The New Hollanders generally difplay great perfonal bravery on the appearance of any danger. An old man, whom governor Phillip had treated with fome familiarity, took occafion to fteal a fpade; but being taken in the fact, the governor gave him a few flight flaps on the fhoulder; on which the old man caught hold of a fpear, and, coming up to him, feemed for fome time determined to frike, thongh had he done fo, it would have been impoffible for him to efcape, being then furrounded by the officers and foldiers. No encounters between parties of the natives themfelves have been obierved, though from fome circumftances it appears that wars are carried on among them. They have more than once been feen affembled as if bent on fome expedition. An officer one day met 14 of them marching along in a regular Indian file through the woods, each man having a fear in one hand and a fone in the other. A chief appeared at their head, who was diftinguilhed from the reft by being painted. They paffed on peaceably, though greatly fuperior in numbers to our people. On another occafion they offered no hoftilities when affembled to the number of 200 or 300 , and meeting the governor attended only by a fmall party. With all their courage, however, they are much afraid of a muket, and almoft equally fo of a red ceat, which they know to be the martial drefs of the Europeans. The mifchief which they have hitherto done has been exercifed onily on fome fraggling cenvicts, moft of whom probably have been the firt aggreffors,

Though thefe favages allow their beards to grow to a confiderable leugth, it does not appear that they look upon them to be any ornament, but rather the contrary, as appears from the following inftance. Some young gentlemen belonging to the Sirius, one day met an old man in the woods with a beard of confiderable length. This his new ac'quaintance let him know that they would rid him of, froaking their chins, and howing him the Imoothnefs of them at the fame time. At length the old fellow contented; and one of the youngfters taking a penknife from his pocket, and making the beft fubftitute for lather he conld, performed the operation with fuch fuccefs that the Indian feemed highly delighted. In a few days he paddled alongfide of the Sirius again, pointing to his beard; but could not by any means be prevailed upon to enter the fhip. On this a barber was fent down to him, who again freed him from his beard, at which

## H O L

New-Hol- which he expreffed the utmoft fatisfaction. It has, land. however, been found impoflible to form any kind of permanent intercourfe with the natives, though many attempts have been made for that purpofe; but in his letter above quoted, governor Phillip declares that he has not the leaft apprehenfion of their doing any damage to the colony. At firt the colonifts imagined the fpears of the New-Holianders to be very trivial weapons; but it now appears that they are capable of inflicting very grievous and mortal wounds. They are fometimes pointed with a harp piece of the fame reed of which the fhafts are made, but more frequently with the fharp bone of the fting-ray. They certainly burn their dead ; which perhaps has given rife to the report of their being canibals. Governor Phillip, obferving the ground to be raifed in feveral places, caufed one of thefe tumuli to be opened, in which were found a jaw-bone half confumed and fome afhes. From the manner in which the afhes are depofited, it appears that the body has been laid at length, raifed from the ground a little fyace, and confumed in that pofture; being afterwards lightly covered with mould.

The only domeftic animals they have are the dogs already mentioned, which refemble the fox-dog of England. In their language thefe animals are called dingo; but all other quadrupeds without exception they name kangaroo.-They feem very little given to thieving in comparifon with the inhabitants of moft of the South Sea iflands; and are very honeft among themfelves, leaving their fpears and other implements open on the beach, in full and perfect fecurity of their remaining untouched. They are very expert at throwing their javelins, and will hit a mark with great certainty at a confiderable diftanee; and it feems that fometimes they kill the kangaroo with this weapon, as a long fplinter of one of the fpears was taken out of the thigh of one of thefe animals, the flef having clofed over it completely. The people are more numerous than was at firft imagined, though fill the number of inhabitants muft be accounted few in comparifon to the extent of country; and there is great reafon to believe that the interior parts are uninhabited.

The New-Hollanders bake their provifions by the help of hot ftones, like the inhabitants of the Southfea illands. They produce fire with great facility according to Captain Cook, but with difficulty according to later accounts, and furead it in a wonderful manner. To produce $i$, they take two pieces of dry foft wood; one is a ftick about eight or nine inches long, the other piece is flat. The ftick they llape into an obtufe point at one end ; and preffing it upon the other, turn it nimbly, by holding it between both their hands, as we do a chocolate-mill; often fhifting their hands up, and then moving them down upon it, to increafe the preffure as much as pofible. By this method they get fire in lefs than two minutes, and from the fmalleft fark they increafe it with great fpeed and dexterity. "We have often feen (fays captain Cook) one of them run along the fhore, to all appearance with nothing in his hand, who ftooping down for a moment, at the diftance of every fifty or an hundred yards lefr fire behind him, as we could fee, firnt by the fmoke, and then by the flame along the drift of wood and other litter which was fcattered along the place. We had the curiofity to examine
one of thefe planters of fire when he fet off, and we faw him wrap up a fmall fpark in dry grais, which when he had run a little way, having been fanned by the air that his motion produced, began to blaze; he then laid it down in a place convenient for his purpofe, inclofing a fpark of it in another quantity of grafs, and fo continued his courfe."

Hor land in commerce, a fine and clofe kind of linen, fo called from its being firft manufactured in Holland.

HOLLAR (Wenceflans), a celebrated engraver, born at Prague in 1607. His parents were in a genteel line of life; and he was at firft defigned for the fudy of the law. But the civil commotions, which happened in his youth, ruining his family affairs, he was obliged to fhift for himfelf; and by difcovering fome genius for the arts, he was placed with Marian, a very able defigner and engraver of views. Being himiflf a man of great ingenuity, he profited haftily from the inftruction of his tutor. He principally excelled in drawing geometrical and perfpective views and plans of buildings, ancient and modern cities and towns; alfo landfeapes, and every kind of natural and artificial curiofities; which be executed with a pen in a very peculiar ftyle, excellently well adopted to the purpofe. He travelled through feveral of the great citiespof Germany; and, notwith ttanding all his merit, met with fo little encouragement, that he found it very dificalt to fupport himfelf. The earl of Arundel being in Germany took him under his protection, brought him to England, and recommended him to the favour of Charles I. He engraved a variety of plates from the Arundel collection, and the portrait of the earl himfelf on horfeback. The civil wars, which happened foon after in England, ruined his fortune. He was taken prifoner, with fome of the royal party, and with difficulty efcaped; when he returned to Antwerp and joined his old patron the earl of Arundel. He fettled in that city for a time, and publifhed a confiderable number of plates; but his patron going to Italy foon after for the benefit of his health, Hollar fell again into diftrefs, and was obliged to work for the print and bookfellers of Antwerp at very low prices. At the reftoration he returned into England; where, though he had fufficient employment, the prices he received for his engravings were fo greatly inadequate to the labour neceffarily required, that he could bat barely fubfift; and the plague, with the fucceeding fire of London, putting for fome time aul effectuai fop to bufinefs, his affairs were fo much embarraffed, that he was never afterwards able to improve his fortune. It is faid that he ufed to work for the bookfellers at the rate of fourpence an hour; and always had an hour-glafs before him. He was fo fcrupuloully exact, that when obliged to attend the calls of nature, or whilf talking, though with the perfons for whom he was working and about their own bufinefs, he conftantly laid down the glafs, to prevent the fand from running. Neverthelefs, all his great induftry, of which his namerous works bear fufficient teftimony, could not procure him a fufficient maintenance. It is melancholly to add, that on the verge of his 70thyear, he was attached with an execution at his lodgings in Gardner's lane, Weftminfter; when he defired only the liberty of dying in his bed, and that he might not be removed to any other prifon

Holland,

than the grave: a favour which it is uncertain wiether he obtained or not. He died, however, in 1677.
Holocauft. -His works amount nearly to 24,000 prints according to Vertue's Catalogue ; and the lovers of the art are always zealous to collect them. Generally fpeaking, they are etchings performed almoft entirely with the point; and their merits are this charaeterized by Mr Strutt: "They poffefs great fpirit, with aftonifhing freedom and lightnefs, efpecially when we confider how highly he has finilhed fome of them. His views of abbeys, churches, ruins, \&c. with his fhells, muffs, and every fpecies of ftill life, are admirable; his landfcapes frequently have great mer:r; and his diftant views of towns and cities are not only executed in a very accurate, but a very pleafing manner." A fomewhat colder character is given of them by Mr Gilpin in his Eflay on Prints: "Hollar gives us views of particular places, which he copies with great truth, unornamented as he found then. If we are farisfied with exact reprefentations, we have them no uhere better than in Hollar's works: but if we expect pictures, we muft feek them elfewhere. Hollar was an antiquarian and adraughtfman; but feems to have been little acquainted with the principles of painting. Stiffnefs is his characteriftic; and a painful exactnefs void of tafte. His larger views are mere plans. In fome of his fmaller, at the expence of infinite pains, fomething of an effest is fometimes produced. But in general, we confider him as a repofitory of curiofities, a record of antiquated dreffes, abolifhed ceremonies, and edifices now in ruins."

HOLLOA, in the fea-language, an exclamation of anfwer, to any perfon who calls to another to afk fome queftion, or to give a particular order. Thus, if the mafter iatends to give any order to the people in the main-top, he previoully calls Main top, hoay! to which they anfwer, Holloa! to flow that they hear him, and are ready. It is alfo the firft anfwerin hailing a fhip at a diftance. See Halling.

HOLLY, in botany. See Ilex.
Sea-Holly. See Eryngium.
HOLM (Sax. bulmus, infula amica), denotes an ine or fenny ground, according to Bede: or a riverilland. And where any place is called by that name, and this fyllable is joined with any other in the names of places, it fignifies a place furrounded with water; as the Flatholmes and Stepholmes in the Severn near Briftol: but if the fituation of the place is not near the water, it may then fignify a hilly place; holm in Saxon, fignifying alfo "a hill or cliff."

HOLOCAUST (formed from ves " whole," and xथw "I confume with fire)," a kind of facrifice, wherein the whole offering is burnt or confumed by fire, as an acknowledgement that God, the creator, preferver, and lord of all, was worthy of all honour and worfhip, and as a token of mens giving themfelves entirely up to him. It is called alfo in Scripture a burnt-offering.-Sacrifices of this fort are often mentioned by the lieathens as well as Jews; particularly By Xenophon, Cyroped. lib. viii. p. 464. ed. Hutchinf. 1738, who fpeaks of facrificing holocaufs of oxen to Jupiter, and of horfes to the fun: and they appear to have been in ufe long before the intitution of the other Jowilh facrifices by the law of Mofes; (fee Jobi. 5. xlii. 8. and Gen. xxii. 13. viii. 20). On this account,
the Jews, who would not allow the Gentiles to offer Holofernes. on their altar any other facrifices peculiarly enjoined by the law of Mofes, admitted them by the Jewifh priefts to offer holocaufts; becaufe thefe were a fort of facrifices prior to the law, and common to all nations. During their fubjection to the Romans, it was no uncommon thing for thofe Gentiles to offer facrifices to the God of Ifrael at Jerufalem. Holocaults were decmed by the Jews the moft excellent of all their facrifices. It is laid, that this kind of facrifice was in common ufe among the heathens, till Prometheus introduced the cuftom of burning only a part, and referving the semainder for his own ufe. See Sacrifice.

HOLOFERNES, lieutenant-general of the armies of Nebuchadonofor king of Affyria, who having in a remarkable encounter overcome Arphaxad king of the Medes, fent to all the neighbouring nations with an intention of obliging them this way to fubmit to his empire, pretending that thcre could be no power capable of refifting him. At the fame time Holofernes, at the head of a powerful army, paffed the Euphrates, entered Cilicia and Syria, and fubdued almoft all the people of thefe provinces.

Being refolved to make a conquelt of Egypt, he advanced towards Judæa, little expecting to meet with any rediftance from the Jews. In the mean time, he was informed that they were preparing to oppofe him; and Achior the commander of the Ammonites, who had already fubmitted to Holofernes, and was with fome auxiliary troops in his army, reprefented to him that the Hebrews were a people protected in a particular manner by God Almighty folong as they were obedient to him; and therefore he could not fiatter himfelf with expectations of overcoming them, unlefs they had committed fome offence againft God, whereby they might become unworthy of his protection. Holofernes, difregarding this difcourfe, commanded Achior to be conveyed within fight of the walfs of Bethulia, and tied to a tree, and left there, whither the Jews came and loofed him.

In the mean time Holofernes formed the fiege of Bethulia; and having cut off the water which fupplied the city, and fit guards at the only fountain which the belieged had near the walls, the inhabitants were foon redaced to extremity, and refolved to furrendcr, if God did not fend then fuccour in five days. Judith, being informed of their refolution, conceived the defign of killing Holofornes in his camp. She took her fineft clothes, and went out of Bethulia with her maid-fervant; and being brought to the general, fhe pretended that fhe could no longer endure the fins and exceffes of the Jews, and that God had infpired her with the defign of furrendering herfelf to him.-As foon as Holofernes, faw her, he was taken with her beauty; and fome days after invited her to a great fealt, which he prepared for the principal officers of his arrey. But he crank fo much wine, that leep and drunkennefs hindered him from fatisfying his paffon. Judith, who in the night was left alone in his tent, cut off his head with his own fword; and departing with ber fervant from the camp, the returned to Bethulia with the head of Holofernes. As foon as it was day, the befieged made a fally upon the enemies, who going into their general's tent, found his headlefs carcafe wallowing in its own blood. They

ria. with precipitation, leaving the camp abounding with rich fpoils : the Jews purfued them, killed a great namber of them, and returned loaded with booty.

There is a great diverfity of opinions concerning the time when this war between Holofernes and the Jews happened. Some date it from the captivity of Babylon, in the reign of Manaffeh, and pontificate of Eliakim the high-prieft ; others place it at fome time after the captivity; and fome doubt the truth of the whole tranfaction. See the article Judith.

HOLOGRAPHUM (compofed of onos " all," and rpaфш " I write"), in the civil law, fomething writren wholly in the hand-writing of the perfon who figns it. The word is chiefly ufed in fpeaking of a teftament written wholly in the teftator's own hand.

The Romans did not approve of holographic teftaments; and, though Valentinian autborifed them by a novel, they are not ufed where the civil law is in full force.

HOLOSTEUM, in botagy: A genus of the trigynia order, belonging to the triandria clafs of plants; and in the natural method ranking under the 22 d order, Caryophyllei. The calyx is pentaphyllous; the petals five, the capfule unilocular, and nearly cylindrical, opening at top.

HOLOTHƯRIA, in zoology, a genus belonging to the order of vermes mollufca. The body detached, naked, gibbous, terminated by the anus. Many tentacula at the other extremity, furrounding the mouth. There are nine feecies, all inhabitants of the ocean. The following defcriptions of three fpecies are given
Plate

## ecxxxy

 by Mr Barbut.r. The tremula, or quivering holothuria, "commonly meafures eight inches in length when dead; but alive it extends itfelf to more than a foot, or contracts its body into a ball. Its figure is cylindric, the diameter of which is every way equal to an inch and a few lines. The back of a dark brown proudly bears a variety of flehy pyramid-like nipples, of a dark colour likewife at their bafis, but white at their apex. They are obferved to be of two different fizes; the larger occupy the length of the back, in number 14 on each fide, at the diftance of fix lines one from the other, when the holothuria is contracted, but the intervening fpace is full eight lines when the animal is extended. Others like thefe are placed here and there promifcuoufly. The lefs are fcattered in like manner, without order, in every part of the back. Out of them all exfudes a whitifh mucilage ferving to lubricate the body. Hence all the forefaid nipples feem to be fo many glands furnifled with an excretory duet, the aperture of which is fo minute as not to be difcoverable by the help of a common glafs. That they are moreover provided with various mufcies follows hence, that the holothuria can raife and obliterate them at pleafure. While the large papillæ are quite ereet, their axis and the diameter of their bafe meafures three lines. The belly or part oppofite to the back in the holothuria is of a pale brown and fet all over with cylindric tentacula, in fuch numbers that the head of a fin conld farce find room between. Their diameter is not much above a line, and their length is that of four lines. They are of a mining whitenefs, except the extremily which is of a dark colour,

Vol. VIII.
and fhaped like a focket. By the help of thefe ten. Holothutacula the holothuria fixes its body at the bottom of the fea, fo as not to be eafily forced away by tempeft,
ria,
Holftein. which would otherwife happen the more frequently, as this zoophite dwells near the fhores where the water fcarce rifes to a fathom's height. Now if it adheres toother bodics by means of its ventral tentacula, their point nuft neceffarily have the form of a focket, as the cuttle-fifh, fea-urchins, and far-fifh have theirs fhaped, by which they lay hold of any other body. From this fituation of the holothuria at the bottom of the fea, which it alfo retains when kept in a veffel filled with fea-water, it mult be evident to any one, that I have not groundlefsly determined which was its back, and which its belly, which otherwife in a cylindric body would have been a difficult tak. But as all animals uniformly walk or reft upon their bellies, and the holothuria has likewife that part of its body turned to the earth on which the cylindric tentacula are to be feen, it is clear that part is the abdomen or belly of this zoophite. However, both the abdominal and dorfal tentacula are raifed and obliterated at the animal's pleafure; from which it is no light conjecture to conclude, that they are furnifhed with elevating and deprefling mufcles, and particularly becaufe all the forefaid tentacula difappear after the animal's death : and hence it farther appears, that all naturalifts have given the reprefentation of a dead holothuria, feeing they have afligned it no tentacula. I entertain fome doubt whether the illuftious Linnæus himfelf did not draw his generical character of the holothuria from a dead fubject, as he makes no mention of thefe tentacula."
2. The phyfalis, or bladder-haped holothuria. The body of this feccies is oval, approaching to triangular, of a gloffy tranfparency; the back harp edged, of a dark green colour, whence run our a number of finews; anteriorly the body is of a reddif hue. The trunk firal, reddifh towards the thicker end, Many tentacula of unequal length under that thicker end; the fhorter ones are taper and thicker, the middle ones capillary, the point clay colour and in hape like a ball; the reft which are longer are filiform, of which the middlemoft is thicker and twice as long. Brown, in his Jamaica, calls it a diaplanous bladder with numerous tentacula reprefenting a man's belly; above it is furnifhed with a comb full of cells; under the other extremity hang a number of branchy tentacula. It inhabits the feas.
3. The Pentactes, or five rowed holothurin, has the mouth encompaffed with rentacula, the body bearing tentacula five different ways. The animal is of a red colour, nearly oval, or fomewhat cylindrical, affuming various fhapes. The month is fet round with ten rays briftly at the points. The body longitudinally doted in five places with clay-coloured hollow warts, fituate two together. It inhabits the fea of Norvay, taking in and calting out again the water, as it either fwims or dives to the botiom.

HOLSTEIN, a duchy of Germany, bounded by the German ocean on the weft; the Baltic, or the gulph of Lubeck, on the ealt; the duchy of Necklenburg on the fouthealt; that of Bremen, with the river Elbe, on the fouth-wet; ; and Luaenburg, with the territory of Hamburgh, on the fouth. Ite greateit 4 I
length

Holftin. length is about 80 miles, and its breadth 60. The diocefe of Eutin, and the county of Ranzan, though they make a part of the duchy of Holftein, yet being lands belonging to the empire and circle, hall be defcribed feparately.

A great part of this country confifts of rich marh, land, which being much expofed to intundations both from the fea and rivers, dykes have been raifed at a great expence to guard and defend them. The patures in the marfhes are fo rich, that catrle are bred in vaft numbers and fattened in them, and great quantities of excellent butter and cheefe made of their milk. They are alfo very fruitful in wheat, barley, peafe, beans, and rape-feed. In the more barren, fandy, and heathy parts of the country, large flocks of fheep are bred and fed: nor are orchards wanting, or woods, efpecially of oak and beech; nor turf, poultry, game, and wild-fowl. Here is a variety both of fea and river filh; and the beef, veal, mutcon, and lamb, are very fat and palatable. Holftein is alfo noted for beautiful horfes. The gentry ufually farm the cows upon their eftates to a Hollander, as he is called, who for every cow pays from fix to ten rix-dollars; the owner providing pafture for them in fummer, and ftraw and hay in winter. It is no uncommon thing here to drain the ponds and lakes once in three or four years, and fell the carp, lampreys, pike, and perch, found in them; then fow them for feveral years after with oats, or ufe them for pafture; and after that lay them under water again, and breed fith in them. There are hardly any hills in the country; but feveral rivers, of which the principal are the Eyder, the Stor, and the Trave. The duchy contains about 30 towns great and finall: moft part of the peafants are under villenage, being obliged to work daily for their lords, and not even at liberty to quit their eftates. The nobility and the proprietors of manors are poffeffed of the civil and criminal jurifdiction, with other privileges and exemptions. Formerly there were diets, but now they feem to be entirely laid afide: meetings, however, of the nobility are ftill held at Kiel. The predominant religion here is Lutheranifm, with fuperintendencies as in other Lutheran comtries. In feveral places the Jews are allowed the exercife of their religion. At Gluckftadt and Altena are both Callvinift and Popifh churches; and at Kiel a Greek Ruffian chapel. Befides the Latin fchools in the towns, at Altena is a gymnafium, and at Kiel an univerfity. Notwirhftanding this country's adyantageous fituation for commerce, there are few manufactures and little trade in it. Hamburg and Lubec fupply the-inhabitants with what they want from abroad; from whence and Altena they export fome grain, malt, grots, ftarch, buck-wheat, peafe, beans, rapefeed, butter, cheefe, theep, fwine, horned cattle, horfes, and fifh. The manufactures of the duchy are chiefly carried on at Altena, Kiel, and Gluckftadt. The duchy of Holftein confifts of the ancient provinces of Holftein, Stormar, Ditmarhy, and Wagria. It belongs partly to the king of Denmark and partly to the dukes of Holltein Gottorf and Ploen. Ancienty the counts of Holfte in were vaffals of the dukes of Saxony; but afterwards they received the invatiture of their territories from the emperor, or the linops of Lubec in the emperor's name, though now
the inveftiture is given by the emperor in perfon. The Holftein king of Denmark appoints a regency over his part of Holitein and the duchy of Slefiwick, which has its office at Gluckftadt. The feat of the great duke's privy council and regency-court, together with the chief confifory, which is united to it, is at Kiel : there are many inferior courts and confiftories, from which an appeal hes to the higher. In the dachy of Holftein; the government of the convents and nobility is alternately in the king and duke for a year, from Michatimas to Michaelmas. The perfon in whom the government is lodged adminitters it by his regency. In fome cafes an appeal lies from this court to the Aulic council or chamber at Wetzlar; the convents, the nobility, and the proprietors of manors in the country have a civil and criminal jurifdiction over their eltates. The revenues of the fovereigns arife principally from their demefnes and regalia; befides which, there is a land and feveral other taxes and impofts. The duke's income, fetting afide his ducal parrimony, has been eftimated at 70,000 or 80,000 pounds. The king ufually keeps here fome regiments of foot and one of horfe. With refpect to the duke's military force, it amounts to about 800 men. The king, on accoant of his fhare in this country, ftyles himfelf duke of HoLftein, Stormar, and Ditmar/b. The dukes both of the royal and princely houle ftyle themfelves heirs of Norway, dukes of Slefwick, Holftein, Stormar, and Ditmarfh, and counts of Oldenburg and Delmenhorft. On account of Holftein, both the king of Denmark and the grand duke have a feat and voice in the college of the princes of the empire, and in that of the circle. Together with Mecklenburg they alfo nominate an affeffor for this circle in the Aulic chamber. The matricular affeffment of the whole duchy is 40 horfe and 80 foot, or 8000 florins; to the chamber of Wetzlar both princes pay 189 rix-dollars, 31 kruitzers. In 1735, duke Charles Frederic of Holitein Gottorf founded an order of knighthood here, viz. that of St Anne, the enfign of which is a red crofs, enamelled, and worn pendant at a red ribbon edged with yellow.-The principal places of that part of the duchy belonging to the king of Denmark and the duke of Ploen are Gluckftadt, Itzhoe, Rendiburg, and Ploen; and that part belonging to the great duke are Kiel, Oldenburg, Preetz, and Altena.

HOLSTENIUS (Lucas), an ingenious and learned German, born at Hamburg in 1596, was bred a Lutheran; but being converted to popery by father Sirmond the Jefuit, he went to Rome, and attached himfelf to cardinal Francis Barberini, who took him under his protection. He was honoured by three popes; Urban VIII. gave him a canonry of St Peter's; Innocent X. made him librarian of the Vatican; and Alexander VII. fent him in 1655 to queen Chrifina of Sweden, whofe formal profeflion of the Catholic faith he received at Infpruck. He fpent his life in fudy, and was very learned both in facred and profane antiquity. He died in 1661; and though he was not the author of any great works, his notes and differtations on the works of others have been highly efteemed for the judgment and precition with which they are drawn up.

HOLT (Sir John), knight, eldeft fon of Sir Thomas IIoit, ferjeant at law, was born in 1642 . He enn

Holt tered himfelf of Gray's Inn in 1658; and applied to If lic common lav with fo much induitry, that he foon Holyhead. became a very eminent barrifter. In the reign of James fI. he was made recorder of London, which office he difcharged with much applanfe for about a year and an haif; but lolt his place for refufing to expound the law fuitably to the king's defigns.- On the arrival of the prince of Orange, he was chofen a member of the convention parlianent, which aforded him a good opportunity of difplaying his abilities; fo that, as foon as the government was fettled, he was madelord chief juftice of the court of king's bench, and a privy counfellor. He continued chief juftice for 22 years, with great repute for fteadinefs, integrity, and thorough knowledge in his profeffion. Upon great occafions he alferted the law with intrepidity, though he thereby ventured to incur by turnsthe indignation of both the houfes of parliament. He publiged fome reports, and died in 1909.

Holt (Sax.) "a wood;" wherefore the names of towns beginning or ending with bolt, as Buck-holt, \&c. denote that formerly there was great plenty of wood in thofe places.
holy. See Holiness.
HOLY.GHOST, or Holy Spirit. The Spirit of God. See Trinity.

Order of the Holr Ghost, the principal military order in France, inflituted by Henry III. in 1569. It confifts of roo knights, who are to make proof of their nobility for threc defcents. The king is the grand-mafter or fovereign; and as fuch takes an oath on his coronation-day to maintain the dignity of the order.

The knights wear a golden crofs, hung about their necks by a bluc filk ribbon or collar. Bar before they receive the order of the Holy-Ghoft, that of St Michael is conferred as a neceflary degree; and for this reafon their arms are furrounded with a donble collar.

HOLY HEAD, a town and cape of the ille of Anglefea in Wales, and in the Irifh channel, where people ufually embark for Dublin, there being three packetboats that fail for that city every Monday, Wednefday, and Friday, wind and weather permitting. It is 276 miles from London, and has a very convenient harbour for the northern trade, when taken fhort by contrary winds. It is fuated near the extremity of the Ille, and is joined to the north-weft part of it by a fone bridge of one arch. It has a fmall market on Saturdays. The parilh is about five or fix miles long, and two or three broad, bounded nearly by the fea. The church ftands above the harbour, within an old quadrangular fortification, with a baftion at each corner, built about 450. On a mountain near it is another old fortification, called Turris Munimentum, which is an old fone wall without mortar, and in its centre is a fmall turret, and contains a well of water. Holyhead w'as frequently formerly vifited by Irifi rovers, and was defended as a place of confequence. There are feveral remains of old fortifications and Druidical antiquities in its neighbourhood, as well as chapels of religious worlhip. The parilh chiturch of Holyhead was built in the reign of Edward III. and is in the form of a crofs, with a porch and feeple very antique. There was an old chapel near the church, now converted into a fchool-houfe. A falt-honfe was
erected on an illand in the harbour in quetil Anne's Holyhead, rign, but it is now in ruins. The town is litte more than a fifhing town, rendered contiderable by being the place of pallage to ireland. It has threc good inns. 'The paffage hence to Ireland is in general about twelve hours. There is no frefh water here except from rain, nor any bread fold but what comes from Ireland. A bath and affembly-room were erected here in 1770. Under the mountains that overhang the town is a large cavern in the rock, fupported by natural pillars, called the Parliament-houie, acceffible only by boats, and the tide runs into it. If this harbour was properly repaired, and ware-houfes built, it would be very convenient for the Irifh to import fuch of their goods as pay Eng. lith duty, it being bue a few hours fail from Dublin. Befides, the Dublin merchants might come over with the packet to fee their goods landed. The commodities are, butter, cheefe, bacon, wild-fowl, lobiters, crabs, oyfters, razor-fifh, flrimpo, herrings, cod-fifh, whitings, whiting-pollacks, cole-fill, fea-tenches, turbots, foles, flounders, rays, and plenty of other filh. On the rocks the herb grows of which they make kelp, a fixed falt ufed in making glafs, and in alum works. In the neighbourhood there is a large vein of white fullers earth and another of yellow, which might be ufeful to fullers. On the ifle of Skerries, nime miles to the north, is a light-houfe, which may be feen 24 miles off. Large flocks of puffins are often feen here: they all come in one night, and depart in the fame manner.

HOLY-Is $A N D$, a fmallilland lying on the coalt of England, 10 miles fouth-eaft of Berwick, in Northumberland. Bede calls it a Semi-ifland, being, as he obferves, twice an ifland and twice a continentin one day: for at the flowing of the tide, it is encompaffed by wa. ter ; and at the ebb, there is an almoft dry paffage, both for horfes and carriages, to and from the main land; from which, if meafured in a ftraight line, it is diftant about two miles eaftward; but on account of fome quickfands paffengers are obliged to make fo many detours, that the length of the way is nearly doubled. The water over thefe flats at fring tides is only feven feet deep.-This ifland was by the Britons called Inis Niedicante ; alfo Lindisfarne, from the fmall rivalet of Lindi or Landi, which here runs into the fea, and the Celtic word Fabren or "recefs;" and on account of its being the habitation of fome of the firft monks is this country, it afterwards obtained its prefent name of Holy-Iland. It meafures from eaft to weft about two miles and a quarter, and its breadth fromi north to fouth is fcarcely a mile and an half. At the north-weft part there runs out a fpit of land of about a mile in length. The monaftery is fituated at the fouthermoft extremity; and at a fmall diftance north of it ftands the village. On this ifland there is plenty of fifh and fowl; but the air and foil are bad. There is not a tree on the ifland. The village which ftands on a rifing ground, confifts of bur a few fcattered houfes, chiefly inhabited by fifhermen; and it has two inns. The norch and eaft coaffrece formed of perpendicular rocks, the other fidesson ay gradual flopes to the fands. There is a commodious harbour defended by a block-houfe; which laft was furprifed and taken in 1715 , but was foon invefted and retaken.

Holy-illand, though really part of Northumberland, belo g's to Durham; and all civil difputes mult be de-

## H O L [ 628$] \quad$ H O L

Holy- termined by the juftices of that county.-It was a 1Rand. very ancient epifcopal feat. Ardan the firft bilhop,
after reliding in it 14 years, died and was baried here A. D. 65r. Finan, his fücceffor, built a wooden church, thatched with reeds, but before the end of the century covered wirh lead by bifhop Eardbert. St Cuthbert, who from a poor hepherd became monk of Melrofs 15 years, was prior here 12 more, when he retired to one of the barren Farn rocks, from whence he was called to this fee, which he held only two years, and returned to his retirement, where he died, and was buried at the eaft end of his oratory, where his fone coffin is ftill thown. His body was found frefh in years after his death. Lindisfarn was ruined by the Danes, A. D. 793, when the monks carried his body about for feven years, and at laft fettled at Chefter-le-ftreet, whether the fee was tranflated, and where it continued many years. On a fecond deftruction of the monaftery by the Danes they were removing to Rippon, but ftopyed by a miracle at Durham, where the faint continued till the reformation, when his body was found entire, and privately buried in a wooden coffin, as fome pretend, near the clock, but more probably in the ground under where his fhrine ftood. The entrochi found among the rocks at Landisfarn are called St Cuthbert's beads, and pretended to be made by him in the night. Eighteen bighops fat here
till the removal of the fee to Chefter, which had eight Hoiy-Rowl more till the removal to Durh m, A. D. 995. Lin- Horywit. disfarn became a cell to that Benedictine monaftery, valued at 481 . per ann. The north and fouth walls of the charch are ftanding, much inclined; part of the weft end remains, but the eaft is down. The columns of the nave are of four different forts, 12 feethigh, and 5 feet diameter, maffy and richer than thofe of Durham; the bafes and capitals plain, fupporting circular arches. Over each arch are large windows in pairs, feparated by a hort column, and over thefe are fmall. er fingle windows. In the north and fouth walls are fome pointed arches. The length of the body is $13^{3}$ feet, breadth 18 feet, and with the two ailes 36 feet; but it may be doubted whether there ever was a tranfept. One arch of the centre tower remains adorned at its entrance from the nave with Saxon zigzag. Somewhat to the eaft is the bafe of a crofs, and to the weft the prefent parifh-church (A).

Holr-Rood Day, a feftival obferved by the Roman catholics, in memory of the exaltation of our Saviour's crofs. See Cross and Exaltation.

Holywell, a town of North Wales, in the county of Flint. It is a place of great note, for the well of St Winnifred, who is reputed a virgin martyr ; and it is much frequented by people that come to bathe in it, as well as by popilh pilgrims out of devotion. The
(A) A reference was inadvertently made to this article for a defcription of BAMEOROUGH, as if it had been lituated upon, or belonging to, Holy-Ifand.- Bamborough lies feveral miles to the fouth, and is fituated on the main land. The town is now an inconfiderable village ; but it once was a royal borough, and fent two members: It even gave name to a large tract extending fouthward, which was called Bamboroughfibire. It had alfo three religious foundations; a houfe of friars preachers founded by Henry III. a cell of canons regular of Sc Auftin, and an hofpital. Its very ancient cafte fands on an almoft perpendicular rock clofe to the fea, and accelible only on the fouth-eaft fide, on a fpot where, according to the monkifh hiftorians, there flood the caite or palace of the kings of Northumberland ; built, as it is faid, by king Ida, who began his reign about the year 559. Part of the prefent ruins are by fome fuppofed to be the remains of king Ida's work. The ancient name of this place was, it is faid, Bebbanborough; whofe nameCambden, from the authotity of Bede, imagines borrowed from Bebba, Ida's queen : but the author of the additions to that writer is of a contrary opinion, as in the Saxon copy it is called Cynclicanberg, or the "royal manfion." According to Florilegus, king Ida at firt fenced it only with a wooden inclofure, but afterwards furrounded it with a wall. It is thus defrribed by Roger Hoveden, who wrote in the year 1192: "Bebba is a very ftrong city, but not exceedingly large ; containing not more than two or three acres of ground. It has but one hollow entrance into it, which is admirably raifed by fteps. On the top of the hill ftands a fair church; and in the weftern point is a well curioufly adorned, and of fweet clean water." This caftle was befieged anno 642 by Penda, the Pagan king of the Mercians, who, as the flory goes, attempted to burn it : for which purpofe he laid vaft quantities of wood under the walls, and fet fire to it as foon as the wind was favourable; but no fooner was it kindled, than by the prayers of St Adian, the wind changed and carried the flames into his camp, fo that he was obliged to raife the fiege. In 710, king Ofred, on the death of Alfred his father, took fielter in this cafte with Brithric, histutor or guardian; one Edulph having feized the crown, by whom, with his partifans, they were unfuccefsfully befieged. Brithric made fo gallant a defence, that the fiege was turned into a blockade, which gave the loyal fubjeets time to arm in defence of their youngking. On their marching hither to his relief, Edulph fled but was followed, taken, and put to death by Brithric, who thereby fecurely feated Ofred on the throne, when this caftebecame his palace. In the reign of Egbert, Kenulph biflop of Lindisfarn was confined here 30 years from 750 to 780 . In 933 , it was plundered and totally ruined by the Danes; but being of great importance in defending the northern parts againft the continual incurfions of the Scots, it was foon after repaired, and made atelace of confiderable ftrength. It is faid to have been in good repair at the time of the conqueft, whe: it was probably pur into the cuftody of fome trufty Norman, and had in all likelihood fone additioss made to its works; and this is the more probable, as the prefent area, contained within its walls, meafures upwards of 80 acres, inflead of three, as defcribed by Hoveden. Abour the year 1095 it was in the poffeffion of Robert de Mowbray earl of Northumberland, who engaging in fome treafonable practices againf William Rufus, that hing laid fiege to it, and obliged it to furrender. In the next reign it was entrunted by Henry I. to Euflace Fitz John, who was difnofeffed of it and his other employments by king

Holyoak, fpring guhes furth with fuch impetuofity, that at a fmall Holywood. ditance it turns feveral mills. Over the fpring is a chapel built upon piliars, and on the windows are panted the hiftory of St Winniferd's life. There is a mofs about the well, which fome foolifhly imagine to be St Winnifred's hair. V; Long. 3. 15. N. Lar. 54. 23. HOLYOAK (Francis), author of the Latin dictionary, became refor of Eouth-ham in Warwiknire, in 1604 ; and beinggreally citeemed, was chofen member of the convocation in the firft year of Charles I.'s reign. He Cuftered much for the king; and died in 1653, aged 87. His fon Thomas made enlargements to the faid Dictionary.
HOLYWOOD (John), or Halifax, or Sacrobofco, was, according to Lelaud, Bale, and Pitts, born at Halifax in Yorkfhire ; according to Stainhurft, at Holywood near Dublin ; and, according to Dempfter and Mackenzie, in Nithfdale in Scotland, The laftmentioned author informs us, that, having finifhed his fudies, he entered into orlers, and was made a canon regular of the order of St Auguftin in the famous monaltery of Holywood in Nithfdale. The Englifh biographers, on the contrary, tell us, that he was educated at Oxford. They all agree, however, in affert-
$6297 \quad \mathrm{H} \mathrm{O} \mathrm{M}$
ing that he fpent mof of his life at Paris; where, fays Homage, Mackenzie, he was admitted a member of the univer. Homberg. fity on the fifth of June in the year 2221 , under the fyndics of the Scotifl nation; and foon after elected profeffor of mathematics, which he taught for many years with applaufe. We are told by the fame author, that he died in 1256 , as appears from the infcription on his monument in the cloifters of the convent of St Maturine at Paris. Holywood was certainly the firft mathematician of his time. He was cotemporary with Roger Bacon, but probably older by about 20 years. He wrote, r. De fphara mundi; often reprinted, and illuftrated by various commentators. 2. De anni ra. tione, feu de cumputo ecclufiaflico. 3. De algorifmo, printed with Combm. Petri Cirvilli Hi/p, Paris 1498.

HOMAGE, in law, is the fubmiffion, loyalty, and fervice, which a tenant promifed to his lord when he was firf admitted to the land which he beld of the lord in fee : alfo that owing to a king, or to any fuperior.

HOMBERG (Wiliiam), a celcbrated phyfician, chemift, and philofopher, was the fon of a Saxon gentleman, and born in Batavia, in the Eaf Indies, in 1652. His father afterwards fettling at Amfterdam, William there profecuted his fudies; and from hence removed

Stephen, that king being jealous of his attachment to laud, daughter of Henry I. Irritated at this, Fitz John delivered the cafte of Alnwick to David king of Sootland, and brought to his aid all the forces he could raife ; be was, however, afterwards reconciled to king Stephen, and held the manors of Burg and Knarefborough in Yorkfhire, but never recovered the government of this cafle.
In the 16th of Henry II. fome great repairs feen to hive been done here, as in Madox's hiftory of the exchequer, under the article of Amercements, it appears one William, fon of Waldef, was fined five marks for refufing his affiftance in the king's works at Baenburg cafle. Its keep is fuppofed to have been the work of this reign.
Edward I. fummoned Baliol to meet him here 1296; and on his refufal invaded Scotland, and took him prifoner. Edward II. fheliered Gavefton here 1310 . It was taken by the Yorkifts after the battle of Hexham. In the reign of Elizabeth, Sir John Fofter, warden of the marches, was governor of it, and made a kuight banneret after the batte of Muifelburgh ; and his grandfon John obtained a grant of both caftle and mainor from James I. His defcendant Thomas forfeited it in 175; but his maternal uncle Nathaniel Crew bifhop of Durhan purchafed and hequeathed them to unconfined charitable ufes. The ruins are ftill confiderable; but many of them now filed with fand, caught up by the winds which rage here with great violence, and carried to very diftant places. The remains of a great hall are very fingular ; it had been warmed by two fire places of a valf fize, and from the top of every window ran a flue like that of a chimney, which reached the fummits of the battlements. Thefe flucs feem defigned as fo many fupernumerary chimnies to give vent to the fmoke that the inmenfe fires of thofe hofpitable times filled the rooms with; for halls fnoky, but filled with good cheer, were in thofe days thought no inconvenience. In the year 1757, the truftees for Lord Crew's charity began the repairs of the keep or great tower ; the direction and management being committed to Dr Sharp archdeacon of Durham, one of their number; who has made a moft judicious and humane application of his lordhip's generous bequeft. The walls are from 9 to 12 feet thick. The upper parts of the bailding have been formed into granaries; whence, in times of fcarcity, corn is fold to the indigent without any diftinction at four fhillings per buhel. A hall and fome fmall apartments are referved by the Dotor, who frequently refides here to fee that his noble plan is properly executed.-Among the variety of diftreffed who find relief from the judicious difpofition of this charity, are the mariners navigating this dangerons coaft, for whofe benefit a conftant watch is kept on the top of the tower ; from whence fignals are given to the fifhermen of Holy Illand when any fhip is difcovered in diftrefs, thefe fiflermen by their fituation being able to put off their boats when none from the land can get over the breakers. The fignals are fo regulated as to point out the particular place where the diftreffed veffel lies. Befides which, in every great form, two men on horfeback patrole the adjacent coaft from fun-fet to fun-rife, who, in cafe of any fhipwreck, are to give immediate notice at the cafte. Premiums are likewife paid for the earlieft information of any fuch misfortune. By thefe means the lives of many feamen have been, and will be, preferved, who would otherwife have perifhed for want of timely affiftance. Not does this benevolent arrangement fop here. The flipwrecked mariner find an hofpitable reception in this caftle; and is here maintained for a week or longer, as circumftances may require. Here likevife are ftore-houfes for depofiting the goods which may be faved; inftruments and tackle for weigbing and raifing the funken and ftranded veffels; and, to complete the whole, at the expence of this fund, the la offices are decently ferformed to the bodies of fuch drowned failors as are caft on flore.

## $\mathrm{HOM} \quad[630] \quad \mathrm{HOM}$

Homberg, removed to Jena, and afterwards to Leiplic, where he Home. ftudied the law. In 1642, he was made advocate at Magdeburg, and there applied himfelf to the ftudy of experimental philofophy. Some time after he travelled into Italy; and applied himfelf to the ftady of medicine, anatomy, and botany, at Padua. He afterwards ftudied at Bologna; and at-Rome learned optics, vainting, fculpture, and mufic. He at length traveled into France, England, and Holland ; obtained the cgree of doctor of phyfic at Wittemberg; travelled ito Germany and the North; vifited the mines of Jaxony, Bohemia, Hungary, and Sweden; and returned to France, where heacquired the efteem of the learned. He was on the point of returning into Germany, when $M$. Colbert being informed of his merit, made him fuch advantageons offers, as induced him to fix his refidence at Paris. M. Homberg, who was already well known for his phofphorus, for a preumatic machine of his own invention more perfect than that of Guericke, for his microfcopes, for his difcoveries in chemiftry, and for the great nember and variety of his curious obfervations, was received into the academy of fciences in 1691 , and had the laboratory of that academy, of which he was one of its principal ornaments. The duke of Orleans, afterwards regent of the kingdom, at length made him his chemift, fettled upon him a penfion, gave him the moft fuperb laboratory that was ever in the poffeffion of a chemift, and in 1704 made him his firft phyfician. He had abjured the Proteftant religion in 1682, and died in 1715 . There are a great number of learned and curious pieces of his writing, in the memoirs of the academy of fciences, and in feveral journals. He had begun to give the elements of chemiftry in the memoirs of the academy, and the reft were found among his papers fit for printing.

Homberg, a town of Germany, in the circle of the Upper Rhine, and landgravate of Heffe, feated ten miles north of Francfort, and gives title to one of the branches of the honfe of Heffe, who is its fovereign. E. Long. 8. 24. N. Lat. 50. 20.

Homberg, a town of Germany, in the palatinate of the Rhine, and ducliy of Deuxponts. E. Long. 7.6. N. Lat. 49. 20.

HOME (Henry), Lord Kames, an eminent Scottifh lawyer, and author of many celebrated works on various fubjects, was defcended of a very honourable and ancient family, and was born in the year 1696. Lord Kames's grandfather, Henry Home, was a - younger fon of Sir John Home of Renton, who held the high office of lord juftice-clerk, or chief criminal judge of Scotland, in the year 1663. He received the eftate of Kames from his uncle George, brother to the then lord juftice-clerk. The family of Renton is defcended from that of the earls of Home, the reprefentatives of the ancient princes of Northumberland, as appears from therecords of the Lion Office.

The coanty of Berwick in Scotland has the honour of having given birth to this great and ufeful member of fociety. In early youth he was lively, and eager in the acquifition of knowledge. He never attended a public fchool; but was inftructed in the ancient and modern languages, as well as in feveral branches of mathematics, and the arts neceffarily connected with that fcience, by Mr Wingate, a man of
confiderable parts und learning, who fent many years as preceptor or private tutor to Mr Home.
After fudying, with acutenefs and diligence, at the univerlity of edinburgh, the civil law, and the municipal law of his own country, Mr Home early perceived that a knowledge of thefealone is not fufficient to make an accomplinted lawyer. An acquaintance with the forms and practical bufinefs of courls, and efpecially of the fupreme court, as a member of which he was to feek for fame and emolument, he confidered as effentially neceffary to qualify him to be a complete barrifter. He accordingly attended for fome time the chamber of a writer to the fignet, where he had an opportunity of learning the ftyles of legal deeds, and the modes of conducting different fpecies of butinefs. This wife ftep, independently of his great genius and unvearied application, pracured him, after his admiffion to the bar, peculiar refpect from the court, and proportional employment in his profeffion of an advocate. Whoever perufes the law-papers compofed by Mr Home when a young man, will perceive an uncommon elegance of ftyle, befides great ingenuity of reafoning, and a thorough knowledge of the law and cenftitution of his country. Thefe qualifications, together with the ftrength and vivacity of his natural abilities, foon raifed him to be an ornament to the Scottill bar; and, on the 2 d day of February 1752 , he was advanced to the bench as one of the judges of the court of feffion, under the title of Lord Kames.

Before this period, however, notwithitanding the unavoidable labours of his profeffion, Mr Home liad favoured the world with feveral ufeful and ingenious works. In the year 1728 , he publihed Remarkable $D e$ cifions of the Court of Seflion from 1716 to 1728, in one vol. folio.-In 1732 appeared $E(f a y s$ upon fegeral fubjects in law, viz. Fustertit; Beneficium cedendarum actionum; VincoV incentem; andPrefoription; in one volume 8 vo. This firt produce of his original genius, and of his extenfive views, excited notonly the attention, but the admiration of the judges, and of all the other members of the college of juftice. This work was fucceeded, in the year i 74r, by Decifions of the Court of Seffron from its firft inftitution to the year 1740 , abridged and digefled into proper heads, in form of a DiEtionary, in two volumes folio: A very laborious work, and of the greateft utility to every practical lawyer. In 1747 appeared Elfays upon feveral fubjects concerning Bris $t i f h$ Antiquities, viz. r. Introduction of the feadal law into Scotland. 2. Conftitution of parliament. 3. Honour, Dignity. 4. Succefion, or Defcent; with an appendix upon hereditary and indefeafible right, compofed anno 1745, and publifhed 1747, in one volume 8 vo . In a preface to this work, Lord Kames informs us, that in the years 1745 and 1746 , when the nation was in great fufpence and dintraction, he retired to the country ; and in order to banifh as much as poffible the uneafinefs of his mind, he contrived the plan, and executed this ingenious performance.

Though not in the order of time, we fhall continue the lift of all our author's writings on law, before we proceed to his productions on other fubjects. In 1757, he publifhed The Statute law of Scotland abridged, with hifforical notes, in one volume 8vo; a moft ufeful and laborious work. In the year 1759, he prefented to the public anew work under the title of Hiffo-

## HOM <br> [ 632 ] <br> H O M

Horse. muft inform the public, that all the intcligent farmers in Scotland uniformely declare, that, atter perufing Young, Dickfon, and a hundred other writers on agriculture, LordKames's Cientleman Farmer contains the beft practical and rational information on the varions articles of hufbandry which can any where be obtained. As a practical farmer, Lord Kames has given many obvious proofs of his fkill. After he facceeded, in the right of his lady, to the ample eftate of Blair-Drammond in the county of Perth, he formed a plan for turning a large mofs, confifing of at leaft 1500 acres, into arable land. His Lordfhip had the pleafure, before he died, to fee the plan fuccefsfully, though only partially, executed. The fame plan is now carrying on in a much more rapid manner by his fon George Drummond, Efq. But as this is not a proper place for details of this nature, we muft refer the reader to the article Moss; where a particular account of this extraordinary, but extenfively ufeful, operation hall be given.

In the year 1773 , Lord Kames favoured the world with Sketches of the Hijtory of Man, in 2 vols 4to. This work confifts of a great variety of facts and obfervations concerning the nature of man; the prodace of much and profitable reading. In the courfe of his ftudies and reafonings, he had amaffed a vaft collection of materials. Thefe, when confiderably advanced in years, he digefted under proper heads, and fubmitted them to the confideration of the public. He intended that this book fhould be equally intelligible to women as to men; and, to acomplifh this end, wher he had occafion to quote ancient or foreign books, he uniformly tranflated the paffages. The Sketches contain much ufeful information; and, like all his Lord hip's other performances, are lively and entertaìning.

We now come to Lord Kames's laft work, to which he modeftly gives the title of Loofe Hints upon Education, chiefly concerning the Culture of the Heart. It was publithed in the year 178 r , in one vol. 8 vo , when the fenerable and aftonifhing author was in the 85 th year of his age. Though his Lordfhip chofe to call them Loofe Hints, the intelligent reader will perceive in this compofition an uncommon activity of mind at an age fo far advanced beyond the ufual period of human life, and an carneft defire to form the minds of youth to honour, to virtue, to induftry, and to a veneration of the Deity.

Befide the books we have enumerated, Lord Kames publifhed many temporary and fugitive pieces in different periodical works. In the E Eays Phyfical and Literary, publifhed by a fociety of gentlemen in Edin. burgh, we find compofitions of his Lordhip On the Laws of Motion, On the Aduantages of Shallow Ploughing, and on Evaporation; all of which exhibit evident marks of genius and originality of thinking.

How a man employed throngh life in public bufinefs;
and in bufinefs of the firit importance, could find leifure for fo many different purfuits, and excel in them (A), it is not eafy for a meaner mind to form even a conception. Much, no doubr, is to be attributed to the fuperiority of his genius; bue much muft likewife have been the refult of a proper diftribution of his time. He rofe early; when in the vigour of life at four o'clock, in old age at fix; and fudied all morning. When the conrt was fitting, the duties of his office employed him from eight or nine till twelve or one; after which, if the weather permitted, he walked for two hours with fonc literary friends, and then went home to dinner. Whilft he was on the bench, and we believe when he was at the bar, he neither gave nor accepted invitations to dinner during the term or feflon; and if any friend came uninvited to dine with him, his Lordfhip difplaycd his ufeful chearfulnefs and hofpitality, but always retired with his clerk as foon as he had drank a very few glaffes of wine, leaving his company to be entertained by his lady. The afternoon was fpent as the morning had been, in ftudy. In the evening he went to the theatre or concert, from which he returned to the fociety of fome men of learning, with whom he fat late, and difplayed fuch talents for converfation as are not often found. It is oblerved by a late celebrated atithor, that " to read, write, and converfe in due proportions, is the bufinefs of a man of letters; and that he who hopes to look back hereafter with fatisfaction upon paft years, muft learn to know the value of fingle minutes, and endeavour to let no particle of time fall ufelefs to the ground." It was by practifing thofe lef. fons that Lord Kames rofe to literary eminence, in oppofition to all the obftacles which the tumult of public bufinefs could place in his way.
To give a proper delineation of the public and private character of Lord Kames, would far exceed our limits. The writer of this article, however, who had the honour of an intimate acquaintance with this great and good man for more than twenty years, muft be indulged in adding a few facts which fell under his own obfervation.

Lord Kames was remarkable for public fpirit, to which he conjoined activity and great exertion. He for a long tiact of time had the principal management of all the focieties and boards for promoting the trade, fihheries, and manufactures, in Scotland. As conducive to thefe ends, he was a flrentous advocate for making and repairing turnpike roads through every part of the country. He had likewife a chief lead in the diftribution and application of the funds arifing from the eftates in Scotland which had unfortunately been annexed to the crown. He was no lefs zealous in fupporting, both with his writings and perfonal influence, literary affociations. He was in fome meafure the parent of what was called the Phyfical and Literary Socicty. This fociety was afterwards incorporated
(A) Upon refiecting on the $t u d i o u f n e f s$ of Lord Kames's diffoftion, and his numerous literary productions, the reader will naturally recal to his mind a friking fimilarity between his Lordhip and the laborious Pliny the Elder. In a letter from Pliny the Younger to Macer, the following paffages occurs, which is equally applicable to both: ivoune videtur tibi, recordanti quantum legervt, quantum foripferit, nec in officiis ullis, ner in anicitia principum fuife? which is thus trandated by Melmoth: "When you reflect on the books he has read and the volumes he has written, are you not enclined to fufpect, that he never was engaged in the affairs of the public, or the fervice of his prince?"

rated into the $\boldsymbol{R}_{0}$ jal Socicty of Edinburgh; which received a charter from the crown, and which is daily producing marks of genius, as well as works of real utility.

As a privatc and domeftic gentleman, Lord Kames was admired by both fexes. The vivacity of his wit and of his animal fpirits, evenwhen advanced in years, rendered his company not only agrceable, but greatly folicited by the literati, and courted by ladies of the higheft rank and accomplifhments. He told very few ftories; and rarcly, if ever, repeated the fune ftory to the fame perfon. From the neceffity of retailing anecdotes, the miferable refuge of thofe who without genius, attempt to thine in converfation, the abundance of his own mind fet him free ; for his wit or his learning always fuggefted what the occafion required. He could with equal eafe and readinefs combat the opinions of a metaphylician, unravel the intricacies of law, talk with a farmer on improvementsin agriculture, or eftimate with a lady the merits of the drefs in fathion. Inftead of beingjealous of rivals, the characteriftic of little minds, Lord hames foftered and encouraged every fymptom of merit that he could difcover in the fcholar, or in the loweft mechanic. Before he fuccecded to the eftate of Blair-Drummond, his fortune was fmall. Notwithftanding this circumftance, he, in conjaction with Mrs Drummond, his refpectable and accomplifhed fooufe, did much more fervice to the indigent than moft families of greater opulence. If the prefent neceffity was preffing, they gave money. They did more : When they difcovered that male or female petitioners were capable of performing any art or labour, both parties exerted themfelves in procuring that fpecies of work which the poor people could perform. In cafes of this kind, which were very frequent, the lady took charge of the women and his Lordihip of the men. From what has been faid concerning the various and numerous productions of his genius, it is obvious that there could be few idle moments in his long protracted life. His mind was inceffantly employed ; either teeming with new ideas, or purfuing active and laborious occupations. At the fame time, with all this intellectual ardour, one great feature in the character of Lord Kames, befides his literary talents and his public firit, was a remarkable innocency of mind. He not only never indulged in detraction, but when ally fpecies of fcandal was exhibited in his company, he either remained filent, or endeavoured to give a different turn to the converfation. As natural confequences of this amiable difpofition, he never meddled with politics, even when partiesran to indecent lengths in his country; and, what is fill more remarkable, he never wrote a fentence, notwithftanding his numerous publications, without a direct and a manifef intention to benefit his fellow-creatures. In his temper he was naturally warm, though kind and affectionate. In the friendfhips he formed, he was ardent, zealous, and fincere. So far from being inclined to irreligion, as fome ignorant bigots ininuated, few nen poileffed a more devour habit of thought. A conftant fenfe of Deity, and a veneration for Providence, dwelt upon his mind. From this fource arofe that propenfity which appears in all his writings, of inveftigating final caufes, and tracing the wifdom of the Supreme Author of nature. But here we muft ftep. Lord Kames, to the

Vol. VIII.
greatregret of the public, diedonthe 27 ll day of De. IIoma. cember r 782 . As he had no marked difeale but the debility neceflarily refulting from extreme old age, a fe: days beiore his death he went to the Court of Seffion, addreffed all the judges feparately, told them he was fpeedily to depart, and took a folemin and an affectionate farewell.

HOMER, the prince of the Greek poets, flourifhed, according to Dr Blair, abour goo B. C. according to Dr Prieftlcy 850, according to the Arandelian marbles 300 , after the taking of Troy; and agrecable to them all, above 400 years before Plato and Ariftotle. Seven cities difputed the glory of having given him birth, viz. Smyrna, Rhodes, Colophon, Salamis, Chios, Aruos, and Athens; which has beencxpreffed by the following diftich:

Smyrna, Rbodes, Colopbon, Salamis, Chios, Argos, Alliena; Orbis de patria cortut, Homere, tua.
We have nothing that is very certain in relation to the particulars of hislife. The moft regular account is that which goes under the name of Herolous, and is ufually printed with his hiftory : and though it is generally fuppofed to be a fpurious picce, yet as it is ancient, was made ufe of by Strabo, and exhibits that idea which the later Greeks, and the Romans in the age of Auguftus, entertained of Homer, we muft content ourfelves with giving an abftract of it.

A man of Magnefia, whofe name was Menalippus, went to fettle at Cumæ, where he married the daugh. ter of a citizen called Homyres, and had by her a danghter called Crithcis. The father and mother dying, the young woman was left under the tuition of Cleonax her father's friend, and fuffering herfelf to be deluded was got with child. The guardian, though his care had not prevented the misfortune, was however willing to conceal it; and therefore fent Critheis to Smyrna, which was then building, 18 years after the founding of Cumæ, and about 168 after the taking of Troy. Critheis being near her time, went one day to a feftival, which the town of Smyrna was celebrating on the banks of the river Meles; where her pains coming upon her, fhe was delivered of Homer, whom the called Melefigenes, becaufe he was born on the banks of that river. Having nothing to maintain her, fhe was forced to fpin: and a man of Snyyrna called Phemius, who taught literature and mufic, having often feen Critheis, who lodged near him, and being pleafed with her houfewifery, took her into his houfe to fpin the wool he received from his fcholars for their fchooling. Here he behaved herfelf fo modeftly and difcreetly, that Phemius married her ; and adopted her fon, in whom he difcovered a wonderfulgenius, and the beft natural difpofition in the world. After the death of Phemius and Critheis, Homer faccecded to hisfather-in-law's fortune and fchool; and :as aimired, not only by the inhabitants of Smyria, but by ftrangers, who reforted from all parts to that place of trads. A hipmafter called Mertes, who vas a man of learning and a lover of poetry, was fo taken with Homer, that he perfuaded him to leave his fcl:ool, and to travel with him. Honer, who had then began his poem of the Iliad, and thought it of great confequence to fee the places he fhould have occafion to treat of, embraced the opportunity. He embarked with Mentes, and during their feveral voyages never failed carerully

## $\mathrm{HOM} \quad\left[\begin{array}{lll}64 & \mathrm{HOM}\end{array}\right.$

Homer.
to note down all that he thought worth obferving. He travelled into Egypt; from whence he bronght into Greece the names of their gods, the chief ceremonies of their worflip, and a more improved knowledge in the arts than what prevailed in his own country. He vifited Africa and Spain; in his return from whence he touched at Ithaca, where he was much troubled with a rheum falling upon his cyes. Mentes being in hafte to take a turn to Leucadia his native country, left Homer well recommended to Mentor, one of the chief men of the iband of Ithaca, who took all poffible care of him. There Homer was informed of many things relating to Ulyffes, which lie afterwards made ufe of in compoling his Odyffey. Mentes returning to Ithaca, found Homer cured. They embarked together ; and after much time fent in vifiting the coafts of Peloponnefins and the iflands, they arrived at Colophon, where Homer was again troubled with the defluxion upon his eyes, which proved fo violent, that he is faid to have loft his fight. This misforrune made him refolve to return to Smyrna, where he finified his Iliad. Some time after, the ill pofture of his affairs obliged him to ge to Cumæ, where he hoped to liave found fomerelief. Here his poems were highly applauded: but when he propofed to immortalize their town, if they would allow him a falary, he was anfwered, that " there would be no end of maintaining all the ounpos or "blind men;" and hence he got the name of Homer. He afterwards wandered through feveralplaces, and fopped at Chios, where he married, and compofed his Odyffey. Some time after, having added many verfes to his poems in praife of the cities of Greece, efpecially of Athens and Argos, he went to Samos, where he fpent the winter, finging at the houfes of the great men, with a train of boys after him. From Samos lie went to Io, one of the Sporades, with a defign to continue his voyage to Athens; but landing by the way at Chios, he fell fick, died, and was buried on the fea-fhore.

Theonly inconteftable works which Homer hasleft behind him are the Iliad and Odyssey. The Batrachomyomachia, or battle of the frogs and mice, has been difputed. The hymns have been difputed alfo, and attributed by the fcholiafts to Cynæthus therhapfodift: but neirher Thucydides, Lucian, nor Paufanias, have fcrupled to cite them as genuine. Many other pieces are afcribed to him : epigrams, the Eartiges, the Cecropes, the deftruction of Oechalia, of which only the names are remaining.

Nothing was ever comparable to the clearnefs and majefty of Homer's ftyle ; to the fublimity of his thoughts; to the ftrength and fweenefs of his verfes. All his images are ftriking; his defcriptions juft and exact; the paffions fo well expreffed, and nature fo juft and: finely painted, that he gives to every thing motion, life, and action. But he more particularly excels in invention, and in the different characters of his heroes, which are fo varied, that they affeet us in an inexpref: fible manner. In a word, the more he is read by a perfon of good tafte, the more he is admired. Nor are his works to be efteemed merely as entertaining Goems, or as the monuments of a fublime and varied genins. He was in general fo accurate with refpect to coftume, that he feldom mentioned perfons or things that we may not conclude to have been known during
the times of which he writes; and it was Mr Pope's opinion, that his account of people, princes, and countries, was purely liftorical, founded on the real tranfactions of thofe times, and by far the moft valuable piece of hiftory and geograplyy left us concerning the fate of Greece in that early period. His geographical divifions of that country were thought fo exact, that we are told of many controverfies concerning the boundaries of Grecian cities which have been decided upon the authority of his poems. Alcibiades gave a rhetorician a box on the ear for not having Honcr's writings in his fchool. Alexander was raviflied with them, and commonly placed them under his pillow with his fword : he inclofed the Iliad in the precious cafket that belonged to Darius ; " in order (faid he to his courtiers) that the moft perfect production of the human mind might be inclofed in the moft valuable canket in the world." And one day feeing the tomb of Achilles in Sigæa, "Fortunate hero! (cried he), thou haft had a Homer to fing thy victories!" Lycurgus, Solon, and the kings and princes of Greece, fer fuch a value on Homer's works, that they took the utmoft pains in procuring correct editions of them, the moft efteemed of.which is that of Ariftarchus. Didymus was the firft who wrote notes on Homer ; and Euftathius, archbifhop of Theffalonica, in the i2th century, is the moft celebrated of his commentators. Mr Pope has given an elegant tranlation of the Iliad, adorned with the harmony of poetic numbers; and Mad. Dacier has tranflated both the Iliad and Odyfley in profe.

Thofe who defire to know the feveral editions of Homer, and the writers who have employed themfelves on the works ofthat great poet, may confult Fabricius, in the firft volume of his Bibliotheca Graca.
A very fingular difcovery, however, which was made a few years ago in Ruffia, deferves to be herementioned, together with the circumftances tlat attended it. Chriftian Frederic Matthæi, who had been educated by the learned Ernefti, and did credit to the inftructions of that celebrated mafter by the great erudition that he difplayed, being invited to fetrle at Mofcow, and to affift in a plan of literature for which his abilities and acquifitions eminently qualified him, on his arrival at that city was informed, equally to his aftonifhment and fatisfaction, that a very copious treafure of Greek manufcrif: was depofited in the library of the Holy fynod, which no perfon in that country had either the abilities to make ufe of, or the curiofity to examine. Struck with the relation of a circumftance fo unexpected, and at the fame time fo peculiarly agreeable to his claffical tafte, he immediately feized the opportunity that was fortunately offered him, to explore this repofitory of hidden treafure. After having examined feveral curious books, he difcovcred a manufcript copy of the works of Homer, written about the conclufion of the 1 4th centary, but evidently a tranfcript from a very ancient and moft valuable copy, which, befides the Iliad and the Odyffey, contains alfo 16 of the hymns, which have been long publifhed under the name of Homer. Nor was this all. I welve lines of a loft hymn to Bacchus, and the hymn to Ceres, which was alfo loft, were preferved in this curious and long unoticed manufcript. The hymn to Ceres appears to be entire, excepting a few lines towards the clofe: andit is furely remarkable,

## H O M

Fomer that a Greek poem, attributed to Homer, which had !|. been loft for ages, fhould be at length difcovered in Mufcovy, the radeft and moft unclaffical country in Europe, M. Matthæi, exnlting in an acquilition fo unexpected, and at the fame time fo valuable, communicated it, with fingular difintereftednefs, to his learned friend M. Ruhnkenius, with whofe talents and extraordinary erudition he was well acquainted, that this gentleman might prefent it to the world without thofe delays which would probably have retarded the publication of it at Mufcovy. He was ratherinduced to employ M. Ruhnkenius in the publication of this curious and beautiful remnant of antiquity, becaufe he knew that this gentleman had been particularly engaged in the ftudy of the hymns of Homer, in order to give the public a complete edition of them. The hymm to Ceres, and the fragment of the hymn to Bacchus, were printed in 1780 at Leyden, under the care of M. Ruhnkenius; who has added fome very valuable notes and obfervations on the hymn to Cezes, which tend to illuftrate its beantics, and to throw a light on fome of its obfcurities. The learned editor obferves, that nothing was more diftant from his expectations than the difcovery of the hymn to Ceres. He knew indeed that a poem bearing that title, and afcribed to Homer, exifted in the fecond century; but as it had long been confidered as irretrievably loft, he had formed no hopes of ever fecing it refcued from the obfcurity to which it had been configned. He acknowledges, that he has many doubts with refpect to the high and illuftrious origin afcribed to this hymn; but as no pofitive external evidence can be produced to determine the point, he choofes to reft his argument on what appears to him the more certain ground of internal proof; and obferves, that though the poem be exquifitely beautiful, yet that it is evidently deficient in fome of Homer's more ftriking and predominant characteriftics. It wants his energy and fpirit; that vigour, that infpiration, which animate and give an irrefiftible power, as well as an enchanting beauty, to the poems of that fublime and inimitable bard. This opinion, as we have already feen, hath been given by other critics of all the hymis of Homer. But though M. Ruhnkenius is not inclined to attribute the hymn of Ceres to Homer, he yet acknowledges, that the fructure of its language is founded on the model of that great poet, and he hefitates not to give it the honour of very high antiquity. He is of opinion, that it was written immediately after Homer, or at leaft in the age of Hefiod: and he congratulates the age on the difcovery of fo curious a poem, refcued by mere accident from the darkeft retreats of oblivion, and perhaps but at a flight diftance from inevitable perdition. He deems it to be an acquifition, not only calculated to gratify the curiofity of the connoiffeurs in claffic antiquity, or to entertain thofe lovers of Greek poetry whofe ftudies are made fubfervient to a refined and elegant fpecies of amufement, but he alfo efteems it to be of particular ufe to the critic, as it tends to illuftrate fome obfcure paffages both in the Greek and Latin pocts.

HOMER, OMER, or Chomer, a Jewifh meafure, containing the tenth part of the epla. See Corus and Measure.
homesoken. Sce Hamesecken.
HOMICIDE, fignifies in general, the taking away ©f any perfon's life. It is of three kinds; juffifiable,
excufable, and filonious. The firt has no flare of lion.icite. guilt at all; the fecond very little; but the thitd is the higheft crime againft the law of nature that man is capable of committing.
I. Juftifiable homicide is of divers kinds.

1. Such as is owing to fome unavoidable necefity, without any will, intention, or delire, and withont any inadvertence or negligence, in the party killing, and therefore wibout any fhadow of blame; as, for inftance, by virtue of fuch an office as obliges onc, in the execution of public juftice, to put a malefactor to death, who hath forfeited his life by the laws and verdiet of his country. This is an aet of neceffity, and even of civil duty ; and therefore not only juftifiable but commendable, where the law requires it. But the law muft require it, otherwife it is not juftifiable: therefore wantonly to kill the greateft of malefactors, a felon, or a traitor, attainted or outlawed, deliberately, uncompelled, and extrajudicially, is murder. And farther, if judgment of death be given by a judge not authorized by lawful commiffion, and execution is done accordingly, the judge is guilty of murder. Alfo fich judgment, when legal, muit be executed by the proper officer, or his appointed deputy; for no one elfe is required by law to do it, which requintion it is that juftifies the homicide. If another perfon doth it of his own head, it is held to be murder ; even though it be the judge himfelf. It muft further he executed, fervato juris ordine; it muft purfue the fentence of the court. If an officer beheads one who is adjudged to be hanged, or vice verfa, it is murder : for he is merely minifterial, and therefore only juftified when he acts under the autherity and compulfion of the law. But, if a fheriff changes one kind of punifhment for another, he then acts by his own authority, which extends not to the commifion of homicide : and betides, this licence might occafion a very grofs abufe of his power. The king indeed may remit part of a fentence, as in the cafe of treafon, all but the beheading: but this is no change, no introduction of a new punifhment; and in the cafe of felony, where judgment is to be hanged, the king (it hath been faid) cannot legally order a peer to be beheaded.

Again: In fome cafes homicide is juftifiable, rather by the permiffion, than by the abfolute command, of the law: cither for the advancement of public juiffice, which without fuch indemnification would never be carried on with proper vigour ; or, in fuch inftances where it is committed for the prevention of fome atrocious crime, which cannot otherwife be avoided.
2. Homicides committed for the odvancement of public juftice, are, I. Where an officer, in the execution of his office, either in a civil or criminal cafe, kills a perfon that affaults and refifts him. 2. If an officer, or any private perfon, attempts to take a man charged with felony, and is refifted; and, in the endeavour to take him, kills him. 3. In cafe of a riot, or rebellious affembly, the officers endeavouring to difperfe the mob are juftifiable in killing them, both at common law, and by the riot act, I Geo. I. c. 5 . 4. Where the prifoners in a gaol, or going to gaol, affault the gaoler or officer, and he in his defence kills. any of them, it is juttifiable, for the fake of preventing an efcape. 5. If trefpaffers in forefts, parks, chafes, or warrens, will notfurrender themfelves to the keepers, they may be lain; by virtue of the ftatute 4 K 2

## H O M <br> H O M

Homicide. 21 Edward I. f. 2. de malefattonibus in parcis, and 3 S 4 V. \& M.c. To. Eht, in all thofe cafes, there muft be a apparent necetity on the o etr's fide ; wiz. that the party could not be arrefted or apprehended, the riot could not he lappreffed, the prifoners could not be kept in hold, the deer-ficalers could not but efcape, unlefs fuch homicice were committed: otherwife sithout fuch abfolute necelfity, it is not juftifiable. 6. If the champions in a trial by battle killed either of them the other, fuch homicide was juftifiable and was imputed to the juft judgement of God, who was thereby prefumed to have decided in favour of the struth.
3. In the next place, fuch homicide as is commitated for the prevention of any forcible and atrocious crime, is juftifiable by the law of nature; and alfo by che law of England, as it ftood fo early as the time of Bracton, and as it is fince declared by fat. 24 H. VIII. c. 5. If any perfon attempts a robbery or murder of another, or altempts to breakopen a honfe in the nighttime, (which extends alfo to an attempt to burn it) a nd alfo be killed in fuch attempt, the flayer fhall be acquitred and difcharged. This reaches not to any crime unaccompanied with force, as picking of pockets:; or to the breaking open of any houfe in the dayiime without it carries with it an attempr of robbery .alfo. So the Jewill law, which punithed no, theft -with,death, makes homicide only juftifiable in cafe of norturzalhoufe-breaking: "'ifa thiet be found breaking up, and he be fmitten that he die, no blood fhall be fhed for him: but if the fun be rifen upon him, there Siall be blood thed for him; for he hould have made fill reftitution.". At Athens, if any theft was committed by night, it was lawful to kill the criminal, if taken in the fact: and by the Roman law of the twelve tables a thief might be flain by night with impunity; or even by day, if he armed him--felf with ainy dangerous weapon : which amounts very nearly to the fame as is permitted by our own conftitution.

The Romat law alfo juftifies homicide : when comos mitted in defence of the chaftity either of one's felfor relations: and fo alfo, according to Selden, food the Jaw in the Jewifh republic. The Englifh law likewife juftifies a woman killing one who attempts to ravifh her: and to too the hufband or father may juftify killing a man who attempts a rape upon his wife or daughter; but not if he takes thenk in adultery by confent ; for the one is forcible and fellonious, but not the other. And there is no donbt the forcibly attempting a crime, of a ftill more deteftable nature, may be equally refifted by the death of the unnatural aggreflor. For the one uniform principle that roms through our own, and all other laws, feems to be this: That where a crime in itfelf capital, is endeavoured to be committed by force, it is lawfui to repel the force by the death of the party attempting. But we muft not carry this doctrine to the fame vifionary length that Mr Locke does; who holds, "f that all fnanner of force without right upon a man's perfon, puts him in a ftate of war with the aggreffor ; and of confequence, that being in fuch a ftate of war, he may lawfully kill him that puts him under this unnatural reftraint." However juft this conclufion may be in a fate of uncivilized nature, yet the law of Eng-
land, like that of every other well-regulated commu- Homicide. nity, is too tender of the public peace, too canciul of the dives of the fubjects, to adopt fo contentions a fyfrem; nor will it tuffer with impunily any crime to be prevented by death, unlefs the danie, if commitred would allo be panifbed by death.
In theleinftances of juffifiable homicide, it may be obferved, that the llayer is in no kind of fault whatioever, not even in the minuteft degree: and is therefore to be totally acquitted and difcharged, with commendation rather than blame. But that is not quite the cafe in excufable homicide, the very name whereof inports fome fault, fome error, or omifion ; fo trivial, however, that the law excufes it from the guile of felony, though in ftrictnefs it judges it deferving of fome little degree of punifhment.
II. Excufable homicide is of two forts; either per infortunium, by mifadventure; or fe defendendo, upon a principle of felf prefervation. We will firft fee wherein thefe two fpecies of homicide are diftinct and then whercin they agree.

1. Homicide per infortunium, or mifadventure, - is where a man, doing a lawful act, without any intention of hurt, unfortunately kills another: as where a man is at work with a hatchet, and the head thereof flies off and kills a ftander-by; or, where a perfon, qualified to keep a gun, is chooting at a mark, and undefignedly kills a man: for the act is lawful, and the effect is merely accidental. Lo where a parent is moderately correcting his child, a mafter inis apprentice or fcholar, or an oficer punilling a criminal, and happens to occafion his death, it is only mifadventure; for the act of correction was lawful: and $i$. he exceeds the bounds of moderation, either in the manner, the inftrument; or the quantity of punifment, and death enfues, it is manflaughter at leaft, and in fome cafes (according to the circumftances) murder; for the adt of immoderate correction is unlawful. Thus by an cdict of the emperor Conftantine, when the rigour of the Roman law wirh regard to flaves began to relax and foften, a mafter was allow ed to chaltife his flave with rods and imprifonment and if death accidentally enfued he was guilty of no crime: but if he flruck him with a club or a ftone, and reereiy accafioned his death, or if in any other yet groffer manner, ammoderate juo jure ut tur, tunc ress bonicidii fit.

But to proceed. A tilt or tournament, tho martial diverfion of our anceftors, was however an unlawtud act; and fo are boxing and fword playing, the fucceeding amufencuts of tacir ponterity : and thicfore, if a knight in the former cafe, or a gladiator in the latter, be killed, fuch k:lling is felony or manflaugh. ter. But if the king command or permit fuch diver. fion, it is faid to be only milaciventure; for then the act is lawful: In like manner as, by the laws both of Athens and Rume, he whokilled another in the pascratium, or public games, authorifed or permitted by the fate, was not held to be guilty of homicide. Likewife to whip another's horle, whereby he runs over a child and kills him, is held to be accidental in the rider, for he has done nothing unlawinl; but manflanghter in the perfon who winpped him, for the act was a trefpals, and at beft a piece of idlenefs, of inevitably dangerous confequence. And in general, if death enfues in confequence of an idle, dangerous,

## H O M

Homicide. and unlawful fport, as fhooting or cafting fones in a fown, or the barbarous diverfion of cock-throwing; in thefe and fimilar cafes, the flayer is guilcy of manflaughter, and not mifadventure only; for thefe are unlawful acts.
2. Homicide in $\int$ ctf-defence, or $\int$ edefendendo, upon a fudden affiray, is allo excufable rather than juftifiable by the Englifh law. 'This fpecies of Celf-defence muft be diftinguifhed from that juft now mentioned, as calculated to hinder the perpetration of a capital crime ; which is not only a matter of excufe, but of juftification But the felf-defence which we are now fpeaking of, is that whereby a man may protect himfelf from an ar fault, or the like, in the courfe of a fudden brawl or quarrel, by killing him who affaults him. And this is what the law expreffes by the word chanec-medley, or (as fome rather choofe to write it) chaud-medley; the former of which in its etymology fignifies a cafualaffray, the latter an effray in the beat of blood or paffion : both of them of pretty much the fame import ; but the former is in common feech too often erroneounly applied to any manner of homicide by mifadventure; whereas itappears by the fatute 24 H . VIII. c. 5. and the ancient books, that it is properly applied to fuch killing as happens in felf-defence upon a fudden rencounter. The right of natural defence does not imply a right of attacking: for, inftead of attacking one another for injuries patt or impending, men need only have recourfe to the proper tribunals of juttice. They cannot, therefore, legally exercife this right of preventive defence, but in fudden and violent cafes; when certain and immediate fuffering would be the confequence of waiting for the affiftance of the law. Wherefore to excufe homicide by the plea of felf-defence, it mult appear that the flayer had no other poffible means of efcaping from his affailant.

In fome cales this fpecies of homicide (upon chancemedley in felf-defence) difters but little from manflaughter, which alfo happens frequently upon chance-medley in the proper legal fenfe of the word. But the true criteriop between them feems to be this; when both parties are actually combating at the time when the mortal ftroke is given, the dayer ispthen guilty of manflaughter; but if the flayer liath not begun to fight, or (having begun) endeavours to decline any farther ftruggle, and afterwards, being clofely preffed by his antagonift, kills him to avoid his own deftruction, this is homicide excufable by felf-defence. For whichreafon the law requires, that the perfon, who kills another in his own defence, fhould have retreated as far as he conveniently or fafely can, to avoid the violence of the affault, before he turus upon his affailant; and that not fictitioully, or in order to watch his opportunity, but from a real tendernefs of thedding his brother's blood. And though ir may be cowardice, in time of war between two independent nations, to flee from an enemy; yet between two fellow-fubjects, the law countenances no fach point of honour ; becaufe the conftitutional courts are the vindices injuriarum, and will give to the party wronged all the fatisfaction he deferves. In this the civil law allo agrees with ours, or perhaps goes rather farther ; " qui cum aliier tuerife non polfunt, damni culpam dederint, inizoxii funt." The party aflaulted muft therefore flee as far as he convepiently can, cither by reafon of fome wall, ditch, or
other impediment; or as far as the fiercenefs of the Homicide a flatr will permit him; for it may be fo fierce as not $\underbrace{-}$ to allow him to yield a fep, without manifeft danger of his life, or enormous bodily harm; and then in his defence he may kill his affailant inftantly. And this is the doctrine of univerfal juftice, as well as of the municipal law.

And, as to the nanner of the defence, fo is alfo the time to be confidered : for if the perfon affaulted does not fall upon the aggreffor till the affray is over, or when he is running away, this is revenge and not defence. Neither under the colour of felf-defence, will the law permit a man to fcreen himfelf from the guilt of deliberate murder : for if two perfons, $A$ and $B$, agree to fight a ducl, and A gives the firft onfet, and B retreats as far as he poffibly can, and then kills A, this is murder ; becaufe of the previous malice and concerted defign. But if A upon a fudden quarrel affaults $B$ firf, and, upon B's returning the affatilt, A really and bona fide flies; and being driven to the wall, turns again upon B and kills him ; this may be Se defendendo, according to fome of our writcrs; tho ${ }^{2}$ others have thought this opinion too favourable : inafinuch as the neceffity, to which he is ar laft reduced, originally arofe from his own fault. Under this excufe of felf-defence, the principal civil and natural relations are comprehended : therefore, mafter and fervant, parent and child, lufband and wife, killing an affailant in the neceffary defence of each other refpectively, are excufed; the act of the relation affift. ing being conftrued the fame as the act of the party himfelf.

There isone fpecies of homicide fe defendendo, where the party flain is equally innocent as he who occalions his death : and yet this homicide is alfo excufable from the great univerfal principle of felf prefervation, which prompts every man to fave his own life preferable to that of another, where one of them mult inevitably perifh. As, among others, in that cafementioned br lord Bacon, where twe perfons, being fhipwrecked, and getting on the fame plank, but finding it not able to fave them both, one of them thrufts the other from it, whereby he is drowned. He who thus preferves his own life at the expence of another man's, is excufable through unavoidable neceffity, and the principle of felf-defence ; fince their both remaining on the fame weak plank is a mutual, though innocent, attempt upon, and endangering of, each other's life

Let us next take a view of thofe circumftances wherein thofe two fpecies of homicide, by mifadven. tare and felf-defence, agree; and thofe are in their blame and punifhment. For the law fets fo high a value upon the life of a man, that it always intends fome mifbehaviour in the perfon who takes it away, unlefs by the command or exprefs permifion of the law. In the cafe of mifadventure, it prefumes negligence, or at leaft a want of fufficient caution in him who was fa unfortunate as to commit it; who therefore is not altogether faultlefs. And as to the neceffity which excufes a man who kills another fe defendendo, lord Bacon intitles it necefitas culpabilis, and thereby diftinguifhes it from the former neceflity of killing a thief or a malefactor. For the law intends that the quarrel or affalt arofe from fome unknown wrong, or fome proyocation, cither in word or deed: and fince in
quarrels

## HOM [ 638$] \quad$ H O M

Konicien quarris borh parties may be, ard ufually are, in fome fault ; and it farce can be tried who was originally in the wrong : the law will not hold the furvivor entirely guiltlefs. But it is clear, in the other cafe, that where I kill a thief who breaks into my houfe, the original default can never be upon my fide. The law belides may have a farther view, to make the crime of homicide more odions, and to caution men how they fenture to kill another uron their own private judgment ; by ordaining, that he who flays his neighibour without an exprefs warrant from the law fo to do, thall in no cafe be abfolutely free from guilt.

Nor is the law of England fingular in this refpect. Even the flaughter of enemies required a folemn purgation among the Jews; which implies, that the death of a man, however it happens, will leave fome fain behind it. And the Mofaical law appointed certain cities of refuge for him " who killed his neighbour unawares; as if a man goeth into the wood with his neighbour to hew wood, and his hand fetcheth aftroke with the ax to cut down a tree, and the head flipperh from the helve, and lighteth upon his neighbonr that he die, he fhall flee into one of thofe cities and live." But it feems he was not held wholly blamelefs, any more than in the Englifh law; fince the avenger of blood might flay him before he reached his afylum, or if he afterwards ftirred out of it till the death of the high prieft. In the imperial law likewife cafual homicide was excufed, by the indulgence of the emperor digned with his own fign manual, " adnotatione principis;' otherwife, the death of a man, however committed, was in fome degree punifhable. Among the Greeks, homicide by misfortune was expiated by voluntary banifhment for a year. In Saxony, a fine is paid to the kindred of the flain; which alfo, among the weftern Goths, was little inferior to that of voluntary homicide: and in France, no perfon is ever abfolved in cafes of this nature, without a largefs to the poor, and the charge of certain maffes for the foul of the party killed.

The penalty inflicted by the Englifh laws is faid by Sir Edward Coke to have been anciently no lefs than death; which, however, is with reafon denied by later and more accurate writers. It feens rather to have confifted in a forfeiture, fome fay, of all the goods and chattels, others only of part of them, by way of fine or weregild: which was probably difpofed of, as in Franee, in pios ufus, according to the humane fuperftition of the times, for the benefit of bis foul who was thus fuddenly fent to his account with all his imperfections on his head. But that reafon having long ceafed, and the penalty (efpecially if a total forfeiture) growing more fevere than was intended, in proportion as perfonal property has become more confiderable, the delinquent has now, and has as eafly as our records will reach, a pardon and writ of reftitution of his goods as a matter of courfe and right, only paying for fuing out the fame. And, indeed, to prevent this expenfe, in cafes where the death has notorioully happened by mifadventure or in felf-defence, the judges will ufually permit (if not direct) a general verdict of acquittal.
III. Felowious homicide is an act of a very different nature from the former, being the killing of a human ereature of any age or fex, without juftification or
excuie. This may be done either by killing one's felf, or anotherman : for the condideration of which fee the arm licles Self Alurder, Murder, and Mansiaughter.

HOMLLY, in ecclefiaftical writers, a fermon or difcourfe upon fome point of religion, delivered in a plain manner, fo as to be eafily underftood by the commoh people. The word is Greck, ous ed of ouri( $Q$, catus, "alfembly or council."

The Greek homily, fays M. Fleury, fignifies a familiar difcourfe, like the Latin fermo; and difcourfes delivered in the church took thefe denominations, to intimate that they were not harangues or matters of oftentation and flourifh, like thofe of profane orators, but familiar and ufeful difcourfes, as of a mafter to his difciples, or a father to his children.

All the homilies of the Greek and Latin fathers are compofed by the bifhops. We have none of Tertullian, Clemens Alexandrinus, and many other learned perfons; becaufe, in the firft ages, none but bifhops were admitted to preach. The privilege was not ordinarily allowed to priefts till toward the fifth century. St Chryfoftom was the firft prefbyter that preaclied ftatedly. Origen and St Auguftine alfo preached ; but it was by a peculiar licence or privilege.
Photius diftinguifhes bomily from fermon; in that the homily was performed in a more familiar manner, the prelate interrogating and talking to the people, and they in their turn anfwering and interrogating him, fo that it was properly a converfation; whereas the fermon was delivered with one form, and in the pulpit, after the manner of the orators.

The practice of compiling homilies, which were to be committed to memory, and recited by ignorant or indolent priefts, commenced towards the clofe of the 8th century; when Charlemagne ordered Paul Deacon and Alcuin to form homilies or difcouries upon the Gofpels and Epiftles, from the ancient doctors of the church. This gave rife to that famous collection intitled the Homiliarium of Charlemagne, and which being followed as a model by many productions of the ame kind, compofed by private perfons, from a principle of pions zeal, contributed much (fays Mofheim) to nourifh the indolence, and to perpetuate the ignorance of a worthlefs clergy.

There are ftill extant feveral fine homilies, compofed by the ancient fathers, particularly St Chryfoftom and St Gregory.

Clementine Homiless, in ecclefiantical hiftory, are nineteen homilies in Greek, publifhed by Cotelerius, with two letters prefixed; one of them written in the name of Peter, the other in the name of Clement, to James bifhop of Jerufalem ; in which laft letter they are intitled Clement's Epitome of the. Preaching and Travels of Peter. According to Le Clerc, thefe homilies were compofed by an Ebionite in the fecond century; but Montfaucon fuppofes that they were forged long after the age of St Athanafius. Dr Lardner apprehends, that the Clementine homilies were the original or firft edition of the Recognitions; and that they are the fame with the work cenfured by Eufebius ander the title of Dialogues of Peter and Appion.

HOMINE replegiando, a writ for the bailing of a man out of prifon when he is confined without commandment of the king or his judges, or for any canfe Homine

## $\mathrm{HONN} \quad[639] \quad \mathrm{HON}$

Hammec that is repleviable. Bur this writ is now feldom afed; ${ }^{I I}$ Honan a writ of babeas corpus being fued out onthe neceffary occalions.

HOMMOC, a name given by mariners to a hilloc or fmall eminence of land, refembling the figure of a cone, and appearing on the fea-coaft of any country.

HOMO, man, is ranked by Limæus under the order of primates; and characterifed by having four parallel foreteeth both in the upper and lower jaw, and two manmer on the breaft. The fpecies, according to this author, are two, viz. the homo fapiens, and the homo troglodytes.

He fubdivides the homo fapiens into five varieties, wiz. the American, the European, the Aliatic, the A. frican, and what he calls the monftrous. Sec Man.

The troglodytes, or orang outang, is a native of Ethiopia, Java, and Ambuina. His body is white; he walks erect; and is about one-half the ordinary human lize. He generally lives about 25 ycars. He conceals himfelf in caves during the day, and fearches for his prey in the night. He is faid to be exceedingly fagacious, but is not endowed with the faculty of fpeech. See Troglodytes, Simia, and Comparative Anatomy, p. 250, col. 2.
homogeneous, or Homogeneal (compofed of the Greek opos $\operatorname{lik}$ e, and $\gamma \varepsilon v o s k(/ i d)$ ), is a term applied to various fubjects, to denote, that they confift of fimilar parts, or of parts of the fame nature and kind : in contradiction to beterogeneous, where the parts are of different natures, \&c.

HOMOLOGATION, in the civil law, the act of confirming or rendering a thing more valid and folemn, by publication, repetition, or recognition there-of.-The word comes flom the Greek oporogea " confent, affent;" formed of opos fimilis, " like," and nozos of ro zerv, dicere, "to fiay;" q. d. to fay the fame thing, to confent, agree.

HOMOLOGOUS, in geometry, an appellation given to the correfponding fides and angles of fimilar figures, as being proportional to each orther.

HONAN, a province of China, bounded on the north by that of Ptecheli and Chanfi, on the weft by Chanfi, on the fouth by Houquang, and on the eaft by Chantong. Every thing that can contribute to render a country delightful is found united in this province; the Chinefe therefore call it Tong-boa or the middle flower: it is indced fituated almoft in the centre of China. The ancient emperors, invited by the mildnefs of the climate and the beauty of the country, fixed their refidence here for fome time. The abundance of its fruits, paftures, and corn, the effeminacy of its inhabitants (who are accounted extremely voluptuous), and laftly, the cheapnefs of provifions, have no doubt prevented trade from being fo flourifhing here as in other provinces of the empire. The whole country is flat exceptingitowards the weft, where there arifes a long chain of mountains, covered with thick forefts; and the land is in fuch a high ftate of cultivation, that thofe who travel through it imagine they are walking in an immenfe garden.-Befides the river Hoangho, which traverfes this province, it is watered by a great number of fprings and fountains; it has alfo a valuable lake, which invites to its banks a prodigious number of workmen, becaufe its water has the property of communicating luftre to filk, which can-
not be imitated. Exclufive of forts, caftes, and places of ftrength, this province contains eight fou or cities of the firft clafs, and 102 of the fecond and third. In one of thefe cities named Nanyang, is found a kind of ferpent, the fkin of which is marked with fmall white fpots : the Chinefe phyftcians fteep it in wine, aud ufe it afterwards as an excellent renedy againft the palfy.

Honan-Fou, a city of the above province, fituated amidft mountains and between three rivers. The Chinefe formerly believed this city to be the centre of the earth, becaufe is was in the middle of their empire. Its jurifdiction is very extenfive ; for it compreh :nds one city of the fecond clafs and thirteen of the third; one of thefe cities named Teng-fong-hien, is famous on account of the tower erected by the celcbrated Tcheoukong for an obfervatory ; there is fill to be feen in it an inftrument which he made ufe of to find the fhadow at noon, in order to determine the latitude. This aftronomer lived above a thoufand years before the Chrittian era, and the Chinefe pretend that he invented the mariner's compafs.
HONDEKOOTER (Melchior), a famous Dutch painter born at Utrecht, excelled in painting animals, and efpecially birds. His father and grandfather were of the fame profeffion, and their fubjects the fame. He was trained up to the art by his father ; but furpaffed not only him, but even the heft of his cotemporaries in a very high degree. Till he was feventeen years of age, he continued under the direction of his father, and accuftomed himfelf to paint feveral forts of birds; but particularly he was pleafed to reprefent cocks, hens, ducks, chickens, and peacocks, which he defcribed in an elegant variety of actions and attitudes. -After his father's death, which happened in 1653, he received fome inftructions'from his uncle John Baptift Weeninx ; but his principal and beft inftructor was nature, which he fudied with intenfe application. His pencil was wonderfully neat and delicate; his touch light ; his colouring exceedingly natural, lively, and remarkably tranfparent; and the feathers of his fowls were expreffed with fuch a fwelling foftnefs, as might readily and agreeably deceive the eye of any fpectator. It is reported that he had trained up a cock to ftand in any attitude he wanted to defcribe, and that it was his cuftom to place that creature near his eafel; fo that at the motion of his hand the bird would fix itfelf in the proper pofture, and would continue in that particular pofition without the fmalleft perceptible alteration for feveral bours at a time. The landfcapes which he introdaces as the back gromeds of his pictures, are adapted with peculiar judgment and kill, and admirably finifhed; they harmonize with his fubject, and always increafe the force and the beauty of his principal objects. His touch was very fingular, in imitating the natural plumage of the fowls he painted; which not only produced a charming effect, but alfo may prove ferviceable to an intelligent obferver, to affift him in determining which are the genuine works of this mafter, and which are impofitions. His pictures fell at a high price, and are much fought after. He died at Utrecht in 1695, aged 59.

HONDURAS, a province of North America in New Spain, lying on the North Sea, being about 370 miles in length, and 200 in breadth; it was difcover-...

Home, ed by Chriftopher Columbus in the year i502. The Hozay. Englifh have been poifiticd of the logwood counry on the bay of Honduras a great while, and cut large quantities every year. The Mofquito native Americarss live in the eaftern parts; and being independent of the Spaniards, have entered into treati : with the Englih, and ferve them in feveral capacities. This province is watered by feveral rivers, which enrich the country by their inundations; and it is very fertile in Indian corn. It is faid there are fome mines of gold and filver in this province. Valadolid is the capital town.

HONE, a fine kind of whet fone, ufed for fetting razors, pen-kuives, and the like.

HONEY, a fweet vegetable juice, collected by the bees from the flowers of various plants, and depofited in the cells of the comb; from which it is extracted either by fpontaneous percolation through a fieve in a warm place, the comb being feparated and laid there. on, or by expreffion. That which runs fontaneoully is purer than that which is expreffed, a quantity of the wax and other matters being forced out along with it by the preflure. The beft fort of honey is of a thick confiftence, a whitifh colour inclining to yellow, an agreeable fmell, and pleafant tafte: both the colour and flavour are faid to differ in fome degree, accord. ing to the plants which the bees collect it from. It is fappofed that honey is merely the juice of the flower perfiring, and becoming infpifated thereon ; and that the bee takes it up with its probofcis, and carries it to be depolited in its waxen cells, with which the young bees are to be fed in fummer, and the old bees in winter: but it is certain, that honey can be procured by no other method of collecting this juice than by the bees. The honey wrought by the young bees, and that which is permitted to run from the comb without heat or preffure, is white and pure, and called virgin's honey. The honey of old bees and that which is forced from the comb by heat or preffure, is yellow, from the wax. Honey produced where the air is clear and hot, is better than that where the air is variable and cold.-The honey of Narbonne in France, where rofemary abounds, is faid to have a very manifeft flavour of that plant, and to be imitable by adding to other honey an infulion of rofemary flowers.

Honcy, confidered as a medicine, is a very ufeful detergent and aperient, powerfully diffolving vifcid juices, and promoting the expcctoration of tough phlegm. In fome particular conftitutions it has an inconvenience of griping, or of proving purgative; which is faid to be in fome meafure prevented by previoully boiling the honey. This, however, with all confitutions, is by no means effectual ; and the circumftance mentioned has had fo much weight with the Edinburgh college, that they do not now employ it in any preparation, and have entirely rejected the mella medicata, fubftituting fyrups in their place: but there can be no doubt that honey is very ufeful in giving form to different articles, although there be fome individuals with whom it may difagree. In order, however, to obtain the good effects of the honey itfelf, it mult be ufed to a confiderable extent, and as an article of diet. The following remarkable inftances of the good effects of honey in fome afthmatic cafes, given by Dr Monro in his Medical and Pharmaceutical

Chemiftry, deferve to be here inferted. "The late Dr John Hume, one of the commiffoners of the fick and hurt of the royal navy, was for many years violently aflicted with the afthma. Having taken many medicines without receiving relief, le at laft refolved to try the effects of honey, having long had a great opinion of its virtues as a pectoral. For two or threc years he ate fome ounces of it daily, and got entirely free of his afthma, and likewife of a gravelly complaint which he had long been afflicted with. About two years after he had recovercd his health, when he was fitting one day in the office for the fick and hurt, a perfón labouring under a great difficulty of breathing, who looked as if he could not live many days, came to him, and afked him by what means he had been cured of his afthma? Dr Hume told bim the particulars of his own cafe, and mentioned to him the means by which he had found relief. For two yeats after he heard nothing of this perfon, who was a ftranger to him, and had feemed fo bad that he did not imagine that he could have lived many days, and therefore had not even afked him who he was; but at the end of that period, a man feemingly in good health, and decently dreffed, came to the dick and hurt office, and returried him thanks for his cure, which he affured him had been entirely brought about by the free ufe of honey."

HoNET-Dew, a fweet faccharine fubftance found on the leaves of certain trees, of which bees are very fond, by the hnfbandmen fuppofed to fall from the heavens like common dew. This opmion hath been refuted, and the true origin of this and other faccharine dews fhown by the Abbe Boiffier de Sauvages, in a memoir read before the Society of Sciences at Montpelier. "Chance (fays the Abbe) afforded me an opportunity of feeing this juice in its primitive form on the leaves of the holm oak: thefe leaves were covered with thoufands of fmall round globules or drops, which, without touching one another, feemed 10 point out the pore from whence each of them had proceeded. My rafte informed me that they were as fweet as honey: the honey-dew on a neighbouring bramble did not refemble the former, the drops having run together; owing either to the moitture of the air which had diluted them, or to the heat which had expanded them. The dew was become more vifcous, and lay in large drops, covering the leaves; in this form it is ufually feetr.
"The oak had at this time two forts of leaves; the old, which were ftrong and firm ; and the new which were tender, and newly come forth. The honey-dew was found only on the old leaves; though thefe were covered by the new ones, and by that means fheltered from any moifture that could fall from above. I obferved the fame on the old leaves of the bramble, while the new leaves were quite free from it. Another proof that this dew proceeds from the leaves is, that other neighbouring trees not furnifhed with a juice of this kind had no moifture on them; and particularly the mulberry, which is a very particular circumftance, for this juice is a deadly poifon to filkworms. If this juice fell in the form of a dew, mift, or fog, it would wet all the leaves withont diftinction, and every part of the leaves, under as well as upper. Heat may have fome hare in its production : for

Honey.

## HON

Money.
though the common heat promotes only the tranfin ration of the more volatile and thuid juices, a fultry hear, efpecially if reflected by clonis, may to far dilate the veffel as to produce a more vifcons juice; fuch as the honey-dew.
"The fecond kind of honey-dew, which is the chief refource of bees after the fpring flowers and dew by tranfuiration on leaves are paft, owes its origin to a fmall infect called a vine-fretter; the excrement ejected with fome force by this infect makes a part of the moft delicate honey known in mature (fee Apis). Thefe vine-fretters reft duting feveral months on the barks of particular trees, and extract their food by piercing that bark, without hurting or deforming the tree. Thefe infects alfo caufe the leaves of forne trees to curl up, and produce galls upon others. They fettie on branches that are a year old. The juice, at firft perhaps hard and crabbed, becomes, in the bowels of this infect, equal in fweetnefs to the honey obtained from the flowers and leaves of vegetables; excepting that the flowers may communicate fome of their effertial oil to the honey, and this may give it a peculiar flavour, as happened to myfel fby planting'a hedge of rofemary near my bees at Sauvages: the honey has tafted of it ever fince, that fhrob continuing long in flower.
"I have obferved two fpecies of vine-fretters, which live unfheltered on the bark of young branches; a larger and a leffer. The leffer fpecies is of the colour of the bark upon which it feeds, generally green. It is chiefly diftinguifhed by two horns, or ftrait, immoveable, flefhy fubftances, which rife perpendicilarly from the lower fides of the belly, one on each fide. This is the fpecies which live on the young branches of branble and elder. The larger fpecies is double the fize of the other ; is of a blackifh colour; and inftead of the horns which diftinguifh the other, have in the fame part of the fkin a fmall button, black and hining like jet.
" The buzzing of bees in a tuft of holm-oak, made me fufpect that fomething very interefting brought fo many of them thither. I knew that it was not the feafon for expecting honey-dew, nor was it the place where it is ufually found; and was furprifed to find the tufts of leaves' and branches covered with drops which the bees collected with a humming noife. The form of the drops drew my attention, and led me to the following difcovery. Inftead of being round like drops which had fallen, each formed a fmall longifh oval. I foon perceived from whence they proceeded. The leaves covered with thefe drops of honey were fituated beneath a fwarm of the larger black vine. fretters; and on obferving thefe infects, I perceived them from :ime to time raife their bellies, at the exremity of which there then appeared a fmall drop of an amber colour, which they inftantly ejected from them to the diftance of fome inches. I found by talling fome of thefe drops which I had catched on my hand, that it had the fame flavour with what had before fallen on the leaves. I afterwards faw the fimaller fpecies of vine-fretters eject their drops in the fanse manner. This ejection is fo far from being a matter of indifference to thefeinfects themfelves, that it feems to have been wifely infltuted to procure cleanlinefs in cach individual, as well as to preferve the whole fwarm

Vol. VIII.
from def̂ruêtion ; for preffing as they co one upon another, they would otherwife foon be glued together; and rendered incapable of ftirring. The drops thas fpurted out fall upon the ground, if not intercepted by leaves or branches; and the fpots they make on flones remain fome time, unlefs walhed off by rain. This is the only honey dew that falls; and this neve: falls from a greater height than a branch where thefe infects can clufter.
"It is now eafy to account for a phænomenon which formerly puzzled me greatly. Walking andel: a lime-tree in the king's garden at Paris, I fitt my hand wetted with little drops, which I at firft took for finall rain. The tree indeed fhould have fheltered me from the rain, but I efcaped it by going from urder the tree. A feat placed near the tree fhone with thefe drops. And being then unacquainted with any thing of this kind, except the honey-dew found on the leaves of fome particular trees, I was at a lofs to conceive how fo glarinous a fubftance could fall from the leaves in fuch fmall drops: for I knew that rain could not overcome its natural artraction to the leaves till it became pretty large drops; but I have fince found, that the lime-tree is very fubject to thefe vine-fretters.
"Bees are nor the only infeets that feaft apon this honey; ants are equally fond of it. Led into this opinion by what naturalifts have faid, I at firf believed that the fivms in ty: leffer fpecies of thefe vine fretters had in their extremity a liquor trinicis one anan went in fearch of : but I foon difcovered that what drew the ants after thém came from elfewhere, both in the larger and leffer feccies, and that no liquor is difcharged by the horns. There are two fyecies of ants which fearch for thefe infects. The large black ants follow thofe which live on the oaks and chefnut; the leffer ants attend thofe on the elder. But as the ants are not, like the bees, provided with the means of fucking up fluids; they place themfelves near the vine-fretters, in order to feize the drop the moment they fee it appear upon the anus; and as the drop remains fome time on the fmall vine-fretter before they can calt it off, the ants have leifure to catch it, and thereby prevent the bees from having any fhare; but the vine-fretters of the oak and chefnut being ftronger, and perhaps more plentifully fupplied with juice, dart the drop inftantly, fo that the larger ants get very little of it.
"The vine-fretters finding the greaten plenty of juice in trees about the middle of fummer, afford allo at that time the greateft quantity of honey; and this leffens as the feafon advances, fo that in the autumn the bees prefer it to the flowers then in feafon. Though thefe infects pierce the rree to the fap in a thoufand places, yet the trees do not feen to fuffer at all from them, nor do the leaves lofe the leaft of their verdure. The hufbandman therefore atts injudicioufly when he deftroys them."

and trade in bome-iace. It is feated on the river Seine, in E. Long. o. 8. N. Lat. 17.49.

HCNi soit Quimal y pense, q. d. "Evil to him that evil thinks;" the motro of the mont noble order of the knights of the Garter. See Garter.

HCNITON, a very pleafant market and borough town in Devonfhire, fituated 156 miles W. of London, and $t 6$ eaft of Exeter. It confifts of about 400 houles; and has one church on a hill full half a mile from the town, and a chapel and frce grammar-fohool in the town. It is well paved and lighted, and lakes of water run through it. This place has fuffered by fires greatly in 1747 and 1765 . The market is on Saturday, and one fair in July; its manufactures are ferge, and rich bone lace and edgings. It was a chartered corporation by James II. but reverted to its old conflitation on the revolution, and is now governed by a portreeve who is chofen annually. It firft returned members the 28th Edw. I.

HONORIACI, in antiquity, an order of foldiery under the cattern empire, who introduced the Goths, Tandals, Alani, Suevi, \&c. into Spain. Didymus and Verinianus, two brothers, had, with great vigilance and valour, defended the paffages of the Pyreneans againft the Barbarians for fome time, at their own expence; but being ar length killed, the emperor Conftantins appointed the honoriaci to defend thofe paffages, who, not contented to lay themopen to all the nations of the north then ravaging the Gauls, joined themfelves to them.

HONOUR, a teftimony of efteem and fubmiffion, expreffed by words, actions, and an extérior behaviour, by which we make known the veneration and refpect we entertain for any one on account of his dig. nity or merit. The word bonour is alfo ufed in general for the efteem dae to virtue, glory, and reputation. It is allo ufed for virtue and probity themfelves, and for an exactuefs in performing whatever we have promifed; and in this laft fenfe we ufe the term, a man of honour. But honour is more particularly applied to two different kinds of virrue; bravery in men, and chaftity in women. - Virtue ard Honour were deified among the anicient Greeks and Romans, and had a joint temple confecrated to them at Rome: but afterwards each of of them had feparate temples, which were fo placed, that no one could enter the temple of Honour without paffing through that of Virtue ; by which the Romans were continually put in mind, that virtue is the only direct paih to true glory. Plutarch tells us, that the Romans, contrary to their ufual cuftom, facrificed to Honour uncovered; perhaps to denote, that whereever honour is, it wants no covering, but hows itfelf openly to the world.

The Spanifh hiftorians relate a memorable inftance of honotir and regard to truth. A Spanifl cavalier in a fudden quarrel flew a Moorifh gentleman, and fled. His purfuers foon loft fight of him, for he had unperceived thrown himfelf over a garden wall. The owner, a Moor, happening to be in his garden, was addreffed by the Spaniard on his knees, who acquainted him with his cafe, and implored concealment. "Eat this," fid the Moor (giving him half a peach), "you now "، know that you may confide in my protection." He then locked him up in his garden apartment, telling thim as foon as it was night he would provide for his
efcape to a place of greater fafety. The Moor then Honourwent into his houfe, where he had but jult feated himfelf, when a great croud with lond lamentations, came to his gate, bringing the cotpfe of his fon, who had juft been killed by a spaniard. When the firt hock of furprife was a little oyer, lie learnt from the defcription given, that the fatal deed was done by the very perfon then in his power. He mentioned this to no one; but as foon as it was dark retired to his garden, as if to grieve alone, giving orders that none fho Id follow him. Then accofing the Spaniard, he faid, "Chriftian, the perfon you have killed is my fon, his body is now in my houfe. You ought to fuffer; but you have eaten with me, and I have given you my faith, which muft not be broken." He then led the aftoniffed Spanjard to his ftables, mounted him on one of his fleeteft ho: fes, and faid, "Fly far while the night can covir you; you will be fafe in the morning. You are indeed guilty of my fon's blood: but God is juft and good; and I thank him I am innocent of yours, and that my faith given is preferved."

This point of honour is moft religioully obferved by the Arabs and Saracens, from whom it was adopted by the Moors of Africa, and by them was brought into Spain. The following inftance of Spanifh honour may fill dwell in the memory of many living, and de-, ferves to be handed down to the latef polierity. In the year 1746 , when the Britifh were in hor war with Spain, the Elizabeth of London, captain William Edwards, coming through the Gulph from Jamaica, richly laden, met with a mof violent form, in whicl the fhip fprung a leak, that obliged them, for the faving of their lives, to run into the Havannah, a Spanifh port. The captain went on hore, and direstly waited on the governor, told the occation of his putting in, and that he furrendered the flip as a prize, and himfelf, and his men as prifoners of war, only requefting good quarter. "No, Sir," replied the Spanilh governor, " if we had taken you in fair war at fea, or approaching onr coaft with hoftile intentions, your fhip would then have been a prize, and your people prifoners; but when, diftreffed by a tempeft, you come into our ports for the fafery of your lives, we, though enemies, being men, are bound as fuch by the laws of humanity to afford relief to diftreffed men who afk it of is. We cannot evep againft our enemies take an advantage of an act of God. You have leave therefore to unload your hip, if that be neceffary, to fop the leak; you may refit her here, and traffic fo far as fhall be neceflary to pay the charges; you may then depart, and I will give you a pals to be in force till you are beyond Bermuda: if after that you are taken, you will then be a lawful prize.; but now you are only a ftranger, and have a ftranger's right to fafety and protection." The fhip accordingly departed, and arrived fafe in London.

A remarkable inftance of the like honour is recorded of a poor unenlightened African negro, in Captain Snelgrave's account of his voyage to Guinea. A New England floop, trading there in 1752, left a fecond mate, William Murray, fick on fhore, and failed without him. Murray was at the houfe of a black named Cudjoe, with whom he had contracted an acquaintance during their trade. He recovered; and the floop being gone, he continued with his black friend till fome other opportunity fhould offer of his getting home.

## HON

Honour.
Ia the mein time a Butch hip came into the road, and fome of the blacks coming on board her, were treacherontly feized and carriedoff as their laves. The yclations and friends, tranfported with fudden rage, ran into the houfe of Cudjoe, to take revenge by killing Murray. Cudjoe ftopt them at the door, and demanded what they wanted. "The white men," faid they, " have carried away our brothers and fons, and we will kill all white men. Give us the white man you have in your houfe, for we will kill him." "Nay," faid Cudjoe, "the whire men that carried away your relations are bad men, kill them when you can take then ; but this white man is a good man, and you muft not kill him."-" But he is a white man," they cried; " and the white men are all bad men, we will kill them all." "Nay," faid he, " you muft not kill a man that has done no harm, snly for being white. This man is my friend, my houfe is his poft, 1 am his foldier, and muft fight for him ; you muft kill me before you can kill him. What good man will ever come again under my roof, if I let my floor be ftained with a good man's blood ?" The negroes feeing his refolution, and being convinced by his difcourfe that they were wrong, went away afliamed. In a few days Murray ventured abroad again with his friend Cudjoe, when feveral of them took him by the hand, and told him, "They were glad they had not killed him ; for as he was a good (meaning innocent) man, their God would have been very angry, and would have fpoiled their filhing."

Honour, in the beau monde, has a meaning materially different from the above, and which it is eafier to illuftrate than define. It is, however, fubject to a fyftem of rules, called the law of honour, conftructed by people of fafhion, calculated to facilitate their intercourfe with one another, and for no other purpofe. Confequently, nothing is conlidered as inconfiftent with honour, but what tends to incommode this intercourfe. Hence, as Archdeacon Paley fates the matter, profanenefs, neglect of public worfhip or private devotion, cruelty to fervants, rigorous treatment of tenants or other dependants, want of charity to the poor, injuries done to tradefmen by infolvency or delay of payment, with numberlefs examples of the fame kind, are accounted no breaches of honour; becaufe a man is not a lefs agreeable companion for thefe vices, nor the worfe to deal with in thofe concerns which are ufually tranfacted between one gentleman and another. -Again, the law of honour being conftituted by men occupied in the purfuit of pleafure, and for the mutal conveniency of fuch men, will be found, as might be expected from the character and defign of the law-makers, to be, in moft inflances, favourable to the licentious indulgence of the natural paffions. Thas it allows of fornication, adultery, drunkennefs, prodigality, duelling, and revenge in the extreme; and lays no ftrefs upon the virtues oppofite to thefe.
Honour or Rank.- The degrees of honour which are obferved in Britain may be comprehended under thefe two heads, viz. nobiies majores, and nobiles minnores. Thofe included under the firft rank are, archbihops, dukes, marquifes, carls, vifcounts, bihopls, and barons; which are alldiftinguifhed by the refpective ornaments
of their efcutcheons: and thofe of the laf are baronets, knights, efquires, and gentlomen. There are fome authors who will have baronets to be the laft under the firft rank ; and their reafor is, becaufe their honour is hereditary, and by patent, as that of the nobility. See Commonalty and Nobility.

Honours of $W$ ar, in a fiege, is, when a governor, having made a long and vigorous defence, is at laft obliged to furrender the place to the enemy for want of men and provifions, and makes it one of his principal articles to march out with the bonours of war: that is, with fhouldered arms, drums beating, colours flying, and all their baggage, \&c.

Military Honours. Allarmies falute crowned heads in the molt refpectful manner, drums beating a march, colours and ftandards dropping, and officers faluting. Their guards pay no compliment, except to the princes of the blood; and even that by courtefy, in the abfence of the crowned head.

To the commander in chief the whole line turns out without arms, and the camp-guards beat a march, and falute. To generals of horfe and foot they beat a march and falute. Lientenant-generals of ditto, three raffs, and falute. Major-generals of ditto, two ruffs, and falute. Brigadiers of ditto, refted arms, one ruff, and falute. Colonels of ditto, refted arms, and no beating. Centinels reft their arms to all field.oficers, and fhoulder to every officer. All governors, that are not general officers, fhall, in all places where they are governors, have one ruff, with refted arms; but for thofe who have no commilfion as governors, no drum fhall beat. Lientenant-governors fhall have the main-guard turned out to them with fhouldered arms.
Pruflian Honours of War, chiefly imitated by moft powers in Europe, are,

To the king all guards beat the march, and all officers filute. Field-marhals received with the march, and faluted in the king's abfence. General of horfe or foot, four ruffs; but if he commands in chief, a march and falute. Lieutenant-generals of horfe or foot, commanding or not, guards beat three ruffs. Major-generals of horfe and font, two ruffs. Officers, when their guards are under arms, and a general makes a fignal, maft reft to him, but not beat; when not got under arms, and a fignal made, only ftand by their arms. Village-guards go under arms only to the king, field-marthals, generals of horfe and foor, and to the general of the day. Generals guards go under arms only to the king, field-marlhals, and the general over whom they monnt. Commanding officers of regiments and battalions, their own quarter and rear guards to turn out ; but not to other field officers, unlefs they are of the day. Generals in foreign fervice, the fame.

Hovovrs paid by Centinels. Field-marhals; two centinels with ordered fire-locks, at their tent or quarters. Generals of horfe or foot; two centinels, one, with his fire-lock fhouldered, the other ordered. Lieute-nant-generals; one, with fire-lock ordered. Majorgenerals; one, with fire-lock fhouldered.

The firft battalion of Britifh guards go under arms to the king only; not to ftand by, nor draw up in the rear of their arms to any other; nor to give centinels to fareigners. Second and third battalions draw up behind their arms to the princes, and to field-marfinals;

## $\mathrm{H} O \mathrm{~N} \quad \mathrm{~L} 6_{44} \mathrm{~J} \quad \mathrm{HCOO}$

Henour, butwhen on grenalier guards or out-polts, theyturn out, as other guards do, to the officers of the day. They give one centinel with houldered arms to the princes of the blood, and to field-marhals when they lie alone in garrifon.

Court of Hoveur. Sec Court of Chivilar.
foumain of Hovour. In Britain the king is fo fyled, as being the foarce of honours, dignities, \&c. See Prerogative.

It is impoffible that government can be maintained withour a due fabordination of rank; that the people may know and difinguilh fuch as are fet over them, inorder to yield them their due refpect and obedience; and alfo that the uficers the mfelves being enconraged by emalation and the hopes of fuperiority, may the better difcharye their functions : and the Englifh law fippofes, that noone can be fogood a judge of their feveral merits and fervices as the king himfelf who employs them. It has therefore entrufted him with the fole power of conferring dignities and honours, in confidence that he will beftow them upon none but fuch as deferve them. And therefore all degrees of nobility, ef knighthood, and other titles, are received by immediate grant from the crown : cither expreffed in writing, by writs or lecters patent, as in the creaion of peers and baronets; or by corporeal inveftiture, as in the creation of a fimple knight.

From the fame principle alfo arifes the prerogative of ereciing and difpoling of offices: for honours and offices arein their nature converible and fynonymous. All offices ander the crown carry in the eye of the law an honour along with them; becaufe they imply a fuperiority of parts and abilities, being fuppofed to be always filled with thofe that are moft able to execute them. And, on the other hand, all honours in their original had daties or offices annexed to them : an earl, conves, was the confervator or governor of a county; and a knight, miles, was bound to attend the king in his wars. Fur the fame reafon therefore that honours are in the difpofal of the king, offices ought to be fo likewife; and as the king may create new titles, fo may he create new offices : but with this reftriction, that he cannot create new offices with new fees annexed to them, nor annex new fees to old offices; for this would be a tax apon the fubject, which cannot be impofed but by act of pariament. Wherofore, in 13 Hen. IV. a new office being created by the king's letters patent for meafuring cloths, with a new fee for the fame, the letters patent were, on account of the new fee, revoked and declared void in parliament.

Upon the fame or a like reafon, the king has alfo the prerogative of conferring privileges upon private perfons. Such as granting place or precedence to any of his fubjects, as fhall feem good to his royal wiffom : or fuch as converting aliens, or perfons born out of the king's dominions, into denizens; whereby fome very condiderable privileges of natural born fubjeets are conferred upon them. Such allo is the prerogative of erecting corporations; whereby a number of plivate perfons are united and knit together, and ejjoy many liberties, powers, and immunities in their prlitic capacity, which they were utterly incapable bi in the er natural.

Maids of Honour, are youag ladies in the qucen's Honour houlehold, whofe office is to attend the queen when the goes abroad, \&c. In Englard they are fix in number, and their falary 3001 . por annum each.
Hon our is particulariy applied in Euglih cultomsto the nore noble kind of feignories or lordhips, whereof other inferior lurdhips or manors hold or depend. As a manor confifts of feveral tenements, fervices, cuftoms, \&c. fo an honour contains divers manors, knights-fees, \&c. It wasallo formerly calledieneficium or royal fee, being always held of the king in capite.

Howcur-Point, in heradury, is that next above the centre of the efcutcheon, dividing the upper part into two equal portions.

Honourable, a title conferred on the younger fons of earls, the fons of vifcounts and barons; as alfo on fuch perfons as have the king's commifion, and upon thofe who enjoy places of truft and honour.

HONOURARY, fonething done or conferred upon any one, to do him honour. See the article Honour.

Honourary is fometimes inderftood of a perfon who bears or poffeffes fome poif or title, only for the name's fake, without doing any thing of the functions belonging to it, or receiving any advantage from it : thus we fay honourary counfellors, honourary fellows, \&c.

Honourary is alfo ufed for a lawyer's fee, or a fil lary given to public profeffors in any art or fcience.

HOOD (Robin), a famous outlaw and deer-ftealer, who chicfly harboured in Sherwood foret in Notting-. hamihire. He was a man of family, which by his pedigree appears to have had fome title to the eandom of Huntingdon ; and played his pranks about the latter end of the inth century. He was famons for archery, and for Lis treatment of all travellers who came in his way; levying contributions on the rich, and relieving the poor. Falling fick ar laft, and requiring to be blooded, he is faid to have been berrayed and bled to death. He died in 1247 ; and was buried at Kirklees in Yorkfhire, then a Benedicine monaftery, where his graveftone is fill fown.
Hood. See Chaperon and Cowl.
Hood, in falconry, is a piece ol leather, wherewith the head of a hawk, falcon, or the like, is covered.

Hond I/land, one of the Marquesas Iflands, in the South Sea. It was difcovered in April 1774 by Captain Cook, who gave it that name from the perfon who firft faw the land. It is the moft northerly of the clufter, and lies in S. Lat. 9. 25. W. Long. 139. 13.

HOOF, the horny fubftance that covers the feet of divers animals, $2 s$ oxen, horfes, \&c.

Hoof-bound, in farriery. Sce there, $f$ xlii.
HOOFT (Peter Cornclius Van), an eminent hiftorian and poet, born at Amfterdam in 1581. He was lord of Muyden, judge of Goyland, and knight of the order of St Michael. He died at the Hague in 1647. He wrote, 1 . An excellent hiftory of the Netherlands, from the abdication of Charies V. to the year 1588 . 2. Several Comedies, and other works. By thefe he acquired fach reputation, that the Flemings confidered him as the Homer and Taitus of the Netherlands.

HOOGUES.

## HO O $\quad 645$ ］HOO

Hooguef－ tratten

HOOGUESTRATTEN，a town of the Nether－ lands，in Dutch Brabant，and capital of a county of the lime name．E．Long．4．Ai．N．Lat．55． 25. HoOK，in angling，\＆c．See Fishgig Hook．
Hooks，in building，\＆c．are of various foes； fame of iron $a \cdots$ others of brads，viz．i．Amour－ hooks，which are generally of brats，and we to lay up arms upon，as grus，wursts，half－pikes，piles，jove－ loins，sec．2．Cafement－hooks．3．Chimney hooks， which are made both of brats and iron，and of differ． ene falchions：their fe is to fec the tongs and fire－ f hovel against．4．Curtain－hooks．5．Hooks for doors， gates，\＆ce．6．Double line－hooks，lire and fall． 7．Single line－hooks，large and fall．8．Tenter－ hooks ？ f various forts．See Tenter．

Hooks of a $j$ ip，are all chore forked timbers which are placed directly upon the keel，as well in lien run as in her rake．

Car－Houns，thole which being made fat to the end of a rope with a noose（like that which brewers ufe to fling or carry their barrels on），are made ute of for lings．

Foo：－Hoors，in a hip，the fame with futtock．
Loof－Hocks，a tackle with two hooks；one to hitch into a cringle of the main or fure－fail，in the boltrope at the leach of the fail by the clew；and the other is to hitch into a frap，which is fuliced to the chefs－tree．

Their ufe is to pall down the fail，and fuccour the tackles in a large fail and fief gale，that all the ftrefs may not bear upon the tack．It is alfo unfed when the tack is to be feized more fecure，and to take off or put on a bonnet or drabler．

Hook Pins，in architecture，are taper iron pins，only with a hook－head，to pin the frame of a roof or floor together．

HOOKAH，among the Arabs and other nations of the Eat，is a pipe of a fingular and complicated con－ fraction，through which tobacco is smoked；out of a fall veffel of a globular form，and nearly full of water，iffue two tubes，one perpendicularly，on which is placed the tobacco；the other obliquely from the tide of the veffel，and to that the perfon who mokes applies his mouth；the fmoke by this means being drawn through water，is cooled in its paffage and ret－ deed more grateful：one takes a whiff，draws up a large quantity of moke，puffs it out of his nofe and mouth in an immenfe cloud，and yaffes the hookah to his neighbour；and thus it goes round the whole circle．－The hookah is known and unfed throughout the eaft；but in thole parts of it where the refine－ menes of life prevail greatly，every one has his hookah faced to himself；and it is frequently an implement of a very coftly nature，being of filer，and fer with precious ftones：in the better kind，that tube which is applied to the mouth is very long and pliant；and for that reafon is termed the fake：people who ufa it in a luxurious manner，fill the veffel through which the moke is drawn with role water，and it thereby receives forme of the fragrant quality of that fluid．

HOOKE（Robert），a very eminent Engin mathe－ matician and philofopher，was the for of Mr John Hooke minifter of Freflwater in the ane of Wight， where he was born in 1635 ．He very early difeovered a genius for mechanics，by making curious toys with great art and dexterity．He was educated under Dr

Buffy in．Weftminfter school；where he not only ac－ quire a competent hare of Greek and Latin，loge－ the with an infight into Hebrew and tome other Oriental languages，but alfo made himself matter of a good part of cuclid＇s elements．About the year 1653 he went to Christchurch in Oxford，and in 1655 was introduced to the Phitofophical Society the er；where， difcovering his mechanic genius，he was frt employed to affect Dr Willis in his operations in chemiftry，and afterwards recommended to the honourable Robert Boyle，Eff；whom he ferved feveral years in the fame capacity．He was alpo initructed in aftronomy about this time by Dr Seth Ward，Savilian profelfor of that faience ；and from henceforward diftinguilied himfelf by many noble inventions and improvements of the mechanic kind．He invented Several aftrono－ mica inftruments，for making observations both at fa and land；and was particularly ferviceable to Mir Boyle，in completing the invention of the air－pump． Sir John Cutler having founded a mechanic fchool in 1664 ，he fetched an annual ftipend on Mr Hooke for life，intrufting the president，council，and fellows，of the Royal Society to direct hin with refpect to the number and fubject of his lectures；and on the nth of January $1664-5$ ，he was elected by that fociety curator of experiments for life，with an additional fa－ alary．In 1666 he produced to the Royal Society a model for rebuilding the city of London destroyed by fire，with which the fociety was well pleafed；and the lord mayor and aldermen preferred it to that of the city furveyor，though it happened not to be car－ riced into execution．It is aid，by one part of this mo－ del of Mr Hooke＇s，it was defigned to have all the chief frets，as from Leaden－hall to New gate，and the like，to lie in exact freight lines，and all the other crofs－ftreets turning out of them at right angles， with all the churches，public buildings，market； \＆c．in proper and convenient places．The rebuild－ ing of the city according to the act of parliament requiring an able person to fut out the ground to the proprietors，Mr Hooke was appointed one of the Surveyors；in which employment he got mont part of his fare，as appeared pretty evident from a large iron cheft of money found after bis death，locked down with a key in it，and a date of the time，which flowed it to have been fo flat up above 30 years．－ Mr Oldenburgh，fecretary to the Royal Society，dying in 1677，Mr Hooke was appointed to fapply his place，and began to take minutes at the meeting in October，but did not publifh the Tranfactions．In the beginning of the year 1687 ，his brother＇s dough－ ter，Mrs Grace Hooke，who had lived with hin fe－ veral years，died；and he was fo affected with grief at her death，that he hardly ever recovered it，but was obferved from that time to become leis active， more melancholy，and，if that could be，more cynical than ever．At the fame time，a chancery fut in which he was concerned with Sir John Cutler，on account of his falary for reading the Cutlerian lectures，made him very uneafy，and increafed his diforder．In 1691， he was employed in forming the plan of the hospital near Hoxton，founded by Robert Aft alderman of London，who appointed archbilhup Tillotfon one of his executors；and in December the fame year，Howe was created doctor of phis，by a warrant from that

Hooke. prelate. In Juy s 696, the chancery fuit with Sir John Cutler was wetermined in his favour, to his inexpreffible fatisfaction. His joy on that ocealion was found in his diary thus exprefted; Domshigissa: that is, Deo, Optimo, Naximo, fit honor, laus, gloria, it fiecula factulorum, Amen. 'f I was born on this day of July 1635 , and God hath given me a new birth: may I rever forget his mercies to me! while he gives me breath may I praife him!'" In the fame year r696, an order was granted to him for repeating moft of his experiments at the expence of the Royal Society, upon a promife of his finifhing the accounts, obfervations, and deductions from them, and of perfecting the defcription of all the inftruments contrived by him; but his increafing illnefs and general decay rendered him unable to perform it. He continued fome years in this wating condition; and thus lan. guihing till he was quite emaciated, he died March 3d, 1702, at his lodgings in Greflam College, and was buried in St Helen's church, Bifhopfgateftreet ; his corple being atiended by all the members of the Royal Society then in London.-As to Mr Hooke's character, it is not in all refpects one of the moft amiable. He made but a defpicable figure as to his perfon, being fhort of ftature, very crooked, pale, lean, and of a meagre affect, with dark brown hair, very long and hanging over his face uncut and lank. Suitable to his perfon, his temper was penurious, melancholy, miftruftful: and, lhough poffeffed of great philofophical knowledge, he had fo much ambition, that he would be thought the only man who could invent or difcover; and thus frequently laid claim to the inventions and difcoveries of others, while he boafted of many of his own which he never communicated. In the religious part of his character he was fo far exemplary, that he always expreffed a great veneration for the Deity; and feldom received any remarkable benefit in life, or made any confiderable difcovery in nature, or invented any afeful contrivance, or found oat any difficult problem, without fetting down his acknowledgments to God, as many places in his diary plainly fhow. He frequently ftudied the facred writings in the original; for lye was acquainted with the ancient languages, as well as with all parts of the mathematics.-He wrote, i. Lectiones Cutleriance, 2. Micrographia, or Defcriptions of minute bodies made by magnifying glaffes. 3. A defcription of heliofcopes. 4. A defcription of fome mechanical improvements of lamps and water-poifes, quarto. 5. Philofophical collections. After his death were publifhed, 6. Pofthumous work collected from his papers by Richard Waller fecretarytothe Royal Society.

HOOKE (Nathaniel), author of an efteemed Roman hiftory and other performances. Of this lcarned gentleman the earlieft particulars to be met with are furniflied by hinself, in the following modeft but manly addrefs to the Earl of Oxford, dated Oct. 7.
Nicbol's 1722: "c My Lord, the firft time I had the honour to Anecdetes of wait upon your lordfhip fince your coming to LonBowycr, don, your lordfhip had the goodncis to ank me, what 2 cc, way of life I was then engaged in ; a certain may- vaife honte hindered me at that time from giving a direct anfwer. The truth is, my lord, I caunot be faid at prefent to be in any form of life, but rather to live extempore. The late epidemical diftemper feizedne,

I endeavoured to be tich, imagined for a while that I was, and am in fome meafure happy to find my fulf at this inftant but juft worth nothing. If your lordhip, or any of your numerous friends, have need of a fervant, with the bare qualifications of being able to read and write, and to be honeft; I mall gladly undertake any employments your lordihip flall not think me unworthy of. I have been taught, my lord, that neither a man's natural pride, nor his felf-love', is an equal judge of what is it for him ; and I fhall endeavour to remember, that it is not the flort part we act, but the manner of our performance, which gains or lofes us the applaufe of Him who is finally to decide of all human actions. Ay Lord, I am juft now employed in tranf. lating from the French, a Hiftory of the Life of the late archbifnop of Cambray; and I was thinking to beg the hononr of your lordmip's name to protect a work which will have fo much need of it. The original is not yet publifhed. 'Tis written by the author of the 'Difcourle upon Epic Poetry,' in the new edition of Telemaque. As there are fome paffages in the book of a particular nature, I dare not folicit your lordhip to grant me the favour I have mentioned, till you firft have perufed it. The whole is fhort, and pretty fairly tranferibed. If your lordhip could find a fpare hour to look it over, I would wait upon your lordhip with it, as it may poffibly be no unpleafing entertainment. I hould humbly afk your lordfip's pardon for fo long an addrefs in a featon of fo much bufiners. Bat when fhould I be able to find a time in which your lordmip's goodnefs is not employed ? I am, with perfect refpect and duty, my lord, your lordihip's moft obliged, moft faithful, and moft obedient humble fervant, Nathaniel Hooke." The tranflation here fpoken of was afterwards printed in 12mo, 1723. From this period till his death, Mr Hooke enjoyed the confidence and patronage of men not lefs diftinguifted by virtue than by titles. In 17 . . he publified a tranf. lation of Ramfay's Travels of Cyrus, in 4to; in 1733 he revifed a tranflation of "the Hiftory of the Conqueft of Mexico by the Spaniards, by Thomas Towne fend, Efq;" printed in 2 vols 8 vo ; and in the fame year he publithed, in 410 , the firft volume of "The Roman Hiftory, from the building of Rome to the ruin of the Commonwealth; illuftrated with maps and other plates." In the dedication to this volume, Mr Hooke took the opportnnity of " publicly tettifying his juft efteem for a worthy friend, to whom he had been long and much obliged,'" by telling Mr Pope, that the difplaying of his name at the head of rhofe fheets was "like the hanging out a fplendid fign, to catch the traveller's eye, and entice him to make trial of the entertainment the place affords. Bat," he proceeds, " when I can write under my fign, that Mr Pope has been here, and was content, who will queftion the goodnefs of the houfe?" The volume is introduced by "Remarks on the Hifory of the Seven Roman Kings, occafioned by Sir Ifaac Newton's objections to the fuppofed 224 years duration of the royal fate of Rome." His nervous pen was next em. ployed in digefting "An Account of the conduct of the Dowager-duchefs of Marlborough, from her firft coming to Court to the year 1710, in a Letter from herfelf to Lord ——. in 1742. ' 8 vo. His reward on this

1akr. thisoccafion was confiderable; and the reputation he acquired by the performance much greater. The circumfances of this tranfaction are thus related by Dr Maty, in his memoirs of Lord Cheflerfield, vol.i. p. is6. "The relict of the great dake of Marlborough, being defirous of fubmitting to poterity her political conduct, as well as her lord's, applied to the earl of Chefterfield for a proper perfon to rective her information, and put the memoirs of her life into a proper drefs. Mr Hooke was recommended by him for that purpofe. He accordingly waited upon the duchefs, while fhe was fill in bed, oppreffed by the infiruities of age. But, knowing who he was, the immediately got herfelflifted up, and continuted fpeaking during fix hours. She delivered to him, without any motes, her accounts in the moft livcly as well as the moft connected manner. As the was not tired herfelf, flie would have continued longer the bufinefs of this firft fitting, had not the perceived that Mr Hooke was quite exlaufted, and wantedrefrefhment as well as reft. So eager was the for the completion o the work, that fhe indifted upon Mr Hooke's not leaving her houfe till be had fimiffed it. This was done in a fhort time ; and her Grace was fo well pleafed with the performance, that the complimented the author with a prefent of 50001 . a fom which far exceeded his expectations. As foon as he was free, and permitted to quit the houfe of his benefactrefs, he hattened to the earl, to thank him for his favour, and communicated to him his good fortune. The perturbation of mind he was under, occafioned by the frong fenfe of his obligation, plainly appeared in his ftammering our his acknowledgments : and he, who liad fucceeded fo well as the incerpreter of her Grace's fentiments, could farce uter his own." The fecond volume of his Roman hiftory appeared in 1745 ; when Mr Hooke embraced the fair occafion of congratelating his worthy friend the earl of Marchmont, on "that true glory, the confenting praife of the honeft and the wife," which his lordhlip had fo early acquired. To the fecond volume Mr Hooke added "The Capitoline Marbles, orConfular Calendars, an ancient Monument accidentally difcovered at Rome in the year 1545, dinring the Pontificate of Paul III." In i 758 Mr Hooke publifhed "Obfervations on, I. The Anfwer of M. 1'Abbe de Vertot to the late earl of Stanhope's Inquiry concerning the Senate of ancient Rome : dated December, I719. II. A Differtation upon the Conftitution of the Roman Senate, by a Gentleman : publifhed in 1743. III. A Treatife on the Roman Senate, by Dr Conyers Middleton: publifhed in I 747. IV. An Effay on the Roman Senate, by Dr Thomas Chapman: publifhed in 1750 ;" which he with great propricty inferibed to Mr Speaker Onflow. The third volume of Mr Hooke's Roman Hiftory, to the end of the Gallic war, was printed under his infpection before his laft illnefs; but did not appear till after his death, which happened in 1764 . The fourth andlaft volume was publifhed in 177 I . Mr Hooke left two fons; of whom one is a divine of the church of England; the other, a doctor of the Sorbonne, and profeffor of aftronomy in thai illuftrious feminary.

HOOKER (John), alias Vowell, was born in Exeter, about the year 1524 , the fecond fon of Robert Hooker, who in 1529 was mayor of that city,

He was infrugcd in grammar learning by Dr Moreman, vicar of Menhinit in Cornwall, and thence removed to Oxford; but to what college is uncertain. Havi!ng left the univerfity, he travelled to Germany, and refided fone time at Cologne, where he kentex. erciles ia law, and probably grabated. Thenco he went to Strafburg, where he ftudied divinity under the famous Fcter Martyr. He now returned to England, and foon aftr vilited France, intending to proceed to Spain and Italy; but was prevented by a declaration of war. Returning therefore again to England, he fixed his refidence in his native city, where having married, he was in 5554 elected chamberlain, being the firft perfon who held that office, and in 1571 reprefented his fellow-citizens in parliament. He died in the year r60r, and was buried in the cathedral church at Excter. He wrote, amoag other works, i. Order and ufage of keeping of parliaments in Ireland. 2. The events of comets or blazing fars, made upon the fight of the comet Pagonia, which appeared in November and December 1577. 3 An addition to the chronicles of Ireland from 1546 to 1568; in the fecond volume of Folinthed's chronicle. 4 A defcription of the city of Exerer, and of the fondrie aflaults given to the fame; Holinh. chron. vol. iii. 5. A book of enfigns. 6. Tranflation of the hiftory of the conqueft of Ireland from the Latin of Giraldus Cambrenfis; in Holinfa. chron. vol. ii. 7. Synopfis chorographia, or an hiftorical record of the province of Devon; never ptinted.

Hookek (Richard), a learned divine, was born at Heavy-tree, near Exeter, in the year 1553. Some of his anceftors were mayors of that ciry, and he was nephew to $70 h n$ Hooker the hiftorian. By this uncle he was firft fipported at the univerlity of Oxford, with the addition of a fmall penfion from Dr Jewel, bifhop of Salifbury, who in 156 I got him admitted one of the clerks of Corpas Chrifti college. In 1573 he was elected fcholar. In 577 he took the degree of matter of arts, and was admitted fellow the fame y ear. In July 1579 , he was appointed deputyprofefor of theHebrew language. In October, in the fame year, he was for fome trivial mifdemeanorexpelled the college, but was immeiliately reftored. In 558 i he took orders; and being appointed to preach at St Paul's crofs, he came to London, where he was unfortunately drawn into a marriage with Joan Churchman, the termagant daughter of his hoftefs. Having thus loft his fellowihip, he continued in the utmoft diftrefs till the year 1584 , when he was prefented by John Cheny, Efq. to the rectory of Dray-ron-Beaucham in Buckinghamfhire. In this retirement he was vifited by Mr Edwin Sandys, and Mr George Cranmer, his former pupils. They found him, with a Horace in his hand, tending fome fheep in the common field, his fervant laving been ordered home by his fweet Xantippe. They attended him to his houle ; but were foon deprived of his company by an order from his wife Joan, for him to come and rock the cradle. Mr Sandys's reprefentation to his father, of his cutor's fituation, procured him the maf. terfhip of the Temple, In this fituation he met with confiderable moleftation from one Travers, lec. turer of the Temple, and a bigoted Puritan, who in the afternoon endeavoured to confute the doctrine de. livered in the morning. From this difagreeable fitua-
fome countiy recirement, where he might profecute his fudics in tranquillity. Accordingly, in 159 I , he obtained tue rechory of Bofcomb in Wilthire, together with a prebend in the church of Salifbury, of which he was alfo made fub-dean. In 1594 he was prefented to the rectory of Bifhopfbourne in Kent, where he died in the year $16 c 0$. He was buried in his own parifh-church, where a monument was erectcd to his memory by William Cooper, Efq. He was a meek, pious, and learned divine. He wrote, r. Ecclefiaftical politie, in eight books, fol. 2. A difcourfe on juftification, \&c. with two other fermons, Oxford 1612, 4to. Alfo feveral other fermons printed with the Ecclefiaftical Politie.

Hooker, in naval architecturé, a veffel nuch ufed by the Dutch, built likea pink, but rigged and mafted like a hoy.-Hookers will lie nearer a wind than veffels with crofs-fails can do. They are frem 50 to 200 tons burden, and with a few hands will fail to the Eaft Indies.

HOOP, a piece of pliant wood, or iron, bent into a circular form, commonly ufed for fecuring cafks, \&c.

Driving a Hoop, a boyih exercife, of good effect in rendering the limbs pliable, and for frengthening the nerves.

HOOPER (John), bihop of Worcefter, and a martyr in the Proteftant caufe, was born in Somerfetflire, and educated at Oxford, probably in Mertoncollege. In 1518 he took the degree of bachelor of arts, and afterwards became a Cittercian monk; but at length, difiiking his fraternity, he returned to Oxford, and there became infected with Lutheranifm. In 1539, he was made chaplain and houle-fleward to Sir John Arundel, who afterwards fuffered with the protector in the reign of Edward VI. But that very catholic knight, as Wood calls him, difcovering his chaplain to be a heretic, Hooper was obliged to leave the kingdom. After continuing fome time in France, he returned to England, and lived with a gentleman called Seintlow: but being again difcovered, he efcaed in the habit of a failor to Ir cland; thence embarked for the centinent, and fixed his abode in Swizerland. -When king Edward came to the crown, Mr Hooper retarned once more to his native country. In 1550, by his old patron Sir John Arandel's intereat with the earl of Warwick, he was confecrated bihop of Gloucefter; and in 552 was nominated to the fee of Worcefter, which he held in commendam with the former. Rut queen Mary had fearce afcended the throne, before his lordfhip was imprifoned, tried, and, not choofing to recant, condemined to the flames. He fuffered this terrible death at Gloucefter, on the gth of February 1554, being then near 60 years of age. He was an avowed enemy to the church of Rome, and not perfectly reconciled to what he thoughr remnants of Popery in the church of England. In the former reigh he had been one of Bonner's accufers, which, fufficiently accounts for his being one of queen Mary's firt facrifices to the holy fee. He was a fer, fon of good parts and learning, as nay be found in Fox's Book of Martyrs.

Hooper (George), a very learned writer, hilhop of Bath and Wells, was well fkilled in mathematics, and 2
in the eaftern learning and languages. He fat in thofe fees above 24 years, often retufed a feat in the privy council, and could not be prevailed upon to accepr of the bilhopric of London on the death of bifhop Compton. He wrote, 1 . The church of England free from the imputation of Popery. 2. A difcourfe concerning Lent. 3. New danger of Prefbytery. 4. An inquiry into the ftate of the ancientmeafures. 5. De Valentinianorum harefi conjectura. 6. Several fermons; and other works.

HOOPING-covgh. See (the Index fubjoined to) Medicine.

HOOPOE. See Upupa.
HOORNBECK (John), profeffor of divinity in the univerfities of Leyden and Utrecht, was born at Harlaem in 1617. He underfood the Latin, Hebrew, Chaldaic, Syriac, Rabbinical, Dutch, German, Englifh, French, and Italian languages; and publifhed many works, among which are, I. A refutation of Socinianifm, in 3 vols 4to. 2. A treatife for the conviction of the Jews. 3. Of the converfion of the Heathens. 4. Theological infitutions, \& c. which are written in Latin. Mr Bayle reprefents him as a complete model of a good paftor and divinity profeffor.

Hop, in botany. See Humulus.
Hops were firft brought into England from the Netherlands in the year 1524. They are firf mentioned in the Englifh ftatute-book in the year 1552, viz. in the 5 and 6 of Edw..VI. cap. 5. And by an act of parliament of the firft year of King James I. annoi603, cap. 18. it appears, that hops were then produced in abundance in England.

The hop being a plant of great importance in the article of brewing, we fhall confider what relates to the culture and management of it, under the following heads:

Of Soil. As for the choice of their hop-grounds, they efteem the richeft and ftrongeft grounds the molt proper; and if it be rocky within two or three feet of the furface the hops will profper well; but they will by no means thrive on a ftiff clay or fpongy wet land.

The Kentifh planters account new land beft for hops; they plant theirlop gardens with apple trees at a large diftance, and with cherry-trees between; and when the land hath done its beft for hops, which they reckon it will in aboat ten ycars, the trees may begin to bear. The cherry trees laft about 30 years, and by that time the apple trees are large, they cut down the cherry trees.

The Effex planters account a moory land the moft proper for hops.

As to the fituation of a hop-ground, one that inclines to the fouth or weft is the moft eligible; but if it be expofed to the northeaft or fonthwelt winds, there fhould be a fhelter of fome trees at a diftance, becaufe the northeaft winds are apt to nip the tender fhoots in the fpring; and the fouthweft winds frequently break and blow down the poles a: the latter end of the fummer, and very much endarger the hops. In the winter-time provide your foil and manure for the hop-ground againft the following fpring.

If the dung be rotten, mix it with woor three parts of common earth, and let it incorporate together till

H O P
Ilops. you have occafion to make ufe of it in making your hop hills; but if it be new dung, then let it be mixed as beiore till the fpring in the next year, fornew dung is very injurious to hops.

Dung of all forts was formerly more commonly made ufe of than it is now, efpecially when rotied and turned to mould, and they who have no other manure muft ufe it ; which if they do, cows or hogs-dang, or human ordure mixed with mud, may be a proper compoft, becaufe hops delight mont in a manure that is cool and noift

Flanting. Hops require to be planted in a fituation fo open, as that the air may freely pafs round and between them, to dry up and difipate the moifture, whereby they will not be fubject to fire-blafts, which often deftroy the middles of large plantations, while the putfides remaid unhurt.

- As for the preparation of the ground for planting, it fhould, in the preceding winter, be plowed and harrowed even; and then lay upon it in heaps a good quantity of frefh rich earth, or well rotted dung and earth mixed together, fufficient to put half a bufhel in every hole to plant the hops in, unlefs the natural ground be vory frefliand good.

The hills where the hops are to be planted fhould be eight or nine feet afunder, that the air may freely pais between thein; for in clofe plantations, they are very fulject to what the hop-planters call the fire-blaft.

If the ground is intended to be ploughed with horfes between the hills, it will be beft to plant them in fquares checquerwife ; but if the ground is fo fmall that it be may done with the breaft-plough or fpade the holes fhould be ranged in a quincunx form. Which way foever you make ufe of ii, a ftake fhould be fuck down at all the places where the hills are to be made
Perfons ought to be very curious in the choice of the plants as to the kind of hop; for if the hop garden be planted with a mixture of feveral forts of hops that ripen at feveral times; it will canfe a great deal of trouble, and be a great detriment to the owner.

The two beft forts are the white and the grey kinds; the latter is a large fquare hop, more hardy, and is the more plentiful bearer, and ripens later than the former.

There is alfo another fort of the white kind, which ripens a week or ten days before the common; but this is tender, and a lefs plentiful bearer; but it has this advantage, that it comes firf to market.

But if three grounds, or three diftant parts of one ground, be planted with thefe three forts, there will be this conveniency, that they may be picked fucceffively as they becone ripe. The fets hould be five or fix inches long, with three or more joints or buds on them.
If there be a fort of hop you value, and would increafe plants and fets from, the fuperfloous binds may be laid down when the hops are tied, cutting off the tops, and burying then in the hill; or when the hops are dreffed, all the cuttings may be faved; for almoft every part will grow, and become a good fet the next fring.

As to the feafons of planting hops, the Kentifh planters beft approve the months of Qetober and March, beth which fometimes fucceed very well; but the fets are not to be had in October, unlefs from Vol. VIII.

## 649 」 HOP

fome ground that is to be defroged; and likewife there is fome danger that the fets may be rotted, if the win-

Hops. $\underbrace{\text { Hops. }}$ ter prove very wet; therefore the noft afial time of procuring them is in March, when the hops are cut and dreffed.

As to the manner of planting the fets, there fhould befive good fets planted in every hill, one in the middle, and the reft round aboul floping, the cops meeting at the centre; they muft fand even with the furface of the ground; lex them be profed clofe with the hand, and covered with fine earth, and a Rick should be placed on each fide the hill to fecure it.

The ground being thus planted, all that is to be done more during that fumacr, is to keep the hills clear from weeds, and te dig up the ground about the month of May, and to raife a fmall hill round about the plants. In Junc you muft twift the young biud or branches together into a bunch or knot; for if they are tied up to finall poles the firf year, in order to have a few hops from them, it will not countervail the weakening of the plants.

A mixture of compoft or dung being prepared for your hop ground, the beft time for laying it on, if the weather prove dry, isabout Michaclmas, that the wheels of the dung cart may not injure the hops, nor furrow the ground: if this be not done then, you muft be obliged to wait till the froft has hardened the ground, fo as to bear the dung cart; and this is alfo the time to carry on your new poles, to recruit thofe that are decayed, and to be caft out every year.

If you have good fore of dung, the beft way will be to Spread it in the alleys all over the ground, and to dig it in the winter following. The quantity they will require will be 40 loads to an acre, reckoning about 30 bufhels to the load.

If yon have not dung enough to cover all the ground in one year, you may lay it on one part one year, and on the reft in another, or a third ; for there is no occafion to dung the ground after this manner oftener than once in three years.

Thofe who have but a fmall quantity of dung, ufually content themfelves with laying on about twenty loads upon an acre cvery year; this they lay only on the hills, either about November, or in the fpring, which laft fome account the beft time, when the hops are dreffed, to cover them after they are cut ; but if it be done at this time, the compolt or dung ought to be very well rotted and fine.

Drefling. As to the dreffing of the hops, when the hopagronnd is dug in January or February, the earth about the hills, and very near them, ought to betaken away with a fpade, that you may come the more conveniently at the fock to cut it.

About the end of February, if the hops were planted the fpring before, or if the ground be weak, they ought to be dreffed in dry weather; but elfe, if the ground be ftrong and in perfection, the middle of March will be a good time; and the latter end of March, if it be apt to produce over-rank binds, or the beginning of April may be foon chongh.

- Then having with an iron picker cleared away all the earth out of the hills, fo as to clear the fock to the principal roots, with a harp linife you murt cut off all the fhoots which grew up with the binds the laft year; and alfo all theyoung fuckers, that none be.left to ram 4 M

## H O P

in the alley, and weaken the hill. It will be proper to cut one part of the ftock lower than the other, and alfo to cut that part low that was left highefe the preceeding year. By purfuing this method you may expect to have ftronger buds, and alfo keep the hill in good order.

In dreffing thofe hops that have been planted the year before, you ought to cut off both the dead tops and the young fuckers which have fprung up from the fets, and alfo to cover the ftocks with fine earth a finger's length in thicknefs.

The poling. Abont the middle of April the hops are to be poled, when the fhoots begin to fprout up; the poles muft be fet to the hills deep into the ground, with a fquare iron picker or crow, that they may the better endure the winds; three poles are fufficient for one hill. Thefe fhould be placed as near the hill as may be, with their bending tops turned outwards from the hill, to prevent the binds from entangling; and a fpace berveen two poles onght to be left open to the fonth to admit the fur-beams.

The poles ought to be in length rof or 20 fect, more or lefs according as the ground is in ftrength; and great care muft be taken not to overpole a young or weak ground, for that willdraw the ftock too much, and weaken it. If a grond be overpoled, you are not to expect a good crop from it; for the branches which bear the hops will grow very little till the binds have over-reachedthepoles, which they cannot do when the poles are toolong. Two fmall poles are fufficient for a ground that is young.

If you wait till the fprouts or young buds are grown to the length of a foot, yon will be able to make a betterjudgment where to place the largeft poles; but if you ftay till they are fo long as to fall into the alleys, it will be injurious to them, becaufe they will entangle one with another, and will not clafp about the pole readily.

Mapple or athen poles are accounted the beft for hops, on which they are thought to profper beft, becaufe of their warmth; or elfe becaufe the climbing of the hop is promoted by means of the roughriefs of the bark. But for durability, afhen or willow poles are preferable; but chefinut poles are the moft durable of all.

If after the hops are grown up you find any of them have been under-poled, taller poles may beplaced near thofe that are too fhort to receive the binds from them.

The tying. As to the tying of hops; the buds that do not clafp of themfelves to the nearen pole when they are grown to three or four feet high, muft be guided to it by the hand, turning them to the fun, whofe courfe they will always follow. They muft be bound with withered rufles, bunnot fo clofe as to hinder them from climbing up the pole.

This you muft continue todo till all the poles are furnifhed with binds, of which two or three are enough for a pole; and all the fpronts and binds that you have no occafion for, are to be plucked up; but if the ground be young, then none of thefe ufelefs binds hould be plucked up, but hould be wrapt ap together in the middle of the hill.

When the binds are grown beyond the reach of your hands, if they forfake the poles, you fhould make wfe of a ftand-ladder in tying them up.

Towards the latter end of May, when you have made an end of tying them, the ground muft have the fimmer dreffing : this is done by calting up with the fpade fome fine earth into every hill; and a monrh after this is done, you muft hoe the alleys with a Dutch hoe, and make the hills up to a convenient bignefs.

Gathering. About the middle of July hops begin to blow, and will be ready to gather about Bartholomew Tide. A judgment may be made of their ripenefs by their ftrong fcent, their hardnefs, and the brownifh colour of their feed.

When by thefe tokens they appear to be ripe, they muft be picked with all the expedition poffible; for if at this time, a ftorm of wind fhould come, it wonld do them great damage by breaking the branches, and braifing and difcolouring the hops; and it is very well known'that the hops being picked green and bright, will fell for a third part more than thofe which are difcoloured and brown.

The moft convenient way of picking them is into a long fquare frame of wood, called a bin, with a cloth hanging on tenter-hooks within it, to receive the hops as they are picked.

The frame is compofed of four pieces of wood joined together, fupported by four legs, with a prop at each end to bear up another long pjece of wood placed at a convenient height over the middle of the bin; this ferves to lay the poles upon which they are to be picked.

This bin is commonly eight feet long, and three feet broad; two poles may be laid on it at a time, and fix or eight perfons may work at it, three or four on each fide.

It will be beft to begin to pick the hops on the eaft or north fide of your ground, if you can do it conveniently; this will prevent the fouth weft wind from breaking into the garden.

Having made choice of a plot of the ground containing I I hills fquare, place the bin upon the hill which is in the centre, having five hills on each fide; and when thefe hills are picked, remove the bin into another piece of ground of the fane extent, and fo proceed till the whole hop-ground is finithed.

When the poles are drawn up to be picked, you muft take great care not to cur the binds too near the hills, efpecially when the hops are green, becaufe it will make the fap to flow exceffively.

The hops maft be picked very clean, i.e. free from leaves and ftalks; and, as there mall be occation, two or three times in a day the bin muft be emptied into a hop-bag made of coarfe linen cloth, and carried immediately to the oaft or kiln in order to be dried; for if they hould be long in the bin or bag, they will be apt to hear and be difcoloured.

If the weather be hot, there fhould no mere poles be drawn than can be picked in an hoar, and tiey flould be gathered in fair weather, if it can be, and when the hops are dry; this will fave fome expence in firing, and preferve their colow better when they are dried.

The crop of hops being thins beftowed, you are to. take care of the poles againft another year, which are beft to be laid up in a fhed, having firft ftripped off the haulm from them; but if you have not that conveni-

## HOP <br> [

Hops.
ency, fet up three poles in the form of a triangle, or fix poles (as you pleafe) wide at bottom; and having fet them into the gronnd, with an iron picker, and bound them together at the top, fet the reft of your poles about them; and being thus difpofed, none but thofe on the outtide will be fubject to the injuries of the weather, for all the inner poles will be kept dry, unlefs at the top; whereas, if they were on the ground, they would receive more damage in a formight than by their ftanding all the reft of the year.

Drying. The beft method of drying hops is with charcoal on an oaft or kiln, covered with hair-cloth, of the fame formand fafhion that is ufed for drying malt. There is no need to give any particular directions for making the fe, lince every carpenter or bricklayer in thofe countries where hops grow, or malt is made, knows how to build them.

The kiln ought to be fquare, and may be of 10,12 , 14 , or 16 feet over at the top, where the hops are laid, as yout plantation requires, and your room will allow. There ought to be a due proportion between the height and breadth of the kiln and the beguels of the fteddle where the fire is kept, viz. if the kiln be 12 feet fquare on the top, it ought to be nine feet high from the fire, and the fteddle ought to be fix feet and a half fquare, and fo proportionable in other dimenfions.

The hops muft be firead even upon the oaft a foot thick or more, if the depth of the curb will allow it ; but care is to be taken not to overload the oaft if the hops be green or wet.

The oaft ought to be firft warmed with a fire before the hops are laid on, and then an even fteady fire muft he kept under them; it muft not be too fierce at firft, left it forch the hops, nor muft it be fuffered to fink or flacken, but rather be increafed till the hops be nearly dried, left the moifture or fweat which the fire has raifed fall back or difcolour them. When they have lain about nine hours they muft be turned, and in two or three hours more they may be taken off the eaft. It may be known when they are well dried by the brittlenefs of the ftalks and the eafy falling off of the hop leayes.

It is found by cxperience that the turning of hops, though it be after the moft eafy and beft manner, is not only an injury or wafte to the hops, but alfo an expence of fuel and time, becaufe they require as much fuel and as long a time to dry a fuall quantity, by turning them, as a large one. Now this may be prevented by having a cover (to be let down and raifed at pleafure) to the upper bed whereon the hops lie. This cover may alfo be tinned, by nailing fingle tin plates over the face of it ; fo that when the hops begin to dry, and are ready to burn, i.e. when the greateft part of their moifture is evaporated, then the cover may be let down within a foot or lefs of the hops (like a reverberatory), which will reflest the heat upon them, fo that the top will foon be as dry as the lowermoft, and every hop be equally dried.

Bagging. As foon as the hops are taken off the kiln, lay them in a room for threc weeks or a month to cool, give, and toughen ; for if they are bagged immediatcly they will powder, but if they lie a while (and the longer they lie the becter, provided they be covered clofe with blankets to fecure them from the
air) they may be bagged with more fafety, as not being liable to be broken to powder intreading; and this will make them bear treading the better, and tinc harder they are trodden the becter they will keep.

The common method of bagging is as follows: they have a hole made in an upper floor, cither round od fquare, large enough to receive a hop bag, which confifts of for." ells and a half of cll-wide cloth, and alfo contains ordinarily two hundred and a half of hops; they tie a handful of hops in each lower corner of the bag to ferve as handles to it ; and they faften the mouth of the bag, fo placed that the hoop may reft upon the edges of the hole.

Then he that is to tread the hops down into the bag, treads the hops on every fide, another perfon continually putting them in as he treads them till the bag' is full; which being well filled and trodden, they unrif the faftening of the bag to the hoops, and let it down, and clofe up the mouth of the bag, tying up a handful of hops in each corner of the mouth, as was done in the lower part.

Hops being thus packed, if they have been well dried, and laid up in a dry place, will keep good feveral years; but care mult be taken that they be neither deftroyed nor fpoiled by the mice making their nefts in them.

Produce. The charge of an acre of hop-ground in moft parts of England where hops are cultivated, is computed thas: three pounds for the hufbandry, four pounds for the wear of the poles, five pounds for picking and drying, one pound ten fhillings for dung, one pound for rent, though in fome places they pay four or five pounds an acreyearly for the rent of the land, and ten fhillings for tythe; in all L. 15 a year. The hopplanters in England reckon that they have but a moderate return, when the produce of an acre of hops does not fell for more than L.30. They frequently have fifty, fixty, eighty, or a hundred pounds; and in a time of general fcarcity conliderably more : fo that, upon the whole, if the total charge of an acre of hops is computed at fifteen pounds a year, and its average produce at thirty pounds, the clear profit from an acre will befffeen pounds a year. But the plantation of hops has lately fo much increafed, and the average produce fo much exceeded the confumption, that hops have been with many planters rather a lofing than a very profitable article.
$U_{f e s}$. In the fpring-time, while the bud is yet tender, the tops of the plant being cut off, and boiled, are ate likeafparagus, and found very wholefome, and effectual to loofen the body ; the heads and tendrils are good to purify the blood in the fcurvy, and moft cutaneous difeafes; decoctions of the flowers, and fyrups thereof, are of ufe againft peftilential fevers ; Juleps and apozems are alfo prepared with hops for hypochondriacal and hyfterical affections, and to propiote the nonfes.

A pillow ftaffed with hops and laid under the head,' is faid to procure fleep in fevers attended with a delirium. But the principal ufe of hops is in the brewery for the prefervation of malt liquors; which by the fuperaddition of this balfamic, aperient, and diuretic bitter, become lefs vifcid, lefs apt to turn four, more detergent, more difpofed to pafs off by urine, and in general more falubrious. They are faid to contain an

## HOl

Hops,
Hove.
agreeableodoriferous principle, which promotes the vinows fermenration. When figh ly boilcd or infufed in varm water, they inereafe is firitasity.

Lums reluing to Hops. Dy 9 Amue, cop. 121. an additional duty of 3 d a poind is laid on all hops imporrel, over and above all other duties; and hops landed before entry and payment of daty, or without warrant forlaning, hall be forfeited, and barnt ; the fhip alfo thall be forfeited, and the perfon concerned in inporting or landing thall forftir 5 l, a hundred weight. 7 Gco. H. cap. 19. By 9 Ante, cup. I2. therc hall be paid a duty of id. for every pound of hops grown in Creat Britain; and made fit for ufe, within fix months after thcy are cured and bagged; and hopgrounds are required to be entered on pain of 40 s . an acre. Places of curing and keeping are alfo to be entered, on pain of 501 . which nay be vifited by an officer at any time without obftruction, under the penalty of 201 . All hops flall, within fix weeks after gathering, be brought to fuchiplaces to be cured and bagged, on pain of 5 s . a pound. The re-bagging of foreign hops in Britifh bagging for fale or exportation, incurs a forfeiture of rol. a hundred weight; and defrauding the king of his duty by ufng twice or oftener the fame bag, with the officer's nuark upon it, is liable to a penalty of 40 1. The removal of hops before they have been bagged. and weighed, incurs a penalty of 501. Concealment of hous fibjects to the forfeiture of 201. and the concealed hops; and any perfon who hall privately convey away any hops, with intent to defraud the king and owner, fhall forfeit 5 s . a pound. And the duties are required to be paid within fix months after curing, bagging, and weighing, on pain of double duty, two-thirds to the king, and one-third to the informer. No common brewer, \&c. hlall ufe any bitter ingredient inftead of hops, on pain of 201 . Hops which have paid the duty may be exported to Ireland; but by 6 Geo. II. cap. Ir there fhall be no drawback; and by 7 Geo. II. cap. 19. no foreign hops fhall be landed in Ireland. Notice of bagging anid weighing fhall be fent in writing to theofficer, on pain of 501 . 6 Geo. cap. 21. And by 14 Geo. III. cap. 68. the officer fhall, on pain of 51 . weigh the bags or pockets, and mark on them the true weight or tare, the planter's name, and place of abode, and the date of the year in which fuch hops were grown ; and the altering or forging, or obliterating fuch mark, incurs a forfeiture of pol-The owners of hops hall keep their oafts, $\& c$. juft weights and fcales, and permit the officer to ufe them on pain of 201. 6. Geo. cap. 21. And by Io Geo. III. cap. 44. a penalty of iool. is inflicted for falfe fcales and weights. The owners are allowed to ufe cafks inftead of bags, under the fame regulations. 6 Geo. cap. 21. If any perfon thall mix with hops any drug to alter the colour or fcent, be fhall forfeit 5 1. a hundred weight. If any perfon fhall unlawfully and maliciouly cut hop binds growing on poles in any plantation, he thall be guilty of felony without benefit of clergy: 6. Geo. 11. cáp. 37. By a late act, five per cent. is added to the duties on hops.

HOPE ( Dr John), profeffor of botany in the univerfity of Edinburgh, was born at Edinburgh on the 1oth of May 1725. He was the fon of Mr Robert Hope a refpectable furgeon, whofe father, Lord Rankeiler, made a diftinguighed figure as one of the fena-
tors of the college of Juftice in the king dom ot Scotland. By his mother he was defcendediron the ancient family of Glats of Sauchie in Stirlinginice. After finishing the ufual courfe of feltool education, he entered to the univerfity of Edinburgh; and havinc, as it were, an hereditary predilection for the healing art, his attention was foon particularly directed to that branch of fcience. Having finilhed his academical education at Edinburgh, he vifited other medical fchools; and upon his return to his native country, he obtained the degree of Doctor of Medicine from the univerfity of Glalgow in the beginning of the yeat 1750. A few months after that, he was admitted a member of the royal college of phylicians in Edinburgh, and entered upon the practice of medicine in that city. After he had continued about ten years in practice, difcharging the duties of his profeffion with a degree of judgment, attention, and humanity, which did him great honour ; by the death of Dr Alfton the botanical chair in the univerfity became vacant; when Dr Hope, by a commiffion from his fovercign, dated the I3th of April I76I, was appointed king's botanift for Scotland and fuperintendant of the royal garden at Edinburgh. A few weeks after this he was elected by the town-council of Edinburgh as the fucceffor of Dr Alfton in the pirofeliorlhips both of botany and materia medica; and thus be became one of the niembers of the faculty of medicine in the univerfity. After he had continued for about fix years to give regular courfes of lectures on thefe fubjects, with no lefs credit to himfelf than benefit to his hearers, teaching the one branch during the fummer, and the other during the wiater months, he found that his bealth was confiderably impaired; which induced him to form the refolution of retigning the materia medica, and of afterwards folely confining his labours as a teacher of his favourite fcience of botany. This refolation he carried into effect in the year 1768 ; and by a new commiffion from his majefty, dared the 8th of May, he was nominated regius profeffor of medicine and botany in the univerfity, and had the offices of king's botanift and fuperintendant of the royal garden conterred upon him for life, which till that time had been always granted during pleafure only.

Dr Hope's predeceffor, although a learned and worthy man, could never obtain fufficient public fundsfor the eftablifhment of a proper botanical garden at Edinburgh ; and from the fiftuation as well as the extent of the garden at that time, joined to the fmallnefs of its confervatories for plants, it could boaft of no riches in the way of exotics. The only field for improvement, therefore, to the botanical Itudent, was. the environs of Edinburgh, to which it muft indeed be allowed that nature has been uncommonly liberal, in affording a very great variety of indegenons vegetables. In this fruation, the eftabiifliment of a new garden natirally fuggefted itfelf as a grand and important object; and itwas accomplifhed by the zeal and indaftry of Dr Hope, aided by the munificence of his prefent majefty. The firftaffiftance given to the undertaking. was under the adminiftration of Lord Bute ; and atterwards, under that of the duke of Portland, a permanent fund for the fupport of the botanical garden at this place was eftablifhed, which may render itnot inferior to any in Europe. Dr Hope's anweatied cx-

## HO P

Hope.
ertions in procuring for the garden the vegetable productions of every climate, could not be exceeded. His endeavours were constantly directed in adding not to the flow; but to the riches of the garden ; and they were employed with foch fincecfs, that in a very holt time the intelligent boanift might gratify his curiolily, in contemplating the rarefy plants of every commtry which has yet been explored. Nor were his induftious exertions more afliduoully beftowed in forming and enriching the garden, than in cherishing and promoting a zeal for botanical facies. From but a very fall number of lectures, which was all that his predeceflor ever gave, he gradually prolonged the courfe till it became as complete as any one delivered at this place; and during all this extended courfe, he taught in fuck a manner, as clearly demonstrated a degree of ardour and enthufiafm in himself, which could hardly fail to infpire fimilar emotions in others. But even fuch precept and fuck example were not the only means he employed for directing the attention of the industrious, the ingenious, and laudably ambithous ftudent, to this branch of faience. By beftowing, entirely at his own expense, an annual gold medal, as a teftimony of fuperior merit, he gave a fur to exertion, from which the toils of ftudy were alleviated by the love of fame, and the labours of industry converted into the pleafures of emulation.

Dr Hope married the daughter of Dr Stevenfon an eminent phyfician in Edinburgh; by whom he had four cons and one daughter. He died in November 1786. He was a member not only of the Royal Sociery of London, but aldo of feveral foreign focieties; and at the time of his death he held the diftinguilhed office of president of the royal college of pliyficians. Dr Hope, with whom it was a principal object to make botany fubfervient to the acts more immediately utefull to life, and particularly to medicine, was one of the fief who, in conjunction with the late Sir Alexander Dick, turned his attention to the practical caltivation of rhubarb in Britain; and he demonftrated the facility with which it might be multiplied. He lived to fee it cultivated in foch abundance, that the British market was no longer under any neceflity of depending upon foreign climates for this valuable and once expensive medicine; also he has flown that the asafetida plant, by proper attention, not only bears the viciffitudes of the climate, but grows in fuch a vigorous and healthfulitate as to be fully impregnated with its active gum. There is therefore reafon to hope, that by the exertions of future industry, the hop of the apothecary may be fupplied with this article aldo from his own garden. Betides being the author of come papers in the Philofophical Tranfactions, particularly two reflecting the ufeful plants jut mentioned, Dr Hope had in contemplation a more extenfiye botanical work, on which he had beftowed much ftady and reflection. It was his with to increafe thole advantages which refult from the very ingenious and ufeful artifacial arrangements of Linnæus, by conjoining it with a fyftem of vegetables diftributed according to their great natural orders. For this parpofe, no inconfiderable part of that time which he could fare from other avoidable engagements was employed in attempts to improve and perfect the natural method in the arrangemont of vegetables. In this work he has made very

6537 H O
confiderable progress; and it mut be the fubject of fincere regret to every lover of botany, it from the event of his death the public fall be for cur deprived of thole fruits of has labours.

Hope, ill ethics, is the define of forme good, attended with a belief of the polibility at leaf, of obtaining it, and enlightened with joy, greater or left, according to the greater or clefs probability of our paneling: the object of our hope. Alexander, preparing for his Alan expedition, diftribated his hereditary dominions among his friends; allowing to forme villages, to others boroughs, to others cities; and being anked what he had referved for himself, replied, Hope.

Good-Hope: See Good-Hope.
HOPEA, in botany: A genus of the polyandria order, belonging to the polydelphia class of plants. The calyx is quinquefid, fuperior ; the corolla penta. petalous; the ftamina are many and collated into five pencils; there is one frye; the fruit is a plum with a trilocular kernel. There is only one Species, the tinctora, a native of Carolina.

HOPKINS (Ezekiel), bifhop of Derry in Ireland, was the fol of an obscure clergyman in Devonfhire; and was for lome time a chorister of Magdalen college, Oxford; and uther of the adjoining fehool. He was afterwards a Prefbyterian minifter, and was extolled as an excellentopreacher. John, lord Roberts, happening to hear him preach, was fo pleafed with his perfon, his difcourfe, and his manner, that he retaine him as his chaplain when he was font in quaity of lord lieutenant into Ireland, and preferred him to. the deanery of Raphoe; and on his being recalled, io fronglyrecommended him to his fucceffor, that he was foo preferred to the bifhopric of Raphoe, whence he was tranflated to Derry. During the war under the earl of Tyrconnel at the revolution, he withdrew into England; and was chosen minifter of St Mary, Aldermanbury, in London, where he died in 1690. His Sermons, his expofition of the ten commandments, and that of the Lord's-prayer, are much efteented. His works were printed together in 1710 , folio. He was the father of Mr Charles Hopkins, Several of whole poetical pieces are in Dryden's Mifcellanics.

HOPLITES, Host IT $x$ (formed of onto armour), in antiquity, were foch of the candidates at the Olym. pic and other faced games as ran races in armour.

One of the finest pieces of the famous Parrhafirn was a painting which reprefented two hoplites; the one running, and feeming to fweat large drops; the other laying his arms down, as quite f pent and out of breath.

HOPLITODROMOS (formed of omicy armour, and $\delta_{p o \mu \omega}$ I run), in the ancient gymnastic forts, a term applied to fuch perfons as went through thole toilfome and robust exercifes: in complete armour ; by which the exercife became much more violent, and the wearing of armour in the time of battle mach more eafy.

HOPLOMACHI, о о $\lambda 0 \mu a \chi$ (composed of $\theta \pi \lambda c y$ armour, and $\mu \times x \cdot \mu$ as I fight), in antiquity, were a fpecies of gladiators who fought in armour; either completely armed from head to foot, or only with a calk and cuirass.

HOPPER, a veffel wherein fced-corn is carried at the tine of lowing.

[^50] es. The:

## HOR

The word is alfo ufed for the wooden trough in a mill, into which the corn is put to be ground.

HOR, a mountain, or mountainous tract of Arabia Petræa, fituated in that circuit which the Ifraclites took to the fouth and fouth-eaft of Edom in their way to the borders of Moab: on this mountain Aaron died. The inhabitants were called Horttes. This tract was alfo called Seir, either from a native Horite, or from Efau, by way of anticipation from his hairy habit of body; whofe pofterity drove out the Ho. rites.

## HOR凡. See Hours.

HOK ЖA, in antiquity, folemn facrifices, confift: ing of fruits, \&c. offered in fpring, fummer, autimn, and winter; that heaven might grant mild and temperate weather. Thefe, according to Meurfius, were offered to the goddeffes called apar; i. e. Hours, who were three in number, attended upon the Sun, prefided over the four feafons of the year, and had divine worfhip paid them at Athens.

HORAPOLlo, or Horus Apollo, a grammarian of Panaplus in Egypt, according to Suidas, who firft taught at Alexandria, and then at Conftantinople under the reign of Theodofius: There are extant under his name, two books on the hieroglyphics of the Egyptians; which Aldus firft publifhed in Greek in 1505, in folio; and they have often been publifhed fince, with a Latin verfion and notes. It is not certain, however, that the grammarian of Alexandria was the author of thefe books; they being rather thought to belong to another Horapollo of more ancient date : on which head, fee Fabricius' Bibliotheca Greca.

HORATII, three Roman brothers, who, under the reign of Tullus. Hoftilius, fought againft the three Curiatii, who belonged to the Albanian army. Two of the Horatii were firft killed; but the third, by his addrefs, fincceffively flew the three Curiatii, and by this victory rendered the city of Alba fubject to the Romans. See Rome.

HORATIUS, furnamed Cocles from his loding an cye in combat, was nephew to the conful Horatius Pulvillus, 'and defcended from one of the three brothers who fought againft the Curiatii. Porfenna, laying fiege to Rome, drove the Romans from Janiculum; and parfued them to the wooden bridge over the Tiber, which joined the city to Janiculum. Largins, Herminios, and Horatius Cocles, fuftained the fhock of the enemy on the bridge, and prevented their entering the city with the Romans; but Largins and Herminius having paffed the bridge, Horatius Cocles was left alone, and repulfed the enemy till the bridge was broken under him: he then threw hinufelf armed into the Tyber, fwam acrofs the river, and entered Rome in triumph.

Horatius (Quintus Flaccus), the mon excellent of the Latin poets of the lyric and fatirical kind, and the moft judicions critic in the reign of Auguftus, was the grandion of a freedman, and was born at Venufum 64 B. C: He had the beft mafters in Rome, after which he completed his education at Athens: Having taken up arms, he embraced the party of Brutus and Caftus, but left his fhield at the battle of Philippi. Some time after, he gave himfelf up entirely to the ftudy of polite literature and poetry. His ta.
lents foon made him known to Augufus and Macænas, who had a particular efteem for him, and loaded him with favours. Horace alfo contracted a ftrict friendfhip with Agrippa, Pollio, Virgil, and all the other great men of his time. He lived without ambtion, and led a tranquil and agreeable life with his friends; but was fubject to a defluxion in his eyes. He died at the age of 57 . There are fill extant his Odes, Epiftles, Satires, and the art of poetry; of which there have been a great number of editions. The beft are thofe of the Louvre, in 1642 , folio; of Paris, 1691, quarto; of Cambridge, 1699 ; and that with Bentley's emendations, printed at Cambridge in $\mathbf{x I I}$.

HORD, in geography, is ufed for a company of wandering people, which have no fettled habitation, but ftroll about, dwelling in waggons or under tents, to be ready to fhift as foon as the herbage, fruit, and the prefent province is eaten bare: fuch are feveral tribes of the Tartars, particularly thofe who inhabit beyond the Wolga, in the kingdom of Aftracan and Bulgaria.

A hord confifts of 50 or 60 tents, ranged in a circle, and leaving an open place in the middle. The inhabitants in each hord ufually form a military compary or troop, the eldeft whereof is commonly the captain, and depends on the general or prince of the whole nation.

HORDEUM, bariey, in botany: Agenus of the digynia order, belonging to the triandria clafs of plants; and in the natural method ranking under the 4th order, Gramina The calyx is lateral, bivalved, uniflorous, and triple. The involucrum confifts of fix leaves, and contains three flowers. There are eight 'fpecies; only one of which, viz. the murinum, or wall-barley-grafs, is a native of Britain. The native place of the vulgar, or common barley cultivated in the fields, is not known. For the culture, \&c. of common barley. fee Agriculture, no 139 - 146.

HORDICALIA; or Hordicidia, in antiquity, a religious feaft held among the Romans, wherein they facrificed cattle big with young. This feaft fell on April 15 . on which day they facrificed 30 cows with calf to the goddefs Tellus or the Earth; part of them were facrificed in the temple of Jupiter. The calves taken out of their bellies were burnt to afhes at firft by the pontifices, afterwards by the eldeft of the veftal virgins.

HOREB, or Oreb, a mountain of Arabia Petræa, contiguous to and on the fouth fide of mount Sinai; the fcene of many miraculons appearances.

HORESTI (Tacitus), a people of Britain, beyond Solway Frith. Now Efkdale (Camden).

HORITES, an ancient people, who at the beginning dwelt in the mountains of Seir beyond Jordan (Gen. xiv. 6.) They had princes, and were powerful, even before Efan made a conqueft of their country, (id. xxxvi. 20-30.) The Horites, the defeendants of Seir, and the Edonites feem afterwards to have been confounded, and to have compored but one people (Deut. ii. 2. xxxiii. 2. and Judg. v. 4). They dwelt in Arabia Petrea, and Arabia Deferta, to the fouth-caft of the promifed land. We find the Hebrew word Chorinn, which in the book of Genefis is tranflated Horites, to be ufed in an appellative fenfe in feveral other paffages of feripture, and to fignify no:

Horehound bles, or great and powerful men (y Kings xxi. 8, in. $\|$ and Nch.ii. 16.iv. 14.v.7.vi. 17.vii. 5.xii. 17.Eccl. $\underbrace{\text { Horizontal }}$ x. 17. Ifa.xxxiv. 12. Jer. xxvii. 20. xxxix.6.); andit is very probable, that the Grecks derived from hence their beroos in like manner as they derived Anax "a king,' from the fons of Anak, the famons giant in Paleftine.

HOREHOUND, Ballota, or Stachys, in botany. See Marrubium.

HORIZON, or Horison, in geography and aftronomy, a great circle of the fphere, dividing the world into two parts or hemifpheres; the one upper and vifible, theother lower and hid. The word is pure Greek, apryou, whicb literally fignifies " bounding or terminating the fight ;" being formed of opo $\zeta \omega$, termino, definio, "I bound, I limit "" whence it is alfo called finitor, finifher." See Astronomy and Geography.

The horizon is either rational or fenfible.
Rational, true, or aftronomical Horizon, which is alfo called fimply and abfolutely the horizon, is a great circle, whofe plane paffes through the centre of the earth, and whofe poles are the zenith and nadir. It divides the fphere into two equal parts or hemiSpheres.

Senfible, vifible, apparent $H_{o r i z o n, ~ i s ~ a ~ l e f f e r ~ c i r-~}^{\text {r }}$ cle of the fphere, which divides the vifible part of the fphere, from the invifible. Its poles, too, are the zenith and nadir: and confequently the fenfible borizon is parallel to the rational; and it is cut at right angles, and into two equal parts, by the verticals.--The fenfible horizon is divided into eaftern and zveftern. The eaftern or ortive horizon, is that part of the horizon wherein the heavenly bodies rife: The weftern or oceidual horizon, is that wherein the ftars fet. The altitude or elevation of any point. of the fphere, is an arch of a vertical circle intercepted between it and the fenfible horizon.

By fenfiblo horizen is alfo frequently meant a circle; which determines the fegment of the furface of the earth, over which the eye can reach; called alfo the phyfical horizon. In this fenfe we fay, a fpacious horizon, a narrow fcanty horizon.

HORIZONTAL, fomething that relates to the horizon, is taken in the horizon, or on a level with the horizon.-We fay, a horizontal plane, horizontal line, \&c.

Horizontal Dial, is that drawn on a parallel to the horizon : having its gnomon, or ftyle, elevated according to the altirude of the pole of the place it is defigned for. Horizontal dials are, of all others, the moft fimple and eafy. The manner of defcribing them, fee under the arricle Dial.

Horizontal Line, in perfpective, is a right line drawn through the principal point, parallel to the horizon : or, it is the interfection of the horizontal and perfective planes. See Perspective.

Horizontal Plane, is that which is parallel to the borizon of the place, or nothing inclined thereto.

The bufinefs of levelling is to find whether two points be in the horizontal plane; or how much the deviation is. See Levelegng.

Horizontal Plane, in perfpective, is a plane parallel to the horizon, paffing through the eye, and cutting the perfpesive plane at right angles.

Horizontal Projection. Sce Geography, no66,69. Horizern
Horizontal Range, or Level Range, of a piece of tal orduance, is the line it defcribes, when directed on a parallel to the horizon or horizontal linc. See GunNERY, palfinz.

Horizontal Moon. See Astronomy, no 374.
Hortzontal Speculum. See Speculum.
HORMINUM, clary, in botany: A genus of the gymnofpermia order, belonging to the didynamia clafs of plants; and in the natural method ranking under the 42 d order, Vericillata. The calyx is campanulated, with four fegments nearly equal, the fonth larger, and emarginated; the upper lip of the corolla concave. There are feveral fpecies; the moft rematkable of which is the verbenaceum, or common wild clary. It grows natarally on fandy and gravelly ground in many parts of Britain. It has fometimes been called oculus Chrifti, from the fuppofed virtues of its feeds in clearing the fight, which it does byits vifcous covering; for when any thing happens to fall into the eye, if onc of the feeds is put in at one coriner, and the eyelid kept clofe over it, moving the feed gently along the eye, whatever happens to be there will ftick to it, and fo bre brought out. The virtues of this are fuppofed to be the fame as thofe of the garden clary, but not quite fo powerful.

HORN, in phyfology, a hard fubftance growing on the heads of divers animals, particularly the clovenfooted quadrupeds; and ferving them both as weapons of offence and defence.

The horn of animals is of the fame nature as their gelatinous matter ; and is only that matter charged with a lefs quantity of water, and larger quantity of earth, and fufficiently condenfed to have a firm and folid confiftence. By digefting liorn with water in Papin's digefter, it may be entirely converted into jelly.

Horn is a perfectly animalifed matter, and furnifhes in diftillation the fame principles as all animal matters; that is, at firft a pure phlegm, with a degree of heat not exceeding that of boilng water ; then a volatile alkaline fpirit, which becomes more and more penetrating and ftrong; a fetid, light, and thin oil ; a concrete volatile falt, which forms ramifications upon the fides of the receiver ; much air; fetid oil, which becomes more and more black and thick; and lattly, it leaves in the retort a confiderable quantity of almoft incombuftible coal, from which, after its incineration, fcarcely any fixed alkali can be obtained.

Animal oil, and particularly that which is drawn firit in the diftillation of horn, is fufceptible of acquiring great thinnefs and volatilnty by repeated diftillations, and is then called oil of dippel.

The horns of fags, and of other animals of that kind, are the mof proper to furnifh the animal oil 10 be rectified in the mauner of dippel; becanfe they yield the largeft quantity. Thefe horns alfo differ from the forns of other animals in this, that they centain a larger quantity of the fame kind of earth - Which is in bones; hence they feem to poffefs an intermediatenature betwixt horns and bones.

Hart's-Horn. See $H_{A R r}$ 's-Horm.
Horns make a condiderablearele in the arts and manufactures. Bullocks horns, foftened by the fire, ferve to make lanthorns, combs, knives, inl: lioms, to-bacco-boxes, \&c.

$$
D_{y, i} g
$$

## H OR

Dyeins of trorn-Black is performed by fteeping brafs in aqta-fortis till it be turned green : with this the horn is to be wafhed once or 2 wice, and then put into a warmed decoction of logwood and warer. Green is begun by boiling it, \&c. in alum-water; then with verdigris, ammoniac, and white-wine vinegar; keeping it hot therein till fufficiently green. Ked is begun by boiling it in alum-water, aud finifhed by decoction in a liquor compounded of quick-lime fteeped in rain water, ftrained, and to every pint an ounce of Brazil-wood aaded. In this decoction the bone, \&c. is to be boiled till fufficiently red.

Dr Lewis informs us that horns receive a deep black ftain from folution of filver. It ought to be diluted to fuch a degree as not fenfibly to corrode the fubject ; and applied two or three times, if neceffary, at confiderable intervals, the matter being expofed as much as poflible to the fin, to haften the appearance and decpening of the colour.

Dyeing or jtaining Horn to imitate Tortoifefhell.The horn to be dyed muft be firft preffed into proper plates, fcales, or other flat forms ; and the following mixture prepared. Take of quick-lime two parts, and of litharge one part; temper them together to the confiftence of a foft pafte with foap-ley. Put this pafte over all the parts of the horn, except all fuch as are pro$\mathrm{pc} \cdot \boldsymbol{\text { to }}$ be left tranfparent, in order to give it a nearer refemblance of the tortoife-fhell. The horn muft remain in this manner covered with the pafte till it be thoroughly dry; when, the pafte being bruthed off, the horn will be found partly opaque and partly tranfa parent, in the manner of tortoife-fhell; and when put over a foil, of the kind of latten called affidue, will be fearcely diftinguifhable from it. It requires fome de. gree of fancy and judgment to difpofe of the pafte in luch a manner as to form a variety of tranfparent parts, of different magnitudes and figures, to look like the effects of nature: and it will be an imprevement to add femitranfparent parts; which may be done by mixing whiting with fore of the pafte to weaken its operation in particular places; by which fpots of a reddift brown will be produced, which if properly interfiperfed, efpecially on the edges of the dark parts, will greatly increafe both the beanty of the work, and its fimilitude with the red torioife-fhell.

FI ORN, is alfo a fort of a mufical inftrument of the wind kind ; chiefly ufed in hunting, to animate and bring together the dogs and the hanters. The term anciently was, wind a horn, all horns being in thofe tines encompaffed; but fince ftraight horns are come in fafhion, they fay blow a born, and fometimes found a hurn.-There are various leffons on a horn; as the recheat, double recheat, royal recheat, running or farewell recheat, \&cc. See Recheat.

The French born is no other than a wreathed or contorted trumpet. It labours under the fame defects as the trumpet itfelf; bat thefe have of late been fo palliated, as to require no particular felection of keys for this inftument. In the beginting of the year 1773, a foreigner, named Spandau, played in a cons cert at the o'era-houfe a concerto, part whereof was in the key of C , with the minor-third ; in the performance of which all the intervals feemed to be as perfect as in any wind-inftrument. This improvement was effected by putting lis right-hand into the bottom
or bell of the inftument, and attempering the founds Horn, by the application of his fingers to different parts of the tube.

The Hebrews made ufe of horns, formed of rams horns, to proclaim the jubilee; whence the name Jubilee.

Cape-Horn. See Terra del Furco.
Horn-Beam, in botany. See Caprinus.
Horn-Bill, ill ornithology. Sec Buceros.
Horx-Blend, is a black or green indurated bole or clay, confinting of fcaly particles, which are diftinguifhable from thofe of mica, by being lefs fhining, thicker, and rectangular. It is generally found among $f$ iron ores, and fometimes intermixed with mica, forming a compact fone.

Human Horns. In Dr Charles Leigh's natural his. ftory of Lancafhire, Chechire, and the Peak in DerbyChire, England, is the print of a woman with two horns on her head. When fhe was 28 years of age an excrefcence grew upon her head like a sven, which continued 30 years, and then grew into two horns. After four years fhe caft them, and in their place grew two others. After four years the caft thefe alfo; and the horns which were on her head in 168 I (the time when the account was written) were then loofe. Her pic. ture and one of her horns are in Afmnole's mufeum. In the univerfity library at Edinburgh is preferved a horn which was cut from the head of Elizabeth Love, in the 50th year of her age. It grew three inches above the ear, and was growing feven years.

Horn Diftemper, a difeafe incident to horned cattle, affecting the internal fubftance of the horn commonly called the pith, which it infenfibly waftes, and leaves the horn hollow. The pith is a fpongy bone, the cells of which are filled with an unctuous matter. It is furnifhed with a great number of fmall blood veffels, is overfpread with a thin membrane, and appears to be united by futures with the bones of the head.-Ac.cording to an account of this diftemper, publifhed by Dr Toifts in the Memoirs of the American Academy, vol. i. the faid fpongy bone is fometimes partly, and fometimes entirely, wafted. The horn lofesits natural heat, and a degrce of coldnefs is felt upon handling it. The diftemper, however, is ferdom fulpected without a particular acquaintance with the other fymptoms, which are a dulnefs in the countenance of the beaft, a fluggifhnefs in moving, a failure of appetite, an inclination to lie down, and, when accompanied with an inflammation of the brain, a giddinefs and frequent toffing of the head. The limbs are fometimes affected with fliffnefs, as in a rheumatifm; in cows the milk often fails, the udder is hard, and in almoft all cafes there is a fudden wafting of the flefh. As foon as the diftemper is difcovered, an opening into the difeafed horn fhould be immediately made; which may be done with a gimlet of a moderate fize, in fuch a part of the horn as is moft favorabable for the difcharge: It is recommended as moft prudent to bore at firt two or three incles above the head. If it is found hollow, and the gimlet paffes through to the oppofite fide, and no blood difcharges from the aperture, it may be beft to bore ftill lower, and as near the head as it fhall be judged that the holownef: extends. This opening is affirmed to be a neceffary meafure, and often gives inmediate relief. Care mult

Horn be taken to kecp it clear, as it is apt to be clogged by a thin fluid that gradually oozes out and fills up the paffage. Some have practifed fawing off the horn; but, according to the beft obfervations, it does not facceed better than boring. From the caies Dr Tufts has feen, he is led to conclude that injections are in general unneceffary; that, when the diftemper is early difcovered, no more is required than a proper opening into the horn, keeping it fufficiently clear for the admiffion of freth air, the removal of the compreflion; and the difcharge of floating mater. But when the diftemper has communicated its effects to the brain, fo as to produce a high degree of inflammation, it is much to be doubted whether any method of cure will fucceed.
Horn-Fifh, Gar-ffh, or Sea-Needle. See Esox.
HoRN-Work, in fortification, an outwork compofed of two demi-baftions joined by a curtain. See Fortification.
HORNBY, a town of Lancalhire in England, feated on a branch of the river Lune, and beautified with a handfome parochial chapel. The ruins of a decayed caftle are fill to be feen here. W. Long. 2. 20. N. Lat. 54.6.

HORN-castle, a town of Lincolnfhire in England. It had a caftle, as the name imports; from the architecture of which, and the Roman coins that are fometimes dug up here, it is thought to have been a camp or flation of the Romans. The town is well bailt, and is almoft furrounded with water. It is a figniory of 13 lordflips. In thefe lordflips there are feveral chapels for the convenience of the inhabitants, who are at too great a diftance from the mother-church, and pretty numerous. It has a market on Saturdays, and fairs in June and Auguat.
HORNDON, a town in Effex, in England. It ftands near a rivulet, that at a fmall diftance from hence falls into the Thames, which is there called the Hope. E. Long. O. 30. N. Lat. 5 1. 20.
HORNECK (Dr Anthony), a learned and pious divine, was born at Baccharach, in the Lower Palatinate, in 1641 . He fudied divinity under Dr Spanheim at Heidelberg; and afterwarás coming to England, completed his fudies at Oxford and became vicar of Allhallows in that city. In 6665 , he removed into the family of the Duke of Albemarle; and was tutor to his grace's fon, then lord Torrington. . The duke prefented him to the rectory of Doulton in Devonllire, and procured for him a prebend in Execer. He was afterwards chofen preacher of the Savoy. In 1693, he was collated to a prebend in Weftminfter, and the fame year admitted to a prebend in the cathedral of Wells. He publifhed, I. The great law of confideration. 2. The happy afcetick. 3. Delight and judgnent. 4. The fire of the aits. 5. The exercife of prayer. 6. The cracified Jefus. 7. Several fermons, and other works. He died in 1696, and was interred in. Wettminfter abbey, where a monument is crected to his memory.
HORNERS, thofe people whofe bufinefs it is to prepare various utenfils of the horns of catule. The horners were a very ancient and confiderable fraternity in the city of London fome hundred years ago. In the reign of Edward II. they complained to parliament, that by foreigners buying up the hornsin Eng-

Vol. VIII.
land, they were ith danger of being ruined, and this Horret bufinefs loft to the nation. For this reafon was made the fatute 6 Edw . IV. by which the fale of homs to Hom rape. foreigners (except fuch as the faid horners refufed) was prohibited; and the wardens had power granted them to fearch all the markers in London and 24 miles round, and to iufpect Sturbridge and Ely fairs, to frevent fuch practices, and to parchafe horns at fated prices. Bat on plaufible pretences this law was repealed in the reign of James I. and therenpon the old evil revived. The horners again applied to parliament, and king Edward's ftatute was renewed (excepting as to the infpection of the fairs), and ftill remains in force. The importation of unwrought horns into Britain is alfo prohibited. In 1750, there were exported to Holland 514,500 luntern-leaves, befides powder flatks. There was formerly a duty of 20 thillings a thoufand, under which in 1682 weic exported 76,650 ; but in the reign of George 1 . this duty was taken off, and thefe and all other manufacures made of horns may be exported free. The prefent company of horners were incorporated January 12, 1638 ; and confilt of a mafter, two wardens, and nine afliftants, without livery or hall. They have a warehoufe in Spitalfields, to which the horns are fent as brought from town and country markets, and thence regnlarly divided, the widows and orphans of deceafed members having equal fhares.

HORNET, in zoology, a fpecies of wafp. Sec Vespa.

HORNING, in Scots law, a writing iffuing from the fignet, in his majelty's name, at the intance of a credicor againft his debtor, commanding him to pay or perform within a certain time, under pain of being declared rebel, and by a caption put in prifon.

HORNIUS (Gcorge), profeffor of hiftory at Leyden, was born in the Palatinate, and died at Leyden in 1670 . He was a little maniacal towards the end of his life; which diforder was fuppored to be occafioned by the lofs of 6000 fiorins he had entrufted with an alchemift at the Hague. His works are, i. Hifloria Ecclefiaftica adan. 1666. This has been well efteemed. 2. De Originibus Americanis, 1652, 8vo. 3. Geographia Vetus 6 Nova. 4. Orbis Politicus. He was 2 man of vaft reading, rather than great parts.

HORNSEY, a town in Yorkfhire, 188 miles from London. It is almoft furrounded by a finall arm of the fea; and the church having a high fteeple, is a noted fea-mark. Not many years ago there was a ftreet here called hornfey beck, which was wafhed away by the fea, except a houfe or two. E. Long. o.6. N. Lat. s4. o.

Hornsey, a town of Middlefex, five miles north of London. It is a long flraggling place, fituated in a low valley, but extremely pleafant, having the new river winding through it. Its church, of which Highgate is a hamlet, is fuppofed to be built with the ftones that came from Lodge-Hill, the bifiop of London's hunting-feat in his park here; it having been his manor from the moft ancient times. About a mile nearer this is a coppice of young trees, caller hornfey-wood, at the entrance of which is a pablic houfe, to which great numbers of perfons refort from the city. This houfe being lituated on the top of a hill, affords a deligittil profpect of the neighbouring country.

HORNPIPE, á common inframent of malic in 4 N

Wales

## H O R <br> H O R

Horolo- Wales, confifting of a wooden pipe, with holes at fagium, ted diftances, and a horn at each end; the one to col$\underbrace{\text { Herofope. lect the } \mathrm{vind} \text { blown into it by the mouth, and the }}$ other to carry off the founds as modulated by the performer.

Hornpipe is alfo the name of an Englifh air, probably derived from the above inftrument. The mea. fure of this air is triple time, with fix crotchets in a bar ; four of which are to be beat with the hand down and two up.

HOROLOGIUM, $\Omega$ poiogiov (compofed of wpa hora, "time, hour," and nozos "f feech, difcourfe"), a common name among ancient writers for any inftrument or machine for meafuring the hours; (fee Chronometer). -Such are our clocks, watches, fun-dials, \&c. See Clock, Watch, Dial, and Clepsydra.

Modern inveutions, and gradual improvements, have given birth to fome new terms that come properly under this head, and annexed new meanings to others totally different from what they had originally. All chronometers that announced the hour by ftriking on a bell, were called clocks: thus, we read of pocketclocks, though nothing could feem more abfurd than to fuppofe that a clock, according to the modern idea, fhould be carried in the pocket. In like manner, all clocksthat didnot ftrike the hour were called watches, or time-pieces; and the different parts of a friking clock were diftinguinhed by the watch-part and the clockpart ; the former meaning that part which meafures the time, and the latter the part which proclaims the hours. In the report of Sir Ifaac Newton to the houfe of commons, anno 1713 , relative to the longitude act, he ftates the difficulties of afcertaining the longitade by means of a watch : yet it is obvious, from feveral circumftances, that his remarks were directly to be underfood of a time-piece regulated by a pendulum ; for his objections are founded on the known properties of the pendulum, fome of which differ effentially from the properties of the balance and fpring. It is alfo to be remembered, that all the attempts of Huygens of finding the longitude were by means of pendulum clocks that did not ftrike the hours, and confequently, according to the language of the times, were called watches. At this time fuch machines for meafuring time as are fixed in their places are called clocks, if they frike the hour : if they do not frike the hour, they are called tizne-pieces; and when conftructed with more care, for a more accurate meafure of time, they are called regutators. Some artists of late have affected to call fuch watches as were conftructed for aftronomical and nautical obfervations by the name of timepieces, probably to intimate that they poffers the advantages of thofe conftracted with a pendulum.

Mr John Harifon firft gave the name of time-keeper to his watch, for the performance of which he received from parliament the fum of L, 20,000. See LongrTUDE.

For the account of the principles of this machine, fee Time-keeper. And for the chief improvements that have been made for the more accurate meafure of time, fee Pallets, Pendulum, and Scapement.

HOROSCOPE, in aftrology, the degree or point of the heavens arifing above the eaftern point of the horizon at any given time when a prediction is to be wade of a future event; as, the fortune of a perfon
then born, the fuccefs of a defign then laid, the wea- Horofopy ther, \&c. The word is compofed of apa hora, " hour," and the verb $\sigma x \in \pi \tau \circ \mu \alpha$, /pectio, confidero, "I confider."

Horfe. They were formerly fo infatuated with horofcopes, that Albertus Magnus, Cardan, and others, are faid to have had the temerity to draw that of Jefus Chrift. Horoscope is alfo ufed for a fcheme or figure of the twelve houfes; i. e. the twelve figns of the zodiac, wherein is marked the difpofition of the heavens for any given time. Thus we fay, to draw a horofcope, contruct a horofcope, \&c. We call it, more particularly, calculating a nativity, when the life and fortune of a perfon are the fubject of the prediction; for they draw horofcopes of cities, great enterprizes, \&c. See House.

## HOROSCOPY. See Divination, $\mathrm{n}^{2} 2$.

HORREA, in Roman antiquity, were public magazines of corn and falt meat, out of which the foldiers were furnifhed on their march in the military roads of the enpire. Horrea was alfo the name which they gave to their granaries.

HORROX (Jeremiah), an eminent Englifh aftronomer in the 17 th century, was born at Texteth near Liverpool in Lancalhire in 16 rg . He died, to the great lofs of that fcience and of the world, in the 23d year of his age, after he had juft finifhed his Venus in fole zifa; which, with fome other works, were publithed by Dr Wallis, in quarto.

HORROR, ftrictly fignifies fuch an excefs of fear as makes a perfon tremble. See Fear, Fright, and Terror. In medicine, it denotes a flivering and fhaking of the whole body, coming by fits. It is common at the beginning of all fevers, but is particularly remarkable in thofe of the intermittent kind.

Horror of a Vacuum, was an inaginary principle among the ancient philofophers, to which theyafcribed the afcent of water in pumps, and other fimilar phenomens, which are now known to be occafioned by the weight of the air.

HORSE, in zoology. Sce the article EquUs.
Horfes were very rare in Jadæa till Solomon's time. Before him we find no horfemen mentioned in the armies of Ifrael. David having won a great battle again ft Hadadezer king of Shobah (2 Sam. viii. 4. 5.) rook 1700 horfes, and lamed all belonging to the chariots of war, referving only 100 chariots. The jedges and princes of lfrael ufed generally to ride on mules or affes. After David's time, horfes were more common in the country of Judah, \&c. Solomon is the firft king of Judah who had a great nunber of horfes, and he kept them rather for pomp than for war; for we do not read that he made any military expeditions. He had, fays the fcripture (r Kings iv. 16.) 40,000 ftalls of horfes for his chariots, and 12,000 horfemen diftributed in his fortified places ( 1 Kings x. 26.) He had his horfes from Egypt (ibid.ver. 28, 29.); and there was not a fet which did not coft him more than 600 hhekels, which make of our money abont 9 ol. fterling. Mofes had forbidden the king of the Hebrewis to keep a great number of horfes (Deut.xvii. 16.), left at any time he fhould be inclined to carry the people back into Egypt.

We read in the fecond book of Kings (xxiii. I 7.), that Joliah took away the horfes which the kings of Joulah his predeceffors had confecrated to the fun. We
know
know the finn was worfhipped over all the ealt, and that the horfe, the fwifteft of tame beafts, was confecrated to this deity, who was reprefented as riding in a chariot drawn by the mont beantiful and fwifteft horfes in the world, and performing every day his journey from eaft to wen, in order to communicate his light to mankind. Xenophon defcribes a folemn facrifice of horfes, which was made with ceremony to the fun; they were all the fineft fteeds, and were led with a white chariot, crowned, and confecrated to the fame god. We may believe that the horfes which Jofiah removed out of the court of the temple, were appointed for the like facrifices. The rabbins inform us, that thefe horfes were every morning put to the chariots dedicated to the fun, whereof there is mention made in the fame book; and that the king, or fome of his officers, got up and rode to meet the fun in its rifing, as far as from the eaftern gate of the temple to the fuburbs of Jerufalem. Others are of opinion, that the horles mentioned in the book of kings were of wood, ftone, or metal, erected in the temple in honour of the fun : Others, that they were horfes which none were permitted to ride or faften to the yoke, but were free, and left to themfelves, like thofe which Julius Cæfar let loofe and fet at liberty after his paffage of the Rubicon.

Horles were ufed both amongft the Greeks and Romans in war, but were not originally numerous; for as each horfeman provided his own horfe, few would be able to bear the expence. Horfes for a confiderable time were managed by the voice alone, or by a 1witch, without bridle, faddle, or firrups. Their harnefs was ikins of beafts, or fometimes cloth. Both horfes and men among the Greeks underwent a fevere probation before their admiffion into the cavalry. -Horfe-races were common among the Greeks and Romans, and the place where they ran or breathed their courfers was called bippodromus.

Management of a Horse upon and after a Fourney. See that his flooes be not too ftrait, or prefs his feet, but be exactly flaped; and let him be fhod fome days before you begin a journey, that they may be fettled to his feet.

Obferve that he is furnifhed with a bitt proper for him, and by no means too heavy, which may incline him to carry low, or to reft upon the hand when he grows weary, which horfemen call making ufe of his fifth leg.

The mouth of the bitt fhould relt upon his bars about half a finger's breadth from his tulles, fo as not to make him frumble his lips; the curb flould reft in the hollow of his beard a little above the chin; and if it gall him, you muft defend the place wilh a piece of buff or other foft leather.

Take notice that the faddle do not reft upon his withers, reins, or back-bone, and that one part of it do not prefs his back more than another.

Some riders gall a horfe's fides below the faddle with theirftirrup-leathers, efpecially if he be lean; to hinder it, you fhould fix leather ftraps between the points of the fore and hind-bows of the faddle, and make the firrup leather pafs over them.

Begin your journey with hort marches, efpecially if your horfe has not been exercifed for a long time: futfer him to ftale as often as you find him inclined;
and not only fo, but invite him to it: but do not excite your mares to ftale, becaufe their vigour will be thereby diminifined.

It is advifable to ride very foftly; for a quarter or half an hour before you arrive at the inn, that the horfe not being too warm, nor our of breath, when put into the flable, you may unbriddle him: but if your bufinefs obliges you to put on fharply, you maft then (the weather being warm) let him be walked in a man's hand, that he may cool by degrees; otherwife, if it be very cold, let him be covered with cloths, and walked up and down in fome place free from wind; but in cafe you have not the conveniency of a hle? tered walk, ftable him forthwith, and let his whole body be rubbed and dried with ftraw.

Although fome people will have their horfes legs rubbed down with ftraw as foon as they are brought into the fable, thinking to fupple them by that means; yet it is one of the greateft errurs that can be committed, and produces no other effects than to draw down into the legs thofe humours that are always ftirred up by the fatigue of the journey: not that the rubbing of horfe's legsis to be difallowed; on the contrary, we highly approve of it, only would not have it done ar their firft arrival, but when they are perfectly cooled.

Being cone to your inn, as foon as your horfe is partly dried, and ceafes to beat in the flanks, let him be unbridled, his bit wafhed, cleanfed, and wiped, and let him eat his hay at pleafure.

If your horfe be very dry, and you have not given him water on the road, give him oats wafhed in good mild ale.

The duft and fand will fometimes fo dry the tongues and mouths of horfes, that they lofe their appetites: in fuch cafe, give them bran well moiftened with water to cool and refrefh their mouths; or wafh their mouths and tongues with a wet fonge, to oblige them to eat.
The foregoing directions are to, be obferved after moderate riding ; but if you have rode exceflively hard, unfaddre your horfe, and fcrape off the fweat with a fweating knife, or fcraper, holding it with both hands, and going always with the hair; then rub his head and ears with a Jarge hair-cloth, wipe him alfo between the fore-legs and hind legs; in the mean while, his body fhould be rubbed all over with fraw, efpecially under his belly and beneath the faddle, till he is thoroughly dry.

That done, fet on the faddle again, cover him; and if you have a warm place, let him be gently led up and down in it, for a quarter of an hour ; but if not, let him dry where he ftands.

Or you may unfaddle him immediately ; fcrape off the fweat; let the oftler take a little vinegar in his mouth, and fquirt it into the horfe's ; then rub his head, between the fore and hind-legs, and his whole body, till he is pretty dry: let lim not drink till thoroughly cool and has eaten a few oats; for many, by drinking too foon, have been fooiled. Set the faddle in the fun or by a fire, in order to dry the pannels.

When horfes are arrived at an inn, a man fhould, before they are unbriddled, lift up their feet, to fee whether they want any of their floes, or if thofe they

Forfe. have do not reft upon their fides; afterwards he fhould pick and clear them of the earth and gravel, which may be got betwixt their fhoes and foles.

If you water them abroad, upon their return from the river caufe their feet to be fopped with cowdung, which will eafe the pain therein; and if it be in the evening, let the dang continue in their feet all night, to keep them foft and in good condition : but if your horfe have brittle feet, it will be requifite to anoint the fore-feet at the on-fetting of the hoofs, with butter, oil, or hog's greafe, before you water him in the morning, and in dry weather they fhould be alfo greafed at noon.

Many horfes, as foon as unbridled, inftead of eating, lay themfelves down to reft, by reafon of the great pain they have in their feet, fo that a man is apt to think them fick; but if he looks to their eyes, he will fee they are lively and good; and if he offers them meat as they are lying, they will eat it very willingly; yct if he handles their feet, he will find them extremely hot, which difcovers their fuffering in that part. You muft therefore fee if their fhoes do not reft upon their foles, which is fomewhat difficult to be certainly known without unfhoeing them; but if you take off their fhoes, then look to the infide of them, and you may perceive that thofe parts which reft upon the foles are more fmooth and fhining than the others : in this cafe you are to pare their feet in thofe parts, and fix on their hoes again, anointing the hoofs, and flopping the foles with fcalding hot black pitch or tar.

After a long day's journey, at night feel your horfe's back, if he be pinched, galled, or fwelled (if you do not immediately difcover it, perhaps you may after fupper) there is nothing better than to rub it with good brandy and the white of an egg. If the galls are between the legs, ufe the fame remedy; but if the oftler rubs him well between the legs, he will feldom be galled in that part.
In order to preferve horfes after travel, take thefe few ufeful inftructions. When you are arrived from a journey, immediately draw the two heel-nails of the fore-feet; and, if it be a large floe, then four: two or three cays after, you may blood him in the neck, and feed him for 10 or 12 days oniy with wet bran, without giving him any oats; but keep him.well littered.

The reafon why you are to draw the heel-mails, is becaufe the heels are apt to fwell, and if they are not thus eafed, the fooes would prefs and Araiten them $t 00$ mach: it is allo advifable to fop them with cowdung for a while; but do not take the fhoes off, nor pare the feet, becaufe the humours are drawn down by that means.

The following bath will be very ferviceable for preferving your horfe's legs. Take the dang of a cow or ox ind uake it thin with vinegar, fo as to be of the the confifence of thick broth; and laving added a handful of fmall falt, rab his fore-legs from the knees, and the bind-legs from the gambrels, chafing them well with and againet the hair, that the remedy may sink in and fick to thofe parts, that they may be all covered over with it. Thus leave the horfe till morning, not wetting his legs, but giving him his water that evening in a pait; next morning lead him to the ri-
ver, or wafh his legs in well-water, which is very good, and will keep them from fwelling.

Thofe perfons, who, to recover their horfes feet, make a hole in them, which they fill with moiftened cow-dung, and keep it in their fore-feet during the fpace of a month, do very ill; becaufe, though the continual moifture that iffues from the dung occafions the growing of the hoof, yet it dries and hrinks it fo exceffively when out of that place, that it fpiits and breaks like glafs, and the foot immediately fraitens. For it is certain, that cow-dung (contrary to the opinion of many people) fpoils a horfe's hoof: it does indeed moiften the fole; but it dries up the hoof, which is of a different nature from it. In order, therefore, to recover a horfe's feet, inftead of cow-dung, fill a hole with blue wet clay, and make him keep his fore-feet in it for a month.

Mon horfes that are fatigued, or over-rid, and made lean by long journeys, have their flanksaltered without being purfy, efpecially vigorous horfes that have worked too violently.

There is no better method to recover them, than to give each of them in the morning half a pound of honey very well mingled with fcalded bran; and when they readily eat the half pound, give them the next time a whole one, and afterwards two pounds, every day continuing this courfe till your horfes are empty, and purge kindly with it; but as foon as you perceive that their purging ceafes, forbear to give them any more honey.

You may adminifter powder of liquorice in the fcalded bran for a confiderable time; and to cool their blood, it will not be improper to let them have three or four glifters.

In cafe the horfe be very lean, it is expedient to give him fome wer bran, over and above his proportion of oats; and grafs is alfo extraordinary beneficial, if he be not purfy.

It it be a mare, put herto a horfe; and if fhe never had a foal before, it will enlarge herbelly.

Sometimes exceffive feeding may do horfes more harm than good, by rendering them fubject to the farcy. You fhould therefore be cautious in giving them too great a quantity at a time, and take a little blood from them now and then.

When a horfe begins to drink water heartily, it is a certain fign that he will recover in a fhort time. As to the niethod of giving him water during a journey, obferve the following rules :

All the while you are upon a journey, let your horle drink of the firft good water you come to, after feven o'clock in the morning if it be in fummer time, and after nine or ten in winter.

That is accomnted good water which is neither too quick and piercing, nor too muddy and finking.

This is to be done, unlefs you would have him gallop a long time after drinking ; for if fo, you muft forbear.

Though it is the cutom of England to run and gallop horfes afier drinking, which we call wateringcourfes, to bring them (as they fay) into wind; yet fays M. de Solleyfel, it is the moft pernicious practice that can be imagined for horfes, by which many are rendered purly.

While a horfe is drinking, draw up his head five or fix times, making him move a little between every

## H O R

draught ; and notwithftanding he be warm, and fweat very much, yet if he is not quite out of breath, and you have fill four or five miles to ride, he will be better after drinking a little, than if he had drank none at all: it is true, indeed, that if the horfe is very warm, you fhould, at coming ont of the water, redouble your pace, to make him go at a gentle trot, to warm the water in his belly.

You ought to let him drink after this manuer during the whole time of your journey; becaule, if when you happen to bait he be hot or fweaty, you muft not let him drink for a long time, as it wonld endanger his life ; and when his bridle is taken off, his exceflive thirft will hinder him from eating, fo that he will not offer to touch his meat for an hour or two, which perhaps your occafions will not allow you for a baiting time, and not to have any food will render him unfir for travel.

If you meet with any ford before you come to your inn, ride the horfe through it two or three times, but not up to the belly: this will only cleanfe his legs; but the coldnefs of the water will bind up the humours, and prevent them from defcending.

If your horfe has been very warm, and you have not had the conveniency of watering him upon the road, he will, when unbridled, eat but very little; therefore he fhould have his oats given him wafhed in ale or beer, or only fome of them, if you intend to feed him again after he has drank.

Some are of opinion, that horfes are often fpoiled by giving them oats before their water; becaufe they fay the water makes the oats pafs too foon, and out of the ftomach undigefted. But M. de Solleyfel affirms, that though it be the common cuftom not to do it till after, yet it is proper to feed with cats both before and after, efpecially if the horfe be warm, and has been hard rode; for they will be a great deal the better for it, and in no danger of becoming fick.

Breading of Horses. When the ftallion is chofen, and all the mares intended for him are collected together, there muft be another fone-horfe, to difcover whicli of the mares are in heat; and, at the fame time, contribute to enflame them. All the mares are to be brought fucceffively to this fone-horft; which hould alfo be inflamed, and fuffered frequently to neigh. As he is for leaping every one, fuch as are not in heat keep him off, whilft thofe which are fo fuffer him to approach them. But inftead of being allowed to fatisfy his impulfe, he muft be led away, and the real ftallion fubftituted in his ftead. This trial is neceffary for afcertaining the true time of the mare's heat, efpecially of thofe which have not yet had a colt; for with regard to fuch as have recently foaled, the heat afually begins nine days after their delivery ; and on that very day they may be led to the fallion to be covered; and nine days after, by the experiment abovementioned, it may be known whether they are ftill in heat. If they are, they muft be covered a fecond time; and thas fuccetlively every ninth day while their heat continues: for when they are impreguated, their heat abates, and in a few days ceafes entirely.

Bur that every thing may be done eafily and conveniently, and at the fame time with faccefs and advantage, great attention, expence, and precaution are requifice. The ftud muft be fixed in a good foil 2

## 661 1 <br> H O R

and in a faitable place, proportioned to the uumber of Horfe. mares and ftallions intended to be ufed. This fpot muft be divided into feveral parts, "inclofed with rails or ditches well fenced ; in the part where the pafture is the richeft, the mares in fold, and thofe with colts by their fides, are to be kept. Thofe which are not impregnated, or have not yet been covered, are to be feparated, and kept with the fillies in another clofe, where the pafture is lefs rich, that they may not grow too fat, which would obfruct the progrefs of generation. Lafly, the young ftone-colts or geldinges, are to be kept in the drieft part of the fields, and where the ground is moft unequal ; that by rumning over the uncven furface, they may acquire a freedom in the motion of their legs and fhoulders. This clofe, where the ftone colts are kept, muft be very carcfully feparated from the others, left the young horfes break their bounds, and enervate themfelves with the mares. If the trach be fo large as to allow of dividing each of thefe clofes into:wo parts, for putting oxen and horfes into them alternately, the pafture will laft much longer than if continually eaten by horfes ; the ox improving the fertility, whereas the horfeleffens it. In each of thefe clofes fhould be a pond; ftanding water being better than running, which often gripes them : and if there are any trees in the ground, they fhould be left ftanding, their fhade being very agreeable to the horfes in great hears ; but all ftems or ftamps fhould be grubbed up, and all holes levelied, to prevent accidents. In thefe paftures your horfes hould feed daring the fummer ; but in the winter the mares fhould be kept in the fable and fed with hay. The colts alfo mult be houfed, and never fuffered to feed abroad in winter, except in very fine weather. Stallions that ftand in the ftable hould be fed more with fraw than hay; and moderateiy excrifed till coveri'g time, which generally lafts from the beginning of April to the end of June. But during this feafon they fhould have no other exercife, a:d be plentifully fed, bat with the fame food as ufual. Before the ftallion is brought to the mare, he fhould be dreffed, as that will greatly increife his ardonr. The mare muit aln be curried, and have no fhoes on her hind feet, fome of them being ticklifh, and will kick the fallion. A perfon holds the mare by the halter, ard wo otherslead the fallion by long reins; when he is in a proper fituation, another alfifant carefully directs the yard, pulling afide the mare's tail, as a fingle hair might hurt him darigeroufly. It fometimes happens that the ftallion does not complete the work of generation, coming from the mare without making any injection: it hould therefore be attentively obferved, whether, in thelaft mo. ments of the copulation, the dock of the failion's tail has a vibrating motion; for fuch a motion always accompanies the emiffion of the feminal lymph. If he has performed the act, he muft on no conlideration be fuffered to repeat it; but be led awey directly to the ftable, and there kepi two days. Fu-, horvever able a good ftallion may be of covering every day during the three months, it is much better to let hine be led to a mare only every other day : his prodnce sill be greater, and he himfelflefs exhanted. Daring the firf feven days, lei four differentmares be fucceffively brought to him; and the ninth day let the firn be again brought, and fo fucceflively while they continue in beat: but as

## HOR [ 662 [ HOR

Horse. foon as the heat of any one is over, a frefh mare is to be put in her place, and covered in her turn every nine days; and as feveral retain even at the firft, fecond, or third time, it is computed that a ftallion, by fuch management, may, during the three months, cover 15 or 18 mares, and beget io or 12 colts. Thefe animals have a very large quantity of the feminal lymph; fo that a confiderable portion of it is nled during the emiffion. In the mares likewife is an emiffion, or rather difillation of the feminal lymph, during the whole time they are horfing; ejecting a vifcid whitifh lymph, called the beats, which ceafe on conception. This ichor the Greeks called hippomanes; and pretended that philtres might be made of it, one remarkable effect of which was, to render a horfe frantic with luft, This hippomanes is very different from that found in the fecundines of the foal, which M. Daubenton firt difcovered, and has fo accurately defcribed its nature, origin, and fituation. The ejection of this liquor is the moft certain fign of the mare's heat ; but it is alfo known by the inflation of the lower part of the vulva, by her frequent neighings, and attempts to get to the horfes. After being covered, nothing more is requifite than to lead her away to the field. The firft foal of a mare is never fo ftrongly formed as the fucceeding; fo that care fhould be taken to procure for her, the firft time, a larger ftailion, that the defect of the growth may be compenfated by the largenefs of the fize. Particular regard fhould alfo be had to the difference or congruity of the fafhion of the ftallion and the mare, in order to correct the fanlts of the one by the perfections of the other : efpecially never to make any difproportionate copulations, as of a fmall horfe with a large mare, or a large horfe with a fmall mare; as the produce of fuch copulation would be fmall, or badly proportioned. It is by gradations that we mutt endeavour to arrive at natural beauty : for inftance, to give to a mare a little too clumfy, a wellmade horfe and finely fhaped; to a fmall mare, a horfe a little higher; to a mare which is faulty in her forehand, a horfe with an elegant head and noble cheft, $\& \mathrm{c}$.

It has been obferved, that horfes fed in dry and light grounds, produce temperate, fwifr, and vigorous foals, with mufcular legs and a hard hoof; while the fame bred in marfhes and moilt paftures have produced foals with a large heavy head, a thick carcafe, clumfy legs, bad hoofs, and broad feet. Thefe differences proceed from the air and food, which is eafily underfood; but what is more difficult to be accounted for, and fill more effential than what we havehitherto offerved, is, to be continually croffing the breed to prevent a degeneracy.

In coupling of horfes, the colour and fize fhould be fuited to each other, the fhape contrafted, and the breed croffed by an oppolition of climates: but horfes and mares foaled in the fame ftud flould never be joined. Thefe are effentialaricles; but there are others which fhould by no means be neglected : as that no fhorrdocked mares be fuffered in a ftud, becaufe from their being unable to keep off the flies, they are much more tormented by them thanothers which havealong fweeping tail ; and their continual agitations from the ftings of thefe infects, occafions a diminution in the quantity
of their milk, and has a great influence on the conftitution and fize of the colt, which will be vigorous in prow portion as its dam is a good nurfe. Care muft alfo be taken, that the ftud mares be fuch as have been always brought up in paftures, and never over-worked. Mares which have always been brought up in the ftable on dry food, and afterwards turned to grafs, do not breed at firft: fome time is required for accuftoming then to this new aliment.

Though the ufual feafon for the heat of mares be from the beginning of April to the end of June, yet it is not uncommon to find fome among a large number that are in heat before that time: but it is ad.* vifable to let this heat pafs over without giving them to the ftallion, becaufe they would foal in winter; and the colts, befides the inclemency of the feafon, would have bad milk for their nourifhment. Again, if the mares are not in heat till after the end of June, they fhould not be covered that feafon; becaufethe colts being foaled in fummer, have not time for acquiring flrength fufficient to repel the injuries of the following winter.

Many, inftead of bringing the fallion to the mare, turn him loofe into the clofe, where all the mares are brought together ; and there leave him too choofe fuch as will ftand to him. This is a very advantageous method for the mares : they will always take horfe more certainly than in the other; but the ftallion, in fix weeks, will do himfelf more damage than in feveral years by moderate exercife, conducted in the manner we have already mentioned.

When the mares are pregnant, and their belly begins to fivell, they muft be feparated from thofe that are not, left they hurt them. They ufually go i imonths and fome days, and foal ftanding ; whereas moft other quadrupeds lie down. Thofe that cannot foal without great difficulty, muft be affifted ; the foal muft be placed in a proper fituation; and fometimes, if dead, drawn out with cords. The head of the colt ufually prefents itfelf firf, as in all other animals: at its coming ont of the matrix, it breaks the fecundines or integuments that inclofe it, which is accompanied with a great flux of the lymph contained in them; and at the fame time one or more folid lumps are difcharged, formed by the fediment of the infpiffated liquer of the allantoides. This lump, which the ancients called the hippomanes of the colt, is fo far from being, as they imagined, a malis of flefh adhering to the head of the colt, that it is feparated from it by a membrane called amnios. As fron as the colt is fallen, the mare licks it, but without touching the hippomanes; which points out another error of the ancients, who affirmed that fle inftantly devours it.

The general cuftom is to have a mare covered nine days after her foaling, that no time may be loft ; but it is certain, that the mare having, by this means, both her prefent and future foal to nourifh, her ability is divided, and fhe cannot fupply both fo largely as the might one only. It would therefore be better, in order to have excellent horfes, to let the mares be covered only every other year ; they wuuld laft the longer, and bring foals more certainly: for, in common ftuds, it is fo far from being true that all mares which have been covered bring colts every year, that it is conflered

Horfe.

## H OR <br> 663 ] H O R

Horfe. as a fortunate circumftance if half or at molt two thirds of them foal.

Mares when pregnant, will admit of copulation : but it is never attended with any fupericetation. They utually breed till they are 14 or 15 y cars of age: and the moft vigorous till they are above 18. Stallions, when well managed, will engender till the age of 20 , and even beyond; but it muft be obferved, that fuch horfes as are fooneft mide fallions, are alfo the fooneft incapable of generation: thus the large horfes, which acquire ftrength fooner than the fleader, and are therefore often ufed as ftallions as foon as they are four years old, are incapable of generation before they are fixteen.

## Gelding of Ho sres See Gelding. <br> Reating of Horses. See Colt.

Draught-Horse, in farming, a fort of coarfe-made horfe deftined for the fervice of the cart or plough. In the choice of thefe horfes for what is called the flow draught, they are to be chofen of an ordinary height; for otherwife, when put into the cart, one draws unequally with the other, The draught-horfe flould be large bodied and ftrong loined, and of fuch a difpofition, as rather to be too dull than too brifk, and rather to crave the whip than to draw more than is needful. Mares are the fitteft for this ufe for the farmer, as they will be kept cheap, and not only do the work, but be kept breeding, and give a yearly increafe of a foal. They fhould have a good head, neck, breaf, and floulders; for the reft of the fhape, it is not of much confequence. Only, for breeding, the mare thould have a large belly; for the more room a foal has in the dam, the better proportioned ir will be. Draught-horfes fhould be always kept to that employ. Some put them to the faddle on occafion, but it does them great harm, alters their pace, and fooils them for labour. The draught horfe ought to have a large broad head, becaufe horfes of this fhaped head are lefs fubject than others to difeafes of the eyes. The ears thould be fmall, traight and upright; the noftrils large and open, that he may breathe with the more freedom. A horfe with a full and bold eye always promifes well. On the other hand, a funk eye and an elevated brow are bad figns. The horfe is efteemed fitteft for this purpofe alfo, that has a large and round buttock, which neither finks down nor cuts. He muf have a firm and ftrong tail, and the dock muft be thick and well furnifhed with hair, and placed neither very high nor very low. The legs fhould be rather flat and broad than round: the roundnefs of the leg being a fault in a horfe deftined to labour that will foon ruin him. As to the hinder legs, the thighs fhonld be flethy and long, and the whole mufcle which fhows itfelf on the outfide of the thigh fhould be large and very thick. No country can bring a parallel to the fize and ftrength of the Britifl horfes deftined for the draught. In London there are inftances of fingle horfes that are able to draw on a plain, for a mall face, the weight of three tons, and which can with eafe, and for continuance, draw half that weight. The pack horfes of Yorkfhire ufually carry a burden of 420 lb . over the higheft hills of the north, as well as the moit level roads: but the moft remarkable proof of the ftrength of the Britifh horfes is derived from that of the mill horses; fome of which will at one load carry 13 meafures, which at
a moderate computation of 70 lb . each, will amount to 910 lb . Nothisg is fo effential to the healch of thetc ferviceable creatures as cleanlinefs; if they are fed ever fo well, and not kept clean, they will be fubject to numerous difeafes.

The fervant who has the care of them onght to be up very early, and to clean the racks and mangers from all filth. The currying of them ought to be carefully performed every morning, bat not in the fable, for the duft to fall upon the other horfes, as it is too often done. After the horfes are dunted, they fhould daily twift a whifp of fraw hurd up, and wetting it in water, rub the legs, fhoulders and body with it. Many of the difeafes of draught-horfes, which are nor owing to naninefs, are owing to bad water; fuch as are too rav, too muddy, or too cold, being all innproper. If there be any running ftream in the neighbourhood, they fhould always be led to that to water every day in fummer, but in winter, well-water is warmin, and is betcer for them. If there be a necerfity of giving them well-water in fummer, it mont be drawn up fome hours before the time, and expofed to the fun-beamsin tubs or rroughs; marh-water or that of lowland ditches is worft of all. When the labouring horfe has drank his water, he fiould have his oats given him, and thefe fhould be carefully fifted, and the manger dufted firft. It is a common practice, as foon as a horfe is come in from his work, to rub down his legs with a hard whifp of hay; but the beft judges of horfics abfolutely condemn this, and obferve, that this rubbing of the legs after hard labour brings down humours into them, and makes them fiff.

The rubbing itfelf is wholefome, but the doing it when the creature is hot is the mifchicf; while a horfe is in a freat it is a great relief and refrefhment to him to have his body rubbed dowil, but when he is cold is the proper time to rub his legs. The racks are to be well fupplied with hay, and the horfes flould be left to reft and eat, about two hours, and then led to water; after this their oats fhould be given them, and they fheuld then go to work again.

In the evening, when the labour of the day is over, the firft thing to be done is to examine the feet, and fee if any thing is amifs about the hoes, and what earth or gravel is lodged in the foot, between the fhoe and the fole, is to be picked out and fome frefl cowdungputinitsplace, which will cooland refreth the part.

A very materid thing for the prefervation of all forts of cattle, but of none fo much as draught-horfes, is frefl and clean litter.

War-Horse. The proper roles for choofing a horfe for fervice in war, are thefe: he fhould be tall in ftature, with a comely head, and out-fwelling forehead. His eye hould be bright and farkling, and the white part of it covered by the eye brow. The ears fhould be fmall, thin, horr, and pricking; or if long, they fhould be moveable with eafe, and well carried. The neck fhould be deep, and the breaft large and fwelling. The ribs bending, the chine broad and ftraight, and the butocks round and full. The tail hould be high and broad, neither too thick nor too thin; the thigh fwelling; the leg broad and flat, and the paftern horr. When fuch a horfe is chofen, he auft be kept high during the time of his teaching, that he may be full of vigour. His food muft be fu eethay, and good clean oats, or two parts of oats and one part of beans or peafe, well dried and hardened. The quantity fhould be half a peck in the morning, and the fame quantity at noon and in the evening. Upon his refting days he is to be dreffed betueen five and fix in the morning, and watered at feven or eight. In the evening he is to be dreffed at four, and watered about five, and he mult always have provender given him after watering; fo muft be littered about eight, and then mult have food given him for all night. The night before he is ridden all his hay is to be taken away about uine o'clcok, and he muft have a handful or two of oats about four in the morning: when he has eaten thefe, he is to be turned upon the fnaftle, and rubbed very well with dry cloths; then faddled, and made fit for his exercife. When he has performed this, he is to be brought fweating into the ftable, and rubbed down with dry wifps. When this has been done, the faddle is to be taken off, and he is to be rubbed down withdry cloths ; the houfing cluth is then to be faidon; and the faddle being again laid on, he is to be whed gently about till thoroughly cool. After this, he muft ftand without meat two or three hours, then he muft be fed; and in the afternoon he is to be rubbed and dreffed as before, and watered in the ufual manner.

HoRSE Worm, in natural hiltory, a frecies of flyworm called alfo bott, produced of eggs depofited by a uwo-winged fly of thie fhape and fize of the humble bee in the inteftines of horfes. See Borrs.

River-Horse, in zoology. See Hippopotamus.
Horse is alfo uied in the military language, to exprefs the cavalry; or the body of foldiers who ferve on horfeback.

The horfe inclodes horfe guards, horfe grenadiers, and troopers. Dragoons are alfo frequently comprehended under this name, though they fight on foot: of the re there are now 18 Dritith regiments; befdes
three regiments of dragoon-guards raifed in 1685. See Granadier, Dragoons, and Guards. Mafter of the Horse. Sce Master. Light Horse, are regiments of cavairy, mounted on light fwift horfes, whofe men are fnall and lightly accoutred. They were firf raifed in 5757 . The denomination arofe hence, that anciently they were lightly armed, in comparifon of the moyal guards, which were armed at all points.

Hungarian Horse. See Hussars.
Horse is alfo a term ufed in various arts and manufactories, for fomething that helps to fultain their work from the ground, for the more commodious working at it.

The horfe ufed by tanners and kinners, alfo called the leg, is a piece of wood cut hollow and roundifh, four or five feet long, and placed allope; upon which they pare their fkins to get off the dirt, hair, flefh, \&c.

Horse is alfo ufed in carpentry, for a piece of wood jointed acrofs two other perpendicular ones, to fuftain the boards, planks, \&c. which make bridges over fmall rivers; and on divers other occafions.

Horse, in fealanguage, is thename of axope reaching from the middle of a yard to its extremity, or what is called the yard-arm, and depending about two or three feet under the yard, for the failors to tread upon whilf they are loofing, reefing, or furling the fails, rigging out the ftudding-fail booms, \&c. In order, therefore, to keep the horfe more parallel to the yard, it is ufually fufpended to it at proper diftances, by certain ropes called Itirrups, which hang about two feet under the yard, having an eye in their lower ends through which the horfe paffes.

Horse is alfo a thick rope, extended in a perpendicular direction near the fore or after-fide of a maft, for the purpofe of hoifting or extending fome fail upon it. When it is fixed before a maft, it is calculated for the ufe of a fail called the fquare-fail, whofe yard being attached to the horfe, by means of a traveller or bull's eye, which flides up and down occafionally, is retained in a fleady pofition; either when the fail is fet, or whilft it is hoifting or lowering. When the horfe is placed abaft or behind a maft, it is intended for the try-fail of a fnow, and is accordingly very rarely fixed in this pofition, except in thofe floops of war which occafionally affume the form of fnoxws, in order to deceive the enomy.

Horse is alfo a cant name introduced into the management of lotteries, for the chance or bent fit of a ticket or number for one or more days, upon condition, if it be drawn a prize within the cime covenanted for, of returning to the feller an undrawn ticket.-To determine the value of a horfe; multiply the amonnt of the prizes in the lottery by the time the horfe is hired for ; and from the product fubtract the amount of the number of prizes by the value of an undrawn ticket into the time of the horle: the remainder boing divided by the number of tickets into the whole time of drawing, the quotient is the value of the horfe. See Lottery.

Forse-Bread. See Bread.
Horse-Dung, in gardening, is of great ufe in making hor-beds, for the raifing of all forts of early crops; as fallading, cacumbers, melons, afparagus, \&c. for which

Horfe.
which purpofes no other kinds of dung will do fo well. Horfe dung ferments the frongelt ; and if mixed with litter and fea coal afhes in a due proportion, will continue its heat much longer than any other fort of dung whatfoever : and afterwards, when rotted, becomes an excellent matnure for molt forts of land; more efpecially for fach as are of a cold nature. For ftiff clayey land, horfe-dung mixed with fea-coal afhes, and the cleanfing of Itreets, will caufe the parts to feparate much fooner than any other compoft: fo that where it can be obtained in plenty, it is always to be recommended for fuch lands. See Dung.

Animated Hossm-Hairs, a term ufed to exprefs a fort of long and flender water-worm, of a blackifh colour, and fo much refembling a horfe-hair, that it is generally by the vulgar fuppofed to be the hair fallen from a horfe's mane into the water as he drinks, and there animated by fome frange power. Dr Lifter has at large confuted this abfurd opinion in the Philofophical Tranfactions.

Horse-Hair Worms. See Amphisbena.
Horse-Hoeing Hu/bandry. See Agriculture, in 218.

## Or, The Art of Riding, and of Training and Managing, Horses.

## Sect. I. The Method of preparing Horfes to be mounted.

THOUGH all horfes are generally bought at an age when they have already been backed, they fhould be begun and prepared for the rider with the fame care, gentlenefs, and cantion, as if they had never been handled or backed, in order to prevent accidents, which might elfe arife from fkittimnèfs or other caufes: and as it is proper that they fhould be taught the figure of the ground they are to go upon when they are at firft mounted, they fhould be previoully trotted in a longe on circles, without any one upon them.

The manner of doing this is as follows: Put an eafy cave (fon upon the horfe's nofe, and make him go forwards round you, ftanding quiet and holding the longe; and let another man, if you find it neceflary, follow him with a whip. All this mult be done very gently, and but a little at a time : for more horfes are fpoiled by overmuch work, than by any other treatment whatever ; and that by very contrary effects; for fometimes it drives them into vice, madnefs, and defpair, and often ftupifies and totally difpirits them.

The firft obedience required in a horfe is going for, wards, till he perform this duty freely, never even think of making him rein back, which would inevitably make him reftive: as foon as he goes forwards readily, fop and carefs him. You muft remember in this, and likewife in every other exercife, to ufe him to go equally well to the right and left ; and when he obeys, carefs him and difmifs him immediately. If a horfe that is very yourg takes fright and ftands ftill, lead on another horfe before him, which probably will induce him inftantly to follow. Put a fnaffle in his mouth ; and when he goes freely, faddle him, girting him at firft very loofe. Let the cord, which you hold, be long and loofe; but not fo much fo as to endanger the horfe's entangling his legs in it. It muft be obferved, that fmall circles, in the beginning, would conftrain the horfe too much, and put him apon defending himfelf. No bend muft be required at firft: never fuffer him to gallop falle; but whenever he attempts it, fop him wihout delay, and then fet him off afrefh. If he gallops of his own accord, and true, permit him to continue it ; but if he does it not volunVol. VIII.
tarily, do not demand it of him at firf. Should he of placing fly and jump, flake the cord gently upon his nofe the Rider. without jerking it, and he will fall into his trot again. If he flands fill, plunges, or rears, let the man who holds the whip make a noife with it ; but never touch him till it be abfolutely neceffary to make him go on. When you change hands, fop and carefs him, and entice him by fair means to come up to you: for by prefenting yourfelf, as fome do, on a fudden before horfes, and frightening them to the other fide, you run a great rifk of giving them a flynefs. If he keeps his head too low, hake the cavelfon to make him raifo it; and in whatever the horfe does, whether he walks, trots, or gallops, let it be a conftant rule, that the motion be determined, and really fuch as is intended, without the leaft huffing, pacing, or any other irregular gait.

## Sect. II. The Method of placing the Rider and rendering him firm on Horfeback, with fome occafional Inflructions for Riders and the Horfes.

It is neceffary that the greateft attention, and the fame gentlenefs that is ufed in teaching the horfes, be obferved likewife in teaching the rider, efpecially at the beginning. Every method and art mult be practifed to create and preferve, both in man and horfe, all poffible feeling and fenfibility ; contrary to the ufage of moftriding-mafters, who feeminduftrioully to labour at abolifhing thefe principles both in the one and the other. As fo many effential points depend upon the manner in which a man is at firft placed on horfeback, it ought to be confidered and atterided to with the ftricteft care and exactnefs.

The abfurdity of putting a man, who perhaps has never before been upon a horfe, on a rough trotting horfe, on which he is obliged to ftick with all the force of his arms and legs, is too obvious to need mentioning. This rough work, all at once, is plainly as detrimental at firf, as it is excellent afterwards in proper time. No man can be either well or firmly feated on horfeback, unlefs he be matter of the balance of his body, quite unconftrained, with a full poffeffion of himfelf, and at his eafe; none of which requitites can he enjoy, if his attention be otherwife engaged; as it muft wholly be in a raw, unfuppled, and un-

Of placing prepared lad, who is put at once upon a rough horfe; $\underbrace{\text { the Rider. }}$ in fuch a diftreffful tate, he is forced to keep himfelf on at any rate, by holding to the bridie (at the expence of the fentibility both of his own hand and the horfe's month), and by clinging with his legs, in danger of his life, and to the certain depravation of a right feeling in the horfe.
Thie firft time a man is put on horfeback, it ought to be upon a very gentle one. He never fhould be made to trot, till he is quite eafy in the walk; nor gallop, till he is able to trot properly. The fame muft be obferved in regard to horfes; they flould never be made to trot till they are obedient, and their moths are well formed on a walk, nor to be made to gallop, till the fame be effected on a trot. When he is arrived at fuch a degree of firmnefs in his feat, the more he trots, and the more he rides rough horfes, the berter. This is not only the beft method, but alfo the eafieft and the thorteft : by it a man is foon made fufficiently an horfeman for a foldier: but by the other deceftable methods that are commonly ufed, a nan, inftead of improving, contracts all forts of bad habits, and rides worfe and worfe every day ; the horfe too becomes daily more and more unfit for ufe. In proceeding according to the manner propofed, a man is rendered firm and eafy upon the horfe, both his own and the horfe's fenfibility is preferved, and each in a fituation fit to receive and practife all leffons effectually.
Among the various methods that are ufed of placing people on horfeback, few are directed by reafoin. Before youlet the man mount, teach him to know, and always to examine, if the curb be well placed, (that is, when the horfe has a bit in his month, which at firft he fhould not; but only a frafte, till the rider is firm in his feat, and the horfealfo fomewhat taught) : likewife to know if the nofe-band be properly tight ; the throat-band loofing and the nouth-piece neither too high nor too low in the horfe's mouth, but rightly put fo as not to wrinkle the fkin nor to hang lax ; the girts drawn moderately, but not too tight; and the crupper and the breaft-plate properly adjufted. A very good and careful hand may venture on a bit at firf, and fucceed with it full as well as by beginning with a fnaffle alone; only colts, indeed, it is better, in all fchools whatfoever, to avoid any preffure on the bars juft at firf, which a curb, though ever fo delicately ufed, muft in fome degree occafion. When the bridle, \&c. have been well looked to, let the man approach the horfe gently near the floulder; then taking the reins and an handful of the mane in his left hand, let him put his foot foftly in the left nirrup, by pulling it towards him, left he touch the horfe with his toe; then raifing himfelf up, let him reft a moment on it, with his body upright, but not fiff; and after ihat, paffing lis right leg clear over the faddle without rubbing againf any thing, let him feat himfelf gently down. He muft be cautious not to take the reins too fliort, for fear of making the horfe, rear, run, or fall back, or throw up his head; but let him hold them of an equal length, neither tighe nor flack, and with the littef finger betwixt them. It is fit that horfes flould be accuftomed to ftand fill to be mounted, and not to fir till the rider pleafes. All foldiers fhould be in-
$A \quad \mathrm{~N} \quad \mathrm{~S} \quad \mathrm{H} \quad \mathrm{I}$ P.
Sect. II.
ftructed to mount and difmount equally well on both of placing fides, which may be of great ufe in times of hurry and the Rider. confufion. Then place the man in his faddle, with his body rather back, and his head held up with eafe, without fiffnefs; feated neither forwards nor very backwards; with the breaft pufhed out a little, and the lower part of the body likewife a little forwards; the thighs and legs turned in without confraint, and the feet in a fraight line, neither turned in nor out. By this pofition, the natural weight of the thighs has a proper and fufficient preflure of itfelf; and the legs are in readinefs to act when called upon: they muft hang down eafily and naturally; and be fo placed, as not to be wriggling about, touching, and tickling, the horfe's fides, but al ways near them in cafe they fhould be wanted, as well as the heels.
The body muft be carefully kept eafy and firm, and without any rocking when in notion; which is a bad habit very eafily contracted, efpecially in galloping. The left elbow muft be gently leant againft the body, a little forwards : unlefs it be fo refted, the hand cannot be fleady, but will always be checking, and confequently have pernicious effects on the horfe's mouth. And the hand ought to be of equal height with the elbow ; if it were lower, it would conftrain and confine the motion of the horfe's fhoulders: but, as the mouths of horfes are different, the place of the hand alfo muft occafionally differ: a leaning, low, heavy, fore-head requires a high hand; and a horfe that pokes out his nofe, a low one. The right-hand arm muft be placed in fymmetry with the left; only let the right hand be a little forwarder or backwarder, higher or lower, as occafions may require, in order that both hands may be free; both arms muft be 2 little bent at the elbow, to prevent fiffnefs.

A foldier's right hand flould be kept unemployed in riding ; it carries the fword, which is a fufficient bufinefs for it.

There remains one farther obfervation, that ought not to be omitted, about the hand, that it munt be kept clear of the body; i. e. about two inches and a half forwards from it, with the nails iurned oppofite to the belly, and the wrift a lititle rounded with cafe; a pofition not lefs graceful than ready for flackening, tightening, and moving the reins from one fide to the other, as may be found neceffary.
When the men are well placed, the more rough trotting they have without firrups the better ; but with a ftrict care always, that their pofition be preferved very exactly. In all cafes, great care mult be taken to hinder their clinging with their legs : in fhort, no fticking by hands or legs is ever to be allowed of at any time. If the motion of the horfe be too rough, flacken it, till the rider grows by degrees more firm; and when he is quite firm and ealy on his horfe in every kind of motion, firrups may be given him ; but he muft never leave off trotting often without any.
The firrups muft neither be fhort nor long; but of fuch a length, that when the rider, being well placed, puts his feet into them (about one third of the length of each foot from the point of it), the points may be between two and three inches higher than the heels. The'rider mult not bear upon his firrups, but only

Sect. II.

## H O R S $\quad \mathrm{E} \quad \mathrm{M}$

Inftruc- let the natural weight of his legs reft on them : For tions concerning both Man and Horie if the bears upon then he would be railed above and out fo his faddle; which hould never be, except in charging fword in hand, with the body inclined forwards at the very inftant of attacking. Spurs may
be given as foon as the rider is grown familiar with ftirrups; or even long before, if his legs are well placed.

A hand fhould always be firm, but delicate: a horfe's mouth fhould never befurprifed by any fudden tranfition of it, either from flack to tight, or from tight to llack. Every thing in horfemanfhip muft be effected by degrees, but at the fame time with fpirit and refolution. That hand which, by giving and taking properly, gains its point with the leaft force, is the beft ; and the horfe's mouth, under this fame hand's directions, will alfo confequently be the beft, fuppofing equal advantages in both from nature. This principle of gentlenefs hhould be obferved upon all occafions in every branch of horfemanhip. Sometimes the right hand may be neceffary, upon fome troublefome horfes, to affift the left : but the feldomer this is done, the better; efpecially in a foldier, who has a fword to carry, and to make ufe of.

The faffle muft on all occafions be uppermoft; that is to fay, the reins of it muft be above thofe of the bridle, whether the fnaffle or the bit be ufed feparately, or whether they be both ufed together. When the rider knows enongh, and the horfe is fufficiently prepared and fettled to begin any work towards fuppling, one reilumutt be fhortened according to the fide worked to ; but it muft never be fo much fhortened, as to make the whole ftrength reft on that rein alone: for, not to mention that the work would be falfe and bad, one fide of the horfe's month would by that means be always deadened; whereas on the contrary, it fhould always be kept frefh by its own play, and by the help of the oppofite rein's acting deticately in a fomewhat fmaller degree of tenfion; the joint effect of which produces in a horfe's moath the proper, gentle and eafy, degree of appui or bearing.

A coward and a madman make alike bad riders, and are both alike difcovered and confounded by the fuperior fenfe of the creature they are mounted upon, who is equally fpoilt by both, though in very different ways. The coward, by fuffering the animal to have his own way, not only confirms him in his bad habits, but creates new ones in him: and the madman by falfe and violent motions and corrections, drives the horfe, through defpair, into every bad and vicious trick that rage can fuggeit.

It is very requifite in herfemanhip, that the hand and legs fhould act in correfpondence with each other in every thing; the latter alsays fubfervient and affiftant to the former. Upon circles, in walking, trotting, or galloping, the outward leg is the only one to be ufed, and that only for a moment at atime, in order to fet off the horfe trae, or put him right if he be falfe; and as foon as that is done, it inuft be taken away again immediately; but if the horfe be lazy, or otherwife retains himfelf, both legs mult be ufed and preffed to his fides at the fame time together. The lefs the legs are ufed in general, the better. Very delicate
good riders, with horfes they have dreffed themiclves, Inftrucwill fcarcely ever want their help. By the term out- tions conward is underttood the fide which is more remote from eerning the centre; and by inward is meant the fide next to both Man the centre. In rtining back, the rider fhould be care- and Horfe. ful not to ufe his legs, unlefs the horfe backeth on his floulders; in which cafe they muft be both applied gently at the fame time, and correfpond with the hand. If the horfe refure to back at all, the rider's legs muft be gently approached, till the horfe lifts up a leg, as if to go forwards ; at which time, when that leg is in the air, the rein of the fame fide with that leg which is lifted up, will eafily bring the fame leg backwards, and accordingly oblige the horfe to back; but if the horfe offers to rear, the legs muft be inftantly removed away. The inward rein muft be tighter on circles, fo that the horfe may bend and look inwards; and the outward one croffed over a little towards it; and both held in the left hand.

Let the man and horfe begin on very flow motions, that they may have time to underftand and reflect on what is taught them; and in proportion as the effects of the reins are better comprehended, and the manner of working becomes more familiar, the quicknefs of motion muft be increafed. Every rider muft learn to feel, without the help of the eye, when a horfe goes falle, and remedy the fault accordingly: this is an intelligence, which nothing but practice, application, and attention, can give, in the beginnily on flow motions. A horfe may not only gallop falle, but alfo trot and walk falle. If a horfe gallops falfe, that is to fay, if going to the right he leads with the left leg, or if going to the left he leads with the right; or in cale he is difunited, i.e. he leads with the oppofite leg behind to that which he leads with before; ftop him immediately, and put himoff again properly. The method of effecting this, is by approaching your outward leg, and putting your hand outwards; ftill keeping the inward rein the fhorter, and the horfe's head inwards, if poffible: and if he hould ftill refift, then bend and pull his head outwards alfo; but replace it again, bent properly inwards, the moment be goes off true. A horfe is faid to be difunited to the right, when going to the right, and confequentlyleading with the right leg before, he leads with the left behind; and is faid to be difunited to the left, when going to the left, and confequently leading with the left leg before, he leads with the right behind. A horfe may at the fame time be both falfe and difunited; in correcting both which faults; the fame method muft be ufed. He is both falfe and difunited to the right, when in going to the right he leads with the left leg before, and the right behind; notwithftanding that hinder leg be with propriety more forward under his belly than the lefr, becanfe the horfe is working to the right: And he is falle and difunited to the left, when in going to the left he leads with the right leg before and the left behind; notwithftanding, as above, that hinder leg be with propriety more forward under his belly than the right, becanfe the horfe is working to the left:

In teaching men a right feat on horfeback, the greateft attention muft be given to prevent fiffnefs and flicking by force in any manner upon any occa${ }_{4} \mathrm{O}_{2}$
dion:

Offuppling fion : fliffnefs difgraces every ribht work; and fitck$\underbrace{\text { Horfes. }}$ ing ferves only to throw a man (when difplaced) a great diftance from his horfe by the fpring he nuif go off with : whereas by a proper cquilibrating pofition of the body, and by the natural weight only of the thighs he cannot but be firm and fecure in his feat.
As the men become more firm, and the horfes more fupple it is proper to make the circles lefs; but not too much fo, for fear of throwing the horfes forwards upon their fhoulders.
Some horfes, when firf the bit is put into their mouths, if great care be not taken, will put their heads very low. With fuch horfes raife your łight hand with the bridoon in it, and play at the fame time with the bit in the left hand, giving and taking.
On circles, the rider muft lean his body inwards; unlefs great attention be given to make him do it, he will be perpetually lofing his feat outwards. It is fcarce poffible for him to be difplaced, if he leans his body properly inwards.

Sect. III. The Method of fuppling Horres with Men upon them, by the Epaule en dedans, fec. with and without a Longe, on Circles and on ftraight Lines.

When a horfe is well prepared and fettled in all his motions, and the rider firm, it will be proper then to proceed on towards a further fuppling and teaching of both.

In fetting out upon this new work, begin by bringing the horfe's head a little more inward than before, pulling the inward rein gently to you by degrees. When this is done, try to gain a little on the floulders, by keeping the inward rein the fhorter, as before, and the outward one croffed over towards the inward one. The intention of thefe operations is this: The inward rein ferves to bring in the head, and procures the bend; whilf the outward one, that is a little croffed, tends to make that bend perpendicular and as it fhould be; that is to fay, to reduce the nofe and the forehead to be in a perpendicular line with each other: it alfo ferves, if put forwards, as wellas alfo croffed, to put the horfe forwards, if found necef. fary ; which is often requifite, many horfes being apt in this and other works rather to lofe their ground backwards than otherwife, when they fhould rather advance; if the nofe were drawn intowards the breaft beyond the perpendicular, it would confine the motion of the fhoulders, and have other bad effects. All other bends, befides what are above fpecified, are falfe. The ourward rein, being croffed, not in a forward fenfe, but rather a litile backwards, ferves alfo to prevent the outward fhoulder from getting too forwards, and makes it approach the inward one; which facilitates the inward leg's croffing over the outward one, which is the motion that fo admirably fupples the fhoulders. Care muft be taken, that the inward leg pafs over the ontward one, without touching it : this inward leg's croffing over muft be helped alfo by the inward rein, which you muft crofs towards and over the outward rein every time the outward leg comes to the ground, in order to lift and help the inward leg over it: at any other time, but juft when the outward leg comes to the ground, it would be wrong to crofs the inward

A $\quad \mathrm{N} \quad \mathrm{S} \quad \mathrm{H} \quad \mathrm{I} \quad \mathrm{P}$
Sect. III.
rein, or to attempr to lift up the inward leg by it; Directions nay, it would be demanding an abfolute impolibility, for Men and lugging about the reinis and horfe to no purperte : and Horfes, becaufe in this cafe, a very great part of the horfe's weight refting then upon that leg, would render fuch an attempt not only fruitlefs, but alfo prejudicial to the fenfibility of the mouth, and probably oblige him to defend himfelf: and, moreover, it would put the horfe under a neceffity of inraddling before, and alfo of leading with the wrong leg, without being productive of any fuppling motion whatfover.

When the horfe is thus far familiarly accuftomed to what you have required of him, then proceed to effect by degrees the fame creffing in his hinder legg. By bringing in the fore legs more, you will of courfe engage the hinderones in the fame work; if they refift, the rider muft bring both reins more inwards; and, if neceffary, put back alfo, and approach his inward leg to the horfe; and if the horfe throws out his croup too far, the rider mult bring both reins outwards, and, if abfolutely neceffary, he muft alfo make ufe of his outward leg, in order to replace the horfe properly: obferving that the croup fhould always be confiderably behind the fhoulders, which in all actions muft go firft; and the moment that the horfe obeys, the rider muft put his hand and leg again in their ufual pofition.
Nothing is more ungraceful in itfelf, more detrimental to a man's feat, or more deftructive of the fenfibility of a horfe's fides, than a continual wriggling unfettlednefs in a horfeman's legs, which prevents the horfe from ever going a moment together true, feady, or determined.

A horfe fhould never be turned, without firft moving a ftep forwards : and when it is doing, the rider muft not lift his elbow, and difplace himfelf; a motion only of the hand from the one fide to the other being fufficient for that purpofe. It muft alfo be a conftant rale, never to fuffer a horfe to be flopped, mounted, or difmounted, but when he is well placed. The flower the motions are when a man or horfe is taught any thing, the better.

At firft, the figures worked upon muft be great, and afterwards made lefs by degrees, according to the improvement which the man and horfe make ; and the cadenced pace alfo, which they work in, muft be accordingly augmented. The changes from ore fide to the other, muft be in a bold determined trot, and at firft quite ftraight forwards, without demanding any fide-motion on two pifles, which is very neceffary to require afterwards when the horfe is fufficiently fuppled. By two piffes is meant, when the fore-parts and hinder parts do not follow, but defcribe two different lines.

In the beginning, a longe is ufeful on circles, and alfo on fraight lines, to help both the rider and the horfe; but afterwards, when they are grown moreintelligent, they fhould go alone. At the end of the leffon, rein back; then put the horfe, by a little at a time, forwards, by approaching both legs gently to his fides, and playing with the bridle : if he rears, pufh him out immediately inte a full trot. Shaking the cavefon on the horfe's nofe, and alfo putting one's felf before him and rather near to him, will generally make him back, though he otherwife refnfe to do it: and moreover a light ufe and approaching of the rider's legs,
of Head to legs, will fometimes be neceffary in backing, in order the Wall, to prevent the horfe from doing it too much upon his \& fhoulders; but the preflure of the legs ought to be very finall, and taken quite away the moment that he puts himfelf enough upon his haunches. If the horfe does not back upon a ftraight line properly, the rider muft not be permitted to have recourfe immediately to his leg, and fo diftort himfelf by it ; but firlt try, if croffing over his hand and reins to which ever fide may be neceffary, will not be alone fufficient: which moft freguently it will; if not, then employ the leg.

After a horfe is well prepared and fettled, and goes freely on in all his feveral paces, he ought to be in all his works kept, to a proper degree, upon his haunches, with his hinder legs well placed under him; whereby he will be always pleafant to himfelf and his rider, will be light in hand, and ready to execute whatever may be demanded of him, with facility, vigour, and quicknefs.

The common method that is ufed, of forcing a horfe fidewife, is a moft glaring abfurdity, and very hurtful to the animal in its confequences; for inftead of fuppling him, it obliges him to ftiffen and defend himfelf, and often makes a creature that is naturally benevolent, reftive, frightened, and vicious.

For horfes, who have very long and high fore-hands, and who poke out their nofes, a running fnafte is of excellent ufe; but for fuch as bore and keep their heads low, a common one is preferable; though any horfe's head indeed may be kept ap alfo with a running one, by the rider's keeping his hands very high and forwards: but wherever either is ufed alone without a bridle upon horfes that carry their heads low and that bore, it mult be fawed about from one fide to the other.

This leffon of the epaule en dedans fhotle be taught to fuch people as are likely to become ufeful in helping to teach men and to break horfes; and the more of fuch that can be found the better : none others flould ever be fuffered upon any occafion to let their horfes look any way befides the way they are going. But all horfes whatever, as likewife all men whoare defigned for the teaching others, muft go thoroughly and perfectly through this excellent leffon, under the directions of intelligent inftructors, and often practife it too afterwards; and when that is done, proceed to and be finifhed by the leffons of head and tail to the wall.

## Sect. IV. Of the Head to the Wall, and of the Croup to the Wall.

THis leffon fhould be practifed immediately after that of the epaule on dedans, in order to place the horfe properlythe way he goes, \&c. The difference between the head to the wall, and the croup to the wall, confifts in this: in the former, the forc-parts are more remote from the centre, and go over more ground ; in the latter, the hinder parts are more remote from the centre, and confequently go over more ground : and both, as likewife in all other leffons, the fhoulders mult go firf. In riding-horfes, the head to the wall is the eafier leffon of the two at firft, the line to be worked upon being marked by the wall, not far from his head.

A N S H I P.
The motion of the legs to the right, is the fame as of Head to that of the epaule en dedans to the left, and fo vice ver- the Wall, fa; but the head is always bent and turned different- \&c. ly: in the epaule en dedans, the horfe looks the contrary way to that which he goes; in this, he looks the way he is going.

In the beginning, very little bend mult be required; too much at once would aftonifh the horfe, and make him defend himfelf: it is to be augmented by degrees. If the horfe abfolutely refufes to obey, it is a finn that either he or his rider has not been fufficiently prepared by previous leffons.' It may happen, that weaknefs or a hurt in fome part of the body, or fometimes temper, though feldom, may be the caufe of the horfe's defending himfelf: it is the rider's bufinefs to find ont from whence the obftacle arifes; and if he finds it to be from the firf mentioned caufe, the previons leffons mult be refumed again for fome time; if from the fecond, proper remedies mult be applied; and if from the laft caufc, when all fair means that can be tried have failed, proper corrections with coolnefs and judgment muft be ufed.

In practifing this leffon to the right, bend the horfe to the right with the right rein; helping the left leg over the right (at the time when the right leg is juft come to the ground), with the left rein croffed towards the right, and keeping the right fhoulder back with the right rein towards your body, in order to facilitate the left leg's croffing over the right; and fo likewife vice verfa to the left, cach rein helping the other by their properly mixed effects. In working to the right, the rider's left leg helps the hinder-parts on to the right, and his right leg ftops them if they get too forwards; and fo vice vorfa to the left: but neither ought to be ufed, till the hand being employed in a proper manner has failed, or finds that a greater force is neceffary to bring about what is required than it can effect alone t for the legs fhould not only be correfponding with, but alfo fubfervient to, the hand; and all unneceflary aids, as well as all force, ought always to be avoided as much as poflible.

In the execution of all leffons, the equilibre of the rider's body is of great ufe to the horfe : it ought always to go with and accompany every motion of the animal ; when to the right, to the right; and when to the left, to the left.

Upon all horfes, in every leffon and action, it muft be obferved, that there is no horfe but has his own peculiar appui or degree of bearing, and alfo a fenfibility of mouth, as likewife a rate of his own, which it is abfolutely neceflary for the rider to difoover and make himfelf acquainted with. A bad rider always takes off at leaft the delicacy of both, if not abfolutely deftroys it. The horfe will inform his rider when he has got his proper bearing in the mouth, by playing pleafantly and fteadily with his bit, and by the fpray about his chaps. A delicate and good hand will not only always preferve a light appui, or bearing, in its fenfibility; but alfo of a heavy one, whether naturally fo or acquired, make a light one. The lighter this appui can be made, the better; provided that the rider's hand correfponds with it; if it does not, the more the horfe is properly prepared, fo much the worfe. Inftances of this inconvenience of the beft of appuis.

To make Horfes ftand Fire \&c.
appuis, when the rider is not equally taught with the horfe, may be feen every day in fome gentlemen, who try to get their horfes bitted as they call it, withont being fuitably prepared themfelves for riding them; the confequence of which is, that they ride in danger of breaking their necks; till at length, after much hauling about, and by the joint infenfibility and ignorance of themfelves and their grooms, the poor animals gradually become mere fenfelefs unfeeling pofts; and thereby grow, what they call, fettled. When the proper appui is found, and made of courfe as light as poffible, it mutt not be kept duly fixed without any variation, but be played with; otherwife one equallycontinued tenfion of reins wonld render both the rider's hand and the horfe's mourh very dull. The flighteft and frequent giving and taking is therefore neceffary to keep both perfect.

Whatever pace or degree of quicknefs you work in, (be it ever fo falt, or ever fo flow), it mult be cadenced ; time is as neceflary for a horfeman as for a mufician.

This leffon of the head and of the tail to the wall, muft be taught every foldier: fcarce any manœuvre can be well performed withoutit. In clofing andopening of files, it is almoft every monent wanted.
Sect. V. The Method of making Horfes fland Fire, Woifes, Alarms, Sights, \&c.
Is order to make horfes ftand fire, the found of drums, and all forts of different noifes, you muf ufe them to it by degrees in the ftable at feeding-time; and inftead of being frightened at it, they will foon come to like it as a lignal for eating.

With regard to fach horfes as are afraid of burning objects; begin by keeping them ftill at a certain diftance from fome lighted ftraw : carefs the horfe; and in proportion as his fright diminifhes, approach gradually the burning fraw very gentiy, and increafe the fize of it. By this means he will very quickly be brought to be fo familiar with it, as to walk undaunted even throagh it.

As to horfes that are apt to lie down in the water, if animating them, and attacking them vigoroufly, fhould fail of the defired effect, then break a ftrawbottle full of water upon their heads, and let the water ran into their ears, which is a thing they apprehend very mach.

All troop-horfes muft be taught to fland quiet and Aill when they are fhot off from, to fop the moment you prefent, and not to move after firing till they are required to do it; this leffon ought efpecially to be obferved in light troops : in fhort, the horfes mult be tanght to be fo cool and undifturbed, as to fuffer the rider to act upon him with the fame freedom as if he was on foot. Patience, coolnefs, and temper, arc the only means requifite for accomplifhing this end. Begin by walking the horfe gently, then ftop and keep him from firring for fonse time, fo as to accultom him by degrees not to have the leaft idea of moving without orders: if he does, then back him; and when you fop him, and he is quite ftill, leave the reins quite loofe.

To ufe a horfe to fire-arms, firft put a piftol or a carabine in the manger with his feed; then ufe him to the found of the lock and the pan; after which,

A $\mathrm{N} \boldsymbol{S} \mathrm{H}$ I P.
when you are upon him, fhow the piece to him, pre- To make fenting it forwards, fometimes on one fide, fometimes Horfes on the other: when he is thus far reconciled, proceed ftand Fire, to flafh in the pan; after which, put a fmall charge $\underbrace{\& c}$ into the piece, and fo continue augmenting it by degrees to the quantity which is commonly ufed : if he feems uneafy, walk him forward a few fteps llowly; and then fop, back, and carefs him. Horfes are often alfo difquieted and unfteady at the clafh, and drawing, and returning of fwords; all which they mult be familiarized to by little and little, by frequency and gentlenefs.

It is very expedient for all cavalry in general, but particularly for light cavalry, that their horfes fhould be very ready and expert in leapiag over ditches, hedges, gates, \&c. The leaps, of wharever fort they are, which the horfes are brought to in the beginting, ought to be very fmall ones; the riders muft keep their bodies back, raife their hands a little in order to help the fore-parts of the horfe up, and be very attentive to their equilibre. It is beft to begin at a low bar covered with furze, which pricking the horfe's legs, if he does not raife himfelffufficiently, prevents his contracting a fluggifh and dangerous habit of touching, as he goes over, which any thing yielding and not pricking would give him a cuftom of doing. Let the ditches you firft bring horfes to be narrow; and in this, as in every thing elfe, let the increafe be made by degrees. Accuftom then to come up to every thing which they are to leap over, and to fand coolly at it for fome time; and then to raife themfelves gently up in order to form to themfelves an idea of the diftance. When they leap well Ganding, then ufe them to walk gently up to the leap, and to go over it without firft halting at it; and after that practice is familiar to them, recuat the like in a gentle trot, and fo by degrees fafter and fafter, till at length it is as familiar to them to leap flying on a full gallop as any other way; all which is to be acquired with great facility by calm and foft means, without any hurry.

As horfes are naturally apt to be frightened at the fight and fnell of dead horfes, it is advifable to habituate them to walk over and leap over carcafes of dead horfes: and as they are particularly terrified at this fight, the greater gentlenefs ought confequently to be afed.

Horfes hould alfo be accuftomed to fwim, which often may be neceflary upon fervice ; and if the men and horfes both are not ufed to it, both may be frequently liable to perifh in the water. A very fmall portion of ftrength is fufficient to guide a horfe, anywhere indeed, but particularly in the water, where they muft be permitted to have their heads, and be no-ways conftrained in any fhape.

The unreafonable rage in Britain of cutting off all extremities from horfes, isin all cales a very pernicious cuftom. It is particularly fo in, regard to a troop. horfe's tail. It is almoft incredible, how mach they Suffer at the picket for want of it: comfantly fretting, and fweating, kicking about and laming one another, tormented, and fung off their meat, miferable, and helplefs; whilft other horfes, with their tails on, brofh off all flies, are cool and at their eafe, and mend daily; whilf the docked ones grow every hour more and more out of condition.

Sect.

Of reining Sect. VI. The Method of reining back, -and of movback, \&. ing forwards imnnediately after;—of Piafing,—of Pillars, \&c.

Never finifh your work by rcining back with horfes that have any difpofition towards retiining themfelves; but always move them forwards, and a little upon the haunches alfo, after it, beforc you difmount, (unlefs they retain themfelves very mach indeed, in which cafe nothing at all muft be demanded from the haunches). This leffon of reining back, and piafing, is excellent to conclude with, and puts an horfe well and properly on the haunches: it may be done, according as horfes are more or lefs fuppled, either going forward, backing, or in the fame place: if it is done well advancing, or at moft on the fame fpot, it is full fufficient for a foldier's horfe: For to piafe in backing, is rather too much to be expected in the hurry which cannot but attend fuch numbers both of men and horfes as mutt be taught together in regiments. This leffon muft never be attempted at all, till horfes are very well fuppled, and fomewhat accuftomed to be put together; otherwife it will have very bad confequences, and create reftivenefs. If they refufe to back, and ftand motionlefs, the rider's legs muft be approached with the greatelt gentlenefs to the horfe's fides; at the fame time that the hand is acting on the reins to folicit the horfe's backing. This feldom fails of procuring the defired effect, by raifing one of the horfe's fore-legs, which beigg in the air, has no weight upon it, and is confequently very eafily brought backwards by a fmall degree of tenfion in the reins. When this leffon is well performed, it is very noble and ufeful, and has a pleafing air ; it is an excellent one to begin teaching fcholars with.

The leffon is particularly ferviceable in the pillars, for placing fcholars well at firf. Very few regimental riding-houfes have pillars, and it is fortunate they have not: for though, when properly made ufe of with fkill, they are one of the greateft and beft difcoveries in horfemandij; they muft be allowed to be very dangerous and pernicious, when they are not under the direction of a very knowing perfon.

## Sect. VII. The Method of curing Refivenefles, Viees, Defences, Starting, \&c.

Whenever a horfe makes refiftance, one ought, before remedy or correction is thought of, to examine very minutely all the tackle about him, if any thing hurts or tickles him, whether he has any natural or accidental weaknefs, or in fhort any the leaft impediment in any part. For want of this precaution, many fatal difafters happen : the poor dumb animal is frequently accefed falfely of being reftive and vicious; is ufed ill without reafon; and, being forced into defpair, is in a manner obliged to act accordingly, be his temper and inclination ever fo well difpofed. It is very feldom the cafe, that a horfe is realy and by nature vicious; but if fuch be tound, he will defpife all careffes, and then chaftifements become neceffary.

Correction, according as you ufe it, throws a horfe into more or lefs violent action, which, if he be weak, he cannot fupport : but a vicious ftrong horfe is to be confidered in a very different light, being able both
to undergo and confequently to profit by all leffons; Of curing and is far preferable to the beft natured weak one Reftivenefs upon earth. Patience and attention are never failing means to reclaim fuch a horfe: in whatfoever manner he defends himfelf, bring him back frequently with gentlenefs (not however without having given him proper chaftifement if neceflary) to the lefon which he feems moft averfe to. Horfes are by degrees made obedient, through the hope of recompenfe and the fear of punifhment : how to mix thefe two motives judicioully together, is a very dificule matter ; it requires mach thought and practice; and not only a good head, but a good heart likewife. The cooleft and beft natured rider will always fucceed beft. By a dexterous ufe of the incitements abovementioned, you will gradually bring the horfe to temper and obedience; mere force, and want of fkill and coolnefs, would only tend to confirm him in his bad tricks. If he be impatient or choleric, never frike him, unlefs he abfolutely refufe to go forwards; which you muft refolutely oblige him to do, and which will be of itfelf a correction, by preventing his having time to meditate and put in exccution any defence by retaining himfelf. Refiftance in horfes, you muft confider, is fometimes a mark of ftrength and vigour, and proceeds from fpirit, as well as fometimes from vice and weaknefs. Weaknefs frequently drives horfes into viciouinefs, when any thing wherein ftrength is neceffary is demanded from them; nay, it inevitably muft; great care therefore fhould always be taken to diftinguilh from which of thefe two caules any remedy or punifhment is thought of. It may fometimes be a bad fign when horfes do not at all defend themfelves, and proceed from a fluggifh difpofition, a want of fpirit, and of a proper fenfibility. Whenever one is fo fortunate as to meet with a horfe of juft the right fpirit, activity, delicacy of feeling, with frength and good nature, he cannot be cherifhed too much; for fuch a one is a rare and ineftimable jewel, and, if properly treated, will in a manner do every'thing of himfelf. Horfes are oftner fpoilt by having too much done to them, and by attempts to drefs them in too great a hurry, than by any other treatment.

If after a horfe has been well fuppled, and there are no impediments, either natural or accidental, if he ftill perfifts to defend himfelf, chaftifement then becomes neceffary: but whenever this is the cafe, they muft not be frequent, but always firm, though always as little violent as poffible; for they are both dangerous and very prejudicial when frequently or flightly played with, and fitl more fo when ufed too violently.

It is impoffible, in general, to be too circumfpect in leffons of all kinds, in aids, chaftifements, or careffes. Some have quicker parts, and more cunning, than others. Many will imperceptibly gain a little every day on the rider. Various, in flort, are their difpofitions and capacities. It is the rider's bufnefs. to find out their different qualities, and to make them fenfible how much he loves them, and defires to be luved by them; but at the fame time that he does. not fear them, and will be mafter.

Plunging is a very common defence among reftive and vicious horfes : if they do it in the fame place, or backing, they muff, by the rider's legs and fpurs
firmly

Plain Rales firmly applied, be obliged to go forwards, and their for bad heads kept up high. But if they do it flying for$\underbrace{\text { Horfemen. wards, keep them back, and ride them gently and }}$ very flow for a good while togerher. Of all bad tempers and qualities in horfes, thofe which are oecafioned by harfh treatment and ignorant riders are the worft.

Rearing is a bad vice, and, in weak horfes efpecially, a very dangerous one. Whillt the horfe is up, the rider muft yield his hand; and when the horfe is defcending, he muft vigoroufly determine him forwards : if this be done at any other time but whilft the horfe is coming down, it may add a fering to his rearing, and make him fall backwards. With a good hand on them, horfes feldom perfift in this vice; for they are themfelves naturally much afraid of falling backwards. If this method fails, you muft make the horfe kick up behind, by getting fomebody on foot to frike him behind with a whip; or, if that will not effect it, by pricking him with a goad.

Starting often proceeds from a defect in the fight; which therefore mult be carefully looked into. Whatever the horfe is afraid of, bring him up to it gently; if you carefs him every ftep he advances, he will go quite up to it by degrees, and foon grow familiar with all forts of objects. Norhing but great gentlenefs can correct this fault ; for if you inflict punifhment', the apprehenfion of chaftifement becomes prevalent, and caufes more farting than the fear of the object. If you let him go by the object, without bringing him itp to it, you increafe the fault, and confirm him in his fear ; the confequence of which is, he takes his rider perhaps a quite contrary way from what he was going, becomes his mafter, and puts himfelf and the perfon upon him every moment in great danger.

With fuch horfes as are to a very great degree fearful of any objects, make a quiet horfe, by going before them, gradually intice them to approach nearer and nearer to the thing they are afraid of. If the horfe, thus alarmed, be undifciplined and head ftrong, he will probably run away with his rider; and if fo, his head munt be kept up high, and the fnaffle fawed backwards and forwards from right to left, taking up and yielding the reins of it, as allo the reins of the bit : but this latter muft not be fawed backwards and forwards like the fnaffle, but only taken up and yielded properly. No man ever yet did, or ever will, ftop a horfe, or gain any one point over him, by main force, or by pulling a dead weight againft him.

## Sect. VIII. Rules for bad Horfemen.

In the firft place every horfe hould be accuftom-

Thomfon's Rules.

A N S H I P.
tering, has at the fame time both bridle and ftirrup to Plain Rules give. This contalion would be prevented, if every for bad horfe was taught to ftand fill when he is mounted. Horfemend Forbid your groom, therefore, when he rides your horfe to water, to throw himfelf over him from a horfe-block, and kick him with his leg, even before he is fairly upon him. This wrong manner of mounting is what chiefly teaches your horfe the vicious habit againft which we are here warning. On the other hand, a conftant practice of mounting in the proper manner, is all that is neceffary to prevent a horfe's going on till the rider is quite adjufted in the faddle.

The next thing neceffary therefore is, that the rider fhould mount properly. The common method is to ftand near the croup or hinder part of the horfe, with the bridle held very long in the right hand. By this manner of holding the bridle before you mount, you are liable to be kicked; and when you are mounted, your horfe may go on fome time, or play what gambols he pleafes, before the rein is thort enough in your hand to prevent him. It is common likewife for an aukward rider, as foon as his foot is in the ftirrup, to throw himfelf with all his force to gain his feat : which he cannot do, till he hath firft overbalanced himfelf on one fide or the other: he will then wriggle inte it by degrees. The way to mount with eafe and fafety is, to ftand rather before than behind the firrup. In this pofture take the bridle fhort, and the mane together in your left hand, helping yourfelf to the ftirrup with your right, fo that your toe may. not touch the horfe in monnting. When your left foot is in the ftirrup, move on your right, till. you face the fide of the horfe, looking acrofs over the faddle. Then with your right hand grafp the hinder part of the faddle; and with that and your left; which holds the mane and bridle, lift yourfelf upright on your left foot. Remain thus a mere inftant on your firrup, only fo as to divide the action into two motions. While you are in this pofture, you have a fure hold with both hands, and are at liberty, either to get fafely down, or to throw your leg over and gain your feat. By this deliberate motion, likewife, you avoid, what every good horfeman would endeavour to avoid, putting your horfe into a flutter.

When you difmount, hold the bridle and mane together in your left hand, as when you mounted ; put your right hand on the pommel of the faddle, to raife yourfelf; throw your leg back over the horfe, grafp the hinder part of the faddle with your right hand, remain a moment on your ftirrup, and in every refpeet difmonnt as you mounted; enly what was your firft motion when you mounted, becomes the laft in difmounting. Remember not to bend your right knee in difmounting, left your fpur fhould rub againft the horfe.

It may be next recommended to hold your bridle at a convenient length. Sit fquare, and let not the purchafe of the bridle pall forward your fhoulder; but keep your body even, as it wonld be if each hand held a rein. Hold your reins with the whole gralp of your hand, dividing them with your little finger. Let your hand be perpendicular ; your thumb will then be uppermoft, and placed on the bridle. Bend your

plainRules wrift a litile ontward ; and when you pull the bride, for bad raife your hand toward your breaft, and the lower Horfemen, part of the palm rather more than the upper. Let the bridle be at fuch a lenget in your hand, as, if the horfe fhould fomble, you may be able to raife his head, and fupportit by the ftreugth of your arms, and the weight of your body thrown backward. If you hold the rein too long, yon are fubject to fall backward as your horfe rifes.

If, knowing your horfe perfecely well, you think a tight rein unneceffary, advance your arm a little (but not your thoulder) towards the horfe's head, and keep your ufual length of rein. By this means, you hare a check apon your horfe, while you indulge him.

If you ride with a curb, make it a rule to hook on the chain yourfelf; the noft quiet horfe may bring his rider into danger, fhonld the curb hart him. It, in fixing the curb, you turn the chain to the right, the links will unfold themfelves, and then oppore a farther turning. Put on the chain loofe enough to hang down on the horfe's under lip, fo that it may not rife and prefs his jaw, till the rems of the bride are moderately pulled.

If your horfe has been ufed to fand till when lie is mounted, there will be no occafion for a groom to hold him : but if he docs, fuffer him not to touch the reins, but that part of the bridle which comes down the cheek of the horfe. He cannot then interfere with the management of the reins, which belongs to the rider only; and holding a horfe by the curb (which is ever painful to him) is evidently improper when he is to ftand ftill.

Another thing to be remembered is, not to ride with your arms and elbows as high as your fhoulders; nor let them fhake up and down with the motion of the horie. The pofture is unbecoming, and the weight of the arms (and of the body too if the rider does not fit ftill) acts in continual jetks on the jaw of the horfe, which muft give him pain, and make lim unquiet, if he has a tender mouth or any fpirit.

Bad riders wonder why horfes are gentle as foon as they are mounted by fkilful ones, tho' their kill feems unemployed, the reafon is, the horfe goes at his eare, yet finds all his motions watched; which he has fagacity enough to difcover. Such a rider hides his whip, if he finds his horfe is afraid of it; and keeps his legs From his fides, if he finds he dreads the fpur.

Avoid the ungracefal cuftom of letting your legs hake againt the fides of the horfe: and as you are not to kecp your arms and elbows high, and in motion; fo you are not to rivet them to your fides, but let them fall eafy. One may, at a diftance, diftinguifh a genteel horfeman from an aukward one; the firf fits ftill, and appears of a piece with his horfe; the latter feems flying off at all points.

1 l is often faid with emphafis, that fuch a one has nofeat on hor feback; and it means, not only that he does not ride well, but that he does not fit on the right part of the horfe. To have a good feat, is to fit on that part of the borfe, which, as he fprings, is the centre of motion; and from which, of courfe, any weight would be with mont difficulty haken. As in the rifing and falling of a board placed in aquilib io, the centre will be always molt at rell ; the true feat Vol. VIII.
will be found in that part of your faddle, into which Phin Rules your body would naturally hide, if you rode without for bad itirrups; and is only to be preferved by a proper poife Horicmen. of the body, though the generality of writers imagine it is to be done by the grafp of the thighs and knees. The rider fhould confider himfelf as united to his horfe in this point; and when hlaken from it, endeavour to reftore the balance.

Perhaps the mention of the two extremes of a bad feat may belp to defcribe the true one. The one is, when the rider fits very far back on the faddle, fo that his wight preffes the loins of the horfe; the other, when his body hangs forward over the pommel of the faddle. The firft may be feen praclifed by grooms, when they ride with their firrups affectedly hort ; the latter, by fearful horfemen on the leaft fluter of the horfe. Every good rider has, even on the lunting faddle, as deternined a place for his thighs, as can be determined for him by the bars of a demi-peak. Indeed there is no difference between the feat of cither: only, as in the firft you ride with fhorter firrups, your body will be confequently more behind your knees.

To have a good feat yourfelf, your faddle muft fit wall. To fix a precife rule might be difficult: it may be a diredtion, to have your faddle prefs as nearly as poffible on that part which we have defcribed as the point of union between the man and horfe; however, fo as not to obftruct the motion of the horfe's firoutders. Place yourfelf in the middle or loweft part of it: fit erect ; but with as little conftraint as in your ofdinary fitting. The eafe of akion marks the gentleman : you may repole yourfelf, bur not loange. The fet and fudied erectnefs acquired in the riding-houfe, by thofe whofe department is not eafy, appears ungenteel and unnaural.
If your horfe ftops fhort, or endeavours by rifing and kicking to unfeat you, bend not your body forward, as many do in thofe circumftances: that motion throws the breach back ward, and you off yeur fork or twift, and out of your feat: whereas, the advancing the lower part of your body, and bending back the upper part and fhoulders, is the method both to keep your feat, and to recover it when loft. The bending your body back, and that in a great degree, is the greateft fecurity in fying leaps; it is a fecurity too, when your horfe leaps ftanding. The horfe's rifing does not try therider's feat; the lafh of his hind legs is what ought chiefly to be guarded againft, and is beft done by the body's being greatly inclined back. Stitfen not your legs or thighs; and let your body be pliable in the loins, like the coachman's on his box. This loufe manner of fitting will elade every rough motion of the horfe; whereas the fixture of the knees, fo commonly laid a ftrefs on, will in great fhocks concuce to the violence of the fall.

Was the cricket-player, when the ball is ftruck with the greatent velocity, to hold his hand firm and fixed when he receives it, the hand would be bruifed, or perhaps the bones fractured by the refintance. 'To obviate this accident, he therefore gradually yiclis his hand to the motion of the ball for a certain ditance ; and thus by a due mixture of oppolition and obedience, catches it without fuftainiug the leat injury. The cafe is exactly the fame in riding: the fkilfulhorfeman

Plain Rules will recover his poife by giving fome way to the mofor bad tion; and the ignorant horfeman will be flung out of ${ }^{\text {Horfmen. }}$ his feat by endeavouring to be fixed.

Stretch not out your legs before you; this will pulh you againft the back of the faddle: neither gather up. your knees, like a man riding on a pack; this throws yourthighs upwards : each practice unfeats you. Keep your legs ftraight down; and fit not on the moft flefhy part of the thighs, but turn them inwards, fo as to bring in your knees and toes: and it is more fafe to tide, with the ball of the foot preffing on the firrap, than with the firrup as far back as the heel; for the preffure of the heel being in that cafe behind the firrap, keeps the thighs down.

When you find your thighs thrown upwards, widen your knees to get them and the upper part'of your fork lower down on the horfe. Grafp the faddle with the hollow or inner part of your thighs, but no more than juft to affilt the balance of your body; this will alfo enable you to keep your fpurs from the horfe's fides, and to bring your toes in, without that affected and ufelefs manner of bringing them in practifed by many, Sink your heels ftraight down; for while your heels and thighs keep down, you cannor fall: this (aided with the bend of the back) gives the fecurity of a feat, to thofe who bear themfelves up in their flirrups in a fwift gallop, or in the alternate rifing and falling in a full trot.

Let your feat deternine the length of your firrups, rather than your ftirrups your feal. If more precifion is requifite, let your firrups (in the hunting faddle) be of fuch a length, as that, when yout ftand in them, there may be the breadth of four fingers be. tween your feat and the faddle.

It would greatly affift a learner, if he would practife riding in a large circle, as directed fect. ii. without firrups; keeping his face looking on the outward part of the circle fo as not to have a full view of the horfe's head, but juft of that ear which is on the outward part of the circle ; and his fhoulder, which is towards the centre of the circle, very forward. By this means you learn to balance your body, and keep a true feat, independent of your ftirrups: you may probably likewife efcape a fall, hould yon at any time lofe them by being accidentally fhaken from your feat.

As the feat in fome meafure depends on the faddle, it may not be amifs to obferve, that becaufe a faddle with a high pommel is thought dangerous, the other extreme prevails, and the pommel is fcarce allowed to be higher than the middle of the faddle. The faddle fhould lie as near the back-bone as can be, withoat burting the horfe; for the inearer you fit to his back, the better feat you have. If ir does fo, it is plain the pommel maft rife enough to fecure the withers from preffure : therefore, a horfe, whofe withers are higher than common, requires a higher pommel. If, to avoid this, you make the faddle of a more ftraight line, the inconvenience fpoken of follows; you fir too much above the horfes back, nor can the faddle form a proper feat. There fhould be no ridge from the button at the fide of the pommel, to the back part of the faddle. That line alfo hould be a little concave, for your thighs to lie at eafe. In hort, a faddle ought to be, as nearly as poffible, as if cut out of the horfe.

## A N S H I P.

Sect. VIII.
When you want your horfe to move forward, raife Plain fules his head a little, and rouch him gently with your whip; for bad or elfe, prefs the calves of your legs againtt his lides. Horfemen. If he does not move faft enongh, prefs them with more force, and fo till the fpur juit touches hin. By this practice he will (if he has any firit) move upon the leaft preffure of the leg. Never fpur him by a kick; but if it be neceffary to fpur him brinkly, keep your heels clofe to his fides, and flacken their force as he becomes obedient.

When your horfe attempts to be vicious, take each rein feparate, one in cach hand, and advancing your arms forward, hold him very fhorr. In this cafe, it is common for the rider to pull him hard, with his arms low. But the horfe by this nieans having his head low too, has it more in his power to throw out his heels : whereas, if his head be raifed very high, and his nofe thrown out a little, which is confequent, he can neither rife before nor behind ; becaufe he can give himfelf neither of thofe motions, withuut having his head at liberty. A plank placed in equilibrio, cannot rife at one end unlefs it links at the other.
If your horfe is headftrong, pull not with one conltinued pull, but ftop, and back him often, joff fleking the reins, and making little repeated pulls till he obeys. Horfes are fo accuftomied to bear on the bit when they go forward, that they are difcouraged if the rider will not let them do fo.
If a horfe is loofe-necked, he will throw up his head at a concinued pull; in which fituation, the rider, feeing the front of his face, can have no power over him. When your horfe does thus, drop your hand and give the bridle play, and he will of courfe drop his head again into its proper place: while it is coming down, make a fecond gentle pall, and you will find his mouth. With a little practice, this is done almoft inflantancounly; and this method will ftop, in the diftance of a few yards, a horfe, which will run away with thofe who pull at him with all their mighr. Almoft every one muft have obferved, that when a horfe feels himfelf pulled with the bride, even when he is going gently, he often miftakes what is detigned to ftop him, as a direction to bear on the bit and to go fafter.
Keep your horfe's head high, that he may raife his. neck and' creft ; play a little with the rein, and move the bit in his mouth, that he may not prefs on it in one coniftant and continued manner : be nor afraid of raifing his head too high; he will naturally be too ready to bring it down, and tire your arns with its weight, on the leaf abatement of his metal. When you feel him heavy, flop him, and make him go back a few paces : thus you break by degrees his propenfity to prefs on his bridle.

You ought not to be pleafed (though many are) with a round neck, and a head drawn in towards his breaft : let your horfe carry his head bridling in, provided he carries it high, and his neck arching upwards;: but if his neck bends downwards, his figure is bad, his fight is toonear his toes, he leans on the bridle, and you have no command over him. If he goes prefling but lightly on the bridle, he is the more fure-footed, and goes pleafanter; as your wrif oniy may guide him. If he hangs down his head, and makes you fupport the weight of that and his neck with your arms bear-

Plain Rules ing on his fore-legs, (which is called being on bis ghoulfor bad ders), he will Itrike his toes againft the ground, and Horfemen. ftumble.

If your horfe is heavy upon the bit, tie him every day, for an hour to two, with his tail to the manger, and his head as high as you can make him litt it, by a rein on each poft of the ftall, tied to each ring of the fnaffle bit.

Horfe-breakers and grooms have a great propenfity to bring a horfe's head down, and feem to have no feat without a ftrong hold by the bridle. They know indeed, that the head fhould yield to the reins, and the neck form an arch; tur do not take the proper pains to make it an arch upward. A temporary effect of attempting to raife a horfe's head, may perhaps be making him puth out his nofe. They will here tell you, that his head is too high already; whereas it is not the diftance trom his nofe, but from the top of his head to the ground, which determines the head to be high or low. Befides, although the fault is faid to be in the manner of carrying the head, it hould rather be faid to be in that of the neck; for if the neck was raifed, the head would be more in the pofition of one fet on a well formed neck.

The defign therefore of lifting up the head, is to raife the neck, and thereby bring in the head; for even while the bridle makes the fame line from the rider's hand to the bit, the horfe's note may be either drawn in, or thruft out, according as his neck is raifed or depreffed. Inftead of what has been here recom. mended, we ufually fee colts broke with their heads caveffoned very low, their necks ftiff, and not in the leaft fuppled. When the breaking-tackle is left off; and they are mounted for the road, having more tood and reft, they frequently plunge, and a fecond breaking becomes neceffary. Then, as few gentlemen can manage their own horfes, they are put into the hands of grooms, from whom they learn a variety of bad habits.

If, on the other hand, your horfe carries his head (or rather his nofe) too high, he generally makes fome amends by moving his fhoulders lightly, and going fafely. Attend to the caufe of this fault. Some horfes have their necks fet folow on their houlders, that they bend firft down, then upwards, like a ftag's. Some have the upper line of their necks, from their ears to their withers, too fhort. A head of this fort cannot poffibly bend inwards and form an arch, becaufe the vertebre (or neck bones) are too hort to admit of flexure ; for in long and fhort necked horfes the number of the vertebræ is the fame. In fome, the jaw is fo thick, that it meets the neck, and the head by this means has not room to bend. On the other hand, fome have the under line from the jaw to the breaft fo fhort, that the neck cannor rife.

In all thefe cafes you may gain a little by a nice hand with an eafy bit; but no curb, martingale, or other forcibte method, will teach a horfe to carry his head or neck in a pofture which nature has made uneafy to him. By trying to pull in his nofe farther than he can bear, you will add a bad habit to nature. You could not indeed contrive a more effectual method to make him continually tufs his nofe up, and throw his foam over you.

The rule already given to ride a loofe-necked horfe,

## A $\quad \mathrm{N} \quad \mathrm{S} \quad \mathrm{H}$ I P .

will be a proper one for all light-mouthed horfes: one Plain Rules caution being added, which is, always to fearch whe- for bad ther his faddle or girths may not in fome way pinch Horfenen. him; and whether the bit may not hurt his lip by being too high in his mouth : becaufe, whenever he frets from either of thefe caules, his head will not be fleady.

It is a common cuftom to be always pulling at the bridle, as if to fet off to advantage either the fpirit of the horfe, or the fkill of the rider. Our horfes therefore are taught to hold their heads low, and pull fo, as to bear up the rider from the faddle, ftanding in his firrups, even in the gentleft gallop: how very improper this is, we are experimentally convinced, when we happen to meet with a horfe which gallops otherwife. We immediately fay, he canters excellently, and find the eafe and pleafure of his motion. When horfes are defigned for the race, and fwiftnefs is the only thing confidered, the method may be a good one.
It is not to be wondered that dealers are always pulling at their horfes; that they have the fpur conftantly in their fides, and are at the fame time continually checking the rein: by this means they make them bound, and champ the bit, while their rage has the appearance of firit. Thefe pcople ride with their arms fpread, and very low on the fhoulders of their horfes: this method nakes them fretch their necks, and gives the better appearance to their fore-heads; it conceals alfo a thick jaw, which, if the head was up, would prevent its yielding to the bir; it hides likewife rhe ewe-neck, which would otherwife how itfelf. Indeed, if you have a horfe anfteady to the bit, formed with a natural heavy head, or one which carries his nofe obftinately in the air, you muft find his mouth where you can, and make the beft of him.

Many horfes are tanght to fart by whipping them for ftarting. How is it poffible they can know it is defigned as a puniflment? In the riding-houfe, you teach your horfe to rife up before, and to fpring and

- lafh out his hinder legs, by whipping him when tied between two pillars, with his head a little at liberty. If he underfood this to be a punifhment for doing fo, he would not by that method learn to do it. He feems to be in the fame manner taught to fpring and fly when he is frightened. Moft horfes would go quietly paif an object they were beginning to fly from, if their riders, inttead of gathering up their bridles, and fhowing themfelves fo ready, fhould throw the reins loofe upon their necks.

When a horfe ftarts at any thing on one fide, moft riders turn him out of the road, to make hiro go up to what he ftarts at: if he does get the better of his fear, or readily comply, he generally goes palt the object, making with his hinder parts, or croap, a great circle of the road; whereas, he hould learn to keep fraight on, without minding objects on either fide.

If he ftarts at any thing on the left, hold his head high, and keep it Araight in the road, pulling it frome looking at the thing he ftarts at, and keeping your right leg hard preffed againft his fide, towards his flank : he will then go fraight along the road. By this method, and by turning his head a little more, he may be forced with his croup clofe up to what frightened him: for as his head is pulled one way, his croup neceflarily turns the other. Always avoid a ${ }_{4}$ P 2
quat-

Plain Rules quarrel with your horfe, if yuo can: if he is apt to for bad ftart, you will find occations enough to exetcife his Horfemen. obedicnce, when what he tharts at lies directly in his way, and you muf make him pafs; if he is not fubject to ftart, you hould not quarrel with him about a trite.

It muft be obferved, therefore, that this rule ja going paft an olject may perhaps be a litule irregular in a managed horfe, which will always obey the leg: but even fuch a horfe, if he is feally afruid, and not reflive, it may nor be amifs to make him look another way; unlefs the object be fomething you would par. ticularly accuitom him to the fight of.

The caic will alfo ve different with a horfe whofe tear is owing to his being lot ufed to objects; but fuch a one is not to be rode by any horfeman to whom theforules aredirected: the ftarting here meant arifcs merely from the horfe's being pamper'd, and fyring*ing through livelinefs.

She notion of the neceffity of making a horfe go immediately up to every thing be is afraid of, and nut dutfering him to become mafter of his rider, feems to be in general carried too far. It is an approved and good method to conquer a horfe's fear of the found of a drum, by beating one near to hin at the time of feeding him: this not only familiarizes the noife to him, but makes it pleafant, as a fore-runner of his mear*; whereas, if he was whipped up to ir, he might peringa fiart at it as logg as he lived. Might nor this be applied to his flarting at other things, and flow that it would be better to fuffice him (provided he does not turn back) to go a little from and avoid an object he has a dillike to, and to accuftom him to it by degrees, convincing him, as it were, that is will not hurt him ; than to puniln him, quarrel wieh him, and perheps fatmit to his will at latt, while you infift on his overcuming his fear in an inftant? If he fees a like object again, it is probable he will recoilect his dicad, and arin himfelf to be difobedient.
We are apt to fieppofe that a horfe fears nothing fo much as his rider: but may he not in many circumftances, be afraid of inftant deflruftion? of being cruht d ? of being drowned? of falling down a precipice? Is it a wonder that a horfe fhould be afraid of a loaded wargon? may not the hanging load feem to threaten the falling on him ? there cannor be a rule more general, than, in fuch a cafe, to how him there is roon for him to pafs. This is done by turning his head a very little from the carriage, and preffing your leg, which is farthenf from it, againk his fide.

A horfe is not to ftop without a fign from his rider. -Is it nor then probable, that when driven up to a ea riage he flarts at it, he conceives himfelf obliged either to attack or run againft it? Can he underfand the rider's fipurring him with his face directed to it, as a gign for hin to pafs it? That a horfe is eafily alarmed for his face and cyes (he witl even catch back his head from a hand going to carefis him) ; that he will not go with any furce, face to face, even to another horfe (if in his power to top) ; and that he fees perfettly fideways,-may be uffeful hizes for the treatment of horfes with regard to flarting.
Though you ought not to whip a horfe for farting, there ean be no good effect from clapping his neck with your hand to encourage him. If one took any
notice of his farting, it thould be raiher with fome PlainRulcs thue of voice which he ufually underfood as an ex- for bad preffon of dillike to, what he is doing; for there is $\underbrace{\text { Horfmes. }}$ otpofition mixed winh his ftaring, and a horfe will ever repeat winat he finds has foiled his riuer.

Nutwithitanding the directions above given, of not prefing a horfe up to a carriage he ftarts at; yet if one which you apprebend will frighten him mets you at a narrow part of the road, when yon have once let him know he is to pass it, be fure you remain determined and prefs bin on. Do this more efpecially when part of the carriage has alrcady patfed you: for if, when he is frightencd, he is accutomed togo back, and turn round, he will cercainly do it if he finds, by your hand ilachening, and legs not preding, that you are irrefolute; and this at the moft dangerous point of time, when the wheels of the carriage take him as beturns. Remember not to touch the curb rein at this time; it will certaimly check him. It is not known to every one, that the perfon who would lead a horfe by the bridle, hould not turn his face to him when he refufes to follow him: if, befides this, he raifes his arms, fhows his whip, or polls the bridle with jerks, he frightens the horfe, inflead of perfuading bim to follow: which a little paticuce may pring about.

Ride with a fnaffle; and ufe your curb, if you have one, only occafonally. Choofe your faafte full and thick in the mouth, efpecially at the ends to which the reins are faftencd. Molt of them are made too fmall and long; they cut the horfe's mouth, and bend back over the bars of his jaw, working like pincers.

The management of the curb is too nice a matter to enter on here, farther than to prefcribe great cat tion in the ufe of it : a turn of the wrif, rather than the weight of your arm, honld be applied so it . The claticity of a rod, when it hath hooked a fill, may give you fome idea of the proper play of a horfe's head on bis bridle; his fyirit and his pliablenefs are both marked by it.

A horfe bould never be pat to do any thing in a curb which he is nct ready at : you may force him, or pull his head any way with a fnaffe; but a curb acts only in a ftraight line. It is true, that a horfe will be turned out of one track into another by a curb, but it is becaufe he knows it as a fignal. When he is pat to draw a chair, and does not underftand the neceflity he is then under of taking a larger fweep when he turns, you frequently fee him reffire, as it is then called : but put him on a fnafle, or buckle the rein to that part of the bit which does not curb him; and the horfe fubmits to be pulled abont, till he underflands what is defired of him. Thefe directions fuppofe your horfe to have firit, and a good mouth : if he has not, you mult take him as he is, and ride him with fuch a bit as you find moft cafy to your'felf.

When you ride a journcy, be not fo attentive to your horfe's nice carriage of himfelf, as to your encouragement of him, and keeping him in good humour. laife bis head; hut if he thags, you may indulge him with bearing a liptle more upon the bit than you would fuffer in an airing. If a horfe is lame, tenderfooted, or tired, he naturally hangs upon his bridle.

Ihain Rules On a jouraey, therafore, his mouth will depend greatly
for bad on his ftrength and the goodnefs of his feet. Be then Horfemen. very carefulabout his feet, and let not a farrier fooil them. You will be en.bied to ketp them from danger, by the directions given under the article farhisfy, p. 167.

Very few, although practifed in riding, know they have any power over a horfe but by the bridle; or any ute for the fur, excepe to make himgo forward. A litrle experience will reach them a fartier ufe. If the left fur touches him (and he is at the fame tine prevented from going forward), he has a liga, which he will foon undertand, to move lideways to the right. In the fame manner to the left, if the rishe fuar is clofed to thim: he afterwards, through fear of the fpuf, obeys a toich of the leg; in the fame manaler as a horfe moves his croup from one fide of the ftall to the other, when any one atrikes him with his hand. In thore, his croup is guided by the leg, as his head is by the bridle. He will never difobey the leg, unlefs he becomes reftive. By this means you will have a far greater power over him : he will move fideways, if you clofe one leg to him ; and fraight forvard, if both: even when he fands fill, your legs held near him will kecp him on the witch; and with the flightef, unfeen motion of the briale upwards, he will raife his head, and thow his forehead to advantage.

On this ufe of the legs of the rider, and guidance of the croup of the horfe, are founded ali the airs (as the riding-maters exprefs themfelves) which are taughe in the manege; the palfage, or fide-motion of troopers to clofe or open their files, and indeed all their evolutions. But the convenience or fome degree of this difcipline for common ufe is the reafun of mentioniag is here. It is ufeful if a horfe is apt to fumble or fart. If to the firft, by preffing your legs to his flank, and keeping up his head, he is made : 0 go light on his fore-legs, whieh is aiding and fupporting him; and the fane if he does actuthy tumble, by helping him at the very indant to excre himfelf, while as yet any part of him remains nut irrecoverably imprefled winthe procipitare notion. Hence this ufe of the hand and legs of the rider is called giving aids to a horfe; for, as the holding ap the weight of a heavy unactive horfe, by mere pulling, it is as impoftible as to recover him when falling down a precipice.

A horfe is fupported and helped by the hands and legs of his rider in every action they require of him ; hence he is faid to perform his airs by the aids from his rider.

The fame manner is ufeful if a horfe ftarts. For if plaig Rutes when he is beginning to thy to one fide, you leg on for bad the fide he is flying to, he ftons hi: fipring immedi- Herfemen. ately. He goes paft what he farted ar, keeping Atraight on, or as yoa choofe to dire rhim; and hewill not tly back from any thing if yon prefs him with both legs. Youkeep his haunches under him, going down a hill; help him on the fite of a bank; more eafily avoid the wheel of a carriage; and approach more gracefilly and newrer to the lide of a coach or horfeman. When a pampered horfe carvets irregularly, and twifts his body to and fro, turn his head either to the right or left, or both alictnately (but without letting him move out of the track), and prefs your leg to the oppofice fide: your horfe cannot then fpring on his hind-legs to one lide, becaufe your leg grevents him; nor to the other, becaufe his head looks thit way, and a horfe does not fart and furing to the fide on which he looks. Here it may not be amifs to obs ferve the impropriety of the babit which many riders have, of letting their legs hake againt the fides of the horfe: if a horfe is tanght, they are then continually prefling him to violent action; and if he is not, they render him infentible and incapable of being taught. The fretring of a hot horíe will hence be excelive, as it can no orherwife be moderated than by the utmont fillnefs of the feat, hands, and legs of the rider.

Coles at firft are taught to bsar a bit, and by degrees to pull at it. If they did not preís it, they could not be guided by it. By degrees they find their necks ftronger than the arms of a man; and that they are capable of making great oppolition, and often of foiling their riders. Fhen is the time to make them fupple and pliant in every part. The part which of all others requires moft this pliancy is the neck. Hence the metaphor of flif-meck:d for difobedient. A horfe cannet move his head but with the mafcles of his neck : this may be calked his belm; it guides his conre, changes and directs his motion.

The ufe of this pliancy in the different parts and limbs of a horfe has been already hown in a former fection. The prelens feation being directed to the anexperizaced horfeman, ir may futtice to add, that his idea of fupplenefs need only be, that of an ability and readinefs in a horfe to move every limb, on a fign given him by the hands or legs of his rider; as alfo, to bend his body, and move in a fhort compafs, quick and colle $t$ ed within himfelf, fo as inftantly to be able to perform any other motion.

Horham. HORSHAMI, a town of Sulfex, feated near St Leonard's foreft, $3^{8}$ miles from London. It has its name from Horfa, brother to Hengift the Suxon ; and is one of the largeft towns in the county. It has fent members to parliament ever lince the 3 oth of Edward $I$. and is the place where the county-gaol is beld, and often the affizes. It is a borough by prefcription, with the title of two bailiffs and burgage bolders within and without ole borough, \&ce. who elcest the members af

## H O R

parliament, and they are returned by the bailiffo chore yearly by a court-leet of the lord of the manor, who

Horftius. rerum four candidares to the fteward, and he nominates two of them for the offec. Here is a very fine church, and a well endowed free-fchool. Great fore of poultry is bought up for London at its market on Saturday, and it bas a pacent alfo for a monthly market.

HORSTIUS (James), profeflor of medicine in the univerfity

Horfius II Hortus,
univerfity of Helmftadt, in the 16 th century. He joined devotion with the knowledge and practice of phyfic. He carefully prayed to God to blefs his prefcriptions, and publithed a form of prayer upon this fubject. He allo wrote, r. A treatife on the qualities of a good phyfician. 2. Another on the qualities of a good apothecary. 3. A treatife on the plague, in German. 4. A commentary in libros Happocratis de corde, and orher works.

Horstive (Gregory), nephew of the former, called the Iffculapius of Germany, publifined feveral books, which are efteemed.

HORTAGILERS, in the grand fignior's court, upholfterers, or tapeftry-hangers. The grand fignior has conftantly 400 in his retinue when he is in the camp : thefe go always a day's journey before him, to fix upon a proper place for his tent, which they prepare firft ; and afterwards thofe of the officers, according to their rank.

HOR TENSIUS (Quintus), a celebrated Roman orator, the cotemporary of Cicero, pleaded with univerfal applaufe at 19 years of age, and continued the fame profeffion during 48 years. But being at laft eclipfed by Cicero, he quitted the bar, and embraced a military life; became a military tribune, pretor, and afterwards conful, about 70 B. C. Cicero fpeaks of him in fuch a manner as makes us regret the lofs of his orations. Hortenfius had a wonderful memory, and delivered his orations without writing down a fingle word, or forgetting one particular that had been advanced by his adverfaries. He died very rich, a little before the civil war, which he had endeavoured by all poffible means to prevent.

HORTUS SICCUS, a dRy GARDEN; an appellation given to a collection of fecimens of plants, carefully dried and preferved.

The value of fuch a collection is very evident, fince 1000 minutix may be preferved in the well dried fpecimens of plants, which the moft accurate engraver will overlook. We fhall taerefore give two methods of drying and preferving a hortus ficcus: the firft by Sir Robert Southwell in Philofophical Tranfactions, $n^{\circ} 237$; and the other by Dr Hill, in his review of the works of the Royal Society, with his objections to Sir Robert's method.

According to the former gentleman, the plants are to be laid flat between papers, and then put between two fmooth plates of iron, fcrewed together at the corners; and in this condition committed to a baker's oven for two hours. When taken out, they are to be rubbed over with a mixture of equal parts of aquafortis and brandy; and after this to be faftened down on paper with a Colution of the quantity of a walnut of gum tragacanth diffolved, in a pint of water. Sce Herbal.

To this the Doctor objects, that the heat of an oven is much too uncertain to be employed in fo nice an operation; and that the face of time ordered for continnting the plants in it is of no information, unlefs the degree of heat, and even the different nature of the plant as to its fucculency and the firmnefs or tendency of its fibres, be attended to; there being fcarcely any two plants alike in thefe particulars: confequently the degree and duration of heat fufficient for one plant would deftroy another. Befides which,
the acid ufed deftroys the colour of many plants; and never recovers that of others loft in the drying ; and frequently after the plant is fixed down, rots both the paper it is fixed to, and that which falls over it. Dr Hill's method is as follows. Take a fpecimen of a plant in flower, and with it one of its bottom leaves if it have any; bruife the ftalk if too rigid, or lit it if too thick : fpread out the leaves and flowers on paper, cover it with nore paper, and lay a weight over all. At the end of 18 hours take out the plants, now perfectly fiattened, and lay them on a bed of dry common fand; fift more dry fand over them to the depth of two inches, and thus let themlie about three weeks: the lefs ficculent dry much fooner, but they take no harm afterward. If the floor of a garret be coveved in fpring with fand two inches deep, leaving fpace for walking to the feveral parts, it will receive the collection of a whole fummer ; the covering of fand being fifted over every parcel as laid in, they need no farther care from the time of laying them till they are taken up to be ftuck on paper. The cement ufed by the Doctor is thus prepared : early in the fpring pat two ounces of camphor into three quarts of water in a large bottle, fhake it from time to time, and when the firft collected plants are ready for the faftening down, put into a pint of the water, poured off into an earth. en veffel that will bear the fire, two onnces of common glue, fuch as is ufed by the carpenters, and the fame quantity of ichthyocolla beat to fhreds; let them ftand 36 hours, then gently boil the whole a few moments, and ftrain it off through a coarfe cloth ; this is to be warmed over a gentle heat when it is to be ufed, and the back of the plants fimeared over with a painter's brufh : after this lay them on paper, and gently prefs them for a few minutes, then expofe them to the air a little; and finally, lay them under a fmall weight between quires of paper to be perfectly dried.

It is fcarce to be conceived how ftrongly the water becomes impregnated with the camphor by this fingle procefs : a part of it indeed flies off in the making of the cement and the uling of it: but enough remains with the plants to prevent the breeding of it fects in it. He farther obferves, that plants may be dried very well without fand, by only putting them frequently into frefh quires of paper, or a few, by only preifing them between the leaves of a book: but the fand method preferves the colour $b \in f t$, and is done with leaft trouble.

Another method much better than that of the oven is the flattening and drying the plant by paffing a common fmoothing iron for limen over the papers between which it is laid: but for nice things the moft perfect of all methods is that by a common fand heat, fuch as is uled for chemical purpofes. The cold fand is to be fpread fmooth upon this occafion, the plant laid on it carefully flatied, and a thick bed of fand fifted over: the fire is then to be made, and the whole procefs carefully watched until by a very gentle heat the plant be carefully dried. The colour of the tendereft herb may by this manner be preferved; and .flowers, that can no way elfe be preferved, may be managed perfectly well thus.

HORUS, a renowned deity of ancient Egypt .He was an emblem of the fun. Plutarch (in his treatife de Ifide et Ofiride) fays, "that virtue-which prefides

Hortue, Horus.

Horus. over the fun, whilft he is moving through fpace, the Egyptians called Horus and the Greeks Apollo." Job alfo calls $U r$ or Orus the fun-"If I gazed upon the fun ( Ur, Orus) when he was hhining, or on (Järếcha) the moon walking in brightnefs, and my heart hath been fecretly enticed (i. e. to worfhip), or my mouth hath kiffed my hand; this alfo were an iniquity to be punifhed by the judge, for I fhould have denied the God who is above." Chap. xxxi. ver. 26, 27, 28.

The interpretation left by Hermapion of the hicroglyphics engraved on the obelifk of Heliopolis (according to Ammianus Marcellinus), offers the fe remarkable words: "Horus is the fupreme lord and author of time." Thefe qualities, it is known, were chiefly attributed to Ofiris: that they may apply, therefore, to Horus, he muft neceffarily denote the ftar of the day in certain circumftances; and this is what is ex. plained to us by the oracle of Apollo of Claros:

## Learn that the firt of the gods is Jao. <br> He is called invifible in winter, Jupiter in the fpring, <br> The fun in funmer, and towards the end of autumn the tender $\mathfrak{7 a o}$.

The ftar of the day, on attaining the fummer folftice, and called per excellentiam. The fun, is the fame as Horus. In fact, the Egyptians reprefented him borne on lions, which fignified his entrance into the fign of the lion. They who prefided over the divine inftitutions, then placed fphynxes at the head of the canals and facred fountains, to warn the people of the approaching inundation. Macrobius $\dagger$, who informs us why the Greeks gave Horus the name of Apollo, confirms this fentiment: "In their myfteries (fays he) they difcover as 2 fecret, which ought to be inviolable, that the fun arrived in the upper hemifphere, is called Apollo." Thefe teflimonies concur in proving, that the emblematical deity was no other than the far of day, paffing through the figns of fummer.

Thefe lights may lead us to the explication of the facred fable, which the priefts publifhed on the fubject of Horus; for they enveloped in myftery every point of their religion. Plutarch gives it at length in his treatife of Ifis and Ofiris: Of which the following are the principal traits. They faid that he was the fon of Ofiris and of Ifis; that Typhon, after killing his brother Ofiris, took poffeffion of the kingdom; that Horus, leaguing himfelf with Ifis, avenged the death of his father, expelled the tyrant from his throne without depriving him of life, and reigned glorioully in Egypt. A perfon who has travelled ever fo little in Egypt, eafily difcovers natural phenomena hid under the veil of fable. In the fpring, the wind khamfin frequently makes great ravages there. It raifes whirlwinds of burning fands, which luffocate travellers, darken the air, and cover the face of the fun in fuch a manner as to leave the earth in perfect obfcurity. Here is the death of Ofiris and the reign of Typhon. Thefe hurricanes break loofe ufually in the months of February, March, and April. When the fun approaches the fign of the lion, he changes the fate of the atmofphere, difperfes thefe tempefts, and reftores the northerly winds, which drive before them the malignant vapours, and preferve in Egypt coolnefs and falubrity under a burning fliy. This is the trinmph of Horus over Typhon and his glorious reign. As the
natural philofophers acknowledge the influence of the moon over the ftate of the atmofphere, wey united her with this god, to drive the ufurper from the throne. The priefts confidering Ofiris as the father of time, might beftow the name of his fon on Horus, who reigned three months in the year. This, accorđing to Mr Savary $\dagger$, is the natural explication of this alle- + Letters on gory. And all enlightened men, he thinks, muft have Egypt, II. underftood this language, which was familiar to them. 403. The people only, whofe feeble fight extends no farther than the exterior, without diving into the true meaning of things, might regard thefe allegorical perfonages as real gods, and decree prayers and offerings to them.

Jablonki, who has interpreted the epithet of Araeri, which the Egyptians gave to Horus, pretends that it fignifies efficacious virtue. Thefe expreffions perfectly charackerife the phenomena which happened daring the reign of this god. It is in fummer, in fact, that the fun manifefts all its power in Egypt. It is then that he fwells the waters of the river with rains, exhaled by him in the air, and driven againft the fummits of the Abyfinian mountains; it is then that the hafbandman reckons on the treafures of agriculture. It was natural for them to honour him with the name of Arueri, or efficaciousvirtue, to mark thefe aufpicious effects.

HOSANNA, in the Hebrew ceremonies, a prayer which they rehearfed on the feveral days of the feaft of tabernacles. It was thus called, becaufe there was frequent repetitions therein of the word nunc, or ferva precor; i. e. fave us now; or, fave us, we pray.

There are divers of thefe hofannahs. The Jews call the bofchannoth; i. e. the bofannabs. Some are rehearfed on the firft day, others on the fecond, \&c. which they call hofanna of the firft day, hofanna of the fecond day, \&c.

Hosanna Rabba, or Grand Hofanna, is a name they. give to their feaft of tabernacles, which lafts eight days; becaufe, during the courfe thereof, they are frequently calling for the affiftance of God, the forgivenefs of their fins, and his bleffing on the new year ; and to that purpofe they make great afe of the hofchannoth, or prayers abovementioned.-The Jews alfo apply the term hofanna, rabba, in à more peculiar manner, to the 反eventh day of the feaft of tabernacles; becaufe they apply themfelves more immediately on that day to invoke the divine bleffing, \&c.

HOSCHIUS (Sidronius), a jefuit, who was born at Marke, in the diocefe of Ypres, in 1596 , and died at Tongres in 1653 . He wrote fome elegies and other poems in Latin with great purity and elegance.

- HOSE, from the Saxon Hofa, a ftocking. See Stocking.

HOSEA, a canonical book of the Old Teftament; fo called from the prophet of that name, its author, who was the fon of Beri, and the firft of the leffer prophets. He lived in the kingdom of Samaria, and delivered his prophefies under the reign of Jeroboam II. and his fucceffors, kings of lfrael; and under the rcigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. His principal defign is to pablifh the grofs idolatries of the people of Ifrael and Judah, to denounce the divine vengeance againft them, and to foretel the captivity in Affyria.

## HOS

Hofpinian, Hofpital.

HOSPIAIAN (Rodotphus), one of the greatef witers that Switzerland has given birth to. He was borin in 1547, at Altorf near Zurich; obtained the freedom of Zurich; and was made provifor of the abbey fehool. Notwithfanding this employment, he undertook a noble work of valt extent, which was a Hiftory of the Errors of Popery. Though he could not complete this work according to his plan, le publihed fome confiderable parts of it: what he pablifhed on the Encharift, and another work called Concordia Difcors, exceedingly exafperated the Lutherans. He did not reply to them; but turning his arms againft the Jefuits, ptblikhed Hiftoria fefritica, \&c: Thefe writings gained him preferment; he being appointed archdeacon of Caroline church, and then minifter of the abbey-charch. He died in 1626 ; and there was an edition of his works publinhed at Geneva 168r, in feveril volumes in folio.

HOSPITAL, popularly Spittal, a place or buildinf erected, out of charity, for the reception and fupport of the poor, aged, infirm, fick, and orherwife helplefs. The word is formed of the Latin bofpes, "holt, franger." See Host.

In the firftages of the church, the bifiop had the immediate charge of all the poor, both found and difeafed, as allo of widows, orplans, ftrangers, \&c.When the churches came to have fixed reverites allotted them, it was decreed, that at leaft one fourth part thereof fhould go to the relief of the poor ; and to provide for them the niore commodiounly, divers houfes of charity were built, which are fince denominated boffitals. They were governed wholly by the priefts and deacons, inder the infuection of the bithep. In courfe of time, feparate revenues were affigned for the hofpitals; and particular perfons, out of motives of piery and charity, gave lands and money for crecting of horpitals. When the chiurch difcipline began to relax, the priefts, who till then had been the adminiftrators of hofpitals, converted them into a fort of benefices, which they held at pleafure, without giving account thereof to any body; referving the'greateft part of the income to their own ufe; fo that the intentions of the founders were fruftrated. To remove this abife, the council of Vienne cxprefsly prohibited the giving any hofpital to fecular priefts in the way of a benefice; and directed the adminiftraion thereof to be given to fufficient and refponable laymen, who thould take an oath, like that of tutors, for the faithful difcharge thereof, ànd be accountable to the ordinaries. - This decree was executed and confirmed by the council of Trent.

In Britain, hofpitals are buildings properly endowed, or otherwife fapported by charitable contributions, for the reception and fupport of the poor, aged, infirm, fick, or helplefs.

A charitable fonndation laid thus for the funtenance and relief of the poor, is to continue for ever. Any perfon feized of an eftate in fee, may, by deed inrolled in chancery, erect and found an hofpital, and nominate fuch heads and governors therein as he fhall think fit; and this charitable foundation niall be incorporated, and fubject to the infpection and guidance of the heads and vilitors nominated by the founder. Likewife fuch corporations Øiall have, take, and pur-
chafe lands, roas not to exceed 2001 .ayear, provided the Hofuital, fame be nor held of the king; and to makeleafes, refer- Hofpitality ving the accuftomed yearly rent. See Corporation.

HOSPITAL (Michael del'), chancellor of France in the ath century, was one of the greateft men of his age, and had raifed himfelf by degrees. He agreed to an ediet much feverer againft the Protefants than lie could have wilhed, to prevent the introduction of the inquilition. It was that of Romorantin. The
 tion, made him much fufpecied by the Roman Catholics, and extremely odions to the court of Rome. The maxims of fate upon which he regulated bimfelf were of great advantage to France, fince he formed fome difciples who oppofed, in proper time, the pernicious attempts of the leaguers, and remdered them abortive. His pacific views being difiliked by Catharine de Medicis, who had contributed to his advancement, fhe excluded him from the council of war, and occafioned his difgrace. He retired, however, of his own accord, in 1568 ; and fpent the reft of his life at his country-feat at Vignai, where he died in 1573 , aged. 68. His poems are efteemed. He alfo publifhed foime excellent feeches and memeirs.

Hosprtal (William-Francis-Antony, marquis of), a great mathemutician of France, was born of an ancicnt family in 160 r . He was a geometrician almof from his infancy; for one day being at the duke of Rohan's, where fome able mathematicians were fpeaking of a problem of Pafchal's which appeared to them extremely difficult, he ventured to fay, that he believed he could folve it. They werc amazed at fuch prefumption in a boy of 15 , for he was then no more; neverthelefs, in a few days he fent them the folntion.: He entered car y into the army, and was a captain of horfe; but being extremely thort-fighted, and expofed on that account to perpetual inconveniences anderrors, he at length quitted the army, and applied himíelf entircly to his favourite amufement. He contracted a fiiendmij, with Malbranche, and took his opinion upon all occalions. In 1693, he was received an honorary member of the academy of fciences at Paris; and he publibued a work upon Sir Ifaac Newton's calculatious, intitled, L'Analyje des infuinuens petis. He was the frit in France who wrote upon this fubject; and on this account was regarded almoft as a prodigy. He engaged afterwards in another work of the mathematical kind, in which he included Les Suciiones Coniques, les Lieus Geometriques, la Conttraction des Equations, et Une Theorie des Corrrbes Mechanique's : but a little before he had finifhed it, he was feized witha fever, of which he died Feb. 2. 1704, aged 43. It was. publifhed after his death.

HOSPITALITY, the prasice of entertaining ftrangers. Dr Robertfon, fpeaking of the midile ages; fays, "Among people whole maṇiners are fimple; and who are feldom vifited by Atrangers, bofpitality is a virtue of the firft rank. This duty of hofpitality was fo neceffary in that ftate of fociety which took place during the middle ages, that it was not confidered as one of thofe virtues which men may prafife or nor; according to the temper of their minds and the generolity of their hearts. Hofpitality was enforcèd by ftatutes, and thofe who neglected the duty were liable

Mofita- to punifhment. The laws of the Slavi ordained that lity.
the moveables of an inhofpitable perfon fhould be con-
fifcated, and his houle burnt. They were even fo folicitons for the entertainment of frangers, that they permitted the landlord to fteal for the fupport of his gueft."
The hofpitality of the ancient Britifl particularly of the great aud opulent barons, hath been much admired, and conidered as a certain proof of the noblenefs and generofity of their fpirits. The fatt is well attefted. The caftles of the powerful barons were capacious palaces, daily crouded with their numerous retainers, who were always welcome to their plentiful tables. They had their privy commellors, their trea. furers, marhhals, conftables, ftewards, fecretaries, chaplains, heralds, purfuivants, pages, henfhmen or guards, trumpeters, minftrells, and in a word all the officers of a royal court. The etiquette of their families was an exact copy of the royal houfchold; and foune of them. lived in a degree of pomp and fplendor little inferior to that of the greateft kings. Richard Neville, earl of Warwick, we are told, "was ever had in great favour of the commons of the land, becaufe of the exceeding houfehold which he daily kept in all cometries whether he fojourned or lay: and when he came ro London, he held fuch an houfe, that fix oxen were eaten at a breakfaft; and every tavern was full of his meat." The earls of Douglas in Scotland, before the fall of that great family, rivalled or rather exceeded their fovereigns in pomp and profufe hofpitality. But to this manner of living, it is highly probable thefe great chieftains were prompred by a defire of increa. fing the number and atrachment of their retainers, on which, in thofe turbulent times, their dignity and even their fafety, depended, as much as to the innate generofity of their tempers. Thofe retainers did not confantly refide in the families of their lords; but they wore their liveries and badges, frequently feafted in their halls, fwelled their retinues on all great rolemnities, attended them in their journeys, and followed them into the field of battle. Some powerful chieftains had fo great a number of thefe retainers confantly at their command, that they fet the laws at defiance, were formidable to their fovercigns, and terrible to their fellow-fubjects; and feveral laws were made againft giving and receiving liveries. But thefe laws produced little effect in this period.

Hofpitality was not confined to the great and opulent, but was practiled rather more than it is at pre. fent by perfons in the middle and lower ranks of life. But this was owing to neceffity, arifing from the fcarcity of inns, which obliged travellers and ftrangers to apply to private perfons for lodging and entertaimment; and thofe who received them hofpitably acquired a right to a fimilar reception. This was evidently the cafe in Scotland in the firft part of this period. James I. A: D. 1424 , procured the following act of parliament. "It is ordainit, that all burrow townis, and throuchfaris quhair commoun paffages ar, that thair be ordaint hoftillaries and refettis, havand ftables and chalmers; and that men find with thame bread and aill, and all uther fude, alfweil for horfe as men, for refonable pricc." But trayellers had been fo long accuftored to lodge in private houfes, that thefe public inns were quite neglected; and thofe who kept Vol. VIII.
them prefented a petition to parliament, complaining, Hofpital-
"That the liegis travelland in the realme, quien they cun to burrowis and throuchfaris, herberis thame not in hoftillarics, bot with their acquaintance and friendis." This produced an act prohibiting travellers to lodge in private honfes where there were hoftalries, under the penaliy of 40 s . and fubjecting thofe who lodged them to the fame penalty.

The inhabitants or the Highlands and Weftern Incs of Scotland were remarkable for their hofpitality and kindnefs to flrangers, and ftill retain the fame difpofition. See Hightanders.

HOSPITALLERS, Hospitalarif, an ordcr of religious knights, who built an hofpital at Jecufalem, wherein pilgrims were received. To thefe pope Clement V. rransferred the effects and revenues of the Templars; whom by a council held at Vienne, he fupprelfed for their many and great mifdemeanours. Thefe hofpitallers were otherwife called Knights of St Fohn of ferufalom; and are the rame with thofe whom we now call Kuight of Malta.

HOSPITIUM, a term ufed in old writers either for an inn or a monaftery, built for the reception of ftrangers and travellers. See Inn and Monastery.

HOSPODAR, a title borne by the princes of Walachia and Moldavia, who receive the inveftiture of their principalities from the grand fignior. He gives them a veft and ftandard; they are under his protection, and obliged to ferve him, and he even fometimes depofes them; but in other refpects they are abiolute fovereigns within their own dominions.

HOST, hoSres, a term of mutual relation, applied both to a perfon who lodges and entertains another, and to the perfon thus lodged, \&c.-The word is formed of the Latin hofpes, which fome will have thus called quafi hoftium or oftium petens; for offium was anciently written with an afpirate.-Thus the inn-keeper fays, he has a good hcff, in fpeaking of the traveller who lodges with him : and the traveller, again fays, he has a kind $h o f f$, in fpeaking of his landlord.

It muft be ohferved then, that it was the cuftom among the ancients, when any franger alked for lodging, for the mafter of the houfe, and the ftranger, each of them to fet a foot on their ow: fide of the thisefhold, and fwear they would neither of them do any harm to the other. It was this ceremony that raifed fo much horror againft thofe who violated the law or right of hofpitality on either fide; inafinuch as they were looked on as perjured.

Inftead of hofpes, the ancient Latins called ithoffis; as Cicero himfelf informs us: though in courfe of time, hoffis came to fignify an enemy; fo much was the notion of hofpitality altered.

Host is allo ufed by way of abbreviation for hoffia, a victim or facrifice offered to the Deity. In this fenfe, hoft is more inmediately underfood of the per. fon of the Word incarnate, who was offered up ant hoft or hoffi to the Farher on the crofs for the fins of mankind. See Hostia.

Host, in the church of Rome, a name given to the elements ufed in ine eucharift, or rather to the confecrated wafer; which they pretend to offer up every day a new hoft or facrifice for the fins of mankind. They pay adoration to the hoft, upon a falle 4 Q
pre

Hoftage prefumption that the elements are nolonger bread and wine, but tranfubitantiated into the real body and blood of Chrift. See Transubstantiation-Pope Gre- gory IX. firft decreed a bell to be rung, as the fignal for the people to betake themfelves to the adoration of the hoft.- The veffel wherein the hofts are kept is called the $c, b e r y$; being a large kind of covered chalice.
HOSTAGE, a perfou given up to an enemy as a fecurity for the performance of the articles of a treaty.

HOSTIA, Host, in antiquiry, a victim offered in facrifice to a deity.

The word is formed from hofis, "enemy:" it being the cuftom to offer up a facrifice before they joined battle, to render the gods propitious; or, after the battle was over, to give them hanks. Some choofe to derive the word from hofiio, q. d. ferio, " 1 frike." Ifidore on this word remarks. that the name boftia was given to thofe facrifices which they offered before they marched to atlack an enemy, (antequam ad boftem pergerent); in contradiftinction from victima, which were properly thofe offered after the victory.

Hoftia alfo figuified the leffer forts of facrifice, and victimea the larger. A. Gellius fays, that every prieft indifferently, might facrifice the boffia. but that the viftima could be offered by none bur the conqueror himfelf. But after all, we find thefe two words pro-* mifcuoully ufed one for the other by ancient writers. Weread of many kinds of hofice: as boffia pate, which were pigs or lambsten days old; bofia pracidanee, facrificesoffered the day before a folemn feaft ; hoftice $b i$ dentes, facrifices of theep or other animals of twe years old; hoftice eximize, a facrifice of theflower of the flock; boftia fuccedane ex, facrifices offered after others which had exhibitcd fomeillomen; boffit ambarvales, victims facrificed after having been folemnly led round the fields at the ambarvalia; boffie amburbiales, victims flainafter the amburbium; boftia caneares or cuviares, victins facrificed every fifth year by the college of pontiffs, in which they offered the part of the tail called caviar ; boftia prodigie, facrifices in which the fire confumed all, and left nothing for the priefts; bofia piaculares, expiatory facrifices; hoffice ambegus or ambicgna, facrifices of cows or fheep that had brought forth twins; boflia baruga, victims offered to predict future events from; hoflize mediales, black victims offcred at noon.

HOSTILITY, the action of an enemy, or a fate of warfare. The word is Latin, boffilitas, formed of the primitive bofis, wlich fignifies ", enemy;" and which anciently fignified "flranger," bo/pes.

HOT-beds, in gardening, beds made with frelh horfe-dung, or tanner's bark, and covered with glaffes to defend them from cold winds.

By the fkilful management of hot-beds, we may imitate the temperature of warmer climates; by which means, the feeds of plants brought from any of the countries within the torrid zone may be made to flourifh even under the poles.

The hot-beds commonly ufed in kitchen-gardens, are made with new horfe dung mixed with the litter of a ftable, a few fea coal-ahnes, which laft are of fervice in continuing the heat of the dung. This fould remain fix or feven days in a heap; and being then turned over, and the parts mixed well iogether, it flould be again caftinto a heap; where it may continue five or fix days logger, by which tine it will
have acquired a due heat. Thefe hot-beds are made in the following manner : In fome fheltered part of the garden, dig out a trench of a length and width proportionable to the frames you intend it for: and if the ground be dry, about a foot or a foot and a half decp; but if it be wet, not above fix inches: then wheel the dung into the opening, obferving to fir cvery part of it with a fork, and to lay it exactly even and finooth on every part of the bed, laying the botom part of the heap which is commonly free from litter upon the furface of the bed : and if it be defigned for a bed to plant out cucumbers to remain for good, you muft make a hole in the middle of the place defigned for each light about ten inches over, and fix deep, which fhould be filled with good freh earth, thrufting in a ftick to fhow the places where the holes are; then cover the bed all over with the earth that was taken out of the trench, about four inches thick, and put on the frame, letting it remain till the earth be warm, which commonly happens in three or four days after the bed is made, and then rhe plants may be placed in it. Buc if your hot-bed be detigned for other plants, there need be no holes made in the dung; but after having fmoothed the furface with a fpade, you hould cover the dung about three or four inches thick with good earth, putting on the frames and glaffes as before. In making thefe beds, care rault be taken to fettle the dung clofe with a fork; and if it be pretty full of long litter, it fhould be trod down equal!y on every part. During the firft week or ten days after the bed is made, you-fhould cover the glafes but flightly in the night, and in the day-time carefully raife them to let out the fteam: but as the heat abates, the covering fhould be increafed; and as the bed grows cold, new het dung fhould be added round the fides of it.
The hot-bed made with tanner's bark is, however, much preferable to that defcribed above, efpecially for all tender exotic plants and fruis, which require an even degree of warmth to be continued for feveral months, which cannot be effected with horfe dung. The manner of making them is as follows: Dig a trench about three feet deep, if the ground be dry; but if wer, it muft not be above a foot deep at moft, and munt be raifed two feet above the ground. The length muf be proportioned to the frames interded to cover it ; but it fhould never be lefs han ten or twelve feet, and the wideb not lefs than lix. The trench flould be bricked up round the fides to the abovementioned height of three feet, and filled in the fyring with the fref tanners bark that has been lately drawn out of their vats and has lain in a round heap, for the moifture to drain out of it, only three or four days: as it is put in, gently beat it down equally with a dung-fork; but it mult not be trodden, which would prevent its heating, by fetiling it too clofe: then put on the frame, covering it with glafies; and in abont ten days or a fortnight it will begin to heat; at which time-plunge your pots of plants or feed into it, obferving not to tread down the bark in doing it. Thefe beds will continue three or four months in a good temper of heat; and if you ftir up the bark pretty deep, 'and mix a load or two of frell bark with the old when you find the warmth decline, you will preferve irs heat two or three months longer. Many

Hotel

## Hotientots

lay fome hot horfe-dung in the bottom of the trench muder the bark ; but this ought never to be practifed unlefs the bed is wanted fooner than the bark would heat of itfelf, and eventhen there ought only to be a finall quantity of dung at the botton.

Themes which cover thefe beds, fhould be pro. portioned to the feveral plants they arc defigned to contain. If they are to cover the ananas or pineapple, the back part hould be three feet high, and the lower part 15 inches: if the bed be intended for taller plants, the frame muft be made of a depth proportionable to them : but if it be for fowing of feeds, the frame need not be above 14 inches high at the back, and 7 in the front; by which means the heat will be much greater.

Hot-Houfe. Sce Stove and Hypocatestum.
HOTEL, a French term, anciently fignifying a houfe or dwelling place.-It is now more commonly ufed for the palaces or houfes of the king, princes, and great lords. In this fenfe they fay, the botel de Conde, hotel de Conti, hetel a'u Louvre, \&c.

The grand prevot de l'botel, is the firft judge of the officers of the king's houfehold. His jurifdiction is much like that of lord fteward of the honfehold of the king of England.

The hotelde ville is what we call a tuwn houfe or town-hall.
hotel, is likewife ufed for a large inn, alfo for a large lodging-houle ready furnifhed.

HOTMAN (Francis), one of the moft learned civilians in the r6th century. He profeffed , law at Bourges : but, oll account of religion, retired to Ge neva, read lectures on civil law there, and publifhed books with much frength againft the perfecutors, though great promifes were made to engage him not to write any more in that manner ; but he did not regard their offers. He died at Bafil in 1590 . His Franco Callia is well known, having been done in Englifl by lord Molefworth. Some perfons think he was the author of Vindicia contra Tyrannos. All his works were printed at Geneva in 1590, in 3 vols folio.

HOTTENTOTS, a people in the fouthern part of Africa, whofe country furrounds the empire of Monomotapa, in furm of a horfe-hoe, extending, according to Magin, from the Negroett of Cabo, as far as the Cape of Good Hope; and from thence north ward to the river Magnica, or Rio de St Siprita, including. Mattatan a diftinct kingdom. According to Sanutus, this coaft, beginning at the Mountains of the Moon under the tropic of Capricorn in $23^{\circ{ }_{T}^{x}} \mathrm{~S}$. Lat. cxtends north beyond the Cape to the coaft of Zanguebar ; having the Indian fea on the eaft, the Ethiopic on the weft, the fouthern ocean on the fouth; and on the north the kingdoms of Mattatan; Monomotapa, and the coaft of Zanguebar, or rather the Mountains of the moon, which divide it from the reft of the continent.

The Europeans firft became acquainted with this conntry in the year 149 , when Bartholomew Diaz, a Portuguefe adminal, difcovered the mof foutherly point of Africa now called the Cape of Goud Hope, but by him Cabo dos totos tormentos, or Cape of all Plagues, on account of the forms he met with in the neighbourhood; but Jobn, then king of Yortugal, ha-
ving from the account of Diaz concluded that a paf- Hortentots fage to the Eaft Indies was now difcovered, changed the name to that of the Gape Good Hope, which it ftill retains. In 1497, it was circumnavigated by Vafco de Gama, who made a voyage to India that way ; however, it remained ufelefs to Europeans till the year 1650, when Van Ricbeck a Dutch furgeon firft faw the advantages that would accrue to the Eaft India company in Holland from a fettlement at fuch a convenient diftance both from home and from India. The colony which he planted has everfince continued in the hands of the Dutch, has greatly increafed in value, and is vifited by all the European hips trading to the Eaft Indies. See Good. Hope.

The country now polfeffed by the Dutch is of pretty confiderable extent, and comprchends that part of the African coaft on the welt called Terra de Natal It is naturally barren and mountainous; but the induftry of the Dutch hath overcome all natural difficulties, and it now produces not only a fufficiency of all the neceffaries of life for the inhabitants, but alfo for the refreflmment of all the Europeans who pals and repafs that way.

The coaft abounds in capes, bays, and roads. Thirty leagues to the eaft of the Cape of Good Hope, in S. Lat. 34. 2 I. is another Cape which runs out beyond $35^{\circ}$, called by the Portugnefe, who firft doubled it, Cabo dos Agulhas, or the Cape of Needies, on account of fome ftrange variations in the magnetical needle obferved as they came near it. Near this Cape is a flat fhore, with plenty offint : it begins in the weft near a frefh-water iver, and, extending 15 leagues in the main fea, ends in the eaft near Fi/h-bay. Cabo rialfo, fo called by the Portuguefe, who returning from India miftook it for the Cape of Good Hope, lies to the eaftward between thefe two capes, about eight or nine leagues beyond wat of Good Hope. Along the coafts, and on both fides of the Cape of Good Hope, are many fine bays. Twenty-feven leagues to the northweft is Seldonha bay, fo named from a Portuguefecaptain fhipwrecked on the coaft. The largeft and moft commodious is Table Bay, on the fouth, and near the mountain of that name, fix leagues in circumference, with four fathom water clofe to the beach. Oppofite to this bay is Robu Eilan, or the illand of Rabbits, in 34. 30. S. Lat. 67 leagues eaft from the Cape of Grod Hope. Peter Both, in 1661 , difcovered a bay, which he named Uleeft, fheltered only from north winds, iu which is a fmallifand, and on the weft a rivulet of frefl water extremely convenient for European mariners. Twenty-five or thirty leagues farther eaft, Both difcovered Marfhal Bay, afterwards named by the Portugufe Seno Formofo. Next to this is Seno de Lago, from its refemblance to a lake. There are feveral roads in this bay, and an inland called Itha dos Caos. Cabo de S. Francifco, and Cabo das Serras are marked upon charts between thefe two bays. Near the latter of thefe capes is Cabo de Arecito, and the ifland Contento ; and formething more north-eaft is St Chriftopher's river, called San Chrifovano by the Portuguef, and by the Hottentots Nagod. The country beyond this river was called by the Portuguefe, who difcovered it on the day of our Lord's nativity, Terra de Natal. Between the Cape of Good Hope and Cabo das Agulhas are the Sweet, $4 Q^{2}$

Salt,

## H O T

Hotentots Salt, and Jagulina rivers, which run intrg the fea, and Sweet-water river flows from the Table-mountain.

The moft remarkable mountains in this country are, Table-mountain, Devil's Tower, Lion's Head, and the Tiger-hills. The three firff lie near Table bay, and furround Table-valley, where the Cape town flands. (See the article Good-Hope.) Mr Forfter, in his voyage informs us, that " the extremity of Africa towards the fouth is a mafs of high mountains, of which the outermoft are craggy, black, and barren, confinting of a coarfe granite, which contains no heterogeneous parts, fuch as petrefied fhells, \&c. nor any volcanic productions. The ground gradually rifes on all fides towards the three mountains which lie round the bottom of the bay, keeping low and level only near the fea-fide, and growing fomewhat marfhy in the Ifthmus between Falfe and Table Bays, where a falt rivulet falls into the latter. The marfly part has fome verdure, but intermixed with a great deal of fand. The ligher grounds, which, from the fea fide, have a parched and dreary appearance, are, however, covered with an inmenfe variety of plants, among which are a prodigious number of flrubs, but fcarce, one or two fipecies that deferve the name of trees. There are alfo a few fmall plantations wherever a little rus of water moiftens the ground. The afcent of Table-mount is very fteep and difficult, on account of the number of loofe fones which roll away under the fett of the craveller. About the middle of the mountain is a bold, grand chafm, whofe walls are perpendicular, and often impending rocks piled up in ftrata. Small rills of water ooze out of crevices, or fall from precipices in drops, giving life to hundreds of plants and low fhrubs in the chafn. The fummit of the mountain is nearly level very barren, and bare of foil; feveral cavities, however, are filled with rain water, or contain a fnill quantity of vegetable earth, from whence a few odoriferous plants draw their nonriflment. Some antelopes, howling baboons, folitatyvultures, and toads, are fometimes to be met with on the mountain. The view from thence is very extenfive and picturefque. The bay feems a fmall pond or bafon, and the fhipe in it dwindled to little boats; the town under our feet, and the regalar compartments of its gardens, look like the work of children."

Moft accounts of this country that have been publifhed mention a furprifing phenomenon which is annually to be feen on the top of Table-hill from September to March; namely, a white cloud hovering on itstop, and called by failors the Devil's table-cloth. (See the article CooD. Hope.) This clond is faid by fome to appear at firft no bigger than a barley-corn; then increafes to the fize of a walnut, and foon after convers the whole top of the mount. But, according to MrKolben, it is never lefs, even on its firft appearance, than the fize of a large ox, often bigger. It hangs in feveral fleeces over the Table-hill and the Wind or Devil's-hill; which fleeces, at laft uniting, form a large clond that covers the fummits of thefe two hills. After this has refled for fome time without change or motion, the wind burfts out fuddenly fron it with the utmolt fury. The fkirts of the cloud are white, but feem much more compact than the matter of common clonds: the upper parts are of a leaden colour. No rain falls from it, but fometimes it dif-
covers agreat deal of humidity; at which times it is Hottentots of a dark er coloar, and the wind iffuing from it is broken, raging by fits of hort continuance. In its ufual ftate, the wind keeps up its firft fury unabated for ono, two, three, or eight days; and fometines for a whole month together. The cloud feems all the while undiminifhed, though little flecees are from time to time detatched from it, and hurried down the fides of the hills, vanifhing when they reach the bottom, fo that during the form the cloud feems to be fupplied with new matter. When the cloud begins to brighten up, thefe fupplies fail, and the wind proportionably abates. At length, the cloud growing tranfparent, the wind ceafes. During the continuance of thefe fouth-eaft winds, the Table-valley is torn by fu:ious whirlwinds. If they blow warm, they are gencrally of fhort duration; and in this cafe the clond foon difappears. This wind rarely blows till after funfet, and never longer than till towards midnight, though the cloud remains ; but then it is thin and clear: but when the wind blows cold, it is a fure fign that it will laft for fome time, an hour at noon and midnight excepted ; when it feems to lie fill to recover itfelf, and then lets loofe its fury anew.

The Europeans at the Cape confider the year as divided into $t$ wo feafons, which they term monfoons. The wet monfoon or winter, and the dry one or fummer. The firft begins with our fpring in March ; the latter with September, when our fummer ends. In the fummer monfoon reign the fouth eaft winds already mentioned; which, though they clear and render the air more healihy, yet make it difficult for fhips outward bound to enter Table-bay. In the bad feafon, the Cape is much fubject to fogs; and the noth-weft winds and rain make the inhabitants fay much at home. But there are frequent intermifions and many clear days till June and July ; when it rainsalmoft continually, and from thence till fummer. The weather in winter is cold, raw, and unpleafant ; but never more rigorons than autumn in Germany. Water never freezes to above the rhicknefs of half a crown; and as foon as the fun appears, the ice is diffolved. The Cape is rately vifited by thunder and lightning, excepting a little near the turn of the feafons, which never does any hurt. During the continuance of the forth-eaft winds which rage in fummer, the fky is free of all clouds except that on the Table and Wind Hills already mentioned ; but during the north-weft winds, the airis thick, and loaded with heavy clouds big with rain. If the fouth-eaft winds wonld ceafe for any length of time, the air becomes fickly by reafon of the fea-weeds driving allore and rotting ; hence the Europeans are at fuch times affected with head achs and other diforders: but, in the other hand, the violence of thofe winds fubjects them to inflimmations of their eyes, \&c.

The natives of this country are called Hottentots, in their own language; a word of which it is vain to inquire the meaning, fince the language of this country. can fcarce be learned by any other nation. The Hottentot language is indeed faid to be a compofition of the moft ftrange and difagreeable founds, deemed by many the difgrace of fpeech, without luman found or articulation, refembling rather the noife of irritated turkies, the chattering of magpies, hooting of owls, and
depending

## H O T

## $\mathrm{HO}^{\mathrm{T}}$

Hottentote depending on extraordinary vibrations, inflexions and clafhings of the tongue againft the palate.-lf this account is true, however, it is obvious, that all the relations we have concerning the religion, \& $\&$. of the Hottentots derived from themfelves, muft fall to the ground, as nobody can pretend to underfand a language in itfelf unintelligible. The manuers and cuftoms of thofe people, however, are eafily obfervab'e, whether they themielves give the relation or not; and if their language is coniomable to them, it is no doubt of a nature fufficiently wonderful.

Many accounts lave been publiflied concerning the extreme naftinefs and fillhy cuftoms of the Hottentots; but from the obfervations of late travellers it appears, that thefe have either been exaggerated, or that the Hotrentots (which is not improbable) have in fome meafure laid afide their former mamers. Dr Sparrman defribes them in much lefs difgufful terms, and M. Vaillant feems to have been charmed with their innocence and fimplicity. According to the Doctor, there people are as tall as the generality of Europeans, tho' more llender in their perfons, which he attributes to their fcanty fupply of food, and not accuftoming themfelves to hard labour. The characteriftic of the nation, however, and which he thinks has not been obferved by any one before, is, that they havermall hands and feet in proportion to the other parts of their body. The diftance between the eyes appears greater than in Europeans, by reafon of the root of the nofe being very low. The tip is pretty flat, and the iris of the eye has generally a dark-brown caft, fometimes approaching to black. Their fkin is of a yellowill brown, fomething like that of an European who has the janndice in a high degree: though this colour does not in the leaft appear in the whites of the eyes. Their lips are thinner than thofe of their neighbours the Negraes, Caffres, or Mozambiques. "In fine (faysour author) their mouths are of a middling fize, and almoft always furnifhed with a fet of the fineft teeth that can be feen; and, together with the reft of their features, as well as their carriage, flape, and every motion, in fhort their tont enfemble indicates health and delight, or at leaft an air of fans fouci. This carelefs mien, however, difcovers marks at the fame time both of alacrity and refolution ; qualities which the Hottentots, in fact, can how upon occation." The hair of the head is black and frizzled, though not very clofe; and has fo much the appearance of wool, that it would be taken for it, were it not for its harfhnefs. They have but feldom any appearance of a beard, or hair upon other parts of their bodies; and when any thing of this kind happens to be vifible, it is always very llight.
A general opinion has prevailed, that the Hottentot women have a kind of natural veil which covers the fexual parts; but this is denied by our author. "The women (fays he) have no parts uncommon to the reft of their fex: but the clitoris and nymphex, particularly of thofe who are paft their youth, are pretty much elongated; a peculiarity which has undoubredly got footing in this nation in confequence of the relaxation neceffarily produced by the method they have of befmearing their bodies, their flohfulnefs, and the warmth of the climate."
The Hottentots befmear all their bodies copioully
with fat mixed up with a little foot. "This (fays Hottentos our author) is never wiped oft ; on the contrary, I never faw them ufe any thing to clean their kins, excepting that when in greating the wheels of their waggons, the re hands were befmeared with tar and pitch, they ufed to get it off very eafily with cow-dung, at the fame time rubbing their arms into the bargaim up to the fhoulders with this cofnetic; fo that as the duft and other filth, together with their footy oiutment, and the fweat of their bodies muft neceffarily, notwithftanding it is continually wearing off, in fome meafure adhere to the fkin, it contributes not a little to conceal the natural hie of the latter, and at the fame time to change it from a bright umber-brown to a brownifh-yellow colour, obfcured with filth and naftinefs." - The Doctor was enabled to difcover the natural colour of the Hottentots by means of the nicety of fome Dutch farmers wives, who had made their Hottentot girls wafl and foour their kins, that they might be lefs filthy in looking after the children, or doing any other work that required cleanlinefs. Many of the colonifts, however, are of opinion, that this operation of walhing is no improvement to the look of an Hottentot ; but that their natural y yllow is full as difagreeable as the black or brown colour of the ointment ; and that the wa hed dkin of a native of this comntry feems to be deficient in drefs, like fhoes that want blacking. This the Doctor does not pretend to determine; though, whatever may be fuppofed deficient in look we fhould think, maft be made up in cleanlinefs.

The Hottentots perfume their bodies, bedanbing them all over with rhe powder of an herb, the finell of which is at once rank and aromatic, approaching to that.of the poppy mixed with fices. For this purpofe they ufe various fpecies of the diofma, called by them buckhu, and which they imagine to be very efficacions in the cure of diforders. One fpecies of this plant, growing about $C_{\text {oud }}$ 's-rivier is faid to be fo valuable, that no more than a thimble-full of its powder is given in exchange for a lamb.

By the ointment of foot and greafe ftuck full of the powder of buckbu, a pafte is formed which defends the bodies of the Hottentots in a great meafure from the action of the air; fo that they require very few clothes, and in fact go almoft quite naked. The only covering of the men confifts of two leather fraps, which generally hang down the back from the chine to the thighs, each of them in the form of an ifoficles triangle, their points uppermoft, and faftened to a belt which goes round their wafte, their bafes not being above three fincers broad; fo that the covering they form is extremely trifling. Thefe ftraps have very little drefing beftowed upon them, fo that they make a rattling noife as the Hottentot runs along : and our author fuppofes that they may produce an agreeable coolnefs by fanning him. Befides this, the men have a bag or flap made of fin which hangs down before, and is faftened to the belt already mentioned. The hollow part of this feems defigned to receive that which with us modefly requires to be concealed; but being only faftened by a frall part of its upper end to a narrow belt, in other refpects hanging quite loofe, it is bur a very imperfect concealment; and when the wearer is walking, or otherwife in potion, it is none at all. They

## H OT

Hottentots call this purfe the Dutch name of jackall, it being almert always prepared of the fin of that animal, with the hairy fide turned outwards.

The women cover themfilves mach more frrupuloully than the men, having always two, and very often three coverings like aprons; though even thefe feem to be abundantly fmall for what we would term decency in this country. The out irmont of thefe, which is the largeft, meafures only from about fix inches to a foot in breadth. All of them are made of a fkin well prepared and greafed, the outermoft being adorned with glafs beads ftrung in different figures. The outcrmoft reaches about half-way down the thighs, the middle about a third, or one halt lefs, and the third fcarcely exceeds the breadth of the hand. The firft is lidid to be defigned for ornament, the fecond as a defence for modefty, and the third to be ufeful on certain occalions, which, however, are much lefs troublefome to the Hottentot than to the European females. Our author, with great probability fuppofes, that it was the fight of this innermoft apron which mined the reverend Jefuit Tackard, who, on his return to Europe, firft propagated the ftories concerning the natural vails or excrefcences of the Hottentots.-A ftory was likewife commonly believed, that the men in general had but one tefticle, and that fuch as were not naturally formed in this manner were artificially made fo. But this our author likewife denies; and though he fays that fuch an operation might have been formerly performed upon the males, yet it is not fo now.

The otiner garments worn by the Hotrentots are formed of a fheep's-fkin with the woolly fide turned inwards; this forming a kind of cloak, which is tied forwaids over the breaft : chough fometimes, initead of a fheep's-fkin, fome fmaller kind of fur is ufed as a material. In warm weather they let this cloak hang carelefsly over their fhoulders, fu that it reaches down to the calves of the legs, leaving the lower part of the breaft, fomach; and fore-part of the legs and thighs bare; one in cold weather they wrap it round them; fo that the forc-part of the body is likewife pretty well covered by it as far as the knees: But as one fheep-1kin is not fufficient for this purpofe, they few on a piece on the top at each fide with a thong or catgut. In warm weatherthey fonctimes wear the woolly fide outwards, but more fregueutly take off the cloak altogether, and ramy it under their arm. This cloak or $\dot{k} \cdot \operatorname{lif}^{\prime}$ ferves them not only for clothes, but bedding alfo; and in this they lie ou the bare ground, drawing up their bodics fo clofe, that the cloak is abindantly fufficient tu-cover them.- I he cloaks ufed by the women differ little from thefe already deferibed, excepting only that they have a long peak on them, which they turn up; forming it with a little hood or pouch, with the hairy fide inwards. In this they car: $y$ their little children, to which the mother's breafts are now and inen thrown over the fhoulders; a cuftom common among fome other nations, where the breafts of the temales, by continual want of fupport, grow to an enormous length. The men commonly wear no covering on their heads, though our author fays he has feen one or' two who wore a greafy night-cap made of kin with the hair taken off. Thofe wholive neareft the colonifts have taken a liking to the European hats, and wear them flonched all round, or with only one lide turned
up. The women allo frequently go bare-headed; Hottentote though they fometimes wear a cip made in the flape of a hort truncated cone. This appears to be the fection of fome animal's ftomach, and is perfectly blacked by foot and fat mixed up together. Thefe caps are frequently prepared in fuch a manner as to look fhaggy; others have the appearance of velvet; and in our author's appearance are not inelegant. Over this they fometimes wear an oval wreath or kind of crown made of a buffaloe's hide, with the hair outermoft. It is about four fingers breadth in height, and furrounds the head fo as to go a little way down upon the forehead, and the fame depth on the neck behind, without covering the upper part of the cap above defcribed. The edges of this wreath, both upper and under are always fmooth and even; each of thom Set with a row of fmall fhells of the cyprea kind, to the number of more than 30 , in fuch a mannner, that being placed quite clofe to one another, their beautiful white enamel, together with their mouths, are turned outwards. Between two rows of thefe thells run two others parallel, or elfe waved and indented in varions ways. The Hottentots never adorn their ears or nofes as other favages do : though the latter are fometimes marked with a black ftreak of foot ; at others, though more rarely, with a large fpot of red lead ; of which laft, on feftivals and holidays, they likewife put a little on their cheeks. The necks of the men are bare, but thofe of the women are ornamented with a thong of undreffed leather, upon which are ftrung eight or ten ficlls. Thefe, which are about the fize of beans, have a white ground, with large black fpots of different fizes : but as they are always made ufe of in a burnihhed ftate, the Doctor is uncertain whether they be of that kind which is received in the Syftema Naturæ under the name of nerita albcilla, or exuvia. Thefe fhells are fold at an enormous price, no lefs than a fheep for each; and it is faid that they come from the moft diftant coaft of Caffraria. Both men and women are very fond of European beads, particularly the blue and white ones of the fize of a pea; of which they tie feveral rows round the middle, and next to the girdles which hold the coverings abovementioned. Befides thete ornaments, they ufe rings on their arms and legs; moft of them made of thick leather ftraps generally cut in a circular hape; which, by being beat and held over the fire, are rendered tough enough toretain the curvature that is given then. From thefe rings it has been almoft unverfally believed, that the Hottentots wrap guts about their legs in order to eat them occafionaliy. The men wear from one to five or lix of thefe rings on the arms juft above the wrift; but feldom on their legs. The matrons of a higher rank have frequently a confiderable number of them both on their arnss and legs, efpecially on the latter; fo that they are covered with them from the feet up to the knces. Thefe rings are of rarious thickneffes, from that of a goofe-quill to two or three times that fize. Sometimes they are made of pieces of leather forming one entire ring; fo that the arms and feet mult be put through them when the wearer wifhes to put them on. They are ftrung upon the legs, fmall and great, without any nicety; but are fo large, that they fhake and get twifted when the perfon walks, Rings of iron or copper, but efpecially of brafs, of the fize of a

## HOT

Hottentots goofe-quill, are confidered as more genteel than thofe of leather. However, they are fometimes worn along with the latter, to the number of iix or eight at a time, particulatly on the arms. The girls are not allowed to ufe any rings till they are mariareable. The Hortentots feldom wear any hoes; but fuch as they do make ufe of are of the fame form with thole worn by the African peafants, by the Eafthonians, and Eivonians, as well as by fome finlanders; fo that it is impoilible to fay whether they are the invention of the Dutch or the Hottentors themfelves. They art made of undrefled leather, with the hairy fide ontward with out any other preparation than that of being beat and moiftened. It it be a thick and ftout hide, as that of a buffaloe, it is kept for fome hours in cowdung, which renders it befides very foft and pliable. Some kind of greafe is afterwards ufed for the fame purpofe. The foes are then made in the following manner. They take a piece of leather, of a rectangular form, fomething longer and broader than the toot of the perion for whom the fhoes are intended; the two foremoft corners are donbled up together, and fewed down, fo as to cover the fore-part of the foot; but this feam may be avoided, and the fhoes made much meater at the toes, by fitting immediately over them a cap taken from the membrane in the knee-joint of the hind-leg of fome animal. In order to make this piece of $\mathbb{k} \mathrm{in}$ or leather rife up to the height of an inch on both fides of the foot, and clofe it in neatly, it is pierced with holes at fmall diftances all round the edge, as far as the hind quarters; and through thefe holes is palfed a thong, by which the rim is drawa ap into gathers. In order to make ftrong hind quarters, the back part of the piece of leather is doubled inward, and then raifed up and preffed along the heel. The ends of the thong or gathering ftring are then threaded on both fides through the upper edge of the hindquarters to the height of about two inches; they are then carried forwards, in order to be drawn through two of the abovementioned holes on the infide of each rim. Laftly, they are tied over the inftep, or if it be thought neceffary to tie the fhoe ftill fafter, they are carried crols-ways over the inftep, and fo downwards under the thong, which comes out from the hind-quarters; then upwards again over the ancle, and even round the legitfelf if the wearer choofes. Shoes of this kind are not without their advantages: they fit as neat upon the foot as a focking, and at the fame time preferve their form. They are eafily kept foft and pliable by conftantly warming them; or if at any time they fhould become fomewhar hard, this is eafily remedied by beating and greafing them. They are extremely light and cool, by reafon that they do not cover fo much of the foot as a common fhoe. They wear very well, as they are without any feam, and the foles of the hous are both tough and yielding. Thefe field floes, as they are called, being made of almoft raw leather, are much more durable than thofe of tanned leather which are burnt up by the African fands, and dip and roll about in them ; being alfo very ready to be torn in a rocky foil which is not the cafe with the others. The Doctor is of opinion, that thefe fhoes would be particularly ufeful to failors.

The huts of the Hottentots are built exactly alike; and we may readily give credit to our author when he

687 J H O T
tells us, that they are done in a fyle of architecture IIottentote which does not a little contribute to keep envy from infinuating itfelf under their roofs. Some of thefc huts are circular, and others of anoblong fhape, refembling a romd bee-hive or vanlt; the ground-fot being from 18 to 24 feet in diameter. The higheft are fo low, that it is farce ever poffible for a middle-fized man to ftand upright even in the centre of the arch; "، but(fay; our author) neither the lownefs thereof nor that of the door, which is but juft three feet high, can perhaps be confidered as any inconvenicnce to a Hottentot, who finds no difficulty in fooping and crawling upo:i all fours, and is at any time more inclined to lie down than to ftand. The fire-place is in the middle of each hut, by which means the walls are not fo much expofed to danger from fire. From this fituation of the fire-place alfo the Hottentots derive this additional advantage, that they can all fit or lie in a circle round it, enjoying cqually the warmith of the fire. The door, low as it is, alone lers in day-hight or lets out the fmoke; and fo much are thefe people accuftoned to live in fuch fmoky manfions, that their eyesare never affected by it in the leaft, nor even by the mephitic vapour of the fuel, which to Eurnpeans wonld be certain death.

The frame of the arched roof is compofed of lender rods or fprays of trees. Thefe being previoully bent into a proper form, are laid, either whole or pieced, fome parallel to one another, others croiswife; after which they are ftrengthened by binding others round them in a circular form with withies. All thefe are taken principally from the clifforter conoides, which grows plentifully in this country near the rivers. Large mats are then placed very neatly over this lattice work, fo as perfectly to cover the whole. The a perture which is left for the door is clofed occafionally by a fkin or piece of matting. Thefe mats are made of a kind of kane or reed in the following manner. The reeds being laid parallel to one another, are faftened together with finews or catgat, or fome kind of catgut whicli they have had an opportunity of getting from the Europeans; fo that they have it in their power to make them as long as they pleafe, and as broad as the length of the reeds, which is from fix to ten feet. The calonifts make ufe of the fame kind of matting, next to the tilts of their waggons, to prevent the failcloth from being rubbed and worn, and likewife to. help to keep out the rain.

In a craal, or Hottentot village, the huts are moft commonly difpofed in a circle, with the doursinwards: by which means a kind of court-yard is formed, where the cattle are kept at nights. The milk, as foon as taken from the cow, is put to other milk which is curdled, and kept in a leather fack with the hairy fide inwards as being the more cleanly; fo that thus the milk is never drunk fweer. In fome northern diftricts, where the land is dry and parched, borh Hottentots and colonifts are hepherds. When an Hottentot has a mind to fhift his divelling, he lays all the mats, kins, and rods, of which it is compofed, on the backs of his cattle, which, to a ftanger, makes a monftrous, un wieldy, and even ridiculous appearance.

There is a fpecies of Hotrentots namd $B_{0} /$ hiefmen who dwell in the woody and mountainous parts, and fubfift entirely by plunder. They wif mifoned ar-

Hottentots rows which they fhont from bows about a yard long and an iuch in thicknefs in the middle, very mach pointed at both ends. Dr Sparman does not know the wood of which they are made, but thinks that it is not very elaftic. The ftrings were made, fome of finews, and others of a kind of hemp, or the inner bark of tome vegetable : but moft of them in a very flovenly manner. The arrows are about a foot and an half long, headed with bone, and a triangular bit of iron; having alfo a piece of quill bound on very ftrongly with finews, about an inch and an half from the top, in order to prevent it from, being eafily drawnout of the flelh. The whole is laftly covered over with a very deadly poifon of the confiftence of an extract. Their quivers are two feet long and four inches in diameter; and are fuppofed by our author to be made of the branch of a tree hollowed out, or more probably of the bark of one of the branches taken off whole, the bottom and cover being made of leather. It is daubed on the outfide with an unctuons fubftance which grows hard when dry, and is lined about the aperture with the fkin of the yellow ferpent, fuppofed to be the moft deadly in all that part of the world. The poifon they make ufe of is taken from the moft venomous ferpents; and, ignorant as the Hottentots are, they all know that the poifon of ferpents may be fwallowed with fafety. See the article Boshiesmem.

In the year 1779 , Lieutenant William Paterfon, who took a long and dangerous excurfon, from the Cape along the eaftern fide of the continent, difcovered a new tribe of Hottentots, whofe living, he fays is in the higheft degree wretched, and who are apparently the dirtieft of all the Hottentot tribes. Their drefs is compofed of the fkins of feals and jackals the flefh of which animals they feed upon. It a grampus happen to be caft afhore, they remove their huts to the place, and feed upon the carcafe as long as it lafts, though perhaps it may be halfrotten by the heat of the weather. They befmear their fkins with the oil; by which means they fmell fo exceedingly rank that their approach may be thus perctived before they come in fight. Their huts, however, are much fuperior to thofe of the fouthern Hottentots already defcribed; being higher, thatched with grafs, and furnifhed with ftools made of the back-bones of the grampus. They dry their fifh in the finn ; as the lieutenant found feveral kinds of filh near their huts fufpended from poles, probably for this purpofe. He found alfo feveral aromatie plants which they had been drying.

With refpect to the religion of the Hottentots, it does not appear that they have any. On being queftioned on the fabject of a Creator and Governor of the univerfe, they anfwer that they know nothing of the matter; nor dothey feem willing to receive any inftruction. All of them, however, have the moft firm belief in the powers of magic ; from whence it might be in ferred that they belicve in ath evil being analogous to what we call the devil; but they pay no religions worfhip to him, though from this fource they derive all the evil that happens, and among thefe evils they reckon cold, rain, and thunder. So monftroully ignorant are they, that many of the colonifts affured Dr Sparrman, that their Bothiefmen would abufe the No 158.
thunder with many opprobrious epithets and threaten Hottentot to affalt the flafhes of lightning with old fhoes, or any thing that comes firft to hand. Even the moft intelligent among them could not be convinced by all the arguments our author could ufe, that rain was not always an evil, and that it would be an unhappy circuinftance if it were never to rain. "A maxim (fays he), from a race of men in oher refpects really endowed with fome fenfe, and frequently with no fmall degree of penetration and curning, ought, methinks, to be confidered as an indelible religious or fuperftitious no. tion entertained by them from their infancy, rather than as an idea taken up on due deliberaion and confequent conviction."

As the Hottentots have fo frong a belief in the powers of magic, it is no wonder that they have abundance of witches and conjurers among them. Thefe will readily undertake any thing, even to put a ftop to thunder and rain, provided they be well paid for their pains; and if it happen to thander or rain longer than the time they promifed, they have always for an excufe, that a more powerful conjurer has put a fop to their incantations. Many of the Hottentots be* lieve that all diforders incident to the human body are cured by magic. The wizards are fond of encouraging this idea; but at the fame time take care to employ both external and internal remedies. Among the former may be reckoned a cure performed upon Captain Cook in fome of the South Sea, illands, viz. that of pinching, cuffing, and kneading the whole body of the patient. To this, however, the Hottentot phyficians add that of pretending to fuck out a bone from fome part of the patient's body. After this it fometimes happensthat thefick perfon is relieved, and fometimes nor. In the later cafe the operation is repeated; and if he dies, his friends lament that he was bewitched beyond the power of any one to affift him. Thefe conjurors appear to be poffeffed of confiderable flight of hand. Our author was informed by a colonift, that when he was achild, and playing with abone of an ox which he drew as a cant, it appeared to his great aftonifhment to be fucked out of a fick perfon's back , by a wizard; and as far as he could remember, the pa* tient recovered foonafter. Thefe pretenfions of the wizards fometimes render them liable to perfecutions; and there is an inftance of a chief named Paloo, who orderedageneral maffacre among them, in hopes of cutting off the perfon who he believed had bewitched himfelf. and afflicted him with fore eyes.

The fuperftition of the Hottentots never operates in the way of making them afraid in the dark. They feem, however, to have fome ideas of a future fate, as they reproach their friends, when dead with leaving them fo foon; at the fame time admonifhing them from henceforth to demean themfelves properly : by which they mean, that their deceafed friends fhould not come back again and haunt them, nor allow themfelves to be made ufe of by wizards to bring any mifchief on thofe who furvive them.

There is a genus of infects (the mantis) which, is has been generally thought, the Hottentots worhip; but our author is fo far from being of this opinion that he telis us they have more than once catched feveral of them for him, aflifted him in flicking pins througn
rally grow in their own country, viz. tobacco, water- Hotenteto melons, a fmall kind ofkidney-beans, andhemp. The -r women alfo make their balkets and the mats on which they lie. The men are very fond of their cattle, and cut their horns in fuch a manner as to be able to turn them into any fhape they pleafe and teach them to anfwer to a whiftle. Mr Paterfon is of opinion that the country they inhabit is greatly fuperior to any part of Africa.

Of the Dutch fettlements and policy $2 t$ the Cape, Mr Forfter gives the following account.
" The income of the governor here is very confiderable; for, befides a fixed appointment and the ufe of houfes, gardens, proper furniture, and every thing that belongs to his table, he receives about io dollars for every leagre of wine which the company buy of the farmer in order to be exported to Batavia. The company allows the fum of 40 dollars for cach leagre, of which the farmer receives but 24; what remains is fhared between the governor and fecond or deputy; the former taking two thirds, which fometimes are faid to amount to 4600 dollars per annum. The deputy governor has the direction of the company's whole commerce here, and ligns all orders to the different departments under him, as well as the governor to others. He and the fifcal have the rank of upper koopman. The fifcal is at the head of the police, and fees the penal laws put in execution : his income confifts of fines, and of the duties laid on certain articles of commerce : but if he be ftrict in exacting them, he is univerfally detefted. The found policy of the Dutch has likewife found it neceffary, to place the fifcal as a clieck, to overawe the other officers of the company, that they may not counteract the interefts of their mafters or infringe the laws of the mo-ther-country. He is, to that end, commonly well verfed in juridical affairs, and depends folelyupon the mother-country. The major (at prefent Mr Von Perhn, who received us with great politenefs) has the rank of koopman, or merchant ; this circumftance furprifes a ftranger, who, in all other European ftates, is ufed to fee military honours confer diftinction and precedence ; and appears fill more fingular to one who knows the contraft in this particular between Holland and Ruffia, where the idea of military rank is annexed to every place, even that of a profeffor at the univer. fity. The number of regular foldiers at this colony amounts to abont 700 : of which 400 form the garrifon of the fort, near the Cape town. The inliabitants capable of bearing arms form a militia of 4000 men ; of whom a confiderable part may be affembled in a few hours, by means of fignals made from alarmplaces in different parts of the country. We may from hence make fome eftimate of the number of white people in this colony, which is at prefent fo extenfive that the diftant fetilements are above a month's journey from the Cape; but thofe remote parts lie fometimes more than a day's journey from each other, are furrounded by various nations of Hottentots, and too frequently feel the want of protec. tion from their own government at that diftance. The flaves in this colony are at leaft in the proportion of five or more to one white perfon. The principal inhabitants at the Cape have fometimes from 20 to 30 flaves; which are in general treated with great lenity, 4 R
and

Hottentots and fometimes become great favourites with their mafters, who give them very good clothing, but oblige them to wear neither floes nor fockings, referving thefe articles to themfelves. The flaves are chiefly brought from Madagafcar, and a little veffel annually goes from the Cape thither on that trade; there are, however, befides them, a number of Malays and Bengalefe, and fome negroes. The colonifts themfelves are for the greateft part Germans, with Yome families of Dutch, and fonc of French Proteftants. The character of the inhabitants of the town is mixed. They are induftrious, but fond of good living, hofpitable, and focial ; though accufomed to hire their appartments to ftrangers for the time they touch at this fettlement, and ufed to be complimented with rich prefents of ftuffs, \&c. by the o-cers of merchant fhips. They have no great opportunities of acquiring knowledge, there being no public fchools of nore at the Cape; their young men are thercfore commonly fent to Holland for improvement, and their female education is too much neglected. A kind of diftike to reading, and the want of public amufements, make their converfation uninterefting, and too frequently turn it upon fcandal, which is commonly carried to a degree of inveteracy peculiar to little towns. The French, Englifh, Portuguefe, and Malay languages, are very commonly fpoken, and many of the ladies have acquired them. This circumftance, together with the accomplifhments of finging, dancing, and plying a tune on the lute, frequently united in an agreeable perfon, make amends for the want of refined manners and delicacy of fentiment. Thereare, however, among the principal inhabitants perfons of both fexes, whofe whole deportment, extenfive reading, and well-cultivated underftanding, would be admired and diftinguifhed even in Europe. Their circumftances are in general cafy, and very often affluent, on account of tlre cheap rate at which the neceffaries of life are to be procured; but they feldom amafs fuch prodigious riches here as at Batavia; and I was told the greateft private fortune at the Cape did not exceed 100,000 dollars, or about 22,500 1. fterling.
" The farmers in the country are very plain hofpitable people; but thofe who dwell in the remoteft fettlements feldom come no town, and are faid to be very ignorant : This may be eafily conceived, becanfe, they have no better company than Hottentots, their dwellings being often feveral days journey afunder, which muft in a great meafure preclude all intercourfe. The vine is cultivated in plantations within the compais of a few days journey from the town; which were ceftablifhed by the firft colonifts, and of which the groand was given in perpetual property to them and their heirs. The company at prefent never part with the praperty of the ground, bur let the furface to the farmer for an annual rent, which, though extremely moderate, being only 25 dollars for 60 acres, yet does not give fufficient encouragement to plant vineyards. The difant fettlements, therefore chiefly raife corn and rear cattle; nay, many of the fettlers entirely follow the latter branch of ruftic employment, and fome have very numerous flocks. We were told there were two farmers, who had each 15000 fheep, and oxenin proportion ; and feveral who poffeffed 6000 or 80 on fheep, of which they drive great droves to
town every year : but lions and buffaloes, and tine fa- Hottentots tigue of the journey, deftroy numbers of their cattle before they can bring them fo far. They commonly take their families with them in large waggons covered with linen or leather, fpread over hoops, and drawn by 8,10 , and fometimes 12 pair of oxen. They bring butter, mutton-tallow, the flefh and fkins of fea-cows (hippopotamus), together with lion and rhinoceros' akins to fell. They have feveral laves, and com monly engage in their fervice feveral Hottentors of the poorer fort, and (as we were told) of the tribe called Boshiesmen, Bofchemans, or Bufbmen, who have no cattle of their own, but commonly fubfift by hunting, or by committing depredations on their neighbours. The opulent farmers fet upa young beginner by intrufting to his care a flock of 400 or 500 fheep, which he leads to a diftant fpot, where hefinds plenty of good grafs and water; the one-balf of all the lambs which are yeaned fall to his fhare, by which means he foon becomes as rich as his benefactor.
" Though the Dutch company feem evidently to difcourage all new fettlers, by granting no lands in private property; yet the products of the country have of Jate years fufficed not only to fupply the ines of France and Bourbon with corn, but likewife to furnifh the mother-country with feveral fhip-Joads. Thefe exports would certainly be made at an eafier rate than at prefent, if the fettlements did not extend fo far into the country, from whence the products muft be brought to the Table-bay by land-carriage, on roads which are almoft impaffable. The intermediate faces of uncultivated land between the different fettlements are very extenfive, and contain many foots fit for agriculture; but one of the chief reafons why the colonifts are fo much divided and fcattered throughout the country, is to be met with in another regulation of the company, which forbids every new fettler to eftablifh himfelf within a mile of another. It is evident, that if this fettlement were in the hands of the commonwealth, it would have attained to a great population, and a degree of opulence and fplendor of which it has not the leaft hopes at prefent : but a private company of Eaft-India merchants find their account much better in keeping all the landed property to themfelves, and tying down the colonift, left he fhould become too great and pnoverful.
"The wines made at the Cape are of the greateft variety poffible. The beft, which is made at M. Vander Spy's plantation of Conftantia, is fpoken of in Earope more by report than from real knowledge; 30 leagres (or pipes) at the utmont are annually raifed of this kind, and each leagre fells for about 501 . on the fpot. The vines from which itis made were originally brought from Shiraz in Perfia. Several other forts grow in the neighbourhood of that plantation, which produce a TWeet rich wine, that generally paffes for genuine Conftantia in Europe. French plants of burgundy, murcade, and frontignac, have likewife been tried, and have fucceeded extremely well, fometimes producing wines fuperior to thofe of the original foil. An excellent dry wine, which has a flight agreeabletartnefs, is commonly drank in the principal families, and is made of Madeira vines tranfplanted to the Cape. Several low forts, not entirely difagreeable, are raifed in. great plenty, and fold at a very cheap rate; fo that

Hottinger the failors of the Eaf-India hips commonly indulge \| themelves very plentifully in them whencver they Hovedon. come alhore.
" The products of the country fupply with provifions the fhips of all nations which touch at the Cape. Corn, flour, bifcuit, falred beef, brandy and winc, are to be had in abundance, and at moderate prices; and their frefh greens, fine fruits, good mution and beef, are excellent reftoratives to deamen who have made a long voyage."

HOTTINGER (John Henry), barn at Zarich in switzerland in 1620, profeffed the Orientallanguages at Leyden, and was efteemed by all his learned colleagues. He was drowned, with part of his family, in the river Lemit, in the year 1667 . He wrote a prodigious'number of works; the principal of which are, 1. Exercitationes Anti-Moriniance de Pentateucho; Samaritano, 4 to ; in which he defends the Hebrew text againft father Merin. 2. Hiftaria Oricntalis, 4 to. 3. Bibliothecarius quadripartitus. 4. Thefaurus Fhilologicu: Sacra Scripture, 4to. 5. Hifloria Ecclefiaflica. 6. Promptuarium, five Bibliotheca Orientalis, 4 to. 7. Differtationes mifcellana, \&c.
hottonia, water-violet: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking un. der the 2 nft order, Precia. The corolla is falverflaped; the famma are placed in the tube of the co. rolla; and the capfule is unilocular. There is but one fpecies, viz. the paluftris, with a naked falk. It grows naturally in the fanding waters in many parts of England. The leaves, which are for the moft partimmerfed in water, are finely winged and flat like moft of the fea-plants; and at the bottom lave long fibrous roots, which ftrike into the mud: the flowerftalks rife five or fix inches above the water, and toward the top have two or three whorls of purple flowers terminated by a fmall clufter of the fame. Thefe flowers have the appearance of thofe of the ftock-gilliflower, fo make a pretty appearance on the furface of the water. It may be propagated in deep ftanding waters, by procuring the feeds when they are ripe, from the places of their natural growth; which flould be immediately dropped into the water in thofe places where they are defigned to grow, and the fpring following they will appear; and if they are not difturbed, they will foon propagate themfelves in great plen-ty.-Cows eat this p'ant; fwine refufe it.

Houbraken (Jacob), a celebrated engraver, whole great excellence confifted in the portrait line. His works are diftinguifhed by an admirable fofinefs and delicacy of execution, joined with good drawing, and a fine tafte. If his beft performances have ever been furpaffed, it is in the mafterly determination of the features, which we find in the works of Nanteuil, Edelink, and Drevet : this gives an animation to the countenance, more eafily to be felt than defcribed. His works are pretty numerons; and moft of them being for Englifh publications, they are fufficiently known in that country. In particular the greateft and beft part of the collection of portraits of Illuftrious men, publifhed in London by I. and P. Knapton, were by his hand.

HOVEDON (Roger de), born of an illuftrious family in York hire, moft probably at the town of that name now called Howden, fome time in the reign of Henry I. After he had received the firft parts of edu-
cation in his native country, be fadied the civil and canon law, which were then become mon fafthionable and lucrative branches of learning. He became domeftic chaplain to Henry II. who emploged him to tranfact feveral ecclefiatical affairs: in which he acquitted hinfelf with honour. But his moft meritorious work was his annals of England, from A. D. 73r, when Bede's ecclefiaftical hiftory ends, to A. D. 1202 . This work, which is one of the moft voluminous of ancient hiftoties, is morc valuable for the tincerity with which it is written, and the great variety of facts which it contains, than for the beauty of its Atyle, or the regalarity of its arrangenent.

HOUGH, Ham, in the manege, the joint of the hind-leg of a beaft, which connects the thigh to the leg. See Ham.

To Hough, or cut the Houghs, is to liam-ftring, or to difable by cuting the finews of the ham.

HOULIERES (Antoniette de), a French lady, whote poetry is highly efteemed in Francc. Her works and thofe of her danghter have been collected and printed together in two volumes. Moft of the Idyls, particularly thofe on theep and birds, furpats every thing of the kind in the French language: the thoughts and exprefions are noble, and the ftyle pure, flowing, and chafte. Mademoirelle des Houlieres carried the poetic prize in the French academy againft Fontenelle. Both of thefe ladies were members of the acadeny of Ricovatri; the molher was allo a member of the academy of Arles. Thore who defire to be more particularly acquainted with the hiftory of Madam des Houlieres, may confult her life prefixed to her works in the Paris edition of 5747, 2 vols 12 mo.
HOUSLWORTHY, a large town of Devonfhire, feated between two branches of the river Tamer, having a good market town for corn and provilions. W. Long. 4. 42. N. Lat. 50.50.

HOUND.See CanIS, BLOOD.Hound, or GRE-Hound.
Training of Hounds. Before we fpeak of the methods proper to be ufed for this purpofe, it will be neceffary to point out the qualities which fportfinen defire to meet with in thefe animals. It is generally underftood, that hounds of the middle fize are the moft proper, it being remarked, that all animals of that defeription are ftronger than ei her fuch as are very fmall or very large. The flape of the hound ought to be particularly atterded to; for if he be not well proportioned, he can neither run faft nor do ruuch work. His legs ought to be ftraight, his feet round, and not very large; his fhoulders back; his breaft rather wide than narrow; his cheft deep, his back broad, his head fmall, his neck thin; his tail thick and bulhy, and if he carry it well fo much the better. None of thofe young hounds which are out at the elbows, or fuch as are weak from the knee to the foot, fhould ever be taken into the pack. That the pack may look well, it is proper that the hounds hlould be as much as poffible of a fize: and if the animals be handfome at the fame time, the pack will then be perfec. It muft not, how ever, be thought, that this contributes any thing to the goodnefs of a pack; for very unbandfome packs, confifing of hounds entirely different in lize and colour, have bicen known to afford very good fuort. It is only neceflary that they flould run well together; to which indeed an uniformity in Hound.

## HOU

Hound. fize and flape would feem to contribute in fome degree. The pack that can run ten miles, or any other confiderable fpace, in the fhorteft time, may be faid to go fafteft, though the hounds taken feparately might be contuderably inferior to others in fwiftnefs. A pack of hounds, confidered in a collective body, go faft in proportion to the excellence of their nofes and the head they carry. Packs which are compofed of hounds of various kinds feldom run well. When the packs are very large, the hounds are feldom faficiently hunted to be good; twenty or thirty couple therefore, or at moft forty, will be abundantly fufficient for the keeneft fportfman in the country, as thus he may be enabled to hunt three or even four times a week. The number of hounds to be kept, mult, however, in a confiderable degree, depend on the ftrength of the pack and the country in which you hunt. They fould be left at home as feldom as poffible; and too many old hounds fhould not be kept. Nont ought to be kept above five or fix feafons, though this alfo is fomewhat uncertain, as we have no rule for judging how long a hound will laft.

In breeding of hounds, confiderable attention ought to be paid to the dog from whom you breed. All fuch are to be rejected as have a tender nofe, as are babblers or firters. An old dog fhould never be put to an old bitch ; nor fhould any attempts be made to crofs the breed unlefs in a proper and judicious manner . Mr Beckford $\dagger$ informs us that he has feen foxhounds bred out of a Newfoundland dog and fox-
little care that is taken of them. "If the diftemper (fays he) once get among them, they muft all have it : yet notwithftanding that, as they will be conftantly well fed, and will lie warm (in a kemnel built on purpofe), lan confident it would be the faving of many lives. If you fhould adopt this method, you muft remember to ufe them early to go in couples : and when they become of a proper age, they muft be walked out often; for fhould they remain confined, they would neither have the healrh, fhape, or underftanding, which they ought to have. When I kept harriers, I bred up fome of the puppies at a diftant kennel; but having no fervants there to exercife them properly, I found them much inferior to fuch of their brethren as had the luck to furvive the many difficulties and dangers they had undergone at their walks; thefe were afterwards equal to any thing, and afraid of nothing; whilft thofe that had been nurfed with fo much care, were weakly, timid, and had every difadvantage attending private education. I have often hieard as an excufe for hounds not hunting a cold fcent, that they were too high-bred. I confefs I know not what that means : but this I know, that hounds are frequently too ill-bred to be of any fervice. It is judgment in the breeder, and patience afterwards in the huntfman, that makes them hunt.
" When young houndsare firftaken in, they fhould be kept feparate from the pack; and as it will happen at a time of the ycar when there is little or no hunting, you may eafily give then up one of the kennels and grafs court adjoining. Their play frequently ends in a battle; it therefore is lefs dangerous where all are equally matched.-If you find that they take a dillike to any particular hourd, the fafeft way will be to remove him, or it is probable they will kill him at laft. When a feeder hears the hounds quarrel in the kennel, he halloos to them to ftop them; he then goes in among them, and flogs every hound he can come near. How much more reafonable, as well as efficacious, would it be, were he to fee which were the combatants before he fpeaks to them. Punifhment would then fall, as it ought, on the guilty only. In all packs there are fome hounds more quarrelfome than the reft; and it is to them we owe all the mifchief that is done. If you find chaftifement cannot quiet them, it may be prodent to break their holders; for fince they are not neceffary to them for the meat they have to eat, they are not likely to ferve them in any good purpofe. Young hounds fhould be fed twice a day, as they feldom take kindly to the kennel meat at firft, and the diftemper is molt apt to feize them at this time. It is better not to round them till they are thoroughly fettled; nor fhould it be put off till the hot weather, for then they would bleed too much. It may be better perhaps to round them at their quarters, when about fix months old ; fhould it be done fooner, it would make their ears tuck up. The tailing of then is ufually done before they are put out ; it might be better, perhaps, to leave it till they are taken in. Dogs muft not be rounded at the time they bave the diftemper upon them, as the lofs of blood would weaken them too much.
"If any of the dogs be thin over the back, or any more quarrelfome than the reft, it will be of ufe to cut them: I alfo fpay fuch bitches as I hall not want to breed from; they are more ufeful, are ftouter, and

Hound. hound bitch ; the whelps were monftroully ugly, and had other bad qualities befides. The crols moft likely to be of fervice to a fox-hound is the beagle. The reafon of croffing the breeds fometimes is, that the imperfections of one may fometimes be remedied by another. The months of January, Febraary, and March, are the beft for breeding ; late puppies feldom thrive. After the females begin to grow big with young, it will not be proper to let them hant any more, or indeed to remain for a much longer time in the kennel. Sometimes thefe animals will have an extraordinary number of whelps. Mr Beckford informs us that he has known a bitch have i 5 puppies at a litter; and he affures us, that a friend of his informed him, that a hound in his pack broaght forth 16, all of them alive. In thefe cafes it is proper to put fome of the puppies to another litch, if you want to keep them all; but if any are deftroyed, the beft coloured ought to be kept- The bitches fhould not only lave plenty of fleh, but milk alfo; and the puppies fhould not be taken from them till they are able to take care of themfelves : their mothers will berelieved when they learn to lap milk, which they will do in a fort time. After the puppies are taken away from their mothers, the litter fho:ld have three purging balls given them, one every other morning, and plenty of whey the intermediate day. If a bitch bring only one or two puppies, and you have another that will take them, by putting the puppies to her, the former will foon be fit to hunt again. She fhould, however, be firft phyficked, and it will alfo be of fervice to snoint her dugs with brandy and water.

Whelps are very liable to the diftemper to which dogs in general are fubject, and which frequently makes great havoc among them at their walks; and this is fuppofed by Mr Beckford to be owing to the

## HOU

Hound. are always in better order ; befides it is abfolutely neceffary if you hunt late in the fipring, or your pack will be very fhore for want of it. The latter operation, however, does not always fucceed ; it will be necelfary therefore to employ a dkilful perfon, and one on whom you can depend; for it it be ill done, though they cannot have puppies, they will go to heat notwithitanding. They fhould be kept low for feveral days before the operation is performed, aud muft be fed on thin nicat for fome time after."

It is impoffible to determine how many young hounds ought to be bred in order to keep up the pack, as this depends altogether on contingencies. 'I he deficiencies of one year muft be fupplied by the next; but it is probable, that from 30 to 35 couple of old hounds and from eight to twelve couple of young ones, will anfwer the purpofe where no more than 40 couple are to be kept. A confiderable number, however, ought always to be bred; for it is undoubtedly, and evidently true, that thofe who breed the greateit number of hounds mult expect the beft pack.

After the hounds have been rounded, become acquainted with the huntfman, and anfwer to their names, they ought to be coupled together, and walked out a mong theep. Such as are particularly ill natured ought to have their couples loofe about their necks in the kennel till they become reconciled to them. The moft fubborn ought to be coupled to old hounds rather than to young ones; and two dogs fhould not be coupled together when you can avoid it. As young hounds are aukward at firft, a few ought only to be fet out at a time with people on foot, and they will foon afterwards follow a horfe. When they have been walked out often in this manner amongit the fheep, they fhould be uncoupled by a few at a time, and thole chaftifed who offer to run after the fheep; but it will be difficult to reclaim them if rhey have once been allowed to tafte blood. Some are accuftumed to couple the dogs with a ram in oruer to break them from fheep; but this is very dangerous for both parties. Mr Beckford relates a ftory of a nobleman who put a large ram into his kennel in order to break his hounds from fheep: but when he came fome time after to fee how nobly the ram defended himfelf, he found him entirely eaten wp, and the hounds gone to fleep after having filled their bellies.

When hounds are to be aired, it is beft to take them out feparately, the old ones one day, and the young another: though, if they are to have whey from a diftant dairy, both old and young may be taken ont together, obferving only to take the young hounds in couples, when the old ones are along with them. Young hounds are always apt to fall into mifchief, and even old ones when idle will be apt tojoin them. Mr Beckford mentions a whole pack running after a flock of fheep through the mere accident of a horfe-falling, and then running away.

With regard to the firft entering of hounds to a fcent, our author gives fuch directions as have fubjected him to a fevere charge of inhumanity. We fall give them in his own words. "Youl had better enter them at their own gane it will fave you much trouble afterwards. Many dogs I belicve, like that fcent beft which they were firft blooded to: but be this as it may, it is moft ccrtainly reafonable to ufe them to that which it is intended they flould hunt. It may
not be amifs firf when they begin to hunt to juliaite Het:d. collars on them. Young hounds may eafily get out of their knowledge ; and fhy ones, after they have beea much beaten, may not choofe to return home. Collars, in that cafe may prevent their being loft.-You fay you lile to fee your joung, lounds run a thai-fcent.-I have no doubt that you would be glad to tee tinem run over an open down, where you cuald fo eafily obferve their action and their fpecd. I cannot think the doing of it once or twice could hurt your hounds; andyet as a fportfiman I dare not recommend it to you. All that 1 can fay is, that it would be lefs bad than cntering themat hare. A cat is as good a trail as any, but on no account hould any trail be ufed after your hounds are ftooped to a fcent. I know an old fportf man who enters his young hounds firft at a cat whic $h^{\prime}$ he drags along the gronnd for a mile on two, at the end of which he turns out a Ladger, firft taking cate to break his teeth; he takes about a couple of old hounds along with the young ones to hold them on, He never enters his young hounds but at vermin; fus he fays, Train up a child in the way he fhould $g^{*}$ and then when he is old he will not depart from ir."

Hounds ought to be entered as foon as poffible, thongh the time mutt be uncertain, as it depends on the nature of the cumntry in which they are. In corn countries hunting may not be practicable till the corn is cut down; but you may begin fooner in grafs countries, and at any time in woodlands. "If (fays Mr Beckford) you have plenty of foxes, and can afford to make a facrifice of fome of them for the fake of making your young hounds fteady, take them firft where you have leaft riot, putting fome of the fteadieft of your old hounds among them. If in fuch a place you are fortunate enough to find a litter of foxes, you may affure yourfelf you will have but little trouble with your young hounds afterwards.-If, owing to a fcar-city of foxes, you fhould ftoop your hounds at hare, let them by no means have the blood of her ; nor, for: the fake of confiftency, give them much encourage ment. Hare-hunting has one advantage; - -hounds are chiefly in open ground, where you can cafily command them; but notwithftanding that, if foxes be in tolerable plenty keep them to their own game -Frequent hallooing is of ufe with young hounds, it keeps them forward, prevents their being loft, and hinders them from hunting after the reft. The oftener therefore that a fox is feen and hallooed, the better. I by no means, however, approve of much hallooing to old hounds; though it istrue that there is a time when hallooing is of ufe, a time when it doeshurt, and a time when it is perfectly indifferent: but long practice and great attention to hunting can only teach the application.
" Hounds at their firf entrance cannot be enconraged too much. When they are become handy, love a fcent, and begin to know what is right, it will then be foon enough to chaftife them for what is wrong; in which cafe onc fevere beating will fave a great deal of trouble. When a hound is fogged, the whipper-in fhould make ufe of his voice as well as lis whip. If any be very unfteady, it will not be amifs to fend them out by themfelves when the men goout to exercife their horfes If you have hares in plenty, let fome be found fitting and turned ont before them; and you will find that the moft riotous will not run after them. If you in.

## $\mathrm{H} O \mathrm{U}$

Hound tend them to be fteady from deer, they fhonld often fee deer, and then they will not regard them; and if after a probation of this kind you turn out a cub before them with fome old homends to lead them on, you may affure yourfelf they will not be uniteady long."

It is proper to put the young hounds into the pack when they ftoop to a fcent, become handy, know a rate, and ftop eafily. A few only are to be put to the pack at a time: and it is not advifable even to begin this till the pack have been out a few times by them felves, and " are gotten well in blood." They fhould be low in flefh when you begin to hunt; the ground being generally hard at that time, fo that they are liable to be thaken. - By hounds being handy, our author means their being ready to do whatever is required of them; and particularly, when caft, to turn eafily which way the hontfman pleafes.

Mr Beckford begins to lunt with his young homeds in Auguft. The huntfman in the preceding months keeps his old hounds healthy by giving them proper exercife, and gets his young hounds forward; and for this purpofenothing anfwers fo well as taking them frequently out. The hnntfman fhould go along with them, get trequently off his horfe, and encourage them to come to him:-too much reftraint will frequently incline the hounds to be riotous. Our author frequently walks out his homds among fheep, hares, and deer. Sometimes he turns down a cat before them, which they kill : and when the time of hunting approaches he curns out young foxes or badgers; taking out fome of the mort fteady of his old hounds to lead on the young ones. Small covers and furze-brakes are drawn with them to ufe them to a halloo, and to teach them obedience. If they find improper game and hunt it, they are ftopped and brought back; and as long as they will ftop at a rate, they arenot to be chaftifed. At fuch times as they are taker ont to air, the huntfman leads them into the country in which they are defigned to hunt ; by which means they acquire a knowledge of the country, and cannot mils their way home at any time afterwards. When they begin to hunt, they are firft brought into a larger cover of his own which has many ridings cut in ir ; and where young foxes are turned out every year on purpofe for them. After they have been hunted for fome days in this manner, they a e fent to more diftant covers; and more old hornds added to them. There they continue to hont till they are taken into the pack, which is feldom later than the beginning of September ; for by that time they will have learned what is required of them, and feldom give much trouble afterwards. In September he begins to nunt in earneft; and after the old hounds having killed a few foxes, the young ones are put into the pack, two or three couple at a time, till all have hunted. They are then divided; and as he feldom has occation to take in more than nine or ten couple, one half are taken out one day, and the other the next, till they are fteady.

To render fox-hunting complete, no young hounds fhould be taken into the pack the firft feafon ;--a requifite too expenfive for moft fortfinen. The pack fhould confift of about 40 couple of hounds, that have hunted one, two, three, four, or five feafons. The young pack fhould confift of about 20 couple of young hounds, and'an equal number of old ones. They fhould have a feparate eftablifment, and the two kennels
flould not be toonear one another. When the feafon Houndiow is over the beft of the young hounds fhould be taken into the pack, and the draught of old ones exchanged for them. Many munt be bred to enable a fportfinan to take in 20, couple of young hounds every feafon: It will always' be eafy to keep up the number of old hounds; for when your own draft is not fufficient, drafts from other packs may be obtained, and at a finall expence. When young hounds are hunted together for the firft feafon, and have not a fufficient number of old ones along with them, it does more harm than good,

Kennel for Hounds. See Kennel.
HOUNSLOW, a town of Middlefex, iomiles from London. It is fituated on a heath of the fame name; and belongs to two parifhes, the north fide of the ftreet to Hefton, and the fouth fide to Illeworth. It is fituated on the edge of a heath of the fame name, and near it are powder-mills. It has fairs on Trinity-Monday, and Monday after September 29. Her is a charityfchool and a chapel. In this place was formerly a convent of mendicant friars, who by their inftitution, were to beg alms for the ranfom of captives raken by the infidels.-The heath is noted for robberies and horfe-races.

HOU-QUANG, a province of China, occlupying nearly the centre of the empire: the river-Yang-trekiang traverfes it from weft to eaft, and divides it into two parts, the northern and fouthern. This province (the greater part of which is level, and watered by lakes, canals, and rivers) is celebrated tor its fertility; the Chinefe call it the fore houfe of the empire; and it is a common faying among them, that "the abundance of Kiang-fi conld furnilh all China with a breakfaft ; but the province of Hou-quang alone could fupply enoigh to maintain all its inhabitants." Some princes of the race of Hong-viou formerly refided in this province; but this family was entirely deftroyed by the Tartars when théy conquered China. The people here boaft much of their cotton cloths, fimples, gold-mines, wax, and paper made of the bamboo-reed. The northern part of the province contains eight fou, or cities of the firft clafs, and fixty of the fecond and third. The fouthern comprehends feven of the firft clafs, and fifty-four of the fecond and third, exclulive of all forts towns and villages, which are every where to be found.

HOUR, in chronology, an aliquot part of a natural day, ufually $d 24 \mathrm{th}$, but fometimes a 12 th. The origin of the word hora, or wpa, comes according to forne authors, from a furname of the fun, the father of hours, whom the Egyptians call Horus. Others derive it from the Greek opa旨iv, to terminate, diffinguifh, \&c. Others from the word upov urine; holding, that Trifmegiftus was the firft that fettled the divifion of hours, which he did from obfervation of an animal confecrated to Serapis, named cynocepalus, which makes water 12 times a-day, and as often in the night, at equal intervals.

An hour, with us, is a meafure or quantity of time, equal to a 24 th part of the natural day, or nycthemeron ; or the duration of the 24 th part of the earth's diurnal rotation. Fifteen degrees of the equator anfwer to an hour ; though not precifely, but near enough for common ufe. It is divided into $60 \mathrm{mi}-$ nutes; the minute into 60 feconds, \&c.

## $\mathrm{HOOU} \quad[695] \quad \mathrm{H} O$ U

Hours The divifion of the day into hours is very ancient : as is fhownby Kircher, Oedipt. Egypt. Tom. II. P.II. claff. VII. c. 8.: though the pafiages lie quotes from Scripture do not prove it. - The moft ancient hour is that of he i2th part of the day. Herodotus, lib. ii. obferves, that the Greeks learnt from the Egyptians, among other things, the method of dividing the day into twelve parts.-T he aftronomers of Cathaya, \&c. bifhop Beveridge obferves, ftill retain this divifion. They call the hour chag ; and to each chag give a pe. culiar name, taken from fome animal: The firft is called zeth, " moufe;" the fecond, chiu, " bullock;" the third, zem, "leopard;" the fourth, mau, " hare ;" the fifth, chiu, "crocodile," \&c.

The divition of the day into 24 lionts, was not known to the Romans before the firft Punic war.Till that time they only regulated their days by the rifing and fetting of the fing. They divided the 12 hours of their day into four, viz. prime, which commenced at lix o'clock; third, at nine; fixth, at twelve, and none, at three. They alfo divided the night into four watches, each containing three hours.

HOURS, Horf, in the ancient mythology, were certain goddeffes, the daughters of Jupiter and Themis; at firft only three in number, Eunomia, Dice, and Irene; to which were afterwards added two more, Carpo and Thallote.

Homer makes them the doorkeepers of heaven. $O$ vid allots them the employment of harneffing the fun : Ffungere equos Titan velocibus imperat Horis.
And fpeaks of them as ftanding, at equal diftances, about the throne of Sol:

## —et, pofita Spatiis cqualibus, Horx.

The poets reprefent them as dreffed in fine coloured or embroidered robes, and gliding on with a quick and eafy notion.

Hours, Hora, in the Romilh, church, are certain prayers performed at fated times of the day : as mattins, vefpers, lauds, \&c.-The leffer hours are, prime, tierce, fixth, and none. They are called hours, or canonical hours, as being to be rehearfed at certain hours prefcribed by the canons of that church, in commenoration of the my fteries accomplifhed at thofe hours. Thefe hours were anciently alfo called cour $\int e$, curfus; F. Mabillon has a differtation on them, intitled, De

## - Curfu Gallicano.

The firft conftitution'enjoining theoblervation of the canonical bours, is of the ninth century, being found in a capitular of Heito bifhop of Bafil directed to his curates, importing that the pricfts fhall never be abfent at the canonical hours either by day or night.

Hour-G/a/s, a popular kind of chronometer or clepfydra, ferving to meafure the flux of time by the defcent or running of fand out of one glafs veffel into another. The beft hour-glafles are thofe which, inftead of fand, have egg-fhells well dried in the oven, then beaten fine and lifted.-Hour-glaffes are much ufed at fea for reckoning, \&c.

HOURIS, in modern hiftory, is a name given by the Mahometans to thofe femalesthat are defigned for the faithful in paradife. Thefe are not the fame with whom they have lived on earth, but formed for this purpofe with fingular beauty and undecaying charms.

HOUSE, a habitation, or place built with conveniences for dwelling in. See Architecture.
Houses, amongft the Jews, Greeks, and Romans,
were flat on the top for them to walk upon, and had ufually fairs on the outfide, by which they might afcend and defcend withourcoming into the houte. Each houfe, in fact, was fo laid out, that it inclofed a quadrangular area or court. This court was expofed to the weather, and being open to the 1 ky , gave light to the houfe. This was the place where company was received, and for that purpofe it was ftrewed with mattsor carpets for their better accommodation. It was paved with marble or other materials, according to the owner's ability, and provided with an umbrclla of vellum to fhelter them from the heat and inclemencies of the weather. This part of their houfes, called by the Romans imptuvium, or cava adium, was provided with channels to carry off the water into the common fewers. The top of the houfe was level, and covered with a ftrong plafter by way of terrace. Hither, efpecially amongft the Jews, it was cuftomary to retire for meditation, private converfe, devotion, or the enjoyment of the evening breezes.

The Grecian houfes were ufually divided into two parts, in which the men and women had difinct man fions affigned. The part affigned to the men was towards the gate, and called Ardpavitis the apartment of the women was the fartheft part of the houle, and called 「urauxaritis. Jews, Greeks, and Romans, fuppofed their houfes to be polluted by dead bodies, and to ftand in need of purification.

House is alfo ufed for one of the eftates of the kingdom of Britain affembled in parliament. Thus we fay, the houfe of lords, the houfe of commons, \&c. See Peers, commons, \&c.

House is alfo ufed for a noble family, or a race of illuftrious perfons iffued from the fame fock. In this fenfe we fay, the houfe or family of the Stuarts, the Bourbons, the houfe of Hanover, of Auftria, of Lorrain, of Savoy, \&c.

Cheap, eafy, and expeditious Method of conft ructing HoUSES, zubich have been found to be very ufeful hofpitals. for the recovery of the fick, and therefore may probably. make very wholfome places of refidence for the healthy. The firft thing to be done is to choofe a dry and airy fituation, on a gravelly or chalky foil if poffible; upon this lay down the plan of your building, make one end of it face that quarter from whence the pureft and healthieft winds may be expected to blow, of a breadth that can be conveniently roofed. Then, if boarding does not come fo cheap, drive fakes, at about fix feet diftance from eachother, in to the ground, fo as to ftand about fix feet above it; and, interlacing them with wattles, coat the wattles on the fide next the weather with frefh ftraw ; and make the roof in the fame manner, but thicker, or of thatch, in the ufual way, with a hole at the very top of it, to open occalionally, Let the end of the building facing the wholefomeft quarter lie open fome feet back, fo as toform a porch, where the convalefcents may take the air without danger of any injury from the weather. A large chimney and kitchen grate may be erected at the other end. If the foil happens to be chalky or gravelly, you may hollow it four or five feet decp, within a foot or eighteen inches of the walls; but let the fteps into this hollow lie far enough within the porch, that no watc: may get into it, and, if of chalk, the fteps may not grow flippery in wet weather. Fron time to time open the vent-hole at the roof; by means.

## $\mathrm{HOU} \quad\left[\begin{array}{ll}696 & \mathrm{HOC}\end{array}\right.$

of which ail the unwholfome infectious air, as being warmer, and confequently lighter, than that which is pure and wholefome, will be driven out by the rufh ing in of the frefh air : a parpofe, which the little openings, that may be left in the fides and roofs of fuch rude and hafty buildings, will, even of themfelves, anfwer fo well, as fufficiently to compenfate any cold they may let in, even in the coldeft months. Let the floor likewife be fcraped three or four inches deep every five or fix days, and what comes off removed to fome diftance. Halls of this kind, 50 feet long and 20 broad, coft but a trifle to build; yet, with thefe precautions (even without the addition of clean ftraw for every new patient.to lie on, inclofed in clean wafhed facks fit for the purpofe, which come infinitely cheaper than the bare cleaning of flock or even feathe: beds, fuppofing it poffible to wafh fuch beds), proved of infinitely more advantage in the recovery of fick foldiers, than the low-rooted rooms of the farm-houfes of the lle of Wight, or even the better accommodations of Carifbrooke caftle in the fame ifland, in which there perihhed four times the number of fick that there did in thefe temporary receptacles; which were firft thought of by doctor Brocklefby on occafion of fome terrible infections from confined animal cffluvia.

Is it not furprifing, that we have not availed ourfelves more of the above difcovery in natural hiftory, being, perhaps, the moft important the moderns can boaft of, in the moft ufeful fcience, viz. the fuperior lightnefs of unwholfome and infectious air! The upper fathes in moft houfes, even of thofe whe pretend to fome knowledge in thefe matters, are generally immoveable, by means of which no part of the foul air above the level of the loweft rail of the otherfafie's greateft rife can efcape by the window ; and, if it efcapes by the doors, it is generally for want of a vent in the higheft part of the roof, merely to accumulate in the upper fory of the honfe, and add to the infection, which the great quantities of old furniture ufually ftored up there are of :hemfelves but too apt to create, when care is not frequently taken to open the windows of it. Thus, the chief benefit to be expected from lofty rooms is in a great meafure loft. Whereas, were the upper fahes contrived to come down, all the air might be ealily changed, and that almoft infenfibly, by letting them down an inch or two. Nay, the upper fafh might be often let entirely down, with lefs danger or inconvenience from cold, than the lower thrown up the tenth part of an inch, though the doing of the former would be attended with infinitely more advantage to the health of the inhabitants than the latter. It is, perhaps, on this principle, that we are to account for the good health enjoyed by the poor who live crowded in damp cellars, and often with great numbers of rabbits, poultry, and even fwine about them. Thefe cellars are open to the ftreet, with doors reaching from the floor to the very ceiling, but never fo clofe at bottom or at top as to prevent a free circulation of air ; in confequence of which, that all vivifying fluid, as faft as it is fpoiled by paffing through the lungs of the inhabitants and their fock, or is infected by their infenfible perfipiration, excrements, \&c. is driven out and replaced by the frefh air.

House, in aftrology, denotes the twelfth part ofthe
Houre. heavens.

The divifion of the heavens into houfes, is founded upon the pretended influence of the fars, when meeting in them, on all fublunary bodies. Thefe influences are fuppofed to be good or bad; and to each of thefe houfes particular virtues are affigned; on which aftrologers prepare and form a judgment of their horof copes. The horizon and meridian are two circles of the celefial houfes, which divide the heavens into four equal parts, each containing three houfes; lix of which are above the horizon and fix below it; and fix of thefe are called eaftern and fix weftern houfes.

A fcheme or figure of the heavens is compofed of 12 triangles, all called boufes, in which is marked the ftars, figus, and planets, fo incladed in each of thefe circles. Every planet has likewife two particular houfes, in which it is pretended that they exert theirinfluence in the ftrongeft manner; but the fun and moon have only one, the houfe of the former being Leo, and that of the latter Cancer.
The houfes in aftrology have alfo names given them according to their qualities. The firft is the houfe of life : this is the afcendant, which exrends five degrees above the horizon, and the reft below it. The fecond is the houfe of riches : the third, the houfe of brothers : the fourth, in the loweft part of the heavens is, the houfe of relations, and the angle of the earth; the fifth, the houfe of children : the fixth, the houfe of health : the feventh, the houfe of marriage, and the angle of the weft : the eighth, the houfe of death : the ninth, the houfe of piety : the tenth, the houfe of offices; the eleventh, the houfe of friends : and the twelfth, the houfe of enemies.

Counntry-House, is the gilla $\dagger$ of the ancient Ro- $\dagger$ See mons the quinta of the Spaniards and Portuguefe, the Villa. cloferie and calfine of the French, and the vigna of the Italians.

It ought always to have wood and water near it ; thefe being the principal beauties of a rural feat. The trees make a far better defence than hills, as they yield a cooling and healthy air, fhade during the heat of fummer, and very much break the feverities of the winter feafon.

It fhould not be fitnated too low, on account of the moifture of the air ; and, on the other hand, thofe built on places expofed to the winds, are expenfive to keep in repair. In houfes not above two fories high, and upon a good foundation, the length of two bricks, or 18 inches, for the heading courfe, will be fufficient for the ground-work of any common ftructure; and fix or feven courfes above the earth, to a water-table, where the thicknefs of the walls are abated or taken in, on either fide the thicknefs of a brick, viz. two inches and a quarter. But for large and high houfes of three, four, or five ftories, with garrets, their walls onght to be three heading courfes of bricks, or 28 inches at leaft, from the foundation to the firft water-table; and at every fory a water-table, or taking in, on the infide, for the fummers, girders, and joifts to reft upon, laid into the middle, or one quarter of the wall at leaft, for the better bond. But as for the partition-wall, a brick and half will be fufficiently thick; and for the upper ftories, a brick length or nine inch brick will fuffice.

Hot-House See Stove and Hypocaustum.

HOU
Houre. House-Breaking, or Robbing, is the breaking into Houfehold. and robbing a houfe in the day-time; the fame crime - being termed burciary when done by night : buth are felony withour benefit of clergy.

HOUSEHOLD, the whole of a family confidered collectively, including the miftrefs, children, and fervants. But the houtehold of a foverelga prince includes only the offiecrs and domeftics belonging to his palace.
The principal officers of his Britannic majefty's houfehold are, the lord feward, lord chamberlain of the houfehold, the groom of the ftole, the mafter of the great wardrobe, and the mafter of the horic.
The civil government of the king's houfe is under the care of the lord fteward of the king's houfehold; who, being the chief officer, all his commands are obferved and obeycd. His authority extends over all the other officers and fervants, except thofe of his majefty's chapel, chamber, and ftable, and he is the judge of all crimes committed cither within the court or the verge.

Under him are the treafurer of the houfehold, the comptroller, cofferer, the mafter of the houfehold, the clerks of the green-cloth, and the officers and fervants belonging to the accounting-houfe, the marflatifea, the verge, the king's kitchen, the houfehold kitchen, the acatery, bake-houfe, pantry, buttery, cellar, paftry, \&c. Next to the lord flewar! is the lord chamberlain of the houfehold, who has under him the vice-chamberlain, the treafurer, a:id comptroller of the chamber; 48 gentlemen of the privy chamber, 12 of whom wait quarterly, andtwo of them lie every night in the privychamber; the gentleman ufher, the grooms of the great chamber, the pages of the prefence-chamber; the macebearers, cup bearers, carvers, muficians, \&c. See Lord Chamberlain of the Houfehold.
The groom of the fole has under him the if other lords of the bed-cha:nber, who wait weekly in the bedchamber, and by turns lie there a-nights on a palletbed; and alfo the grooms of the bed-chamber, the pages of the bed-chamber and back-ftairs, \&c. Soe Groom of the Stoce.

The mafter or keeper of the great ward robe has under him a deputy, comptroller, clerk of the robes, brufher, \&c, and a number of tradefmen and artificers, who are all fworn fervants to the king.
The mafter of the horfe has under his command the equerries, pages, footmen, grooms, coachmen, farriers, faddlers, and all the other officers and tradefmen employed in his majefty's ftables.
Next to the civil lift of the king's court, is the military, confifting of the band of gentlemen penfioners, the yoomen of the guard, and the troops of the hourehold; of which the two firf guard the king above flairs.
When the king dines in pullic, he is waited upon at table by his majefty's cup-bearers, carvers, and gentlemen fewers; the muficians playing all the time. The dinner is brought up by the yeomen of the guard, and the gentlemen fewers fet the difhes in order. The carvers cut for the king, and the cup-bearers ferve him the drink with one knee on the ground, after he has firft tafted it in the cover.
House and Window Duty, a branch of the king's

* See

Revenue, extraordinary revenue*.-As early as the conquent mention is made in domefday book of fumage or fuVor. VIII.
gage, vulgarly called /noke-farthings; which were paid Houfciols by cufton to the king for every chimney in the houfe. And we read that Edward the Black Prince (foon after his fucceffes in France), in imitation of the Englifi cuftom, impoled a tax of a florin upon cyery hearth in his French dominions. But the firft parliamentary cftablifhment of it in England was by ftatute 13 \& 14 Car. II. c. ro. whereby an hereditary revenue of 2 s. for every hearth, in all houfes paying to church and poor, was granted to the king for ever. And, by fubfequent fatates, for the more regular affeffinent of this tax, the conftable and two other fubfantial inhabitants of the parifh, to be appointed yearly (or the furveyor appointed by the crown, together with fuch conftable or other public officer), were, once in every year, cinpowered to view the infide of every houle in the parifh. Bat, upon the Revolution, by ftat. I. W. $\& x$ M. c. 10. hearth-money was declared to be " not only a great oppreffion to the poorer fort, but a badge of hlavery upon the whole people, expofing every man's houfe to be entered into and fearched at pleafure, by perfons unknown to him ; and therefore, to erect a lafting monument of their majefties goodnefs, in every houfe in the kingdom the duty of hearth-money was taken away and abolifhed." This monument of goodnefs remains in Britain to this day : but the profpect of it was fomewhat darkened, when in fix years afterwards by ftatute 7 W . III. c. I8. a tax was laid upon all houfes (except cottages) of 25 . now advanced to 3s. per houfe, and a tax alfo upon all windows, if they exceeded nine, in fuch houfe. Which rates have been from time to time varied, being now extended to all windows exceeding fix ; and power is given to furvey. ors, appointed by the crown, to infpect the outfide of houfes, and alfo to pafs through any houfe, two days in the year, into any court or yard, to infpeet the winidows there.

Schemes of the different rates of duty upon houles and windows may be feen in the Almanacks, or in Kear/ley's Tax-Tables publined y carly.

House-Leck, in botany. See Sedum and Sempervivum.

HOUSING, or House-Line, in the fea language, a fmall line, formed of three fine ftrands or twitts of hemp, fmaller than rope yarn. It is chiefly ufed to feize blocks into their ftrops, to bind the corners of the fails, or to faften the bottom of a fail to its boltrope, \&c. See Bolt-Rope.

Housing, or Houfee, a cover laid over the faddle of a horfe, in order to fave it from the weather, dirt, \&c. The word is formed of the French houfee, which fignifies the fame thing; thoughit anciently denoted a kind of hood worn by country people.-The cavaliers appeared with their embroidered houfings.

Housing, among bricklayers, a term ufed for a brick which is warped, or is caft crooked or hollow in burning; in fuch a cafe, they fay it is houfing.

HOUSTONIA, in botany; a genus of the monogy niaorder, belonging to the tetrandria clafs of plants; and in the natural method ranking under the 47 th order, Stellata. The corolla is monoperalous and funnelhhaped ; the capfule bilocular, difpernous, fuperior.

HOU-TCHEOU-FOU, a ciry of China, in the province of Tche-kiang. It is a city of the firft clafs; and is fituated on a lake, from which it takes its name. The quantity of filk manufactured here is almontincre-
dible.

Hesward. dible. To give fome idea of it, we fiall only fay, that the tribute paid by a city underits jurifdiction, named Te-tfin-hien, amounts to more than 500,000 taë/s or ounces of filver. Its diftrict contains feven cities, one of which is of the fecond, and fix of the third clafs:

HOW ARD (Heniy), earl of Surry, a foldier and a poet, the fon and grandfon of two lord treafarers, dukes of Norfolt, was born probably about the year 1520 , and educatedat Windor cafle, with young Fitzroy, earl of Richmond, natiral fon to king Hen. VIII. Wood fays, from tradition, that he was fore time a ftudent at Cardinal College, Oxford. In his youth he became enamoured of the fair Geraldine, whom his fonnets have immortalized. In 1532, Howard with his companion Richmond was at Paris, where they continued fome time. The later died in 1536 ; after which our young hero made a tcur to Italy, and at Florence, like a true enamorato, publifined a challenge againft allcomers, whether Chriftians, Jews, Saracens, Turks, or cannibals, in defence of the beauty of his fair Geraldine; and was victoricus in the tournament inftituted by the grand duke on the occation. The duke, we are told, was fo charmed with his gallant exploits, that he wonld gladiy have retained bim at his court; but he rejected the invitation, being determined to maintain the fuperlative beauty of his Geraldine in all the principal cities in Italy. This romantic refolution was however fruftrated by the command of his fovereign, Henry VIII. to return to England.

In 1540 , he fignalized himfelf in a tonruament at Weftminfter, againft Siz John Dadlyy, Sir Thomas Seymour, and others. In 1542 , he marched, under the command of his father, againf the Scots; and in the fame year was confined at Windfor caftle for eating fefh in Lent, contrary to the king's proclanation. In 1 544, on the expedition to Boulogne in France, he was appointed field-marflat of the Englifh army; and after the taking of that town, in 1546, made captaingenemal of the king's forces in France. He was at this time knight of the garter. In the fame year, attempting to intercept a convoy, he was defeated by the French, and foon after fuperfeded in his command by the earl of Hertford.

Saxry, after his return to England, confcious of his former fervices, and peevifh under his difgrace, could not help reflecting on the king and council. This was his firft ftep towards deftruetion. He had married Frances, the daughter of John earl of Oxford; and, after her death, is faid to have made love to the princefs Mary. For this the Seymours, rivals of the Norfolk family, and now in favour with the king, accufed him of afpiring to the crown ; adding, that he already prefumed to quarter part of the royal arms with his own ; but, whatever might be the pretence, the caufe of his ruin was the jealoufy and power of his enermies. In hort, the deftruction of the Howards being determined, Surry, and his father the duke of Norfolk, were committed to the Tower, in December 5546 ; and on the I 3 th of January following, Surry was tried at Guild-hall by a common juty, and beheaded on Tower-hill on the 19th day of the fame month, nine days before the death of the king; who thus, that the meafure of hiscrimes might be full, finihed his life with the murder of his befl fubject. The accufations brought againft this amiable and innocent young noble-
man on his trial, were fo extremely ridiculons, that Howard. one is attonifhed how it was pollible, even in the moft defpotic reign, to find a judge and jury fo pufillanimoully villanous as to carry on the farce of juftice on the occation. The Britilh bean of their excellent conftitution, and their trial by jurjes; bat this example may teach them, that their conttitutionand their juries are not incompatible with defpotic monarchy. He was firf interred in the church of All-hallows, Barkin, inear Tower-hill; and afterwards, in the reign of king James I. removed to Farminghan in Suffili, by his fon Henry earl of Northampton.

As to the character of this unformanate earl, all the Britifh poets have fung his praife. Mr. Walpole begins his anecdotes of Surry with thefe words :-fi We now emerge from the wilight of learning to an almoft claffic author, that ornament of a boilterous, yet not unpolihed court, the earl bf Surry, celebrated by Drayton, Dryden, Fenton, Pope, illuftrated by his own mufe, and lameuted for his unhappy death : a man (as Sir Walter Raleigh fays) no lefs valiant than learned, and of excellent hopes." Leland calls him the confcript enrolled heir of Sir Thomas Wyatr, the elder, in his learning and other excellent qualitics; and the author of The Art of Engli/h Poetry fays, that the earl of Surry, and Sir Thomas Wyatt, may be juftly called the reformars of our poetry and fille. His poems were publifhed in 1557, 12 mo ; and in 1565, 1574, $1585,1587,8$ vo. Several of the fonnets ate by Sir Thomas Wyatr and others.

Howard (Charles), an able ftatefman and experienced feaman, was the fon of lord William Howard, baron of Effingham, and born in 536 . He ierved under his father, who was lord high admiral of England, till the acceffion of queen Elizabeth. In January I 573, he fucceeded his father in his title and eftate: after which he fucceffively became chamberlain of the houfehold and knight of the garter ; and in 1585 was made lord high admiral, at that critical juncure when the Spaniards were fending their Armada, in theiropi--nion, to the affured conqueft of that kingdom. When he received intelligence of the approach of the Spanilh fleer, and faw the prodigious confequence it was to get out the few fhips that were ready at Plymouth, he not only gave orders in every thing himfelf, but wrought alfo with his own hands, and the firft night left the port with fix fhips. The next morning, though he had only 30 fail, and thofe the fmalleftof the fleet, he attacked the Spanifh navy; but firft difpatched his brother-in-law, Sir Edward Hobby, to the queen to defire her to make the proper difpofition of her landforces for the fecurity of the coaft, and to haften as many hips as poffible to his affiftance. His valour was confpicuoully difplayed in his repeated attacks of a fuperior enemy. The coolnefs of his temper was no lefs confpicuous; and it was owing to his magnanimity and prudence that the victory was fo great. The queen expreffed her fenfe of his merit in the mof honourable terms; and granted him a penfion for life. In 1596, he commanded in chief at fea, as Effex did by land, the forces fent againft Spain, when his prudence and moderation were among the principal caufes of the faccefs the Englifh met with in thar great and glorious enterprize; fo that, upon his return the next year, be was advanced to the dignity of carl of Nottingham.

## HOW

Heward. The next eminent fervice in which his lordhip was $\cdots$-ram engaged was in 1599 , when the Spaniards feemed to meditate a new invafion. Her majelly, who always placed her fafety in being too quick for her enemies, drew together, in a fortnight's time, fuch a fleet, and fuch an army, as took away all appearance of fuccefs fromber foreign and domeftic enemies; and the gave the earl the fole and fupreme command of both the fiect and army, with the title of lord lieutenant gener al of all England, an ofice unknown in fucceeding times. When age and infirmity had unfitted him for action, he refogned his office, and fpent the remaining part of bis life in eafe and retirement, till the time of his deccale, whicis happened in 1624 , in the 87 th year of bis age.
floward (John), Efq. a man of fingular and tranfcondent hamanity was the fon of a reputable tradefman in.St Paul's chorch yard. He was born about the year 1725 or 1 726; and at a properage was putan apprcintice to Mrivarhaniel Newnham, wholufale grocer inWatling ftreet. His father died, leaving only his fon and a daughter, to both of whom he bequeathed handfome fortunes: and by his will directed that his fon fhould not be confidered of age till he was five and twenty. His conftitution was thought very weak, and his health appeared to have been injured by the meceflary duties of his apprenticethip; and therefore at the expiration of it, he took an apartment in a lodging-houfe in Church-ftreet, Stoke Newington, Middlefex ; but not meeting with the tendereft treatment there, he removed to another lodging-houfe in the fame freet, which was kept by a widow lady Mrs Sarah Lardeau, a worthy fenlible woman, but an invalid. Here he was nurfed with fo much care and attention, that he refolved to marry his landlady out of gratitude for her kindnefs. In vain the expoltulated with him upon the extravagance of fuch a proceeding, he being about 28 and the about 51 years of age, and 20 years older in conftitu. tion : but nothing conld alter his refolution, and they were privately married abour the year 1752 . She was poffeffed of a fmall fortune, which he prefented to her fifter. During his refidence at Newington, the minifter of the diffenting meeting-houfe thererefigned his office and a fucceffor was elected; and Mr Howard, who was bred a diffenter, and fedfaftly adhered all his life to that profeffion, propofed to purchafe the leafe of a houfe near the meeting-houfe, and to appropriate it as a par-fonage-houfe for the ufe of the minifter for the time being, and contributed 50 . for that purpofe. His wife died November 10. 1755, aged 54 ; and he was a fincere and affectionate mourner for her death. About this time, it is believed, he was elected F. R.S. In the year 1756 he had the fortune to experience fome of the evils which it afterwards became the bufinefs of his life to redrefs. He embarked that year in a Lifbon packet, the Hanover, in order to make the tour of Portugal ; when the veffel was taken by a French privateer."Be-

- On Prifans, 4 to. $5,{ }^{5}$ Ans, 4 , P. Ir. mity of thirf, nothaving for above 40 hours one drop at Breft I lay fix nights upon ftraw; and obferving how cruelly niy countrymen were uied there and at Morlaix, whither I was carried next, during the two months I was at Carhaix upon parole, I correfponded with the Englifh prifoners at Breft, Morlaix, and Din-
nan: at the laft of thefe towns were feveral of our Iloward. fhip's crew, and my fervant. I had fufficient evidence of their being treated with fuch barbarity, that many hundreds had perifhed, and that 36 were buried in a hole at Dinnan in one day. When I came to England, ftill on parole, I made known to the commifioners of fick and wounded feamen the fundry particulars, which gained their attention and thanks. Remonfrance was made to the French court : our failors had redrefs ; and thofe that were in the three prifons mentioned above were brought home in the firft cartel fhips.Perhaps (adds Mr Howard) what I fuffered on this occafion increafed my fympathy with the unhappy people whofe cafe is the fubject of this book."'

He afterwards, it is faid, made the tour of Italy; and at his return fettled at Brokenhurft, a retired and pleafant villa in the New Foreft, near Lymingtor in Hamphire, having, April 25. 1758, married a daughter of Edward Leeds, Efq. of Croxton, Cambridgefhire, king's ferjeant. This lady died in 1765 in child bed, of her only child, a fon, who unfortunately became lunatic. After her death Mr Howard left Lymington, and purchafed an eftate at Cardington, near Bedford.
" While he lived here in retirement (fays Mr Palmer $\ddagger$ ), it was his meat and drink to make his neigh - $\ddagger$ Funeral bours happy. His neat but humble mandion was ever Sermons on hofpitable to a few felect friends, but was never the tbe death of fcene of riot or luxurious banqueting. Though polite Mr How to all, he neither fought nor admitted the company of the profligate, however diftinguifhed by rank or for-tune.-His charity had no bounds, except thofe of prodence; and was not more commendable for the extent of it, than for the manner in which it was exercifed. He gave not his bounty to comntenance vice and idlenefs, but to encourage virtue and induftry. He was fingularly ufeful in furnifhing employment for the labouring poor of both fexes, at thofe feafons when a farcity of work rendered their fituation moft compaffionable. And at ocher times, though never inattentive to the tale of woe, he was not eafily impored upon by it, but made himfelf acquainted with the cafe. He had indeed a general acquaintance with the cafes and characters of the poor around him, and made it his bufinefs to vifit the abodes of aftidition. In circumftances of bodily diforder he often acted the part of a phyfician as well as a friend. But his kindnefs was not confined to the bodies of his fellow-creatures, it extended to their fpiritual and immortal part. He carefully watched over the morals of his neighbourhood, and ufed his advice, his admonitions, and influence, to difcountenance immorality of all kinds, and to promote the knowledge and practice of religion. As a moft effectual means to this great end, he provided for the inftruction of poor children, by erecting and fupporting fchools, which he carefully fuperintended. In hort, he was a univerfal bleffing to the village where he refided, in every part of which are to be feen the pleafing monaments of his munificence and tafte.-His liberality extended alfo to adjacent places, in which there are many who will call him bleffed. Nor was it confined to perfons of his own religious perfualion, but comprehended the neceffitous and deferving of all parties; while he was particularly ufeful in ferving the intereft of the Chriftian fociety to
which

## H OW $\quad[700] \quad \mathrm{HOW}$

Howard, which he belonged. What wonder if fuch a man were univerfally beloved? Was it poffible he fhould have an enemy? One however he had (and I never heard of more), an idle and diffolute wretch, who, having been often réproved by him for his vices, formed the defperate refolution to murder him as he was going to public worfhip, which he almoft always did on foot. But Providence remarkably interpofed to preferve fo valuable a life, by inclining him that morning to go on horleback a different road."

Bat the fphere in which he had hitherto moved was too narrow for his enlarged mind. Being named in 1773 to the office of heriff of Bedfordnire, from that time his fcene of ufefulnefs was extended. His office, as he limfelf obferves, brought the diftrefs of prifoners more immediately under his notice. A fenfe of duty induced him perfonally to vilit the county-jail, where he obferved fach abufes, and fuch feenes of calamity, as he had before no conception of; and he foon exerted himfelf in order to a reform. With a view to obtain precedents for certain regulations which he purpofed, he went to infpect the prifons in fome neighbouring counties. But finding in them equal room for complaint and commiferation, he determined to vifit the principal prifons in England. The farther he proceeded, the more fhocking were the fcenes pre. fented to his view : which induced him to refolve upor exerting himfelf to the utmof, in order to a general reform in thefe horrid places of confinement; confidering it as of the higheft importance not only to the wretched objects themCelves, but to the community at large. Upon this fubject he was examined in the hoofe of commons in March r774, when he had the honour of their thanks. This encouraged him to proceed in his defign. He revifited all the prifons in the kingdom, together with the principal houfes of correction. Hie alfo in 1775 enlarged his circuit by going into Wales, Scotland, and Ireland, where he found the fame need of reformation.

One grand object which he had in viev was, to pit a ftop to that hocking diftemper called the jailFioor ; which raged fodreadtully in many of the prifons, as to render them to the laft degree offenfive and dangerous. A diftemper, by which more had been taken off than by the hands of the executioner; and which, in feveral inftances, had been communicated from the prifoners into the courts of juftice, and had proved fatal to the magiftrates and judges, and to multitudes of perfons who attended the trials, as welt as to the families of difcharged felons and debtors. Another end he propofed was, to procure the immediate releafe of prifoners, who, upon trial were acquitted, bat who often continued long to be unjufly detained for warit of being able to pay the accuftomed fees: As alfo to aboiifh many other abfurd and cruelufages which had long prevailed. But the great object of all was, to introduce a thorough reform of morals into the prifons; where he had found the moft flagrant vices to prevail in fuch a degree that theywere become feminaries of wickcdnefs and villany, and the moft formidable nuifances to the commanity; in confequence of the promifcuous intercourfe of prifoners of both fexes, and of all ages and defcriptions; whereby the young andlefs experienced were initiated, by old and hardened finners, into all the
arts of villany and the myfteries of iniquity ; fo that, Howard. inftead of being reformed by their confinement (which hould be the chief end of punifnment), thofe that were difcharged became more injurious to fociet y than before.

In order to the attainment of thefe great objects, Mr Howard fared no pains nor expence, and cheerfutly expofed himfelf to much inconvenience and ha. zard ; particularly from that malignant diftemper, of which he faw many dying in the moft loathome durngeons into which none, who were not obliged, befides himfelf, would venture. "I have been frequently (fays Mr Howard) afked what precautions I ufed to preferve mylelf from infection in the prifons and hofpitals which I vifit. I here anfwer, next to the free goodnefs and mercy of the Author of my being, temperance and cleanlinefs are my prefervatives. Trufting in divine Providence, and believing my felf in the way of my duty, I vilit the moft noxious cells ; and while thus employed, I fear no evil. I never enter an hofpital or prifon before breakfaft; and ${ }^{7}$ an offenfive room, I feldom draw my breath deeply."

His laudable endeavours he had the pleafure to fee, in fome inftances, crowned with fuccefs; particularly in regard to the healthinefs of prifons, fome of which were rebuilt ander his infpection. Throngh his interpotition alfo, better provifion has been made for the inflruction of prifoners, by the introduction of bibles and other pious books into their cells, and a more conftant attendance of clergymen. The gaolers likewife have, by act of parliament, been rendered incapable of felling ftrong liquors, which had been the fource of mach drunkennefs and diforder. But a minute detail of particulars is not to be expected here; for thefe the reader is referred to Mr Howard's publications, which fhow that mach is yet wanting.

But in order to a more general and happy regulation, and the reformation of criminals, he determined to vifit other countries, to fee the plansthere adopted; in hope of collecting fome information which might be ufeful in his own country. For this purpofe lie travelled into France, Flanders, Holland, Germany, and Switzerland. Afterwards through the Prufian and Auftrian dominions. He vilited alfo the capitals of Denmark, Sweden, Ruffia, and Poland, and fome cities in Portugal and Spain. In all thefe expenfive and hazardous journeys, he denied himfelf the ufual gratifications of travellers, and declined the honours which were offered him by perfons of the firft diftinction, applying himfelf folely to his own grand object. To him the infpection of a jail, or hofpital, was more grateful than all the entertainments of a palace. With what aftonifhment and gratitude he was reccived by their miferable inhabitants may eafily be imagined, fince while he made obfervationson their fituation, he meditated their relief; and many diftreffed prifoners abroad as well as at home, partook of his bounty, and fome were liberated by it; for he confidered allof every nation, and people, and tongue as brethren. Nor was be fparing of advice, or of reproof, as he faw occafion to perfons of rank and inflaence, whereby the miferies of their conntrymen might be relieved. Ashe courted the favour of none, neither did he fear the frowns of any; but, with a manly freedom and a Chriftian fortitude, fooke his mind to crowned heads
imperfect), he publified the refult of his laft laborious

Howard. (particularly the late emperor of Germany) in a manner to which they were not accuftomed; which, however, in a perfon of fuch difinterefted views, procured him reverence and efteem, and in fome inftances proved effectual for relieving the mifcrable and oppreffed. On his return, he publifled in 1777, "The State of the Prifons in England and Wales, with Preliminary Obfervations and an Account of fome foreign Prifons." 4to. And in 1778 he took a third journcy through the Pruflian and Auftrian dominions, and the free cities of Germany, and likewife extended his tour through Italy, and revifited fome of the countries he had before feen. The obfervations he made in this tour were publifhed in an appendix, I 780 ; containing alfo fome remarks refpecting the management of prifoners of war, and the hulks on the Thames. But wifhing to acquice fome further knowledge on the fubject, he in 178 r again revifited Holland and fome cities in Germany. He vifited alfo the capitals of Denmark, Sweden, Ruflia, and Poland; and in 1783 fome cities in Portugal and Spain, and returned through France, Flunders, and Holland. The fubfance of all thefe travels was afterwards thrown into one narrative, which was publifhed in 1784 . He alfo publifhed a curious account of the Baftile, in 8vo; that infamous French prifon happily now no more.

His travels and exertions, however, were not yet at an end. He conceived a further defign, which was to vifit the principal lazarettos in France and Italy, in order to obtain information concerning the beft methods to prevent the fpreading of the plague, with a view to apply them with refpect to other infectious diforders. Not gaining all the fatisfaction here which he wifhed for, he proceeded to Smyrna and Conftantinople, where that moft dreadful of human diftempers actually prevailed, "pleafing himielf (as he faid) with the idea of not only learning, but of being able to communicate fomewhat to the inhabitants of thofe diftant regions.". In the execution of this defign, though he was fo much expofed to danger, and aenally caught the plague, "that merciful Providence (as he himfelf pioully remarks) which had hitherto preferved him, was pleafed to extend his protection to him in this journey alfo, and to bring him home once more in fafety." In his return lie revifited the chief prifons and hofpitals in the countries throngh which he paffed; and afterwards went again to Scotland, and then to Ireland, where he propored a new and very important object; namely, to infpect the Proteftant Charter Schools, in fome of which he had before obferved flameful abufes, which he had reported to a committee of the Irinh Houfe of Commons. In this more extenfive tour, be took a particular account of what he obferved amifs in the conduct of this noble charity, with a view to a reformation, and nor without confiderable fuccefs. In the courfe of thefe journeys, particular cities and communities were not unmindful to pay him proper refpect. At Dublin, he was created by the univerfity a Doctor of Laws; and the city of Glafgow and the town of Liverpool did honour to themfelves by enrolling him among their members. Upon his return home, having again infpeeted the prifons in England, and the hulks on the. Thaines, to fee what alterations had been made for the better (which he found to be very confiderable, though yet
invertigations, in " An Account of the principal Lazarettos in Europe, with various Papers relative to the Plague, together with further Obfervations on fome Foreign Prifons and Hofpitals, and additional Remarks on the prefent State of thofe in Great-Britain and Ireland," with a great number of curious plates. The work like wife contained Obfervations on Penitentiary Houfes, which had been encouraged by act of parliament, for the correction and reformation of criminals, of which he and Dr Fothergill had been nominated by the king to be fuperintendants. Befide thefe, he publifhed the Grand Duke of Tufcany"s "new Code of Criminal Law with an Englifh Trandiation :" and of all his publications he gave away a valt number of copies among his acquaintance in the inoft liberal manner. His laying open the horrors of defpotifm in a neighbouring country had very nearly expofed him to the fufferings of them ; and had it not been for the timely notice of our ambalfador, he had ended his days in the Baftile.

Not fatisfied, however, with what he had already. done, he concludes his "Account of Lazarettos" with announcing his " intention again to quit his counrry, for the purpofe of revifiting Ruffia, Turkey, and fome other countries, and extending his tour in the Eaft. I am not infenfible (fays he) of the dangers that muft attend fuch a journey. Trufting, however, in the protection of that kind Providence which has hio therto preferved me, I calmly and cheerfully commit myfelf to the difpofal of unerring wifdom. Should it pleale God to cat off my life in the profecution of this defign, let not my conduct be uncandidly imputed to rahnefs or enthuliafm, but to a ferious deliberate conviction that I am parfuing the parh of duty, and to a fincere defire of being made an inftrument of more extenfive ufefulnefs to my fellow-creatures than could be expected in the narrower circle of a retired life." Accordingly, to the great concern of his friends; he fot out in fummer 1789 on this hazardons enterprize; the principal object of which was to adminifter a medicine in high repute at home, in malignant fevers,* "Drjames's under a frong perfuafion that it would be equally effi- Powder. cacious in the plague. In this fecond tour in the Eaft "it did pleafe God to cut oft his life:" for, having fpent fome time at Cherfon, a new fettlement of the Emprefs of Raffia, in the mouth of the Dnieper or Bory thenes, toward the northern extremiry of the Black Sea, near Oczakow; he caught, in viliting the Ruffian hofpital of that place, or as fome fay a young lady who was ill of the fame complaint, a malignant fever, which carried him off on the 2oth of January, afier an illnefs of about twelve days: and after having been kept; according to his exprefs directions to his fervant, five days, he was buried by his own defire, in the garden of a villa in the neighbourhood, belonging to a French gentleman from whom he had received great civilities, by his faithful fervant who had attended him on his former journeyings, and whom he exprefsly enjoined not to return home till five weeks from his death. While abfent on his firft tour to Turkey, dra. his character for active benevolence had fo much attracted the public attention, that a fabferip. tion was fet on foot to ereft a fatue to his honour, and in no long fpace above L. i 500 was fubfcribed for that i purpofeoi.

## $\mathrm{HOW} \quad\left[\begin{array}{cc}\mathrm{TM} \\ \mathrm{FO}\end{array}\right] \quad \mathrm{H} \mathrm{O} \mathrm{W}$

Howard purpofe. But fomc of thofe whoknew Mr Howard beft, $f$ never concurred in the fcheme, being well affured that
Howe. he would neither countenance nor accede to it ; and in $t$ See Gent, confequence of two letters from Mr Howard himfelf. $\dagger$ Mag. sol. , to the fubfcribers, the defign was laid afide. It has, lvii.p. ror. however, been refumed fince his death:- And furely, of all the fatues or monuments ever ereeted by public gratitude to illuftious characters either in ancient or modern times, none was ever ereeted in honour of worth fo genuine and admirable as his- in ho devoted his time, his ftength, his fortune, and finally facri. ficed hislife, in the purfuits of humanity:--who (to $\ddagger$ Speech at adopt the exprefive words of Mr Burke $\ddagger$ ) '" vilited Guidhall in all Europe [and the Eaft, not to Gurvey the fumptuBrifol, oufnefs of palaces, or the ftatelincis of temples; not - 980. to nake accurate meafurements of the remains of an. cient grandeur, nor to form a feale of the curiofity of modern art: not to collect medals, or to collate manufripes; but to dive into the depth of dungeons; to plunge into the infection of hofpitals; to furvey the manfions of forrow and of pain; to take the guage and dimenfions of mifery, depreffion, and contempt; to remember the forgotten; toattend to the neglected; to vifit the forfaken; and to compare and collate the diftreffes of all men in all countries. His plan is origiual ; and it is as full of genius as it is of humanity. It is a vayage of difcovery, a circumnavigation of eharity; and already the benefit of his labour is felt more or lefs in every country."

HOWDEN, a town in the Eaft Riding of Yorkfhire, 180 miles from London, ftands on the north fide of the Oufe, has a market on Saturdays, and four fairs in the year. Here was formerly a collegiate charch of fiwe prebendaries, erected in the laft century but one; adjacent to which the bilhops of Durham, who poffers many eftates hereabouts with a temporal jurifdiction, have a palace. One of them built a very tall fteeple to the church here, whither the inhabitants might retire in cafe of inundations; to which it is very liable from the great frefthes that come down the Oufe fometimes at ebb. This part of the country is from hence called Howdenmire, and is watered by a conflux of feveral large rivers that fall into the Humber. At Howdendike is a ferry over the Oufe.

HOWE (John), a learned Englifh nonconformift divine born in 1630 . He became minifter of Great Torrington in Devonfhire, and was appointed houfehold chaplain to Cromwell; but feems to have been free from the fanaticifm then in faftion, as he offended Cromwell greatly by preaching againft the notion of particular faith, which the minifters of his court were great advocates for. When Oliver died, he continued chaplain to Richard; and when Richard was depofed, he returned to Torrington, where he continued pill the act of uniformity teok place and fet him afide. He afterwards fettled at Utrecht, until the declaration for liberty of confcience was publifhed by king James II. under fhelter of which he returned to London, where he died in 1705. He publifhed a great number of fermons and religious works, which have been reprinted together in two vols folio.

Howe-Iland, a fmall illand of the South Sca, difcovered by captain Wallis, called by the inhabitants of the Society-ifland Mopeha; lies in S. Lat. 16. 46. and W. Long. 154.8 .

Lord Hore's Ifand, a fmall i日and in the neigh bouthood of New South Wales, difcovered on Eebruary 17.1788 , S. Lat. 31. 36. E. Long. 159.04 . It is of an arched figure, lying from north-weft to fouth-eaft, the two extremities including a face of about fix miles, thougb, by reafon of the curved figure of the illand itielf, it is near feven in length. It is deeply indented on the middle of the eaftern part by a 'bay named Rofs's Bay, and on the oppofite and weftern parr has another named Prince William Henry's Bay; fo that the whole has the appearance of two iflands $\mathbf{j}$ ined together by an ifthmus, which in fome places is not above half a mile broad. On the fouthern part of that divifion which iies moft to the northward are two coniterable bays, named Callam's and Hunter's Bay'; and on the fouth-weltern part of the other are two high mountains, the moft foutherly named Monnt Gower, and the other Mount Lidgbird. The convex part of the inland lying towards the northeaft, and the concave fide towards the oppofite quarter, is terminated by two points named Point King and Point Philip. No frefh water was found on the ifland; but it abounds with cabbage palms, mangrove, and manchine el trees, even up to the fummits of the mountains. There are plenty of ganers, and a land fowl of a dufky brown colour, with a bill about four inches long, and feet like thofe of a chicken. Thefe were fonid to be remarkably fine meat, and were very fat. There are many large pigeons, and the white birds found in Norfolk Ifland were alfo met with in this place. The blll of this bird is red, and very frong, thick, and fharp pointed. Great numbers of fine turtle frequent this inland in fummer, but go to the northward in winter. Thefe, it was imagined, would prove of great fervice to the colony at Port Jackfon; but, from fome caufe or other, it appears they have hitherto been difappointed. Plenty of fifh were canght by a hook and line. At the diftance of about four leagues from Lord Howe's Illand is a very remarkable and high rock, to which the name of Ball's Pyramid has been given. This illand may be approached withour danger ; but about four miles from the fouth-weft part of the pyramid there is a very dangerous rock, which hows itfelf above the furface of the water, and appears not to be larger than a boat. The fouthern part of the illand is lined with a fandy beach, which is guarded againgt the fea by a reef of coral rock, at the diftance of half a mile from the beach, through which there are feveral fmall openings for boats; but there is nowhere a greater depth of water within the reef than four feet. By the account of Mr Watts, who vifited this ifland in his return from Port Jackfon, the ifthmus which joins the two parts has evidently been overdowed, and the ifland disjoined, as in the very centre the men faw large beds of coral rocks and great quantities of fhells; and on the eaft, which feams in general to be the weather-fide, the fea has thrown up a bank of fand from 25 to 30 feet ligh, which ferves as a barrier againft future inundations. The ifland alfo appears to have fuffered by volcanic eruptions, as great quantities of pumice-ftones and other matters of that kind were found upon it. Mr Auftin alfo found the whole reef which fhelters the weft bay a burnt-up mafs. The time he vifited the illand was that of the incubation of the ganets, of whicli there were then prodigi-

 .

$\qquad$

$\qquad$

$\qquad$

$\qquad$

Howel ous numbers, their neft: being only hollows made in the fand, there not being any quadrupeds on the illand to difurb them. Belides the large pigeons already mentioned, they met with beautitul parrots and parroquets; a new feecies of the coote, as well as of the rail and magpie. They fond likewife a very beautiful fmall bird of a brown colour with a ycllow breatt, and yellow on the ving, which feemed to be a fpecies of humming tird. They funnd alfo a black sird like a fheervater, having a hooked bill; and which burrows in the ground. The only infects met with here were the common earth worni and ants; which laft were in great plenty. Befides the trees already mentioned, they found feveral cfculent vegetables, as fcurvy grafs, celcry, fpinach, endive, and famphire.

HOWEL (James), a voluminous writer of the 17 th century, fupported himfelf many years by writing and tranlating of books. Thongh he had been a zealous loyalift, he afterwards flattered Cromwell ; yet on the reftoration he was miade hiftoriographer to the king, being the firft in England who enjoyed that title. He died in 1666.

HOWITZ, a kind of mortar, mounted upon a fieldcarriage like a gun. The difference between a mortar and a howitz is, that the trumions of the firf are at the end, and at the middle in the laft. The invention of howitzes is of much later date than mortars, for they really had theirorigin from them. The conftrugions of howitzes are as various and uncertain as thofe of mor. tars, excepting the chambers, which are all cylindric. Thry are diftinguifhed by the diameter of the bore; for inftance, a ten inch howitz is that the diameter of which is roinches; and fo of the fimaller ones.

HOW TH, a promontory which formsthe northern entrance of the bay of Dublin, having a fmall village about feven miles north eaft from that city in the province of Leinfter. It gives title of earl to the family of St Lawrence, who were fo called from a victory obtained by them over the Irih on St Lawrence's day II77, their former name being Triftram; and this place has continued in polfeflion of the family above 600 years. N. Lat. 53.21 W. Long. 6. 22. The fhores off this hill are rocky and precipious, affording, however, a few harbours for fmall crafr. It was formerly called Ben-hedar, i. e. "the Birds promontory;" and celebrated for having Dun Criomthan, or the rath or royal palace of Criomthan erected on it, he having been chief or king of that diftrict, and memorable for making feveral fuccersfal defcents on the coaft of Britain againft the Romans in the time of $A$. gricola. Howth, though now ftript of trees, was formerly covered with venerable oaks, and was a feat of the Druids; one of their altars ftill remains in a fequeftered valley on the eaft fide of the hill. The manfionhoufe is built in form of a cafte, and was probably erected by Sir Armoricus Triftram. Near the houfe ftands the family chapel, and on the weftern fhore are the ruins of St Mary's church, with fome ancient monuments of Lord Howth's anceftors. Due iwe th Howth houfe are the ruins of St Fenton's church.

HOY, a fmall veffel, chiefly ufed in coafting, or carrying goods to or from a fhip, in a road or bay, where the ordinary lighiers cannot be managed with fafery or convenience

It would be very difficult to deferibe, precifely, the marks of diftinction bet ween this veffel and fome others of the fanc fize, u hich are alforigged in the fame manner ; becaufe what is called a boy in one place, would aflume the name of a gloop or fmack in another; and even the people who navigate thefe veffels, have, upor examination, very vague ideas of the marks by which they are dittinguifhed from thole above mentioned. In Holland, the hoy has two mafts; in England, it has but one, where the main-fail is fometimes extended by a boon, and fometimes without it. Upon the whole, it may be defined a fmall veffel, ufually rigged as a floop, and employ ed for carrying paffengers and luggage froin one place to another, particularly on the féa-coaft.

Hoy, an ifland of Scotland, and one of the Orcades. It is about 10 miles long; and that part called Waes is fruifful and pretty populous, and is a good place for filhing.

HOYE, a town of Germany, in Wenthalia, and capital of a county of the fame name. It is feated in the river Wefer, and is fubject to the elector of Hanover. E. Long. 9. O. N. Lat. 53. 5.

HUAHINE, one of the Sucietr-Ifands, in the South-Sea, fituated in S. Lat. 16. 43. W. Long. 150. 52. and is about feven or eight leagues in compafs. Its furface is hilly and uneven, and it has a fafe and convenient harbour. It was firft difcovered by captaiu. Cook in 1769 . It is difided by a deepinlet into two peninfulas connested by an inthonas, which is entirely overflowed at high water. From the appearance of its hills it may be concluded, that the comntry has at fome period or other been the feat of a volcano. The fummit of one of them had much the appearance of a crater, and a blackifl fpongy earth was feen upon one of its fides, which feemed to be lava; and the rocks and clay cvery where had a burnt appearance. The illand is plentifully fapplied with water by many rivulets which defcend from the mountains and broken rocks. Tbe inhabitants are nearly as fair as Europeans; and their conduct is bolder than that of the inhabitants of : the other Society Illands. They are a fout large made people, fome of the talleft being fix feet three inches in height; they are extremely indolent, and feem to have as little cariofity as fear. The dogs are in grear favour with all their women, " who could not have careffed them (fays Mr Forfter) with a more ridiculous affection if they had been European ladies of fathion." Here was feen a middle-aged woman, whofe breaits were fall of milk, offering them to a litule puppy who had been trained up to fuck them. The fight difgufted thofe who faw it fo much, that they could not forbear expreffing their dillike to it ; but the woman fmiled, and told them fie allowed young pigs to do the fame. It appeared afterwards that this woman had luft her child. Some of the gentlemen were prefent at a dramatic entertainment on thisilland : the piece reprefented agirl running away from her parentss and feemed to be levelled at a female paffenger who had come in captain Cook's thip from Otaheite, and who happened to be prefent at the reprefentation. It made fuch an impreffion on the girl, that the gentlemen could fcarce prevail upon her to fee the piece out, or to refrain from tears while it was acting. It concluded with the reception the was fuppofed to meet with from

Priber
her friends, which was made out not to be a very agreeable one.-Thefe people introdace extempore pieces upon occafion ; and it is moft probable that this was meant as a fatire upon the girl above mentioned, and to difcourage others from acting in the fame manner.

HUBER (Ulric), one of the greatelt civilians in the 17 th century was born at Dockum in 1636. He became profeffor of law at Franeker: and wrote, I. A treatife De jure civitatis. 2. Furifprudentia Frifica. 3. Speciment pbilofophia civilis. 4. Inftitutiones hifforice civilis; and feveral other works nhich are eftecmed. - He died in 1694.

HUBERT (St), a town of the Netherlands, on the confines of Liege, with a very fine abbey, where they bring thofe that are bit by mad animals to be cured. E. Long. 5. 25. N. Lat. 34. 32.

HUBNER (John), a learned geographer of Germany, taught geography at Leipfic and Hamburg with extraordinary reputation; and died at Hamburg in 1732, aged 63. His principal work is A Geographical treatife, printed at Bafilin 1746 , in 6 vols a 2 mo .

HUDSON (Jeffrey). Sce Dwarf.
Hudson (Henry) an eminent Englifl navigator, who, about the beginning of the laft century, undertook to find out a paffage by the north-eaft or northweft to Japan and China. For this purpofe he was four times fitted out: he returned three times unfuccefsful; but in the laft voyage, in 1610 , being perfuaded that the great bay to which his name has been fince given, muft lead to the paffage he fought, he wintered there, to profecute his difcovery in the fpring. But their diftreís during the winter producing a mutiny among his men, when the fpring arrived, they turned him, with his fon and feven lick men, adrift in his own fhallop, and proceeded home with the fhip. As Hudion and his unhappy companions were never heard of afterward, it is to be fuppofed they all perifhed.

HUDSON (John), a very lcarned Englifh critic, born in 1662. He dillinguihed himfelf by feveral valuable editions of Greek and Latin authors; and, in 1701 , was clected head keeper of the Bodleian library at Oxford. In 1712, he was appointed principal of St Mary's Hall, through the intereft of the famous Dr Ratcliffe; and it is faid that the univerfity of Oxford is indebted for the molt ample benefactions of that phyfician to Dr Hudfon's folicitations. He died in 1719 , while he was preparing for publication a catalogue of the Bodleian library, which he had caufed to be fairly tranfcribed in fix folio volumes.

Hudson's-Bay, a large bay of North-America, lying between 5 r and 69 degrees of latitude, difcovered in 5610 by Henry Hadfon. This intrepid mariner, in fearchingafter a north-weft paffage to the South-feas, difcovered three ftraits, through which be hoped to find out a new way to Afia by Anmerica. He had made two voyages before on the fame adventure; the firf ill 1607, and the fecond in 1608. In his third and laft, 1610 , he entered the freights that lead into this new Mediterranean, the bay known by his name; coafted a great part of it; and penetrated to eighty degrees and an half into the heart of the frozen zone. His -ardour for the difcovery not being abated by the difficulties he ftruggled with in this empire of winter, and
world of frof and fnow, he faid here until the enfu. Hudfon, ing fpring, and prepared in the begiming of rori to purfue his difcoveries; but his crew, who fuffered equal hardinips, without the fame firit to fupport them, mutinied, feized upon him and feven of thofe who were moft faithful to him, and committed them to the fury of the icy feas in an open boat. Hudfon and his companions were either fwallowed up by the waves, or gaining the inhofpitable coaft were defloyed by the favages; but the thep and the reft of the men returned home. Other attempts towards a difcovery were made in 1612 and 1667 ; and a patent for planting the country, with a chatter for a company, was obtained in the year 1670 . In 1746 Captain Ellis wintered as far north as 57 degrees and a half, and Captain Chrifopher attempted farther difcoveries in 1765. But befides thefe and the late voyages, which fatisfy us that we mut not look for a paflage on this fide of the latitude 67 degrees north, we are indebted to the Hudfon's Bay Company for a journey by land; which throws much additional light on this matter, by affording what may be called demonftration, how much farther north, at leanin fome parts of their voyage, Aips muft go, before they can pafs from one fide of Anerica to the other. The northern Indians, who came down to the company's factories to trade, had brought to the knowlecge of our people a river, which on account of much copper being found near it, had obtained the name of the Copper-mine river. The company being defirous of examining into this matter with precifion, directed Mr Hearne, a young gentleman in their fervice, and who having been brought up for the navy and ferved in it the war before laf, was extremely well qualified for the purpofe, to proceed over land under the convoy of thofe Indians, for that river, which he had orders to furvey if polfible quite down to its exit into the fea; to make obfervations for fixing the latitudes and longitudes; and to bring home maps and drawings both of it and the countries through which he fhould pafs. Accordingly Mr Hearne fet out from the Prince of Wales's Fort, on Churchill river, latitude $58^{\circ} 47^{\prime \prime}{ }^{\prime}$ North, and longitude $94^{\circ} 7 \frac{1}{2}^{\prime}$ Weft from Greenwich, on the 7 th of December 1770 . On the 13th of June be reached the Copper-mine river, and found it all the way, even to its exit into the fea, encumbered with fhoals and falls, and emptying itfelf into it over a dry flat of the fhore, the tide being then cut, which feemed by the edges of the ice to rife about 12 or 14 feet. This rife, on account of the falls, will carry it but a very fmall way within the river's month, fo that the water in it had not the leaft brackifh tafle. Mr Hearne was neverthelefs fure of the place it emptied itfelf into being the fea, or a branch of it, by the quantity of whalebone and feal fkins which the Efquimaux had at their tents; and alfo by the number of feals which he faw upon the ice. The fea at the river's mouth was full of inlands and fhoals as far as he could fee by the affitance of a pocket telefcope; and the ice was not yet (July 17th) broken up, but thawed away only for about three quarters of a mile from the bore, and for a little way round the-illands and hoals which lay off the river's mouth. But he had the moft extenfive view of the fea when he was about eight miles up the river; from which ftation the extreme parts of it bore N. W.

## Y U D

Fiuden's by W. and N, E. By the time Mr Fieathe had finithBay. cd his furvey of the river, which was about oneo'clock
in the morning on the 18 th, there cameon a very thick fog and drizzling rain; and as he had found the river and fica in cvery refpeet unlikely to be of any utility, he thought it unneceflary to wait for fair weather to determine the latitude more exactly by obfervation; but by the extraordinary care he touk in obferving the courfes and diftances, walking from Congecatlawhachaga, where he had two very good obfervations, he thinks the latitude may be depended on within $2 \mathrm{O}^{\prime}$ at the utmoft. It appears from the map which Mr Hearne conftructed of this fingular journey, that the mouth of the Copper-mine river lies in latitude $72^{\circ} \mathrm{N}$. and longftude $25^{\circ} \mathrm{W}$. from Churchill river; that is about $19^{\circ} \mathrm{W}$. of Greenwich. Mr Hearne's journey back from the Copper-mine-river to Churchill lafted till June zorh 1772; fo that he was abfent alnooft a year and feven months. The unparalleled bardflips he fuffered, and the effential fervice he performed, met with a fuitable reward from his mafters, and he was made governor of Prince of Wales's Fort on Churchill river. But though the adventurers failed in the original purpofe for which they navigated this hay, their project, even in its failure, has been of great advantage to their country, as is flown under the article Company (Hudfon's Bay.)
The country lying round Hudfon's Bay is called New Britain, or the country of the Efquimanx; comprehending Labrador, now North and South Wales. The entrance of the bay from the ocean, after leaving to the North Cape Farewell and Davis's Straits, is between Refolution ifles on the north, and Button's ifles on the Labrador coaft to the fouth, forming the eaftern extremity of the ftraits diftin uilhed by the name of its great difcoverer. The coafts are very high, rocky, and rugged at top; in fome places precipitous, but fometimes exhibit large beaches. The ifles of Salifbury, Nottingham, and Cigges, are alfo very lofty and naked. The depth of water in the middle of the bay is a lundred and forty fathoms. From Cape Churchill to the fouth end of the bay are regular foundings; rear the fhore fhallow, with muddy or fandy bottom. To the north of Churchill the foundings are irregular, the bottum rocky, and in fome parts the rocks appear above the furface at low water. From Moofe river or the bottom of the bay to Cape Churchill the land is flat, marlhy, and wooded with pines, birch, larch, and willows. From Cape Churchill to Wager's Water the coafts are all high and rocky to the very fea, and woodlefs, except the mouths of Pockerekefko and Seal rivers. The hills on their back are naked nor are there any trees for a great diftance inland.

The mouths of all the rivers are filled with thoals; except that of Churchill, in which the larjeft dhips may lie : but ter miles higher, the channel is obftructed with fand-banks ; and all their rivers, as far as has been navigated, are full of rapids and cataracts from ten to fixty feet perpendicular. Down thefe rivers the Indjan traders find a quick palfage ; but their return is a labour of many months. As far inland as the company have fettements, which is fix hundred miles to the weft, at a place called Hudfon Houfe, lat. 53. long. ro6. 27 . from London, is a llat country : nor is it

Vol. VIII.

## -05 ] IH D

known how far to the caftward the greatciain feen by Wuthons onr navigators from the Pacific Ocean branches off:

The climate even about Haye's river, in only lat. 57, is duing winter exccilively cold. The fors begin to fall in October, and continue falling by intervale the whole winter ; and whea the frolt is mott rigorous, in form of the fineft fand. The ice on the rivers is eight feet thick. Port-winc freezes into a folid mafs; brandy coagulates. The very breath fell on the blankets of the beds in the form of a hoar frolt, and the bed-cloathsoften werefound frozen to the wall. The fun rifes in the florteft day at five minutes paft nine and fets five miantes before thece. In the longeft day the fun rifes at three, and fets about nine. The ice hegins to difappear in Niay, and hot weather commences about the middle of June, which at tines is fo violent as to feezch the face of the hunters. Thander is not frequent but very violent. But there moft be great difference of heat and cold in this vaft extent, which reaches from lat. 50. 40, to lat. 63 north. During winter the firmament is not without is beauties. Mock funs and halos are not unfrequent; they are very bright and richly tinged with all the colours of the rainbow. The fun rifes and fets with a large cone of yellowifh light. The night is enlivened with the Aurora Borealis which fpreads a thonfand different lights and colou"s over the whole concave of the fky, not to be defaced even by the fplendour of the fall moon; and the ftars are of a fiery rednefs.

The eaftern boundary of the bay is Terra di Labrador ; the northern part has a ftraight coaft facing the bay, guarded with a line of ifles innumerable. A vaft bay, called the Archiwinnipy Sea, lies within it, and opens into Hudf.n's Bay by means of Gulpli Hazard, through which the Beluga whales dart in great numbers. Here the company had a fettlement for the fake of the fifhery, and for trading with the Efquimaux; but deferted it as anprofitable about the year 1758 or 1759. The eaftern coaft is barren paft the efforts of cultivation. The furface is every where uneven, and covered with maffes of fone of an amazing lize. It is a country of fruitlefs valleys and frightul mountains, fome of an aftonifhng height : the firft watered by a chain of lakes, formed not from fprings but rain and fnow, fo chilly as to be productive of only a few fmah trout. The mountains liave here and there a blighted fhrub, or a little mofs. Thevallcys are full of crooked Atunted trees, pines, fir, birch, and cedars, or rather a feecies of Juniper. In lar. 60 , on this coaft, vegetation ceafes. The whole hore, like that on the weft, is faced with inands at fome diftance from land." The inhabitauts among the mountains are Indians; along the coafts Efquimaux... The dogs of the former are very finall; of the latter large, and headed like a fox. Notwithftanding they have rein deer, they never train them for the fledge; but apply the dogs to that ufe. Walrufes vilit a place called Nuchvânk, in lat. 60, during winter; from thence the natives purchafe the teeth with which they head their darts. Davis fuf. pected that he had found a paffage on this coaft, in 1586, to the Weftern Ocean; but it proves no more than a deep bay.

The laudable zeal of the Moravian clergy induced them to fend, in the year 1752 , milfionarics from
$4 T$ Gieca.

Hudfon's Greenland to this country. . They fixed on Nifbet's Lay harbour for their fettlement; but the firft party was $\|$. partly killed, partly driven away. In 17,4 , under the $\underbrace{\text { Hudfonia: }}$ protection of the government, another attempt was made. The miffionaries were well received by the Efquimaux, and the mifion goes on with fuccefs.

The animals of thefe countries are, the moofe deer, ftags, rein-deer, bears, tygers, buffaloes wolves, foxes, beavers, otters, lynxes, martins, fquirrels, ermins, wild cats, and hares. The rein-decr pafs in valt herds towards the north in October, feeking the extreme cold. The male polar bears rove out at fea, on the floating ice, moft of the winter, and till June: the females lie concealed in the woods, or beneath the banks of rivers till March; when they come abroad with their twin cubs, and bend their courfe to the fea in fearch of their conforts. Several are killed in their pasfage ; and thofe which are wounded how vaft fury, roar hideoully, and bite and throw up into the air even their own progeny. The females and the young, when not interrupted continue their way to fea. In June the males return to hore, and by Auguft are joined by their conforts, with the cubs, by that time of a confiderable 'fize. The feathered kinds are, geefe, buftards, ducks, partridges, and all manner of wildfowls. Indeed multitades of birds retire to this remote country to Labrador and Newfouudland, from places moft remutely fouth, perhaps from the Antilles; and fome even of the moft delicate little fpecies. Moft of them, with numbers of aquatic fowls are feen returning fouthward with their young broods to more favourable climates. The favages in fome refpects regulate their months by the appearance of birds; and. have their goofe month from the vernal appearance of geefe from the fouth. All the grous kind, ravens, cinereous crows, titwoufe, and Lapland finch, brave the fevereft winter; and feveral of the falcons and owls feek fhelter in the woods. Of fifh, there are whales, morfes, feals, cod-fifh, and a white fifh preferable to herrings; and in their rivers and freh waters, pike, perch, carp, and trout.

All the quadrupeds of thefe countries are clothed with a foft, warm, fur. In fummer there is here, as in other places, a variety in the colours of the feveral a"animals; when that feafon is.over, which holds only for three months, they affume the livery of winter, and every fort of beafts, and moft of their fowls, are of the colour of the frow; every thing animate and inanimate is white. This is a furprifing phenomenon. But what is yet more furpriling, and what is indeed one of the moft ftriking things, that draw the moft inattentive to an admiration of the wifdom and good. nefs of Providence, is, that the dogs and cats from Great Britain that have been carried into Hudfon's Bay, on the approach of winter have entirely changed their appearance, and acquired a much longer, fotter, and thicker coat of hair than they had originally.

Hudson's-Bay Company. See Company.
Hudsovis-River, a large river of North America, which rifes on the eaft of Lake Ontario, and running by Albany, and on the back of the fouth part of New-- England through part of New-York, fails into the bay of the fea beyond the weft end of Long-Illand, and below the City of New-York.

HUDSONIA, in lotany; a genas of the mono-
gynia order, belonging to the dodecandria clafs of plants. There is nocorolla; the calyx is pentaphyllous and tubular: there are 15 ftamina; the capfule is milocular, trivalvular, and trifpermous.

HUE and $\mathrm{C}_{\mathrm{Ry}}$, in law, the purfuit of a perfon who has committed felony on the high-way.-Of this cuftom, which is of Britifh origin, the following deduction is given by Mr Whitaker. "When it was requifite for the Britons to call out their warriors into the field, they ufed a method that was particularly marked by its expeditioufinefs and decifivenefs and remains partially anong us to this moment. They raifed a cry, which was immediately canght up by others, and in an inftant tranfmitted from mouth to mouth through all the region. And as the notice paffed along, the warriors fnatched their arms, and hurried away to the rendezvous. We have a remarkable defcription of the fact in Cæfar, and there fee the alarm propagated in 16 or 17 hours through 260 miles in a line. And the fame practice las been retained by the Highlanders to our own time. When the lord of a clan received intelligence of an enemy's approach, he immediately killed a goat with his own fword, dipped the end of a half-burnt ftick in the blood, and then gave it and the notice of the rendezvous to be carried to the next hanlet. The former fymbolically threatened fire and fword to all his followers that did net inftantly repair to the later. The notice was difpatched from hamlet to hamlet with the utmof expedition. And in three or four hours the whole clan was in arms, and affembled at the place appointed. This was within thefefew years the ordinary mode by which the chieftains affembled their followers for war. The firft perfon that received the notice, fet out with, it at full fpeed, delivered it to the next that he met, who inftantly fer out on the fame fpeed, and handed it to a third. And, in the late rebellion of 1745 , it was fent by an unknown hand through the region of Breadalbane; and, flying as expeditioully as the Gallick fignal in Cæfar, traverfed a tract of 32 miles in three hours. This quick method of giving a diffufive alarm is even preferved among ourfelves to the prefent day; but is applied, as it feems from Cæfar's account above to have heen equally applied among the Celtæ, to the better parpofes of civil polity. Thebutefium and ctamour of our lawis, and the bue and cry of our own times, is a well-known and powerful procefs for fpreading the notice and continning the purfuit of any fugutive felons. The cry, tike the clamour of the cials or the fimmmons of the Highlanders, is taken from town to town and from county to county ; and a chain of commnnication is fpeedily carried from one end of the kingdem to the other."

HUER, a name given'to certain fountains in ICElAND, of a moft extraordinary nature ; forming at times jets d'eaux of fcalding water ninety-four feet high and thirty in diameter, creating the mof magnificent gerbes that can be imagined, efpecially wher backed by the fetting fun. They arife out of cylindrical tubes of unknown depths: near the furface they expand intorpertures of a funnel chape, and the mouths Spread into large extent of ftalactitical matter, formed of fucceflive fcaly concentric undulations. The playing of thefe ftupendous fpouts is forctold by noifes roaring like the cataract of Niagara. The cylinder

Huefca begins to fill: it rifes gradually to the firface, |l Huct.

Plate and gradually increafes its height, fmoking amazingly, and flinging up great ftones. After attaining its greateft height it gradually links till it totally difappears. Boiling jets d'ea:sx and boiliing fprings are frequent in moft parts of the ifland. In many parts they are applied to the culinary ufes of the natives. The moft capital is that which is called Geyer or Gey $/ e r$, in a plain riling into fmail hills, and in the midtt of an amphitheatre, bounded by the moft magnificent and various-flaped icy mountains; among which the three-headed Hecla foars pre-eminent. Sce Iceiand, $\mathrm{N}^{9}$ 4.——Thefe huers are not confined to the land; they rife in the very fea, and form fcalding fountains amidft the waves. Their diftance from the land is unknown; but the new volcanic ine, twelve miles off the point of Reickenes, emitting fire and fmoke, proves that the fubterraneous fires and waters extend to that fpace; for thofe awful effects arife from the united fury of thefe two elements.

HUESCA, an ancient and confiderable town of Spain, in the kingdom of Arragon, with a bifhop's fee and an univerfity. It is feated on the Iffiela, iu a foil producing excellent wine, in W. Long. 0.13 . N. Lat. 40. 2.

HUESCAR, or Guescar, a town of Spain, in the kingdom of Granada, feated on a plain in W. Long. I. 45. N. Lat. 37.32.

HUSENE, or Huena, a fmall illand in the Baltic Sea, in the Sound, where was the famous oblervatory of Tycho Brahe. E. Long. 13. 5. N. Lat. 55. 54 .

HUET (Peter Daniel); a very lean ned French writer, born at Caen in Normandy, on the 8th of February 1630. He difcovered, from his infancy, a great inclination to the ftudy of polite literature and the fciences, and at firft applied himélf to the law; but DesCartes's principles, and Bochart's facred geography, made him change his ftudies for thofe of philofophy, mathematics, the languages, and antiquities. His admiration for Bochart made him defirous of knowing him. He contracted a very frict friendfhip with him, and accompanied that learned man to Sweden. Here Chriftina would have engaged him in her fervice ; but he, fenfible of her inconftant temper, returned to France. All he brought with him was a copy of a MS. of Origen, which he tranfcribed at Stockholm. He refufed feveral offers from Chriftina after the abdicated and went to Rome, and from Gufavus her fucceffor. In 1670, Mr Boffitet being apz pointed by the king preceptor to the dauphin, his majefty choofe Mr Huet for his colleague, with the title of fub preceptor to the prince. It was he that formed the plan of the commentaries in ufum Delphini, and directed the execution. His fentiments of piety determined him to enter into holy orders, which he did at the age of 45 . Soon after this, he was prefented by the king to the abbey of Aunay; and in 1685 was nominated to the bifhopric of Soiffons, which he exchanged for the fee of Avranches. After governing that diocefe ten years, he refigned, and was made abbot of Fontenay near Caen. His love to his native place determined him to fix there. But lawfuits coming upon him, he retired to Paris, and lodged among the Jefuits in the Maifon Profeffe, whom he
had made heirs to his library. A fuvere ditternper liugt: weakened his body extremely, but not the vivacity of his genius; he wrote his own life in a very degrantirguents flyle; and died in 1721, aged 9r. He was a man of very agrecable converfation; and of great probity, as well as immenfe erudition.- The following are the titles of his principal works. I. De charis interpere tibus, et de optimo genere interproiandi. 2. An edition of Origen's commentarics on the holy Scriptures, in Greek and Latin. 3. A treatife ou the origin of the Romans. 4. Demonffratio coangelica, folio. 5. Quafliones Alnetande de concordia rationis at fidei. 6. Of the fituation of the terreftrial paradife, it French. 7. A hiftory of the commerce and navigetion of the ancients, which has been tranflated into Englifh. 8. Commentarius de rebus ad eum pertinentibus. 9. Huetiana. 1o. Latin and Greek ver$\mathrm{f} \cdot \mathrm{s}, \& \mathrm{c}$.
HUGHES (John), an ingenious and polite writer; was born in 1677. In the earlieft parts of his youth, he cultivated the fifter-arts, poetry, drawing, and mulic, in each of which he by turns made a confiderable progrefs; but followed thofe and his other ftudies only as agreeable amufements, under frequent confinement on account of his ill fate of health. The lord Chancellor Cowper made him fecretary for the commifions of the peace without his knowledge, and diftinguilhed him with fingular marks of his efteem. He continued in the fame employment under the earl of Macclesfield, and held it to the day of his death ; which happened in 1719 , the very night in which his tragedy, intilled The fiege of Damafcus, was firlt acted. He was then 42. He tranflated Fontenelle's dialogues of the dead, Vertot's revolutions of Portugal, and the letters of Abelard and Eloifa. He gave a very accurate edition of Spencer's works, with his life, a gloffary, and remarks ; and wrote feveral papers, in the Tatler, Spectator, and Guardian. Mr Duncombe, who married his fifter, collected his poems and effays in 2 vols 12 mo , in 1735.

HUGHLY, a town of Alia, in the kingdom of Bengal, feated on the moft wefterly branch of the river Ganges. It is of large extent, reaching aboar two miles along the river-fide, and drives a great trade in all the commodities of that comntry; affording rich cargoes for 50 or 60 bips annually, befides what is brought on carriages to the neighbouring towns. Saltpetre is brought hither from Parnia in veffels above 50 yards long and five broad. The inhabitants are chiefly Indians; but there are alio Portuguefe, Englifh, and other Europeans. E. Long. 87.55. N. Lat. 22.0

HUGO CAPET, chief of the third race of the kings of France, being count of Paris and Orleans: he was raifed to the throne for his military valour and public virtues in 987 . See France, $n^{\circ} \quad 38$.

HU GONIA, in botany: A genus of the decandria order, belonging to the monadelphia clafs of plants; and in the naiural method ranking with thofe of which the order is donbtful. The corolla is pentapetalous; the froit is a plum with a ftriated kernel.

HUGUENOTS, an appellation given by way of contempt to the reformed or Proteftant Calvinifts of France.

Huguenots, not agreed as to the origin and occafion thereof : bat Eulk. one of the two following feems to be the leaft forced
derivation.

One of the gates of the city of Tours is called tlie gate Fourgon, by corruptiou from feu Hugon, i. e. the gate Hugon. This Hugon was once count of Tours, according to Eginhardus, in his life of Charles the Great, and to fome olher hiftorians. He was it feems a very wicked man, who by his ficree and cruel temper made himfelf dreadful; fo that after his death he was fuppofed to walk about in the night-time, beating all thofe he met with : this tradition the judicions Thuanus has noc forupled to mention in his hiftory. Davila and other hiftorians pretend, that the nickname of Haguenots was firft given to the French Proteftants, becaufe they ufed to nieet in the night time in fubterrancons vanlts near this gate of Hugon; and what feems to countenance this opinion is, that they were firft called by the name of Huguenots at this city of Toars.

Others affign a more illuftrious origin to that name; and fay that the leaguers gave it to the reformed, becaufe they were for keeping the crown upon the head of the prefent line defcended from Hugh Capet; whereas they were for giving it to the houfe of Guife, as defcended from Charles the Great.

Others again derive it from a French and faulty pronunciation of the German word eidgno(fen, fignitying confederates, and originally applied to that valiant part of the city of Geneva, which entered into an alliance with the S wifs cantons, in order to maintain their liberties againft the tyranaical attempts of Charles III duke of Sayoy.

Thefe confederates were called Eignots, whence Hignenots.

The perfecution which they underwent has farce its parallel in the hiftory of religion: though theyobtained a peace from Henry 111. in 1576 , it was only of Gort continuance ; and their fufferings, mitigated by the famous edict of Nantes, granted to them in 1598 by Henry IV. were again renewed, after the rewocation of this $\epsilon$ dict, by Louis XIV. in 1685 .

HULK, an old hip of war, fitted with an apparatus, to fix or take out the mafts of his majefty's flips, as occalion requires.

The maft of this veffel is extremelyhigh, and withal properly ftrengthened by forouds and flays, inorder to fecure what are called the heers, which ferve, as the arm of a crane, to hoift out or in the mafts of any hip lying alongfide. The heers ane compofed of feveral long maits, whofe heels reft upon the fide of the hulk, and having their headsdeclining outward from the perpendicular, fo as to hang over the veffel whofe mafts are to be fixed or difplaced. The tackles, which axtend from the head of the maft to the fleer-heads, are intended to pull in the latter towards the mafthead, particularly when they are charged with the weight of a maft after it is raifed out of any fhip, which is performed by ftrong tackles depending from the fheer-heads. The effort of thefe tackles is prodaced by two capfterns, fixed on the deck for this purpofe.

Hulk, is alfo a name beftowed on any old veffel kaid by as unfit for forther fervice. It is probablyde-
rived from the ox*adss, or veffels of burthen, of the ancient Grecians.

HULL, in the fea-language, is the main body of a fhip, without either mafts, yards, fails, or rigging. Thus $t$ f flrike a Hull in a ftorm, is to take in her fails, and to lafh the helm on the lee-fide of the thip; and $t$ hull, or lie a-hull, is faid of a dhip whore fails aie thus taken in, and helm lathed a-lee.

Hull, a river in Yorkhire, which falls into the Humber at Kingflon upon Hull. See Kingston.

HUMAN, in general, is an appellation given to whatever telates to mankind: thus we fay, the human foul, human body, humanlaws, \&c.

HUMANITY, the peculiar nature of man, whereby he is dininguilhed from all other beings.

Humanities, in the plural, fignify grammar, rhetoric, and poctry, known by the nanie of litera, humaniores; for teaching of which, there are proferfors in the univerfities of Scotland, called humaniffs.

HUMBER, a river formed by the Trent, Oufe, Derwent, and feveral other ftreams. By the late inland navigation, it has a communication with the rivers Merfey, Dee, Ribble, Severn, Thames, Avon \&c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Lancafter, Weftnoreland, Chefter, Stafford, Warwick, Leicefter, Ox'ord, W orcefter. It divides Yorfhkire from Lincolnihire, and falls into the German ocean near Holdernefs.

HUME (David, Eff ;) a late celebrated philofopher and hiftorian, was born in the fouth part of Scotland on the 26 th of April O.S. in the year 171: Being the younger fon of a country gentleman of good family, but no great fortume, his patrimony was of confequence infafficient to fupport him. For this reafon he was deftined for the bar, and pafled through his acadenical courfers in the unirerfity of Edinburgh; but being more inclined 10 ftudies of a different nature, he never pat on the gown, nor even took the introductory fteps neceffary for that purpore. The writings of Locke and Berkely had directed the attention of the generality of learned men towards metaphyfics; and Mr Hame having early applied himfelf to fudies of this kind, publifhed in 1739 the twofirft volumes of his Treatife of human nature, and the third the following year. He had the mortification, however, to find bis book generally decried ; aid to perceive, that the tafte for fyftematic writing was now on the decline. He therefore divided this tratife into deparate Effays and Difertations, which he afterwards publifhed at different times with alterations and improvements.

In 1742 , Mr Hume publighed two finall volumes, confifting of Effays moral, political, and literary. Thefe were better recejved than his former publicaton ; but contributed litule to his reputation as an author; and ftill lefs to his profit ; and his fmall patrimony being now almoft fpent, he accepted an invitation from the marquis of Annandale to cone and live with him in Eagland. With this nobleman he faid a twelve-month; during which time his fimall fortune was confiderably increafed. He then received an iavitation from General St Clair, to attend him as a fecretary on his expedition, which was at firft meant againft Cana-

Hull
HII Hume.

## H U M

 da, but afterwards ended in an excurfion againft thecoaft of France. In $\mathbf{7 4 7}$, herectived an invitation foom the general to attend him in the fame ftation in his military embafly to the courts of Vienna and Turin. He then wore the uniform of an officer ; and was introduced at thefe courts as aid de-camp to the general, along with Sir Harry Erfkine and captain Grant, afterwards general Grant. In 1749 he returned to Scotland, and lived two years with his brother at his country-houfe; where he compofed the fecond part of his effays, called Political Difcourfes. And now the general approbation of his performances was indicated by a more extenfive fale than formerly, and likewife by the numerous anfwers publifhed by different perfons in order to counteract their fuppofed pernicious tendency. In 1752, were publifhed at Edinburgh his Political Dif. courfes, the only work of his which was well received on its firt appearance ; and the fame year, at London, his Inquiry concerning the Principles of Morals, which in his own opinion was incomparably the beft of all his performances. This year alfo he was appointed librarian to the faculty of Advocates at Edinburgh; the principal advantage refulting from which employment was, that he had by that means the command of a large library. He then formed the plan of writing the Hiftory of England; but deeming the whole to be too extenfive, he confined his hiftory to that of Britain under the houfe of Stuart. The book was almoft univerfally decried on its firf appear. ance, and foon after feemed to fink in oblivion. Dr Herring primate of England, and Dr Stone primate of Ireland, were the only literati of the author's acquaintance who approved of the work, and fent him meflages not to be difcouraged.

Notwithitanding the approbation of thefe eminent men, however, Mr Hume's firits were fo much funk by his bad fuccefs, that he had fome thoughts of retiring to France, changing his name, and biddingadieu to his own conntry for ever ; but his defign was rendered impracticable by the breaking out of the war of 1755 between France and Britain. He then publifhed his Natural Hiftory of Religion ; to which an anfwer was publifhed, foon after its appearance, in the name of Dr Hurd bifhop of Litchfield and Coventry ; of which, however, he hath fince difclaimed being the fole author. In I756, the fecond volume of the Hiftory of the Stuarts was pablinhed, two years after the appearance of the firft. This was better received, and helped to retrieve the character of the former volume. Thrce years after, his Hiftory of the Houfe of Tudor made its appearance; which was almoft as ill received as the Hiftory of the Stuarts had been, the reign of Elizabeth being particularly obinoxious. The author, however, had now learned to defyife popular clamours; and continued to finifh at his lifure the more early part of the Englifh hiftory, which was publifhed in 176 I , and was received with tolerable fucceis.

Mr Hume being now turned of fifty, and having ob. tained by the fale of his books a competent and independant fortune, retired into his native country of Scotland, determised never more to fet his foot out of it. From this relolution, bowever, he was diverted by the earl of Hertford; whon he attended as fecretary on his embaly to Paris in 4763 . In 765 , the

091 H U M
earl being appointed lord lieutcnant of Irctand, Mr Hume was entrufted with the fole management of the bufinefs of the ftare till the arrival of the duke of Richmond towards the latter end of the year. In 1767, he returned to Edinburgh, with a much larger income, procured to him by the earl of EIcrtford, than lie formerly had; and now formed the fame delign he had formerly entertained, namely, of burying himfelf in his philofophical retreat. In this, however, he was again difappointed, by receiving aninvitation from general Conway to be monder fecretary; and this invication he was prevented from declining, both by the character of the perfon, and his connections with lord Heitford. In 1769 he returned to Edinburgh, poffeffed of L. iooo a-year, healthy, and though fomewhat ftriken in years, yet having a profpect of long. enjoying his eafe, and of feeing the increafe of his reputation. Of his laft illnefs and character, he him. felf gives the following account. "In fring 1775 , I was ftruck with a diforder in my bowels; which as firft gave me no alarm, but has fince, as I apprehend it, become mortal and incurable. I now reckon upon a fpeedy diffolution. I have fuffered very litule pain from my diforder ; and what is more ftrange, have, notwithftanding the great decline of my perfoir, never fuffered a moment's abatement of my fpirius; infomuch, that were I to name the period of my life which I hould moft choofe to pafs over arain, I might be tempted to point to this latter period. I polfefs. the fame ardour as ever in ftudy, and the fame gaiety in company. I confider, befides, that a man offixtyfive, by dying, cursoffonly a few years of infirmities; and though I fee many fymptoms of my literary reputation breaking out at laft with an additional luitre, I know that I could have but few years to enjoy it. It is difficult to be more detached from lice than I am at prefent.
"To conclude, hiftorically, with my own character, I am, or rahher was (for that is the flyle I mult now ufe in fpeaking of myfelf, which emboldens me the more to fpeak my fentiments); I was, I fay, a man of mild difpofitions, of command of temper, of an open, focial, and cheerfal bumour, capable of attachment, bat little fufceptible of enmity, and of great moderation in all my paffions. Even my love of literary fame, my ralitg paffion, never foured my temper, notwith landing my frequent difappointments. My company was not macceptable to the young aidd carelefs, as well as to the ftudions and literary; and as I took a particular pleafure in the company of nodeft women, I had no reafon to be difpleafed with the reception I met with from them. In a word, though mon men any wife eminent have found reafon to com, phain of calumny, I never was touched, or even attackcd, by her baleful tooth; and though I wanto:ly expofed myfelf to the rage of both civil and religious factons, they feemed to be difarmed in my belanif of their wonted fary. My friends neverhad oscafion to vindicate any one circumfance of my character and conduct: not but that the zealors, we may weli fuppofe, would have been glad to invent and propagate any ftory to my difadvantage, but they could never find. any which they thonght would war the facc of poobability. I cannot fay there is no vanity in maling this funeral ouation of myfclf, but lhope it is not $\%$ mifplacs ${ }^{\text {d }}$

## H U M

Humedz- mifplaced one ; and this is a matter of fact which is tion cafily cleared and afcertained."

His fears concerning the incurablenefs of his diforder proved too trut. He died, on the 25 th of Auguft 1770 ; and was interred in the Calton buryingground, Edinburgh, where a monument is erected to his memory.

HUMECTATION, formed of humour, moifture, moiftening, in pharmacy, the preparing of a medicine, by fteeping it a while in water, in order to foften and moiften it when too dry ; or to cleanfe it, or prevent its fubtile parts from being diflipated in grinding, or the like.

Humecarion is alfo ufed for the application of moiftening remedies.

In this fenfe we fay, embrocations, emtplafters, unctions, humectations, fermentations, \&c.

HUMERUS, or Os HUMERr, in anotomy, the uppermoft bone of the arm, popularly called the fhonlderbone; cxtending from the fcapula; or houlder-blade, to the upper end of the cubitus, or elbow. See ANatomy, $\mathrm{n}^{\circ} 47$.

HUMIDITY, that quality in bodies whereby they are capable of wetting other bodies. This differs very much from fluidity; and feems to be merely a relative thing, depending on the congruity of the component particles of the liquor to the pores of fuch particular bodies as it is capable of adhering to, penetrating a little into, or wetting. Thus, for inftance, quickfilver is not a moift thing with regard to our hands or clothes; but may be called fo in reference to gold, tin, or lead, to whofe furfaces it will perfectly adhere, and render them foft and moift.

HUMILIATI, a congregation of religious in the church of Rome, eftablifined by fome Milanefe gentlemen on their releafe from prifon, where they had been confined under the emperor Conrad, of, as others fay, under Frederick 1. in the year in62. This order, which acquired great wealrh, and had no lefs than 90 monafteries, was abolifhed by pope Pius V. in 1570 , and their houfes given to the Dominicans and Cordeliers for their luxury and cruelty.

HUMILIATION, the at of humbling, i. e. of abating a perfon's pride, and bringing him lower in his opinion.

In this fenfe, humiliation ftands diftinguifhed from mortification : humiliation brings down the mind; mortification fubdues the fleff.

HUMILITY, in erhics, is a virtuc confifting in the moderate value which a perfon puts upon himfelf, and every thing relating to him. Or, more particularly, it confifts in not attributing to ourfelves any excellence or good which we have not; in not over-rating any thing which we have or do; in not taking an immoderate delight in one's felf; in not affuming more of the praife of a quality or action than belongs to us; and in a lowly fenfe and acknowledgment of our imperfections, errors, and fins. This virtue expreffesitfelf in the modefty of our appearance, of our purfuits, and of our behavour towards other men. It is diftinguifled from affectation, bafhfulnefs, and meannefs.

HUMMING-bird.* Sec Trochiids.
HUMOUR, from the Latin bumor, in its original fignification, ftands for moifture in general; from whence it has been reftrained to fignify the moifture of
animal bodics, or thofe fluids which circulate throngh them.

Humout,
It is diftinguihned from moifture in general in this, that humours properly exprefs the fluids of the body; when, in a vitiated Itate, it would not be improper to fay, that the fluids of fuch a perfon's body were full of humours.

The only fluids of the body, which, in their natural and healthfal ftate, are called humours, are thofe in the eye; we talk of the aqueous humour, the cryftalline homour, without meaning any thing that is morbid or difeafed : yet, when we fay in general, that fuch a perfon has got a humour in his eye, we underftand it in the ufual fenfe of a vitiated fluid.

As the temper of the mind is fuppofed to depend upon the ftate of the fluids in the body, HumOUk has come to be fynonymous with temper and difpofition. A perfon's humour, however, is different from his difs pofition, in this, that humour feems to be che difeafe of a difpofition : it would be proper to fay that perfons of a ferious temper or difpofition of mind, were fubject to melancholy humours; that thofe of a delicate and tender difpofition, were fubject to peevilh humours.

Humour may be agreeable or difagrecable: but it is ftill humour ; fomething that is whimfical, capricious, and not to be depended upon. An ill-natured man may have fits of good-humour, which feem to come upon him aecidentally, without any regard to the common moral caufes of happinefs or mifery.

A fit of cheerfulnefs conftitutes the whole of goodhumour ; and a man who has many fuch fits, is a good. humoured-man : yet he may not be good-natured; which is a character that fuppofes fomething more conftant, equable, and unifotim, than what was requifite to conftitute good humour.

Humour is often made ufe of to exprefs the quality of the imagination, which bears a confiderable refemblance to wit.

Wit expreffes fomething that is more defigned, concerted, regular, and artificial; humour, fomething that is more wild, loofe, extravagant, and fantaftical ; fomething which comes upon a man by fits, which he can neither command or reftrain, and which is not perfectly confiftent with true politenefs. Humour, it has been faid, is often more diverting than wit; yet a man of wit is as much above a man of humour, as a gentleman is above a buffoon; a buffoon, however, will often divert more than a gentleman. The duke of Buckingham, however, makes humour to be allin all: wit, according to him, fhould never be ufed, but to add an agreeablenefs to fome proper and juft fentiment, which without fome fuch turn might pafs without its effect. See Wit.
HUMPHREY (Dr Lawrence), a very learned Englifh divine in the i6th century, who during the perfecution under queen Mary, reired with other Pro-teftant-refugees to Zurich. He returned on the acceffion of queen Elizabeth; and was made prefident of Magdalene college, Oxford, dean of Gloucefter, and then dean of Winchefter. He was a great and general fcholar, an able linguift, and a deep divine; and publifhed, r. Dereligionis confervatione et reformatione, deque primaturegum.2. De ratione interpretandiauctores. 3. Optimates; five de nobilitate, ejufque origine. 4. Sermons, and other works. He died in 1590 .

HUMULUS,

## H U N

Humulus, Hundred,

HUMULUS, the нор: a genus of the pentandria order, belonging to the diwecia clafs of plants; and in the natural method ranking under the 53d order, Scabrida. The male calyx is pentaphyllous; there is no corolia; the female calyx is monophyllons, patent obliquely, and entire, there is no corolla; but two fyles; and one feed within the calyx, the latter confifing of one large leaf. There is only one fpecies, viz. he lupulus, which is fometimes found wild in hedges near houres and gardens, but probably is not indigenous. The falk is weak and climbing; it creeps up the fupport in the fipiral, afcending always from the right hand to the left. The falk and the leaves are rough to the touch; the upper leaves are heart fhaped, the lower ones divided into three lobes ferated on the edges, and grow in pairs on long footftalks. The male flowers grow on a diftinct plant on branched peduncles; the females on peduncles in pairs of the form of a ftrobilus or cone, compofed of large imbricated calyces containing each one or two feeds. For the culture aud ufes of hops, fee the articles Hor and Husbandry.
hundred, hundredum, or Centuria, a part or divifion of a county; which was anciently fo called from its containing an hundred families, or from its furnifhing an hundred able men for the king's wars. After king Alfred's dividing England into counties, and giving the government of each county to a Sheriff, thefe counties were divided into hundreds, of which the conftable was the chicf officer. The grants of hundreds were at firft made by the king to particular perfons; but they are not now held by grant or prefeription, their jurifdiction being devolved to the county-court; a few of them only excepted that have been by privilege annexed to the crewn, or granted to fome great fubjects, and fill remain in the nature of a framchife.

Hundred-Court. This is only a larger Court-Ba. ron, being held for all the inhabitants of a paricular hundred inftead of a manor. The free fuitors are here alfo the judges, and the fteward the regifter as in the cafe of a court-baron. It is likewile no courc of record; refembling the former in all points, except that in point of territory it is of a greater jurifdiction. This is faid by Sir Edward Coke to have been derived out of the county-court for the eafe of the people, that they might have juftice done them at their own doors, without any charge or lofs of time ; but its inftitulion was probably co-eval with that of hundreds themfelves, which were formerly obferved to have been introduced though not invented by Alfred being derived from the policy of the ancient Germans. The centeni, we may remember, were the principalinhabitants of a diftrict compofed of different villages, origiially in number an bundred, but afterwards only called by that name; and who probably gave the fame denomination to the diftrict out of which they were chofen. Cæfar feciks pofitively of the judicial power exercifed in their hundred-courts and courts-baron. "Principes regionuni, atque pagorum," (which we may fairly conftrue, the lord of hundteds and manors) "inter fuos jup dicunt, controver fiaf que minaunt." And Tacitus, who had examined their confitution fill more attentively, informs us not only of the aurhority of the lord, but that of the centeni, the hundredors, or jury; who were taken out of the common freehold-

## 7II] <br> H U N

ers, and had themfelves a fhare in the determination. Hungary. ". Eliguntur in conciliiset princiecs, qui jurafer jagns vicofque reddunt: centeni fingulis, explebe comitus, cunfiliznn firmul et autoritas, adfunt." This hundredcourt was denominated haredu in the Gothic conftiantion. But this court, as canfes are equally liable to removal from hence as from the common coart baron, and by the fame writs, and nay alfo be reviewed by writ of falfe judgment, is thercfore fallein into equal difufe with regard to the trial of actions.
hUNGARY, a kingdom of Europe, the greateft part of which was anciently called Pamnonia. It had the name of Hungary from the Hunns, a Scythian ro Tartar nation, who fubdued it in the ninth century. It lies between the 18 th and 22 degrees of eall long. and betwixt the 45 th and 49 th degrees of north lat. being bounded to the north by the Carpathian mountains, which feparate it from Poland; to the fouth by Servia, and the river Drave, which feparates' it from Sclavonia; to the weft by Moravia, Auftria, and Stiria; and to the eaft by Wallachia and Tranfylvania. It is about 240 miles in length, and 235 in breadth; and is divided into the upper and Lower Hungary, the former being that part which lies towards the eaft, and the latter that which lies towards the weft.

The northern parts of the kingdom are monntainous and barren, but healthy ; the fouthern, on the contrary, are level, and exceeding fruitful, but not very healthy. The country along the Danube, from Prefburg to Belgrade, for upwards of 200 miles, is onc continued plain, and no foil can be more fertile; but the air by reafon of the many fwamps and moraffes, is not fo wholefome as on the higher and drier grounds. Here'are mines of gold, filver, copper, iron, lead, quickfilver, cinnabar, antiunony, yellow orpiment, fulphar, vitriol, marcafite, falt native and factitious, faltpetre, magnets, afbeftos or ftoneflax, marble of feveral colours, alabalter, with diamonds, and all forts of precious ftones. Corn is in fuch plenty, that it is fold for one fixth of its price in England. Their grapes are large and lufcious; and their wines preferred to any in Europe. They have vaft numbers of cattle and horfes, the latter moftly moufe-coloured, with buffaloes, deer, wildfowl, game, and fifh, and many fpecies of wildbeafts, particularly chamois, goats, bears, and lynxes. Of vegetables, befides vines and the common forts, here are tobacco, faffron, buck-wheat, millet, melons, and chefnuts. Here alfo are excellent warm baths, and fprings of various kinds and qualities. The chief mountains of Hungary are the Crapack or Carpathian, which is the general name for all thofe that feparate this kingdom from Poland, Moravia, Silefia, and fone part of Anfuria. The fides. of mont of them are covered with wood, and their tops with fnow. The chief rivers are the Danube, the Drave, the Save, the Wag or Waag, the Gran, the Temes, the Raab, and Thiefs, all well focked with filh. There are feveral lakes among the Carpathian mountains, and fome affo in the lowlands.

The inhabitants are a mixture of the defcendants of the ancient Hunns, Sclavonians, Camani, Ge:mans, W allachians, Greeks, Jews, Turks, and a wandering people called Zigdmns, faid to be of uncertain origini,
$\mathrm{H} \mathrm{N} \quad\left[\begin{array}{ll}712\end{array}\right] \quad \mathrm{HUN}$
pungary. but probably the fame as thofe we called gipfics. The - IEungarians are faid to be of a fanguine choleric cem. per, and fomewhat fierce, crucl, proud, and revengefil Thoyhave been always reputed good folditers, being much more inclined to aras, marrial exercifes, and hunting, than to arts, learning, trade, or agriculture. The nobility affect great pomp and magnificence, and are much addicted to feafting and caroufing. The men in general are ftrong and well proportioned. They thave their beards but leave whifkers on the upper-lip; wearing fur caps on their heads, a clofe-bodied coat girt with a fafh, with a Thort cloak or mantle over all, fo contrived as to be buckled under their arm, and leave the right hand at liberty. Their horfe are called buffars, and their foot hyditkes. The former wear a broad-fword, or fcymeter, and carry a hatchet or battle-ax. Their horfes are fleet, but not near fo large as the German hotfes, and therefore they ftand up on their fhort firrups when they ftrile. The heydukes ufually wear feathers in their caps, according to the number of the enemies they pretend to $h$ ve killed. Both horfe and loot are an excellent militia, very good at a purfuit, or ravaging and plundering a country, but not equal to regular troops in a pitched battle. The women, when they go abroad, wear fhort cloaks and a veil.

There are four languages fpoken in this country, viz. the Hungarian, which like the people, is of Scythian origin, and has little or no affinity with any European tongue; the German, Sclavonian, Wallachian, and Latin. The laft is fpoken not only by the better fort, but alfo by the common people, though very corruprly. The people called Zigduns have alfo a particular jargon.-Chriftianity was planted in Hangary in the ninth and tenth centuries. In the fixteenth the reformation made a great progrefs in it ; but at prefent, though the Roman catholics hardly - make a fouth part of the inhabitants, their religion is predominant, the Proteftants enjoying only a bare toleration. Befides feveral fects ot Proteftants, here are alfo great numbers of the Greek chureh and Jews; the laft pay doable taxes of all kinds. Befices Jefuits colleges and other convents, there are feveral univerfities for the Roman-catholics. The Lutherans alfo and Calvinifts have their gymnafiums and fchools, but ander divers reftrictions.

As to the traffic of this coantry, it is almoft wholly in the hands of the Greeks and Jews. The exports confift chiefly of wine, horfes, eatile, metals, minerals faffron, wool, and leather. Hungary, in particular furnihes Auftria, and other comnties weft of it, with valt droves of cattle, as well as variety of excellent wines, of which thofe of Tockay are recloned the bef. The principal manufactures are thofe of copper, brafs, iron, and other hard wares. Great quantities of brafs and iron are exported, wrought and unwrought.

Hungary at firft, like moft other countries, was divided intomany little principalities and fates, which at length were united under one head, who had the title of duke. The laft of thefe dukes was Geyfa: who, becoming a profclyte to Chriftianity, was baptized; after which he refigned the government to his fon Stcphen who took ihe title of king, annon 1000 . But
as the throne was filled by election, though generally Mungary, unt of the fame family, the difpofal of the crown was Hungar. difputed between the Turkifh and German emperors for near 200 years; but after the year 1527, when Ferdinand archduke of Auftria was advanced to the throne, the Auftriaus found means to influence the elections in fuch a manner, as to kecp the crown in their family till 1687, when is was. fettled hereditarily on their heirs male; and now, in confequence of an act made by the diet at Prefburg in 1723, in cafe of the failure of heirs-male, it is to defcend to famales. The ftares of the kingdom conlift of the prelates, the barons, the gentry, and the royal towns. To the firft clafs belong two archbifhops, about a dozen bifhops, near as many abbots and provofts, with the Pauline and Præmonftratenfian Jefuits. To the fecond, the ftadtholder or palatine, who reprefents the king : the court-judge ; the ban or viceroy of Dalmatia, Croatia, and Sclavonia; the ftadtholder of Tranfilvania; the great treafurer, the great eup-bearcr, the fteward of the houfehold, the mafter of the horfe, the lord chamberlain, the captain of the ycomen of the guards, and the grand-marhal of the courts who are ftyled the great barons, together with the inferior bans or counts and barons. To the third clafs belong the gentry, fome of whom have noble manors, and others only the privileges of nobles. To the fourth clafs belong the royal free cities, which are not fubject to the counts, but hold immediately of the king. The gentry alfo, who hold of the archbifhops, and bilhops, have the fame privileges as the Hungarian nobility, The common people are vaffals to the lords, on whofe lands they live, whether thefe lands belong to the crown, the clergy, nobility, or gentry.
The ordinary revenue of this kingdom is faid to exceed a million Sterling, arifing from the mines, duties on eattle, royal demefnes; falt-works, contributions, cuftoms, \&c. The forrifications and garrifons conftantly maintained on the frontiers againft the Turks, are a great expence to the government. Hungary can eafily bring into the field 100,000 men, regulars and militia; for there are 50,000 in actual pay, and the provinces furnifh the other 50,000 when liey are wanted.

Hungary-Water, a diftilled water prepared from the tops of flowers of rolemary; fo denominated from a queen of Hungary, for whofe afe it was firft made. See Pharmact.

HUNGER, an uneafy fenfation occafioned by long abftinence from food when the body is in a healthy: ftate.-See Abstinence; Fasting; and Anatomy, $\mathrm{n}^{\mathrm{O}} \mathrm{I} 03$.

The following ufeful obfervations upon hunger or famine are cxtracted from a paper by Dr Percival in the fecond polume of the Manchefter Tranfactions.

In famine, life may be protracted (the Doctor obferves) with lefs pain and mifery, by a moderate allowance of water. For the acrimony and putrefaction of the humours are obviated by fuch dilution, the fmall veffels are kept permeable, and the lungs are furnifhed with that moifture which is effential to the performance of their functions. Fontanus, a writer of refpectable authority in the eitimation of Morgagni, relates the hiftory of a woman who obftinately refufed to take any fubliftence, except

H U N 7
71
Hunger. twite, daring the fpace of 50 days, at the end of which period the died. But he adds, that the ufed water by way of drink, though in fmall quantity. Redi, who made many experiments (cruel and unjuftifiable in my opinion), to alcertain the effe?s of fafting on fowls, obferved, that none were able to fupport life beyond the ninth day to whom drink was denied; whereas one indulged with water lived more than 20 days.

Hippocrates has obrerved, that children are more affected by abstinence than young perfons; thefe, more than the mididle aged; and the middle aged, nore than old men. The power to endure famine, howe ver, mult depend no lefsinpon the flate of health and ftrength than on the age of the fufferer. Thereare alfo particular conftitutions which do not fuffer much pain from the calls of hunger. Dr Percival was informetby a young phyfician from Geneva, that when he was a fudent at Montpelier, he fatted three nights and four days; with no other refrethment than a pint of water daily. His hunger was keen, but never painful, during the firlt and fecond days of his abftincnce; and the two following days, he perceived only a faintuefs when he attempted either bodily or mental exertion : A fenfe of coldnefs was diffufed over his whole frame, but more particularly affected the extremities. His mind was in a very unufual fate of pufillanimity; and he experienced a great tendency to tears whenever he recollected the circumftance which had been the occation of his fafting. During the whole period, the alvine excretions were fupprefled, but not thofe by the kidneys : and at the clofe of it, his fkin became tinged with a fhade of yellow. The firf food he took was veal broth; which had fomething of an intoxicating effect, producing a glow of warmth, and railing his fpirits, fo as to render lim aflamed of his defpondency. Perhaps in the cafe of Sextius Baculus, as recorded in the commenta-

- Lib. 6. ries of Cæfar*, the extraordinary courage and prowefs which he fuddenly exerted, might be aided by the exhilerating effect of futtenance, which, under fuch circumfances, it is probable he would no longer decline. The fact, however, evinces, that neither his ficknefs nor the fenfations of hanger had been fo violent as much to impair his frrength of body or vigour of mind. Pomponins Atticus, the celebrated friend of Cicero, who put a voluntary end to his life in the 77th year of his age by refufing all food, appears to have experienced eafe from his diforder, rather than any acute fafferings by fanime. "Sic cum biduò cibo fe abfinuiffer, fubito febris deceffit, leviorque morbus effe cæpit: tamen propofitum nihilo fecius perigit. Ita-" que die quinto, poftquam id confilium inicrat, deceffit." (Corn. Nepos in Vit. Pomp. Attic.) From the former circumftance it has been conjectured, that he did not wholly deny himfelf the afe of water, or of fome other diluent. But though a few examples of this kind may be adduced, we have the evidence of numerous melancholy facts to fhow, that the preffure of want is agonizing to the human frame. "I have talked (fays an $+D_{r}$ Guld- ingenious writer $\dagger$ ), with the captain of a fhip who ymith's. Hijf. was one of lix that endured it in its extremity, and who of the Earthb, was the only perfon that had not loft his fenfes when Fol. ii. 126 . they received accidental relief. He affured me his pains at firft were fo great, as to be often tempted to eat a part of one of the men who died, and which the reft of his crew actually for fome time lived upon:

Vol. VIII.

He faid, that during the continuance of this paroxy fin, he found his pains infupportable, and was defirous at one time of anticipating that death which he thought inevitable: But his pains, he faid, gradually decreafed after the fixth day (forthey had water in the fhip, which kept them alive folong), and then he was in a ftate rather of langour than defire; nor did he much wifh for food, except when he faw others eating ; and that for a while revived his appetite, though with diminifhed importunity. The latter part of the time, wher his health was alnoft deftroyed, a thonfand frange images rofe upon his mind; and every one of his fenfes began to bring him wrong information. The moft fragrant perfumes appeared to him to have a fetid fmell; and every thing he looked at took a greenifh hue, and fometimes a yellow. When he was prefented with food by the hip's company that took him and his men up, four of whom died fhortly after, he could not help looking upon it with loathing inftead of defire ; and it was not till after four days that his flomach was brought to its natural tone; when the violence of his appectite returned with a fort of canine eagernefs."

To thofe who by their occupations are expofed to fuch dreadful calamities, it is of ferious importance to be inftructed in the means of alleviating them. The American Indians are faid to ufe a compofition of the juice of tobacco, and the fhells of frails, cockles, and oy fters calcined, whenever they undertake a long journey, and are likely to be deftitute of provifions. It is probable the flells are not burnt into quicklime, but only fo as to deftroy their tenacity, and to render them fit for levigation. The mafs is dried, and formed into pills, of a proper fize to be held between the gum and lip, which, being gradually difolved and fwallowed, obtund the fenfations both of hunger and of thirft. Tobacco, by its nareotic quality, feems well adapted to counteract the uneafy impreffions which the gaftric juice makes on the nerves of the ftomach when it is empty ; and the combination of teftaceous powders with it may tend to correct the fecretion that is fappofed to be the chicf agent in digettion, and which, if not acid, is always united with acidity. Certain at leaft it is, that their operation is both grateful and falutary ; for we find the luxurious inhabitants of the Eaf Indies mix them with the betel nut, to the chewing of which they are üniverfally and immoderately addieted. Perbaps fuch abforbents may be ufefully applied, both to divide the dofes and to moderate the virulence of the tobacco. For, in the internal exhibition of this plant, much caution is required, as it produces ficknefs, vertigo, cold clammy fweats, and a train of other formidable fy mptoms, when taken in too large a quantity. During the time of war, the imprefled failors frequently bring on thefe maladies, that they may be admitted into the hofpitals, and releafed from fervitude. It would be an eafy and fafe experiment to alcertain the efficacy, and to adjuft the ingredients, of the Indian compofition mentioned. And there is reafon to believe, that the trial would be in fome degree fuccefsful : for it is known that fmoking tobacco gives relief in thofe habitual pains of the fomach which appear to arife from the irritation of the gaftric fecretions. The like effect is fometimes produced by increafing the flow of faliva, and fwallowing what is thas difcharged. And Dr Percival has related

Hunger. the cafe of a gentleman, who ufed to mafticate, many hours daily, a piece of lead, which being neither hard, friable, nor offenfive to the palate, fuited his purpufe, as he thought, better than any other fubItance. He continued the cuftom many years, deriving great eafe from it, and fuffering no fenfible injury from the poifonous quality of the metal. On nuchtioning this faet to a navy furgeon, the Doctor was told, that the failors, when in hot climates, are wont to mitigate thirft by rolling a bullet in their mouths. A more innocent mean, the Doctor obferves, might be devifed ; but the efficacy of this evinces, that the falivary glands are for a while capable of furnifhing a fubfitute for drink. When a fearcity of water occurs at fea, Dr Franklin has advifed, that the mariners fhould bathe themfelves in tubs of fall-water: For, in purfuing the amufement of fwimming, he obferved, that, however thirfty he was before immerfion, he never continued fo afterwards; and that, though he foaked himfelf feveral hours in the day, and feveral days fucceffively in falt-water, he perceived not, in confequence of it, the leaft tafte of faltriefs in his mouth. He alfo furrher fuggefts, that the fame good effect might perhaps be derived from dipping the failors' apparel in the fea; and expreffes a confidence that no danger of catching cold would enfue.

To prevent the calamity of famine at fea, it has been propofed by Dr Lind, that the powder of falep fhould conftitute part of the provifions of every flip's company. This powder and portable foup, diffolved in boiling water, form a rich thick jelly ; and an otance of each of thefe articles furnilhes one day's fubfiftence to a healthy full grown man. Indeed, from Dr Percival's experiments it appears, that falep contains more nutritious matter, in proportion to its bulk, than any other vegetable production now ufed as food. It has the property alfo of concealing the naufeous tafte of falt-water; and confequenly may be of great advantage at fea, when the ftock of frefh water is fo far confaned, that the mariners are put upon lhort allowance. By the fame mucilaginous quality, it covers the offenfivenefs, and even, in fome meafare, corrects the acrimony of falted and putrefcent meats. But, as a prefervative againf hunger, falep would be moft efficacious combined with an equal weight of beef fuet. By fwallowing little balls of this lubricating compound at proper intervals, the coats of the fomach would be defended from irritation : and as oils and mucilages are highly nutritive, of flow digeftion, and indifpofed to pafs off by perfpiration, they are peculiarly well adapted to fupport life in fmall quantities. This compefition is faperior in fimplicity, and perhaps equal inf efficacy, to the following one, fo much extolled by Avicenna the celebrated Arabian phyfician; to whom we are indebted for the introduction of rhubarb, caffia, tamarinds, and fenna, into the materia medica. "Take fweet almonds and beef fuet, of each one pound; of the oil of violets two ounces; and ot the roots of marth mallows one ounce : bray the efe ingredients together in a mo:tar, and form the mafs into bolufes, about the fize of a common nut." Animal fat is fingularly powerful in affiaging the moft acute fenfations of thirft, as appears from the narrative of the fufferings experienced by thicfe who were confined in the black hole at Calcutta. A hundred and forty-fix perfons, exhaufted by fatigue
and military duty, were there thruft rogether into a Hunger. chamber of 18 cubic feet, laviug only two windows; ftrongly barred with iron, from which, in a clofe fultry night, and in fuch a climate as that of Bengal, little or no circulation of frefla air conld be enjoyed. In a few minutes, thefe unhappy wretches fell into fo profufe a perfipiration, that an idea can harcily be formed of it; and this was fucceeded by a raging thirft, which increafed in proportion as the body was drained of its moitture. Water! Water ! became the univerfal cry; and an old foldier on the outfide, through pity, furnifhed them with a few dikinfuls of it. But thefe fcanty fupplies, like fprinklings on the fire, terved only to feed and increafe the flame. From this experience of its effects, Mr Howel, their chief, derermined to drink no more ; and kept his mouch mait by facking the perfiriation out of his firirt fleeves, and catching the drops as they fell from his head and face. "You cannot inagine (fays he) how unhappy I was if any of them efcaped me." He came into the prifon without his coat, the feafon being too hot to bear it : and one of his miferable conlpanion's, obferving the expedient he had hit upon of allaying his chirft, robbed him from rime to time of a coiniderable part of his fore. This plunderer, whom he found to be a young gentleman in the fervice of the Eaft India Coma pany, afterwards acknowledged, that he owved his life to the many comfortable draughts which he derived from him. Before Mr Howel adopted this mode of relief, he had attempted, in an ungovernable fit of thirft, to drink his own urine : but it was fo intenfely bitter, that a fecond tafte could not be entured; whereas, he affes us, no Briftol water could be more foft and pleafant than his perfpiration. And this, we may prefume, confifted chiefly of animal fat, nolled by exceflive hear, and exuding from the cellular membrane through the pores of the flin.

Perfons who have been accuftomed to animal food, are foon reduced when fupplied only with the farinacea. Several years ago, to deternine the comparative nutritive powers of different fubftances, an ingenious young phyfician, as Dr Percival informs us, made a variety of experiments on himfelf, to which he unfortunately fell a facrifice. He lived a month apon bread and water; and under this regimen of diet he every day diminilthed much in his weight. But in 1784, a fudent of phylic at Edinburgh confined himfelf for a longer fpace of time to a pint of milk and half a pound of white bread daily : And he affured our author, that he paffed through the ufual labours of fudy and exercife, without feeling any decay of healih or ftrength, and without any fenfible lofs of bulk. The cutaneous, urinary, and alvine excretions, were very fcanty during the whole period; and the difcharge of fæces occurred only once in a week.' In this cafe the oily and coagulable parts of the milk probably furnifhed a larger proportion of aliment, and at the fame time contributed to check the wafte by perfpiration and other difcharges; for oleaginous fubftances are retained long in the body by their vifcidity. Dr Ruffel, in his Natural Hiftory of Aleppo, relates, that in thofe feafons when oil abounds, the inhabitants, by indulgence in it, are difpofed to fever, and affected with infarctions of the lungs ; maladies which indicate both retention and obftruction. Milk bas been-

Fenger. fufpeeted by fome of producing fimilar effects, though in a dighter degree; and the free ufe of it has been on this account forbidden to afthmatics.
Gum arabic might be a good fubftitute for falep in the compofition already recommended; and as it will give fuch firminefs to the mals, as to require manducation, the faliva, by this means feparated and carried into the ftomach, would further contribute to alfuage the fenfations both of hunger and of thirft. See Gum-Arabic. This gum, combined with fugar and the whites of eggs, has been lacely extolled in France, under the name of patigumn, as a remedy for catarrhal defluxions. Dr Percival has feen cakes made of thefe ingredients, and thinks they might very well be applied to the purpofe of obviating hanger. They are not perihable in the hotteft climates, may be cartied abour the perfon with convenience, and though very rough are pleafant to the tafte. In the formula by which they are made, the proportion of fugar is too large, and that of gum arabic too fmall, if the mafs be intended to alfuage the cravings of appetite. According to our author's information, the receipt is as follows. "Take of fine fugar four ounces, and of gum arabic one ounce: Levigate them well together; and add half an ounce of rofe water, and of the white of eggs a fufficient quantity."
In our attempts to recover thofe who have fuffered under the calamities of famine, great circumfpection is required. Warmuth, cordials, and food, are the means to be employed; and it is evident that thefe may prove too powerful in their operation, if not adminiftered with caution and judgment. For the body, by long fafting, is reduced to a ftate of more than infantile debility ; the minuter veffels of the brain, and of the other organs, collapfe for want of fluids to diftend them ; the ftomach and inteftines thrink in their capacity; and the heart languidly vibrates, having fcarceiy fufficient energy to propel the feanty current of blood. Under fach circumflances, a proper application of heat feems an effential meafure, and may be effected by placing on each fide a healthy man in contact with the patient. Pediluvia or fomentationsmay alfo be ufed with advantage. The temperature of thefe fhould be lower than that of the human body, and gradually increafed according to the effects of their ftimulus. New milk, weak broth, or water gruel, ought to be employed both for the one and the other; as nutriment may be conveyed into the fyftem this way, by paffages probably the moft pervious in a ftate of fafting, if not too long protracted. "A lad at New-market $\dagger$, a few years ago, having been almoft ftarved in order that he might be reduced to a proper weight for riding a match, was weighed at nine o'clock in the morning, and again at ten; and he was found to have gained near thirty ounces in weight in the courfe of an hour, thongh hic liad oaly drank half a glafs of wine in the interval, The wine probably ftimulated the action of the nervous fy ftem, and incited nature, exhaufted by austinence, to open the abforbent pores of the whole boly, in order to fuck in fome nourifhment from the air." But no fuch abforption as this can be expected in a fate of extreme weaknefs and emaciation gradually induced; becaufe the lymphatics mult partake of the general want of tone and energy. And notwithftanding the falutary effects of wine in the cafe of the jockey,
who, it is likely, had been reduced by fweating as well as by abftinence, fuch a ftimulant might prove dange. rous, and even fatal in other cafes. It appears fafer therefore to advife the exhibition of cordials in very fimall dofes, and at firf confiderably diluted. Slender wine-whey will perhaps beft anfwer this purpofe; and afford, at the fame time, an eafy and pleafant nourifhment. When the fomach has been a little Itrengthened, an egg may be mixed with the whey, or adminiftered under fome other agreeable form. The yolk of one was, to Cornaro, fufficient for a meal; and the narrative of this noble Venetian, in whom a fever was excited by the addition of enly two ounces of food to his daily allowance, lhows, that the return to a full diet thould be condacted with great caution, and by very flow gradations.

HUNNS, a fierce and favage nation, who formerly inhabited that part of Sirmatia bordering on the Paulus Mæotis and the Tanais, the ancient boundary between Europe and Alia. Their country, as defcribed by Procopias, lay north of monnt Caucafus, which, extending from the Euxine to the Cafpian Seas, parts Afiatic Sarmatia from Colchis, Iberia, and Albania; lying on the ifthmus between the two feas abovementioned. Here they refided, unknown to other nations, and themfelves ignorant of other countries, till the year 376. At this time, an hind purfued by the hunters, or, according to fome authors, an ox ftung by a gad-fly, having palfed the marfh, was followed by fome Hunns to the other fide, where they difcovered a country much more agreeable than their own. On their return, having acquainted their countrymen with what they had feen, the whole nation paffed the marfh, and, falling upon the Alans who dwelt on the banks of the Tanais, almof exterminated them. They next fell upon the Oftrogoths, whom they drove ont of their conntry, and forced to retire to the plains between the Boryfthenes and the Tanais, now known by the name of Podolea. Then attacking the Viligoths, they obliged them to fhelter themfelves in the rooft mountainous parts of their country; till at laft the Gothick nations, finding it imponible to withftand fuch an inundation of barbarians, obtained leave from the emperor Valens to fettle in Thrace.

The Hunus thus became mafters of all the country between the Tanais and Danube in 376, where they continued quietly till the year 388 , when great numbers of them were taken into the pay of Theodofius I. but, in the mean time, a party of thems, called the Nephthalite or White Hunns, who had continued in Afia, over-rar all Mefopotamia, and even laid fiege to Edeffa, where they were repulfed with great laughter by the Romans. The European Hunns frequently paffed the Danube, committing the greateft ravagesin the weftern empire; fometimes they felluponthe eaftern provinces, where they put all to fire and fword. They were often defeated and repulfed by the Romans, but the empire was now too weak to fubdue or confine them from toaking excurfions; fo that they continued to make daily encroachments, and became every day more formidable than before. In 441, the Hunns, under Attila, threatened the weftern empire wirh total deftruction. This monarch, having made himfelf mafter of all the northern countries from the confines of Ferfia to the banks of the Rhine, invaded Mæfa,

Thrace,

## HUN <br> 16 ] H U N

Funne:

Thrace, andllyricum; where he made fuch progrefs, that the enperor, not thinking himfelf fafe in Conftantinople, witherew into Aliz. Attila then broke into Gaul; where he took and deftroyed feveral cities, maflacring the inhabitants with the greatelt crucliy. At laft he was driven out with great flaughter by Actins the Roman general and Theodoric king of the Goths, and could never afterwards make any great progrefs. About the year 452 or 453 Attila died, and his kingdon was inmediately fplit into a number of fmall ones by his numerous children, who waged perpetual war with each other. The Hunns thenceated to be formidable, and becane daily lefs able to cope with the orher barbarous nations whom Attila had kept in fubjection. Still, however, their cominion was confiderable; and in the time of Charles the Great they were mafters of Tranfylvania, Walachia, Servia, Carniola, Carinthia, and the greater part of Auftria, together with Bofnia, Sclavonia, and that part of Hungary which lies beyond the Danube. In the year 776, while Charles was in Saxony, two princes of the Hunns, Caganus and Jugunus, ient ambalfadors to him, defiring his friendhip and alliance. Charles received them with extraordinary marks of friendfhip, and readily complied with their requeft. However, they entered, not long after, into an alliance with Taffila duke of Bavaria, who had revolted from Charles, and raifed great difturbances in Germany. Charles diffembled his refentment till he had entirely reduced Bavaria, when he refolved to revenge himfelf on the Hanns for thofe faccours they had underhand given to his enemy. Accordingly, he ordered levies to bemade throughout his dominions; and having by that means affembled a very numerous arny, he divided it into two bodies, one of which he commanded himfelf, and the other he committed to the care of his generals. The two armies entered the country of the Hunns at different places, ravaged their country far and near, burnt their villages, and took all their ftrong holds. This he continued for eight years, till the people were almoft totally extirpated; nor did the Hunns ever afterwards recover themfelves, or appear as a diftinct nation.

There were two different nations that went by the name of Hunns; the Nephthalite or White Hunns, and the Sarmatian or Scythian Hunins. The former inbabited a rich country, bordering to the north on Perfia, and at a great diftance from the Sarmatian or Scythian Hunns, with whom they had no intercourfe nor the leaf refemblance either in their perfons or manners. They were a powerful nation, and often ferved againft the Romans in the Perfian armies; but in the reign of the emperor Zeno, being provoked by Perozes king of Perfia laying claim to part of their country, they defeated the Perfians in two pitched battles, flew their king, over-ran all Perfia, and held it in fubjection for the fpace of two years, obliged Cabades, the fon and fucceffor of Perozes, to pay them a yearly tribute. Thefe Hunns, called by the writers of thofe times the white Hunns, did not wander, like the others, from place to place; but, colatented with their own country, which fupplied them with all neceflaries, they lived under a regular government, fibject to one prince, and feldom made inroads, unleis provoked cither into the lerfian or Roman territories.

They lived according to their own laws, and dealtuprightly with one another, as well as with the neighbouring people. Each of thair great men ufed to choofe 26 or more companions to evjoy with him his wealth, and partake of all his divertions; but, upon his deceafe, they were all buried with him in the fame grave. This cuftom fayours of barbarity; but in every other refpect, the Nephthalite were a far more civilized nation than the Scythian Hunns, who, breaking into the empire, filled mofs of the provinces of Europe with blood añd llaughtcr.

The latter were, accorcing to Ammianus Marccllinus, a favage people, exceeding in craelty the moft barbarous nations. They begin to practife their cruclty, fays Jornandes, upon their own children the very firf day they come into the world, cutting and mangling the cheeks of their males, to prevent the growth of hair, which they mult have looked upon, contrary to the fentiments of other nations, as unbecoming and ummanly. -They had, perhaps, in this practice another view, which Jornandes feems to intinuate elfewhere, $\boldsymbol{v i z}$. to firike terror into the enemy with their countenances, thus deformed and covered with fcars. They had no other food but roots and raw meat, being quite unacquainted with the ufe of fire, and no houfes at all, not even huts; but lived. conftantly expofed to the air in the woods, and on the mountains, where, from their infancy, they were inured to hanger, thirft, and all manner of hardhips: nay, they had fuch an averfion to houfes, which they called the fepulchres of the living, that, when they wemt into other countries, they could bardly be prevailed upon to come within the walls of any houfe, not thinking themfelves fafe when hut up and covered. They ufed even to eat and fleep on horfeback, farce ever difmounting; which, in all likelihood, induced Zofimus to write, that the Hunns could not walk. They covered their nakednefs with goats \&kins, or the ikins of a fort of mice fewed together. Day and night were indifferent to them, as to buying, felling, eating, and drinking. They had no law, nor any kind of religion; but complied with their inclinations, whatever they prompted them to, without the leaft reftraint, or diftinction between good and evil. In war, they began the battle with great fury, and an hideous noife: but if they met with a vigorous oppofition, their fury began to abate after the firft onfet; and when once put into diforder, they never rallied, but fled in the utmoft confufion. They were quite unacquainted with the art of befieging towns; and authors obferve, that they never attacked the enemy's camp. They were a faithlefs nation, and thought themfelves no longer bound by the moft folemn treaties, than they found their advantage in obferving them. Hende we often find them, upon the leaft profpect of obtaining more advantageous conditions, breaking into the Roman empire, in defiance of the mont folemn oaths and engagements. Several corps of Hunns, after their coming into Europe, ferved in the Roman armies againft the Goths and other barbarous nations; nay, they were ready, for hire, to fight againft each orher, being blind to every other regard and confideration.

HUNGERFORD, a town of Berkhire in England, feated on the river Kennet, in a low and watery foil. It is a great thoroughfare in the Bath and Bri-

## Fuma, Hungerford.

Humin= Aol road, 65 miles from London; and was formerly
guen, Huntcr.
called Ingleford-Charnam/lreet. The conftable of this town, who is chofen anmually, is lord of the manor, which he holds immediately of the crown. They have a horn here which holds about a quart; and appears by au infeription on it to have been given by John of Gaunt, together with a grant of the royal fithery, in a part of the river which abounds with good trouts and craw filh. Here is a market on Wednefdays, and fair in Auguft.

HUNNINGUEN, a town of Germany, in Alface, and in Suntgaw, fubject to the French; fated on the Rhine, and fortified by Vauban. E. Long. J1. 40. N. Lat. 47.42.

HUNTER, a name given to a horfe qualified to carry a perfon in the chace. The flape of the horfe defigned for this fervice, flould be ftrong and well knit together, as the jockeys exprefoit. Irregular or unequal hapes in thefe creatures are always a token of weaknefs. The inequalities in flape which thow a horfe improper for the chace, are the having a large head and a fmall neck, a large leg and a fmall foot, and the like. The head of the hunter fhould indeed always be large, but the neck fhould alfo be thick and ftrong to fupport it. The head fhould be lean, the noftrils wide, and the windpipe ftraight.

The hunter, in order to his behaving well in the field, ought to have great care and indulgence in the ftable:- he ought to have as much reft and quiet as may be, to be kept well fupplied with good meat, clean litter, and frefh warer by him ; he fhould be often dreffed, and fuffered to feep as much as he pleafes. He fhould be fo fed, that his dung may be rather foft than hard, and it muft be of a bright and clean colour. All this may be eafily managed by the continual obfervance and change of his food, as occafion requires. After his ufual foourings he fhould have exercifes and mahnes of fweet malr, or bread and beaas: or wheat and beans mixed together, are to be his beft food, and beans and oats his worn.

Some very great fportfmen are for keeping their horfes out at grafs all the buck-hunting feafon, never taking them up into the fable at all, but allowing them in the field as much oats with their grafs as they will eat. Thehorfes may be thus rid three days in the week for the whole feafon, and never damaged by it, nor ever howing any marks of harm afterwards.

The whole flape of a horfe intended for a hanter, fhould be this: The ears fhould be fmall, open, and pricked; or though they be fomewhat long, yet if they ftand up erect and bold like thofe of a fox, it is a. fign of toughnefs or hardinefs. The forehead fhould be long and broad, not flat ; or, as it is uftully termed, mare-faced, but rifing in the middle like that of a hare; the feather fhould be placed above the eye, the contrary being thought by fome to threaten blindnefs. The eyes fhould be full, large, and bright; the noftrils not only large, but looking red and frefh within; for an open and frefh noftril is always efteemed a fign of a good wind. The month fhould be large, but deep in the wicks, and hairy. The wind-pipe fhould be large, and appear ftraight when he bridles his head ; for if; on the contrary, it bends like a bow on his bridling, it is not formed for a free paffage of the breath. This defect in a horfe is expreffed among the dealers by the
phrafe cock throppied. The head floould be fet on to the neck, that a fpace may be felt between the neck and the chine ; when there is no fuch face, the horfe is faid to be bull-necked; and this is not only a blemifh in the beauty of the horfe, but it alfo occalions his wind not to be fo good. The creft fhould be frong, firm, and well-rifen; the neck fhould be fraight and firm, not loofe and pliant; the brealt fhonld beftrong and broad, the ribs round like a barrel, the fillets lirge, the buttocks rather oval than broad, the legs clean, ... flat, and ftraight; and, finally, the mane and tail. onght to be long and thin, not thert and bumy, the laft being counted a mark of dulluefs. Whein a hanter is thas chofen, and has been taught fuch obedience, that he will readily anfwer to the rider's fignals both of the bridle and hand, the voice, the calf of the leg, and the fpurs: that he knows how to make his way forward, and has gained a true temper of mouth, and a right placing of his head, and has learned to ftop, and to turn readily, if his age be fufficiently advanced, he is ready for the field. It is a rule with all ftaunch foortfmen, that no horfe hould be ufed in hunting till he is full five years old; fome will hant them at four, but the horfe at this time is not come up to his true frength and courage, and will not only fail at every. tough trial, but will be fubject to frains and accidents of that kind, much more than if he were to be kept another year firf, when his frength would be more confirmed.

When the honter is five years old, he may be put to grais from the middle of May, till Bartholomewtide; for the weather between thefe is hot, that it will be very proper to fpare him from work. At Bar-tholomew-tide, the ftrength of the grafs beginning to be nipped by frofts and cold dews, io that it is apt to engender crudities in the horfe, he fhould be taken up while his coat is yet fmooth and fleek and put intothe ftable. When he is firt bronght home, he fhould be put in fome fecure and fpacious place, where he may evacuate his body by degrees, and be brought not all: at once to the warm keeping; the next night he may. be ftabled up. It is a general rule with many not to clothe and fable up their horfes till two or three days after they are taken from grafs, and others who put them in the ftable after the firft night, yet will not drefs and clothe them till three or four days afterward ; but all this, except the keeping the horfe one day in a large and cold place, is needlefs caution.

There is a general practice among the grooms, in many places, of giving their hunters wheat-ftraw as foon as they take them up from grafs. They fay they do this to take up their bellies; but there feems much reafon to difapprove of this. The change is very, violent, and the nature of the fraw fo heating and: drying, that there feems good reafon to fear that the aftringent nature of it would be prejudicial; more than is at firf perceived. It is always found that the dung is hard after this food, and is voided wirh pain and-: difficulty, which is in general very wrong for this fort of horfe. It is better therefore to avoid this. Itrawfeeding, and to depend upon moderate airing, warm clothing, and good old hay, and old corn, than to have recourfe to any thing of this kind.

When the horfe has evacuated all his grafs, and has: been properly fhod, and the hoes have had time to: fertle:

Huncer. fetife to his feet, he may be ridden abroad, and treated in this manner: the groom ought to vilit him ear. ly in the morning, at five o'clock in the long days, and at lix in the fhort ones; he mult then clean out the ftable, and feel the horfe's neck, flank, and belly, to find the ftate of his health. If the flank feels foft and flabby, there is a necelfity of good diet to harden it, otherwife any great exerctife will occafion fwellings and goutinefs in the heels. After this examination, a handful or two of good old oats, well fifted, hould be given him ; this will make him have more inclination to water, and will alfo make the water fit better on his flomach, than if he drank fafting. After this he is to be tied up and dreffed. If in the doing of this he opens his mouth, as if he would bite, or attempts to kick at the perfon, it is a proof that the tecth of the curry-comb are too harp, and muft be filed blanter. If after this he continues the fame tricks, it is through wantonnefs, and he fhould be corrected for it with the whip. The intent of currying being only to raife the daft, this is to be bruthed off afterwards with a horfe-tail nailed to a handle, or any other light brufh. Then he is to be rubbed down with the brufh, and dufted a fecond time; he fhould then be rubbed over with a wet hand, and all the loofe hairs, and whatever foulnefs there is, thould be picked off. When this is done, and he is wiped dry as at firf, a large faddlecloth is to be put on, reaching down to the fpurring place; then the faddle is to be put on, and a cloth Thrown over it that he may not take cold: then rub down his legs, and pick his feet with an iron picker, and let the mane and tail be combed with a wet manecomb, Lafly, it is a cuftom to fpurt fome beer in his mouth juft before the leading him out of the ftable. He fhould then be mounted, and walked a mile at leaft to fome running water, and then watered; but he muft only be fuffered to take abour half his water at one drinking.

It is the cuftom of many. to gallop the horfe at a wiolent rate as foon as he comes out of the water; but this is extremely wrong for many reafons. It endangers the breaking a horfe's wind more than anyother practice, and often has been the occafion of burfting very good hories. It ufes them alfo to the difagreeable trick we find in many horfes, of running away as foon as ever they come out of the water : and with fome it makes them averfe to drinking, fo that they will rather endure thirft, and hurt themfelves greatly by it, than bring on the violent exercife which they remem. ber always follows it. The better way is to walk him a little after he is out of the water, then put him to a gentle gallop for a little while, and after this to bring fim to the water again. This fhould be done three or four times, till he will not drink any more. If there is a hilly place near the watering place, it is always well to ride up to it; it otherwife, any place is to be chofen where there is free air and fun. That the creature may enjoy the benefit of this, he is not to be galloped, but walked about in this place an hour, and then taken home to the ftale. The pleafure the horfe himfelf takes in thefe airings when well managed is very évident ; for he will gape, yawn, and hrug up his body; and in thefe, whenever he hould fand ftill to ftale, dang, or liften to any noife, he is not to be
hindered from it, but encouraged in every thing of Hunter. this kind.

The advantages of thefe airings are very evident; they purify the blood, teach the creature how to make his breathing agree with the reft of the motions of hais body, and give him an appetite to his food, which hunters and racers that are kept ftalled up are otherwife very apt to lofe. On returning from airing, the litter of the flable chould be frefh, by ftirring this and whiftling, he will be brought to ftale. Then he is to be led to his Itall, and tied up, and again carefully rubbed down; then he thould be covered with a linen cloth next his body, and a canvas one over that, made to fit him, and reaching down to his legs. This, as the duke of Newcaftle obferves, is a cuftom whici we learned of the Turks, who are of all people the moft niceand careful of their horfes. Over this covering there hould be put a body-cloth of fix or eight ftraps ; this keeps his belly in flape, and does not hart him. Tais clothing will be fufficient while the weather is not very fiarp but in fevere feafons, when the hair begins to rife and ftart in the uncovered parts, a woollen cloth is to be added, and this will always prove fully fufficient.

Different horfes, and different feafons, make variety of the degree of clothing neceffary ; but there always is an obvious rule to point out the neceffary changes, the roughnefs of the coat being a mark of the want of clothing, and the fmoothinefs of is a proof that the clothing is fufficient. Therefore if at any time the hair is found to ftart, it is a notice that fome farther clothing is to be added.

If the horfe fweat much in the night, it is a fign that he is over fed and wants exercife; this therefore is eafily remedied. An hour or more after the horfe is come in from his airing, the groom thould give him a wifp of clean hay, making lim eat it ont of his hand; after this let the manger be well cleaned out, and a quartern of oats clean fifted be given him. If he eats up this with an appetite, he fonld have more given him; but if he is flow and indifferent abour it, he mult have no more. The bufinefs is to give him enough, but not to cloy him with food.

If the horfe gets fiefh too faft on this home feeding, he is not to be finted to prevent it, but only his exercife increafed ; this will take down his flefh, and at the fame time give him frength and wind. After the feeding in the morning is over, the ftable is to be fhut up, only leaving him a little hay on his litter. He need be no more looked at till one o'clock, and then only rubbed down, and left again till the time of his evening watering, which is four o'clock in the fummer and three in the winter. When he has been watered, he mult be kept out an hour or two, or more if necerfary, and then taken home and rubbed as after the morning watering. Then he is to have a feed of corn at fix o'clock, and another at nine at night ; and being then cleaned, and his litter put in order, and hay enough left for the night, he is to be left till moruing. This is the direction for one day, and in this manner he is to be treated every day for a fortnight; at the end of which time his flefh will be fo hardened, his wind fo improved, and his mouth fo quickened, and his gallop brought to fo good a froke, that he will be

Hunter, fit to be put to moderate hunting. During the time that he is ufed to hunting, he maft be ordered on his days of reft exactly as he is directed for the fortnight when he is in preparation; bat as his exercife is now greatly increafed, he mult be allowed a more flengthening food, mixing fome old fplit beans at every feeding with his oats.

And if this is not found to be fufficient, the following bread mult be given: let two pecks of old beans and one peck of wheat be ground together, and made into an indifferently fine meal; then knead it into dough with fome warm water and a goud quantity of yealt; letic lie a time that it may rife and fwell, which will make the bread the lighter; then make it into loaves of a peck each, and let it be baked in a flow oven, that it may be thoroughly done without being burnt; when it is taken out of the oven, it muft be fet bottom upwards to cool : when it is one day old the cruft is to be chipped off, and the crumb given him for food. When this is ready, he fhould have fome of it at leaft once in the day; but it is not to be made the only food, but fome feeds are to be of oats alone, fome of oats and this bread, and fome of oats and beans mixed together. The making a variety in this manner being the beft of all methods of keeping up the appetite, which is often apt to fail.

The day before the horfe is to hunt, he muft have no beans, becaufe they are hard of digeftion, bat only fome oats with his bread; or if he will be brought to eat the bread alone, that will be beft of all. His ever. ing feed fhould on this day be fomewhat earlier than ufual ; andafter this he is only to have a wirp of hay out of the groom's hand till he return from hunting.

HUNTER (Dr William), a celebrated anatomift and phylician, was born on the 23d of May 1718, at Kilbride in the county of Lanerk in Scotland. He was the feventh of ten children of John and Agnes Hunter, who refided on a fmall eftate in that parifl called Lorg Calderwood, which had been long in the poffeflion of his family. His great grandfather by his father's fide, was a younger fon of Hunter of Hunterfton, chief of the family of that name. At the age of fourteen his father fent him to the college of Glafgow. In this feminary he paffed five years; and by his prudent behaviour and diligence acquired the efteem of the profeffors, and the reputation of being a good fcholar. His father had defigued him for the church; but the idea of fubfribing to articles of faith was fo repugnant to the liberal mode of thinking he had always adopred, that he felt an infuperable averfion for his theological purfaits. In this flate of mind he happened to become acquainted with Dr Cullen, the late celebrated profeflor at Edinburgh, who was then juft eftablifhed in practice at Hamilton under the parronage of the duke of Hamilton. Dr Callen's converfation foon determined him to lay afide all thoughts of the church, and to devote himfelf to the profeffion of phyfic. His father's confens having been previoully obtained, Mr Hunter in $1737^{\text {went }}$ to refide with Dr Collen. In the family of this excellent friend and preceptor he paffed nearly three years; and thefe, as he has been often heard to acknowledge, were the happieft years of his life. It was then agreed, that he fhould go and profecute his medical fudies at Edinburgh and Lon-
don, and afterwards return to fettle at Hamilton in partnerfhip with Dr Cullen. He accordingly fet out for Edinburgh in November:1740; and contintied there till the following fpring, atcending the lectures of the medical profeffors, and amongit others thofe of the late Dr Alexander Monro, who many years afterwards, in allufion to this circumftance, ftyled himfelf his old mafter.

Mr Hunter arrived in London in the fummer of 1741, and took up his relidence at Mr, afterwards Dr Smellie's, who was at that time an apothecary in Pail Mall. He brought with hima letter of recommendation to his countryman Dr James Douglas, from Mr Foulis printer at Glafgow, who had been afeful to the Doctor in collecting for him different editions of Horace. Dr Donglas was then intent on a great anatomical work on the bones, which he did not live to complete, and was looking out for a young man of abilities and induftry whom he might employ as a diffector. This induced him to pay particular attention to Mr Hunter ; andfinding him acute and fenfible, he defired him to make him another vifit. A fecond converfation confirmed the dostor in the good opinion he had formed of Mr Hunter; and without any farther hefitation he invited him into his family to affift in his diffections and to fuperintend the education of his fon.-Mr Hunter having accepted Dr Douglas's invitation, was by his friendly affiftance enabled to enter himfelf as a.furgeon's pupil at St George's Hofpital under Mr James.Wilkie, and as a diffecting pupil under Dr Frank Nichols who at that time taught anaw tomy with confiderable reputation. He likewife attended a courfe of lectures on experimental philofophy by Dr. Defaguliers. Of thefe means of improvement he did not fail to make a proper ufe. He foon became expert in diffection, and Dr Donglas was at the expence of having feveral of his preparations engraved. But before many months had elapfed, he had the misfortunt to lofe this excellent friend.-The death of Dr Donglas, however, made no change in the fituation of our author. He continued to refide with the Doctor's family, and to purfue his fludies with the fame diligence as before.

In 1743 he communicated to the Royal Society an effay on the Structure and Difeafes of articulating Cartilages. This ingenious paper, on a fubject which till then had not been fufficiently inventigated, affords a ftriking teftimony of the rapid progrefs he had made in his anatomical inquiries. As he had it in contemplation to teach anatomy, his attention was dirceted principally to this object; and it deferves to be men. tioned as an additional mark of his prudence, that he did not precipitately. engage in this attempt, but paffed feveral years inacquiring fach a degree of knowledge and fuch a collection of preparations, as might infure him fuecefs. Dr Nichols, to whom he communicated his feheme, and who declined giving lectures about that time in favour of the late Dr:Lawrence, did not give him much encouragement to pro. fecute it. But at length an opportunity prefented itfelf for the difplay of his abilities as a teacher. . A fociety of navy furgeons had an apartment in Covent Garden, where they engaged the late Mr: Samuel Sharpe to deliver a courfe of lectures on the operations of furgery. Mr Sharpe continued to repeat this courfe,
© nter, till finding that it interfered too much with his oticu engagements, he declined the tafk in favour of Mr Hunter ; who gave the fociedy fo much Jatisfaction, that they requefted him to extend his plan to anatomy, and at firft he had the ufe of their room for his lectures. This happened.in the winter of 1746 . He is fild to have experienced much folicitude when he began to fpeak in public: but the applaufe he met with foon infpired him with courage; and by degrees he became fo fond of teaching, that for many years before his death he was never happier than whenemployed in delivering a lecture. The profits of his twe firft courfes were confiderable; bat by contributing to the wants of different friends, he found himfelf at the return of the next leafon obliged to defer hislectures for a fortnight, merely becaufe he had not money enough a to defray the neceflary expence of advertifements.

In 1747, he was admitted a member of the corporation of fargeons; and in the fpring of the following year, foon after the clofe of his lectures, he fet out in company with his pupil, Mr James Douglas, on a tour through Holland to Paris. "His lectures fuffered no interruption by his journey, as he returned to England foon enough to prepare for his wiater-colarfe, which began about the ufual time.

At firf he practifed both furgery and midwifery ; but to the former of thefe he had always an averfion. His patron, Dr James Douglas, had acquired confider:able reputation in midwifery; and this probably indaced Mr.Hunter to direct his views chiefly to the fame line of praktice. His being elected one of the furgeon men-midwives, firft to the Middlefex, and foon afterwards to the Britilh Lying-in Hofpital, affilted in bringing him forward in this branch of his profeffion, in which he was recommended by feveral of the moft eminent furgeons of that time, who refpected his anatomical talents and wifhed to encourage him. But thefe were not the only circumftances that contributed to his fuccefs. He owed much to his abilities, and much to his perfon and manner, which eminently qualified him for the practice of midwifery.

In 1750, he feems to have entirely relinquifhed his views of fargery; as in that year he obtained the degrec of Doctor of Phy fic from the univerfity of Glafgow, and began to practife as a phyfician. About this time be quitted the family of Mrs Douglas, and went to refide in Jermyn-ftrect. In the fummer of 175 I he revifited his native country, for which he always retained a cordial affection. His mother was ftill living at Long'Calderwood, which was now become his property by the death of his brother James. Dr Callen, for whom he always entertained a fincere regard, was then eftablifhed at Glafgow, and had ac, quired confiderable reputation both as a practitioner and teacher of phyfic; fo that the two friends had the pleafure of being able to congratulate each other on their mutual profperity. During this vifit he fhowed his attachment to his little paternal inheritance, by giving many inftructions for repairing and improving it, and for purchafing any adjoining lands that might be offered for fale. After this journey to Scotland, to which he devoted only a few weeks, he was never abfent from London, unlefs his profeffional engagements, as fometimes happened, required his attendance at a diftance from the capital.

In 1755 , on the refignation of Dr Layard, one of the phyficians of the Britilh lying-in hofpital, we find the governors of that inflitution voting their "6thanks to Dr Hunter for the fervices he had done the hofpital, and for his continuing in it as one of the phyficians:" fo that he feems to have been eftablimed in this office without the ufual form of an election. The year following he was admitted a licentiate of the Royal College of phylicians. Soon afterwards he was elected a member of the Medical Society; and to the Obfervations and Inquiries publinhed by that fociety, heat different periods contributed feveral valuable papers.

In 1762 , we find him warmly engaged in controverfy, fupporting his clain to diffcrent anatomical difcoveries, in a work entitled Medical Commentaries, the fyle of which is correct and fpirited; As an excule for the tardinefs with which he brought forth this work, he obferves in his introduction, that ir required a good deal of time, and he had little to fpare; that the fubject was unpleafant, and therefore he was very foldom in the hamour to take it up. In this publication he confined himfelf chiefly to a difpute with the prefent learned profeffor of anatomy at Edinburgh, concerning injections of the tefticle, the dacts of the lacrymal gland, the origin and ufe of the lymphatic veffels, and abforption by veins. He likewife defended himfelf againft a reproach thrown upon him by profeflor Monro fenior, by giving a concife account of a controverfy he was involved in with Mr Pott concerning the difcovery of the Hernia Congenita. It was not long before Mr Pott took occafion to give the public his account of the difpute ; and, in reply, Dr Hunter added a fupplement to his commentaries. No man was ever more tenacious than Dr Hunter of what he conceived to be his anatomical rights. This was particularly evinced in the year 1780 , when his brother communicated to the Ruyal Society a difcovery he had made 25 years before, relative to the ftructure of the placenta, the communication between it and the uterus, and the valcularity of the fpongy chorion.- At the next meeting of the fociety, a letrer was read, in which Dr Hunter put in his claim to the difcovery in queftion. This letter was followed by a reply from Mr John Hunter, and here the difpute ended.

In 1762, when the queen became pregnant, DrHunter was confulted: and two years afterwards he had the honour to be appointed-phyfician extraordinary to her majefty.

About this time his avocations were fo numerous, that he became defirous of leffening his fatigue; and having noticed the ingenuity and affiduous application of the late Mr William Hewfon, F. R. S. who was then one of his pupils, he engaged him firft as an affiftant, and afterwards as a partner, in his lectures. This connection continued till the year 1770 ; when fome difputes happened, which terminated in a feparation. Mr Hewfon was fucceeded in the partnerfhip by Mr Cruikfhank, whofe anatomical abilities are defervedly refpected.

In 1767, Dr Hunter was elected a fellow of the Royal Society : and in the year following communicated to that learned body obfervations on the bones, commonly fuppofed to be elephants bonts, which have been found near the river Ohio in America. This

Hunter. was not the only fubjest of natural hiftory on which our author employed bis pen; for in a fublequent volume of the Philofophical Tranfsctions, we find him otlering his remarts on fome bones lound in the rock of cibraltar, and which he proves to have belonged to fome quadruped. In the fame work, likewife, he publifted an account of the nyl-ghau, an Indian animal not deícribed before. In 1768, Dr Hunter became a fcllow ot the Society of Antiquaries; and the fame year at theinftitution of a Royal Academy of Arts, he was appointed by his majefty to the office of profeflor of anatoriy. This appointment opened a newfield for his abilitics; and he engaged in it as he didin every other pur. fut of his life, with unabating zeal. He now adapted his anatomical knowledge to the objects of painting and fculpture, and the novelty and juftnefs of his obfervations proved at once the readinefs and extent of his genius. In january a 78 r , he was unanimoully clected to fucceed the late Dr John Fothergill as prefident of the Medical Society. As his name arrd talents were kuown aud refpected in every part of Europe, fo the honours conferred on him were not limited to his own country. In i 780 the Royal Medical Society at Paris elceted him one of their foreign aflociates; and in 1782, he received a fimilar mark of diftinction from the Royal Academy of Sciences in that city.

The moft fplendid of Dr Hunter's medical publications was the Anatomy of the Human Gravid Uterus. The appearance of this work, which had been begun fo early as the year 175 x (at which t:me 10 of the 34 plates it contains were completed), was retarded till the year 1775 , only by the auhor's defice of fending it into the world with fewerimperfections. This great work is dedicated to the king. In his preface to it, we find the author very candidly acknowledging, that in moft of the diffections he-had been af fifted dy his brother Mr John Hunter, "s whofe accu. racy (he adds) in anatomical refcarches is fo well known that to omit this opportunity of thanking him for that affiftance would be in fome meafure to difregard the future reputation of the work itfelf." He likewife confeffes his obligations to the ingenious artifts who made the drawings and engravings; " but particularly to Mr Strange, not only for having by his hand fecured a fort of imnortality to two of the plates, but for having given his advice and affiftance in every part with a fteady and difinterefted friendfhip. An anatomical defcription of the gravid uterus was a work which Dr Hunter had in contemplation to give the public. He had likewife long been einployed in collecting andarranging materials for a hiftory of the various concretions that are formed in the human body Amongft Dr Hunter's papers have been found two introductory lectures, which are written out fo fairly, and with fuch accuracy, that he probably intended no farther correction of them before they fhould be given to the world. In thefe lectares Dr Hunter traces the hiftory of anatomy from the earlieft to the prefent times, along with the gencral progrefs of fcience and the arts. He confiders the great uility of anatomy in the practice of phyfic and furgery; gives the ancient divifions of the different fubfances compofing the human body, which for a long time prevailed in anatomy; points out the molt advantageous mode of caltivating this branch of natural knowledge; and conVol. VIII.
cludes with explaining the paticular plan of his own Inater. lectures. Befides thefe manaforints, be has alfo left behind him a conliderable number of cafes wídilection; moftly relating to pregnant woincn.

The fame year in which the Tables of the Givid Uterus made their appcarance, Dr Hunter communicated to the Royal Souiety an Etay on the Origin of the Venercal Difafe. In this paper he attemped to prove, that this dreadful malady was not biught from America to Europe by the crew of Columbus, as had been commonly fippofed; altbough it madc its firft appearance about that period. After this paper had beenread to the Royal Society, Dr Hunter, in a converfation with the lave Dr Mufgrave, was convinced that the teftimony on which he placed his chief dependence was of lefs weight than he had at firft imagined, as many of Martyr's letters afford the mont convincing proofs of their having been writtena confiderable time after the period of their dates. He therefore very properly laid afide his intention of giving his ef. fay to the public. In the year a 777 Dr Hunter joined with Mr Watfon in prefenting to the Royal Society a flort account of the late Dr Maty's illnefs, and of the appearances on diffection; and the year following he publifhed his Reflections, on the Section of the Symphyfis Pubis.

We muft now go back a little into the order of time to defcribe the origin and progrefs of Dr Hunter's mufeum, withont fome account of which the hiftory of his life would be very incomplete.

When he began to practife midwifery, he was defrous of acquiring a fo tune f.fficien:t to place him in eafy and independant circumftances. Before many years had elapfed, he found himfelf in poffeffion of a fum adequate to his wines in this refpect; and this he fet apart as a refource of which he might avail himfelf whenever age or infirmities flould oblige him to retire from bufinefs. After he had obtained this comfetency, as his wealth continued to accumulate, he formed a laudable defign of engaging in fome fcheme of public utility, and at firft had it in contemplation to found ant anatomical fchool in Edinburgh. For this purpofe, about the year 1765 , during the adminiftration of Mr . Grenville, he prefented a memorial to that minifter, in which he requefted the grant of a piece of ground in the Mews, for the fcite of an anatomical theare. Dr Hunter under. took to expend L. 7000 on the building, and to endow a profeflorfhip of anatomy in perpenity. This fcheme did not meet with the reception it deferved. In a converfation on this fubject foon afterwards with the carl of Shelburne, his lordfhip expreffed a wing that the plan might be carried into execution by fubfeription, and very generoufy requefted to have his name fet down for a thonfand guineas. Dr Hunter's delicacy woald not allow him to adopt this propsfal. He chofe rather to execate it at his own expence; and accordingly purchafed a fot of ground in Ureat Wind mill-ftreet, where he erected a fpacious houfe, to which he removed from Jermyn-ftreet in 1770 . In this bailding, befles a handfome amphitheatre, and other convenient apartments for his lectures and dilections, there was one magnificent room, fitted up with great clegance and propriety as a mufeam. Of the magaithde and value of his andomical collcction fome idea
traner, may heformed, when we confider the great length of Hunticg. years he employed in the maling of anatomical prep
rations and in the diffetion of morbid bodies, adided to the cagernels with which he procured additions from the collections of Saidys, Hewfon, Falconer, Blackall, and others, that were at diferent times offered for fale in the metropolis. His fpecimens of rare difeafes were likewife frequen:ly incteafed by prefents from his medical friends and pupils; who, when any thing of this fort occurred to them, very juftly thought they could not difpofe of it more properly than by placing it in Dr Hunter's mufeum. Speaking of an acquifition in this way in one of his publications, he fays, "I look upon every thing of this kind which is given to me, as a prefent to the public; and confider myfelf as thereby called upon to ficrve the pablic with more diligence."

Before his removal to Windmill-ftreet, he had confined his colletion chiefly to fpecimens of human and comparative anatomy and of difeafes; but now he extended his views to foffils, and likewife to the promotion of polite literature and erudition. In a fhor fipace of time he became poffeffed of "the moft magnificent treafure of Greck and Latin books that has been accumulated by any perfon now living fince the days of Mead." A cabinet of ancient medals contributed likewife much to the richnefs of his mufeum. A defcription of part of the coins in this collection, ftruck by the Greek free cities, has lately been publifhed by the Doctor's learned friend Mr Combe. In a claffical dedication of this elegant volume to the queen, Dr Hunter acknowledges his obligations to her majefty. In the preface tome account is given of the progress of the collection, which has been brought together fince the year 1770, with fingular tafte, and at the expence of upwards of L. 20,000 . In 178 r , the mufeum received a valuable addition of hells, corals, and other curious fubjects of natural hiftory, which had been collected by the late worthy Dr Fothergill, who gave directions by his will, that his collection fhould be appraifedafter his death, and that Dr Hanter thould have the refufal of it at $L$. 500 under the valuation. This was accordinglydone, and Dr Hunter purw chaled it for the fum of L. 1200. The fame of this nufeum firead throughout Europe. Few foreigners diftin guiflied for their rank or learning vifited the metropolis without requefting to fee it. Men of feience in Britain always had eafy accefs to it.-Considered in a collective point of view, it is perhaps with. out a rival.

Dr Hunter, at the head of his profeffion, honoured with the efteem of his fovereign, and in poffeffion of every thing that his reputation and wealth could confer, fecmed now to have attained the fummit of his wifhes. But thefe fources of gratification were imbittered by a difpolition to the gout, which haraffed him frequently during the latter part of his life, notwithftanding his very abftemious manner of living. On-Saturday the 15 th of March 1783 , after having for feveral days experienced a return of a wandering gout, he complained of a great head-ach and naufea. In this fate he went to bed, and for feveral days felt more pain than ufial both in his ftomach and limbs. On the Thurfday following he found himfelf fo much recovered, that he determined to give the introductory lectore to the
operations of furgery. It was to no purpofe that his Huating. friends arged to him the impropriety of fuch an attempt. He was determined to make the experiment, and accordingly delivered the lecture ; but towards the conclufion hisftrength was fo exbaufted that he fainted away, and was obliged to he carried to bed by two fcrvants. The following night and day his fymptoms were fuch as indicated danger; and on Saturday morn* ing Mr Combe, who made him an early vifit, was alarmed on being told by Dr Hunter himfelf that dat. ring the night he had certainly had a paralytic froke: As neither his fpeech nor his pulfe were affected, and he was able to raife himfelf in bed, Mr Combe encou* raged him to hope that he was miftaken. But the event proved the docter's idea of his complaint to be but too well founded; for from that time till his death, which happened on Sunday the 3orh of March, he voided no urine without the affiftance of the catheter, which was occafionally introduced by his brother : and purgative medicines were adminiftered repeatedly with out procuring a paffage by fool. Thefe circumftances, and the abrence of pain, feemed to flow that the int teftines and urinary bladder had loft their fenfibility and power of contraction : and it was reafonable to prefume that a partial palfy had affected the nerves diftributed to thofe parts.

By his will, the ufe of his mufeum, under the direction of traftees, devolves to his nephew Matthew Baillie. B. A. and in cafe of his death to Mr Cruik: fhank for the term ofthirty years, at the end of which period the whole collection is bequeathed to the univerfity of Glafgow. The fum of eight thoufand pounds iterling isleft as a fund for the fupport and angmentation of the collection.

Dr Hunter was regularly fliaped, but of a nender make, and rather below a middle ftature. His manner of living was extremely fimple aud frogal, and the quantity of his food was fmall as well as plain. He was an early rifer; and when bufinefs was over, was conftantly engaged in his anatomical purfaits, or in his mafeum. There was fomething very engaging in his manner andaddrefs: and hichad fuch an appearance of attention to his patients, when he was making his inquiries, as could hardly fail to conciliate their confidence and efteem. In confiltation with his medical brethren, hedelivered his opinions with diffidenceand candour. In familiar converfation he was cheerful and unaffuming. As a teacher of anatomy he has been long and defervedly celebrated. He was a good orator ; and having a clear and accurate conception of what he tanght, he knew how to place in diftinct and intelligible points of view the moft ablture fubjects of anatomy and phyfiology. Among other methods of explaining and illustrating his doctrines, he ufed frequently to introduce fome appofite ftory or cafe that had occurred to him in practice ; and few men had acquired a more interefting fimd of anecdotes of this kind, or related them in a more agreea: ble manner.

HUNTING, the exercife or diverfion of purfuing four footed beafts of game. See the article Game.

Four-footed beafts are hunted in the fields, woods, and thickets, and that both with guns and giehounds.

Birds, on the contrary, are either fhot in the air,

## H U N <br> $723]$ <br> H U N

Hunting, or taken with nets and other devices, which exercife is called fowling; or they are purfued and taken by birds of prey, which is called havoking. See the articlesFowling, Hawkinc, Falconry, Shuoting, Bird-Catching, and Decoy.
F. de Launay, profeffor of the French laws, has an exprefs treatife of hunting. From thofe words of God to Adam, Gen. i. 26, and 28. and to Noah, Gein. ix. 2, 3. hunting was confidered as a right devolved or made over to man ; and the following ages appear to have been of the fame fentiment. Accordingly we find, that among the more civilized nations it made one of their diverfions; and as to the wilder and more barbarous, it ferved them with food and neceffaris. The Roman jurifprudence, which was formed on the manuers of the firft ages, made a law of it, and eftablifhed it as a maxim, that as the natural right of things which have no mafter belongs to the firft poffeffor, wild beafts, birds, and fifhes, are the property of whofoever can take them firft.

But the northern nations of barbarians who over-ran the Roman empire, bringing with them a ftronger tafte for the diverfion, and the people being now poffeffed of other and more eafy means of fubliftence from the lands and poffeffions of thofe they had vanquithed, their chiefs and leaders began to appropriate the right of hunting, and, inftead of a natural right, to make it a royal one. Thus it continues to this day; the right of hunting, in Britain, belonging only to the king, and thofe who derive it from him.

The hunting ufed by the ancients was much like that now practifed for the rein-deer: which is feldom hunted at force, or with hounds; but only drawn with - a blood-hound, and foreftalled with nets and engines. Thus did they with all beafts; whence a dog is never commended by them for opening before he has difcovered where the beaft lies. Hence, they were not in any manner curious as to the mufic of their hounds, or the compofition of their kennel or pack either for deepnefs, loudnefs, or fweetnefs of cry, which is a - principal point in the hunting of our days. Their huntfmen, indeed, were accuft med to fhout and make a great noife as Virgil obferves in the third of his Georgics: Ingentum clamore premes ad retia cervum. But that confufion was only to bring the deer to the nets laid for him.

The Sicilian way of hunting had fomething in it very extraordinary.-The nobles or gentry being informed which way a herd of deer paffed, gave notice to one another, and appointed a meeting; every one bringing with him a crols bow or a long-bow, and a bundle of ftaves fhod with iron, the heads bored, with a cord pafling through them all : thus provided, they came to the herd, and cafting themfelves about in a large ring, furrounded the deer.-Then, each taking his ftand, unbound his faggot, fet up his ftake, and tied the end of the cord to that of his next neighbour, at the diftance of ten feet from one another.-Then taking feathers, died in crimfon, and faftened on a thread, they tied them to the cord; fo that with the leaft breath of wind they would whirl round. -

Which done, the perfons who kept the ftands with drew, and hid theinfelves in the next covert. Then the chief ranger entering within the line with hounds to draw a fter the herd, roufed the game with their cry ; which flying towards the line, were turned off, and, ftill gazing on the fhaking and fhining feathers, wandered aboutas if kept in with a real wall or pale. The ranger ftill purfued, and calling every perfon by name as he palled by their ftand, commanded him to hoot the firf, third, orlixth, as he pleafed : and if any of them milicd, or fingledout another than that alligned him, it was counted a grievons difgrace. By fucly means, as they paffed by the feveral ftations, the whole herd was killed by the feveral hands. Pier. Hieroglyphic. lib. vii. cap. 6.
Hunting formed the greatef part of the employment of the ancient Germans, and probably of the Britons alfo, when they were not engaged in war. We are informed by fome ancient hiftorians, that this was the cafe even as late as the third century with the unconquered Britens who lived beyond Adrian's wall ; nay, that they fubfifted chiefly by the prey they took in this way. The great attachment hown by all the Celtic nations to hunting, however, proceeded moft probably from its being a kind of apprenticeflip to war. Thus their youth acquired that courage, ftrength, fwiftnefs, and dexterity in handling their arms, which made them fo formidable in time of war to their enemies. Thus alfo they freed the country from many mifchievous animals which abounded in the forefts, furnifhing themfelves alfo with materials for thofe fealts which feem to have conftituted rheir greareft pleafure. The young chieftains had thuslikewife an opportunity of paying court to their miftreffes, by difplaying their bravery and agility, and making them prefents of their game; nay, fo ftrong and univerfal was the paffion for hunting among the ancient Britons, that young ladies of the higheft quality and greateft beauty fpent much of their time in the chace. They employed much the fame weapons in hunting that they did in war, viz. long fpears, javelins, and bows and arrows; having alfo great numbers of dogs to affif them in finding and purfuing their game. Thefe dogs, we are alfo told, were much admired among other nations, on account of their fwiftnefs, ftrength, fiercenefs, and exquifite fenfe of fmelling. They were of feveral different kinds, called by different names, and formed a confiderable articie of commerce. They are highly valued by all the Celtic nations, infomach that fome very comical penalties were inticted upon thofe who were convicted of ftealing them ( $\Delta$ ). From the poems of Offian alfo it appears, that the Britons were not unacquainted with the art of catching birds with hawks trained for that parpofe; but they feem to have been abfolutely ignorant of the method of catching filh; for there is nota fingle allufion to this art in all the works of that venerable bard. Their ignorance of this art is both confirmed and accounted for by Dio Niceus, who affures us, that the ancient Britons never tafted fifh, though they had innumerable multitudes in their feas, rivers, and lakes. "By the by (fays Dr Henry), we $4_{4}{ }_{2}$ may:

Honting. may obferve that this agreement between the poems of Offian and the Greek hiftorian, in a circumftance fo fingular, is at once a proof of the genuine antiquity of thefe poens, and that the Greek and Roman writers were not foill informed about the affairs and manners of the ancient Britons as fome liave imagined."

The Mexicans, whatever imbecility may be impured to them in other refpects, werc very dexterons in hunting. They ofed bows and arrows, darts, nets, frares, and a kind of tubes named carbottane, through which they fhot by blowing out little balls at birds. Thofe which the kings and great men made ufe of were culioully carved and painted, and like wife adorncd with gold and filver. Befides the exercife of the chace which private individals took either for amufement or to provide food for themfelves, there were general hunting-matches, fometimes appointed by the king; at others, undertaken with a view to provide plenty of victims for facrifices. A large wood, generally that of Zacatapec, not far diftant from the capital, was pitched upon as the fcene of thefe grand hunting-matches. Here they chofe the place heft adapted for fetting a great number of fartes and nets. The wood was inclofed by fome thoufands of hunters, forming a circle of fix, feven, or eight miles, according to the number of animals they intended to take. Fire was then fet to the grafs in a great number of places, and a terrible noife made with drums, horns, fhonting, and whifling. The hunters gradually contracted their circle, continuing the noife till the gane were inclofed in a very fmall face. They were then killed or taken in fnares, or with the hands of the hunters. The number of animals taken or deftroyed on thefe occafions was fo great, that the firft Spanifh viceroy of Mexico would not believe it without making the cxperiment himfelf. The place chofen for his hunting-matcl was a great plain in the-country of the Otomies, lying between the villages of Xilotepec and S. Giovani del Rio ; the Indians being ordered to proceed according to their ufual cuftoms in the times of their paganifm. The viceroy, attended by a vaft retinue of Spaniards, repaired to the place appointed, where accommodations were prepared for them in houfes of wood erected for the purpofe. A circle of more than is iniles was formed by 11,000 Otomies, who ftarted fucls a quantity of game on the plain, that the viceroy was quite aftonihed, and commanded the greater part of them to be fet at liberty, which was accordingly done. The number retained, however, was ftill incredibly great, were it not attefted by a witnefs of the higheft credit. On this occahon upwards of 600 deer and wild goats, 100 cajotes, with a furprifing number of hares, rabbits, anid other fmaller animals. The plain fill retains the Spanif name Cazadero, which fignifies the "place of the chace."

The Mexicans, befides the ufaal methods of the chace, had particular contrivances for catching certain animals. Thus, to catch young affes, they made a fmall fire in the woods, putting among the burning conls a particular kind of fone named cacalottl "raven or black ftone," which burfts with a loud noife when heated. The firerwas covered with earth, a little maize laid around it. The affes quickly affembled with their young, in order to feed upon the maize; but while they were thus employed, the fone burft, and
fcared away the old ones by the explofion, while the young ones, unable to fly, were carried off by the hunters. Serpents weretaken even by the hands, feizing them intrepidly by the neck with one land, and fewing up their mouths with the other. This method is fill practifed. They flowed the greateft dexterity in tracing the fteps of wild beafts, even when an European could not have difcerned the fmalleft print of their feet. The Indian method, however, was by obferving fometimes the herbs or leaves broken down by their feet; fometimes the drops of blood which fell from them when wounded. It is faid that fome of the American Indiaus fhow fill greater dexterity in difcovering the tracts of their enemies, which to an European would be altogether imperceptible.

Hunting was a favourite divertion of the great and bloody conqueror Jenghiz Khan, if indeed we can apply the word diverfion to a monfter whofe mind was fet upon the deftruction of his own fpecies, and who only endeavoured to make the murder of brutcs fubfervient to that of men, by keeping his foldicrsin a kind of warfare with the beafts when they had no human enemies to contend with. His expeditions were conducted on a plan fimilar to that of the Mexicans already mentioned; and were no doubt attended with ftill greater fuccefs, as his numerous army could inclofe a mucli greater face than all the Indians whom the Spanifh viceroy could mufter. The Eaft Indian princes ftill fhow the fame inclination to the chace; and Mr Blane, who attended the luanting excurfions of Afoph Ul Dowlah vifir of the Mogul empire and nabob of Oude in 1785 and 1786 , gives the following account of the method practifed on this occafion.

The time chofen for the hunting party is about the beginning of December; and the diverfion is continned till the bears, which commence about the beginning of March, oblige them to fop. During this time a ci:cuit of between 400 and 600 miles is generally made, the hunters bending their courfe towards the fkirts of the northern mountains, where che country is $\%$ ind anduncultivated. The vifir takes aleag witin iim not only his court and feraglio, but a grcat part of the inhabitants of his capital. Hisimmediate attendants may amount to about 2000; but befides thefe he is allo followed by 500 or 600 horfe, and feveral battalions of regular fepoys with their field pieces. Four or five lundred elephants are alfo caŕried along with him; of which fome are ufed for riding, others for fighting, and fome for clearing the jungles and forefts of the game. Aboit as many fumpter hotifes of the beauiful Perfian and Arabian breeds are carried along with him. A great many wheel carriages drawn by bullocks likewife attend, which are ufed chiefly for the convenience of the women; fometimes alfo he has an Englifh chaife or two, and fometimes a chariot; but all thefe as well as the horfes are mercly for flow, the vifir himfelf never ufing any other convcyance than an elephant, or fometimes when fatigued or indifpofed a palanquin. The animals ufed in the foort arc prinncipally gre-hounds, of which there may be about 300; lie has alfo about 200 hawks, and a few trained leopards for hunting deer. There are a great number of markfmen, whofe profeffion it is too fhoot deer; with many fowlers, who provide game; as none of the natives of India know how to hoor game with

## $\mathrm{HUN} \quad[72 \mathrm{j}] \quad$ II U N

$\underbrace{\text { Hunthg. fmall fhot, or to hunt with fow hounds. A valt num- }}$ ber of matchlocks are carried along with the cumpany with many Englifl pieces of various kinds, 40 or 50 pairs of piftols, bows and arrows, belides fwords, dag. gers, and fabres without number. There are alfo nets of various kinds, fome for quail, and others very large, for fifhing, whichare carried along with him upon elephants, attended by fifhermen, fo as always to be ready for throwing into any river or lake that may be met with. Every article that call contribute to luxury, or pleafure is likewife carried along with the army. A great many carts are loaded with the Ganges water, and even ice is tranfporred for cooling the drink. The fruits of the feafon and freih vegetables are daily fent to him from his gardens by bearers ftationed at the diftance of every ren miles; by which means each article is conveyed day or night at the rate of four miles an hour. Befides the animalsalready mentioned, there are alfo fighting antelopes, buffalocs, and rams in great numbers; alfo feveral hundred pigeons, fome fighting cocks, with a vari variety of parrots, nightingales, \&c.

To complete the magnificence or extravagance of this expedition, there is always a large bazar, or moving town which attends the camp; confifting of fhopkeepers, and artificers of all kinds, moneychangers, dancing-women; fo that, on the noft moderate calculation, the whole number of people in his camp cannot be computed at fewer than 20,000 . The nabob himfelf, and all the gentlemen of his camp, are provided with double fets of tents and equipage, which are always fent on the day before to the place to which he intends to ge; and this is generally eight or ten miles in whatever direction molt game is ex pected; fo that by the time he has fininged his fport in the morning, he finds his whole campready pitched for his reception.

The nabob, with the attending gentlemen, proceed in a regular moving court or durbar, and thus they keep converfing together and looking out for game. A great many foxes, hares, jackals, and fometimes deer, are picked up by the dogs as they pafs along: the hawks are carried immediately before the elephants, and let fly at whatever gane is fprung for them, which is generally partridges, buftards, quails, and different kinds of herons, thefe laft affording excellent fport with the falcons or harp-winged hawks. Wild boars are fometimes ftarted, and either fhot or run down by the dogs and horfemen. Hunting the tyger, however, is looked upon as the principal diverfion, and the difcovery of one of thefe animals is accounted a matter of great joy. The cover in which the tyger is found is commonly long grafs, or reed, of fuch an height as frequently to reach above the elephants; and it is difficult to find him in fuch a place, as he commonly endeavours either to feal off, or lies fo clofe to the ground that he cannot be roufed till the elephants are almoft upon him. IIe then roars and fkulks away, but is thot at as foon as he can be feen: it being generally contrived that the nabob thall have the compliment of firing firft. If he be not difabicd, the tyger continues to fkulk along, followed by the line of elephants; the nabob and others fhooting at him as often as he can be feen till he falls. The elephants themfelves are very much afraid of this terrible animal, and difcover their apprehenfions by fhrieking and roaring
as foon as they ucyin to lincll him and hear ing growl; Huntig. generally atempting to turnaway from the place wherc ne is. When the tyger cat be traced to a particular font, the elepinants art difpoled of in a circle round Dina; ia which cafe he will at laft make a defperate attack, fipringing upon the elcohant that is nearcft, and attemptine to tear him winh histe hor his claws. Sume, out vory few, of the elephants can be broughe to attack the typer; and this they do by curling up their trunt sundur their mouths, and then ancmpting to tofs, or otherwife deftroy him, with their tuks, or to cruth him with their feet or knees. It is confidered as good Sport to kill one tyger in a day ; though fome. times, when a female is met with her youngo ones, two or three will be killed.

The other objects of parfuit in thefe excurfons arc wild elephants, buffaloes, rhinocarofes. Our author was prefent at the hunting of a wild elcphant of yaft fize and frength. An atiempt was made to take him alive by furrounding hin with tane elcplants while he was kept ar bay by crackers and other fireworks; but he conftantly eluded every effort of this kind. Sometimes the drivers of the tame clephants, got fo near him, that they threw ftrong ropes over his head, and endeavoured to detain him by faftening them around trees; but he conftantly fnapped the ropes like pack-threads, and purfued his way to the foreft. Some of the ftrongeft and moft furious of the fighting elephants were then brought up to engage him; but he attacked them with fuch fury that they were all obliged to defftt. In his ftruggle with one of them he broke one of his tufks, and the broken piece, which,was upwards of two inches in diameter, of folid ivory, flew up into the air feveral yards above their heads. Orders were now given to kill hin, as it ap. peared impoffible to take him alive; bur event this was not accomplifhed withont the greateft dificulty. He twice turned and attacked the party who purfued him; and in one of thefe attacks ftruck the elephant obliquely on which the prince rode, threw him upon his fide, but then paffed on without offering farther injury. At laft he fell dead, after having received as was fuppofed upwards of 1000 balls into his body.
Notwithftanding the general paffion amongit moftuations for hunting, however, it has by nany been deemed an exercife inconfiftent with the principles of hamanity. The late king of Prufia expreffed himfelf on this fubject in the following manner. "T The chace is one of the moft fenfual of pleafures, by which the powers of the body are firongly exerted, but thofe of the mind are unemployed. It is an cxercife which makes the limbs ftrong, active, and pliable; but leaves the head without improvement. It confifts in a violent defire in the purfait, and the ind ligence of a cruel pleafure in the death of the game. I am convinced, that man is more cruel and favage than any beat of prey: We exercife the dominion given us over thefe our fellow-creatures in the moft tyrannical manner. If we'pretend to any fuperiority over the beafts, it otght certainly to confift in reafon; but we commonly find that the molt paffionate lovers of the chace renounce this privilege, and converfe only with their dogs, hories, and other irrational animals. This renders them wild and unfeeling; and it is probable that they cannot be very merciful to the buman fpecies.

## H U N

Hunting. For a man who can in cold blood torture a poor innocent animal, cannot feel much compaffion for the dift:eifes of his own fpecies. Aud, belides, can the chace be a proper employmene for a thinking mind?"

The arguments ofed by his majefly againft hunting feem indeed to be much confirmed by confidering the various nations who have moft addicted themfelves to it. Thefe, as muft be feen, from what has already been faid, were all barbarous; and it is remarkable, that IMimrod, the firft great hunter of whom we have any account, was likewife the firft who opprefied and enflaved his own fpecies. As nations advanced in civilization, it always became neceffary to reftrain by law the inclination of the people for hunting. This was done by the wife legillator Solon, left the Athenians fhould neglect the mechanic arts on its account. The Lacedemonians, on the contrary, indulged themfelves in this diverfion without controul; but they were barbarians, and moft cruelly oppreffed thofe whom they had in their power, as is evident from their treatment of the Helots. The like may be faid of the Egyptians, Perfians, and Scythians ; all of whom delighted in war, and oppreffed their own fpecies. The Romans on the other hand, who were fomewhat more civilized, were lefs addicted to hunting. Even they, however, were exceedingly barbarous, and found it neceffary to make death and flaughter familiar to their citizens from their infancy. Hence their diverfions of the amphitheatre and circus, where the hunting of wild beafts was fhown in the moft magnificent and cruel manner; not to mention their ftill more cruel fports of gladiators, \&c.

In two cafes only does it feem poffible to reconcile the practice of hunting with humanity: viz. either when an uncultivated country is over-run with noxious animals; or when it is neceffary to kill wild animals for food. In the former cafe, the noxious animals are killed becaufe they themfelves would do foif they were allowed to live ; but if we kill even a lion or a tyger merely for the pleafure of killing him, we are undoubtedly chargeable with cruclty. In like manner, our modern fox-hunters exprefsly kill foxes, not in order ta deftroy the breed of thefe noxious animals, but for the pleafure of feeing them exert all their power and cunning to fave their lives, and then beholding them torn in pieces after being half dead with fatigue. This refinement in cruelty, it feems, is their favourite diverfion; and it is accounted a crime for any perfon to deftroy thefe animals in felf-defence, as appears from the following paffage in Mr Beckford's treatife on hunting. "Befides the digging of foxes, by which method many young ones are taken and old ones deftroyed, traps, \&c. are too often fatal to them. Farmers for their lambs (which, by the bye, few foxes ever kill), gentlemen for their game, and old women for their poultry, are their inveterate enemies. In the country where live, moft of the gentlemen arefportfmen ; and even thofe who are not, flow every kind of attention to thofe who are. I am forry it is otherwife with you; and that your old gouty neighbour fhould deftroy your foxes, 1 muft own cancerns me. I know fomegentlemen, who, when a neightour had deftroyed all their foxes, and thereby prevented them from purfuing a fà vourite amulement, loaded a cart with fpaniels, and went altogether and deftroyed his phea1.ants. I chink they might have called this very pro-
perly lex talionis: and it had the defired effect; for as Hunting. the gentleman did not think it prudent to fight them
all, he took the wiffer method, he made peace witl then. He gave an order that no more foxes fhould be deftroyed, and they never afterwards killed any of his pheafants."

In the firft volume of the Manchefter Tranfactions we have a difiertation upon the diverfion of hunting, fhooting, \&c. as compatible with the principles of humanity. One argument ufed by the author is, that death is no pofitive evil to brutes. "It would perhaps (fays he) be too hafty an affertion to affirm, that death is the evil to brutes. We are not comperent to determine whether their exiftence, like our own, may not extend to fome future mode of being, or whether the prefent limited fphere is all in which they are interefted. On fo fpeculative a queftion little can be advanced with precifion; nor is it neceffary for the inveftigation of the fubject before us. If we may be allowed to reafon from what we know, it may be fafely conjectured, that death to brutes is nopofitive evil : we have no reafon to believe they are endowed with forefight; and therefore, even admitting that with them the pleafures of life exceed its pains and cares, in terminating their exiftence, thcy only fuffer a privation of pleafure."

On this extraordinary piece of reafoning we may obferve, that it wonld hold much more againft the human fpecies than againft the brutes. There are few amongft us willing to allow that the pleafures we enjoy are equivalent to our paiis and cares; death therefore muft be to us a relief from pain and mifery, while to the brates it is a privation of pleafure. Hence, if it be no pofitive evil for a brute to fuffer death, to a man it mult be a pofitive good : add to which, that a man lives in hope of an endlefs and glorious life, while a brute has no fuch hope; fo that, if to kill a brute, on our anthor's principles be no cruelty, to kill a man moft be an act of tendernefs and mercy!

Another argument, no lefs inconclufive, is our author's fappofing that death from difeafe is much more to be dreaded in a brute than a violent death. Were krutes naturally in as helplefs a flate as man, no doubt their want of fupport from fociety in cafes where they are attacked by ficknefs, wonld be very deplo. rable; but it muft be confidered that the parallel betwixt the two fpecies is in this refpect by no means fair. A brute has every where its food at hand, and is naturally capable of refilting the inclemencies of the weather; bur man has not only a natural inability to procure food for himfelf in the way that the brutes do, but is, befides, very tender and incapable of refifting the inclemency of the air. Hence, a man unaffifted by fociety mult very foon peridh; and, no doubt, it would be much more merciful for people to kill one another at once, than to deprive them of the benefits of fociety, as is too frequently done in various ways needrefs to be mentioned at prefent. A brute, lowever, has nothing to fear. As long as its ftomach can receive food, nature offers an abundant fupply. One that feeds upon grais has it always within reach; and a carnivorous one will content itfelf with worms or infects, whrich, as long as it is able to crawl it can fill make a fhift to provide ; but fo totally helplefs is man when left to himfelf in a ftate of weaknefs, that many:

## $\mathrm{HUN} \quad[727] \quad \mathrm{H} \mathrm{U} \mathrm{iv}$

Hunting. barbarous nations have looked upon the h.Jliag of their old and infirm people to be an act of mercy.

Equally unhapy is our author in his other arguments, that the quick tranfition from a ftate of perfeet health to death mitigates the feverity. 'The tranfition is not quick. The fportfmen enimate their diverfion by the length of the chafe, and during all that time the creature muft be under the ftrongef agonies of terror ; and what perfon of humanity is there who muft not feel for an animal in this fituation? All this is affented to by our author, who fays, " Hard is the heart who does not commiferate the fufferer.". Is not this an acknowledgement on his part, that before a perfon can become a thorough fportfman, he mult harden his heart, and ftifte thofe amiable fenfations of compafion, which on all occations ought to be encouraged towards every creature, unlefs in cafes of neceffity. But in the prefent cale no necelity is or can be pretended. If a gentleman choofes to ecgale himfelf with venifon of any kind, he may breed animals for the purpofe. We call Domitian cruel, becaufe he took pleafure in catching flies, and ftabbing them with a bodkin. A butcher is excluded from fitting on a jury on account of his being accuftomed to fights sich are deemed inhuman; but whether it is moere inhuman to knock down an ox at once with an ax, or to tear lim in pieces with dogs (for they would accomplifh the purpofe if properly trained), mult be Icft to the fportfmen to detcrmine.

Laftly, the great argument in favour of hunting, that it contributes to the health of the body and exhilaration of the firits, feems equally fallacious with thereft. It cannot be proved that hunters are more healthy or long lived than other people. That exercife will contribute to the prefervation of health, as well as to the exhilaration of the mind, is undoubted; but maxy other kinds of exercife will do this as well as hunting. A man may ride from morning to night, and amufe himfelf with viewing and making remarks on the country through which he paffes ; and furely there is no perfon will fay that this exercife will tend to impair his health or fink his fpirits. A man may amufe and exercife himfelf not only with pleafure, but profit alfo, in many different ways, and yet not accuftom himfelf to behold the death of animals with indifference. It is this that conftitutes the cruelty of hunting; becaufe we thus wilfully extinguifh in part that principle naturally implanted in our nature, which if totally eradicated would fet us not only on a level with the moft ferocious wild bealts, but perhaps confiderably below them; and it muft always be remembered, that whatever pleafure terminates in death is cruel, let us ufe as many palliatives as we pleafe to hide that cruclty from the eyes of others, or even from our own.

The gentlemen and mafters of the fort have invented a fet of terms which may be called the huntinglanguage. The principal are thofe which follow:
I. For beafts as they are in company.-They fay, a berd of harts, and all manner of deer. A bey of roes. A founder of fwine. A rout of wolves. A richefs of martens. A brace or leafh of bucks, foxes, or hares. A cortple of rabbits or coneys.
2. For their lodging.-A hart is faid to parbour.

A buck lodges. A roc beds. A hare feals or jowns. oller watcios. A badger eartbs. A boar couches.Hence, to exprefs cheir difodging, hey, fiy $U_{j}: h_{h}$. botir the hart. Roufe the buck. Siart the hare. Eisto the concy. Unkerime the fox. Uiltre the marten. Fint the otter. Dig the badger. Rena the loar.
3. Fur their noife at rutting tinc.-A hárt betloth. A buck growns or troats. A roc b.tace. A bare: beats or taps. An otter whimes. A buar frowin. A fox barks. A badger foricks. A woll bowis. A gnoli rattes.
4. For their copulation.-A hart or buch goes i) rut. A roe gaes to tourn. A boar gocs to brim. A hare or coney goes to buck. A fox goes to clichiating. A wolf gues to match or make. An ocrer bumeth for his kind.
5. For the footing and treading.--Of a hact, is $c$ fay the pot. Of a buck, and all fallow-deer, the vie:s. Of all deer, if on the grafs and farce viible, the foiling. Of a fox, the print; and of other the like vermin, the footing. Of an otter, the marks. Ci a boar, the track. The hare, when in open field, is faid to fore: when fhe winds about to deceive the hounds, fhe doubles; when the beatson the hard highway, and her footing comes to be perceived, fhe pricketh: in fnow, it is called the trac: of a hare.
6. The tail of a hart, buck, or other deer is called the fingle. That of a boar, the wreath. Of a fox, the brufb or drag; and the tip at the end, the chape. Of a wolf, the fiern, Of a hare and concy, the /cut.
7. The ordure or excrement of a hart and all deer, is called fewnets or fewmiffing. Of a hare, crotiles, or crotifing. Of a boar, leffes. Of a fox, the billiting; and of other the like vermin, the fuants. Of an otter the $\int p r a i n t s$.
8. As to the attire of deer, or parts thereof, thore of a Itag, if perfect, are the bur, the pearls, the little knobs on it, ihe bean, the gutters, the antler, the furantler, royal, fur-royal, and all at top the croches. Of the buck, the bur, bean, brour-antler, black autler, advancer, palm, and fpellers. If the crotches grow in the form of a man's hand, it is called a palmed head. Head bearing not above three or four, and the croches placed'aloft, all of one height, are called crowned beads. Heads having double croches, are called forked heads, becaufe the croches are planted on the top of the beam like forks.
9. They fay, a litter of cubs, a nef of rabbits, a fquirrel's dray.
ro. The terms ufed in refpect of the dogs, \&c. are as follow.-Of gre-hounds, two make a brace; of hounds, a couple. Of gre hounds, three make a leafh; of hounds a couple and balf.-They fay, let fip a gre-hound, and, caft of $a$ hound. The ftring wherein a gre-hound is led, is called a leafh; and that of a hound, a lyome. The gre-hound has his collar, and the hound his couples. We fay a kennel of hounds, and a pack of beagles.

Hunting, as practifed among us is chiefly performed with dogs: of which we have various kinds, accomodated to the different kinds of game, as hounds, gre-hounds, blood-hounds, terriers, \&c. See Canis, Hound, \&c.

## H U N

Hunting.
In the kennels or packs they generally rank them under the heads of enterers, drieers, flyers, tyors, \&c.

On fome occations, nets, fpears, and inftruments for digging the ground, are alfo requited; nor is the hunt-ing-hom to be omitted.

The ufual chafes among us are, the bart, buck, ree, bare, fox, batger, and ctter.-We Thall here give fomething of what rclates to each thereof, firft premifing an explanation of fome general terms and phrales, more immediately ufed in the progrefs of the fport itfelf; what belongs to the feveral forts of game in particular being referved for the refpective articles.

When the hounds, then, being caft off, and finding the fcent of fome gaine, begin to open and cry; they are faid to challerige. When they are too buify ere the-feent be good, they are faid to babble. When too buly where the feent is good, to baw!. When they ran it endwife orderly, holding in together merrily, and making it good, they are faid to be in full cry. When they run along without opening at all, it is called runing mute.

When fpaniels open in the ftring, or a gre-hound in the conarfe, they are faid to lapfe.

When beagles cry and bark at their prey, they are faid to yearn.

When the dogs hit the fcent the contrary way, they are faid to druw amifs.

When they take frefk feent, and quit the former chafe for a new one, it is called bunting change.

When they hunt tic game by the heelor track, they are faid to bunt counter.

When the chafc goes off, and returns again, traverfing the fanc ground, it is called bunting the foil.

When the dogs run at a whole herd of deer, initead of a fingle one, it is called runuing riot.

Dogsfet in readinefs where the game is expected to come by, and caft off after the other bounds are pafsed, are called a relay. If they be caft off cre the other dogs be come up, it is called vauntiay.

When, finding where the chafe has been, they make a profter to enter, but returin, it it is called a biemifh.

A leffon on the hom to encourage the hounds, is named a call, or a recheat. That blown at the death of a deer, is called a mort. The part belonging to the dogs of any chafe they have killed, is the reward. They fay, lake off a deer's fkin; flrip or cafe a hare, fox, and all forts of vermin; which is done by beginning at the frout, and turning the fkin over the ears down to the tail.

Hunting is practifed in a different manner, and with different apparatus, according to the nature of the beatts which are lianted, a defcription of whon may be found under tieir refpective aricles, infra.

With regard to the feafons, that for hart and buckhunting begins a fortnight after midfummer, and tafts till Holy-rood day; that for the hind and doe, begiiis on Holy-rood day, and lafts till Candlemas; that for fos hunting begins at Chrifmas, and holds till Ladyday; that for roe hanting begins at Michaelmas, anid ends at Chriftmas; hare-hunting commenees at Mi chaelmas, and lafts till the end of febwary; and where the wolf and boar are hanted, the feafon for each be'gins ar Chriftnas, the firftending at Lady-day, and the latter at the Purification.

When the fortfract have provided themfelves with
nets, fpears, and a hunting-horn to hold the dogsto- Kunting. gether, and likewife with inftrunents for digging the ground, the following directions vill be of ufe to them in the purfuic of each fort of game.

Bager-Hontang. In doing this you muft feek the earths and burrows where he lies, and in a cleat moonthine night go and ftop all the burrows, except one or two, and therein place fome facks, faftened with drawing itrings; which may fhut him in as foon as he ftraincth the bag. Some ufe no more than to fet a hoop in the mouth of the fack, and to put it into the hole; and as foon as the badger is in the fack and ftraineth it, the fack flippeth off the hoop and follows him to the earth, fo he lies tumbling therein till he is taken. Thefe facks or bags being thus let, caft off the hounds, beating about all the woods, coppices, hedges, and tufts round abous, for the compais, of a mile or two ; and what badgers are abroad, being alarmed by the hounds, will foon betake themfelves to their burrows; and, obferve that he who is placed to watch the facks, muft fand clofe and upon a clear wind; otherwife the badgere will didcover him and will immediately fly fome other way into his burrow. But if the hounds can encounter him, before he can take his fanctuary, he will then ftand at bay like a boar, and make good fport, grievoufly biting and clawing the dogs, for the manner of their fighting is lying on their backs, ufing both teeth and nails; and by blowing up their fkins detend themfelves againft all bites of the dogs, and blows of the men apon their nofes. And for the better prefervation of your dogs, it is good to put broad collars about their necks made of grey dkins.

When the badger perceives his terriers to begin to yearnhim in his burrow, he will fop the hole betwixt hinir and the terriers, and if they ftill continde baying he will remove his couch into another chamber or part of the burrow, and so fron one to another, barricading the way before them, as they retreat until they can go no farthcr. If you intend to dig the badger ont of bis burrow, you mnt be provided with the fame tools as for digging out a fox; and befides, you fhould have a pail of water to refreda the teriers, when they cone out of the earth to take bre th and cool themfelves. It will alfo be neceffary to put collars of bells upon the necks of your terriers, which inaking a noife may caufe the badger to bolt oct. The tools ufed for digging out the badger, being troablefome to be carricd on mens backs, may be broughtin a cart. In digging, you mult confider the fitation of the gtound, by which you may judge were the chjef angles are; for elfc, inftead of advancing the work, you will hinder it. In this order you may befiege them in their holds, or caftles; and may break their platforms parapets, cafements, and work to themwith mines and comtermines unt 1 you have overcome them.

Having taken a live and lufty badger, if you would make fiport, carry him home in a fack and turn him out in your court-yard, or fome other inclofed place, and there let him be hanted and worried to death by your liounds.
There are the following profits and adyantages which accrue by killing this animal. Their fleih, blood, and greafe, though they are not good food, yot are very ufeful for phyficians and apothecaries for oils, oint-

Hunting. ments, falves, and powders for flortnefs of breath, the cough of the lungs, for the fone, fprained finews, colt-aches, \&c. and the fkin bcing well drelled, is very warm and good for old people who are treabled with paralytic diftempers.

## Boar-Hunting. See Boar

Buck-Hunting. Here the fame hounds and methods are ufed as in running the ftag; and, indeed, he that can hunt a hart or ftag well, will not hunt a buck ill.
In order to facilitate the chace, the game-keeper commonly feleets a fat buck out of the herd, which he fhoots in order to maim him, and then he is run down by the hounds.

As to the method of hunting the buck. The company generally go out very early for the benefit of the morning. Sometimes they have a deer ready lodged ; if not, the coverts are drawn till one is roufed: or fometimes in a park a deer is pitched upon, and forced from the herd, then more hounds are laid on to run the chace. If you come to be at a fault, the old faunch hounds are only to be relied upon till your recover him again : if he be funk, and the hounds thrut him up, it is called an imprime, and the company all found a rechear; when he is run down, every one frivestoget in to prevent his being torn by the hounds, fallow-deer feldom or never ftanding at bay.

He that firf gets in, cries hoo-up, to give notice that he is down, and blows a death. When the company are all come in, they paunch him, and rewara the hounds ; and generally the chief perfon of quality amongit them takes fay, that is, cuts his belly open, to fee liow fat he is. When this is done, every one has a chop at his neck; and the head being cut off, is the wed to the hounds, to encourage them to run only at male deer, which they fee by the horns, and to teach them to bite only at the head: then the company all fanding in a ring, one blows a fingle death; which being done, all blow a double recheat, and fo conclude the chace with a general halloo of hoo-up, and depart the fich to their feveral homes, or to the place of meeting ; and the huntfiman, or fome other, hath the deer calt crols the buttocks of his horfe, and fo carries him home.

Fox-Hunting makes a very pleafant exercife, and is either above or below ground.
I. Above-ground. To hunt a fox with hounds, you muft draw about groves, thickets, and buthes near villages. When you find one, it will be neceffary to ftop up his earth the night before you defigu to hunt, and that about midnight; at which time he is gone ont to prey : this may be done by laying two white nicks acrofs in his way, which he will imagine to be fome gin or trap laid for him ; or elfe they miay be flopped up with black thorns and earth mixed together.

Mr Beckford is of opinion that for fox-hunting the pack fhould confift of 25 couple. The hour moft favourdble for the diverfion is an early one; and hethinks that the hounds fhould be at the cover at fun rifing. The huntiman fhould then throw in his hounds as quietly as he can, and let the two whippers in keep wide of him on either hand; fo that a fingle hound may not efcape them ; let them be attentive io his halloo, and let the fyortman be ready to encourage or rate as that directs. The fux ought on no account

Vol. VHI,
to be hallooed too foon, as in that cafe he would mor certainly turn back again, and fpoil all the fport.Two things our author particularly recommends, viz. the making all the hounds Iteady, and making them all draw. "Many buntfmen ( l ys he) are fond of having them at their horfe's heels; but they never can get fo well or fo foon together as when they fpread the cover ; befides, I have often known, when there have been only a few finders, that they have found their fox gone down the wind, and been heard of no more that day. Much depends upon the firft finding of your fox; for I look upon a fox well found to be half killed. I think people are generally in too great a hurry on this occafron. There are but few inftances where fportfmen are not too noify, and too fond of encouraging their hounds, which feldom do their budinefs fo well as when little is faid to them. The huntf: man ought certainly to begin with his foremoft hounds ; and I fhould wilh him to keep as clofe to them as he conveniently can; nor can any harm arife from it, unlefs he flould not have common fenfe. No hounds can then flip down the wind and get out of his hearing; he will alfo fee how far they carry the fcent, a neceffary requifite; for without it he never can make a calt with any certainty. - You will find it not lefs neceflary for your huntfman to be active in preffing his hounds furward when the fcent is good, than to be prudent in not harrying them beyond it when it is bad. It is his bufinefs to be ready at all times to lend them that affiftance which they fo frequently need, and which when they are firft at a fault is then moft critical. A foxhound at that time will exert himfelf moft ; he afterwards cools and becomes more indifferent about his game. Thofe huntfmen whodo not get forward enough to take advantage of this eagernefs and impetuofity, and direct it properly, feldom know enough of hunting to be of much ufe to then afterwards. Though a huntfonan cannot be too fond of humting, a whipperin eafily may. His bufinefs will feldom allow him to be forward enongh with the hounds to fee much of the fport. His only thought therefore heuld be to keep the hounds together, and to contribute as much as he can to the killing of the fox : keeping the hounds toge ther is the fureft means to make them fteady. When left to themfelves they feldom refufe any blood they can get; they become conccited; learn to tie upon the foent; and befides this they frequently get a trick of hunting by themfelves, and are feldom good for much afterwards.
"Every country is foon known; and nine foxes out of ten, with the wind in the fame quarter, will follow the fame track. It is eafy therefore for the whipperin to cut fhort, and catch the hounds again. With a high fcent you cannot puli on hounds too much. Screams keep the fox forward, at the fame time that they keep the hounds together, or let in the tailhounds : they alfo enliven the fport; and, if difcreetly ufed, are always of fervice; but in cover they fhould be given with the greateft canion. Halloos feldom do ally hurt when you are rumiug up the wind, for then none but the tail-hounds can hear you: when you are runing down the wind, you thould halloo no nore than may be neceffary to bring the tail-hounds forward; for a hound that knows his bulinefs feldom wants encourggenient when he is upon a fcent.-Moft

H U N
Hunting. fox-hunters wifh to fee their hounds run in a good fyle. I confefs I myfelf am one of thofe; I hate to fee a ftring of them; nor can Ibear to fee them creep where they can leap. A pack of harriers, if they have time, may kill a fox; but I defy them to kill him in the ftyle in. which he ought to be killed ; they mult hunt him down. If you intend to tire him out: you muft expect to be tired alfo yourfelf; I never wifh a chace to be lefs than one hour, or to exceed two: it is fufficiently long if properly followed : it will feldom be longer unlefs there be a fault fomewhere; either in the day, the humefman, or the hounds.
" Changing from the hunted fox to a frefl one is as bad an accident as can happen to a pack of foxhounds, and requires all the ingenuity and obfervation that man is capable of to guard againft it. Could a fox-hound diftinguifi a hunted fox as the deer-hound does the deer that is blown, fox-hunting would then be perfect. A huntfman fhould always liften to his hounds while they are running in cover ; he fhould be particularly attentive to the headmoft hounds, and be flhould be conftantly on his guard againft a kirter ; for if there be two fcents, he muft be wrong. Generally fpeaking, the beft fcent is leaft likely to be that of the hunted fox: and as a fox feldom fuffers hounds to run up to hin as long as he is able to prevent it: fo, nine times out of ten, when foxes are hallooed early in the day, they are all frefh foxes. The hounds moft likely to be right are the hard running line-hunting ones; or fuch as the huntfman knows had the lead before there arofe any doubt of changing. With regard to the fox, if he break over an open country, it is no fign that he is hard run; for they feldom at any time will do that unlefs they are a great way before the hounds. Alfoif they run up the wind;-they feldom ornever do that when they have been long hunted and grow weak; and when they ruan their foil, that alfo may direct him. All this requires a good ear and nice obfervation ; and indeed in that confifts the chief excellence of a huntiman.
"When the hounds divide and are in two parts, the whipper-in, in ftopping, muft attend the huntfinan and wait for his halloo, before lie attempts to ftop either : for want of proper management in this refpect I have known the hounds ftopped at both places, and both foxes loft. If they have many fcents, and it is quite uncertain which is the hunted fox, let him fop thofe that are fartheft down the wind; as they can hear the others, and will reach them fooneft: in fich a cafe there will be little ufe in ftopping thofe that are up the wind. When hounds are at a check, let every one be filent and fand ftill. Whippers-in are frequently at this time coming on with the tail-hounds. They fhould never halloo to them when the hounds are at fault; the leaft thing does them harm at foch a time, but a halloo more than any other. The huntiman, at a check, had better let his hounds alone; or content himfelf with holding them forward, without taking them off their nofes. - Should they be at a fault, after having made their own caft (which the huntfman fhould always firft encourage them to do), it is then his bufinefs to affift them farther; but except in fome particular inftances, I never approve of their being caft as long as they are inclined to hant. The firft caft I bid my huntfman make is generally a regularone, not chooling to rely entirely on his judgment : if that fhould not facceed, he is then at liberty to follow his own opinion,
and proceed as obfervation or genius may direet. When fuch a caft is made, I like to fee fome mark of good fenfe and meaning in it; whether down the wind, or towards fome likely cover or frong earth. However, as it is at beft uncertain, I always wifh to fee a regular caft before I fee a knowing one; which, as a laft refource, fhould not be called forth till it be wanted : The letting hounds alone is but a negative goodnefs in a huntfman ; whereas it is true this laft hows real genius; and to be perfect, it mult be born with him. There is a fault, however, which a knowing huntfman is too apt to commit : he will find a frefh fox, and then clain the merit of having recovered the hunted one. It is always dangerous to throw hounds iuto a cover to retrieve a loft feent ; and unkefs they hit himin, is not to be depended upon.
"Gentlemen, when hounds are at fault, are ton apt themfelves to prolong it. They flould always fop their horfes fome diftance behind the hounds; and if it be poffible to remain filent, this is the time to be fo. They fhould be careful not to ride before the hounds or over the fcent; nor fhould they ever meet a hound in the face unleis with a defign to fop him. Should you at any time be before the hounds, turn your horfo's head the way they are going, get ont of their track, and let them pafs by you. In dry weather, and particularly in heathy countries, foxes will run the roads. If gentlemen at fuch times will ride clofe upon the hounds, they may drive them miles without any fcent. -High mettled fox-hounds are feldom inclined to ftop whilf horfes are clofe at their heels. No one fhould ever ride in a direction which if perfifted in would carry him amongft the hounds, unlefs he be at a great diftance behind them.
" The firft moment that hounds are at fanlt is a critical one for the fport-people, who fhould then be very attentive. Thofe who look forward may perhaps fee the fox; or the running of fheep, or the purfuit of crows, may give them fome tidings of him. Thofe who liften may fometimes rake a hint which way he is gone from the chattering of a magpye; or perhaps be at a certainty from a diftant halloo: nothing that can give any intelligence at fuch a time onght to be neglected. Gentlemen are too apt to ride all together: were they to fread more, they might fometimes be of fervice ; particularly thofe who, from a knowledge of the fport, keep down the wind; it would then be difficult for either hounds or fox to efcape their obfervation.-You hould, however, be cautious how you go to a halloo. The halloo itfelf mult in a grear meafure direct you; and though it afford no certain rule, yet you may frequently guefs whether it can be depended upon or not. At the fowing-time, when boys are keeping off the birds, you will fometimes be deceived by their halloo; fo that it is beft, when you are in doubt, to fend a whipper-in to know the certainty of the matter."

Hounds ought not to be calt as long as they are able to hunt. It is a common, though not a very juft idea, that a hunted fox never fops ; but our author informs us that he has known them ftop even in wheelruts in the middle of a down, and get up in the middle of the bounds. The'greateft danger of lofing a fox is at the firlt finding him, and when he is finking; at both which times he frequently will run fhort, and the eagernefs of the bounds will frequently carry them beyond the fcent. When a fox is firft found, every one ought

Hunting.

## H U N

Hunting. ought to keep behind the hounds till they are well fettled to the feent; and when the hounds are catching him, our author wifhes them to be as filent as poffible; and likewife to eat him eag: rly after he is caught. In fome places they have a method of treeing him ; that is, throwing him acrofs the branch of a tree, and fuffering the hounds to bay at him for fome minutes before he is thrown among then; the intention of which is to make them more eager, and to let in the tailhounds; during this interval alfo they recover their wind, and are apt to eat him more readily. Our atlthor, however, advifes not to keep him too long, as he fuppofes that the hounds have not any appetite to eat him longer than while they are angry with him. 2. Under ground. In cafe a fox does fo far efcape as to earth, countrymen muft be got together with hovels, fpades, mattocks, pickaxes, \&c. to dig him out, if they think the earth not too great. They make their earths as near as they can in ground that is hard to dig, as in clay, ftony ground, or amongft the roots of trees; and their earths have commonly but one hole, and that is ftraight a long way in before you come at their couch. Sumetimes craftily they take poffeffion of a badger's old burrow, which hath a variety of chambers, holes, and angles.

Now to facilitate this way of hunting the fox, the huntfman mait be provided with one or two terriers to put into the earth after him, that is, to fix him into an angle ; for the earth often confifts of many angles: the ufe of the terrier is to know where he lies; for as foon as he finds him, he continues baying or barking, fo that which way the noife is heard that way dig to him. Your terriers muft be garnifhed with bells hung in collars, to make the fox bolt the fooner ; befides, the collars will be fome fmall defence to the terriers.

The inftruments to dig withal are thefe; a fharppointed fpade, which ferves to begin the trench where the ground is hardeft and broader tools will not fo well enter; the round hollowed fpade, which is ufeful to dig among roots, having very fharp edges; the broad flat fade to dig withal, when the trench has been pretty well opened, and the ground fofter; mattocks and pickaxes to dig in hard ground, where a fpade will do but little fervice; the coal-rake to cleanfe the hole, and to keep it from ftopping up; clamps, wherewith you may take either fox or badger out alive to make fport with afterwards. And it would be very convenient to have a pail of water to refrefh your terriers with, after they are come out of the earth to take breath.

Hare-Hunting. As, of all chafes, the hare makes the greatelt paftime, fo it gives no little pleafure to fee the craft of this fmall animal for her felf-prefervation. If it be rainy, the hare ufually takes to the high-ways; and if the come to the fide of a young grove, or fpring, fhe feldom enters, bat fquats down till the hounds have over-fhot her; and then fhe will return the very way the came, for fear of the wet and dew that hangs on the boughs. In this cafe, the hintfman ought to ftay an hundred paces before he comes to the wood-fide, by which means he will perceive whether fhe return as aforefaid; which if the do, he muft halloo in his hounds; and cail them back; and that prefently, that the hounds may not think it the counter the came firf.

The next thing that is to be obferved, is the place
where the hare fits, and upon what wind he makes Hunting. her form, either upon the north or fouth wind: me will not willingly run into the wind, but run upon afide, or down the wind; but if fhe form in the water, it is a fign the is foul and meafled: if you hunt fuch a one, have a feccial regard all the day to the brookfides; for there, and near plahes, fhe will make all her croffings, doublings, \&c.

Some hares have been fo crafty, that as foon as they have heard the found of a horn, they would inftantly ftart out of their form, though it was at the diftance of a quarter of a mile, and go and fwim in fome pool, and reft upon fome rulh-bed in the midft of it ; and would not fir from thence till they have heard the found of the horn again, and then have ftarted out again, fwimming to land, and have ftood up before the hounds four hours before they could kill them, fwimming and ufing all fubtilties and croffings in the water. Nay, fuch is the natural craft and fubtilty of a hare, that fometimes after fhe has been hunted three hours, fhe will ftart a frefh hare, and fquat in the fame form. Others having been hunted a condiderable time, will creep under the door of a Sheep-cot, and hide themfelves among the fheep; or, when they have been hard hunted, will run in among a flock of heep, and will by no means be gotten out from among them till the hounds are coupled up, and the fheep driven into their pens. Some of them (and that feems fomewhat ftrange), will take the ground like a coney, and that is called going to the vault. Some hares will go np one fide of the hedge and come down the other, the thicknefs of the hedge being the only-diftance between the courfes. A hare that has been forely hunted, has got upon a quickfethedge, and ran a good way upon the top thereof, and then leapt off upon the ground. And they will frequently betake themfelves to furz buflies, and will leap from one to the other, whereby the hounds are frequently in default.

Having found where a hare hath relieved in fome pafture or corn field, you muft then confider the feafon of the year, and what weather it is: for if it be in the fpring-time or fummer, a hare will not then fet in buhtes, becaufe they are frequently infefted with pirmires, fnakes, and adders; but will fet in corn-fields, and open places. In the winter-time, they fet near towns and villages, in tufts of thorns and brambles, efpecially when the wind is northerly or foutherly. According to the feafon and nature of the place where the hare is accuftomed to fit, there beat with your hounds, and ftart her; which is much better fport than trailing of her from her relief to her form.

After the hare has been ftarted and is on foot, then ftep in where you faw her pafs, and halloo in your hounds, until they have all undertaken it and go on with it in full cry: then recheat to them with your horn, following fair and foftly at firft, making not too much noife either with horn or voice; for at the firft, hounds are apt to overfhoot the chace through too much heat. But when they have run the face of an hour, and you fee the hounds are well in with it, and ftick well upon it, then you may come in nearer with the hounds, becaufe by that time their heat will be cooled, and they will hunt more foberly. But above all things, mark the firf doubling, which muft be your direction for the whole day; for all the doublings

## H U N $\quad 7732] \quad \mathrm{H}$ U N

Hunting. that the fhall make afterwards will be like the former; and according to the policies that you thall fee her ufe, and the place where you humr, you maft make your compaffes great or little, long or thort, to help the defaults, always fecking the moiftef and moft commodious places for the hounds to feent in.

To conclude: Thore who delight in hunting the hare muft rife carly, left they be deprived of the feent of the foat-fteps.

Hart or Stag Huntung. Gefner, fpeaking of harthunting, obferves, that this wild, deceifful, and fubthe beaft, frequently deceives its hunter by windings and turnings. Wherefore the prudent humter mult train his dogs with words of art, that he may be able to fet them on and take them off again at pleafure.

Firft of all, he flould encompafs the beaft in her own layer, and fo unharbour her in the view of the dogs, that fo they may never lofe her flot or footing. Neither muft he fer upon every one, either of the herd or thofe that wander folitary alone, or a little one. but partly by fight, and partly by their footing and fumets, make a judgment of the game, and alfo obferve the largenefs of his layer.

The hunffman, having made thefe difcoveries in order to the chace, takes off the coaplings of the dogs; and fome on horfeback, others on foot, follow the ery, with the greateft art, obfervation, and fpeed; remembering and intercepting him in his fubtile turaings and headings; with all agility leaping hedges, gates, pales, ditches; neither fearing thorns, down hills, nor woods, bat mounting frefh horfe if the firft tire. Follow the largeft head of the whole herd, which muat be fingled out of the chace; which the dogs perceiving, mult follow : not following any other. The dogs are animated to the fport by the winding of horns, and the voices of the hantrmen. But fometimes the crafty beaft fends forth his little fquire to be facrificed to the dogs and hunters, inftead of himfelf, lying clofe the mean time. In this cafe, the buntfman muft found a retreat, break off the dogs, and take them in, that is, leam them again, until they be brought to the fairer game; which rifeth wilh fear, yet fill friveth by flight, until he be wearied and breathlefs. The nobles call the beaft a wife hart, who, to avoid all his enemies, runneth into the greateft herds, and fo brings a clond of crror on the dogs, to obftruct their farther purfuit; fometimes alfo bearing fome of the herd into his footitgs, that fo he may the more eafily efcape by amufing the dogs. Afterwards he betakes himfelf to his heels again, fill running with the wind, not only for the fake of refrefhment, but alfo becaufe by that means he can the more cafily hear the voice of his purfuers whether they be far from him or near to him. But at laf being again difcovered by the hunters and fagacious feent of the dogs, he flies into the herds of cattle, as cows, fheep, \&c. leaping on a cow or ox, laying the foreparts of his body thereon, that fo touching the earth only with his hinder feet, he may leave a very fmall or no feent at all behind for the hounds to difcern. But their ufual manner is, when they fee themfelves hard befet and every way intercepted, to make force at their enemy with their horns, who firft comes upon him, unlefs they be prevented by fpear or fword. When the beaft is flain, the huntfman with his horn windeth the fall of the beaft; and then the whole com-
pany comes up, blowing their horns in triamph for Hunting. fich a conqueft; among whom, the 化ilfulleft opens the beaft, and rewards the hounds with what properly belongs to them, for their future encouragement; for which purpofe the huntimen dip brad in the akin and blood of the beaft to give to the hounds.

It is very dangerous to go in to a hart at bay; of which there are two forts, one on land and the other in water. Now, if the hart be in a deep water, where you cannot well come at him, then couple up your dogs; for fhould they continue long in the water, it would endanger their furbating or foundering. In this cafe, get a boat, and fwim to him, with a digger drawn, or elfe with a rope that has a noofe, and throw it over his horns: for if the water be fo deep that the hart fwims, there is no danger in approaching him : otherwife you muft be very cantions.

As to the land-bay, if a hart be burnifhed, then you muft confider the place; for if it be in a plain and open place, where there is no wood nor covert, it is dangerous and difficult to come in to him ; but if he be on a hedge-fide, or in a thicket, then, while the hart is ftaring on the hounds, you may come foftly and covertly behind him, and cut his throat. If you mifs your aim, and the hart turn head upon you, then take refuge at fome tree; and when the hart is at bay, couple up your hounds; and when you fee the hart turn head to fly, gallop in roundly to him, and kill him with your fword.

Directions at the Death of a Hart or Buck. The firft ceremony, when the huntfman comes in to the death of a deer, is to cry " ware haunch," that the hounds may not break in to the deer; which being done, the next is the cutting his throat, and there blooding the youngeft.hounds, that they may the better love a deer, and learn to leap at his throat: then the mort having been blown, and all the company come in, the beft perfon who hath not taken fay before, is to take up the knife that the keeper or huntiman is to lay acrofs the belly of the deer, fome holding by the fore legs, and the keeper or huntfman drawing down the pizzle, the perfon who takes fay, is to draw the edge of the knife leifurely along the middle of the belly, beginning near the briket, and drawing a little upon, enough in the length and depth to difcover how fat the deer is; then he that is to break up the deer, firf flits the fkin from the cutting of the throat downwards, making the arber, that fo the ordure may not break forth, and then he paunches him, rewarding the hounds with it.

In the next place, he is to prefent the fame perfon who look fay, with a drawn hanger, to cut off the head of the deer. Which being done, and the hounds rewarded, the concluding ceremony is, if it be a ftag, to blow a triple mort; and if a buck, a double one; and then all who have horns, blow a recheat in concert, and immediately a general whoop, whoop.

Otter-Hunting is performed with dogs, and alfo with a fort of inftruments called otter-fpears; with which when they find themfelves wonnded, they make to land, and fight with the dogs, and that moft furioufly, as if they were fenfible that cold water would annoy their green wounds.

There is indeed craft to be ufed in hunting them; but they may be catched in fnares under water, and by river-fides: but great care mult be taken, for they

## H U N [ 733 ] H U N

Hunting. bite forely and venomoully; and if they happen to remain long in the fuare, they will not fail to get themflves frec by their teeth.

In huating them, one man muft be on one fide of the river, and another on the other, both $b$ ating the banks with dogs; and the beaft not being able to endure the water long, you will foon difcover if there be an otter or not in that quarter ; for he muft come out to make his fpraiuts, and in the night fometimes to feed on grals and herbs.

If any of the hounds find out an otter, then view the foft grounds and moift places, to find out which way he bent his head: if you cannot difcover this by the marks, you may partly perceive it by the fpraints; and then follow the hounds, and lodge him as a hart or deer. But if you do not find him quickly, yon may imagine he is gone to couch fomewhere farther off from the river; for fometimes they will go to feed a confiderable way from the place of their reft, choofing rather to go up the river than down it. The perfons that go a-hunting otters, muft carry their fpears, to watch bis vents, that being the chief advantage; and if they perceive him fwimming under water, they muft endeavour to frike him with their fpears, and if they mifs, munt purfue him with the hounds, which, if they be good and perfectly entered, will go chanting and trailing along by the river-fide, and will beat every root of a tree, and ofier-bed, and tuft of bulrufhes; nay, they will fometimes take water, and bait the beaft, like a fpaniel, by which means he will hardly efcape.

Roe-buck Hunting is performed divers ways, and very eafily in the woods.

When chafed, they ufually run againft the wind, becaufe the coolnefs of the air refrefhes them in their courfe; therefore the huntfmen place their dogs with the wind: they ufually, when hunted, firft take a large ring, and afterwards hunt the hounds. They are alfo often taken by counterfeiting their voice, which a fkilful huntfman knows how to do by means of a leaf in his mouth. When they are hunted, they turn"much and often, and come back upon the dogs directly; and when they can no longer endare, they take foil, as the hart docs, and will hang by a bough in fuch a manner, that nothing of them fhall appear above the water bat their fnout, and they will fuffer the dogs to come juft upon them before they will ftir.

The venifon of a roe-buck is never ouc of feafon, being never fat, and therefore they are hunted at any time: only that fome favour ought to be fhown the doe while the is big with fawn, and afterwards till her fawn is able to fhift for himfelf; but fome roe. does have been killed with five fawns in their bellies.

He is not called, by the fkilful in the art of hunting, a great roe-buck, but a fair roe-buck; the herd of them is called a bevy: and if he hath not bevy-greafe upon his tail, when he is broken up, he is more fit to be dog's meat than man's meat. The hounds mult be rewarded with the bowels, the blood, and feet flit afunder, and boiled all together ; this is more properly called a dofe than a reward.

Huntivg-Match. The firf thing that is to be confidered by one who defigns to match his horfe for his own advantage, and his horfe's credit, is not to Hatter himfelf with the ofinion of his horfe, by fancying
that he is a fwift, when he is but a flow gallopper; Hunting, and that he is a wholc-running-horfe, that is, that he will run four miles without a fob at the height of his fpeed, when he is not able to run two or three. Very probably fome gentlemen are led into this crror, by their being miftaken in the fpeed of their hounds, who, for want of tryingthem againft other dogs that have been really fleet, have fappofed their own to be fo, when in reality they are but of a middling feced; and becaufe their horfe, when trained, was able to follow them all day, and upon any hour, to command them upon deep as well as light earths, have therefore made a falfe conclufion, that their horfe is as fwift as the beft: but, upon trial againft a horfe that has been rightly trained after hounds that were truly fleet, have bought their experience perhaps full dear. Therefore it is advifable for all lovers of hunting to procure two or three couple of tried hounds, and once. or twice a week to follow after them at train-fcent; and when he is able to top them on all forts of earth, and to endure heats and colds ftoutly, then he may better rely on his fpeed and toughnefs.

That horle which is able to perform a hare-chafe of five or fix miles brifkly and courageoully, till his body be as it were bathed in fweat; and then, after the hare has been killed, in a nipping frofy morning, can endure to ftand till the fweat be frozen on his back, fo that he can endure to be pierced with the cold as well as the heat ; and then, even in that extremity of cold, to ride anotherchafe as brinkly, and with as much courage as he did the former; that holfe which can thus endure heats and colds is moft valucd by fporifmen. Thercfore, in order to make a judgment of the goodnefs of a horfe, obferve him after the death of the firt hare, if the chace has been any thing brifk: if, when he is cold, ine fhrinks up his body, and draws his legs up together, it is an infallible fign of want of vigour and courage : the like may be done by the flackening of his girths after the firft chace, and from the dulnefs of his teeth, and the dulnefs of his countenance, all which are truc tokens of faintnefs and being tired; and fach a horfe is not to be relied on in cafe of a wager.

Here it will not be improper to take notice of the way of making matches in former times, and the modern way of deciding wagers. The old way of trial was, by ronning fo many train-fcents afrer hounds, as was agreed upon between the partics concerned, and a bell-courfe, this being found not fo uncertain, but more durable than hare hunting; and the advantage confifted in having the trains led on earth moft fuitable to the qualifications of the horles. But now others choofe to hunt the hare till fuch an hour, and then to run this wild-goofe chace; a method of racing that takes its namefrom the manner of the fight of wild-geefe, which is generally one after another ; fothe two horfes, after running of twelve fcore yards, had liberty, which horfe foever could get the leading, to ride what ground he pleafed, the hindmoth hore being bound to follow him, within a certain diftance agreed on by articles, or elfe to be whipped up by the triers or judges which rode by; and which ever horfe could diftance the other won the match.

But this chace, in itfelf very inhuman, was foon found to be very deftrutive to good horfes, efpecially when two good horfes were matched; for neither being alle

## H U N [ 734 ] H U

Hunting to diftance the other till both were ready to fink under II. their riders through weaknefs ofteptimes the match Hunting- was fain to be drawn and left undecided, though both donfhire. the horfes were quite fpoiled.

This bronght on the cuftom of train-feents, which afterwards were changed to three heats and a ftraight courfe ; and that the lovers of horfes might be enconraged to keep good ones, plates have been erected in many places in Britain. The fewer of thefe before you come to the courfe, if your horfe be fiery and mettled, the better; and the fhorter the distance, the better. Alfo, above all things, be fure to make your bargain to have the leading of the firft train ; and then make choice of fuch grounds where your horfe may beft flow his fpeed, and the fleeteft dogs you can procure : give your hounds as much law before you as your triers will allow, and then, making a loofe, try to win the match with a wind ; but if you fail in this attempt, then bear your horfe, and fave him for the courfe; but if your horfe be flow, but well-winded, and a true fpurred nag, then the more train-fcents you run before you come to the ftraight courle; the better. But here you ought to obferve to gain the leading of the firft train; which in this cafe you muft lead upon fuch deep earths, that it may not end near any light ground : for this is the rule received among horfemen, that the next train is to begin where the laft ends, and the laft train is to be ended at the ftarting place of the courfe; therefore remember to end your laft on deep earths, as well as the firft.

HUNTINGDON, the county-town of Huntingdonhire in England, feated upon an ealy afcent, on the north fide of the river Oufc. It was made a free borough by king John, confinting of a mayor, 12 aldermen, burgeffes, \&c. by whom the two members of parliament are chofen. It had ancicatiy 15 parifhes, and has now but two; in one of which, called St fohn's, Oliver Cromwell was born, in 1599. Here was formerly a caftle, built by William the Conqueror, which afterwards belonged to David, a prince of Scotland, with the title of earl; but Henry VIII. gave it to George Haftings, with the earldom annexed, in whofe family it fill continues. It ftands in the great north road; and has a bridge built of free-ftone over the Oufe, which is made navigable for fmall veffels as high as Bedford. It is the place where the aflizes are kept, and where the county-jail ftands. It has a good mar-ket-place, and feveral convenient inns, befides a gram-mar-fchool; and is very populous. W. Long. 0.15. N. Lat. 52. 23 .

Huntingdonshire, a county of England, boundedon the fouth by Bedfordnhire; on the weft by Northamptonfhire, as alfo on the north; and by Cambridgefhire on the eaft; extending 36 miles in length from north to fouth, 24 in breadth from eaft to weft, and near 67 in circumference. This county, which is in the diocefe of Lincoln, is divided into four hundreds, and contains 6 market-towns, 29 vicarages, 78 parifhes, 279 villages, about 8220 houfes, and upwards of $4 \mathrm{r}, 000$ inhabitants ; but fends only four members to parliament, namely, two knights of the fhire, and two members for Huntingdon. It is a good corn country ; and abounds in paftures, efpecially on the eaftern fide, which is fenny. The reft is diverffied by rifing hills and fhady groves, and the river Oufe waters the fouthern parts.

The air of this county is in moft parts pleafant and Hu-quagg wholefome, except among the fens and meres, though they are not fo bad as the hundreds of Kent and Effex. Hurdles. The foil is fruitful, and produces great crops of corn, and the hilly parts afford a fit pafture for heep. They have great numbers of cattle; and plenty of waterfowl, fifh, and turf for firing; which laft is of great fervice to the inhabitants, there being but little wood, though the whole country was a foreft in the tine of Henry II. The only river befides the Oufe is the Nen, which runs through Whittlefey Mere.

HU QUANG, a province of the kingdom of China, in A fia, which has a great river called Yang, and Tfechiang, which runs acrofs it from eaft to weft. It is divided into the north and fouth parts, the former of which contains eight cities of the firf rank, and 60 of the fecond and third; and the latter feven of the firft rank, and five of the fecond and third. It is a flat, open country, watered e very where with brooks, lakes, and rivers, in which there are great numbers of fifh. Here is plenty of wild-fowls; the fields nourifh cattle without number, and the foil produces corn, and various kinds of fruits. There is gold found in the fands of the rivers; and in the mines they have iron, tin, \&c. In fhort, there is fuch a variety of all forts of commodities, that it is called the magazine of the empire.

HURA, in botany: A genus of the monadelphia order, belonging to the monœcia clafs of plants; and in the natural method ranking under the 38 th order, Tricocca. The amentum of the male is imbricated, the perianthium trancated: there is no corolla; the filaments are cylindrical, peltated at top, and furrounded with numerous or double antherx. The female has neither calyx nor corolla, the ftyle is funnel-hhaped; the ftigma cleft in twelve parts; the capfule is twelvecelled, with a feed in each cell. There is but one fpecies, viz. the crepitans, a native of the Weft-Indies. It rifes with a foft ligncous fem to the height of 24 fect, dividinginto manybranches, which abound with a milky juice, and have fcarson their bark where the leavès have fallen off. The male flowers come out from between the leaves upon foot-ftalks three inches long; and are formed iuto a clofe fike or column, lying over each other like the fcales of fifh. The female flowers are fituated at a diftance from them; and have a long funnel-thaped tube freading at the top, where it is cut into 12 reflected parts. After the flower, the germen fwells, and becomes a round compreffed ligneons capfule, having 12 deep furrows, each being a diftinct cell, containing one large round compreffed feed. When the pods are ripe, they burft with violence, and throw out their feeds to a confiderable diftance. It is propagated by feeds raifed on a hot-bed; and the plants muft be conftantly kept in a ftove. The kernels are faid to be purgative, and fometimes emetic.

HURDLE, is the name of a fledge ufed to draw traitors to the place of execution.

HURDLES, in fortification, are made of twigs of willows or ofiers interwoven clofe together, fuftained by long ftakes. They are made in the figure of a long fquare, the length being 5 or 6 feet, and the breadth three and an half. The clofer they are wattled together, the better. They ferve to render the batteries firm, or to cover traverfes and lodgments for the defence of the workmen againft fire-works or ftones thrown againft them.

The

Difeafes,
\& 4 . 8vo. ing a hurricane (fays Dr Mofely $\dagger$ ) cannotbedefcribed. Like fire, its refiflefs force confumes every thing in its track, in the moft terrible and rapid manner. It is generally preceded by an awful ftilinefs of the elements, and clofenefs and miftinefs in the atmofphere, which makes the fun appear red, and the ftars larger. But a dreadful reverfe fucceeding-The fky is fuddenly overcaft and wild-The fea rifes at once from a profound calm into mountains-The wind rages and roars like the noife of cannon-The rain defcends in deluges-

## 735 ] H U S

A difmal obfcurity envelopes the earth with darknefsThe fuperior regions appear rent with lightning and thunder - The earth often does and always feems to tremble-Terror and confternation diftracts all nature -Birds are carricd from the woods into the ocean; and thofe whofe element is the fea, feek for refuge on land -The frightened animals in the field affemble together, and are almolt fuffocated by the impetuofity of the wind in fearching for hhelter : which, when found, ferves them only for deftruction-The roofs of houfes are carried to valt diftances from their walls, which are beat to the ground, burying their inhabitants under them-Large trees are torn up by the roots, and huge branches fhivered off, and driven through the air in every direction, with immenfe velocity-Every tree and mrub that with ftands the fhock, is ftripped of its boughs and foliage-Plants and grafs are laid flat on the earth -Luxuriant fpring is changed in a moment to dreary winter. - This direful tragedy ended, when it happens in a town, the devaftation is furveyed with accumulated horror: the harbour is covered with wrecks of boats and veffels; and the fhore has not a veftige of its former fate remaining. Mounds of rubbin and rafters in one place, heaps of earth and trunks of trees in another, deep gullies from torrents of water, and the dead and dying bodies of men, women, and children, half buried, and fcattered about, where freets but a few hours before were, prefent the miferable furvivors with a fhocking conclufion of a fpectacle to be followed by famine, and when accompanied by an earthquake, by mortal difeafes.

Thefe deftuctive phænomena are now thought to arife from electricity, though the manner in which it acts in this cafe is by no means known. It feems probable, indeed, that not only hurricanes, but even the moft gentle gales of wind, are produced by the action of the electrical fluid; for which fee the article Wind, Whirlwind, \&c.
hurst, Hrrst, or Herst, are derived from: the Saxon hyrft, i. e. a wood, or grove of trees. There are many places in Kent, Suffolk, and Hamphire, in England, which begin and end with this fyllable ; and the reafon may be, becaufe the great wood called Anderfwald extended throngh thofe connties.
Hurst-Cafle, a fortrefs of Hamplhire in England, not far from Limington. It is feated on the extreme point of a neck of land which fhonts into the fea, towards the ine of Wight, from which it is diftant two miles.

HUSBAND, a man joined or contracted with a woman in marriage. See Marriage.

Huseand-Land, a term ufed in Scotland for a portion of land containing fix acres of fock and fcythe land; that is, of land that may be tilled with a plough, and mown with a fcythe.

## $\begin{array}{lllllllll}H & U & S & B & A & N & R & Y\end{array}$

THE bufinefs of a farmer, or one who lives by cultivating the ground. In this view it includes mot only agriculture, but feveral other branches connected with it, fuch as the rearing of cattle, the management of the dairy, making butter, cheefe, raifing flax, timber, \&c. the management of bees, and
number of other aricles which it is difficult to enumerate particularly.

Agriculture, properly fo called, treats only of the Difference culivation of different foils, and preparing them for betwixt yielding the largeft crop of any kind of vegetables; but agric iturd it belongs to hufbandry to make choice of the foil mof and bandry,

## H U S B A. N D R Y.

proper for each different vegetable, and to manage matters fo that each foil may carry what it is beft adapted for, fo that on the whole the produce of the farm may be as advantageous as polible. In like manner, the hufbandman mult know what crops are molt proper to be raifed in the country where he lives, tither with a view to fale or to provender for cattle. The rearing of thefe, indeed, conditutes one of the moft effential articles of huibandry; i: being requifite that the hufbandman hould know not only how to feed them properly, but how to keep them free from difeafes, and to diftinguifh the beft breeds, fo that fuch as are defigned for work may be capable of doing the moft at leaft expence, and thofe deligned for fale may with the leaft trouble be brought in good condition to market, and afford the greateft profit to himfelfas well as

It is by means of the hufbandrian only that all the inhabitants of a country are enabled to live; whence it ought to be a confideration with him to cultivate the ground in fuch a manner, as may enable him to afford the produce at the loweft price. Thus he will alfo confult his own intereft ; for cheapnefs of provifions is the only true means by which the population of any country can be advanced; and the greater the number of inhabitants, the greater market will the hufbandman have for his goods. Indeed, by a certain mode of arguing, it may be imagined, that it would be more advanrageous to keep up provitions at as high a price as poffible, raiher than to lower thein : but however this may apply to manufactures of various kinds, it never can apply to hubandry; for by railing the price of provifions, the price of every other thing is alfo raifed, and it tecomes more difficult for the hufbandman himfelf to live, as well as others.

Thus the butinefs of the hubandman is not only extremely complicated and difficult, but important alfo; infomuch, that focieties have been lately inftituted in many different parts of Europe for its advancement, and premiums offered to thofe who excelled in any particular branch. Some of thefe preniums are held out for raifing the greatef quantity of particular kinds of vegetables; others for gaining the greateft extent of ground from the fea: fome forimproving wafte ground; others for the invention of the moft ufefulimachines for harrowing, fowing, and various operations in agriculture. But though the intention of thefe focieties is undoubtedly landable and patriotic, and though the invention of man has in a manner been exliauted to accomplith the purpofes for which they were inftituted; it remains yet a matter of great doubt and uncertainty whether they have really been productive of any public good or not. It does not clearly appear, that the means of fubfintence are rendered more generally cafy, or that the lives of mankind are more happy and comfortable, than before any focieties were inftituted, or beforeany confiderable improvenents in hofbandry were made. On the contrary, provilions of all kinds, infead of beconing cheaper, have gradually become dearer, and their price on the whole is fenfibly augmented every four or five years. Hence it is impolfible to avoid concluding, that, not withftanding the apparent improvements which have been made in fach numbers, there is not any realone in the whole art.-Something of this kind has been taken notice of even by the
members of thefe focieties themfelves; and on this Batb $P_{a-}$ fubject Mr Wimpey exprefes himfelf as follows: pers, voliii.
"It is certainly clear from the average prices of corn p. ift. and provifions of all kinds for 20 years patt, that there is not too much land in cultivation. Prices have advanced confiderably above what lias been deemed and Opinion ef that jufly too, the medium ftandard. As a manufac- pey. Wimturing and commercial country, it is properly the duty of the legiflature to provide, as far as may be confiftenty with the liberty of the fubject, that the price of provifions may be kept as near as poffible to their mediun value. This is conceived to be very practicable, even fo as to be a convenience to the grower as well as the confumer. Some writers (Locke, Montefquieu, \&c.) have fippofed, that the advance of commodities in price is rather apparent and nominal than real. Things are not fo minch, if at all (fay they), advanced in price, as it is imagined. The precions metals are exceedingly increafed in quantity, and proportionably fallen in va. lue. Poffibly there may be fome truth in this obfer. vation; it we go back fome hundreds of years; and if taken upon a fale that comprehends all Europe: but for the term of 40 or 50 years, or even from the time that Mr Locke wrote to the prefent hour, there is litthe difference in the value of gold and filver; an ounce of either being much the fame value now as then. The frequent and ladden chalges that take place in the price of corn and other commodities, which are fometimes at double the price one year they were the foregoing, muft be owing to fome other caule than that abovementioned, which operates flowly, if at all, and is not perceptible in lefs than a century.
"If the quantity of corn and provifions at market always has borne the fame proportion to the demand there is for them, the price would be always invariably and unchangeably the fame. The variation of the prices, therefore, is governed by the variation of the faid proportion. If the demand be greater and the quantity the fame, or the demand the fame and the quantity lefs, the price muft neceffarily advance; and vice verfa, if the quantity thould increafe, and the demand remain the fame, the price muft as neceffarily fall; and it is not in the power of man to make it otherwife. But though this immutable relation is beyond our power to alter, we can by art and induftry augment the quantity, and thereby lower the price; cheapners being an infallible confequence of plenty, which is the direct object of an improving cultivation. This is a matter of great confequence to the poor labourer, the manufacturer, and the merchant; and no difadvantage to the grower; becaufe, what he would lofe by the fall of price, he would gain by the increafed confumpt.
"It is not eafy to conceive how many and how great why thofe the improvements are which have been made in this why have molt important of all arts in the courfe of the prefent gained precentury. A patriotic firit of uncommon areour hath miums gone forth; and the nobility and gentry, like the fe- from focienators of Rome, have fet, as it were, their hands to the ties have plough, and excited their tenants and neighbour not been practices of which they had no idea before. Yea, they of any real have done more; they have inftitated focieties, and the courmade them receptacles and diftributors of ufeful know- try. ledge; they have raifed fubferiptions, and added marks of honour and pecuniary advantages to the rewards which naturally refult from the attention and induftry

Batb $\mathrm{Pa}=$
of the ingenious artift. But it muft be allowed, that though much has been done, there fill remains much more to be done. Experimenters have not always (pcrhaps but felitom) entered inso the views, and ably feconded the intentions, of rhofe valuable inftutions. Animated with the hope of obtaining the premiuns held ont by dint of extraordjary exertions, expenfive manmes, and a concurrence of fortunate circumftances, more the effect of chance than of delign, they often have been the fuccefsful adventurers, though at the fame time entirely ignorant to what caufes they owed their fuccefs. We too often indeed afcribe effests to canfes, thich are no way connected with them. The practice of fuch men is more like the noftrums of quacks, thas the recipes of a regular phyfician. The medicinc may be good; but being ignorant of principles, they know not how to accommodate it as circumfances nay require."

Confiderations of this kind muft certainly lead us to fuppofe, that mort, if not all, the improvements made in hufbandry for a long time paft, are too expenfive; and that, though by their means larger crops are now obtained than formerly, the profits arc more than fwallowed up by the enormons fums required to prodace them. Hence we have as yet obtained only larger or more elegantly formed beafts of different kinds; and whether this acquifition is ultimately to be confidered as profitable, remains yet to be determined. Unfortunately this fentintent feems to be confirmed by taking a review of the agricultural improvements made during the laft half-century. Thefe are:

1. Inprovements in the Art of Tillage. Improvements of this kind confift in more perfectly breaking and pulverifing the foil, and keeping it more free from wecds than formerly. Mr Jethro Tull was the author of thefe, and flowed the advantages thence ariling. By frequent turning over and pulverifing the foil, we not only deftroy the weeds vary effectually, but likewife grubs, beetlcs, worms, and maggots of many different kinds. "Nothing (fays Mr Wimpey) fo effectually prevents the ravages of the feveral tribes of fubterraneous infects as the frequent ftirring and crumbling the ground: have had large patches of feveral poles fquare in a ficld of beans deftroyed by the grub of the cock-chaffer; and many hundreds of cabbage-plants by a grey grub of fmaller fize. Both thefe cxecute their mifchief under-ground. The former eat the roots of the beans even when in kid, and then they wither, fall, and die: the latter bites off the ftem of the plant juft under the farface, and does infinite mifchief : but have always found tillage, duly performed, capable of deftroying the whole race."
2. Invcntion of new lomplements of Hu band $y$, or ineprovements of the old. This clafs includes all the new invented ploughs, harrows, horfe and hand hocs, \&c. by means of which it is generally fuppofed that the work of tillage can be performed at much lefs cxpence, as well as more effectually than formerly.
3. Sairing a great guantity of ficd in foving, as:d the production of better crops, by the mors regetlar difitibu. thor fonhat is /own. This improvement chiefly condifts in driling inftead of fowing in the broad-caft way as formerly. The gain is here evident; and ir Wimpey calculates it at a tenth or twelfth part of the vihole produce: and if the community are not yet fenfible of Yol. VIII.
any advantage from fuch a confiderable faving, it maiz be becaufe the drilling hufbandry has not yet become very gencral.
4. Suiting the Crop to the Nature and Condition of the Soil. The farmer is now enalied to do this better than formerly, by the introtiction of a number of new vegetables formeriy unknown. Thas, as there are many grounds very unfit for the production of wheat, there is now no occalion for reaping feanty crops of it from fuch as are little adapted to the raifing of that grain; becaufe anobler article, for which perbaps there was formerly no domand, may now be raifed with confiderable profit on a foil where wheat will not grow to any advantage.
5. The Retation of Cirops. Thus a very confiderable addition is made to the produce of the gromed by keeping it perpetually fertile; whereas formerly it was otten worn ont and rendered barren by too frequent cropping, when a proper rotation was not known.
6. The Introduclion of new Manares. Thefe are principally lime and marle; of the action of which an account is given under the article Agriculture, $11^{0} 20$.
7. The Introduction of many new Articles into Field. Culture. Thefe, whatever profir they may yield to the farmer, confift principally of provender for cattle. They ought, however, to have a confiderabic effect in producing plentiful harvefts, as hereby the cattle may be fuppofed to do their work more perfectly, and to be maintained at lefs expence than before.
8. The Application of the fe to the rearing and fattening of Cattle. The good effects of this ought to be felt in the manner mentioned in the former article, and partly in lowering the price of fech-meat, and confequently of all other kinds of provifions.

Thus we fee, $\mathbf{x o}$ Thas we fee, that in the courfe of half a century, Little admethods have been found of eradicaing weeds, deftroy- vantage reing infects, faving vaft quantities of feed-corn, of fuit-fultingfrom ing the crops to the foii, of ufing new manures, raifing the whole. new plants; and all this, together with multitudes of nev machines in performing ia a better manner the operations of agriculture, has apparently amounted to mere nothing. The price of provilions feems to have begun to rife with the improvements, and to be continually advancing. It is by no neans in our power to point out particularly the caufes of fodifagreeable an event. It Conjectures muft, however, mudoubtedly depend on fome mifcalcu- concerning Iation, or over-rating the profts which havearifen from the caufes. thofcimprovements: whence the landholdershaveuniformly been induced to raife their rents, while the farmors, finding their cxpencegreatly augmentednotonly on account of the advance of rent, but likewife from the more cofl:y modes of tillage, have been obliged to angment the prices of their grain beyond what the in creafed infux of moncy into the kingdom would bear. -Such mitalculationsare not unconmon in every bufinefs. A mandfucturer is apt to te enticed by a certainty of having at: increafe of his grods in a given time : but frequently, when improvencints are tried, it is found that the abfolete expence, or the quantity or labour requifite to probuce tice increafe is greiter than the angmentation of profitcan boar ; and he is afterwards, with regret andiofs, rbli red to lay adide the improvements from whicl he lad once fiaf bopes. In the like manner, wo fear, it has fared with tic hefbardman. The
improve-

## $\begin{array}{lllllllll}\mathrm{H} & \mathrm{U} & \mathrm{S} & \mathrm{B} & \mathrm{A} & \mathrm{N} & \mathrm{D} & \mathrm{K} & \mathrm{Y} .\end{array}$

improvement in hufbandry originated principally among the landholders; whote principal view, we may fuppofe, was an anginentation of-rent. The tenants were obliged 10 attempt improvements in order to pay the advance, as well as by the exprefs order of their landlords. Hence they were induced to keep a great number of horfes, that their lands might be tilled with fufficient expedithon, and in a more perfect manner than before. The oxen, formerly made ufe of, and which anfwered the purpofes both of proviition and labour, were difcarded, and a fet of moft expenfive animals, ufelefs except for the purpofes of labour or pleafure, introduced in their flead. A vaft quantity of grain, which ought to have fuftained the human fpecies, was thus beftowed on the brute creation : and though this might in fome meafure be fuppoied to be counteracted by the increafe of crop in confcquence of employing horfes, it is evident that it has not anfwered the gencral expectation; fince we may fay, that the farmers have not been able to pay one penny of adwanced rent without advancing allo

## Ofthe rear-

Withregard to the rearing of cattie, the cafe is equalvattlc̣. ly doubtful. The moft extravagant prices have been given for the beft breeds as they are called; but it remains yet to be proved, that thefe brecds are really more ufful to the country than the f naller ones. The expence of keeping them is undoubtedly greater, and this expence is enhanced by the large cattle being generally lefs hardy than the fmaller. It feems, befides, impolfible that one large horfe, for inftance, can be equally ufeful with two fmall ones, even though he fhould be as ftrong as both; for this plain reafon, that two horfes, though ever fo fmall, can be put to two different kinds of work ai once, which cannot be done with the largeft fingle horfe imaginable. The like is applicable to black cattle: We cannot fuppofe the largeft fingle ox to be equal to two ordinary oxen, though he may perhaps require more to fatten him than would bring to market three or four of an ordinary quality ; and fo of other animals.

It is much to be feared that the fame reafoning extends to moft of the improvements hitherto made in hubbandry. The vegetative powers of the earth cannot be made always to exert themfelves to the utmont, without an expence which the increafe of produce can by no means balance. By a total neglect of culture, indeed, the foil will produce little or nothing; by a moderate degree of culture the product will be greatly augmented, the farmer will be enabled to pay hisrent, and at the fame time to afford his grain at fuch a price as can allow the labourers to live comfortably: but if we go on with extraordinary methods of culture, expecting to increafe the produce of the foil, and to be able to exact an augmentation of rent ad infuitum, we will certainly be deceived ; for thus the price of provifions muft be infinitely increafed alfo. Thus, indeed the produce of the ground will be fomewhat increafed, but the farmer will ultimately be a lofer; fo that, to fave himfelf from ruin, he muft at lat burthen the public both with his advanced rent and the expence of moft of his improvements, by advancing the price of grain and of all kinds of provilions.

Such feemingeneral to be the reafons why the counery inas reaped to linle advantage by the improvements
made of late in the affairs of agriculture and humandry. If experiments are now to be made, it is plain that they ought to be with a view to determine that medium of culture which the ground can bear with the greateft profit, comparing the expence and produce of the two different modes together; and that mode which is the leaft expenfive onght undoubtedly to be chofen, even though attended with no more profit than that which is executed at a greater expence. Thus, if a 14 farmer, by laying out 5 . can produce a crop equivalent tage of ilto 7/. he ought undoubtedly to prefer that to a mode lowing farof cultivation by which he lays ont feven to pro- mers to excure nine. Nay, though by his new method he pend large. fhould procure 9/. Ios. by laying out 7/. it woald fill griculture, be evidently for the good of the community that the in order to former method were followed. The reafon of this is, enrich that every expence of the hufbandman, as well as of themfelves every other, muft ultimately be defrayed by the coni. by a fimail munity at large. Thus if the hufbandman employs a of profit. greater number of hands than would otherwife be ne- of profit. ceffary, it is plain that the expence of thefe mult be defrayed by the community, not only becaufe of the provilions they muft neceffarily confume, but becaufe each of thefe, were he not employed in that particular way, might contribute in fome other towards his own fupport and that of others: and the very fame may be faid of the farmer who employs a greater number of horfes than would otherwife beneceffary. Now, in the example juft given, the farmer, or the community at large, by laying out $5 \%$ gain 40 s . which is 40 per cent.; but in the other cafe, viz. that of expending 7\% for a return of $9 \%$. Ios. the farmer indeed gets 50 inftead of 40 s . but the community do not gain equally, having now not quite 36 per cent. inftead of 40 which they had before.

Hence it becomes evident, that by encouragingindividuals to expend large fums on agriculture, and thus diminifh the proportion of their own profits, the community muft always fuffer, and a rife of provifions will infallibly take place, whether the individuals enrich themfelves or not. Evils of this nature can be romedied only by the fegiflature; but it is to be feared that the time is yet very diftant when any certain mode of culture will be eftablifhed by law; and until this happen, it is vain to think that either the feculations or experiments of individuals or of focieties will be attended with much benefit to the community, whatever advan-. tage particular perfons may fometimes derive from them. Leaving this fubject, therefore, we fhall now proceed to thofe which more immediately relate to the bufinefs of hufbandryin its prefent fate.

In confidering, this fubject in its full extent, it evi- Divition of dently dividesitfelf into three parts; the $\operatorname{fir/f}$, Kelating humbandry to the cultivation of fuch vegetables as are proper for into three the fubfiftence of mankind or the rearing of cattle; as parts. grain, grafs, cabbage, turnips, and other vegerables of that kind; the fecond, Such as belong more particularly to trade and commerce ; as flax, hemp, haps, bees, timber, \&c. Under both the fe are included the knowledge of various manures, of the nature of different foils, \&c. The third part includes, the raifing and management of cattle, poultry, of the dairy, with other adventitious articles, lefs connected with e.friculture; of all which we fhall now treat in order.

# Part. I. Of the Vegetables mof proper to be raifed for the ufe of the Humaid Species, or as Food for Cattle. 

AMONG thofe raifed for the ufe of mankind, wheat has univerfally been fuppofed to bold the firft place, and other kinds of grain to be the next to it; but in modern times, an author of no mean reputation has arifen, who endeavours to prove that wheat ought not to be cultivated, nor bread to bc eaten. This is M. Linguet, who has written a treatife exprefoly upon the fubject; and, ridiculous as the affertion may feem, has been thought worthy of a formal refutation by Dr Tiffot.-One of M. Linguet's arguments is, that wheat impoverihes the ground on which it grows: but in oppofition to this, Dr Tiflot urges, that corn is more eafily cultivated than grafs; and that confequently, in the country he fpeaks of (Switzerland), the beft fields are appropriated to hay, and the worft to corn. "If there are fome diftricts of very poor land (fays he) almoft entirely fown with corn, they are not poor becanfe they produce only corn, but becaufe they are not fit to produce any thing elfe. Their foil is fo bad, that they can grow but very little fodder : confequently they maintain only fuch catcle as are abfolutely neceflary for labour ; and thoie are ill fed, and frequently perilh. They have but little manure, and their crops are fimall; for large crops of all forts can only be expected from lands naturally rich or ftrongly manured. Thus the poverty of the inhabitants ts only owing to their poffelfing an ungrateful foil.-What proves evidently that it is the natural foil which is in the fault, and not the corn which impoverifhes, is, that where there is meadow and arable land, the price of the meadow-land is much more confiderable than that of the arable. In moft parts of this country the proportion is nearly ten to one; and there are even fome meadows, for one part of winich they would give 30 of field-lands ; and fome of vines, for which 100 of arable would be given. Thofe diftricts where the foil will produce nothing but corn, arc poor ; but in thofe which furnilh fodder, an l allo fine crops of grain, the inhabitants are wealchy and happy, unlefs they are oppreffed by taxes."
M. Linguet draws another objection from the length of time required to cultivate wheat ; but Tiffor, by another calculation, fhows, that 48 days work thronghout the year wonld cultivate more wheat than is fufficient for a family of fix perfons. The time neceffary for cultivation of arable land alfo does not increafe in proportion to its extent ; but in cafe more is cultivated than is requifite for the fubdiftence of the family, a trade is formed, which might be increafed to an milimited extent. He then compares the time requifite for the cultivation of vines $w$ hich are recommended by M. Lingieet, and finds it to be mach longer than that required for wheat. "I know very well (fays he) that the one requires cattle, and the other does not: but thefe cattle, far from being expenfive, will, if properly managed, increafe the gain of the farmer ; therefore they muft not be looked upon as an expence. Corn is fubject to many accidents, but vines are fubject to many more: thoie which the vines fuffer; fometimes
fpoil the vintage for feveral years; whereas thofe which happen to arable land, only fpoil the crop for the feafon: and as the expence of cultivating vines, for which ouly manual labour can be cmployed, is much more confiderable; therefore the vigneron (or perfon wino cultivates vines), who engages more largely than the farmer, will confequently be a much greater lofer ifun-fuccefsful.- Hay is alfo fubject to frequent and very difagreeable accidents; the fecuring it is fometimes very difficult; and, when it is badly made, it is very hurtful to cattle.-A fingle fact will be fufficient to prove the cafualties to which hay is fubject ; viz. that it varies in price as much as grain. Accidents of haymows taking fire are bur too frequent; and this is not to be feared in corn-mows."

The other objections of M. Linguet to wheat appear tobequite frivolous; fo that concerning the cultivation of this grain, Dr Tiffot draws the following conclutions: "It appears then, from what has been faid, that wheat is not a commodity that is impoverithing in itfelf; and that this grain will grow indifferently at leaft in lands and litations which are unfavourable to orher plants. This grain is likewife adapted to molt climıtes ; and if there are diftricts almoft entirely fown with wheat, and yet poor, it is the fault of the foil, and not of this ufeful grain."

But the moft extraordinary argument perhaps ever thought of on this fubject is M. Linguet's aifertion, that the ufe of wheat, or bread made from it, is detrimental to population; and that the conntries where this grain is cultivated are poor and thinly inhabited, whereas thofe which abound with vineyardsand pafture-lands are rich and populous. But this, in Dr Tiflocts opinion, thews only that one foil is morerich than another, and that a fertile foil will maintain moft inlabi. tants. "No perfon (fays he) is more capable of affigning the caufe of the fubjection of the Roman empire to the northern powers, than M. Linguet; but he cannot furely be ferious when he fays, that they were enabied to conquer them becaufe thofe northern countries produced no corn, and that population decreafed fince the introduction of grain. I hall make three obfervations on this paffage ; Firft, the armies of Guftavas Adolphas, Charles XH. and the king of Pruffia, whofe food was bread, would be formidable againit the Italians of thofe times, who eat lefs than was eaten in the days of Scipio, as their anceftors were 1400 years ago againft the Romans: and M. Linguer muft certainly know, that thofe Greeks who fublifted on bread, thofe Romans who eat nothing but bread and vegetables in pottage, fubdued all the known world, anong whom were many nations who ate lefs brea' than themfelves. A Roman foldier's allowance of bread was much greater than what foidiers have at prefent; and by the ule of this food they had much more ftrength than our modern foldiers can boant of. The allowance to a Roman fuldier was 64 pourds of wheat per month; and this he was ftricily forbidden
either to fell or cxchange. Their foldiers had very chitua any cheefe, bacon, or pulfe; fo that wheat wis almoft their only food, and the propertion was donble of what is allowed folliters in our days. Hey ate it in bread, in four-milk, and in thin cales; and they were not fubject to epiemic or purtid diforders, which is too much the cale with our moditin armics. We may cafily judge from the weight of theiraccontrements, that the Roman foldiers were not poliefied of lets perfonal frength than thufe which compole the armies at this day; they were not le is brave, nor did their food yender themin any way anicalily : on the contrary, where there is fach diffoulty in procuring a fupply of good animal food to an arn $y$, as is of en ihe cafe in modern times, it is probable tatit reduciag then to the fimple diet of a Ruman foldier wonld be the moft proper method of preventing epidcinic difeafes among then. Secondly, it is very doubufal whether thofe conntries were more populous formerly than they are at this time; it is even probable that they were le is fo. Lattly, the people of thefe northern commerie were not without wheat; it was the batis of their food and drink: without quoting other authors who atteft it, fuffice it to fay, that Tacitus affirms it." \&c.

In this laft particuls, however, our author appears to be miftaken; but whatever may be in this, lle apprehend that tew of our readers will entertain any doubt concerning the wholefomencis of wheat, or the propriety of making it into bread afrer once it is cultivated. The trily important matter is to determine, whether it be a profitable crop or not for the perfon who cultivates it ? In this refpect indeed it has been condcmned by the generality of farmers, and dairyfarms are univerfally fuppofed to be more profiable than fach as produce corin. The vaft fuperiority of the former is fetforth by Thomas Davis, Efq; of Longleat, in the following words. "Experience fufficientBatb $P$. $=$ ly evinces the extreme difficulty of perfuading tenants fers, vol, iii that they get more (generally fpeakiag) by feeding thoir lands, than by ploughing them; yet it requires very few arguments to convince a landlord, that in culd wet lands efpecially, the lefs ploughed land you have, the lefs you put i. in a tenant's power to ruin your eftate. That a tenant of 601 . perannum on a dairy farm will get money, while a corn farm of the fame fize will ftarve its occupier (thouglr perhaps the former gives 15 s . per acre for his land, and the latter only 10 s.), is felf-evident. Tbe plough is a friend of every body's, though its advantages are very far from being particularly and locally felt; corn being an article that will bear keeping till the whim or caprice, or fuppofed advantage of its pof. felfor, call it forth. But the produce of the cow is far otherwife. Cheefe muft neceffarily be fold at a certaia period: it is a ponderous article; and one. twelfih, or at leaftone-fiteenth, of its value, is oftern paid for carrying it to a fair 50 miles oft; and the butter end kimend mill: find their way no great diAance from home, as is cvident by the price of butter varying frequently one-third in 22 or 30 miles. Every inhabitant of Bath muft be fentible, that bitter and cheefe have rifen one-third or more in price within 20 years. Is not this owing to the great encouragement given to the plongh and tograzing, at a time when,
on account of the inereafed demand for mill, cream, butser, and checfe, every exertion on behalt of the dary thould have been enconraged ?" \&:c.

In fome remarks on this letter by Fir Billingfley, the fame fuperiority of dairy-farms io the arable kind is afferted ju the moft politive terms. "Perhaps (fays he) there cannot be a ftronger proof of the inf criority of the plough with refpect to profit, than the fuperior punctuality of the dairy-farmer in the payment of his rent. This obfen vation, I believe, moit ftewards who fuperintend manors devoted partly to corn and partly to dairy-farms, will verify : at leaft I have never met with one who controvertsit. But perhaps the advocate for the plough will defire me nor to confound the abofe of a thing with its intrinfic excellence; and fay, that the generality of corn farmers are moft egregious flovens; that lands devoted to the plough are not confined to fuch a mediocrity of profit as io s. per acre; that the produce of artificial graifes (withour which a well managed arable farm cannot exift), far excceds ihar of natural grafs both in refpect of quantity and lituation; that the ftraw-yard is a moft convenient receptacle for the cow when freed from the pail. Thele, and many other reafons, may be adduced to fhow the propriety of walsing in the niddle path, and of judicioutly blending a able with pafture; in the proporion perhaps of three of the latter to one of the former."

On thefe letters we fhall only remark, that for the good of mankins' we hope the opinions they contain will never come into general practice; as thas the price of bread muft be raifed fo high, that the lower clafies of people would be entirely deprived of ir. In the Bath Papers, vol. v. p. 43. We have a method propofed by Rir Wimpcy of improving fmall arable farms in fuch a manner as to make them yield as much milk, butter, and cheefe, as thofe which are kept contimadly in pafture. He agrees with the maxim already mentioned, that finall arable farms do not afford the occupier fo good a maintenance as dairy farms of the fame value; and that the poffeffor of a dairy farm will do well and fave money, while the former, with much toil and trouble, is ftarving himfelf and family. Notwithftarding this, he maintains, that there is an effential difference between ground that is naturally arable, and fuch as is by nature adapted for pafture. Land which is naturally arable, according to him, can by no means be converted into pafture of any duration. "Such as, from a wild flate et name, over-run with furze, fern, buthes and hrambles, has been rendered fertile by means of the plough, muft be kept in that improved fate by its frequen ufe ; oherwife is would $f$ on revert to that wild barren fate which was its original condition. A farm, therefore, which confifts wholly, or almon fo, of land that is properly arable, muft ever continue arable; for it is not practicable to render it in any degree fertile but by means. of the plough, or to keep it lung in that ftate even when it is made fo." He is of opinion, however, that by railing crops proper for feeding catte, the pofferfor of an arable farm may raife as great a number of horned cattle as one who has a pafture farm; the only queftion is, Whether he can be reimburfed of his expences by the produce? "To afcertain this fact
(fays he), we mult inquirc what may be the average expences of keeping a milch-cow on a dairy-farm for any given time. It is faid, upon very good authority, that the expence is generally from $33^{1 .}$ to 31 . ros. peraunum. Two acres and an half of palture fit for this ufe is fufficient to keep a cow the whole year through, and fuch land is valued at from 255 . to 30 s per acre. At 25 s . the keeping of each cow would amomut to 31.2 s .6 d . per annum. A dairy-farm, therefore, conlifing of 48 acres, at 25 s . per annum, would amount to 601 . rent; and the number of cows that might be kept on fuch a farm would be about 20 . In the next place, with regard to the expence of keeping a cow upon food raifed in arable land as a fuccedaneum for grafs, we are affured by unqueftionable authority, that a bufhel of potatoes given lialf at night and half in the morning, with a fmall allowance of hay is fufficient to keep three cows a-day; by which allowance their milk will be as rich and as good as in the fammer months when the cows arein pafture. An acre of land properly cultivated with potatoes, will yield 337 bufhels; and the total expence of cultivation, rent and tithe included, will not exceed 61. 13 s . If three cows eat feven bufhels per week, then they would eat 364 buthels in a year : and 20 cows would confume 1433 bulhels;" So that, according to this calculation, feven acres and a quarter would mearly maintain as many cows as on the arable farm could be maintained by 48 actes. If then the cultivation of one acre of ground cofts 6113 s . the cultivation of feven acres and a quarter will coft about 481 . We have feen, however, that the rent of a dairy-farm capable of maintaining 20 milch-cows, is not lefs than 69 l . fo that the calculation is thus entirely in favour of the arable farm; feven or eight acres of the arable farm being fuperior by 19 . in value, when cultivated with potatoes, to 48 acres of meadow or pafture-ground." "It muft indeed be obferved (adds our author), that in this ftatement no allowance is made for the finall quantuty of hay given to the cows with the potatoes. It muft be noted alfo, that the account of cultivation is charged with 40 s . an acre for manure, and fome expence for ploughing, which of right is chargeable to the crop of wheat that is to follow. Now, if we deduct 40 s . an acre from the expence of cultivating the potatoes, it reduces the fum to 41 . I3 s. and the wholc expence uponfeven acres anda quarter is thus lefs than 341 . and confequently the keeping of 20 cows is little more than half to the occupier of the arable farm what it is to the occupier of the grazing farm. If this conclufion be fairly drawn, and the calculation free from crrors, it is matter of the greateft importance, efpecially to the litule arable farmer. It plainly raifes him from a ftate of acknowledged inferiority to one greatly fuperior.
Objection Our author next proceeds to obviate an objection, anfwered from an experiment of Mr Vagg. "that the whole of his reafoning muft beindecifive, as relating only to potatoes." In oppofition to this, he adduces an experiment made on a pretty large fale by MrVagg ; from which itappears, that cabbages, when raifed upon arable ground, are nearly as much fuperior
whole expence of culture and carting off the crop amounted only to il. I 4 s . fo that all the coll of the twelve acres was 381.9 s. From the prodnce were fed 45 oxen and upwards of 60 fheep; and he was affured that they inproved as falt upon it as they do in the beft pafture months, May, June, and July. "Now (fays Mr Wlimpey), if inltead of 60 hecpue reckon 15 oxen, or that four theep are equal to ebout one ox, in which we cannot err nuch ; then 60 oxear were kept well for three mombs, or, which is the fame thing, 15 for a wholc year, for 381.9 s.; and confequently 20 oxen would coft 5 I 1.5 s .4 d . which is not quite 3. l. more than the keeping of 20 cows would coft in potatoes. Turnips, turnip-rooted cabbage, carrots, parfinips, and fome other aricles, by many experiments often repeated, have been found quite adequate to the fame valuable purpoles; at lealt fo far as to be more lucrative than meadow or palture. Clover and rye-grafs are omitted, as having been long in general practice; but are in common very fhort of the advantages which may be derived from the cultivation of the other articles recommended." Sainfoin is greatly recommended ; but our author acknowledges that it makes but a miferable appearance the firft year, though afterwards he is of opinicn that one acre of fainfoin is equal to two of middling pafture-ground; for whith reaton lie accufes the farmer of intolerable ingolence who does not cultivate fo ufefal a plant. Sn this fubject, however, we muf remember, that the culture of fainfoin is clogged with the lofs of one if not two crops; which may fometimes be inconvenient, thongh afterwards it remains in perfection for no lefs than 20 ycars. The moft advantageous method of raifing it he fuppofes to be after potitocs. Thus it will thrive even upon very poor ground; as the culture and manure neceffry for the potatoss both putverife the foil and enrich it to a fufficient degree.

From thefe experimentsand obfervarions, thercfore, Great it appears very probable at leaft, that it is by no means quantitics againf the intereft of a farmer to cultivate large quan- of grain ties of grain ; and that he may even do this in a con- may be ado fiftency withraifiug as many cattle as he can have oc- vantagecation for. Some grounds, no doubt are naturally fo filted for pafture, that it would be too expenfive to force them into arable ground; bit whereverthis can be done, it feems proper always to have as much arable as pollible, inftead of as little, which Meifrs Davis and Billingfley advife. Grain of different kinds, therefore, and particularly wheat, onght to be cutivated by a farmer to as great an extent as pofible ; though thefe different kinds can be determined only from the nature of the foil, and certain circumfances arifing from the fituation of the place, for which no particular rules can be given. A view of the general practice of fome of the principal counties in England, however, may perhaps be of fome ufe to furnifh g neral directions for the farmer.

## Sect. I. Of tije Ciutivation of Wheat.

There is perthaps ne part of Great Britain wherethis Culture of fpecies of grin is cultivated to more perfection than in wheat in Nerfolk. Mr Marthal informs ns, that the Specjes Norfolk. wifed in that comatry is called the Norfolk red, and to a natural crop as potatoes are. Twelve acres were employed in this experiment, and thofe of an iudifferent quality. The rent was 30 s . per acre, and the
weighs

Wheat. Weir. shoavier than any other which has yet been introduced, though he owns that its appearance is much againft the affertion, it being a long thin grain, refembling rye more than well bodied wheat. About 16 or 20 years ago a new fpecies was introduced, named the Kentifh cofh; againft which the millers were at firft very much prejudiced, though this prejudice is now gor over. A remarkable circumftance refpecting this grain is, that though upon its introduction into the country the cofh or huik be perfectly white, yet fuch is the power either of the foil or of the mode of cultivation to produce what the botanifts call varieties, that the grain in queftion is faid to lofe every year fomewhat of the whitenefs of its hufks, until they become at laft equally red with thofe of the former kind. The fouthern and fontheaftern parts of the country generally enjoy a fronger and richer foil than the more northerly, and therefore are more proper for the cultivation of that fpecies of grain. In the northern parts are fome farms of very light foil, where the farmers fow only a finall quantity of wheat ; and thefe light lands are called barley farms.
The greatelt part of the wheat in Norfolk is fown upon a fecond year's lay ; fometimes it is fown upon a firft year's lay; fometimes on a fummer-fallow ; af- ter peas, turnips, or buck harvefted or plowed under. The practice adopted by thofe who are looked upon as fuperior hufbandmen in the county of Norfolk is as follows. The fecond year's lays having finifhed the bullocks, and brought the flock-cattle and horfes thro' the fore-part of fummer, and the firft year's lays having been made ready to reccive his flock, the farmer
21 begins to break up his old land or lay-ground by a peRice balk- culiar mode of cultivation named rice balkiug, in which - ing, a par- the furrow is always turned toward the unplowed ticular mode of culture ex plained. ground, the edge of the coulter paffing always clofe by the edge of the flag lant turned. This is done at firft with an even regular furrow ; opportunity being taken for performing the operation after the furface has been moiftened by a fummer-fhower. In this ftate his fummer-laysremain until towards the end of harveft, when he harrows and afterwards plows them acrofs the balks of the former plowing, bringing them now up to the full depth of the foil. On this plowing he immediately harrows the manure, and plows it in with a flallow furrow. The effects of the third plowing are to mix and effectually pulverife the foil and manure ; to cut off and pulverife the apper furfaces of the furrows of the fecond plowing ; and thus, in the mort cffectual manner, to eradicate or fmother the weeds which had efcaped the two former ones. Thus it lies until the feed-time, when itis harrowed, rolled, fown, and gathered up into ridges of fuch width as the farmerthinks moft proper. Thofe of fix furrows are molt common, though fome very good farmers lay their wheat-land.into four-furrow, and others into tenfurrow ridges; ". which laft (fays our author) they execute in a ftyle much fuperior to what might be expected from wheel-plows." They excel, however, in the fix-furrow plowing ; of which Mr Marfhal gives a particular account. When plowing in this manner, they carry very narrow furrews; fo that a fix-furrow ridge, fet out by letting the off-horfe return in the firtmade furrow, does not meafure more than three feet eight or nine inches.

When wheat is cultivated after the firft year's lay, wheat, the feed is generally fown upon the flag or furrow turned over. After peafe, one or twe plowings are given; the other parts of the managenent being the fame with that after the fecond year's lay already mentioned. After buck harvefted he feldom gives more than two, and fometimes but one, plowing. In the former cafe he fpreads his manure on the fubble, and plows it in with a hallow furrow; harrows, rolls, fows, and gathers up the foil into narrow work. The manure is in like manner fpread on the fubble after once plowing, and the feed is then fown among the manure; the whole plowed in together, and the foil gathered up into narrow ridges, as if it had undergone the operations of a fallow. An inconvenience attending this prasice is, that the buck which is neceffarily fhed in harvefting fprings up among the wheat, and becomes a weed to it, at the fame time that the rooks, if numerous, pull up both buck and wheat, leaving feveral patches quite bare. This is obviated in a great meafire by firft plowing in the manure and felf-fown buck with a ll.allow furrow; in confequence of which the buck vegetales before the whear.
It is likewife a favourite practice with the Norfolk farmers to raife wheat after buck plowed under. They plow under the buck by means of a broom made of rough buthes fixed to the fore tackle of the plow between the wheels, which bears down the plant with. out lifting the wheels from the ground. Sometimes when the buck is ftrong, they firit break it down with a rolier going the fame way that the lough is intended to go; afterwards a good plowman will cover it fo effectually that fcarce a ftalk can be feen. Sometimes the furface of the ground is left rough, but it is more eligible to harrow and roll it. The practice of fummerfallowing feldom occurs in Norfolk; though fometimes, when the foil has been mach worn down by cropping, and over run by weeds, it is efteemed a judicious practice by many excellent hufbandmen, and the practice feems to be daily gaining ground. After turnips the foil is plowed to moderate depth, and the feed fown ovet the firft plowing: but if the rumips be got in early, the weeds are fonctimes firft plowed in with a fhallow furrow, and the feed plowed under with a fecond plowing, gathering the foil into narrow ridges.

With regard to the manuring of the ground for Manuring wheat in Norfolk, that which has beenrecently clayed the ground or marled is fuppofed to need no other preparation in Norfolk. any more than that which has received 15 or 2oloads of dung and mould for turnips; and the firft year's lay having been teathed in antumn, and the fecond fed off. Where the foil is good, and the wheat apt to run 100 mach to ftraw, it is the practice of fome judicious farmers to fet their manure upon the young clover, thereby depriving the wheat in fome degree of its rankuefs; but it is moft common to fpread it upon the broken ground; or if the fced be fown upon the turned furrow, to fpread it on the turf and plow it under; or to fpread it on the plowed furface, and harrow it in with the feed as a top-dreffing. A fmaller quantity of manure is generally made ure of for wheat than for turnips. From eight to ten cartloads (as much as three horfes can conveniently draw) are reckoned fufficient for an acre; three or four

Wheat. four chaldrons of lime to one acre, or 40 bulhels of foot to the fame quantity of ground; or about a ton of rape cake to three acres.

In this county they never begin to fow wheat till after the $1 \mathrm{~g}_{\mathrm{ch}}$ of October, and continue till the begiming of December, fometimes even till Chriftmas. They give as a reafon for this late fowing, that the wheat treated in this manner is lefs apt to run to ftraw than when fown earlier. The feed is generally prepared with brine, candied in the ufual manner with
24 lime. The following method of preparing it is faid to be effectual in preventing the fimut. "The falt is diflolved in a very fmall quantity of water, barely fufficient for the purpore. The lime is laked with this folution, and the wheat candied with it in its hotreft ftate, having been previoully moiftened with pure water." According to our author's obfervation, the crops of thofe farmers who ufe this preparation are in general more free from finut than thofe who make ufe of any other.

The practice of dibbling or fetting of wheat has not as yet become general throughout Norfolk, the common broad-caft method being ufually followed, except on the Suffolk fide of the county. Some few make ufe of dibbling and fluting rollers; but drilling is almoft entirely unknown, notwithftanding tbe great aptitude of foil for the practice. Plowing in the feed under furrow is the favourite mode of the Norfolk farmers, and is performed in the following manner : "the land having been barrowed down level, and the furface rendered fmooth by the roller, the head-plow-

25
Method fowing. man (if at leifure) marks out the whole piece in narrow flips of about a ttacute rod in width. This he does by hanging up the plough in fuch a manner, that no part of it except the heal touches the ground; and this makes a fure mark for the feedman, which he cannot by any means mistake. In cafe the ploughs are all employed, the feedfman himfelf marks the ground, by drawing a piece of wood or other heavy body behind him." Mr Marfhall prefers this to the Kentifh method of fetting up fticks in the form of a lane as being lefs liable to produce miftakes.

In thofe places where wheat is dibbled they make ufe of iron inftruments for the purpofe. The acting part is an egg-fhaped knob, fonewhat larger than a pigeon's egg; the finaller end is the point of the dibble, the larger having a rod of iron riling from it about half an inch fquare, and two feet and an half long the head being received into a crofs piece of wood refembling the cruch of a fpade or fhovel, which form the handle. The dibbler ufes two of thefe inftruments, one in each had; and, bending over them, walks backward upon the turned furrows, making two rows of holes in each of them. Thefe rowsareufually made at the diftance of four inches from each orther; the holes being two and an half or three inches diftant, viz, four in each length of the foot of the dibbler. The great art in makingulhefe lies in leaving them firm and fmooth in the fides, fo that the loofe mould may not run in to fill them up before the feeds are depofited. Thisis done by a circular motion of the hand and wrift; making a femi-revolution every flroke; the circular motion beminning as the bit enters, and continuing until it is entircly difengaged from the mould. The operation is not
perfect unlefs the dibbles come ont clean and wear bright. It is fomewhat dificult to make the holes at equal diftances; but more efpecially to keep the iwo ftraight and parallel to each other, fonc practice being required to guide the inftrument in fuch a manner as to correfpond exactly with each other; but though couples have been invented to remedy this inconvenience to keep them at a proper diftance, the other method is ftill found to be preferable. A middling workman will make four holes in a fecond. One dibbler is fufficient for three droppers whence one manand three children are called a fet. The dibbier carrues on three flags or turned furrews; going on fome yards upon one of the outfide furrows, and returning upon the other, after which he takes the middle one: and thus keeps his three dibblers conftantly employed, and at the fame time is in no danger of filling up the holes with his feet. The droppers put in two or three grains of wheat into each hole; but much time and patience is neceffary to teach them to perform the bufinefs properly and quickly. An expert dibbler will hole half an acre in a day; though one third of an acre is ufually reckoned a good day's work. The feed is covered by means of a bufh-harrow; and from one buhel to fix pecks is the ufual quantity for an acre. Notwithitanding the advantages of faviing feed as well as fome others which are generally reckoned undeniable, it is afferted by fome very judicious farmers, that dibbling of wheat on the whole is not really a profitable practice. It is particularly f.id to be produc- Oljections tive of weeds unlefs dibbled very thick which indeed againt the may probably be the cafe, as the weeds are thus al- practice of lowed a greater face to vegetate in, Mr Marfhall him- dibbling. felf is of opinion, that "the dibbling of wheat appears to be peculiarly adapted to rich, deep foils, on which three or four pecks dibbled early may furead fufficiently for a full crop; whereas light, weak, thallow foils, which have lain two or three years, and have become graffy, require an additional quantity of feed, and confequently an addition of labour, otherwife the plants are not able to reach each other, and the graffes of courfe find their way up between them, by which means the crop is injured and the foil rendered foul."

The fame author has likewife given an account of $\mathrm{cu}^{29}$ the method of cultivating wheat practifed in other En- wheat in glifh counties. In the nidland diftrict, including part the midof Sraffordfhire, Derbyfhire, Warwick, and Leicefter- land diffhire, we are informed that the fpecies uftally fown is tric:. that called Red lammas, the ordinary red wheat of the kingdom; but of late a fpecies named the E/fex dun, fimilar to the Kentijh white cofs of Norfolk and. the Hertfordfhire brown of Yorkhire, have been coming into vogue. Cone.wheat, formerly in ufe in this diftrict, is now out of fahion. Spring wheat is cultivated with remarkable fuccefs, owing principally to the time of fowing; viz. the clofe of April. Our author was informed by an excellent farmerin thefe parts, that by fowing early, as in the beginning of March, the grain was liable to be fhrivelled, and the flraw to. be blighted; while that which was fown towards the end of April, or even in the beginning of May, produced clean plump corn. At the time he vited this country, bowever, it fermed to befalling into difre- of Glouce- of the triticum turgidum, is cultivated, as well asthe lamfter. mas and fpring wheats. It is not, bowever, the true cone wheat which is cultivated here, the ears being nearly cylindrical; but our author met with the true fpecies in North Wiltthire. Beans in this country are the common predeceffors of wheat, and fometimes peafe ; but here the farmers cultivate wheat upon every feccies of foil. The time of fowing is in November and December, and the feed is thonght to be fown in fufficient time if it is done before Chriftmas. In this county it is thought that late fown crops always produce better than thofe which are fown early ; but Mr Marthal accounts for this by the valt quantity of weeds the latter have to encounter, and which the late fown crops effape by reafon of the weaknefs of vegetation at that time of the year. The produce, however, throughout the vale of Gloucefter, is but very indiffe-rent.--Seting of wheat is not pracifed, but hocing univerfally.-In harvefting, Mr Marfhalloblerves that the grain is allowed to fland until it be unreafonably ripe, and that it is bound up into very fimall fheaves. The practice of making double bands is unknown in this difrrict; fo that the fheaves are no bigger than can

31 Renarkably fmall Heaves.
pute ; though he looks upon it, in fome fituations, efpecially in a turnip-country, to be eligible. In the ordinary fucceflion in that part of the kingdom, wheat comes after oats: and there is perhips nine tenths of the wheat in this diftrict fown upon oat ftubble. Our author has alfo feen a few examples of wheat being fown upon turf of fix or feven year's laying: and feveralothers on clover ley once plowed, as well as fome after turnips. The beft crops, however, produced in this, or perhaps in any other diftrict, are after fummer fallow. The time of fowing is the month of October, little being fown before Michaelmas; and in a favourable feafon, little after the clofe of the month. Much feed is fown here witiout preparation. When any is made ufe of, it is the common one of brine candied with lime. The produce is very great, the medium being full three quarters per acre, fometimes four or five; and one farmer, in the year 1784, had, on 59 acres of land together, no lefs than 45 bufhels per acre. conveniences of this method are, that the crop requires nore time to ftock, load and unload, and fack; the advantages arc, that the trouble of making bands is aveided: and that if rainy weather happens to intervenc, the fimall heaves dry much fooner than the large ones. Here the crop is cut very high, the ftubble and weeds being mown off in fwaths for litier foon after the crop is cut; and fometimes fold as high as 5 s. per acre.-Mr Marfhall is at a lofs to account for the little quartity produced in this country; it being hardly pofite $t$ derive it from the nature of the foil, almont all ofit beiag proper for the cultivation of the grain.
${ }^{32}$. ${ }^{3}$. mong the Cotiwold hills of Gloucefter the lan:Ia the Corf- mand
wold hills, mand cone wheats are form ; and a new varicty of the latter was railed not long ago by picking out a fiagle crain of feed from among a parcel. The body is very long and large, but not fightrly. - The Cotfwold hills are almoft proverbial for carly fowing of wheal. : The general rule is to begin plowing in July and fowing the firft wet weather in Auguft; fo that here
the fecd-time and harveft of wheat coincide. If in wheat. confequence of this early fowing the blade becomes rank in autumn, it is fupppofed to be proper to eat it down by putting a large flock of fleep uponit at once. Eating it in fpring is confidered as pernicious. It is ufvally weeded with fpud-hooks; not hoed, as ir. the Vale. One inftance, however, is mentianed by our author, in which a very thin crop full of feed-weeds was hoed in autumn with uncommon fuccefs, occurred wheat. in the practice of a fuperior manager in this diftrict; as well as others in which wheat has beein weeded in autamn with great advantage. He alfo met with another well authenticated inftance of the good effect of cutting mildewed wheat while very green. "A fine piece of wheat being lodged by heavy rains, and being foon after perceived to be infected with the mil. dew, was cut, though fill in a perfeetly green flate: namely, about three weeks before the ufual time of cutting. It lay fpread abroad upon the ftubble untilit became dry enough to prevent its caking in the fheaf; when it was bound and fet up in fhocks. The refult of this treatment was that the grain, though fmall, was of a fine colour, and the heavieft whear which grew upon the fame farm that feafon; owing, no donbt; to the thinnefs of its kkin. What appears nuch more remarkable, the ftraw was perfectly bright, not a fpeck upon it.--in this part of the country, the produce of wheat is fuperior to that in the Vale ; but Mr Marflall is of opinion, that the foil is minch more fit for barley than wheat.
In Yorkshire, though generally a grafs-land coun- Cultivation try, and where of confequence corn is only a fecon- of wheat in dary concern, yer feveral kinds of wheat are culti- Yorkfhire. vated, particularly Zealand, Downy Kent, Common White, Hertfordfive Brown, (rllcw Keit, Common Red. All thefe are-varieties of winter wheat; befides which they cultivate alfo the $\int$ pring or fummer wwheat. Here our author makes feveral curious obfervations concerning the raifing of varieties of plants. "It is probable (fays he), that time has the fame effect upon the varietics of wheat and other grains as it has on thofe of cultivated fruits, potatoes, and other vegeta. ble productions. Thus, to produce an early pea, the gardener marks the plants which open into bloffom among the moft early kind he has in cultixation. Next year he fows the produce of thefe plants, and goes over the coming crop in the manner he had done the preceding year, marking the earlier of this early kind. In a fimilar manner new varieties of apples are raifed, by chooling the hardeft leaved plants among a bed of feedlings rifing promifcuoufly frompippins. :Hullandmen, it is probable, have heretofore been equally induftrious in producing frelh varieties of corn; or whence the endlefs variety of winter wheats? If they be naturally one fyecies, as Linnæus has deemed them, they muft have been produced by climature, foil, or induftry ; for althongh nature fports with individuals, the induftry of man is requifite to raife, eftablifh, and continue a permanent variety. The only infince in which I lave had an oppportunity of tracing the variety down to the parent individuat, has occurred to me in this diftrict.-A man of acnte obfervation, having, in a piece of wheat, perceived a plant of un. common frength and luxuriance, diffuling its branches on every fide, and fetting its clofely-furrounding neigh-

Wheat. bours at defiance; marked it, and at harvent removed it feparately. The produce was 15 ears, yielding 604 grains of a Itrong-bodied liver-coloured wheat, different, in general appearance, from everyother variety he had feen. The chaff was fmooth, without awns, and of the colour of the grain; the ftraw fout and reedy. Thefe 604 grains were planted fingly, nine inches afinder, filling about 40 fquare yards of ground, on a clover tubble, the remainder of the ground being fown with wheat in the ordinary way; by which means extraordinary trouble and deftruction by birds were avoided. The produce was two gallons and an half, weighing $20 \frac{1}{2}$ lb. of prime grain for feed, befides fome pounds of feconds. One grain produced 35 ears, yielding 1235 grains; fo that the fecond years produce was fufficient to plantan acre of ground.- What deters farmers from improvements of this nature is probably the mifchievoufnefs of birds; from which at harveft it is fcarcely poffible to preferve a fmall patch of corn, efpecially in a garden or other ground fituated near an habitation ; but by carrying on the improvement in a feld of corn of the fame nature, that inconvenience is got rid of. In this fituation, however, the botanift will be apprehentive of danger from the floral farina of the furrounding crop. But from what obfervations I have made, I amofopinion his fears will be groundlefs. No evil of this kind occurred, though the cultivation of the above variety was carried on among white wheat. But this need not be brought as an evidence; it is not uncommon here to fow a mixture of red and white wheats together; and this, it is confidently afferted, without impairing even the colour of either of them. The fame mode of culture-is applicable to the improvement of varieties; which perhaps would be more profitable to the hufbandman than raifing new ones, and more expeditious."

In Yorkfire a very fingular preparation of feedwheat prevails, viz. the fteeping it in a folution of arfenic, as a preventative of fmut. Marhall was informed by one farmer, that he had made ufe of this prepara- tion for 20 years with fuccefs, having never during that long fpace of time fuffered any fenfible injury from frum. Our author feems inclined to believe the efficacy of this preparation; but thinks there may be fome reafon to apprehend danger in the ufe of fuch a pernicious mineral, either through the careleffinefs of fervants, or handling of the feed by the perfon who fows it. The farmer abovementioned, however, during all the time he ufed it, never experienced any inconvenience either to himfelf, the feedfman, or even to the poultry; though thefe laft, we flould have thought, would have been peculiarly liable to accidents from arfenicated feed.-The preparation is made by pounding the arfenic extremely finc, boiling it in wacer, and drenching the feed with the decoction. "In ftrictnefs (fays Mr Marihall), the arfenic fhould be levigated fufficiently fine, to be taken up and wafhed over with water, reducing the fediment antil it be fine enough to be carried over in the fame manner. -The ufual method of preparing the liquor is to boil one ounce of white arfenic, finely powdered, in a gallon of water, from one to two hours; and to add to the decoction as much water or ftale nrineas will increafe the liquor to two gallons.-In this liquor the feed is, or ought to be, immerged, firpring it about in fuch a

[^61]matiner as to faturate effectually the downy end of each grain. - This done, and the liquordrawn off, the feed is confidered as fit for the feed.baket, without being candied wirh lime, or any other preparation.-A bufhel of wheat has been obierved to take up about a gallon of liquor. The price of arfenic is about $6 d$. per pound; which on this calculation will cure four quarters of feed. If no more than three quarers be prepared with it, the coft will be only a farthing per buikel; but to this muft be added the labour of pomading and boiling. Neverthelefs, it is by much the cheapert, and perhaps, upon the whole (adds Mr Marfhall), the belt preparation we are at prefent acquainted with.-In this country it is believed that a mixture of wheat and rye, formerly a very conmon crop in thefe parts, is never affected with mildew; but our author does not vouch for the truth of this affertion.

## Sect. 1I. Barley.

The county of Norfolk, according to Mr Marfhall, 35 is peculiarly adapted to the cultivation of this grain, of barley the ftrongeft foil not being too heavy, and the lighteft Norfolk. being able to bearit; and fo well verfed are the Norfolk farmers in the cultivation of it, that the barley of this county is defired for feed throughout the whoie kingdom.-It ishere fawn after wheat or turnips; and in fome very light lands it is fown after the fecond year's lay.-After wheat, the feed time of the latter being finifhed, and the fubble trampled down with bullocks, the land is ploughed with a fhallow furrow for a winter-fallow for barley. In the beginning of March the land is harrowed and crofs-ploughed; or if it bewet, theridges arereverfed. In April it reccives an. other ploughinglengthways; and at feed time it is harrowed, rolled, fowed, and the furface renderedas fnootin and level as poffible.-After turnips the foil is broken up as faft as the turnips are taken off; if early in win. ter by rice-balking, a practice already explained*; but *See $n^{\bullet}$ 2r. if late, by a plain ploughing. It is common, if time will permit, to plough three times; the firft fhallow, the fecond full, and the third a mean depth; with which laft the feed is ploughed in. Sometimes, however, the ground is ploughed only once, and the feed fown above; but more frequently in three ploughings, though perhaps the farmer has not above a week to perform them in.-After lay, the turf is generally broken by a win. terfallow, and the foil treated as after wheat.

This grain is feldom manared for, except when fown after lay, when it is treated as wheat. No mantre is requilite after turnips or wheat, if the latter has been manured for. If not, the turnip-crop following immediately, the barley is left to take its chance, unlefs the opportunity be enbraced for winter-marling.

Little barley is fown by the Norfolk farmers be. fore the middle of April, and the feed time generally continues till the middle of May; though this muft in fome meafure depend on the feafon; "s which (fays Mr Marflall) is more attended to in Norfolk than perloaps in all the world belide." In the very backward fpring of 1782 , barley was fown in June with fuccefs. No preparation is ufed. It is all fown broad-caft, and almoft all under furrow; that is, the furface having been fmoothed by the harrow and roller, the feed is 5 A
fown
fown and ploughed under with a flallow furrow; but if rine feafon bewet, and the foil cold and heavy, it is fometimes fown above; but if the fpring be forward, and the laft piece of turnips eaten off late, the ground is fometimes obliged to be ploughed only once, and to be fown above; theugh in this cafe Mr Marflath thinks it the moft eligible management, inftead of turning over the whole thicknefs of the foil, to two furrow it, and fow between. This is done by only fkimming the furface with the firf plough, fowing the feed upon this, and then covering it wirh the bottom-furrow brought up by the fecond plough. Three bufhels are wually fufficient for an acre.

The barley, as well as the wheat, in Norfolk, is allowed to fand till very ripe. It is univerfally mown into fwath, with a fmall bow fixed at the heel of the fcythe. If it receive wet in the fwath in this country, it is not Eurned, but lifted; that is, the heads or ears are raifed from the ground, either with a fork or the teeth of a rake, thereby admitting the air underneath the fwaths; which will not fall down again to the grourd fo clofe as before, fo that the air has free accefs to the under fide: and this method of lifting is fuppofed not to be inferior to that of turning, which requires more labour, befides breaking and rufling the fwaths.
In the Vale In the Vale of Gloncefter the quantity of barley culof Gloucef- tivated is very inconfiderable; the only fpecies is the ter. common long-eared barley, hordeum zeocriton. In this country the grain we fpeak of is ufed, on the every year's lands, as a cleanfing crop. It is fown very late, viz. in the middle or end of May; fomenimes the beginning or even the middle of June. The reafon of this is, that the people of the Vale think, that if a week or ten days of fine weather can be had for the operation of harrowing out couth, and if after this a full crop of barley fucceed, efpecially if it fhould fortunately take a reclining pofture, the bufinefs of fallowing is effectually done, infonuch that the foil is cleaned to a fufficient degree to laft for a number of years. A great quantity of feed is made ufe of, viz. from three to four buhels to an acre; under the idea, that a full crop of barley, efpecially if it ledge, fmothers all kinds of weeds, couch-grafs itfelf not excepted. Our author acknowledges this effect in fome degree, but does not recommend the practice. "If the land (fays he) be tolerably clean, and the feafon favourable, a barley fallow may no doubt be of effential fervice. But there is not one year in five in which even land which is tolerably clean can be fown in feafon, and at the fame time be murch benefited by it for future crops." The barley in this country is all hand-weeded. It is harvelted loofe, mown with the naked fcythe, lies in fwath till the day of carrying, and is cocked with common hay forks. The medium produce is three quarters per acre. Its quality is preferable to that of the hillbarley.

The common long eared fecies is fown among the Cotfwold hills. It is fown in the latter end of March and beginning of April, in the quantity of three bu-. fhels to an acre, producing from 20 bufhels to fourquarters to an acre; which " (fays our author): is a low produce. It moft be obferved, howewer, that this produce is from land deficient in tillage ; and that barley delights in a fine palverous tilth.".

In the Midland diftrict they cultivate two fpecies of Barley. barley, viz. the zeacriton or common long-eared, and 4 x the diffickon or fprat barley; the latter not being of Inthe Midmore than 50 years fanding, but the former of much land difolder date. The fprat is the more hardy, and requires trict. to be more early fown; but the long ear yields the better produce. It fucceeds wheat and turnips; but on the ftrong lands of this diftrict, tine crop after wheat is much lefs productive, as wellas lefs certain, than atter turnips; which circumftance is likewife obferved in Norfolk. It is fometimes alfo fown with fuccefs upon turf. When fown after wheat, the fuil is winter-fallowed by three ploughings; the firft length ways in Noveinber; the fecond acrois in March; the laft, which is the feed-plonghing, lengthways. Between the two Iaft ploughings the foit is harrowed, and the twitch fhaken out with forks; after which it is left loofe and light to die upon the furface, without being either burnt or carried off. After turnips the foil has commonly three ploughings; the reafon of which is, that the turnips being commonly folded off with heep, the foil, naturally of a clofe texture, receives aftiH greater degree of compactnefs, which it is proper to break down, and render it porous. The feed-time is the two laft weeks of April and the firft of May; from two bufhels and a half to three bullels an acre, fometimes even as much as four buthels; the produce very great, fometimes as high as feven or even eight quarters an acre; but the medinm may be reckoned from four to four and an half quarters. Mr Marfhall remarks, that the culture of barley is extremely diff. barley difcult. "S Something (fays he) depends on the nature ficult. of the foil, much on the preparation, much on the feafon of fowing, and much on harvefting. Upon the whole, it may be deemed, of corn crops, the moll difficult to be cultivated with certainty."

In Yorkfhire there are four kinds of barley culti- In Yorkvated, viz, the zeocriton or long-eared; the diffichon fhire. or fprat; the whlgare, big, four-rowed or fpringbarley; and the bexaftichon, fix-rowed or furing-barley. The firft and third forts are principally cultivated; the winter-barley is as yet new to the diftrict. Battledoor barley was formerly very common, but is. now almoft entirely difufed. Mr Marfall obferves, that lefs than a century ago, barley was not faleable until it was malted; there were neither malifters nor public houfes, but every farmer malted his own grain, or fold it to a neighbour who had a malt-kiln. Brakes cut from the neighbouring commons were the faet commonly ufed upon this occafion, and a certain day. for cutting them was fixed, in order to prevent any one from taking more than his hare. The cafe is now totally reverfed; even public malt-houfes being unknown, and the bufinefs of malting entirely performed by maltters, who buy the barley from the farmer, and fell him what malt he may want for his family.

## Sect. III. Oats.

IN: Norfolk this kind of grain is much lefs cultiva. Norfolk. ted than barley; and the only fpecies obferved by cultiviaMrMar:hall is a kind of white oat, which grows quick- tion of ly, and feems to be of Dutch extraction. They are oata. cultivated occafionally on all kinds of foils; but more efpecially on cold heavy land, or on very light, unpro- dactive,

Oats. ductive, heathy, foils. They moft frequently fueceed wheat or lay-ground barley: "but (fays our author) there are no eftablifhed rules refpecting any part of the culture of this time-ferving crop." The culture of the ground is ufually the fame with that of barley; the ground generally undergoing a winter fallow of three or four ploughings, though dometimes they are fown after one ploughing. They are more commonly fown above furrow than barley. The feed-time is made fubfervient to that of barley, being fometimes fooner and fometimes later than barley feed-time: and Mr Marlhall obferves, that he has fometimes feen them fuwn in June; it being obfervable, that oats fown late ripen earlier than barley fown at the fame time. The quantity of feed in Norfolk is from four to five buflels per acre; but he does not acquaint us with the pro-

45
Method of duce. He mentions a very fingular method of culture fometimes practifed in this county, viz. ploughing down the oats after they begin to vegetate, but betore they have got above ground; which is attended with great fuccefs, even though the ground is turned over with a full furrow. By this method weeds of every kind are deftroyed, or at leaft checked in fuch a manner as to give the crop an opportunity of gerting above them; and the porolity communicated to the foil is excellently well adapted to the infant-plants of barley; which probably might frequently receive benefit from this operation.

In the Vale of Gloncefter, Mr Marflall obferves, that the wild oat is a very troublefome weed, as well as in Yorklhire ; and he is of opinion, that it is as truly a native of Great Britain as any other arable weed, and is perhaps the moft difficult to be extirpated. It will lie a century in the foil withont lofing is vegetative quality. Ground which has lain in a ftate of grafs time immemorial, both in Gloucefter and Yorkfiire, has produced it in abundance on being broken up. It is alfo endowed with the fame feemingly inftinctive choice of feafons and fate of the foil as other feeds of weeds appear to have. Hence it is exceffively difficulc to be overcome; for as it ripens before any crop of grain, it fheds its feed on the foil, where the roughnefs of its coat probably fecures it from birds. The only methods of extirpating this plant are fallowing, hoeing, and handweeding, where the taft is practicable, after it has fhot its panicle.

No oats are culivated in the Vale of Gloucefter ; though the wild oat grows every whereasalready faid. Mr. Marfhall is of opinion that it is better adapted to oats than to barley. The reafon he affigas for the preference given to the latter is, that in this part of the country the monks were formerly very numerous, who probably preferred ale to oaten cake.-He now, however, recommends a tialof the grain on the frongor cold lands in the area of the Vale, as they feldom can be got fufficiently fine for barley. The fodder from oats he accounts much more valuable than that from barley to a dairy country; and the grain would more than balance in quantity the comparative diffesence in price.

In the midland diftrict the Poland oat, which was formerly in vogue, has now given place to the $D_{\text {utch }}$ or Friezeland kind. It is conftantly fown afcer turt; one ploughing being given in Febriary, March, or April. The feed-time is the latter end of March and
beginning of April, from four to feven buflels an acre; the produce is in proportion to the feed, the mediam being about lix quarters.

In York hire the Friezeland oats are likewife pre. In Yorkferred to the Poland, as affording more ftraw, and be- quire. ing thinner fkinued than the latter. The Siberian, or Tartarian oat, a fpecies unnoticed by Linnæus, is likewife cultivated in this country : the reed oat is known, but has not yet come into any great eftimation. The grain is light, and the flraw too ready to be affected by cattle.

Oats are particularly cultivated in the weftern divifio: of the Vale of York fhire; where the foil is chiefly a rich fandy loam, unproductive of wheat. Five or fix bufhels, or even a quarter of oats, are fometimes fown upon an acre; the produce from feven to ten quarters. - In this country they are threfhed in the 5 ingula open air, and frequently even upon the bare ground, method of without even the cerenony of interpoling a cloth. The threlhing. reafons affigned for this feemingly ftrange practiceare, that if pigs and poultry be employed to eat up the grain which efcapes the broom, there will be litle or no wafte. Here the market is always very great for new oats, the manufacturing parts of Weft Yorkhire ufing principally oat-bread. The only objection to this pradtice is the chance of bad weather; bat there is always plenty of ftraw to cover up the threfhed corn, and it is found that a litcle rain apon the ftraw does not make it lefs agreeable to cattle.

In an experiment made by Mr Bartley near Briftol, Bath Paupon black oats, we are informed that he had the pro- pers, vol. digious increafe of $94^{\frac{\pi}{4}}$. Winchefter bulhets fron four on the acre : the land was a deep, mellow, fundy loam. It had carried potatoss the former year, and received one ploughing for a winter fallow. Another ploughing was given it in February, and the feed was fown on the 27 th and 28 th of the month. The fuccefs of the experiment was fuppoied to be owing partly to the early fowing and partly to a good deep tillage.

## Sect. IV. Peafe.

In the Bath Papers, vol. i. p. I.48. we have an account of the fuccefs of an experiment by Mr Pavier near Taunton, on fowing peafcindrills, a mathod mentioned under the article Agriculture, no ryo. The fcale on which this experiment was made, however, being fo fmall, it would perhaps be rafl to infer from it what might be the event of planting a large piece of ground in the fane manner. The fpace wasonly 16 fquare yards, but the produce fo great, that by calculating from it, a fatute acre would yield 6oo, or at the leaft 500 pecks of green peafe at the firft gathering; which, at the high price they bore at that time in the county about Taunion, viz. 16d. per peck, would have amounted to 33 l .6 s .8 d . On this the Society obferve, that though they doubt not the truth of the calculation, they are of opinion, that fuch a quantity as 500 or 600 pecks of green peafe would immediatcly rednce the price in any comatry market. "If the abovementioned crop (fay they were fold only at nine pence per peck, the farmer would be well paid for his trouble." In a detter on the drill hubandry by Mr Whitmore, for which the thanks of the fociety were retarned, he informs us, that drilled peafe mult

Peafe. not be fown too thin, or they will always be foul; and in an experiment of this kind, notwithitanding careful hoeing, they turned out fo foul, that the produce was

Peafe muft
not be fown tio often on the fame fpot, only eight buthels to the acre.-From an experiment relate in the $^{5}$ th volume of the fame work, it appears that peafe, however meliorating they may be to the ground at firft; will at the laft totally exhauft it, at leaft with regard to themfelves. In this experiment they were fown on the fame fot for ten years running. After the firf two years the crop became gradually lefs and lefs, until at laft the feed would not vegetate; but became putrid. Strawberries were then planted without any manure, and yielded an excellent crop.
\# See Agri- On the Norfolk culture of peafe*, Mr Marfhall culture, n ${ }^{\circ}$ makes two obfervations. "Laysare feldom ploughed 150. more than once for peafe; and the feed is ingencral

## 54

Mr Mar-
thall's obfervations. dibbled in upon the flag of this one ploughing. But fubbles are in general broken by a winter-fallow of three or four ploughings; the feed being fown broadcaft, and ploughed in about three inches deep with the laft ploughing." -In the Vale of Gloucefter they are planted by women, and hoed by women and children, once, twice, and fometimes thrice; which gives the crop, when the foil is fufficiently free from root-weeds, the appearance of a garden in the fummer time, and produces a plentiful crop in harveft. The diftance between the rows varies from to to 14 inches, but 12 may be confidered as the medium ; the diftance in the rows two inches. In the Cheltenham quarter of the diffrict, they fet the peas not in continued lines, but in clumps; making the holes eight or ten inches diftant from one another, puting a number of peafe into each hole. Thus the hoe has undoubtedly greater freedom ; all the difadvantage is, that in this cafe the foil is not fo evenly and fally occupied by the roots as when they are difpofed in continued lines.-In Yorkfhire it is common to fow beans and grey peafe together, under the name of blendings; and fometimes fitches (probably, fays Mr Mrarfhall, a gigantic variety of the ervum lens) are fown among beans. Such mixtures are found to augment the crop, and the different fpecies are eafily feparated by the fieve.

Thefe are the moft remarkable particulars concerning the culture of corn not taken notice of under AgricUlture : but befides that kind of vegetables called Grain, there is a number of others very important both for the ufe of men and cattle, of which we muft now treat particularly.

## Sect. V. Potatoes.

These, next to the different kinds of grain, may be looked upon as the crop noft generally ufeful for the hufbandman; affording not only a moft excellent food for catile, but for the human fpecies alfo; and are perhaps the ouly fubtitute that could be afed for bread with any probability of fuccefs. In the anfwer by Dr Tifor to M. Linguet already mentioned, the

55
Are not prejudical to mankind. former objects to the confant ufe of them as food; not becaule they are pernicious so the body, but becaufe they hurt the faculties of the mind. He owns, that thofe who eat maize, potatoes or even millet, may grow tall and acquire a large fize; but doubts if any fach ever produced a literary work of merit. It does mot ${ }_{2}$ however, by any means appear, that the very ge-
neral ufe of potatoes in Britain has at all impaired cither the health of body or vigour of mind of its inhabitants. The queftion then, as they have already been fhown to be an excellent food for cattle, comes to be merely with regard to the profit of cultivating them; and this feems already to be fo well determined by innumerable experiments, as well as by the general practice of the country, that no room appears left for doubt. In the Tranfactions of the Society for the encouragement of Arts, a number of experiments are related by Mr Young on that kind called the cluffered or hog potato, which he ftrongly recommends as food for the poor, in preference to the kidney or meris other more expenfive kinds. The following is the the clurefult of the moft remarkable of his experiments.

In the firft week of March I 780 , two acres and a quarter of barley fubble were fown with the clufter potato, which appeared on the 23 d of May. A fharp froft on the 7 th of June turned them as black as they ufually are by the frofts of November and December. In time, however, they recovered; and by the end of October produced 876 bulhels from the $2^{2}$ acres ; which, when cleaned, were reduced to 780 , or 350 bufhels per acre ; thus affording, when valued only at 6d. per bufhel, a clear profit of 7l. 14s. 4d. per acre. This experiment, however, in his opinion, would have been ftill more profitable, had it not been for the following circumftances. I . The f.il was not altogether proper. 2. The crop was grievoully injured by the froft already mentioned, which, in our author's opinion, retarded the growth about fix weeks: 3. The dung was not of his own raifing, but purchafed; which cannot but be fuppofed to make a great difference, not only on account of the price, but likewife of the quality, as lappened to be the cafe at prefent. He is of opinion, however, that potatoes, at leaft this kind of them, are an exhaufting crop. Having fown the field after this large crop of potatoes with wheat, his neighbours were of opinion that it would be too rank ; but fo far was this from being the cafe, that the wheat fhowed not the leaft fign of luxuriance, nor the leaft fuperiority over the parts adjacent which were fown without dang. He was willing to account for this by the poverty of the dung, and the fevere cropping which the ground had undergone while in the poffeffion of the former tenant. In another experiment, however, in which the ground had been likewife exhaufted by fevere cropping, the fucceeding crop of wheat fhowed no lixuriance; fo that the former fifpicion of the exhaufting quality of the clufter potato was rather confirmed. The ground was a fine turnip loam; but though the prodace was even greater than in the former cafe, viz. 356 bufhels trom an acre, the profit was much lefs, \&c. only 4l. 15s. 6d. An acre of leyground was fown at the fame time with the turniploam, but the produce from it was only 200 buthels. Mr Young fuppofes that the produce would have been greater if the potatoes had been planted with an iron dibble, as the turf, in plorghing, lay too heavy upon the feed. A few rows of other potatoes, planted along with the cluftered kind, did not vegetare at all; which fhows that the latter have a powerful vegetative faculty.

Having fucceeded fo well with his experiments on Experithis kind of potato hitherto, Mr Young determined to ments on
try fale.

Potatoes. try the culture of them upon a larger fcale ; and therefore, in the year 1782 , fowed in acres: but being obliged to commit the care of fowing them to an ignorant labourer, his ankilfulnefs, together with the excelfive cold and moifture of that feafon, fo diminithed the pro. duce, that he had only a fingle acre oat of the whole. This produced 180 buhels, which yielded of clear profit 4l. 2s. 6d. From this experiment he draws the following conclulions: I. "That the poor loam, on which thefe potatoes were fown, will yield a crop of clufter-potatoes, though not of any other kind. 2. That the manare for potatoes ought to be carted and fpread upon all foils inclinable to wet before the planting feafon, either in autumn preceding, or elfe during a hard froit.' In 1782 he flucceeded ftill worfe; for having that year fown three acres and a half, the profit did not exceedins. 4d. per acre. The produce was about 224 buthels per acre. He gives two reafons for the failure of this crop: 1. The cluftered-potato thrives beft in wet years; but the fummer of a 783 was dry and hot. 2. The fring froft, by interrupting the hoeing, not only greatly raifed the expences, but vety much injured the crop by encouraging the growth of weeds. Barley was fows after the laft crop, and produced well: fo that our author thinks the potatoes feem to be a better preparation for fpring corn than wheat. His experiment in 1784 produced a clear profit of 21 . os. 4 d .; the produce being 250 bufhels per acre. Still however, an error was committed, by employing an old man and woman to cut the fets; by whofe undillfulnefs there were many great gaps among the potatoes as they came up; fo that, on the whole,
he reckons that he thus loft from 500 to 800 bufhels. e clufter-potato. " With fmall crops (fays he), col- and at the low rate of value which is produced by contivation of funing them at home, they are clearly proved to be a this kind. crop which will pay the expence of mannring, and very ample tillage and hocing. This is, after all, the chief object of nodern hufbandry; for if a man can rely upon this potato for the winter confumption of his yard in fattening or keeping hogs, in feeding his horfes, and fattening his bullocks, he has made one of the greateftacquifitions that can be defired ; fince he can do all this upon land mach too ftiff and wet for turnips, houfes his crops before the winter rains come on ; and confequently without doing any of that injury to his land which the turnip culture is known to ent:il, and from which even cabbages are not free. Thofe who know the importance of winter-food on a turnip farm, cannot but admit the magnitude of this object on wet foils."
Mr Marfhall, in his Rural Ceconomy of Yorkfhire, has feveral ve y interefting remarks on the potato. Its varieties, he fays, are endefs and tranfitory. The rough-fkinned Ruffia potatoe, which was long a favourite of the Yorkfhire farmers, he is of opinion, has now no longer an exitence more than many others which flourifhed for a time. "There is fome reafon to believe (fays he) that the difeafe which has of late years been fatal to the potato-crop in thes and in other diftricts, under the nane of CURLED TOPS, has arifen from too long a continuance of de lining varieties. Be this as it may, it appears to be an eftablifhed opinion here, that frefh warietres, raifed from feed, ire not liable
to that difeafe." Our author, however, does notlook Potatoes. upon this to be a fact abfolutely eftablifhed; thongh one infance fell under his obfervaion, in which its removal was in all probability owing to the introluc. tion of new varieties. It made its appearance between 40 and 50 years ago, and fpread in fome degree over the whole kingdom. In fome places it continued but a fhort time, fo that its effects are almont forgotten. It is feldom, obvious at the firft coming up of the plant, but attacks them as they increafe in fize; the elltire top becomingdwarfifh and fhrivelled as if affected by drouglat or loaded with infeets : they neverthelefs live and increafe, though flowly, in fize; but the roots are unprodactive. Some crops have been almoft wholly deftroyed by this difeafe. In Yorkthire the Morelands are in a manner free from it, but the Vale is in fome mealure infected. Plants procured from the Morelands remain free from it in the Vale the firft year; but, being continued, become liable to the difeafe. Where the attack has been partial, weeding. out the dileafed plants as they failed, is faid to have had a good effect; and it is faid the Morelanders got rid of the difeafe by this means.

61
In Yorkfhire, fome intelligent hufbandmen are ac- Method of quainted with the method of raifing potatoes from raifing vafeed; which is as follows. "In autumn, when the rieties apples are beginning to fall fpontancoufly, they are from feed. gathered by hand, and preferved among fand until the fipring, when they are mafled among the fand or among freft mould; feparating the feeds and mixing them evenly with the mould. As foon as the fpring frofts are julged to be over, they are fown in fine garden mould; and as faft as the plants get into rongh leaf, and are ftrong enough to be handled without injury, they are tranfplanted into another bed of rich mould in rows, which are kept clean during fammer. In atutumn, bunches of fmall potatoes are found at the roots cf the $e$ plants; varying in fize, the firft year from an hazel-nut to that of a crab. Thefe being planted next fpring, produce potatocs of the middle-fize; but they do not arrive at their fulleft bulk until the third or fourth year. Where the ufe of the fove or the garden frame can be had, this procefs may be fhorrened. The feeds being fown within cither of thefe early in the fpring, the plants will be fit to be planted out as foon as the frofts are gone; by which means the fize of the roots will be much increafed the firft year, and will in the fecond rife early to perfection."

In the ath volume of the Bath Papers, Dr Anderfon 62 relates fome experiments made on potatoes raifed from $\operatorname{Dr}$ Ander: feed. The firf year they were of different fizes, from riments. a pigeon's egg to that of a fmall pea. On planting thefe next year, it was invariably found, that the lar. geft poratoes yielded the largeft crop; and the fame happened the third, when a few fhowed bloffom; but not even thefe had bulbs equal to what would have been produced by very large potatoes. Whence he concludes, that it is impoffible to affign any time in. which thefe feedling potatoes will arrive at what is, called perfection; but that it maft depend very much. on the nature of the foil and the culture beftowed up. on them. From the practice of the Yorkmire farmers, however, and even from the experiments of the Doctor himfelf, it is evident, that potatoes raifed in:
inferior. The profit attending the cultivation of them, however, appears to be much more doubtful than that of potatoes. Mr Arthur Young informs us, that from Norden's Surveyor's Dialogue, publifhed in 1600, it appears, that carrots were commonly cultivated at that time about Orford in Suffolk, and Norwich in Nor folk; and he remarks, that the tract of land between tivated in Orford, Woodbridge, and Saxmandam, has probably Suffolk and more carrots in it than all the reft of the kingdom put part of together." In 1779, few farmers in thefe parts had Iefs than five or fix acres: many from io to 20; and one had 36 acres : the ftraight, handiome, and clean roots were fent at 6 d. per buflel to London; the reft being ufed at home, principally as food for horfes. In other countics, he obferves, the culture of carrots has not extended itfelf; that fome have begun to cultivate them in place of turnips, but have foon defifted; fo that the culture feems in a manner ftill confined to the angle of Suffolk, where it firft began. In attempting to inveftigate the caufe of this general neglea, he obferves, that " the charge of cultivation is not fo great as is commonly imagined, when managed with an eye to an extenfive culture, and not a confined one for one or two particular objects." Two acres which our author bad in carrots coft L. 3: 17:6 per acre, including every expence; but had not the fummer been dry, he obferves, that his expences might have been much higher ; and when he tried the experiment 5 years before, his expences, throngh inadvertence, ran much higher. His difficulty this year arofe chiefly from the polygonum aviculare, the predominant weed, which is fo tough that farcely any hoecan cut it. Some acres of turnips which he cultivated along with the carrots were all eaten by the fly; but had they fucceeded, the expence of the crop would have been 18 s .5 d . lefsper acre than the carrots. "But (adds our author) if we call the fuperiority of expence 20s. an acre, I believe we fhall be very near the trath : and it mult at once be apparent that the expence of 208. per acre cannot be the caufe of the culture foreading fo little; for, to anfwer this expence, there are favourable circumftances, which muft not be forgotten. I. They (the carrots) are much more impenctrable to froft, which frequently deftroy Inferiority號 turnips, 2. They are nor fubject to the diftempers and to turnips. accidents which frequently affect turnips; and they are fown at a feafon when they cannot be affected by drought, which frequentlyalfo deftroys turnips.3.They laft to April, when fock, and efpecially fheep-farmers are fo diftreffed, that they know not what refource to provide. 4. The culture requifite for turnips on a fandy foil, in order to deftroy the weeds, deftroys alfoits tenacity, fo that the crop cannot thrive; but with carrots the cafe is otherwile.-Hence it appears, that the reafon why the cultivation of carrots is lill fo limited, does not arife from the expence, but becaufe the valne is net afcertained. In places where thefe roots can be Difficult fent to London, or fold at a good price, the tops being of afcerufed as food for cattle, there is not the leaft doubr that taining the they are profitable; and therefore in fuch places they value, are generally cultivat ed : but from the experiments as yet laid before the public, a fatisfactory decifive knowJedge of the value is not to be gained. The mont confiderable practice, and the only one of common farmers upon a large fcale, is that of the fands of Woodbridge: but herethey have the bencfit of a London market, as already

Carrots, already mentioned. Amongit thofe whofe experiments are publifined, Mr billinglley ranks foremolt. Here again the value of carross is rather depreciated than advanced; for he raifed great crops; had repeated experience upon a large fcale of their excellence in fatrening oxen and theep; feeding cows, horfes, and liogs; and keeping ewes and lambs in a very fuperior manner, late in the fpring, after turnips were gone : but notwithftanding thefe great advantages, he gave the culture up: from which we may conclade a deficiency in value. ' In feveral experiments (thongh not altogether deterninate), I found the value, upon an average of all applications, to be 13 d. a bufhel, heaped mea. fure ; cltimating which at 70 lb . weight, the ton is L. i, I4s." The following are the valuations of feveral gentlemen of the value of carrots in the way of fattening catile ;
Mr Mellin of Blyth a general valuation of per ton.
renin of Blyth a general valuation of horfes, cows, and hogs,
Mr Stovin of Doncafter, hogs beught lean, fatted, and foid off, -
Mr Moody of Ratford, oxen fatted, and the account accurate,
Mr Taylor of Bifrons, faving of hay and
corn in feeding horfes, - -
100

Mr Le Grand of Afh, fattening wethers, Sir John Hoby Mill of Bihham, fartening hogs,

0139
logs, - ${ }^{-} \quad-\quad-\quad 160$ Mr Billinglley, for fattening hogs, - 1130 Some other gentlemen whom our author confulted, conld not make their carrots worth any thing : fothat, on the whole, it appears a matter of the utmoft doubr, fo contradictory are the accounts whether the culture of carrers be really attended with any profit or not. Thus Sir John Mill, by fattening kogs, makes.L. I, os. and Mr Stovin L. 4; but others could not fatten hogs upon them at all: and forte of Mr Young's neighbours told him, that carrots were good for nothing except to four hogs to death. The experiment of Mr Le Grand upon wethers appeared to be made with the greateftacearacy ; yet two circumftances feem to militate againft it. I. The fheep were put lean to them; whereas it is a fact well known, that if they are not half fat when put to turnips no profit will refult; and it is poffible that the cafe may be the fame with carrots. 2. He gave them alfo as much fine hay as they would eat.
68
In this uncertain fate of the matter, the only thing that can be done is to make a number of experiments with as much accuracy as poffible, in order to afcertain the real value per ton : and our anthor endeavours to fhow, that there is no danger of lofing much by experiments of this kind. "I have fhown (fays he), that they are to be cultivated for L. 4 per acre, left on the ground for fheep. Suppofe the crop-only two buhthels at 70 lb . each, per rod, 320 per acre, or ten tons; it will readily be agreed, that fuch a produce is very low. to calculate upon, fince 2.0 tons are common among: carrot cultivators. It appears from Mr Le Grand's experiments, that a wether worth L. 2, 5 s. eats I 6 lb . of carrots, and four pounds of hay per day : dropping the hay, and calculating for fheep of lefs that half that fize (which aremuch more common), it will be perhaps an ample allowance to affign them 121 l , of carrots a day. If they are, as they ought to be, half far when
put up, they will be completely fattened in 100 days. At this rate, Io wethers will, in 100 days, Carrots. eat in tons, or very little more than one moderate acre. Now, let it be remembered, that it is a good acre of turnips which will fatten cight fuch wethers, the com. mon Norfolk calculation : from which it appears, that one acre of carrots are, for this purpofe, of more value than twoof turnips. Further, letus fuppofe horfes fed will them inftead of oats : to top, cart, and pack up, Io tons of carrots, I know may be done for 20s. -an acre, therefore (other expences included) cofts L. 5 . Fifty pounds weight of carrots are an ample allowance for a horle a day : ten tons, at that rate, laft three horfes for five months. But this L. 5 laid out in oats at I6s. per quarter, will purchafe little more than fix quarters; which will laft three horfes, at two bufhels each per week, no more than two months; a molt enormous inferiority to the carrots."

In the fame volume, p. 187. Mr Young gives an ac. count of another experiment made by himfelf on the ment on feeding of lambs with carrots. The quantities they eat feeding varied exceffively at different times; thirty-fix of them lambs with confumed from five to ten buhtelsper day; but on an then. average, he rates them at four bathels of 56 pounds per day. In all they confumed 407 bufhels from November to April, when they were fold and killed fat. At putting upon the carrots, the lambs were valued only at L. 18, but were fold in April at L. 25, 4s.; fo that the value of the carrots was exactly L.7, 4s.; or about 4d. per bufhel. This price he fuppofes to be fufficient to: induce any one to attempt the caltare of carrots, as thus he would have a clear profit of 40 s . per acre; "which (fays he) is greater than can attend the beft wheat crops in this kingdom." The land on which the carrots grew was fown next year with barley, and pro. duced the cleaneft in the parifl ; which conrradicts an affertion our author had heard, that carrots make land foul. The grafs upon which the theep were fed with the carrots, and which amonnted to about an acre, was very. litule improved for the crop of hay in 1781 , owing to the drynefs of the feafon; but in 1782 was greatly faperior to the reft of the field, and more improved in quantity: " for, inftead of an indifferent vegetation, fcattered thick with the centaurea fcabiofa, filago, rhinanthus, crifta galli, and linum catharticum, with other plants of little value, it encouraged a very beautiful heet of the beft plants that can appear in a meadow, viz. the lathyrus pratenfis, achillea millefolium, trifolium repens, trifoliam ochrolencrum, trifolium alpeftie, and the plantago lanceolata.

In the fame volume of the Barh Papers, p. $227, \mathrm{Mr}$ Carrots Billinglley gives an account of the comparative profit compared: of carrots and cabbages. Of the former, however, he with cabobtained only feventons 1.5 cwt . peracre; the cabbages bages. prodnced 36 tons : neverthelefs, according to him, the profit of the former was L. $5,8 \mathrm{~s}$.; of the latter, only L. 3; ins. In a paper on the culture of carrots by Mr Kirby of Ipfwich, vol. 3. p. 84, informs us, that he never determined the weight of an acre, but reckons the produce from 200 to 500 bulliels; which, at 56 lb . to the buhnel, is from five to ten tons and an half. In the fame volume, p.320, the Rev. Mr Onley feems to prefer the culture of carrots to potatoes. Culture of "However valuable (fays he) from eafe of culture, and carrotspregreatnefs of produce to the poor, efpecially in all fmall ferred to-

Mr Young, in the paper already quoted, informs us, that "turnips dunged for are univerfally a lofng crop: for if they are ftated from 30s. to 40s. an acre, their value does not amount to the dung alone which is fpread for potatoes; yet the latter pays that dung, all other expences, and leaves a profit fometimes confiderable. 1 admit that turnips fed upon the land will prepare better for corn ; but that is by no means the queftion. Would not the dung raifed in the farm-yard by the confumption of the potatoes, fuppofing it fpread on the potato acre, make the produce more than the turnip one? I have no doubt bat it would give a fuperiority. Bur turnips are liable to great failures, and cannot be relied on late in the fring; potatoes may; and are applicable to ufes to which the other root cannot be applied."-In the fecond volume of the Bath Papers, F. Ior. we have a comparative account of the value of turnips, turnip-rooted cabbage, and lucerne, as food for cattle. The refult of this writer's obfervations is, that " when heep are allowed as many turnips as they can eat (which fhould always be the cafe when they are fattening), they will, on an average, eat near 20 pounds each in 24 hours.-An acre of turnips twice hocd, will, if the land be good, produce about 50 tons; which will, on the above calculation, maintain 100 fheep 52 days. The fheep mentioned weigh 20 pounds per quar-ter.-An acre of turnip-rooted cabbage will maintain 100 heep for a month, and fometimes five weeks; bur an acre of Scots cabbages will maintain 200 . Theep a fuil month." The number fed by lacerne is not determined.

The greateft difadvantage which attends a crop of turnips, is their being fo ready to be damaged by the fly, which fometimes deftroys them fo completely, that they muft be fown over again two or three times the fame feafon, and even this withoutany certainty of fuccefs. Innumerable methods of avoiding this evil have been projected, which may all be reduced to the following claffes: I . Steeping the feed in certain liquids, 2. Fumigation of the fields with the fmoke of certain herbs. 3. Rolling. 4. Strewing foot, lime, afhes, \&c. on the furface of the ground. It is very difficult, however, to determine, wirh any degree of certainty, whether remedies of this kind are effectual or not; becaufe fometimes the turnips are not injured though no precaution has been made ufe of: and when this happens to be the cafe, after the ufe of any fuppofed preventative, the prefervation of the crop is afcribed to the ufe of that preventative, whether it be really efficacious or not.-The virtues of feeps feem to have been fully afcertained by Mr Winter Charlton near Brifol, of 76 whofe experiments an account is given in the Tranf- fleeps for actions of the Society for Encouraging Arts, vol. 5, turnipfeed The feeds were of the Dutch kind, fowed on beds in be of any the kitchen-garden in drills about 12 inches diftant, an ufe. inch and a half deep, on the 1 ith of May 1786 . The beds had been prepared with rotten dung in May 1785 , and afterwards fown with cabbages. The quality of the turnips is exhibited in the following table; the beft being marked I ; and thofe of inferior quality, $2,3,8 c$. The obfervations were taken on the 26th of June.

Seed without any preparation, - . I fteeped in train-oil, flourifhed extremely, fteeped in linfeed-oil, fomewhat inferior,

## Turnips.

75 Their culture generally attended with ne profit.

Part I. tation, the nice mode of cultivation, and even of taking ther up (all of which, expentive as they are, bear a very inferior proportion to the value of a medium crop), mult leave the land, efpecially if taken off it in an early period, fo mellow for the plough, as to form a feedbed for barley equal to any fallow tilth."

Mr Onley's delideratuna was a fubftitute for oats to feed horfes; of which great numbers are kept in his county (Effex). Potatoes, heobferves, are excellent for finall pork, when baked or boiled, mixed with a little barley-meal; but for large hogs, they are moft profitably given raw, if thefe have at the fame time the thack of the barn door in the threfhing feafon, \&c. In the 5 th volume he refumes the fubject, and acquaints us, that he applied a fingle acre in his bean-field to the culture of carrots., whicls generally produced 400 bufhels; and this he confiders as afmall produce. "I am, however, fenfible (fays he) that they will amply repay every expence of the finelt culture; and hould, from their extenlive utility on found, deep, and friable land, be every where attempted. Some of my neighbours, who have been induced to try them on rather a larger fale, with finer culture, and frefher foil, have raifed from 600 to 900 buthels per acre, and applied them more profitably, as well as more generally, than any other winter-
72 herbage, to deer, fheep, bullocks, cows, and horfes. Superior to At theloweft calculation, from our little trials, they are turnips and bats.
computed to exceed turnips in value one-third, as to quantity of food; but are far fuperior in what arifes from convenience for the ftable; where to us they feem to be a fubnitute for corn to all horfes, at leaft fuch as are not ufed in any quick work; and partially fo with corn for thofe that are."

In making a comparifon betwixt the profit on oats and carrots, Mr Onley finds the latter exceed by no lefs than L2. 15 s . 8d. per acre. His method of cultivation is to fow them in March or April : to hoe them three times, harrowing after each hoeing. Sometimes he leaves them in the ground till after Chriftmas, taking them up as wanted; but of late he takes them up in October, in dry days, putting them directly into fmall upright cocks of 10 buifels each, covered entirely with the tops cut off.-Thus they appear to dry berter than in any other way, and bear the weather with very little lofs. If, after being thas dried, they are carried into any barn or thed, it will be better, if they are in large quantities, not to pack them clofe, on account of the danger of heating, but rather to throw them promifcuoully into heaps, with a little fraw over them. When perfectly dry, they do not in general require any wafhing, except for horfes regularly kept in the fable.

## Sect. VII. Turnips.

These have long been in fuch general ufe as food for cattle, that the profit on raifing them might be reafonably thought to be altogether certain; neverthelefs,

Turnips. Seed mixcd with foot and water, with drainings of a dung hill,
 with cluer and barton draining, - 2 with foot, with elder leaf juice, with elder and barton draining, foot being fowed over the covered drills, with ditto, and lime fowed over the drills,
fowed with foot fcattcred over, and then covered, with barton-draining, - an eher-bufl drawn over when the plaits appeared,
with ttale human urine very few plants appeared
with ilackedlime feattered over, and then covered, very fow plants appeared, with elder, barton-draining, and llacked lime, very few plants appeared,
with lime and barton-draining did not vegetate.

Another fet of experiments was made with the green Norfolk turnip, drilled an inch and an half deep, the rows one foot diftant, on bedseight feet three inches long, and two feet wide; half a drachm of feed allowed for each bed, fteeped and mixed with various fubtances like the former. The feeds were drilled upon unmanured ground on the 20th of June 1786 , and the obfervation made on the 17 th of July. None of the beds were found free from the ravages of the fly; but the feeds which had been fteeped in train-oil and lin-feed-oil were much more free from this injury than the others. The linfeed-oil, as in the former experiment, was found inferior to the train-oil, which was fappofed to have been owing to its being kept in a botile that had formerly held oil of turpentine. The leaves of the fteeped feeds were of a much darker green than the orhers, appeared twice as thick in bulk and luxuriancy, and the plants were confiderably larger than thofe of the other kinds. The fubftances mixed with the reft were foaper's alhes, wood-ahes, pounded gun-powder, brimftone, flacked lime, foot, barton-draining; fometimes mixed together in various proportions, and fometimes wirh the addition of a portion of fifted mad.

Thefe experiments flow, that no dependence can be had on fteces or mixtures of any kind with the turnipfeed; though the train-oil and limfeed oil feera greatly to have for arded the vegctation of the plant. It does co have for arded ue vo tar of the pant he does no 88 . indeed does it feem eafy to be tried in fuch a manner as might enfare fuccefs.-In the fourth volume of the ${ }_{7}^{77}$ GulMr Gullet's direc
tions for tions for tions. rections for performing the operation as he thinks would be productive of faccefs - In a preceding paper he had explained the good effects of fumigating orchards; but the cafe wibl the fe muft be very condedeably different from a field of turnips. The trees in an orchard are elevated above the ground, and the finoke naturally a. fcends, and is blownalong their tops: but in fumigating a large field of turnips, it muft creep along the ground in fuch a manner as is by no means agrecable to its naVol. VIII.
ture ; and without an exceflive degrce of labour, as well as a valt quantity of burning materids, there camnot be the lealt hope of fuccefs. Mr Gullet's directions are as follow: "It the turnip-ground be fpaded and burnt, or the weeds, \&c. burnt without finading, the fumigation thereby may fuffice to chafe fuch of the winged tribe from thence asare then there; but in all cafes, whenthe field is ploughed and ready for fowing, let heaps bo made ar different places and intervals round by the hedges and boundaries of the turnip-ground, and foms few lcattered through the ficld; then, as foon as the feed is fown, let the heaps on the windward fide and the feattered ones be lighted and kept fmothering during the continuance of the wind in that quarter; the lefs the fire, and the more the fmoke, ihe better. Shonld the wit: d happen to hift, thofe heaps on the quarter it hifts to muft then be lighted and kept fmothering in like manner ; fo that, during the growth of the tender turnip leaf, and until it becomes rough and out of all danger, this fumigation and fmoke, over and cerofs the field, mult bs continued from one quarter to the other ; which, I venture to affert, will effectually deter and prevent any wingedinfect-tribe from approaching the tur-nip-ground ; nay more, if there already, it would mont completely drive them from thence, as fuch delicately formed infects (which can only feed on the moft tender leaf) would be ill able to continue long in fucha fmother of fire and fmoke. The confequence is obvious and certain, that if the fly be kept from approaching the field, the turnip-crop is fafe; and few, I believe, willdifagree with me, that prevention is better than remedy."

Our author does not fay that he has ever tried this method with turnips; but lays great ftrefs upon his fuccefs in a dimilar experiment with cabbages, in order to preferve them from the caterpillar. To make the matter more fure, however, he recommends the trailing of a bull of elder over the turnip field at the time of harrowing or brulhing in the feed: bat this remedy has by numberlefs experiments becil found infignificant, and by thofe above related feems even to be pernicious: fo that whateve: good effects we can expect from this method, muft depend on the fumigation alone ; and even this is attended with very great uncertainties; as has already been obferved.

Rolling promifes to be of fervice when the young turnips are attacked by fanals, which frequently deftroy them; but it cannot be fuppofed to have much effect in deftroying tlies, thefe being too numerous and too minute to be effectually crufhed by the roller ; and in. deed, though this las been frequently recommended, we have no decifive proofs of its havingever been attended with any good effect.

The itrewing of foot, lime, ahes, \&c. upon the ground, have been derermined ineffectual by the experiments already related, at leaft when applied before the tu:nips come up; and there feems to be little hope of their proving more effectual even whenapplied after the ctop has appeared above-ground. Wre may argue indeed a pricri about the tatecor fmell of foot, lime, \&c. being difargeeable toinfects ; bat of this we have no proof: and even though this were the cafe, the leaf foon emerges from under this covering, or the infects will feed on the under part of the leaves, where thefe fubfances cannot lie. It is evident, therefore, that very $5 B$
litule

## $\begin{array}{lllllllll}\mathrm{H} & \mathrm{U} & \mathrm{S} & \mathrm{B} & \mathrm{A} & \mathrm{N} & \mathrm{D} & \mathrm{R} & \mathrm{Y} .\end{array}$

 that they may be well grown before the fy makes itsappearance. In the Bath Papers, vol. iv. p. I 32. Mr
Wimpey obferves, that, in order to procure food for Wimpey obferves, that, in order to procure food for their cattle in the fpring before the grafs is grown, farmers are obliged to poftpone the fowing of turnips beyond the natural time of vegetation; but were turnips to be fown in April, as foon as the feafon would permit , it is very probable that there would be as great a crop of them as of other vegetables ufually fown in thefe months. On account of the delay in fowing, however, for thereafon already mentioned, the fuccefs of the farmerbecomes exceedingly precarious, unlefs he is fo fortunate as to have a few rainy days, or cloudy weather and frequent howers, foon after the feed is fown: and this our author fuppofes to be the true reafon why the turnip is a more uncertain article than any other. But though fpeculations of this kind have a great flow of probability, there is not any experiment hitherto publifhed, even by our author himfelf; by which the truth of them can be abfolutely afcertained. Our author, however, is of opinion, that none of the common methods propofed can anfwer any good purpofe, farther than as by means of them the vegetation of the plant may be invigorated. Mr Wimpey recommends afhes, foot, or a rich compoft of lime and dung, ufed in fufficient quantities; but the method of uling them is, cither to fow them with the feed, or rather by themfelves immediately before, and to harrow them well in, that they may be completely incorporated with the foil. This for the moft part would fo invigorate and encourage the growth of the plants, as to be an overmatch for the moft vigorous attacks of the fly.

80
2. Another method propofed for fecuring turnips from the fly, is by fowing fuch a quantity of feed as will be more than fufficient for the confunpt of the infects. This we find recommended in a letter to the Bath fociety by a gentleman-farmer in Effex, vol. ii. p. 238. His method is to make the land clean and fine as foon as the feafon will permit, and to fow four pints per acre. It may be objected, that if the fly does not take them, the plants will fand fo thick that they cannot eafily be hoed; but this may be obvianed by harrowing them firf, which will make them fit for the hoe. There can be no expectation of a crop if the fly takes them when only a pint of feed is fown per acre; .but this gentleman remarks, that he has not in any one inftance miffed of a crop when he fowed four pints; becaufe, though the fyy has fometimes deftroyed more than one half, and much damaged the other, ftill there was a fufficient number left behind. He alfo agrees with other of the Suciety's correfpondents, that the gronnd hould be well donged and manured previous to the fowing of turnips, as this makes them grow vigeroully, fo that they quickly get inte the rough leaf, in
$81^{\circ}$

## Manuring

 in autumin preferable to fpring manure.little can be expected from any of the methods hitherto propofed either by way of cure or prevention. The more probable methods are,
I. To fow the turnips at fuch a feafon of the year, that they may be well grown before the fly makes its three acres and an half in the ufual way withont any manure. The manuredcrops were almoft all deftroyed by the fly, fo that he was obliged to fow moft of the land over again. The three acres and an half which had no manure were entirely free from injury, though the plants were much fmaller than thofe of the mannred ground which came up. Not content with this trial, however, herepeated the experiment, by manaring fix acres of wheat ftubble in autumn, plonghing it in immediately, and leaving it to incorporate with the earth during the winter : the turnips which grew upon this were as large as if the ground had been manured in the fpring. This experiment was repeated with furprifing fuccefs in two fucceeding years; whence he infers, that the fly is either engendered in the new dung or enticed by it. But when the manure is laid on in autumn it loofes its noxious qualities, though it ftill retains its nutritive ones.- This conclufion, however, does not appear to be well founded; for it is certain from undoubted experience, that turnips which have been well manured in the common way, have fometimes efcaped any injury; while others, which have got no manure at all, have been almoft totally deftroyed. Another material advantage, however, which this correfpondent obferves is to be derived from manuring in autumn is, that all the feeds contained in the manure, and which are of courfe carried on the land with it, vegetate almoft immediately, and are moftly killed by the cold of the fucceeding winter, while the few that remain can farce efcape defruction from the floughthare.

Mr Wimpey is alfo of opinion, that it is proper to fow a large quantity of feed; but thinks two pounds will be fufficient for an acre. A few onnces indeed would be fufficient to ftock the land; but as the article is fo precarious, he thinks it by far the fafeft way to allow feed in plenty, and reduce the plants afterwards by harrowing. He obferves allo, that it is of great confequence to have feed both grod in quality and of the beft fpecies. He prefers the large and green topped, as being the moft fweet and juicy; others give the preference to the red or purple-topped, as being hardier : but at any rate, the feed from the largeft and fineft tranfplanted turnips, of whatever fort, is greatly to be preferred, even though it flould coft donble or quality o treble the price. Such as is fold by the feedfmen in the feed. London he found generally of a mixed kind, and often ingreat part not worth cultivating. "Whetherplants from new or old feed are moft fecure from the depredations of the fly (fays he), is perhaps a queftion which cannot be eafily decermined even by experiment; for concomitant circumftancesarefrequently fo much more operative and powerful, as to render the difference between them, if there be any, imperceptible. It is, however, known to every practical man, that new feed fprouts or vegetates feveral days before old; and I think more vigoroully: and it is equally well known, that the healthy and vigorous plants efcape the fly, whenthe fintedand fickly feldom or neverefcapethem.

Turnips. It fhould feem then, that new feed, cateris paribus, is more fecure from the fly than old; and for my own ufe I would always prefer it."
84

## Of fowing

 turnips
## with other

 grain.$\qquad$ 3. The fowing of turnips along with other grain. -This, of all others, feems to be the moft eligible and p. 2 ro. an Hertfordhire correfpondent gives an account of the fuccefs of an experiment of drilling turnips with wheat. A fmall field of fpring-wheat was drilled in rows two feet apart; and in the month of May turnips were fown by hand in the intervals. They came up very well, and were thinned once by the hoe. The crop of wheat turned out better than another field of the fame foil fown broadcalt in autumn, though it ripened fomewhat later. The turnips were no other way injued by cutting it, than having fome of the large leaves trodden down by the reapers. After harvelt the weeds were cut up round the tornips with a hand-hoe, and they grew very large and vigorous. They were of the purple and white long kind, and the crop proved nearly as good as the fame land produced in common. An excellent crop of barley and 86 clover was got from the fame field afterwards.
Mr Andercount of feveral faccersfal experiments in fowing tur riments of nips between rows of beans. The advantages of this fowing them with
beans. method are ftrongly fet forth by R. P. Anderdon, Efq; who made fome of the experiments, and are as follow: " 1 . You may have a crop of beans and turnips on the fame field the fame year. 2. The bean crop being well horfe-hoed, no ploughing is wanted for turnips, for which the beft Norfolk farmers give five ploughings. 3. It is hoed cheaper, more effectually, and confequently more profitably, than in any other way. 4. The ground is kept clean from weeds. 5. It is in order for a Lent crop the fucceeding year with one earth. 6. The ground is kept in heart, if not improved, by fallowing your alleys. 7. It brings the plant to perfection in poor ground, where it would not become fo otherwife. 8. It doubles the crop in any ground which Mr Anderdon has had experience of. 9. You have the crops more within your own power in this than in any other mechod, let the feafons turn out as they will. Io. You may have on the fame ground a bean and turnip crop annually, if the land be fuitable, and you think proper. II. The clay fazmer, by this mode, renders land which is naturally unfit for turnips, fo free and open by feafonable horfe-hoeings,
87 that it will bring this ufeful plant to great perfection." Objections On this paper the fociety made fome remarks, and by the Bath fated the following objeetions: 1. The fame foil canSociety. not be proper for both crops. Scotch cabbages are more adapted for a bean foil; and they wifhed him to repeat the experiment with cabbages inftead of turnips betwixt his beans. 2. The Norfolk farmers rarely ufe more then three plongings for turnips, inftead of five, as Mr Anderdon reprefents, unlefs the ground be full of couch-grafs. 3. They think him too fanguine in his expectations of having double crops on the fame field. 4. Nothing renders a clay foil fofree and open
as to have it expofed to frofts and nnow by being laid up in high ridges in January and February; but, on Mr Anderdon's plan, this cannol be done, unlefs the turnips are leffened in value by being fed off in autumn.

Turnipa.

Thefe ftrictures were fent to Mr Anderdon before ${ }_{\mathrm{Mr}}{ }^{88}$ Anderthe papers were printed, but did not make any alter- don'sreply. ation in his opinion; and he replied to the following purpofe:

1. The fame foil cannot be proper for beans and turnips, \&c.-Granted.--But had Mr Anderdon adhered rigo. roully to this rule, he would have fowed no turnips at all, not having on his farm any foil altogether proper for that crop; " but (fays be) while I can get in fingle rows, four feet afonder or more, from half a dozen to half a fcore tons of turnips per acre, after, or rather between, a crop of beans in my heavy lands, If fhall feel that product here more beneficial than to drop the mode. I believe the medium of the two, fo far as I can judge by the eye or get information, to be fuperior to the average produce of prepared fallow turnip crops in to miles round me."-On this the Society make the following remarks: "The queftion here is, Whether, ifinftead ofturnips, MrAnderdonhad planted his beans two feet diftant only, the extra produce of his crop would not have exceeded in value that of his turnips ? We think they would, as thefe intervals would freely admit his horfe hoe between the beans."

Mr Anderdon then proceeds to acquaint the conmittee, that he had tried the experiment as they wifh. ed with Scotch cabbages inftead of turnips betwixt the rows of beans; but the crop of the turnips was fomuch preferable, that he found himfelf inclined to fuppofe the cabbage would not get to fo great perfection there as to be profitably introduced on a large fcale, for want of the great quantity of dung neceffary for that crop, and which conld not be procured in that part of the country. He further remarks in favour of turnips, that they have an abundance of very fmall lateral fibrous roots, which run fo far in fearch of food, and feed as ravenoully where they can penetrate, as chofe of almoft any ether vegetable; and the plant certainly derives more nourifiment from thofe than from its tap-root (A). Thofe fine fibrous routs, almoft imperceptible to the eye, iffue chiefly from the apple or body of the turnip, and get into the richert part of the foil near the furface, and will bring the plants to a confiderable magnitude in heavy lands adapted to beans, when mellowed by the horfe hoe. Some of his turnips weighed ten pounds each : and if he conld have only two fuch turnips on every fquare yard, it would be at the rate of 43 tons per acre.
2. The Committee doubt of the poffibility of coubling the crop. Mr Anderdon gives the following explanation. "I have made many comparative trials on turnips be* tween this mode and broad caft fowing, and always found on my ground the horfe hoed crops the beft. But here, in denoting the benefits of the horfe-hoe by its doubling a crop, I wifh to be underfood, that if, in foils like mine, a crop be drilled, leaving proper in.
(A) Here the Society remark, that this is not the cafe with thofe kinds of turnips which grow chiefly above ground, and which are generally the beft crops, and mont capable of refifting the froflso

## Tarnips.

tervals for horfe-hoeing, and one part be horfe-hoed the other not, the horfe-hoed part will double the other in product."

Mr Anderdon, in the courfe of his reply to the committee, gives an account of another experiment he made in confequence of being deficient in winter fodder for his cattle. By this necedfity he was induced to fow turnips wherever he could; and on the 18 th of July drilled a fingle row betu een his drilled wheat. On the 20th and 22 d of Augut he drilled four rows of winter vetches in each interval between the turnips. at the rate of lefs than one peck and three quarters of feed to an acre. "The turnip crop (fays he) is very acceptable, and my vetches fucceed beyond my warmeft expectation ; are thick enough, and give me the pleafing profpect and hope, that I hall not, when my dry meat is gone, want a feafonable fupply of early green fodder that will laft me till my lucerne comes on."

This fubject is further confidered in the fame volume by Mr Pavier, who viewed Mr Anderdon's turnips, and gave in a report of them to the committee. He fuppofes a crop of beans drilled in fingle rows at four feet diftance, and the turnips drilled in the inter. vals, according to Mr Anderdon's method, there will then be four rows of 77 feet in length to make a fquare perch; whereas Mr Anderdon's rows were only 15 feet 8 inches in length; and this difparity in length will make a difference of weight on a perch from 230 to 249 pounds, ond on an acre from 16 tons 8 cwt . 2 qrs. 8 lb . Mr Anderdon's produce, to 17 tons 15 cwt. 2 qrs. 24 lb . - Each turnip at this diftance (viz. four feet from row to row, and nine inches in the rows) muft occapy a face of three fquare feet; confequently the greateft number produced on an acre mult be 14,520; but if fown in broadcaft, twice hoed, and the diftance on an average 15 inches, each turnip will then occupy little more than one foot and an half; and the number produced on an acre may be about 27,920; an excefs which may reafonably be fuppofed to overbalance the value of the beans, let us fappofe the crop as great as we can realonably do. Thus far the argument feems to lie againft this method of cultivating beans and turnips together: but on the other hand, Mr Pavier confidersit probable that the expence of drilling and horfe-hocing the beans, together with drilling the turnips in the manner Mr Anderdon did, mult be confiderably lefs than that of fallowing and preparing the ground, and fowing the turnips in broad-cant; to which we muft likewife add the facility of hoeing the drilis in comparifon of the broad caft. But befides thefe, the great advantage arifing from this method, and which, if certain, gives it a decided fuperiority, is, " the great chance, if not an almoft certainty, of preferving the turnips from the depredations of the fly." Mr Pavier was inclined to think that this muft be the cafe, as Mr Anderdon had fuch crops repeatedly without any damage of that kind: but the committee differ from him, and think that this muft have proceeded from fome oiher calle; though they do not affign any reafon for this opinion. "The principal point (fays Mr Pavier), in determining this queftion, feems to me to be this: if the crop of beans drilled as above, after deducting the feed, and fome additional expence in taking the crop off the ground without injuring the turnips, can be, one year
vier's opivier's opinion.
with another, fuppofed to be as valuable as the quanttity of turnips that might be reafonably expected in the broad-caft method more than in the other, I hould not hefitate to declare in favour of drilling between the beans."

Thus far the argoment feems to be carried on $\bar{a}$ priori. Mr Wimpey, in the letter already quoted, inclines to the practice of fowing turnips between beans planted in rows. "It exactly correfponds (fays he) with all my obfervations on the fuccefsful vegetation of that root. A confiderable degree of moinure is neceffary to the rapid vegetation of that very juicy root, and nothing retains mointure equal to flade; and flade can be obtained and fecured by no means. fo effectually on a large tcale as in the intervals of tall growing plants, as beans or wheat planted in drills." The fuccefs of Mr Bult of Kingfon near Taunton, leaves little room to doubt of the propriety of the method, and its fuccefs in preventing the fly. The beans were planted in drills not quite two feet afunder, on two plowings, horfe hoed three times, and the turnips fown in the intervals at the latt hoeing. The field meafured fix acres and a quarter, and was a very good clayey foil, but had not been manured, nor had any dreffing laid upon it for fix years before. It produced this year thrie quarters of beans per acre, and 37 tons 5 cwt . of turnips. This field was alf viewed by Mr Pavier, who makes the following obfervations upon it. I. The turnips were fown promifcuoufly among the beans at the laft hoeing, which was givenabout midfummer; from which time nothing was done but drawing off the beans and carrying them off the land. 2. The crop of beans was believed to be confiderably above 20 bufhels per acre, which is much more than were produced by any other method that feafon in the neighbouring part of the country; and as Mr Pavier had this account before he faw the turnip crop, he did not expect any thing confiderable from the latter; but as it turned out, the produce mult be accounted higlhly profitable, when we confider that there was no crop loft, no preparation, dreffing, nor any expence whatever, excepting the price of the feed and fowing ic. 4. This he confiders as one of the ftrongeft recommendations of the drill hufbandry he ever knew or heard of; but he is of opinion that it never can anfwer except where the ground is perfectly clean and free from weeds, by the crops having been horfe-hoed for a few years before. 5. He thinks the beans ought to have been planted at wider intervals, by which the fun and air would be freely admitted, and the plants would alfo be lefs damaged by the operation of the hoe.

Mr Pavier likewife informs the Society of two other experiments on a fimilar plan; butwith this difference, that the turnips were fown among the beans at the fecond horfe-hoeing. The turnip crops were very good, and the beans more than double the value of thofe raifed in the ufual mode of hubandry. "I think it is very evident (fays he), that the beans preferve the turnips from the fly; and as no expence or troubleattends the practice, I apprehend it will foon become more general." The Society own, that he uncommonfuccefs of Bult's experiment feems to militate at leaft againf uhat they faid on Mr Anderdon's letter; but they infift that the cafes are by no means fimilar. "Though the land (fay they), in both inftances, is called a heavy

$\qquad$

Turnips. clay, they are very different. Mr Anderdon's is poor, wet, and cold; the other a good rich clay; and we apprehend naturally mixed with a kind of marle, which is called clay by perfous not thoroughly acquainied with the nice dillinction of foils apparently alike, but very different in their nature. Onr principle, therefore, that cold wet clay lands are unfuitible for turnips, remains unaffected by this experiment, and gencral practice confirms the trith of the theory.'

In another letter, Mr Pavier gives a more paricular account of the two other crops of beans and turnips raifed upon Mr Bult's plan. The beans were drilled in rows about 22 inches diflanse, twice horfe-hoed, and the produce from about 25 to 30 bufhels the computed acre, or from 30 to 36 buthels the ftatute acre. The preceding fummer had been very unfavourable to beans, and the produce per acre in the common hufbandry did not, on an average, equal a third part of this quanticy. One of thefe crops was fuperior to that of Mr Bult: they were fown upon a field of nine computed acres on the roth of June, after the fecond horfe-hoeing; but whether the fecond hoeing was performed too foon, the ground not clean, or whatever might be the caufe, the beans were weeded twice by hand afterwards; and he is of opinion, that the turnips were fome what benefited by it. Mr Pavier was affured by a very intelligent farmer, that this was the beft crop of lurnips he had ever feen. The turnip-feed in the other crop was put in between the rows of beans by a hand-drill; but the work was badly performed, the plants coming up in fome places vaftly too thick, and in others as mach too thin; but wherever they happened to be of a proper thicknefs, the farmer told him it was one of the mof profitable crops he ever had. The foil was wet, heavy, and not very favourable for turnips. Hence Mr l'avier deduces the following conclufions. 1. That with refpect to beans in paricular, the drilling and horfe-hoeing is vaftly faperior to the common mode of huibandry. 2. That the beans are undoubtedly a good prefervative of the turnips from the depredations of the fly. 3. That as by this method no crop is loft, and confequently no rent, but a mere trifle of expence (if any) chargeable to the turnip crop, it muft be one of the moft profitable as well as the moft certain method of propagating that ufeful root ever yet practifed. - He fillinfifts, however, that if he had an opportunity of tryinu this method, he would drill the beans in rows at a greater diftance, that the turnips might be tand-hoed eafily; and that he fhould prefer the London tick-bean to any other, by reafon of their fhortnefs and being fuch bearers; that he fhould alfo take off their tops as foon as the under bloffoms began to decay; which, he fuppofes, would
liftrument We fhall clofe this differtation on the ufes and culfor tranf- ture of turnips with an account of an inftrument ufed planting turnips.
Batb $P_{a}$ pers, vol. iv. p. 126. in Norfolk for tranfplanting them, and thus flling up the gaps which frequently happen in fields from the failure of the plants in particular fots. It is reprefented on the margin; and the conftrution and mode of ufing it is obvious from the figure. - When the tur-
over the plant that is to be taken up, and with your foot force it into the ground; then give it a twitt round, and by drawing it gently up, the earth will adhere to the roots of the plant in a folid body; then with another inftrument of the fame lize take the earth out where the plant is to be put, and bringing the inftrument with the plant in it, put it into the hole which has been made by the other; then kecp your right hand ftealy, and draw up your left, and the earth and plant will be left in the hole with the roots undifturbed. In this operation two men muft be employed, each of them having an inftrument of the form reprefented ou the margin. One man talses ap a plant while the other fills his inftrument with earth only, thereby making rom for the depolition of the plint; fo that the hole which is made by inking tp the plant is filled with the eartin taken out where ine plant is to be put; which being depolited, be thics upaplant, and returns to the place he firt fet out firm, the former man at the fame tint returning with the earth only: fo that each man is alternately the plater, and eacl being employed both ways, the work goes on brifkly.-This inftrament was the invention of Mr Cubitt Gray of Southrepps, Norfolk.

Turnips being the erand batis of the Nortolk hufbandry, Mr Ma;hall gives a very particular acenunt of their culture in that county. - Tise fecties culiva. ted are, I. The common white flock, called in many places the Norfoll turnip. 2. The purfl /lock is limilar to the former, but its rind is of a dark red or parple colour; its fize in general fmailer, and its texture Norfolk clofer and firmer than that of the common white-ftock ; cultivation it alfo ftands the winter better, and is more fucculeni of turnips. in the fpring, but it is not fo well relihed by cattle as the former; whence it is lefs gencially cultivated. 3. The pudding ftock, the tankard-turin, of the Midland counties, is in flape fo perfectly different from the common fort, that it might be ranked as a diftinct fpecies. It rifes in a cylindrical form, eight, ten, or twelve inches high, fanding in a manner wholly above ground; generally taking a rough irregular outline, and a fomewhat reclining pofture. It very much refembles the common turnip, and is by much its moft formidable rival. In many refpects it feems to be fuperior, particularly in beingreadily drawn, and eaten off by flecp with much lefs wafte than the common turiip.-The difadvantage is; that they are liable to the attacks of froft, by reafon of their ftandiner fo high above the furface of the ground; fo that on the whole, Mr Marthall conchudes, that the common white turnip is to be preferred to every oiher.

In Norfoik, turnips are fown upon every fpecies of 93 arable land. Marl is found to be highly beneficial : of ufing and by means of this manure, a foil naturally unfit marl. for turnips may be rendered prope: for it. They fucceed barley rather than any other crop; fome few are fown on wheat or pea ftubble after harvelt ; but this is not a general praftice. The manures in greatcft Manures reputation for turnips are dung, "ith a greater or of diffureat fmaller admixture of mould; malt conntis are alfo inkinds. good repute, and oil-cake is ufed by a few individuals; "s but it may be faid, that nine acres of ten of the turnips grown in eaft Norfolk are manared with muck."-The quaniicy of dung fer on for a crop of turuips gen rally depends on the quantity on hand,

Method of
fowing and
and the quantity of turnip-ground to be manured. From to to 15 cart-loads of muck are confidered as a good dreffing; and about a ton of oil-cake to three acres; 50 or 60 buthels of malt-coombs, and 40 or 50 buthels of foot, to an acre.

When the turnips are intended for early confumption, the fooner they can be got into the ground the better: but when they are intended to ftand the winter, the beginuing of july is thought foon enough. The moft general rule is to begin fowing about a week before mid fummer, and continue till about a fortnight after, viz. from the $\mathbf{7 t h}$ or 18 th of June to the 7 th or sathare. 8th of Joly.-Broad caft fowing is univerfal, in the quantity of two pints to an acre. The feed is covered by two lines of a pair of light harrows drawn backward, in order to prevent the lines, which ufaally point fomething forward, from tearing up the clods, and burying the feed too deep. The horfes are univerfally walked one way, and trotted back again in the fame place. This is an excellent cuftom: the quick zig-zag motion of the harrows at once affinting to level the furface, and to difltribute the feeds more evenly.-They are univerfally hoed; and unlefs they be fown very late, are generally hoed twice. The diftance of time between the fowing and the firft hoeing depends upon the foil and feafon; the fize of the plants being the only guide. When turnips are fuffered to grow too large before they are hoed, the plants are difficult to be fet out fingly, and are liable to be drawn up by weeds, thereby acquiring a flender upright tendency; whereas their natural growth, in their infant flate, is procumbent, fpreading their firft leaves on the ground, and taking the form of a rofe.-If the hoe be pur in too foon, the plants which are fet out are liable to be buried, and their tender roots difturbed in the act of fetting out the neighbouring plants. The time for hoeing, as dirested by the mon judicious hufbandmen, is when the plants, as they lie fpread upon the ground, are about the fize of the palm of the hand: it, however, feed-weeds be numerous and luxuriant, they ought to be checked before the turnips arrive at that fize, left by being drawn up tall and fiender they fhould acquire a weak and fickly habit. The proper diftance depends upon the nature of the foil and the time of fowing; fuch as are fown early, in a rich productive foil, require to be fet out wider than thofe fown late on a foil of a contrary niature. If the foil be at par, the diftance ought to be regulated by the time of fowing: if this be at par, the nature or flate of the foil fhonld be the regulator-Mr Marfhall complains of the conduet of the Norfolk farmers in general in this refpect, who " hack out their turnips 14, 15, or perhaps $\mathbf{I} 8$ inches afunder, without any regard to the flate of the foil or time of fowing. This practice was eftablifhed while the Norfols foil was full of marl, and new to turnips; and when, it is probable, if or 12 inches in diamcter was no uncommon fize, with tops proportionalily large, and fpreading; and 14 or 15 inches might then be a proper diftance. But now, when the efficacy of marl is leffened, and the foil no longer the favourite of turnips, which feldom reach more than feven or eight inches in diameter, it is ruinous and abfurd to continue the practice."

Turnips are cultivated either for feed, for fale, or for confumption. When cultivated for feed, it is fup-
pofed in moft parts of the kingdom that it ought always to be taken from tranfplanted roots; but in Nor. $\underbrace{\text { Turnips. }}$ folk they are frequently raifed from fuch as are untranfplanted. "It is a fact (fays Mr Marflall) well un-Cultivati derftood by every hufbandman here, that if the feed be on of tur* gathered repeatedly from untranfplanted roots, the nips for plants from this feed will become coarfe-necked and fecd. foul-rooted; and the flefh of the root itfelf will become rigid and impalatable. On the contraty, if it be gathered year after year from tranfplanted roots, the necks will become too fine, and the fibres too few; the entire plant acquiring a weak delicate habit, and the produce, though fweet, will be fmall. For the neck, or onfet of the leaves, being reduced to the fize of the finger (for inftance), the number and fize of the leaves will be reduced in proportion; and in a fimilar proportion will the number and fize of the fibrils be reduced. From a parity of reafoning, it may perhaps be inferred, that when the neck acquires a thicknefs equal to that of the wrift, the fize of the root will be in proportion.
:\% With refpect to the fibres or rootlings, this is a juft inference; but with refpect to the bulb, it is in a great meafure erroneous. For a few generations the fize of the bulb will keep pace with the increafe of leaves and fibres; but after havingonce reached the, limits which nature has fet to its magnitude, it begins to revert to its original ftate of wildnefs, from which to its prefent ftate it has undoubtedly been raifed by tranfplantation. The farmer has therefore two extremes to avoid. The one is difcoverable by the thicknefs and coarfenefs of the neck, the fealy roughnefs of the balb, the thicknefs of the rind in general, the foulnels of irs bottom, and the forkednefs of its main or tap-root: the other, by the flendernefs of the neck, the fineness of the leaf, and the delicacy of the root. The former are unpalatable to cattle, and are therefore creative of wafte : the latter are unproductive, are difficult to be drawn, and do not throw out fuch ample tops in the fpring, as do thofe which are, by confitution or habit, in a middle fate between thefe two extremes. There is not, however, any general rule refpecting how many years turnips ought to be tranfplanted fucceffively, and how often they ought to be fuffered to run up from the feed-bed: the foil and fituation have, and other circumftances may have, in: fluence on the habit and conftitution of vegetables as of animals; and the farmer munt attend alone to the ftate of the turnips themfelves. Whenever he judges, that, by repcated tranfplantation, they have paffed the acme of perfection, then it is his duty and intereft to let them ron up to feed without tranfplantation. In Norfolk it has been found, by long experience, that tranfplanting two, threc, or four years, and letting the plants run up the third, fourth, or fifth, will keep the flock in the defired fate. The time of tranfplanting is from Old Chriftmas to Old Candiemas. In the choice of plants, the farmer is not guided by fize, but picks the cleaneft plants without regard to fize; or, more accurately fpeaking, he makes choice of fuch as are near, but not at or above, the ftate of perfection. In almoft every turnip-field there are plants in various flates: much judgment, therefore, is requifite in the choice of plants. A piece of rood quifite in the choice of plants. A piece of good Method of
ground near a habitation is generally chofen for this planting. purpoic ; but the method of planting is various: the

Turnips. plants are generally fet in rows, at uncertain diftances from one another." Thefe diftances our author has obferved to be 16 or 18 inches, and the diftance of the plants in them nine or ten inches; but the practice of a man who, he tells us, is indifputably near the head of his proteffion, is to plant them in rows two feet afunder, the plants in the rows being contighous. The only culture required, is tu keep the intervals clean hoed; but when the feed begins to ripen, much care is requifite to keep it from birds. If the plot be large, is is neceffary to employ a boy to fcare them; but if the following expedient ufed with fuccefs. "On a flender polt, riling in the midft of the patch of feed, was fixed a bell; from which a line paffed into the kitchen; in the moft frequented part of this hung the pull. Whoever paifed the pull, rung the bell; fo that, in a farm-houfe kitchen, where a miftrefs and two or three maids were fome of them almoft always on the foot, an inceflant peal was kept up; and the birds, having no refpite from alarms, forfook their prey.

The time of drawing commences about Michaclmas, the turnips. and continues until the plants be in blow. The procefs of drawing, he fays, "in fevere weather, is an employment which nothing but cuftom could reconcile to thofe whofe lot it is to go through it, namely, ftout lads and youths; whofe hands are frequently fwelled until the joints are difcernible only by the dimples they form ;' neverthelefs henever heard of any initance of bad effects from this circumftance. When the tops will bear it, their method of pulling is very expeditions: they pull with both hands at once; and having filled each hand, they bring the two together with a fmart blow to difengage the foil from the roots, and with the fame motion throw them into the cart. If the tops be cat off by the froft, or if this be in the ground, the turnips are raifed with two tined forks named crooms. If the roots are buried under deep fnow, it is removed by means of an implement called the /nowRedge. This confifts of three deal-boards from one to two inches thick, 10 or 12 inches deep, and from feven to nine feet long, fet upon their edges in the form of an equilateral triangle, andftrongly united with nails or fraps of iron at the angles; at one of which is faftened, by means of a double ftrap, a hook or an eye, to faften the horfes ro. Thiis being drawn over a piece of turnips covered with fnow, forces up the latter into a ridge on each fide, while between the ridges a ftripe of turnips is left bare, without having received any ma* terialinjury from theoperation. Though it is cuftomary, in drawing, to clear the ground entirely, our author met with one inftance in which the fimall ones were left by a very good hufbandman on the ground, both to increafe in lize, and to throw out tops in the fpring ; it being obfervable, that a fmall turnip fends up a top nearly equal to one whofe bulk is larger. There is one inconvenience, however, arifing from this practice, the plough is prevented from entering upon the foil until late in the fpring; which upon fome foils, is an mfurmountable objection : though it may be very proper upon land which will bring good 1or barley with one ploughing after turnips.
Mathod of Mr Marthall relates the following fimple method, by preferving which a Norfolk farmer preferved turnips through a turnips. confiderable part of the winter feafon. Having cut
off their tops with a fpade, he gave them to his cows, and carried thebulbs toa new-made ditch, into which he threw them, and then covered them up with fraw, laying over it a quantity of bramble kids. Here they lay until wanted in a froft. They were then again carted by means of a fork, and given to the cattle, who eat them as well, or ather betterthan frehdrawn turnips; and in general they come out as frefh as they went in. Our author is of opinion, that this method might be extended to the prefervation of turnips till the fpring.

## Sect. VIII. Turnip-rooted Cabbage.

This plant may defervedly bereckoned nextin value to the turnip itfelf. Its advantages, accorcing to Sir Thomas Beevor, are, that it affords food for cattle late in the fpring, and refitts mitdew and froft, which fome times deftroy the common turnip ; whence he is of opinion that every farmer who cultivates the common turnip fhould al ways have part of his farm laid out in the cultivation of this root. For his mode of culture, \&c. fee Agriculture, $\mathrm{n}^{\circ} 170$; and under $\mathrm{n}^{8}$ i 73 of the fame article is given an account of Mr Robins's method of raifing them. In another letter from Sir Thomas Beevor, Bath Papers, vol. iii. p. 489. he expreffes his hope that the turnip-rooted cabbages he had would laft until he fhould have plenty of grafs for all his ftock. To make a comparative eftimation of the quantity of food yielded by the turnip-rooted cabbage and the common turnip, he felected fome of each kind, and having girted them with as much accuracy as pof feed in this and having girted them with as much accuracy as pof- and in the fible, he found, that a turnip-rooted cabbage of 18 common inches circumference weighed $5 \frac{1}{4} 1 \mathrm{~b}$. and at common turuip. turnip of the fame fize only $3 \frac{1}{+} \mathrm{lb}$; on trying others, the general refult was found to be in that proportion. Had they been weighed with the tops, the fuperiority of the turnip-rooted cabbage would have been greater, the tops of them being remarkably bufhy. They were weighed in the month of March ; but had this been done at Chriftmas, our author is of opinion that the difference would not have been fo great ; tho' he reckons this very circumftance of their continuing fo long to afford a nourifhing food, an inftance of their excellency above almoft every other vegetable whatever.

## 103

Comparifon of the quantity of Advantages attencultivation of thisroot.

Turniprooted Calibage.

In the fourth volume of the fame work, Sir Tho. Other ex mas gives an account of another experiment on five periments. acres of turnip-rooted cabbage, four of which were eaten upon the field, the other was pulled up and carried to the ftables and ox-honfes. They were fown and cultivated as other turnips; the beafts were put to them on the rath of Aprit, and continued feeding upo: them till the itth of May. The cattle fed for this fpace of time were, 12 Scotch bullocks weighing 40 tone each ; cight homebreds, two years old ; fitteen cows full-fized; 40 hheep; 18 horfes; befides 40 ftore hogs and pigs, which lived upon the broken pieces and offal withoat any other allowance for the whole four weeks. The whole value of the plant, exclulive of the feeding of the pigs, amounted, according. to our author's calculation, to L. 18 : and he fays that the farmers would willingly give this fum in the fpring. for feeding as many cattle "' becaufe it enables then to fave the young frooing grafs (which is fo frequently:

Difadran-
tages attending che cultiva tion of this plant.
injured by the tread of tle catule in the frofty nights) until it gets to fuch a lengeth ata thicknefs as to be afterwards but little affecied by the funimer's drought. Befides this, the tops or leaves are in the fpring much more abundant, and much better food than thofe of the common tarnip, as already obferved; and they continue in full perfection after all the common turnips are rotien or worthlefs.
Thedifadvantagesattendingtheculivation ofturniproosed cabbages are, that they require a great deal of time and pains to take them up out of the ground, if they are to be carried off the field; and if fed where they grow, it requires almoft an equal labour to take up the pieces left by the cattle. A great deal of earth is alfo taken up along with the root; and the fubftance of the later is fo firm and fulid, that they muft be cut in two in order to enable the cattle to eat them. To obviate fome of thefe objections, it will be proper to for the plants on rich and very light land; and as they are longer in coming to the hoe than the common turnip, it will be proper to fow them about the begin105 ning of June.
Why every In another experiment upon this plant by the fame farmer gentleman, the cabbages held out during the long and ought to fevere froft of 1788 without the leaft injury, though cultivate this plant. it deftroyed three-fourths of all the common turnips in the neighbourhood. On the 21 ft of April 1789 , the average produce of an acre was found to be fomewhat more than $24 \frac{x}{2}$ tons, though the tops had not fprouted above three inches. Confidering the precarionfnefs of turnips and other crops, Sir Thomas is decifively of opinion, that all farmers ought to have as many turniprooted cabbages as would afford and enfure them a full provifion for their cattle for about three or four weeks during the latter part of the fpring. This quantity he reckons fufficient, as the confumption, paricularly when drawn and carried off the land, is atrended with more trouble and eypence than that of common turnips, efpecially if the foil be wet and heavy. In another letter, dated May 3. 1790, Sir Thomas Beevor once more fets forth the advantages of having a crop of thefe wegetables during the fpring feafon. "In confequence (fays he) of the very cold weather we have had here, the grafs is but juft fringing: as the turnipsare wholly eaten thp, it occafions much diftreis among the farmers for want of fome green vegetable food for their theep and cattle; whereas, by the affiftance of my turniprooted cabbages, I have abundance cf the beft and moft nutritive food that can be found them." He then proceeds to recommend their culture "for the fupjort of almoft all live fock for the three laft weeks of April, or firft week of May, when the grafs thoots late."

In the 4th volume of the Tranfagions of the Society for encouraging firts, Mr Robins, who received a promium for raifing the greateft guantity of this plant, informs us, that the foil on which it grew was 2 fore braifi, incliung to fand, not worth nore than yos. per acre; the preparation the fame as for turnips. The manure was a compoft of carth and dung, which he finds to anfwer better than dung. The feed was fown atout the beginning of April on a clean foot of groned, and he commonly ufes an old patture where tie brep-fold has beenin the winter, after taking away the dung, and digging it very fhallow; " as the roots
of the young plants (fays he) might foon reach the Turnipdung or falts, which mult confequently be left, in or- rooted dor to force them out of the fly's way." Thefe in. Cabbage. feets, our author obferves, are extrencly fond of the turnip-rooted cabbage; much more fo, he believes, than of common turnips. About the middle of June they fhould be planted ont upon one-bout ridges raifed by a double plough made for the purpofe. Seven thoufand plants are fufficient for one acre ; but if only fix are ufed, the roots will be the larger.

To determine how many fheep might be kept upon Number of an acre of turnip-rooted cabbage, our author fhut up fheepfedby 200 ewes with their lambs upon a piece of poor pafture- an acre of land of no great extent ; the whole not exceeding ten turnipacres. One ton was found fufficient for keeping them rooted cabin fufficient health for a day. On giving them a larger piece of ground to run over, though it had been eat all winter and late in the fpring ; yet with this trifling affintance 13 tons of turnip-cabbage were made to ferve 18 days; at the end of which the ewes and lambs were found very much improved, which could not have been expected from four acres of turnips in the month of April, the time that thefe were fed.

From fome trials made on the turnip rooted cabbage experiat Cullen Houfe in the north of Scotland, it appears ments at that the plant is adapted to the climate of every part Cullenof Britain. The firft trial was made in the year Houfe. 1784. The feeds were fown about the middle of Niarch in garden-ground properly prepared. The cabbages were tranfplanted about the middle of March that year into a dry light foil, and cleaned and dunged with rotten cow-dung, in rows three feet diftant from each other, and at the diftance of 20 inches in the rows. They were kept very clean, and the earth was hoed up to the roots of the plants; by which means they were probably prevented from attaining the hardnefs they would have otherwife arrived at; though, after all, it was neceffary to cut the rowis in two before the fheep could eat them. When thus cut, the animals eat them greedily, and even preferred them to every other food. The roots continued good for at leaft a month after the common turnips were unfit for ufe : fome of them weighed from eight to ten pounds, and a few of them more. Other trials have fince been made; and it now appears that the plunt will thrive very well with the orginary culture of turnips in the open fields, and in the uftal manner of fowing broad caft. From a comparative trial made by the earl of Fife upon this root with fome others, the quantities produced upon 100 fquare yards of ground were as follows :

|  |  | Stone. | lb. |
| :--- | :--- | ---: | :--- |
| Common turnips | - | 92 | 4 |
| Turnip-rooted cabbage | - | 88 | 0 |
| Carrors | - | 95 | 0 |
| Root of Scarcily | - | 77 | 0 |

The turnip-rooted cabbage was planted in lines 20 inches afunder ; the common turnips fown broad-caft, and hand-weeded, fo that they came up very thick, being not more than threc or four inches afunder when full grown. Two cows were fed for iix weeks winh the tarnips, two with rhe turnip-rooted cabbage, and two with the root of farcity for an equal time : the two fed with turnips gave moft milk, and. thofe wilh the root of fearcity the leaft. His lordfhip ob-
ferves,

Swedih ferves, however, that carrots thrive better on his farm
Turnip. than any other crop; that his horfes had been fed on them at the rate of two pecks a day, with no corn, and a little more than half the ufual quantity of hay. "They were kept at work every day from feven to eight hours, and were never in better order."'

## Sect.IX. Swediß Turnip.

The ruta baga, or Swedifh turnip, is a plant from which great expectations have beenformed. It is faid to be hardier thit the common turnip, and of greater fweetnefs and folidity. It allo preferves its freflanefs and fucculence till a very late period of its growth, even after it has produced feed; on account of which properry it has been recommended to the notice of farmers as an excellent kind of fucculent food for domeftic animals in the fpring of the year, whencommon turnips and mont other winter crops have failed, and before grafs got up to furnill an abundant bite for feeding beafts. This peculiarity, to valuable, yet fo fingular as to have led many at firft to doubt the fact, feems to be fufficiently afcertained by experiment. Dr $+T h e$ Bee, vol. iii. p . ngr. J. Anderfon $\dagger$ in particular informs us, that it" begins to fendout its flower-ftemsin the fpring, nearly about the fame time with the common turnip; but that the root, in confequence of that change of ftate, fuffers very little alteration. I continued to ufe thefe turnips at my table every day till towards the middle of May; and had Intver gone into the garden myfelf, I fhould not even then have fufpected, from the tafte or appearance of the bulb itfelf, that it had been hot at all. The ftems, however, at the feafon I gave over ufing them, were from four to five feet high, and in full flower. I fhould have continued the experiment longer, had not the quantity 1 had left for that purpofe been exhaufted, and a few only left for leed.
"This experiment, however, fully proves, that this kind of turnip may oe employed as a fucculent food for cattle till the middle of May at leaft, in an ordinary year ; and I have not the fmallent doubt but it will continue perfectly good for that purpofe till the end of May in any feafon ; at which time grafs and other fpring-crops can eafly be had for bringing beafts forward in flefh. I can therefore, without hefitation, recommend this plant to the farmer as a moft valuable fring fceding for cattle and fheep; and for this purpofe, I think no wife farmer flould be without a proportion of this kind of turnip to fucceed the other forts after they fail. The profitable method of confuming it, where it is to be kept very late, is, I am convinced, to cut off the tops with a fcythe or fickle when from one foot to eighteen inches high, to induce it to fend out frefh fems, that will continue foft and fucculent to the end; whereas, without this procefs, the ftems would become ficky and ufelefs:
" I cannot, however, recommend this kind of turnip, from what 1 have feen, as a general crop; becaufe I think it probable, that unlefs in particular cifcumfances. the common field-turnips grow to a much larger fize, and afford upon the whole a more weighty crop. Thefe, therefore, hould fill continue to be cultivated for winter ufe, the other being refervedonly for fring confumption.
"Experiments are fill wanting to afcertain with cer*ainty the peculiar foil and culture that beft agree with Vox. VIII.
this plant; but from the few obfervations I have hitherto had an opportunity of making upon it, it feems to me probable, that it thrives better, and grows to a larger lize on damp clayey foil, than on light fandy land. But I would not wifh to be underfood as here fpeaking politively ; I merely throw it out as a hint for future obfervation: on fpungy foil it profpers.

Though the ufes of this as a garden plant are of much fmaller confequence than thofe above-fpecified, it may not be improper to remark, that its leaves form a very fweet kind of greens at any time ; and merely for the fake of the experiment, I cauled fome of thefe to be picked off the ftems of the plants coming to feed, on the 4 th of June, the king's birth-day, which, on being readied, were found perfectly fweet, without the fmalleft tendency to bitternefs, which mof, if not all other kinds of greens that have been hitherto cultivated are known to acquire after their ftems are coninderably advanced ; no family, therefore, can ever be at a lofs for greens when they have any of this plant in feed.
"A root of this kind of turnip was taken up this day (June 15th); the feed ftalks were firm and woody, the pods full furmed, and in fome of them the feeds were nearly ripe. The root, however, was as foft and fucculent as at any former period of its growth; nor was the fkin, as I expected, hard or woody. It was made ready and brought to the table : fome perfons there thonglit the tafte as good, if not better, than at any former period of its growth ; but I myfelf, perlaps through prejudice, thought it had not quite fo high a relifh as in winter: At any rate, however, there can be no doubt, that if ever it could be neceffary, it might, even now, be employed very properly as a feeding for cattle."

## Sect. X. Turnip-Cabbage

This phant is as yet but little known. The feed is faid to have been brought frem the Cape of Good Hope by Mr Haftings, where it is very common as well as in Holland. It has allo had an exiftence in Britain for many years, though not generally known. In has a much greater affinity to the cabbage than to the turnip ; and is very hardy, bearing the winter as well, if not better, than common brocoli, and may therefore be confidered as a valuable acquifition to the kitchen-garden as well as for cattle. The beft time for fowing it for the garden is the end of May or beginning of June, though none of the plants have cver been obferved to run to feed though fown ever fo early. Even though fown in Angult at the caulifower feafon, the greater part food throughont the following fummer, and did not feed till the fecond fpring. The plants require nearly the fame management with brocoli as to diftance, tranfplanting, \&c. and are ufually moft efteemed when young, and about the lize of a moderate garden turnip ; thofe fown in June will continue all winter. The bulb muft be Aripped clean of its thick fibrous rind ; after which it may be ufed as a common turnip. The crown or fprout is very good, butefpecially in the foring, when they begin to runto feed. Mr Bronghton, from whofe account in the Bath Papers, vol.v. this article is taken, thinks that the turnip-cabbage is more nteritious than the common turmip. The large't bulb he meafured was 23 inches
circum-

[^62]

[^63]

$\mathrm{H} \quad \mathrm{U}$ S B circumference; but the thieknefs of the rind is fo great, that fome"farmers imagined that the bulb would be too hard for flieep. The objection, however, was obviated by Mr Brongliton, who gave fome of the oldeft and touglieft bulbs to his fleep, and found that they not only penetrated through the rind, but even devoured the greateft part of it.

## Sect. XI. Gabbage.

Cabbage lias been recommended by long èxperị. ence as an excellent food for cattle; its ufe as part of human food are alfo well known. In a paper already quoted from thofe of the Bath Society, Scotch cabbages are compared, as to their utility in feeding catile, with turnips, turnip-rooted cabbage, and carrois. In this trial the cabbages ftand next in value to the carrots; and they are recommended as not liable to be af-

3 ro
Quantity raifed on: anacre, \&c. fécted by froft, if they be of the true flit-topped firm kind. Fifty-four tons have been railed upon an acr : of ground not worth more than 12 hillings. There is likewile an advantage attending the feeding of cattle with cabbages, viz. that their dung is more in proportion than when fed with turnips or with hay ; the formier going off more by urine; and the lat: r having too little moifture. They alfo impoverifh the ground much lefs than grain. Mr Billinghey accounts 46 tons per acre a greater crop than he ever read of; but Mr Vagg, in the $4^{\text {th }}$ volume of Bath Papers, gives an account of a crop for which he received a premjum from the Society, which was much fuperior to that of Mr Billinglley. Itsextent was 12 acres; the produce of the worft was 42 , and of the beft 68 tons. They were mianured with a compoft of lime, weeds, and earth, that lay under the hedges round the field, and a layer of dung, all mixed and turned together. About 25 cart-loads of this were fpreadupon an acre with the ufual ploughing given to a common fummer-fallow; but this, he fays, "admitting fuch a crop to exhauft the manure in fome degree by its growth, an ample reftoration will be made by its refufe ploughed in, and by the ftirring and cleaning of the ground. The whole expence of an acre, exclufive of the rent, according to Mr Vagg's calculation, amounts to L. I: 14: 1, only four ounces of feed being requifite for an acre. The 12 acres, producing as abovementioned, would feed 45 exen, and up.wards of 60 fheep, for three months; improving them as much as the grafs in the beft months of the year, May, June, and July. He recommends fowing the feed about the middle of Auguft, and tranfplanting the young cabbages where they may be fheltered from the froft; and to the neglect of this he aferibes the partial failure, or at leaft inferiority of one part of his ground in the crop juft mentioned, the young plants not being removed till near midfummer, and then in fodry a time, that they were almoft
fcorched up.

In the Farmer's Magazine, vol. ii. p. 217. we have feveral pertinent remarks up the culture of this ufeful pla:1t, particularly with regard to watering. "It is a rule (fays this correfpondent) never to water the plants, let the feafon be as dry as it may; infifting that it is entirely ufelefs. If the land is in fine tilth and well danged, this may be right, as the expence muft be confiderable ; but it is probable, in very dry feafons, when the new fer plants have nothing but a
buining fon on them, that watering would fave vaft numbers, and might very well anfwer the expence, if a pond is near, anothe werk done with a water-cart." He takes notice alfo of another ufe of cabbages, which has not met with the accention it merits, viz. the planting of lands where turnips have failed. A late fown crop of thefe feldom turns to any account ; but cabbages platited on the ground without any plonghing would prove very beneficial for theep late in the fpring; in all probability (unlefs on light, fandy, or liniefone foils) of greater value than the turnip;, had they facceeded.

Mr Marfhall obferves, thatin the Midland diftrict, a valuable fort of arge if not raifed, by Mr Bakewell, who is not more cele- inthe Mid. brated for hisbreed of rams than for his breed of cab- land difbages. Great care is obferved here in raifing the feed, trict. being careful to fuffer no other variety of the braffica tribe to blow near feed-cabbages; by which means they are kept true to their kind. To this end, it is faid, that fome plant them in a piece of wheat ; a good method, provided the feed in that lituation can be preferved from birds."

The advantage of having large cabbages is that of Diftance being able to plant them wide enongh from each other, which they to admit of heir being cleaned with the plough, and yet ouglit to to afford a full crop. The proper diftance depends in be placed. fome micafure on the natural lize of the fpecies and the flength of the foil; the thinner they fand, the larger they will grow : but our author is of opinion, that cabbages, as well as turnips, are frequently fet out too thin. Four feet by two and an half, accord: ing to Mr Marfhall, are a full diftance for large cabbages on a rich foil.

## Sect. XII. Parfnips.

These, though little ufed in Britain, are highly an excelefteemed in France and fome of our neighbouring lent food inlands as food for cattle. In Brittany particularly, for catsle. they are thought to be little inferior in this refpect to wheat ; and cows fed with them are faid to give as much milk, and of as good quality, as in the fummermonths. It is alfo very much commended for fwine which rear young pigs, and for fattening the fwine themfelves. The author of this paper alfo recom. mends a method of determining the nutritive qualities of plants by the quantity of mucilagethey contain ; which may be known by boiling them in water, and then evaporating the decoction : the parfnip, he fuppofes, would yield a greater quantity of mucilage than either carrots or potatoes.
"To cultivate this root (fays Mr Hazard) fo as to Batb Pamake it advantageous to the farmer, it will be right to pers, vol. iv. fow the feed in the autumn immediately after it is $\hat{p} .244$. ripe; by which means the plants will appear early the following fpring, and get ftrong before the weeds can rife to injure them. Nei her the feeds nor younc: plants are ever materially injured by frofts; on which account, as well as many others, the autumn is preferable to the fpring fowing. The beft foil for them is a rich deep loam, and next to this fand. They will thrive well in a black gritty foil, but not in fonebrafh, gravel, or clay; and they are always largeft in the deepeft earth. If the foil be proper, they do not require mach manure. Mr Hazard obtained a yery
$\underbrace{\text { Parfnips. good crop for three years upon the fame piece of }}$ ground witheut uling any; but when he laid on about 40 cart loads of fand per acre upon a fiff loam, and ploughed it in, he found it anfwer very well; whence he concludes, that a mixture of foils may be proper for this root. The feed may be fown in drills at about 18 inches diftance from one atother, that the plants may be the more conveniently hand or horfe-hoed; and they will be more luxuriant if they undergo a fecond hocing, and are carcfully earthed, fo as not to cover the leaves. Such as have not ground to fpare, or cannot get it in proper condition in atume, may at that time fow a plot in their garden, and tranfplant from thence in the latter end of April, or early in the month of May following. The plants mult be carefully $\mathrm{dra}_{\mathrm{d}} \mathrm{wn}$, and the ground well pulverifed by harrowing and rolling ; after which a furrow flould be opened with the plough about fix or eight inches deep, in which the plants fhould beregularly laid at the diftance of abour ten inches from cach other, taking care not to let the root be bent, but for the plant to itand perpendicular after the eaxth is clofed about it, which ought to be done inmediately by neaus of perfons who flould for this purpofe follow the planter with a hoe. Another furrow muft be opened about 18 inches from the former, in the fame direction, and planted as before; and fo on in like manner until all the plants are depolited, or the field be completcly cropped: and when the weeds appear, hoeing will be neceffary, and it will afterwards be proper to earth them; but if the leaves of the plants be covered with earth, the roots will be injured. Parfuips ought not to be planted by dibbling, as the ground thas becomes fo bound, as feldom to admit the fmall lateral fibres with which thefe roots abound to fix in the earth, by which they are prevented from expanding themfelves, and never attain a proper lize. When circumftances are properly attended to, there is little doubt that a crop of parfhips would anfwer much better than a crop of carrots.

They are equal if not fuperior, in fattening pigs; 35 Parfnips. they make their flefh whiter, and the animals themfelves are more fond of thefe roots than of carrots. Horfes eat them greedily when clean wathed and hiced among bran, and thrive very well upon them; and black cattle are faid likewife to approve of them.

The foregoeing are the principal vegetables which have as yet been recommended, or which experience has determined to be proper, to be raifed as food for men or for cattle.
One or two other plants may be juft noticed, which have lately fallen under the obfervation of thofe who apply themfelves to the ftudy of hufbandry, viz. the root of fiarcity, and what are called mowing cabbages. Of the Concerning the latter, no experiment has yct been mowing made to determine fufficiently their properties and va cabbage. lue. They are mentioned in the Bath Papers $\dagger$ by $\dagger$ Vol. v. Sir John beevor, who had a fmall parcel of feed fent p. 424. him; which he fowed in fpring, and feveral plants were produced. Some of thofe were cut down three times, and grew into heads again fo fpeedily, " that (fays he) had I had leifure to have attended to them, I doubt not but that the cuttings might have been repeated; but as there is never on my farm any want of frefh vegetable food for catcle in the fummer, unlefs I can find them continue to vegetate in like manner during the winter (which mine have not done) or very early in the fpring, I think they will not prove to me, or any one under the like circumftances, an object of much value.-As to the root of farcity, we have no- Root of thing to add to what has been faid on it under Agri-farcityculture, $1^{\circ}$ 52. Notwithftandinga great number of experiments, it fill appears uncertain whether it be really ufeful or not.

With regard to Graffes, the moft ufeful fpecies have Graffes. been deferibed under the article Grass, and the cultivation of them fo fully explained under AcricutTURE, as to require no further enlargement here.

## Part II. Cultivation of Vegetables more properly Articles of Commerce.

THESE in general are fuch as cannot be ufed for food; and are principally flax, hemp, rape, hops and timber of various kinds; and of each of thefe we hall treat particularly in the following feetions.

## Sect. I. Of Flax and Hemp.

THis plant is cultivated not only with a view to the common purpofes of making linen, but for the fake of its feed allo; and thus forms a moft extenfive article of commerce, all the oil ufed by painters, at leaft for

119 Linfeedcake, linfeed itfelf, and and linteed -il, ufed for fall infor fattening fhall informs us that it is, next to hay, the main arcattle. common purpofes, being extracted from this feed. The cake which remains after the extraction of the oil is in fome places ufed as a manure, and in others fold for fattening of catcle. In the Vale of Gloucefter, Mr Marcome fo great, that it probably now leaves little or no profir to the confumer, having within a few years rifen from three guineas to fix and fix and an half, and the loweft price being five guineas per ton ; and even this is lower than it was lately. Hence fome individuals have been induced to try the effeet of linfeed itfelf boiled to a jelly, and mixed with flour, bran, or
chaff with good fuccefs, as Mr Marthal has been informed; and even the oil itfelf has been tried for the fame purpofe in Herefordfhire. Though this plant is in univerfal culture over the whole kingdom, yet it appears by the vaft quantity imported, that by far too little gronnd is employed in that way. As Mr Mar- Culure Alall takes notice of its culture only in the county of flax in Yorkfhire, it probably does not make any great part of Yorkinire. the huibandry of the other counties of which he treats; and even in Yorkfhire, he tells us, that its cultivation is confined to a few dittricts. The kind cultivated there is that called " blea line," or the blue or lead-coloured flax, and this requires a rich dry foil for its cultivation. A deep, far, fandy loam is perhaps the only foil on which it can be cultivated with advantage. If fown upon old corn-land, it ought to be well cleaned from weeds, and rendered perfectly friable by a fummer-fallow. Manure is feldom or ever fer on for a line crop; and the foil procefs confifts generally of a fingle plowing. The feed-time is the month of May, but much depends on the fate of the foil at the time of fowing. " It fhould neither be wet nor dry; and the furfaceought to be made as fine as that of a garden bed. Not a clod of the fize of an egg fhould re-
main

## $\begin{array}{lllllllll}\mathbf{H} & \mathbf{U} & \mathbf{S} & \mathbf{B} & \mathrm{A} & \mathrm{N} & \mathrm{D} & \mathrm{R} & \mathrm{Y} .\end{array}$

Flax and main unbroken." Two bufhels of feed are ufually Hemp. fown upon an acre: the furface, after being harrowed, is fometimes raked with garden or hay-rakes; and the operation would be ftill more complete if the clods and other obftructions, which cannot be eafily remoyed, were drawn into the interfurrows. A light handroller ufed between the final raking and harrowing would much affift this operation. The chietrequifite during the time of vegetation is weeding; which ought to be performed with the utmoft care; and for this reafon it is particularly requifite that the ground fhould be previonfly cleanfed as well as poffible, otherwife the expence of weeding becomes too great to be borne, or the crop muft be confiderably injured. It is an irreparable injury, if, through a dry feafon, the plants come up in two crops; or if by accident or nifnanagement they be too thin. The goodness of the crop depends on its running up with a fingle ftalk without branches: for whenever it ramifies, there the length of the line terminates; and this ramification is the confequence of its having too much room at the root, or getting above the plants which furround them. The branches are never of any ufe, being unavoidably worked off in dreffing; and the ftemitfelf, unlefs it bear a duc proportion to the length of the crop, is like wile worked off among the refufe. This ramification of the flax will readily be occafioned by clods on the ground when fown. A fecond crop is very feldom attended with any profit; for being overgrown with the fpreading plants of the firf crop, it remains weak and fhort, and at pulling time is left to rot upon the land.

Flax is injured not only by drought but by froft, and is fometimes attacked, even when got five or fix inches high, by a fmall white flag, which ftrips off the leaves to the top, and the ftalks bending with their weight are thus fomctimes drawn into the ground. Hence if the crop does nor promife fair at weeding time, our autbor advifes not to beftow further labour and expence uponit. A crop of turnips or rape will generally pay much better than fucha crop of flax. The time of flax-harven in Yorkhire is generally in the latter end of July or beginning of Augult.

On the whole, our author remarks, that "the goodnefs of the crop depends in fome meafure upon its length; and this upon its evennefs and clofenefs upon the ground. Three feet high is a good length, and the thicknefs of a crow's quill a good thicknefs. A fine ftalk affords more line and fewer fhivers than a thick one. A tall thick fet crop is therefore defirable. But malefs the land be good, a thick crop cannot attain a fufficient length of ftem. Hence the folIy of fowing flax on land which is unfit for it. Nevorthelefs, with a fuinable foil a fufficiency of feed evenly difributed, and a fawourable feafon, flax may turn out a very profitable crop. The flax-crop, however, has its difadvantages: itinterferes with harveft, and is generally believed to be a great exhaufter of the foil, efpecially when its feed is fuffered toripen. Its cultivation ought therefore be confined to rich grafslar ' diftricts, where harveft is a fecondary object, and where its exhauftion may be rather favourable than lurtful to fucceeding arable crops, by checking the too great ranknefs of rich freth broken ground.
Mr Bart- In the 5th volume of Bath-Papers, Mr Bartley near ley's expe- Briftol, gives an account of the expences and produce
minentr. , miments.
of five acres of flax cultivated on a rich toamy fand. Flax and The total expence was 42 l. 13s. 4 d. the produce was Hemp. ten packs of flax at 51.5 s . value 52 l . Io s. 35 bufhels of linfeed at 5 s . value 81.15 s . the net profit therefore wasi81. IIs. 8 d . or 4 l . $13 \mathrm{~s}, 4 \mathrm{~d}$. per acre. This gentleman is of opinion that flax-growers onght to make it their ftaple article, and confider the other parts of their farm as in fubferviency to it:

In the 2d volume of Bath-Papers, a Dorfethire Remarks gentleman, who writes on the culture of hemp, and flax, of a Dorfetgives an account fomewhat different from that of Mr flire genMarhall. Inftead of exhaufting crops, he maintains tlemañ. that they are both ameliorating crops, if cut without feeding; and as the beft crops of both are raifed from foreign feed, he is of opinion that there is little occafion for raifing it in Britain. A crop of hemp, he informs us, prepares the land for flax, and is therefore clear gain to the farmer. "That thefe plants. impoverifh the foil," he repeats, "is a mere valgar notion, devoid of all truth. -The beft hiftorical relations, and the verbal accounts of honeft ingenious planters, concur in declaring it to be a vain prejudice, unfupported by any authority; and that thele crops really meliorate and improve the foil." He is like- Flax and wife of opinion, that the growth of hemp and flax is hemp may not neceffarily confined to rich foils, but that they may be cultivabe cultivated with profit alfo upon poor fandy ground, if ted upon a little expence be laid out in manuring it. "c. Spal- poor as ding-moor in Lincolnflire is a barren fand; and yet foils. with proper care and culture it produces the beft hemp in England, and in large quantities. In the ine of Afholme, in the fame county, equal quantities are produced; for the culture and management of it is the principal employ of the inhabitants; and, according. to Leland, it was fo in the reign of Henry VIII. In Marfhland the foil is a clay or ftrong warp, thrown up by the river Ouze, and of fuch a quality, that it cracks with the heat of the fun, till a hand may be put. into the chinks; yet if it be once covered with the hemp or flax before the heats come on, the ground will not crack that fummer. When the land is fandy, they firft fow it with barley, and the following fpring they manure the fubble with horfe or cow dung, and plongh it under. Then they fow their bemp or flax, and harrowit in with a light harrow, having fort teeth. A good crop deftroys all the weeds, and makes it a fine fallow for flax in the furing. As foon as the flax is pulled, they prepare the groand for wheat. Lime, marl, and the mud of poods, is an excellent compoft for hemp-lands."

Our author takes notice of the vaft quantity of flax $\mathrm{v}^{125^{\circ}}$ and hemp, not lefs than, ir,000 tons imported in the tities of daxyear 1763 into Britain ; and complains that it is not and hemp raifed in the ifland, which he thinks might be done, imported though it would require 60,000 acres for the parpofe. into Brt He obferves, that the greater part of thofe rich marthy tain. lands lying to the weft of Mendip hills are very proper for the cultivation of hemp and flax; and if laid our in. this manner could not fail of turning out highly advantageous both to the landholders and the public at large. ". The val quantities of hemp and flax (fays he) which havebeen railed on lands of the fame kind in Lincolnhire marges, and the fens of the Ine of Ely and Huntingdon. Gire, are a full proof of the truth of my :affertion. Many hundreds of acres in the above mentioned places, which, for pafturage or grafing, were

Cole Seed. not worth more than 20 or 25 millings per acre, have been readily let at 41 . the firft year, 31 . the fecond, and 2l. the third. The reafon of this fuppofed declining value of land, in proportion to the number of years fown with flax, is, that it is ufual with them to feed it for the purpofe of making oil, that being the principal caufe of the land being inpoverifhed.

## Sect. II. Rape or Cale Seed.

This, as well as linfeed, is cultivated for the purpofe of making oil, and will grow almoft any where.
Batb Pa- Mr Hazard informs us, that in the north of England pers, vol,iv. the farmers pare and burn their pafture lands, and then fow them with rape after one ploughing; the crop
126 commonly fanding for feed, which will bring from Advantage 251 . to 301 . per laft ( 80 bufhels.) Poor clay, or ftoneof cultiva- brafh land, will frequently produce from 12 to 16 or earth will yield one plentiful crop; fo that many in the northern counties have been raifed, by cultivating this feed, from poverty to the greateft affluence. The feed is ripe in July or the beginning of Auguft ; and the thredhing of it out is conducted with the greateft 127 mirth and jollity.
Of cutting The rape being fully ripe, is firft cut with fickles, and and thra/h- then laid thin upon the ground to dry; and when in ing the гаре-feed. proper condition for threfhing, the nei ghbours are invited, who readily contribute their affiftance. The threfhing is performed on a large cloth in the middle of the field, and the feed put into facks and carried home. It does not admit of being carried from the field in the pod in order to be threfhed at home, and therefore the operation is always performed in the field; and by the number of affiftants procured on this occafion, a field of 20 acres is frequently threfhed out in one day. The ftraw is burnt for the fake of its alkali, the afhes being faid to equal the beit kind of
128 thofe imported from abroad.
of fowing The propet time of fowing rape is the month of is. June; and the land fhould, previous to the fowing, be twice well ploughed. Abour two pounds of feed are fufficient for an acre; and, according to our author, it hould be caft upon the ground with only the thumb and two fore fingers; for if it be caft with all the fingers, it will come up in patches. If the plants come up too thick, a pair of light harrows fhould be drawn along the field !ength-ways and crofs-ways; by which means the plants will be equally thinned; and when the plants which the harrows have pulled up are wi: thered, the ground hould be rolled. A few days after the plants may be fet out with a hoe, allowing 16 or

Mr Hazard frongly recommends the tranfplanting of rape, having experienced the good effects of it himfelf. A rood of ground, fown in June, will produce as many plants as are fufficient for 10 acres; which may be planted out upon ground that has previounly borne a crop of wheat, provided the wheat be harvefted by the middle of Auguft. One plonghing will be fufficient for thefe plants; the beft of which fhould be
330 felected from the feed-plot, and planted in rows two sheep may feet afiunder and 16 inches apart in the rows. As rape be fed in is an excellent food for theep, they may be allowed to the fpring with rape.
leaves would fprout again from the fame falks, which Coriander. in like manner might be fed off by ewes and lambs in Sced, \&c. time enough to plough the land for a crop of barley and oats. Planting rape in the beginning of July, however, would be moft advantageous for the cropitfelf, as the leaves might then be fed off in the antumn, and new ones would appear in the fpring. Our author difcommends the practice of fowing rape with uurnips, as the crops injure one another. "Thofe who look for an immediate profit (fays he), will undoubtedly cultivate rape for feed; but perhaps it may: anfwer better in the end to feed it with feeep: the fat ones might cull it over firf, and afterwards the lean or ftore-fheep might follow them, and be folded thercon : if this is done in autumn feafon, the land wild be in good heart to carry a crop of wheat ; or where the rape is fed off in the fpring, a crop of barley might follow. In either cafe rape is profitable to the cultivator; and when it is planted and well earthed round the ftems, it will endure the fevereft winter; but the fame cannot be advanced in favour of that which is fown broadcaft.

## Sect. III. Coriander Seed.

$T_{h i s}$ is ufed in large quantities by diftillers, druggifts and confectioners, and might be a confiderable object to fuch farmers as live in the neighbourhood of great towns; but the price is very variable, viz. from 16s. to 42 s . per cwt. In the 4 th volume of Bath Pa pers, Mr Bartley gives an account of an experiment pers, Mr Bartley gives an account of an experiment Mr isart.
made on this feed which proved very finceefsful. Ten ley's expoperches of good fandy loam were fown with coriander riment. on the 23 d of March 1783 . Three pounds of feed were fufficient for this fpot; and the whole expence: amounted only to 5 s 10 d . The produce was 87 pounds of feed, which valued at 3 d . yielded a profit of r 5s. Ind. or 1.5l. ins. 4d. per acre. He afterwards made feveral experiments on a larger fcale; but none of the crops turned out fo well though all of them afforded a goed. profit.

## Sect. IV. Canary Seed.

Turs is cultivated in large quantity in the Ine of Thaner, where it is faid they. have frequently 20 buhnels to an acre. Mr Bartley, in the month of March 1783 , fowed half an acre of ground, the foil a mixture of loam and clay, but had only. eight buhhels and an half, or 17 buitels per acre. With this produce, how. ever, he had a profit of 4 l .2 s .3 d per acre.

## Ssct. V. Woad.

The ufe of this in dyeing is well known, and the confumption is fo great, that the raifing of the plant raight undoubtedly be an object to the hufbandman, provided he could get it properly manufactured for the dyers, and could overcome their prejudices. At prefent, the growing of this plant is in a manner monopolized by fome people in particular places, particularly at Keynfana near. Briftol in England. Mr Bartley W ${ }^{132}$ informs us, that in a converfation he had with thefe: ly cultivagrowers, the latter afferted, that the growth of wooad ted. was peculiar to their foil and fituation. The foil about this place is a blackinh heavy mould, with a confider-
able proportion of clay; but works freely: that of Brifington, where fri Bartley refides, an hazal, fandy loam; neverthelefs, having fowed half an acre of this foil vith woad-feed, it throve fo well, that he neverfaw a better crop at Keynfham. Having no apparatus, however, or knowledge of the manufacture, .he fuffered it to run to feed, qearning only from the experiment, that woad is very eafily cultivated, and that the only difficulty is the preparing it for the market.

## Sect. VI. Hops.

I33
${ }^{\prime}$ Hops forbid by act of parliaament.

The ufes of thefe, as an ingredient in malt-liquors, are well known. Formerly, however, they were fuppofed to poffefs fuch deleterious qualities, that the wfe of them was forbid by act of parliament in the reign of James VI. But though this act was never repealed, it does not àppear that much regard was ever paid to it, as the ufe of hops has ftill continued, and is found not to be attended with any'bad effects on the human conftitution. The only queftion, therefore, is, How far the raifing a crop of them may be profitable to an hufbandman? and indeed this feems to be very dou'btful.

Mr Arthur Young, in a fortnight's tour through Amals of Kent and Efrex, informs us $\dagger$ that at Caftle Heding. Agriculture, ham he was told by a Mr Rogers, who had a confi-

134 Expcnce of Expence of
cultivating them at Cafle Hedingham. conte-hop plantation, that four acres of hop-ground coit him upwards of i20l. and that the ufual expences of laying out an acre of ground in this way amounted to 341.6 s . By a calculation of the expences of an acre in Kent, it appeared that the money funk to plant an acre there amounted to 321.8 s .6 d .; that the annual expence was 231 , and the prefit no more than Il. 8s. Id. In another place, he was informed by a Mr Potter, who cultivated great quantities of hops, that if it were not for fome extraordinary crops which occurred now and then, nobody would plant them. In Effex, the expences of an lop-plantation are fill greater than thofe we have yet mentioned; an acre many years ago requiring 751. to lay it out on hops, and now not lefs than 1001 . the annual expence being eftimated at 3Il. is. while the produce commonly does not exceed 321 .

In the neighbourhood of Stow-market in this county, Mr Young informs us, there are about. 200 acres planted with hops, but ' 18 or 20 are grubled up within two years, owing to the badnefs of the times." Here they are planted on a black loofe moor, very wet and boggy ; and the more wet the better for the crop, efpecially if the gravel which conftitutes the bottom, be not mone than three fcet from the furface. In preparing the ground for hops, it is formed into beds t 6 feet wide, feparated from each other by trenches. In thefe beds they make holes fix feet afunder, and about 12 inches diameter, three rows upon a bed. Into each hole they put about half a peck of very rotten dung or rich comport; fcatter earth upon it, and plant feven fets in each; drawing earth enough to them afterwards to form fomething of an hillock. A hop garden, Mr Young informs us, " will laft almoft for ever, by renewing the hills that fail, to the amount of about a fcore annually; but. it is reck.oned better to grub up and new-plant it every 20 or 25 years."

In this volume of the annals, Mr Young informs
us, that " one profit of hop-land is that of breaking it Cultivation up. Mr Potter grubbed up one. garden, which fail- of fruit. ing, he ploughed and fowed barley, the crop great; then mazagan beans, two acres of which produced 16 then mazagan beans, two acres of which produced 16 roft of
quarters and five bufhels. Ife then. Sowed it with breakng whear, which produced 13 quarters' and four buthels up hopand an half; but fince that time the crops have not land precabeen greater than common. The fame gentleman has rious. had ro quarters of oats after wheat." In the ninth -volume of the fame work, however, we have an account of an experiment by Mr Le Bland of Sittingbourn in Kent, of grabbing up i2 acres of hopground which was not attended with any remarkable fuccefs. Part of the hops were grubbed up in the year 178 I , and mazagan beans fown in their ftead; but by reafon of the feed being bad, and the dry fummer, the crop turned out very indiferent. Next year the remainder of the hops were grubbed up, and the whole . 12 acres fown with wheat; but fill the crop tuned out very bad, owing to the wet fummer of that year. It was next planted with potatoes, which turned ont well ; and ever fince that time the crops have been good. This gentlemarr informs us, the perfon who had the hop-ground abovementioned did not lofe lefs by it than 15001 .

The culture of hops feems to be confined in a great Culture of meafure to the fouthern counties of England; for Mr hops in Marfhall mentions it as a matter of furprife, that in Norfolk on Norfolk he faw a " tolerably large hop garden." The the declime. proprietor informed him, that three or four years before there had been 10 acres of hops in the parifh (Blowfield) wherelle refided: which was more than could be collected in all the reft of the county; butat that time there were not above five; and the culture was daily declining, as the crops, owing to the low price of the commodity, did not defray the expence.

From all this it appears, that hops are perhaps the moft uncertain and precarious crop on which the hafbandman can beftow his labour. Mr Young is of opinion, that fome improvement in the culture is aeceffary; but he does not mention any, excepting that of planting them in efpaliers. This method was recommended both by Mr Kogers and Mr Potter abovementioned. The former rook the hint from obferving, that a plant which had been blown down, and afterwards thot out horizontally, always produced a greater quantity than thofe which grew upright. He alfo remarks, that hops which are late picked carry more next year than fuch as are picked early; for which reafon he recommends the late picking. The only reafen for picking early is, that the hops appear much more beatuiful than the others.

## SECT . VII. Cuiltivation of Fruit.

In Herefordnire and Gloucefterfhire the cultivation of fruit for the purpofe of making a liquor from the juice, forms a principal part of their hufbandry. In Devonhire alfo confiderable quantities of this kind of liquor are made, though much leifs than in the two counties abovementioned.

The fruits cultivated in Herefordfhire and Gloucef- Frwits terhire are, the apple, the pear, and the cherry. From tivated in the twofirft are made the liquors named cyder and per-Hercford$r y$; but though ir is probable that a liquor of fome va- fhire and, ry ; but though it is probable that a liquor of fome va- Groand
lue might be made from cherries allo, it does not ap- fhire.

## Part II.

Cultivation pear to have ever been attempted. Mr Marfall reof fruit. 139

## Varieties of

fruits en-
tircly artiGicial.

440
Varietics
cannot be made permanent. :peas, that nature has furniflaed only one feecies of pears, and apples, viz. the common crab of the woods and hedges, and the wild pear, which is likewife pretty common. The varietics of the fe fruits are entirely artificial, being produced not by feed, but by a certain mode of culture; whence it is the bufnefs of thofe who wifh to improve fruit therefore, to catch at fuperior accedental varietics; and having raifed them by cultivation to the higheft perfection of which they are capable, to keep them in that fare by artificial propagation. Mr Marlhall, however, obferves, that it is impoffible to make varietics of fruit alogether permanent, though their duration depends much upon management. "A time arrives (fays he) when they can no longer be propagated wich fuccefs. All the old fruits which rafed the fame of the liquors of this country are now loft, or fo far on the decline as to be deemed irrecoverable. The redfireakis given up; the celebrated /fir-apple is going off; and the fquafb-pear, which has probably furnithed this country with more champaign than was evcr imported into it, can no long: er be got to flourifh; the ftocks canker, and are unproductive. In Yorkfhire finilar circumftances have taken place; feveral old fruits which were productive within my own recollection are loft; the ftocks cankered, and the trees would no longer come to bear."

Our author controverts the common notion among orchard-men, that the decline of the old fruits is owing to a want of frefh grafts from abroad, particularly from Normandy, from whence it is fuppofed that apples were originally imported into this country. Mr Marfhall, however, thinks, that the fe original kinets have been long fince loft, and that the numerous varieties of which we are now poffeffed were raifed from feed in this coun ry. He alfo informs us, that ac Ledbury he was fhown a Normandyapple-tree, which, withmany others of the fame kind had been imported immediately from France. He found it, however, to be no other than che bitter fweet, which he had feen growing as a neglected wilding in an Englifh hedge.

The procefs of raifing new variet.es of apples, according to Mr Marthall, is fimple and eafy. "c Elect (fays he ) among the native fpecies individuals of the higheft flavour ; fow the feeds on a highly enriched feed-bed. When new varieties, or the improvement of old ones, are the objects, it may perhaps be eligible to ufe a frame or ftove; but where the prefervation of the ordinary varieties only is wanted, an ordinary loamy. foil will be fufficient. At any rate, it ought to be perfectly clean at leaft from root weeds; and fhould be double dug from a foot to 18 inches deep. The furface being levelled and raked fine, the feeds ought ta be fcattered on about an inch afunder, and covered about half an inch deep with fome of the fineft mould previouflyraked off the bed for that purpofe. During. fummer the young plants fhould be kept perfectly free from weeds, and may be taken up for tranflantation. the enfuing winter; or if not very thick in this feedbed, they may remain in it till the fecond winter. .

The nurfery ground ought alfo to be enriched, and double dug to the depth of 14 inches at leaft; though 38 or 20 are preferable. The feedling plants ought to be forted agreeably to the ftrength of their roots, that they may rife evenly together. The top or downward
roots hould be taken off, and the longer fide rootlets $C$ fhortened. The young trees fhould then be planted in rows three feet afunder, and from 15 to 18 inches diftant in the rows; taking care not to cramp the roots, but to lead them evenly and horizontally among the mould. If they be intended merely for ftocks to be grafted, they may remain in this lituation until they be large enough to be planced out; though, in ftrict management, they onght to be re-tranflanted two years belore the ir being transferred into the orchard, " in frefh but umanared double-dag ground, a quincunx four feet apart every way." In this fecond tranfplantation, as well as in the firlt, the branches of the root ought not to be leff too long, bat to be fhortened in fuch a manner as to induce them to form a globular root, fifficiently fmall to be removed with the plant ; yet fufficiently large to give it firmnefs and vigour in the plantation
$\$ 43$
Hawing, proceeded in this manner with the feed-bed, Method of our author gives the following directions. "Select choofing from among the feedlings the plants whote wood and the plants: leaves wear the moft apple-like appearance: Tranfplant thefe into a rich deep foil in a genial fituation, letting them remain in this nurfery until they begin to bear. With the feeds of the faireft, richeft, and beft flavoured fruit repeat this procels; and at the fame time, or in due feafon, engraft the wood which prodaced this fruit on that of the richeft, fweeteft, beft-flavoured apple : repeating this operation, and transferring the fubject under improvement from one tree and fort to another, as richnefs, flavour, or firmnefs may require ; continuing this donble mode of improvement until the defired fruit be obtained.: Therelas, no dortb, been a period when the improvement of the apple and pear was atrended to in this country; and thould not the fame fpirit of improvement revive, it is probable that the country will, in a courfe of years, be left dettitute of valuable kinds of thefe two fpecies of frnit'; which, thongh they may in fome degree be deemed objects of luxury, long cuftom feemsto have ranked among the neccfliaries of life."

In the forrth volume of Bath Papers, Mr Grimwood Mr Grime fuppofes the degeneracy of apples to be rather imagi- wood's opinary than real. He fays, that the evil complained of nion of the " is not a real decline in the quality of the fruit, but in degeneracy the tree; owing either to want of health, the feafon, of apples. foil, mode of planting, or the fock they are grafted on being too often raifed from the feed of apples in the fame placeor county.-I have not a do ibt in my own mind, but that the trees. which are graftedon the ftocks raifed from the apple-pips are more tender than thofe grafted on the real crab-ftock; and the feafonsin this country have, for many years paft, been unfavourable for fruits, which add much to the fuppofed degeneracy of the apple. It is my opiaion, that if planters of orchards would procure the trees grafted on real crabftocks.from a diftant comery, they would find their account in fo doing mach overbalance the extra cxpence of charge and carriage.
145.

In the fame volume, Mr Edmund Gillingwater af-MrGillingfigns as a reafon for the degeneracy of apples the water's opimixture of various farina, from the orchards being nion. too near each other. In co fequence of this notion, be alfo thinks that the old and beft kinds of apple-trees are not loft, but only corrupted from being

Cultivation of fruit.
planted too near bad neighbours: "Remove them (fays he) to a fituation where they are not expofed to this inconvenience, and they willimnediately recovertheir former excellency." This theory, however, is not fupported by a fingle experiment.

In this volume alfo Mr Richard Sammel expreffes his 146 Mr Samu el's opinion of the nethod of recovering the beft fruts. concern at the " prefent neglect of orchards, where the old trees are decaying, without proper provifon being made for the fucceeding age; for if a farmer plants frefh trees (which does not frequently happen), there is feldom any care taken to propagate the beter forts, as his grafts are ufually taken promifcuonfly from any ordinary kind mont eally procured in the neighbourhood." His remedy is to collect grafts from the beft trees; by which means he fuppofes that the fuperior kinds of fruit would foon be recovered. To a care of this kind he attributes the fuperiority of the fruit in the neighbourhood of great towns to that in other places.

With regard to the method of cultivating fruittrees, it is only neceffary to add, that while they remain in the nurfery, the intervals betwixt them may be occupied by fuch kitchen ftuft as will not crowd or oyerfiadow the plants; keeping the rows in the mean time perfectly free from weeds. In pruning them, the leader hould be particularly attended to. If it hoot double, the weaker of the contending branches fhould be taken off; but if the leader be loft. and not eafily recoverable, the plant hould be cut down to within a hand's breadth of the foil, and a frefh ftem trained. The undermof boughs fhould be taken off by degrees, going over the plants every winter ; but taking care to preferveheads of fufficient magnitude not to draw the ftems up too tall, which would make them fteble in the lower part. The ftems in Herefordfhire are trained to fix feet high; but our author prefers feven, or even lulf a rod in height. A tall ftemmed tree is much lefs injurions to what grows below it than a dow headed one, which is itfelf in danger of being hurt, at the fametime that it hurts the crop under it. The thicknefs of the ftem ought to be in proportion to its height; for which reafon a tall fock ought to remain longer in the nurfery than a low one. The ufualfize at which they are planted out in Herefordfhire is from four to fix inches girt ar three feet high; which fize, with proper management, they will reach in feven or eight years. The price of thefe ftocks in Hereford. fhire is 18 d . each. Our author met with one inftance of crabtocks being gathered in the woods with a good

In Herefordnire it is common to have the ground of the orchards in tillage, and in Gloucefterfire in grafs ; which Mr Mardhall fuppofes to be owing to the difference betwixt the foil of the two counties; that of Herefordhire being generally arable, and Gloucefter grafs land. Trees, hewever, are very deftructive nod only to a crop of corn, but to clover and turnips; though tullage is fawourable to fruit-trees in general, efpecially when young. In grafs grounds their progrefs is comparatively flow, for want of the earth being fitred abourthem, and by being injured by the cattle, efpecially when low-headed and drooping. After they begin to bear, cattle ought by all means to be kept away from them, as they not only deftroy all the fruis within their reach, but the fruit itfelf is dangerous to the cattle, being apt to ftick in their throats and choak
them. Thefe inconveniences may, be avoided, by eating the fruit grounds bare before the gathering feafon, and keeping the boughs out of the way of the cattle : but Mr Marflall is of opinion, that it is wrong to plant orchards in grafs land. "Let them (fays he) lay their oldorchards to grafs; and if they plant, break up their young orchards io arable. This will be changing the courfe of hufbandry, and be at once beneficial to the land and the trees.

Our author complains very much of the indolent Indolence and carelefs method in which the Herefordmire and of the farGloucenterhire farmers menage their orchards. The natural enemies of fruit-trees (fays he) are, r. A re dundancy of wood. 2. The milletoc. 3. Mofs. of 4. Spring frofts. 5. Blights. 6. Infeets. 7. An excefs of fruit. 8. Old age.

Cultiva-
tion of fruit.

1. A redundancy of wood is prejudicial, by reafon of Excefs of the barren branches depriving thofe which bear fruir wood how of the nourifhment which ought to belong to them. ${ }^{\text {remedied. }}$ $\Lambda$ multitude of branches alfo give the winds fuch an additional power over the tree, that it is in perpetual danger of being overthrown by them: trees are likewife thus injured by the damps and want of circulation of air, fo that only the outer branches are capable of bringing fruit to maturity. "It is no uncommon fight (fays he) to fee trees in this diftrict, with two or three tires of bouglis preffing down hard upon one another, with their twigs fo intimately interwoven, that even when the leaves are off, a fmall bird can fcarcely creep in among them.
2. The milletoe in this country is a great enemy to Minetoe the apple-tree. It is eafily pulled out with hooks in how defrofty weather, when, being brittle, it readily breaks flroyed, off from the branches. It likewife may be applied to a profitable purpofe, theep being as fond of it as of ivy. in clearing the trees of it; and in Kent there are people who make it their profeflion to do \{o.
3. Spring-frofts, efpecially when they fuddenly fuc- 153 ceed rain, are great enemies to fruit-trecs; dry frofts frofts. only keep back the bloffoms for fome time. Art can give no farther affiftance in this cafe than to keep the trees in a healthy and vigorous fate, fo as to enable them to throw out a ftrength of bad and bloffom; and by keeping them thin of wood, to give them an opportunity of drying quichly before the froft fet in.
4. Blight is a term, as applied to fruit trees, which Blighte 154 Mr Mardhall thinks is not underftood. Two bearing uncertain years, he remarks, feldom come together: and he is of term. opinion, that it is the mere exhanfing of the treesby the quantity of fruit which they have carried one year, that prevents them from bearing any the next. The only thing therefore that can be done in this cafe is, to keep the trees in as healthy and vigorous a ftate as poffible.
5. Infects deftroy not only the bloffoms and leaves, Method but fome of them alfo the fruit, efpecially pears. In propofed of the year 1783 much fruit was deftroyed by wafps. deftroying Mr Marhall advifes to fet a price upon the female wafps. wafps in the fpring ; by which thefe mifchievous infects would perhaps be exterminated, or at leaft greatly leffened.
6. An excefs of fruit ftints the growth of young or 156 trees, and renders all ing general barren for two or three cefs of years ; while in many cafes the branches are broken fruit.

Timber- off by the weight of the fruit; and in one cafe Mr trees.

157
Daration of fruit-trees may be lengthened Marfhall mentions, that an entire tree had funk under its burthen. To prevent as much as poffible the bad effects of an excefs of fruit, Mr Marfhall recommends "s to graft in the booghs," and when fully grown, to thin the bearing branches; thus endeavouring like the gardener, to grow fruit every year."
8. Though it is impoffible to prevent the effeets of old age, yet by proper management the natural life of fruit trees may be confiderably protracted. The moft eligible method is to graft ftocks of the native crab in the boughs. The decline of the tree is preceded by a gradual decline of fruitfulnefs, which long takes place before the tree manifefts any lign of decay. During this decline of fruitfulnefs, there is a certain period when the produce of a tree will no longer pay for the ground it occupies, and beyond this period it ought by no means to be allowed to ftand. In the Vale of Gloucefter, however, our author faw an inftance of fome healthy bearing apple-trees, which then had the fecond tops to the fame ftems. The former tops having been worn out, were cut off, and the ftumps fawgrafted. Our author obferves, that the pear-tree is much longer lived than the apple, and onght never to

358
Mr Marfall's obfervation on the cultureof tim her-trecs. be planted in the fame ground. He concludes with the following general obfervation: "Thus conlidering fruit-trees as a crop in hufbandry, the general management appears to be this: Plant upon a recently broken-up worn out fward. Keep the foil under a ftate of arable management, until the trees be well grown: then lay it down to grafs, and let it remain in fward until the trees be removed, and their roots be decayed; when it will again require a courfe of arable management."

## Sect. VIII. Of Timber-Trees.

The importance and value of there is fo well known, that it is fuperfltous to fay any thing on that fubject at prefent : notwithftanding this acknowledged value, however, the growth of timber is fo llow, and the returns for planting fo diftant, that it is generally fuppofed for a long time to be a pofitive lofs, or at leaft to be attended with no profit. This matter, however, when properly confidered, will appear in another light. There are four diftinet fpecies of woodlands : viz. woods, timber-groves, coppices, and woody waftes. The woods are a collection of timber-trees and underwood; the timber-groves contain timber-trees without any underwood; and the coppices are collections of underwood alone. All thefe turn out to advantage fooner or latter, according to the quick or flow growth of the trees, and the fituation of the place with refpect to certain local advantages. Thus in fome places underwood is of great confequence, as for rails, hoops, ftakes, fuel, \&c. and by reafon of the quicknefs of its growth it may be accounted the moft profitable of all
plantations. An ofier-bed will yield a return of profit in the fecond or third year, and a coppice in 15 or 20 years; while a plantation of oaks will not arrive at perfection in lefs than a century. This laft period is fo long, that it may not unreafonably be fuppofed likely to deter people for making fuch plantations of this kind, as few are willing to take any trouble for what they are never to fee in perfection. It mult be Vol. VIII.
remembered, however, that though the trees themfelves do not come to perfection in a fhorter time, the value of the ground will always increafe in proportion to their age. Thus, fays one author upon this fubject, "we have fome knowledge of a gentleman now living, who during bis lifctime has made plantations tages of which in all probability will be worth to his fon as much as his whole eftate, handfome as it is. Suppofing that thofe plantations have been made 50 or 60 years, and that in the courfe of 20 or 30 more they will be worth L. 50,000 ; may we not fay, that at prefent they are worth fome 20,0001 . or 30,0001 ? Mr Pavier, in the 4th volume of Bath Papers, computes the value of 50 acres of oak timber in roojears to be L. 12,100, which is near 50 s . annually per acre; and if we conGider that this is continually accumulating without any of that expence or rifk to which annual crops are fubject, it is probable that timber-planting may be ac* counted one of the moft profitable articles in hufbandry. Evelyn calculates the profit of 1000 acres of oakland in 150 years, at no lefs than L. 670,000; bat this is moft probably an exaggeration. At any rate, however, it would be improper to occupy, efpecially with timber of fuch flow growth, the gronnds which either in grafs or corn can repay the trouble of cultivation with a good annual crop.

162
In the 4th volume of the Bath Papers, Mr Wag- planting ftaffe recommends planting as an auxiliaryto cultiva-meliorates tion. He brings an inftance of the fuccefs of Sir Wil- the foil. liam Jerringharn, who made trial of "the mot unpromifing ground perhaps that any fuccefsful planter has hitherto attempted." His method was to plant beechtrees at proper diftances among Scotch firs, upon otherwife barren heaths. "Thefe trees (fays MrWagftaffe), in a foil perhaps without clay or loam, with the heathy fod trenched into its troken ftrata of fand or gravel, under the protection of the firs, have laid hold, though lowly, of the foil ; and accelerated by the fuperior growth of the firs, have proportionally rifen, until they wanted an enlargement of fpace for growth when the firs were cut down." He next proceeds to obferve, that when the firs are felled, their roots decay in the ground; and thus furnifh by that decay a new fupport to the foil on which the beeches grow: by which means the latter receive an additional vigour, as well as an enlargenent of face and freer air; the firs themfelves, thongh cut down before they arrived at their full growth, being alfo applicable to many valuable purpofes.
In the 6th volume of the Anmals of Agriculture, we find the culture of trees recommended by Mr Harries: and he informs us, that the larch is the quickeft grower and the moft valuable of all the retinous timbertrees; but unlefs there be pretty good room allowed for the branches to ftretch out on the lower part of the trunk, it will not arrive at any confiderable fize ; and this obfervation, he fays, holds good of all pyramidal trees. Scotch firs may be planted between them, and pulled out after they begin to obftruct the growth of the larch. Some of thefe larches he had feen plant. ed about 30 years before, which at five feet diftance from the ground meafured from four feet to five feet fix inches in circumference. The mot barren grounds, he fays, would anfwer for thefe trees, but better foil is required for the oaks. In this paper he takes no5 D
tice
163. Culture of timbertrees re-commended by Mr Harries.

[^64]

Timber- tice of the leaves of one of his plantations of oaks ha trees. ving been almont entirely deftroyed by infects; in conIncreafe of ufual : but another which had nearly efcaped thefe ra. oak-trees. vages, increafedat an average one inch in circumference. "A tree four feet round (fays he), that has timber 20 feet in length, gains by this growth a folid foot of timber annually, worth one fhilling at leaft, and pays 5 per cent. for ftanding. It increafes more as the tree gets from five to fix feet round. 1 have a reafonable hope to infer from my inquiry, that I have in my groves 3000 oaks that pay me one hilling each per annum, or L. 150 a year. My poplars inave gained in circumference near two inches, and a Worcefter and witch elm as much. I have lately been informed, that the fmooth cut of a holy-tree, that meafures 20 inches and upwards round, is worth to the cabinet165
mereafe of The following table fhows the increafe of trees in trees inthe 21 years from their firft planting. It was taken from Marquis of Lanfdowne's plantation. the marquis of Lanfdowne's plantation begun in the year 1765, and the calculation made on the 15 th of July 1786 . It is about fix acres in extent, the foil parly a fwampy meadow upon a gravelly bottom. The meafures were taken at five feet above the furface of the ground ; the fmall firs having been occafionally drawn for pofts and rails, as well as rafters for cottages; and when peeled of the bark, will ftand well for feven years.

|  |  | Height in <br> Feet. | Circumference <br> in Feet. |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Lombh. |  |  |  |

From this table it appears, that planting of timbertrees, where the return can be waited for during the fpace of 20 years, will undoubtedly repay the original profits of planting, as well as the intereft of the money laid out ; which is the better worth the attention of a proprietor of land, that the ground on which they grow may be fuppofed good for very little elfe. From a comparative table of the growth of oak, ath, and elm timber, given in the itth volume of the Annals of Agriculture, it appears that the oak is by much the noweft grower of the three.

With refpect to the growth of under-wood, which
in fome cafes is very valuable, it is to be remarked, that in order to have an annual fall of it, the whole quantity of ground, whatever its extent may be, ought to be divided into annual fowings. The exact number of fowings muft be regulated by the ufes to which it is intended to be put. Thus if, as in Surrey, ftakes, elders, and hoops are faleable, there ought to be tight or ten annual fowings ; or if, as in Kent, hoppoles are demanded, 14 or 15 will be required; and
if, as in Yorknire, rails be wanted, or, as in Gloucefterfhire, cordwood be moft marketable, 18 or 20
fowings will be neceffary to produce a fucceffion of Timber. annual falls. Thus the bufinefs by being divided, trees, will be rendered lefs burthenfome: a certain proportion being every year to be done, a regular fet of hands will, in properfeafon, be employed; and bybeginning upon a fmall fale, the errors of the firlt year will be corrected in the practice of the fecond, and thofe of the fecond in that of the third. The produce of the intervals will fall into regular courfe ; and when the whole is completed, the falls will follow each other in regular fucceffion. The greateft objection to this method of fowing woodlands is the extraordinary trouble in fencing; but this objection does not hold if the fowings lie at a diftance from one another ; on the contrary, if they lie together, or in plots, the entire plot may be inclofed at once; and if it contain a num. ber of fowings, fome fubdivifions will be neceffary, and the annual fowings of thefe fubdivifions may be fenced off with hurdles, or fome other temporary contrivance; but if the adjoining land be kept under the plough, little temporary fencing will be neceffary. It muft be obferved, however, that in raifing a woodland from feeds, it is not only neceffary to defend the young. plants againft cattle and heep, but againft hares and rabbits alfo: fo that a clofe fence of fome kind is abfolutely neceffary. See the articles Fence and Hedge.

With regard to the preparation of the ground for raifing timber, it may be obferved, that if the foilbe of a ftiff clayey nature, it flould receive a whole year's fallow as for wheat; if light, a crop of turnips may be taken; but at all events it muft be made perfectly clean before the tree feeds be fown, particularly from perennial root weeds; as, after the feeds are fown, the opportunity of performing this neceffary bufinefs is in a great meafure loft. If the fituation be moift, the forl fhould be gathered into wide lands, fufficiently round to let the water run off from the furface, but not high. The time of fowing is either the month of October or March; and the method as follows: "The Methed of land being in fine order, and the feafon favourable, the fowing, whole fhould be fown with corn, or pulfe adapted to the feafon of fowing: if in autumn, wheat or rye may be the crop; but if in fpring, beans or oats.Which ever of thefethree fpecies be adopred, thequantity of Yeed ought to be lefs than ufual, in order to give a free admiffion of air, and prevent the crop from lodging. The fowing of the grain being completed, that of the tree-feeds malt be immediately fet about. Thefe are to be put in drills acrofs the land $=$ acorn and nuts hou'd be dibbled in, but keys and berries fcattered intrenches or drills drawn with the corner of a hoe, in the manner that gardeners fow their peafe. The diftance might be the quarter of a ftatute rod, or four feet and one inch and an half. A land chain fould be ufed in fetting out the drills, as not being liable to be lengthened or flortened by the weather. It is readily divided into rods: and the quarters may be eafily marked.

The fpecies of under-wood to be fown munt be determined by the confumpt of it in the neighbourhood of the plantation. Thus, if ftakes, hoops, \&c. be in requef, the oak, hazel, and afh, are efteemed as under-wood. Where charcoal is wanted for iron forges, beech is the prevailing underwood. The oak,

Timber. box, beech, \&c, are all in requcftin different countries, trees. and the choice mult be determined by the prevailing demand. As the keys of the afl fometimes lie two or even three years in the ground, it will be proper to have the places where they are fown diftinguifhed by fome particular marks, to prevent them from being difturbed by the plough after harvent as a few beans fcattered along with them, if the crop be oats; or oats, if the crop be beans. The crop thould be reaped, not mown, at harveft time, and be carried off as faft as porfible. Between harveft and winter, a pair of furrows fhould be laid back to back in the middle of each interval, for meliorating the next year's crop, and laying the feedling plants dry; while the ftabble of the unploughed ground on each fide of the drills will keep them warm during the winter. The next year's crop may be potatoes, cabbages, turnips, or if the firft was corn, this may be beans; if the firf was beans, this nay be wheat drilled. In the fpring of the third year the drills which rofe the firft year muft be looked over, and the vacancies filled up from thofe parts which are thickeft; but the drills of the afh fhould be let alone till the fourth year. The whole fhould afterwards be looked over from time to time; and this, with cultivating the intervals, and keeping the drills free from weeds, will be all that is neceffary until the tops of the plants begin to interfere.

The crops may be continued for feveral years; and if they only pay for the expences, they will fill be of confiderable advantage by keeping the ground firred, and preferving the plants from hares and rabbits. Even after the crops are difcontinued, the ground ought fill to be ftirred, alternately throwing the
mould to the roots of the plants, and gathering it into a ridge in the middle of the interval. The beft method of doing this is to fplic the ground at the approach of winter in order to throw it up to the trecs on both fides; this will preferve the roots from froft: gather it again in the fpring, which, will check the weeds, and give a frefli fupply of air : fplit again at mid-fummer, to preferve the plants from drought : gather, if neceffary, in autnmn, and fplit as before at the approach of winter. The fpring and mid-fummer ploughings fhould be continued as long as a plough can pafs between the plants.

Whenever the oaks intended for timber are in danger of being drawn up too flender for their height, it will be neceffary to cut off all the reft at the height of about an handbreadth above the groand; and thole defigned to fland muft now be planted at about two rods diftant from each other, and as nearly a quincunx as poffible. The fecond cutting muft be determined by the demand there is for the underwood; with only this provifo, that the timber ftands be not too much crowded by it: for rather than this fhould be the cafe, the coppice fhould be cut, though the wood may not have reached its moft profitable ftate. What is here faid of the method of rearing oak-trees in woods, is in a great meafure applicable to that of raifing other trees in timber-groves. The fpecies moft ufually raifed in thefe are the afh, elm, beech, larch, fpruce fir, Weymouth pine, poplar, willow, alder, chefnut, walnut, and cherry. The three laft are ufed as fubftitutes for the oak and beech, and thefe two for the mahogany.

Timber-
trees.

## Part III. Of the Cattile proper to be employed in Farm-Work; Rearing and Managing of them. Of Hogs, Poultry, \&c. Management of Bees. Of the Dairy. Of Manures.

## Sect. I. Of the Cattle proper to be employed.

As great part of the ftock of an hufbandman muft always confift of cattle, and one of his principal expences in the maintenance of them, this part of his bufinefs is certainly to be looked upon as one of the moft important of the whole. The cattle belonging to a farm may be divided into two claffes, viz. fuch as are intended for work, and fuch as are defigned for fale. The former are now principally horfes, the oxen formerly employed being fallen into difufe, thongh it does not yet certainly appear that the reafons for the exchange are fatisfactory. In the fecond volume of Bath Papers, we have an account of acomparative experiment of the utility of horfes and oxen in hufbandry by Mr Kedington near Bury in Suffolk, in whicir the preference is decifively given to oxen. He informs us, that at the time he began the experiment (in 1779 ), he was almoft certain that there was not an ox worked in the whole county; finding, however, the expence of horfes very great, he purchafed a fingle pair of oxen, but found much difficulty in breaking them, as the workmen were fo much prejudiced againft them, that they would not take the proper pains. At laft he met with a labourer who underteok the taik; and the
oxen "foon became as tractable and as handy, both at ploughing and carting, as any horfes." On this he determined to part with all his cart horfes; and by the time he wrote his letter, which was in 1781 , he had not a fingle horfe, nor any more than fix oxen; which inconfiderable number performed with eafe all the work of his farm (confifting of upwards of 100 acres of arable land and 60 of palture and wood), befides the ftatute duty on the highways, timber and corn, carting, harrowing, rolling, and every part of rural bufinefs. They are conftantly fhoed; their harnefs is the fame as that of horfes (excepting the neceffary alterations for difference of fize and hape) ; they are driven with bridles and bits in their mouths, anfwering to the fame words of the ploughman and carter as horfes will do. A fingle man holds the plough, and drives a pair of oxen with reins: and our author informs us, that they will plough an acre of ground in lefs than eight hours time; he is of opinion that they would do it in feven. The intervals of a fmall plantation, in which the trees are fet in rows ten feet afunder, are ploughed by a fingle ox with a light plough, and he is driven by the man who holds it. The oxen go in a cart either fingle, or one, two, or three, according to the load. Four oxen will draw 80 bufhels of barley or oats in a waggon with eafe; and if good

Cattletobe of this kind, will travel as faft as horfes with the fame employed. load. Onc ox will draw 40 buthels in a light cart,

169 Reafonsfor preferring oxen to horfes, lowing reafons.

1. They arekept at much lefs expence, never eating meal or corn of any kind. In winter they are fed with fraw, turnips, carrots, or cabbages ; or inftead of the three laft, they have each a peck of bran per day while kept conftantly at work. In the fpring they eat hay; and if working harder than ufual in feed-time, they have bran befides. When the vetches are fit for mowing, they get them only in the flable. After the day's work in fummer they have a fmall bundle of hay, and ftand in the ftable till they cool; after which they are turned into the pafture. Our author is of opinion, that an ox may be maintained in condition, for the fame conftant work as an horfe, for at leaft 41 . lefs annually.
2. After a horfe is feven years old, his value declines every year; and when lame, blind, or very old, he is fcarce worth any thing ; but an ox, in any of thefe fituations, may be fatted, and fold for even more than the firft purchafe ; and will always be fat fooner after work than before.
3. Oxen are lefs liable to difeafes than horfes.
4. Horfes are frequently liable to be fpoiled by fervants riding them without their matter's knowledge, which is not the cafe with oxen.
5. A general afe of oxen would make beef plentiful, and confequently allother meat; which would be
${ }^{17} 70$ Difficulty in fhocing exen. a national benefir.

Mr Kedington concludes his paper with acknowledging, that there is one inconvenience attending the ufe of oxen, viz. that it is difficult to thoe them; tho' even this, he thinks, is owing rather to the undkilfulnefs of the fmiths who have not been aecuttomed to thoe thefe animals, than to any real difficulty. He confines them in a pound while the operation is performing.

Mr Marfhall, in his Rural Economy of the Midland counties, fhows the advantage of employing oxen in preference to horfes from the mere article of expence, which, according to his calculation, is enormons on the part of the horfes. He begins with eftimating the mamber of fquare miles contained in the kingdom of England; and this he fuppofes to be 30,000 of cultivated ground. Suppoliag the work of huibandry to be done by horfes only, and each fquare mile to em ploy 20 horfes, which is about 3 to 100 acres, the whole number ufed throughout Britain would be 600,000 ; from which deducting one fixth for the number of oxen employed at prefent, the number of horfes juft now employed will be 500,000 . Admitting that each horfe works ten years, the number of farm-horfes which die annually are no fewer than 50,000 ; each of which requires full four years keep before be is fit for work. Horfes indeed are broke in at three, fome at two, years old, but they are, or ought to be, indulged in keep and work till they are fix; fo that the coft of rearing and keeping may be laid at full four ordinary years. For all this confumption of $v$ cgetable produce he returns not the community a fingle article of food, clothing, or commerce; even his ikin for economical purpofes being barely worth the taking off. By working hol fes in the affairs of bufbandry, therefore, "the commonity is lofing onnually the amount
of 200,000 years keep of a growing horfe;" which at Cattle to be the low entimate of five pounds a-year, amounts to a employed. million annually. On the contrary, fuppoling the bu- $\quad 172$ linefs of hulbandry to be done folely by cattle, and a million admitting that oxen may be fatted with the fame ex- annually penditure of vegetable produce as that which old horfes loft by require to fit them for full work, and that inftead of keeping 50,000 horfes dying, 50,000 oxen, of no more than horfes. 52 flone each, are annually flaughtered ; it is evident, that a quantity of beef nearly equal to what the city of London confumes would be annually brought inco the market ; or, in other words, 100;000 adaitional inhabitants might be fupplied with one pound of animal food a-day each ; and this without confuming one additional blade of grafs. "I am far from expecting (fays Mr Marfhall), that cattle will, in a hort fpace of time, become the univerfal beafts of draft in hufbandry; nor will I contend, that under the prefent circumftances of the ifland they ought in ftrict propriety to be ufed. But I know that cattle, under proper management, and kept to a proper age, are equal to every work of hufbandry, in moft if not all fituations: And I am certain, that a much greater proportion than there is at prefent might be worked with confiderable advantage, not to the community only, but to the owners and occupiers of lands. If only one of the 500,000 carcafes now loft annually to the community could be reclaimed, the faving would be an object."

In Norfolk our anthor informs us that horfes are the only beafts of labour ; and that there is not per. haps one ox worked throughout the whole county. It is the fame in the Vale of Gloucefter, though oxen are ufed in the adjoining counties. Formerly fome oxen were worked in it double; but they were found to poach the land teo mach, and were therefore given np. Even when worked lingle, the fame objection is made: bat, fays Mr Marfhall, "in this I fufpect there is a fpice of obftinacy in the old way; a want of a due portion of the fpirit of improvement; a kind of indolence. It might not perhaps be too fevere to fay of the Vale farmers, that they would rather be eaten up by their horfes than fep out of the beaten tract to avoid them." Shoeing oxell with whole fhoes, in our author's opinion, might remedy the evil complained of; bat "if not, let thofe (fays he) who are advocates for oxen calculate the comparative difference in wear and keep, and thofe who are their enemies eftimate the comparative mifchiefs of rading; and thus decide upon their value as beafts of labour in the Vale." In the Cotfwold oxen are worked as well as horfes; but Confold oxen are whed in the but the latter, our anthor fears, are fill in the pro- Cotfwold. portion of two to one : he has the fatisfaction to find, however, that the former are coming into more gencral ufe. They are worked in harnefs; the collar and harnefs being ufed as for horfes, not reverfed, as in moft cafes they are for oxen. "They appear (fays our author) to be perfectly handy, and work, cither at plough or cart, in a manner which thows, that although horfes may be in fome cafes convenient, and in moft cafes pleafurable to the driver, they are by no means neceffary to hufbandry. A convenience ufed in this country is a moveable harnefs-houfe, with a Rledge bottom, which is drawn from place to place as occafion may require. Thus no labour is loft eilher by the oxen or their drivers.

## 173

## No oxera

 ufed in Norfolk. 174Objection to them in the Vale of Gloucester.

Cattle tobe In Yorkfhire oxen are fill ufed, though in much employed. fewer numbers than formerly; but our author does not uility. The Yorkllire plough was formerly of fach ufe of oxen an unwieldy confrustion, that four or lix oxen, in is declining yokes, led by two horfes, were abfolately requifite to in York- draw it; but the improvements in the conftruction of hire. the plough have of late been fo great, that two horfes are found to be fufficient for the purpofe; fo that as Yorkfhire has all along been famous for irs breed of horfes, we are not to wonder at the prefent difufe of exen. Even in carriages they are now much difufed; but Mr Marfhall afligns as a reation for this, that the roads were formerly deep in winter, and foft to the hoof in fummer; but now they are univerfally a caufeway of hard limeftones, which hurt the feet of oxen even when hod. Thus it even appears matter of furprife to our author that fo many oxen are employed in this county; and the employment of them at all is to him a convincing argument of their utility as beafts of draught. The timber carriers fill continue to ufe them, even thongh their employment be folely upon the road. They find them not only able to fland working every day provided their feet do not fail them, but to bear long hours better than horfes going in the fame pafture. An ox in a good pafture foon fills his

178

## Superiority

 of oxen to horfes. belly, and lies down to reft; but an horie can fcarce fatisfy his hunger in a fhort fummer's night. Oxen are alfo confidered as much fuperior at a difficult pull to horfes; but this he is willing to fappofe arifes from their ufing half-bred hunters in York fhire, and not the true breed of cart-horfes. " But what (fays he) are thorough-bred cart-horfes? Why, a fpecies of itrong, heavy, fluggith animals, adapted folely to the purpore of draught; and according to the prefent law of the country, cannot, without an annual expence, which nobody beflows upon them, be ufed for any other purpofe. This fpecies of beafts of draught coft at tour years old from 201. to 301.; they will, with extravagant keep, extraordinary care and attendance, and much good luck, continue to labour eight or ten years; and may then genérally be fold for five fhitfings a-head. If we had no other fpecies of aninials adapted 10 the purpofes of draugbt in the ifland, carthorfes would be very valuable, they being mach fuperior to the breed of fadale-horfes for the purpofe of draught. But ir appears evident, that were only a fmall hare of the attention paid to the breeding of dranght oxen which is now beftowed ou the breedrag of cart-horfes, animals equally powerfal, more active, lefs coflly, equally adapted to the purpofes of huftandry if larnefled with equal jadgment, lefs expentive in kcep and attendance, much more darable, and infinitely more valuable after they have finifhed their labours, might be produced. A ftect, like a colt, ought to be familiarized to harnefs at two or three years old, but hould rever be fulyjected to hard labour until he be five years old; from which age, until he be 15 or perhaps 20, he may be confidered as in his prime as a beaft of draaght. An ox which I worked feveral years in Surrey, might at 17 or 18 years of age have challenged for ftrength, agility and fagacity, the beft bred cart-horie in the kingdom."Sect. II. Of different Kinds of Herfes; and the Methods of Breeding, Rearing, and Feeding them.
The midland counties of England have for fome time been cclebrated on account of their breed of the black cart-horfe; though Mr Marthall is of opinion that this kind are unprofitable as beafts of draught in hufbandry. The prefent improvement in the breed took its rife from fix Zealand mares fent over by the late Lord Chetterfield during his embafly at the Hague. Thefe mares being lodged at his lorddhip's feat at Betby in Derby hiire, the breed of horfes thus became improved in that county, and for fome time it took the lead for the fpecies of thefe animals. As the improved breed paifed into Leicefierfhire, however, through fome unknown circumfances, it became fill more improved, and Leicefter has for fome time taken the lead. It is now found, however, that the very large horfes formerly bred in this diftrict are much lefs 180 ufetul than fuch as are of a fmaller lize. Mr Marhall Horfee bedefcribesin magnificent termsone of thefelarge horfes, longing to a fallion belonging to Mr Bakewell named K ( A ), Mr wakewhich, he fays, was the handfomelt horfe he ever law. well defria "He was (fays he) the fancied war-horf: of the German painters; who, in the luxuriance of imagination, never perhaps excelled the natural grandeur of this hurfe. A man of moderate fize feemed to fhrink behind his fore end, which rofe fo perfectly upright, his ears ftood (as Mr Bakewell fays every horfe's ears ought to ftand) perpendicularly over his fore feet. It may be faid, with little latitude, that in grandeur and iymmetry of form, viewed as a picturable object, he exceeded as far the horfe which this fuperior breeder had the honour of ghowing to his Majefly, and which was afterwards fhown publicly at London, as that horfe does the meaneft of the breed." A more ufeful horfe, bred alfo by Mr Bakewell, however, is deffribed as having "a thick carcafe, his back fhort and ftraight, and his legs flort and clean : as frong as an ox, yet active as a poney ; equally fuitable for a cart or a light. cr carriage."

The ftallions in this county are bred either by farmers or by perfons whofe buinefs it is to breed them, and who therefore have the name of breeders. Thefe laft either cover with ihem themfelves, or let them our to uthers for the feafon, or fell them altugether to ftallion men who travel about with then to different $\mathbf{8 8}$ places. The prices given for them are from 50 to Prices of 200 guineas by purchafe; from 40 to 80 or a hun- fallions dred by the feafon; or from half a guinea to two guineas by the mare. The mares are moftly kept by the farmers, and are worked until near the times of toaling, and moderately afterwards while they fuckle : the beft time for foaling is fuppofed to be the mionth of March or April; and the time of weaning that of Novenber.-" The piice of foals (fays Mr Marhall), for the haften years, has heen from five to ten pounds or guineas ; for yearlings, 10 te 15 or 20 ; for two-yca'-olds, 15 to 25 or 30 ; for fix-year-olds, from 25 to 40 guineas." -Our author acknowledges that this Mr Mar breed of horfes, conlidered abfractedly in the light in thall's obwhich they appear here, is evidently a profitable fpecies of live ftock, and as far as there is a m rket for fix-years old horfes of this breed, it is profitable toagriculture.

Different kinds of horfes.
griculture. " But (fays he) viewing the bufinefs of agriculture in general, not one occupier in ten can partake of the profit; and being kept in agriculture after they have reached that profitable age, they become indifputably one of its heavieft burdens. For befides a ceffation of improvement of four or five guineas a year, a decline in value of as much yearly takes place. Even the brood-mares, after they have paffed that age, may, unlefs they be of a very fuperior qua-
x83 lity, he deemed unprofitable to the farner."
Our author complairs that the ancient breed of Norfolk horfes is almoft entirely worn out. They were fmall, brown muzzled, and light-boned; but they could endure very heavy work with li:tle food : two of them were found quite equal to the plough in the foil of that county, which is not deep. The prefent breed is produced by a crofs with the large one of Lincolnflire and Leicefterfhire already mentioned. He approves of the Suffolk breed, which (he fays) are a "half-horfe halt-hog race of animals, but better adapted to the Norfolk hulbandry than the Leicefterflire breed; their principal fault, in his opinion, is a flatnefs of the rib.-In the Vale of Gloucefter moft farmers rear their own plough-horfes, breeding of horfes not being.practifed. They are of a very ufeful kind, the colour moftly black, inclinable to tan colour, fhort and thick in the barrel, and low on their legs. The price of a fix-year-old horfe from 251. to 351. Some cart-horfes are bred in Cotiwold hills; the mares are worked till the time of foaling, but not while they fuckle; and the foals are weaned early, while there is plenty of grain upon the ground.

Yorkihire,which hasbeenlong celebratedforitsbreed of horfes, fill flands foremoft in that refpect among
the Englifh counties. It is principally remarkable for the breed of faddle-horfes, which cannot be reared in Norfolk, though many attempts have been made for that purpofe. Yorkfhire ftallions are frequently fent into Norfolk; but though the foals may be handfome when young, they lofe their beauty when old. In Yorkfhire, on the other hand, though the foal be ever fo unpromifing, it acquires beauty, frength, and activity as it grows up. Mr Marlhall fuppofes that from five to ten thoufand horfes are annually bred up between the eaftern Morelands and the Humber.
"Thirty years ago (fays Mr Marfhall), flrong faddle-horfes, fit for the road only, were bred in the Vale ; but now the prevailing breed is the falhionable coach-horfe, or a tall, ftrong, and over-fized hunter; and the fhows of ftallions in 1787 were flat and fpiritlefs in comparifon with thofe of 1783 ." The bláck cart-horfe, an object of Mr Marfhall's peculiar averfion, is alfo coming into the Vale.

In the breeding of horfes he complains greatly of the negligence of the Yorkfhire people, the mares being almoft totally neglected; though in the brute creation almoft every thing depends upon the female.

With regard to the general maintenance of horfes, we have already mentioned in this article, and that of Acriculture, feveral kinds of food upon which experiments have been made with a view to determine the moft profitable mode of keeping them. Perhaps, however, the moft certain method of afcertaining this matter is by obferving the practice of thofe counties where horfes are moft in ufe. Mr Marfhall, recommends
the Norfolk management of horfes as the cheapeft me- Different thod of feeding them practifed any where; which, kinds of however, he feems willing to afcribe in a great mea. horfes. fure to the excellency of their breed. In the wiater 186 months, when little work is to be done, their only Norfolk rack-meat is barley-ftraw : a referve of clover-hay be- manageing ufually made againft the hurry of feed-time. A ment of bufhel of corn in the moft bufy feafon is computed to horfes rebe an ample allowance for each horfe, and in more co Icifure times a much lefs quantity fuffices. Oats and fometimes barley, when the latter is cheap and unfaleable, are given ; but in this cafe the barley is generally malted, i.e. fteeped and afterwards fpread abroad for a few days, until it begin to vegetate, at which time it is given to the horfes, when it is fuppofed to be lefs heating than in its natural ftate. Chaff is univerfally mixed with horfe-corn : the grear quantities of corn grown in this country afford in general a fufficiency of notural chaff; fo that cut chaff is not much in ufe: the chaff, or rather the awns of barley, which in fome places are thrown as ufelefs to the dunghill, are here in good efteem as provender. Oat-chaff is defervedly $\quad$ I8y confidered as being of much inferior quality.-It may 'This me* here be remarked, that this method of keeping horfes thod folwhich Mr Marfhall approves of in the Norfolk far-lowed in mers, is practifed, and probably has been fo from time many plaimmemorial, in many places of the north of Scotland; ces in and is found abundantly fufficient to enable them to go through the labour required. In fummer they are in Norfolk kept out all night, generally in clover leys, and in fummer their keep is generally clover only, a few tares excepted.

In the fourth volume of the A nmals of Agriculture, 188 Mr Young gives an account of the expence of keep- tions of the ing horfes; which, notwithftanding the vaft numbers expence of kept in the ifland, feems fill to be very indeterminate, keeping as the informations he received varied no lefs than from horfes. L. 8 to L. 25 a-year. From accounts kept on his own farm of the expence of horfes kept for no other purpofe than that of agriculture, he ftated them as follows;

Average on the whole L. II: 12:3.
By accounts received from Northinimis in Herefordfhire, the expences ftood as follows:

Average L. 16: 13 : 1.
On thefe difcordant accounts Mr Young obferves, undoubtedly with juftice, that many of the extra expences depend on the extravagance of the fervants ; while fome of the apparent favings depend either on their careleffnefs, or flealing provender to their beafts

Rearing
black cattle.
privately, which will frequently be done. He concludes, however, as follows: "The more exactly the expence of horfes is examined into, the more advantageous will the ufe of oxen be found. Every day's experience convinces me more and more of this. If horfes kept for ufe alone, and not for flow, have proved thus expenfive to me, what mult be the expence to thofe farmers who make their fat fleek teams an object of vanity? It is eafier conccived than calculated.

## $\mathrm{S}_{\mathrm{Ect}}$. III. Of the Broeding and Rearing of Black Cattle.

These are reared for two different purpofes, viz. work, and fattening for flaughter. For the former purpofe, Mr Marfhall remarks, that it is obvioufly neceffary to procure a breed without horns. This he thinks would be no difadvantage, as horn, though formerly an article of fome requeft, is now of very litrle value. The horns are quite ufelefs to cattle in their domeftic fate, though nature has beftowed them upon them as weapons of defence in their wild fate; and our author is of opinion that it would be quite practicable to produce a hornlefs breed of black cattle as well as of fheep, which laft has been done by aitention and perfeverance; and there are now many hornlefs breeds of thefe creatures in Britain. Nay, he infifts, that there are already three or four breeds of hornlefs cattle in the illand; or that there are many kinds of which numbers of individuals are hornlets, and from thefe by proper care and attention a breed might be formed. The firft itep is to felect females; and havingobferved theirimperfections, to endeavour to correct them by a well chofen male.

The other properties of a perfect breed of black cattle for the purpofes of the diary as well as others, ought, according to Mr Marlhall, to be as follows. r. The head fmall and clean, to leffen the quantity of off.1. 2. The neck thin and clean, to lighten the foreoff.1. 2. The neck thin and clean, to lightenthe fore-
end, as well as to leflen the collar, and make it fit clofe and eafy to the animal in work. 3. The carclofe and eafy to the animal in work. 3 . The car-
cafe large, the cheft deep, and the bofom broad, with the ribs ftanding out full from the fpine; to give ftrength of frame and conftitution, and to admit of
the inteftines being lodged within the ribs. 4 The ftrength of frame and conftitution, and to admit of
the inteftines being lodged within the ribs. 4 The fhoulders fhould be light of bone, and rounded off at thoulders hould be light of bone, and rounded off at
the lower point, that the collar may be eafy, but broad to give ftrength : and well covered with flefh for the greater eafe of draught, as well as to furnifh a defired point in fattening cattle. 5. The back ought to be wide and level throughout: the quarters long; the thighs thin, and flanding narrow at the round bone; the udder large when full, but thin and loofe when empty, to hold the greater quantity of milk; with large dug-veins to fill it, and long elaftic teats for drawing it off with greater eafe. 6. The legs (below the knee and hock) ftraight and of a middle length; their bone, in general, light and clean from flefhinefs, but with the joints and linews of a moderate fize, for the purpofes of ftrength and activity. 7. The flefh ought to be mellow in the fate of flethinefs, and firm in the ftate of fatnefs. 8. The hide mellow, and of a middle thicknefs; though in our author's opinion this is a point not yet well determined.

As the milk of cows is always an article of great importance, it becomes an object to the hulbandman, if polifle, to prevent the wafte of that ufeful fluid, which in the common way of rearing calves is unavoidable. A method of bringing up thefe young animals at lefs expence is propofed by the Duke of Northumberland. His plan is to make fkimmed milk anfwer the purpofe withou of that which is newly drawn from the teat ; and mill. which, he fuppofes, might anfwer the purpofe at one Annals of third of the expence of new milk. The articles to be Agriculture, added to the fkinmed milk are treacle and the com- vol. i. mon linfeed oil cake ground very fine, and almoft to ${ }^{\text {p. 296, }}$ an impalpable powder, the quantities of each being fo fimall, that to make 32 gallons would coft only 6 d . befides the fimmed milk. It mixes very readily and almolt intimately with the milk, naking it more rich and mucilaginous, without giving it any difagreeable tafte. The receipt for making it is as follows. Take one gallon of ikimmed milk, and to about a pint of it add half an ounce of treacle, ftirring it until it is well mixed; then take one ounce of linfeed vil-cake finely pulverifed, and with the hand let it fall gradually in very fmall quantities into the milk, firring it in the mean lime with a fpoon or ladle until it be thoroughly incorporated; then let the mixture be put into the other part of the milk, and the whole be made nearly as warm as new milk when it is firft taken from the cow, and in that fate it is fit for ufe. The quantity of the oil-cake powder may be increafed from time to time as occafion requires, and as the calf becomes inured to its flavour. On this fubject Mr Young remarks, that jn rearing calves, there are two Mr You objects of great importance. I. To bring them up experiwithout any milk at all; and, 2. To make fkimmed ments. milk anfwer the purpofe of fuch as is newly milked or fucked from the cow. In confequence of premiums offered by the London Society, many attempts have been made to accomplifh thefe defirable purpofes; and Mr Budel of Wanborough in Surry was rewarded for an account of his method. This was no other than to give the creatures a grut made of ground barley and oars. Mr Young, however, who tried this method with two calves, affures us that both of them died; though he afterwards put them upon milk when they were found not to thrive. When in Ireland he had an opportunity of purchafing calves at three days old from 20d. to 3 s. cach; by which he was indaced to repeat the experiment many times over. This he did in different ways, having collected various receipts. In confequence of thefe he tried hay-tea, bean-meal mixed with wheat-flour, barley and oats groand nearly, but not exactly in MrBudd's method; but the principal one was flax-feed boiled into a jelly, and mixed with warm water ; this being recommended more than all the reft. The refult of all thefe trials was, that out of 30 calves orly three or four were reared; thefe few were brought up uith barley and oatmeal, and a very fma!l quantity of hax-feed jelly; one only excepted, which at the defire of his coachman was brought up on a mixture of two-thirds of kimmed milk and one third of water, with a fmall addition of flax jelly well diflolved.

The fecond object, viz. that of inproving fimmed milk, according to the plan of the Duke of Northumberland, feems to be the more practicable of the two

Rearing black cattle.
19 r Of rearing calves re,
$\qquad$

A hornlefs breed defirable for work.

Nearing Mr Young inforins us, that it has anfwered well with black him for two feafons; and two farmers to whom he cattle. communicated it gave like wife a favourable report.

Method of formed that the Cornwall farmers ufe the following rearing method in rearing their calves. "They are taken calves in from the cow from the fourth to the fixth day; after Cornwall.
which they have raw milk from fix to ten or 14 days.

After this they feed them with fcalded fkimmed milk and gruel made of fhelled oats, from three quarts to four being given in the morning, and the fame in the evening. The common family broth is thought to be as good or better than the gruel, the favour of the falt being fuppofed to ftreng then their bowels. The proportion of gruel or broth is about one third of the milk given them. A little fine hay is fet before them, which they foon begin to eat.
194 MrCrook's method.

In the fifth volume of Bath Papers, we have an account by Mr Crook of a remarkably tuccefsful experiment on rearing calves without any milk at all This gentleman, in 1787, weaned 17 calves; in 1788, 23; and in 1789, 15 . In 1787, he bought three facks of linfeed, value L. 2, 5 s. which lafted the whole three years. One quart of it was put to fix quarts of water ; which, by boiling 10 minutes, was reduced to a jelly: the calves were fed with this mixed with a fimall quantity of tea, made by fleeping the beft hay in boiling water. By the ufe of this food three times a day, he fays that his calves throve better than thofe of his neighbours which were reared with milk.-Thefe unnatural kinds of food, however, are in many cafes apt to produce a loofenefs, which in the end proves fatal to the calves. In Cornwall they remedy this fometimes by giving acorns as an aftringent ; fometimes by a cordial ufed for the human feecies, of which opium is the

In Norfolk, the calves are reared with milk and turnips; fometimes with oats and bran mixed among the latter. Winter calves are allowed more milk than fummer ones; but they are univerfally allowed new milk, or even to fuck.-In the middle counties bullcalves are allowed to remain at the teat until they be fix, nine, or twelve months old, letting them run either with their dams or with cows of lefs value bought on purpofe. Each cow is generally allowed one male or two female calves. Thus they grow very faft and become farprifingly vigorons. The method of the dairy-men is to let the calves fuck for a week or a fortnight according to their trength ; next they have new milk in pails for a few meals; after that new and fkimmed milk mixed; then fkinmed niilk alone, or porridge made with milk, water, ground oats, \&c. fometimes with oil cake, \&c. until cheefe-making commences; after which they have whey-porridge, or fweet whey in the field, being carefully boufed in the night until the warm weather come in.

With regard to the method of fattening cattle tarnips are coming into general ufe throughout Britain. In Norfolk no other method is thought of. The general rule is, to allow them to eat their turnips in the field while the weather remains moderately warm, but to give them under cover when it becomes wet or very cold. In this refpect, however, there is a confiderable difference with regard to the manner in which the catthe have been brought up; for fuch as have been ac-
cuftomed to a fevere climate will ftand the winter in Rearing the field much better than thofe which have been and fattenbrought up under fhelter. It is likewife afferted by ing hoga. fome, with a great deal of probability, that the fiefh of cattle fatted under cover is lefs agreeable than that of fuch as are allowed to remain in the open air.

## Sect.IV. Of the Rcaring and Fattening of Hogs.

The practice ofkeepingthefe animals is fogeneral, efpecially in England, that one Chould think the profit attending it would be abfolutely indifpatable; and this the more efpecially when it is confticered how litte nicety they have in their choice of food. From fuch experiments, however, as have been made, the matter appears to be at leaft very doubtful, unlefs in particular circomitances. In the firft volume of Annals of Agriculture, we have an experiment by Mr Mure of feeding hogs with the clufter-potato and carrots ; by which it appeared, that the profit on large hogs was much greater than on fmall ones; the latter eating almof as much as the former, without yielding a proportionable increafe of flefh. The gain was counted by weighing the large and fmall ones alive; and it was found, that from November ioth to January 5th, they had gained in the following proportion :

On being finifhed with peafe, however, it appeared, that there was not any real profit at laft ; for the accounts flood ultimately as follow :

In fome experiments by Mr Young, related in the fame volume, he fucceeded fill worfe, not being able to clear his expences. His firft experiment was attended with a lufs of one guinea per hog; the fecond, with a lofs of ins. 8d; the third, of only $\mathrm{z}_{\mathrm{s}}$. In thefe three the hogs were fed with peafe; given whole in the two firt, but ground into meal in the laft. The fourth experiment, in which the hog was fed with Jerufaiem artichokes, was attended with no lofs; bur another, in which peafe were again tried, was attended with a lofs of 45 . Other experiments were tried. with peafe, which turning out like wife unfavourable, barley was tried ground along with peafe and beans. This was attended with a fmall profis, counting nothing for the trouble of feeding the animals. The expences on two hogs were L. 14: 13: $1 \mathrm{r}^{2}$, the value L. 15,

Sheep, \&o. ris. $3 \frac{7}{2} \mathrm{~d}$. Jo that therc was a balance in his favour of 175. $4 \frac{1}{2} \mathrm{~d}$. In another experiment, in which the hogs were fed with peafe and barley ground, the beans being omitted as ufelefs, there was a profit of 12 s . 3 d . upon an expence of L. 20: 15:9; which our author fippofes would pay the attendance. In this experiment the peafe and barley meal, were mixed into a liquid like cream, and allowed to remain in that ftate for three weeks, till it became four. This was attended in two other inftances with profit, and in a third with lofs: however, Mr Young is of opinion, that the practice will ftill be found advantageous on account of the quantity of dung raifed; and that the farmer can thus ufe his peafe and barley at home without carrying them

Mr Marfhall remarks, that in the Midland diftrict, oats are preferred to barley as a food both for young pigs and breeding fows. It is alfo fuppofed that young
pigs require warm meat to make them grow quickly. Barley-meal and potatoes are ufed in fatcening them; beans and peafe being generally difufed.-In this difrict it is common to keep two or three pigs in the fly along with the old hogs to be fatted. This is done that there may be no wafte; as the young pigs lick out the trough clean when the old ones are ferved. Mr Marfhall obferves, that in a confined place the old ones are apt to "lord it too much over the little ones;" for which reafon he would have a feparate apartment affigned to them, with a door fo fmall the large fwine hould not be able to get intoit.

Sect. V. Sheep.

## Seethe article Pasturage.

## Sect. VI. Rabbits.

Is particular fituations thefe animals may be kept to advantage, as they multiply exceedingly, and require no trouble in bringing up. A confiderable number of them are kept in Norfolk, where many parts, confifting of barren hills or heaths, are proper for their reception. They delight in the fides of fandy hills, which are generally unproductive when tilled; but level gronnd is improper for them. Mr Marfhall is of opinion, that there are few fandy or other loofe-foiled hills which would not pay better in rabbit warrens than any thing elfe. "The hide of a bullock (fays he) is not worth more than ${ }^{2}$. th of his carcafe; the 1 kin of a fheep may, in full wool, be worth from a fixth to a tenth of its carcafe; but the fur of a rabbit is worth twice the whole value of the carcafe ; therefore fuppofing a rabbit to confume a quantity of food in proportion to its carcafe, it is, on the principle offered a fpecies of fock nearly three times as valuable as ei$\rightarrow$ ther cattle or fheep. Rabbit warrens ought to be inclofed with a fone or fod wall: and at their firft ftocking, it will be neceffary to form burrows to them -until they have time to make them to themfelves.
200
Method of deftroying birds of prey, Boring the ground horizontally with a large augre is of perhaps the beft method that can be practifed. Eagles, and pole-cats, are great enemies of rabbits. The norfolk warreners catch the birds by traps placed on the tops of ftumps of trees or artificial hillocks of a coni. Vol. VIII.
cal form, on which they naturally alight.-Traps alfo feem to be the only method of getting rid of the other enemies: though thus the rabbits themfelves are in danger of being canght.

## Sect. VII. Poullry.

Though thefc make a part of every hufbandman's ftock, the keeping of great numbers of them will never be found attended with any advantage; as it is certain they never will pay for the grain neceflary to fuftain them, if that grain maft be bought. On a tarm, therefore, they are only ufeful to pick up what would otherwife be wafted; and even thus we can onlycount then profitable at certain times of the year; and their number muft always be regulated by the fize of the farm. -In Norfolk a great number of turkies are bred, of a fize and quality fuperior to thofe in other parts. Mr Grear Marfhall accounts for their number in the following ber of turmanner : "It is underftood in general, that to rear kies feared turkies with fuccefs, it is necelfary that a male bird in Norfolk. thould be kept upon the fpot to impregnate the eggs fingly ; but the good houfewives of this country know, that a daily intercourfe is unneceffary; and that if the hen be fent to a neighbouring cock previous to the feafon of exclufion, one act of impregnation is fufficient for one brood. Thus relieved from the expence and difagreeablenefs of keeping a male bird, moftlittle farmers, and many cottagers, rear turkies. This accounts for their number: and the fpecies and the food they aro fatted with (which, I believe, is wholly buck) account for their fuperior fize and quality."

In fome, fituations, particularly in the neighbourhood Poultry of great towns, it might perlaps be an object to rear will not confiderable numbers of poultry, even though fome part thrive of the farm fhould be cultivated, merely for their fub- when confiftence. It mult however, be remembered, that poul- fined. try cannot bear confinement. They a re fpoiled, not only by being kept in a houfe, but even in a yard and its environs; for which reafon Mr Young informs us that Lord Clarendon conftantly flifts his poultry through different parts of the park in which they are kepr. In Norfolk it is cuftomary to put young goilings upon green wheat.

## Sect. VIII. Bees.

These may be confidered as of confiderable importance in hufbandry, on account of the unlimited demand there is for honey and wax, and the little expence at which it is obtained. It is nor, however, to Differencer be expected, than in all fituations the honey produced ofthe quanwill either be in equal quantity or of equal quality, tity and This depends on the quantity and quality of the flowers quality of in the neighbourhood to which the bees have accefs. houcy. Thus the honey of Norfolk is of inferior quality to that produced in other parts : owing, as fome have fuppofed to the bees feeding upon the flowers of buck-wheat, which grows in great quantity thronghout the county. Mr Marfhall, however, afcribes its peculiar tafte to the heaths and moorilh places in Norfolk, to which the bee\$ refort, and which feems to be a natural prodect of the Norfolk foil: He does not however affert, that the buck can have no effect upon it; he owns that the buck-flowers are lufcious and difagrecable to many 5 E people;
people, though thofe of beans are equally fo to orhers; but wifhes that their imparting any bad quality to honey may be doubred, until pofitive proof be brought to the contrary.

The Morelands and Vale of Yorkfhire are remarkable for the quantities of honey they produce; buit is of an inferior quality, owing, as Mr Marfhall fuppofes, to the heath. He obferves, that in the hives fituated between the heaths and cultivated country, there is a remarkable difference between the vernal and autumnal combs. The former, gathered cmirely from the meadows, pafture-lands, trees, and cultivated crops, are in a manner as white as friow ; the latter brown, and the honey rather like melted rofin than the pure limpid confiftence of the former.-In the winter of 1782 , a remarkable mortality took place among the bees of this diftrict, vaft numbers of hives perifhing gradually, tho' plenty of honey renained. The phenomenon appeared unaccountable ; but Mr Marfhall explains it with fome probability, from a want of what is called bee-bread, and which the beescollect from the farina of the flowers, as they do the honey and wax from the nectarium and piftillum. The farina cannot be obtained until the antheræ are burft by the fun, which, in the very cold rainy feafon of 782 , could not be expected, as the influence of the fun was not only very fmall, but the farina, when once collected, was liable to be wathed away by the rains. Hence, while the bread which the bees had co.lected in fmall quantity lafted, they continued to live; but whè this was exhaufted, they gradually perifhed one after another; for it is now univerfally allowed, that without bee-bread the life of thefe infects cannot be fuftained, eventhough they have plenty of honey.
In a paper on the fubject of bees by Mr John Keys,

Batb $P_{a}$ pers, vol 5

205
Mr Key's obfervations.
the farina is fuppofed to be ufeful for nourinhing the young brood, and the honey for the fupport of the oldones: hence, according to the quantity of farina to be procured the flock of bees is lim ted. In the place where he refided at the time his letter was wrote (néar Pembroke), no more than eight hives could be kept by a fi.gle perfon with propriety; but at Chefhuit in Her efordhire, where he refided before, he could keep 12 or 14. In bis opinion, none but the good firt fwarms ought to be preferved; the after-fwarms fhould be 1 eturned to the ftock, by which means the increafe of honey would be much greater. "An incorporated fock (he fays) will gather more boney than three or four tingle ones." Hives of half a bufhel meafure ought to weigh 20 pounds at leaft, and larger hives in proportion; and they ought not to be above two years of age: He laments it as a national lofs, that great part of the prime fwarms are fuffered to efcape, from an erroneous opinion about figns and hours of fwarming; " whereas nothing lefs than a conftant watching from feven to four, can prevent this lofs, but which the peafantry will not comply with." Mr Keyshas in vain attempted to find an exify method of fwarming themar-tificially.-For the general method of managing bees, fee the articles. Apis and Bee.

## Sect.IX. Of the management of the Dairy.

As this includes not only the proper method of preferving milk in a wholefome and uncorrupted fare, but
the inaking of butter and cheefe from it, it may de- Managefervedly be accounted as importanta part of hufbanciry ment of the as any ; and accoruing'y feveral treatics have been writucn exprefsly upon the fabjeit.

Lairy.
206
in the hit in volume 0 . Bath Papers, the fubject feems $\mathrm{Dr}_{\mathrm{r}}^{206}$ Anderto be cunt dered in as accurate and fcientific a manner fon's opiby Dr Anderion as by any perfon who has treated this nions on matter ; at leath as tar $u$ regards the making of butter the making The requifites for manuracturing this valuable commo- of butter. dity, accoraing to him, are the rollowing:

1. To bave cuws oj a good quaity. In this we are to attend more to the quantity of cream which the milk of a cow yields, than to the abfolute quantity of milk; and this may commonly be judged of from the chicknefs of it. The fmall Alderney cows (he fays) attord the richeft milk hitherto known; thongh there are many individuals of diIterent kinds which aftord much richer milk /hanothers; and thefe ought carcfully to be fought after, that a good breed may be eftabliihed.
2. To make the cows yield a large quant ty of milk. For this purpofe they muit have plenty of food; and of all other kinds the Doctor determines grais to be the beft; and that grafs which fprings up tpontaneoully on rich dry foils to be the beft of all. He is of opinion, however, that there is no virtue in old paftures, as many fuppofe, more than in new ones; and he affiures us, that he has feen much richerbutter made from the milk of cows fed upon hay from clover and rye-grafs in the houfe, than fuch as had liberty to range in old pafture. He thinks, however, that the cows fhould be permitted to pafture at pleafure during the mornings and evenings, but at noon fhould be taken into a houle, and fupplied with arefh food. If abuidantly fed, they fhould be milked three times a day ; and as great care fhould be taken that this operaiion be properiy performed, only confidential perfons fhould be emiployed. He fuppofes that a cow well fed, will give as much milk each time when milked thrice, as when milked only twice.
3. The qualities of the milk itfeff. Thefe are reduced by our author to the following aphorifins. I. Of the milk drawn from a cow at any tine, that which comes firft is always thinneft, and comtinnes to increafe in thicknefs to the very laft drop. This, as well as all the fucceeding ones, are proved by experiment; and fo great is the importance of attending to it , that "the perfon who, by bad milking of his cows, loofes but half a pint of his milk, lofes, in factas much cream as $n$ ould beafforded by fix or eight pints at the beginning, and lofes befides that part of the cream which alone can give richuef's and high flavour to his butter." 2. Whien milk throws up cream to the furface, that portion which rifes firft will be thicker, and of better quatity, as well as in greater quantity, than that which rifes in a fecond equal portion of time. 3. Thick milk throws up a fimalicr quantity of crean to the furface than fuch as is thimer ; but that cream is of a richer quality. If water be added to that thick milk, it will aftorda co fiderably greater quanuty of cream than betore, but its quality is at the fame time greatly debafed. 4. Nilk when carricd in veffels to any diftance, fo as to fuffer con liderable agitation, never throws up cream fo rich, ioi in fuch quantity, as if the fame had been put into the milk-pans without any agitation. From thefe aphorifms, the following corollaries are deducible. x. The cows ought always

Manage- to be milked as near the dairy as poffible. 2. The ment of the mill of different cows fhould be kept by themfelves, Dairy.

## 207

 Method followed in the Highlands of Scotland. that the good cows may be diftinguifhed from the bad. 3. For butter of a very fine quality, the firft drawn milk ought always to be kept feparate from the laft.Our author now commends the method ufed by the Highlanders of Scotland, where every cow is allowed to fackle her own calf. The calves are kept in an inclofure till the time of milking, when they are allowed to come to the door. Each call there is allowed to

208
Ufeful pre
paration of fweet milk, fack its dam as long as the milk-maid pleafes; when it is driven away, and the woman milks the remainder. Thus they obtain only a fmall quantity of milk, but of exceeding good quality; and to this practice Dr Anderfon afcribes the richnefs of the Highland butter, which is ufually attributed to the old grafs in the remote glens of the Highlands. In places where the practice cannot be economically followed, the Doctor recommends to keep the milk which comes firft, and that which comes laft feparate from each other. The former might be fold fweet, or made into cheefe. Another ufe our author mentions, viz. " Take common fkimmed milk when it begins to turn four ; put it into an upright churn or barrel with one of its ends out, or any other convenient veffel; heat fome water, and pour it into a tub that is large enough to contain with eafe the veflel in which the milk was put. Set the veffel containing the milk into the hot water, and let it remain there for the fpace of one night. In the morning it will be found that the milk hath feparated into two parts; a thick cream like fubfance which occapies the upper part of the veffel, and a thin, ferous, watery part that remains in the bottom : draw off the thin part (called here wigg), by opening a fop-cock placed for that purpofe clofe above the bottom, and referve the cream for ufe. Not much lefs than the half the milk is thus converted into a fort of cream, which when well made feems to be as rich and as fat as real cream itfelf, and is only diftinguilhable from that by its fournefs. It is eaten with fagar, and efteemed a great delicacy; and ufually feils at donble the price of unkimmed milk." 4. Befides feparating the firft from the laft drawn milk." it will be neceffary alfo to take nothing but the cream firft feparated from the beft milk. The remainder of the milk may be employed either in making cheefes, or allowed to throw up cream for butter of an inferior quality. 5. Hence it is plain, that butter of the very beft. quality, could be made only in a dairy of confiderable extent, as only a fnall portion of the milk of each cow could be fet apart for it. 6. Hence it appears that burter and cheefe can be made in a confiftency with one another; the beft of the milk being fet apart for the former, and the worft for the latter. But as perhaps no perfon would choofe to give fuch a price for the very beft butter as would indemnify the farmer for his trouble and expence, it may be fufficient to take only the firft drawn half of the milk for cheefe, and ufe the remainder for butter; and the cream of this, even though allowed to ftand till it begins to turn four, will always yield lutter of a much fuperior quality to that produced in the ordinary,

## 209

13airy de-
fcribed.

Our author now proceeds to enumerate the properties of a dairy. The miil-houfe ought to be cool in
fummer and warm in winter ; fothat an equal temperature may be preferved thronghout the yea:. It onght alfo to be dry, fo as to admit of being kept freet and clean at all times. A feparate building fhould be erected for the purpofe, near a cool fipring or running water, wherc the cows may have eafy accefs to it, and where it is not liable to be incommoded by ftagnant water. The apartment where the milk ftands fhould be well thatched, have thick walls, and a ventilator in the top for admitting a free circulation of air. There fhould alfo be an apartment with a fire-place and cauldron, for the purnofe of falding and cleaning the veffels. The Doctor is of opinion, that the temperature of from 50 to 55 degrees is the moft proper for feparating the cream from the milk, and by proper means this might eafily be kept up, or nearly fo, both fummer and winter.

The utenfils of the dairy thould be all made of Wooden wood, in preference either to lead, copper, or even utenfils precaft iron. Thefe metals are all very eadily foluble in ferable to acids ; the folutions of the two firft highly poifonous ; every other and though the latter is innocent, the tafte of it might render the products highly difagreeable. The creaming difhes, when properly cleaned, fweet, and cool, ought to be filled with the milk as foon as it is drawn from the cow, having been firft carefully ftrained through a cloth, or clofe ftrainer made of hair or wire : the Doctor prefers filver wire to every other. The creaming difhes ought never to exceed three inches in depth; but they may be fo broad as to contain a gallon or a gallon and an half; when filled they ought to be put on the helves of the milk-houfe, and remain there until the cream be fully feparated. If the fineft butter be intended, the milk ought not to ftand above fix or eight hours, but for ordinary butter it may ftand twelve hours or more; yet if the dairy be very large, a fufficient quantity of crean will be feparated in two, three, or four hours, for making the beft butter. It is then to be taken off as nicely as poffible by a fkimming-difh, without lifting any of the milk; and immediately after put into a veflel by itfelf, until a proper quantity for churning be collected. A firm, neat, wooden barrel feems well adapted for this purpofe, open at one end, and having a lid fitted to clofe it. A cock or fpigot ought to be fixed near the bottom, to draw offany thin or ferous part which may drain from the cream; the infide of the opening fhould be covered with a bit of fine filver wire gauze, in order to keep back the cream while the ferum is allowed to pafs: and the barrel fhould be inclined a little on its ftand, to allow the whole to run (ff.

The Doctor contradiets the opinion that very fine Cream butter cannot be obtained, except from cream that is ought to not above a day old. On the contrary, he infifts that be kept it is only in very few cafes that even tolerably good fome time butter can be obtained from cream that is not above one day old. The feparation of butter from cream bade into only takes place after the cream has attained a certain degree of acidity. If it be agitated before that acidity has begun to take place, no butter can be ottained, and the agitation muft be continued till the time that the fournefs is produced; after which the buter begins to form. "In-fummer, while the climatare is warm, the heating may be, without very mach difficulty, continued until the acidity be pro-

5 E 2 duced

Management of the Dairy.

Mauagement of the

Dairy. duced, fo that butter may be got: but in this cafe the procefs is long and tedious; and the butter is for the moft part of a foft confiftence, and tough and glucy to the touch. If this procefs be attempted during the cold weather in winter, butter can farcely be in any way obtained, unlefs by the application of fome great degree of heat, which fometimes affifts in producing a very inferior kind of butter, white, hard and brittle, and almoft unfit for any culinary purpofe whatever. The judicious farmer, therefore, will not attempt to imitate this practice, but will allow his cream to remain in the veffel appropriated for keeping it, until it has acquined the proper degree of acidity. There is no rale for determining how long it is to be kept; but our author is of opinion that a very great latinude is allowable in this cafe; and that if no ferous matter be allowed to lodge among the cream, it may be 212 kept good for making butter a great many weeks.
Of the churn.

The churn in which butter is made likewife admits of confiderable diverfity; but our author prefers the old-fathioned upright churn to allothers, on account of its being more eafily cleaned. The labour, when the cream is properly prepared, he thinks very trifling. Much greater nicety, he fays, is required in the procefs of churning than moft people are aware of; as a few hafty and irregular ftrokes will render butter bad, which otherwife would have been of the fineft quality. After the procefs is over, the whole onght to be fcparated from the milk, and put into a clean difh; the infide of which, if made of wood, ought to be well rubbed with common falt, to prevent the butter from adhering to it. The butter fhould be preffed and worked with a flat wooden ladle or fkimming diAn, having a fhort handle, fo as to force out all the milk that was lodged in the cavities of the mafs. This operation requires a confiderable degree of ftrength as well as dexterity; but our author condemns the beating up of the butter with the hand as "an indelicate and barbarous practice." In like manner he condenms the employing of cold water in this operation, to walh the butter as it is called. Thus, he fays, the quality of it is debafed in an aftonifhing degree. If it is too foft, it may be put into fmall veffels, and thefe allowed to fwim in a tub of cold water; but the water ought never to touch the butter. The beating fhould be continued sill the milk be thoroughly feparated, but not till the butter become tough and gluey; and after this is completely done, it is next to be falted. The veffel into which it is to be put muft be well feafoned with boiling water feveral times poured into it; the infide is to be rubbed over with common falt, and a little melted butter poured into the cavity between the bottom and fides, fo as to make it cven with the bottom; and it is then fit for receiving the butter, laftead of common falt alone, the Doctor reconmends the following compofition, "Take of fu-

Conipolivion for preferving gar one part, of nitre one part, and of the beft Spanifh great falt two parts. Beat the whole into a fine posiver, mix them well together, and put them by for ufe. One ounce of this to be thoronghly mixed with a ponsd of butter as foon as it is freed from the milk, and then immediately put into the veffel defigned to hold it; afier which it muft be preffed fo clote as to leave no air holes; the furface is to be fmoothed and
covered with a piece of linen, and over that a piece of Managewet parchment; or in defect of this laft, fine linen ment of the that has been dipped in melted butter, exactly fitted

Dairy. to the edges of the veffel all round, in order to exclude the air as mach as poffible. When quite full, the calk is to be covered in like manner, and a little melted butter put round the edges, in order to fill up effectually every cranny, and totally to exclude the air. "If all this (fays the Doctor) be carefully done, the butter may be kept perfectly found in this climate for many years. How many years I cannot tell ; but I have feen it two years old, and in every refpect as fweet and found as when only a month old. It deferves to be remarked, that butter cured in this manner does not tafte well till it has ftood at leaft a fortnight after being falted ; but after that period is elapfed, it eats with a rich marrowy tafte that no other butter ever acquires; and it taftes fo little of falt, that a perfon who had been accuftomed to eat butter cared with common falt only, would not imagine it had got one-fourth part of the falmeceffary to preferve it." Otur author is of opinion, that ftrong brine may be ufeful to pour upon the furface during the time it is uling, in order the more effectually to preferve it from the air, and to avoid rancidity.

As butter contains a quantity of mucilaginous matter much more purrefcible than the pure oily part our- To prepare ter much more putrefcible than the pure oily part, our butter for
author recommends the purifying it from this muci- fending to lage, by melting in a conical veffel, in which the mucilage will fall to the bottom; the pure oily part fwimming at top. This will be ufeful when butter is to be fent a long voyage to warin climates, as the pure part will keep much better than when mixed with the other. He propotes another method of preferving Preferved butter, viz. by mixing it with honey, which is very by honey. antifeptic, and mixes intimately with the butter. Thus mixed, it ears very pleafantly, and may perhaps be fuccefsfully afed with a medicinal intention.

217
The other grand object of the dairy is cheefe-Making of making, which in fome counties of England becomes checfe. a very confiderable article. In this the fame precaution is to be obferved as with regard to butter ; viz. the milk ought not to be agitated by carrying to any diftance nor ought the cows to be violently driven before they are milked, which reduces the milk almoft to the fame ftate as if agitated in a barrel or chorn. To this caufe Mr Twamley, who has written a rreatife upondairy management, attributes the great difficulty fonctimes met with in making the milk coagulate; four or five hours being fometimes neceffary infead of one (the ufial time employed); and even after all, the curd will be of fuch a foft nature, that the cheefe will fwell, puff up, and rent in innumerable places without ever coming to that folid confiftence which it ought to have. As this frequently happens in confequence of heat, Mr Twamley, advifes to mix a little cold fpring-water with the milk. It is a bad practice to put in more runnet whein the curd appears difficult to be formed; for this, after having once formed the curd by the ufe of a certain quantity, will diffolve it again by the addition of more.

The moft common defects of cheefe are its appear- General ${ }_{218}^{218}$ ing when cut full, of fnall holes called eyes; its puffing defects of up, cracking, and pouring out quantities of thin ferous cheefe.

Sect. IX.
$\begin{array}{lllllllll}H & U & S & B & A & N & D & R & Y .\end{array}$

Manage- liguor ; becoming afterwards rotten and full of magment of the gots in thofe places from which the liquor iffaed. All
$\underbrace{\text { Dairy. }}$ this, according to our author, procceds from the formation of a fubftance called by him fip curd, a kind of half coagulum, incapable of a thorough union with the true curd, and which when broken into very finall bits produceseyes; but if in larger pieces, occafions thofe rents and cracks in the cheefe already mentioned: for though this kind of curd retains its coagulated nature for fome time, it always foonner or later diffolves into a ftrous liquid. This kind of curd may be produced 1. by uling the milk too hot. 2. By bad runnct. 3. by not allowing the curd a proper time to form. The firft of thefe is remedied by the ufe of cold water, which our anthor fays is fo far from being detrimental to the quality of the cheefe, that it really promotes the action of the runnet upon the milk. The fecond viz, a knowledge of good from bad runnet, can only be acquired by long practice, and no particular directions can be given, farther than that the utmoft care 219 mult be taken, that it have no putrid tendency, nor Of prepar- any rancidity from too great heat in drying. The ing runnet. only rale that can be given, for its preparation is to take out the maw of a calf which has fed entirely upon milk; after it is cold, fwill it a little in water ; ruib it well with falt ; then fill it with the fame andafterwards cover it. Some cut them open and fpread them in falt, putting them in layers above one another, letting them continue in the brine they produce, fometimes firring or turning them for four, fix, or nine months; after which they are opened todry, ftretched out upon fticks or fplints. They may be ufed immodiately after being dried, though it is reckoned beft to keep them till they be a year old before they are ufed. The beft method of making the runnet from the fkins, according to our author, is the following; "Take pure fpring-water, in quantity proportioned to the runnet you intend to make: it is thought beft by fome two fkins to a gallon of water; boil the water, which makes it fofter or more pure; make it with dalt into brine that will fwim an egg; then let it ftand till the heat is gone off to about the heat of blood-warm; then put your maw•fkin in, either cut in pieces or whole; the tormer I fhould imagine beft or moft convenient; letting it fteep 24 hours, after which it will be fit for ufe. Such quantity as is
judged neceffary muft then be put into the milk; about a tea c $u_{1}$,ful being neceffary for ten cows milk; though in this refpect very particular directions cannot be given."

In the Bath Papers, Mr Hazard gives the following reccipt for making runnet. "When the maw fkin is well prepared and fit for the purpofe, three pints or two quarts of foft water, clean and fweet, fhould be mixed with falt, wherein fhould be put fweet brier, rofe-leaves and flowers, cinamon mace, cloves, mace, and in fhort almoft every fort of fice and aromatic that can be procured; and if thefe are put into two quarts of water, they nualt boil gently till the liquor is reduced to three pints, and care fhould be taken that this liquid is not finoked; it inould be frained clear from the ficies, \&c. and when found not to be warmer than milk from the cow, it hould be poured upon the vell or maw; a lemon may then be fliced into it,
when it may remain a day or two ; after which it Managefhould be frained again and pat into a bottle, where if ment of the well corked it will keep good for twelve months or more; it will finell like a perfume, and a fmall quantity of it will turn the milk and give the cheefe a pleafing flavuar." He adds that if the vell or maw be falted and dried for a week or two near the fire, it will do for the purpofe again almoft as well as before.

In the making of cheefe, fuppofing the ramet to 221 bue making of cheefe, fupponing the rumet to particulars be of a good quality, the following particulars muft to be obbe obferved; f. The proper degree of heat. This ferved in ought to be what is called milk-warm, or "' a few making of degrees removed from coolnefs," according to Mr cheef.
Twamley; confiderably below the heat of milk taken from the cow. If too hot, it may be reduced to a proper temperature by cold water, as already mentioned. 2. The time allowed for the runnet to take effect. This our author obferves, onght never to be lefs than an hour and a half. The procefs. may be accelerated, particularly by putting falt to the milk before the runnet is added. Mr Twamley advifes two handfuls to ten or twelve cows milk; but he affures us, that no bad confequence can follow from the curd being formed ever fo foon; as it then unly becomes more folid and fit for making checfe of a proper quality. 3. To prevent any difficulty in fepara: ting the curd from the whey, prepare a long cheefe knife from lath; one edge being flarpened to cut the curd acrofs from top to bottom in the tab, croffing it with lincs checkerwife; by which means to e whey rifes through the vacancies made by the knife, and the curd finks with much more eafe. A fieve has alfo been ufed with fuccefs, in order to feparate the whey perfectly from the curd. 4. Having got the curd all firm at the botom of the tub, take the whey from it; let it ftand a quarter of an hour to drain before you put it into the vat to breakit. If any bits of flep-curd fwim among the whey, pour it all off together rather than put it among the cheefe, for the reafons already given. Some dairy-women allow the curd to ftand for two hours; by which time it is become of fo firm a nature, that no breaking is neceflary; they have only to cut it in flices, put it into the vat and work it well by fqueezing thoroughly to make it fit clofe; then put itinto the prefs. Our author, however, approves. more of tie method of breaking the curd, as lefs apt to make the cheefe hard and horny. 5. When the whey is of a white colour, it is a certain fign that the curd has not fibbided; but if the method juft now laid down be followed, the whey will always be of a green colour; indeed this colour of the whey is always a certain criterion of the curd having been properly managed. 6. The beft method of preventing cheefe from heaving, is to avoid making the runnet tooftrong, to take care that it be clean, and not tainted; to be certain that the curd is fully come, and not to ftir it before the air has had time to efcape; a quantity of air being always difcharged in this as in many other chemical procefles. 7. Cheefe is very apt to fplit in confequence of being " falced within," efpecially when the vat is about half filled. In this cafe the curd thongh feparated only in a fmall degree by the falt, never clofes or joins as it ought to do. Mr Twamley prefers falting in the milk greatly to this method. 8. Dry cracks in cheefe are before

Fruit Li - generally produced by keeping curd from one meal to quors. another, and letting the firft become too ftiff and hard before it is mixed with the other. 9. Curdly or wrinkle-coated cheefe is caufed by four milk. Cheefe made of cold milk is apt to be lard, or to break and fly before the knife. ro. Such coated cheefe is caufed by being made too cold, as cheefe that is made in winecr or late in autumn is apt to be, unlefs laid in a warm room after it is made.

Cheefe is of very different quality, according to the milk from which it is made; Thus, m Gloucefterhire, what is called the fecond or two-meal cheefe, is made from one meal of new milk and one of fkimmed or old milk, having the cream taken away. Skimmed cheefe or fet milk cheefe, is made entirely from kimmed milk the cream having been taken off to make butter. It goes by the name of Suffolk-cheefe, and is much ufed at fea; being lefs liable to be affected by the heat of warm climates than the other kinds. A great deal of difference, however, is to be obferved in the quality of it, which our author fuppofes to arife chiefly from greater care being taken in fome places than in others.

Slip coat or foft cheefe is made entirely of flip-curd, and diffolves into a kind of creamy liquor which is a demonftration of the nature of this curd as already mentioned. It is commonly computed, that as mach milk is required to make one pound of butter as two of cheefe : and even more where the land is poor, and the paftures afford but little cream.-For further parculars with regard to thefe two commodities, fee the articles Butter and Cheese.

## Sect X. Making of Fruit-Liquors.

These, as objects of Britifh hufbandry, are principally two, Cyder and Perry; the manufacturing of which formsa capital branch in the fruit counties. and of which the improvement mult be confidered as of great importance to the public, but particularly fo to the inhabitants of thofe diftricts where thefe liquors conftitute their common beverage.

223

## Excellence

## of cyder

 and perry.Cyder and perry, when genaine and in high perfection, are excellent vinous liquors, and are certainly far more wholefome than many others which at prefent are in much higher eftimation. When the muft is prepared from the choiceft fruit, and undergoes the exact degree of vinous fermentation requifite to its perfection, the acid and the fweet are fo admirably blended with the aqueous, oily, and fpiritous principles, and the whole fo imbued with the .grateful flavour of the rinds, and the agreeable aromatic bitter of the kernels, that it affumes a new character ; grows lively, fparkling, and exhilarating; and when completely mellowed by time, the liquor becomes at once highly delicious to the palate, and congenial to the conftitution; fuperior in every refpect to moft other Englifh wines, and perhaps not inferior to many $\dagger$ Bath $p_{a}$ - of the beft foreign wines. Such (fays Dr Forhergill $\dagger$ ) $\dagger$ Bath $P_{a}$ or would it be pronounced by all competent judges, were p. 343. it not for the popular prejudice annexed to it as a cheap home-brewed liquar, and confequently within the reach of the valgar. To compare fuch a liquor with the foreign fiery fophifticated mixtures often imported un. der the name of wines, would be to degrade it ; for
it certainly furpaffes them in flavour and pleafantnefs, as much as it excels them in wholefomenefs and cheapnefs. But rarely do we meet with perry or cydar of this fuperior quality. For what is generally fold by dealers and inn-keepers is a poor, meagre, vapid liquor, prone to the acetous fermentation, and of courfe very injurious to the conftituion. Is it not very mortifying after the experience of forman that the art of preparing thote ancient Britih lienors hould fill be fo imperfectly underfood as yet to fcem to bein its very infancy? - That throughout the principal cyder diftricts, the practice fhould ftill reft on the mont vague indeterminate principles, and that the excellence of the liquor fhonld depend rather on a lucky random hit, than on good management ! Y et fuch appears to be really the cafe even among the noft experienced cyder-makers of Herefordhire and Gloucefterfhire.
Mr Marfhall, that nice obferver of rural affairs, in his late tour* through thofe counties (exprefsly un- * Rural Edertaken for the purpofe of inquiry on this fubject), con.of Glouinforms us, that fcarcely two of thefe profeffional ar- efferfbire, tifts are agreed as to the management of fome of the ii. p. 308 , more effential parts of the procefs. That palpable er- Errors
rors are committed as to the time and manner of ga- pointed more effential parts of the procefs. That palpable er- Errors
rors are committed as to the time and manner of ga- pointed thering the fruit-in laying it up-in neglecting to out. feparate the unfound-and to grind properly the rinds
and kernels, \&c. That the method of conducting feparate the unfound-and to grind properly the rinds
and kernels, \&c. That the method of conducting the vinous fermentation, the moft critical part of the
operation, and which ftamps the future value of the the vinous fermentation, the moft critical part of the
operation, and which ftamps the future value of the liquor, is by no means afcertained : While fome promote the fermentation in a fpacious open vat, others reprefs it by inclofing the liquor in a hoghead, or flive to prevent it altogether. That no determinate
point of temperature is regarded, and that the ufe of fltive to prevent it altogether. That no determinate
point of temperature is regarded, and that the ufe of the thermometer is unknown or neglected. That they are as little confiftent as to the time of racking off;
and whether this ought to be done only once, or five or are as little confiftent as to the time of racking off;
and whether this ought to be done only once, or five or fix times repeated. That for fining down the liquor, many have recourfe to that odious article, bullock's many have recourle to that odious article, bullock's
blood, when the intention might be much better an. fwered by whites of eggs or ilinglafs. And, finally,
that the capricious tate of particular cuftomers is gethat the capricious tafte of particular cuftomers is generally confulted rather than the real excellence of the liquor; and confequently that a very imperfect liquor is often vended, which tends to reduce the price, to difgrace the vender, and to bring the ufe of cyder and perry into difrepute.

The art of making vinous liquorsis a curious chemical procefs; and its faccefs chiefly depends on a dexterous management of the vinous fermentation, befides a clofe attention to fundry minute circumftances, fides a clofe attention to fundry minute circumftances,
the theory of which is perhaps not yet fully underftood by the ableft chemifts. Can we longer wonder then that fo many errors fhould be committed by illiterate cyderoo many errors hould be committed by illiterate cyder-
makers, totally anverfed in the firft principles of the chemical art? Some few, indeed, nore enlightened than their brethren, and lefs bigotted to their own opinions, by dint of obfervation frike out improvements, and produce every now and then a liquor of ments, and produce every now and then a liquor of
fuperior quality, though perhaps far. fhort of excellence, yet ftill fufficienr to fhow what might polibly be accomplined by a feries of new experiments conducted on philofophical principles. This might lead

226
Means of
improve-
ment. bithero unknown, by which the demand, both at home and abroad, wonld foon be enlarged, the prices augmented according to the quality, the value of eftates increafed, and the liealth and profperity of there counties proportionably advanced. This might alfo help to point ont a method of correcting the imperfections of thefe liquors; and of meliorating thofe of a weak meagre quality, by fafer and more effectual means than are now practifed ; and though nothing can fully compenfate the defect of funfhine in maturing the faccharine juices in unfavourable feafons, yet probably fuch liquor might, without the dangerous and expenfive method of boiling in a copper veffel, admit of confiderable improvement by the addition of barm or other fuitable ferment, as yet unknown in the practice of the the cyder diftricts; or perhaps rather by a portion of rich mult, or fome wholefome fweet, as honey, fugar-candy, or even molaffes, added in due proportion, previous to the fermentation. In fact, it appears from a late publication $\dagger$, that the Germans are known to meliorate their thin harf wines by an addition of concentrated muft, not by evaporation, but by freezing. By this fimple procefs they are made to emulate good French wines; a pracLice worthy of imitation, efpecially in the northern climates.

Cyder, as is well known, is made from apples, and Perry from pears only. The general method of preparing both thefeliqnorsis very much the fame; and under the article Cyder a defcription is given of the way in which thofe fruitsaregathered, ground, and preffed. The mill is not effentially different from that of a common anner's mill for grinding bark. It conifts of a millftone from two and an half to four feet and an half in diameter, running on its edge in a circular fone trough, from nine to twelve inchesin thicknefs, and from one to two tuns in weight. The bottom of the trough in which this fone runs is fonewhat wider than the thicknefs of the fone itfelf; theinner fide of the groove rifes perpendicularly, but the outer fpreads in fuch a manner as to make the top of the trough fix or eight inches wider than the botom; by which means there is room for the ftone to ran freely, and likewife for putting in the fruit, and ftirring it up while grinding. The bed of a middle-fized mill is about 9 feet, fome IO, and fome 12 ; the whole being compofed of two, three, or four ftones cramped together, and finifhed after being cramped in this nanner. The beft ftones are found in the foreft of Dean ; generally a dark, reddift gritfone, not calcareous; for if it were of a calcareous quality, the acid juice of the fruits would act upon it and fooil the liquor: a clean-grained grindfone grit is the fitteft for the purpofe. The runner is moved by means of an axle paffing through the centre, with a long arm reaching without the bed of the mill, for a horfe to draw by ; on the other fide is a fhorter arm paffing through the centre of the fone, as reprefented in the figure. An iron bolt, with a large head, paffes through an eye, in the lower part of the fwivel on which the fone turns, into the end of the inner arm of the axis; and thus the double motion of it is ob-
tained, and the ftone kept perfectly upright. There Fruit Liought alfo to be fixed on the inner arm of the axis, about a foot from the runncr, a cogged whecl working in a circle of cogs, fixed upon the bed of the mill. The ufe of thefe is to prevent the runner from fliding, which it is apt to do when the mill is full; it likewife makes the work more eafy for the horfe. Thefe wheels ought to be made with great exactnefs. Mr Marflall obferves, that it is an error to make the horfe draw by traces: "The acting point of draught (fays he), the horfe's houlder, ought, for various reafons, to be applied immediately at the end of the arm of the axis; not two or three yards before it; perhaps of a fimall mill, near one fourth of its circumference." The building in which the mill is inclofed ought to be of fuch a fize, that the horfe may have a path of three feet wide betwixt the mill and the walls; fo that a middling-fized mill, with its horfe-path, takes up a fpace of 14 or 15 fect every way. The whole dimenfions of the mill-houle, according to our author, to render it any way convenient, are 24 feet by 20 : it ought to have a floor thrown over it at the height of feven feet; with a door in the middle of the front, and a window oppofite, with the mill on one fide and the prefs on the other fide of the window. The latter muft be as near the mill as convenience willallow, for the more eafy conveying the ground fruit from the one to the other. The prefs, of which the principle will be underftood from the figure, has its bed or bottom about five feet fquare. This ought to be made entirely either of wood or ftone ; the practice of covering it with lead being now univerfally known to be pernicious. It has a channel cut a few inches within its outer edges, to catch the liquor as it is exprefled, and convey it to a lip formed by a projection on that fide of the bed oppofite to the mill; having under it a fone trough or wooden veffel, funk within the ground, when the bed is fixed low, to receive it. The prefs is worked with levers of differentlengths; firit a fhort, and then a moderately long one, both worked by hand; and laftly, a bar eight or nine feet long worked by a capftane or windlafs. The expence of fitting up a mill-honfe is not very great. Mr Marihall computes it from 201. to 251. and, on a fmall fcale, from rol. to 151 . though much depends on the diftance and carriage of the ftone: when once fitted up, it will laft many years.

The making of the fruit-liquors under confideration requires an attention to the following particulars. I. The fruit. II. The grinding. III. Preffing. IV. Fermenting. V. Correcting. VI. Laying up. VII. Bottling; eacl of which heads is fubdivided into feveral others.

1. In the management of the fruit, the following particulars are to be confidered.
r. The time of gathering $;$ which varis r. The time of gathering; which varies according fruit. to the nature of the fruit. The early pears are fit for the mill in September; but few apples are ready for gathering before Michaelmas; though, by reafon of accidental circumftances, theyare frequently manufactured before that time. For fale cyder, and keeping drink, they are fuffered to hang upon the trees till fully ripe ; and the middle of Octom
quors.

Fruit Li- ber is generally looked apon to be a proper time for gaquors. thering the fire apple. The criterion of a due degree
of ripenefs is the fruit falling from the tree : and to force it away before that time, in Mr Marhall's opinion, is robbing it of fome ofits moft valnable particles. "The harvefting of fruit (fays he) is widely different in this refpect from the harvefting of grain ; which has the entire plant to feed it after its feparation from the foil ; while fruit, after it is fevered from the tree, is cut off from all poffibility of a further fupply of nourifhment; and although it may have reachedits wonted fize, fome of its more effential particles are undoubtedly left behind in the tree." Sometimes, however, the fruits which are late in ripening are apt to hang on the tree until fpoiled by frofts; though weak watery fruits feem to be moft injured in this manner ; and Mr Marthallrelates an inftance of very fine liquor being made from golden pippens, after the fruit had been frozen as hard as ice.
${ }^{229}$ of 2. The method of gathering. This, as generally gathering practifed, is directly contrary to the principlelaid down it. by Mr Marihall, viz. beating them down with long flender poles. An evident difadvantage of this method is, that the fruit is of unequal ripenefs; for the apples on the fame trees will differ many days, perhaps even weeks, in their time of coming to perfection ; whence fome partof the richnef's and flavour of the frait will be effectually and irremediably cut off. Nor is this the only evil to be dreaded; for as every thing depends on the fermentation it has to undergo, if this be interrupted, or rendered complex by a mixture of ripe and unripe fruits, and the liqnor be not in the firft inftance fufficiently purged from its feculencies, it is difficult to clear the liquor afterwards. The former defect the cyder makers attempt to remedy by a mixture of brown fugar and brandy, and the latter by bullock's blood and brimftone ; but neither of thefe can be expected to anfwer the purpofe very effectually. The beft method of avoiding the inconveniences arifing from an unequal ripening of the fruit is to go over the trees twice, once with a hook, when the fruit begins to fall fpontaneoully; the fecond time, when the latter are fufficiently ripened, or when the winter is likely to fet in, when the trees are to be cleared with the poles abovementioned.
3. Maturing the gathered fruit. This is ufually done by making it into heaps, as is mentioned under the article Cyder: but Mr Marhall entirely difapproves of the practice; becaufe, when the whole are laid in a heap together, the ripent fruit will begin to rot before the other has arrived at that degree of artificial ripenefs which it is capable of acquiring. "The due degree of maturation of fruic for liquor (he obferves) is a fubject about which men, even in this diftrict, differ much in their ideas. The prevailing practice of gathering into heaps until the ripeft begin to rot, is wafting the beft of the frait, and is by no means an accurate criterinn. Some hake the fruit, and judge by the rattling of the kernels; others cut through the middle, and judge by their blacknefs; but none of thefe appear to be a proper teft. It is not the fate of the kernels but of the flefh; not of a few individuals, but of the greater part of the prime-fruit, which renders the collective body fit or unfit to be fent to the mill. The moft $\mathrm{ra}_{\mathrm{a}}$ tional teft of the ripenefs of the fruit, is that of the flefh
having acquired fuch a degree of mellownefs, and its Fruit Litexture fuch a degree of tendernefs, as to yield to mo- quors. derate preffure. Thus, when the knuckle or the end of the thumb can with moderate exertion be forced into the pulp of the fruit, it is deemed in a fit fate for grinding."
4. Preparation for the mill. The proper management of the fruit is to keep the ripe and unripe fruits feparate from each other: but this cannot be done without a conlide rable degree of labour ; for as by numberlefs accidents the ripe and unripe fruits are frequently confounded together, there cannot be any effectual method of feparating them except by hand; and Mr Marfhall is of opinion, that this is one of the grand fecrets of cyder-making, peculiar to thofe who excel in the bufinefs; and he is furprifed that it fhould not before this time have come into common prastice.
5. Mixing fruits for liquor. Our author feems to doubt the propriety of this practice; and informs us, that the finer liquors are made from felect fruirs; and be hints that it might be more proper to mix liquors after they are made, than to put together the crude fruits.
II. Grinding, and management of the fruit when ground.
I. For the greater convenience of putting the fruit into the mill, every mill-houfe fhould have a fruit chamber over it, with a trap-door to lower the fruit down into the mill. The beft manner in which this can be accomplifhed, is to have the valve over the bed of the mill, and furnihed with a cloth, fpout or tunnel reaching down to the trough in which the fone moves. No ftraw is ufed in the lofts, but fometimes the fruit is turned. In Herefordfhire, it is generally believed, that grinding the rind and feeds of the fruit as well as the fleflyy part to a pulp, is neceffary towards the perfection of the cyder ; whence it isneceflary, that every kind of pains chould be taken to perform the grinding in the moft perfect manner. Mr Marhall complains, that the cyder-mills are fo imperfectly finifhed by the workmen, that for the firft fifty years they cannor perform their work in a proper manner. Inftead of being nicely fitted to one another with the fquare and chiffel, they are hewn over with a rough tool in fuch a carelefs manner, that horfe beans might lic in fafety in their cavitics. 'Some even imagine this to be an advantage, as if the fruit was more effectually and completely broken by rough than fmooth ftones. Some ufe fluted rollers of iron; but thefe will be corroded by the juice, and thus the liquor might betinged. Smooth rollers will not lay hold of the fruit fufficiently to force it through.

Another improvement requifite in the cyder-nitls is to prevent the matter in the trough from rifing before the fone in the laft fage of grinding, and a method of ftirring it up in the trough more effectually than can be done at prefent. To remedy the former of ${ }^{-}$ thefe defects, it might perhaps be proper to grind the fruit firft in the mill to a certain degree; and then put it between two fmooth rollers to finifh the operation in the moft perfect manner. It is an error to grind too much at once; as this clogs up the mill, and prevents it from goining eatily. The ufual quantity for a middlefized mill is a bag containing four corn bufhels; but our author had once an opportunity of feeing a minl

## 235

 Grinding.liruit Li- in which only half a bag was put $;$ and thus the work $\underbrace{\text { quars. }}$ than wh put in at one time is to be taken out when ground. The ufual quantity of fruit ground in a day is as much as will make three hoglheads of perry or two of cyder.
2. Management of the ground-fruit. Here Mr Marfhall condemms in very trong terms the practice of preffing the pulp of the fruit as toon as the grinding is finifled; becanfe thus neither the rind nor feeds have time to communicate their virues to the liquor. In order to extract thefe virrues in the moft proper manner, fome allow the ground-fruit to lie 24 hours or more after grinding, and even regrind it, in order to havein the mont perfect manner the Hivour and virtues of the feeds and rind.

## 232 Preffing,

 $\& c_{0}$1II. Freffing the fruit, and management of the refiduum. This is done by folding up the ground-fruit in pieces of hair cloth, and piling them up above one another in a fquare frame or mould, and then puling down the prefs upon them, which fqueezes out the juice, and forms the matter into thin and almoft dry cakes. The firft runnings come off foul and mudady; but the laft, efpecially in perry, will be as clear and fine as if filtered thro' paper. It is common to throw a way the refidunm as ufelefs; fometimes it is inade ufe of when dry as fuel; fometimes the pigs will eat it, efpecially when not thoroughly fqueezed; and fometimes it is ground a fecond time with water, and fqueczed for an inferior kind of liquor ufed for the family.Mr Marfhall advifes to continue the preflure as long ás a drop can be drawn. "It is found (fays he), that even by breaking the cakes of refufe with the hands only gives the prefs frefh power over it; for though it has been preffed to the laft drop, a gallon or more of additional liquor may be got by this means. Regrinding them has a ftill greater effect: In this ftate of the materials the mill gains a degree of power over the nore rigid parts of the fruit, which in the firft grinding it could not reach. If the face of the runner and the bottom of the trough were dreffed with a broad chiffel, and made true to each other, and a moderate quantity of refiduum ground at once, fcarcely a kernel could efcape unbroken, or a drop of liquor remain undrawn.

But though the whole virtue of the fruit cannot be extracted without grinding it very fine, fome inconvenience attends this practice, as part of the pulp thus gets through the hair cloth, and may perhaps be injurious to the fubfequent fermentation. This, however, may be in a great meafure remedied by ftraining the firft runnings through a fieve. The whole fiould alfo be allowed to fente in a cafk, and drawn off into a frefh veffel previous to the commencement of the fermentation. The reduced fruit ought to remain fome time between the grinding and prefling, that the liquor may have an opportunity of forming an extract with the rind and kernels : but this muft not be pufhed too far, as in that cafe the colour of the cyder would be hurt ; and the moft judicious managers object to the pulp remaining longer than 12 hours without preffure. "Hence (fays our author), upon the whole;

* the moft eligible management in this ftage of the art appears to be this: Grind one prefsfnl a-day; prefs Vel. VIIL.
and regrind the refiduum in the evening; infufe the Frut-Lireduced matter all night among part of the firft ran- quors. nings; and in the morning re-prefs while the next pretisful is grinding.
IV. Fermentation. The common practice is to have Fermentathe liquor turned; that is, put into cafks or hog- tion. Sheads immediately from the prefs, and to fill them quite full : but it is undoubtedly more proper to leave fome face empty to be filled up afterwards. Noaccurate experimient has been made with regard to the temperature of the air proper to be kept up in the place where the fermentation goes on. Frof is prejudicial: but when the procefs ufually commences, that is about the middle of October, the liquor is put into aify fhades, where the warmth is fcarce greater than in the open atmofphere; nay, they are frequently expofed to the open air withoutany covering farther than a piece of tile or flat flone over the bung-hole, propped up by a wooden pin on one fide to caufe the rain water run off. In a complete manufactory of fruit-liquor, the fermenting room thould be under the fame roof with the mill-houfe; a continuation of the prefs-room, or at leaft opening into it, with windows or doors on every fide, to give a free admiffion of air into it; fufficient defences againft froft; fruit-lofts over it, and vault underneath for laying up the liquors after fermentation; with fmall holes in the crown of the arch to admit a leathern pipe; for the purpofe of conveying the liquors occafionally from the one to the other.

In making of fruit-liquors, no ferment is ufed as in making of beer; though, from Mr Marfhall's account of the matter, it leems far from being unneceffary. Owing to this omiffion, the time of the com² mencement of the fermentation is entirely uncertain. It takes place fometimes in one, two, or three days; fometimes not till a week or month after turning: but it has been obferved, that liquor which has been agitated in'a carriage, though taken immediately from the prefs, will fometimes pafs almoft immediately into a ftate of fermentation. The continuance of the fermentation is nolefs uncertain than the commencement of it. Liquors, when much agitated, will go through it perhaps in one day; but when allowed to remain at reft, the fermentation commonly goes on two or three days, and fometimes five or fix. The fermenting liquor, however, puts on a different appearance according to circumftances. When produced from fruits properly matured, it generally throws ap a thick fcum refembling that of malt liquor, and of a thicknefs proportioned to the fpecies and ripenefs of the fruit; the riper the fruit, the more fcum being thrown up. Perry gives but lititle fcum, and cyder will fometimes alfo do the fame ; fometimes it is intentionally prevented from doing it.

After having remained fome time in the fermenting veffel, the liquor is racked or drawn off from the lees and put into frefh calks. In this part of the operation alfo Mr Marfhall complains greatly of the little attention that is paid to the liquor. The ordinary time for racking perry is before it has done hiffing, or fometimes when it begins to emit fixed air in plenty. The only intention of the operation is to free the liquor from its fæces by a cock placed at a litule diftance from the bottom; after which the remainder is to be

5 F
filtered

Fruit-Li- filtered through a canvas or flannel bag. This filtered quors. liquor differs from the reft in having an higher colour ; having no longer any tendency to ferment, but on the contrary checking ithe fermentation of that which is racked off; and if it lofes its bightnefs, it is no longer cally recovered.-A frefli fermentation ufually commences after racking; and if it become violent, a f.ein racking is neceffary in order tocheck it ; in confequence of which the fame liquor will perhaps be racked five or fix times : but if only a fmall degree of fcrmentation takes place, which is called fretting, it is allowed to remain in the fame cafk; though even here the degree of fermentation which requires racking is by no means determined. Mr Marhall informs us that the beft manufacturers, however, repeat the rackings antil the liquor will lie quiet, or nearly fo ; and if it be found impracticable to accomplifh this by the ordijary method of fermentation, recourfe muft be had to fumigation with fulphur, which is called ftumming the calks. For this fumigation, it is necelfary to have matches made of thick linen-cloth about ten inches 1 ng , and an inch broad, thickly coated with brimfone for about eight inches of their length. The cafk is then properly feafoned, and every vent except the bung-hole tightly fopped; a match kindled; lowered down into the cark, and held by the end undipped until it be well lighted and the bung be driven in ; thus fufpending the lighted match within the calk. Having burnt as long as the contained air will fupply the fire, the match dies, the bung is raifed, the remnant of the match drawnout, and the cafk fuffered to remain before the liquor be putinto it for two or three hours, more or lefs according to the degree of power the fulphur ought to have. The liquor retains a fmell of the fulphureous acid; but this goes off in a fhort time, and no bad effect is ever obferved to follow.

In fome places the liquor is left to fermient in open cafks, where it ftands till the firft fermentation be pretty well over; after which the froth or yeaft collected upon the furface is taken off, it being fuppofed that it is this yeaft mixing with the clear liquor which caufes it to frectafter racking. The fermentation being totally ceafed, and the lees fubfided, the liquor is racked offinto a frefl cafk, and the lees filtered as above dircecel. Our author mentions a way of fermenting fruit-liquors in broad thallow vats, not lefs than five feet in diameter, and little more than two feet deep; each vat containing about two hogtheads. In thefe the liquor remains until it has done rifing, or till the fermentation has nearly ceafed, when it is racked off without $\mathbb{A k i m m i n g}$, the critical juncture being canght before the yeaft fall; the whole finking gradually together as the liquor is drawn off. In this practice alfo the liquor is feldom drawn off a fecond time.

Cyder is made of three different kinds, viz rough, fweet, and of a niddle richnefs. The firf kind being ufually defigned for fervants, is made with very little ceremony. "If ir is but zeyder (fays Mr Marhall), and has body enough to keep, no marter for the richnefs and flavour. The rougher it is, the further it will go, and the more acceptable cuftom has rendered it not only to the workmen but to their malters. A palateaccuftomed to fweet cyder would judge the rough cyder of the farm-houfes to be a mixture of vinegar and water $_{2}$ with a litule diffolved alum to give it rongh-
nefs." The method of producing this auftere liquor Jruit-1.iis to grind them in a crude under-ripe ftate, and fub- quors. jeft the liquor to a full fermentation.-For the fwect liquor, make choice of the fweeter fruits : mature thein fully; and check the fermentation of the liquor.-To produce liquors of a mildle richnefs, the nature of the fruit, as well as the feafon in which it is matured, mult be conlidered. The fruits to be made choice of are fuch as yicld juices capable of affording a fufficiency both of richnefs and ftrength, though much depends upon proper management. Open vats, in our author's opinion, are preferable to clote veffels: but if canks be ufed at all, they ought to be very large, and nor filled; nor ought they to lie upon their fides, but to be fet on their ends with their heads out, and to be filled only to fuch an height as will produce the requifite degree of fermentation : but in whatever way the liquor be put to ferment, Mr Marfhall is of opinion that the operation ought to be allowed to go on freely for the firt time; though after being racked off, any fecond fermentation ought to be prevented as much as poffible.

235
V. Corretting, provincially called doctoring. The of corredimperfections which art artempts to fupply in thefe li- ing or docquors are, 1 . Want of ftrength; 2. Want of richnefs. toring the 3. Want of flavour. 4. Want of colour and bright- liquore. nefs.

The want of frength is fupplied by brandy or any other fpirit in fufficient quantity to prevent the acetous fermentation. The want of richnefs is fupplied by what are generally termed fweets, but prepared in a manner which our author fays has never fallen under his notice. To fupply the want of flavour, an in fufion of hops is fometimes added, which is faid to communicate an agreeable bitter, and at the fame time a fragrance; whence it becomes a fubftitute for the juices of the rind and kernels thrown away to the pigs and poultry, or otherwife wafted. The want of colour is fometimes fupplied by elder berries, but more generally by burnt fugar, which gives the delired colour, and a degree of bitter which is very much liked. The fugar is prepared either by burning it on a falamander, and fuffering it to drop, as it melts, into water, or by boiling it over the fire (in which cale brown fugar is to be ufed), until it acquire an agrecable bitter; then pouring in boiling water in the proportion of a gallon to two lb . of fugar, and fir until the liquor become uniform. A pint of this preparation will coloura hogthead of cyder. Brightinefs is obt ined by a mixture of the blood of bullocks or theep; that of fwine being rejected, though it does not appear to be more unfit for the purpofe than either of the other two. The only thing neceffary to be done here is to ftir the blood well as it is drawn from the animal, to prevent the parts from feparating; and it ought to be ftirred "both ways, for a quarter of an hour." The liquor, however is not always in a proper condition for being refined wih this ingredient: on which accounta little of it ought frequently to be tried in a vial. A quart or lefs will be fufficient for a hoghead. After the blood is poured in, the liquor fhould be violemily agitated, to mix the whole intimately together. This is done by a ftich ait into four, and inferted into the bang hole; working it brikly about in the liquor until the whole be thoroughly mixed. In about 24 hours

Fruit-Li- the blood will be fubfided, and the liquor ought inquors. fantly to be racked off; as by remaining upon the blood even for two or three days, it will raceive a taint not eafily to be got rid of. It is remarkable that this refinement with the blood carries down not only the fæces, but the colour allo; rendering the liquor, though ever fo highly coloured before, almoft as limpid as water. Ilinglafs and eggs are fometimes made ufe of in fining cyder as well as wine.
VI. The laying up or thutting up the cyder in clofe cafks, according to Mr Marhall, is as litule underftood as any of the reft of the parts; the bungs being commonly put in at fome certain time, or in fome particular month, without any regard to the fate the liquor itfelf is in. "The only criterion (fays he) I have met with for judging the critical time of laying up, is when a fine white cream-like matter firf begins to form upon the furface. But this may be too late; it is probably a fymptom at leaft of the acetous fermentation, which if it take place in any degree muft be injurious. Yet if the calks be bunged tight, fome criterion is neceflary ; otherwife, if the vinous fermentation have not yet finally ceafed, or hould recommence, the caiks will be endangered, and the liquor injared. Hence, in the practice of the moft cautious manager whofe practice I have had an opportunity of obferving, the bungs are firf driven in lightly, when the liquor is fine; and the vinous fermentation is judged to be over ; and fome time afterward, when all danger is paft, to fill up the cafks, and drive the bungs fecurely with a rag, and rofin them over at top. Moft farmers are of opinion, that after the liquor is done ferment. ing, it ought to have fomething to feed upon; that is, to prevent it from running into the acetous fermentation. For this purpofe fome put in parched beans, others egg-fhells, Come mutton-fuet, \&c. Mr Marfhall does not doubt that fomething may be ufeful; and thinks that ifinglafs may be as preper as any thing that can be got.
VII. Bottling. This depends greatly on the quality of the liquors themfelves. Good cyder can feldom be bottled with propriety under a year old; fomenimes not till two. The proper time is when it has acquired the utmoft degree of richnefs and flavour in the cafks ; and this it will preferve for many years in bottles. It ought to be quite fine at the time of bottling; or if not fo naturally, ought to be fined artificially with ifinglafs and eggs.

The liquor, called cyderkin, purre, or perkin, is made of the nurk or grofs matter remaining after the cyder is prefled out. To make this liquor, the murk is put into a large vat, with a proper quantity of boiled water, which has food till it be cold again : if half the quantity of water be ufed that there was of cyder, it will be good; if the quantities be equal, the cyderkin will be fmall. The whole is left to infufe 48 hours, and then well prefled: what is fqueezed out by the prefs is immediately tunned up and fopped; it is fit to drink in a few days. It clarifies of itfelf, and ferves in families inftead of fmall beer. It will keep, if boiled, after preffure, with a convenient quantity of hops.

We mult not conclade this fection without particular notice of the liquor called gyder zuine, which is
made from the juice of apples taken from the prefs Fruit-1. and boiled, and which being kept three or four years is faid to refemble Rhenifh. The method of pre paring this wine, as communicated by Dr Rull of ${ }^{239}$ Pennfylvania, where it is much practifed, confifts in winger cuaporating in $z$ brewing copper the frefh apple-j ice cording to till half of it be confumed. The remainder is then Dr Rufi's immediately conveyed into a wooden cooler, and af- recipe. terwards is put into a proper calk, with an addition ofyeaft, and fermented in the ordinaty way. The procefs is evidently borrowed from what has long been practifed on the recent juice of the grape, under the term of $z i n$ cuit, or boiled wine, not only in Italy, but alfo in the iflands of the Archipelago, from time immemorial.

This procefs has lately become an object of imiation in the cyder counties, and particularly in the weft of England, where it is reported that many hundred hogsheads of this wine have already been made; and as it is faid to betray no fign of an impregnation of copper by the ufinal chemical tefts, it is confidered as perfectly wholefome, and is accordingly drunk without apprehenfion by the common people. Others, however, fufpect its innocence ; whence it appeared an object of no fmall moment to determine in fo doubtful a matter, whether or not the liquor acquires any noxious quality from the copper in which it is boiled.-With this view Dr Fothergill $\dagger$ madea variety of experiments; and the refult feemed to afford a ftrong prefumption that the cyder wine doas pers, vol, v. does contain a minute impregna- p. 339 tion of copper ; not very confiderable indeed, but yet fufficient, in the Doctor's opinion, to put the public on their guard concerning a liquor that comes in fa very " queftionable a fhape."

It is a curious chemical fact, he obferves, if it be really true, that acid liquors, while kept boiling in copper veffels, acquire little or no impregnation from the metal, but prefently begin to act upon it when left to ftand in the cold. Can this be owing to the agitation occafioned by boiling, or the expulfion of the aerial acid ? Atmolpheric air powerfully corrodes copper, probably through the intervention of the aerial or rather nitrous acid, for both are now acknowledged to be prefent in the atmofphere. But the latter is doubtlefs a much ftronger menflruam of copper than the former.

In the prefent procefs the liquor is properly directed to be paffed into a wooden cooler as foon as the boiling is completed. But as all acids, and even common water, acquire an impregnation and nupleafant tafte, from handing in copper veffels in the cold, why may not the acid juice of apples act in fome degree on the copper before the boiling commences? Add to this, that brewing coppers, without far more care and attention than is generally beftowed on them in keeping them clean, are extremely apt to contract verdegris, (a rank poifon), as appears from the blue or green ftreaks very vifible when thefe veffets are minucely examined. Should the unfermented juice be thought incapable of acting on the copper either in a cold or boiling ftate, yet no one will venture to deny its power of wafhing off or diffolving verdegris already formed on the internal furface of the veffic. Suppofe only one-eighth part of a grain of verdegris to be contained in a bottle of this wine, a quantity that may clude the ordinary tefts, and that a bottle

Manures.
Ghould be drunk daily by a perfon without produeing any violent fymptom or internal uneafinefs; yet what perfon in his fenfes would knowingly chufe to hazard the experiment of determining how long he could continue even this quantity of a llow poifon in his daily beverage with impunity? And yet it is to be feared the experiment is but too often unthinkingly made, not only with cyder-wine, but alfo with many of the foreign wines prepared by a fimilar procefs. For the grape juice, when evapor ted in a copper veffel, under the denomination of vino cotto, or boiled wine, cannot bat acquire an equal if not yet Atronger impregnation of the metal, than the juice of apples, feeing that verdigris irfelf is manufactured merely by the application of the acid hulks of grapes to plates of copper.

Independent of the danger of any metallic impreg. nation, the Doctor thinks ir may be jufty queftioned how far the procefs of preparing boiled wines is neceffary or reconcileable to reaton or ceconomy. The evaporation of the muft by long beiling not only accafions an unneceffary watte of both liquor and fuel, but alfo diffipates certain effential principles, withont which the liquor can never undergo a complete fermentation, and without a complete fermentation there can be no perfect wine. Hence the boiled wines are generally crude, heavy, and flat, liable to produce in. digeftion flatulency, and diarrhœa. If the evaporation be performed hatily, the liquor contracts a burnt empyreumatic tafte, as in the prefent inftance ; if flowly, the greater is the danger of a metallic impreguation. For the procefs may be prefumed to be generally performed in a veffel of brafs or copper, as few families poffefs any other that is fafficiently capacious. Nor can a veffel of caft-iron, though perfectly fafe, be properly recommended for this parpofe, as it would probably communicare a chalybeate tafte and dark colour to the liquor. At all events, brafs and copper v.effels ought to be entirely banifhed from this and every other culinary procefs.

## Sect. XI. On Manures, and the beft Methods of collecting them.

We have deferred treating on thefe to the laft part, as they are in fact derived in more or lefs quantity from every operation in hufbandry, though they are undoubtedly the foundation of the whole ; for no method yet propofed for making a foil fertile without manure has ever been froperly afcertained to be faccefsfal. The mode in which they operate has been fo fully explained under the article Agriculture, that nothing farnher feems neceflary to be added in this place. Of late, however, a new manure has been introduced into fome countries, the operation of which cannot fo well be explained upon the principles there laid down. This is Gypfum. In the eighth volume of the Annals of Agriculture we are informed, that it is commonly afed as a manure in Switzerland. In the roth volume of the fame work, Sir Richard Sutton gives fome account of an experiment made with it on his eflate; but in fuch an inaccurate manner, that nothing could be determined. "The appearance in general (fays he), I think, was rather againft the benefit of the plalter, though not decidedly fo." He tells us, that its pirtues were a fub-
ject of debate in Germany. In America this fubftance Manures. Ceems to have met with more fuccefs than in any other country. In the firth volume of Bath Papers, Mr Kirkpatrick of the Ide of Wight, who had himfelf vifited North America, informs us, that it is much ufed in the United States, on account of its cheapnefs and efficacy; thongh, from what is told in the fame place, we mift undoubredly be led ro fuppofe, that its efficacy muft be very great before it can be intitled to chactionefs. In the firft place, it is brought from the hills in the neighbourhood of Paris to Havre de Grace, and from thence exported to America; which of irfelf muft occafion a conliderable expence, though the plafter were originally given gratis. In the nexi place, it muft be powdered in a tamping mill, and the finer it is powdered fo much the better. In the third place, it muft be fown over the ground to be manured with it. The quantity for grafs is fix buthels to an acre. It ought to be fown on dry ground in a wet day; and its efficacy is faid to laft from feven to twelve years. It operates entirely as a top drefling.

In the roth volume of Annals of Agriculture, we have fome extracts from a treatife by Mr Powel, prefident of the Philadelphia Society for encouraging Agriculture, upon the fabject of gypfum as a manure; of the efficacy of which he gives the following inftances. 1. In October 1786, plafter of Paris was fownin a rainy day upon wheat- ftubble without any previous culture. The crop of wheat had farce been worth reaping, and no kind of grafs feed had been fown upon the ground ; neverthelefs, in the month of June it was covered with a thick mat of white clover, clean and even, from lix co eight inches in height. A piece of ground adjoining to this white clover was alfo fown with gypfum, and exhibited a fine appearance of white and red clover mixed with fuear-grafs. Some wet ground fown at the fame time was not in the leaft improved.-This anecdote reftsentirely on the veracity of an anonymous farmer. 2. Eight buthels of plafter of Paris fpread upon two acres and an half of wheat-fubble ground, which the fpring be fore had been fowed with about two pounds of red clover feed to the acre for pafture, yield. ed five tons of hay by the middle of June. A fmall piece of ground o: limilar quality, bot without any plafter, produced only one ton and an half in the fame proportion,-Nir Powel concludes in favour of the effects of the plafter upon arable as well as grafs land.Other accounts to the fame purpofe have been publifhed ; but it does not appear to have been tried in Britain.

With regard to the other kinds of manne commonly of 241 in uie in this country, their efficacy is well known; the common only difficulty is to procure them in fufficient quantity. kinds of - In fuch lands as lie near the fea, fea-weeds offer an manure. unlimited quantity of excellent manure. In the neighbourhood of rivers, the weeds $\because$ ith which they abound offer likewife an excellent manure in plenty. Oil-cake, malt-coombs, the refufe of flanghter-houfes, \&c. all are excellent where they can be got : but the fituations whichafford thefeare comparatively few ; fothat in moft cafes the farmer muft depend much on his own ingenuity. and induftry for raifing a fufficient quantity of dung to anfwer his purpoles; and the methods taken for this purpofe vary according to the fituation of different pla-. ces, or according to the fancy of the himbandman.

Manures.
In all comntries where chalk, marle, or lime are to be had, they are cortainly to be empluyed in their proper departments; but befides thefe, dung, properly focalled, mixed with earth or putrid animal and vegetable fub-

Mr Mar-
fhall's direstions for
raifing
dung. ftances, conftitutes a principal part of the manare. In Norfolk, Mr Marnhall tells us, that the quality of dung is attended to with greater precition than in moft other difticis. Tcwosmuck, as it is called, is held in moot eftimation ; and the large towns. Norwich and Yarmouth fipply the neighbouring country. As Yarmonth; however, is a maritime place, and otherwife in a manner furrounded by marhes, ftraw is of courfe a fcarce and dear article: whence, inftead of littering their horfes with it, they ufe fand. As the bed becomes foiled or wet, frefl fand is put on, until the whole is in a manner faturated with urine and dung, when it is cleared away, and reckoned muck of fach excellent quality, that it is fent for from a very great diftance: With regard to orher kinds of dung, that from horfes fed upon hay and corn is looked upout to be the beft; that of fatting cattle the next; while the dung of lean cattle, particularly of cows, is fuppofed to be greatly inferior, even though turnips make part of their food. The dung of cattle kept on ftraw alone is looked upon to be of liftle or no value; while the muck from trodden ftraw i by fome thought to be better than that from the fraw which is caten by the lean-ftock. Compolts of dung with earth or marle are very generally uled.

In the midland counties of England, Mr Marfhall informs, the cores of horns erufhed in a mill have been ufed as manure: though he knows not with what fu cefs. His only objection is the difficulty of r ducing them to powder. Dung is extremely der in Norfolk; half a guizea being commonly given for a wag-gon-load driven by five horfes. Great quanticies of lime and marle are fonnd in this dittrict. -With reqard to the method of raifing dung in general, perhaps the obfervations of Mr Marflall upon the management of the York hire farmers nay be equally fatisfactory with any thing that has yet been pabliflied on the fobject.
"s The general practice (fays he) is to pile the dung on the ligheft part of the yard; or, which is ftill lefs judicious, to let it lie fattered about on the fide of a flope, as it were for the purpofe of diffipating its virtues. The urine which does not mix with the dong is almoft invariably led off the neareft way to the common fewer, is if it were thought a mifance to the premifes. That which mixes with the dung is of courfe carried to the miditen, and affifts in the general diftipation. A yard of $/ a n g$, nine-tenths of which are ftraw, will difcharge, even in dry weather, fome of its more
fluid particles; and in rainy weather, is, notwithfanding the ftraw, liable to be wathed away if expofed on a

## Manures.

 rifing ground. Bat how mach more liable to wafte is a mixture of dung and urine, with barely a fafficiency of fraw to keep them together? In dry weather the natural oozing is confiderable; and in a wet feafon every fhower of rain wathes it away in quanticies. - The Norfolk method of bottoming the dung-yard with mould is here indifipenfably neceffary to common good management. There is no better manare for grafs jands than mould faturated with the oozings of a dunghill : it gets down quickeramong the grafs, and has generally a more vifible effect than the dung itfelf. Under this management the arable land wonld have the felffame dung it now has; while the grass land would have an annal fupply of riches, which now run wafte in the fewersand rivulets.- But before a dung-yard can with propriety be botromed with mould, the bottom of the yard itfelf ought to be properly formed. A part of it fituared conveniently for carriages to come at, and low enoagh to reccive the entire drainings of the fable, cattle-ftalls, and hog-fties, fhould be hollowed ont in the manner of an artificial drinking-pool, with a rim ${ }^{-}$ fomewhat rifing, and with covered drains laid into it from the various fources of liquid manure. During the fummer months, at leifure tinies, and embracingopportunities of back-carriage, fill the hollow nearly full with mould; fuch as the foowerings of ditches, the hovellings of roads, the maiden earth of lanes and watte corners, the coping of ftone-quarries, \&c. \&c. leaving the furface fomewhat difhed; and within this difl fet the dung pile, carefully keeping up a rim of monld round the bafe of the pile higher than the adjoining furface of the yard : 'equally to prevent extraneous matter from finding its way into the refer voirs, and to prevent the efcape of that which falls within its circuit."In the fir: volume of the Annals of Agriculture, MrYoung 's. Mr Young, from a theory that phlogifton is the food experiof plants, made feveral experiments upon charcoal as a ${ }^{\text {neents on }}$ manure; but the refilts were not fufficiently favoura- charcoal. ble to induce a trial of it in the large way. It muft be remembered, that though phlogifton is very probably the true vegetable food, yet it is phlogifon volatilized, as in putrid animil and vegetable fubfances, not in its fixed fate as in charcoal, which can have any effect, See Agriculture, Part I. Sect. i. et feq.

A very advantegeous method of nanuring grafslands, when tbere is an opportunity, is that of overflow ing them with water, which is moftly practifed with low flat grounds. For an account of the beft methods in ufe for this purpofe, fee the article Meas. D. W.

And on a ftrict obfervition, more of Tirgil's hufbandry is at this time practifed in England than in Italy itfelf. This change in the Ita-

## H U S

the corruptions that prevailed among the facerdotal Huffites. order.

There were other circumftances that contributed to inflame the refentment of the clergy againft him. He adopted the philofophical opinions of the realifts, and vehemently oppofed and even perfecured the nominalifts, whofe number and influence were confiderable in the univerfity of Prague. He alfo multiplied the number of his enemies in the year 1408, by procuring, through his great credit, a fentence in favour of the Bohemians, who difputed with the Germans concerning the number of fuffrages which their refpective nations were intitled to in all matters that were carried by election in this univerfity. In confequence of a decree obtained in favour of the former, which reftored them to their conftitutional right of three fuffrages, ufurped by the latter, the Germans withdrew from Prague, and, in the year 1409 , founded a new academy at Leipfick. This event no fooner happened, than Hufs began to inveigh with greater freedom than he had before done againft the vices and corruptions of the clergy, and to recommend, in a public manner, the writings and opinions of Wickliffe, as far as they related to the papal hierarchy, the defpotifm of the court of Rome, and the corruption of the clergy. Hence an accufation was bronght againft him, in the year 1410, before the tribunal of John XXIII. by whom he was folemnly expelled from the communion of the church. Notwithftanding this fentence of excommunication, he proceeded to expofe the Romifh church with a fortitude and zeal that were almoft univerfally applauded.
This eminent man, whofe piety was equally fincere and fervent, though his zeal was perhaps too violent, and his prudence not always circumfpect, was fummoned to appear before the council of Conflance. Secured, as he apprehended, from the rage of his enemies by the fafe conduct granted him by the emperor Sigifinund, for his journey to Conftance, his relidence in that place, and his return to his own country, John Hafs obeyed the order of the council, and appeared before it to demonftrate his innocence, and to prove that the charge of his having deferted the church of Rome was entirely groundlefs. However, his enemies fo far prevailed, that by the moft fcandalous breach of public faith, he was calt into prifon, declared a heretic becaufe he refufed to plead guilty againft the dictates of his confcience, in obedience to the council, and burnt alive in 1415 ; a punifhment which he endured with unparalleled magnanimity and refignation.

The fame unharpy fate was borne by Jerome of Prague, his intimate companion, who attended the council, in order to fupport his perfecuted friend. Jerome, indeed, was terrified into temporary fubmiffion; but he afterwards refumed bis fortitude, and maintained the opinions, which he had for a while deferted through fear, in the flame in which he expired in 1416.

The difciples of Hufs adhered to their mafter's doctrine after his death with a zeal which broke out into an open war, that was carried on with the moft favage and unparalleled barbarity. John Zirka, a Bobemian knight, in 1420 , put himfelf at the head of the Huffites, who were now become a very condiderable

Funtings party, and threw off the defpotic yoke of Sigifmund, who had treated his brechren in the moft barbarous Hutchefon. manner. Zikka was fucceeded by Procopius, in the year 1424. The acts of barbarity that were committed on both fides were flocking and horrible beyond expreffion : for not withitanding the irreconcileable oppolition between the religious fentiments of the conrending parties, they both agreed in this one horrible principle, that it was innocent and lawful to perfecute and extirpate with fire and fword the enemies of the true religion; and fuch they reciprocally appeared to each other. Thefe commotions in a great meafure fabfided, by the interference of the council of Bafil, in the year 1433.

The Huffites, who were divided into two parties, viz. the Calixtines and Taborites fpread over all Bohemia and Hungary, and even Silefia and Poland; and there are fome remains of them fill finbfifting in all thofe parts.

HUSTINGS (from the Saxon word Huflinge, i. e. concilium or curia), a court held at Guild-hall before the lord-mayor and aldermen of London, and reckoned the fupreme court of the city. Here deeds may be inrolled, outlawries fued out, and replevins and writs of error determined. In this court alfo is the election of aldermen, of the four members of Parliament for the city, \&c. This court is very ancient, as appears by the laws of Edward the Confeffor. Some other cities have likewife had a court bearing the fame name, as Winchelter, York, \&c.

HUSUM. a town of Denmark, in the duchy of Slefwick, and capital of a bailiwick of the fame name, with a frong citadel, and a very handfome church. It is feated near the river Ow , on the German Sea; and is fubject to the dakes of Holftein-Gottorp. E. Long. 9. 5. N. Lat. 54. 55.

HUTCHESON (Dr Francis), a very elegant writer and excellent pinilofopher, was the fon of a diffenting winifter of the north of Ireland, and was born on the 8 th of Angult 1694. He early difcovered a fuperior capacity; and having gone through a fchooleducation, began his courfe of philorophy at an academy, whence he removed to the univerfity of Glafgow, where he applied himfelf to all the parts of literature, in which his progref's was fuitable to his uncommon abilities.

He then retarned to Ireland; and entering into the miniftry, was juft about to be fettled in a fmall congregation of diffenters in the north of Ireland, when fome gentlemen about Dablin, who knew his great abilities and virtues, invited him to take up a private academy there. He complied with the invitation, and mot with much fuccefs. He had been fixed bat a fhort time in Dublin, when his fingular merits and accon:plifhments made him generally known ; and his acq:aintance was fought by men of all ranks, who had any tafte for literature, or any regard for learned men. The late lord vifcount Molefworth is faid to have taken great pleafure in his converfation, and to have affifted him with his criticifms and obfervations upon his "Inquiry into the Ideas of Beauty and Virtue," before it canie abroad. He received the fame favour from Dr Synge, lord lifhop of Elphin, with whom he alfo lived in great friendihip. The firft edition of this performance came abroad without the all-
thor's name, but the merit of it would not fuffer him Hutchefon to be long concealed. Such was the reputation of the Hutchinfor work, and the ideas it had raifed of the author, that lord Granville, who was then lord-lisutenant of Ireland, ient his private fecretary to enquire at the bookfeller's for the author; and when he could not leara his name, he left a letter to be conveyed to him: in confequence of which he foon became acquainted with his excellency, and was treated by him, all the time he continued in his government, with diftinguifhed marks of familiarity and efteem.

From this time his acquaintance began to be flill more courted by men of diftinction either for ftation or literature in Ireland. Archbihop King, the author of the celebrated book De origine mali, held him in great efteem; and the friendihip of that prelate was of great ufe to him in fcreening him from two feveral attempts made to profecute him, for daring to take upon him the education of youth, without having qualified himfelf by fubferibing the ecclefiaftical canons, and obtaining a licence from the bihop. He had alfo a large fhare in the efteem of the primate Bolter, who through his inflaence made a donation to the univerfiry of Glafyow of a yearly fund for an exhibitioner to be bred to any of the learned profetions. A few years after his "Inquiry into the Ideas of Beauty and Virtue," his "Treatife on the paffions" was publifhed : both thefe works have been often reprinted; and always admired, both for the fentiment and language, even by thofe who have not affented to the philofophy of them, nor allowed it to have any foundation in nature. About this time he wrote fome philofophical papers, accounting for laughter, in a different way from Hobbes, and more honourable to human nature : which papers were publifhed in the collection called Hibernicus's Letters.

After he had taught in a private acadcmy at Dublin for feven or eight years with great repuration and fuccefs, he was called, in the year 1729 , to Scotland, to be a profeffor of philofophy in the univerfity of Glafow. Several young gentlemen came along with him from the academy, and his high repatation drew many more thither both from England and Ireland. Here he fpent the remainder of his life in a manner highly honourable to himfelf and ornamental to the univerfity of which he was a member. His whole time was divided between bis ftudies and the daties of his office ; except what he allotted to friendhip and focicty. A firm conftitution and a pretty uniform State of good health, except fome few light artacks of the gout, feemed to pronife a longer life; yet he did not exceed the 53 d year of his age. He was mar. ried, foon'after his fettlement in Dublin, to Mrs Mary Wilfon, a gentleman's daugheer in the county of Lang. ford; by whom he left behind him one fon, Francis, Hutchefon, dostor of medicine. By this gentleman was publifhed, from the origitual manafeript of his father, "a fyftem of Moral Philofophy, in three books, by Francis Hutchefon, L. L. D. at Glafgow, 1755,' in two volumes, 4 to.

HUTCHINSON (John), a philofophical writer, whofe notions have made no inconfiderable noife in the world, was born in 1674. He ferved the duke of Somerfet in the capacity of lteward; and in the courfo of his travels from place to place employed himfelf in
conecting foffis: we are told, that the large and noble collecion bequeathed by Dr Woodward to the univerlity of Cambridge was aciually made by him, and even unfairly abtained from hint. When he lefr the duke's fervice to indulge his fudies with more freedom, the dule, then matter of the horfe to George I. made him his riding furveyor, a kind of finecure place of 200 l . a-j ear widh a good houfe in the Menfe. In 1724 he publifhed the firft part of Int/is's Principia, in which he ridiculed DrW oodward's Natural Hiftory of the Earth, and exploded the doctrine of gravitation eftablihed in Newton's Prinatipia: in 5727 , he publifhed the fecond part of Mofes's Friucipia, containing the principles of the Scripture Philofophy. Fron this time to his death, he publiflied a volume every year or-two, which, with the MSS. he left behind, were publifined in 1748 , in 12 vols 8 vo. On the Monday before his death, Dr Mead urged him to be bled ; faying pleafantly, "I will foon fend you to Mofes,', meaning to his ftudies : but Mr Hutchinfon taking it in the literal $\{⿷ \cap f e$, anfwered in a muttering tone, "I believe, Doctor, you will;" and was fo difpleafed, that he difmiffed him for another phy: fician; but died in a few days after, Auguft 28, 1737. Singular as his notions, are, they are not without fome defenders, who have obtained the appellation of Hutchinfonians. The reader may, find a diftinct and comprehenfive account of the Hutchinfonian fyfem in a Book intitled, Thoughts concerning Religion, \&c. printed :at Edinburgh 1743 ; and in a letter to a bifhop, annexed to it, firft printed in 1732.

HUXING of pike, among finhermen, a particular method of catching that fin.

For this purpofe, they take 30 or 40 as large bladders as can be got; blow them up, and tie them clofe and ftrong; and at the mouth of each tie a line, longer or horter according to the depth of the water. At the end of the line is faftened an armed hook, artfully baited; and thus they are put into the water with the advantage of the wind, that they may gently move up and down the pond. When a mafter pike has ftruck himfelf, it affordsgreat entertainment to feehim bounce about in the water with a bladder faftened to him ; at laft, when they perceive him almoft fpent, they take him up.

HUY, a town of the Netherlands, in the bifhopric of Liege, and capital of Condrafs. It is advantageoufly feated on the river Maefe, over which there is a bridge. E. Long. 10.22. N. Lat. 52. 31.

HUYGENS (Chriftian), one of the greateft mathematicians and aftronomers of the 17 th century, was the fon of Conftantine Huygens, lord of Zuylichem, who had ferved three fucceffive princes of Orange in the quality of fecretary; and was born at the Hague, in 1629. He difcovered from his infancy an extraordinary fondnefs for the mathematics; in:a little time made a great progrefs in them ; and perfected himfelf in the le ftudies under the famous profeffor Schooten, at Leyden. In 1649, he went to Holiftein and Denmark, in the retinue of Henry count of Naflau ; and was extremely defirous of going to Sweden, in order to fee Des Caites, but the count's fhort ftay in Denmark would not permit him. He travelled into France and England; was, in 1663, made a member of the Royal Society ; and, upon his return into France, M.

Colbert, being informed of his merit, fettled a confi- Huyfun. derable penfion upon him to engage him to fix at Pa ris; to which Mr Huygens confented, and faid there from the year 1666 to 168 I , where he was admitted a member of the acacemy of Sciences. He loved a quiet and ftidious manner of life, and irequently retired into the country to avoid interruption, but did not contract that morofenefs which is fo frequently the effect of folitude and retirement. He was the firft who difcovered Saxurn's ring, and a third fatellite belonging to that planet, which had hitherto efcaped the eyes of aftronomers. He difcocerel the means of sendering clocks exac., by applying the pendulum, and rendering all its vibrations equal by the cycloid. He brought telefcopes to perfection, made many other ufeful difcoveries, and died at the Hague in 1695 . He was the author of feveral excellent works. The principal of thefe are contained in two collections; the firft of which was printed at Leyden in 1682, in quarto, under the title of Opera varia; and the fecond at Amfterdam in 1728 , in two volumes quarto, intitled $0 p e-$ rareliqua.

HUYSUM, the name of feveral Dutch painters; the moil celebrated of whom was John, whofe fubjects were flowers, fruit, and landfcapes. According to Mr Pilkington, this illuttious painter hath furpalfed all. who have ever painted in that ftyle: and his works excite as much furprife by their finifhing as they excite admiration by their truth. He was born at Amfterdam in 1682, and was a difciple of Juftus van Huyfum his father. He fet out in his profefion with a moft commendable principle, not fo much to paint for the acquifition of money as of fame; and therefore he did not aim at expedition, but at delicacy, and, if poffible, to arrive at perfection in his art. Having attentively fudied the pictures of Mignon, and all other artigs of diginction who had paint ed in his own flyle, he tried which manner would fooneft lead him to imitate the lightnefs and fingular beauties of each flower, fruit, or plant, and then fixed on a manner peculjar to himfelf, which feems almof inimitable. His pictures are finithed with inconceivable truth; for he painted every thing after nature, and was fo fingularly exact, as to watch even the hour of the day in which his model appeared in its greateft perfection. By the judicious he was accounted to paint with greater freedom than Mignon or Braeghel ; with more tendernefs and niture than Mario da Fiori, Michael Angelo di Campidoglio, or Segers; with more mellownefs then De Hecm; and greater force of colouring than Baprift. His reputation rofe to fuch a height at laft, that he fixed immoderate prices on his works; fo that none but princes, or thofe of princely fortunes, conld pretend to become purchafers. Six of his paintings were fold at public fale in Holland for prices that were almoft incredible. One of them, a flower piece, for fourteen hundred and fifty guilders; a fruit piece for a thoufand and five guilders; and the fmaller pictures for nine hundred. The vaft fums which van Huyfum received for his works, caufed him to redouble his endeavours to excel ; no perfon was admitced into his room while he was painting, not even his brothers; and his method of mixing the tints, and preferving the luftre of his colours, was an irpenetrable fecret, which he never

## H U Y <br> [ 793 <br> H Y A

Hupfum, would difclofe. Yet this conduct is certainly not to his honour, but rather an argument of a low mind, fearful of being equalled or furpalfed. From the fame principle, he would never take any difciples, except one lady, named Huvernan; and he grew envisus and jealous even of her merit. By feveral domeftic difquiets his temper 'ecame changed; he grew morofe, fretful, and apt to withdraw himifelf from fociety. He had many enviers of his fame, which has ever been the fevere lot of the molt deferving in all profeffions; but he continued to work, and his reputation never diminified. It is univerfally agreed that he has excelled all who have painted fruit and flowers before him, by the confeifed faperiority of his touch, by the delicacy of his pencil, and by an amazing manner of finihing; nor does it appear probable that any furure artift will become his competitor. The care which he took to purify his oils and prepare his colours, and the various experiments he made to difcovt., the moft luftrous and durable, are inftances of extraordinary care andiaduftry as well as capacity. From having obferved fome of his works that were perfectly finithed, fome only half finithed, and others only began, the principles by which he conducted himfelf may perhaps be difcoverable. His cloths were prepared with the greateft care, and primed with white, with all poffible purity, to prevent his colours from being obfcured, as he laid them on very lightly. He glazed all other colours except the clear and tranfparent, not omitting even the white ones, till he found the exact tone of the colour ; and over that he finifhed the forms, the lights, the fhadows, and the reflections, which are all executed with precition and warmth, without drynefs or negligence. The greateft truth, united with the greateft brilliancy, and a velvet foftuefs on the furface of his objects, are vifible in every part of his compofitions ; and as to his touch, it looks like the pencil of narnre. Whenever he reprefented flowers placed in vales, he always painted thofe vafes after fome elegant model, and the bas-relief is as exquifitely finithed as any of the other parts. Through the whole he fhows a delicate compolition, a fine harmony, and a mont happy effect of light and fhadow. Thofe pictures which he painted on a clear ground are preferred to others of his hand, as having greater luftre, and as they demanded more care and exactnefs in the finining ; yet there are fone on a darkifh ground, in which appears rather more force and harmony. It is obferved of him, that in the grouping of his flowers, he generally defigned thofe which were brighteft in the cencre, and gradually decreafed the torce of his colonr from the centre to the extremities. The birds nefts and theiregrs, the feathers, infects, and drops of dew, are expreffed with the utmoft truth, fo as even to deceive the fyectator. And yer, after all this merited and juft praife, it cannot but be confeffed, that fometimes his fruits appear like wax or ivory, withont that peculiar foftnefs and warmeth, which is conftantly obfervable in nature. Befides hismcritasa flowerpainter, healf, painfed landfcapes with great, applaufe. Theyarewell compored; andalthongli he hadnever feenRone, he adorned his feenes with the noble remains of ancient nagnificence which are in that city. His pictures in that ftyle are well coloured, and every tree is diftinguifhed by a touch that is proper for the leating. The

Voł. VIII.
grounds are well broken, and difpofed with tafte and Huzzoor, judgment; the figures are defigned in the manner of Hyacinth. Lairefle, highly finifhed, and touched with a great de. 1 of firit; and through the whole compolition, the fcenes reprefent Italy, in the trees, the clouds, and the kies. He died in 1749 , aged 67.

HUZZOOR, a Hindoftan word ignifying The prefince; applied, by way of eminence, to the Mogul's court. Accurding to polite ufage, it is now applied to the prefence of every Natob or great man.

Huzzoor Neves; the fecretary who refides at court, and keeps copies of all firmauns, records, or letters.

HYACINTH, in natural Hiftory, a genus of pellucid gems, whofe colour is red with an admixture of yellow.

The hyacinth, though lefs ftriking to the eye than any other red gem, is not without its beanty in the fineft fpecimens. It is fomd of various lizes, from that of a pin's head to the third of an inch in diameter. They are harder than quartz-cryftals; tranfparent, and formed into prifms pointed at bothends. Thefe points are always regular with regard to the number of facets; being four on each facet, but the latter feldom: the fides of the main body are alfo very unceridin, in regard both to their number and flape; being found of four, five, fix, feven, and fometimes of eight lides; fometimes being fo compreffed as alnoft to refemble the face of a fpherical facetted garnet. Sometimes they are of a dodecaedral form like the garnet, but with more obtufe angles. The fpecific gravity of the hyacinth, according to Dutans, is 2.63 I ; buc Rome de L'ille fays that Brifon found it to be 3.6873 ; and the European hyacinths to be 3.760 .

The hyacinth, as well as all other gems, is divided into oriental and occidental; the former being very hard and brilliant, fo that they are frequently ranked among the topazes; but when foft, they are fuppoled to belong to the garnet kind, as mentioned under that article. The hyacinths, however, may generally be diftinguihed from the garnets by lofing cheir colour in the fire, becoming white, and not melting. The is a kind of a yellow-brown kyacinth, refembling the coluor of honey, which is diftinguifhed from the reft by the remarkable property of not being electrical, and being likewife inferior in hardnefs.

Onr jewellers allow all thofe gems to be hyacinths or jacinths that are of a due hardnefs with the mixed colour abovementioned; and as they are of very different beauty and value in their feveral degrees and mixture of colours, they divide them into four hins; three of which the; call fyacinths, but the fourth, very improperly, a ruby. I. When the fone is in its mot perfect ftate, and of a pure and bright flamt-colour, neither the rednor the yellow prevailing, in this fate they call it hyacintba la belle. 2. When it has an overproportion of the red, and that of a dukier colour than the fine high red in the former, and the yellow that appears in a faint degree in it, is not a fine, bright, and clear, but a dufky brownill yellow, then they call it the faffron hyacinth. 3. Such tiones as are of a dead whitig yellow, with a very fmall proportion of red in them, they call amber-byaciath. And, 4. When the ftone is of a fine deep red, blended with a dufy and very deep yellow, they call it a ra'acelie. 5 G

Dut

Hyacinthus But though the over proportion of a Atrong red in Hyacinthia this gem has made people refer it to the clafs of rubies, its evident mixture of yellow flows that it truly belougs to the hyacinth.

The hyacinth la belle is found both in the Eaft and Weft Indies. The oriental is the harder, but the American is often equal to it in colour. The rubacelle is found only in the Eaft Indics, and is generally brought over a mong the robies; but it is of little value: the other varieties are found in Silefia and Bohemia.

HYACINTHUS, hyac: nth, in botany: A genus of the monogynia order, belonging to the hexandria clafs of plants; and in the natural method ranking under the soth order, Cofonerice. The corolla is campanulated, and there are three melliferous pores at the top of the germen. There are fix fipecies; of which the moft remarkable is the orientalis, or eaftern hyacinth. Of this there are a great number of varieties, amounting to fome hundreds, each of which differs from the reft in fome refpect or other. This plant hath a large, purplifh, bulbous root, fending ip feveral narrow erect leaves eight or ten inches long; the flower ftalk is upright, robuft, and fucculent, from 10 to 15 inches in height: adorned upward with many large funnel or bell haped flowers, fwelling at the bafe, and cut half way into fix parts; collected into a large pyramidal fpike of different colours in the varieties; flowering in April or May.

Thefe plants are cultivated with the greateft fuccefs in Holland, from whence great numbers are annaally imported into Britain. Each variety is by the florifts diftinguifhed either by the name of the place where firft raifed, or the perfon who raifed them, or the names of illuftrious perfonages, as of kings, generals, poets, and celebrated ancient hiftorians, gods, goddeffes, \&c. They are fold by all the feed-dealers, The prices arc from three pence per root tofive or ten pounds or more; and fome varieties are in fuch high efteem among the florifts, that $20 /$ or $30 /$. will be given for a fingle bulb. They are hardy, and will profper any where, though the fine kinds require a little fhelter daring the winter. They may be propagated either by feeds or off-fets from the roots.

The properties of a good oriental liyacinth are, a ftem perfectly upright, of moderate length, and fo ftrong and well-proportioned that it will faftain the weight of the florets without bending: the florets thould be large, fwelling below, expanded above, and numerous, 10 or 15 at leaft, but are often 20 or 30 in number ; and hould be placed equally round the fem, the pedicles on which they grow longer below than above, diminifhing gradually in length upward in fuch a manner as to reprefent a pyramid, and each pedicle fufficiently frong to fupport the florets without drooping. The curious in thefe plants are careful never to plant the fine forts two years together in the fame bed of earth; for by planting them every year in a frefh bed, the beauty of the flowers is greatly improved.

HYACINTHIA, in antiquity, feafts held at Sparta, in honour of Apollo, and in commemoration of his favourite Hyacinth.

This Hyacinth was the fon of Amyclas king of Sparta, and was beloved both by Apollo and Zephy-
rus. The youth fhowing moft inclination to the former, his rival grew jealous; and, to be revenged, one day as Apollo was playing at the difcus, i. e. quoits, with Hyacinth, Zephyrus turned the direction of a quoit which Apollo bad pitched full nipon the head of the unhappy Hyacinth, who fell down dead. Apolle then trausformed him into a flower of the edme name ; and as a farther token of refpect, they fay, commanded this feaft. The Hyacinthia lafted three days; the first and third whereof were employed in bewailing the death of Hyacinth, and the fecond in feafting and rejoicing.

HYADES, in aftronony, are feven Rars in the bull's head, famous among the poets for the bringing of rain. Whence their name radus, from the Greek verv "to rain." The principal of them is in the lefe eye, by the Arabs called aldebaran.

The poets feign them the daughters of Atlas and Pleone. Their brother Hyas being torn to pieces by a lionefs, they wept his death with fach vehemence, that the gods, in compafion to them, tranflated them into heaven, and placed them in the bull's forehead, where they continue to weep; this conftellation being fuppofed to prefage rain. Others reprefent the Hyades as Bacchus's nurfes; and the fame with the Dodonides, who fearing the refentment of Juno, and flying from the cruelty of king Lycurgus, were tranllated by Jupiter into heaven.

HY 压NA, in zoology, fee Canis.
HY $\mathbb{E}$ NIUS lapis, in natural hiftory, the name of a flone faid to be found in the eyes of the byæna. Pliny tells us, that thofe creatures were in old times hunted and deftroyed for the fake of thefe ftones, and that it was fuppofed they gave a man the gift of prophecy by being put under his tongue.

HYBERNACULUM, in botany, winter-eUarters; defined by Linnæus to be part of the plant which defends the embryo herb from injuries du. ring the feverities of the winter. See Byib and Gemma.

HYBLA (anc. geog.), or ME GARA; which laft name it took from the Megareans, who led thither a colony ; called alfo Hybla Parva, and Galeotis. In Strabo's time Megara was extinct, but the name Hybla remained on account of its excellent honey named from it. It was fituated on the eaft coaft of Sicily, between Syracufe and the Leontines. Galeote, and Megarenfes, the names of the people, who were of a prophetic fpirit, being the defcendants of Galeus the fon of Apol10. Hyble us the epithet. - The Hyblai colles, fmalleminences at the fprings of the Alabas near this place, were famous for their variety of flowers, efpecially thyme; the honey gathered from which was by the ancients reckoned the beft in the world, excepting that of Hymettus in Attica. By the moderns it was called Mel Po $/ f$, for the fame reafon, namely, on account of its excellent honey, and extraordinary fertility, till it was overwhelmed by the lava of 灰tna; and having then become totally barren, its name was changed to Mal Paffi. In a fecond eruption, by a thower of afhes from the mountain, it foon reaflumedits ancient beauty and fertility, and for many years was called Bel $p_{a f f}$ : and laft of all, in the year 1669, it was again laid under an ocean of fire, and reduced to the moft wretched fterility; fince which time it is again known

Hyades
Hyble.

## H Y D

by the appellation of Mal Paff. However, the lava in its conrfe over this beautiful country has left feveral little iflands or hillucks, juft fufficient to llow what it formerly was. Thefe make a fingular appearance in all the bloom of the moft laxuriant vegetation, furrounded and rendered almoft inacceffible by large fields of black and rugged lava.

Hibla-Major, (anc. geog.), was fituated in the tract lying between mount titna and the river Symethus. In Paufanias's time defolate.
$H_{Y}$ ELA-Minor, or Fieraa, (anc. gcog.), an inland town of Sicily, fituated berween the rivers Oanus and Herminius; now Racusa.
HYBRIDA PLANTA, a monflrous production of two different fpecies of plants, analogous to a mule among animals. The feeds of hybrid plants will not propagate.

HY BRISTICA, (of $\cup C_{p s t}$ injury), in antiquity, a folemn feaft heldanong the Greeks, with facrifices and otherceremonies; at which the men attended in the apparel of women, and the women in that of men, to do honour to Venus in quality either of a god or a goddofs, or both. Or, according to the account given by others, the hybriftica was a feaft cetebrated at Argos, wherein the women bing dreffed like men, infulted their hurbands, and treated them with all marks of fuperiority, in the memory of the Argian dames having anciently defended their country with fingular courage againft Cleomenes and Demariatus.

Plutarch fpeaks of this feaft in his treatife of the great actions of women. The name, he obferves, fignifies infarm ; which is well accommodated to the occafion, wherein the women flutted about in men's clothes, while the men were obliged to dangle ir petticoats.

HYDATIDES, in medicine, little tranfparent veficles or bladders full of water, fometimes found folitary, and fometimes in clufters, upon the liver and various other parts, efpecinlly in hydrepical cafes.
hydATOSCOPAA, called allo htdromancy, a kind of diviation or method of foretelling future events by water.

HYDE (Edward), carl of Clarendon, and lord high chancellor of England, was defcended from an ancient family in Chellire, and born at Dinton near Hindon, in Wilthire, in 1608. He was entered of Magdalenhall, Oxford, where, in 1625, he took the degree of A. B. alid afterwards fudied the law in the MiddleTemple. In the parliament which begon at Weftminifter April 10,1640 , he ferved for Wotton Baffet in Wilthire. But that parliament beiug foon after diffolved, he was chofen for Saltallin Cornwall in the long parliament. His abilities were much taken notice of, and he was employed in feveral committees to examine into divers grievances ; but at laft being diffatisfied with the proceedings in the parliament, heretired to the king, and was madechancellor of the exchequer, a privy-councellor, and knight. Upan the declining of the king's caufe, he went to France, where after the death of king Charles I. he was fworn of the privy council to Charles II. In 1649, he and the lord Cottington were fent ambalfadors extraordinary into Spain, and in 1657 he was conftituted lord high chancellor of England. The year before the refuration, the duke of York fell in love with Mrs

Anne Hyde, the lord chancellor's elden daughter, but carefully concealed the amour both from the king and chancellor. As it twas by a promife of marriage, however, that he had gained upon her, he was atterwards induced to fulfil his engagement, and the ceremony was performedafter the reftoration. Upon the refloration, her father was chofen chancellor of the univerfity of Oxford; and foon after created baron Hindon, in Wilthire; vifcount Cornbury in Oxfordnhire, and earl of Clarendon in Wilthire ; and on the dearh of Henry lord Falkland, was made lord lieutenant of OxfordMire. He took care neither to load the king's prerogative, nor encroach upon the liberties of the people; and therefore would not fet afide the petition of right, nor endeavour to raife the far-cliamber or high-commifion courts again: nor did he attempt to repeal the bill for triennial parliaments; and when he might have obtained rwo millions for a ftanding revenue, he afked but one million two hundred thoufand pounds per annum, which he thought would fill put.the king upon the neceffity of having recourfe to his parliament. In this juft conduct he is faid to have been influenced by the following incident, which happened fome years be fore. When he firf began to grow eminentin the law he went down to vifit his father in Wilthire; who, one day as they were walking in the fields together, obferved to him, that men of his profeffion were apt to ftretch the prerogative too far, and to injure liberty; but charged him, if ever be came to any eminence in his profeffion, never to facrifice the laws and liberty of his country to hisown intereft or the will of his prince: he repeated his advice twice ; and immediately falling into a fit of an apoplexy, died in a few hours: and this circumftance had a laftinginfnence uponhim. In 1662, he oppofed a propofal for the king's marriage with the infanta of Portugal, and the fale of Dunkirk; however, the following y ear, articles of high treafon were exlibited againft him by the earl of Briftol; but they were rejected by the houfe of lords. In 1664 , he oppofed the war with Holland. In Auguft 1667, he was removed from his poft of lord chancellor ; and in November following impeached of high treafon and other crimes and mifdemeanors by the boufe of commons : apon which he retired into France, when a bill was paffed for banilling him from the king's dominions. See Britain, no 211, 217. He refided at Rouen in Normandy; and dying there in 1674, his body was brought to England and interred in Weftminfter abbey. He wrote, ri' A hiftory of the rebellion, 3 vols folio, and 6 vols octavo; a fecond part of which was lately bequearhed to the public by his lordfhip's defcendant the late lord Hy de and Cornbury. 2. A letter to the duke of York, and another to the duchefs of York, upon occafion of their embracing the Romifh religion. 2. An anfwer to Hobbes's Leviathan. 4. A hiftory of the rebellion and civil wars.ima Ireland, octavo, and fome other works.

The reverend Mr Granger; in his Biographical Hifory of England, obferves, that "the virtue of the earl of Clarendon was of too ftubborn a nature for the age of Charles II. Could he have been content (fays he) to have enflaved millions, he might have been more a monarcl than an unprincely king. But he did not only look upon hrimfelf as the guardian of the laws and liberties of bis country, but had alfo a pride 5 :G 2

## H Y D

in his nature that was above vice; and chofe rather to be a vidim himfelf, than factifice bis integrity. Fe had only one part to act, which was that ot an honeft man. His encmies allowed themfelves a much greater latitude; they loaded him with calumnies, blamed him even for their own errors and mifconduct, and helped to ruin him by fuch buftooneries as he defpifed. He was a much greater, perhaps a much happier, man, alone and in exile, than Charles the Second upon his thronc."

And the following character of this nobleman is given by Mr Walpole. "Sir Edward Hyde (fays he), who oppofed an arbitrary court, and embraced the party of an afllicted one, muft be allowed to have acied confcientioully. A better proof was bis behaviour on the reftoration, when the torrent of an infatuated nation intreated the king and his minifter to be abfolute. Had Clarendon fought nothing but power, his power hed never ceafed. A corrupted court and a blinded fopulace were lefs the caufes of the chancellor's fall, than an ungrateful king, who could not pardon lis lordihip's having refufed to accept for him the flavery of his country. Like juftice herfelf, he held the balance between the neceffary power of the fupreme magiftrate and the interefts of the people. This neverdying obligation his cotemporaries were taught to overlook and clamour againct, till they removed the only man, who, if he could, would have corrected his miafter's evil government. Almoft every virtue of a minifter mace his character venerable. As an hiftorian, he feems more exceptionable. His majefty and eloquence, his power of painting characters, his knowledge of his fubject, rank him in the firft clafs of writers; yet he has both great and little faults. Of the latter, his ftories of ghofts and omens are not to be defended. His capital fault is his whole work being a Jaboured juftifination of lking Charles. If he relates faults, fome palliating epithet always lides in; and he has the art of breaking his darkeft fhades with gleams of light that take off all impreffion of horror. Cne may pronounce on my lord Clarendon, in his double capacity of fatefman and hiftorian, that he aced fcr liberty, but wrote for prerogative."

Hyde (Dr Thomas), profeffor of Arabic at Oxford, and one of the moft learned writers of the 17 th century, was born in 1636; and ftudied firft at Cambridge, and afterwards at Oxford. Before he was 18 years of age, he was fent from Cambridge to London to affift Mr Brian Walton in the great work of the Polyglot Biole; and about that period underiook to tranfribe the Perfian Pentateuch ont of the Hebrew charagers, which archbimop Uther, who well knew the diffealty of the undertaking, pronounced to be an impoffible tafk unlefs to a nativePerfian. Afterthe had happily fucceeded in this, he affifted in correcting feveral p,rts of Mr Walton's work, for which he was perfectly qualified. He was made archdeacon of Gloncefter, cauon of Chilif-church, head keeper of the Bodleian library, and profelfor both of Hebrew and Arabic, in the univertity of Oxford. He was interpreter and fecretary of the Oriental languages, during the reigns of Charles II. James II. and William II.; and was perfectly qualified to fill this polt, as he could converfe in the languages which he underftood. Therenever was an Englifhman in his fituation of life who made fo
great a pregrefs; but his mind was foengrofed by his belordedtuaics, that he is faid to have been but ill qualitied to aprear to ally advantage in common con- Hydrange verfation. Of all his learned works (the very catalogue of which, as oblerved by Anth. Wood, is a curiofity), his Religic $\sqrt{\text { enem Fin Perfartm is the moft }}$ celebra.ed. Dr Gregory sharpe, the late learned and ingenious mafter of the Tcmple, has collected feveral of his pieces formerly printed, and republifhed them, with fome additional cillertations, and his life prefixed, in two elegant volumes quarto. This great man died on the 18 th of Feiruary, r7c2. Among his other works are, i. A Latin cranflation of Ullag Beg's obfervations on the longitude and latitude of the fixed itars; and, 2. A cetalogue of the printed books in the Bodleian library.

HYDNUM, in botany: A genus of the naturai orcer of fuagi, belonging to the cryprogamia clafs of plants. The fungus is echinated or prickly on the under iide. One of the fpecies, named the Imbricatam, is a native of Britain, and is found in woods. It hath a convex hat, tiled, fanding on a fmooth pillar, of a pale flefli-colour, with white prickles. It is eaten in Italy, and is faid to be of a very dolicate tatte.

HYDRA, in fabulons liftory, a ferpent in the marh of Lerna, in Peloponnefus, reprefented by the poets with many heads, one of which being cut off, another immediately fucceeded in its place, unlefs the wound was inftantly cauterized. Hercules attacked this monfter; and having caufed lolaus to hew down wood for fiaming brands, as he cut off the heads he applied the brands to the wouncs, by which neans he dettroyed the Hydra.

This hydra with many heads is fail to have been only a multitude of ferpents, which infefted the marmes of Lerna near Mycene, and which feemed to moltiply as they were deliroyed. Hercules, with the affiftance of his companions, cleared the country of them, by burning the reeds in which they lodged.

HYDRA, inaftronomy, a fouthern conftellation, confilting of a number of tars, imagined to reprefent a water ferpent. The fars in Hydra, in Ptolemy's catalogue, are twenty-feven; in Tycho's, nincteen; in Hevelius's, thirty-one.

EYDRA, in zoology; a genus of the order of zoophyta, belonging to the clafs of vermes. There are feveral fuecies, known by the general name of polypes. See Polype; and Aninalcule, no 24.6 feq .

HYDRAGOGUES, among phyficians, remedies which evacuate a large quantity of water in dropfies, The word is formed of ujop water, and àest to draw or lead; but the application of the term proceeds upon a miftaken fuppolition, that every purgative had fome particular humour which it would evacuate, and which could not be evacuated by any other. It is now, however, difcovered, that all ftrong purgatives will prove bydragogues, if given in large quantity, or in weak conttitutions. The principal medicines recommended as hydragogues, are the jnice of elder, the root of iris, foldanella, mechoacan, jalap, \&c.

HYDRANGEA, in botany: a genus of the digynia order, belonging to the decandria clafs of plants; and in the natural method ranking under the 13 th order, Succulente. The capfule is bilocular, biroftrated,

## HYD [ 797] HYD

Eydrafis and cut round, or parting horizontilly. There is but 1 one fpecies, viz. the arborefcens, a mative of North A. merica, from whonce it hati lately been fent to Europe, and is preferved ingardens, more for the false
of variety than beauty. It rifes about three feet high; and hath many foft pithy falks, garnifhed with two oblong heart-thaped leaves placed oppofice. The flowers are produced at the top of the falks in a corymbus. They are white, compofed of five petals with ten flamina furrounding the ftyle. It is cafily pro. pagated by parting the roots ; the beft time for which is the end of October. The plants thrive beft in a moitt foil, and require to be theltered from fevere froits.

HYDRASTIS, in botany: A genus of the polygamia order, belonging to the polyandria clafs of plants; and in the natural method ranking with thofe of which the order is donbeful. There is neither calyx nornectariam; there are three petals; and the berry is compofed of monofpermous acini.

HYIDRARGYRUM, a name given to mercury, or quicl filver. The word is formed of usop aqua, "water," and apzians, argentum, "filver; q. d. water of filver, on acconnt of is refembling liquid or melted filver.

HYDRAULICS, the frience of the motion of flaids, and the conftruction of all kinds of inftruments and machines relating therefo. Sce Hydrostatics, fect. iv.

HYDRENTEROCELE, in furgery, a fpecies of hernia, wherein the inteftines defcend into the fcrotum, together with a quantity of water.

HYDROCELE, in furgery, denotes any hernia arifing from water; but is particularly ufed for fuch a ore of the fcrotum, which fometimes grows to the fize of one's head, without pain, but exceedingly troublefome to the patieut. See Surgery.

HYDROCEPHALUS, a preternatural diftenfion of the head to an uncommon fize by a fagnation and extravafation of the lymph; which, when collected in the infide of the cranium, is then termed internal; as that collected on the outfide is termed external. See (the Index fubjoined to) Medicine.

HYDROCHARIS, the little water-lify: A genus of the anneandria order, belongiag to the dioecia clats of plants; and in the natural merhod ranking under the firft order, Palmue. The fpatha of the male is diphyllous; the calyx trifid; the corolla tripetalous; the three interior filaments fyliferous. The female calyx trifid; the corolla tripetalous; the fyles fix; the capfule has fix cells, and is polyfpermous inferior. There is only one fpecies, a native of Britain, growing in flow ftreams and wet ditches. It hath kidney fhaped leaves, thick, fmooth, and of a brownifl green colour, with white bloffoms. There is a variety with double flowers of a very fweet fmell.

HyDROCOTYLE, water-nayelwort: A genus of the digynia order, belonfing to the pentandria clafs of plants; and in the natural method ranking under the 45 th order, Umbellate. The umbel is fimple; the involncrum tetraphyllons; the petals entire; the feeds are half round and comprefled. There are feveral fpecies, none of which are ever caltivated in gardens. One of them, a native of Britain, growing in marliy grounds, is fuppofed by the furae.s to occafion
the rit in fleep. The leaves have centralleaf-ftulks, Hydrograwith about five fowers in a roride; the petals are of a reddilh white.

HYDROGRAPHY, the art of meafuring and deferibing the fea, rivers, canals, lakes, \&c.-With regard to the fea, it gives an account of its tides, coun-ter-tites, foundings, bays gulphs, creeks, \&c.; as alfo of the rocks, Chelves, fands, ीlallows, promontories, harbours; the diftance and bearing of one port from anorher; with every thing that is remarkuble, whether out at fea or on the coalt.

HYOROLEA, in botany: A genus of the digynid order, belonging to the pentandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The calyx is pentaphyllous : the corolla rotacenas; the filaments at the bafe are cordate ; the capfule is bilocular and hivalved.

HYDROMANCY, a method of divimation by water, pracifed by the ancients. See Divination, $n^{\circ} 7$.

HYDROMEL, honey diluted in nearly an equal weight of water. When this liquor has not fermented, it is called fimple hydromel; and when it has utidergone the firituous fermenration, it is called the vinctus hydromel or mead.

Honey, like all faccharine fubftances, vegetable or arimal, is fufceptible of fermentation in general, and particularly of the feirituous fermentation. To indace this fermentation, nothing is neceffary but to dilute it fufficiently in water, and to leave this liquor expofed to a convenient degree of heat. To make good vinous hydromel or mead, the whiteft, purett, and beff rafted honey muft be chofen; and this mult be put into a kettle with more than its weight of water: a part of this liquer mult be evaporated by boiling, and the liquor fommed, till its confitence is fuch that a frefl egg thall be fupported upon its furface without finking more than half its thicknefs into the liquor; then the liquor is to be ftrained and poured through a funnel into a barrel: this barrel, which ought to lie nearly full, mun be expoled to a heat as equable as is poffible, from 20 to 27 or 28 degrees of Mr Reaumur's thermometer, taking care that the bung-hole be lightly covered, but not clofed. The phenomena of the fuirituous fermentation will appear in this liquor, and will fubfift during two or three months, according to the degree of heat ; after which they will diminith and ceafe. Duriag this fermentation, the barrel muft be filled up occafionally with more of the fame kind of liquor of honey, fome of which ought to be kept apart on parpofe to replace the liquor which fows out of the barrel in froth. When the fermentation ceafes, and the liquor has become very vinous, the barrel is the to be put in a celiar and well clofed. A year afterwards the mead will be fit to pat into bottles.

The vinons hydromel or mead is an agreeable kind of wine; neverrbelefs it retains long a tafte of honey, which is unpleafing to come perfons; but this tufte ic is faid to lofe entircly by being kept a very long time.

The fpirituons fermentation of honey, as alfo that of fugr , and of the moft of vinous liquors, when it is wery faccharine, is generally moredificultly effected, requires more heat, and continues longer thon that of ordiatev wines made from the juice if irropes; and thefe vinous liquors always preferve a faccharine tafte. which

HYDROMETER, an inftrument to meafure the gravity, denlity, velocity, force, íc. of water and other Huids. See Hydrostatics, $n^{\circ}$ I3.

Though this inftrument is incapable of determining the fpecific gravity of liquors with perfect accuracy, yet in the way of public bufinefs it has undoubtedly the advantage of every other, on account of the eafe and expedition with which it can be ufed; and for this reafon it has been adopted by government, in order to determine the ftrengh of fpirituous liquors.
phil. Tranf. Dr Blagden, who was lately employed to make expe-
vol. 80 .
vol. 80.
P. 342. riments on this fubject, is of opinion, that glafs is the moft proper material for the conftruction of an hy- drometer. Its fenfibility depends on the fize of its ftem. In the old areometers the ftem was made fo large, that the volume of water difplaced between its leaft and greatef immerfions was equal to the whole difference of fpecific gravity between water and alcohol, or perhaps more; whence its fcale of divifions mult be very fmall, and could not give the fpecific gravity with mach accuracy. On this account weights were introduced, by means of which the fem could be made fmaller ; each weight affording a now commencement of its fcale; fo that the fize of the divifions on a given length was doubled, tripled, \&c. as one or more weights were employed, the diameter of the ftem being leffened in the fubduplicate proportion of the increafed length of the divifions. This method, however, in our author's opinion, has been carried to excefs; and the following is recommended as a proper mean betwixt thefe extremes, to determine the fpecific gravity of firituous liqnors to three places of decimals.

In this method the weight of water is fuppofed to be unity, or I with any number of cyphers annexed: "t the whole compafs of numbers, therefore, from rectified fpirit to water, at 60 degrees of heat, would be the difference between 825 , the weight of rectified fpirit, and 1000 the weight of water, which is 175 . To make allowance for the lighteft firit and heavieft water, however, at all the common temperatures, the difference may be fuppofed 220. The item might fhow every twenty of thefe divifions, and thus ten weights would be fufficient for the whole. Hence the inconvenience of fhifting the weights, which has always been complained of, would in a great meafare be avoided: as people verfant in that bulinefs would feldom err fo far as to the whole amount of the difference previous to making any trial. Hence alfo the ftem may be made finall enough, and the fcale graduated fo nicely as to make the inftrument fufficiently accurate.

According to this arrangement, it would be proper to have the weights adapted to the lydrometer marked with the different fpecific gravitics which they are intended to indicate; Zero on the top of the flem without a weight being fippofed to mean 800, and 20 at the bottom to fignify 820 , which number the firf weight would carry; the fucceflive weights being marked, 840,860 , \&c. ; and the divifion on the fem cut by the fluid under trial, would be a number always to be added to that on the weight; the fum of the two fhowing the true fpecific gravity. The weights hould undoubtedly be made to apply on tit top of the
ftem, fo as never to come in cuntact with the liquor; and in ufing the hydrometer, its ftem flould always be. preffed down lower than the point at which it will ultimately reft, that by being wetted it may oceation no refifance to the floid. The inftrument is felf flould be of as regular a thape and with as few inequalities as poffible, that all impediments to its motions may be avoided.
HYDROMPHALUS, in medicine and furgery, a tumor in the navel, arifing from a collection of water.
HYDROPHANES, Oculus Mundi, or Lapis Mutabilis, a kind of precions fone highly efteemed among. the ancients, but little known to the moderns till Mr Boyle made his obfervations upon ir. Its feccific gravity is about 2.048 ; its colour of an opaque whitilh. brown; it is not foluble in acids nor affected by alkalies, but is eafily cut and polifhed. Sometimes it gives fire with fteel, fometimes not. It is infufible perf:; but when urged by a blow-pipe, changes to a brownin britule fubstance. It is found in beds over the opals in Hungary, Silefia, and Saxony, and over the chalcedonies and agates in Ic cland. Thefe fones in general are either of a yellowifh green, milky grey, or of a yellow like that of amber.

The moft remarkable property of this fone is, that it becomes tranfparent by mere infufion in any aqueous fluid; but gradually refumes its opacity when dry. There are three of thefe fones in the Britifl mufeum: at London; the largeft of them about the fize of a cherry flone, but of an oval form. It is opaque and coloured like a common y ellow pea; it may be feratched, though not withour difficulty, by a common knife, not withtanding which it feems to leave a mark upon glafs. It does uot ferment with nitrous acid. When it has lain fome hours in water, it becomes tranfparent, and of a yellow amber colour. The change begins foon after the immerfion, and at one end in form of a little fpot; but in a fmall oue of the fame kind, the tranffarency begins round the edges. By degrees the fpor increafes, until the whole fone becomes uniformly clear throughout: when out of the water is lofes its tranfparency, firft at one end, and theargradually over the remainder, until the whole has become opaque; which change happens in lefstime thanit takes to become tranfparent. This change is not entirely peculiar to the hydrophanes. Bergman informs us, that fome fteatites produce the fame effect and $M$. Magellan, that the cruft of chalcedonies and agates frequently produce the fame appearance.

Meffrs Brackman and Velthein were the firft who particularly inquired into the nature of this fone, and inveftigated its properties, many of which were brought to light by their endeavours. Their account is to the following purpofe. As foon as the fone is put into water, it exhales a mufty fimell, feveral air-bubbles arife, and it becones gradually tranfparent. Some of the ftones becomes colouriefs as foon as they are thoroughly tranfparent, others have a more or lefs deep yellow colour; fome acquire a beautitul raby colour; and, larly, others gain a fine colour of mother-of-pearl, or of a bluish opal. Whatever be the colour of the liquor in which the hydrophan:s is immerfed, it gains only its uhal degree of tranfparency wi.h the colour peculiar to it. When we look at it in the moift fate,

Hydrophobia
Hydrom phyllax.
we perceive a luminous point, varying its fituation as the polition of the eye is altered. This luminons point is not, according to Mr Bruckman, the immediate image of the fun, but a reflection of that image refracted inthe fuiftance of the ftone itfelf, a phenomenon which probubly gave rife to the name of ocutus mundi. Mr Brackman left a piece of this fone weighing 35 grains feven hours in water, the fpacerequifite to make it perfectly traniparent; and in that time he found that it had gained three grains in weight. The hydrophanes becomes much fooner tranfarent when put into hot watir, and the fame happens if it be dipped in a very dilute acid, or rather a very dilute fol ition of alkali. When dipped in oil of vitriol, it becomes very quick:y tranfarent, and will continue fo, on account of the ftronga traction of that acid for moifture, which takes as much from the atmofphere as is neceffary to keep the ftone tranfparent; but its opacity will return if it be dipped in an alkaline liquor and afterwards dried.

HYDROPHOBIA, an averfion or dread of water : 2 terrible fymptom of the rabies canina; and which has likewife been found to take place iu violent inflammations of the ftomach and in hyfteric fits. See Medi-crne-Index.
HYDROPHYLACIA, a word ufed by Kircher and fame others who have written in the fame fyftem, to exprefs thofe great refervoirs of water which he places in the Alps and other mountains for the fupply of rive is which ran through the feveral lower countries. This he makes to be one of the great ufes of mountains in the economy of the univerfe.

HXDROPHYLLAX, in botany : A genus of the
monogynia order, belonging to the tetrandia clafs of plants. The calyx is tetraparitite; the corolla funnelchaped; the truit two edged and one fseded.

HYDROPHYLLUM, WATER-LEAF: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The corolla is campanul-ted, with five melliferous longitudinal ftria on the infide; the fligma is bifid; the capfula globofe and bivalved. There is only one fpecies, viz, the Virginianum, or water-leaf of Morinus. It grows naturally in Canadd and many other parts of America on moift fpongy ground. The root is compofed of many ftrong flefly fibres, from which arife many leaves with foot-ftalks five or fix inches long, jagged into three, five, or feven lobes, almoft to the midrib, indented on their edges. The flowers are produced in loofe clufters hanging downward, are bellflaped, and of a dirty white colour. It may be propagated by parting the roots ; which ought to be done in autumn, that the plants may be well rooted before fpring, otherwife they will require a great deal of water.

HYDROPS, in medicine, the fame with Dropsy.
HYDROSCOPE, an inftrument anciently ufed for the ineafuring of time.

The hydrofcope was a kind of water-clock, confifting of a cylindrical tube, conical at bottom : the cylinder was graduated, or marked out with divifions, to which the top of the water becoming fucceffively contiguous, as it trickled out at the vertex of the cone, pointed out the hour. Sec Hydrostatics, fect. vi.

[^3]:    (c) Junius derives for from the Greek $\pi p \circ$; Skinner, from the Latm pro; but I believe, fays Horne Tooke, that it is no other than the Gothic fubftantive fairina, "caufe." He imagines alfo that of (in the Gothic and Anglo-Saxon af) is a fragment of the Gothic and Anglo-Saxon words afara and afora, pofteritas, proles, \&c. In a word, he confiders for and of as nouns or fubitantives; the former always meaning cause, the latter always meaning confequence, off spring, fucceffor, folluwer, \&c. If this account of thefe words be juft, and we have no doubt of it, the prepofitions For and of are in fyntax to be confidered as nouns in appofition: with ocher nouns, or with fentences taken abftractly as nouns.
