alone, recoil as well as when their clarges are made to impel a weight of fhot, though the recoil is not in the fame degree in both cafes. It is eafy to determine the velocity of the recoil in any given cafe, by fufpending the gun in an horizontal pofition by two pendulous rods, and meafuring the arc of its afcent by means of a ribbon, as mentioned under
the article Gunfowder; and this will give the momentum of the gun, its weight being known, and confequently the momentum of its charge. Bur in order to derermine the velocity of the bullet from the momentum of the recoil, it will be neceffary to know how much the weight and velocity of the elaftic fluid contributes to it.
" That part of the recoil which arifes from the expanfion of the fluid is always very nearly the fame whether the powder is fired alone, or whether the charge is made to impel one or more bullets, as has been determined by a great variety of experiments.If therefore a gun, fufpended according to the method prefcribed, is fired with any given charge of powder, but without any bullet or wad, and the recoil is obferved, and if the fane piece is afterwards fired with the fame quantity of powder, and a bullet of a known weight, the excefs of the velocity of the recoil in the latter cafe, over that in the former, will be proportional to the velocity of the bullet; for the difference of thete velocities, maltiplied into the weight of the gun, will be equal to the weight of the bullet multiplied into its velocity.-Thus, if $W$ is put equal to the weight of the gun, $\mathrm{U}=$ the velocity of the bullet when fired with a given charge of powder without any bullet; $\mathrm{V}=$ the velocity of the recoil, when the fame charge is made to impel a bullet; $B=$ the weight of the bullet, and $v=$ its velocity; it will be $v=$ $\underline{\overline{\mathrm{V}}-\bar{U}+W} \cdot \mathbf{B}$

To determine how far this theory agreed with practice, an experiment was made with a charge of 165 grains of powder without any bullet, which produced a recoil of 5.5 inches; and in another, with a bullet, the recoll was 5.6 inches; the mean of which is 5.55 inches; anfwering to a velocity of t . 358 feet in a fecond. In five experiments with the fame charge of powder, and a bullet weighing 580 grains, the mean was 14.6 inches; and the velocity of the recoil anfwering to the length juft mentioned, is 2.9880 feet in a fecond: confequently V-U, or $29880-\mathrm{r} .1358$, is equal to 1.8522 feet in a fecond. But as the velocities of recoil are known to be as the cords of the arcs through which the barrel afcends, it is not neceflary, in order to determine the velocity of the bullet, to compute the velocities $V$ and $U$; but the quantity $V-U$, or the difference of the velocities of the recoil when the given charge is fired with and without a bullet, may be computed from the value of the difference of the chords by one operation. - Thus the velocity anfwering to the chord 9.05 , is that of 1.8522 feet in a fecond, is juft equal to $\mathrm{V}-\mathrm{U}$, as was before found.

In this experiment the weight of the barrel with its carriage was juft $47 \frac{\mathrm{r}}{4}$ pounds, to which $\frac{3}{4}$ of a pound were to be added on account of the weight of the rods by which it was fufpended; which makes $W=48$ pounds, or 336,000 grains. The weight of the bullet was 580 grains; whence $B$ is to $W$ as 580 to 336,000 ; that is, as 1 to 579.31 very nearly. The value of $\mathrm{V}-\mathrm{U}$, anfwering to the experiments before mentioned, was found to be 1.8522 , confequently the velocity of the bullcts $=$, , was $1.8522+579.31=1073$ feer, which differs only by 10 from 1083, the velocities found by the pendulum.

The velocities of the bullets may be found from the
recoil by a fill more fimple method; for the velocities Theory. of the recoil being as the chords meafured upon the ribbon, if $c$ is put equal to the chord of the recoil expreffed in Englifh inches, when the piece is fired with powder only, and $C=$ the chord when the fame piece is charged with a bullet: then $\mathrm{C}-c$ will be as $\mathrm{V}-\mathrm{U}$; and confequently as $\frac{\overline{V-U}+W}{B}$ which meafures the velocity of the bullet, the ratio of $W$ to $B$ remaining the fame.-If therefore we fuppofe a cafe in which C-c is equal to one inch, and the velocity of the bullet is computed from that chord, the velocity in any other cafe, wherein C- $c$ is greater or lefs than one inch, will be found by multiplying the difference of the chord $\mathbf{C}$ and $c$ by the velocity that anfwers to the difference of one inch.-The length of the parallel rods by which the piece was fufpended being 64 inches, the velocity of the recoil, $=\mathrm{C}-c$ I inch mea.ured upon the ribbon, is 0.204655 parts of a foot in one fecond; which in this cafe is allo the value of $\mathrm{V}-\mathrm{U}$ : the velocity of the bullet, or $v$, is therefore $0.204655+579$. $3 \mathrm{I}=\mathrm{II} 8.35$ feet in a fecond. Hence the velocity of the buller may in all cafes be found by multiplying the difference of the cords $C$ and $c$ by II 8.35 ; the weight of the barrel, the length of the rods by which it is fufpended, and the weight of the bullet remaining the fame; and this whatever the charge of powder made ufe of may be, and however it may differ in ftrength and goodnefs.

The exactnefs of this fecond method will appear from the following experiments. On firing the pieca with 145 grains of powder and a bullet, the mean of three lets of experiments was $13.25,13.15$, and 13.2 ; and with the fame charge of powder without a bullet, the recoil was $4.5,4.3$, or $4.4:$ C-c therefore was $13.2-4.4=8.8$ inches; and the velocity of the bullets $=8.8+118.35=1045$ feet in a fecosd; the velocities by the pendulum coming out 10.40 feet in the fame face of time.

In the far greatef number of experiments to determine the comparative accuracy of the two methods, a furprifing agrecment was found betwixt the laft mentioned one and that by the pendulum; but in fome few the differences were very remarkable. Thus, in two where the recoil was 12.92 , and 13.28 the velocity, by computation from the chords is 1030 feet per fecond; but in computing by the pendulum it amounted only to 900 ; but in thefe fome inaccuracy was fufpected in the experiment with the pendulum, and that the computation froth the recoil was mof to be depended upon. In another experiment, the velocity by the recoil exceeded that by the pendulum by no lefs than 346 feet : the former howing 2109 , and the latter only 1763 feet in a fecond. In two others the pendulum was alfo deficient, though not in fuch a degree. In all thefe it is remarkable, that where the difference was confiderable, it was ftill in favour of the recoil. The deficiency in thefe experiments appears to have been fomewhat embarafling to our author. "It cannot be fappofed, fays he, that it arofe from any imperfection in Mr Robin's method of determining the velocities of bullets; for that method is founded upon fuch principles as leave no room to doubt of itsaccuracy; and the practical errors that occur in making the experiments, and which cannot be entirely prevented, or

Theory. exachly compenfated, are in general fo finall, that the difference in the velocities caunot be autributed to them. It is true the effect of thofe errors is mure likely to appear in experiments made under fuch circumitances as the prefen:; for the bullet being very light (A), the arc of the afcent of the pendulum was but finall; and a fonall miftake in meafuring the chord upon the ribbon would have produced a very conliderable error in computing the velocity of the bullet: Thus a difference of one-tenth of an inch, more or lefs, upon the ribbon, in that experiment where the difference was greatelt would have made a difference in the velocity ot more than 120 feet in a fecond. But, independent of the pains that were taken to prevent miftakes, the friking agreement of the velocities in fo many other experiments, affords abundant reafon to conclode, that the errors arifing from thofe caules were in no cafe very confiderable.- But if both methods of determining the velocities of bullets are to be relied on, then the difference of the velocities, as determined by them in thefe experiments, can only be accounted for by fuppofing that it arofe from their having been determined by the refiftance of the air in the palfage of the bullets trom the mouth of the piece to the pendulum : and this fufpicion will be much ftrengthened when we confider how great the refiftance of the air is to bodies that move very fwiftly in it; and that the bullets in thefe experiments were not only projected with great velocities, but were alfo very light, and confequently more liable to be retarded by the refiftance on that account.
"To put the matter beyond all doubt, let us fee what the refiftance was that thefe bullets met with, and how much their velocities were diminifhed by it. The weight of the bullet in the molt erroneous experiment was 90 grains; its diameter 0.78 of an inch; and it was projected with a velocity of 2109 feet in a fecond. If now a computation be made according to the law laid down by Sir Ifaac Newton for compreffed fluids, it will be found that the refiftance to this bullet was not lefs than $8 \frac{x}{x}$ pounds avoirdupoife, which is fomething more than 660 times its own weight. But Mr Robins has fhown by experiment, that the refiftance of the air to bodies moving in it with very great velocity, is near three times greater than Sir Iface has determined it; and as the velocity with which this bullet was impelled is confiderably greater than any in Mr Robins's experiments, it is highly probable, that the refiftance in this inftance was at leaft 2000 times greater than the weight of the bullet.
"The diftance from the mouth of the piece to the pendulum was 12 feet; but, as there is reafon to think that the blait of the powder, which always follows the ballet, continues to act upon it for fome fenfible face of time after it is out of the bore, and, by urging it on, counterbalances, or at leaft counteracts in a great meafure, the refiftance of the air, we will fuppofe that the refiftance does not begin, or rather that the motion of the bullet does not begin to be retarded, till it has got to the diftance of two feet from the muzzle. The diftance, therefore, between the barrel and the pendulum, inftead of 12 feet, is to be eftimated at 10

Vol. VIlI.
feut; and as the bullet took up about $\frac{T^{\frac{2}{y}}, ~ p a r t ~ o f ~ a ~}{\text { a }}$ lecond in running over the fpace, it mult in that time have loft a velocity of about 335 feet in a fecond, as will appear upon making the computation; and this will very exactly account for the apparent diminution of the velocity in the experiment : for the difference of the velocities, as deternined by the recoil and the pendulum $=2109-1763=346$ feet in a fecond, is ex. tremely near 335 feet in a fecond, the diminution of the velocity by the refiftance as here determined.
" If the diminution of the velocities of the bullets in the two fubfequent experiments be computed in like manner, it will turn out in one 65, and in the other 33, feet in a fecond: and, making thele corrections, the comparifon of the two methods of afcertaining the velocitieswill ftand thus:

| Velocities by the pendulum, | 1763 | 1317 | 1 I 36 |
| :---: | :---: | :---: | :---: |
| Refiftance of air to be added, | 355 | 65 | 33 |
|  | 2098 | 1382 | 1169 |
| Velocity by the recoil, | 2109 | 1430 | 1288 |
| Difference after correction, | +II | $+48$ | 11 |

of It appears therefore, that notwithftanding thele correations, the velocities as determined by the pendulum, parricularly in the laft, were confiderably deficient. But the manifent irregularity of the velocities, in thofe inftances, affords abundant reafon to conclude, that it mult have arifen from fome accidental caufe, and therefore that little dependence is to be put upon the refult of thofe experiments. I cannot take upon me to determine pofitively what the caufe was which produced this irregularity, but I ftrongly fufpect that it arofe from the breaking of the bullets in the barrel by the force of the explolion: for thefe bullers as has already been mentioned, were formed of lead, inclofing leffer bullets of plafter of Paris; and I well remember to have obferved at that time feveral fmall fragments of the plafter which had fallen down by the fide of the pendulum. I confefs I did not then pay much attention to this circumitance, as I naturally concluded that it arofe from the breaking of the bullet in penetrating the target of the pendulum; and that the fmall pieces of plafter I faw upon the ground, had fallen out of the hole by which the bullet entered. But if the bullets were not abiolutely broken in pieces in firing, yet if they were confiderably bruifed, and the plafter, or a part of it, were feparated from the lead, fuch a change in the form might produce a great increafe in the refiftance, and even their initial velocities might be affected by is; for their form being changed from that of a globe to fome other figure, they might not fit the bore; and a part of the furce of the charge might be loft by the windage. - That this actually happened in the experiment laft mentioned, feems very probable; as the velocity with which the bullet was projected, as it was determined by the recoil, was coniderably lefs in proportion in that experiment than in many others which preceded and followed it in the fame fer.
"As allowance bas been made for the refiftance of the air in thefe cafes, it may be expected that the fame Dd fhould
flould be done in all other cafes : but it will probably appear, upon inquiry, that the diminution of the velocities of the bullets, on that account, was fo inconfiderable, that it might fafely be neglected: thus, fur inlance, in the experiments with an ounce of powder, when the velocity of the bullet was more than 1750 feet in a fecond, the diminution turns out no more than 25 or 30 feet in a fecond, though we fuppofe the full refiftance to have been fo near as two feet from the mouth of the piece; and in all cafes where the velocity was lefs, the effect of the refiftance was lefs in a mach greater proportion : and even in this inflance, there is reafon to think, that the dimination of the velocity, as we have derermined it, is too great ; for the flame of gutpowder expands with fuch amazing rapidiy, shat ic is fcarcely to be fuppofed but that it follows the bullet, and continues to ast upon it more than two feet, or even four feet, from the gan; and when the velocity of the bullet is jefs, its action upon it muft be fenfible at a fill greater diftance."

As this method of determining the velocities of bullets by the recoil of the piece did not occur to Mr Thomfon till after he had finifhed his experiments with a pendulum, and taken down his apparatus, he had it not in his power to determine the comparative ftrength of the recoil without and with a bullet; and confequently the velocity with which the flame iffues from the month of a picce. He is of opinion, however, that every thing relative to thefe matters may be determined with greater accuracy by the new method than by any other formerly practifed; and he very juftly remarks, that the method of determining the velocity by the recoil, gives it originally as the bullet fets out; while that by the pendulum fhows it only after a part has been deftroyed by the refiftance of the air. In the courfe of his remarks, he criticifes upon a part of Mr Robins's theory, that when bullets of the fame diameter, but different weight, are difcharged from the fame piece by the fane quantity of powder, their velocities are in a fub-duplicare ratio of their weight. This theory, he obferves, is manifeftly defective, as being founded upon a fuppofition, that the action of the elaftic flaid, generated from the powder, is always the fame in any and every given part of the bore when the charge is the fame, whatever may be the weight of the bullet; and as no allowance is made for the expenditure of force required to put the fluid itself in motion, nor for the lofs of it by the vent. " It is true (fays he) Dr Hutton in his experiments found this law to obtain without any great error; and poffibly it may hold good with fufficient accuracy in many cafes; for it fometimes happens, that a number of errors or actions, whofe operations have a contrary tendency, fo compenfate each orher, that their effects when united are not fenfible. But when this is the cafe, if any one of the caufes of error is removed, thofe which remain will be dereeted.-When any given charge is loaded with a heavy bullet, more of the powder is inflamed in any very fhort fpace of time than when the bullet is light-$e$-, and the action of the powder ought upon that account to be greater ; but a heavy bullet takes up longer time in pafing through the bore than a light one; and confequently more of the elaftic fluid generated from the puovder efcap $\epsilon$ sy the vent and by windage.

It may happen that the augmentation of the force, on account of one of thefe circumftances, may be inf able to counterbalance the diminution of it arifing from the other, and if it thould be found upon trial, that this is the cafe in general, in pieces as they are now conftyucted, and with all the variety of hot that are made ufe of in practice, it would be of great ufe to know the facl : but when, with Mr Robins, concluding too haftily from the refult of a partial experiment, we fuppofe, that becaufe the fum total of the preffure of the elaftio fluid upon the ballet, during the time of its paffage through the bore, happens to be the fame when bullets of different weights are made ufe of, that therefore it is always fo, our reafonings may prove very inconcluive, and lead to very dangerous errors."

In the profecution of this fubject Mr Thomfon proves mathematically, as well as by actual experiment, that the theory laid down by Mr Robins in this refpect is erroneous. The excefs is in favour of heavy bullets, which acquire a velocity greater than they ought to do according to Mr Robins's rule; and fo confiderable are the errors, that in one of Mr Thomfon's experiments, the difference was no lefs than 2042 feet in a fecond. When the weight of the bullet was increafed four times, the action of the powder was found to be nearly doubled; for in one experiment, when four bullets were difcharged at once, the collective preffure was as I; but when only a fingle bullet was made ufe of, it was no more than 0.5825 ; and on the whole he concludes, that the velocity of bullets is in the reciprocal fub-triplicate ratio of their weights. Our anthor obferves alfo, that Mr Robins is not only miftaken in the particular juft mentioned, but in his conclufion wirh regard to the abfolute force of gunpowder compared wish the preflure of the atmofphere; the latter being to the force of gunpowder as I to 1000 according to Mr Robins; but as 1 to 1308 according to Mr Thomfon.

## SEct. III. Practice of Gunnery.

With regard to the practical part of gunnery, which ought to confift in directing the piece in fuch a manner, as always to hit the object againft which it is pointed, there, can be no certain rules given. The following maxims are laid down by Mr Robins as of ufe in practice.
I. In any piece of artillery whateyer, the greater the quantity of powder it is charged with, the greater will be the velocity of the bullet.
2. If two pieces of the fame bore, but of different lengths, are fired with the fame charge of powder, the longer will impel the bullet with a greater celerity than the fhorter.
3. It two pieces of artillery different in weight, and formed of different metals, have yet their cylinders of equal bores and equal lengths; then with like charges of powder and like bullets they will each of them dif. charge their fhot with nearly the fame degree of celerity.
4. The ranges of pieces at a given eleyation are no jult meafures of the velocity of the fhor ; for the fame piece fired fucceffively at an invariable elevation, with the powder, bullet, and every other circumanance as
$\underbrace{\text { Pratice. }}$ nearly the fame as poffible, will yet range to very different diftances.
5. The greareft part of that uncertainty in the ranges of pieces which is defcribed in the preceding maxim, can only arife from the refiftance of the air.
6. The refiftance of the air acts upon projectiles in a twofold manner : for it oppofes their motion, and by that means continually diminifhes their celerity; and it befides diverts them from the regular track they would otherwife follow ; whence arife thofe deviations and inflections already treated of.
7. That action of the air by which it retards the motion of projectiles, though much neglected by writers on artillery, is yet in many inftances, of an immenfe force; and hence the motion of thefe refifted bodies is totally different from what it would ocherwife be.
8. This retarding force of the air ats with different degrees of violence, according as the projectile moves with a greater or leffer velocity; and the refiftances obferve this law. That to a velocity which is double another, the refiftance within certain limits is fourfold; to a treble velocity, ninefold; and fo on.
9. But this proportion between the refiftances to two greater velacities, does not hold if one of the velocities be lefs than that of 1200 feet in a fecond, and the other greater. For in this cafe the refiftance to the greater velocity is near three times as much as it would come out by a comparifon with the fmaller, according to the law explained in the laft maxim.
ro. To the extraordinary power exerted by the refiftance of the air it is owing, that when two pieces of different bores are difcharged at the fame elevation, the piece of the largeft boreufually ranges fartheft, provided they are both fired with fit bullets, and the cufomary allotment of powder.
11. The greateft part of military projectiles will at the time of their difcharge acquire a whirling motion round their axis by rubbing againft the infide of their refpective pieces : and this whirling motion will caufe them to ftrike the air very differently from what they would do had they no other than a progreffive motion. By this means it will happen, that the refiftance of the air will not always be directly oppofed to their flight; but will frequently act in a line oblique to their courfe, and will thereby force them to deviate from the regular tract they would otherwife defcribe. And this is the true caufe of the irregularities defcribed in maxim 4.
12. From the fudden trebling the quantity of the air's refiftance, when the projectile moves fwifter than at the rate of 1200 feet in a fecond (as hath been explained in maxim 9). it follows that wharever be the regular range of a bullet difcharged with this iaft mentooned velocity, that range will be but little increafed how much foever the velocity of the bullet may be ftill fartheraugmented by greater clarges of powder.
13. If the fame piece of cannon be fucceffively fired at an invariable elevation, but with varions charges of powder, the greateft charge being the whole weight of the bullet in powder, and the leatt not lefs than the fifth part of that weight ; then if the clevation be not lefs than eight or ten degrees, it will be found, that fome of the ranges with the leaft charge will exceed fome of thofe with the greateft.

14 If two pieces of cannon of the fame bore, but Pratice. of different lengths, are fucceffively fired at the fame elevation wilh the fame charge of powder; then it will frequently happen that foine of the ranges with the fhorter piece will exceed fome of thofe with the longer.
15. In diftant cannonadings, the advantages arifing from long pieces and large charges of powder are but of litile moment.
16. In firing againft troops with grape-fhot, it will be found, that charges of powder much leis than thofe generally ufed are the moft advantageous.
17. The principal operations in which large charges of powder appear to be more efficacions than fmall ones, are the ruining of parapets, the difmounting of batteries covered by ftout merlons, or battering in breach; for, in all cafes, if the object be but little removed from the piece, every increafe of velocity will increafe the penetration of the bullet.
18. Whatever operations are to be performed by artillery, the leaft charges of powder with which they can be effected are always to be preferred.
19. Hence, then, the proper charge of any piece of artillery is not that allotment of powder which will communicate the greateft velocity to the bullet (as moft practitioners formerly maintained); nor is it to be determined by an invariable proportion of its weight to the weight of the ball: but, on the contrary, it is fuch a quantity of powder as will produce the leaft velocity for the purpofe in land; and, inftead of bearing always a fixed ratio to the weight of the ball, it mult be different according to the different bufinefs which is to be performed.
20. No field-piece ought at any time to be loaded
 its bullet in powder; nor fhould the charge of any battering piece exceed $\frac{f}{3}$, of the weight of its bullct.
21. Although precepis very different from thole we have here given have been often advanced by artillerifts, and have been faid to be derived from experience; yet is that pretended experience allogether fallacious: fince from our doctrine of refiftance eftablifhed above, it follows, that every fyeculation on the fubject of artillery, which is only founded on the experimental ranges of bullets difcharged with confiderable velocities, is liable to great uncertainty.
The greatef irregularities in the motion of the bullets Defcripare as we have feen, owing to the whirling motion on tion and their axis, acquired by the friction againft the fides of ufe of rifled the piece. The beft method hitherio known of preventing thefe is by the nfe of pieces with riffed barrels. Thefe pieces have the infides of their cylinders cut with a number of fpiral channels; fo that it is in reality a female fcrew, varying from the common fcrews only in this, that its threads, or rifles are lefs deflected, and approach more to a right line; it being ufual for the threads with which the rifled barrel is indented, to take little more than one turn in its whole length. The numbers of thefe threads are different in each barrel, according to the fize of the piece and the fancy of the workman; and in like manner the depil to which they are cut is not regulated by any invariable rule.

The ufiual method of charging thefe pieces is this: When the proper quanity of powder is put down; a

Pradice. leaden bullet is taken, a fmall matter larger than the bore of the piece was before the rifles were cut: and this bullet being laid on the mouth of the piece, and confequently too large to go down of itfelf, it is forced by a ftrong rammer impelled by a mallet, and by repeated blows is driven home to the powder; and the foftnefs of the lead giving way to the violence with which the bullet is impelled, that zone of the bullet which is contiguous to the piece varies its arcular form, and takes the thape of the infide of the barrel ; fo that it becomes part of a male fcrew exactly anfwering to the indents of the rifle.

In fome parts of Germany and Switzerland, however, an improvement is added to this practice; efpecially in the larger pieces which are ufed for fhooting at great diftances. This is done by cutting a piece of very thin leather, or of thin fuftian, in a circular mape, fomewhat larger than the bore of the barrel. This circle being greafed on one fide, is laid upon the muzzle with its greafy fide downwards; and the bullet being then placed upon it, is forced down the barrel with it : by which means the leather or fuftian inclofes the lower half of the bullet, and by its interpofition berween the bullet and the rifles, prevents the lead from being cut by them. But it muft be remembered, that in the barrels where this is practifed, the rifles are generally fhallow; and the bullet ought not to be too large.-But as both thefe methods of charging at the mouth take up a good deal of time; the rifled barrels which have been made in Britain, are contrived to be charged at the breech, where the piece is for this purpofe made larger than in any other part. The powder and bullet are put in through the fide of the barrel by an opening, which, when the piece is loaded, is then filled up with a frew. By this inears, when the piece is fired, the bullet is forced through the rifles, and acquires the fpiral motion already defcribed: and perhaps fomewhat of this kind, fays Mr Robins, though not in the manner now practifed, would be of all others the mon perfect method for the conftruction of thefe kinds of barrels.

From the whirling motion communicated by the rifles, it happens, that when the piece is fired, that indented zone of the bullet follows the fweep of the rifles: and thereby, befides its progreffive motion, acquires a circular motion round the axis of the piece; which circular motion will be continued to the bullet after its feparation from the piece; and thus a bullet dificharged from a rifled barrel is conftantly made to whirl round an axis which is coincident with the line of its flight. By this whirling on its axis, the aberration of the bullet which proves fo prejudicial to all eperations on gannery, is almoft totally prevented. The reafon of this may be ealily underftood from confideriag the flow motion of an arrow through the air. For example, if a bent arrow, with its wings not placed in fome degree in a fpiral pofition, fo as to make it revolve round its axis as it flits through the air, were fhot at a mark with a true direction, it would confatanty deviate from it, in confequence of being preffed to one fide by the convex part oppofing the arr obliquely. Let us now fuppofe this deflection in a flight of 100 yards to be equal to 10 yards. Now, if the fame bent arrow were made to revolve round its axis once every two yards of its flighr, its greatefi de-
viation would take place when it had procecded only Practice. one yard, or made half a revolution ; fince at the end of the next half revolution it would again return to the fame direction it had at firft; the convex fide of the arrow having been once in oppofite pogitons. In this manner it would proceed during the whole courfe of its fight, conftantly returning to the true path at the end of every two yards; and uhen it reached the mark, the greateft deflection to either fide that could happen would be equal to what it makes in proceeding one yard, equal to ${ }_{5} \frac{1}{\sigma}$ th part of the former, or 3.6 inches, a very fimall deflection when compared with the former one. In the fame manner, a cannonball which turns not round its axis, deviates greatly from the true path, on account of the inequalities on its farface ; which, although imall, canfe great deviations by reafon of the refiftance of the air, at the fame time that the ball acquires a motion round i is axis in fome uncertain direction occafioned by the friction againft its fides. But by the motion acquired from the rifles, the error is perpetually corrected in the manner juft now defcribed; and accordingly fach pieces are much more to be depended on, and will do execution at a much greater diftance, than the orher.

The reafons commonly alledged for the fuperiority of rifle barrels over common ones, are, either that the inflammation of the powder is greater, by the refiftance which the bullet makes by being thus forced into the barrel, and that hereby it receives a much greater impulfe; or that the bullet by the compounding of its circular and revolving motions, did as it were bore the air, and thereby flew to a much greater diftance than it would otherwife have done; or that by the fame boring motion it made its way through all folid fubftances, and penetrated into them much deeper than when fired in the common manner. But Mr Robins hath proved thefe reafons to be altogether crroneous, by a great number of experiments made with rifle-barrelled pieces. "In thefe experiments," fays he, "I have found that the velucity of the bullet fired from a rifled barrel was ufually lefs than that of the bullet fired from a common piece with the fame proportion of powder. Indeed it is but reafonable to expect that this hould be the cafe; for if the rifles are very deep, and the bullet is large enough to fill them up, the friction bears a very confiderable proportion to the effort of the powder. And that in this cale the friction is of confequence enough to have its effoets obferved, I have difcovered by the continued ufe of the fame barrel. For the metal of the barrel being foft, and wearing away apace, its bore by half a year's ufe was confiderably enlarged, and confequently the depth of its rifles diminifhed; and then I found that the fame quantity of powder would give to the bullet a velocity near a tenth part greater than what it had done at firft. And as the velocity of the bollet is not increafed by the ufe of riffed barrels, fo neither is the diftance ro which it flies, nor the depth of its penetration into folid fubftances. Indeed thefe two laft fuppoftions feem at the firft fight too chimerical to deferve a formal confutarion. But I cannot help obferving, that thofe who have been habituated to the ufe of rifled pieces are very excufable in giving way to thefe prepoffefions. For they conflantly found, that

Practice. with them they could fire at a mark with tolerable fuccefs, though it were placed at three or four times the diflance to which the ordinary pieces were fuppofed to reach. And therefore, as they were ignorant of the true caufe of this variety, and did not know that it arofe only from preventing the deflection of the ball; it was not unatural for them to imagine that the fuperiority of effect in the rifled piece was owing either to a more viotent inpulfe at firft, or to a moxe ealy paflage through the air.
" In order to confirm the foregoing theory of riflebarrelled pieces, I made fome experiments by which it might befeen whether one fide of the ball difcharged from them uniformly keeps foremoft during the whole courfe. To examine this particular, I took a rifled barrel carrying a bullet of hx to the pound; but inftead of its leaden bullet ufed a wooden one of the fame lize, made of a foft fringy wood, which bent itfelf eafily into the rifles without breaking. And firing the piece thus loaded againft a wall at fuch a diftance as the bullet might nor be fhivered by the blow, I always found, that the fame furface which lay foremolt in the piece continued foremolt without any fenfible deflection during the time of its flight. And this was eafily to be obferved, by examining the bullet; as both the marks of the rifles, and the part that impinged on the wall, were fufficiently apparent. Now, as thefe wooden bullets were but the 16 th part of the weight of the leaden ones; I conclude, that if there bad been any unequal refiftance or deflective power; its effeets muft have been extremely fenfible upon this light body, and confequently in fome of the trials I made the furface which came foremolt from the piece muft have been turned round in another fituation.
"c But again, I took the fame piece, and loading it now withaleaden ball, I fer it nearly upright, noping it only three or four degrees from the perpendicular in the direction of the wind ; and firing it in this fituation, the bullet generally continued about half a minute in the air, it rifing by computation to near three quarters of a nile perpendicular height. In thefe trials I found that the bullet commonly came to the ground to the leeward of the piece, and at fuch a diftance from it, as nearly correfponded to the angle of its inclination, and to the effort of the wind; it ufually falling not nearer to the piece than 100 , nor farther from it than 150 , yards. And this is a frong confirmation of the almoft fteady flight of this bullet for about a mile and a half : for were the fame trial made with a common piece, I doubt not but the deviation would often amount to half a mile, or perhaps confiderably more ; though this experiment would be a very difficult one to examine, on account of the little chance there would be of difcovering where the ball fell.
37 Salls from rifledpieces will at length deviate from their true courfe.
' It muft be obferved, however, that though the bullet impelled from a rifle-barrelled piece keeps for a time to its regular track with finfficient nicety; yet if its flights be fo far extended that the track becomes conliderably incarvated, it will then undergo confiderable deffections. This, according to my experiments, arifes from the angle at laft made by the axis on which the buller turns, and the direction in which it flies: for that axis continuing, nearly parallel to itfelf, it mult neceffarily diverge from the line of
the flight of the buller, when that line is bent from its original direction; and when it once happens that the bullet whirls on an axis which no longer coincides with the line of its flight, then the unequal refiflance formerly defcribed will take place, and the deficting power hence arifing will perpetuaily increafe as the track of the bulle, by having its range extended, becomes more and more incurvated. - This matter I have experienced in a fmall rifle-barrelled piece, carrying a leaden ball of near an ounce weight. For this piece, charged with one drachm of powder, ranged about 550 yards at an angle of 12 degrees with fufficient regularity; but being afterwards elevated to an angle of 24 degrees, it then ranged very irregularly, gencrally deviating from the line of its direction to the left, and in one cafe not lefs than 100 yards. This apparencly arofe from the caufe abovementioned, as was confirmed from the conflant deviation of the bullet to the left; for by confidering how the revolving motion was continued with the progreflive one, it appeared that a deviation that way was to be expected.
"The beft remedy I can think of for this defect is the making ufe of bullets of an egg-like form inftead of fpherical ones. For if fuch a buller hath its fhorter axis made to fit the piece, and it be placed in the tarrel with its fmaller end downwards, then it will acquire by the rifles a rotation round its larger axis; and its centre of gravity lying nearer to its fore than its hinder part, its longer axis will be conftantly forced by the refiftance of the air into the line of its flight ; as we fee, that by the fame means arrows conftantly lic in the line of their direction, however that line be incurvated.
" But, befides this, there is another circumftance in the ufe of thefe pieces, which renders the flight of their bullets uncertain when fired at a confiderable elevation. For I find by my experiments, that the velocity of a bullet fired with the fame quantity of powder from a rifled barrel, varies much more from iffelf in different trials than when fired from a commorn piece.-This, as I conceive, is owing to the great quantity of friction, and the impoflibility of rendering it equal in each experiment. Indeed, if the rifles are not deeply cut, and if the bullet is nicely fitted to the piece, fo as not to require a great force to drive is down, and if leatber or funtian well greafed is made ufe of between the bullet and barrel, perhaps, by a careful attention to all thefe particulars, great part of the inequality in the velocity of the bullet may be prevented, and the difficulty in queftion be in fome meafure obviated: bur, till, this be done, it cannot be doubted, that the range of the fame piece, at an elevation, will vary confiderably in every trial; alihough the charge be each time the fame. And this I have myfelf experienced, in a number of diverfified trials, with a rifie-barrelled piece loaded at the breech in the Englifh manner. For here the rifies being indented very deep, and the bullet fo large as to fill them up completely, I found, that thongh it flew with fufficient exactnefs to the diftance of 400 or $5 c 0$ yards ; yet when it was raifed to an angle of about 12 degrees (at which angle, being fired with one-fifth of its weight in powder, is medium ringe is nearly 1000 yards); in this cafe, I fay, 1 found that its range was variable although the exeanit $^{\text {reare was toben to picuent any }}$
inequalitics

Practice. $\underbrace{\text { Practe. }}$ nequalities in the quantity of paroder, or in the man. ner of charging. And as, in this cafe, the angle was too fonall for the firt mentioned irregularity to produce the obferved effects; they can only be imputed to the different velocities which the bullet each time rectived by the nnequal action of the friction."

Thus we fee, that it is in a manner impofible entitely to correct the aberrations arifing from the refiftance of the atmofphere ; as even the rifle-barrelled pieces cannot be depended upon for more than onehalf of their actual rarge at any confiderable elevation. It becomes therefore a problem very difficult of follution to know, even within a very conliderable diftance, how far a piece will carry its ball with any probability of hitting its mark, or doing any execution. The bent rules hitherto laid down on this fubject are thofe of Mr Robins. The foundation of all his calculations is the velocity with which the bullet flies off from the mouth of the piece. Mr Robins himfelf had not opportunities of making many experiments on the velocities of cannon-balls, and the calculations from fmaller
ones cannot always be depended upon. In the 68th volume of the Phil. Tranf. Mr Hutton hath recited a number of experiments made on cannon carrying balls from one to three pounds weight. His machine for difcovering the velocities of thefe balls was the fame with that of Mr Robins, only of a larger fize. His charges of powder were two, four, and eight ounces; and the refults of 15 experiments which feem to have been the moft accurate, are as follow.

In another courfe, the mean velocities, with the fame charges of powder, were 6 13, 873, 1162. "The mean velocities of the balls in the firt courfe of experiments (fays Mr Hutton) with two, four, and eight ounces of powder, are as the numbers 1, I.414, and 1.993; but the fubduplicate ratio of the weights (two, four, and cight) give the numbers $1,1.414$, and $I$, to which the others are fufficiently near. It is obvious, however, that the greateft difference lies in the laft number, which anfwers to the greateft velocity. It will ftill be a little more in defect if we make allowance for the weights of the balls; for the mean weights of the balls with the two and four ounces in $18 \frac{3}{4}$ ounces, bur of the eight ounces it is $18 \frac{3}{3}$ : diminifhing therefore the number 1.993 in the reciprocal fubduplicate ratio of $18 \frac{3}{3}$ to $18 \frac{3}{4}$, it becomes 1.985 , which falls hort of the number 2 by .or 5 , or the 133 d part of itfelf. A fimilar defect was obferved in the other courfe of experiments; and both are owing to three evident caufes, viz. I. The leis leagth of cylinder through which the ball was impelled; for with the eight-ounce charge it lay three or four inches nearer to the muzzle of the piece than with the others. 2. The greater quantity of elanic fluid which efcaped in this cafe than in the others by the windage. This happens from its moving
with a greater velocity; in confequence of which, a Pracice. greater quantity efcapes by the vent and windage tban in fmaller velocities. 3 . The greater quantity of powder blown out unfired in this cafe than in that of the leffer velocities; for the ball which was impelled with the greater velocity, would be fooner out of the piece than the others, and the more fo as it had a lefs length of the bore to move through ; and if powder fire in time, which cannot be denied, though indeed that time is manifeftly very fhort, a great quantity of it muft remain unfired when the ball with the greater velocity iflues from the piece, than when that which has the lefs velocity goes out, and ftill the more fo as the bulk of powder which was at firft tu be inflamed in the one cafe fo inuch exceeded that in the orhers.
"Let us now compare the correfponding velocities in both cales. In the one they are 701, 993, 1397 ; in the other, 613, 873, 1162. Now the ratio of the firft two numbers, or the velocities with two ounces of powder, is that of 1 to 1.1436 , the ratio of the next two is that of 1 to 1.1375 , and the ratio of the laft is that of $I$ to 1.2022 . But the mean weight of the fhot for two and four ounces of powder, was $28 \frac{1}{3}$ ounces in the firft courfe and $18 \frac{3}{7}$ in this; and for eight ounces of powder, it was $28_{\frac{2}{3}}^{4}$ in the firft and $18 \frac{3}{3}$ in this. Taking therefore the reciprocal fubduplicate ratios of thefe weights of Shot, we obtain the ratio of I to 1.224 for that of the balls. which were fired with two ounces and four ounces of powder, and the ratio of 1 to 1.24 I for the balls which were fired with eight ounces. But the real ratios above found are not greatly different from thefe : and the variation of the actual velocities from this law of the weights of thot, inclines the fame way in both courfes of experiments. We may now collect into one view the principal inferences that have refulted from thefe experiments.
r." It is evident from them, that powder fires almoft inflantaneoully.
2. "The velocities communicated to balls or thot of the fame weight with different quantities of powder, are nearly in the fubduplicate ratio of thefe quantities ; a very finall variation in defect taking place when the quantities of powder become great.
3." When flot of different weights are fired with the fame quantity of powder, the velocities commonicated to them are nearly in the reciprocal fubduplicate ratio of their weights.
4. "Shot which are of different weights, and impelled by different quantities of powder, acquire velocities which are direetly as the fquare roots of the quantities of powder, and inverfely as the fquare roots of the weights of the thot nearly."

39
The velocities of the bullets being thus found as Mr Ronearly as poffible, the ranges may be found by the fol bin's melowing rules laid down by Mr Robins.
I. "Till the velocity of the projectile furpaffes that of isoo feet in a fecond, the refiftance may be reckon- bulles of ed to be in the duplicate proportion of ihe velociry, and its mean quantity may be reckoned abont half an ounce avoir lupoife on a 12 -pound fhot, moving with a velocity of about 25 or 26 feet in a fecond.
2. "If the velocity be greater than that of 1100 or 3200 feet in a fecond, then the abfolute quantity of the refiftance in thefe greater velocities will be near three times as great as it Mhould be by a comparifon

Practice. with the finaller velocities.-Hence then it appears, that if a projectile begins to move with a velocity lefs than that of 1 Hoo feet in $\mathrm{I}^{\prime \prime}$, its whole motion may be fuppofed to be confidered on the hypohefis of a refiftance in the duplicate ratio of the velocity. And if it begins to move wilh a velocity greater than this laft mentioned, yet if the firft part of is motion, till fits velocity be reduced to near 1 roo feet in $\mathrm{I}^{\prime \prime}$, be confidered feparately from the remaining part in which the velocity is lefs than inoo feet in $1^{\prime \prime \prime}$; it is cvident, that borh parts may be truly affigned on the fame hypothefis; only the abfulute quantity of the refiftance is three times greater in the firft patt than in the laft. Wherefore, it the motion of a projectile on the hypothefis of a retiftance in the duplicate ratio of the velocity be truly and generally aftigned, the actual motions of refifted bodies may be thereby determined, notwithflanding the increafed refiftances in the great velocities. And, to avoid the divifion of the motion into two, I hall fhow how to compute the whole at one operation with little more tronble than if no fuch increafed refiftance took place.
"To avoid frequent circumlocutions, the diftance to which any projectile would range in a vacuum on the horizontal plane at $45^{\circ}$ of elevation, 1 thall call the potential random of that projectile; the diftance to which the projectile would range in vacuo on the horizontal plane at any angle different from $45^{\circ}$, I fhall call the potential range of the projectile at that angle ; and the diftance to which a projectile really ranges, I fhall call its actual range.
"If the velocity with which a projectile begins to move is known, its potential random and its porential range at any given angle are eafily determined from

- See Pro- the common theory of projectiles*; or more geneseafile. rally, if either its original velocity, its potential ran- dom, or its potential range, at a given angle, are known, the other two are eafily found out.
"To facilitate the computatio:" of relifted bodies, it is neceffary, in the confideration of each refifted body, to aflign a certain quantity, which I fhall denominate $\mathbf{F}$, adapted to the refiftance of that particular projectile. To find this quamtity F to any projectile given, we may proceed thus: Firft find, from the principles already delivered, wilit what velocity the projectile muft move, fo thatiis refiftance may be equal to its gravity. Then the height from whence a body muft defcend in a vacuum to acquire this velocity is the magnitude of F fought. But the concifen way of finding this quantity $F$ to any fhell or bullet is this: If it be of folid iron, multiply its diameter meafured in inches by 300 , the product will be the magnitude of $F$ expreffed in yards. If, inftead of a folid iron-bullet, it is a thell or a bullet of fome other fubftance; then, as the fpecific gravity of iron is to the fpecific gravity of the fhell or bullet given, fo is the $F$ correfponding to an iron-bullet of the fame diamerer to the proper F for the hell or bulle given. The quantity $F$ being thus aftigned, the neceflary compurations of there refifted motions may be difpatched by the three following propofitions, always remembering that thefe propofitions proceed on the hypothefis of the refiftance being in the duplicate proportion of the velocity of the refilted body. How to apply this principle, when the velocity is fo great as to have its refiftance augmenced beyond this rate,
fhall he fhown in the corollary, to be annexed to the Prasice. firft propolition.

" PROP. I. Given the actual range of a given fhell or bullet at any fmall angle not exceeding $8^{\circ}$ or 100, to determine its potential range, and coniequently its potential random and original velocity.
" Sor. Let the actual range given be divided by F correfponding to the given projectile, and find the quote in the firft column of the preceding table; then the cortefponding number in the fecond column multiplied into $F$ will be the potential range fought: and thence by the methods already explained, the potential random and the original velociry of the projectile is given.

Exam. An 18 pounder, the diameter of whofe fhot is about 5 inches, when loaded with 2 lb . of powder, ranged at an elevation $3^{\circ} 30^{\prime}$ to the diftance of 975 yards.
"The F correfponding to this bullet is $\mathbf{1 5 0 0}$ yards, and the quote of the actual range by this number is 65 ; correfponding to which, in the fecond column, is .817; whence 817 F, or 1225 yards, is the potenial range fought; and this, augmented in the ratio of the fine of twice the angle of elevation to the radius,

Pratice, gives 10050 yards for the porential random; whence it will be found, that the velocity of the projectile was that of 984 feet in a fecond.
"Cor. itt. If the converfe of this propdition be defired; that is, if the potential range in a fmall angle be given, and thence the-actual range be fought; this may be folved with the fame facility by the fame table: for if the given potential range be divided by its correfpondent $F$, then oppolite to the quote fought in the fecond column, there will be found in the firlt column a number which multiplied anto $F$ will give the actual range required. And from hence it follows, that if the actual range be given at one angle, it may be found at every other angle not exceeding $8^{\circ}$ or $10^{\circ}$.
"Cor. 2d. If the actual range at a given finall angle be given, and another actual range be given, to which the angle is fought; this will be determined by finding the potential range correfponding to the two given actual ranges; then the angle correfponding to one of thefe potential ranges being known, the angle correfponding to the other will be found by the common theory of projectiles.
"Cor. 3d. If the potential random deduced from the actual range by this propofition exceeds 13000 yards; then the original velocity of the projectile was fogreat as to be affected by the treble refiftance defcribed above; and confequently the real potential random will be greater than what is here determined. However, in this cafe, the true potential random may be thus nearly affigned. Take a $4^{\text {th }}$ continued proportional to 13000 yards, and the potential random found by this propofition, and the $4^{\text {th }}$ proportional thus found may be affumed for the true potential random fought. In like manner, when the trite potential random is given greater than 13000 yards, we mult take two mean * The ope- proportionals berween 13000 and this random*; and rations di- the firf of thefe mean proportionals muft be affumed rectedin this corollary are beft performed by the table of logarithms.
other inevitable errors, which arife from the nature of Practice. this fubject.
"PROP. II. Given the actual range of a given fhell or buller, at any angle not exceeding $45^{\circ}$, to determine ins potential range at the fame angle; and thence its potential random and original velocity.
"Sol. Diminifh the F correfponding to the fhell or bullet given in the proportion of the radius to the cofine of $\frac{3}{4}$ of the angle of elevation. Then, by means of the preceding table, operate with this reduced $F$ in the fame manner as is prefcribed in the folution of the lalt propofition, and the refult will be the potential range fought; whance the potential random, and the original velocity, are eafily determined.
is Exam. A mortar for fea-fervice, charged with 301 l . of powder, has fometimes thrown its hell, of $12 \frac{3}{4}$ inches diameter, and of 23 I lb . weight, to the diftance of 2 miles, or 5450 yards. This at an elevation of $45^{\circ}$.
" The F to this fhell, if it were folid, is 3825 yards; but as the fhell is only $\frac{4}{5}$ of a folid globe, the true $F$ is no more than 3060 yards. This, diminifhed in the ratio of the radius to the co-fine of $\frac{3}{4}$ of the angle of elevation, becomes 2544. The quote of the potential range by this diminifhed F is $\mathrm{x}, 384$; which fought in the firft column of the preceding table gives 2.280 for the correfponding number in the fecond colvmn; and this multiplied into the reduced $F$, produces 5800 yards for the potential range fought, which, as the angle of elevation was $45^{\circ}$, is alfo the potential random : and hence the original velocity of this hell appears to be that of about 748 feet in a fecond.
"Cor. The converfe of this propofition, that is, the determination of the actual range from the potential range given, is eafily deduced from hence by means of the quote of the potential range divided by the rednced F ; for this quote fearched out in the fecond column will give a correfponding number in the firft column, which multiplied into the reduced $F$, will be the actual range fought.
"Alfo, if the potential random of a projectile be given, or its actual range at a given angle of elevation; its actual range at any other angle of elevation, not greater than $45^{\circ}$, may hence be known. For the potential random will affign the potential range at any given angle; and thence, by the method of this cororlary, the actual range may be found.
"Exam. A fit mufquet-bullet fired from 2 piece of the ftandard dimenfions, with $\frac{7}{5}$ of its weight in good powder, acquires a velocity of near 900 feer in a fecond ; that is, it has a potential random of near 8400 yards. If now the actual range of this bullet at $15^{\circ}$ was fought, we muft proceed thus:
"From the given potential random it follows, that the potential range at $15^{\circ}$ is 4200 yards; the diameter of the bullet is $\frac{3}{4}$ of an inch; and thence, as it is of lead, its proper F is 337.5 yards, which, reduced in the ratio of the radius to the cofine of $\frac{3}{4}$ of $15^{\circ}$, becomes 331 yards. The quote of 4200 by this number is 12.7 nearly; which, being fought in the fecond column, gives 3.2 nearly for the correfponding number in the firt colume; and this multiplied into 331 yards (the reduced F) makes 1059 yards for the actual range fought.
"Exam. II. The fame bollet; fired with its whole weight in powder, acquires a velocity of about 2100

Pradice. feet in a fecond, to which there correfponds a potential random of about 45700 yards. But this number greally exceeding 13000 yards, it mult be reduced by the method defcribed in the third corollary of the firft propofition, when it becomes r9700 yards. If now the actual range of this bullet at $15^{\circ}$ was required, we fhall from hence find, that the porential range at $15^{\circ}$ is 9850 yards, which divided by the reduced F of the laft example, gives for a quote 2975 : and thence following the fteps prefcribed above, the actual range of this bullet comes out 1396 yards, exceeding the former range by no more than 337 yards; whereas the difference between the two potential ranges is above ten miles. Of fuch prodigious efficacy is the refiftance of the air, which hath been hitherto treated as too infignificant a power to be attended to in laying down the theory of projectiles!
"Schol. I muft here oblerve, that as the denfity of the atmofphere perpetu:lly varies, increafing and diminifhing often by $\frac{2}{3 \pi}$ parr, and fometimes more, in a few hours, for that reafon I have not been over rigorous in forming thefe rules, but have confidered them as fufficiently exact when the errors of the approximation do not exceed the inequalities which woald take place by a change of ${ }_{5}{ }^{2}$. parr in the denfity of the atmofphere. With this reftriction, the rules of this propofition may be fafely applied in all poffible cafes of practice. That is to fay, they will exhibit the true motions of all kinds of fhells and can-non-fhot, as far as $45^{\circ}$ of elevation, and of all mufket bullets fired with their largeft cuftomary charges, if not elevated more than $30^{\circ}$. Indeed, if experiments are made with extraordinary quantities of powder, producing potential randoms greatly furpafing the ufual rate; then in large angles fome farther modifications may be neceffary. And though, as thefe cafes are beyond the limits of all practice, it may be thought unneceffary to confider them ; yet to enable thofe who are fo difpofed to examine thefe uncommon cafes, I hall here infert a propofition, which will determine the actual motion of a projectile at $45^{\circ}$, how enormous foever its original velocity may be. But as this propofition, will rather relate to fpeculative than practical cafes, inftead of fuppofing the actual range known, thence to affign the potential random, I hall now fuppole the potential random given, and the actual range to be thence inveltigated.
© PROP. III. Given the potential random of a given fhell or bullet, to determine its actual range at $45^{\circ}$.

Sol. Divide the given potential random by the F correfpending to the fhell or bullet given, and call the quotient $q$, and let 1 be the difference between the tabular logarithms of 25 and of $q$, the logarithm of 10 being fuppofed unity; then the actual range fought is $3 \cdot 4 \overline{\mathrm{~F}+2} \mathrm{~F}--\frac{11}{10} \mathrm{~F}$, where the double fine of 21 F is to be thus underftood; that if $q$ be lefs than 25 , it muft $b-21 F$ : if it be greater, the it maft be + 21F. In this folution, $q$ may be any number not lefs than 3 , nor more than 2500 .
"Cor. Computing in the manner here laid dowa, we fhall find the relation between the potential randoms, and the actual range at $45^{\circ}$, within the limits of this propofition, to be exprefed in the folllowing table.

Voi. VIII.

Potential Random.

Whence it appears that, when the potential ratndom is increafed from 3 F to 2500 F , the actual range is only increafed from $\frac{1}{7} \mathrm{~F}$ to 7 F , fo that an increale of 2497 F in the poteltial random produces no greater an increafe in the actual range than $5 \frac{1}{2} F$, which is not its ${ }_{\boldsymbol{q}^{\frac{5}{\sigma}} 0} \mathrm{O}$ part; and this will again be greatly diminifhed on account of the increafed refiftance, which takes place in great velocities So extraordinary are the effects of this refiftance; which we have been hitherto taught to regard as inconfiderable.
"That the juftnefs of the approximations laid down in the 2 d and 3 d propofitions may be eafier examined; I fhall conclude thefe computations by infering a table of the actnal ranges at $45^{\circ}$ of a projectile, which is refifted in the duplicate proportion of its velocity. This table is computed by methods different from thofe hitherto defcribed, and is fofficiently exaet to ferve as a ftandard with which the refult of our orher rules may be compared. And fince whatever errors occur in the application of the preceding propofitions, they will be moft fenfible at $45^{\circ}$ of elevation, it follows, that hereby the utmoft limits of thofe errors may be alligned.

Potential Randoms.

We have now only to confider chat part of practical gunnery which relates to the proportions of the different parts of cannon, the metal of which they are made, \&c.

Formerly the guns were made of a very great length, and were on that account extremely troublefome and unmanageable. The error here was firft difcovered by accident; for fome cannon, having been caft by miftake two feet and an half horter than the common ftandard, were found to be equally efficacious in fervice with the common ones, and much more manageable. This foon produced very confiderable alterations in the form of the artillery throughout Europe: but in no country have greater improvements in this refpect been made than in Britain. For a long time brafs, or rather a kind of bell-metal, was thonght preferable to calt iron for making of cannon. The compofition of this metal

47
Compofition for brals guns is generally kept a fecret by each particular founder. The author of the Military Dictionary gives the forlowing proportion as the moft common, viz. "To 240 lb . of metal fit for cafting they put 68 lb . of cop$\mathrm{per}, 50 \mathrm{lb}$. of brafs, and $\mathbf{5} 2 \mathrm{lb}$. of tin. To 4200 ll . of of metal fit for cafting the Germans pat $3687 \frac{3}{4} \frac{3}{3} \mathrm{lb}$. of copper, $204 \frac{1}{4} \frac{1}{7} \mathrm{lb}$. of brafs, and $307 \frac{3}{4} \frac{6}{4} \mathrm{lb}$, of tin. O . thers ufe 100 lb , of copper, 6 lb . of brafs, and 9 lb . of tin ; while fome make ufe of 100 lb . of copper, 10 lb . of brafs, and 55 lb . of tin. This compofition was both found to be very expenfive, and alfoliable to great inconveniences in the ufing. A few years ago, therefore, a propofal was made by Mr Maller for ufing iron guns of a lighter conftruction than the brafs ones, by which he fuppofed that a very great faving would be made in the expence; and likewife that the guns of the

Mr Muller's propofal for reducing the weight of guns. new conftruction would be more manageable, and even efficacious, than the old ones. "The reduction of the expence ( (ays Mr Muller ) of the very large artillery neceffary for fea and land fervice, is to be confidered under two heads ; the one, To diminilh the weight; and the other, Not to ufe any brafs ficld-artillery, but only iron, to leffen the great burthen of our fhips of war, and to carry larger calibers than thofe of other nations of the fame rate. If the weights of our gans are diminifired, they will require fewer hands to manage them, and of confequence a fmaller number will be expoled to danger at a time: and if we carry larger calibers, our rates will be a match for larger fhips.
"The advantage of ufing iron gans in the field inftead of brafs, will be that the expences are leffened in proportion to the colf of brafs to that of iron, which is as 8 to I .
"'The only objection againft iron is, its pretended brittlenefs: but as we abound in iron that is ftronger and tougher than any brafs, this objection is invalid. This I can affert; having feen fome that cannot be broken by any force, and will flatten like hammered iron; if then we ufe fuch iron, there can be no danger of the guns burfting in the moft fevere action.
"Though brafs guns are not liable to burf, yet Practice. they are fooner rendered unferviceable in action than iron. For by the foftnefs of the metal, the vent widens fo foon, and they are fo liable to bend at the muzzle, that it wonld be dangerous to fire them; as we found by experience at Belleille, and where we were obliged to take guns from the fhips to finilh the fiege.
© Thefe being undeniable facts, no poffible reafon can be affigned againft ufing iron guns in both fea and land fervice, and thercby leffen the expences of artillery fo confiderably as will appear by the following tables.

Lengths and Weights of Iron Ship-Guns.

| Old Pieces. |  |  | New Pieces |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Calib. | Length. | Weight. | ${ }^{\text {Calib }}$ | Length. | Weight. |

" Guns of this conftruction appear fufficiently ftrong from the proof of two three-ponnders made for Lord Egmont, and they even may be made lighter and of equal fervice.

Length and Weight of Battering Piéces.

"That thefe guns are fifficiently ftrong, is evident from the former trial ; befides, there are feveral 32 : pounders of the fame dimenfions and weight now exifting and ferviceable; thought caft in king Charles II.'s time.
N.B.

" It appears from thefe tables, that no proportion has been obferved in any giuns hitherto made, in refpect to their length or weight, but mercly by guefs.

## Some Examples to Jhow what may be faved by this Scheme.

The old Royal George carried 100 brafs guns, which weighed together 218.2 tons: the ton colts 130 pounds, workmanhlip included.
The expence of thefeguns is then 28366 pounds
A fet of ironguns ot the fame number and calabers, according to my conltruction, weighs -
The ton coft 16 pounds, and the whole fet
127.8 tons
2044.8 pounds

The Royal George carries then 90.4 tons more than is neceffary, and the difference between the expence is

2632 I. 2 pounds
That is, 12.5 times more than the new iron fet cofts: or 12 hips of the fame rate may be fitted out at lefs charge.
A fet of the $\left\{\begin{array}{l}\text { Old } \\ \text { New }\end{array}\right\} \begin{aligned} & \text { iron guns for a } \\ & \text { firt-rate weighs }\end{aligned}\left\{\begin{array}{l}204.4 \\ 127.8\end{array}\right\}$ tons
The difference between the weight

$$
\text { of the old and new is } \quad-\quad 76.6 \text { tons }
$$

The difference between the expence is then 1225.6 pounds

A fet of brafs battering pieces weighs in. 36 tons
A ton cofts $\mathrm{I}_{3} 0$ pounds, and the fet 1476.8 pounds A fet of the new weighs
7.55 tons

The ton colts 16 pounds, and the fet 117.8 pounds
That is, the old fet cofts in times, and 632 over, more than the new fet; or I fets of the new could be made at lefs expence than one of the old.
"This table thows what may be faved in the navy; and if we add thofe on board floops, the different garrifons, and the fitld train, with the great expence of their carriage in the ficld, it may be found pretty near as much more.

| $\left\|\begin{array}{c} \text { Num } \\ \text { of } \\ \text { Guns } \end{array}\right\|$ | $\begin{gathered} \text { Weight } \\ \text { of } \\ \text { old } \end{gathered}$ | $\begin{gathered} \text { Weight } \\ \text { of } \\ \text { of } \end{gathered}$ | Differ. | $\begin{aligned} & \text { Num } \\ & \text { of } \\ & \text { Ships } \end{aligned}$ | Total difference |

Expences of the $\left\{\begin{array}{l}\text { Brafs guns of two firft rates } 203918 \text { I5 } \\ \text { Iron ditto }\end{array}\right.$
We get $\mathrm{L}, 25702800$

This and other propofals for reducing the weight Prakice. and expence of guns have been greatly attended to of late; and the Carron-company in Scotland have not only greatly improved theje of the old conftruction, but a gun of a new confruction hath been invented Plate by Mr Charles Gafcoigne director of that work, which CCXXV. promifes to be of more effectual fervice than any hi- 43 therto made ufe of._Fig. 6. reprefents the form Preporand proportion of the guns made at Carren, and tions, \& e. which ferve for thole of all fizes, from: pounders of the $q$ uns and upwards. The proportions are meafured by the made at diameters of the caliber, or bore of the gim, divided carron. into 16 equal parts, as reprefented in the figure. The following are the names of the different parts of 2 camon.
$A B$, the length of the cannon.
$A E$, the firft reinforce.
$E F$, the fecond reinforce.
FB, the chafe.
HB , the mazzle.
Ao the cafcabel, or pomiglion.
AC, the breech.
CD, the vent-field.
FI, the chafe-girdle.
$r s$, the bafe-ring and ogee.
$t$, the vent-aftragal and fillets.
$p q$, the reinforce-ring and ogee.
$v w$, the fecond reinforce ring and ogee.
$x$, the chafe-aftragal and fillets.
$z$, the muzzle-aftragal and fillets.
$n$, the muzzle mouldings.
$m$, the fwelling of the muzzle.
Ai, the breech mouldings.
TT, the trunnions.
The dotted lines along the middle of the piece fhow the dimenfions of the caliber, and the dotted circle fhows the fize of the ball. Fig. 7. Shows a cohorn made alfo at Carron, and which may be meafured by the fame fale.

As the breech of the cannon receives an equal im. Ufeand depulfe with the bullet from the action of the inflamed frription of gunpowder, it thence follows, that at the moment the carriages. bullet flies off, the piece itfelf pufhes backward with very great force. This is called the recoil of the can*on; and if the piece is not of a very confiderable weight, it would fly upwards, or to a fide, with extreme violence. If again it was firmly faftened down fo that it coald not move in the leaft, it would be very apt to burft, on acconnt of the extreme violence with which the powder wonld then act upon it. For this reafon it hath been found neceffiry to allow the recoil to take place, and confequently all large pieces of artillery are mounted upon carriages with wheels, which allow them to recoil freely; and thus they may be fired withour any danger. There are feveral forts of carriages for ordnance, viz. baftard carriages, witi low wheels and high orlicels; fea-carriages, made in imitation of thofe for thif-riats; and carriages for field-pieces, of which there are two kinds. The cerriages mut be proportioned to the pieces moanted on them. The ordinary proportion is for the carriage to have once and a half the length of the gun, the wheels to be half the length of the piece in height. Four times the diameter or caliber gives the depth of the planks in the fore end ; in the middle $3 \frac{1}{2}$.

Fig.

Pratice. 45
Defcription of the carronade.

* See Gar ronade.

Fig. 8. Hhows Mr Galcoigne's newly-invented or rather improved gun called a carronade*; and which, in June 1779, was by the king and council infituted a ftandard navy-gun, and ro of them appointed to be added to each thip of war, from a firft-rate to a floop. Of this gun the Carron company have publifhed the following account.
"The carronade is made fo fhort, that it is worked with its carriage in the fhip's port; the trunnions lying immediately ever the fill of the port: it is correctly bored; and the fhot being perfeetly round, fills the caliber with fuch exactnefs, that the leaft poffible of the impulfe of the powder efcapes, upon explofion, between the cylinder and the flot; which laft alfo is thereby more truly directed in its flight. The bottom of the cylinder is a hemifphere, to which the end of the cartridge is not liable to ftick, and in which the fmalleft charge of powder envelopes the hot, extraufting nearly the whole of its impelling force upon it: the trunnions are placed fo as to leffen the recoil, and that the gun cannot reft againft the fides of the carriage, and is balanced with the utmof facility. There are views caft upon the vent and muzzel, to point the gun quickly to an objeet at 250 and 500 yards diftance. There is an handle $A$ fixed upon the pommelend of the gun, by which it is horizontally ranged and pointed; and there is a ring caft upon the cafcabel, through which the breechin rope is reeved, the only rope ufed about thefe guns.
" The carronade is mounted upon a carriage $B$, with a perfectly fmooth bottom of flrong plank, without trucks; infead of which there is fixed on the bottom of the carriage, perpendicular from the trunnions, a gudgeon C of proper ftrength, with an iron wafher Dand pin $E$ at the lower end thereof. This gudegon is let into a correfponding groove $F$, cut in a fecond carriage G, called a Iide-carriage; the wafter fupported by the pin over-reaching the under-edges of the groove H. This flide-carriage is made with a fmooth inper furface, upon which the gun-carriage is moved, and by the gudgeon always kept in its right fation to the port; the groove in the flide-carriage being of a fufficient length to allow the gun to recoil and be loaded within board. The fide-carriage, the groove included, is equally broad with the fore-part of the gun-carriage, and about four times the length; the fore-part of the flide-cariage is fixed by hingebolts 1 , to the quick-work of the fhip below the port, the end lying over the fill, clofe to the outfide plank, and the groove reaching to the fore end ; the gudgeon of the gun-carriage, and confequently the trumnions of the guan, are over the fill of the port when the gan is run out; and the port is made of fuch breadth, with its fides bevelled off within board, that the gun and carriage may range from bow to quarter. The flide-carriage is fupported from the deck at the hinder end, by a wedge $K$, or ftep-ftool; which being altered at pleafure, and the fore-end turning upon the hingebolts, the carriage can be conftantly kept upon an borizontal plane, for the more eafy and quick working of the gun when the fhip lies along.
"The gun and carriages beingin their places, the brecehin rope, which muft be ftrong and limber, is reeved through the ring on the breech, then led thro an eye-bolt drove downwards, the eye flanding up-
right upon the upper edge of each chieck of the gun- Practice. carriage; from thefe eye-bolts the ends of the breechin rope are feized down as ufual to an eye bolt driven into the quick-work on each fide, in a line with the lower furface of the fide carriage.
"The gun being mounted and ready for aetion, is loaded with $\frac{1}{\frac{1}{2} \text { th }}$ part of the weight of its ball in fervice charge of powder put into a wollen cartridge, and the end tied up with worfted yarn, and placed next to the fhot ; and with a fingle ball, well rammed home upon the powder, without a wadding between them : the gun being then run out in the port, is ranged and elevated with great facility, by means of the handle on the pommel; and, by the views, very quickly pointed.-Upon difcharge, the gun attempts to kick upwards, which being prevented by the wafher of the gudgeon bearing hard againft the under part of the fide-carriage, the recoil takes place; and the gudgeon fliding backwards in the groove (the wafher fill bearing againft an iron plate on the under edge of the groove), till the gun is brought up by, the breechin rope, as much re-action fucceeds as fackens the rope, fo that the gun and carriage may be inftanuly turned fore and aft by the handle, and loaded again.
"This gun has many fingular advantages over the others of light conftruction.- It is fo extremely light, that the fmalleft fhips can carry almoft any weight of fhot (the 12 -pounder weighing under 500 wt . and the other calibers in proportion), and that without being attended with the inconveniences imputed generally to light guns, fince it cannot injure its carriage, or jump out of its fation in the port upon recoil ; and it will never heat.
"It can be cafily managed and worked of all calibers, from the 12 pounders downwards with two hands, and the 18 and 24 -pounders with three hands. It may be readily ranged, pointed, and difcharged, twice in three minutes, which doubles the Arength of the fliip againft an enemy of equal force. It is wrought upon a horizontal plane to windward or to leeward how much foever the fhip lies along under a preffure of fail; and therefore, befides being hampered with no tackles or other ropes, except the breechin rope, it may be worked with as much eafe and expedition in chace or ir a gate of wind as in lying to for action. -It can be ranged from bow to quarter, fo as to bring a broadfide to bear in a circuit of above jo points of the compafs on each fide.-It is no more expenfive in ammunition than the old guns of two thirds lefs weight of fhot ; and it requires very few hands above the complement neceflary for navigating mer-chant-fhips; and increafes the ftrength of privateers crews, by expofing few hands at the guns, and augmenting the number at fmall arms.
" Though the carronade cannot, frictly fpeaking, throw its hoot to an equal difance with a longer gun; yet, from the finefs of the fhot to its cylinder, the powers of this gun will greatly furpafs the expectations of fuch as are nor intimately acquainted with the effects of the elaftic force of fired powder, fince, with $\frac{8}{\mathrm{z}}$ th part of the weight of its ball, at very fmall elevations, it will range its flot to triple the diffance at which fhips generally engage, with fufficient velocity for the greatef execution, ard with all the accuracy in

Practice. its direction that can be attained from gans of greater 46 lengths.

Objections
$t o$ its ufe
anfwered.
ss There have been two feeming difadvantages imputed to this gun, which it does not merit, viz. the nicety of fitting the fhot to the bore of the gun, and its incapacity to hold more than two fhot at one charge. But as feamen have few opportunities of confirming themfelves in jult opinions by experiments made on hore, and cannot, in that cafe, be fully converfant with the fubject; the following loofe hints may not be inept towards removing thefe objections.
" It is an axiom in projectiles, That a hot cannot be impelled from a gun to any diftance in a direction truly parallel to the axis of the cylinder of the piece, or what is commonly called point blank, arifing from feveral wellknown caufes: for, however juft may be the cylinder, and however perfect and fmooth may be the fphere of its correfponding fhot, and admitting that the impulfe of the powder acts through the centre of gravity of the hot, and alfo that the flot confequently leaves the piece in a direction parallel to the axis of its cylinder; yet is the hot no fooner difcharged, but it becomes more or lefs inflected by its gravity, and deflected, according to its velocity, by the refiffance of the air and wind.
"Thefe irregularities are of little importance in clofe fea-fights, and, being the effect of natural caufes, are common to all. Befides thefe, the deviation of a hot from its true dircetion, is further augmented by the windage between the cylinder and its fhot; but the greateft uncertainty in the flight of a hot, making allowance for the action of its gravity, and the air's refiftance, fprings from the defects of the fhot itfelf. Round-fhot for fhip-guns are feldom nicely examined; and, unlefs they are caft /olid and truly globulak, and free of all hollows, roughnefs, and other outfide blemihes, and well fitted to the gun, cannot even be difcharged in the direction of the axis of the piece; to the difappointment of thofe that ufe fuch, and to the diferedit of the gun-founder, however juftly the piece is viewed, or difparted; but, being impelled againft the furface of the cylinder, bounds and rebounds from fide to fide, acquires a rotatory motion, and when caft hollow withal, and breaking within the cylinder before difcharge, (which fometimes happens, efpecially with double charges), never fails to injure: and, when often repeated, may at laft burft the very beft guns.-Roundfhot fhourd not be taken on board a fhip, without be . ing examined as to its lhape and furface, gaged for its
fize to the caliber of the gun, and weighed that it be not above or below the ftandard more than half aat ounce in the pound of its refpective caliber: good hot then, being of the fame importance toall guns, removes the firft objection.
"If the direction of the flight of a hot to its object is affected by fo many feeming trivial caufes, how much more uncertain muft it be, when two or more fhot are difcharged together from one gun? for the fhot next the powder being impelled with more celerity than that immediately betore it, frikes againft it after difcharge, and fometimes thivers itfelf to pieces, and never fails to change obliquely the direction of both; and this happens with round and double-headed, \&c. and all double charges; and which, from their various figures, cannot reach an object at the fame elevations with the round-fhot; efpecially when thefe other fhots are of greater weight than the round, which is often the cafe. However frightful a broadfide with double charges may appear at fea, more confufion is created by them, and more time loft within board, by the frain and exceffive recoil, than real damage done without board by the additional charge : for upon a trial on hore, where the effect can be traced, it will be found, that, at 100 yards diftance, more fhot will take place with in a fmall compafs by fingle than by double charges; and the charges will be oftener repeated in a given time, without heating the gun; and there facts being eftablifhed, remove alfo the fecond objection."

The following account of the proof of one of thefe guns will perhaps ferve to give a more adequate idea of the great ufefulnefs of them, than any defcription:
"On Monday, Oct. 4. 1779, there was an experiment made at Carron, before the earl of Dunmore, \&c. \&c. with a 68 pounder carronade, nearly of the weight of a Britifh navy 12 - pounder gan, and charged with the fame quantity (viz. 6 lb . of powder.-The carronade was mounted, on its proper carriages, into a part of the dimenfions of a 74 gun hip's lower-deck port ; was pointed without elevation, at a centre of cight inches diameter, marked on a bulk's head of the thicknefs of two feet five inches folid wood, at 163 yards diftance ; behind which, at 168 yards, there was another bulk's head of two feet four inches thick; and behind that again, at 170 yards diftance, a bank of earth. The fhot pierced the bulk's head each time, and was buried from three to four feet into the bank, and the fplinters were thrown about to a confiderable diftance on all fides.

"The carronade was laid each time by the views without an inftrument; and the fhot were all to the left of the mark, owing to a fmall error in difparting the views; the third, fourth, and fifth hot, made one
fracture, as did alfo fixth, feventh, and eighth, and the fixth and eighth fruck the fame pot,
" The Carronade was eafily worked with four men ${ }_{2}$ and may be readily worked and difcharged on board a

Pråice.

## 47

Deicription w. rifled ordnanze.
hip twice a minue with fix men.-With fix pound weight of powder the flot was impelled with a velocity of 5400 feet a fecond."

We have already feen of how much confequence rifle-barrels are in order to bring the art of gunnery to perfection; as they enlarge the fpace in which the ball will fly without any lateral deffection to three or foar times its ufual quantity. This improvement, however, till very lately, only took place in muket-barrels. But in the begimining of the year 1774, Dr Lind, and Captain Alexander Blair of the 69 th regiment of foot, invented a fpecies of riffed field-pieces. They are made of caft-iron; and are not bored like the common pieces, but have the rifles moulded on the core, after which they are cleaned out and:finifhed with proper initruments.

Guns of rhis conftraction, which are intended for the field, ought never to be made to carry a ball of above one or two pounds weight at moft; a leaden bullet of that weight being fufficient to deftroy either man or horfe.-A ponnd-gun of this conftruction, of good metal, fuch as is now made by the Carron-company, need not weigh above an hundred pounds weight, and its carriage about another hundred. It can, therefore, be eafily tranfporied from place to place, by a few men; and a couple of good horles may tranfport fix of thefe gans and their carriages, if put into a cart.

But, for making experiments, in order to determine the refiftance which bodits moving with great velocities meet with from the air, a circumfance to which thefe gans are particularly well adapte, or for annoying an enemy's fappers that are carrying on their ap. proaches towards a befieged place, a larger caliber may be ufed.

The length of the gunbeing divided into feven equal parts, the length of the firft reinforce $A B$ is two of thefe parts; the fecond BC , one and $\frac{1}{7} \frac{5}{6}$ of the diameter of the caliber; the chale $C D$, four wanting $\frac{15}{\frac{5}{6}}$ of the diameter of the catiber.

The diftance from the hind-part of the bafe-ring A to the beginnirtg of the bore, is one caliber and $\frac{3}{6}$ of a caliber. The trunnions TT are each a caliber in breadth, and the fame in length; their centres are placed three-fevenths of the gun's length from the hind part of the bafe-ring, in flich a manner that the axis of the trunnions pafs through the centre line of the bore, which prevents the gun from kicking, and breaking its carriage. The lengrth of the cafcabel is one caliber and ${ }_{2} \frac{3}{6}$ of a caliber.

The caliber of the gin being divided into 16 equal paris;

The vent thould be placed about half an inch from the bottom of the chamber or bore, that the carridge may be pricked, left fome of the bottoms of the cartridges thould be left in when the gun is fponged, a circumftance which mighe retard the firing till the fhot be again drawn (which is no ealy matter), and the gun be cleaned out. From fome experimenis of colonel Defaguiliers and Mr Muller, it has been imagined, that the powder never has fo frong an effect as when it is fired clofe to the bottom of the bore; yet it is found, by the experiments of Count de la Lippe, to have the greatelt effect when fired near to the middle of the charge. This he proved by firing with tubes, introduced at a vent bored through the bution and breech of the gun, of different lengihs, fo as to reach the different parts of the powder. In the fame manner a moket or fowling-piece is found to puih mote when the touch-hole is placed at fome little diflance from the bottom of the bore; which arifes from nothing but the powder's acting with more force, by being inflamed to greater advantage ; confequently, in this cafe, the fame quantity of powder will have a greater effect, than when the touch-hole is placed at the bottom of the bore, which may be of fome ufe in hufbanding the powder.

The above dimenfions are taken from fome elegant $\frac{1}{2}$ pound guns, which were made for the prince of Anfturias by the Carron company.

The rifles make one fpiral turn in the length of the bore ; but go no nearer to the breech, in their full fize, than two calibers: and then terminate with a gentle flop in half a caliber more, fo as not to prevent the cartridge with the powder from being eafily fent home to the bottom of the gan, which would otherwife confantly happen with the flannel cartridges, and even fomerimes with paper ones, if not made to enter very loofely. The flape of the rifles is femicircular, their breadth being equal to the diameter, which is $\frac{-\pi}{T \pi}$ of a caliber, and their depth equal to the femadiameter, or $\frac{9}{7} \frac{5}{6}$ of a caliber.

The bullets, fig. io. are of lead, having fix knobs caft on them to fit the rifles of the gan. Being thus made of foft metal, they do not injure the riffes ; and may alfo fave an army the trouble of carrying a.great quantity of fhot about with them, fince a fupply of

Prastice. lead may be had in molt countries from roofs, \&ce. which can be caft into balls as occafion requires. Lead likewife being of greater fpecific gravity than caftiron, flies to a much greater diftance.
Rifled ordnance of any caliber might be made to carry iron fhot for battering or for other purpofes; provided holes, that are a little wider at their bottom than at their upper parts, be caft in a zone round the ball, for receiving afterwards leaden knobs to fit the rifles of the cannon ; by which means, the iron thot will have its intended line of direction preferved, without injuriag the rifles more than if the whole line was of lead, the rotatory motion round its axis, in the line of is direction (which corrects the aberration) being communicated to it by the leaden knobs, following the fpiral turn of the riftes in its progrefs out of the gun. It is particularly to be obferved, that the balls muft be made to go eafily down into the piece, fo that the cartridge with the powder and the bullet may be both fent bome together, with a fingle pufh of the hand, without any wadding above either powder or ball; by which means, the gun is quickly loaded, and the ball flies farther than when it is forcibly driven into the gun, as was found from many experiments. The only reafon why, in conmon rifled mukets, the bullets are rammed in forcibly, is this, that the zone of the ball which is contiguous to the infide of the bore may have the figure of the rifles imprefled upon it, in fucb a manner as to become part of a male fcrew, exaclly fitting the indents of the rifle, which is not at all neceffary in the prefent cafe, the figure of the rifles being originally caft upon the ball. Thefe knobs retard the flight of the bullet in fome degree: bat this fmall difadvantage is fully made up by the eafe with which the gun is loaded, its fervice being nearly as quick as that of a common field-piece ; and the retardation and quantity of the whirling motion which is communicated to the bullet being conftantly the fame,' it will not in the leaftaffect the experiments made with them, in order to 48 determine the reflitance of the air.
Sector and In order to hit the mark with greater certainty than telefcope can be done in the common random method, thefe belonging to this kind of erdnance. guns are furnifhed with a fector, the principal parts of which are, $r$. The limb, which is divided in facha manner as to fhow elevations to 15 or 20 degrees. The length of the radius is five inches and an half, and its nonius is fu divided as to fhow minutes of a degree. 2. The telefcope, AB, fig. If. an achromatic refractor, is feven inches in length (fuch as is ufed in Hadley's quadrants, that are fitted for taking diftances of the moon from the fun or flars, in order to obtain the longitude at fea), having crofs hairs in it. 3. The parallel cylindric bar, CD , is ${ }_{5}^{4} y$ of an inch in diameter, having two rectangular ends EF, each halfaninch fquare and an inch long. On one fide of the end next the limb of the fector, is a mark correfponding to a fimilar one in the hinder cock of the gun with which it muft always coincide when placed on the gun. The length of the parallel bar, together with its ends, isfeven inches. This bar is fixed to the fector by means of two hollow cylinders, $G, H$, which allow the fector 2. motion roind the bar. There is a finger-fcrew; a, upon the hollow cylinder, $G$, which is nit, in order to tighten it at pleafure upon the bar. 4 The circular level I, fig. II. and I2. for fetting the plane of the
fector always perpendicular when placed upon the gun, is $\frac{3}{4}$ of an inch in diameter. There is a imall forew, $d$, to adjuft the level at right angles to the plane of the fector. 5. The finger-fcrew $b$, for fixing the index. of the fector at any particular degree of elevation propofed.

The line of collimation (that is, the line of vifion clit by the interfecting point of the two crofs-hairs in the telefcope (muft be adjufted truly parallel to the bar of the fector when at o degrees. This is done by placing the fector fo that the vertical hair may exactly cover fome very diftant perpendicular line. If it again covers it when the fector is inverted, by turning it half round upon the bar, which has all the while been kept fteady and frm, that hair is correet; if not, correat half the error by means of the fmall frews, cde, fig. II. and 13. at the eye-end of the telefcope, and the other half by moving the bar ; place it again to cover the pespendicular line, and repeat the above operation till the hair covers it in both pofitions of the fector. Then turn the fector, till the horizontal hair cover the fame pe:pendicular line, and turning the fector half round on its bar, correct it, if wrong, in the fame manner as you did the vertical hair.
$N . B$. Of the four fmall ferews at the eye-end of the telefcope, thofe at the right and left hand move whatever hair is vertical, and thofe at top or underneath move whatever hair is horizontal.
On the ficle of the gun upon the firt reinforce, are caft two knobs, $F$, fig. 9. and I4. having their middle part diftant from cach other lix inches, for fixing on the brafs cocks, A, fig 14. and 15 . which receive the rectangular ends of the parallel cylindric bar of the fector, when placed on the gun.

The next adjuftment is to make the parallel bar, and line of collimation of the telefcope, when fet at 0 degrees, parallel to the bore of the gun, and confequently to the direction of the fhot. The gun being loaded, the cartridge picked, and the gun priued, place the fector in the cocks of the gan; and having firt fet the fector to what elevation you think neceffary, bring the interfection of the crofs hairs in the telefcepe upon the centre of the mark, the limb of the fector being fet vertical by means of the circular level, and then take off the fector without moving the gun. Fire the gun; and if the bullet hits any where in the perpendicular line, pafling through the centre of the mark, the line of collimation of the telefcope and direction of the hot agree. But if it hit to the right of the mark, fo much do they differ. In order to correct which, bring the gun into the fame pofition it was before firing, and lecure it there. Then file away as much of the forecock, on the fide next the gun, as will let the interfection of the crofs-hair fall fomewhere on the line pafsing perpendicularly throngh the point where the fhot fell; and it is then adjufted in that pofition, fo much being filed off the fide of the cock at $a$, fig. 14. and 18. as will allow the fide $b$ to be ferewed clofer, that the ends of the parallel bar may lave no fhake in the cocks. To correct it in the other pofition, and fo to find the true o degrees of the gun, that is, to bring the line of collimation of the telefcope, parallel-bar, and bore of the gun, traly parallel to each other, repeat the above with the trunnions perpendicular to the horizon, the fector being tarned a quarter round upon its

Frattice. bar, fo as to bring its plane vertical. The deviation of the flot found in this way is corrected by deepening one of the cocks, fo that the vertical hair of the telefcope may be brought to cover the line paffing perpendicularly through the point where the buller hits; the gun being placed in the fame pofition it was in before it was fired. This adjufment being repeated two or three times, and any error that remains being corrected, the gun is fit to be mounted on its carriage for fervice. It is to be obferved, that this fector will fitany gun, if the cocks and rectangular ends, \&c. of the parallel bar be of the above dimenfions, and will be equally applicable to all fuch pieces whofe cocks have been adjufted, as if it had been adjufted feparately with each of them. And if the fector be fet at any degree of elevation, and the gun moved fo as to bring the interfection of the crofs hairs on the ohject to be fired at (lie limb of the fector being vertical), the bore of the gun will have the fame elevation above it, in the true direction of the fhot, whatever pofition the carriage of the gun is fanding in. A telefcope with crofs hairs, fixed to a common rifled mufket, and adjufted to the direction of the fhot, will make any perfon, with a very little practice, hit an object with more precifion than the moft experienced markfman.

For garrifon-tervice, or for batteries, the fhip or garrifon carriage, with two iron ftaples on each fide to put through a couple of poles to carry thefe guns from place to place with more difpatch, are as proper as any. But, for the field, a carriage like that at fig. 16. where the fhafts pull in upon taking out the iron pins $a b$, and moving the crofs bar A, upon which the breech of the gun relts, as far down as the fhafts were puffed in, is the propereft, fince the whole can then be carried like a hand-barrow, over ditches, walls, or rough ground, all which may be eafily underfood from the figure.

The principal advantage that will accrue from the ufe of rifled ordnance, is the great certainty with which any object may be hit when fired at with them, fince the thot deviates but little from its intended line of direction, and the gun is capable of being brought to bear upon the object with great exactnefs, by means of the telefcope of crofs-hairs.

The other pieces of artillery commonly made ufe of are mortars, howitzes, and royals. The murtars are a kind of flort cannon of a large bore, with chambers for the powder, and are made of brafs or iron. Their ule is to throw hollow fhells filled with powder, which falling. on any building, or into the works of a fortification, burft, and with their fragments deftroy every thing near them. Carcafes are allo thrown out of them; which are a fort of hells with five holes, filled with pitch and other materials, in order to fet buildings on fire; and fometimes balkets full of ftones, of the fize of a man's fint, are thrown out of them upon an enemy placed in the covert-way in the time of a fiege. Of late the ingenious General Defaguliers has contrived to throw bags filled with grapehot, containing in each bag from 400 to 600 hhot of different dimenfions, out of mortars. The effect of thefe is tremendous to troops forming the line of batte, pafling a defile, or landing, \&xc. the fhot pour-
ing down like a fhower of hail on a circumference of Practice. above 300 feet.

Mortars are chiefly diftinguiifhed by the dimenfions of their bore; for example, a r3ch-inch mortar is one the diameter of whofe bore is 13 inches, \&c.-The land-mortars are thofe ufed in fieges, and of late in battles. They are mounted on beds, and both mortar and bed are tranfported on block carriages. There is likewife a kind of land-mortars mounted on travelling carriages, invented by count Bukeburg, which may be clevared to any degree: whereas all the Englifh mortars are fixed to an angle of $45^{\circ}$. This cuftom, however, does no appear to have any foundation in reafon. In a fiege, fhells fhould never be thrown with an angle of 45 degrees, excepting one cafe only; that is, when the battery is fo far off, that they cannot otherwife reach the works : for when fhells are thrown out of the trenches into the works of a fortification, or from the town into the trenches, they fhould have as little elevation as poffible, in order not to bury themfelves, but to roll along the ground, whereby they do much more damage, and occafion a much greater confternation among the troops, than if they flink into the ground. On the contrary, when fhells are thrown upon magazines, or any other buildings, the mortars fhould be elevated as high as poffible, that the fhells may acquire a greater force in their fall, and confequently do more execution.

There are other kinds of mortars, called partridgem mortars, hand-mortars, and firelock-mortars; which laft are alfo called bombards. The partridge-mortar is a common one, furrounded with 12 other little mortars bored round its circumference, in the body of the metal; the middle one is loaded with a hell, and the others with grenades. The vent of the large mortar being fired, communicates its fire to the reft; fo that both the hell and grenades go off at once. Handmortars were frequently ufed before the invention of cohorns. They were fixed at the end of a faff four feet and a half long, the other end being fhod with iron to ftick in the ground ; and while the bombardier with one hand elevated it at pleafure, he fired it with the other. The firelock mortars, or bombards, are fmall mortars fixed to the end of a firelock. They are loaded as all common firelocks are; and the grenade, placed in the mortar at the end of the barrel, is difcharged by a flint-lock. To prevent the recoil hurting the bombardier, the bombards reft on a kind of halberd made for that purpofe.
The chamber in mortars is the place where the powder is lodged. They are of different forms, and made varioufly by different nations; but the cylindric feems to be preferable to any other form.
The howitz is a kind of mortar mounted on a fieldcarriage like a gun: it differs from the common mortars in having the trunnions in the middle, whereas thofe of the mortar are at the end. The conflruction of howitzes is as various and uncertain as that of mortars, excepting that the chambers are all cylindric. They are diftinguinted by the diameter of their bore; for inflance, a 10 -inch howitz is that which has a bore of Io inches diameter, and fo of others. They were much more lately invented than mortars, and indeed are plainly derived from them.

Royals

Sect. III. G U N
Practice. Royals are a kind of fmall mortars, which carry a 52 . fhell whofe diameter is 5.5 inches. They are mountparts of a ed on beds in the fame way as other mortars.

0 , chamber.
$p$, hore.
$q$, mouth.
$r$, vent.
The mortar-beds are formed of pery folid timber, and placed upon very ftrong wooden frames, fixed in fuch a manner that the bed may turn round. The forepart of thefe beds is an arc of a circle defcribed from the centre on which the whole turns. powder into the piece, and which confins of two parts, viz. of a wooden box, appropriated to the caliber of the piece for which it is intended, and of a caliber and a half in length with its vent ; and of a piece of copper nailed to the box, at the height of a half ca-liber.-This lantern mult have three calibers and a half in length, and two calibers in breadth, being rounded . at the end to load the ordinary pieces.
2. The rammer is a round piece of wood, commonly called a box faftened to a fick 12 feet long, for the pieces from 12 to 33 pounders; and 10 for the 8 and 4 pounders; which ferve to drive home the powder and ball to the breech.
3. The fpunge is a long ftaff or rammer, with a piece of fheep or lamb-fkin wound about its end, to ferve for fcouring the cannon when difcharged, before it be charged with frefh powder; to prevent any fpark of fire from remaining in her, which would endanger the life of him who fhould load her again.
4. Wad-fcrew confifts of two points of iron turned ferpent-wife, to extract the wad out the pieces when one wants to unload them, or the dirt which had chanced to enter into it.
5. The botefeux are fticks two or three feet long, and an inch thick, fplit at one end, to hold an end of the match twifted round it, to fire the cannon.
6. The priming-iron is a pointed iron-rod, to clear the tomeh-hole of the pieces of powder or dirt ; and alfo to pierce the cartridge, that it may fooner take fire.

Vox. VIII.
$\mathrm{N} \quad \mathrm{E} \quad \mathrm{Y}$.
7. The primer, which muf contain a pound of pow. pradice. der at leaft, to prime the pieces.
8. The quoin of mire, which are picces of wood with a notel on the fide to put the fingers on, to draw them back or pulh them forward when the gunner points his piece. They atc placed on the fole of the carriage.
9. Leaden-plates, which are ufed to cover the touchhole, when the piece is charged, left fome dirt fhould enter it and ftop it.

Before charging the piece, it is well fponged, to clean it of all fith and dirt withinfide; then the proper weight of gmpowder is put in and rammed down; care them. being taken that the powder be not bruifed in ramming, which weakens its effect ; it is then run over by a little quantity of paper, hay, or the like; and lantly, the ball is thrown in.

To point, level, or direct the piece, fo as to play ageinft any certain point, is done by the help of a quadrant with a plummet: which quadrant confifts of two branches made of brafs or wood; one about a foot long, eight lines broad, and one line in thicknefs; the other four inches long, and the fame thicknefs and breadth as the former. Between thefe branches is a quadrant, divided into 90 degrees, beginning from the fhorter branch, and furnifhed with thread and pluminet.

The longeft branch of this inftrument is placed in the cannon's mouth, and elevated or lowered till the thread cuts the degree neceffary to hit the propofed object. Which done, the cannon is primed, and then fer fire to. The method by the fector, however, propofed by Dr Lind, is certainly in all cafes to be pre. ferred.

A 24 pounder may very well fire 90 or 100 fhots every day in fummer, and 60 or 75 in winter. In cafe of neceflity it may fire more; and fome French officers of artillery affure, that they have canfed fuch a piec e to fire every day 150 fhots in a fiege.-A 16 and a 12 pounder fire a little more, becaufe they are eafier ferved. There have even been fome occafions where 200 fhots have been fired from thele pieces in the face of nine hours, and 138 in the fpace of five. In quick firing, tubes are made ufe of. They are made of tin; aind their diameter is two-tentlis of an inch, being jult fufficient te enter into the vent of the piece. They are about fix inches long, with a cap above, and cut flanting below, in the form of a pen ; the point is frengthened with fome folder, that it may pierce the cartridge without bending. Through this tube is drawn a quick. march, the cap being fitted with mealed powder moiftened with fpirits of wine. To prevent the mealed powder from falling out by carrriage, a cap of paper or flannel fteeped in Spirits of wine is tied over it. To range pieces in a battery, care muft be taken to reconnoitre well the ground where it is to be placed, and the avenues to it. The pieces muf be armed each with wo lanterns or ladles, a rammer, a fpunge, and two pri-ming-irons. The battery muft allo be provided with carriages, and other implements, neceffary to remount the pieces which the enemy fhould chance to difmount.

To ferve expeditioufly and fafely a piece in a battery, it is neceflary to have to each a fack of leather, Ff
larg
large enough to contin about 20 pounds of powder to charge the lanterus or ladles, without carrying them to the magazine; and to avoid thereby making thofe trains of powder in bringing back the lantern from the magazine, and the accidents which frequently happen thereby.
A battery of three pieces mult have 30 gabions, becaufe fix are employed on each of the two; fides or epaulments, which make 12, and nine for each of the two merlons.
There ought to be two gunners and fix foldiers to each piece, and an officer of artillery.
The gunner pofted on the right of the piece mult take care to have always a pouch full of powder and two priming irons : his office is to prime the piece, and load it with powder. The gunner ou the left fetches the powder from the little magazine, and fills the lantern or ladle which his comrade holds; after which, he takes care that the match be very well lighted, and ready to fet fire to the piece at the firft command of the officer.
There are three foldiers on the right and three on the left of thepiece. The two firft take care to ram and fpunge the piece, each on his fide. The rammer and fpunge are placed on the left, and the lantern or ladle on the right. After having rammed well the wad put over the powder and that put over the buller, they then take each a handfpike, which they pafs berween the foremont fpokes of the wheel, the ends whereof will pafs under the head of the carriage, to make the wheel urn round, leaning on the other end of the handfpike, towards the embrafure.
It is the office of the fecond foldier on the right to provide wad, and to put it into the piece, as well over the powder as over the bullet; and that of his comrade on the left to provide 50 bullets, and every time the piece is to be charged to fetch one of them and put it into the piece after the powder has been rammed. Then they both take each an handfpike, which they pars under the hind part of the wheel, to puifh it in battery.
The officer of artillery muft take care to bave the piece diligently ferved.

In the night he muft employ the gunners and foldiers, who fhall relieve thofe who have ferved 24 heurs to repair the embrafures.
If there be no water near the battery, care mull be paken to have a calk filled with it, in which to dip the fpunges and cool the pieces every 10 or 12 rounds.
The carriage for a mortar of 12 inches of diameter muft be 6 feet long, the flaks 12 inches long and 10 thick. The trunniens are placed in the middle of the carriage.

The carriage of an 88 inch mortar muft be 4 feet long, and the flaks in inches high and 6 thick.

To mount the mortars of new invention, they ufe carriages of cant iron.

In Germany, to monnt mortars from 8109 inches, and carry then into the field, and exceute then horizontally as a piece of cannon, they make ure of a piece of wood 8 feet 2 inches long, with a hole in the middle to lodge the body of the mortar and its trunnions as far as their half diameter, and mounted on two wheels feurfect high, 10 which they join a vantrain prepor-
tioned to it, and made like thofe whtch ferve to the Practice. carriages of cannons.
Having mounted the mortar on its carriage, the next thing is to caliber the bomb by means of a great caliber, the two branches whereof embrace the whole eircumference of the bomb : thefe two branches are brought on a rule where the different calibers are marked, among which that of the bomb is found.

If no defect be found in the bomb, its cavity is filled, by means of a funnel, with whole gunpowder; a little fpace or liberty is left, that when a fufce or wooden tube, of the figure of a truncated cone, is driven thro ${ }^{\circ}$ the aperture (with a wooden mallet, not an iron one for fear of accident), and faftened witi a cement made of quicklime, afhes, brick-duft, and fteel filings, worked together in a glatinous water, or of four parts of pitch, two of colophony, one of turpentine, and one of wax, the powder may not be bruifed. This tube is filled with a combuftible matter made of two ounces of nitre, one of fulphur, and three or more of gunpowder duft well rammed. See Fuzee.

This fufee fet on fire burns flowly till it reaches the gunpowder; which goes off at once, barfting the hiell to pieces with incredible violence. Special care, however, muft be taken that the fufee be fo proportioned as that the gunpowder do not take fire ere the fhell arrives at the deftined place ; to prevent which, the fufe is frequently wound round with a wet clammy thread.

Batteries confint,-I. Of an epaulment to thelter the mortars from the fire of the enemy. 2. Of platforms on which the mortars are placed. 3. Of fmall magazines of powder. 4. Of a boyan, which leads to the greas magazine. 5. Of ways which lead from the battery to the magazine of bombs. 6. Of a great ditch before the epaulment. 7. Of a berm or retraite.

The platforms for mortars of 12 inches muft have 9 feet in length and 6 in breadth. -1 he lambourds for common mortars muft be four inches thick; thofe of a concave chamber of 8 lb . of powder, 5 inches ; thofe of 12 lb .6 inches; thofe of 181 b .7 inches or thereabouts. Their length is at difcretion, provided there be enough to make the platforms 9 feet long.-The forepart of the platform will befituated at two feet diflance from the epaulment of the battery.-The bombardiers, to fhelter themfelves in their battery, and not be feen from the town befieged, raife an epaulment of 7 feet or more high, which epaulment has no embrafures.

To ferve expeditioufly a mortar in battery, there are required,--five ftrong handfpikes; a dame or rammer, of the caliber of the conic chamber, to ram the wad and the earth; a wooden knife a foot long, to place the earth round the bomb; an iron fcraper two feet long, one end whereof mult be four inches broad and roundwife, to clean the bore and the chamber of the mortar, and the other end made in form of a fpoon to clean the little chamber; a kind of brancard to carry the bomb, a flovel, and pick-ax.

The officer who is to mind the fervice of the mortar munt have a quadrant to give the degrees of elevation.

Five bombardiers, or others, are employed in that fervice ; the firft mult take care to fetch the powder to charge the chamber of themortar, putting his primingiron in the touch-hole before he charges the chamber;

Practice. and never going to fetch the powder before he has anked his officer at what quantity of powder he defigns to charge, becaufe more or lefs powder is wanted according to the diftance where it is fired; the fame will take care to ram the wad and earth, which another foldier puts in the chamber.

The foldier on the right will put again two hovelful of earth in the bottom of the bore, which Mould be likewife very well rammed down.

This done, the rammer or dame is returned into its place againft the epaulment on the right of the mortar: he takes an handficike in the fame place to poft himfelf behind the carriage of the mortar, in order to help to puth it into battery : having laid down his handfpike, he takes out his.priming-iron, and primes the touchhole with fine powder.

The fecond foldier on the right and left will have by that tine brought the bomb ready loaded, which mult be received into the mortar by the firft foldier, and placed very ftrait in the bore or chafe of the mortar.

The firft on the right will furnifh him with earth to put round the bomb, which he mult take care to ram clofe with the knife given him by the fecond on the left.

This done, each fhall take a handfpike, which the two firft on the right and left fhall put under the pegs of retreat on the forepart, and the two behind under thofe of the hindpart, and they together pulh the mortar in battery.

Afterwards the officer points or directs the mortar.
During that time, the firf foldier takes care to prime the touch-hole of the mortar, without ramming the powder; and the laft on the right muft have the match ready to fet fire to the furee of the bomb on the right, while the firft is ready with his on the left to fet fire to the touch-hole of the mortar, which he ought nor to do till he fees the fufee well lighted.

The foremoft foldiers will have their handfpikes ready to raife the mortar upright as foon as it has difcharged, while the hindmoft on the left fhall with the fcraper clean the bore and chamber of the mortar.

The magazine of powder for the fervice of the battery fhall be fituated 15 or 20 paces behind, ard covered with boards and earth over it.-The loaded bombs are on the fide of the faid magazine, at five or fix paces diftance.

The officer who commands the fervice of the mortar muft take care to difcover as much as poffible with the eye the diftance of the place where he intends to throw his bomb, giving the mortar the degree of elevation according to the judgment he has formed of the diftance. Having thrown the firft bomb, he muft diminifh or increafe the degrees of elevation according to the place on which it fhall fall. Several make ute of tables to difcover the different diftances according to the differences of the elevations of the mortar, efpecial. ly the degrees of the quadrant from ito 45 : but thefe, from the principles already laid down, muft be fallacious.

The petard is the next piece of artillery which deferves our attention ; and is a kind of engine of metal, fomewhat in hape of a high-crowned hat, ferving to break down gates, barricades, draw bridges, or the like works, which are intended to be furprifed. It is very lhort, narrow at the breech and wide at the
muzzle, made of copper mixed with a little brafy, or Practice. of lead with tin.

The perards are not always of the fame height and bignefs: they are commonly roinches high, 7 inches of diameter a-top, and 10 inches at botiom. They weigh commonly 40,45 , and 50 pounds.

The madrier, on which the petard is placed, and where it is tied with iron circles, is of two feet for its greateft width, and of 18 inches on the fides, and no thicker than a common madrier. Under the madric: are two iron-bars paffed croffwife, with a hook, which ferves to fix the petard.

To charge a petard 15 inches high, and 6 or 7 inches of caliber or diameter at the bore, the infide mult be firft very well cleaned and heated, fo that the hand may bear the heat; then take the beft powder that may be found, throw over it fome fpirit of wine, and expofe it to the fun, or put it in a frying-pan; and when it is well dried, 5 lb . or 6 lb . of this powder is put into the petard, which reaches within three fingers of the mouth : the vacancies are filled with tow, and ftopped with a wooden-tampion; the mouth being ftrongly bound up with cloth tied very tight with ropes; then it is fixed on the madrier, that has a cavity cut in it to receive the mouth of the petard, and faftened down with ropes.

Some, inftead of gunpowder for the charge, ufe one of the following compofition, viz. gunpowder fever pounds, mercury fublimate one ounce, camphor eight ounces; or gunpowder fix pounds, mercury fublimate three ounces, and fulphur three; or gunpowder fix, beaten glafs half an ounce, and camphor three quarters.

Before any of thefe pieces are appropriated for tervice, it is neceffary to have each undergo a particular trial of its foundnefs, which is called a proof, to be made by or before one authorifed for the parpofe, called the proof-mafler.

To make a proof of the piece, a proper place is chofen, which is to be terminated by a mount of earth very thick to receive the bullets fired againft it, thar: none of them can run through it. The piece is laid on the ground, fupported only in the middle by a block of wood. It is fired three times; the firft with yowder of the weight of the bullet, and the two ohhers with $\frac{1}{4}$ of the weight ; after which a litule more powder is put in to finge the piece, and after this, water, which is impreffed with a fpunge, putting the finger on the touch-hole to difcover if there be any cracks; which done, they are examined with the cat, which is a piece of iron with three grafps, difpofed in the form of a triangle, and of the caliber of the piece; then it is vinted with a wax-candle, but it is of very little fervice in the fmall pieces, becaufe if they be a little long the fmoke extinguifhes it immediately. See Plate CCXXIV.
Beides the large pieces already mentioned, iuvent-of 5 mal. ed for the deftruction of mankind, there are others arms. called fmall gunş; viz. mufkets of ramparts, common mufkets, fufils, carabines, mufketoons, and piftols.

A mufket, or mufquet, is a fire-arm borne on the moulder, and ufed in war, formerly fired by the appli. cation of a lighted match, but at prefent with a flige and lock. The common muilet is of the caliber of 20 leaden balls to the pound, and receives balls from 22 to 24: its length is fixed to 3 feet 8 inches from the muzzle to the souch-pan.

A fuil, or frelock, has the fame length and caliber, and ferves at prefent instead of a muket.

A carabinc is a finall fort of fire-arm, fhorter than a fufil, and carrying a ball of 2.4 in the pound, borne by the light-horfe, hanging at a belt over the left fhoulder. This piece is a kind of medium between the piftol and the mufket; and bears a near affinity to the arqueburs, only that its bore is fmaller. It was for-
merly made with a match-lock, but of late unly with a Practice. fint-lock.
The mufquetoon is of the fame length of the carabine, and the barrel polifhed, and clean within. It carries five ounces of iron, orf feven, and an half of lead, with an equal quamity of powder.

The barrel of a piftol is generally 14 inches long.

## G U N

Gumpowder.

GUNPOWDER, a compofition of faltpetre, fulphur, and charcoal, mixed together and uflally granulated; which eafily takes fire, and, when fired, rarifies or expands with great vehemence, by means of jis claltic force.

It is to this powder we owe all the action and effect of guns, ordnance, \&c. fo that the modern military arr, fortification, \&c. in a great meafure depend thereon.
Invention of Gunpowder. See Gun.
Method of making Gunpowder. Dr Shaw's receipt for this purpofe is as follows: Take four ounces of refined faltpetre, an ounce of brimftone, and fix drams of fmall coal: reduce thefe to a fine powder, and continue beating them for fone time in a ftone mortar with a wooden peftle, wetting the mixture between whiles with water, fo as to form the whole into an uniform pafte, which is reduced to grains, by pafing it through a wire-lieve fit for the purpofe; and in this form being carefully dried, it becomes the common ganpowder.

For greater quantities mills are ufually provided, by means of which more work may be performed in one day than 2 man can do in a hundred.

The nitre or faltpetre is refined thus: Diffolve four pounds of rough nitre as it comes to us from the Indies, by boiling it in as much water as will commodioully fuffice for that purpole : then let it hoot for two or three days in a covered veffel of earth, with fticks laid acrofs for the cryftals to adhere to. Thefe cryftals being taken ont, are drained and dried in the open air.

In order to reduce this falt to powder, they diffolve a large quantity of ic in as fmall a proportion of water as poflible; then keep it conftanty ftirring over the fire till the water exhales and a white dry powder is left behind.

In order to purify the brimftone employed, they diffolve it with a very gentle heat; then fom and pals it through a doubie ftrainer. If the brimitone fhould bappen to take fire in the nelting, they have an iron cover that fits on clofe to the melting-veffel, and damps the flame. The brimitone is judged to be fufficiently refined if it melts, withour yielding any fetid odour, between two hot iron-plates, into a kind of red fubfance.

The coal for the making of ginpowder is cirher that of willow or hazel, well charred in the ufual manner, and reduced to powder. And thus the ingredients are prepured for making this commodity: but as thefe ingredients require to be intimately mixed, and as there wonld be danger of their firing if beat in a dry form, the method is tokeep ilem coninually moin,

## G U N

either with water, urine, or a folution of fal ammoniac: they continue thus ftamping them together for 24

Gunpowder, hours; after which the mafs is fit for corning and drying in the fin, or otherwife, fo as feduloully to prevent its firing.

Different kinds of Cunpowder. The three ingredients of gunpowder are mixed in various proportions according as the powder is intended for mulkets, great guns, or mortars : though thefe proportions feem not to be perfectly adjufted or fettled by competent experience.

Semicnowitz, for mortars, directs an hundred pounds of falcpetre, twenty-five of fulphur, and as many of charcoal; for great guns, an hundred pounds of faltperre, fifteen pounds of fulphur, and eighteen pounds of charcoal; for mukets and piftols, an hundred pounds of faltpetre, eight pounds of fulphur, and ten pounds of charcoal. Miethius extols the proportion of one pound of faltpetre to three ounces of charcoal, and two or two and a quarter of fulphur; than which, he affirms, no gunpowder can proffibly be ftronger. He adds, that the ufual practice of making the ganpowder weaker for mortars than guns, is withour any foundation, and renders the expence needlefsly much greater: for whereas to load a large mortar, twentyfour pound of common powder is required, and confequently, to load it ten times, two hundred and forty pound, he hows, by calculation, that the fame effect would be had by one hundred and fifty pound of the ftrong powder.

On this fubject Mr Thomfon $\dagger$ obferves, that almoft $\dagger$ Phil. all thofe who have written upon gunpowder, particu. Tram. larly thofe of the laft century, have given different re- Vol. 75. ceipts for its compofition; and he propofes it as a query, Whether thefe differences have not arifen from obferving that fome kinds of powder were better adapted to particular purpofes than others, or from experiments made on purpofe to afcertain the fact? "There is one circumftance (he fays) that would lead us to fuppofe that this was the cafe. That kind of powder defigned for mortars and great guns was weaker than that intended for fmall arms: for if there is any foundation for thefe conjectures, it is certain, that the weakeft powder, or the heavieft in proportion to its claftic force, onght to be ufed to impel the heavieft bullets; and particularly in guns that are imperfectly formed, where the vent is large, and the windage very great. I am perfectly aware (adds he), that an objection niay here be made, viz. that the elaftic fluid generated from gunpowder muft be fuppofed to have the fame properties very nearly, whatever may be the proportion of its feveral ingredients: and that therefore the only difference there can be in powder is, that

## $G \mathrm{G} \quad\left[\begin{array}{l}237\end{array}\right] \quad \mathrm{G} U \mathrm{~N}$

Gunpow- one kind may generate more of this fuid, and another der. lefs; and that when it is generated it acts in the fame manner, and will alike cfcape, and with the fame velocity, by any paffage it can find. Bat to this I anfwer, that though the fluid may be the fame, as it undoubtedly is, and though its denfity and elafticity may be the fame in all cafes, at the inftant of its generation; yet in the explofion, the elaftic and unelaftic parts are fo mixed together, that I imagine the fluid eannot expand without taking the grofs matter along with it ; and the velocity with which the flame iffues at the vent is to be computed from the elafticity of the fluid, and the denfity or weight of the fluid and grofs matter taken together, and not fimply from the denfity and elafticity of the fluid."

To increafe the ftrength of powder, Dr Shaw thinks it proper to make the grains confiderably large, and to have it well lifted from the fmall duft. We fee that gunpowder, reduced to dult, has little explofive force; but when the grains are large, the flame of one grain has a ready paffage to another, fo that the whole parcel may thus take fire nearly at the fame time, otherwife much force may be loft, or many of the grains go away as hot unfired.

In the 7 flt volume of the Phil. Tranf. Mr Thomfon gives an account of feveral attempts to augment the force of gunpowder by the addition of different ingredients. The power of fteam has by many been overrated to fuch a degree, as to be fuppofed capable of anfwering the purpofes of gunpowder; but no attempts to accomplifh this have ever fucceeded in any degree. Mr Thomfon attempted to combine the forces of feam and gunpowder together in the following manner. Having procured a number of air bladders of very fmall fifhes, he put different quantities of water into them from the fize of a fmall pea to that of a piftol bullet, and tying them up with fome very fine thread, hang them up to dry on the outfide. He then provided a number of cartridges made of fine paper, and filled them with a quantity of gunpowder equal to the ufual charge for a common horfeman's piftol. He then loaded the piftol with a bullet, fired it againft an oaken plank about fix feet from the muzzle, and obferved the recoil and penetration of the bullet. He next tried the effect of one of thefe fmall bladders of water when put among the gunpowder, but always found the force of the powder very much diminifhed, and the larger the quantity of water the greater was the diminution; the report of the explofion was alfo diminifhed in a fill greater proportion than the force of the bullet or recoil. It being fuppofed that the blaclder had burft, and thus by werting the gunpowder prevented it from taking fire, the experiment was repeated with highly rectified firit of wine, but the diminution of the force was very little inferior to what it had been by water. Etherial oil of turpentine, and fmall quantities of quick filver were alfo tried, but with no better fuccefs than before. Thinking, however, that the failure of the quickfilver might be owing to its having been too much in a body, the experiment was repeated with the metal difperfed in fmall particles through the powder. To accomplifh this difperfion the more completely, 20 grains of Ethiops mineral were mixed very intimately with 145 grains of powder ; but fill the force of the bullet was much lefs than if
the powder had been ufed without any addition. As
the explofion of pulvis fulminans appears vaftly fuperior to that of gunpowder, fome falt of tartar in its pureft fate, was mixed in the proportion of 20 grains to 145 of powder; but on firing the piece, it was ftill found that the force of the explofion was leffened. Sal ammoniac was next tried; which, under certain circumftances, is found to produce a great quantity of air or elaftic vapour ; but on mixing 20 grains of it with 145 of gnopowder, the force of the explofion was ftill found to be diminifhed. As molt of the metals, when diffolved in acids, particularly brafs in fpirit of nitre, are found to produce much elaftic vapour, it was thought worth while to try whether the force of powder could be augmented by this means. Twenty grains of brafs duft were therefore mixed with 145 grains of powder ; but fill the force of the explofion was not augmented. In our author's opinion, how ever, neither brafs duft nor Ethiops mineral diminifh the force of the explofion otherwife than by filling up the interftices between the grains, obftructing the paffage of the flame, and thus impeding the progrefs of the inflammation. Thus it appears, that little hope remains of augmenting the force of gunpowder by any addition either of liquid or inflammable folids : the reafon is obvious, viz. becaufe all of them, the liquids efpecially, abforb great quantities of hear before they can be converted into vapour; and this vapour, after it is formed, requires more heat to make it cxpand more forcibly than air : hence, as the effects of gunpowder depend entirely upon the emiffion of a quan. tity of air, and its rarefaction by vehement heat, the power muft be greatly diminifhed by the abforption of this heat, which ought to be fpent in rarefying the air. Even folid bodies cannot be fet on fire without a previous abforption of heat to convert them into vapour*; but liquids have this property fill more than *Scéflat folids, as is explained under the articles Chemistry, Evaporation, \&c. and muft therefore diminifh the explofive force fill more. Lime added to ganpowder, however, is faid to augment the power of the explom fion by one third.

In his experiments on gunpowder, Mr Thomfon had the curiofity to compare the frength of aurum fulminans, when enclofed in a gun barrel, with that of common gunpowder; but his experiment only verified what has been found by others, viz. that this powder, which in the open air makes fach a very violent report, has in clofe veffels fcarce any power, comparatively feaking, either of explofion or projecting a bullet. Mr Thomfon, however, taking it for granted that the power of aurum fulminans would be found much greater than that of gunpowder, took care to have a barrel of uncommon frength prepared for the experiment. The weight of it was 7 lb .5 oz . the length 13,25 inches, and the width of the bore 0.55 inches. This barrel, being charged with 27,4.4 grains of aurum fulminans and wo leaden bullets, which, together with the leather put about hem to make them fit the bore without wincage, weighed 427 grains: it was laid upon a chaffing-difh of live coals at the diftance of about ten feet from the pendulum, and the piece was directed againg the centre of the pendulum. Some minttes clapfed before the powder exploded; but when it did fo, the explofion

Gunpow- did not much exceed the report of a well charged airder. gun; and it was not till he faw the pendulum in
motion, that Mr Thompfon could be perfuaded that the bullets had been difcharged. On examination, however, it was found that nothing had been left in the barrel, and that the powder had probably been all exploded, as a great many particles of the revived metal were thrown about. From a calculation of the motion communicated to the pendulum, it was found that the velocity of the bullets had been about 428 feet in a fecond: whence it appears that the power of aurum fulminans, compared with that of gunpowder, is only as 4 to 13 very nearly.
Method of trying and examining Gunpowder. There are two general methods of examining gunpowder; one with regard to its purity, the other with regard to its flrength. Its purity is known by laying two or three little heaps near each other upon white paper, and firing oate of them. For if this takes fires readily, and the finoke rifes upright, without leaving any drofs or feculent matter behind, and without burning the paper, or firing the other heaps, it is efleemed a fign that the fulphur and nitre were well purified, that the coal was good, and that the three ingredients were thoroughly incorporated together; but if the other heaps alfo take fire at the fame time, it is prefumed, that either common falt was mixed with the nitre, or that the coal was not well ground, or the whole mafs not well beat and mixed together; and if either the nitre or fulphur be not well purified, the paper will be black or fpotted.

Several inftruments have been invented to try the ftrength of gunpowder; but they have generally been complained of as inaccurate. Mr Thomfon, in the IIf volume of the Philofophical Tranfactions, gives an account of an exact method of proving the ftrength of it. "As the force of powder (fays he) arifes from the action of an claftic fluid that is generated from it in its inflammation, the quicker the charge takes fire, the more of this fluid will be generated in any given fhort fpace of time, and the greater of courfe will its effect be upon the bullet. But in the common method of proving gunpowder, the weight by which the powder is confined is fo great in proportion to the quantity of the charge, that there is time quite fufficient for the clarge to be all inflamed, even when the powder is of the floweft compofition, before the body to be put in motion can be fenfibly removed from its place. The experiment therefore may fhow which of the two kinds of powder is the ftrongeft, when equal quantities of both are confined in equal faces, and both completely inflamed; but the degree of the inflammability, which is a property effential to the goodnefs of the powder, cannot by this means be afcertained. Hence it appears how powder may anfwer to the proof, fuch as is commonly required, and may neverthelefs turn out very indifferent when it comes to be ufed in fervice. But thongh the common powder-triers may fhow powder to be better than it really is, they can never make it appear to be worfe than it is; it will therefore always be the intereft of thofe who manufacture the commodity to adhere to the old method of proof, but the purchafer will find his account in having it examined in a method by which its goodnefs may be afcertained with greater precifion."

In order to determine the goodyts of powder by Mr Thomfon's method, it is ner flary to have a barrel fufpended by twu iron rods in fuch a manner that it can eafily move backward or forward by the vibration of the rods; and the fpace it moves through afcertained by marking it on a piece of ribbon. The barrel being then charged wilh powder, and fitted with a proper bullet, is to be fired, and the recoil marked upon the ribbon. The experimeat is to be repeated three or four times, or oftenc. :' Here is any difference in the recoil; the extremes of which may be marked with black lises on the ribbon, and the word proof written upon the middle line betwixt the two. But if the experiments are made wich fufficient accuracy, there will conmonly be very litte difference in the length to which the ribbon is drawn out. Thus the comparative goodnefs of powder may eafily be afcertained; for the ftronger the paoder is, the greater will be the recoil, and confequently the greater length to which the ribbon will be drawn out; and if care is taken in proportioning the charge to the weight of the bullet, to come as near as poffible to the medium proportion that obtains in practice, the determination of the goodnefs of gunpowder from the refult of this experiment cannot fail to hold good in aetual fervice. The bullets flould be made to fit the bore with very little windage; and it would be better if they were all caft in one mould and in the fame parcel of lead; as in that cafe their weights and dimenfions would be more accurateiy the fame; and the experiments would of courfe be more conclufive. The fated charge of powder might be half an ounce, and it fhould always be put in a carridge; and after the piece is loaded, it flould be primed with other powder, firft taking care to prick the cartridge by thrufting a priming wire down the vent.
From feveral experiments it appears, that the effeet of the charge is confiderably augmented or diminiffed, according to the greater or lefs force employed in ramming it down. To prevent this inconvenience, Mr Thomfon advifes the ufe of a cylindric ramrod of wood, fitted with a metal ring about an inch or an inch and an half in diameter; which being placed at a proper diftance from the end which goes up into the bore, will prevent the powder from being too much compreffed. In making experiments of this kind, however, it is neceffary to pay attention to the heat of the barrel as well as to the temperature of the atmofyhcre; for heat and cold, drynefs and moifure, have a very fenfible effect upon gunpowder to augment or diminif its force. When a very great degree of accuracy therefore happens to be requifite, it will be proper to begin by firing the piece two or three rimes, mercly to warm it ; after which three or four experiments may be made with fandard powder, to determine the proof: mark a fecond time, for the frength of powder is different at different times, in confequence of the flate of the atmorphere. After this the experiments may be made with the powder that is to be proved, taking care to preferve the fame interval of time between the difcharges, that the heat of the piece may be the fame in each trial.

Having thus determined the comparative degrees of ftrength of two different kinds of powder, their comparative value may be afcertained by augmenting the quantity of the weaker powder till the velocity of the

## G U N

cunpow- bullets in both cafes becones the fame. The der. frong powder is therefore precifely as mich more valuable than the weak, as it produces the fame effect with a fmaller quantity. Thus if a quarter of an ounce of one kind of powder difcharges a bullet with the fame velocity that half an ounce of another kind does, it is plain that the former is twice as valuable as the latter, and ought to he fold at double the price.By comparifons of this kind, Mr Thompion found that the beft battle powder (fo called from its being made at the village of Battle in Kent) is ftronger than government powder, in the proportion of 4 to 3 ; but from a comparifon of the prices, it appears that the former is no lefs than $4 \mathrm{I}_{\frac{3}{3}}^{2}$ per cent, dearer than it ought to be, and confequently, that whoever ufes it in preference to government powder, does it at a certain lofs of $4 \mathrm{I}_{5}^{2}$ per cent. of the money it cofts him.

There has been much talk of a white powder, which, if it anfwered the character given it, might be a dangerous compofition; for they pretend that this white powder will throw a ball as far as the black, yet without making a report; but none of the white powder we have feen, fays Dr Shaw, anfwers to this character : being, as we apprehend, commonly made either with touchwood or camphor, inftead of coal.
Under the article Gunnery, the phyfical caufe of the explofion of powder, and the force wherewith it expands, have been fo fully confidered, that it would be fuperfluous to add any thing here concerning them. Only we may obferve, that though it is commonly made ufe of for military purpofes only in fmall quantities, and confined in certain veffels; yet when large quantities are fired at once, even when unconfined in the open air, it is capable of producing terrible deftruction. The accounts of damage done by the blowing up of magazines, powder-mills, \&c. are too numerous and well-known to be here taken notice of. The following is a relation of what even a moderate quantity of powder will accomplin, when fired in the open air. "The king of Navarre took Monfegur. Captain Milon inclofed $5 c 0$ pounds of powder in a bag, which he found means to introduce, by a drain from the town, into the ditch between two principal gates: the end of the leader was hid in the grafs. Every thing being ready to play off this machine, the king gave us leave to go and fee its effects; which were furprifing. For one of the gates was thrown into the middle of the town, and the other into the field fifty paces from the wall; all the vanlts were deftroyed, and a paffage was made in the wall for three men to enter abreaft, by which the town was taken."-For farther accounts of the force of large quantities of powder, fee the article Mines.
From this and other accounts of the dreadful effects of gonpowder, when fired in a large quantity in the open air, it would feem, that great as its power is in clofe veffels, it is fill greater when the air has aceffs to it; for from the quancity of powder requifite to charge grear guns, it is by no means probable that double the quantity of powder confincd in fire-arms of any fize or capacity, and difclarged all at once againft the walls, would have produced fuch effects; efpecially when we confider thit the power nuff bave been equally great at an equal diftance all round; fo that had there been other walls and gates behind his

## GUN

quantity of powder as well as before it, they would in Gunjx all probability have been thrown down alfo. This conjecture feems to be fomewhat confirmed by the great diminution of the force of pulvis fulminans and aurum fulminans when confined in clofe veffels. Mr Thomfon mentions likewife a very fingular fact relative to gunpowder which feems to be fomewhat analogous to that juft mentioned; and which indeed feems to explain it: nanely, that the heat communicated by gunpuwder when flightly confined, is much greater than when otherwife. "I was much furprifed (fays be), upon taking hold of the barrel immediately after an experiment when it was fired with 330 grains of powder without any bullet, to find it fu very hot that I could fcarce bear it in my hand, evidently much hotter than I had ever found it before, notwithftanding. the fame charge of powder had been made ufe of in the two preceding experiments; and in both thefe experiments the piece was loaded with a bullet, which one would naturally imagine, by confining the flame, and prolonging the time of its action, would heat the barrel much more than when it was fired with powder alone. I was convinced that I could not be miftaken in the fact: for it bad been my conflaut practice to take hold of the piece to wipe it our as foon as. an experiment was filifhed, and I never before had. found any inconvenience from the heat in holding it. But in order to pur the matter beyond all doubt af. ter letting the barrel cool down to the proper temperature, I repeated the experiment twice with the fame charge of powder and a buller; and in both thefe trials the heat of the piece was evidently much lefs than what it was in the experiment abovementioned.. Being much fruck with this accidental difcovery of the great degree of heat that pieces acquire when they are fired with powder, without any bullet, and being defirous of finding out whether it is a circumflance that obtains uniyerfally, I was very, attentive to the heat of the barrel after each of the fucceeding ex. peiments; and I confantly found the heat fenfibly greater when the piece was fired with powder only, than when the fame charge was made to impel one or more bullets."

To account for this, our author fuppofes that very little of the heat acquired in firing a piece of ordnance comes from the powder; for the time that ir continues in the piece, perhaps not exceeding the 200th part of a fecond, is fo fmall, that were the flame four hundred times, infead of four times, as Mr Robins. fuppofes, hotter than red hotiron, it is by far too fhort to communicate a fenfible degree of heat to one of our large pieces of cannon. Befides, if the heat of the flame was fufficient to communicate fuch a degrec of beas to the gun, it munt undoubtedly be capable of burning up all combuntible bodies that come in its way, and of melting lead thot when fuch were ufed : but infead of this, we frequently fee the fineft paper difcharged from the mouth of a gun without being inflamed, after it has finfained the action of the fire through the whole Iength of the bore; and the fmalleft lead-hot is difeharged whithout being melted. The objeation. drawn from the heat of buliets taken up immediately after being difcharged fron fite-arms does not hold; for bullets difcharged from air-guns and even crols bows are likewife found hot, effecially when they happen to:

# G U N 

Qunpow. ftrike any hard body, and are mack fiattened. If. a der. muket ball be difcharged into water, or againft any yery foft body, it will not be fenfibly heated; but if it hits a plate of iron or any other body which it cannot penetrate, it will be broken in pieces by the blow, and the difperfed parts will be found in a flate little hort of actual fufion. Hence our author concludes, that bullets are not heated by the flame but by percuffion. Another objection is, that the vents of brafs guns are frequently enlarged to fuch a degree by repeatedly firing them, that the piece becomes ufelefs. But this proves only that brafs is eafily corroded by the flame of the gunpowder; which indeed is the cafe with iron alfo. We cannot fuppofe that in either cafe any real folution takes place : on the contrary, it is very evident that it does not ; for when the vents of fire arms.are lined with gold, they will remain without enlargement for any length of time, though it is well known that gold is much more eafily melted than iron. As the heat communicated to bullets, therefore is nor to be afcribed to the flame but to percuffion, fo the heat acquired by guns is to be attributed, in our author's opinion, to the motion and friction of the internal parts of the metal among themfelwes by the violent action of the flame upon the infide of the bore. To generate heat, the action of the powder muft be not only fufficient to ftrain the metal, and produce a motion in its parts, but this effect muft be extremely rapid; and the effect will be much augmented if the exertion of the force and the duration of its action are momentaneous; for in this cafe the fibres of the metal that are violently ftretched will return with their full force and velocity, and the fwift vibratory motion and attrition ahovementioned will be produced. Now the effort of any given charge of powder upon the gun is very nearly the fame whether it be fired with a bullet or without; but the velocity with which the generated elaftic fluid makes its efcape, is much greaker when the rowder is fired alone than when it is made to impel one or more bullets; the heat ought therefore to be mach greater in the former than in the latter cafe as has been found by experiment. "But to make this matter fill plainer, ( (ays our author), we will fuppofe any given quantity of powder to be confined in. a fpace that is juft capable of containing it, and that in this fituation it is fet on fire. Let us fuppofe this fpace to be the chamber of a piece of ordnance, and that a bullet or any other folid body is fo firmly fixed in the bore, immediately upon the charge that the whole effort of the powder fhall not be able to remove it as the powder goes on to be inflamed, and the elaftic fluid to be generated, the preffure upon the infide of the chamber will be increafed, till at length all the powder being burnt, the ftrain upon the metal will be at its greateft heighr, and in this fituation things will remain; the cohefion or elafticity of the particles of metal counterbalancing the preflare of the fluid.-Under thefe circumftances very little heat would be generated; for the continued effort of the elaftic fluid would approach to the nature of the preffire of a weight : and that concuflion, vibration, and friction among the particles of the metal, which in the collifion of elaftic bodies is the caufe of the heat produced, would fcarcely take effect. But innead of being firmly fixed in its place, let the bullet
now be moveable, but let it give way with great diff. cunpowculty and by flow degrees. In this cafe the elaftic fluid. will be generated as before, andwill exert its whole force upon the chamber of the piece; but as the bullet gives way to the preflure, and moves on in the bore, the fluid will expand itfelf and grow weaker, the particles of the metal will gradually return to their former firuations; bat the velocity with which the metal reftores itfelf being but fmall; the vibration that remains in the metal after the elanic fluid has made its efcape will be very languid, as will the heat be which is generated by it. But if inftead of giving way with fo much difficulty, the bullet is made lighter, fo as to afford but little refiftance to the elaftic fluid in making its efcape, or if it is fired without any bullet a tall; then, there being little or nothing to oppofe the paffage of the flame through the bore, it will expand itfelf with an amazing velocity, and its action upon the gun will ceafe almoft in an inftant; the ftrained metal will reftore itfelf with a very rapid motion, and a harp vibration will enfue, by which the piece will be much heated."

This reafoning of Mr Thomfon's, however, feems not to be very well founded. In the firft place, we are by no means certain that beat is produced by the motion or vibration of the particles of a folid body among each other. On the contrary, even in the hotteft bodies we cannot be made fenfible of vibration exifting among their particles, while certain founds will caufe the moft folid fubftances vibrate perceptibly, and yet without producing any heat.-From this as well as innumerable other experiments, it is probable, that heat confifts in the emiffion of a certain fubtile fluid from the heated body, which is every moment replaced from the atmofphere, or from fome other fource. Hence the more air that has accefs to any burning body, the hotter it will become, and the more will any other that is in its vicinity be heated. This is evident from the contrivance of Argand's lamp, which is neither more nor lefs than the admiffion of a larger quantity of air to the fame quantity of flame. The cafe is the fame with the firing of gunpowder, when a bullet is put into the piece, the accefs of the air is much more effectually prevented than when only a fimple wadding is made ufe of. In confequence of this, no fooner is the powder fired without a bullet, than the external air rulhes down the bore, mingles with the flame, and vehemently augments the heat, as well as the abfolute force of the explofion. It is true, that without the external air, the nitre in the gunpowder itfelf produces as much air as to inflame it very violently; but this does not prove that it coud not be inflamed fill more by the admiflion of more air. Befides, when the external air is thus admitted, the flame itfelf is agitated by its admiffion, and driven againft the fides of the piece with a force fuperior to what it has by the mere expanfive preffure; whence the heat muft alfo be confiderably augmented, in the fanme manner that the heat of any other body will be by the having flame blown againft it inftead of being blown away from it, or fuffered to burn quietly by its fide. Thus, without any recourfe to an anknown and conjectural vibration among the particles of a folid metal, we may account for the augmented head of a piece cbarged only with powder, and likewife in fome meafure for the prodi-

## GUN

Cunpow. gious force of ganpowder, aurum fulminans, and pulvis der. fulminans, when fired in the open air, compared with what they have when exploded in clofe veffels.The force of gunpowder is manifeftly augmented in clofe veffels, as has been already faid, by being rammed down or compreffed together: but this arifes from another caufe, namely, that a greater quantity of flame is compreffed into the fame face than when the powder is not rammed; and this compreffion of the flame is in proportion to the compreflion of the powder in the chamber of the piece. But in this cafe the flame is probably lefs powerful than in the former, though the quantity inclofed in a finall fpace may probably make up for the quality. Mr Thomfon's experiments on the increafed force of gunpowder by compreflion are as follow :-Having put a charge of al 8 grains of powder, inclofed in a cartridge of very fine paper, gently into the bore of the piece, the velocity of the bullets, at a mean of four experiments, was at the rate of 1225 feet in a fecond; but in a medium of three experiments, when the fame quantity of powder was rammed down by five or fix ftrokes of the ramrod, the velocity was 1329 feet in a fecond, "Now (fays he) the total force or preffure exerted by the charge upon the bullet, ts as the fquare of its velocity; and $\overline{329^{\circ}}$ is to $1225^{\circ}$ as $\mathrm{r}, 776$ is to 1 ; or nearly as 6 is to 5 : and in that proportion was the force of the given charge of powder increafed by being rammed.-When, inftead of ramming the powder, or preffing it gently together in the bore, it is put into a fpace larger than it is capable of filling, the force of the charge is theres by very fenfibly leffened, as Mr Robins and others have found by repeated trials. In my zoth experiment, the charge, confifting of no more than 165 grains of powder, was made to occupy 3.2 inches of the bore, inftead of 1.45 inches, which fpace it juft filled. When it was genrly puffed into its place without being rammed, the confequence was, that the velocity of the bullet, inftead of being 1100 feet or upwards in a fecond, was only at the rate of 914 feet, and the recoil was leffened in proportion.- Hence we may draw this practical inference, that the powder with which a piece of ordnance or a fire-arm is charged, ought always to be preffed together in the bore; and if it is rammed to a certain degree, the ve. locity of the bullet will be fill farther increafed. It is well known that the recoil of a muiket is greater when its charge is rammed than when it is not; and there cannot be a ftronger proof that ramming increafes the force of powder."

To recover damaged Gunpowder. The method of the powder-merchants is, to put part of the powder on a fail cloth, to which they add an equal weight of what is really good; and with a thovel mingle it well together, dry it in the fun, and barrel it up, keeping it in a dry and proper place. Others again, if it be very bad, reftore it by moiftening it with vinegar, water, urine, or brandy : then they beat it fine, fearce it, and to every pound of powder add an ounce, an munce and a half, or two ounces, according as it is decayed, of melted falt-perre. Afterwards, thefe ingredients are to be moiltened and mixed well, fo that nothing can be difcerned in the compofition, which may be known by cutting the mafs; and then they granulate it as aforefaid. In cafe the powder be in

Voe. VIII.

a manner quite fpoiled, the only way is to extract the Gun. faltpetre with water according to the ufual manner, Smithery. by boiling, filtrating, evaporating, and cryftallizing ; and then with frech fulphur and charcoal to make is up anew again.
In regard to the medical virtues of gunpowder, Boerhaave informs us, that the flame of it affords a very healthy fume in the height of the plague, becaufe the explofive acid vapour of nitre and fulphur corrects the air ; and that the fame vapour, if received in a fmall clofe pent-up place, kills infects.

It is enacted by 5 and in of Geo. I. and 5 Gee. II. c. 20. that gunpowder be carried to any place in a covered carriage ; the barrels being clofe-jointed ; or in cafes and bags of leather, \&c. And perfons keeping more than 200 pounds weight of gunpowder at one time, within the cities of London and Weftminfter, or the fuburbs, \&c. are liable to forfeitures if it be not removed ; and juftices of peace may iffue warrants to fearch for, teize, and remove the fame.

Gun-Shot Wounds. See Surgery.
GUN-Smith, a maker of fmall firc-arms, as mukets, fowling pieces, piftols, \&c.

GUN-Smithery, the bufinefs of a gun-fmith, or the art of making fire-arms of the finaller fort, as mukets, fowling-pieces, piftols, \&c.

The principal part of thefe inftruments is the barrel, which ought to have the following properties. t. Lightnefs, that it may incommode the perfon who carries it as little as pofible. 2. Sufficient ftrength and other properties requifite to prevent its burfting by a difcharge. 3. It ought to be conftructed in fuch a manner as not to recoil with violence. And, 4. It ought to be of fufficient length to carry the fhot to as gerat a diftance as the force of the powder employed is dapable of doing.

The manufacture of fire-arms is now carried to fach a degree of perfection by different European nations, that it may perhaps be junly doubted whether any farther improvement in the requifites juft mentioned can be made. For the materials, the fofteft iron that can be procured is to be made ufe of. The beft in Britain are formed of flubs as they are called, or old horfe-fhoe nails; which are procured by the gunfmiths from farriers, and from poor people who fubfint by picking them up on the great roads leading to London. Thefe are fold at about 10 s . per ewt. and 28 pounds are requifite to form a fingle muket barrel. The method of manufacturing them from this material is as follows: A hoop of about an inch broad, and fix or feven inches diameter, is placed in a perpendicular fituation, and the fubs, previoully well cleaned, piled up in it with their heads outermoft on each fide, till the hoop is quite filled and wedged tight with them. The whele then refembles a rough circular cake of iron; which being heated to a white hear, and then frongly hammered, coalefces into one folid lump. The hoop is now removed, and the heatiogs and hanmerings repeated till the iron is rendered very tough and ciofe in the grain; when it is drawn out into pieccs of about 24 inches in length, half an inch or ${ }^{\circ}$ more in breadth, and an half en inch ia thicknels.

Four of thefe pieces are employed for one barrel i but in the ordinary way a fingle bar of the beft foft iron is employed. The workmen begin with fiammering out this into the form of a flat ruler having its
length

## G U N

Gun- length and breadth proportioned to the dimenfions of Smithery. the intended barrel. By repeated heating and hammering this plate is turned ronnd a tempered iron rod called a mandril, the diameter of which is confiderably fmaller than the intended bore of the barrel. One of the edges of the plate being laid over the other about balf an inch, the whole is heated and welded by iwo or three inches at a time, hammering it brikly, but with moderate ftrokes, upon an anvil which has a number of femicircular furrows in it, adapted to barrels of different fizes. Every time the barrel is withdrawn from the fire, the workman frikes it gently againt the anvil once or twice in an horizontal direction. By this operation the particles of the metal are more perfeetly confolidated, and every appearance of a feam in the barrel is obliterated. The mandril being then again introduced into the cavity of the barrel, the latter is very ftrongly hammered upon it in one of the femicircular hollows of the anvil, by fmall portions at a time; the heatings and hammerings being repeated until the whole barrel has undergone the operation, and its parts rendered as perfectly continuous as if they fiad been formed out of a folid piece. To effect this completely, three welding heats are neceffary when the very beft iton is made ufe of, and a greater number for the coarfer kinds. The French norkmen imagine, that by giving the barrel, while in the fire, flight horizontal ftrokes with the hammer, fo as to communicate a vibratory motion to the iron, thofe particles are thrown off which are in a flate of fufion and cannot eafily be converred into malleable iron: but confidering the great number of operations already defcribed which the metal has undergone, we can fcarce fuppofe this to be of much confequence.

The next operation in forming the barrels is the boring of them, which is done in the following manner : Two beams of oak, each about fix inches in diameter, and fix or feven feet long, are placed horizon. tally and parallel to one another; having each of their extremities mortifed upon a flrong apright piece about three feet high, and firmly fixed. A fpace of three or four inches is left berween the horizonral pieces, in which a piece of wood is made to flide by having at either end a tenon let into a groove which runs on the infide of each beam throughout its whole length. Through this liding piece a ftrong pin or bolt of iron is driven or fcrewed in a perpendicular direction, having at its upper end a round hole large enough to admit the breech of the barrel, which is fecured in it by means of a piece of iron that ferves as a wedge, and a vertical forew paffing through the upper part of the hole. A chain is faftened to a flaple in one fide of the fiding piece which runs between the two horizontal beams; and paffing over a pully at one end of the machine, has a weight hooked on to it. All upright piece of timber is fixed above this pully and between the ends of the beams, having its upper end perforated by the axis of an iron crank furnified with a fquare focket; the other axis being fupported by the wall, or by a ftrong poft, and loaded with a heavy wheel of caft iron to give it force. The axes of this crank are in a line with the hole in the bolt already mentioned.-The borer being then fixed into the focker of the crank, has its other end, previoully well oiled, introduced into the barrel, whole breech part is made faft in the hole

## 242 J $G$ U N

of the bolt : the chain is then carried over the pully, Gunand the weight hooked on: the crank being then turn- Smithery. ed with the hand, the barrel advances as the borer cuts its way, till it has paffed through the whole length. The boring bit confifts of an iron rod fomewhat longer than the barrel, one end of which fits the focket of the crank; the other is adapted to a cylindrical piece of tempered feel about an inch and a half in lengti, having its furface cut after the manner of a perpetual fcrew, with five or fix threads; the obliquily of which is very fmall. The breadth of the furrows is the fame with that of the threads, and their depth fufficient to let the metal cut by the threads pafs through them eafily. Thus the bit gets a very ftrong hold of the metal; and the threads, being fharp at the edges, fcoop out and remove all the inequalities and roughnefs from the infide of the barrel, and render the cavity fmooth and equal throughont. A number of bits, each a little larger than the former, are atterwards fucceflively parfcd through the barrel in the fame way, until the bore has acquired the magnitude intended. By this operation the barrel is very much heated, elpecially the firft tinc the borer is paffed through it, by which means it is apt to warp. To frevent this in fome meafure, the barrel is covered with a cloth kept conftantly wetted, which not only preierves the barrelfrom an excefs of beat, but likewife prefervesthe temper of the bit from being defroyed. The borer itfelf muft alfo be withdrawn from time to time; both to clean it from the thavings of the metal and to oil it, or repair any damages is may have fuftained. Every tire a frefh bit has been paffed through the barrel, the latter mult be caretully examined, to fee if it has wayped; and likewife if there are any fots, by the workmen called blacks, on its infide. When warped, it mult be ftraightened on the anvil ; for which a few night frokes on the convex parts will be fufficient; and this istermed fetting up the barrel. When black fpots are perceived the correfponding patt on the outfide mult be marked, and driven in by gentle ftrokes with the hammer, when they will be completely removed by paling the borer another time through the piece.

The equality of the bore is of the utmoft conftquence to the perfection of a bartel; infumtech that the greateft poffible accuracy in every other refpect will not make amends for any deficiency in this refpect. The method ufed by gunfmilhs to afcertain this is by a cylindrical plug of tempered feel highly polifted, about an inch in length, and fittingthe boretxactly. This is fcrewed upon the end of an iron rod, and introduced into the cavity of the barrel, where it is moved backwards and forwards; atd the places where it. paffes with difficulty being marked, the boring bit is repeatedly paffeduntil it moves with equal caferhrough every part. Any perfon who winces to know the merit of his picce in this refpect, may do it with tolcrable accuracy by means of a plug of lead caft on a rod of iron; or even by a muket ball filed exactly to the bore, and pulhed through the barrel by a ramrod; taking care, however, not to ufe much force left the ball be flatiened, and its paffage thus rendered difficult.

The laft fep towards the perfection of the infide of the barrel is termed fine boring ; by which is meant the fmoothing it in fuch a manner as to remove all marks and inequalities left by the borer. The fine borer refembles

## G U N

Gun- fembles the other in its general conftraction: but insmithery. ftead of the piece of fteel cut in form of a fcrew which belongs to that, it is furnifhed with a fquare broach 10 or 12 inches long, highly polifined, and very fharp, by which means it cuts the metal very fmoothly. It is found to anfwer the purpofe beft when only two of its edges are allowed to work, the other two are covered with dips of oiled paper, one or more additional flips being put on each time that the inftrument is palfed throagh, the barrel. The fine-borer is frequently pafled through from the muzzle to the breech, and from the breech to the muzzle, until the whole infide prefents a perfectly equal and polifhed furface; the barrel being likewife examined and fer up, if requifite, after each time. It is abfolutely neceffary that this in. ftrument hould be perfectly true, and not in the leaft caft or warped in rhe rempering.

Befides the operations above defcribed, another, called polifhing, is ufially performed in gan-barrels, though it is doubtful whether this laft be attended with any good effect or nut. It is performed by a cylinder of lead, five or fix inches long, caft upon a rod of iron, and filed exactlj to the bore. The lead being then covered with very fine emery and oil, is wrought backwards and forwards through the whole lene th of the barrel until the infide has acquired the requifite degree of polih. The difadvantages of this operation are that it is fcarce poffible to perform it without prefling more upon one part than another, and thus producing fome degree of inequality on the infice, which is of the very worft confequence to fire-arms. The polifh thus given is likewife very perillable; fo that the fine-boring may juftly be confidered as the laft operation neceffary for the infide of a barrel; and is is then proper to give the external form and proporcions by means of a file. For this purpofe, four faces are firf formed upon it, then eight, then 16 ; and fo on dill it be quite round, excepting the part next the breech, called the reinforced part, which is always left of an octagonal form. It being abfolutely neceffary that the barrel fhould be equally thick on every fide, gunfmiths employ, for accomplihing this purpofe, a particular tool named a compafs. This confifts of an iron rod bent in fuch a manner as to form two parallel branches about an inch diftant from one another. One of thefe branches is introduced into the barrel, and kept clofely applied to the fide, by means of one or more fprings with which it is furuifhed: the other defcends parallel io this on rhe ootfide, and has feveral fcrews paffing through it with their points directed to the barrel. By forewing thefe until their points touch the furface of the barrel, and then turning the inftrament round within the bore, we perceive where the metal is too thick, and how much it malt be reduced, in order to render every part perfectly equal throught its circumference. It may be made long enough to reach the whole length of the barrel, though it will be more convenient to have it only half as much, and to introduce it firft at one end and then at the other. Inftead of rounding the barrel by means of a file and compafs, however, fome people do fo by turning it in a lathe; which is no doubt more cxpeditions, though neitherfo.certaiu nor exact. A fpindle as long as a gun barrel cannot without great difficulty, be prevented from fringing confiderably under the tool employed to reduce or fmooth it in turn-

## 243 G U N

ing ; whence it is found, that by this operation barrels Gur are more frcquently warped than by all the borings Smithe they undergo; and there is now this farther inconconvenience, that they cannot be fet up as formerly, without danger of deftroying them entirely.

The barrels being thus bored and formed externally, it is cuftomary for the gunimiths in France to. folder on the loops and aim before they breech the barrel. The Englid, however, do not reftrict themfelves in th is manner: for as foft folder is fufficient for faftening on thefe, they never ufe any other; while the French, who ufe bard fotder, mult of confiquence employ a great heat. Thus the infide is roughened iometimes fo confiderably, that it is neceffary to repeat tl: fine boring: which could not be done withont injuring the threads of the ferew formed for the breech, if the barrel were prepared for the latter wichout folecring on the former.
The firft teol employed in forming the breech-fcrew is a plug of tempered fteel, fomewhat conical, with the threads of a male frrew upon its furface, and by the workmen termed a forew tap. This being introduced into the barrel, and worked from lefto right and back agaill, until it has marked out the four firft threads of the ferew, another lefs conical tap is introduced; and when this has carried the imprefion of the forew as far as it is intended to go, a third one, nearly cylindrical, is made ufe of, fcarcely differing from the plug of the breech intended to fill the forew thus formed in the barrel. The plug itfelf has its ferew formed by means of a ferew-plate of tempered-iteel, with feveral female fcrews, correfponding with the taps employed for forming that in the barrel. Seven or eight threads are a fufficient length for a plug; they ought to be ueat and Charp, fo as completely to fill the curns made in the barrel by the tap. The breech-plug is then to be caiehardened, or to bave its furface converted into fteel, by covering it with thavings of horn, or the parings of the hoofs of horfes, and keeping it for fome time red hot; afier which it is plunged in cold water.

The only thing now requilite for completing the barrels is to give them a proper colour; as a preparation for which their outfide is firf to be neatly polithed with oil andenery. This being done, it was formerly the cuftom to give fuch a degree of heat as would make them blue throughout; but as this cannot be effected without a partial calcination of the furface, which of confequence affects the infide alfo, the blue colour has been for fome time dififed, and a brown one fubfituted in its place. To give this colour, the pieces are firft rubbed over with aquafortis or firit of falt dituted with water; after which they are laid by till a complete coat of ruft is formed upon them : a litile oil is then applied; and the furface being rubbed dry, is polinied by means of a hard brufl and bees-wax.

Thus the common mufket-barrels for the purpofes efpecially of fpormanihip are made; but there are fome other methods of manufacture, by which the barrels are made to differ in fome refpeets from thofe juft defcribed, and are thought to be confide:aliy inprovei. One kind of thefe are called twiffed harrels; and by the Enclifh workmen are formed out of the plates made of fitubs formerly defcribed. Four of thefe, of the fize already mentioned, are requifite to make one barrel. One of then heated red hot for five or fix inches is

## G U N [ 244 ] G U N

GunSmithery.
turned like a cork-fcrew by means of the hammer and anvil; the remaining parts being treated fucceffively in the fame manner until the whole is turned into a fpiral, forming a tube the diameter of which correfponds with the bore of the intended barrel. Four are generally fufficient to form a barrel of the ordinary length, i.e. from 32 to $3^{8}$ inches; and the two which form the breech or ftrongeft part, called the reinforced part, are confiderably thicker than thofe which torm the mazzle or fore part of the barrel. One of thefe tubes is then welded to a part of an old barrel to ferve as an handle; after which the turns of the firal are united by heating the tube two or three inches at a time to a bright white heat, and friking the end of it feveral times againft the anvil in a horizontal direction with confiderable ftrength, which is called jurapeing the barrel; and the beats given for this purpofe are called jumping teats. The next ftep is to introduce a mandril into the cavity, and to hammer the heated portion lightly in order to flatten the ridges or burrs raifed by the jumping at the place where the fpirals are joined. As foon as one piece is jumped througbour its whole length, another is welded to it, and rreated in the fame manner, until the four pieces are united, when the part of the old barrel is cut off, as being no longer of any ufe. The welding is repeated three times at leaft, and is performed exactly in the fame manner as directed for plain barrels; and the piece may afterwards befinifhed according to the directions already given.

The operation for the French twifted barrels is very different from that juft mentioned, and much moreexceprionable. It confifts in heating the barrel by a few inches at a time to a ftrong red heat ; one end is then fcrewed into a vice, and a fquare piece of iron with an handle like an augre is introduced into the other. By means of thefe the fibres of the heated portion are twifted into a fpiral direction, which is fuppofed to refift the effort of the inflamed powder betrer than the other. To render this operation complete, however, it muft be obferved, that when once the feveral portions of the barrel have been twifted, the fubfequent heats ought not to be very great, or the grain of the metal will regain its fomer ftate, and the barrel be no better for the twifting than before. To twift a barrel in this manner, alfo, it will be neceffary to forge it at leaft half a foor longer than it is intended to be, that a fufficient length may be kept cold at each end to give a fufficient purchafe to the vice and twifling inftrument ; and thefe portions muft afterwards be cut off before the barrel is bored, or two pieces of an old barrel may be welded to the muzzle and breech of that which is to be twifted, and cut off when the operation is over. There pieces may alfo be made ftronger than ufual to refift the force of the vice and iwifting inftrument ; and in order to give the latter a firmer hold, the cavity of the muzzle may be made of a fquare form. The Englif workmen are unanimoully of opinion that this method of twifting is really injurious to the barrel, by ftraining the fibres of the metal. At any rate, from the injudicious methods followed by the French artifts, the greatef part of their barrels, faid to be twifted, are not to in yeality ; there being at leaft fix or feven inches at the muzzle, and feven or eight at the breech, which axe not affeeted by the operation.

The Freach ribbon barre/s have a great refemblance
to the Englifh twifted ones; but the procefs for making them is much more operofe, though it feems not Smithery. to poffefs any real advantage over that ufed by the Englifh artifts. A plate of iron, about the twelfth part of an inch in thicknefs, is turned round a mandril, and welded its whole length in the fame manner as a plain barrel. Upon this nlight barrel, which is called the lining, a plate of iron about an inch in breadth, and bevelled oft at the edges, is by means of fucceffive heats rolled in a fpiral direction; after which it is cermed the ribbon, and muft have a thicknefs correfponding with that part of the barrel which it is to form. As it would, however, be difficult to form a ribbon of fufficient length for the whole barrel, it is made in feveral pieces; and when one piece is rolled on, another is welded to its end, and the operation continued until the lining be entirely covered. The edges are fo much bevelled, that the one folds overthe other about a quarter of an inch. After the ribbon is all rolled on, the barrel muft be heated by two or three inches at a time, and the turns of the fpiral united to eachother and to the lining by being welded in the fame manner as the twifted barrel ; though, from what has been faid of the conftruction of thefe barrels, it is plain that the operation of jumping cannot be admitted in them. The barrel is afterwards bored in fuch a manner that almof the whole of the lining is cut out, and fcarce any thing left but the ribbon with which the lining was covered.

The fuperiority of twifted and ribbon barrels over the plain kind gave occafion to a third fort named wired barrels. Thefe were invented by an ingenious workman at Paris named Barrois; whofe method was as follows: Upon a thin barrel, filed and drefled as ufual, he rolled, as clofe as poffible, and in a fpiral direation, a tempered iron wire about the thicknefs of a crow-quil, the firt layer covering only the reinforced part. The turns of the wire were foldered to each other and to the barrel with a compofition which he kept a fecrer. The wired part was then filed fmooth and bright, but not fo much as to weaken it; a fecond layer of wire was applied over the firft, extending twothirds of the length of the barrel ; and this being fmoothed and brightened like the firf, a third layer was applied, which covered the two former and reached quite to the muzzle.

The barrels made after this manner are fuppofed to le much fuperior to others, though the fuppofition feems not to be well founded. It is certain that wire is not preferable to other iron as a material for gunbarrels; and the folder ufed by M. Barrois in a quantity nearly equal to the wire itfelf, muft be accounted a defect as far as it was ufed; for no metal has yeo been found equal to iron for the purpofes of gunfmiths: fo that by the ufe of fo much of this folder in the compofition of the barrel, it mult be undoubtedly weaker than if it had been all made of iron. We are not to fuppofe the wire abfolutely free from flaws; and even thdugh it were, there will always be fmat cavities between its turns, which the folder cannot fill completely. Befides, as the operation of wiring was performed by M. Barrois upon a barrel that had been previoufly bored and dreffed within, the repeated heats. to which it was afterwards fubjected in foldering, if they did not caufe it warp, at leaft rendered it fo

## G U N [ 245 ] G U N

Gun- rough that it was neceffary to fine-bore it afterwards. Smithery. Theonly advantage therefore which thefe barrels were found to poffers was their beautiful appearance; which was greatly overbalanced by the circumftances juft mentioned, as well as by the extravagant prices at which they were fold; a fingle barrel being fold at 5 l. and a double one at twice that fum ; whence the fale of them never anfwered the expectation of the inventor, and after his death nobody thought of making them.

The Spanif barrels have long been held in great eftimation, both on account of their being formed of better iron than thofe of other countries, and likewife from an opinion of their being more perfectly forged and bored. Thofe made at Madrid are the beft, and cven of thefe fuch as have been made by former gunfmiths are in the greatef eftimation. The moft celebrated Spanifh gunfmiths were Nicholas Biz, who lived in the beginning of the prefent century, and died in 1724 ; and the barrels fabricated by him in the former part of his life are held in the greateft eftimation. Thofe of his cotemporaries, Juan Belan and Juan Fernandez, are no lefs valued; all of their barrels felling in France at 1000 livres, or 451.15 s . Aterling. The fucceffors of thefe great artifts were Diego Efquibal, Alonzo Martinez, Agoftin Ortiz, Matthias Vaera, Luis Santos, Juan Santos, Francifco Garcia, Francifoo Targarone, Jofeph Cano, and N. Zelaya. The moft celebrated now in life are Francifico Loper, Salvador Cenarro, Miguel Zeguarra, Ifidoro Soler, and Juan de Soto. The three firft are gunfmiths to the king; and the barrels made by all of them fell for 131. fterling. Almoft all the Madrid barrels are compofed of the old fhoes of horfes and mules, which are collected for the purpofe. They are manufactured firlt by welding longitudinally, and then being joined together in four or five pieces like the Englifh barrels made from ftubs, as already mentioned. In this, and indeed all other operations for making gun barrels, an immenfe wafte of the iron takes place; but that of the Spanifh iron is by far the greateft, a mafs of 40 or 45 pounds being required to make one barrel, which when rough from the forge weighs only fix or feven pounds; fo that from 30 to 38 pounds are loft in the hammerings. It may perhaps, however, be doubted, whether the iron be really purified by this walte; for it is certain, that by long continued working in the fire it may be rendered totally ufelefs and deftroyed; neither can we be affured that the other advantages pretended to refult from their method of manufacture are of any confequence. The Spanifh artifts likewife value themfelves on giving the infide of their barrels a very high polifh; but the advantage of this, as has already been obferved, is extremely dubious. The only thing requifite in a gun-barrel is that it do not lead; that is, that the mark of the bullet be not perceived on the infide after it has been difcharged, by fome of the lead rubbed off as it paffes through. In the opinion of very good judges, therefore, it is better to take a barrel immediately after it has undergone the operation of fineboring than to give it any higher polifh ; and in fupport of this opinion, M. de Marolles, an author of great reputation, informs us, that he has feen a barrel rough. from the borer throw a charge of fhat deeper into a guire of paper than one which was highly poliflied.
within, though the length, bore, and charge weye the fame in both.

As the Spanifh iron is univerfally allowed to be excellent, it has not been unreafonably fuppofed that the fuperiority of the barrels manufactured in that kingdom is owing more to the goodnefs of the materials than to the kill of the workmen. It muft be obferved, however, that inftead of making the plates overlap a little in the place where they join, they give one of them a complete turn; fo that every Spanifh barrel may be faid to be double throughont its whole length. The different portions of the iron are alfo forged in fuch 2 manner, that the grain of the iron is difpofed in a fpiral manner; whence it has the fame effect with a ribbon or twifted barrel. The outfide is finifhed by turning them in a lathe; whence probably they are always lefs elegantly wroughr than the French and Englifh pieces. The great value put upon them is alfo thought to be more owing to fancy than to any real good qualities they pofefs. Formerly they were made from three to three feet and a half long; their bore being fuch as to admit a bullet from 22 to 24 in the pound; and their weight from three to three pounds and an half. The reinforced part extends two-fifths of the length; and at 10 or 12 inches from the brecch is placed a fight, fuch as is ufually pur upon rifle-barrels or thole intended only for ball. According to Efpinas, arquebufs-bearer to Philip IV, the weight of a Spanin barrel ought to be four pounds and an half when their length is 42 inches; but both weight and length are now much reduced, they feldom exceeding the dimenfion already mentioned. Next to the barrels made at Madrid, the molt efteemed are thofe of Biftindui and St Olabe at Placentia in Bifcay ; and of Jeun and Clement Padwefteva, Eudal Pous, and Martin Marechal, at Barcelona; the ufual price. of them being about 3l. ios. fterling.
Having now defcribed the method of forging barrels, we hall next proceed to give an account of thofe imperfections to which they are fometimes liable, and which render them apt to burft or recoil with violence. The principal of thefe are the ctizk, crack, and flaw. The firft is a fmall rent in the direction of the length of the barrel; the fecond acrofs it; and the third is a kind of feale or fmall plate adhering to the barrel by a narrow bafe from which it fpreads ont like the head of a nail from its hank, and when feparated leaves a pit or hollow in the metal. The chink or flaw are of much worfe confequence than the crack in fire-arms, the force of the powder being-exerted nore upon the circumference than the length of the barrel. The flaw is much more frequent than the chink, the latter fcarce ever occurring but in plain barrels formed out of: a tingle plate of iron, and then only when the metal is deficient in quality. When flaws happen on the out frde, they are of no great confequence; but in the infide they are apt to lodge moitture and foulnefs which corrode the iron, and thas the cavity enlarges continually till the piece barfs. This accident, however, may arife from many other caufes befides the defect of the barrel itfelf. The beft pieces will burft when the ball is not fufficiently rammed home, fo that a face is left between ir and the powder. A very fmall windage or paffage for the inflamed powder between the fides of the barrel and ball will be fufficient to prevente

Gun- the accident ; but if the ball has been forcibly driven $\underbrace{\text { smithery }}$ down with an iron ramrod, fo as to flll ap the cavity of the barrel very exactly, the piece will almoft certainly burft, if only a very fmall fpace be left between it and the powder; and the greater the fpace is, the more certainly does the event take place. Of this Mr Robins gives a remarkable inltance, accomaing at the lame time for the phenomenon. "A moderate charge of powder (fays lie), when it has expanded itfelf through the vacant face and reaches the ball, will, by the velocity each part has acquired, accunulate itfelf behind the ball, and will thereby be condenfed prodigisolly : whence, if the barrel be not of an extraordinary ftrength in that part, it muft infalibly buift. The truth of this I have experienced in a very good Tower mufket forged of very tough iron: for charging it with 12 pennyweight of powder, and placing the ball loofely 16 inches from the breech; on the firing of it the part of the barrel juft behind the bullet was fwelled out to double its diameter like a blown bladder, and two large pieces of two inches in lengit were burlt out of it." A piece will frequently burit from having its month ftopped up with earth or fnow; which accident fometimes happens to fportfmen in leaping a ditch in which they have affifted themTelves with their fowling-piece, puting the mouth of it to the ground; and when this does not happen, it is only to be accounted for from the floppage being extremely light. For the fame reafon a mufket will certainly burft if it be fired with the muzzle immerfed -aly a very little way in water. It will alfo burft from an overcharge; but when fuch an accident happens in other circumftances, it is moft probably to be arrributed to a defect in the workmanihip, or in the iron itfelf. Thefe defects are principally an imperfection in the welding, a deep flaw having taken place, or an inequality in the bore; which laft is the moft common of any, efpecially in the low-priced barrels. The reaton of a barrel's burfting from an inequality in the bore is, that the elaftic fluid, fet 'onfe by the inflammation of the powder, and endeaveuring to expand itfelf in every direction, being repelled by the ftronger parts, acts with additional force againtt the weaker ones, and frequently burfts through them, which it would not have done had the fides been equal:y thick and ftrong throughout. With regard ro defects arifing from the bad quality of the iron, it is impoflible to fay any thing certain. As the choice of the materials depends entirely on the gunfmith, the only way to be affured of having a barrel made of proper metal is to purchafe it from an artift of known reputation, and to give a confiderable price for the piece.

The recoil of a piece becomes an object of importance only when it is very great; for every piece recoils in fome degree when it is difclarged, the mot frequent caufe of an excelfive recoil is an inequality in the bore of the barrel; and by this it will be occafoned even when the inequality is too fmall to be perceived by the cye. The explanation of this upon mechanicul prinicples indeed is not very cafy; for as it is there an invariable law, that action and reaction are equal to one another, we fhould be apt to fuppofe that every time a piece is difcharged it fhould recoil with the whole differene between the velocity of the bullet and shat of the inflamed powder. But were this the
cafe, no man could fire a muket without being de. ftroyed; for the bullet flies out only with a velocity of 1700 feet in a fecond, or not mach more, while that of the powder, as calculated by Mr Robins, is not lefs than 7000 feet in the fame fpace. But was the recoil to be made with the difference of there velocities, or with one half of it, it is plain that no man could bear it. The fame thing therefore mult take place in the recoil of a muket which Dr Prieftley obferved in his experiments on the explofion of inflammable and dephlogifticated air, viz. that the force is exerted much more upon the part fartheft from that where the inflammation begins than upon that next to it. At any rate, however, the ftrength of the recoil will always be tound proportionable to the weight of the piece; that is, the lighter the piece is, the greater the recoil, and vice verfa. The recoil may be increafed by any thing which retards the paffage of the thot ; whence it is allo augmented by the foulnefs of the barrel by repeated firing. M. de Marolles informs us alfo, that a piece will recoil, if, from the breech-plug being made too thort, fome turns of the forew remain empiy; as in thefe a part of the powder is lodged which forms an obftacle to the explofion; though in what manner this explofion takes place is not very apparent, as, though the powder lodged there might contribute litule or nothing to the force of the explofion, it can fatce b hown to ftand in the way of it. The fame author likewfe informs us that a bariel monnted upon a very fraght fock will recoil more than one that is confiderably bent. Sometimes alfo a fowling-piece will recoil from the fportiman applying it improperly to his fhoulder ; though this laf circumftance feems likewife inexplicable. It is molt probable therefore that the fuppofed greater recoil taken notice of in this cafe, arifes only from the ufual recoil being more fenfibly felt in one pofition than another.

The canfe to which too great a recoil in mufkets has been ufually attributed, is the placing of the touchhole at fome diftance from the breech-plug ; fo that the powder is fired about the middle, or towards its fore-part, rather than at its bafe. To avoid this, fome artifts form a groove or channel in the breech-plug, as deep as the fecond or third turn of the forew; the touch-hole opening into this channel, and thus firing the powder at its very loweft part. It appears, however, from a number of experiments made upon this fubject by M. le Clerc gunfanith to the king of France, that it made very litile difference with regard to the recoil, whether the touch-hole was clole to the breech $o$ an inch diftans from it. The only circumftance to be attended to with refpect to its fituation therefore is, that it be not quite clofe to the brecch-plug; as in fuch a cafe it is found to be more apt to be choaked up than when placed about a quarter of an inch from it.

The only other circumftance now to be determined with regard to muket-barrels is their proper length. Formerly it was fuppoled trat the longer they were made, the greater would be the diftance to which they carried the fhot, and that witheut any limitation. This opinion continued to prevail till about half a century ago, when it was firft propofed as a doubt whether long barrels carried farther than fhort ones. With regard to cannon, indeed, is had long before shis time

GunSmithery.

## $G U N$

[

Gun. Smithery.
been known that they might be made too long; and Balthazar Killar, a celebrated cannon-founder in the reign of Louis XIV. was able to account for it. When afked by Monf. Suriry de St Remy, why the culverin of Nancy, which is 22 feet long, did not carry a ball equally far with a fhorter piece? he replied, that ' the powder, when inflamed, ought to quit the cavity of the piece in a certain time, in order to exert its whole force upon the bullet: by a longer ftay, part of the force is loft; and the fanie cause may produce an intequality in the fhots, by giving a variation to the buller, fo as to deftroy its rectilineal courfe, and throw it to one fide or other of the mark." Mr Robins, who on this as well as every other queftion in gunnery has almoft exhaufted the fubject, "informs us, that "if a mulket-barrel, of the common length and bore be fired with a leaden bullet and half its weight of powder, and if the fame barril be afterwards flortened oie half and fired with the fame charge, the velocity of the bullet in this fhortened barrel will be about one-fixth lefs than what it was when the barrel- was entire; and if inftead of thortening the barrel, it be increated to twice is ufaal length, when it will be near eight feet long, the velocity of the bullet will not hereby be angmented more than one-eight part. And the greater the length of the barrel is in proportion to the diameter of the bullet, and the fmaller the quantity of powder, the more inconiderable will thefe alterations of velocity be." From thefe confiderations it appears, that the advantages gained by long barrels are by no means equivalent to the difadvantages arifing from the weight and incumbrance of ufing them; and from a multitude of experiments it is now apparent, that every one may choofe what length he pleafes, without any fenfible derriment to the range of his piece. The moft approved lengths are from 32 to 38 inches.

An opinion has generally prevailed among fportfmen, that by fone unknown manouvre the gunfmith is able to make a piece, loaded with fmall for, throw the contents fo clofe together that evea at the diftance of 40 or 50 paces the whole will be confined within the breadth of a hat. From fuch experimenes as have been made in this fubject, however, it appears, that the clofenefs or widenefs with which a piece throws its fhot is liable to innumerable variations from caufes which no kill in the gunfimith can poffibly reach. So variable are thefe caufes, that there is no poffibility of making the fame piece throw its hot equally clofe twice fucceffively. In general, however, the clofer the wadding is, the better dilpofed the thot feems to be to fall within a fmall compafs. "The clofenefs of the fhot therefore would feem to depend in a great meafure on preventing the flame of the powder from infinuating itfelf among its particles; whence the following method is faid to be pratifed with fuccefs by thofe who fhoot for a wager at a mark with fmall fhot; viz. to put in the fhot by fmall quantities at a time, ramming down a little tow or thin paper over each; fo as to fill the interfices of the grains, and thus prevent the flame from getting in amongft the grains and fcattering them. In firing with fmall flot, a curious circumfance fometimes occurs, viz. that the grains, inftead of being equally, dift ributed over the fpace they ftrike, are thrown in clufters of $10,12,15$, or more; whilft feveral confiderable fpaces are left without a
grain in them. Sometimes one-third or one half of Gun. the charge will be colleeted into a clufter of this kind; Smithery. nay, fometimes, though moch more rarely, the whole charge will be collected into one mafs, fo as to pierce a board rear an inch thick at the diftance of 40 or 45 paces. Small barrels are faid to be more liable to this cluftering than large ones; and M. de Marolles informs us, that this is efpecially the cafe when the barrels are new, and likewife when they are frefhwafhed: though he acknowledges that it did not always happen with the barrels he employed even after they were walhed. It is probable, thercfore, that the clofenefs of the fhor depends on fome circumflance relative to the wadding rather than to the mechanifm of the barrel.

Some pieces are compofed of two or more barrels joined together; in which cafe the thicknefs of each of the barrels is tomewhat lefs than in fingle-barrelled pieces. After being properly dreffed each of them is filed flat on the fide where they are to join each other, fo that they may fit more clofely together. The correfpondins notches are then made at the inuzzle and breech of each barrel; and into thefe are fitted two Imall pieces of iron to hold them more ftrongly together. Being then anited by tinning the contiguons parts, a triangular piece of iron called the rib is faftened on in like manicr, running the whole Jength on the upper fide; which ferves to hold them more frongly together. After this they are to be polifhed and coloured in the manner defcribed for fingle barrels. Grear care fhould be taken that the barrels joined in this manner floould be quite equal in ftrength to one another, and that both fhould be quite upright, or of an equal thicknefs throughout. If any inequality takes place in the ftrength of the barrels, the weaker will be warped by the action of the ftronger, and the warping from this caufe has fometimes been fo confiderable as to render on, of the barrels ufedefs. To bring every part of the circumterence of each barrel to an equal Atrength as mearly as poffibie, fo that no part may be frained by the explolion, that fide where they touch each oblire muft be fo reduced, that the partition between the two calibers may be no thicker than either barrel was at the fame place before it was fled to join in this manner. formerly the dorble-barrelled pieces were made with one barrel lying over the other, each barrel baving a feparate pan, hammer, and ham-mer-ipring, but only one cock for both. The barrels were thencfore made to turn round at the place where the breeches joined with the foock, fo that as foon as one was fred off, the other conld be brought into its place by preflig a fpring moved by, the guard with the righi hand, while with the left the barrels were turned upon their common axis; and as foon as the charged-barrel was thus brought into its proper fituation, the fring defeended into a notch and kept is firm. But this method was found to be too complicated and embarraffed, though upon the fame plan three and fohr barrels were fometimes mounted upon one flock; but thefe pieces were intolerably heavy, and have no real fuperiority over the donble-barrelled pieces which do not turn round, and which of confequence are now only made ufe of.

In forging barrels of all kinds. it is of confiderable importance to have them made at firft as near as poffi-

## GUN

Gunter.
ble to the weight intended when they are finifhed, fo that very little be taken a way by the boring and filing : for as the outer furface, by having undergone the action of the hammer more immediately than any other part, is rendered the moft compact and pure, we fhould be careful to remove as little of it as poffible; and the fame holds, though in a lefs degree, with the infide, which is to be cat with the borer. Piftol-barrels are forged in one piece, two at a time, juined by their muzzles, and are bored before they are cut afunder: by which means there is not only a faving of time and labour, bat a greater certainty of the bore being the fame in both.

GUNTER (Edmund), an excellent Englifh mathematiciatn and aftronomer, was born in Herffordhire in $T 58 \mathrm{r}$, and ftudied at Weftminiter-fchool ; from whence he removed to Oxford, where he took the degree of mafter of arts in 1606, and afterwards enteredinto holy orders. In 1615 he took the degree of bachelor of divinity : bat being peculiarly eminent for his knowledge in the mathematics, he had two years before been chofen profeflor of aftronomy in Grefham-college, London; where he diftinguillied himfelf by his lectures and writings. He invented a fmall portable quadrant ; and alfo the famous line of proportions, which, after the inventor, is called Gunter's foale. He likewife publihed Canon Triangulorum; and a work intitled Of the Sector, Crols-ftaff, and other inftruments. This laft was publihed, with an Englifh trandlation of his Canton Triangulorum, in 4to, by Samuel Fofter profer. for of Grefham-college. Mr Gunter died at that colledge in 1626.
Gunter's Line, a logarithmic line, ufually graduated upon feales, fectors, \&c.
It is alfo called the line of lines and line of number: being only the logarithms graduated upon a ruler, which therefore ferves to folve problems inftrumentally in the fame, manner as logarithms do arithmetically. It is ufually divided into 100 parts, every tenth whereof is numbered, begianing with $t$ and ending with 10 : fo that if the firf great divilion, marked 1 , fand for one tenth of any integer, the next divifion marked 2, will fand for two tenths, 3, three-tenths, and fo on; and the intermediate divifions will in like manner reprefent toodth-parts of the fame integer. If each of the great divifions reprefent 10 integers, thea will the leffer divifions fand for integers; and if the greater divifions be fuppofed each 100 , the fubdivifions will be each 10.

Ufe of Gunter's Line. I. To find the product of two numbers. From 1 extend the compages to the multiplier; and the fame extent, applied the fame way from the multiplicand, will reach to the product. Thus if the product of 4 and 8 be required, extend the compaffes from 1 to 4, and that extent laid from 8 the fame way will reach to 32. their prodact. 2. To diyide one number by another. The extent from the divifor to unity will reach from the dividend to the quotient : thus, to divide 36 by 4 , extend the compaffes from 4 to 1 , and the fame extent will reach from 36 to 9 , the quotient fought. 3. To three given numbers to find a fourth proportional. Suppofe the numbers 6, 8, 9 : extend the compaffes from 6 to 8 ; and this extent, laid from 9 the fame way, will reach to 12 , the fourth proportional required. 4. To find a mean pre.
portional between the two given nustbers. Suppofe 8 and 32 ; extend the compaffes from 8 , in the left-hand part of the line, to 32 in the right; then biffecting this diftance, its half will reach from 8 forward, or from 32 backward, to 16 , the mean proportional fought. 5.To extratt the fquare root of any number. Suppofe 25: biffect the diftance between i on the feale and the point reprefenting 25: then the half of this difance, fet off from 1 , will give the point reprefenting the root 5 . In the fame manner the cube root, or that of any higher power, may be found by dividing the diftance on the line between 1 and the given number into as many equal parts as the index of the power expreffes; then one of thofe parts, fet from 1 , will find the poins reprefenting, the root required.

Gunter's Quadrant, one made of wood, brafs, \&xc. containing a kind of ftereographic projection of the fphere, on the plane of the equinoatial; the eye being fuppofed placed in one of the poles.

Gunter's Quadrant, called by navigators fimply the gunter, is a large plain fcale, generally two feet long, and about an inch and a half broad, with artificial lines delineated on it, of great ufe in folving queftions in trigonemetry, navigation, \&c.

GUNWALE, or GUNNEL, is the uppermoft wale of a hip, or that piece of timber which reaches on either fide from the quarrer-deck to the fore caftle, being the uppermoft bend which finifhes the upper works of the hull, in that part in which are pat the ftanchions which fupport the wafte-trees.

GURK, an epifcopal town of Carinthia in Germany, feated on the river Gurk, in E. Long. 14. 15. N. Lat. 47. 10.

GURNARD, in ichthyology. See Trigla.
GUST, a fudden and violent fquall of wind, burfting from the hills upon the fea to as to endanger the fhipping near the chore. Thefe are peculiar to fome coafts, as thofe of South Barbary and Guinea.

GUSTAVIA, in botapy; a genus of the polyaadria order, belonging to the monadelphia clafs of plants. There is no calyx : the petals very numerous; the berry multilocular; the feeds appendaged.

GUSTAVUS I. king of Sweden, fon of Eric de Vafa duke of Gripholm. Chriftian II. king of Denmark having made himfelf mafter of the kingdom of Sweden, confined Guftavis at Copenhagen ; but he making his efcape wandered a long time in the forefts, till the cruelties of the tyrant having occafioned a revolution, he was firlt declared governor of Sweden, and in 1513 elected king. This prince introduced Lutheranifm into his dominions, which in a littie time fpread itfelf all over the kingdom. He died in 1560 ; having made kis kingdom hereditary, which was before elective. See Sweden.

Gustavos Adolphus, furnamed the Great, king of Sweden, was born at Sockholm in 1594, and fucceeded his father Charles in 16ri. He efpoufed the caufe of the Proteftants in Germany, who were oppreffed and almoft entirely ruined by the emperor Ferdinand. Hie was a great warrior, and gained many vietories, of which an account is given under the article Sweden. He was at laft killed in the battle of Lutzen, where his tronps got the victory, and defeated two of the emperor's armies.

GUTHALUS, or Guttalus (ane. geog.), is thought
$\qquad$
Gunter Guthalus.

though ta be the Viadrus of Ptolemy. Now the Oder; which rifing in Moravia, runs through Silefia, Brandenbarg, and Pomerania, into the Baltic.

GUTTA, a Latin term for what in Englilh we call drop.

Gutra Rofacea, in medicine, denotes a red or pimpled face ; a diftemper which, though not always owing its original to hard drinking, is neverthelefs mott incident to tipplers of ftrong beer, wines, fpirits, \&c.

Gurta Serena, a difeafe in which the patient, without any apparent fant in the eye, is deprived of fight. See (Index fabjoined to) Medicine.

Gutta, in architecture, are ornaments in the form of little cones ufed in the Doric corniche, or on the architrave underueath the triglyphs, reprefenting a fort or drops of bells.

GUTTURAL, a term applied to letters or founds proneunce 1 or formed as it were in the throar.

GUTTY, in heraldry, a termuled when any thing is charged or fprinkled with drops. In blazoning, the colour of the drops is to be named ; as gutty of fable, of gules, \&c.

GUY (Thomas), an eminent bookfeller, founde: of the hofpital for fick and lame in Southwerk bearing his name, was the fon of Thomas Guy lighterman and coal-dealer in Horlley-down, Southwark. He was put apprentice, in 1660, to a bookfeller in the porch of Mercer's-chapel ; and fet uptrade with a ftock of about 2001 . in the houfe that forms the angle between Cornhill and Lombard-ifreet. The Englifh Bibles being at that time very badly printed, Mr Guy engaged with others in a fcheme for printing them in Holland and importing them'; but this being put a flop to, he contracted with the univerfity of Oxford for their privilege of printing them, and carried on a great bible-trade for many years to a confiderable advantage. Thus he began to accumulate money, and his gains refted in his hands; for being a fingle man, and very penurious, his expences could not be great when it was his cuftom to dine on his fhop-counter which no other table covering than an old uewfpaper ; he was moreover as litule ferupulous about the ftyle of his apparel. The bulk of his fortune, however, was acquired by purchafing feamens tickers during quecu Anne's wars, and by SourhSea flock in the memorable year i 720 . To how what great events foring from trival caufes, it may be obferved, that the public owe the dedication of the greateft part of his immenfe fortune to charitable purpofes, to the indifcreet officionfnefs of his maid-fervant in interfering with the mending of the pavement before the door. Guy had agreed oo marry her ; and, preparatory to his nuptials, had ordered the pavement before his door, which was in a neglected ftate, to be mended, as far as io a particular fone which he pointed out. The maid, while her mafter was ont, innocently looking on the paviers at work, faw a broken place that they had not repaired, and mentioned it to them : but they told her that Mr Guy had directed them not to go fo far. Well, fays he, do you mend it : tell him 1 bade you, and 1 know he will not be angry. It happened, however, that the poor girl prefumed too much on her influence over her careful lover, with whom a few exrraordinary fhillings expence turned the fale totally againft her : the men obeyed; Guy was enraged to find his orders exceeden, his matrimo.

Vol. VIII.
nial fcheme was renounced, and fo he built hofpitals in his old age. In the year 1707 he built and furnifled three wards on the north fide of the outer court of St Thomas's Hofpital in Southwark, and gave 1001. to it annually for eleven years preceding the crection of his own hofpital: and, fonc time before his death, erected the ftately iron-gate, with the large houfes on each fide, at the expence of about 3000 l . He was 76 years of age when he formed the delign of building the hofpital contiguous to that of St Thomas's, which bears his name, and liyed to fee it roofed in; dying in the year 1724. The charge of erecting this valt pile aniounted to 18,7931 . and he left 219,499 l. 'to endow it ; a much larger fum than had ever been dedicated to charitable ufes in Britain by any one man. He erected an alms- boufe with a library at' $\Gamma$ anworth in Staffordilize (the place of his mother's nativity, and for which he was reprefentative in parliament) for 14 poor men and women ; and for their penfions, as well as for the putting out poor children apprentices, bequeathed 125 l. a-year. Laftly he bequeathed 10001. to every one who could prove themfelves in any degree related to him.

Guy, a rope ufed to keep fteady any weighty body. whillt it is hoitting or lowering, particularly when the fhip is fhaken by a tempeftuons fea.

Guy is likewife a large flack rope, extending from the head of the main-matt to the head of the fore-malt, and having two or three large blocks faftened to the middle of it. This is chietly cmployed to futtain the tackle ufed to hoift in and out the cargo of a mercbant fhip, and is accordingly removed from the mafthead as foon as the veffel is laden or delivered.

Gur's Cliff, in Warwickfhire, a great cliff on the weft fide of the Avon and the north fide of Warwick, where in the Britons time was an oratory, and in that of the Saxons a hermitage, where Guy earl of Warwick, who is faid to have retired to it after his fatigues by the toils and pleafures of the world, built the chapel, and cohabited with the hermit; and that from thence it had the name. This hermitage was kept up to the reign of Henry VI. when Rich. Beanchamp earl of Warwick eftablifhed a chantry here, and in memory of the famous Guy erected a large fatue of him in the chapel eight feet in height, and raifed a roof over the adjacent Springs. The chapel is in the parifh of St Nicholas, in the fuburbs of Warwick.

GUYON (Johanna Mary Bourtiers de la Mothe), a Frenchlady, memorable for her writings, and for her fufferings in the caufe of Quietifm, was defcended from a noble family, and born at Montargis in 1648. She gave fome extraordinary fymptoms of illumination from her earlieft infancy; and tried to take the veil before fhe was of age to difpofe of herfelf; but her parents obliged her to marry a gentleman to whom they had promifed her. She was a widow at the age of 28 : when difinguifhing herfelf in, and making many converts to, the way of contemplation and prayer known by the name of Quietifm, complaints were made of her firitualifm, and the was confined by order of the king, and feverely examined foreight monchs. She was difchar-: ged; but was afterwards involved in the perfecution: of the archbilhop of Cambray, and thrown into the Baftile, where the underwent many examinations: but nothing being made ont againft her, fle once more H h obtained

## Guy,

 Guyon.obtained her liberty, and liyed private to her death in 1717. She fpent her latter y ears in myftical reveries; covering her tables, ceilings, and e very thing that would receive them, with the fallies of a vifionary imagination. Her pious verfes were collected after her death in 5 vols. intitled Cantiques Spirituels, ou d'Emblemes fur l'Amour Divin. Her publications were, Le moyen court et tres facile de faire Oraifons; and Le Cantique des Cantiques de Salomion interprete felon le fens myftique; which were condemned by the archbilhop of Paris.

GWINIAD, in ichthyology. See Saimò.
GYARUS (anc. geog.), one of the Cyclades, 12 miles in compafs, lying to the eaft of Delos. It was a defart ifland, and allotted for a place of baniflument by the Romans.

GYBING, the act of hiffing any boom-fail from one fide of the maft to the other.

In order to underfand this operation more clearly, it is neceffary to remark, that by a boom- fail is meant any fail whofe bottom is extended by a boom, the foreend of which is hooked on its refpective maft ; fo as to fwing occafionally on cither fide of the veffel, deferibing an arch, of which the maft will be the centre. As the wind or the courfe changes, it alfo becomes frequently neceffary to change the pofition of the boom, together with its fail, which is accordingly flifted to the other fide of the veffel as a door turns upon its hinges. The boom is pufhed out by the effort of the wind upon the fail, and is reftrained in a proper fituation by a ftrong tackle commanicating with the veffel's fern, and called the fheet. It is alfo confined on the fore-part by another tackle called the guy.

GYGFUS (anc. geog.), called alfo Colous; a lake of Lydia, diftant 40 ftadia, or 5 miles, from Sardes.

GYGES (fab. hill.), a Lydian, to whom Candanles king of the country thowed his wife naked. The queen was fo incenfed at this inftance of imprudence and infirmity of her hufband, that fhe ordered Gyges either to prepare for death himfelf, or to pur Canduales to death. He chofe the latter; and marrying the queen, afcended the vacaut throne about 718 years before the Chriftian era. He was the firft of the Mermnadx who reigned in Lydia. He reigned 38 years, and diftinguined himfelf by the immenfe prefents which he made to the oracle of Delphi (Herod. 1: c. 8.) According to Plato, Gyges defcended into a chafm of the earth, where he found a brazen horfe, whofe fides he opened, and faw within the body of the carcafe a man of uncommon fize, from whofe finger he took a brazen ring. This ring, when he put it on his finger, rendered him invifible; and by means of its virtue he introduced himfelf to the queen, murdered her hufband, and married her and ufurped the crown of Lydia. (Gic. Off. iii. c. 9.)
GYMNASIARCH, in antiquity, the director of the gymnafium. He had two deputies under him : the one called $x y$ farch, who prefided over the athletæ, and had the overlight of wreftling; the other was gymmaftes, who bad the direction of all other exercifes.

GYMNASIUM, in Grecian antiquity, a place fitted for performing exercifes of the body, \&c.-The word is Greek, formed of $\gamma u \mu, \mathbb{G}$, " naked;" by reafon they anciently put off their clothes, to practife with the more freedom.

Gymnafia, according to Potter, were firft ufed at

Lacedænin, but were afterwards very common in all parts of Greece ; and imitated, very much augmented, and improved, at Rome. There were three principal gymnalia at Athens; the academy where Plato taught; the Lyceum, noted for Ariftotle's lectures; and the Cynofarges, allotted for the populace.

Vitruvius deferibes the ftructure and form of the ancient gymnafia, lib. v. cap. in. They were called gymnafia; becaufe feveral of the exercifes were perfored naked; and polaftro, from wreftling, which was one of the moft ufual exercifes there : the Romans fome times alfo called them therma, becaufe the baths and bagnios made a principal part of the building.-It appears that they did not perform their exercifes quite naked fo early as the time of Homer, but always in drawers; which they did not lay afrde before the 32 d Olympiad. One Orfippus is faid to have been the firft who introduced the practice : for having been worfted. by means of his drawers undoing and entangling him, he threw them quite afide, and the reft afterwards imitated him. They were not fingle edifices, but a knot of buildings united, being fufficiently capacious to hold mavy thonfands of people at once; and having room enough for philofophers, rhetoricians, and the profeffors of all other fciences to read their lectures,-and wreftlers, dancers, and all others who had a mind to exercife, -at the fame time without the leaf difturbance or interruption. They confifted of a great many parts. Vitruvius recites no lefs than 12, viz. I. The exterior porticos, where the philofophers, rhetoricians, mathematicians, phyficians, and other virtuofi, read public lectures, and where they alfo difputed and re hearfed their performances. 2. The ephebeum, where the youth affembled very early, to learn their exercifes in private, without any feectators. 3. The coryceun, apodyterion, or gymnafterion, a kind of wardrobe, where they ftripped, cither to bathe, or exercife. 4. The elæothefrum, alipterion, or unctuarium, appointed for the unctions, which either preceded or followed the ufe of the bath, wrefting, pancratia, \&c. 5. The conifterium or coniftra, in which they covered themfelves with fand or duft, to dry up the oil or fweat. 6. The palæftra, properly fo called, where they practifed wreftling, the pugillate, pancratia, and divers other exercifes. 7. The fphærifterium or ten-nis-court, referved for exercifes wherein they ufed balls. 8. Large unpaved alleys, which comprehended the fpace between the porticos and the walls wherewith the edifice was furrounded. 9. The xyli, which were porticos for the wreftlers in winter or bad weather. 10. Other xyftis or open alleys, allotted for fummer and fine weather, fome of which were quite open, and others planted with trees. II. The baths, confifting of feveral different apartments. 12. The ftadium, a large fpace of a femicircular form, covered with fand, and furrounded with feats for the fpectators.

For the adminiftration of the gymnafia, there were different officers: the principal were, 1 . The gymnafiarcha, who was the director and fuperintendant of the whole. 2. The xyftarcha, who prefided in the xyftus or ftadiam. 3. The gymnafta, or mafter of the exercifes, who underfood their different effects, and could accommodate them to the different complexions of the athletæ. 4. The pædotriba, whofe bufinefs was mechanically to teach the exercifes, without underftanding

## G Y M

Gymna fium, Gymmaflics.
their theory or ufe. Under thefe four officers were a number of fubalierns, whofe names diftinguilhed their different functions.

The gymnaftic exercifes may be reduced to two gene. ral claffes; as they depend either on the action of the body alone, or as they require external agents or inftruments. The latier confifted chiefly in mounting the horie, driving the chariot, and fwimming. The former were chiefly of two kinds; orcheftice, and palællice.

The orcheftice comprehended, x. Dancing. 2. Cubiftice, or the art of tumbling. 3. Sphrriftice or tennis, including all the exercifes with pilx or balls.

The palæftrice comprifed all exercifes under the denominatiou paleftre; as wreftling, boxing, pancratia, hoplomachia, running, leaping, throwing the difcus, the exercife of the javelin, and that of the hoop, denominated by the Greeks rpo $\propto Q$, which confifted in rolliug an iron hoop five or fix feet in diameter, befet with iron rings, the noife of which apprifing the people to give way, afforded them alfo an amulement. Both ftrength and fkill were requifite in directing his hoop, which was to be driven with an iron rod. To thefe mult alfo be added the exercifes belonging to the medicinal gymnaftics; as, I. Walking. 2. Vociferation or fhouting. 3. Holdirg one's breath. Hoffinan enumerates no fewer than 55 forts of exercifes that were practifed in the gymnafia.

GYMNASTICS, Gymnastice, or the Gymnastic art, denotes the art of performing exercifes of the body, whether for defence health, or diverion. Sec Gymnasium.

Several modern writers have treated of this art. M. Burette has given the hiftory of gymmattics in the Memoirs of the Royal Academy of Infcriptions.

On the firf eftablifhment of fociety, men, being apprifed of the neceffity of military exercifes, for repelling the infults of the neighbours, inftiuted games and propofed prizes to anmate their youth to combats of divers kiuds. And as running, leaping, ftrength and dexterity of arm in throwing the javelin, driving a ball, or tofing a quoit, together with wreftling, \&c. were exercifes fiuited to the manner of fighting in thofe days; fo the youth vied to excel in them, in the prefence of the aged, who fat as their judges, and difpenfed prizes to the conquerors; till what was originally only amufement, became at length a matter of fuch importance, as to intereft great cities and entire nations in its practice. Hence arofe an emulation and eagernefs to excel, in lopes, one day, of being proclaimed and crowned conquerors in the public games, which was the higheft honour a mortal could arrive at : nay, they went fo far as to imagine, that even gods and demigods were not infenfible of what men were fo captivated with ; and, in confequence hereof, to introduce the greateft part of thefe exercifes into their religious ceremonies, the worfhip of their gods, and the funeral honours done to the manes of the dead.

Though it be hard to determine the precife epocha of the gymnaftic art, yet it appears from feveral paffages in Homer, and particularly the 23d book of the Iliad, where he defcribes the games celebrated at the funeral of Patroclus, that it was not unknown at the time of the Trojan war. From that defaription, which is the carlieft monument now extant of the Grecian gymna-
ftics, it appears, that they had chariot-races, boxiug, wreftling, foot-races, gladiators, throwing the difcus, drawing the bow, and hurling the javelin; and it flould feem, from the particular account Homer gives of thefe exercifes, that even then the gymnaflic art wanted little of perfection : fo that when Galen fays there was no gymnattic art in Homer's days, and that it began to appear no carlier than Plato, he is to be underfood of the medicinal gymnaftics only. This lan indeed had its rife later; becaufe while men continued fober and laborious, they had no occafion for it ; but when luxury and idlenefis had reduced them to the fad neceflity of applying to phyficians, thefe, who had found that nothing contributed fo much to the prefervation and re-eftablifhment of health as cxercifes, proportioned to the different complexions, ages, and fexes, did not fail to refer them to the practice of gymnaftics.

According to Plato, one Herodicus, prior a little tine to Hippocrates, was the firf whointroduced this art into playlic; and his fucceffors, convinced by experience of its ufefulnefs, applied themfelves in earneft to improve it. Hippocrates', in bis book of Regimen, has given inftances of it, where he treats of exercife in general, and of the particular effects of walking, with regard to health, alfo of the different forts of races, either on foot or horfeback ; leaping, wreftling, the exercife of the fufpended ball, called corycus, chironomy, unctions, frictions, rolling in the fand, \&c. But as phyficians did not adopt all the exercifes of the gymnaftic art in their practice, it came to be divided between them and the mafters of marrial, and athletic exercifes, who kept fchools, the number of which was greatly increafed in Greecc. At length the Romans alfo caught the fame tatte; and, adopting the military and athletic exercifes of the Greeks, they improved and advanced them to the utmoft pitch of magnificence, not to fay extravagance. But the declenfion of the empire involved the arts in its ruin, and, among others, gymnaftics and medicine; which laft unhappily then relin. quified the title it had to the former, and has neglected to refume it ever fince.

GYMNOPYRIS, in natural hiftory, a name given by Dr Hill to the pyritæ of a fimple internal flructure, and not covered with a cruft. See Prrites.

Of thefe there are only two fpecies. I• A green varioully fhaped kind. 2. A botryoide kind.

The firf fpecies is the moft common of all the pyrire, and appears under a great diverfity of mapes. It is very hard and heavy, very readily gives fire with fteel, but will not at all terment with aquafortis. The fecond〔pecies is very elegant and beautiful, and its ufual colour is very agreeable pale green; but what moft diftinguilhes it from all other pyritæ is, that its furface is always beautifully elevated into tubercles of various fizes, refembling a clưter of gràpes.

GYMNOSOPHISTS, a fet of Indian philofophers, famous in antiquity; fo denominated from their going barefoot. The word is formed of the Greek rupvogoфrsns, q. d. a fophift or philofopher who goes naked.

This name was given to the Indian philofophers, whom the exceffive heat of the country obliged to go naked ; as that of Peripatetics was givento thofe who philoiophifed walking. The Gymnofophifts, however, did not go abfolutely naked; but only clothed them$\mathrm{H}_{\mathrm{h}} 2$
felves

Gymis. fics Gymnofi phifts.
eyminoto- felves no farther than modefty required. There were phils fome of thele fages in Africa; but the moft celebrated Gymotus. claia of them was in India. The African gymnofophifts dwelt upon a mountain in Æthiopia, near the Nile, without the accommodation either of houfe or cell. They did not torm themfelves into focieries like thofe of India; but each had his private retefs, where he ftudied and performed his devotions by hrimfelf. If any perfon had killed another by chance, he applied to thefe fages for abfolution, and fubmitted to whatever penancis they enjoined. They oblerved an extraordinary frugality, and lived only upon the fruits of the tarth. Lucan aícribes to thefe Gymnofophifts feveral new difcoveries in at tronomy.

As to the Indian Gymnofophifts, they dwelt in the woods, where they heed upon the wild products of the earih, and never drank wine nor married. Some of them pratifed phytic, and travelled frorn one place to another ; thefe were particularly fanous for their remedies againft barrennefs. Some of them, likewife, pretended to practife magic, and to fortel future events.

In general, the Gymnofophits were wife and learned men: their maxims and difcourfes, recorded by hiftorians, do not in the leaft favour of a barbamons edueation ; but are plainly the refult of great ferfe and deep thought. They kept ap the dignity of their cbaracter to fo high a degree that it was never their cuftom to wait upon any body, not even upon princes themfelves. They believed the immortality and tranfmigration of the toul: they placed the chief happinefs of man in a contempt of the goods of fortune and the pleafures of fenfe, and gloried in having given faithful and difiiterefted counfels to princes and magiftrates. It is faid, that when they became old and iufirm, they threw themfelves into a pile of burning wood, in order to prevent the miferies of an advanced age. One of theas, named Calamus, thus burnt himfelf in the prefence of Alexander the Grear.
Apuleius + defcribes the Gymnofophifts thus: "They are all devoted to the fludy of wifdom, boh the elder mafters and the younger pupils; and what to me appears the noft amiable thing in their character is, that they have an averfion to idfenefs and indolence: accordingly, as foon as the table is fpread, before a bit of viftuals be brought, the youths are all called together from their Ceveral places and offices, and the mafters examine them what good they have done lince the fan-rife : here one relates fomething he has difcovered by meditation; another has learned fomething by demonftration ; and as for thofe who have nothing to allege why they fhould dine, they are turned out to work fafting."
The great leader of the Gymnofophifts, according to Jerome, was one Buddas, called by Clemens Butta, who is ranked by Saidas among the Brachmans. That laft author makes Buddas, the preceptor of Manes the Perfian, the founder of the Gymnotophifts.
GYMNOSPERMIA, in botany, (from ruurGu "na. ked," and oreppua "feed;") the firt order in Linnaeus's clafs of didynamia. It comprehends thofe plants of that clafs which have naked feeds. The feeds are conlantly forr in nanber, except in one genus, viz. phryms, which is monofpermous. Sec Botany, p. 43 I. GYMNOTUS in ichthyology, a genas of filhes
belonging to the order of apodes. They have two cijmnotus. tentacula at the upper lip; the eyes are covered with the common ikin; therearéfive rays in the membrane of the gills; the bedy is conpreffed, and carinated on the belly with a fin. There are five fpecies, the molt remarkable of which is the electricus, or electric eel, called by the French anguille tremblante. This fpecies is peculiar to Surinam ; and is found in the rocky parts of the river, at a great diflance from the fta. The moft Plate accurate defcription we have of this fifh is in the Philo- cexxi. fophical Tranfactions for 1775, where Alex. Garden, M. D. gives an account of three of them brought to Charleftown in South Carolina. The largeft was about three feet eight inches in length, and might have been from 10 to 14 inches in circumference about the thickeft patr of its body. The head was large, broatl, flat, and frooth, impreffed here and there with holes, as if perfurated with a blunt needfe, efpecially towards the fides, where they were more regularly ranged in a line on each fide. There were two noflrils on each fide ; the firt large, tinbular, and elevated above the farface; the others mall, and level with the fkin. The eyes were fmall, flatiifh, and of a bluifh colour, placed aloont three quarters of an inch behind the noftrils. The whole body, from about four inches beluw the head was clearly diftinguithed into four longitudinal parts or divifions. The upper part or back was of a dark colour, and feparated from the other parts on each fide by the lateral lines. Thefe lines took their rife at the bafe of the head, juft above the pectoral fins, and run down the fides, graduatly converging as the firh grew fmaller to the tail. The fecond divifion was of a lighter and clearer colour than the firft, inclining to blue. It feemed to fwell out on each fide; but towards the under part of it is again contracted and tharpened into the third part or carima. This part is eafily diftinguifhed from the other two by its thinmefs, its apparent laxnefs, and by the reticulated fkin of a more grey and light colour, with which it is covered. The carina begins about fix or feven inches below the bafe of the head; and gradually deepeaing or widening as it goes along, reaches down to the tail, where it is thinneft. The fourth part is a long, deep, foft, and wavy fin, which takes its rife about three or four inches at moft below the head; and thus runs down the fharp edge of the carina to the extremity of the tail. The fituation of the anus was very fingular ; being an inch more forward than the pectoral fins. Externally it feemed to be a pretty large rima; but the formed excrements were only the lize of a quill of a common dung-hill-fowl. There were two pecoral fins fituated juft behind the head, farcely an inch in lengit ; of a very thin, delicate confiftence, and orbicular fhape. They fecmed to be chiefly ufeful in fupporting and raifing the head of the fifh when he came up to breathe; which he was obliged to do every four or five minutes. Acrofs the body were a number of fmall bands, aninular divifions, or rather ruge of the fkin. By means of thefe the fifh feemed to partake of the vermicular nature, had the power of lengtibening or flortening fis body like a worm, and could fwim backwards as well as forwards, which is another property of the vermicnlar tribe. Every now and then it laid itfelf on one fide in the water as if to reft.-For an account of the fingular properties of this fim, fee Electricity, $n^{0} 255$.

GY.

## G Y P

nent $E C E U M$, among the ancients, the apart of the women, a feparate roon in the inner part niug, weaving, and needle-work.

GYNALOCRACY, denotes the government of women, o: a flate where women are capable of the fupreme command. Such are Britain and Spain.

GYNECOCRATUMENI, an ancient ptople of Sarmati. Europæa, inhabiinus the eaftern banks of the river Tanais, near its opening into the Palus Mrotis; thus called, as authors relate, becante they had no women amony them; or, rather, becaule they were under the suminion of women. The word is formed of yuyn womizan, and xpatoupsyos varuquifhed, of xpates $I$ overcome if. d. overcome by women.

Fa. Hardouin, in his nores on Pliny, fays, they were thus called, becaufe after a batte which they loft againit the Anazons, on the banks of the Thermodoon, they were obliged to have venereal commerce With them, in order to get them children : Et quad victricibus obfequantur ad procurandanzezs fobolem.-Hardouin calls them the hubbands of the Amazons, Amazonum connubia; for, as the author obferves, the word unde muit be retrenched from Pliny, having been foifted into the text by people who were not mafters of the author's meaning, usde Amazoni'm connsibia. Sce Amazons. They who take the Amazons for a fabilous people, will conclude the fame of the Gynæcoeratumenians.
GYNANDRIA, (from zun a "s woman;" and amp a " mail.") The name of the 20th clats in Linnæus's fexual fyftem, confifting of plants with hermaphrodite flowers, in which the ftamina are placed upon the ftyle, or, to fpeak more properly, upun a pillarthaped receptacle, refembling a flyle, which ifes in the middle of the flower, and bears both the ftamina and pointal ; that is, both the fuppofed organs of generation. See Borany. p. 430.

The flowers of this clats, fays Linneus, have a monftrous appearance, arifing, as he inagincs, from the fingular and unufual fitudion of the parts of fructification.

GYPSIES, or Egyptians, an outlandidh ribe of vagabonds, who difguifing themfelves in uncouth habits, finearing their faces and bodies, and framing to themfelves a canting language, wander up and down, and, under pretence of telling fortunes, curing difeafes, \&c. abufe the common people, trick them of their money, and feal all that they can come at.

They are a ftrange kind of commonwealth among themfelves of wandering impoftors and jugglers, who made their firf appearance in Germany about the beginning of the i 6 th century. Munfter, is is true, who is followed and relied upon by Spelman, fixes the time of their firt appearance to the year 1417: but as he owns that the firf thom he ever faw were in 1529 , it is probably an error of the prefs for 1517; efpecially as other hiftorians inform us, that when Sultan Selim ennquered Egypt in the year 1517, Ceveral of the natives refufed to fubmit to the Turkifh yoke, and re. volted under one Zinganeus; whence the Tarks call them Zinganees; but being at length furrounded and banifhed, they agreed to difperfe in finall parties all over the world, where their fuppofed fkill in the black -art gave them an univerfal reception in that age of fu-
perftition and credulity. In the compafs of a very few years they gained fuch a number of idle profelytes (who initated cheir language and complexion, and betook themfelves to the fane arts of chiromancy, begging, and pilfering), that they became troublefome, and even formiable to moft of the flates of Europe. Hence they were expelled from France in the year 1560, and from Spain in 159 r . And the government of England tuok the alarm much earlier: for in 1530 they are defcribed by Stat. 22. Hen. VIII. c. 10. as " an outlandifh people calling themfelves Egyptians, uling no craft nor feat of merchandize, who have come into this realm, and gone from hise to hire, and place to place, in great companies, and nifed great, fubule, and cratty means to deccive the people, bearing them in hand that they by palmiltry could tell mens and womens formes; and fo many times by craft and fubuilty have deceived the people of theirmoney, and alfo have committed many heinous felonies and robberies." Wherefore they are directed to avoid the realm, and not to retura under pain of imprifonment, and forfciture of their goo.'s and chattels; and upon their rrials for any felony which they may have committed, they fhall nut be entitled to a jury de medictate lingua. And afterwards it is enacted, by ltatotes ilt and $2: 1 \mathrm{Ph}$, and Mary, c. 4. and 5th Eliz. c. 20. that if any fuch perfons ihall be inperted into the kingdom, the importer fhall forfeit 40l. And if the Egyptians themfelves remain one month in the kintgdom, or if any perfon being 14 years old, whether natural born fubject or ftranger which harth been feen or found in the fellowhip of fuch Egyptians, or which hath difguifed him or herfelf like them, thatl remain in the fane one month at one or feveral times, it is felony without benefit of clergy. And Sir M. Hale intorms us, that at one Suffolk affizes no lefs than 13 perfons were executed upon thefe ftatutes a few years before the reftoration. Bot, to the honour of the national humanity, there are no inflances more modern than this of carrying thefe la:s into practice ; and the laft fanguinary act is itfelf now repealed by 23 Geo. H1. c. 54.

In Scotland they feem to have enjoyed fome flare of indulgence; for a writ of privy feal, dated 1594 , fupports John Faw, lurd and earl of Litile Egypt, in the execution of juftice on his company and folk, conform to the laws of Egypt, and in punihing certain perfons there named who rebclled againft him, left him, robbed him, and refufed to turn home with him. James's fubjects are commanded to affit in apprechending them, and in affifting Faw and his adherents to return home. There is a like writ in his favour from Mary Q of Scots 1553, and in 1554 he obtained a pardon for the murder of Nunan Small. So that it appears he had ftaid long in Scotland, and perbaps fome of the time in England; and from him this kind of frolling people might receive the name of Faw Gang, which they ftill retain.

A very circumfantial account of this fingolar race of vagrants has been lately given in an exprefs Inquiry concerning them, written in German by H. M. G. Grellman, and tran lated by Mr Raper. It is incredible to think how this regular fwarm of banditi has fpreaditfelfover the face of the earth. They wander about in Afia, in the interior parts of Africa, and, like locults, have over-run molt of the European nations.

## G Y P [ 254 ] G Y P

Gypfies. In the reigns of Heury VIII. and queen Elizabeth, as we have feen, they were fet up as a mark of general perfecution in England; yet their numbers do not appear to have much diminifthed. Spain is fup. pored by Mr Twifs to contain 40,000 of thefe vagrants ; but by others 60,000; and by fome even double that number. They are lefs numerous in France in confequence of the ftrictnefs of the police. In Italy they abound, efpecially in the dominions of the church, on account of the bad police and the prevalence of fufuperfition, which permit and entice them to deceive the ignorant. They are fcattered, thought not in great numbers, through Germany, Denmark, Sweden, and Ruffia; but their chief population is in the fonth-eaft parts of Europe, which feem to be the general rendezvous of the gypfy nation. At a moderate computation Europe contains more than feven hundred thoufand of thefe vagabonds.-For near four centuries they have wandered through the world; and in every region, and among every people, whether barbarous or civilifed, they have continued equally unchanged by the lapfe of time, the variation of climate, and the force of example. Their fingular phyfiognomy and particular manners are the fame in every councry. Their fw rthy complexion receives no darker hade from the aurning fun of Africa, nor any fairer tincture from the bemperate climates in Europe; they contract ro additionnal lazinefs in Spain, nor acquire any new ninduftry in England: in Turkey they behold the mofque and the crefcent with equal indifference as they do the reformed and the catholic church in Europe. In the neighbourhood of civilifed life they continue barbarous; and, beholding around them cities and fettled inhabitants, they live in tents or holes in the earth, and wander from place to place as fugitives and vagabonds.
They are paffionately fond of ornaments : in which however they confult veither propriety nor confiftency ; they will wear an old laced coat, while the reft of the garments fcarcely hang together. In Hungary and Tranfylvania, their fummer habitations are tents; their winter ones holes 10 or 12 feet deep in the earth, except fuch as keep inns, or exercife trades. They are fond of plate, particularly filver cups, which they bury under the hearth for fecurity. Their principal occupations are, fmith's work, or tinkers, or wooden ware, and horfe-dealing; and in Hungary and TranTylvania they are executioners of criminals, flayers of dead beafts, and wafhers of gold. The women deal in old cloaths, proftitution, wanton dances, and for-tune-telling. Notwichtanding thefe occupations, the majority of this people are lazy, beggars, and thieves. They bring, up their children to their own profeffions, and are very fond of them. They have few diforders, except the mealles and fmall pox, and weaknefs in their eyes, occafioned by finoke, and live to an advanced age, with a frong attachment to life. Their phyfic is faffron in their foups, or bleeding.

Thefe people, however, appear to be diftinguithed by different fingularities in different countries. At leaft in the following circnmftance the German gypfies differ widely from thofc commonly met within England. It is a great feaft to them our author fays, whenever they ean rrocure a roaft of cattle that died of any diftemper, it is all one to them, whether
it be a carrion of a haeep, hog, cow, or other beaft, horie-fleh onty exceptea; they are fo far from heing difgufted with it, that to eat their fill of fuch a meal, is to them the height of epicurifin. When any one cenfures their talte, or fhows furprife at it, they anfwer, "The flefl of a beaft which God klls, muft be better than one killed by the hand of man." They therefore take every opportunity of getring fuch dainties. That they take carrion from a layitall, as is affirmed of the gypfies in Huagary, is by no means certain, any more than that they eat horite-flefh. But if a beaft out of an herd dies, and they find it before it becomes rotren and puritied; or if a farmer gives them notice of a cow dead, they proceed without hefitation, to get poffieffion of this booty. Their favourite object is animals that have been deftroyed by fire; therefore, whenever a conflagration has happened, either in town or country, the next day the gypfies, from every neighbouring quarter, affemble and draw the fuffocared balf confomed beaft out of the ahhes. Men, women, and children, in troops, are extremely bufy, joyfully carrying the flefl home to their dwel-ling-places ; they retarn feveral times, provide themrelves plentifully with this roaft meat, and glattonize in their huts as long as their nuble fare jafts.
The gypfies have, at leaft in Tranfylvania, a fort of regular government, rather nominal than real or effective. They have their leaders or chiefs, whom they diftinguin by the Sclavonian title, Waywode. To this dignity every perfon is elegible who is of a family defcended from a former way wode; but the preference is generally given to thofe who have the beft clothes and the moft wealth; who are of a large ftature, and not paft the meridian of life.-Of religion, however, they have no fenfe; though, with their ufual cunning and hypocrify, they profefs the eftablified faith of e very country in which they live. They alfo fpeak the languages of the refpective countries, yet have a language of their own; from whence derived, authors differ. The only fcience which they have attained is mufic. Their, poetry is ungrammatical indecent rhyme.
Their general charafter and capacities are thus defcribed: Imagine people of a childiif way of thinking; their minds filled with raw, undigefted conceptions; guided more by fenfe than reafon; ufing underflanding and reflection fo far only as they promote the gratification of any particular appetite; and you have a perfect iketch of the gypfies character. They are lively, uncommonly loquacious and chattering; fickle in the extreme, confequently inconflant in their purfuits; faithlefs to-every body, even their own caft; void of the leaft emotion of gratitude, frequently rewarding benefirs with the molt infidious malice. Fear makes them navihly compliant wheu under fubjection; bur having nothing to apprehend, like other timorous people, they are cruel. Defire of revenge often caufes them to take the moft defperate refolutions. To fuch a degree of violence is their fury fometimes excited, that a mother has been known in the excefs of paffion, to take her fmall infant by the feet, and therewith frike the object of her anger, when no other inftrument has readily prefented itfelf. They are fo addicted to drinking, as to facrifice what is moft neceffary to them, that they may feal their palate with firits. They have, too,

## GYP [ 255 ] GYP

Gypfles, what one would little expect, an enormons fhare of vasity, which hows itfelf in their fondnefs for fine clothes, and their gait and deportment when dreffed in thern. One would imagine, that this pride would have the good effect to render a gyply cantious not to be guilty of fuch crimes as fubject him to public flame; but here comes in the levity of character, for he never looks to the right nor to the left in his tranfactions. In an hour's time he forgets that he is juft untied from the whipping poft. But their pride is grounded on mere idle conceit, as appears plainly from their making it a point of honour to abufe their companions, and put on a terrible appearance in the public market, where they are fure to have many fpectators; they cry out, make a violent noife, challenge their adverfary to fight, but very feldom any thing comes of it. Thus the gypfy feeks honour, of which his ideas coincide very little with thofe of orher people, and fometimes deviate entirely from propriety.
" Nothing (continues our author) can exceed the unreftrained depravity of manners exifting among thefe people, I allude particularly to the other fex. Unchecked by any idea of hame, they give way to every defire. The mother endeavours, by the moft fandalous arts, to train up her daughter for an offering to fenfuality; and this is fearce grown up before fhe becomes the feducer of others. Lazinefs is fo prevalent among them, that were they to fubfift by their own labour only, they would hardly have bread for two of the leven days in the week. This indolence increafes their propenfity to fealing and cheating, the common attendants on idlenefs. They feék to avail themfelves of every opportunity to fatisfy their lawlefs defires. Their univerfal bad character therefore for ficklenefs, infidelity, ingratitude, revenge, malice, rage, depravity, lazinefs, knavery, thievilhnefs, and cunning, though not deficient in capacity and clevernefs, render thefe people of no ufe in fociety, except as foldiers to form maurauding parties. Perfons in their company, and under their difguife, have formed dangerous defigns againt cities and countries. They have been banifhed from almolt all civilized ftates, in their turn, except Hungary and Tranfylvania, and to little purpofe. Our author is of opinion, that as Turkey would allow them toleration, it would be better for the European flates to take fome fteps for cultivating and civilizing them, and making them ufeful. But while they are infenfible of religion and ftrongly attached to their own manners, it is to be feared the attempt will be impracticable. This appears from a very intelligent Hungarian lady's experience on the fubject, commanicated in a letter as follows: 'There are a great number of them on my eftates, but I have permitted two families in particular to eftablifh themfelves at the place of my own refidence, under the exprefs condition that no others fhall come here and join them. I took all poffible pains to make them reafonable creatures. I fet the elder ones to work; the younger ones tend the catthe. I obferved that they were more fond of horfes than any thing elfe; for which reafon I placed a gypfy under each groom. I had their children clothed, that none of them might be running about naked, according to their úfual practice. It appeared, however, that cuftom was become nature with them. The old ones worked diligently fo long as any body ftood over them; the moment their back was turn-
ed, they all got together in a circle, their legs acrofs, facing the fun, and chattered. Thus they cannot poffibly earn more, indeed hardly fo much, as would find them bread, although very cheap with us; for the bread I give them does not fland me in half a kreutzer the pound. Even in winter they cannot bear a hat on their head nor thoes on their feet. The boys run like wild things wherever they are fent, either on foot or on horfeback ; put they fooil horfes unmercifully ; beat them on the head, jerk the bits in their mouths, fo as to make them run down with blood. They cannot be biought by any means whatever to drefs horfes. Cloath them as you will, they always fell or lofe their cloaths. In a word, one cannot but confider them as void of reafon; it is really fhocking to fee even well grown children put whatever they find into their mouths, like infants before they can fpeak; wherefore they eat every think, even carrion, let it fink never fo much. Where a mortality happens among the cattie, there thefe wretched beings are to be found in the greateft numbers.'
The origin of this people, as we have feen, has been generally believed to be Egyptian; and that belief is as old as their exiltence in Europe. Thomafius, Salmon the Englifh geographer, and lately Signior Grifelini; have endeavoured to prove it by fatisfactory evidence. This theory, however, according to our author, is without foundation. The Egyptian defcent of thefe people, he thinks, is not only deftitute of proofs, but the moft pofitive evidence is found to contradict it. Their language differs entirely from the Coptic; and their cuftoms are very different from thofe of the Egyptians. They are indeed to be found in Egypt ; but chey wander about there as ftrangers, and form a diftinct people, as in other countries. The exprefions of Bellonius are ftrong and decifive; "s No part of the world, I believe is free from thofe banditti, wandering about in troop:, whom we by mittake call Egpytians and Bohemians. When we were ar Cairo, and in the villages bordering on the Nile, we found troops of thefe ftrolling thieves fitting under palm trees: and they are efteemed foreigners in Egypt as well as among us."
The Egyptian defcent of the gypfies being rejected, our author next endeavours to how that they come from Hindoftan. The chief balis of his theory, however, is no other than that very dubions one, a fimilarity of language. He adds a long vocabulary of the giply and the Hindoftanic languages; in which, it muft be confeffed, many words are the fame; bur many are different. A principal proof which he adduces on this head is from the relation of Captain Szekely von Doba, to whom a printer in 1763 related, that a preacher of the Reformed church, when a ftudent at Leyden, being intimately acquainted with three young Malabar ftudents, took down 1000 of their words, which he fancied correfponded with the giply Janguage ; and they added, that a tract of land in their illand was named Ozigania. He repeated thefe words to the Raber gypfies, who explained them without cronble or hefitation. This account was publifhed in the Vienna Gazette. Suppofing thefe three young men to be fons of Bramins, who ufe the Sanfcrit, the common language of Hindoitan comes as near to that as modern Italian to pure Latin. The comparifon of

## G Y P

Gyplies, the two languages takes up above 30 pages; and Mr Grellman thinks it eftablidies his fytem. The fame opinion is muntained by Mr Marfden, in a paper upon this fabject in the 7 th volume of the Archeologia. The numerals, however, both in Ifindoflanic and gipfy, differ greally as flated by the two authors. And here, as in other fuch comparifons, one is aftonimed at the credulity of the comparers of orthoepy and orthography (as a periadical critic obferves), which can have no connection in languages with which we are not perfectly familiar, even were both languages reduced to writing by their refpeative people : how much lefs, then, where one of the two languages is never reduced to writing, as is the cafe of the giply, but is blended with the language of the country where the clan relides? This appears from the correlpondence of feveral words in all languages with the giply. Mr Grellman acknowledges the two gipfy verfions of the Lord's Prayer, at different periods, differ fo widely, that one would almof be inclined to doubr whether they were really the fame language. We think we can difcern a few words differently indeed written, but probably pronounced alike. Nor can we, in all the languages in which Chamberlayne gives the Lord's Prayer, perceive the leaft refemblance to the gipfy name of father, Dade and Dad, except in the Wellh, Taad. In profecuting his argument, Mr Geellman does not infift on the fimilarity of colour between the two people, nior on the cowardice common to both, nur on the attachment of the Indians to tents, or letting their children go naked; all thefe being trais to be met with in other nations : but - he dwells on the word Polgar, the name of one of the firft gipfy leaders, and of the Indoftanic god of marriage; alfo on the correfpondence between the travelling fmiths in the two people, who carry two pair of bellows; the Indian's boy blows them in India, the wife or child of the g'pfy in Europe: As if every travelling tinker, in every nation where tinkers travel, had not the fanse journeymen. In lafcivious dances and chiromancy the two people agree; nor are thefe uncommon in other parts of the globe. The exceflive loquacity of the two people is produced as fimilar ; as if no other nations in the world were loquacious. Fainter refemblances are, a fondnefs for faftron, and the intermarrying only with their own people. The laft pofition in the author's theory is that the gipfies are of the loweft clafs of Indians, namely, Parias, or, as they are called in Hindoftan, Suders. He compares the manners of this clafs with thofe of the gipfies, and enumerates many circumftances in which they agree: forne of the comparifons are frivolous, and prove nothing. As an inItance of which we may take the following: 'Gipfies are fond of being about horfes; the Suders in India likewife, for which reafon they are commonly employed as horfe-keepers by the Earopeans refident in that country.' This reafoning does not prove that the gipfies are Suders, any more than that they are Arabians or Yorkfhire farmers.

The objections, howe'ver, to which this learned and induftrious author's theory is liable, are fach as only flow it to be by no means fatisfactory; but do not prove that it is wrong. It may poffibly be right; and upon this fuppofition the canfe of their emigration from their country, he conjectures, not without probability, to be the war of Timur Beg in India. In the

## $256] \quad G Y P$

years 1408 and 1409 the conqueror ravaged India; and the progrefs of inis arms was attended with devaftation and cruclry. All who made refiftance were defroyed; thofe who fellinto the enemy's hands were made hlaves; of thefe very haves 100,000 were put to death. Ason this occafion an univerfal panic took place, what could be more natural than that a great number of terrified inhabitants fhould endeavour to fave themfelves by flight? - In the laft place, the anthor endeavours to trace the route by which the gipfies came from Hindoftan to Europe : but here he juftly acknowledges that all that can be faid on the fubject is merefurmife; and, upon the whole, after peruling all the preceding details, the reader will probably be of opinion that there ftill hangs a cloud over the origin of this extraordinary race.

GYPSOPHILA, in botany : A genus of the digy. nia order, belonging to the decandria clafs of plants; and in the natural method ranking under the 22 d order, Caryophyllei. The calyx is monophyllons, campanulated, and angulated; the petals are five in number, ovate, and feffile ; the capfule globofe and unilocular.

GYPSUM, Plaster-stone, or Alabaffer; a natural combination of the calcareous earth with vitriolic acid. See Alabaster.

The properties of gypfum, according to Cronftedt, are, 1. It is loofer and more friable than a calcareous earth. 2. It does not effervece with acids either in its crude or calcined fate ; or at molt but in a very flight degree, in proportion to what it wants of the vitriolic acid for the complete faturation of its bafe. 3. It falls into powder in the fire very readily. 4. When burnt without being made red-hot, its powder readily concretes with water into a mals which foon hardens; bat without any fenfible heat being excited in the operation. 6, According to our author, it is nearly as difficule of fufion as limeftone; and fhows almof the fame effects upon other bodies with limeftone, though the acid of vitriol feems to promote the vitrification. M. Magellan, however, informs us, that he has found mofl of the gypfeous kind, particularly the fibrous, to melt in the fire pretty eafily by themfelves. 7. When melted in the fire with borax, it puffs and bubbles very much, and for a long time during the fution. According to M. Magellan, when a fmall quantity of any gypfum is melted together with borax, the glafs becomes colourlefs and tranfparent; but fome forts of alabafter and fparry gypfo, when melted in quantity with börax, yield.a fine yellow tranfparent coloured glafs, refembling that of the beft topazes; but if tob much of the gypfom is ufed in proportion to the borax, the glafs becomes opaque, juft as it happens with the pure linesfone. 8. When burnt with any inflammable matter it emits a fulphureous fmell, and may thus be decompounded, as well as by either of the fixed alkaline falts; but if this left method is followed, there ought to be five or fix times as much falt as there is of $g$ pfum. 9. On being decompounded in this manner the refiduam commonly fhows fome figns of iron. The fpecies are,

1. Friable gypfeous earth of a white colour, found in Saxony.
2. Indurated gypfom of a folid texture, the particles of which are not vifble, comnonly called alabafter. This is fometimes found unfaturatod with vitriolciacid;

Gypio. phila, Gypfum.

## G Y P

Gypfum. in which cafe only it will effervefce with aquafortis, as it is faid to do under the Article Alabaster. It is very eafily fawed or cut, and takes a dull polifh. It is of feveral kinds; as, white; clear tranfparent from Perfia, opaque from Italy and Trapans in Sicily ; of a yellow coluar, of which there are likewife two kinds, tranfparent and opaque ; the former being met with in the eaftern countries, the latter in Spain. Brunnick informs us, that in this country thete are a great many fine varieties of the fpecies we treat of ; and from hence he fuppofes that the ancients obtained the beauriful alabafters they ufed. Fabroni tells us, that a great variety of fine alabafters are met with in Italy. Twentyfour quarries of them, each of a different colour, are now worked out at Volterra; but he is of opinion that the Romans brought the greareft part of the alabafters they made ufe of from Greece.
3. Gypfum of a fealy texture, or common plafter of Paris. This is found in many different countries, of two kinds ; viz. white with coarfe fcales, or with frall fcales yellowih or greyifh. According to Bergman, plafter contains ${ }_{4}^{46}$ of vitriolic acid, ${ }_{5}^{\frac{30}{5 \%}}$ of purecalcareous earth, and ${ }^{2 \%} \%$ of water. It is folnble in 500 times its weight of warm water, or 450 times its weight of boiling water. It is well known by its property of forming an hard mafs with water after being hightly burned; and during this confolidation a llight degree of heat is produced, though lefs than when lime is haked. It is often employed in building; andmay be taken off and ufed again and again for the fame parpofe.
4. Fibrous gypfum, or plafter ftone, has likewife two varieties, viz. with coarfe or with fine fibres. It is of a white colour.
5. Selenites, or fpar-like gypfum, by fome alfo call--d glacies manx, and confounded with the clear and tranfparent mica. It is found of two kinds, clear and tranfparent, or yellowilh and opaque.
6. Cryftallized gyptuin, or gypfeous drufen. This is found compofed of wedge-fhaped and fometimes of capillary cryftals, fometimes white and fometimes yellowifh.
7. Stalactitical gypfum is found of a grear many different forms and colours. When found in large pieces it commonly varies between white and yellow, and likewife in its tranfparency in different parts of the fame mafs. It is ufed as alabafter in feveral works.

Befides the conntries already mentioned, England abounds with fubftances of a gypfeous natare. There
are plenty in Derbydhire and Nottinghamhire, fo fine as to be ufed like alabafter, that is, to take a fine polifh. In the countries juft mentioned there are large pits of this kind, alfo in moft of the cliffs of the Severn, efpecially at the Old Paffage in Somerfethire. A very fine femipellucid folid alabafter is found in Derbyhire. Very fine fibrous tales are alfo found in the abovementioned pits of ftone, and many other places. Selenites every where ahound, fo that it is impofible to enumerate the different places. Very fine gypfoous drufen are found in Sheppey Ine, and fome exceedingly beautiful, large and clear as cryital, have been dug from the falt-rocks at Nantwich in Chefhire. The felenites rhomboidales is found in plenty in England; tho' rare in other countries. Shotover hill in Oxfordhire is remarkable for them. The Ifle of Sheppey affords a kind of fpar-like gypfum, of a fibrous nature, and always accreting like the radiations of a ftar on the feptaria, and thence called fella Septarii.

The principal ufe of gy pfum is as a material for fimall flatues and figures of various kinds, alfo for moulds for cafting wax-works, \&c. It has lately been introduced as a manure in France and America, though its fuccefs in this refpect has not yet been fufficiently experienced.

GYR-falco, in zoology, the name of a large and fierce fpecies of falcon, called in Englifh the jer falcon. See Falco.

It is a very bold and daring bird, attacking allother fowl withont referve, particularly the heron and fork kinds. I he other falcons are all afraid of this.

GYRINUS, in zoology; a genus of infeets of the coleoptera order. The generic characters are: The Plate antennæ are cylindrical, fliff, and fiorter than the ccxxif head; and the eyes are four, two on the upper and two on the under pait of the head. Mr Barbut, however, fays that the eyes only appear on the upper and under parts of the head, but that they are not fons The natator, or common water-flea, is of a bright black colour ; the feet are yellow, flat, and large; li, infect is in length one-third of an inch. It rwo. with great celerity in circles on the furface of the $5:-$ ters and is very difficult to catch, plunging down io. ftantaneounly when attempted to be taken. There ar. eight otherfpecies, which frequem the waters in different parts of the globe.

GYSHORN, a town of Germany, in the duchy of Lunenburgh, fituated on the river Aller, in E. Long. 10. 45. N. Lat. 52. 50.

## H.

HThe eighth letter and fixth confonatit in our alphaber; though fome grammarians will have it to be only an afpiration, or breathing. But nothing can be more ridiculous than to difpute its being a diainct found, and formed in a particular manner by Vol. VIII.
the organs of fpeech, at leaf in our language : with nefs the words eat and heat, arm and barm, car and hear, at and hat, \&c. as pronounced with os without the $h$.

## H A B | 258 H A B

Hag between the lips, clofing, as it were, by a gentle motion of the lower jaw to the upper, and the tongue nearly approaching the palate.

There feems to be no doubt, but that our $b$, which is the fame with that of the Romans, derived its figure from that of the Hebrew $\pi$. And indeed, the Phœnicians, the moft ancient Greeks, and Romans, ufed the fame figure with our H , which in the feries of all thefe alphabets keeps its primitive place, being the eighth letter.

H , ufed as a numeral, denotes 200 ; and with a dah over it, $\mathrm{H}, 200,000$.

As an abbreviation, $H$ was ufed by the ancients to denote homo, beres, hor a, \&c. Thus H. B. ftood for beres bonorum; and H. S. corrupted for LLS. fefterce ; and H. A. for Hadrianus.

HAAG, or HAG, a town of the duchy of Bavaria in Germany, feated on a hill on the weft fide of the river I nn , in E. Long. 12. 23. N. Lat. 48. 16.

HABAKKUK, one of the twelve leffer prophets, whofe prophecies are taken into the cannon of the Old Teftament. The name is writien in the Hebrew with $\pi$ bheth; and fignifies "a wreftler." There is no precife time mentioned in Scripture when this Habakkuk lived; but from his predicting the ruin of the Jews by the Chaldeans, it may be concluded that he prophefied before Zedekiah, or about the time of Manaffeh. He is reported to have been the author of feveral prophecies which are not extant : but thoie that are indifputably his, are contained in three chapters. In thefe the prophet complains very pathetically of the diforders which he obferved in the kingdom of Judæa. God reveals to him, that he would fhorly punifh them in a very terrible manner by the arms of the Chaldeans. He foretels the conquelts of Nebuchadnezzar, his metamorphofis, and death. He foretels, that the valt defigns of Jehoiakim would be frnftrated. He fpeaks againft a prince (probably the king of Tyre) who built with blood and iniquity ; and he accufes another king (perhaps the king of Egypt) of having intoxicated his friend, in order to difcover his nakednefs. The third chapter is a fong or prayer to God, whole majefty he defcribes with the utmolt grandeur and fublimity of expreflion.

HABET, a province of Africa, in Barbary, and in the kingdom of Fez. It is furrounded by the Mediterranean, the Straits of Gibraltar, and the Atlantic Ocean. The principal towns are Arzilla, Tetuan, and Ceuta; which laft is in poffeffion of the Spaniards.

HABDALA, a ceremony of the Jews obferved on the evening of the fabbath, when every one of the family is come home. At that time they light a taper or lamp, with two wicks at leaft. The mafter of the family then takes a cup, with fome wine, mixed with fragrant fices; and having repeated a paffage or two of leriptare, as for example, "I will take the cup of falvation," \&c. Pfal. cxvi. and "The Jews had light and gladnefs,'" \&x. Efth, viii. he bleffes the wine and fpices. Afterwards he bleffes the light of the fire ; and then cafts his eyes on his hands and nails, as remembering that he is going to work. The whole is intended to fignify, that the fabbath is over, and is from that moment divided from the day of labour which follows. For this reafon the ceremony is called Habdata, which fignifies" dintinction." After the cere-
mony is over, and the company breaks up, they wifh one another, not " a good night," buc "a good week."

HABEAS corpus, in law, is the great remedy in cales of Falfe Imprisonment. The incapacity of the three other remedies referred to under that article, to give complete relief in every cafe, hath almoft entirely antiquated them, and hath cauled a general recourfe to be had, in behalf of perions aggrieved by illegal imprifonments to the prefent writ, the mon celebrated in the Englinh law. Of this there are various kinds made uie of by the courts at Weftminfter, for removing prifoners from one cuurt into another for the more cafy adminiftration of juftice. Such is the babeas corpus ad refpondendum, when a man hath a caufe of action againft one who is confined by the procefs of fome inferior court; in order to remove the prifoner, and charge him with this new action in the court above. Such is that ad fatisfaciendum, when a prifoner bath had judgment againft him in an action, and the plaintiff is defirous to bring him up to fome fuperior court to charge him with procefs of execution. Such alfo are thofe ad profequendum, tefificandum, deliberandum, \& c ; which iffue when it is neceflary to remove a prifoner, in order to profecute or bear tellimony in any court, or to be tried in the proper jurifdiction wherein the fact was committed. Such is, laftly, the common writ ad faciendum et recipiendun, which iffiues out of any of the courts of Weftminfterhall, when a perfon is fued in fome inferior jurifdiction, and is defirous to remove the action into the fuperior court; commanding the inferior judges to produce the body of the defendant, together with the day and caufe of his caption and detainer (whence the writ is frequently denominated an habeas corpus cum caufa), to do and receive whatfoever the king's court thall coninder in that behalf. This is a writ grantable of common right, without any motion in court, and it inftantly fuperfedes all proceedings in the court below. But, in order to prevent the furreptitious difcharge of prifoners, it is ordered by ftatute 1 \& 2 P. \& M. c. 13. that no babeas corpus fhall iffue to remove any prifoner out of any goal, unlefs figned by fome judge of the court of which it is awarded. And, to avoid vexatious delays by removal of frivolons caufes, it is enacted by ftatute 21 Jac . I. c. 23. that, where the judge of an inferior court of record is a barrifter of three years ftanding, no caufe fhall be removed from thence by habeas corpus or other writ, after iffue or demurrer deliberately joined : that no canfe, if once remanded to the inferior court by writ of procedendo or otherwife, Shall ever afterwards be again removed : and that no caufe fhall be removed at all, if the debt or damages laid in the declaration do not amount to the fum of five pounds. But an expedient having been found out to elude the latter branch of the ftatute, by procuring a nominal plaintiff to bring anotier action for five pounds or upwards (and then by the courfe of the court the habeas corpus removed both actions together), it is therefore enacted by flatute 12 Geo. 1. c. 29. that the inferior court may proceed in fuch actions as are under the value of five pounds, notwithfanding other actions may be brought againft the fame defendant to a greater amount.
But the great and efficacious writ, in all manner of illegal

juft caufe, and therefore hath a right to be delivered, the writ of habeas corpus is then a writ of right which may not be denied, but ought to be granted to every man that is committed, or detained in prifon, or otherwife reftrained, though it be by the command of the king, the privy council, or any other."

In the articles Liberty and Rights, we expatiated at large on the perfonal liberty of the fubject. This was fhown to be a natural inherent right, which conld not be furrendered or forfeited unlefs by the commiffion of fome great and atrocious crime, and which ought not to be abridged in any caufe without the feecial permifion of law. A doctrine coeval with the firft rudiments of our conftitution ; and handed down to us from the Anglo-Saxons, not withftanding all their fruggles with the Danes, and the violence of the Norman conqueft : afferted afterwards and confirmed by the conqueror himfelf and his defcendants: and though fometimes a little impaired by the ferocity of the times, and the occafional defpoifin of jealous or ufarping princes, yet eftabliihed on the firmeft bafis by the provifions of magna cbarta, and a long fucceffion of flatutes enacted under Edward III. To affert an abfolute exemption from imprifonment in all cafes, is inconfiftent with every idea of law and political fociety; and in the end would deftroy all civil libercy by rendering its protection impoffible: but the glory of the Englifh law conlifts in clearly defining the times, the caufes, and the extent, when, wherefore, and to what degree, the inaprifonment of the fubject may be lawful. This it is which indnces the abfolute neceffity of expreffing upon every commitment the reafon for which it is made; that the court, upon an babeas corpus, may examine into its validity: and according to the circumftances of the cafe may difcharge, admit to bail, or remand the prifoner.

And yet, early in the reign of Charles $I$. the court of king's-bench, relying on fome arbitrary precedents (and thofe perhaps mifunderftood), determined * that they could not upon an habeas corpus either bail or state delivera no mon trials, viii, deliver a prifoner, though committed withour any ${ }_{3} 6$. caufe affigned, in cafe he was commited by the fpecial command of the king, or by the lords of the privycouncil. This drew on a parliamentary inquiry, and produced the petition of right, 3 Car. I. which recites this illegal judgment, and enacts that no freeman hereatter hhall be fo imprifoned or detained. But when, in the following year, Mr Selden and others were committed by the lords of the council, in purfuance of his majefty's feecial command, under a general charge of " notable contempts and firring up fedition againft the king and government," the judges delayed for two terms (including alfo the long vacation) to deliver an opinion how far fuch a charge was bailable ; and when at length they agreed that it was, they however annexed a condition of finding furreties for the good behaviour, which fill protracted their imprifonment ; the chief juftice Sir Nicholas Hyde, at the fame time declaring $\dagger$, that " if they were again remanded for that caufe, perhaps the court would not afterwards graut a babeas corpus, being already made acquainted with the caufe of the imprifonment." But this was heard with indignation and aftonifhment by every lawyer prefent; according to Mr Selden's

## H A B $\quad[260] \quad$ H A B

Habeas own account of the matter, whofe refentment was Corpus. not cooled at the diftance of four and twenty years.

Thefe pitiful evafions gave rife to the flatute 16 Car. I.c.10. §. 8. wherely is is enacted, that if ang perfon be committed by the king himfelf in perfon, or by his privy council, or by any of the members thereof, he fhall have granted unto him, without any delay upon any pretence whatfover, a writ of habeas corpus, upon demand or motion made to the court of king's bench or common-pleas ; who fhall thereupon, within three courr-days after the return is made, examine and derermine the legality of fuch commitment, and do what to juftice flall appertain, in delivering, bailing, or remauding fuch prifoner. Yet fill in the cafe of Jenks, before alluded to, who in 1676 was com: nitted by the king in council for a terbulent speech at Gaildhall, new fhifis and devices were made Ule of to prevent his enlargement by law; the chief jutice, (as wcll as the chancellor) declining to award a writ of habeas corpus ad fubjiciendum in vacation, though at laft he thought proper to award the ufual writs ad deliberandum, \&c. whereby the prifoner was difcharged at the Old Bailey. Other abufes had alfo crept into daily practice, which had in fome meafure defeated the benefit of this great conflitutional remedy. The party imprifoning was at liberty to delay his obedience to the firft writ, and might wait till a fecond and a third, called an alias and a pluries, were iffued, before he produced the party : and many other vexatious fhifts were practifed to detain flate-prifoners in cuftody. But whoever will attentively confider the Englifh hiftory, may obferve, that the flagrant abufe of any power, by the crown or its rinifters, kas always been productive of a ftruggle: which either difcovers the exercife of that power to be contrary to law, or (if legal) reftrains it for the future. This was the cafe in the prefent inftance. The oppreflion of an obfaure individual gave birth to the famous habeas corpus act, 31 Car. II. c. 2. which is frequently confidered as another magna charta of the kingdom; and by confequence has alfo in fubfequent times reduced the method of proceeding on thefe writs (though not within the peach of that ftature, but ifluing merely at the common law) to the true ftandard of law and liberty.

The fatate itfelf easets, I . That the writ fhall be returned and the prifoner brought up, within a limited time according to the diflance, not exceeding in any cafe twenty days. 2. That fuch writs fhall be endorfed, as granted in purfaance of this act, and figned by the perfon awarding them. 3. That on complaint and requeft in writing by or on behalf of any perfon committed and charged with any crime (unlefs committed for treafon or felony expreffed in the warrant, or for furficion of the fame, or as acceffary thercto before the fact, or convicted or charged in execution by legal procefs), the lord chancellor, or any of the twelve judges in vacation, upon viewing a cupy of the warrant, or affidavit that a copy is denied, fhall (unlefs the party las neglected for two terms to apply to any court for his enlargement) award a babeas corpus for fuch prifoner, reurnable immediately before himfelf or any other of the judges; and upon the retarn made Rall difcharge the party, if bailable, upon giving fecurity to appear and anfwer to the accufation in the
proper court of judicature. 4. That officers and Habeas keepers neglecting to make due returns, or not delivering to the prifoner or his agent within fix hours after demand a copy of the warrant of commitnent, or hifting the cuftody of a prifoner from one to another without fufficient reafon or authority (fpecified in the act), fhall for the firft offence forfeit 1001. and for the fecond offence 200l. to the party grieved, and be difabled to hold his office. 5. That no perfon, once delivered by habeas corpus, thall be recommitted for the fame offence, on penaly of 5001 . 6. That every perfon committed for treafon or felony, fhall, if he requires it the firft week of the next term, or the firft day of the next feflion of oyer and terminer, be indicted in that term or feffion, or elfe admitted to bail; unlefs the king's witneffes cannot be produced at that time: and if acquitted, or if not indieted and tried in the fecond term or feffion, he flall be difcharged from his imprifonment for fuch imputed offence: but that no perfon, after the affizes fihall be opened for the county in which he is detained, fhall be removed by babeas corpus, till after the affizes are ended; but fhall be left to the juftice of the judges of affife. 7. That any fuch prifoner may move for and obtain his babess corpus, as well out of the chancery or exchequer as out of the king's bench or common pleas; and the lord chancellor or judges denying the fame, on fight of the warrant, or oath that the fame is refufed, forfeit feverally to the party grieved the fum of 5001 . 8. That the writ of babcas corpus fhall run into the counties palatine, cinque ports, and other privileged places, and the ifands of Jerfey and Guerniey. 9. That no inhabitant of England (except perfons contracting, or conviets praying to be tranfported; or having comnitred fome capital offence in the place to which they are fent) fhall be fent prifoner to Scotland, Ireland, Jerfey, Guernfey or any places beyond the feas, within or without the king's domunions: on rain that the party committing, his advilers, aiders, and affiftants, thall forfeit to the party grieved a fum not lefs than 5001 . to be recovered with treble cofts; flall be difabled to bear any office of truft or profit; hall incur the penalties of pramunire; and fhall be incapable of the king' pardon.

This is the fubfance of that great and important flatute: which extends (we may obferve) only to the cafe of commitments for fuen criminal charge as can produce no inconvenience to public juftice by a temporary enlargement of the prifoner ; all other cafes of unjuf imprifonment being left to the habeas corpus at common law. But even upon writs at the conmon law it is now expected by the court, agrecable to ancient precedents and the firitit of the act of parliament, that the writ fhould be immediately obeyed, without waiting for any alias or pluries; otherwife an atrachment will iflue. By which admirable regulations, judicial as well as parliamentary, the remedy is now complete for renoving the injury of unjuft and illegal confinement. A remedy the more neceffary, becaufe the oppreffion does not always arife from the ill-nature, but fometimes from the mere inattention, of government. For it frequently happens in foreign countries (and has happened in England during the temporary fufpenfions of the fatute), that perfons ap-
prehended

## $\mathrm{H} A \mathrm{~B}$

Haber-
prchended upon fufpicion have fuffered a long imprifonment, merely becaufe they were forgotten.

HABERDASHER, in commerce, a 反eller of hats and other fmall wares.-The mafter and wardens of the company of haberdafhers in London, calling to theiramitance one of the company of cappers, and another of the hat-makers, and mayors, \&c. of towns, may fearch the wares of all hatters who work hats with fureign woul, and who have not been apprentices to the trade, or who dye them with any thing bat copperas and galls, or woad and madder: in which cales they arc hable to penalties by flat. 8. Eliz. cap 7. and 5 Geo. II. cap. 22.

For the etymology of this denomination, fee BerDASH.

Habergion, or Hauberceon, Mabergetum, a coat of mail; an ancient piece of defenfive armour, in form of a coat, defcending from the neck to the middle, and formed of litile iron rings or malles, linked into each other. - The word is alfo written haberge, haliberge, haubere, haubert, bauther, houtbert, and hauberk. Spelman takes it to have been formed from the ancient French hault, "high," and berg, " armour, covering;" as ferving to defend the upper part of the body. Du Cange and Skinner choofe to derive in from the Belgic bals, or Teuronic haitz, "neck," and bergent, "t to cover;" as if it were a peculiar defence for the neck: Others will have it formed of al, alla, q. d. all, and bergen, "to cover;" as importing it a cover for the whole body.

HABAICOT (Nicholas), a celebrated furgeen, born at Bonny in Gatinois, acquired great reputation by his fkill in his profeffion; and by his writings; and died in 1624. He wrote a treatife on the plague, and feveral other curious works.

HABINGTON (William), an Englifh poet and hiftorian, was the fon of Thomas Habington, Efq. He was born in 1605, at Hendlip in Worcefterfhire; and was educated at St Oners and at Paris. He died in 1654, and left feveral manuferipts in the hands of his fon. His printed works are. I. Poems under the title of Caftura. 2. The queen of Arragon, a tragi-comedy. 3. Obfervations upon Hiftory. 4. The hiftory of Edward IV. king of England, written and publinhed at the defire of Charles $I$. This work is compored in a very florid ftyle.

HABIT, in philofophy, an aptitude or difpocition either of mind or body, acquired by a frequent repetition of the fame act. See Custom and Habit.

Habit is alfo ufed for drefs or garb, or the compofition of garments, wherewith a perion is covered. The principal part of the drefs worn by the Jews and
 an upper garment, confifting of a loofe fquare piece of cloath wrapped round the body; the $\chi^{\text {riav }}$ was an under garment, or tunic, which was faftened round the body and embraced it clofely, falling, down to the midthigh. It is proper in this place to obferve that a perfon divefted of this upper garment or $\quad \mu a t r o n$, in the eaAern language, is Atyled naked, and in this fenfe David danced naked before the ark.
The feveral forts of garments in ufe with both fexes, amongh the Romans, were the toga, tunics, peluna, lacerna, chlamys, paludamentum, læna, fola, pallium or pailia. Sge Toga, \&c.

## 261 H A C

For the habits of the priefts amongft the Jews, Greeks, and Romans, fee the article Priests.

Habit is particularly ufed for the uniform garments of the religious, conformable to the rule and order whereof they make profeffion ; as the habit of St Bcnedict, St Augultine, \&c.
In this fenfe we fay abfolutely, fuch a perfon has taken the habit; meaning he lias entered upon a noviciate in a certain order. So he is faid to quit the ha. bit, when he reuounces the order. See Vow.

The habits of the feveral religions are not fuppofed to bave been calculated for fingularity or novelty: the founders of the orders, who were at firft chiefly inhabitants of deferts and folitudes, gave their monks the habit ufual among the country people. Accordingly, the primitive habits of St Anthony, St Hilarion, St Benedict, \&c. are defcribed by the ancient writers as confinting chiefly of fheep fkins, the common drefs of the peafants, fhepherds, and mountaincers, of that time; and the fame they gave to their difciples.

The orders eftablifhed in and about cities and inhabited places took the habit worn by other ecclefialtics at the time of their inftitution. Thus, St Dominic gave his difciples the habit of regular canons, which he himfelf had always worn to that time. And the like may be faid of the Jefuits, Barnabites, Theatins, Oratorians, \&c. who took the common habit of the ecclefiaftics at the time of their foundation. And what makes them differ fo much from each other, as well as from the ecclefialtical habit of the prefent times, is, that they have always kept invariably to the fame form; whereas the ecclefiaftics and laics have been changing their mode on every occafion.

HABITE and Repute, in Scors law, the common opinion of the people; among whom a perfon lives, with refpect to any circuinflance relating to him.

HABITUDE, among fchoolmen, the refpect or relation one thing bears to anorher. Sec Relation.

HABSBURGH, or Harsburg, an ancient caftle of Swiferland, in the canton of Bern. It is the place where the ancient counts of Hapfburg refided, and is feated near the lake of Lucern, and to the eaft of the town of that name. E. Long. 8. Io. N. Lat 47. 22.

HACHA, a fea-port town of South America, in Terra Firma, feated at the mouth of a river of the fame name. Here the Spanifh galleons touch at their arrival in South America, from whence expreffes are fent to all the fettlements to give them notice of it. W. Long. 72. 8. N. Lat. 11.30.

HACKET (John), bihop of Litchfield and Coventry, was born in 1592. In 1623, he was made chaplain to James I. and prebendary of Lincoln : and foon after obtained the rectory of St Andrew's Holborn, with that of Cheam in Surry; his patron telling him, he intended Holborn for wealth, and Cheam for healch. In 1642 he was prefented to a prebendary and refidentiary; but was deprived of the enjoyment of them, as well as of $\mathrm{S}_{t}$ Andrew's, by the enfuing troubles. He then lived retired at Cheam with little difturbance, until he recovered his preferments by the reftoration of Charles II. by whom he was preferred to the fee of Litchfield and Coventry in 1661. Finding the beautiful cathedral of Litchfield almoft battered to the

Kabi Hacket.

## HAC

Mackney. ground, he in eight years finifhed a complete church fuperior to the former, at his own expence of 20,0001 . excepting 1000 1. he had from the dean and chapter, with what he could procure from private benefactors. He laid out 1000 I . on a prebendal houfe, his palaces at Litchfield and Ecclefhall having been demolifhed during the civil wars : and befide thefe acts of munificence, left feveral other benefactions at his death in 1670 . He publified, before he entered into orders, a comedy intitled Loyola, which was twice acted before king James I. After his death there appeared a "Century of his fermons on feveral remarkable fubjects," in folio; and "Che life of archbifhop Williams," " in folio, which was abridged in 1700 by Ambrofe Philips.

HACKNEY, a parifh of Middlefex, on the northealt fide of London, containing no lefs than 12 hamlets. At the bottom of Hackney-Marfh, through which the river Lea runs, between Old-Ford and the Wyck, there have been difcovered the remains of a great ftone cauleway, which, by the Roman coins, \& c. found there, was no doubt one of the famous highways made by the Romans. The church here is of a veryancient foundation, fo old as Edward II. and the number of houfes near 800 . That part next London is called Mare Street; the middle Church Street; and the north part Clapton Dorlefton and Shaklewell are of the weft, and Hummerton, which leads to the Marfh, on the eaff. Here are three meeting-houfcs and feveral boarding. fchools, befides the free fchools in the church-yard, a charity-fchool, and 17 almfhoufes. It was from this place that the coaches let to the people in London firt received their name; for in the lafl century, many people having gone on vifits to fee their friends at Hackney, it occafioned them often to hire horfes or carriages, fo that in time it became a common name for fuch horfes, coaches, and chairs as were let to the people of London; and the name has now diffured itfelf not only throughout Britain, but likewife Ireland.

Hackney Coaches, thofe expofed to hire in the ftreets of London; and fome other great cities, at rates fixed by authority. See Coach. -Thefe firlt beganto ply in the ftreets of London, or rather waited at inns, in the year 1625 , and were only 20 in number; but in 1635 they were fo much increafed, that king Charles iffued out an order of council for reftraining them. In 1637, he allowed 50 hackney-coachmen, each of whom might keep 12 horfes. In 1652, their number was limited to 200 ; and in 1654, it was extended to 300. In $166 \mathrm{r}, 400$ were licenfed, at 5 1. annually for each. In 1694,700 were allowed, and taxed by the 5 and 6 of W. \& M. at 4l. per annum each. By 9 Anne cap. 23. 800 coaches were allowed in London and Weftminifter ; but by 8 Geo. III. cap. 24. the number is increafed to 1000 , which are to be licenfed by commifioners, and to pay a duty of 5 fh. per week to the king. On Sundays there were formerly only 175 hackney-coaches to ply, which were to be appointed by commiffioners; but their number is now unlimited.

The fare of hackney coachmen in London, or with. in ten miles of the city, is 12 hillings and fixpence per day, allowing 12 hours per day. By the hour it is is . 6 d . for the firft, and is. for every hour afterwards; none are obliged to pay above is. for any diftance not exceeding a mile and a half: or above is. 6d. for
any diftance not exceeding two milcs. Where hack-Haddingney coachmen refure to go at, or exact more than theirlimited hire, they are fubject to a forfeit not under ios. nor exceeding 31. and which the commiffioners have power to determine. Every hackney-coach mult be provided wilh check ftrings, and every coachman plying without them incurs a penalty of 5 s .Drivers of hackney coaches are to give way to perfons of quality and gentlemens coaches, under the penalty of 5 l .

The duty arifing from licences to hackney-coaches and chairs in London, forms a branch of the $\mathrm{king}^{2} \mathrm{~s}$ extraordinary and perpecual revenue *. This revenue is governed by comiffioners of its own, and is in truth a bencfit to the fubject; as the expence of it is felt by no individual, and its neceffary regalations have eftablifhed a competent jurifdiction, whereby a very refractory race of men may be kept in fome tclerable order.

HADDINGTON, a borough-town of Scotland, in Eaft Lothian, which, alonglt with four others, fends one member to parliament. It is furrounded with many feats of nobility and gentry, and is about i6 miles eaft of Edinburgh. It is the county town, and gives title of Earl to a branch of the Hamilton family. W. Long. 2. 25. N. Lat. 55. 50.

HADDOCK, the Englifh name of a fpecies of Gadus.

HADDON (Dr Walter), a great reftorer of the learned languages in England, was bern in 1516 . He diftinguifhed himfelf particularly by writing Latin in a fine fyle, which he acquired by a conftant fudy of Cicero. He was a ftrenuous promoter of the reformation under king Edward: and was therefore thought a proper perfon to fucceed bifhop Gardiner in the mafter Ch ip of Trinity-hall, Cambridge, on his deprivation. He lay concealed during the reign of queen Mary; but acquired the favour of Elizabeth, who conftitured him one of the mafters of the court of requefts, and fent him one of the three agents to Bruges in 1566 , to reftore commerce between England and the Netherlands. He was alfo engaged with Sir John Cheke in drawing up in Latin that ufeful code of ecclefiaftical law, publifled in 5 57 by the learned John Fox, under the title of Reformatio legum ecclefiafticarum; his orher works are collected and publifhed under the tille of Lucubrazions. He died in 1572 .

HADERSLEBEN, a fea-port town of Denmark, in the duchy of Slefwick, with a ftrong citadel, built upon a fmall ifland. It is feated on a bay of the Baltic Sea, and has a well-frequented harbour. E. Long. 9. 35. N. Lat. 55. 24.

HADES, in the Scriptures is ufed in various fenfes. Sometimes it fignifies the invifible regions of the dead, fometimes the place of the damned, and fometimes the grave. In Greek authors it is ufed to fignify in general the regions of the dead. See Heli.

HADLEY, a town of Suffolk, feated in a bottom on the rives Prefton. It confifts of about 600 houfes; with a very handfome church, a chapel of eafe, and a Prefbyterian meetin ${ }_{z}$-honfe. The ftrects are pretty broad, but not paved. Large quantities of yarn are fpun here for the Norwich manofacture ; and this town had once a conliderable woollen manufacture, which is now decayed. E. Long I. O. N. Lat. 52. 7. HADRIAN. See Adrian.
HAMAGOGOS, among phyficians, a compound

Hxman- medicine, confifting of fetid and aromatic fimples mixthus I
Hæmato. pus. ed with black hellcbore, and prefcribed in order to promote the menfrua and hæmorrhoidal fluxes: as alfo to bring away the luchia.

HAMANTHUS, the BLOOD-FLOWER: a genus of the monogynia order, belonging to the hexandria clats of plants; and in the natural method ranking under the ninth order, Spathacea. Theinvolucrum is hexaphyllous and muliturous; the corolla fexpartite fuperior; the berry trilocular.

Species. 1. The coccineus, with plain tongue-fhaped leaves, rifes about a foot high, with a ftalk fupporting a clufter of bright and tubuluas flowers. It hath a large bulbous root, from which in the autumn comes out two broad flat leaves of a flefhy confiftence, fhaped like a tongue, which turn backward on each fide, and fpread on the ground, fo that they have a frange appearance all the winter. In the fpring thefe decay; fo that from May to the beginning of Augult they are deftitute of leaves. The flowers are produced in the autumn juft before the leaves come out. 2. The carinatus, with keel fhaped leaves, has a taller falk and paler flowers than the former; its leaves are not flat, but hollowed like the keel of a boat. 3. The puniceus, with large fpear-lhaped waved leaves, grows about a foot high, and hath flowers of a yellowifl red colour. Thefe are fucceeded by berries, which are of a beautiful red colour when ripe.

Culture. All thefe plants are natives of the Cape of Good Hope, and do not propagate very falt in Europe, their roots feldom puting forth many off-fets. The beft method of managing them is to have a bed of good earth in a bricked pit, where they may be covered with glafles, and in hard frofts with mats and fraw. The earth in the frame fhould be two feet decp, and the frame fhould rife two feet above the furface, to allow height for the flower-ftems to grow. The roots fhould be planted nine or ten inches afunder; and in winter, if they are protected from froft, and not fuffered to have too much wet, but in mild weather expo. fed to the air, they will flower every year, and the flowers will be much ftronger than with any other management. The third fort requires to be conftantly kept in a dry fove.

H压MATITES, or blood stone, a hard mineral fubftance, red, black, or purple, but the powder of which is always red. It is found in maffes fometimes Spherical, femi-fpherical, pyramidal, or cellular, that is like a honeycomb. It contains a large quantity of iron. Forty pounds of this metal have been extracted from a quintal of flone; but the iron is of fuch a bad qua. lity, that this ore is not commonly fimelted. The great hardnefs of hæmatites renders it fit for furbilhing and polihing metals.

HÆMATOPUS, the SEA-PYE, in ornithology, a genus belonging to the order of grallæ. The beak is compreffed, with an equal wedge fhaped point ; the noftrils are linear; and the feet have three toes withont nails, There is but one feecies, viz. The oftralegus, or oyftercatcher, a native of Earope and America. It feeds upon fhell-fing near the fea-hore, particularly oy fters and limpets. On obferving an oyfter which gapes wide enough for the infertion of its bill, it thrults it in, and takes out the inhabitant : it will alfo force the limpets from their
adhefion to the rocks with fufficient eafe. In turn it feeds on marine infeets and worms. With us thefe birds are often feen in confiderable flocks in winter: in the fummer they are met with only in pairs, though chiefly in the neighbourhood of the fea or falt rivers. The female lays four or five eggs, on the bare ground, on the flore, above high-water mark : they are of a greenilh grey, blotched with black. The young are faid to be hatched in about three weeks. Thefe birds are pretcy wild when in flocks ; yet are ealily brought up tame, if taken young.

HÆMATOXYLUM, Locwood, or Campeachy wood: a genus of the monogynia order, belonging to the decandria clafs of plants; and in the natural method ranking under the 3 dorder, Lomentacea. The calyx is quinquepartite; the petals five ; the capfule lanceolated; unilocular, and bivalved; the valves navicular or keeled like a boar.

Ofthis genus there is only one fpecies, viz. the campechianum, which grows naturally in the bay of Campeachy at Honduras, and other parts of the Spanifh Weft-Indies, where it rifes from 16 to 24 feet high. The fems are generally crooked, and very deformed; and feldom thicker than a man's thigh. The branclies, which come out on each fide, are crooked, irregular, and armed with ftrong thorns, garnithed with winged leaves, compofed of three pair of obfcure lobes indented at the top. The flowers come in a racenus from the wings of the leaves, ftanding erect, and are of a pale yellowifh colour, with a purple empalenient. They are fucceeded by flat oblong pods, each containing two or three kidney-feeds.-Dr Wright informs us, that this tree was introduced into Janaica from Honduras in 1715 ; and is at this time too common, as it has overrun large tracts of land, and is very dificule to root out. It makes a beautiful and frong fence sgainft cattle. If pruned from the lower branches, it grows to a fizeable tree, and, when old, the wood is as good as that from Honduras. The trees are cut up into billets or junks, the bark and white fap of which are chipped off, and the red part, or heart, is fent to England for fale.

Logwood is ufed in great quantities for dyeing purple, but efpecially black colours. All the colours, however, which can be prepared from it, are of fading nature, and cannot by any art be made equally durable with thofe prepared from fome other materials. Of all the coloursprepared from logwood, the black is the molt durable. Dr Lewis recommends it as an ingredient in making ink. "In dyeing cloth (fays he), vitriol and galls, in whatever proportions they are ufed, produce only browns of different fhades: I have often been furprifed that with thefe capital materials of the black dye I never could obrain any true blacknefs in white cloth, and attributed the failure to fome unheeded mifmanagement in the proceis, till I found it to be a known fact among the dyers. Logwood is the material which adds blacknefs to the vitriol and gallbrown; and this black dye, though not of the moft darable kind, is the moft common. On blue clotha good black may be dyed by vitriol and galls alone; but even here an addition of logwood contributes not a little to improve the colour."-Mr Delaval, however, in his Effay on Colours, informs us, that with an infufion of galls and iron filings, he not only made up an

## H A E $\quad[264] \quad \mathrm{HACG}$

Hzmop. exceedingly black and durable ink, but alfo dyed linen tyfi. cloth of a very deep black. See Colour-Making,
$1^{\circ}$ 12, 13, 14.; Dyeing, no 17.; and Ink. Logwood is alfo found to have a confiderable aftringent virtue as a medicine, and an extract of it is fometimes given with great fuccefs in diarrbœas.

HÆMOPTYSIS, Hemaptysis, or Hemoptöe ; a fpiting of blood. See (Index fubjoined to) Medicine.

HÆMORRHAGY, (compounded of atra" " blood," and pervues "I burft forth, )" in medicine, a flux of blood at any part of the body; arifing either from a rupture of the veffels, as when they are too full or too much preffed; or from an erofion of the fame, as when the blood is too fharp and corrofive. -The hemorrhagy, properly fpeaking, as underftood by the Greeks, was only a flux of blood at the nofe; but the moderns extend the name to any kind of flux of blood, whether by the nofe, mouth, lungs, fomach, inteftines, fundament, matrix, or whatever part. See Medicine and Surcery.
HEMORRHOIDAL, an appellation givel, by anatomits to the arteries and veins going to the intefinum rectual.
HÆMORRHOIDS, or Piles, an hæmorrhage or iffue of blood from the hæmorrhoidal veffels. Sec (Index fubjnined to) Medicine.
HÆMUS, (anc. "geog.), a vaft ridge, running from Illyricum towards the Euxine, (Pliny) ; fo high as to aftord a profpect both of the Euxine and Adriatic. Here, in after ages, was conftituted a province called Hemimons, or Hemimontus.

HÆRETICO comburendo, a writ which ancient. ly lay againft an heretic, who, having once been con. victed of herefy by his bifhop, and having abjured it, afterwards falling into it again, or into fome other, is thereupon committed to the fecular power. This writ is theught by fome to be as ancient as the common law itfelf; however, the conviction of herefy by the common law was not in a pety ecclefiaftical court, but before the archbithop himfelf in a provincial fynod, and the delinquent was delivered up to the king to do with him as lie pleafed : fo that the crown had a control over the firitual power. But by 2 Hen. IV. cap. 15. the diocefan alone, without the intervention of a fynod, might convict of heretical tenets; and unlefs the convift abjared his opinions, or if after abjuration he relapied, the m eriff was bound ex officio, if required by the bifhop, to commit the unhappy victim to the flames, without waiting for the confent of the crown. This writ remained in force, and was actaally executed on two Anabaptifts in the feventh of Elizabeth, and on two Arians in the ninth of James I.-Sir Edward Coke was of opinion, that this writ did not lie in his time; but it is now formally taken away by fatute 29 Car. II. cap. 9. Bur this ftatute does not extend to cake away or abridge the juriddiction of Proteftant archbihops or bifhops, or any other judges of any ecclefialtical courts, in cafes of atheifm, blafphemy, he. refy, or fchifm, and other damnable doctrines and opinions; but they may prove and punifh the fame according to his majefty's ecclefiaftial laws, by excommunicacion, deprivation, degradation, and orher ecclefiaftical cenfures, not extending to death, in fuch fort and no
other, as they might have done before the making of this act. Sec. 2. See Heresy.

HAERLeM. See Harlen.
HAG, in zoology. See Myxine.
HAGARENS, the defcendants of Inmael. They are called alfo I/bmaelites and Saracens; and lanly, by the general name of Arabians.
As to the Hagarens, they dwelt in Arabia the Happy, accordiag to Pliny. Strabo joins them writh the Nabathæans, and Chavlotæans, whofe habitation was rather in Arabia Deferta. Others think their capital was Petra, otherwife Agra, and confequently they Should be placed in Arabia Petræa. The author of the lxxxiii. Pfalm, ver. 6. joins them with the Moabites; and in the Chronicles it is faid (r Chr. v. 10.), that the fons of Reuben, in the time of Saul, made war againft the Hagarens, and became mafters of their country eaftward of the mountains of Gilead. This therefore was the true and ancient country of the Hägarens. When Trajan came into Arabia, he befieged the Capital of the Hagarens, bat could not take it. The fons of Hagar valued themfelves of old upon their wifdom as appears by Baruch iii. 23.

HAGEDORN (Frederick de), a celebrated German poer, was born at Hamburgh, where his father was refident for the king of Denmark, in 1708. He finifhed his ftudies at Jena; and, in 1718 , publifhed a number of poetical pieces in Germany, which were well received. He afterwards came to England, where he obtained the friendhip of many of the learned: and, at his return, was made fecretary to the Englifh Hamburgh company, a lucrative employment that left him fufficient time for cultivating the mufes. In 1738, he pubiifhed his Fables and Tales, the firft collection of the kind of which Germany can boaft. He afterwards publihed other pieces of poetry of different kinds, as Moral Poems, Epigrams, and five books of Songs: which of all his poerical pieces are moft efteemed. He died in 1754 .

HAGENAU, a town of Germany, and capital of a bailiwick of the fame name, which was formerly imperial, but now belongs to the French. It was taken by them in 1673; the Imperialifts retook it in 1702; after which it was feveral times taken and retaken by both parties; but at laft the French got poffeflion of it in 1 706. It is divided by the river Motter into two parts; and is feated near a foreft of its own name, in E. Long. 7. 53. N. Lat. 48. 49.

HAGGAI, the tenth of the fmall prophets, was born, in all probability, at Babylon, in the year of the world 3457 , from whence he returned with Zerubbabel. It was this prophet who by command from God (Ezra, v. I, 2, \&c.) exhorted the Jews, after their retarn from the captivity, to finifh the rebuilding of the temple, which they had intermitted for 14 years. His remonftrances had their effect ; and to encourage them to proceed in the work, he affured them from God, that the glory of this latter houfe fhould be greater than the glory of the former houfe; which was accordingly fulfilled, when Chrift honoured it with his prefence : for with refpect to the building, this latter temple was nothing in comparifon of the former.

We know nothing certain of Haggai's death. The Jews pretend, that he died in the laf year of the

don : the palace of Opdam, or Waffenaar, is built in a very elegant tafte : the prince and princefs grafts are fine ffreets: the plan, in Dutch Het Pleyn, is a beautiful grove, laid out in feveral crofs walks, and furrounded with fately houfes. The Jewifh fynagogue is well worth being feen by a curious traveller; andalfo the palaces of the prince of Orange, the hotel of Spain, the new Woorhout, the maufoleum of the baron of Opdam in the great charch, and the feveral hofpitals. The environs of the Hague are exceedingly pleafant. Among other agrecable objects are the wood, with the palace of Orange at the extremity of ir, called the houfe in the wood'; the village of Schevcling; and the fand-hilts along the north fea; with the village of Voorburg, and the charming feats and fine gardens round it. Two miles from the Hague is Ryfwick, a village: and, a quatter of a mile from that, a noble palace belonging to the prince of O range, famous for the treaty of peace concluded there in 1697. Loofdaynen, where Margaret, coumeds of Henmeburg, and daughter of Florence IV. count of Holland and Zealand, is faid to have becn delivered of 365 children at 2 birth in 1276 , is about five miles from the Hague. Five miles beyond Loofduynen, and not far from the beautiful village of Graveiande, is Honflardyck, another palace belonging to the prince of Orange, and one of the fineft itructures in the Low Conntries.

HAHN (Simon Frederick), a celebrated German hiftorian. At ten years of age he was not oilly far advanced in the Latin, but underftood leveral living languages. Four years after he pronounced a fpecch on the origin of the cloyfter at Bergen, the place of his birth, which was printed with fume other pleces; and in 1708 he publifined a Continuation of Meibomius's Chronicle of Bergen. After having for feves ral years given pablic leetures at Hall, he became, at the age of 24, profelfor of hiftory at H. lmitadt; and was at length counfellor, hifturiugrapher, and librarian, to the king of Great Britain, elector of Hanover. He died in 1729, aged 37.-Belides the above, and fome other works, he wrote, 1 . The firlt volume of the Hiftory of the Empire. 2. Collectio monumentor unv ve. teram et recentium ine ditorum, 2 vols 8 vo .
hai nan. See Hainan.
$H_{A x}$-Tang, a beantiful Clinefe Ihrub, originally brought from the bottom of the rocks which border the fea-coaft. It has been cultivated in China for more than 14 centuries; and is celebrated as often in the works of the Chinefe poets, as rofes and lilies are in thofe of ours. Painters and embroiderers ornament almoft all their works with its foliage and Howers. The falk of the hai-tang is of a cylindric form, and fhoors forth a number of branches of a parple tint towards their bafes, and full of knots, which are alfo of a purple colour round the edges. It produces a number of floots, the talleft of which are about two feet and a half in height. Its leaves (which are much indented, of an oval form towards the nalk, pointed at their upper extremities, and full of fmall prickles) grow almoft oppofite one another on the branches, and at the fame diftance as the knots. Their colour above is a deep-green; that below is much lighter, and almoft effaced by their fibres which are large, and of a delicate parple : all thefe feaves togerher have a beau-

K k
cifù

Hai-Tan

## H A G

Hai-Tang, tiful effect to the eye. The flowers grow in bunches Hail. a the extremities of the branches. Each flower is compofed of four petals, two great and two fmall, refembling in colour the bloom of a peach tree, and which have almoft the fame figure as the bloffom of our cherry.trees. The two large are cemented one upon the other, in the form of a purfe; and when they blow, the two fmall blow alfo in their turn ; and then the whole four reprefent a crofs. The piftil is compofed of very bright yellow grains, which feparate gradually one from another by the lengthening of the filaments to which they adhere ; they then open into little bells, and compore a fmall yellow tuft, fupported by a llender ftalk, which rifes above the petals. The calyx, which fuftains each of the flowers, is compored of two purple-coloured leaves, united in form of a porfe. In proportion as the flowers grow and increafe in fize, the two leaves of the calyx open, become pale and dry, and drop off. The flowers, fupported by fmall ftalks, feparate one from the other, and produce of themfelves other flowers, which rife up from a new calyx.

This plant is propagated from feed, but with difficulty. It thrives beft in a fandy foil; dung or monld deftroy it; and great care muft be taken to refreh it only with the pureft water. As it cannot endure the fun in any feafon, it is always planted , below walls that are expofed to the north. It generally begins to flower about the end of Auguft. After it has produced feed, all its branches are cut; and it commonly fhoors forth new ones before the fpring fol lowing; but it is neceffary to heap up gravel and pieces of brick round its root, to prevent them from rotting. Notwithftanding all the care that is taken to cultivate this tree at Peking, it does not thrive fo well there as in the foutluern provinces. The fmell of it leaves has an affinity both to that of the rofe and the violet ; but it is weaker, and never extends to any great diftance.

HAIL, in natural hifory, a meteor generally defined frozen rain, but differing from it in that the hailitones are not formed of fingle pieces of ice, but of many little fpherules agglutinated together. Neither are thefe fpherules all of the fame confiftence; fome of them being hard and folid like perfect ice ; others foft, and moftly like fnow hardened by a fevere froft. Sometimes the hailfone hath a kind of core of this foft matter; but more frequently the core is folid and hard, while the outfide is formed of a fofter, matter. Hailfones aflume various figures, being fometimes round, at other times pyramidal, crenated, angular, thin, and flat, and fomerimes fellated, with fix radii like the fmall cryftals of fnow.

Natural hiftorians furnifh us with various accounts of furprifing howers of hail, in which the hailfones were of extraordinary magnitude. Mezeray, fpeaking of the war of Louis XII. in Italy in the year 1510 , relates, that there was for fome time an horrible darknefs, thicker than that of night; after which the clouds broke into thunder and lightring, and there fell a shower of hailftones, or rather (as he calls them) peb-ble-ftones, which he deftroyed all the finn, birds, and beafts of the comntry.-It was attended with a ftrong fmell of fulphar ; and the ftones were of a bluifh colour, fome of them weighing an hundred pounds. Hi/t. de France, Tom.II. p. 339.

## 266 ] HA G

At Lifle in Flanders, in 1686 , fell lallfenes of a very large fize; fome of which contained in the middle a dark brown matter, which thrown on the fire, gave a very great report. Phil. Tranf. $\mathrm{N}^{0} 203$.

Ir Halley and others alforelate, that in Chemire, Lancafhire, \&c. April 29. 1697, a thick black clond, coming from Carnarvonhire, difpofed the vapours to congeal in fuch a manner, that for about the breadth of two miles, which was the limit of the cloud, in its progrefs for the fuace of 60 miles, it did inconceivable damage ; not only killing all forts of fowis and other fmall animals, but fplitting trees, knocking down horfes and men, and even ploughing up the earth ; fo that the hailfones buried themfelves under ground an inch or an inch and a half deep. The hailitones, many of which weighed five ounces, and fome half a pound, and being five or fix inches abour, were of various figures; fome round, otbers half round ; fome fmooth, others emboffed and crenated : the icy fubftance of them was very tranfparent and hard, but there was a fnowy kernel in the middle of them,

In Hertfordhire, May 4. the fame year, after a fevere ftorm of thunder and lightning, a hower of hail fucceeded, which far exceeded the former : fome perfons were killed by it, their bodies heat all black and blue; vaft oaks were fplit, and fields of rye cut down as with a fcythe. The ftones meafured from 10 to 13 or 14 inches about. Their figures were various, fome oval, others picked, fome flat. Philofoph. Tranf, $\mathrm{N}^{\mathrm{R}} 229$.

It is remarkable, that, fo far as we know, bail is a meteor which never produces any bentficial effect. The rain and dew invigorate and give life to the whole vegetable tribe ; the froft, by expanding the water contained in the earth, pulverifes and renders the foil fertile; fnow covers and preferves the tender vegetables from being deftroyed by too fevere a froft. But hail does none of all thefe. In winter, it lies not fufficiently clofe to cover vegetables from the nipping frofts; and in fpring and fummer it not only has a chilling and blafting effect from its coldnefs, but often does great damage to the more tender plants by the weight of the ftones, and in great hail-forms the damage done in this manner is prodigious.

Hail is one of the natural phenomena for which it is almof impoffible to account in any fatisfactory manner. It is certain, that on the tops of mountains hailitones, as well as drops of rain, are very fmall, and continually increafe in bulk till they reach the lower grounds. It would feem, therefore, that during their paffage through the air, they attract the congealed vapour which increates them in fize. But here we are at a lofs how they come to be folid hard bodies, and not always foft, and compofed of many fmall fars like fnow. The flakes of fnow, no doubr, increafe in fize as they defcend, as well as the drops of rain or hailfones; but why fhould the one be in foft cryftals, and the other in large hard lumps, feeing both are produced from congealed vapour? Some modern philofophers afcribe the formation of hail to electricity. Signior Beccaria fuppafes hail to be formed in the higher regions of the air, where the cold is intenfe, and where the electric matter is very copious. In thefe circomilances, a great number of particles of water are brought near toge-

Hais.

## HAI

from their mines, with their eagle-wood and clamba, fo much efteemed by the Orientals. A deputy was fent to the frontiers, to examine the cloths and other commodities of the Chinefe, whofe principal traders repaired to the place of exchange fixed on ; and atter the Chinefe wares were delivered, they put into their hands with the greateft fidelity what they had agreed for. The Chinele governors made immenfe profits by this barter.

The emperor Kang-hi, informed of the prodigions quantity of gold which paffed through the hands of the mandarins by this traffic, forbade his fubjects, unm der pain of death, to have any communication with thefe illanders : however, fome private emiffaries of the neighbouring governors fill find the means of having iutercourfe with them ; but what they get at prefent by this clandeftine trade is little, in companifon of that which they gained formerly. The natives of this illand are very deformed, fmall of fature, and of a copper colour: both men and women wear their hair thruft through a ring ou their forchead; and above they have'a fmall ftraw-hat, from which hang two ftrings that are tied under the chin. Their drefs confifts of a piece of black or dark-blue cotton cloth, which reaches from the girdle to their knees: the wo. men have a kind of robe of the fame ftuff, and mark their faces from the eyes to the chin with blue ftrjpes made with indigo.

A mong the animals of thisilland are a curious fpecies of large black apes, which have the fhape and features of a man; they are faid to be very fond of women : there are allo found here crows with a white ring round their necks; ftarlings which have a fmall crefcent on their bills; a fpecies like black-birds of a deep blue colour, with yellow ears rifing half an inch; and a multitude of other birds remarkable for their colour or fong. Befides mines of gold and lapis lazuli, which enrich the ifland of Hainan, it produces in abundance various kinds of curious and valuable wood. The predeceffor of the prcfent emperor caufed fome of it to be tranfported to Peking, at an immenfe expence, to adorn an edifice which he intended for a maufoleum. The moft valuable is called by the natives hoali, and by the Europeans rofe or violet-wood from its fmell; it is very durable, and of a beauty which nothing can equal; it is therefore referved for the ufe of the emperor.

Hainan, on account of its fituation, riches, and extent deferves to be ranked among the moft confiderable illands of Afia. Not far from thence is another fmallifland, commonly called San-cias. It is celebrated by the death of St Francis Xavier : his tomb is $\cap \mathrm{fill}$ to be feen on a fmall hill, at the hottom of which is a plain covered on one fide with wood, and on the cther ornamented with feveral gardens. This ifland is not a defert, as fome travellers have pretended: it con. tains five villages; the inhabitants of which are poor people, who have nothing to fubfift on but rice and the fifh which they catch.

HAINAULT, a province of the Netherlands, belonging partly to France and partly to the houfe of Auftria. It is bounded to the ronth by Champagne and Picardy; to the north by Flanders; to the eaft by the duchy of Brabant, the county of Namur, and the bihopric of Liege; and to the weft by Artois and

Hainan, Hainault
properly and truly live, and receive nutriment to fill and diftend it like the other patts : which they argue hence, that the roots do not turn grey in aged perfons fooner than the extremities, but the whole changes colour at once, and the like is obferved in boys, \&xc.; which fhows that there is a direct communication, and that all the parts are affected alike.

It may be obferved, however, that, in propriety, the life and growth of hairs is of a different kind from that of the reft of the body; and is not immedately derived therefrom, or reciprocated therewith. It is rather of the nature of vegetation. They grow as plants do out of the earth; or as fome plants fhoot from the parts of others; from which though they draw their nourifhment, yet each has, as it were, its feveral life and a diftinct economy, They derive their food from fome jaices in the body, bat not from the nutritious juices of the body, whence they may live, tho' the body be ftarved.-Wulferus, in the Philifophical Collections, gives an account of a woman buried at Norimberg, whofe grave being opened 43 years after her death, there was hair found iffuing forth plentifully through the clefts of the coffin; infomuch that there was reafon to imagine the cofifin had fome time been covered all over with hair. The cover being removed, the whole corple appeared in its perfect fhape; but, from the crown of the head to the fole of the foor, covered over with a rhick-fet hair, long and curled. The fexton going to handle the upper part of the head with his fingers, the whole ftructure fell at once, leaving noihing in his hand but a handful of hair; there was neither fkull nor any other bone left; yet the hair was folid and flrong enough.-Mr Arnold, in the fame collection, gives a relation of a man hanged for theft, who, in a litule time, while he yet hung upon the gallows, had his body frangely covered over with hair.Some moderns, however, deny the authenticity of thefe and fimilar inftances.

The hairs ordinarily appear round or cylindrical; but the microfcope alfo difcovers triangular and fquare ones; which diverlity of figure arifes from that of the pores, to which the hairs always accommodate themfelves. Their length depends on the quantity of the proper bumour to feed them, and their colour on the quality of that humour: whence, at different ftages of life, the colour ufually differs. Their extremities split into two or three branches, efpecially when kept dry, or fuffered to grow too long; fo that what appears only a fingle hair to the naked eye, feems a bruif to the microfcope.

The hair of a moufe, viewed by Mr Derbam witha microfcope, feemed to be one fingle tranfparent tube, with a pith made up of fibrous fubftances, running in dark lines, in fome hairs tranfverfely, in others fpirally. The darket medullary parts or lines, he obferves, were no other than fmall fibres convolved round, and lying elofer together than in the other parts of the hair. They run from the botom to the top of the hair ; and he imagines may ferve to make a gentle evacuation of fome humour our of the body. Hence the bair of hairy animals; this author fuggefts, may not only ferve as a fence againft cold, \&c. but as an organ of infendible perfpiration.

Though the external furface of the body is the natutural place for hairs, we have many well attefted in.

Hair.
the fkins of animals; and ferving moft of them as a tomy $\mathrm{n}^{\circ} \delta 2$. tegument or covering. nefs of fom

Hair is found on all parts of the human body, exccpt the foles of the feet and the palms of the hands. -But it grows longeft on the head, chin, breaft, in the arin-pits, and about the privities.
The ancients held the hair a fort of excrement, fed only with excrementitious matter, and no proper part of a living body.-They fuppofed it generated of the fuliginous parts of the blood, exhaled by the heat of the body to the furface, and there condenfed in paffing through the pores.-Their ghief reafons were, that the hair being cut, will grow again apace, even in extreme old age, and when life is very low : that in hectic and confumprive people, where the reft of the body is continually emaciating and attenuating, the hair fhall thrive : nay, and that it will grow again in dead car-cafes.-They added, that hair does not feed and grow like the other parts, by introfurception, i.e. by a juice circulating within it ; but, like the nails, by juxtapofition, each part next the root, thrufting forward that immediately before it.

But the moderns are agreed, that every hair does

## H A I

[ 269 ]
The hair of both Jewifh and Grecian women engaged a principal fhare of their attention, and the Roman ladies feem to have been no lefs curious with refpect to theirs. They generally wore it long, and dreffed it in a variety of ways, ornamenting it with gold, filver, pearls, \&c. On the contrary, the men amongt the Greeks and Romans, and amongft the latter Jews, wore their hair fhort, as may be collected from books, medals, ftatues, \&c. This formed a principal diftinetion in drefs betwixt the fexes. This obfervation illuftrates a paffage in St Paul's epiftle to the Coriathians (I Cor. xi. 14.15.)

St Paul torbids the Corinthian women, when praying by divine infpiration, to have their heads dithevelled; probably becaufe this made them refemble the heathen priefteffes, when actuated by the pretendedinfluence of their gods.

Amongit the Greeks, both fexes, a few days before marriage, cut off and confecrated their hair as an offering to their favourite deities. It was alfo cuftomary a mong them to hang the hatr of the dead on the doors of their houles previous to interment. They likewife tore, cut cff, and fometimes thaved their hair, when mourning for their deceafed friends or relations, which they laid upon the corpfe or threw into the pile, to be confumed together with the body. The ancients imagined that no perfon could die till a lock of hair was cut off; and this ant they fuppofed was performed by the invifible hand of death, or Iris, or fome other metfenger of the gods. This hair, thus cut off, they fancied confecrated the perfon to the infernal deities, under whofe jurifdiction the dead were fuppored to be. It was a lort of firlt fruits which fanctified the whole. (Sec Virg. Enr. 4.694.)

Whatever was the fafhion, with refpect to the hair, in the Grecian ftates, flaves were forbidden to imitate the freemen. The hair of the flaves was always cut in a parricular manner called $\theta_{\rho} \xi$ \& $\alpha \delta$ patodeodns, which they no longer retained after they procured their freedom.

It was eftimated a notable honour among the ancient Gauls to have long hair, and hence came the appelia.tion Gallia comata. For this reafon Julius Cæfar, upon fubduing the Gauls, made them cut uff their hair as a token of fubmifion.- It was with a view to this, that fuch as afterwards quitted the world to go and live in eloifters, procured their hair to be haven off; to fhow that they bid adien to all earthly ornaments, and made a vow of perpetual fubjection to their fuperiors.

Greg. of Tours affures us, that in the royal family of France, it was a long time the peculiar mark and privilege of kings and princes of the blood to wear long hair, artfully dreffed and curled: every body elfe was obliged to be polled, or cut round, in fign of in. feriority and obedience. Some writers affure us, that there were different cuts for all the different qualities and conditions; from the prince, who wore it at full length, to the flave or villain who was quite eropt. - To cut off the hair of a fon of France, under the firft race of kings, was to declare him excluded from the right of fucceeding to the crown, and reduced to the condition of a fubject.

In the eighth century, it was the cuftom of people of quality to have their childrems hair cut the firft ime.

HA I
by perfons they had a particular honour and efteem for; who, in virtue of this ceremony, were reputed a fort of spiritual parents or godfathers thereof: Tho' this practice appears to have been more ancient ; infmach as we read, That Confantine Cent the pope the hair of his for Heraclius, as a token that he defired him to be his adoptive father.

The parade of long hair became fill more and more obnoxious in the progrefs of Chriflianity, as fomething utterly inconfitent with the profefion of perfons who bore the crofs. Hence numerous injunctions and ca. no ns to the contrary. -Pope Anicetas is commonly fuppofed to have been the firth who forbade the clergy to wear long hair : but the prohibition is of an older ftanding in the churches of the eat; and the letter wherein that decree is written, is of a much later date than that pope. -The clerical tonfure is related by If idore Hifpalenfis, as of apoftolical inftitution.

Long hair was anciently held fo odious, that there is a canon fill extant of the year roc, importing, that fuck as wore long hair should be excluded coming in. to church while living, and not to be prayed for when dead. We have a furious declamation of Luitprand againft the emperor Phocas, for wearing long hair, after the manner of the other emperors of the eat, all except Theophilus, who being bald, enjoined all his fubjects to have their heads.

The French historians and antiquaries have been very exact in recording the head of hair of their feveral kings. Charlemagne wore it very fort, his on Shorter; Charles the Bald had none at all. Under Hugh Capet it began to appear again; this the ecclefiaftics took in dudgeon, and excommunicated all who let their hair grow. Peter Lombard expoftulated the matter fo warmly with Charles the Young, that he cut off his hair ; and his facceffors for forme generations wore it very fhort.-A profeffor of Utrecht, in 1650, wrote expressly on the queftion, Whether it be lawful for men to wear long hair? and' concluded for the negative.Another divine named Reeves, who had written for the affirmative, replied to him.

The ancient Britons were extremely proud of the length and beauty of their hair, and were at much pains in drefling and adorning their heads. Some of them carried their fondnefs for and admiration of their hair to an extravagant height. It is faid to have been the lat and molt earneft requeft of a young warrior, who was taken prifoner and condemned to be beheaded, that no lave might be permitted to touch lis hair; which was remarkably long and beautiful, and that it might not be ftained with his blood. We hardly ever meet with the defcription of a fine woman or beautiful man, in the poems of Offian, but the hair is mentoned as one of their greateft beauties. Nor conrented with the natural colour of their hair, which was commonly fair or yellow, they made use of certain washes to render it fill brighter. One of there washes was a compofition of lime, the afhes of certain vegetables, and tallow. They made ale of various arts alto to make the hair of their heads grow thick and long; which lat was not only efteemed a great beauty, but was confidered as a mark of dignity and noble birth. Boadicea, queen of the Iceni, is defcribed by Bio with very long hair, flowing over her fhoulders, and reaching down below the middle of her back.

2701 HA I
The Britons fhaved all their beards; except their upper lips; the hair of which they, as well as the Gauls, allowed to grow to a very inconvenient length.

In after-times, the Anglo Saxons and Danes alpo confidered fine hair as one of the greaten beauties and ornaments of their perfons, and were at no little pains in drefling it to advantage. Young ladies before marrage wore their hair uncovered and untied, flowing in ringlets over their fhoulders; but as foon'as they were married, they cut it hotter, tied it up, and put on a head-drefs of forme kind or other according to the prevailing falchion. To have the hair entirely cut off was fo great a difgrace, that it was one of the greateft punifhments inflicted on thole women who were guilty of adultery. The Danifh folders who were quartered upon the Englifh, in the reigns of Edgar the Peaceable and of Ethelred the Unready, were the beaux of thole times, and were particularly attentive to the drefling of their hair; which they combed arleaft once every day, and thereby captivated the affections of the English ladies. The clergy, both fecular and regular, were obliged to have the crowns of their heads, and keep their hair fort, which diftinguifhed them from the laity; and feveral canons were made againit their con. cealing their tonsure, or allowing their hair to grow long. The chape of this clerical tonfure was the -rubjet of long and violent debates between the Englifh clergy on the one hand, and thole of the Scots and Pets on the other'; that of the former being circular, and that of the latter only femicircular. It appears very plainly, that long flowing hair was univerfally efteemed a great ornament; and the tonsure of the clergy was considered as an act of mortification, and felf-denial, to which many of them fubmitted with reluctance, and endeavoured to conceal as much as poffible. Some of them who affected the reputation of fuperior fanctity, inveighed with great bitterness againft the long hair of the laity; and laboured earnestby to perfuade them to cut it hort, in imitation of the clergy. Thus the famous St Walitan bifhop of Xor* center, is raid to have declaimed with great vehemence against luxury of all kinds, but chiefly against long hair as molt criminal and mon univerfal. "t The Englifh (fays William of Malmfbury in his life of St Wulftan) were very vicious in their manners, and plunged in luxury through the long peace which they had enjoyed in the reign of Edward the Confeffor. The holy prelate, Wulftan reproved the wicked of all ranks with great boldnefs ; but he rebuked thole with the greaten Severity who were proud of their long hair. When any of thole vain people bowed their heads before him to receive his bleffing, before he gave it, he cut a lock of their hair with a little tharp knife, which he carried about him for that purpose; and commanded them, by way of pennance for their fins, to cut all the reft of their hair in the fame manner. If any of them refuted to comply with this command, he denounced the mort dreadful judgments upon them, reproached them for their effeminacy, and foretold, that as they imitated women in the length of their hair, they would imitate them in their cowardice, when their country was invaded; which was accomplified at the landing of the the Normans."
This continued to be long a topic of declamation among the clergy, who even reprefented it as one of

Hair.

## HAI [ 271 H A I

Hair. the greateft crimes, and moft certain marks of reprobation. Anfelm archbifhop of Canterbury went fo far as to pronounce the then terrible fentence of excommunication, againft all who wore long hair, for which pious zeal he is very much commended. Serlo a Norman bifhop, acquired great honour by a fermon which he preached before Henry I. A. D. Iro4, againft long and curled hair, with which the king and all his courtiers were fo much affected, that they confented to refign the flowing ringlets, of which they had been fo vain. The prudent prelate gave them no time to change their minds, but immediately pulled a pair of fhears out of his lleeve, and performed the operation with his own hand. Another incident happened about 25 years after, which gave a temporary check to the prevailing fondnefs for long hair. It is thus related by a contemporary hiftorian; "An event happpened A. D. 1129, which feemed very wonderful to our young gallants: who forgetting that they were men, had transformed themfelves into women by the length of their hair. A certain knight, who was very proud of his long luxuriant hair, dreamed that a perfon fuffocated him with its curls. As foon as he awoke from his lleep he cut his hair to a decent length. The report of this fpread over all England and almoft over all the knights reduced their hair to the proper ftandard, But this reformation was not of long continuance; for in lefs than a year all who wifhed to appear famionable returned to their former wickednefs, and contended with the ladies in length of hair. Thofe to whom nature had denied that ornament fupplied the defeet by art."

The Greeks, and, after their example, the Romans, wore falfe hair.

Commerce of HAIR. Hair makes a very confiderable article in commerce, efpecially fince the mode of perukes has obtained. The hair of the growth of the northern countries, as England, \&c. is valued much beyond that of the more foutheri ones, as Italy, Spain, the fouth parts of France, \&c. The merit of good lair confifts in its being well fed, and neither too courfe nor too flender; the bignefs rendering it lefs fufceptible of the artificial curl, and difpoling it rather to frizzle, and the fmallnefs making its curl of too fhort duration. Its length hould be about 25 inches: the more it falls fhort of this the lefs value it bears.

There is no certain price for hair: but it is fold from five fhillings to five pounds an ounce, according to its quality.

The fcarcenefs of grey and white hair has put the dealers in that commodity upon the methods of redscing other colours to this. This is done by fureading the hair to bleach on the grafs like linen, after firf wafhing it out in a lixivious water. This lye, with the force of the fun and air, brings the hair to fo perfect a whitenefs, that the moft experienced perfon may be deceived therein; there being fcarce any way of detecting the artifice, but by boiling and dyeing it, which leaves the hair of the colour of a dead walnut-tree leaf.

There is alfo a method of dyeing hair with bifmuth, which renders fuch white hair as borders too much upon the yellow of a bright filver colour: boiling is the proof of this too, the bifmuth not being able to ftand it.

Hair may br changed from a red, grey, or other difagrceable colour, to a brown or decp black, by a folution of filver. The liquors fold under the name of bair waters, are at buttom no more than folutions of filver in aquafortis, largely diluted with water, with the addition perhaps of other ingredients, which contribute nothing to their efficacy. The folution fhould be fully faturated with the filver, that there may be no more acid in it than is neceffary for holding the metal diffolved; and befides dilution with water, a little fpirit of wine may be added for the further dulcification of the acid. It muft be oblerved, that for diluting the folution, diftilled water, or pure rain-water, mult be ufed ; the common fpring-waters turning it milky, and precipitating a part of the diffolved filver. It is to be obferved alfo that if the liquor touches the fkin, it has the fame effect on it as on the matter to be ftained, changing the part moiftened with it to an indelible black.-Hair may be dyed of any colour in the fame manner as wool. See Dyeing.

Hair which does not curl or buckle naturally is b:ought to it by art, by firft boiling and then baking it in the following manner: After having picked and forted the hair, and difpofed it in parcels according to lengths, they roll them up and tie them tight down upon little cylindrical inftrumems, either of wood or earthen ware, a quarter of on inch thick, and hollowed a little in the middle, called pipes; in which ftate they are put in a pot over the fire, there to boil for about two hours. When taken out, they let them dry; and when dryed, they fread them on a fnect of brown paper, cover them with another, and thus iend them to the paftry cook; who making a cruft or coffin around them of common pafte, fets them in an oven till the cruft is about three-fourths baked.

The end by which a hair grew to the head is called the bead ef the hair; and the other, with which they begin to give the buckle, the point. Formerly the peruke-makers. made no difference between the ends, but curled and wove them by either indifferently; but this made them unable to give a fine buckle; hair wovell by the point never taking a right curl. Foreigners own themfelves obliged to the Englifh for this difcovery, which was firft carried abroad by a peruke-maker of that country.

Hair is alfo ufed in various other arts and manufac-tares.-In particular, the hair of the beavers, hares, conies, \&c. is the principal matter whereof hats are made. Spread on the ground, and left to putrefy on cornlands, hair, as all other animal fubftances, viz. horns, hoofs, blood, garbage, \&c- proves good manure.

HaIR, in farriery, is generally called the coat; and, with regard to horfes, deferves particular confideration'.

The hair growing on the fetlock ferves as a defence to the prominent part of it in travelling in foney ways or in frofly weather. If the hair of a horfe's neck, and the parts mon uncovered, be clofe, fmooh, and neek, it is an indication of his being in bealch and good cafe. In order to make the hair of an horle foft and neek, he mult be kept warm at heart, for the lent inward cold will caufe the hair to fare; alfo fweat him often, for that will loofen and raife the duft and filth that renders his coat fowl; and when he is in the heat of a fweat, fcrape off all the white foam, fweat, and filth, that is raifed up with an oid fword-blade : and alfo when he is blooded, if you rub him all over wirh
his own blood, repeating it two or three days, and curry and drefs him well, it will make his coat hine as if covered wish a fine varnifh.

Hair falling from the mane or tail is caufed either by his having taken fome hear, which has engendered a dry mange; or from fome furfeit, which caufes the evil humours to refort to thofe parts. To cure this, anoint the horfe's mane and creft with black foap; make a ftrong lee of afhes, and walh it all over with it. But if a canker fhould grow on a horfe's tail, which will eat away both flefh and bone; then put fome oil of virtiol to it, and it will confume it; and if you find that the vitriol corrodes too much, you need only to wet is wilh cold water, and it will put a ftop toit.

If you would take away hair from any part of a horie's body, boil half a pound of lime in a quart of water, till one tourth part is confumed, to which add an ounce of orpiment; make this into a plafter, and lay iton.

Hair, or Down, of plants; a general term expreffive of all the hairy and glandular appearances on the furface of plants, to which they are fuppofed by naturalifts to ferve the doable purpulc of defenlive weapons and veffels of fecretion.

Thefe hairs are minute threads of greater or lefs length and rolidity ; fome of them vifible to the naked eye; whilt others are rendered vifible only by the help of glaffes. Examined by a microfcope, almatt all the parts of plants, particularly the young ftalks or ftems, appear covered with hairs.
Hairs on the furface of plants prefent themfelves under various forms; in the legominous plants they are generally cylindric; in the mallow tribe, terminated in a point ; in agrimony, fhaped like fill-hook; in nettle, awl-haped and jointed; and in fome compound flowers with hollow or funnel-fhaped florets, they are terminated in two crooked points.

Probable as fome experiments have rendered it, that the hairs on the furface of plants contribute to fome organical fecretion, their principal ufe feems to be to preferve the parts in which they are lodged from the bad effects of violent frictions, from winds, from extremes of heat and cold, and fuch like external injuries.
M. Guettard, who has eftablifhed a botanical method from the form, fituation, and other circumftances of the hairy and glandular appearances on the furface of plants, has demonftrated, that thefe appearances are generally conftant and uniform in all the plants of the fame genus. The fame uniformity feems to characterife all the different genera of the fame natural order.

The different forts of hairs which form the down upon the furface of plants wereimperfectly diftinguifhed by Grew in 5682 , and by Malpighi in 1686. M. Guetrard juft mentioned was the firft who examined the fubject both as a botanift and a philofopher. His obfervations were publified in 1747.
$H_{A I R}$-Clotb, in military affairs, are large pieces of cloth made with half hair. They are ufed for covering the powder in waggons, or upon batteries; as alfo for covering charged bombs or hand-grenades, and many other ufes in magazines.

Hair-Powder. See Stargh.
Hair-Worm. See Gordius.
HAKE, in ichthyology, the Englif name of a fian
common in the Englifh and fome other feas, and called Haklayts by authors the merlacius and lucius marinus. This finh Halberwas ufed of old dried and falted. Hence the proverb ftadt. obtains in Kent, As dry as abake.

HAKLUYT (Richard), a naval hiftorian, is fuppofed to have been born in London, about the year 1553, and defcended of a genteel family in Herefordmire, as the name frequently occurs in thelift of high heriffs for that connty informer reigns. He was educatedat $W$ eft-minifter-fchool; and thence, inis70, removed to Cbriftchurch, Oxford; where he applied himfelf particularly to the ftudy of cofmography, and read public lectures in that fcience. Sir Edward Stafford being fent ambaffador to France in 1585 , MrHakluyt was one of his attendants, probably in the capacity of chaplain. He was ar this time maller of aris and profeflor of divinity. In 1585 he obtained the royal mandate for the next vacant prebend of Briftol to which preferment he fucceeded daring his refidence at Paris. Conftantly attentive to his favourite colmographical inquiries, in fearching the French libraries, he found a valuable hiftory of Florida, which had been difcovered about 20 years before by Captain Loudonniere and others : this he caufed to be publithed at his own expence, in the French language, and foon after revifed and republined Peter Martyr's book De orbe Novo. After five years refidence in France, Mr Hakluyt returned to England in company with lady Shefficld, fifter to the lord admiral Howard. In the year 1589 he publifined his collection of Voyages in one follo volume, which in $159^{8}$ was republinedin three. In 1605 our author was made prebendary of Weftminfter; which, with the Reetory of Wetheringfet in the connty of Suffolk, feems to have been the fummir of his preferment. He died in 1616, and was buried in Weftminfter-abbey; bequearhing to his fon Edmund his manor of Bridge-Place, and feveral houfes in Tothil-ftrect, Weftminfter. He was an indefatigable and faithful hiftorian. His works are, I. A Collection of Voyages and Difcoveries, a fmall volume. 2. Hiftory of Florida, abovementioned. 3. The principal Navigations, Voyages, and Difcoveries of the Englifh Nation, made by Sea or over Land to the fartheft dinant Quarters of the Earth, at any time within the compais of thete 1500 years, in three vols folio. 4. The Difcoveries of the World, from the firit Original to the Year 15.55, written in the Portugal tongue by Ant. Galvano ; corrected, much amended, and tranlated into Englifh, by Richard Hakluyt. 5. Virginia richly valued, by the Defcription of the Main Land of Florida, her next neighbour, \&c. written by a Portugal gentleman of Elvas, and tranflated by Richard Hakluyt. Befides thefe, he left feveral manufcripts, which were printed in Purchas's collection.

HALBERSTADT, a fmall principality of Germany, bounded on the north-ealt by the dachy of Magdeburg, on the fouth by the principality of $\mathrm{An}_{\mathrm{g}}$ halt, on the weft by the diocefe of Hildfheim, on the caft by part of the electorate of Saxony, and on the north by Bruniwic Woilfenbuttle. It is near 40 miles in length and 30 in breadth. The foil in general is fertile in corn and flax; and there are fome woods, though in general fuel is farce. There are three large towns in it which fend reprefentatives to the diet, to. gether with ro fmall ones, and 9r country-towns and

## H A L

Palbertftadt
Hialde.
villages. The number of the inhabitants is computed at about 200,000; the greateit part of them are Latherans ; but there are alfo Calvinifts, Jews, and Roman Catholics. The manufactures are chiefly woollen (for the country produces a great number of theep) ; the exports are grain, and a kind of beer called broiban. The anmual revenue arifing from this principality, and the incorporated countics and lordihips, is faid to amount to 500,000 rix-dollars. Till the treaty of Weitphalia in 1648 this country was a diocefe, but was then transferred to the electoral houfe of Brandenburg as a temporal principality. It is intitled to a vote both in the diet of the empire and that of the circle. The principal places are Halberftadt, Groningen, Of cherneben, Ofterwick, \&c.

Halberstadt, a city of Germany, in the circle of Lower Saxony, fituated near the river Hothein. It is a neat uniform place; and has fome good churches and other handfonte buildings, of which the cathedral is the chief. There is an inn in this place, which is looked upon to be the largef and to have the bett accommodations of any in Europe. Before the Reformation, it was a bifhop's fee. E. Long. Ir. 29. N. Lat. 52.6.

HALBERT, or Halbard, in the art of war, a well-known weapon carried by the ferjeants of foot, and dragoons. It is a fort of fpear, the fhaft of which is about five feet long, and made of afh or other wood. Its head is armed with a fteel point, not unlike the point of a two-edged fword. But befides this farp yoint which is in 2 line with the thaft, there is a crofs piece of feel, flat and pointed at both ends; but generally with a cutting edge at one extremity, and a bent fharp point at the other; fo that it ferves equally to cut down or to puin withal. It is alfo ufeful in determining the ground between the ranks, and adjufting the files of a battalion: The word is formed of the German hat, " hall," and bard, "an hatcher." Voffius derives it from the German hallebaert, of bel, "clarus, fplendens," and baert, "ax."

The halbert was anciently a common weapon in the army, where there were companies of halbardiers. It is faid to have been ufed by the Amazons, and afterwards by the Rhætians and Vindelicians about the year 570 .

It was called the Danifh ax, becaure the Danes bore an halbert on the left Ghoulder. From the Danes it was cerived to the Scots, from the Scots to the Englifh Saxons, and from them to the French.

HALCYON, in ornithology, a name given by the ancients to the alcedo or king's fifher. See Aicedo.

Halc on Days, in antiquity, a name given to feven days befcre and as many after the winter folftice; by reafon the halcyon, invited by the calmners of the weather, laid its eggs in nefts built in the rocks, clofe by the briak of the fea, at this feafon.

HALOE (John Baptift du), a learned French Jefair, born at Paris in 1674. He was extremely well verfed in Afiatic geography: and we bave of his compilation a work intilled Grand Defcription de la Chine $\dot{\psi}$ de la Tartarie, from original memoirs of the Jefuitical miffionaries, in 4 vols folio. He was alfo concerned in a cellection of letters begun by father Gobien, called Des bettres edifiantes, in 18 vols; and publifhed fome Latin poems and orations. He died in 743. Vol, Vlil.

## 273 - 1 A

HALE, in the fea langoage, fignifies path; as, to hale up, is to pull up; to hale in or out, is to pull in or out. To over-hale a roje, is to hale it too fiff, or to hale in the contrary way.
Keel-Hale. See Ducking.
Hate (Sir Marthew), lord chief juftice of the king's-bench in the reign of Charles II. was the fon of Robert Hale, Efq; a barriller of Lincoln's Inn, and was born in 1609. He was educated ar Oxford, where he inade a confiderable progrefs in learning; but was afterwards diverted from his litudics by the levities of youth. From thefe he was reformed by Mr John Glanvill, ferjeant at law; and applying to the ftudy of the law, entered into Lincoln's Inn. Noy the attory ney-general took early notice of him, and directed him in his nudies. Mr Selden alfo took much notice of him ; and it was this acquaintance that firf fet Mr. Hale on a more enlarged purfuit of learning, which he had before confined to his own profeffion. Duriug the civil wars, he behaved fo well as to gain the efteem of both parties. He was employed in his practice by all the king's party ; and was appointed by the parliament one of the commiffioners to treat with the king. The murder of king Charles gave him very fenGble regret. However, he took the engagement; and was appointed, with feveral others, to confider of the reformation of the law. In 1653 he was by writ made ferjeant at law, and foon after appointed one of the juftices of the Common Pleas. Upon the death of Oliver Cromwell he refufed to accept of the new commifion offered him by Richard his fucceffor. He was returned one of the knights of Gloucefterflire in the parliament which called home Charles II. Soon after he was made lord chief baron of the exchequer; but declined the honour of knighthood, till lord chancellor Hyde, fending for him upon bufinefs when the . king was at his houfe, told his majefty, that "thore was his modeft chief baron;" upon which he was unexpectedly knighted. He was one of the principal judges that fat in Clifford's Inn about fenting the difference between landlord and tenant, after the fire of London, in which he behaved to the fatisfaction of all parties concerned, and alfo in his poft of chief baron acted with inflexible integrity. One of the firft peers went once to his chamber, and told him, "That having a fuit in law to be tried before him, he was then to acquaint him with it, that he might the better underftand it when it fhould come to be tried in court." Upon which the lord chief baron interrupted him, and faid, "He did not deal fairly to come to his cham. bers about fuch affairs; for he never received information of fuch caufes but in open court, where both parties were to be heard alike." Upon which his grace (for he was a duke) went away not a litle diffatisfied, and conplained of it to the king as a rudeneis that was not to be endured: but his majefty bid him content himfelf that he was ufed no worfe; and faid, "That he verily believed he woald have ufed him no better if he had gone to folicit him in any of bis own caufes." Another remarkable incilent happened in one of his circuits. A gentleman who had a trial at the allizes had fent him a buck for his table. When judge Hale therefore beard his mame, he anked " if he was not the fame perfon whe had fent him the venifon !" and finding that be was the fame, told him, that "he could

Hales not fuffer the trial to go on till he had paid him for his buck." The gentleman anfwered, that "ne never fold his venifon; and that he had done nothing to him which he did not do to every judge who had gone that circuit:" which was confirmed by feveral gentlemen prefent. The lord chief baron, however, would not fuffer the trial to proceed till he had paid for the prefeat : upon which the gentleman withdrew the record. In fhore, he was in 167 I advanced to be lord chief juftice of the king's bench; but about four years after this promotion, his health declining, he refigned his poft in February 1675-6, and died in December following. This excellent man, who was ant ornament to the bench, to his country, and to human nature, wrote, I. An Effay on the Gravitation and Non-gravitation of Flnid Bodies, 2. Obfervations touching the Torricellian Experiment. 3. Contemplations, moral and divine. 4. The Life of Pomponius Atticus, with political and moral Reflections. 5. Obfervations on the Principles of Natural Motion. 6. The primitive Origination of Mankind. He alfo left a great number of manufcripts in Lariur and Englifh, upon various fubjects; among which are his pleas of the Crown, fince publifhed by Mr Emyln in two volumes folio; and his Original Inftitution, Power, and Jurifdiction of Parliaments.

Hales (Stephen)ni D. D. a celebrated divine and philofopher, was born in 1677. He was the fixth fon of Thomas Hales, Efq; the eldeft fon of Sir Robert Hales, created a baronet by king Chayles H. and Mary the heirefs of Richard Langley of Abbots-Wood in Hertfordhire. In 1696 he was entered a penfioner at Bennet-college, Cambridge ; and was admitted a fellow in 1703 , and became bachelor of divinity in 1711. He foon difcovered a genius for natural philofophy. Botany was his firf ftudy; and he uled frequently to make excurfions among Gogmagog hills, in company with Dr Stakely, with a view of profecuting that ftudy. In thefe expeditions he likewife collected foffils and infests, having contrived a curious infrument for catching fuch of the latter as have wings. In company with this friend he alfo applied himfelf to the fludy of anatomy, and invented a curious method of obtaining a reprefentation of the lungs in lead. They next applied themfelves to the ftudy of cliemiftry; in which, however, they did not make any remarkable difcoveries. In the fudy of aftronomy Mr Hales was equally affiduons. Having made himfelf acquainted with the Newtonian fyftem, he contrived a machine for howing the phenomena on much the fame principles with that afterwards made by Mr Rowley, and, from the name of his patron, called an Orrery.

About the year ryro he was prefented to the perpetual cure of Teddington near Twickenham, in Middlefex; and afterwards accepted of the living of Porlock in Somerfetfhire, which vacated his fellowfhip in the college, and which he exchanged for the living of Faringdon in Hamphire. Soon after, he married Mary, the daughter and heirefs of Dr Newce, who was rector of Halifham in Suffex, but refided at Minch-Haddam, in Hertfordhire. On the $13^{\text {th }}$ of March 1718, he was elected member of the Royal Sdciety; and on the 5 th of March, in the year following, he exhibited an account of fome experiments he had lately made on the effect of the
fun's warmth in raifing the fap in trees. This pro- Hades. cured him the thanks of the fociety, who alfo requefted him to profecute the fubject. With this requeft he complied with great pleafure; and on the $14^{\text {th }}$ of June 1725 exhibited a treatife in which he gave an account of his progrefs. This treatife being highly applauded by the fociety, he farther enlarged and improved it; and in April 1727 he publifhed it under the title of Vegetable Statics. This work he dedicated to his late majefty king George II. who was then prince of Wales; and he was the fame year chofen one of the conncil of the Royal Society, Sir Hans Sloane being at the fame annual election chofen their prefident. The book being well received, a fecond edition of it was publifhed in 1735. In a preface to this edition Mr Hales promifed a fequel to the work, which he publifhed in 1733 under the title of Statical Effays, \&c. In $\sqrt{732}$ he was appointed one of the truftees for eftablifhing a new colony in Georgia. On the 5 th of July 1733 the Univerfity of Oxford honoured him with a diploma for the degree of doctor of divinity ; a mark of diftinction. the more honourable, as it is not ufual for one univerfity to confer academical honours on thofe who were educated at another. In 1734, when the health and morais of the lower and middling clafs of people were fubverted by the exceffive drinking of gin, he publifhed, though without his name, A friendly Admonition to the Drinkers of Brandy and other Spirituons Liquors; which was twice reprinted. The latter end of the fame year he publifhed a fermon which he preached at St Bride's. before the reft of the truftees for eftablifhing a new colony in Georgia. His text was, "Bear ye one anothier's burdens, and fo fulfil the law of Chrift ;' Galatians vi. 2. In 1739 he printed a volume in 8 vo , intitled, Philofophical Experiments on Sea-water, Corn, Flefh, and other fubftances. This work, which contained many ufeful inftructions for voyagers, was dedicated to the lords of the admiralty. The fame year he exhibited to the Royal Society an account of fome farther experiments towards the difcovery of medicines for diffolving the ftone in the kidneys and bladder, and preferving meat in long voyages; for which be received the gold medal of Sir Godfrey Copley.'s donation. The year following he publifhed fome account of Experiments and Obfervations on Mr Stephens's Medicines for diffolving the Stone, on which their diffolvent power is inquired into and demonflrated.

In 1741 he read before the Royal Society an account of an inftrument which he invented, and called aventilator, for conveying frefh air into mines, hofpitals, prifons, and the clofe parts of hips : he had communicated it to his particular friends fome months before ; and it is very remarkable, that a machine of the fame kind, for the fame purpore, was in the fpring of the fame year invented by one Martin Triewald, an officer in the fervice of the king of Sweden, called captain of mechanies, for which the king and fenate granted him a privilege in October following, and ordered every fhip of war in the fervice of that ftate to be furnifhed with one of them; a model alfo of this machine was fent into France, and all the hips inf the French navy were alfo ordered to have a ventilator of the fame fort. It happened alfo, that about the fame time one Sutton, who kept a coffee-houfe in AlderfgateAreet $_{2}$

## H A L

Hales.
freet, invented a vencilator of another conftruction to draw off the foul air out of Mh ips by means of the cook. room fire : but poor Sutton had not intereft enough to make mankind accept the benefit he offered them; tho' its fuperiority to Dr Hales's contrivance was evident, and among others, Dr Mead and the late ingenions Mr Benjamin Robins gave their teftrmony in its favour: (See Alr-Pipes.) The public, however, is notlefs indebted to the ingenuity and benevolence of Dr Hales, whofe ventilators came more eafily into ufe for many purpofes of the greateft importance to life, particularly for keeping corn fweet, by blowing through it frefh howets of air; a practice very foon adopted by France, a large granary having been made, under the direction of Dubamel, for the prefervation of corn in this manner, with a view to make it a general practice.

In I743, Dr Hales read before the Royal Society a defcription of a method of conveying liquors into the abdomen during the operation of tapping, and it was afterwards primed in their Tranfactions. In 1745, he publified fome experiments and obfervations on tar-water, which he had been induced to make by the publication of a work called Siris, in which the late learned and moft excellent Dr Berkley, bifhop of Cloyne, had recommended tar-water as an univerfal medicine : on this occafion feveral letters paffed between them on the fubject, particularly with refpect to the ufe of tar-water in the difeafe of the horned cattle. In the fame year he communicated to the public, by a letter to the editor of the Gentleman's Magazine, a defcription of a back-beaver, which will winnow and clean corn much fooner and better than can be done by the common method. He alfo, at the fame time, and by the fame channel, communicated to the public a cheap and eafy way to preferve corn fweer in facks; an invention of great benefit to farmers, efpecially to poor leafers, who want to keep fmall quantities of corn for fome time, but have no proper granary or repofitory for that purpofe. He alfo the fame year took the fame method to publifh directions how to keep corn fweet in heaps withont turning it, and to fweeten it when mufty. He publifhed a long paper, containing an account of feveral methods to preferve corn by ventilators; with a particular defcription of feveral forts of ventilators, illuftrated by a cut, fo that the whole mechanifm of them may be eafily known, and the machine conftructed by a common carpenter. He publifhed alfo in the fame volume, but without his name, a detection of the fallacious boafts concerning the efficacy of the liquid fhell in diffolving the ftone in the bladder. In 1746 he communicated to the Royal Society a propofal for bringing fmall paffable fones foon, and with eafe, out of the biadder; and this was alfo printed in their Tranfactions. In the Gentleman's Magazine for July 1747, he publifhed an account of a very confiderable improvement of his back-heaver, by which it became capable of clearing corn of the very fuall grain, feeds, blacks, fmut-balls, \&c. to fuch perfection as to make it fir for feed-corn. In 1748 he communicated to the Royal Society a propofal for checking, in fome degree, the progrefs of fires, occafioned by the great fire which,happened that year in Cornhill: And the fubftance of this propefal was printed in their Tranfactions. In the fane year he
alfo communicated to the Society two memoirs,
Hales which are printed in their Tranfactions; one on the great benefit of ventilators, and the other on fome experiments in electuicity. In 1749 his ventilators were fixed in the Savoy prifon, by orcer of the right hou. Henry Fox, Efq; then lecretaty at war, afterwards lord Holland; and the bencfit was fo great, that though 50 or 100 in a year often died of the jaol-diftemper before, yet from the year 1749 to the year 1752 inclulive, no more than four perfons died, though in the year 1750 the number of prifoners was 240 ; and of thofe four, one died of the fmall-pox, and another of intemperance. In the year 1750 he publifhed fome confiderations on the caufes of earthquakes; occafioned by the llight fhocks felt that year in London. The fublance of this work was alfo printed in the Philofophical Tranfactions. The fame year he exhibited an examination of the ftrength of feveral purging waters, efpecially of the water of 'felfop's well, which is printed in the Philofophical Tranfactions.

Dr Hales had now been feveral years honoured with the efteem and friendhip of his royal highnefs Frederick prince of Wales; who frequently vilited him at Teddington, from his neighbouring palace ar Kew, and took a pleafure in furprifing him in the midft of thofe curious refearches into the various parts of nature which almoft inceffantly employed him. Upon the prince's death, which happened this year, and the fettlement of the houfehold of the princefs-dowager, he was, without his folicitation, or even knowledge, appointed clerk of the clofet or almoner to her royal highnefs. In 1751 he was chofen by the college of phyficians to preach the annuual fermon calledCrowne's lecture : Dr William Crowne having left a legacy for a fermon to be annually preached on "the wifdom' and goodnefs of God difplayed in the formation of man." Dr Hales's text was, With the ancient is wifdont, and in length of days underflanding, Job xii. r 2. This fermon, as ufual, was publifhed at the requeft of the college. In the latter end of the year 1752, his ventilators, worked by a windmill, were fixed in Newgate, with branching trunks to 24 wards; and it appeared that the difproportion of thofe that died in the gaol before and after this eftablifhment was as 16 to 7. He piblifhed alfo a farther account of their fuccefs, and fome obfervations on the great danger arifing from foul air, exemplified by a narrative of feveral perfons feized with the gaul-fever by working in Newgate.

On the death of Hans Sloane, which happened in the yeari 753, Dr Hales was elected a member of the Academy of Sciences at Paris in his room. The fame year the publifhed in the Gentleman's Magazine fome farther confiderations about means to draw the foul air out of the fick rooms of occafional army-hofpials, and private houfes in town. He alfo publinhed many other curious particulars relative to the ufe and fuccefs of ventilators. The fame year a defcription of a fea-gage, which the doctor invented to meafure un-" fathomable depths, was communicated to the pubiic in the fame mifcellany: this paper was drawn up about the year 1732 or 1733, by the doctor, for the late Colin Campbell, Efq; who empioyed the ingenious Mr Hawkbee to make the machine it defcribes, whicla was tried in varions depths, and anfwered with great

## H A L <br> H A L

Hales exifinefs, yet was at laft loft near Bermuda. In 1754, he communicated to the Royal Society fome experiments for keeping water and fin fweet with lime-water, an account of which was publifhed in the Philofophical Tranfactions. He alfo continued to enrich their memoirs with meny ufeful articles from this time till his death, parcicularly a method of forwarding the diftillation of freh from falt water by blowing fhowers of frefl air up through the latier during the operation. In 1757 he communicated to the editor of the Gentleman's Magazine an eafy method of purifying the air, and regulating its heat in melon-frames and green-houfes ; alfo further improvements in his method of diftilling fea-water.

His reputation and the intereft of his family and friends might cafily have procured him farther preferment : but of farther preferment he was not defirous; for being nominated by his late Majefty to a canonry of Windfor, he engaged the princefs to requent his majelty to recal his nomination. That a man to devoted to philofophical ftudies and employments, and fo confcientious in the difcharge of his duty, fhould not defire any preferment which would reduce him to the dilemma either of neglecting his duty, or foregoing his amufement, is not ftrange : but that he would refufe an honourable and profitable appointment, for which no duty was to be done that would interrupt his habits of life, can fcarce be imputed to his temperance and humility without im. peaching his benevolence; for if he had no wifh of any thing more for himfelf, a liberal mind would furely have been highly gratified by the diftribution of fo conliderable a fum as a canonry of Windfor would have putinto his power, in the reward of indugry, the alleviation of diftrefs, and the fupport of helplefs indigence. He was, however, remarkable for focial virtue and fweetnefs of temper ; his life was not only blamelefs, but exemplary in a high degree; he was happy in himfelf, and beneficial to others, as appears by this account of his attainments and purfaits; the conftant ferenity and cheerfulnefs of his mind, and the temperance and regularity of his life, concurred, with a good conftitution, to preferve him in health and vigour to the uncommon age of fourfcore and four. years. He died at Teddington in 176I; and was buried, purfaant to his own directions, under the tower of the parin-church, which he built at his ownexpence notlong before his death.-Her royal highnefs the princefs of Wales erected a momument to his memory. in Weftmintter abbey.

HALESIA, in botany : A genus of the monogynia order, belonging to the dodecandria clafs of plants; and in the natural method ranking under the i8th order, Bicurmes. The calyx is quadridentated, fuperior; the corolla; quadrifid; the nut quadrangular and difpermons.

HALESWORTH, a town of Suffolk in Engiand, feated on a neck of land between two branches of the river Blith, ror miles from Londons It is a well frequented thriving place, and bas a trade in linen yarn and fail-cloth. It has one large church, and about 700 good houfes; bur the fleeets are neither wide nor paved. About the town is raifed a great deal of hemp. E. Long. 1. 40. N. Lar. 52. . 30.

HALF-blood, in law, is where a man marries- a
fecond wife, the firt being dead, and by the firt wen- Half-merk ter he has a fon, and by his fecond venter has likewife a fon ; the two brothers, in this cafe, are but of halfHalifax. blood. Sec Consanguinity and Descent.

Half-Merk; a noble, or 6s. 8d.
Half Moon, in fortification; an outwork compofed of two faces, forming a faliant angle, where gorge is in form of a crefcent or half-moon, whence the name. HALFPENNY, a copper coin, whofe value is expreffed by its name, in reference to the penny.

HALI-BEIGH, firf dragoman or interpretcr at the Grand Signior's court in the 17 th century, was boin of Chrittian parents in Poland; but having been taken by the Tartars when he was young, they fold him to the Turks, who brought him up in their religion in the feraglio. His name, in his native country, was Bobowiki. He learnt many languages, and Sir Paul Ricaut owns he was indebted to him for feveral things which he relates in his Prefent flate of the Otteman empire. He held a great correfpondence with the Englih, who perfuaded him to tranlate fome books into the Turkifh language : and he had a mind to return into the bofom of the Chriftian church, but died before the could accomplifh the defign. Dr Hyde pub. lifhed his book Of the liturgy of the Turks, their pilgri. mages to Mecca, their circumeifion and vifiting of the fick. He tranAlated the catechifm of the church of England, and the bible, into the Turkifh language. The MS. is lodged in the library of Leyden. He wrote likewife a Turkith grammar and dictionary.

HALICARNASSUS, (anc. geog.) a principal town of Caria, faid to be built by the Argives, and fituated between two bays, the Ceramicus and Jafius. It was the royal refidence, (called Zephyra formerly); efpecially of Maufolus, made more illuftrious by his monument. This monument was one of the feven wonders, and erected by Artemifia. Halicarnaffeus, or Halicarnaffenfis, was the gentilitious name of Herodotus and Dionyfius. The former was called the Father of Hiflory; and the latter was not only a good hiftorian but alfo a critic.

HALIETUS, in orinthology. Sce Faico.
halievtics, Halieutica aniertiga, formed of antus, fifberman, which is derived from ans, fea; books treating of fifhes, or the art of fifhing.-We have fill extant the halientics of Oppian.

HALIFAX, the capital of the province of Nova Scotia in America, fituated in W. Long. 64. 30. N. Lat. 44. 45; It was founded in 1749, in order to fecure the Britioh fettements there from the attempts of the French and Indians. It was divided into 35 fquares, each containing 16 lots of 40 by 60 feet: one eftablifhed church, and one meering-houfe, and a fmall number of houfes out of the regular ftrects. The town was furrounded by picketings, and guarded by forts on the outfide; but fince the commencement of the American troubles; it has been very ftrongly fortified. Along the river Chebueto, to the fouthward of the town, are buildings and fifh-flakes for at leaft two miles, and to the northward on the river for about one mile. The plan, however, has been greatly improved by the earl of Halifax, who was the original contriver. The pro clamation iffued for thisfettement, offered 50 acres of land to every foldier and failor who would fectle in that

H A L
channel, a little way below the town is well calculated to annoy veffels in any direction, as they muft of neceffity pals very near it before they are cajable of doing any mifchief. Atove the careening yard, which is at the upper end of the town, there is a large hafon or piece of water, communicating with the harbow below, near 20 miles in ciscuniference, and capable of containing the whole navy of England, entirely Theltered from all winds, and having only one narrow entrance, which, as we obferved before, leads into the harbour. There are a number of detached fettlements lately formed by the loyalifts upon the bafon; the lands at a fmall diftance from the water being generally thought better than thofe near to Halifax; but what fuccefs may atterid their labours, will require fome time to determine. An elegant and convenicnt building has been crected near the town for the convalefcents of the navy; but the healhinefs of the climate, has as yet prevented many perfons from becoming patients; fcarcely any hips in the world being fo free from complaints of every kind, in regard to heaith, as thofe that are employed upon this ftation. There is a very fine light-houre, fanding upon a fmall illand, juft off the entrance of the harbour, which is vifible, either by night or day, fix or feven leagues off at fea.

Halifax, eafl of. See Savilie.
Halifax, a town in the weft riding of Yorkthire in England, feated on the river Calder, in W. Long. 2: 0. N. Lat. 53. 45. It has the title of ant earldom, and is very eminent for the clothier trade. The paring is faid to be the mont populotis, if not the moft extenfive, in England : for it is above 30 miles in circumference ; and, betides the mother church at Halifax, and 16 meering-houfes, has 12 chapels, two of which are parochial. What is a little fingular, all the meet-ing-houfes here, exacpt the quakers, have bells and burying-grounds. The woollens principally manufactured here are kerfeys and fhalloons. Of the former it is affirmed, that one dealer hath fent by commiflion 60,000 pounds worth in a year to Holland and Hamburgh; and of the latter, it is faid, 100,000 pieces are made in this par:fh yearly. The inhabitants here and in the neighbouring towns are fo entirely employed in thefe manufactures, that as riculture is but little minded. Moft of their provifions of all forts are brought from the north and eaft ridings, and from Lancahire, Chefhire, Nottinghammire, and Warwieknire. The markets are very much crowded for the buying and fclling provifions and manufactures. The cloths, at the firft erecting of the woollen manufactures in thefe prarts, having been frequently folen oft the tenters is the night, 2 law was made, by which the magiftrates of Halifax were empowered to pas fentence on, and execme alloffenders, if they were taken in the fact, or owned it, or if the flolen cloth was found upon them, provided allo the crime vas committed, and the criminal apprehended, within the liberties of the foreft of Hardwick. Thofe found guilty were executed in the following manner: an axe was drawn by a pully to the top of a wooden engire, and faftened by a pin, which being pulled out, the axe fell down in an inflant, and did its work. If they had ftole an ox, horfe, or any other beaft, it was led with them to the fcaffold, and there faftened by a cloord to the pin, that held up the axe; and when the fignal was any fervice for ten years, and no more than one fhilling per annum for each 50 acres ever afterwards: to every foldier and failor who had a wife and children, ten acres more were added to every individual of his family, and for every increafe that thould afterwards happen in the fame proportion: To each fubaltern officer 80 acres, and $\mathrm{r}_{5}$ for each of his family; 200 acres to each enfign ; 300 to each licutenant; 400 to each captain; 600 to every officer in rank above a captain, and 30 for each of his family. The government alfo engaged to tranfport and maintain the new fettlers for one year at its own expence, and to furnifh them with fuch arms, provifions, utenfils, implements, \&c. as thould be neceffary to pur them in a way to cultivate their lands, to build habitations, and to commence a filhery. The fame conditions were likewife offered to all carpenters, and other handicraftimen: and furgeons were offered the fame conditions with the enligns.- This proclamation was pablifhed in March, and by the menth of May 3700 perfons had offered themfelves. They accordingly embarked, and eftablighed themfelves in the bay of Chebucto; calling their city Halifax from the title of their patron. Before the end of October the fame year, 350 comfortable wooden houfes were built, and as many more during the winter.-The fame year in which the fettiers embarked, the government granted them 40,0001. for their expences. In 1750 , they granted 57,5821 . $17 \mathrm{~s} .3 \frac{1}{4} \mathrm{~d}$. for the fame purpofe; in $1751,53,9271.14 \mathrm{~s}$. 4d. ; in 1752, 61,492l. 19s. 4 $4 \frac{1}{4} \mathrm{~d}$.; in 1753, 9-4,6151. 125. 4d.; in 1754, 58,4471. 2s.; and in 1755, 49,4181. 7s. 8d. The place has at length attained a degree of fplendor beyond what might have been expected; for which it has been equally indebted to the late war, to the great increafe of population from the exiled loyalifts, and the foftering care of Great Britain ; infomush, that the number of inbabitants has been more than doubled darigg the laft

The harbon is perfectly theltered from all winds at the diftance of 12 miles from the fea, and is fo fpacious, that a thoufand fail of hips may ride in it without the leaft danger. Upon it there are built a great number of commodious wharfs, which have from 12 to 18 feet water at all times of the tide, for the convenience of loading and unloading fhips. The ftreets of the town are regulariy laid our, and crofs each ocher at right angles; the whole rifing gradually from the water upon the lide of a hill, whore top is regularly fortified. but not fo as to be able to withitand a regnlar attack. Many confiderable merchants refide at this place, and are poffeffed of fhipping to the amount of feveral thoufand tons, employed in a flourihing trade both with Europe and the Weft Indies. There is a fmall but excellent careening yard for hips of the Britith navy that are upon this flation, or that may have occafion to come in to refit, and take water, fuel, or freh provifions on board, in their paffage to and from the Weft Indies. It is always kept well provided with naval fores; and hips of the line are hove down and repaired with the greateft eafe and fafety. Several baticries of beavy cannon eommand the harbour, particularly thofe that are placed upon George's Ifland, Which being very feep and high, and fituated in mid. ten years.

Ealictis
Hall.
given by the jurors, who were the firf burghers within the feveral towns of the fureft, the beaft was driven away, and the pin plucked out, upon which the axe fell and did its office. This fevere and fummary courfe of juftice gave occafion to a litany, which is ftill much more frequent in the months of the beggars and vagrants of thefe parts, than is the common prayer, viz.
"From Hell, Hull, and Halifax, good Lord deliver us." though neither the engine, nor manner of proceeding againft them, are now in ufe.

HALIOTIS, the Ear-shell, a genus of infects belonging to the order of vermes teftacea. This is an animal of the friail-kind, with an open fhell refembling an ear. There are feven fpecies, diftinguifhed by the figure of their fhells. See Plate CCXXXIV.

HALITZ, a town of Poland, and capital of a territory of the fame name, in Red Ruffia, with a caftle. It is feated on the river Neifter. E. Long. 260. N. Lat. 49. 20.

HALL, in architecture, a large room at the entrance of a fine houfe and palace. Vicruvins mentions - three kinds of halls; the terraftyle, with four columns fupporting the platfond or ceiling; the Corinthian, with columns all round let into the wall, and vaulted over; and the Egyptian, which had a periftyle of infulated Corinthian columns, bearing a fecond order with a ceiling.

The hall is properly the fineft as well as firft member of an apartment : and in the houfes of minifters of ftate, magiftrates, \&c. is the place where they difpatch bufinefs, and give audience. In very magnificent buildings, where the hall is larger and loftier than ordinary, and placed in the middle of the houre, it is called a faloon.

The length of a hall mould be at leaft twice and a quarter its breadth; and in great buildings, three times its breadth. As to the height of halls, it may be two-thirds of the breadth; and, if made with an arched ceiling, it will be much handfomer, and lefs liable to accidents by fire. In this cafe, its height is found by dividing its breadth into fix parts, five of which will be the height from the floor to the under fide of the key of the arch.
$\mathrm{H}_{\mathrm{ALL}}$ is alfo paricularly ufed for a court of juftice ; or an edifice whercin there is one or more tribunals.

In Weftminfter-hall are held the great courts of England, viz. the king's bench, chancery, common pleas, and exchequer. In adjoining aparments is likewife held the high court of parliament.

Weftminfter-hall was the royal palace or place of refidence of ancient Britifh kings; who ordinarily held their parliaments, and courts of judicature, in their dwelling-honfes (as is ftill done by the kings of Spain), and frequently fat in perfon in the courts of judicature, as they fill do in parliament. A great part of this palace was burnt under Heury VIII. what remains is fill referved for the faid judicatories. The great hall, wherein the courts of king's bench, \&c. are kept, is faid to have been built by William Rufus; others fay by Richard I. or II. It is reckoned fuperior, in point of dimenfions, to any hall in Europe; being 300 feet long and ioo broad.

Hacl (Jofeph), an emineat prelate of the church of

England, was born in 1574 , and educated at Cambridge. He became profeflor of rhetoric in that univerfity, and then fucceflively was made rector of Halfted in Suffolk, prefented to the living of Waltham in Effex, made prebendary of Wolverhampton, dean of Worcefter, bifhop of Exeter, and laftly of Norwich. His works teftify his zeal againft Popery, and are much efleemed. He lamented the divifions of the Proteftants, and wrote fomething concerning the means of puting an end to them. July 1616, he attended the embafly of lord Doncafter into France, and upon his return was appointed by his majefty to be one of the divines, who hould attend him into Scotland. In 1618 he was fent to the fynod of Dort with other divines, and pitched upon to preach a Latin fermon before that affembly. But being obliged to return from thence before the fynod broke up, on account of his health, he was by the ftates prefented with a gold medal. He wrote, 1. Mifcellancous epiftles. 2. Miundus alter et idem. 3. A juft cenfure of travellers. 4. The Chriftian Seneca. 5. Satires, in fix books. 6. A century of meditations; and many other works; which, befides the above fatires, make in all five volumes in folio and quarto: He died in 1656.

Hale (John), a poet of diftinguifhed learning, was born at Durham, and educated at Cambridge, where he was efteemed the brighten genius in that univerfity. In 1646, when he was but 19 years of age, he publifhed his Hora Vacive, or Effays; and the fame year came out his poems. He tranflated from the Greek "Hierocles upon the golden verfes of Pythagoras ; before which is an account of the ingenious tranflator and his works, by John Davies of Kidwelly. He died in $\mathbf{~} 656$, aged 29.

HALLAGE, a fee or toll paid for cloth brought to be fold in Brackwell-hall, London.

HALLAMAS, in old Englih writers, the day of allhallows, or all-faints, viz. November I. It is one of the crofs quarters of the year which was computed, in ancient writings, from Hallamas to Candleniss.

HALLAND, a comntry of Sweden, in the ifland of Schonen, lying along the fea-coalt, at the entrance of the Baltic Sea, and oppofite to Jutland. It is 60 miles along the coaft, but is not above 12 in breadth. Halmftadt is the capital town.

HALLATON, a town of Leicefterflire, in England. It is feated on a rich foil, 12 miles fouth-eaft of Leicefter, in E. Long. O. 50. N. Lat. 5235.

HALLE, a little difmantled town of the Auftrian Netherlands, in Hainault. The church of Notre Dame contains an image of the Virgin Mary, held in great veneration. E. Long. 3. 15. N. Lat. 50. 44.

Halle, a handfome and confiderable town of Germany, in the eircle of Upper Saxony, and in the duchy of Magdeburg, with a famons univerfity and faltworks. It belongs to the king of Pruffia; and is feated in a pleafant plain on the river Sale, in E. Long. 12.23. N. Lat. 5 I. 36.

Halle, a free and imperial town of Germany, in Suabia, famous for its falt-pits. It is feared on the river Kocher, among rocks and mountains, in E Long. Io. 50. N. Lat. 496.

HALLEIN, a cown of Germany, in the circle of Bavaria, and archbihopric of Salifburg; feated on

## H A L <br> 279 ] <br> H A L

Hallelujah, the river Saltza, among the mountains, wherein are Haller. mines of falt, which are the chief riches of the town and country. E. Long. 12. 15. N. Lat. 47. 33.

HALLELUJAH, a term of rejoicing, fometimes fung or rehearfed at the end of verfes on fuch occafions.

The word is Hebrew ; or rather, it is two Hebrew words joined together ; one of them חh, hallelu, and the other $n$, jab; an abridgement of the name of God, היחה Pehovah. The firt fignifies laudate, "praife ye;" and the other, Dominum, "the Lord."

St Jcrome firft introdnced the word hallelujah into the church fervice ; for a confiderable time it was only ufed once a year in the Latin church, viz. at Eafter : but in the Greek church it was much more frequeni. St Jerome mentions its being fung at the interments of the dead, which fill continues to be done in that church, as alfo on fome occafions in the time of Lent.

In the time of Gregory the Great, it was appointed - to be fung all the year round in the Latin church, which raifed fome complaints againft that pope; as giving too much into the Greek way, and introducing the ceremonies of the church of Conftantinople into that of Rome. But he excufed himfelf by alleging, that this had been the ancient ufage of Rome; and that it had been brought from Conftantinople at the time when the word hallelujah was firft introduced under pope Damafcus.

HALLER (Albert Van), an eminent phyfician, was born at Bern, on the 16 th of October 1708 . He was the fon of an advocate of confiderable eminence in his profeffion. His father had a numerous family, and Albert was the youngeft of five fons. From the firft period of his education, he fhowed a very great genius for literature of every kind: to forward the progrefs of his ftudies, his father took into his family a private tutor, named Abraham Billodz; and fuch was the difcipline exerted by this pedagogue, that the accidental fight of him, at any future period of life, excited in Haller very great uneafinefs, and renewed all his former terrors. According to the accounts which are given us, the progrefs of Haller's ftudies, at the earlieft periods of life was rapid almoft beyond belief. When other children were beginning only to read, he was ftudying Bayle and Moreri: and at nine years of age he was able to tranllate Greek, and was beginning the ftady of Hebrew. Not long after this, however, the courfe of his education was fomewhat interrupted by the death of his father; an event which happened when he was in the 13 th year of his age. After this he was fent to the public fchool at Bern, where he exhibited many fecimens of early and uncommon genius. He was diftinguifhed for his knowledge in the Greek and Latin languages; but he was chiefly semarkable for his poetical genius; and his effays of this kind, which were publifhed in the German language, were read and admired throughout the whole empire. In the 26th year of his age he began the ftudy of medicine at Tubingen, under thofe eminent teachers Duvernoy and Camerarius: and continued there for the fpace of two years, when the great reputation of the juftly celebrated Boerhaave drew him to Leyden. Nor was this diftinguihed teacher the only man from whofe fuperior abilities he had there an opportunity of profit-
ing. Ruyfch was fill alive, and Albinus was rifing into fame. Animated by fuch examples, he fpent all the day, and the greateft part of the night, in the molt intenfe fudy; and the proficiency which he made, gained him univerfal efteem both from his teachers and fellow ftudents. From Holland, in the ycar 1727, he came to England. There, however, his tay was but fhott; and it was rather his intention to vifit the illuItrious men of that period, than to profecute his fludies at London. He formed connections with fome of the moft eminent of them. He was honoured with the friendihip of Douglas and Chefelden; and he met with a reception proportioned to his merit from Sir Hans Sloane, prefident of the Royal Socicty. After his vifit to Britain, he went to France; and there, under thofe eminent mafters, Winflow and Le Dran, with the latter of whom he refided during his ftay in Paris, he had opportunities of profecuting anatomy, which he had not before enjoyed. But the zeal of our young anatomift was greater than the prejudices of the people at that period, even in the enlightened city of Paris, could admit of. An information being lodged againft him to the police for diffecting dead bodies, he was obliged to cut fhort his anatomical inveftigations by a precipitate rctreat. Still, however, intent on the farther profecution of his ftudies, he went to Bahl, where he became a pupil to the celebrated Bernoulli.

Thus improved and inftructed by the leetares of the moft diftinguifhed teachers of that period, by uncommon natural abilities, and by unremitting induftry, he returned to the place of his nativity in the 26th year of his age. Not long after this, he offered himfelf a candidate, firft for the office of phyfician to an hofpital, and afterwards for a profefforfhip. But neither the character which he had before he left his native country, nor the fame which he had acquired and fupported while abroad, were fufficient to combat the intereft oppofed to him. He was difappointed in bơth; and it was even with difficulty that he obtained, in the following year, the appointment of keeper of a public library at Bern. The exercife of this office was indeed by nomeans fuited to his great abilities:-bnt it was agreeable to him, as it afforded him an opportunity for that extenfive reading by which he has been fo jufly diftinguifhed. The negle $\frac{1}{}$ of his merit which marked his firft outfer, neither diminifhed his ardour for medical purfuits, nor detracted from his reputation either at home or abroad. And foon after he was nominated a profeffor in the univerfity of Gottingen, by king George II. The duties of this important office he difcharged, with no lefs honour to himfelf than advantage to the public, for the fpace of 17 years; and it afforded him an ample field for the exertion of thofe great talents which he poffeffed. Extenfively aequainted with the fentiments of others refpecting the eeconomy of the human body, frack with the diverfity of opinions. which they held, and fenfible that the only means of invenigating truth was by carefub and candid experimenis, he undertook the arduous talk of exploring the phenomena of human nature from the original fource. In thefe purfints he was nolefs induftrious than fuccefsful, and there was hardly any funetion of the body ore which his experiments did not reflect either a new or a ftronger light. Nar was it long neceffary for him, if.

Haller. this ardnous undertaking, to labour alone. The example of the preceptor infpired his pupils with the fipirit of induftrious exeriin. Zinn, Zimmerman, Caldani, and many others, animated by a gencrous emulation, laboured with indefatigable induftry to proferecute and to perfect the difeoveries of their great mafer. And the mutaal exertion of the teacher and his ftudents, not only tended to forward the progrefs of medical fcience, but placed the philofophy of the human body on a more fure, and almoft entirely new, balis. But the labours of Dr Haller, during his refidence at Got:ingen, were by no means confined to any ane departmant ef fcience. He was not more anxious to be an improver himfelf, than fo iuftigate ochers th funilar pariuits. To him, the Anatomical Theatre, the School of Midwifery, Chirurgical Society, and the Royal Acadeny of Sciences at Gottingen, owe their origin. Such dillinguifhed merit could not fail to meet with a fuitable reward from the fovereign under whofe proteftion he then taught. The king of Great Britain not only honoared him with every mark of attention which he himfelf could beflow, but procured bim alfo letters of nobility from the emperor. Oa the death of Dillenius, he had an offer of the profelforlhip of botany at Oxford; the fates of Holland invited him to the chair of the younger Albinus; the king of Prulfia was anxious that he fhould be the fucceffor of Manpertuis at Berlin. Marflal Kcith wrote ta him in the name of his favereign, offering him the chancellorfhip of the univerfity of Halle, vacant by we death of the celebrated Wolff. Connt Orlow invited him to Ruffia, in the name of his mifters the enprefs, offering him a diftinguighed place at St Peterfbourgh. The king of Sweden conferred on him an unfolicited honour, by raifilig him to the rank of knighthood of the order of the polar ftar ; and the emperor of Geranany did him the honour of a perfonal vifit: during which he thonght it no degracation of his character to pafs fome time with him in the moft faniliar converfation.

Thus honoured by fovereigns, revered by men of literature, and efteemed by all Europe, he had it in his power to have held the bigheft rank in the repablic of letters. Yet declining all the tempting offers which were made to him, he continued at Gottingen, anxioully endeavouring to extend the rifing fame of that medical fchool. But after 17 years refidence in that univerfity, an ill fatco of health rendering him leif fit for the duties of the imporant office which he held, he folicited and obtained permiffion from the regency of Hanover to return to his native city of Bern. His fellow-citizens, who might at firt have fixed him among themfelves, with no lefs honoar than advantage to their city, were now as fenfible as others of his finperior merit. A penfion was fettled upon him for life, and he was nominated at different times to fill the mont important offices in the fate. Thefe occupations, however, did not diminifh his ardour for ufeful improvements. He was the firft prefidemt, as well as the greateft promoter, of the Occonomical Society at Bern; and he may be confidered as the father and founder of the Orphan Hofpital of that city. Declining health, however, reftrained his exertions in the more active genes of life, and for many years he was confined en-
tirely to his own houfe. Even, this however, could Hallerfa, not put a period to his utility: for, with indefatigable Hallcy. indultry, he continued his favourite employment of writing till within a tew days of his deach; which happened in the 7oth year of his age, on the 12 th of December 1777. His Elementa Fbifiologia and Bibliotheca Medicince, will afford, to lateft poiterity, undeniable proofs of hisindefatigable indultry, peneurating genius, and folid judgment. But he was nor lefs diftinguifhed as a philotopher than beloved as a man; and he was not more eminent for his improvement in every department of medical fcience, than for his piety to God, and benevolence to all mankind.

HALLERIA, in botany ; A genus of the angio. fpermia order, belonging to the didynamia a clats of plants; and in the natural method ranking under the 4oth order, Perfonata. The calyx is trifid; the corolla quadrifid; the filaments longer than the corolia; the berry inferior and bilocular, (the fruit not yet fully aefcribed.)
HALLEY (Dr Ednumd), an eminent aftronomer, was the enly ton of a forp-Loiler in London, and was born in 1656. He firt applied himfelf to the ftudy of the languages and fciences, but at length gave himiclf up wholly to that of afronouy. In 1676 he went to the ifland of St Helena to complete the catalogue of fixed tars, by the addition of thofe which lie near the fouth pole; and having delineated a planifphere in which he laid them all down in their exact places, he returned to England in $\mathbf{1 6 7 8}$. In the year 1680 he took what is called the grand tour, accompanied by his friend the celebrated Mr Nelfon. In the midway between Calais and Paris, Mr Halley had a fight of a remarkable comet, as it then appeared a fecond time that year, in its return from the fun. He had the Novenber before feen it in its defcent; and now haftened to complete his obferyations upon it, in viewing it from the reyal obfervatory of France. His defign in this part of his tower was, to fettle a friendly currelipondence between the two royal aftronomers of Greenwich and Paris: and in the mean time to improve himfelf under fo great a mafter as Caffini. From thence he went to Italy, where he \{pent great part of the year 168I; but his affairs calling himbone, he returned to England. In 1683, he publifhed his Theory of the variation of the magnetical compafs; in which he fuppoles the whole globe of the earth to be a grear magnet, with four magnerical poles, or points of attraction : but afterwards thinking that this theory was liable to great exceptions, be procured an application to be made to king William, who appointed him commander of the Paramour Pitzk, with orders to feek by obfervations the difcovery of the rule of variations, and to lay down the longitudes and latitudes of lis majeft's fetclements in America. - He fet out on this attempt on the 24th of November 1698: but having croffed the line, his men grew fickly; and his lieutenant mutinying, he reunrned home in Jone 1699. Having got the lieutenant tried and cahiered, he fet fail a fecond time in September following, with the fame flip and another of lefs bulk, of which he had alfo the command. He now traverfed the valt Atlantic ocean from one hemilphere to the other as far as the ice would pernit him to go; and having made his obfervations at St Helena,

Brażil,

Halley Brazil, Cape Verd, Barbadees, the Madeiras, the Ca-
naries, the coaft of Barbary, and many other latitudes, arrived in September 1700 ; and the next year publifh-
ed a general chart, fhowing at one view the variation of the compais in all thofe places. Caprain Halley, as he was now called, had been at home little more than half a year, when he was fent by the king, to obferve the courfe of the tides, with the longitude and latitude of the principal head-lands in the Britifh channel; which having executed with his ufalal expecition and accuracy, he publifhed a large map of the Britifh channel. Soon after, the emperor of Germany refolving to make a convenient harbour for fhipping in the Adria. tic, Captain Halley was fent by queen Anne to view the two ports on the coaft of Dalinatia. He embarked on the 22 d of November 1702 ; paffed over to Holland; and going through Germany to Vinena, he proceeded to litria: but the Dutch oppoling the defign, it was laid afide; yet the emperor made him a prefent of a rich diamond-ring from his finger, and honoured him with a letter of recommendation, written with his own hand, to queen Anne. Prefently after his retarn, he was fent again on the fame bufinefs; when paffing through Hanover, he fupped with king George I. then electoral prince, and his tifter the queen of Prufia. On his arrival at Vienna, he uras the fame evening prefented to the emperor, who fent his chief engineer to attend him to Iftria, where they repaired and added new fortifications to thofe of Triefte. Mr Halley returned to England in 1703 ; and the fame year was made profeffor of geometry in the univerfity of Oxford, in the room of Dr Wallis, and had the degree of doctor of laws conferred on him by that univerfity. He is faid to bave loft the profefforfip of aftronomy in that city, becaufe he would not profefs his belief of the Chriftian religion. He was fcarcely fettled at Oxford, when he began to tranlate into Latin from the Arabic, Apollonius de fectione rationis; and to refore the two books Defectione fpatio of the fame author, which are loft, from the account given of them by Pappius; and he publifhed the whole work in 1706 . Afterwards he had a hare in preparing for the prefs Apollonius's Conics; and ventured to fupply the whole eighth book, the original of which is alfo loft. He likewife added Serenus on the fection of the cylinder and cone, printed from the original Greek, with a Latin tranfation, and publinhed the whole ia folio. In 1714, he was made fecretary of the Royal Society ; in 1720 , he was appointed the king's aftronomer at the royal obfervatory atGreenwich, in the room of Mr Flamftead; and, in 1729 , was chofen as a foreign member of the Academy of Sciences at Paris. He died at Greenwich in 1742. His principal works are, 1. Catalogas fellarum aum fralium. 2. Tabule aftronomica. 3. an abridgment of the aftronomy of comets, \&c. We are alfo indebted to him for the publication of feveral of the works of the great Sir Ifaac Newton, who had a particular friendihip for him, and to whom he frequently communicated his difcoveries.

Halley's Quadrant. See Quadrant.
HALLIARDS, the ropes or tackles ulalily employed to hoift or lower any fail upon its refpective matt or ftay. Sec jears.

HALMOTE, or Halimote, is the fame with Vol. VIII.
what is now called a court-baron, the word implying Halmftade a meeting of the tenants of the fame hall or manor. The nanie is ftill retained at Lulton, and other places Halterifx in Herefordhire, England. See Mote.
Halmstadt. See Helmstadt.
HALO, or Corona, in natural hillory, a coloured circle appearing round the body of the fun, moon, or any of the large ftars. See Corona.
HALORAGUS, in botany : A genus of the tetragynia order, belonging to the octandria clafs of plants. The calyx is quadrifid above; there are four perals; a dry plum, and a quadrilocular nut.
HALESTEAD, a town of Effex in England, feated on the river Coln, 45 miles from London. It has an old church, the fteeple of which was once burnt down by lightning, but rebuilt at the expence of an individual, (Robert Fike, Efq;). The town confifts of about 600 pretty good houfes, and is fituated on a rifing ground, but the ftreets are not paved. The inhabitants are about 4000 in number. Here is a good maunfactory of fays, bays, callimancoes, \&c. alfo a good free fchool for 40 boys, and a very antique Bridewell. Its market on Friday is noted for corn.

HALT, in war, a paufe or ftop in the march of a military body.-Some derive the word from the Latin balitus, "breath;" it being a frequent occafion of halting to take breath: others from alto, becaufe in halting they raifed their pikes on end, \&cc.

HALTER, in the manege, a head-ftall for a horfe, of Hungary leather, mounted with onc, and fometines two Itraps, with a fecond throat-band, if the horfe is apt to unhalter himfelf.
Halter-Gaft, is an excoriation of the pattern, occam foned by the halter's being entangled abont the foot, upon the horfe's endeavouring to rub his neck with his hinder feet. For the cure of this, anoiat the place, morning and cvening, with equal quantities of linfeed oil and brandy, well mixed.
HALTERISTA, in antiquity, a kind of plavers at difcus ; denominated from a peculiar kind of difcus called by the Greeks àrup, and by the Latins hatter. See Discus.

Some take the difcus to have been a leaden weight or ball which the vaulters bore in their hands, to fecure and keep themfelves the more fieady in their leaping. Others will have the halter to be a lump or mais of lead or ftone, with an hole or handle fixed toit, by which it might be carried; and that the halteriftz were thofe who exercifed themfelves in removing thefe maffes from place to place.

Hier. Mercorislis, in his treatife De arte gymnafica, 1. ii. c. 12. diftinguifhes two kinds of hateriftæ; for though there was but one halter, there were two ways of applying it. The one was to throw or pitch it in a certain mamer ; the other only to hold it ont at arm'send, and in this pofture to give themfelves divers motions, fwinging the hand backwards and forwards ac. cording to the engraven figures thereof given us by Mercurialis.- The halter was of a cylindrical figure, fmaller in the middle, where it was held, by one dita meter, than at the two ends. It was abure a foot lote and there was one for each hand : it was cither of iron, ftone, or lead.

Palton
Ham,
this exercife, and thows of what ufe it is in purging the body of peccant humours; making it equivalent both to purgation and phlebotony.

HALTON, or Haulton, i. e. High Town, a town of Chelhire, 86 miles from London. It ftands on a hill, where a caltle was built anno 107 r , and is a member of the duchy of Lancafter; which maintains a large jurifdiction in the country round it, by the name of Hulton-Fee, or the honour of Halton, having a coart of record, prifon, \&c. within thenTelves. Abour Michaclmas every ycar, the king's officers of the duchy keepa law-day at the cafte, which fill remains a fately building: once a fortnight a court is kept here, to determine all matters within their jurifdiction ; but felons and thieves are carried to the feffions at Chefter, to receive their fentence. By the late inland navigation, it has communication with the rivers Merfey, Dee, Ribble, Oufe, Trent, Darwent, Severn, Humber, Thames, Avon, \&c. which navigation, including its windings, extends about 500 miles, in the connties of Lincoln, Nottingham, York, Lancafter, Weftmoreland, Stafford, Warwick, Leicefter, Oxford, Worcefter, \&c.

HALTWHISTLE, a town of Northumberland in Eogland, fituated in E. Long. 2. o. N. Lat. 55. 0. It is pretty well built, and affords good entertanment for travellers.

HALYMOTE, properly fignifies an holy or ecclefiaftical courc. See Halmote.

There is a court held in Lendon by this name before the Lord Mayor and hleriffs, for regulating the bakers. It was anciently held on Sunday next before St Thomas's day, and for this reafon called the Halymote, or Holy-court.

HALYS, (anc. geog.) the nobleft river of the Hither Alia, through which it had a long courfe, was the boundary of Crœefus's kingdom to the eaft. Running down from the foot of mount Taurus, through Cataonia and Cappadocia, it divided almoft the whole of the Lower Afia, from the fea of Cyprus down to the Euxine, according to Herodotus; who feems to extend its courfe too far. According to Strabo, himfelf a Cappadocian, it had its fprings in the Great Cappadocia. It reparated Paphlágonia from Cappadocia; and received its naine aro rou anos, from falt, becaule its waters were of a falt and bitter tafte, from the nature of the foil over which they flowed. It is famons for the defeat of Crofus king of Lydia, who was milled by the ambiguous word of this oracle:

Xposoos anuv dsabas uszanay apxny dsanuzs,.
If Crofus paffes over the Halys he fhall deftroy a great empire.

- That empire was his own. See Croesus and Lydia. HALYWERCFOLK, in old writers, were perfons who enjoyed land, by the pious fervice of repairing fome chureh, or defending a fepulchre,

This word alfo fignified fach perfons in the diocefe of Durham, as held their lands to defend che corps of St Cathbert, and who from thence claimed the privilege of not being forced to go out of the binopric.

HAM, or Cham (anc. geog.), the country of the Zuzims (Gen. xiv. 5.) the fituation where of is not known,
$\mathrm{H}_{\mathrm{A}} .3$, the youngeft fon of Noah. He was the fa-

## H A M

ther of Cufh, Mizraim, Phut, and Canaan ; each whereof had the feveral countries peopled by them. With refpect to Ham, it is believed that he had all Africa tor his inheritance, that he peopled it with his children. As for himfelf, it is thought by fome thathe dwelt in Egypt ; but M. Bafnage is rather of opinion, that neither Ham nor Mizrain ever were in Egypt, lut that their pofterity fettled in this commery, and called it by the name of their anceftors. And as to Ham's being worfhipped as a god, and called fupi* ter Hammon, he thinks people may have been led into this miftake by the fimilitude of names; and that Jupiter Hammon was the fun, to which divine honours have been paid at all times in Egypt. However that may be, Africa is called the land of Ham, in feveral places of the pfalms, (Pfal. Ixxvii. 5f.civ. 23.cv. 22.) In Plutarch, Egypr is called Chemia; and there are fome footlteps of the name of Ham or Cham obferved in Pfochemmis, Pfitta-chemmis, which are cantens of Egypr.

HAM, a faxon word ufed for "a place of dwelling;" a village or town : hence the termination of fome of our towns; Nottingham, Buckingham, \&c. Alfo a home clofe, or little narrow meadow, is called a bam.

HAM is alfo a part of the leg of an animal ; being the inner or hind part of the knee, or the ply or angle in which the leg and thigh, when bent, incline to each other.

Ham, in commerce, \&c. is ufed for a leg or thigh of pork, dried, feafoned, and prepared, to make it keep, and to give it a brifk agrecable flavour.

Weftphalia hams, fo much in vogue, are prepared by falting them with faltpetre, preffing them in a pıefs eight or ten days, then fteeping them in juni-per-water, and drying them by the fmoke of juniperwood.

A ham may be falted in imitation of thofe of Weftphalia, by fprinkling a ham of young pork with falt for one day, in order to fetch out the blood; then wiping it dry, and rubbing it with a mixture of a pound of brown fugar, a quarter of a pound of faltpetre, half a pint of bay falt, and three pints of common falt, well ftirred together in an iron pan over the fire till they are moderately hot : let it lie three weeks in this falting, and be frequently turned, and then dry it in a chimney.

Ham, a city of Germany, in the circle of Weftphalia, capital of the county of Mark, and fubyect to the king of Proffia. It is reated on the river Lippe, on the frontiers of Munfter. The adjacent counury abounds: in corn, hemp, and flax; and the inhabitants get a good deal of money by travellers. It was formerly a Hanfe-town, but is now reduced. E. Long. 7. 53 : N. Lat. 5 I. 42.

Ham, a town of Ricardy, in Erance, feated on the river Somme, among marfles. It has three parinhes; and there is here a ronnd tower whofe walls are 36 feet thick. It was taken by the Spaniards in 1557 , but reftored by treaty. E. Long. 3.9. N. Lat. 49. 45. HAMADAN. See Amadan.
HAMADRYADES (formed of a $\mu \alpha$ together, and spuas dryad, of spus oak), in antiquity, certain fabulous deities revered among the ancient heathens, and believed to prefide over woods and forefts, and to be inclufe

Hamah,
Hamamelis.
clofed under the bark of the oaks. The hamadryades were fuppofed to live and die with the trees they were attached to; as is obferved by Servius on Virgil, Ectog. x. ver. 62. after Mnefimachus, the fcholialt of Apollonius, \&c. who mentions other traditions relating thereto.

The poets, however, frequently confound the Hamadryads with the Naiades, Napææ, and rural ny nuphs in general; witnefs Catullus, Carm. Ixviii. ver. 23. Ovid, Faft. iv. 229. Met. i. ver. 605. xiv. ver. 628. Propertins, Eleg. xx. 32. Virg. Ecl. x. ver. 64. Georg. iv. ver. 382, 383. Feftus calls them Qxerquetulana, as being iffued or fprang from oaks. An ancient poct, Pherenicus, in Athenæus, lib. iii. calls the vine, figtree, and other fruit-trees, Hamadryades, from the name of their mother the oak.

This conmon idea among the ancients, of ngmphs or intellectual beings annexed to trees, will account for their worlhipping of trees; as we find they did, not only from their poets but their hiftorians. Livy fpeaks of an ambaffador's addrefling himfelf to an old oak, as to an intelligent perfon and a divinity, Lib, iii $\$ 25$.

HAMAH, a town of Turkey in Afia, in Syria, fituated in E. Long. $3^{66.15 .}$ N. Lat. 35. 15. By fome travellers it is corruply called Amarl and Amant. Some miftake it for the ancient Apamea; but this is now called Afamiyah, and is Gituated a days journey from Hamah. Hamah is fituated among hills, and has a caftle feated on a hill. It has all along been a confiderable place, and in the 13 th century had princes of its own. It is very large, and being feated on the afcent of a hill, the houfes rife above one another, and make a fine appearance. It is, however, like moft other towns under the Turkifh government, going to decay. Many of the houfes are half ruined; but thofe which are ftill ftanding, as well as the mofques and caftle, have their walls built of black and white ftones, difpofed in fuch a manner as to form various figures. The river Aff, the ancient Orontes, rans by the fide of the cafle, and fills the ditches round it, which are cut very deep into the rock. This river, leaving the cafte, paffes through the town from fouth to north, and has a bridge over it, though it is pretty broad. In its courfe through the town it turns 18 great wheels, called by the natives faki, which raife great quanities of water to a confiderable height, and through it into canals fupported by arches, by which means it is conveyed ino the gardens and fountains. There are fome pretry good bazars or market-places in Hamal,, where there is a trade for linen, which is manufactured there, and fent to Tripoli to be exported to Europe.

HAMAMELIS, witch hazel; A genus of the digynia order, belonging to the tetrandria clafs of plants: and in the natural method ranking with thofe of which the order is doubtful. The involucrum is triphyllons, the proper calyx tetraphylous; there are four petals; the nut horned and bilocular. There is but one feccies, a native of Virginia. It hath a firubby or woody ftem, branching three or four feet high; oval, indented, alternate leaves, refembling thofe of common hazel; and flowers growing in clufters from the joints of the young branches, but not fucceeded by feeds in Britain.-The plant is hardy,
and is admitted as a variety in gardens; but its Hamam flowers are more remarkable for their appearing in Novenber and December, when the leaves are fallen, Hambden. than for their beauty. - It may be propagated either by feeds or layers.
HAMAM Leef, a town 12 miles eaft from Tunis, noted for its hot baths, which are much reforted to by the Tunifians, and are efficacious in rheumatifin and many other complaints. Here the Bey has a very fine bath, which he frequently permits the confuls and ocher perfons of diftinction to ufe.

HAMATH, a city of Syria, capital of a province of the fame name, lying upon the Orontes. "The entering into Hamath," which is frequently fpoken of in fripture, (Joh. xiii. 5. Judgesiii. 3. 2 Kings xiv. 25 . and 2 Chron. vii. 8.) in the narrow pafs leading from the land of Canaan through the valley which lies between Libanus and Antilibanus. This entrance into Hamath is fet down as the northern boundary of the land of Canaan, in oppofition to the fouthern limits, the Nile or river of Egypt. Jofephus, and St Jerom atter him, believed Hamath to be Epiphania. But Theodoret, and many other good geographers maintain in to be Emefa in Syria. Johua (xix. 35.) afligns the city of Hamath to the tribe of Naphtali. Toi king of Hamath cultivated a good underftanding with David, (2 Sam. viii. 9.) This city was takea by the king of Judah, and retaken from the Syrians by Jeroboam the fecond, ( 2 Kings xiv. 28.) The kings of Alfyria made themfelves malters of it upon the declenfion of the kingdom of Ifrael, and tranfplanted the inhabitants of Hamath into Samaria ( 2 Kings xvii. 24, and xviii. 34. \&c.)

HAmAXOBII, Hamaxobians, in the ancient geography, a people who had no houfes, but lived in carriages. The word is formed from $\alpha \mu \alpha \xi \propto$ a carriage or chariot, and $\beta, G$ life.

The Hamaxobii, called alfo Hamaxobita, were an ancient people of Sarmatia Europæa, inhabiting the fouthern part of Mufcovy, who initead of houfes had a fort of tents made of leather, and fixed on carriages to be ready for hifting and travel.

HAMBDEN (John), a celebrated patriot, defcended of the ancient family of Hambden in Buckinghanifhire, was born in 1594 . From the aniverfity he went to the inns of court, where he made a confiderable progrefs in the ftudy of the law. He was chofen to ferve in the parliament which began in Weftminfter February 5. 1626; and ferved in all the fucceeding parliaments in the reign of Charles I. In 1636 he became univerfally known, by his refufal to pay fhipmoney, as being an illegal tax; upon which he was profecuted, and his carriage throughout this tranfaction gained him agreat character. When the long parliament began, the eyes of all men were fixed on him as their pater patrix. On January 3. 1642, the king orderes articles of high treafon and other mifdemea* nours to be prepared againft Lord Kimbolton, Mr Hambden, and four other members of the Houfe of Commons, and went to that houfe to feize them : but they were then retired. Mr Hambden afterwards made a fpeech in the houfe to clear himfelf of the charge laid againft him. In the beginning of the wars he commanded a regipaent of foot, and did good fer. M m 2
vice

Hamburg, vice to the parliament at the battle of Edge-hill. He received a mortal wound in an engagement with prince Repert, in Chalgrave-ficld in Oxfordfhire, and died in 1643. He is faid to have had the art of Socrates to a great degree, of interrogating, and under the notion. of doults, infinuated objections, fo that he infufed his own opinions into thofe from whom he pretended to learn and recejve them. He was, fays his panegyrift, a very wile man and of great parts; and poffeffed of the moof abfolute fpirit of popularity to govern the people, that ever was in any country: he was mafter aver all his appetites and paffions, and had thereby a very great afcendant pver other mens: he was of an induftry and vigilance never to be tired out, of parts not to be inpofed upon by the moff fubtile, and of courage eq tal to his beft parts.

HAMBURG, an imperial city of Germany, feated in E. Long. 9. 40. N. Lat. 54. O. It name is derived from the old German word Hamme, fignifying a wood, and Burg, acafle ; and ftands on the north-fide of the river Elbe. This river is not lefs than four miles broad oppofite the city. It forms two fpacions harbours, and likewife runs through moft part of it in canals. It flows above Hamburg many miles; but when the tide is accompanied with north-weft winds, a grear deal of damage is done by the inundations occalioned thereby. There are a great many bridges over the canals, which are moftly on a level with the ftreets, and fone of them have houfes on both fides. In the year 833, Ludovicus Pins erected Hamburg firft into a billiopric, and afterwards into an archbiMopric; and Adolphus III. duke of Saxony, among many other great privileges, granted it the right of fifhing in the Elbe, eight miles above and below the city. The king of Denmark, fince they have fucceeded to the counts of Holftein, have continually claimed the fovereiguty of this place, and often compelled the citizens to pay large fums to purchafe the confirmation of their liberties. Nay, it has more than once paid honage to the kings of Denmark; who, notwithflanding, keep a minifer here with credentials, which is a fort of acknowledgnent of its independency and fovereignty. Thongh Hamburg has been conliantly fummoned to the diet of the empire ever fince the year 1618, when it was declared a free imperial city by a decree of the aulic council; yet it waves this privilege, in order to keep fair with Deumark. By their fruation among a number of poor princes, the Hamburghers are continually expofed to their rapacioufnels, efpecially that of the Danes, whe have extorted vaft fums from them. The city is very populous in proportion to its bulk; for though one may walk with eafe round the ramparts in two hours, yet it contains, exclufive of Jews, atleaft 100,000 inhabitants. Here are a great many charitable foundations, the regulations of which are greatly admired by foreigners. All perfons found begging in the ftreets are committed to the houfe of correction to hard labour, fich as the rafping of Brazil and other kinds of wood. There is an hofpital into which unmarried women may be admitted for a fmall fum, and comfortably maintained during the refidue of their lives. The number of hofpitals in this place is greater in proportion to irs bignefs than in any other Proteftant city
in Eirrope. The revenue of the orphan-houfe alone Hamburg. is faid to amount to between 50 and 60,0001 . There is a large fumptuons hofpital for receiving poor travellers that fall lick. In one of their work-houfes or boufcs of correction, thofe who have not performed their tafk are hoifted up in a bafket over the table in the common-hall while the reft are at dinner, that they may be tantalized with the fight and fmell of what they cannot tafte. The eftablififed religion of Hamborg is Latheranifin; as for the Calvinifts and the Roman-catholits, they go to the ambafidors chapels to celebrate their divine fervice and worfhip. They have here what they call a private confelfion, previous to the holy communion, which differs in nothing from that of the church of England, and the alsolution is the fame, only the pooreft of the people here are forced to give a fee to the priefts on thefe occafions. Their churches which are ancient large fabrics, are open thorough fares, and in fome of them there are bookfellers fhops. The palpit of St Catherine's is of marble, curioully carved and adorned with figures and other ornaments of gold; and is organ, reckoned one of the beft in Europe, has 6000 pipes. The cathedral is very ancient, and its tower leans as if juft going to fall; yet on account of the fingularity and beauty of its architecture, the danger attending it has been hitherto overlooked. There are fill a dean and chapter belonging to this church, though fecularized; from whofe court there lies no appeal, but to the imperial chamber at Wetzlar. The chamber confifts of a provoft, dean, 13 canons, eight minor canois, and 30 vi carii immunes, befides others who are under the jarifdiction of the city. The cathedral, with the chapter, and a number of houfes belonging to them, are under the immediate protection of his Britannic majelty as duke of Bremen, who difpofes of the prebends that fall in fix months of the year, not fucceffively, but alternately with the chapter. Hantburg is almoft of a circular form, and fix miles in compais. It has fix gates, and three entrances by water, viz. two from the Elbe and one from the Alter, being divided into the old and new, which are frongly fortified with moats, ramparts, baftions, and out-works. The ramparts are very lofty, and planted with trees; and of fuch a breadth, that feveral carriages may go a-breaft. In the New-town, towards Altena, are feveral freets of mean houfes inhabited by Jews. Through that entrance from the Elbe, called the lower Baum, pafs all fhips going to or coming from fea. Every morning, at the opening of it, is feen a mulitude of boats or fmall barks, whofe cargoes confift of milk, fruits, and all kinds of provifions, rufling in at the fame time. There are fome fine chimes here, efpecially thofe of St Nicholas, which play every morning early, at one $o^{\prime}$ clock in the afternoon, and on all feftivals and folemnities. The other public ffructures in this city, befides the churches, make no great appearance : however, the yard, arfenal, and two armories, are well worth feeing. There are feveral convents or cloifters ftill remaining; which having been fecularized, are now poffeffed by the Lutherans. One of them holds ins lands by this tenure, "That they offer a glafs of wine to every malefactor who is carried hy ir for execution." There is a fine exchange, though inferior

## H A M

Hamburg. to that of London. It is the cuftom of Hamburg, that a citizen, when he dies, muft leave the tenth of his eftare to the city; and foreigners nor naturalized, muit pay a certain fum annully for liberty to trate. The common carts here are only a long pulley laid upon an axle-trec between two wheels, and drawn not by horfes, but by men, of whon a dozen or more are fometimes linked to thefe machines, with flings acrofs their houlders. Such of the fenafors, ! rincipal elders, divines, regular phylician's, and gradtates in law, as allift at funerals, bave a fee. The hangman's houfe is the common prifon for all malefactors; on whom fentence is always pafied on Friday; and on Monday they are executed. As, by their laws, no criminal is punifhable unlefs he plead guilty, they have five different kinds of torture to extort fich confeflion. The government of this city is lodged in the fenate and three colleges of burghers. The former is vefted with almoft every act of fovereignty, except that of laying taxes and managing the finances, which are the prerogatives of the latter. The magiftracy is compofed of four burgomafters, four fyndics, and 24 aldermen, of whom fome are lawyers and fome merchants. Any perfon elected into the magitracy, and declining the office muft depart the place. No burgher is admitred into any of the colleges, unlefs hedwells in a houfe of his own within the city, and is poffeffed of io00 rixdollars in fpecie, over and above the fum for which the houfe has been mortgaged ; or 200 in moveable goods, within the jurifdiction of the fame. For the adminiftration of juftice, here are feveral inferior courts, from which an appeal lies to the Obergericht, or high court, and from that to the aulic council and other imperial colleges. For naval caufes here is a court of admiraity, which, jointly with the city-trea. fury, is alfo charged with the care of the navigation of the Elbe, from the city to the river's mouth. In confequence of this, 100 large buoys, fome white, others black, are kept conftantly floating in the river in fummer; but in winter, inftead of fome of them, there are machines, like thofe called ice-beacons, to point out the fhoals and flats. Subordinate to the admiralty is a company of pilots; and at the mouth of the Elbe is, or at leaft ought to be, a veffel always riding, with pilots ready to put on board the fhips. At the month of the river alfo is a good harbour, called Cuxhaven, belonging to Hamburg; a light-houfe; and feveral beacons, fome of them very large. For defraying the expence of thefe, certain tolls and duties were formerly granted by the emperors to the city. Befides the Elbe, there is a candl by which a communication is opened with the Trave, and thereby with Lubeck and the Baltic, without the hazard, trouble, and expence, of going about by the Sound. The trade of Hamburg is exceedingly great, in exporting all the commodities and manufactures of the feveral cities and fates of Germany, and fupplying them with whatever they want from abroad. Its exports confift of lineds of feveral fort's and countries; as lawns, diapers, Ofnaburgs, dowlas, \&c. linen-yarn, tin-plates, iron, brafs, and ftecl-wire, clap-board, pipe-ftaves, wainfcot-boards, oak-plank, and timber, kid fkins, corn, beer in grear quantities, with flax, honey, wax, anifeed, linfeed, drugs, wine, tobacco, and metals. Its principal imports are the woollen manufactures and other goods of Great

## 285 ] HAAM

Britain, to the amount of feveral hundred thoufand Hambnry pounds a year: they have alfo a great trade with Spain, Portugal, and Italy, which is caried on mottly in Englifh botoms, on account of their Meditertancan palles. Their whalc-fithery is alfo very confiderablc, 50 or 60 dhips being generally fent out every year in this trade. Add to thefe a variety of manufactures, which are performed bere with gredt fuccefs; the chief of which are, fugar-baking, calico-printing, the weaving of damafks, brocades, velvers, and other rich filks. The inland trade of Hamburg is fuperior to that of any in Europe, unlefs perhaps we flould except that of Amfterdam and London. There is a paper publiohed bere at flated times called the Preifcourant, fipecitying the courle of exchatge, with the price which every commodity and merchandife bore laft upon the exchange. There is alfo a board of trade, erected on purpofe for the advancing every project for the improvenient of commerce. Another great advantage to the merchants is, the bank ettablified in 1619 , which has a flourlhing credit. To fupply the poor with corn at a low price, here are public granaries, in which great quantities of grain are laid up. By charters from feveral emperors, the Hamburgers have a right of coinage, which they actually exercife. The Englifh merchants, or, Hamburg Company, as it is called, enjoy great privileges; for they hold a court with particular powers, and a jurifdiction among themfelves, and have a church and minifter of their own.- This city has a diftrict belonging to it of confiderable extent, which abounds with excellent paftures, intermixed with feveral large villages and noblemens feats. A fmall bailiwic, called Bergekorf, belongs to this city and Lubeck. Though Hamburg bas an undoubted right to a feat in the diet of the empire, yet as the pays no contributions to the military cheft in time of war, and is alfo unwilling to draw upon herfelf the refentment of Denmark, fhe makes no ufe of that privilege. There is a fchola illiffris or gymuafum here, well endowed, with fix able profeffors, who read lectures in it as at the univerfities. There are alfo feveral free fencols, and a great number of libraries, public and private. The public cellar of this town has always a prodigious fock and vent of old hock, which brings in a confiderable revenue to the flate. Befides the militia or trained bands, there is an eftablifhment of regular forces, confifting of 12 companies of infantry, and one troop of dragoons, under the commandant, who is ufoally a foreigner, and one who has diftinguimed himfelf in the fervice. There is alfo an artillery company, and a night-guard; the laft of which is polted at night all over the city, and calls the hours.

HAMEL (John Baptifte do), a very learned French philofopher and writer in the inth centuty. At 88 he wrote a treatife, in which he explained in a very fimple manner Theodofius's three books of Spherics; to which he added a tract upon trigonomerry, extremely perficuous, and defigned as an introdection to aftronomy. Natural philofophy, as it was then taught, was oily a collection of vague, knotty, and barren quefions; when our aurbor undertook to eftablifh it upon right principles, and publifhed his Aftrononia Phyfica. In 1666 Mr Colbert propofed to Louis XIV. a fcheme, which was approved of by his majefty, for eftablifing a royal academy of fciences;

## H A M

Ciamelin and appointed our author fecretary of it. He pub Hami. lifhed a great many books; and died at Paris in 1706, of mere old age, being almoft 83. He was regius profeffor of philofophy, in which polt he was fucceeded by M. Varignon. He wrote Latin with purity and elegance.

HAMELIN, a ftrong town of Germany, in the duchy of Calemberg in Lower Saxony. It is fituated at the extremity of the duchy of Brunfwick, to which it is the key, near the confluence of the rivers Hamel and Weíer, in E. Long. 9. 55. N. Lat. 52. 13.

HAMELLIA, in botany: a genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking with thole of which the order is doubtful. The corolla is quinquefid; the berry quinquelocular, inferior, polyfpermous.

HAMESECKEN, Burgiary, or Nocturnal Houfebreaking, was by the ancient Englidh Jaw called Hamefecken, as it is in Scotland to this day.-Violating the privilege of a man's houfe in Scotland is as feverely punifhed as ravilhing a woman.

HAMI, or HA-MI, a country of Afia, fubject to the Chinefe. It is fituated to the north-eaft of China, at the extremity of that defert which the Chinefe call Ghanso, and the Tartars Cobi; and is only 20 leagues diftant from the moft welterly point of the province of Chenfi. This country was inhabited in the early ages by a wandering people, named Iong. About the year 950 before the Chriftian era, they fent deputies to pay homage to the emperor of China, and prefented fome fabres by way of tribute. The civil wars by which China was torn about the end of the dynafty of Tcheou having prevented affiftance from being fent to thefe people, they fell under the dominion of the Hiongnou, who appear to have been the fame as the Huns, and who at that time were a formidable nation. The Chinefe feveral times loft and recovered the country of Hami. In x 3 I (the fixth jear of the reign of Chunty, of the dynafty of the eaftern Han), the emperor kept an officer there in quality of governor. Under the following dy nafties, the fame viciffitudes were experienced: Hami was formetimes united to the province of Chenfi, fometimes independent of it, and fometimes even of the whole empire. The fituation of thefe people (feparated by vall deferts from China, to which, befides, they had no relation, either in language, manners, or cuftoms) muft have greatly contributed to facilitate thefe revolutions. All the tributary ftates of the empire having revolted in 6ro, that of Hami followed their example; but it again fubmitted to the yoke, under Tai-tfong, fecond emperor of the dynafty of Tang, who had fent one of his generals with an army to redace it. This great prince paid particular atecrion to his new conquent. He divided it into three diftricts, and connected its civil and military government in fuch a manner to that of the province of Chenfi and other neighbouring countries, that tranquillity prevailed there during his reign and feveral of thofe that followed. Throngh Hami all the caravans which went from the weft to China, or from China to the weft, were obliged to pafs. The emperors, predeceffors of Tai-tfong, were fatisfied with callfing wine to be tranfported from Hami in fkins carried by camels; but "Tai-rfong (fays the Chinefe hiftory) having fubdued the kingdom of Hami, or-
dered fome vine-plants of the fpecies called majou, to be brought him, which he caufed to be planted in his gardens; he, befides, Iearned the manner of making wine, the ufe of which proved both ferviceable and huriful to him." Luxury and effeminacy having weakened the dynafty of Tang, the Mahometans (who had made a rapid progrefs in all the countries that are fituated between Perfia, Cobi, and the Cafpian fea) advanced as far as Hami, which they conquered. It appears, that thiscountry afterwards had princes of its own, but dependent on the Tartars, who fucceflively ruled thefe immenfe regions. The Yuen or Mogal Tartars again united the country of Hami to the province of Chenfi ; and this reunion fubfifted until r360, at which time the emperor formed it into a kingdom, on conditon of its princes doing homage and paying tribute. The king of Hami was honoured with a new title in 1404, and obtained a golden feal. After a conteft of feveral years for the fucceffion to the throne, the kingdom of Hami fell a prey to the king of Tou-eulh-fan. This yoke foon became uneafy to the people of Hami : they revolted from their new mafters, and made conquefts from them in their curn. The new king whom they made choice of, did not long poffefs the throne: he was conquered and killed in a bloody battic which he fought with the king of Ton-eulh-fan, who alfo perihed fome time after. Since this epecha, the country of Hami has been fucceffively expofed to anarchy, or governed by its own princes. The prince who filled the throne in 1696 , acknowledged himfelf a vaffal of the empire, and fent as tribute to Peking, camels, horfes, and fabres. Kanghi received his honage with the ufual ceremonies, and publifhed a diploma, which eftablifhed the rank that the king of Hami flaould hold among the tributary princes, the time when he thould come to render homage, the nature of the prefents neceflary for his tribute, the number of auxiliaries he was bound to furnifh in time of war, and the manner of his appointing a fucceffor. A!l thefe regulations have fubfifted till this time.

The country of Hami, though furrounded by deferts, is accounted one of the moft delightful in the world. The foil produces abundance of grain, fruits, leguminous plants, and pafture of every kind. The rice which grows here is particularly encemed in China; and pomegranates, oranges, peaches, raifins; and prunes, have a moft exquifite tafte; even the jujubes are fojuicy, and have fo delicious a flavour, that the Chinefe call them perfumed jujubes.. There is no fruit more delicate or more in requelt than the melons of Hami, which are carried to Peking for the emperor's table. Thefe melons are much more wholefome than thofe of Europe ; and have this fingular property, that they may be kept frefl during great part of the win-ter.-But the moft ufeful and moft efteemed production of this country is its dried raifins. Thefe are of two kinds: Tbe firft, which are much ufed in the Chinefe medicine, feem to have a perfect refemblance to thofe known in Europe by the name of Corinthian. The fecond, whichare in much greater requeft for the table, are fmaller and more delicate than thofe of Provence. The Chinefe authors perfectly agree with Mefirs Lemery and Geoffroy, refpecting the virtue and qualities of thefe dried grapes or raifins; but they at-
great deal of gold from it; at prefent it fupplies them Hamilton.
tribute fo much more efficacy to thofe of Hami than to thofe of China, that they prefribe them in finaller dofes. They obferve, that an infution of the firft is of great fervice in facilitating an eruption of the fmall pox about the fourth day, when the patient either is or feems to be too weak; and to promote a gentle peripiration in fome kinds of plentifies or malignant fevers. The dofe mutt be varied according to the age, habit of body, and frength of the patient; great care muft be taken to adminifter this remedy feafonably and with judgment. The emperor caufed plants to be tranfported from Hami to Peking, which were immediately planted in his gardens. As thofe plants were cultivated with extraordinary care, under his own eyes, they have perfectly fucceeded. The raifins produced by them are exceedingly fweet, and have a molt exquifite flavour.

Although the country of Hami (the latitude of which is $42^{\circ} 53^{\prime} 20^{\prime \prime}$ ) lies farther towards the north than feveral of the provinces of France, we are afliured that its climate is more favourable to the culture of vines, and that it gives a fuperior degree of quality to the grapes. It never rains at Hami; even dew and fogs are fcarcely ever feen there; the country is watered only by the fnow which falls in winter, and by the water of this fnow when melted, which is collected at the bottoms of the mountains, and preferved with great care and induftry. The method of drying grapes in Hami is much fimpler than that practifed in the provinces of China. The people of Chenfi hold them over the fteam of hot wine, and even fometimes boil them a few feconds in wine in which a little clarified honey bas been diluted. In the kingdom of Hami they wait until the grapes are quite ripe; they then expofe them to the forching rays of the fun : afterwards piek them, and leave them in that manner until they are quite dry. However dry thefe grapes may be, they become fhrivelled, without lofing any of their fabfance, and without growing flat: good raifins ought to be almoft as crifp as fugar-candy.

The kingdom of Hami contains a great number of villages and hamlets; but it has properly only one city, which is its capital, and has the fame name. It is furrounded by lofty walls, which are half a league in circumference, and has two gates, one of which fronts the eaft, and the other the weft. Thefe gates are exceedingly beautiful and make a fine appearance at a diftance. The flreets are ftraight, and well laid out; but the houfes (which contain only a ground-floor, and which are almoft all conftructed of earth) make very little fhow: however, as this city enjoys a ferene iky, and is fituated in a beautiful plain, watered by a river, and furrounded by mountains which fhelter it from the north winds, it is a moft agreeable and delightful refidence. On whatever fide one approaches it, gardens may be feen which contain every thing that a fertile and cultivated foil can produce in the mildeft climates. All the furrounding fields are enchanting: but they do not extend far; for on feveral fides they terminate in dry plains, where a number of beautiful horfes are fed, and a fpecies of excellent fleep, which have large flat tails that fometimes weigh three pounds. The country of Hami appears to be very abundant in foffils and valuable minerals: the Chinefe have for a long time grocured diamonds and a
with a kind of agate, on which they fet a great value. With regard to the inhabitants of this fmall nate, they are brave, capable of enduring fatigue, very dextrous in bodily exercifes, and make excellent foldiers, hut they are fickle and foon irritated, and when in a palfion they are extrencly ferocious and languinary.

HAMILTON, a town of Scotland, in Clydefdale, feated on the river Clyde, eleven miles fouth caft of Glafgow; from whence the noble family of Hamilion take their name, and title of duke. The town is feated in the middle of a very agreeable plain; and on the weft of the town this family has a large park, which is near feven miles in circumference, inclofed with a high wall, full of deer and other game. The rivulet called Avons runs through the park, and falls into the river Clyde, over which laft there is a bridge of Free-ftone. W. Long. 3. 50. N. Lat. 55.40. The original name of this place, or the lands about it, was Cadzow or Cadyow, a barony granted to an anceftor of the noble owner, on the following occafion. In the time of Edward II. lived Sir Gilbert de Hamilton, or Hampton, an Englifhman of rank; who happening at court to fpeak in praife of Robert Bruce, received on the occafion an infult from John de Spenfer, chambetlain to the king. whom he fought and flew. Dreading the refentment of that potent family, he fled to the Scottifh monarch; who received him with open arms, and eftablifhed him at the place poffeffed by the duke of Hamilton. In aftertimes the name was changed from Cadzow to Ha milton; and in 1445 the lands were erceted intoa lordflip, and the then owner Sir James fat in parliamenc as lord Hamilton. The fame nobleman founded the collegiate church at Hamilton in 145 I , for a provof and feveral prebendaries. The endowment was ratified at Rome by the pope's bull, which he went in perfon to procure.-Hamilton-houfe or palace is at the end of the town; a large difagreeable pile, with two deep wings at rightangles with the centre; the gallery is of great extent; and, furnifhed, as well as fome other rooms, with mof excellent paintings.

Hamilton (Anthony, count), defcended froma noble family in Scotland, was born in Ireland, and fettled in France. He wrote feveral poetical pieces; and was the firft who compofed romances in an agreeable tafte, without imitating the burlefque of Scarron. He is alfo faid to be the anthor of the Merzoirs of the count de Grammont, one of the beft written pieces in the French language. His works were printed in 6 vols 12 mo . He died at St Germaine-en Laye, in. 1720 .

Hamilton (George), earl of Orkney, and a brave warrior, was the fifth fon of William earl of Selkirk, and early betook himfelf to the profeffion of arms.a. Being made colonel in $1689-90$, he diftinguifled himfelf by his bravery at the battle of the Boyne; and foon after, at thofe of Aghrim, Steinkirk, and Landen, and at the fieges of Athlone, Limerick, and Namur.. His eminent fervices in Ireland and Flanders, through the whole courfe of that war, recommendeded him fo. highly to king William III. that, in 1696, he advanced him to the dignity of a peer of Scotland, by: the title of earl of Orkney; and his lady, the finter of Edward vifcount Villiers, afterwards carl of Jerfey, had a grant made to her ${ }_{z}$ under the great feal of Ire-

Familton, land, of almoft all the private eftates of the late king Hamlet.

James, of very confiderable value.

Upon the acceflion of queen Anne to the throne, he was promoted to the rank of major-general in 1702 , and the next year to that of lieutenant-general, and was likewife made knight of the thiftle. His lordthip afterwards ferved under the grear duke of Marlborough; and contributed by his bravery and conduct to the glorious victories of Bleinhim and Mal plaquet, and to the taking of feveral of the towns in Flanders.

In the beginning of 1710 , his lordmip, as one of the 16 peers of Scotland, vored for the impeachment of Dr Sacheverel; and the fame year was fworn of the privy-council, and made general of the foot in Flanders. In 1712, he was made colonel of the royal regiment of fuzileers, and ferved in Flanders under the duke of Ormond. In 1714, he was appointed gentleman-extraordinary of the bed-chamber to king George I. and afterwards governor of Virginia. At length he was appointed conftable, governor, and captain of Edinbirgh caitle, lord-lieutenant of the county of Clydefdake, and field-marhall. He died at his houfe in Albemarle-ftreet. in 1737.

Hamilion (John), the 24th bighop of St Andrew's, to which he was tranflated from Dunkeld. He was natural fon of James the firft earl of Arran, and was in great favour at court whild his friends remained in power. He was one of queen Mary's privy council, and a fleady friend to that unfortunate princefs. He performed the ceremony of chriftening her fon, and was at different times lord privy feal and lord reafuser. The queen had reafon to lament her not following the advice of this prelate, after the fatal battle of Langfide, viz. not to truft her perfon in England. By the regent earl of Murray, he was declared a traitor, and oblized to feek Ihelter among his friends. He was unfortunately in the caftle of Dumbarton when that fortrefs was taken by furprife, from whence he was cartied to Stirling, where on April 9. 1570 he was hanged on a live tree. The two following farcaltic verfes were writtely upon this occation;

> Vive diu, felix arbor, femperque virete.

Frondibus, ut nobis talia poma feras.
HAMLET, Hamel, or Hampfel, (from the Saxon bam. i. e. domus, and the German lct, i.e. membrum), ifonifies a little village, or part of a village or parifh; of which three crords the firft is now only ufed, though Kitchen mentions the two laf. By Spelman there is a difference between villam integram, villann dimidiam,

## 288 <br> H A M

and bamletam ; and Stow expounds it to be the feat of Hamiet. a frecholder. Several county-towns have hamlets, as there may be feveral hamlets in a parifh; and fome particular places may be out of a town or hamlet, though not out of the county.

Hamiet, a prince celebrated in the annals of Denmark ; and whofe name has been rendered familiar in this country, and his ftory interenting, by being the fubject of one of the nobleft tragedies of the immortal Shakefpeare.-Adjoining to a royal palace, which ftands about half a mile from that of Cronborg in Elfineur, is a garden, which, Mr Coxe informs us, is called Hamlet's Garden, and is faid by tradition to be the very fpot where the murder of his father was perpe. trated. The houfe is of modern date, and is firuated at the foot of a fandy ridge near the fea. The garden occupies the fide of the hill, and is laid out in terraffes rifing one above another. Elfineur is the fcene of Shakefpeare's Hamlet; and the original hiftory from which our poet derived the principal incidents of his play is founded upon facts, but fo deeply buried in remote antiquity that it is dificult to difcriminate truth from fable. Saxo-Grammaticus, who flourifhed in the i2th century, is the earlieft hiftorian of Denmark that relates the adventures of Hamlet. His account is extracted, and much altered, by Belleforelt a Erench author; an Englifh tranlation of whofe romance was publifhed under the title of the Hittorye of Hamblet: and from this iranflation Shakefpeare formed the ground-work of his play, though with many alte. rations and additions. The following thort fketch of Hamlet's hiftory, as recorded in the Danilh annals, will enable the reader to compare the original characte. with that delineated by Shakefpeare.

Long before the introduction of Chriftianity into Denmark, Horwendillus, prefect or king of Jutland, was married to Geruthra, or Gerrrude, daughter of Ruricking of Denmark, by whom he had a fin called Amlettus, or Hamlet. Fengo murders his brother Hor. wendillus, marries Gertrude, and afcends the throne. Hamlet, to avoid his uncle's jealonfy, counterfeits folly; and is reprefented as fach an abhorrer of falfehood, that though he conftantly frames the moft evafive and even abfurd anfwers, yet artfully contrives never to deviate from truth. Fengo, fufpecting the reality of his madnefs, endeayours by various methods (a) to difcover the real ftate of his mind : amonglt others, he departs from Elfineur, concerts a meeting berween Hamlet and Gertrude, concluding that the former would not conceal his fentiments fiom his own mother
(a) Among other attempts, Fengo orders his comparions to leave him in a retired foot, and a young woman is placed in his way, with a view to extort from him a confeflion that his folly was connterteited. Hamlet would have fallen into the fiare, if a friend had not fecretly conveyed to him imelligence of this treachery. He carries the woman to a more fecret place, and obtains her promife not to betray him ; which the readily confents to, as the had been brought up with him from her infancy. Being afked, upon his retarn home, if he had indalged his paffion, he anfwers in the affirmative; but renders himfelf not believed by the moft artful fubterfuges, which, though true, feemed evidently to mark a difordered underfanding, and by the pofitive denial of ihe woman. "Upon this woman," as Capell obferves, "c is grounded Shakefpeare's Ophelia: and his deliverance from this fagre by a friend fingefted his Horatio:" - "the rude onclines," as Mr Malone remarks, "of thofe cbaracters. But in this piece there are no traits of the character of Poloniws; there is indeed a counfellor, and he places himfelf in the queen's chamber behind the arras; but this is the whole. The ghoft of the old Hamlet is likewife the offspring of our author's creative imagination." See Capell's School of Shakefpeare, vol. iii. p. 20.: and Malone's Supplement, p. 253.

## H A M

Hamlet, and orders a courtier to conceal himfelf, unknown to both, for the purpofe of overhearing their converfation. The courtier repairs to the queen's apartnent, and hides himfelf under a heap of fraw (B). Hamlet, upon entering the cabinet, fufpecting the prefence of fome $f_{p y}$, imitaces, after his ufual attectation of folly, the crow of a cock, and, thaking his arms like wings, jumps (c) upon the heap of ftraw; till, feeling the courtier, he draws his fword, and inftantly difpatches him. He then cuts the body to pieces, boils it, and gives it to the hogs. He then avows to his mother that he only perfonated a fool, reproaches her for he: inceftuous marriage with the murderer of her hufband; and concludes his remonitrances by faying, "Inftead, therefore, of condoling my infanity, deplore your own infamy, and learn to lament the deformity of your own mind (D)." The queen is filent; bat is recalled to virtue by thefe admonitions. Fengo returns to Ellineur, fends Hamlet to England under the care of two courtiers, and requefts the king by a letter to put him to death. Hamler difcovers and alters the letter; fo that, upon their arrival in England, the king orders the two courtiers to immediate execution, and betroths his daughter to Hamlet, who gives many aftonithing proofs of a molt tranfcendant underftanding. At the end of the year he returns to Denmark, and alarms the court by his unexpected appearance; as a report of his death had been fpread, and preparations were making for his funeral. Having re-aflumed his affected infanity, he purpofely wounds his fingers in drawing his fword, which the byftanders inmediately faften to the fcabbard. He afterwards invites the principal nobles to an entertainment, makes them intoxicated, and in that fate covers them with a large curtain, which he faftens to the ground with wooden pegs : he then fers fire to the palace; and the nobles, being in-

Vol. VIII.

## 2897 <br> HAM

veloped in the curtain, perifh in the flames. During Hanlet. this tranfaction he repairs to Fengo's apartment; and, taking the fword which lay by the fide of his bed, puts his own in its place : he inftantly awakens and informs him, that Hamlet is come to revenge the marder of his father. Fengo ftarts from his bed, feizes the fword; but, being unable to draw it, falls by the hand of Hamlet. The next morning, when the populace were affembled to view the ruins of the palace, Hamlet fummons the remaining nobles; and in a mafterly fpeech, which is too long to infert in this place, lays open the motives of his own conduct, proves his uncle to have been the affafin of his father; and concludes in the fol. lowing words, "Tread upon the afhes of the moniter, who, polluting the wife of his murdered brother, joined inceft to parricide; and ruled over you with the moft oppreffive tyranny. Receive me as the minifter of a juft revenge, as one who feit for the fufferings of his father and his people. Confider me as the perfon who has purged the difgrace of his country; extinguifhed the infamy of his mother; freed you from the defpotifm of a monfter, whofe crimes, if he had lived, wonld have daily increafed, and terminated in your deftruction. Acknowledge my fervices; and if I have deferved it, prefent me with the crown. Behold in me the author of thefe advantages: no degenerate perfon, no parricide; but the rightful fucceffor to the throne's and the pions avenger of a father's murder. I have refcued you from flavery, reftored you to liberty, and re-eftablifhed your glory: I have deftroy od a tyrant, and triumphed over an affafin. The recompence is in your hands: you can entimate the value of my fervices, and in your virtue I reft my hopes of reward." This fpeech has the defired effect : the greater part of the affembly thed cears, and all who are prefent unanimouly proclaim him kingamid repeated ac=lamations. N $n$ Hamlet
(b) The reader will recolleft, that fraw ufed formesly to be fpread over the floors as an article of great luxury.
(c) This part flands thus in the Englifh account: "The counfellor entered fecretly into the queene's chamber, and there hid himfelfe behind the arras, and long before the queene and Hamlet came thither : who being craftie and politique, as foone as he was within the chamber, doubting tome treafon, and fearing if be fhould feak feverely and wifely to his mother touching his fecret prastices he floould be underfood, and by that means intercepted, ufed his ordinary manner of diffimulation, and began to come ( $r$. crow) like a cocke, beating with his arms (in fuch a manner as cockes ufed to ftrike with their wings) upon the hangings of the chanbers; wiereby feeling fomething flirring under thent, he cried, A rat! a rat! and prefently drawing bis fworde, thruft it into the hangings; which done, he pulled the cotinfellor (half deade) out by the heels, made an end of killing him ; and, being flain, cut his body in pieces, which he caufed to be boiled, and then caft it into an open vaultor privie." Malone's Supplement, vol. i. p. 357.
(D) The clofet-fcene, which is fo beautiful in Shakefpeare's Hamlet, is thus concifely, but not lefs finely, defcribed by the Danifl hiftorian; "Cumque mater magno ejulatu quefla prefentis filii focordiam deflere cæpiffer: 'Quid (iuquit) mulierun turpiffima gravifimi criminis diflimulationem falfo lamenti genere expetis, que forti more lafciviens nefariam ac deteftabilem thori conditionem fecuta viri tui interfectorem pleno incefti finu amplecteris: et ei qui prolis tuæ parentem extinxerat obfcenifimis blandimentorum illecebris adulatis. Ita nempe equæ conjugum fuorum vietoribus maritantur. Brutorum natura hec eft; ut in diverfa pafim conjugia rapiantur; hoc tibi exemplo prioris mariti memoriam exeleviffe coultat. Ego vero non ab re ffclidi fpecien gero, cum haud dabitem quin is qui fratrem opprefferit, in affistes qucque pari crudelitate debacchaturus fit: unde folid tatis quæ indulfix habium anplecti preftat, et incolumiratis prefidium ab extrérâ deliramentorum fpemie mutuari. In animotamen pateriæ ultionis fudium perfeverat: fed rerum occafiones aucupor, temporim upporuniates opperior. Non idem ormious locus competit. Contra obfeurnu immitemque animumaltioribus ingenii modis uti convenir. Tibi vero fapervacuum fit meam lamentari defipientiam, quax twam jutius igncminiam deplorare debueras. Itaque non aliene fed propriæ mentis vitium deffeas neceqe eft. Cæeraz filere memineris.' Tali convitio laceratam matrem ad excolendum virtutis habitum revocavit, praterilefque ignes præientibus illecebris preferre docuit:"

## H A M

Hamlet foon after his elevation fails to England, and orders a fhield to be made on which the principal actions of his life is reprefented. The king receives him with feigned demonftrations of joy, falfely affures him that his daughter is dead, and recommends him to repair to Scotland as his ambaffador, and to pay his addreffes to the queeu Hermetruda. He gives this infidieus advice with the hopes that Hamlet may perifl in the attempt; as the queen, who was remarkable for her chaftity and cruedty, had fuch an averfion to all propofals of marriage, that not one of her fuitors had efcaped falling a facrifice to her vengeance. Hamlet, in oppofition to all difficulties performed the embaffy; and, by the affiftance of his hield, which infpires the lady with a favourable opinion of his wifdom and courage, obtains her in marriage, and returns with her to England. Informed by the princefs to whom he had been betrothed, that her father meditates his affalfination, Hamlet avoids his fate by wearing armour under his robe; puts to death the king of England; and fails to Denmark with his two wives, where he is foon afterwards killed in a combat with Vigletus fon of Ruric. Hamlet, adds the hiftorian, was a prince, who, if his good fortune had been equal to his deferts, would have rivalled the gods in fplendor, and in his actions would have exceeded even the labours of Hercules.

HAMMER, a well known tool ured by mechanics, confifting of an iron head, fixed croffwife upon a handle of wood. There are feveral forts of hammers ufed by blackfmiths; as, I. The hand-hammer, which is of fuch weight that it may be wielded or governed with one hand at the anvil. 2. The up-hand fledge, ufed with both hands, and feldom lifted above the head. 3. The about-fledge, which is the biggeft hammer of all, and held by both hands at the farthe $\mathfrak{f t}$ end of the handle; and being fwung at arms lengtlo over the head, is made to fall upon the work with as heavy a blow as poffible. There is alfo another hammer ufed by fmiths, called a rivetting hammer; which is the fmalleft of all, and is feldom ufed at the forge unlefs upon fmall work. -Carpenters and joiners have likewife hammers acconmodated to their feveral purpofes.

HAMMERING, the act of beating or extending and fahnioning a body under the hammer. When it is performed on iron heated for the purpofe, the fmiths ufially call it forging.

Hammernes, in coining. A piece of money or a medal is faid to be hammered when fruck, and the impreffion given with a hammer and not with a mill.

HAMMERSMITH, four miles weft from London, is a hamlet belonging to Fulham, has two charityfchools, a workhoufe, a Prefbyterian meeting-houfe, and a fair May I. There are a number of handfome feats about it, efpecially towards the Thames; among which the moft remarkable is the late lord Melcombe's, which is a very elegant houfe, and contains a marble gallery finifhed at a very great expence.

HAMMOCK, or Hamac, a kind of hanging bed, fufpended between two trees; pofts, hooks, or the like, much ufed throughout the Weft-Indies, as alfo on board of fips. The Indians hang their hammocks to erees, and thus fecure themfelves from wild beafts and infects, which render lying on the ground there very
dangerous. According to F. Plumicr, who has often Hammer. made ufe of the hammock in the Indies, it confints of fmith, a large ftrong coverlet or fheet of coarfe cotton, about Hammond. fix feet fquare : on two oppofite fides are loops of the fame ftuff, through which a ring is run, and thercof other loops are formed, all which are tied together with a cord: and thus is the whole faftened to two neigbouring trees in the field, or two hooks in houfes. This kind of conch ferves at the fame time for bed, quilts, fheets, pillow, \&c.

The hammock ufed on board of fhips is made of a piece of canvas fix feet long and three feet wide, gathered or drawn together at the two ends. There are ufually from fourteen to twenty inches in breadth allowed between decks for every hammock in a fhip of war; but this fpace maft in fome meafure depend on the number of the crew, \&c. In time of battle the hammocks and bedding are firmly corded and fixed in the nettings on the quarter-deck, or wherever the men are too much expofed to the view or fire of the enemy.

HAMMOND (Henry), D. D. one of the mort learned Englith divines in the I7th century, was born in 1605. He fludied at Oxford, and in 1629 entered into holy orders. In 1633 he was inducted into the rectory of Penfhurft in Kent. In r643 he was made archdeacon of Chichefter. In the beginning of 1645 he was made one of the canons of Cbrift-church, Oxford, and chaplain in ordimary to king Charles I. who was then in that city; and he was alfo chofen public orator of the univerfity. In 1657 he atrended the king in his confinement at Woodburn, Cavefham, HamptonCourt, and the Ifle of Wight, where he continued till his majefty's attendants were again put from him. He then returned to Oxford, where he was chofen fub-dean; and continued there till the parliament-vifiturs firf ejected him, and then imprifoned him for feveral weeks in a private houfe in Oxford. During this confinement he began his Annotations on the New Teftament. At the opening of the year 1660, when every thing vifibly tended to the reftoration of the royal family, the doctor was defired by the bifhops to repair to London to affift there in the compofure of the breaches of the church, his fation in which was defigned to be the bifhopric of Worcefter ; but on the $4^{\text {th }}$ of April he was feized by a fit of the ftone, of which he died on the 25 th of that month, aged 55. Befides the above work, he wrote many others; all of which have been pablifhed rogether in four volumes folio.

Hammond (Anthony, Efq;). an ingenious Englifh poet, defcended from a good family of Somerfham Place in Huntingdonhire, was born in 1668 . After a liberal education at St John's college, Cambridge, he was chofen member of parliament, and foon diftinguifhed himfelf as a fine fpeaker. He became a commiffioner of the royal navy, which place he quitted in 1712 . He publifhed A Mifcellany of original Poems by the moft eminent hands; in which himfelf, as appears by the poems marked with his own name, had no inconfiderable fhare. He wrote the Life of Walter Moyle, Efq; prefixed to his works. He was the intimate friend of that gentleman, and dicd about the year 1726.

Hammond (James), known to the world by the LoveElegies which, fome years after his dearh, were pub-

## H A M

Wamprhize. lifhed by the earl of Chefterfield, was the fon of Anthony Hammond abovementioned, and was preferred to a place about the perfon of the late prince of $W$ ales, which he held till an unfortunate accident deprived him of his fenfes. The caufe of this calamity was a paflion he entertained for a lady, who would not return it : upon which he wrote thofe love-elegies which have been fo much celebrated for their tendernefs. The editor obferves, that he compofed them before he was 21 years of age : a period, fays he, when fancy and imagination commonly riot at the expence of judgment and correctnefs. He was fincere in his love as his friendihip; and wrote to his miftrefs, as he fpoke to his friends, nothing but the genuine fentiments of his heart. Tibullus feems to have been the model our author judicioully preferred to Ovid; the former writing directly from the heart to the heart, the latter too often yielding and addrefling himfelf to the imagination. Mr Hammond died in the year 1743, at Stow, the feat of lord Cobham, who, as well as the earl of Chefterfield, honoured him with a particular intimacy.

HAMPSHIRE, or Haunts, a county of England, bounded on the weft by Dorfetihire and Wilthire, on the north by Berkflire, on the eaft by Surry and Suffex, and on the fouth by the Englinh channel. It extends 55 miles in length from north to fouth, and 40 in breadth from eaft to weft, and is about 220 miles in circumference. It is divided into 39 hundreds, and contains 9 forefts, 29 parks, one city, 20 markettowns, 253 parifines, above 36,000 houfes, and by the moft modeft computation 180,000 inhabitants, who elect 26 members of parliament, two for the county, two for the city of Winchefter, and two for each of the following towns, Southampton, Portfmouth, Petersfield, Yarmouth, Newport, Stockbridge, Andover, Whitchurch, Lymingron, Chrift-church, and Newton. -The air is very pure and pleafant, efpecially upon the downs, on which valt flocks of theep are kept and bred. In the champaign part of the county, where it is free of wood, the foil is very fertile, producing all kinds of grain. The country is extremely well wooded and watered ; for befides many woods on private eftates, in which there are vaft quantities of well-grown timber, there is the new foreft of great extent, belonging to the crown, well fored with venerable oaks. In thefe woods and forefts, great mumbers of hogs run at large, and feed on the acorns; and lence it is that the Hamphire bacon fo far excels that of moft orher countries. The rivers are the Avon, Anton, Arle, Teft, Stowre, and Itchin; befides feveral fmaller freams, all abounding in fifh, efpecially trout. As its fea-coaft is of a confiderable extent, it poffeffes many good ports and harbours, and is well fupplied with falt-water finh. Much honey is produced in the country, and a great deal of mead and metheglin made. Here is alfo plenty of game, and on the downs is mont delightful hunting. The manufacture of cloth and kerfies in this county, though not fo extenfive as that of fome others, is yet far from being inconfiderable, and employs great numbers of the poor, as well as contributes to the enriching of the manufacturers by what is fent abroad. The new intended canal in this county, from Bafinghroke to the Wye in Surry, and from thence to the Thames, cannot but be a great advantage to the conniy in gencral, and the parifies it
is to pafs throngh in particular ; to carry which into Hamp:hiren execution above L. 86,000 have been raifed amongh 150 proprietors in 1789, and it will extend 53 miles when completed.

New Hampshire, a fate of North America, in New England: It is bounded on the north by Quebec; north-ealt by the province of Main; fouth-eatt by the Allantic Ocean ; fouth by Maffachufers; weft and north-well by Connecticut river, which divides it frons Vermont. The fhape of New Hamphire refembles an open fan ; Connecticut river being the curve, the fouthern line the Chorteft, and the eaftern line the longeft fide. It is divided into five countries, viz. Rockingham, Stafford, Hilliborough, Chefhire, Grafton. In 1776, there were 165 fertled townhips in this ftate. Since that time the number has been greatly increafed. The chief town is Portsmouth. Exeter, 15 miles fouthweftwardly from Portfmouth, is a pretty town on the fouth fide of the Exeter river. And Concord, fituated on the weft fide of Merrimak river, is a pleafant flourifhing town, which will probably, on accodnt of its central fituation, foon be the permanent feat of government. There are two great rivers, the Pifcata and the Merrimak. The former has four branches, Berwick, Cochechy, Exeter, and Burham, which are all navigable for fmall veffels and boats, fome 15 others 20 miles from the fea. Thefe rivers unite about cight miles from the mouth of the harbour, and form one broad, deep, rapid ftream, navigable for hlips of the largeft burden. This river forms the only port of New Hamphire. The Merrimak bears that name from its mouth to the confluence of Pemigewaffet and Winnifipiokec rivers; the latter has its fource in the lake of the fame name. In its courfe, it receives numberlefs fmall freams iffaing from ponds and fwamps in the valleys. It tumbles over two confiderable falls, Amafkaeg and Pantucket great falls. From Haveril the river runs winding along, through a pleafant rich vale of meadow, and paffing between Newbury Port and Salifbury empties itfelf into the ocean. The land next to the fea is generally low; but as you advance into the country, it rifes into hills. Some parts of the ftate are mountainous. The White mouns tains are the higheft part of a ridge which extends northeaft and fouthweft to a length not yet afcertained. The whole circuit of them is not lefs than 50 miles. The height of thefe mountains above an adjacent meadow, is reskoned to be about 5500 feet, and the meadow is 3500 feet above the level of the fea. The fnow and ice cover them nine or ten months in the year; during which time they exhibit that bright appearance from which they are denominated the white mountains. From this fummit in clear weather is exhibited a noble view, extending 60 or 70 miles in every direetion. Althongh they are more than 70 miles within land, they are feen many leagues off at fea, and appear like an exceeding bright clond in the horizon. Thefe immenfe heights, being copioufly replenifhed with water, afford a variety of beauriful cafcades. Three of the largeft rivers in New England receive a great part of their waters from thefe mountains. Amanoofuck and Ifrael rivers, two principal branches of Connecticut, fall from their weftern fide. Peabody river, a branch of the Amarifcogen, falls from the northeaft fide; and almof the whole of the

Nat
Sac
famphirc. Saco delcends from the fouthern fide. The higheft fummil of the fe montains is about latitude $44^{\circ}$.

The air in New Hampliire is lerene and healthful. The weather is not fo fubject to change as in more fouthern climates. This flate embofoming a number of very high monntains, and lying in the neighbourhood of others whofe towering fummits are covered with fnow and ice three quarters of the year, is intenfely cold in the winter feafon. The heat of fummer is great, but of hort duration. The cold braces the conftitution, and renders the labouring people healthful and robuft.

On the fea coaft, and many places inland, the foil is fandy, but affords good pafturage. The intervals at the foot of the mountains are generally enriched by tie frefhets, which bring down the foil upon them, forming a fine mould, and producing corn, grain, and herbage, in the moft luxuriant plenty. The back lands which have been cultivated are generally very fertile, and produce the various kinds of grain, fruits, and vegetables, which are common to the other parts of New England. The unculivated lands are covered with extenfive forefts of pine, fir, cedar, oak, walnut, \&c. This ftate affords all the materials neceffary for hip,building.

By the return of the Cenfus Auguft roth i 79r, the number of inhabitants in this ftate appeared to be $14 \mathrm{I}, 815$. There is no characteriftical difference between the inhabitants of this and the other New England Nates. The ancient iwhabitants of New Hamphire were emigrants from England. Their pofterity, mixed with emigrants from Maffachulets, fill the lower and middle towns. Emigrants from Connecticut compofe the largeft part of the inhabitants of the weftern towns adjoining Connecticnt river. Slaves there are none. Negroes, who were never namerous in New Hamphire, are all free by the firt article of the bill of rights.

In the townimip of Hanover, in the weftern part of this fate, is Dartmonth College, fituated on a beautiful plain, about half a mile eaft of Connecticnt river, in latitude $43^{\circ} 33^{\circ}$. It was named after the right honourable William Earl of Darmouth, who was one of irs principal benefactors. If was founded in 1769 , for the education and inftruction of youth, of the Indian tribes, in reading, writing, and all parts of learning which fhould appear neceflary and expedient for civilizing and chriftianizing the children of Pagans, as well as in all liberal arts and fciences, and alfo of Englifh youths and any others. Its fituation, in the frontier country, exfufed it during the late war to many inconveniences, which prevented is rapid progrefs. It flourifhed, however, amidft all its embarraflments, and is now one of the moft growing feminaries in the U nited States. It has in the four claffes about 130 ftudents, under the direction of a prefident, two profeffors, and two tutors. It has it truftees, who are a body corporate, invefted with the powers neceflary for fuch a body. The library is elegant, containing a large collection of the mof valuable books. Its appararus confifts of a competent number of ufeful inftraments, for making mathematical and philofophical experiments. There are three buildings for the ufe of the qudents. Such is the falubrity of the air, that
no intance of mortality has happened among the fu. Hampfead dents fince the firit eftablifhment of the college.

At Exeter there is an academy ; at Porifmouth a grammar fchool; and all the towns are bound by law to fupport fchools. The inhabitants of New Hampfine are chiefly Congregationalifts. The other denominations are Prefbyterians, Baptifts, and Epifcopalians.

The firft difcovery made by the Englifh of any part of New Hamphire was in 1614 , by Captain John Smith; who ranged the fhore from Penobscot to Cape Cod; and in this route difcovered the river Pifcataqua. On his return to England, he publifhed a defeription of the country, with a map of the coalt, which he prefented to prince Charles, who gave it the name of New-England. The firlt fettlement was made in 1623.

New Hampfire was for many years under the jurifdiction of the governor of Maflachufers, yet they had a feparate leginatare. They ever bore a proportionable fhare of the expences and levies in all enterprifes, expeditions, and military exertions, whether planned by the colony or the crown. In every flage of the oppofition that was made to the encroachments of the Britifh parliament, the people, who ever had a high fenfe of liberty, cheerfully bore their part.

HAMPSTEAD, a pleafant village of Middlefex, four miles northweft of London, ftands in a healthy air, on a fine rife, at the top of which is a beath of about a mile every way, that is adorned with feveral pretty feats, in a moft irregular romantic fituation, and has a molt extenfive profpect over London, into the counties all round it, viz. Bucks and Hertfordthire, and even Northampton, Effex, Kent, Sarry, Berks, \&c. with an uninterrupted view of Sleooter's Hill, Banfted-Downs, and Windfor Caftle. Irs church was anciently a chapel of eafe to Hendon, inl about 1748. This village ufed to be reforted to formerly for its mineral waters, which havelately been negleeted ; but the wells are fill frequented. It is now crowded with good buildings, even on the very fleep of the hill, where there is no walking fix yards together without meeting a hillock; but in the reign of Henry VIII. it was chiefly inhabited by the laundreffes who wathed for the Londoners. Its old ruinous church, the lord of the manor's chapel, was lately pulled down, and a new one erected in its room. There is, befides, a handfome chapel near the wells, built by the contribution of the inhabitants, who are chiefly citizens and merchants of London.

HAMPTON, a town of Gloacefterfhire in England, feated on the Cotfwold hills, and had formerly a nun. nery. W. Long. 2. 15. N. Lat. 51. 51.

Hampton, a town of Middlefex in England, feated on the river Thames, 12 miles weft of London, and two from Richmond and Kington. It is chiefly famous for the royal palace there, which is the fineft in Britain. It was built by cardinal Wolfey, who had 280 filk beds for ftrangers only, and farnihhed it richly with gold and filver plate. The buildings, gardens, and the two parks, to which William III. made confiderable additions, are about four miles in circumference, and are watered on three fides by the Thames. The inward court, built by king William, forms a piazza, the pillars of whichare fo low, that it looks mors

Hamefoken ॥
more like a cloyfter than a palace ; bowever, the apartments make ample amends, being extremely magnificent, and more exaetly difpofed than in any other pa. lace in the world, and adorned with moft elegant furniture. Since the acceflion of his prefent majefty, however, this palace hath been much neglected, as the king has generally made choice of Windfor for his fummer retreat. Thofe inimitable paintings by Raphacl Urbin called the cartoons, which were placed there by king William, have been removed to the quetn's palace at Wefminfter. For thefe pieces Lonis XV. is faid to have offered $100,000 \mathrm{l}$.

HAMESOKEN, or Hamesecien. See Hamesegken.

HANAPER, or HAMPER, an office in the Englih chancery, under the direction of a mafter, his deputy and clerks, anfwering, in fome meafure, to the $f i f$ cus among the Romans.

Hanaper, (clerk of the) fometimes ftyled warden of the hanaper, an officer who receives all money due to the king for feals of charters, patents, commiffions, and writs, and attends the keeper of the feal daily in term time, and at all times of fealing, and takes into his cuftody all fealed charters, patents, and the like, which he receives in bags, but anciently, it is fuppofed, in to hampers, which gave denomination to the office.

There is alfo an officer, who is comptruller of the hanaper.

HANAU, a town of Germany; and capital of a county of the fame name, is pleafantly fituated on the river Kenzig near its confluence with the Mayne. The river divides it into the old and new town, both of which are fortified. The new town, which was built at firf by French and Flemifh refugees, who had great privileges granted them, is regular and handfome. The caftle, in which the counts ufed to refide, and which ftands in the old town, is fortified, and has a fine flower-garden with commodions apartments, but makes no great appearance. The Jews are tolerated here, and dwell in a particular quarter. The magiftracy of the new town, and the difpofal of all offices in it, belong to the French and Dutch congregations. Here is an univerity, with feveral manufactures, particularly that of roll tobacco, and a very confiderable traffic. E. Long. 9. O. N. Lat. 49. 58.

HaNAU-Munzenberg, a conuty of Germany. The greateft part of it is furronnded by the electorate of Mentz, the bifhopric of Fulda, the lordhips of Reineck, Ilenburg, and Solms; as alfo by the territories of Heffe-Homburg. Barg-Friedburg, and Frankfort. Its length is near 40 miles, but its greateft breadth not above 12. It is exceedingly fertile in corn, wine, and fruits : yielding alfo falt frings, with fome copper, filver, and cobalt. The chief rivers are, the Mayne, the Kenzig, and the Nidda. The prevailing religion is Calvinifm, but Lutherans and Catholics are tolerated. The conntry is populous, and trade and manufactures flowrifh in it. In 1736, the whole male line of the counts of Hanau failing in John Reinard, William VIII. landgrave of the Hefle Caffel, by virtue of a treaty of mutual fueceftion between the families of Hanau and Heffe Cairel, took poffefion of the county, fatisfaction having been firf made to the boofe of Saxony for their claims; and in the year 1754 transferred it to prince William, eldeft on to the then
hereditary prince Frederick, afterwards landgrave, The revenues of the laft count, ariling from this dad other territories, are faid to have amounted to 500,000 florins. The principal places are Hanan, Bergen, Steinau, and Glenhaufen.

HAND, a part or member of the body of man, making the extremity of the arm. Suc Anatomy, $\mathrm{n}^{\mathrm{Q}} 53$, \&c.

The mechanifm of the hand is very curious; excellently contrived to fit it for the various ufes and occafions we have for it, and the great number of arts and manufactures it is to be employed in. It confifts of a compages of nerves, and litile bones joined into each other, which give it a great degree of frength, and at the fame time an unufual flexibility, to enable it to handle adjacent bodies, lay hold of them, and grafp them, in order either to draw them toward us or thruft them off. Anaxagoras is reprefented by ancient authors, as maintaining, that man owes all his wildom, knowledge, and faperiority over other animals, to the ufe of his hands. Galen reprefents the matter otherwife; man, according to him, is not the wifent creature, becaufe he has hands; but he had hands given him becaufe he was the wifeft creature; for it was not our hands that taught us arts, bur our reafon. The hands are the organs of reafon, \& c .

In fcriptare the word band was variounly applicd. To pour water on any one's hand, fignifies to ferve, him. To walh the hands was a ceremony made ufe of to denote innocency from murder or manlaughter. To kifs the hand was an act of adoration. To fill the hand fignified taking poffeffion of the priefthood, and performing its functions. To lean upon any one's hand was a mark of familiarity and fuperiority. To give the hand fignifies to grant peace, fwear friendhip, promifefecurity, or make alliance. The right hand was the place of honour and refpect.-Amongt the Greeks and Romans it was cuftomary for inferiors to walk on the left hand of fuperiors, that their right hand might be ready to afford protection and defence to their left fide, which was, on account of the auk wardnefs of the left hand, more expofed to danger.

Impofition or laying on of HANDS, fignifies the conferring of holy orders; a ceremony wherein the hands are laid on the head of another, as a lign of a miffion, or of a power given him to exercife the functions of the miniftry belonging to the order.

The apofles began to appoint miffionaries by the impolition of hands. See lmposition.

Hand, in falconry, is afed for the foot of the hawk. To have a clean, ftrong, Alender, glutinous band, well clawed, are fome of the good qualities of a hawk or falcon.
$H_{A N D}$, in the manege, fometimes ftands for the fore-feet of a horfe. It is alfo ofed for a divifion of the herfe inpo two parts, with refpect to the riders hand. The fore-hand includes the head, neck, and fore quarters; the hind-hand is all the reft of the horfe.
$H_{A N D}$ is likewife ufed for a meafure of four inches, or of a clenched fift, by which the height of a horfe is computed.

Hand is alfo figuratively ufed in painting, fculp.. ture, \&c. for the manner or ftyle of this or that: mafter.

Fand, Fandel.

HANDS are borne in coat-armour, dexter and finifter: that is, right and lefr, expanded or open ; and after other manners. A bloody hand in the centre of the efcutclieon is the badge of a baronet of Great Britain. Hand-Breadth, a meafure of three inches.
HANDEL (George Frederic) a moft eminent mafter and compofer of mufic; was born at Hall, a city of Upper Saxony in Germany. His father was a phyfician and furgeon, of that place, and was upwards of 60 years of age when Handel was born. During his infancy young Handel is faid to have amufed himfelf with mulical inftruments, and to have made confiderable progrefs before he was feven years of age, without any inftructions. His propenfity for mufic at laft became fo ftrong, that his father, who defigned him for the ftudy of the civil law, thought proper to forbid him even at this early period of life, to touch a mulical inftrument, and would fuffer none to remain in his houfe. Notwithftanding this prohibition, however, Handel found means to get a little clavichord privately conveyed to a room in the uppermoft fory of the Houfe, to which room he conftantly ftole when the family were afleep: and thus made fuch advances in his art, as enabled hin to play on the harpfichord. He was firft taken notice of by the duke of Saxe Weifenfels on the following occafion. His father went to pay a vifit to another fon by a former wife, who was valet de chambre to the dike, and refided at his coutt. Young Handel. being then in his feventh year, carnefly defired permiffion to go along with him; but being refufed, he followed the chaife on foot; and over took it, the carriage being probably retarded by the roughners of the ways His father at firf chid him for his difobedience, but at laft took him into the chaife along with him. While he was in the duke's court, he fill continued to fhow the fame inclination for mufic; it was impoffible to keep him from harpfichords; and he ufed fometimes to get into the organ-loft at church, and play after fervice was over. On one of thefe occafions, the duke happening to go out later than ufual, found fomething fo uncommon in Handel's manner of playing, that he inquired of his valet who it was; and receiving for anfwer that it was his brother, he defired to fee him. This nobleman was fo much taken with the mufical genius hown by young Fiandel, that he perfuaded his father to let him follow the bent of his inclination. He made the boy a prefent; and told him, if he minded his ftudies, no encouragement fhould be wanting:

On his return to Hall, Handel was placed under one Zackaw, the organift of the cathedral church ; and our young mulician was even then able to fupply his mafter's place in his abfence. At nine years of age he begun to compofe church-fervices for voices and inftruments, and continued to compofe onefuch fervice every week for three years fucceffively. At the age of 14 , the far excelled his mafter, as he himfelf owned: and he was fent to Berlin, where he had a relation in fome place about the court, on whofe care and fidelity his parents could rely. The opera was then in a flourifhing condition, being encouraged by the grandfather of the late king of Pruffia, and under the direction of many eminent perfons from Italy, among whom were Buononcini and Attilio. Buononcini, being of a haughty difpofition, treated Handel with con
tempt; but Attilio behaved to him with great kind- Hamdle nefs, and he profited much by his inftructions. His abilities foon recommended him to the king, who frequently made him prefents, and at laft propofed to fend him into Italy under his own patronage, and to take him under his immediate protection as foon as his ftudies fhould be completed. But Handel's parents not thinking proper to fubmit their child to the caprice of the king, declined the offer; upon which it became neceffary for him to return to Hiall.

Handel having now obtained ideas in mufic far exceeding every thing that could be found in Hall, cons tinued there very anwillingly, and it was refolved to fend him into Italy; but as the expence of this journey could not then be fpared, he went to Hamburg, where the opera was little inferior to that of Berlin. Soon after his arrival in this city, his father died; and his mother being left in narrow circumftances, her fon thought it neceffary to procure fome fcholars, and to accept a place in the orcheftra: by which means, inflead of being a burden, he became a great relief to her.

At this time, the firf harpfichord in Hamburg was played by one Kefer, a man who alfo excelled in compofition: but he, having involved himfelfin fome debts; was obliged to abfcond. Upon this vacancy, the perfon who had been ufed to play the fecond harpfichord claimed the firft by right of fucceffion : but was oppofed by Handel, who founded a claim to the firft harpfichord upon his fuperior abilities. After much difpute in which all who fupported or directed the opera enga= ged with much vehemence, it was decided in favour of Handel, but this good fuccefs had almoft coft him his life. His antagonift refented the fuppofed affront fo much, that, as they were coming out of the orcheftra together, he made a pufh at Handel's breaft with a fword, which muft undonbtedly have kiiled him, had there not fortunately been a mufic-book in the bofom of his coat.

Handel, though yet but in his 15 th year, became compofer to the houfe; and the fuccefs of Almeria, his firf opera, was fo great, that it ran 30 nights without interraption. Within lefs than a twelvemonth afterthis, he fet two others, called Florinda and Norene, which were received with the fame applaufe. During his ftay here, which was about four or five years, he alfo compofed a confiderable number of fonatas, which are now loft. Here his abilities procured him the acquaintance of many perfons of note, particularly the prince of Tufcany, brother to John Gafton de Medicis the grand duke. This prince preffed him to go with him to Italy, where he affured him that no convenience fhould be wanting; but this offer Handel thought proper to decline, being refolved not to give up his independency for any advantage that could be offered him.

In the Igth year of his age, Handel took a journey to Italy on his own bottom; where he was received with the greateft kindnefs by the prince of Tufcany, and had at all times accefs to the palace of the grand duke. His Serene Highnefs was impatient to have fomething compofed by fo great a mafter; and notwithftanding the difference between the ftyle of the Italian mulic and the German, to which Handel had hitherto been accultomed, heifet an opera called Rodes

## H A N

Handel. rigo, which pleafed fo well, that he was rewarded with soo fequins and a fervice of plate. After ftaying about a year in Florence, he went to Venice, where he is faid to have been firft difcovered at a mafquerade. He was playing on a harpfichord in his vifor, when Scarlatti, a famous performer, cried out, that the perfon who played conld be none but the famous Saxon or the devil. But a ftory fimilar to this is reported of many eminent perfons whofe abilites have been difcovered in difguife. Here he compofed his opera called Agrippina, which was performed 27 nights fucceffively, with the moft extravagant applaufe.

From Venice our mufician proceeded to Rome, where he became acquainted with cardinal Ottoboni and many other dignitaries of the church, by which means he was frequently attacked on account of his religion; but Handel declared he would live and die in the religion in which he had been educated, whether it was true or falfe. Here he compofed an oratorio called Refurrectione, and 150 cantatas, befides fome fonatas, and other mufic. Ottoboni alfo contrived to have a trial of skill between him and Dominici Scarlatti, who was confidered as the greateft mafter on that infrument in Italy. The event is differently reported. Some fay Scarlatti was victorious, and others give the victory to Handel; but when they came to the organ, Scarlatii himfelf afcribed the fuperiority to Handel.

From Rome, Handel went to Naples; after which, he paid a fecond vifit to Florence; and at laft, having fpent fix years in Italy, fet out for his native country. In his way thither, he was intreduced at the court of Hanover with fo much advantage by the baron Kilmanfeck, that his Electoral Highnefs offered him a penfion of 1500 crowns a year as an inducement for him to continue there. This generous offer he declined on account of his having promifed to vifit the court of the Elector Palatine, and likewife to go over to England in compliance with the repeated invitations of the duke of Manchefter. The elector, however, being made acquainted with this objection, generouly ordered him to be told, that his acceptance of the penfion Should neither reftrain him from his promife nor refolution: but that he fhould be at full liberty to be abfent a year or more if he chofe it, and to go wherever he thought fit. Soon after the place of mafter of the chapel was beftowed upon Handel; and our mufician having vifited his mother, who was now extremely aged and blind, and his old malter Zackaw, and faid fome time at the court of the Elector Palatine, fet out for England, where hearrived in 1710 .

At that time operas were a new entertainment in England, and were conducted in a very abfurd manner: but Handel foon put them on a better footing; and fet a drama called Rinaldo, which was performed with uncommon fuccefs. Having faid a year in Erg. land, he returned to Hanover; but in 1712 he again came over to England; and the peace of Utrecht being concluded a few months afterwards, he compored a grand $T e D e u m$ and $\mathcal{F} u b i l a t e$ on the occafion. He now found the nobility defirous that he fhould refume. the direction of the opera houfe in the Hay Market; and the queen having added her authority to their folicitations, and conferred on him a penfion of L.200 a fear, he forgot his egagements to the Elector of Ha-
nover and remained in Britain till the death of the Handed. queen in 1714. On the arrival of king George I. Fisndel, confcious of his ill behaviour, durlt not appearat court: but he was extricated from his dilemma by the baron Kilmanfeck. Having engaged feveral of the Englifh nobility in his behalf, the baron perfuaded the king to a party of pleafure on the water. Handel was apprifed of the defign, and ordered to prepare fome mufic for the occafion. This he executed with the ut. moft attention, and on the day appointed it was per. formed and conducted by himfelf. The king with pleafure and furprife inquired whofe it was, and how the entertaimment came to be provided without his knowledge. The baron then produced the delimquent; and aiked leave to prefent him to his majefty as one too fenfible of his fault to attempt an excufe, but fincerely defirous to atone for it. This interceffion was accepted. Handel was reftored to favour, his water mofic was: honoured with the higheft approbation, and the king added a penfion of L. 200 a year to that formerly beflowed on him by queen Anne; which he foon after increafed to L. 400, on his being appointed to.teach the young princeffes mufic.

In the year 1715, Handel compofed his opera of $A$ madige; bot from that time to the year 1720 he compored only Tafeo and Paftor Fido, Buononcini and Attilio being then compofers for the operas. About this time a project was formed by the nobility for erecting a kind of academy at the Hay Market, with a view to fecure to themfelves a conftant fupply of operas to be compofed by Handel, and performed under his direction. No lefs than L. 50,000 was fubferibed for this. fcheme, of which the king himfelf fubfcribed L. 1000, and it was propofed to continue the undertaking for 14 : years. Handel went over to Drefden, in order to engage fingers, and returned with Senefino and Duriftanti. Buononcini and Attilio had ftill a ftrong party in their favour, but not equal to that of Handel; and therefore in $\mathbf{7 2 0}$ he obtained leave to perform his opera of Redamiflo. The houfe was fo crowded, that many fainted through exceffive heat; and 40 s . were offered by fome for a feat in the gallery, after having in vain attempted to get one elfewhere. The contention, however, ftill ran very high between Handel's party and that of the two Italian mafters; and at laft it was determined that the rivals fhould be jointly employed in: making an opera, in which each hould take a diftinct act, and he who by the general fuffrage was allowed to have given the beft proof of his abilities noould be put. in poffeffion of the houfe. This opera was caled $M u_{a}$ zio Sicevola, and Handel fet the laft act. It is faid that Handel's fuperiority was owned even in the overture before it; but when the act came to be performed, there remained no pretence of doubt or difpute. The a". cademy was now therefore firmly eftablifhed, and Handel conducted it for nine years with great fuccefs; but about that time an irreconcileable enmity tock place. between Handel himfelf and Senclino. Senefmo ac. cufed Handel of tyranny, and Handel accufed Senefino of rebellion. The merits of the quarrel are not known : the nobility, however, became mediators for Come time; and having failed in that good defign, they became parties in the quarrel. Handel was refolved to difmifs Senefino, and the nobility feemed alfo refolved not to permit him to do fo. The haughtinefs of

## HAN

Findel. Handel's temper would not allow hin to yield, and the affair ended in the total diffolution of the academy.
Handel now found that his abilities, great as they were, could not fupport him againf the powerful oppofition he met with. After the difinifion of Senefino, bis audience fenfibly dwindled away, and Handel entered into an agreement with Mr Heidegger to carry on operas in conjunction with him. New fingers were engaged from Italy; but the offended nobility raifed a fubfcription againft him, to carry on operas in the playhouife in Lincoln's-Inn fields. Handel bore up four years againft this oppofition, three in partuerfhip with Heidegger, and one by himfelf : but though his mufical abilities were fuperior to thofe of his amtagonitts, the aftonilhing powers of the voice of Farinelli, whom the oppofite party had engaged, determined the victory againt him. At latt Handel, having fpent all he was worth in a fruitlefs oppofition, thought proper to defift. His difappointment had fuch an effeet upon him, that for fome time he was difordered in his underftanding, and at the fame time his right arm was rendered ufelefs by a ftroke of the pally. In this deplorable fit:ation, it was thought neceflary that he flould go to the baths of Aix-la-Chappelle; and from them he received fuch extraordinary and fudden relief, that his cure was looked upon by the nuns as miraculous.

In 1736, Handel again returned to England; and foon after his return his Alexander's Feaft was performed with applanfe at Covent Garden. The fuccefs and fplendor of the Hay Market was by this time fo much reduced by repeated inifmanagements, that lord Middlefex undertook the direction of it himfelf, and once nore he applied to Handel for compofition. He accordingly compofed two operas called Faromondo, and Aleffandro Severo, for which in 1737. he received L. roou. In 1738 he received L. 1500 from a fingle benffit, and nothing feemed wanting to retrieve his affairs, excepting fuch conceffions on his part as his opponents had a right to expect. Thefe conceffions, however, he could not be prevailed upon to make; and that he might nolonger be under obligations to act as he was directed by others, he refufed to enter into any engagements upoil fubfription. After having tried a few more operas at Covent Garden withour fuccefs, he introduced another fpecies of mufic called oratorios, which he thonght better fuited to the native gravity of an Englifh audience. Bat as the fubjects of thefe pieces were always taken from facred hiftory, it was by fowe thought to be a profanation to fet them to mulic and perform them at a playhoufe. In confequence of this prejudice, the oratorios met with very indifferent fuccefs; and in 174 Mr Handel found his affairs in fuch a bad fiuation, that he was obliged to quit England, and go to Dublin.

He was received in Ireland in a manner fuitable to his great merit ; and his performing his oratoriocalled the Meffiah for the benefit of the city-prifen, brought him into ufiverfal favour. In nine months time he had bronght his aftairs into a better fituation ; and on his return to England in 1742, he found the public much more favourably difpofed. His oratorios were now performed with great applaufe : His Meffiah, which before had been bur coldly received, became a favourite performance; and Handel, with a generous humanity, de-
termined to perform it annually for the bencfit of the foundling hofpital, which ar that time was only fupported by private benefactions. In 1743, he bad a return of his paralytic diforder; and in 175 y became quite blind by a gutta ferena in his eyes. This laft misfortune for fome time funk him into the deepeft defpondency; but at laft he was obliged to acquiefce in his fituation, after having wichout any relief undergone fome very painful operations. Finding it now imporfible to manage his oratorios alone, he was affifted by Mr Smith, who at his requeft frequently played for him, and conducted them in his ftead; and with this affiftance they were conciumed till within cight days of his death. During the latter part of his life, his mind was often difordered: yet at times it appears to have refumed its full vigour, and he conppofed feveral fongs, chorufes, \&c. which from their dates may be confidered almoft as the laft founds of his dying voice. From about Oetober 1758 his health declined very faft ; his appetite, which had been remarkably keen, and which he had gratified to a great degree, left him; and he became fendible of the approach of death. On the 6th of April 1759, his laft oratorio was performed, at which he was prefent, and died on the 14th of the fame month. On the 20th he was buried by the right reverend Dr Pearce, bilhop of Rochefter, in Weftminfter abbey; where, by his own order, and at his own expence, a monument was erected to his memory.
With regard to the character of this moft eminent mufician, he is univerfally allowed to have been a great epicure: In his temper he was very haughty, but was feldom or never guilty of mean actions. His pride was uniform ; he was not by turns a tyrant and a lave. He appears to have bad a moft extravagant love for liberty and independence ; infomuch, that he would, for the fake of liberty, do things otherwife the mof prejudicial to his own intereft. He was liberal even when poor, and remembered his former friends when he was rich. His mufical powers can perhaps be beft exprefsed by Arbuthnot's reply to Pope, who ferioully afked his opinion of him as a mulician; "Conceive (faid he) the higheft you caan of his abilities, and they are much beyond any thing you can conceive."

Commemoration of HaNDEL; a nulical exhibition inftituted fome years ago, and the grandeft of the kind ever attempred in any nation. Ot the rife and pro. gefs of the defign, together with the manner in which the firlt celebration was executed, an accurate and anthentic detail is given, as might be expected, by Dr Burney in the 4th and laft volume of his Hiftory of Mufic, from which the following account is cxtracted.
"In a converfalion between lord vifoont Fitzwilliam, Sir Warkin Williams Wynn, and Joah Bates, Efq; commilfioner of the victualling-office, the beginning of laft year, 1783 , at the houlf of the latter; after remarking that the number of eminent mufical performers of all kinds, both vocal and inftrumenal, with which London abounided, was far greater than in any other city of Europe, it was lamented that there was no public periodical occafion for colleeting ane confolidating them into one band; by which means a performance might be exlibited on fo grand and mag. nificenta fcale as no other part of the world could equal. The birth and death of Handel naturally occarred to

## H A <br> [ 297 ] <br> HAN

Elandch three fuch enthefiaftic admirers of that great mafter; aud it was immediately rcoollected, that the next year (1984) would be a proper time for the introduction of fuch a curtom, as it formed a complete century lince his birth, and an exact quarier of a century fince his deceafe.
"The plan was foon after communicated to the governors of the Mulical Fund, who approved it, and promifed their adfitance. It was next fubmieted to the directors of the concert of Ancient Mufic; who, with an alacrity which does bonour to their zeal for the menory of the great arift Handel, voluntarily undertook the trouble of managing and directing the celebrity. At length, the defign coming to the knowledge of the king, it was honoured with his majefty's facetion and patronage. Weftminfter-abbey, where the bones of the great mulician were depofited, was thought the propereft place for the performance; and application having been made to the binop of Rochefter for the nfe of ir, his lordhip, finding that the fcherate was honoured with the patronage of his majefty, readily confented; only requenting, as the per. formance would interfere with the annual benefit for the Weftminfter Infirmary, that part of the profits might be appropriated to that charity, as an indemnification for the lofs it would fuftain. To this the projectors of the plan acceded; and it was afterwards fettled, that the profits of the firft day's performance fhould be equally divided between the Mulical Fund and the Weftminfter Infirmary ; and thofe of the fubfequent days be folely applied to the ufe of that fund which Handel himfelf fo long helped to fultain, and to which he not only bequeathed a thoufand pounds, but which almoft every mufician in the capital annually contributes his money, his performance, or both, to fupport. Application was next made to Mr James Wyatr, the achitect, to furnih plans for the neceffary decorations of the abbey; drawings of which having been hewn to his majefty, were approved. The general idea was to produce the effect of a royal mufical chapel, with the orcheftra terminating one end, and the accommodation for the royal family, the other. The arrangement of the performance of each day was next fettled; and it was at his majefty's inftigation that the celebrity was extended to three days in. ftead of two, which he thought would not be fufficient for the difplay of Handel's powers, or fuliflling the charitable purpofes to which it was intended to devote the profirs. It was originally intended to have celebrated this feltival on the 20th, 22d, and 23d of April; and the 20rh being the day of the funeral of Handel, part of the mufic was, in fome meafore, fo. felected as to apply to that incident. But, in confequence of the fudden difflution of parliament, it was thought proper to defer the feftival to the 26 th, 27 hh , and 29 :h of May, which feems to have been for its advantage : as many perfons of render conftitutious, who ventured to go to Weftminter abbey jn warm weather, could not have had the conrage to go thither in cold. Impreffed with a reverence for the memory of Handel, no fooner was the project known, but moft of the practical muficians in the kingdon eagerly manifefted their zeal for the enterprife; and many of the moft eminent profeffors, wavigg elt claims to prece. dence in the band, offered to perform in any fuberVoL. VIII.
dinate farion in which their talents could be mont ufeful.
"In order to render the band as powerful and complete as polfible, it was determined to employ cvery Species of inftrument that was capable of producing

Hatatal.

$\qquad$

[^21][^22][^23]Handel, imaginarion can delineate. All the preparations for receiving their majefties, and the firlt perfonages in the kingdom, at the ealt end ; upwards of 500 muficians at the weft; and the public in general, to the number of between 3000 and 4000 perfons, in the area and galleries; fo wonderfully correfponded with the fyle of architecture of this venerable and beautiful flrueture, that there was nothing vifible either for ufe or ornament, which did not harnonize with the principal tone of the building, and which may not metaphorically have been fiid to have been in perfect tune with it. But, befides the wonderfukmanner in which this conftruction exhibited the band to the fpectators, the orcheftra was fo judicioully contrived, that almoft every performer, both vocal and inftrumental, was in full view of the conductor and leader; which accounts, in fome meafure, for the uncommon eafe with which the performers confefs they executed their parts.
"At the eaft end of the ainle, juft before the back of the choir-organ, fome of the pipes of which were vifible below, a throne was erected in a beauriful Gothic fyle, correfponding with that of the abbey, and a centre bax, richly decorated and furnifhed with crimfoa fattin, fringed with gold, for the reception of their majefties and the royal fanily : on the right hand of which was a box for the bifhops, and, on the left, one for the dean and chapter of Weftminfter; immediat ly below thefe two boxes were two others, one on the right for the families and friends of the directors, and the other for chofe of the pebendarics of Weftminfter. Inmediately below the king's box was placed one for the directors themfelves, who were all diftinguifhed by white wands tipped with gold, and gold medals, ftruck on the occafion, appending from white ribbons. Thefe their majefties likewife condefcended to wear at each performance. Behind, and on each fide of the throne, there were feats for their majefties' fuite, maids of honour, grooms of the bedchamber, pages, \&c.-The orcheiftra was built at the oppofite extremity, afcending regulatly from the height of feven feet from the floor to upwards of forty from the bafe of the pillars, and extending from the centre to the top of the fide aife. The intermediate fpace below was filled up with level benches, and appropriated to the early fubfcribers. The fide ailles were formed into long galleries ranging with the orcheftra, and afcending to as to contain $I 2$ rows on each fide : the fronts of which projected before the pillars, and were ornamented with feltoons of crimion morine. At the top of the orcheftra was placed the occational organ, in a Gothic frame, mounting to, and mingling with, the faints and martyrs reprefented in the painted glafs on the well window. On each fide of the organ, clofe to the windux, were placed the kettle-drums deferibed above. The chural bands were principally placed in view of Mr Batcs, on fteps feemingly afcending into the clouds, in each of the fide ailes, as their cermination wasinvifible to the audience. The principal fingers were ranged in the fromt of the orcheffra, as at oratorios, accompanied by the choirs of Si Paul, the abbey, Windior, and the chapel soyal.
"F Few circumftances will perhaps more aftonifh veteran muficians, than to be informed, that there was but one general rehearfal for each day's performance: an indifputable proof of the high nate of cultivation
to which practical mufic is at profent arrived in Bri- Handet. tain; for if good performers had not been found yeady made, a dozen rehearfals would not have betn fufficient to make them-fo. Indeed, Mr Bates, in examining the lift of performers, and inquiring into their feveral merits, fuggefted the idea of what he called a drilling rehearfal, at Tottenham-Atreet Conctrt Room, a wcek before the performance; in order to hear fuch volunteers, paricularly chorus fingers, as were but little known to himfelf, or of whofeabilities his affiftant was unable to fpeak with certainty. At this rehearial, though it confifted of 120 performers, not more than two of that number were defired to attend no more.
"At the general rehearfal in the abbey, mentioned above, more than 500 perfons found means to obtain admiffion, in fpite of every endeavour to that out all but the performers; for fear of interruptions and perhaps of failure in the firft attempts at incorporating and confolidating fuch a numerous band: confifing lut only of all the regulars, both native and forcign, which the capital could furnifh, but of all the irregulars, that is, dilletanri, and provincial mulicians of character, who could be muftered, many of whom had never heard or feen each other before. This intrution, which was very much to the diffatisfaction of the managers and conductor, fuggefted the idea of turning the eagernefs of the public to fonte profirable account for the charity, by fixilug the price of admiffion to half a guinea for each perfon.
"، But, befides the profits derived from fubfequent rehearfals, the confequences of the firft were not withvut their ufe: for the pleafure and aftonifment of the audience, at the fmall miftakes, and great effects of this firf experment, which many had condemned by auticipation, were foon communicated to the lovers of mufic throughout the town, to the great increafe of fabfribers and foliciors for tickets. For though the friends of the directors were early in fubfribing, perhaps from perfonal refpect, as much as expectation of a higher mufical repaft than ufual; yet the pullic ins general did not manifeft great cagernefs in fecuring tickets till after this rchearfal, Friday May 21. which was reported to have aftonifhed even the performers themfelves by its correchnefs and effects. But fo interefting did the undertaking become by this favourable romour, that from the great demand of tickets it was found neceffary to clofe the fubscription.
"Many families, as well as individuals, were attracted to the capital by this celebrity; and it was never remembered to have been fo full, except at the coronation of his prefent majefty. Many of the performers came unfolicited, trom the remoteft parts of the kingdom at their own expence: fome of them, however, were afterwards reimburfed, and had a cimall gratuity in confideration of the time they were kept from their families by the two unexpected additional performances.
" Foreigners, particnlarly the French, mun be much aftonifhed at fo numerous a band moving in fuch exact meafure, without the aflifance of a Coryphous to beat the time, either with a roll of paper, or a noify baton, or truncheon. Rouffeau fays, that ' the more time is beaten, the lefs it is kept; and it is certain, that when the meafure is broken, the fury of the mu-

Handel hal general or director, increafing with the difobeH. dience and confufion of his troops, be becomes more violent, and his ftrokes and gefticultions more ridicalous in proportion to their diforder.
"As this commenoration is not only the firft infance of a band of fuch magnitude being affembled together, bat of any band at all numerous, performing in a fimilar fituation, without the affiftance of a manuductor to regulate the meafure, the performances in Weftminfter abbey may be fafely prononnced no lefs remarkable for the multiplicity of voices and inftruments employed, than for accuracy and precifion. When ail the wheels of that huge machine, the orcheftra, were in motion, the effect refembled clock-work in every thing but want of feeling and expreffion. And as the power of gravity and attraction in bodies is proportioned to their mals and denfity, fo it feems as if the magaitude of this band had commanded and impelled adhetion and obedience beyond that of any other of inferior force. The pulfations in every limb, and ramifications of veins and arreries in an animal, could not be more reciprocal, ifochronus, and under the regalation of the heart, than the members of this body of muficians under that of the conductor and leader. The totality of found feemed to proceed from one voice and one inftrument ; and its powers produced not only new and exquifite fenfacions in judges and lovers of the art, but were felt by thofe who never received pleafure from mufic before. Thefe effects, which will be long remembered by the prefent public, perhaps to the difadvantage of all other choral performances, run the rifk of being doubted by all but thofe who heard them, and the prefent defcription of being pronounced fabulous if it fhould furvive the prefent generation."

HANG-TCheov-fou, the metropolis of the province of Tche-kiang in China. See Tche-miang.It is, according to the Chinefe, the paradife of the earth; and may be confidered as one of the richeft, beft fituated, and largeft cities of the empire. It is four leagues in circumference, exclafive of its fuburbs; and the number its inhabitants amounts to more than a million. It is computed, that there are a thoufand workmen within its walls employed in manufacturing filk : what renders this city delightful, is a finall lake, called Si-hou, which wafhes the bottom of its walls on the weftern fide; its water is pure and limpid, and its banks are almoft every where covered with fiowers. Halls and open galleries, fapported by pillars, and paved with large flag ftones, have been erected here on piles, for the convenience of thofe who are fond of walking ; caufeways, cafed with cut fone, traverfe the lake in different directions; and the openings which are left in them at intervals, for the paffage of boats, are covered by handfome bridges. In the middle of the lake are two illands, to which company generally refort after having a mufed themfelves with rowing, and in which a temple and feveral pleafure-houfes have been built for their reception. The emperor has a fmall palace in the neighbourhood. The city has a garrifon of 3000 Chinefe, under the command of the viceroy, and 3000 Tartars, commanded by a general of the fame pation. It has under its jurifdiction fevencities of the fecond and third clafs.

HANGING, a common name given to the mechod of inflictiag death on criminals by fufpending
them by the neck.- Phyficians are not agreed as to Hangings the manner in which death is brought on by hanging. De Haen hanged three dogs, whom he afterwards opened. In one, nothing remarkable appeared in the lungs. In another, from whom half an ounce of blood was taken from the jugular vein, the dura and pia $\mathrm{m}_{\mathrm{t}}$ ter were of the natural appearance; but the lungs were mach inflamed. In the third, the meninges were found, and there was no effufion of blood in the ventricles of the brain, but the left lobe of the lungs was turgid with blood. Wepfer, Littræus, Alberti, Bruhierius, and Boerhaave, affirm that hanged animals die apoplectic. Their arguments for this are chiefly drawn from the lived colour of the face; from the turgefeency of the veffels of the brain ; the inflammation of the eyes; and from the farks of fire which thofe who have furvived hanging allege they have feen before their eyes. On the contrary, Bonetus, Petit, Haller, and Lancifi, from otferving that death is occafioned by any fmall body falling into the glottis, have afcribed it th the floppage of refpiration. Others, deeming both thefe caufes ill-founded, have aferibed it to a luxation of the vertebre of the neck.-Do Haen adduces the authority of many eminent authors to prove the poflibility of recovering hanged perfons; and obferves, in general, that with bleeding in the jugular vein, and anointing the neck with warm oil, the fame remedies are to be employed in this cafe as for the recovery of drowned people. See Drowning.

HANGINGS, denote any kind of drapery hung up againit the walls or wainfcotting of a room.

Paper-Hangings. Sce Paper-Hangings.
Wove Hangings See Tapestry.
HANGCLIFF, a remarkable point of land on the eaft coaft of the largeft of the Shetland Inlands. It is frequently the firft land feen by fhips in northern voyages. Captain Phipps determined its fituation to be in W. Long. $0^{\circ} 56^{\prime} 30^{\prime}$. N. Lat. $60^{\circ} 9^{\prime}$.

HANNIBAL, a famous Carthaginian general, of whofe exploits an acconnt is given under the articles Carthage and Rome. After having had the miffortune to lofe a fea-fight with the Rhodians, through the cowardice of Apollonius one of the admirals of Antiochas the Great, he was forced to fly into Creie, to avoid falling into the hands of the Romans. On his arrival in this ifland, he took fanctuary among the Gortynii ; but as he had brought great treafure along with him, and knew the avarice of the Cretans, he thought proper to fecure his riches by the following fratagem. He filled feveral veffels with melied lead, juft covering them over with gold and filver. Thefe he depofited in the temple of Diana, in the prefence of the Gortynii, with whom, he faid, he trufted all his treafure : Juftin tells us, that he left this winh them as a fecurity for his good behaviour, and lived for fome time very quietly in thefe parts. He took care, however, to conceal his riches in hollow fatues of brafs; which, according to fome, he always carried along with him ; or, as others will have it, expored in a public place as things of little value. At laft he retired to the court of Prufias king of Bithynia, where be found means to unite feveral of the neighbouring ftates with that prince into a confcderacy againft Eumenes king of Pergamus, a profeffed friend to the Romans; and daring the enfuing war gave Eumenes feve-

## HAN [ 300$] \quad$ H A N

Hamibal. veraf defeats, more through the ferce of his own genitus than the valour of his troops. The Romans having receivedintelligence of the important fervices performed by Hinaibal, immediately difpatched $T$. Quintias Flaminims as an ambafacor to Prufias, in order to practare his deftraction. At his firft audience, bia conplained of the protection given to that famous general, repreienting him " as the moft inveterate and implacable enemy the Ronians ever had; as one who had ruined both his own country and Antiochus, by drawing them into a deftructive war with Rome."Prufias, in order to ingratiate himfelf with the Romans; immediately fent a party of foldiers to furround Hannibal's houfe, that he might find it impolible to make his efcape. The Carthaginian, having before difcovered nhat no confidence was to be repofed in Prufias, had contrived feven fecret paffages from his houfe, in order to evade the machination of his enemies, even if they fhould carry their point at the Bithynian court. But guards being pofted at thete, be could not fiy, though, according to Livy, he altempted it. Pereeiving, therefore, no poffibility of efcaping, he had recourfe to poifor, which be had long referved for fach a-melancholy occaion. Thentaking it in his hand, " Let us (faid he) deliver the Romans from the difquietude with which they have long heen tortured, fince they have not paticace to wait for an old man's death. Flaminius will nos aequire any reputation or glory by a vietory gained over a betrayed and defence. lefs perfon. This fingle day will be a lafting teftimony of the degentracy of the Romans. Their anceftors gave Pyrrhus intelligence of a defign to poifon him, that he might suard againf the impending denger, even when he was at the head of a powerful army in Italy ; but they havedepated a perfon of confular dignity to excite Prulias impioufly to murder one who has taken refuge in his dominions, in violation of the laws of hofpitality." Then having denounced dreadful imprecations againf Prufias, he drunk the poifon, and expired at the age of 70 yeats. Cornelius Nepos acquains us, that he par an end to his life by a fubtile poifon which he carried about with him in a ring. Plutarch relates, that, according to fome writers, he orlered a fervant to Arangle him with a cloak wrapped about his neck; and ohers fay, that, in imitation of Midas anid Tliemiftoclos, he drank bull's blood.

With refpect to the chardeter of this general, it appears to have been in military affairs what Demofthenes was in oratory, of Newton in mathematics; namely, affolttely perfect, in which no homan wifdom cound difecver a failt, and to which no man could add a perfection. Rollin hath contrafed his character with that of Scipio Africanus. He enomerates the qualities which make a complete general ; and having then given a fummary of what hiftorians have related concerning both commanders, is inclined to give the preference to Hannibal. "There are, however (he fays), two difficulties which hinder him from deciding; one drawn from the characters of the generals whom Hannibal vanquified; the other from the errors he committed. May it not be faid (continues our author), that thofe victories which made Hannibal fo famous; were as much owing to the imprudence and temerity of the Romad generals, as to his bravery and Nill?

When a Fabius and a Scipio were fent againt him, Hannibal, the firf fopped his profrefs, the wher conquered

Hanno. him."

Thefe reafons have been anfwered by Mr Hooke, who hath taken fome pains 10 vindicaie Hannibar's character, by fully and fairly comparing it with that of Scipio Africanus, and other Roman commanders. "I do not fee (fayshe) why thefe diffictitits fhonld check our author's inclination tes declare in favour of the Carthaginian. That Eabias was not beaten by Hannibal, we cannot much wonder, when we remember how fteadily the old man kept to his refolution never te fight with him. But from Fabias's taking this method to put a flop to the victories of the enemy, may we not conclude that he knew no other, and thought Hannibal an overmarch for him? And why does our author forget Ptblius Scipio (Africanas's father), a prudent and able gencral, whom Hannibal vanquiflied at the Tichin? Livy relates fome victories of Hannibal over the celebrated Marcellus ; but neither Marcelles nor any other gencral ever vanquined Hannibal before the battle of Zama, if we may be* lieve Polybius (lib. xv.c. I6.). Terentius Varro, indeed, is reprefented as a headftrong rafb man; but the battle of Cannæ was not loft by his impradence. The order in which he drew up his army is no where coins demned; and Chevalier Folard thinks it excelleitt. And as to the conduct of the battle, Tmilius, Paulus, a renowned captain, and a difciple of Fabius, had a $e$ reater Chare in it than his colleague. The imprudence with. which Varro is taxed, was his venturing, contrary to his colleague's advice, with above 90,000 men to en * counter in a plain field an enemy who had only $50, \mathrm{COO}_{;}$ but was fuperior in horfe. And does not the very advice of Fmilins, and the charge of temerity on Varro for not following it, imply a confellion of Hannibal's fuperioty in military kill over Æmilius as well as Varro? It ought like wife to be offerved, that Hannibal's infantry, had gained the victory over the Roman infantry, before the latter fuffered any thing from the Carthaginian cavalry. It was otherwife when Scipio gained the victory at Zama. His iafantry would probably have been vanquifhed but for his caval:y. Hannibal, with only his third line of foot (his Italian army), maintained a long fight againft Scipio's chree lines of foot; and feems to have had the advantage over them, when Mafiniffa and Lxlius, with the horfe, came to theit affiftance. Polybias indeed fays, that Hannibal's Iralian forces were equal in number to all Scipio's infantry; but this is contradieted by Livy, and is not very probable. The authority of Polybius, who was an intimate friend of Scipio 压milianus, is, I imagine, of little weight in matiers where the glory of line Scipios is particularly concerned. His partiality and flattery to them are, in many inftances, but too vifible.

Our author then proceeds to how, that Hannibal was not guilty of any of the falts laid to his charge as a general ; and having contrafted the moral characters of the two generals wirh each orher, makes it evident, that as a man, as well as a general, Hannibal had greatly the advantage of his rival. Sec Hooke's Romian biflory, vol. iv. p. 15 I . bfeq.

HANNO, general of the Carthaginians, was commanded to fail round Africa. He entered the ocean through

HAN
Hanover. through the Straits of Gibraltar, and difcovered feveral countries. He would have continued his navigation, had itnot been for want of provifions. He wrote an account of his voyage, which was often quoted, but not much credited. Sigifmund Gelenius publilhed it in Greek at Balil, by Frobenius, in 1533 . He lived, according to Pliny, when the affairs of the Carthaginians were in the moft flourifting condition; but this is is a very indeterminate expreflion.

HANOVER, an electoral Ate of Germany, of which the king of Great Britain is elector. - Though the honfe of Hanower is the laft that has been raifed to the electoral dignity in the empire, it may vie with any in Germany for the antiquity and noblenefs of its family. It is likewife very confiderable for the extent of its terxitories, which at prefent are the duchy of Calenberg, in which are the cities of Hanover, Calenberg, Hamelen, Neuftadt, Gottingen, \&c. the dachy of Grubenhagen, the connty of Diepholt, the county of Hloga, in the bihopric of Heldetheim; the bailiages of Coldingen, Lurher, Badenburg, and Wefterhhoven, with the right of protection of the city of Hildelheion; and the county of Danneberg, ceded by the dukes of Wolfenbatie to the dukes of Lanenburg, as an equivalent for their pretenfions on the city of Brunfwic. The elector poffefes likewife the county of Delmenhorft, and the duchies of Bremen and Verden, fold by the king of Denmark in 1715 : the right of poffelfing alternately the bifhopric of Oznabruck belongs folely to the electoral branch ; but if it fhould heppen to fail, the dukes of Wolfenbuttle are to enjoy the fame right. This electorate has no navy, but a confiderable marine on the great rivers Elbe apd Wefer.

In confideration of the great fervices performed by Erneft Anguftus, duke of Brunfwic-Hanover, in the wars which the emperor Leopold had with Louis XIV. that emperor conferred the dignity of an elector of the holy Romsti empire upon him and his heirs male, of which he received the invertiture on the igih of December 1692. This new creation met with great oppefition both in the electoral college and the college of princes : a laft, by a conclution of the three colleges on the 3oth of January 1708 , it was unanimonny determined, that the electoral dignity Chould be confirmed to the duke of Hanover, and his heirs male; but in was added, that if, while that clectoral dignity fublifted, the Palatine electorate hould happen to fall into the hands of a Proteftant prince, the firft Catholic elector mould have a fupernumerary vote.

The princes of this houfe hawe their feat in the college of princes, immediarely after thofe of the electoral houfes; each branch having a voie. The elector, befides his feat in the electoral college, was invefted with the office of arch aandard bearer of the empire; but this being difpated with him by the duke of Wirtemberg, the elector Palatine baving obtained the office of arch-fteward, yielded that of arch-treafurer to the elector of Hanover, who was confirmed in this dignity by a decree of the diet of the istin of January 1710.

The fovereign power is adminiftered by the lords of the regency appointed by the elector. Throughout anl the provinces they polfefs a coniderable thare of free-
$30 \mathrm{I}] \quad \mathrm{HAN}$
dom, the people being reprefented in the aftemblies of Hanover. the ftates. No government can be more mild; and an air of content is fpread over all the inhabitants. The Confcil Intime, the High Court of Juftice, and the Regency, are the priacipal courts of juftice; befides which, every province has its municipal adminifration with the inferior divifions into bailiwicks, 3 cc . The police is excellent, and jultice fairly adminiftered. The elector enjoys the right de non appellando in all criminal affairs, but in civil proceffes only as far as 2000 florins.

Lutheranifm is the eftablifhed religion; but all others enjoy a perfect toleration, and are publicly ex ercifed. Difference in religious fentiments here gives no interruption to that harmony which flould fubfift among fellow citizens. There are 750 Lutheran parifhes. 14 Reformed comnunities, a Romilh college, a con. vent, and fome Catholic churches.

Literature is in a very advanced ftate throughout thefe dominions. The univerfity of Gottingen is defervedly celebrated; and contains about 800 ftudents of different nations, and 60 profeffors. There are befides feveral colleges, and a number of well eftablihed fchools, thronghout the electorate. In general, edacation is much autended to.

Although there are various tracts of heath and marihy ground, the foil in generat products abundance of corn, fruits, hemp, tlax, tobacco, madder, and forne wine. There are feveral large falt-works. A good deal of cattle are reared, and a great number of excellent horfes. Moft metals and minerals are found here. The forefts furning fufficient timber, and large quantities of pitch and tar.- The natural producions of the electorate furnifh ample materials for commerce, fo as to prevent the balance being againft them, although their manufactures are not fufficient for confumption. Cattle, horfes, falt, wrought iron, and fuel, are principal arricles of export. Gremen is one of the greateft commercial towns in Germeny.

The eleftor of Hanover is defeended from the ancient family of the Guclphs, dukes and electors of Bavaria; one of whom, Henry the Lion, in II 40, married Maude, eldeft daughter of king Henry (Plantagener) II. of England. Their fon Wihiam lucceeded to Branfwick-Lunenburg, and his fon Otho was created dake thereof. The dominions defcended in a direct line to Erneft, who divided them upon his death in 1546 inte two branclies, that of Brunfivic Lunenburg Wolfenbuttle, and Biuniwick Lunenburg Zell. The poffeffor of the latter, Erneft Augultus, was in 1692 raifed to the dignity of an elector; before which he was head of the college of Germana princes. Erneft married Sophia, daughter of Frederic Elector Palatine and king of Bohemia, by Elizabeth daughter of James l. king of Eagland. Sophia being the next Proteftant heir to the houfe of Suart, the parliament fixad the crown of Great Britain upon her on quetn Anne's demife ; and George-Louis her elden fou became king of Great Britain in confequence thereof: fince which the electors of Hanover have filled the Britifh throne.
Hanover is alfo the name of the capital of the above electorate ; and is agrecably fituated in a fandy plain on the river Leyne. In E. Long. 10. 5. N. Lat. 22. 5. It is a large well-built town, and pretry

## HAN [ 302 ] A N

well fortified. It has fuffered greatly by the French, who got poffeffion of it in 1757 , but were foon atter driven out. It is noted for a particular kind of beer, reckoned excellent in thefe parts. This city was the relidence of the elegtor before he afcended the throne of Great Britain. The palace makes no great thew outwardly; but within it is richly furnifhed. The regency of the country is adminiftered in the fame manner as if the fovereign was prefent.

HANSE, or HaNs, an ancient name for a fociety or company of merchants, particularly that of certain cities in Germany, \&c. hence called Hanfe-towns. Sce Hanse-Towns.--The word hanfe is obfolete High Dutch or Teutonic; and fignifies " alliance, confederacy, affociation," \&c. Some derive it from the two German words, am-fee, that is "on the fea;" by reafon the firn hanfe towns were all fituated on the feacoalt: whence the fociety is faid to have been firft ealled am zee flenen, that is, "cities in the fea;" and afterwards by abbreviation, hanfee, and banfe.

Hanse-Towns.. The hanfeatic fociety was a league between feveral maritime cities of Germany, for the mutual protection of their commerce. Bremen and Ainfterdam were the two firft who formed it; whofe trade received fuch advantage by their fitting out two men of war in each to convoy their hlips, that more cities continually entered into the league : even kings and princes made treaties with them, and were often glad of aneir affiftance and protection; by which means they grew fo powerful by both fea and land; that they raifed armies as well as navies enjoyed countries in fovereignty, and made peace or war, though always in defence of their trade, as if they had been an united fate or commonwealth.

At this time alfo abundance of cities, though they had no great intereft in trade, or intercourfe with the ecean came into their alliance for the prefervation of their liberties: fo that in 1020 we find no lefs than 72 cities in the lift of the towns of the Hanfe; particularly Bremen, Amfterdam, Antwerp, Rotterdam, Dort, Bruges, Oftend, Dunkirk, Middleburgh, Calais, Rouen, Rochelle, Bourdeaux; St-Malo, Bayonne, Bilboa, Lifbon, Seville, Cadiz, Carthagena, Barcelona, Marfeilles, Leghorn, Naples, Meffina, London, Lubec, Roftock, Stralfund, Stetin, Wifmar, Konigfberg, Dantzig, Elbing, Marienburg.

The alliance was now fo powerful, that their fhips of war were of cen hired by other princes to affift them againft their enemies. They not only awed, but often defeated all that oppofed their commerce; and particularly in 1358, they took fuch revenge of the Danifh fleet in the Sound for having interrupted their commerce, that Waldemar III. then king of Denmark for the fake of peace, gave thern up all Schonen for 16 years; by which they commanded the paffage of the Sound in their own right.-In 1428 they made war on Erick king of Denmark with 250 fail, carrying on board $12 ; 000$ men. Thefe fo ravaged the coaft of Jutland, that the king was glad to make peace with them.

Many privileges were beftowed apon the hanfe towns, by Louis XI. Charles VIII. Louis XII, and Francis I. kings of France; as well as by the emperor Charles $V$. who had divers loans of money from them; and by kingHenry III, who alfo incorporated
them in a trading body, in acknowledgment for Hanif: money which they aidvanced to him, as well as for the good fervices they did him by their naval forces in 1206.

Thefe rowns exercifed a jurifdiction among themfelves; for which purpofe they were divided into four colleges or provinces, difinguithed by the names of their four principalities, viz. Lubec, Cologne; Brunfwic, aud Dantzic, wherein were held their courts of judicature. They had a common flock or treafury at Lubec, and power to call an affembly as often as ne-ceffary.-They kept magazines o: warehoufes for the fale of their merchandifes in London, Brages, Antwerp, Bergen in Norway, Revel in Livonia, Novogorod in Mufcovy, which were exported to mont parts of Europe, in Englifh, Dutch, and Flemifh botoms. One of their principal magazincs was at London, where a fociety of German merchants was formed called the fleelyard company. To this company great privileges were granted by Edward I. but revoked by act of parliament in 1552 in the reign of Edward VI. on a complaint of the Englith merchants that this company had fo engrofled the cloth trade, that in the preceding year they had exported 50,000 pieces, while all the Englifh together had. fhipped off but 1 100. Queen Mary, who afcended the throne the year folluwing, having refolved to marry Philip the emperor's fon, furpended the execution of the aet for three years: butafter that term, whether by reafon of fome new fatute, or in purfuance of that of king Edward, the privileges of that company were no longer regarded, and all efforts of the hanfe-towns to recover this lofs ware in vain.

Another accident that happened to their mortification was while queen Elizabeth was at war with the Spaniards. Sir Francis Drake happening to meet 60 hips in the Tagus, loaden with corn, belonging to the hanfe-towns, took out all the corn as contraband goods which they were forbid to carry by their original patent. The hanfe towns having complained of this to the diet of the empire, the queen fent an ambaffador there to declare her reafous. The king of Poland likewife interefted himfelf in the affaix, becaufe the city of Dantzic was under his protection. At laft though the queen ftrove hard to preferve the commerce of the Englifh in Germany, the emperor excluded the Englifh company of merchant-adventurers, who had confiderable factories at Stade, Embden, Bremen, Hamburg, and Elbing, from all trade in the empire. In fhorr, the hanfe-towns, in Germany in particular, were not only fo flourifhing, bur in fo formidable a ftate, from the 14 th to the 16 th centuries, that they gave umbrage to all the neighbouring princes, who threatened a ftrong coufederacy againft them ; and, as the firf ftep towards it, commanded all the cities within their dominjon or jurifdiction to withdraw from the anion or hanfe, ald be no farther concerned therein. This immediately feparatedall the cities of England, France, and Italy, from them. The hanfe, on the other hand, prudently put themfelves under the protection of the empire : and as the cities juft now mentioned had withdrawn from them ; fo they withdrew from feveral more, and made a decree among themfelves, that none fhould be admitted into their fo. ciety but fuch as flood within the limits of the German
empire,

H A N
Hanway. empire, or were dependent thereon : except Dantzic which continued a member, though in nowife dependent on the empire, only it had been fummoned formerly to the imperial dier. By this means they mainained their confederacy for the protedion of their trade, as it was begun, without being any more envied by their neighbours. Hereby likewife thefe were reduced to Lubec, Bremen, Hamburgh, and Danizic; in the firt of which they kept their regifter, and held affemblies once in three years at leaft. But this hanfe or union has for fome time been diffolved; and now every one of the cities carries on a trade feparately for itfelf, according to the ftipulation in fuch treaties of peace, \&c. as are made for the empire betwixt the cmperor and other potentates.

HANWAY (Jonas), eminent for his benevolent defgns and ufeful writings, was born at Porfnouth, in $\mathrm{H}_{\text {amplaire }}$ on the i2th of Augnft 1712 . His father Mr Thomas Hanway, was an officer in the naval fervice, and for fome years fore-keeper to the dockyard at that place. He was deprived of his life by an accident; and left his widow with four children. Jonas, William, Thomas, and Elizabeth, all of a very tender age. Mrs Hanway, coming to London after the death of her hubband, put Jonas to fchool, where he learned writing and accounts, and made fome proficiency in Latin. At the age of 17 he was fent to Lifbon, where he arrived in June 1729, and was bound apprentice to a merchant in that city. His early life, we are informed, was marked with that difcrett attention to bufinefs, and love of neatnefs and regularity, which afterwards difinguifhed his character. Ai Lif. bon his fftctions were captivated by a lady, then celebrated for her beauty and mental accomplifhments; but he, preferring another for her hufband, returned to England, and fpent the latter part of her life in London with her family, on terms of friendihip with Mr Hnway.-On the expiration of Mr Hanway's apprenticellip, he entered into bufinefs at Lifbon as a merchant or factor; but did not remain there long before he returned te London.

He foon after connected himfelf as a parirer in Mr Dingley's-houfe in St Peterfburg; where he arrived on the roth of June 1743. The trade of the Englifh nation over the Cafpian Sea into Perfia at this period Lad been entruited to the care of Mr Elton, who not content with the parfuit of commercial affairs, had injudicioufly engaged in the fervice of Nadir Shah to build fhips on the Cafpian after the European manner. This had alarmed the merchants in the Ruflian trade, and a refolution was formed that one of their body fhould make a journey into Perfia. On this occafion Mr . Hanway offered his fervice, and was accepted. He fet out on the roth of September; and after experiencing a variety of hazards in that kingdont during a courfe of 12 months, returned to St Peterfburg January 1, 1745, withour being able to eftablifh the intended trade by the Cafpian, partly through the jealoufy of the Ruflian court on account of Elton's connections with the Perfians, and partly by the tronbles and revolutions of the latter kingdom.

Though Mr Hanway's conduct during this expedition feems to have been directed by the ftricteft rules of integrity, yet fome difficulties arofe in fettling his demands on his employers. Thefe, however, in

## 3031 <br> HAN

the end were referred to the determination of impar. Hasway. tial arbitrators, whe at length decided in his favour. " I ubtained (he fays) my own; and as to any other perfonal advantage, it confifted in exercifing my mind in patience under trials, and encrealing my knowledge of the world." He now fettled at St Peterfburg; where he remained five years, with no other variations in his life than fuch as may be fuppofed to occur in the dull round of a mercantile employment. During this time he interetted himfalf grenty in the concerns of the merchants who had engaged in the Cafpian trade; but the independence he had acquired having excited a defire fo fee his native country, he, after feveral difappointments which prevented him from accompliming his view, left St Pecerburg on the 9 th of July 1750 . On his arrival in his native comntry, he did not immediately relinquifh his mercantile conneetions, though he feems to have left Ruflia with that view. He emplsyed himftlf fome time as a merchant; but afterwards, more beneficially to the world, as a private gentleman. In 1753 he publifhed " An Hiftorical Account of the Brituh Trade over the Cafpian Sea; with a Journal of Travels from London through Rufia into Perfia; and back agan rhro' Ruffia, Germany, and Holland. To which are added, the Revolutions of Perfia during the prefent Century, with the particalar Hiftory of the great Ufarper Nadir Kouli," 4 vols 4to; a work which was received, as it deferved to be with great attention from the pubic. In 1754 we find Mr Hanway commending a plan offered for the advantage of Weftminfter, and fuggefting hints for the further inprovement of it, in "A Letter to Mr John Spranger, on his excellent Propofal for Paving, Cleanfing, and Lighting the Streets of Weftminfler, ecc." 8vo. A few years afterwards, when a fcheme of the like kind was carried into effect, many of Mr Hanway's ideas, thrown out in this pamphlet, were adopted. In r 756, be printed " a Journal of Eight Days Journey from Portfmouth to Kingfton upon Thames, with an Eflay on Tea; " which was afterwards reprinted in 2 vols $8 \mathrm{vo}, \mathrm{I} 757$.

At this juncture, Great Britain being on the eve of a war with France, the event of which was very important to the nation at large, and required every effort of patriotifm, and prudence to ward off the impending danger, Mr Hanway publifhed "Thoughts on the Duty of a good Citizen with Regard to War and Invafion, in a Letter from a Citizen to his Friend," 8vo. About the fame time, feveral gentlemen formed a plan, which was matured and made perfect by the affiduity of Mr Hanway, for providing the navy with failors, by furnifhing poor children with neceffaries to equip them for the fervice of their country. The fuccefs and propriety of this fcheme foon became apparent. Mr Hanway wrote and publifhed three pamphlets on this occafion; and the treafurer of the Society, accompanied by Mr Hanway, having waited on the king, the Society reccived 100 cl . from his majefty, 4001. from the Prince of Wales, and 200l. from the Princefs Dowager. This excellenr inftitution through life was the favourite object of Mr Hanway's care, and continned to flourin under bis aufpices greatly to the advantage of the community. In $175^{8}$ he became an advocate for another

## HA N L 304 H A N

Hanvay. charitable inflitution, which derived confiderable emoJument from his patronage of it. This was the Mlagdalen Charity : and to allift it he publithed "A Letter to Robert Dingley, Efq; being a propofal for the Relief and employment of triendletis Girls and repenting Profticures," 4ro. He alfo printed other farall performances on the fame fubject.

Ia $1759, \mathrm{Mr}$ Hanway wrote *Reafoas for an Augmentation of at lealt Twelve Thoufand Mariners, to be cmployed in the Merchants Service and Coafting Trade in 33 Letters to Charles Gray, Efq; of Colchefter, 4 to." The nextyear he pablihed feveral performances : viz. a. "A candid hiftorical Account of the Hefpical for the Reception of expofed and deferted young Children; reprefenting the prefent Plan of it as prodactive of many Evils, and not adapted to the Genius and Happinefs of this Nation." 8vo; which being anfwered by an anony mous Letter from Halifax in " Candid Remarks, 880 1 760, " Mr Hanway replied to it, and the Remarker rejoined. 2. "s An Account of the Society for the encouragement of the Britifh Troops in Germany and North America, \&c." 8vo. 3. "Eight Letters to —— Duke of ——; on the Curtom of Vails-giving in England," 8vo. This praEtice of giving vails had arrived at a very extravagant pitch, efpecially among the fervants of the great. It was Mr Hanway who anfwered the kind reproach of a friend in a high ftation for not coming oftencr to dine with him, by faying " Indeed I cannot afford it." The nobleman to whom the above letters were addreffed was the duke of Newcafle. The tetters are written in that humorous ftyle which is moft attractive of general notice, and was beft adapted to the fubject. It was Sir Timothy Waldo that firft put Mr Hanway on this plan. Sir Timothy had dined with the duke of N-—, and, on his leaving the houfe was contributing to the fupport and infolence of a train of fervants who lined the hall; and at laft put a crown into the hand of the cook, who returned it, faying," Sir, I do not take filver."-ك Don't you indeed !" fald the worthy baronet, putting it in his pocket; then I do not give gold." Among the ludicrous circumftances in Mr Hanway's letters is one which happened to himfelf. He was paying the Servants of a refpectable friend for a dinger which their mafter had invited him to, one by one as they appeared; Sir your great-coat;' a flilling-_-" Your hat:" a fhilling-"' Stick ;', a milling"U Unbretla:" a fhilling-"Sir, your gloves;".*Why, fritnd, "you may keep the gloves they are not worth a fhilling." In 7 761, Mr Hanway produced "Reflections, Effays, and Meditations on Life and Keligion: with a collection of Proverbs and 28 Letters writtenoccafionally on feveral Subjects,' in 2 vols 8vo.

The many ufeful and public fpirited plans which Mr Hanway had promoted for the welfare of the community had now r/andered his character moft refpectably popular, whilehis difintereftednefs, and the fincerity of his intentions, were confpictous to all. Five citizens of London of whom the late Mr Hoare the banker was one, waited on Lord Bute, at that time the minifter; and, in their own names, and the nanes of their fellow citizens, requefted that fome notice might be taken of a man, who at the expence of his own private fortune, and unremitfing application, had ren-
dered fo many and fuch meritorious fervices to his Hianway. country. In confequence of this requeft, he was in July 1762 appointed by a patent one of the commiflioners for victualling the navy; a poft which he held above 21 years. The next act of public beneficence in which we find him engaged is the collection of money for the fufferers by the fire which happened at Montreal, in the province of Quebec, in May 1765, when a fourth part of the city was confumed. On this occafion Mr Hanway, in conjunction with two other gentlemen, celleeted 84551 -The very next year a dreadful fire broke out in Bridge Town in Barbadoes, which confumed buildings and property to the amount of near 100,000 . A fubfoription was opened, in which Mr Hanway was a principal actor, and 14,8861 . were collected, and trandmitted to a committee appointed at Barbadoes to diftribute it to the unfortunate fufferers. At fubfequent periods he continued to intereft himfelf in various other plans for relieving the diftreffes, and promuting the good, of different claffes of the community. His attention was particularly directed towards atleviating the miferies of young chim-ney-fweepers. Befides the eiftreffes of thefe helplefs beings, which are open to general obfervation, fuch as a contortion of the limbs, and the preventitn of their growth, they are liable to a difeafe peculiar to their occupation, now known by the name of the chinizney fweeper's cancer. Four children have been brought together into a workhoufe, all afticted with this dread. ful and incurable difeafe. After much inquiry and conficeration, he publified in 1773 , "The State of the Chimney-fweepers Young Apprentices; fhowing the wretched condition of thefe diftreffed Boys; the ill Conduet of fuch Mafters as do not obferve the ObHigation of indentures; the Neceffity of a ftrict In-. quiry in order tofupport the civil and religious Righ ts of thefe Apprentices," 12 mo . This fmall pamphlet has already been productive of fome advantage to the objects intended to be henefited by it. The fucceding year i 774 he enlarged a former publication, entitled "Advice from a Farmer to his Daughter, \&c." and republifhed it under che title of "Virtue in humble Life : containing Reflections on the reciprocal Daties of the Wealthy and Indigent, the Mafter and the Servant," 2 vol. 8vo ; a work deferving the particular cenfideration of every magiftrate. This edition in a few months being fold, he reprinted it in two quarto volumes, with a dedication to Mrs Montague.

In 1780 , finding his health decline, he determined to refign bis office at the victualling board, which he did on the 2d of October that year; and immediately received a grant of bis whole falary by way of a penfon, to continue for life. This favour he owed to the efteem which his majefty, to whom he was perfonally known entertained of him; excited by his various exertions in behalf of his country and mankind.-He was now releafed from his mof material bufinefs, but did not think it wonld conduce to his happinefs to lead an idje life. He engaged again in behalf of the chimney-fweepers boys; and promoted, by every means in his power, the eftablifliment of Sunday-fchools, which are now in a fair way to be adopted in every county in England. He likewife promoted a fubfcription for the relief of the many black poor people who wanderea about the metropolis in extreme diftrefs;

## HAN [ 305$] \quad \mathrm{HAN}$

Minway, and the lords of the treafury feconded the defign, by directing money, as far as 14 l. a-head, to be iffued to the committee, to enable them to fend the blacks to fuch places abroad as might be fixed on. After encountering many obftacles, about 300 negroes were fent, properly acconmodated with provifions and neceffaries, to Africa, under the conduct of a perfon ap. proved for that ftation. The object of this plan, belides relieving the mifery of thele poor people, was to prevent in time the anatural connections between black perfous and white, the difagreeable confequences of which make their appearance but too frequently in the ftreets.
In the fummer of 1786 Mr Hanway's health de. clined fo vifibly that he thought it neceffary to attend only to that. He had long felt the approach of a diforder in thie bladder, which, increafing by degrees, caufed a ftrangury ; and at length, on the sth of Sep. tember 1786, put a period to a life fpent almont entirely in the fervice of his fellow creatures. On the rgrh he was interred in the family vanlt at Hanwell, being attended to the grave by a numerous retinue of friends; and fince his death the public regard to his virtues has been difplayed by a fubfcription of feveral hundred pounds towards erecting a monument to perperuate his memory.

Mr Hanway in his perfon was of the middle fize, of a thin fpare habit, but well haped: his limbs were fannioned with the nicelt fymmetry. In the latter years of his life he ftooped very much ; and when he walked, found it conduce to eafe to let his head incline towards one fide : but when he went firt to Ruflia at the age of 3.0 , his face was full and comely, and his perfon altogether fuch as obtained for him the appellation of the Hand ome Englifhmen, In his drefs, as far as was condiftent with his ideas of health and eafe, he accom modated himfelf to the prevailing fathion. As it was frequently neceffary for himi to appear in polite circles on unexpected occations, he ufually wore drefs clothes, with' a large French bag. His hat ornamented with a gold button, was of a fize and fafhion to be worn as well under the arm as on the head. When it rained, a finall parapluie defended his face and wig. Thus he was always prepared to enter into any company without impropriety or the appearance of negligence. His drefs for fet public occafions was a fuit of rich dark brown; the coat and waiftcoat lined throughout with ermine, which juft appeared at the edges; and a fimall goldhilted fword. As he was extremely fufceptible of cold, be wore fannel under the linings of all his clothes, and ufually three pair of flockings. He was the firft man who ventured to walk the ftreets of London with an umbrella over his head. After carrying one near 30 years, he faw them come into general ufe. The precarions ftate of his health when hearrived in England from Ruffia, made it neceffary for him to ufe the utmoft caution ; and his perfeverance in following the advice of the medical practitioners was remarkable. After Dr Lieberkyn phyfician to the king of Pruflia had recommended milk as a proper diet to reflore his Arength, he made it the chief part of his food for 30 years; and though it at firft difagreed with him, he perfifted in trying it under every preparation that it was capable of till it agreed with his fomach. By this risidattention and care, his heald was citablifhed;

Vox. VIII.
his lungs acquired ftrength and elafticity; and it is Hanway: probable he would have lived feveral years longer, if the diforder which was the immediate caule of his death had left him to the gradual decay of natare. His mind was the moft active that it is polfible to cenceive; always on the wing, and never appearing to be weary. He rofe in the fummer at four or five, and in the winter at feven. Havingalways buline fs before him, he was every day employed till the time of retiring :a reft; and, when in health, was commonly aneep within two minates after his lying down in bed.

Writing was his favourite employment, or rather amufement; and when the number of his literary works is confidered, and that they were the produce only of thofe hours which lie was able to finatch from public bufinefs, an idea may be formed of his application. But by leaving his work to rranfect his ordinary bufinefs, and afterwards recurring to ir with new ideas. all his literary labours are defective in the artangement of the matter, and appear to have to much of the mifeellaneous in their compofition. The original idea is fomerimes left for the purfuit ofone newly flarted, and cither taken up again when the mind of the reader has almoft loft it, or it is totally deferted. Yet thofe who are judges of literary compofition fay, that his language is well calculated to have the effeet he defired on the reader, and imprefs him with the idea that the author was a man of inflexible integrity, and wrote from the pure dictates of the heart. It is plain and unornamented, without the appearance of art or the affectation of fingularity. Its greatelt defect (fay they) is a want of concifenefs, its greateft beauty, an unaffected and genuine fimplicity. He fjoke French and Portuguefe, and underfood the Rus and modern Perfic imperfeetly. Latin he had been tanght at fchool, but had not much occafion to cultivate it after he entered intolife.

Mr Hanway, although never married himfelf, was yet an advocate for marriage, and recommended it to all young people. He thought it the moft effectual reftraim on licentioufnefs, and that an increafe of unhappinefs was by no means the natoral confequeace of an increafe of domeftic cares. A "Jocal habiration," with the fociety of a fenfible woman, the choice of minbiaffed affection, he efteemed as the moft engaging perfuafive to the love of order and economy; without which he thought life, in whatever fation, muft be disjointed and perturbed and unhappy. The lady who engaged his firlt affection was uncommonly hand fome; and it is probable he was prevented from marrying only by his failing to obtain her, and the unfettied manner in which the firft years of his life were spent: for he loved the lociety of women; and in the parties which frequently breakfafted at his houfe the "ladies ufually made the greater portion of the company.

In his tranfactions with the world, he was always open, candid, and fincere. Whatever he faid might be depended on with implicit confidence. He achered to the ftrict truh, even in the manner of inis relation : and no brilliancy of thought could induce him to vary from the fact : but although fo frank in his own proceedings, he had feen too much of lite to be eatily deceived by others; and he did not often place a concdence that was berrayed. He did nor, however, iting the world fodegenerate as is commonly imagined:

P p

HAP
Planway
"And ifI did (he ufed to fay), I would not let it appear; for nothing can tend fo effectually to make a man wicked, or to keep him fo, as a marked fufpicion. Confidence is the reward of truth and fidelity, and thefe flould never be exerted in vain." In his department of commilione: for victualling the navy he was ancommonly affiduous and attentive; and kept the contractors and perfons who had dealings with the office at a great diftance. He would not even accept a hare or pheafant, nor the fmalleft prefent, from any of them; and when any were fent him, he always returned them, not in a morofe manner, as if he affeeted the excefs of difintereftednefs, but with fome mild anfwer; fuch as, " Mr Han way returns many thanks to Mr ———for the prefent he intended him ; but he has made it a rule not to accept any thing from any perfon engaged with the office: A rule which, whilft he acknowledges Mr-—'s grod intentions, he hopes he will not expeet him to break through." With all this goodnefs, Mr Hanway had a certain fingularity of thought and manners, which was perhaps the confequence of his living the greater part of his life in foreign conntries, and never having been married. He was not by any means an inattentive obicrver of the little forms of politenefs : but as he had fudied them in various realms, felefting thofe which lee approved, his politenefs differed from that of other people; and his converfation had an air of originality in it that was very pleaking.

Belides the works already mentioned in the courfe of this article, Mr Hanway was the author of a great number of others; his different publicationsamounting $2 l l$ together to between fixty and feventy. A complete lift of them is given by his biographer Mr Pugh, from whofe grateful and well-written performance this article has been chiefly extracted.

HAP, or Happ, in law, hignifies to catch or fnatch a thing. Thus we meet with, to hap the poffefion of a deed-poll. Littleton, fol. 8. alfo, to hap the rent. If partition be made between two parceners, and more land be allowed the one than the other, fhe that hath moft of the land charges it to the other, and happeth the rent whereon affize is brought.

HAPPINESS, or Feiricity, abfolutely taken, denotes the durable polfeffion of perfect good without any mixiore of evil, or the enjoyment of pure pleafure nnalloyed with pain; or a fate in which ail the wighes are fatisfied: In which fenfes, Happinefs is known only by name upon the carth. The word happy, when applied to any fate or condition of human life, will admit of no politive definition, but is merely a relative term: that is, when we call a man happy, we mean that he is happier than fome orhers with whom we compare him; than the generality of orhers; or than he himfelf was in fome other fituation.

This interefting fubject bas been treated by many eminent writers, and in a great variety of ways; but ly none does it appear to have been fet in a clearer and more definite point of view than by Archdeacon Paley in the fixth chapter of his Principles of Pbilofophg. "In friennefs (faysthat elegant writer), aty condition may be denominated happy in which the amount or aggregate of pleafure exceeds that of pain ; and the degree of happinefs depends upon the quantity of this excefs. And the greateft quancity of it, ordinarily athanable in human life, is what we mean by happinefs

06 ] H A P
when we inquire or pronounce what human happinefs Happinefs. confifts in.

If any pofitive fignification, diftinct from what we mean by pleafure, can be affixed to the term bappinefs, it may be taken to denote a certain flate of the nervous fyftem in that part of the human frame in which we feel joy and grief, paffions and affections. Whether this part be the heart, which the turn of molt languages would lead us to believe; or the diaphragm, as Buffon, or the upper orifice of the fomach, as Van Helmont thought; or rather be a kind of fine network, lining the whole region of the precordia, as others have imagined; it is polible not only that every painful fenfation may violently fhake and difturb the fibres at the time, but that a feries of fuch may at length fo derange the very texture of the fyftem, as to produce a perpetual irritation, which will fhow itfelf by fretfulnefs, reftleffinefs, and impatience. It is polfible alfo, on the other hand, that a fucceflion of pleafurable fenfations may have fuch an cffect upon this fubtle organization, as to caufe the fibres to relax, and return into their place and order; and thereby to recover, or if not loft to preferve, that harmonious conformation which gives tothe niind its fenfe of complacency and fatisfaction. This ftate may be denominated bappinefs: And is fo far diftinguihable from pleafure, that it does not refer to any particular object of enjoyment, or confint like pleafure in the gratification of one or more of the fenfes; but is rather the fecondary effect which fuch objects and gratifications produce upon the nervous fyftem, or the fate in which they leave it. The comparative fenfe, however, in which we have explained the term happine/s, is nore popular ; and in profecuting the fibject, we may confider, 1 . What buman happinefs does not confift in; and, 2. What it does confift in.

1. Firfl then happinefs does not confift in the pleafures of fenfe, in whatever profufion or variety they be enjoyed. By the pleafures of fenfe are meant, as well the animal gratifications of eating, drinking, and that by which the fpecies is continued, as the more refined pleafures of mufic, painting, architecture, gardening, Splendid fhows, theatric exhibitions, and the pleafures, lafty, of active fports, as of hunting, fhooting, fifhing \&c. For, 1 . Thefe pleafure continue but for a little while at a time. This is true of them, all, efpecially of the groffer fort. Laying afide the preparation and the expectation, and computing ftrictly the actual fenfation, we thall be furprifed to find how inconfiderable a portion of our time they occupy, how few hours in the four and twenty they are able to fill up. 2. By repetition, they lofe their relifh. It is a property of the machine, for which we know no remedy, that the organs by which we perceive pleafure are blunted and benumbed, by being frequently exercifed in the fame way. There is hardly any one who has not found the difference between a gratification when new and when familiar, and any pieafure which does not become indifferent as ir grows habitual. 3. The eagernefs for high and intenfe delights takes away the relilh from all others; and as fuch delights fall rarely in our way, the greater part of our time becomes from this caufe empty and uneafy. There is hardly any delution by which men are greater fufferers in their bappinefs ${ }_{2}$ than by their expecting too much from

H A P
Happinefs, what is called pleafure, that is, from chofe intenfe delights which vulgarly engrofs the name of pleafure. The very expectation fpoils them. When they do come, we are often engaged in taking pains to perfuace ourfelves how much we are plealed, rather than enjoying any pleafure which furings naturaliy out of the object. And whenever we depend upon being vaftly delighred, we always go home fecreily grieved at miffing our ain. Likewife as hath been obferved juft now when this humour of being prodigioully delighted has once taken hold of the imagination, it hinders us from providing for or acquiefcing in thofe gently foothing engagements, the due variety and facceflion of which are the only things that fupply a continued ftream of happinefs.

The truth feems to be that there is a limit at which thefe pleafures foon arrive, and from which they ever afterwards decline. They are by necelfity of hort duration, as the organs cannot hold on their emotions beyond a certain length of time; and if you endeavour to compenfate for their imperfection in their aature by the frequency with which you repeat them, you lofe more than you gain by the fatigue of the faculties and the dimination of fenfibility. We have in thas account faid nothing of the lofs of opportunities or the decay of faculties, which whenever they happen, leave the voluptaary deflitute and defperate; tealed by defires that can never be gratified, and the memory of pleafures which mult return no more. It will alfobe allowed by thefe who have experienced it, and perhaps by thofe alone, that pleafure which is purchafed by the incumbrance of our fortune is purchafed too dear : the pleafure never compenfating for the perpetual irritation of embarraffed circumitances.

Thefe pleafures, after all, have their value: and as the; young are always too eager in their purfuit of them, the old are fometimes too remifs; that is, too ftudions of their eafe to be at the pains for them which they really deferve.

Secondly, Neither does happinefs confift in an exemption from pain, labour, care, butineis, fufpenfe, moleftation, and " thofe evils which are without;" fuch a flate being ufually attended not wich eafe, but with deprefion of fpirits, a tafteleffincfis in all our ideas, imaginary anxieties and the whole train of hypochondriacal affections. For which reafon it feidom anfwers the expectations of thofe who retire from their thops and counting-houfes to enjoy the remainder of their days in leifure and tranquillity; much lefs of fitch as in a fit of chagrin flut themelves upin cloyfters and hermitages, or quit the world and their ftations in it for folitude and repofe.

Where there exifts a known external caufe of uneafinefs, the caufe may be removed, and the uneafinefs will ceafe. But thafe imaginary diftreffes which men feel for want of real ones (and which are equally tormenting, and fo far equally real); as they depend wpon no fingle or aflignable fubject of unealinefs, fo they admit ofl-times of foo application or relief. Hence a moderate pain, upon which the attention may faften and fpend itfelf, is to many a rcfrefhment; as a fit of the gout will fometimes cure the fpleen. And the fame of any moderate agitation of the mind, as a lite. rary conrroverfy, a law-fuir, a contefted election, and above all gaming ; the pafion for which, in men of

## 3071 <br> H A P

fortune and liberal minds, is only to be accounted for Happincts on this principle.

Thirdly, Neither does happinefs confift in greatnefs, rank, or elevated fation.

Were it true that all faperiority afforded pleafore, it would follow, that by how much we were the greater, that is, the more perfons we were fuperior to, in the fame preportion, fo far as depended upon this caufe, we hoould be the happier ; but fo it is, that no fuperiority yields any fatisfaction, fave that which we poffefs or obtain over thefe wiih whom we immediately compare ourfelves. The fhepherd perceives no pleafure in his fuperiority over his dog; the farmer in his fuperiority over the fhepherd; the lord in his fuperiority over the farmer ; nor the king, laftly, in his Superiority over the lord. Superiority, where there is no competition, is feldom contemplated; what mof men indeed are quite unconfcious of. But if the fame fhepherd can run, fight, or whithe, better than the peafants of his village; if the farmer can how better cattle, if he keeps a better horfe, or be fuppofed to have a longer purfe, than any farmer in the hundred; if the lord have more sutereft in an clection, greater favour at court, a better hoale, or larger eftate, than any nobleman in the country; if the king poffeffes a more extenlive territory, a more powerful fleet or army, a more fpendid eftablifhment, more loyal fubjects, or more weight and authority in adjulling the affeirs of nations, than any prince in Europe ; in all thefe cafes, the parties feel an actual fatisfaction in their fi:periority. No fuperiority appears to be of any account but a luperiority over a rival. This, it is manifent, may exift wherever rivalhips do ; and rivalhips fall out amonglt men of all ranks and degrees. The object of emulation, the dignity or magnitude of this object, makes no difference ; as it is not what cither poffeffes that conftutes the pleafire, but what one poffifes more than the other. Philofophy fmiles at the contempt with which the rich and great fpeak of the petty ftrifes and competitions of the poor; not reficeting that thefe Arifes and comperitions are juft as reafonable as their own, and the pleafure which fuccefs affords the fame.

It appears evident then, that happinefs dots not confift in greatnefs; fince what are fuppofed to be the peculiar advantages of greatnefs, the pleafures of ambition and fuperiority, are in reality common to all conditions. But whether the purfuits of ambition be ever wife, whether they contribute more to the happinefs or mifery of the purfuers, is a different queftion; and a queftion concerning which we may be allowed to entertain great doubt. The plealure of fuccefs is exquifite; fo alfo is the anxiety of the purfuit, and the pain of difappointment ; and what is the worft part of the account, the pleafurc is fhort lived. We foon ceafe to look back upon thofe whom we have lefr behind; new conterts are engaged in, new profpets unfold themfelves; a fuccelion of fruagles is keptup, whillt there is a rivalleft within the compars of our views and profenion; and when there is none, the pleafure with the parfuit is at an end.
II. We have feen what happinefs does not confift in. We are next to confider in what it does confift. In the conduet of life, the great matrer is, to know beforehand what will pleafe us, and what pleafures wit

## HAP

$\underbrace{\text { Uappincfs. duld out. So far as we know this, our choice will be }}$ jaitified by the event. And this knowledge is more rare and difficult than at firlt fight it may feem to be : For fometimes pleafures, whichare wonderfully alluring and flattering in the profped, turn out in the pofferfion extremely infipid ; or do not hold out as we expected : at ocher times pleafures tart up, which never enteredinto our calculation, and which ye might have miffed of by not forclecing ; from whence we have reafon to believe, that we actually do mifs of many pleafires from the fame caule.

By reafon of the original diverfity of tafte, capacity, and conftitution, obfervable in the human fpecies, and the ftill greater variety which habit and fathion bave intrujuced in chefe particulars; it is impolible to propofe any plan of happinefs which will fucceed to all, or any method of life which is univerfally eligible or practicable. All that can be faid is, that there remains a prefumption in favour of thofe conditions of life in which men generally appear moft cheerful and contented. For though the apparen happinefs of mankind be not always a true meafure of their real happinefs, it is the beft meafure we iave.

Upon this principle, then, happineis appears to confift,

1. In the exercife of the focial affections. Thofe perfons commonly poffers good fipirits who have about them many objects of affection and endearment ; as wife, children, kindred, frierrds : and to the want of thefe may be imputed the pecvihners of monks, and of fuch as lead a monaftic life. Of the fame nature wih the indulgence of our domeftic affedioms, and equally refrefhing to the fpirits, is the pleafure which refults from acts of bounty and beneficence, exercifed either in giving noney, or in imparting to thofe who want it the affiftance of our kill and profeffion.
2. Another main article of human happinefs is, the exercife of our faculties, either of bady or mind, in the purfuit of fome engaging end.

It feems to be true, that no plenitude of prefent gralifications can make the poffeffor happy for a continuance, unlefs he have fomething in referve, fomething to hope for and look forward to. This may be inferred from comparing the alacrity and fpirits of men who are engaged in any purfuit which interefts them, with the dejection and ennui of almoft all who are either born to fo much that they want nothing more, or who have ufed up their fatisfactions 100 foon, and drained the foarces of them. It is this intolerable vacuity of mind which carries the rich and great to the horfe-corre and the ganing table; and of fen engages them in contefts and purfuits of which the fuccefs bears no proportion in the folicitude and expence with which it is fought.

The queftion now occurs, How we are to provide ourfelves with a fucceffion of pleararable engagements? This requires two things: Jodgmene in the choice of ends adapted to our opportunities; and a command of imagination, fo as to be able, when the judgment has made choice of an end, to transfer a pleafure to the means; after which the end may be forgotien as foon as we will. Hence thofe pleafures are molt valuable, not which are moft exquifite in the fruition, but moft productive of engagement and activity in the purfait.

A n:an who is in earneft in his endeavours after the
happinefs of a future fate, has in this refpect an id. Happinef. vantage over all the world. For he has cunfantly before his eyes an object of fupreme importance, prodactive of perperual engagement and activity, and of which the purfuit (which can be faid of no purfuit befides) tafts him to his life's end. Yet even he muft have many ends befide the far end ; but then they will conduet to thar, be fubordinate, and in fome way or other capable of being referred to that, and deriye their fatisfaction, or an addition of fatisfaction, from that.

Engagement is every thiug. The more figuificant, however, our engagements are, the better; fuch as the planning of laws, inftitutions, manafactures, cha. rities, improvements, public works, and the endeavouring by our intereft, addrefs, folicitations, and activity, to carry them into effect: Or, upon a fmaller falc, the procuring of a maintenance and fortune for our families, by a courfe of induftry and application to our callings, which forms and gives motion to the common occupations of life; training up a child; profecuting a fcheme for his fuure eftablifiment ; making ourfelves malters of a language or a fcience; improving or managing an eftate; labouring after a piece of preferment : And, lanty, any engagement which is innocent is better than none; as the writing of a book, the building of a houle, the laying out of a garden, the digging of a fifh-pond; even the raiing of a cucumber or a culip. Whilft the mind is taken up with the objects or bulinels before it, we are commonly happy, whateyer the object or bufinefs be: when the mind is ablent, and the thoughts are wandering to fomething edfe than what is paffing in the place in which weare, we are often miferable.
3. The artin which the fecret of human happinefs in a great meafure confifs, is to fet the habits in fuch a manner, that every clange may be a change for the better. The habits themfelves are much the fame; for whatever is made habitual hecomes finooth, and caly, and indifferent. The return to an old habit is likewife ealy, whatever the habix be. Therefore the advantage is with thofe habits which allow of indul. gence in the deviation from them. The luxurjous receive no greater pleafure from their dainties than the peadant does from his bread and cheefe; but the peafant whenever he goes abroad finds a feaft, whereas the epicure unut be well eatertained to efeape difgut. Thofe who fpend every day at cards, and thole who go every day to plough, pafs their time much alike; intent upon what they are about, wanting nothing, regretting nothing, they are both in a ftate of eafe: But iten, whatever fulpends the occupation of the cardplayer diftreffes him; whereas to the labourer, every interruption is a refrelhment: and this appears in the different effect that the Sabbath produces upon the two, which proves a day of recreation to the one, but a lamentable burden to the other. The man who has learned to live alone, feels his firits enlivened whenever he enters into company, andtakes his leave without regret: ancther, who has long been accultomed to a crowd or continual fuccefion of company, experien ces in company no elevation of fpirits, nor any greater fatisfaction than what the man of a retired life finds in his chimney-corner. So far their conditions are equal: but let a change of place, fortune, or fituation, feparate the companion from lis circle, his vifitors, his
clab,

## H A P

rence of advantage in the choice and conttitution of the two habits will thow itrelf. Solitude comes to the one clothed with melancholy; to the other it brings libarty and quiet. You will fee the one fretful and reftefs, at a lors how to difpofe of his time, till the hour comes round that he can forget himfelf in bed: the other eafy and fatisfied, taking up his book or his pipe as foon as he finds himfelf alone; ready to admit any little amulement that cafts up, or to turn his hands and attention to the firft bunnefs that prefents itfelf; or content without either to fit fill, and let his trains of thought glide indolently through his brain, without moch ufe, perhaps, or pleafure, but without hankering after any thing better and without irritation. A reader who has inured himfelf to books of fcience and argumentation, if a novel, a well written pamphler, an article of news, a narrative of a curions voyage, or the journal of a traveller, fall in his way, fits down to the repalt with relifh, enjoys his entertainment while it lafts, and can return when it is over to his graver reading without diftafte. Another, with whom nothing will go down but works of humour and pledfantry, or whofe cariofity mult be interefted by perpetual novelty, will confume a bookfeller's window in halt a forenoon : during which time he is rather in fearch of diverfion than diverted : and as books to his tafte are few and Chort and rapidly read over, the ftock is foon exhaufted, when he is left without refource from this principal fupply of innocent amafe. ment.

So far as circumftances of fortune conduce to happinefs, it is not the income which any man poffeffes, but the increafe of income that affords the pleafure. Two perfons, of whom one begins with rool. and advances his income to roool. a year; and the other fets off with 1000 l. and dwindles down to 100 1. may, in the courfe of their time, have the receipt and fpending of the fame fum of money; yet their fatisfaction, fo far as fortune is concerned in it, will be very different: the feries and fun total of their incomes being the fame, it makes a wide difference which end they begin at.
4. Happinefs confifts in health : underftanding by health, not only freedom from bodily diftempers, but alfo that tranquillity, firmnefs, and alacrity of mind, which we call good /pirits. For the fake of healh, according to this notion of it, no facrifices can be too great. Whether it require us to relinquifh lucrative fituations, to abftain from favourite indulgences, to control intemperate paffions, or undergo tedious regimens; whatever difficulties it lays us under, a man, who purfues his happinefs rationally and refolutely, will be content to fubmit to. When we are in perfect health and fpiriss, wefeel in ourfelves a happinefs independent of any particular ontward gratification whatever, and of which we can give no account. This is an enjoyment which the Deicy las annexed to life; and probably conftitutes, in a great meafure the happinefs of infants and brutes, efpecially of the lower and fedentary orders of animals, as of oyfters, periwinkles, and the like.

The above account of human happinefs will juftify thefe two conclufions, which, although found in mont books of morality, have feldom been fupported by any

## HAR

fufficierit reafons: 1. "That happinefs is pretty equally diftributed amangt the different orders of civil fociery; and, 2. That vice has no advantage over virtue, even with refpect to this world's happinefs."
HAQUE, in old writers, a litle hand-gun, prohibited to be ufed for deftruction of game, \& 8 . by ftatute 33 Hen. VIII. cap. 6. and 2 \& 3 Ed. VI. cap. 14. There is alfo the half-haque, or demi-haque, within the faid acts.

Haram. See Seragio.
HARAN, otherwife Charree in Mefopotamia, a city celebrated for having been the place where Abraham firt retreated after he left Ur (Gen. xi. 31, 32): and where Terah, Abraham's father, died and was buried. Thither it was likewife that Jacob recired to Laban when he fled from the indignation of his brother Efau (id. xxvii 45. xxviii.ro, \&cc.) Laftly at Haran or Charre in Mefopotania, Craffus the Roman general was defeated and killed by the Parthians. Haran was fituated between the Euphrates and the river Chebar, at a good diftance from the place where thefe two rivers join.

HARANGUE, a modern French name for a fpeech or oration made by an orator in public,-Menage derives the word from the Italian arenga, which fignifies the fame ; formed, according to Ferrari, from aringo, "a juft, or place of jutting." Others derive it from the Latin ara, "altar;" by reafon the firft harangues were made before altars; whence the verfe of Juvenal

Aut Lugdunenfir rbetor dicturus ad aram.
Harangues were ufually made by the generals, previous to an engagement both amungt the Greeks and Romans. An harangue on fuch occafions was called allocutio. See Alrocutio.

The word is alfo frequently ufed in an ill fenfe, viz. for a too pompous, prolix, or unfeafonable feeceh or declamation.

HARBINGER, an officer of a king's houthold, having four yeomen under him, who ride a day's journey before the court when it travels, to provide lodgeings, \&c.

HARBOROUGH, a town of Leicefterhire, 84: miles from London. It is a great thoroughfare in the road to Derby, near the fource of the river Welland; and was famous in Camden's time, for its beaft fair, where the beft horfes and colts are ftill fold. Its fairs are April 29. and Oct. 19. The market is on Tuefday, for the ufe of which the Earl of Harborongh has lately built a neat market-houfe at his own. expence. Here is a good free-fchool, and a fair chapel of eafe to Great-bowden in its patim.

HARBOUR, a general name given to any fea port. or haven, as affo to any place convenient for mooring hippiag, although at a great diftance from the fea. The qualities requifte in a good harbour are, that the bottom be entirely free from rocks or fhallows; that the opening be of fufficient extent to admit the entrance or departure of large haips without difficulty; that it fhould have good anchoring ground, and be cafy of accefs; that it thould be well defended from the violence of the wind and fea; that is hould have room and convenience to receive the hipping of different nations, and thofe which are laden with differentmerchandifes; that it be furnihed with a good lighthoufe, and have a variety of proper rings, polts, mooringer,

Harburg ings, \&c. in order to remove or fecure the veffels contained dherein; and, finally, that it have plenty of wood, and other materials for firing, befides hemp, iron, mariners, \&c.

HARBURG, a fmall town of Germany in the circle of Lower Saxony, and dutchy of Lanenburg feated on the river Elbe over againft Hamburgh. It was furrounded with walls in 1355 : and 30 years after, a ftrong cafle, which fill remains, was built by the biflop. E. Long. 9. 41. N. 53. 5 I.

HARDENING, the giving a greater degree of hardnefs, to bodies than they had before.

There are feveral ways of hardening iron and fteel, as by hamering them; quenching them in cold water, \&ce. See Steel.

Cafe-Hardening. See Case-Hardering.
HAKDERWICH, a town of the United Provinces, in Dutch Guelderland. It is a well-built town, and the chief of the fea-ports of this province. It has reveral good buildings, particularly the great church, which is much admired. In 1648 the public fchool here was turnedinto an univerfity. The French did it a great deal of damage in 1672 ; diince which time it has been on the declinc. E. Long. 5.37. N. Lat. 52. 14 .

HARDNESS, in bodies, a property directly oppofite to fluidity; by which they refift the impreffion of any oher fubftance, fometimes in an extreme degree. As fluidity has been found to confift in the motion of the particles of a body upon one another in confequence of a certain action of the univerfal fluid or elementary fire among them; we mult conclude that hardnefs confifts in the abfence of this action, or a deficiency of what is called latent beat. This is confirmed by obferving, that there is in intermediate ftate betwixt hardnefs and floidity, in which bodies will yield to a certain force, though they ftill make a confiderable refiftance. This is principally obferved in the metals, and is the foundation of their ductility. It appears, indeed, that this laft property, as well as fluidity, is entirely dependent on a certain quantity of latent heat abforbed, or otherwife atting within the fubftance itfelf; for all the metals are rendered hard by hammering, and foft by being put again into the fire and kept there for fome time. The former operation renders them hot as well as hard; probably, as Dr Black obferves, becaufe the particles of metal are thus forced nearer one another, and thofe of fire fqueezed out from among them. By keeping them for fome time in the fire, that element infinuates itfelf again among the particles and arranges them in the fame maner as befo:e, fo that the ductility returns By a fecond hammering this property is again deftroyed, returning ona repetition of the heating, or annealing as it is called ; and foon, as often as we pleafe.

Hardnefs appears to diminith the cohefion of bodies in forme degree, though their fragility does not by any means keep pace with their hardneis. Thus, glafs is very hard and very brittle: but flint, thoingh nill harder than glafs, is much lefs britule. Among the metals, however, thefe two properties feem to be more conrected, though even here the connection is by no means complete. Steel, the hardeft of all the metals is indeed the moft brittle ; but lead, the fofeft, is not the raolt dustile. Neither is hardnefs connetted with
the fpecific gravity of bodies: for a diamond, the Hardnefi, hardeft fubftance in nature, is litcle more than half Hardouin, the weight of the lightelt metal. As little is it connected with the coldnefs, electrical properties, or any other quality with which we are acquainted: fo that though the principle above laid down may be accepted as a general foundation for our inquiries, a great number of particulars remain yet to be difcovered before we can offer any fatisfactory explanation.

All bodies become harder by cold : but this is not the only means of their doing fo, for fome become hard by heat as well as cold. Thus water becomes hard by cold when it is frozen, but it becomes much harder when its fteam is paffed over red-hot iron, and it enters the fabfance of the metal, by an union with which it becomes almoft as hard as glafs.

Mr Quift and others have conftructed tables of the hardneis of different fabtance. The method parfued in conftrueting thefe tables was by obferving the order in which they were able to cut or make any impreffion upon one another. The following table, extracted from M. Magellan's edition of Croalted's Mineralogy, was taken from DrQuitt, Bergman, and Mr Kirwan. The firt column thows the hardnefs, and the fecond the fpecific gravity.

HARDOUIN (John), a learned French Jefuit in the beginning of the 18 th century, known by the remarkable paradoxes he advanced in his writings; this in particular, That all the works of the ancient profane writers, except Cicero's works, Vi-gil's Gtorgics, Horace's fatires and epiftles, and Pliny's nata-

## H A R

Hardwicke ral hiftory, are mere forgeries. He died at Paris in 1726, aged 83. His principal works are, 1. An edition of Pliny's natural hiftory, with notes, which is much efteewed. 2. Ar edition of the councils, which made much noife. 3. Chronology reftored by medals, 410. 4. A commentary on the New Teftament, folio; in which he pretend that our Saviour and his apofles preached in Latin, \&c.

HaRDWICKE. See York.
HARE, in zoology. See Lepus.
The hare is a beaft of vencry, or of the forcft, but peculiarly fo termed in the fecond year of her age. There are reckoned four forts of them, from the place of their abode : fome live in the mountains, fome in the fields, fome in marhes, and fome wander about every where. The mountain-hares are the fwifteft, the field-hares are not fo nimble, and thofe of the marihes are the floweft : but the wandering bares are the moft dangerous to follow; for they are cunning in the ways and mazes of the ficlds, and, knowing the neareft ways, run up the hills and rocks, to the confufion of the dogs, and the difcouragement of the hanters. See the article Huntinc.

Hares and ratbits are very mifchicvous to new planted orchards, by peeling off the barks of the tender and young trees for their food. They do alfo the fame fort of mifchief to nurferies; for the prevention of which, fome bind ropes about the trees up to fuch a height as they are able to reach; fome danb them with tar; but though this keeps off the hares, it is iffelf mifchievous to the trees; but this hurtul property of it is in fome degree taken off by mixing any kind of fat or greafe with it, and incorporating them well over the fire. This mixture is to be rubbed over the lower part of the trees in Novenber, and will preferve them till that time the next year, without any danger from thefe animals. It is only in the hard weather in the winter feafon, when the other food is fcarce, that thefe creatures feed on the barks of trees.

People who have the care of warrens, pretend to an odd way of making hares fat when they get them there. This is the flopping up their ears with wax, and rendering them deaf. The hare is fo timorons a creature that the is continually liftening after every nuife, and will run a long way on the leaff furpicion of danger ; fo that fhe always eats in terror, and runs herfelf out of flefl continually. Thefe are both prevented by her feeding in a fafe place, and that without apprehenfion; and they fay the will always readily be fattened in this way.

Though the hare lives on vegetables and water only, yet the habitual exercife of this animal exalss its falts, and renders in fomewhat alcalefcent; and this tendency is much increafed, if it is killed immediately after being heated by ftrong exercifc.

> Java Hare. See Mus. HARE's Ear, in botany. See Buplevium.

HARE (Dr Francis), an Englifh bithop, of whofe birth we have no particulars, was bred at Eton fchool, and from that foundation became a member of Eton college, Cambridge; where he had the tuirion of the marquis of Blandford, oaly fon of the illuftrious duke of Marlborough, who appointed him chaplain-general to the army. He afterwards obtained the deanery of Worcefter, and from thence was promoted to the bi.
fhopric of Chichefter, which he held with the deanery Harefoury of St Paul's to his death, which happened in 1740. He was difmiffed from being chaplain to George I. in 1758, by the ftrength of party prejudices, in company with Dr Mofs and Dr Sherlock, perfons ofdiftinguilhed rank for parts and learning-About the latter end of queen Anne's reign he publifhed a remarkable paniphlet intituled, The difficulties and difcouragements which attend the ftudy of the fcriptures, in the way of private judgment : in order to fhew, that fince fuch a ftudy of the fcriptures is an indifpenfable daty, it concerns all Chriftian focieties to remove, as much as poffible, thofe difcouragements. In this work, his manner appeared to be foludicrous, that the convocation fell upon him, as if he were really againft the ftudy of the holy fcriptures: and Whifton fays, that finding this piece likely to hinder that preferment he was feeking for, he aimed to conceal his being the author. He publihed many pieces againft bifhop Hoadly, in the Bangorian Coniroverfy, as it is called; and alfo other learned works, which were collected after his death and publifhed in four vols. 8vo. 2. An edition of Terence, with notes, in 4to. 3. The book of Pfalms in the Hebrew, put into the original poetical metre, 4 to. In this laft work, he pretends to have difcovered the Hebrew metre, which was fuppofed to be irretrievably loft. But his hypothefis, though defended by fome, yet has been confuted by feveral learn. ed men, particularly by Dr Lowth in his Metrice Hareanae brevis confutatio, annexed to his kectures $D e$ Sacra Poefi Hebraorum.
HARESBURY, a town of Wilthire, on the Willy, near Warminftcr, 94 miles from London, is in old records called Heightfbury or Heytfoury; and now it is writ Hatchbury. It was once the feat of the emprefs. Mand. Here are fairs May 14th, and Seprember I5th; and it has fent members to parliament ever fince Henry VI. it being an ancient borough by prefrip. tion. There is an almhoufe here for $\mathbf{I} 2$ poor men and a woman. Here is a collegiate church with four prebendaries, and a free fchool, and the place is governed by a bailiff and burgeffes.
HARFLEUR, an ancient town of France, in Normandy ; but is now a poor place, on account of iss. fortifications being demolifhed, and its harbour choaked up. It was taken by the Englifh, by affault, in the year 1415. It is feated on the river Lizarda, near the Seine, five miles from Havre de Grace, forty nowib weft of Rouen, and one hundred and fix north-weft of Paris. E. Long. O. 17. N. Lat. 49. 30.

HARIOT, or Heriot, in law, a due belonging, to a lord at the death of his tenant, confifing of the beft beaft, cither horfe, or cow, or ox, which he had at. the time of his death; and in fome manors the beit gơ̈ds, piece of plate, \&c. are called hariots.
Hariot (Thomas), See harriet.
HARLECH, a town of Merionethfilise, in norih Wales. It is feated on a rock, on the fea-hore; and is but a poor place, though the hire-town, and fends a. member to parliament. It had formerly a frong handfome caftle, which was a garrifon for Charies $\mathbf{i}$ in the civil wars, for which reafon it was afterwards demolithed by the parliament. W. Long. 4.0. N. Lat. 54. 47.
HARLEIAN COLIEGTION.-A mof valuablecolleation

## HAR

Harleian, collection of ureful and curious manufcripts, begun Harlen. near the end of the laft century, by Robert Har-
ley of Brampton Bryan, Efq; in Herefordhire, after. wards earl of Oxford and lord high-treafurer; and which was conducted upon the plan of the great Sir Robert Cotton. He publimed his firft conlider. able collection in Auguft 1705 , and in lefs than ten years he got together near 2500 rare and curious MSS. Soon after this, the celebrated Dr George Hicks, Mr Antis garter king at arms, bifhop Nicolfon, and many other eminent antiquaries, not only offered him their affiftance in procuring MSS. but iprefented him with feveral that were very valuales. Being thus encouraged to perfeverance by his fuccefs, he kept many perfons employed in purchafing MSS. for him abroad, giving them written inftructions for their conduct. By thefe means the MS. library was 111 theyear 172 r , increafed to near 6000 books, 14,000 original charters, and 500 rolls.

On the 2 Ift of May 1724 lord Oxford died : but his fon Edivard, who fucceeded ta his honours and eftate, ftill farther enlarged the collection; fo that when he died, June 16 th 174 I , it confifted of 8000 volumes; feveral of them containing diftinet and independent treatifes, befides many loofe papers which have been fince forted and hound up in volumes; and above 40,000 original rolls, charters, letters patent, grants, and other deeds and inftruments of great antiquity.

The principal defign of making this collection was the eftablifinent of a MS. Englifh hiftorical library, and the refcuing from deftruction fuch national records as had eluded the diligence of preceding collectors: but lord Oxford's plan was more extenfive ; for his collection abounds alfo with curious MSS. in every feience.-This collection is now in the Britifh Mufeum and an cnumeration of its contents may be feen in the - Amunal Regifter, vi. $140, \& c$.

HAK:EM6 a town of the United Provinces, in Holland, fituated on the river Sparren, in E. Long. 5. 17. N. Lar. 53. 22. It is a large and populons city, and ftands near a lake of the faine name, with which it has a communication, as well as with A mfterdan and Leyden, by means of feveral canals. Schemes have been often formed for draining of this lake, but were never put in execation. To the fouth of the town lies a wood, cut into delightful walks and viflas. The rown is famous for the fiege which it held ont againft the Spaniards for ten months in 1573 ; the townfmen before they capitulated being reduced to eat the vj. left animals, and even leather and grais. The inhabitants correfponded with the prince of Orange for a confiderable time by means of carrier-pigeons. Harlem, as is well known, claims the invention of printing; and in fact, the firft effays of the art are indifputably to be attributed to Laurentius, a magiftrate of that city. [Sce Laurentius, and (Hiftory of )printing.] Before the Reformation, Harlem was a bifhop's fee; and the Papifts ftill greatly outnumber the Proteftants. An academy of fciences was founded here in 1752. Vaft quantities of linen and thread are bleached here; the waters of the lake having a peculiar quality, which renders them very fit for that purpole-A fort of phrenfy with regard to flowers, particslarly tulips, once prevailed here, in confequence of which the mof beautifinl forts were bought and fold at on extravagant price.

HARLEQUIN, in the Italian comedy, a buffoon, Hatlequít drefled in pariy-coloured cloaths; anfwering much the fame purpofe as a merry-andrew or jack-pudding in our drolls, on mountebanks ftages, \& c . We have alfo introduced the harlequin upon our theatres; and this is one of the flanding characters in the modern grotefque or pantonime entertaimments.-The term took its rife from a fambus Italian comedian who came to Paris ulider Henry III. and who frequenting the houfe of M. de Harlay, his companions ufed to call him Harlequino, q. d. litte Harlay; a name which has defcended to all thofe of the fame rank and pro. feffion.

HARLEY (Roberi), carl of Oxford and Mortimer, was the eldeft fon of Sir Edward Harley, and born in 166r. At the Revolation, Sir Edward and his fon raifed a troop of horfe at their own expence; and after the acceffion of king William and queen Mary, he obrained a feat in parlianent. His promotions were rapid: in 1702, he was chofen fpeaker of the houfe of commons; in 1704, he was fworn of queen Anne's privy council, and the fame year made fecretary of flate; in 1706, he acted as one of the commiffioners for the treaty of Union; and in 1710 , was appointed a commiflioner of the treafury, and chancellor and under-treafurer of the exchequer. A daring attempt was made on his life, March 8. 1711, by the marquis of Guifcard a French Papift; who, when under an examianation before a committee of the privy council, fabbed him with a penknife. Of this wound, however, he foon recovered; and was the fame year created earl of Oxford, and lord high-treafurer, which office he refigned juft before the queen's death. He was impeached of high treafon in: 1715 , and commirted to the Tower ; but was cleared by crial, and died in 1724 His character has been varioully reprefent. ed, but cannot be here difcuffed. He was not only an encourager of literature, but the greaten collector in his time of curious books and MSS. his collection of which makes a capital part of the Britif Mufeum. See harletan Collection.

Harling. See Herirng.
HARLINGEN, a fea-port town of the United Netherlands, in Weft Friefland. It ftands on the coaft of the Zuyder fea, at the mouth of a large canal, in E. Long. 5. 25. N. Lat. 53. 12. It was only a hamlet till about the year 1304, when ir was deftroyed by the fea; and being afterwards rebuilt, became a confiderable town. In 1579, it was confiderably enlarged by the care of William prince of Orange. It is now very well fortified, and is naturally ftrong, as the adjacent country can very eafily be laidunder water. The city is fquare; and the ftreets are handfome, ftraight, and clean, with canals in the niddle of them. It has five gates; four towards land; and one towards the fea; but though the harbour is good, yet veffels of great burden cannot get into it unil they are lightened for want of water. The admiralty college of Friefland has its fear here. The manufactures are falt, bricks, and tiles; a confiderable trade is alfo carried on in all forts of linen cloib; and the adjacent country yields abundance of corn and good paftures.

HARLOCK, or Harlefch; a town of Merionehhfhire, in North Wales, 223 miles from London, on the feacoaft, near the north weft point of the county.

## HAR

Harlot, It is naturally frong, a garrifon being kept here for Harmat- the fecarity of the coaft. Its calle lies now in ruins. tan. The town, though a corporation and governed by a mayor, makes hut a very mean appearance. lt has a market on Saturdays, and four fairs in the year.

HARLOT, a woman given to incontinency, or that makes a habit or a trade of proftituting her body.-The word is fuppofed to be ufed for the diminutive whorelet, a "litale whore."-_Others derive it from Arletta, mifrefs to Robert dukc of Normandy, and mother to William the Conqueror ; Camden derives it from one Arlotha, concubine to William the Conqueror: Others from the Italian Arlotta, "a proud whore."

Harlots were tolerated amongft Jews, Greeks, and Romans. Fornication indeed was prohibited among the Jews, under fevere penaltics; but thefe are explained as extending only to women of their own nalion. The public ftews were therefore flocked with foreign proftitutes, who feem to have been taken under the protection of government. Hence appears the reafon why the word firange woman is often found to fignify a harlor. Proftitutes at firft wore veils or mafks ; but by and by their modefly was entirely put to flight, and they went abroad bare-faced. At Athens the proftitutes were generally frangers : and fuch as debatuched an Athenian female were liable to a penalty. To frequent the public ftews was not held difgraceful! The wifeft of the Heathen fages allowed it! Solon permitted common whores to go publicly to the young men who had engaged them, and encouraged the youth of Athens to gratify their luft with thefe, rather than feduce and debauch the wives and daughters of citizens. Cato the Cenfor was of the fame fentiments; and Cicero challenges all perfons to name a time when men were either reproved for this practice, or not countenanced in it. Amongtt the Jews, the harlots ufed to ply in the highways and ftreets of cities; at Athens they frequented the ceramicus, circus, and the old forum. - In fome places they were diftinguilhed by their drefs from other women. Corinth was a remarkable nurfery of harlots, and gave birth to the noted Lais. Their accomplifhments were oftentimes great, in all the polite and elegant parts of female education, viz. philofophy, dancing, finging, rhetoric, \&c. Afpafia, the miftrefs of Pericles, was admired by Socrates for her learning. The more accomplifhed proftitutes frequently amafled large fortunes; a remark able inftance of which we have in Phryne, who offered to rebuild the walls of Thebes, when deftroyed by Alexander, on condition that they would perpetuate her memory and profeffion by an infcription. Proftitutes at Rome were obliged to fix a bill over their doors, indicating their character and profeffion. It was alfo cuftomary for them to change their names, after they had gignified to the proter, their intention of leading fuch a diffolute life : this they did, becaufe their trade was unbecoming their birth and condition; but they re-affumed their family names when they quitted their infamous mode of living. Women whofe grandfather, father, or hufband, had been a Roman knight, were forbidden by the laws to make a public profefion of lewdnefs.

HARMATTAN, the name of a remarkable periodical wind which blows from the interior parts of AVox. VIIL.
frica towards the Allantic ocean. Of this wind we have the following account in the Philofophical Tranfactions, vol. 71. furnified by Mr Norris, a gentleman who had frequent opportunities of obferving its fingular properties and effects.
"On that part of the coans of Africa which lies between the Cape Verd and Cape Lopez, an eafterly vind prevails during the momhs of December, Jamary, and February, which by the Fantees, a nation on the Gold coaft, is called the Harmattan. Cape Verd is in 15 N. latitude, and Cape Lopez in 1 S. latitude; and the coaft between thefe two Capes runs in an oblique direction, nearly from W.S. W. to E.S. E. forming. a range of upwards of 2100 miles. At the ifles de Los, which a a little to the nortliward of Sierra Leone, and to the fouthward of Cape Verd, it blows from the E. S. E on the Gold coalt trom the N. E., and at Cape Lopez. and the river Gabon, from the N. N. E. This wind is by the French and Portuguele, whofre. quent the Gold coaft, called fimply the N. E. wind, the quarter from which it blows. The Englin, who fometimes borrow words and phrafes from the Fantee language, which is lefs gutural and more barmonious, than that of their neightoours, adopt the Fantee word Harmattan.

The harmattan comes on indifcriminately at any hour of the day, at any time of the tide, or at any period of the moon, and continues fometimes only a day or two, fometimes five or fix days, and it has been known to laft fifieen or fixteen days. There are generally three or four returns of it every feafon. It blow's with a moderate force, not quite fo ftrong as the feabreeze (which every day fets in during the fair feafon from the W. W. S. W. and S. W) ; but fomewhat ftronger than the land wind at night from the $N$. and N. N. W.

1. A fog or haze is one of the pecaliarities which always accompanies the harmattan. The gloom occafioned by this fog is fo great as fometimes to make even near objects oblcure. The Englifh fort at Whydall ftands about the midway between the French and Portugnefe forts, and not quite a quarter of a mile from either. yet very often from thence neither of the other forts can be difcovered. The fun, concealed the greateft part of the day, appears only a few hours about noon, and then of a mild red, exciting no painful fenfation on the eye.
2. Extreme drynefs makes another extraordinary property of this wind. No dew falls during the continuance of the harmattan; nor is there the leaft appearance of moifture in the atmofphere. Vegetables of every kind are very much injured, all tender plants and moft of the prodactions of the garden, are deftroyed ; the grafs withers, and becomes dry like hay; the vigorous ever-greens likewife fetl its pernicious influence; the branches of the lemon, orange, and limetrees droop, the leaves become flaccid, wither, and if the harmattan continues to blow for 10 or 12 days, are fo parched, as to be eafily rubbed to dun between the fingers: the fruit of thefe trees, deprived of its nourimment, and ftinted in its growth, only appears to ripen, for it becomes yellow and dry, withont acquiring half the ufual lize. The natives take this opportunity of the extreme drynefs of the grafs and young trees to fet fire to them, efpecially near

Hamattan. their roads, not only to keep thefe roads open to travellers, but to deftroy the fhelter which long grafs, and thickets of young trees, would afford to fkulking parties of their enemies. A fire thus lighted flies with fuch rapidity, as to endanger thofe who travel; in that fituation, a common method of efcape is, on difcovering a fire to windward, to fet the grafs on fire to leeward, and then follow your own fire. There are other extraordinary effects protuced by the extreme drynefs of the barmatran.

The parching effects of this wind are likewife evident on the external parts of the body. The eyes, noftrils, lips, and palate, are rendered dry and uneafy, and drink is often required, not fo much to quench thirf, as to remove a painful aridity in the fauces. The lips and nofe become fore and even chapped; and though the air be cool, yet there is a troublefome fenfation of prickling heat on the $\mathbb{1 k i n}$. If the harmattan continues four or five days, the fcarf fkin peels off, firft from the hands and face, and afterwards from the other parts of the body if it continues a day or two longer. Mr Norris obferved, that when fweat wasexcited by exercife on thofe parts which were covered by his cloaths from the weather, it was peculiarly acrid, and tafted, on applying his tongue to his arm, fomething like fpirits of harthorn diluted with water.
3. Salubrity forms a third peculiarity of the harmattan. Thongh this wind is fo very prejudicial to vegetable life, andoccafions fuch difagreeable parching effects on the human fpecies, yet it is highly conducive to health. Thofe labouring under fluxes and intermitting fevers generally recover in an harmattan. Thofe weakened by fevers, and finking under evacuations for the cure of them; particularly bleeding, which is often injudicioufly repeated, have their lives faved, and vigour reftored, in fpite of the doctor. It ftops the progrefs of epidemics; the fmall-pex, remittent fevers, \&c. not only difappear, but thofe labouring under thefe difeafes when an harmatian comes on, are almoft certain of a fpeedy recovery. Infection appears not then to be eafily communicated even by art. In the year 1770, there were on board the Unity, at Whydah, above 300 llaves; the fmall-pox broke out among them, and it was determined to inoculate; thofe who were inoculated before the harmattan came on got very well through the difeafe. About 70 were inoculated a day or two afier the harmattan fet in, but no one of them had either ficknefs or eruption. It was imagined that the infection was effectually difperfed and the fhip clear of the diforder ; but in a very few weeks it began to appear among thefe feventy. About 50 of them were inoculated the fecond time; the others had the difeafe in a natural way: an harmattan came on, and they all recovered, excepting one girl, who had an ugly alcer on the inoculated part, and died fome time afterwards of a locked jaw."

This account differs remarkably from that given by Dr Lind, who calls the harmattana malignant and fatal wind; (See his Difeafes of Hot Climites.) As to the nature of the foil over which it blows, it eppears that excepting a few rivers and fome lakes, the country about and beyond Whydah is covered for 400 miles back with verdure, open plains of grafs, clumps of trees, and fome woor's of no confiderable extent. The furface is fandy, and below that a rich reddin

314 H 」 R
earth : it rifes with a gentle afcent for 150 miles from Harmodius the fea, before there is the appearance of a bill, with- If out affording a ftone of the fize of a walnut. Beyond Hermonithefe hills there is no account of any great ranges of $\underbrace{\text { ca. }}$ mountains.

HARMODIUS, a friend of Arifogiton, who delivered his country from the ryranny of the Pifiltratidæ. (See Aristogiton.) The Athenians, to reward that patriotifm of thefe illuftrious citizens, made a law that no one fhould ever after bear the name of Ariftogiton and Harmodius.

HARMONIA, in fabulous hiftory, the wife of Cadmus, both of whom were turned into ferpents. See Cadmus.

Though many of the ancient authors made Harmonia a princefs of divine origin, there is a paffage in Athenæus from Euhemerus, the Vanini of his time, which tells us, that the was by profeffion a player on the flute, and in the fervice of the prince of Zidon previous to her departure with Cadmus. This circumftance, however, might encourage the belief, that as Cadmus broughi letters into Greece, his wife brought harmony thither ; as the word apporio harmonia, has been faid to have no other derivation than from her name : which makes it very difficult to afcertain the fenfe in which the Greeks made ufe of it in their mufic $\dagger$; for it has no roots by which it can be decom- + sec Harpounded, in order to deduce from then its erymology mory. The common account of the word, however, that is given by lexicographers, and generally adopted by the learred, does not confirm this opinion. It it generally derived from apmov $\xi^{\prime}($ and this from the old verb Apw apto, to fit or join.

HARMONIC. As an adjective, it fignifies in general any thing belonging to harmony; though in our language the adjective is more properly written barmonical. In this cafe it may be applied to the harmonical divifions of a monochord ; or, in a word, to confonances in general. As a fubftantive neuter, it imports all the concomitant or acceffary founds which, upon the principles refulting from the experiments made on fonerous bodies, attend any given found whatever, and render it appretiable. Thus all the aliquot parts of a mufical ftring produce harmonical founds, or har monics.
