HARMONICA. This word, when originally appropriated by Dr Franklin to that peculiar form or mode of mufical glafes, which he himfelf, after a number of happy experiments, had conltituted, was written Arnionica. In this place, however, we have ventured to reftore it to its native plenitude of fonnd, as we have no antipathy againh the moderate ufe of afpirations. It is derived from the Greek word appovia. The radical word is apsiv, to fuit or fit one thing to another By the word appovia the Greeks expreffed aptitudes of various kinds : and from the ufe which they made of that expreffion, we have reafon to conclude, that it was intended to import the higheft degree of refinement and delicacy in thofe relations which it was meant to fignify. Relations or aptitudes of found, in particular, were underfood by it; and in this view, Dr Franklin could not have fclected a name more expreffive of its nature and genios, for the inftrument which we are now to defcribe; as, perhaps, no mufical tone can poffibly be finer, nor confequently fuf- ceptible

H A R
which in the largeft glaffes is about an inch decp, and Harmoni-

Harmoni- ceptible of jufter concords, than thofe which it produces
In an old Englifh book, whofe title we cannot at
prefent recollect, and in which a number of various a mufements were deferibed, we remember to have feen the elements or firft approaches to mulic by glaffes. That athor enjoins his pupil to choofe half a dozen of fuch as are ufed in drinking; to fill each of them with water in proportion to the gravity or acutenefs of the found which he intended it hould produce ; and having thus adjufted them one to another, he might entertain the company with a church-tune. Thefe, perhaps, were the rude and barbarous hints which Mr Puckeridge afterwards improved. But, for a farther account of him, of the fate in which he left the inftrument, and of the fate to which it has afterwards been carried, we muft refer our readers to the following extracts from Dr Franklin's letters, and from others who have written upon the fame fulbject.

The Doctor, in his letter to Father Beccaria, has given a minute and elegant account of the Harmonica. Nor does it appear that his fucceffors have either more fenfibly improved, or more accurately delineated that angelicinftrument. The detail of hisown improvements, therefore, fhall be giren in his own words.
" Perhaps (fays he) it may be agreeable to you, as you live in a mufical country, to have an account of the new inftrument lately added here to the great number that charming fcience was poffeffed of beforc. As it is an inftrument that feems peculiarly adapted to Italian mofic, efpecially that of the foft and plaintive kind, I will endeavour to give you fuch a defcription of it, and of the manner of conftructing it, that you or any of your friends may be enabled to imitate it, if you incline fo to do, without being at the expence and trouble of the many experiments I have made in endeavouring to bring it to its prefent perfection.
" You have doubtlefs heard the fweer tone that is drawn from a drinking-glafs, by preffing a wet finger round its brim. One Mr Puckeridge, a gentleman from Ireland, was the firft who thought of playing tunes formed of thefe tones. He collected a number of glaffes of different fizes; fixed them near each other on a table: and tuned them by puting into them water, more or lefs as each note required. The tones were brought out by preffing his fingers round their brims. He was unfortunately burnt here, with his inftrument, in a fire which confumed the houfe he lived in. Mr E. Delaval, a moft ingenious member of our Royal Society, made one in imitation of it with a better choice and form of glaffes, which was the firft I faw or heard. Being charmed with the iweetnefs of iss tones, and the mufic he produced from it, I wifhed to fee the glaffes difpofed in a more convenient form, and brought together in a narrower compafs, fo as to admit of a greater number of tones, and all within reach of hand to a perfon fitting before the inftrument; which I accomplifhed, after various intermediate trials, and lefs commodious forms, both of glaffes aud conitruction, in the following manner.
"The glaffes are blown as near as poffible in the form of hemifpheres, having each an open neck or focket in the middle. The thicknefs of the glafs near the brim is about the tenth of an inch, or hardly quite fo much, but thicker as it comes nearer the neck;
an inch and a half wide within; thefe dimenfions lef. fening as the glaffes themfelves diminifh in fize, except that the neck of the fmalleft onght not to be fhorter than half an inch.- The largeft glafs is nine inches diameter, and the fmalleft three inches. Between thefe there are 23 different fizes, differing from each other a quarter of an inch in diameter. To make a fingle inftrument there fhould be at leaft fix glafes blown of each lize; and out of this number one may probably pick 37 glaffes (which are fufficient for three octaves with all the femiones) that will be each either the note one wants, or a little flarper than that note, and all fitting fo well into each other as to taper pretty regularly from the largeft to the fmalleft. It is true there are not 37 fizes; but it often happens that two of the fame fize differ a note or half a note in tone, by reafon of a difference in thicknefs, and chefe may be placed one in the other without fenfibly harting the regularity of the taper form.
's The glaffes being chofen, and every one marked with a diamond the note you intend it for, they are to be tuned by diminifhing the thicknefs of thore that are too harp. This is done by grinding them round from the neck towards the brin, the breadth of one or two inches as may be required; often trying the glafs by a well-tuned harpfichord, comparing the note drawn from the glafs by your finger with the note you want, as founded by that ftring of the harpfichord. When you come near the matter, be careful to wipe the glafs clean and dry before each trial, becauce the tone is fomething flatter when the glafs is wet than it will be when dry;-and grinding a very little between each trial, you will therely tune to great exactnefs. The more care is neceffary in this, becaufe if you go below your required tone there is no fharpening it again but by grioding fomewhat off the brim which will afterwards require polifhing, and thus in. creafe the trouble.
"The glaffes being thus tuned, you are to be provided with a cafe for them, and a fpindle on which they are to be fixed. My cafe is about three feet long, eleven inches every way wide within at the bigget end, and five inches at the fmalleft end; for it tapers all the way to adapt it better to the conical figure of the fet of glaffes. This cafe opens in the middle of its heighth, and the upper part turns up by hinges fixed behind. The fpindle is of hard iron, lies horizontally from end to end of the box within, exactly in the middle, and is made to turn on brafs gudgeons at each end. It is round, an inch diameter at the thickeft end, and tapering to a quarter of an inch ar the fmalleft. -A fquare fhank comes from its thickeft end through the box, on which hank a wheel is fixed by a fcrew. This wheel ferves as a fly to make the motion equable, when the fpindle, with the glaffes, is turned by the foot like a fpinning-wheel. My wheel is of mahogany, 18 inches diameter, and pretty thick, fo as to conceal near its circumference about 25 lb . of lead:-An ivory pin is fixed in the face of this wheel, about four inches from the axis. Over the neck of this pin is put the loop of the ftring that comes up from the moveable ftep to give it motion. The cafe flands on a neat frame with four legs.

To fix the glaffes on the fpindle, a cork is firf to

## H A K

Harmoni- be fitted in each neck pretty tight, and projecting a ca. little without the neck, that the neck of one may not touch the infide of another when put together, for that would make a jarring. Thefe corks are to be perforated with holes of different diameters, fo as to finit that part of the fpindle on which they are to be fixed. When a glafs is par on, by holding it ftiffly between both hands, while another turns the fpindle, ir may be gradually brought to its place. But care mult be taken that the hole be not too fmall, left in forcing it up, the neck fhould fplit; nor too large, left the glafs, not being firmly fixed, fhould turn or move on the fpindle, fo as to touch or jar againft its neighbouring glafs. The glaffes thus are placed one in another; the largeft on the biggeft end of the fpindle, which is to the left hand: the neck of this glafs is towards the wheel; and the next goes into it in the fame pofition, only about an inch of its brim, appearing beyond the brim of the firft, thus proceeding, every glafs when fixed fhows about an inch of its brim (or three quarters of an inch, or half an inch as threy grow fmaller) beyond the brim of the glafs that contains it; and it is from thefe expofed parts of each glafs the tone is drawn, by laying a finger on one of them as the fpindle and glaffes turn round.
" My largeft glafs is G a little below the reach of a compron voice, and my highelt $G$, inclading three complete octaves. To diftinguilh the glaffes more readily to the eye, I have painted the apparent parts of the glaffes within-fide, every femitone white, and the other notes of the octave with the feven prifmatic colours viz. C, red; D, orange; E, yellow; F, green; $G$, blue ; A, indigo; $B$, purple ; and $C$, red again ;fo that the glaffes of the fame colour (the white excepted) are always octaves to each other.
" This inftrument is played upon by fitting before the middle of the fet of glaffes, as before the keys of a harpfichord, turning them with the foor, and wetting them now and then with a fpunge and clean water. The fingers thould be firft a little foaked in water, and quite free from all uneafinefs; a-litule fine chalk upon them is fometimes ufeful, to make them catch the glafs and bring out the tone more readily. Both hands are ufed, by which means different parts are played together.-Otferve, that the tones are beft drawn out when the glaties turn from the ends of the fingers, not when they tarn to them.
" The advantages of this inftrument are, that its tones are incomparably fwect beyond thofe of any other ; that they may be fweiled and foftened at pleafure hy ftronger or weaker preffures of the finger, and conwinued to any length; and that the inftrument, ceins once well tuned, never again wants tuning."

Such was the fate in which this learned and ingenious author found, and fuch the perfection to which he carried, that celeftial inftroment of which we now treat. We call it celeftial; becaufe, in comparifon with any other inftrument which we know, the founds that it produces are indeed heavenly. Some of them, howcver, are fill confructed in the fame imperfect manner as the inftrument of Mr Puckeridge. They are contained in an oblong cheft; their politions are gither exaetly or nearly rectilineal ; the artificial femitones by which the full notes are divided form another parallel line; but the diftances between each of them are
much greater than thofe between the notes of the na- Harmonitural fale, as they take their places, not directly oppofite to the notes which they are intended to heighten or deprefs, but in a fituation between the higheft and loweft, to fhow that in afcending they are tharps to the one, and in defcending flats to the other. This ftructure, however, is doubly inconvenient; for it not only increates the labour and difficulty of the performer but renders fome mufical operations impracticable, which upon the Harmonica, as conftituted by Dr Franklin, may be executed with eafe and pleafure. In this fabric, if properly formed and accurately tuned, the inftrument is equally adapted to harmony and melody. But as no material ftructure could ever yet be brought to the perfection even of homan ideas, this inftrument ftill in fome meafure, retains the perverfe nature of its original ftamina. Hence it is not without the utmoft difficulty that. the glaffes can be tuned by grinding; and the leaft conceivable redundancy or defect renders the difcord uponthis inftrument more confpicuous and intolerable than upon any other. Hence likewife that inexpreffible delicacy to be obferved in the manner of the friction by which the found is produced: or if the touch be too gentle, it camnot extort the tone; and if too ftrong befides the mellow and delicate found which ought to be heard, we likewife perceive the finger jarring upon the glafs, which ningled with thofe fofter founds by which the fenfes had been foothed, gives a feeling fimilar to iron grating upon iron, but more difagreeable. In wind-inftruments the operation of the tongue, in harpfichurds the froke of the quill, and on the violin the morion of the bow, gives that ftrong and fenfible interruption of found which may be called articulation, and which renders the rhy thmus or meafure of an air more perceptible: but upon the glaffes, the touch of the finger is too foft to divide the notes with fo much force, unlefs the mind befteadily atcentive, they feem to melt one into another, by which neans the idea of rbythmus is almott loft. There is no way of performing a flur but by forbearing to ftop the firft found, when that which is immediately fubfequent commences. Thus, when the fur is of any length, and regularly defcends, or rifes by the interval of a fecond, all the notes in the flar. muft be heard together, and produce no agrecable difonance; yet if it rifes or defcends by perfect chords, the effeet is plealing. The open flake, or thrill, is anotheir unhappy operation upon mufical glaffes; which can only be performed by the alternate pulfations of two continued founds; differing from each other only by a note or femitone. But as thefe pulfations thus managed cannot be diftinct, the refult is far from being pleafant; nor is there any fuccedaneum for the clofe hake, which in the violin is performed by alternately deprefling the fring to the finger-board, and fuffering it to rife without entirely removing the finger from it, and which by giving the note that tremulous found produced by the human voice affected with grief, is a grace peculiarly addpted to pathetic and plaintive airs.

We proceed, however, to a farther account of the fame inftrument, extracted frem the Annual Regifter, vol. iv, p. 149.
" Befides thofe tones (fays the author of that account); which every elaflic ftring produces by a vi-

## H A R <br> $317] \quad \mathrm{H} A \mathrm{R}$

Harmoni- bration of all its parts, it is capable of another fet of tones, in which only a part of the fring is fuppofed to vibrate. There founds are produced by the lightelt touches, either by air, as in Ofwald's lyre, or by rubbing the bow in the fofteft manner on the ftring of a fiddle.
"Analogons to thefe founds are thofe produced by bells : in thofe laft, befides thofe tones produced by their elliptical vibrations, there are a fet of tones which may be brought by gently rabbing their edges, and in which the whole initrument does not appear to vibrate in all its parts as before.
" Take, for inftance, a bell finely polifhed at the edges; or, what will perhaps be more convenient, a drinking-glafs : let the edges be as free from any thing oily as polible; then, by moiftening the finger in water (I have found alnm-water to be beft), and rabbing it circularly round the edge of the glals, you will at length bring out the tone referred to.
"' This note is poffeffed of infinite fweetnefs; it has all the excellencies of the tone of a bell without its defects. It is loud, has a fufficient body, is capable of being fwelled and continued at pleafure ; and, befides, has naturally that vibratory foftening which muficians endeavour to imitate by mixing with the note to be played a quarter-tone from below.
" To vary thefe tones, nothirg more is required than to procure feveralbells or glaffes of different tones, tuned as nearly as poffible, which may be done by thinning the edges of either: or, for immediate fatis. faction, the glaffes may be tuned by pouring in water ; the more water is poured in, the graver the tone will be.
" Let us fuppofe then a double octave of thofe glaffes, thus tuned, to be procured. Any common tune may be executed by the fingers rubbing upon each glafs fucceffively; and this I have frequently done without the leaft difficulty, only chofing thofe tunes which are flow and eafy. Here then are numbers of delicate tones, with which muficians have been till very lately unacquainted ; and the only defect is, that they cannot be made to follow each other with that celerity and cafe which is requifite for melody. In order to remedy this, I took a large drinking-glafs, and by means of a wheel and gut, as in the electrical machine, made it to turn upon its axis with a moderately quick but equable motion ; then moiftening the finger as before, nothing more was required than mere. ly to'touch the glafs at the edge, without any other motion, in order to bring out the tone.
"Inftead of one glafs only turning in this manner, if the whole number of glaffes were fo fixed as to keep cominually turning by means of a wheel, it follows, that upon every touch of the finger a note would be expreffed; and thus, by touching feveral glaffes at once, an harmony of notes might be produced, as in an harpfichord.
"As I write rather to excite than fatisfy the curious, I thall not pretend to direct the various ways this number of glaffes may be contrived to turn; it may be fufficient to fay, that if the glaffes are placed in the fegment of a circle, and then a ftrap, as in a cutler's wheel, be fuppofed to go round them alt, the whole number will by this means be made to turn by means of a whecl.
" Inftead of the finger. I have applied moiftened Harmonileather to the edge of the glafs, in order to bring ont ca, the tone : but, for want of a proper elanicity, this did nor fucceed. I tried cork, and this anfwered every purpofe of the finger; but made the tone much louder than the finger could do. Inftead, therefore, of the finger, if a number of corks were fo contrived as to fall with a proper degree of preffure on the edge of the glafs, by means of keys like the jacks of an organ, it is evident, that in fuch a cafe a new and tolerably perfect inftrument would be produced; not folond indeed as fome, but infinitely more melodious than any.
's The mouths of the glaffes or bells ufed in this experiment fhould not refemble the month of a trumpet, but hould rather come forward with a perpendicular edge. The corks ufed in this cafe hould be fmoorh, even free from thofe blemines which are ufually found in them, and at the fame time the more elaftic the better."

In the two accounts here given feers to be comprehended every thing valuable which has been faid upon the fubject. It remains, however, our permanent opinion, that the form and fructure defigned and conftituted by Dr Franklin is by much the moft eligible; nor can we admit, that a cork, however fuccelsfully applied, will produce the fame mellownefs and equality of tone in general with the finger. It appears to us, that, by this kind of voluntary aturition, a note may be fuak or fwelled with much more art and propriety than by the fubftitution of any thing elfe extrinfic to the hand ; and when chords are long protracted, that degree of friction, which renders every found in the chord fenfible to the ear, without harthnefs, muft be the moit agreeable. For this reafon, likewife, we hould recommend alum-water in preference to chalk.

From what has already been faid, it will eafly be perceived, that this inftument requires to be tuned with the nicelt degree of delicacy which the laws of temperament will poffibly admit. For thefe laws the reader will namrally have recourfe to the article Music $\dagger$, in + Char: viis this Dictionary ; where, from $M$ D'Alembert is gi-art: 64 . ven a plain and fatisfactory account, both of the niethod propored by Rameau, and of that eftablified in common practice, without anticipating the experience and tafte of the reader, by dictating which of thefe plans is preferable. To thofe who have occation to tune the inftrument, it may likewife be ufeful to perule the detached article Temperanent in this Wrork. Without recapitulating the different roles of alteration preforibed in thefe accounts, we litall prefuppote the reader acquainted with them; and proceed to defcribe how, under their influence, the Harmonica may be taned. But it is previoully expedient to obferve, that the fame rules which condtet the proce is of tuning a harpfichord, will be equally effeftual in timing the Farmonica; with this only difference, that greater delicacy in adjufting the chords thould, if practicable, be attempied.

There are different notes from whence the procedure of tuning may commence. La or $A$, which is the key that pretty nearly divides the harpichord, is chofen by fome; this la in common finets is 24 natural keys. from the botion, and 13 from the top: and the at above it, or fecond C apon the G cleff, by others. This laft we ghould rather advife, becaule we imagine thofe interyals

## H A R [ 318 ] HAR

Harmoni- intervals which we have called feconds najor to be nore ca. juft through the whole octave, when the courfe of tu. ning is begun by a natural femitone. The initiate, therefore, may begin by turning the fecond $u t$ of his Harmonica, or C above the treble cleff, in unifon with its correfpondent $C$ upon the harpfichord or any other inftrument in concert-pitch; then, defcending to its octave below, atjuft it with the $u t$ above, till cvery pulfation if poffible be loft, and the founds rendered fcarcely diftinguifhable when fimultancoully heard. To the loweft note of this octave he muft tune the fol or $G$ immediarely above it, by a fifth, itill obferving the laws of temperament : To this $G$, the re, or D immediately above it, by the fame chord: To the re, or D above, its octave below : To this, ly a fifth, the la or A immediately above it: To la, the mi, or E afcending in the fame proportion : To mi, its octave below : To this, the $f$ or B immediately above ir by a fifth: To the firft $u t$, or C , which was tuned, the $f a$ or F immediately below by the fame chord.

That the practitioner may be ftill more fecure in the juftice and propriety of his procedure, he may try the thirds of the notes already adjufted, and alter, as much as is confiftent with the fifths and octaves, fuch among thefe thirds as may feem grating and difagreeable to his car. Thus far having accomplifhed his operation, he may tune all the other natural notes whether above or below by octaves. His next concern is with the femitones. And here it will be fuggefted by common fenfe, that as in all inftuments with fixed fcales the flarp of a lower muft likewife anfwer for the flat of a higher tone, the femitone ought as nearly as poffible to divide the interval. He may begin with la or A fharp; which la in its natural tate is a third minor beneath the $u t$ or C , from whence he began in the natural fcale. This femitone fhould correfpond with the F natural immediately above by a fifth. To it may be tuned the re or D fharp inmediately below by a fimilar chord : to D Charp, its octave above: To fi or B narural, immediatelyabove the la or A firft mentioned, may be adjufted the F or fa fharp immediately above it : To this its octave below : To that octave, the C or $u t$-harp above by a fifth: To the Charp, its octave below: To this, by a fifth, the G or fol hlarp above. Between this G fharp and the D fharp immediately above it, the fifth will probably be too flarp; but if the others are juftly tuned, that difcord will not be extremely offenfive; and it is a neceffary confequence of temperament. The reft of the Charys and flats, like their naturals, whether afcending or defcending, may be tuned by their octaves.

The notes, with their chords, may be expreffed by letters and figures, thus; where, however, it mult be oblerved, that the higher notes of any chord are marked with larger capitals. It hould likewife be remarked, that the figures are not expreffive of the different ratios which the notes bear one to another, confidered with refpect to their vibrations; but only fignificant of their nominal diftances, according to the received de-

 ${ }^{5}{ }_{*}^{5} G \notin$. In running over the fharps and flats as the
naturals, it will likewife be neceffary to try the thirds, Harmoniand to alter fuch as may offend the ear ; which, if cauca. tioufly done, will not fenfibly injure the other chords. -Though this article has been protracted to a length which we did not originally intend, we have however the fatisfaction to find, that it comprehends every thing effential ; fo that any perfon who underftands the nature of chords, and the practical principles of mufic as univerfally tanght, may not only be able to tune his infrument, but to acquire its whole manœuvre, without the leaft affiftance from a mafter.

On Plate CCXXVI. is reprefented an inftrument of this kind, made by Mr Dobb of St Paul's churchyard, London.

Though this topic appeared in itfelf complete in the former edition of this extenfive work, yet having fince received from Dr Edmund Callen of Dublin the following obfervations, and reflecting that men of mufical talents have not only different taftes, but different powers of mechanical operation, we have thought it proper to fubmit to the choice of our readers, either Dr Franklin's form and arrangement of the glaffes, or that which has been adopted by Dr Cullen; but in either cale, we would recommend it to the initiate in this inftrument, to diftinguifh by colours, according to Dr Franklin, the notes and femitones.-We likewife cannot forbear to think, that the complete bals practicable on the harmonica, is by many degrees preferable to the chords with which Dr Cullen propores to grace every emphatic note; with which, from the fructure and arrangement of his inftrument, he is under a neceffity of deluding inftead of fatisfying the ear, with the full effect of the regular procedure of the treble and bals upon the fame inftrument.

This inftrument the Doctor defcribes as confinting"of 35 glaffes of different fizes, anfwering to fo many diftinct founds, and ranged in the manner hereafter defcribed. They are exactly of the form of a cocoa nut when the ufual quantity of the top is cut off, or the fugar-bowls made of cocoa-nut thells fo much in ufe will give a preeife idea of their figure. They are blown with plain long ftalks which are fitted to wooden feet ferewed on 2 board at proper diftances, in fuch a manner that the circular tops of all may be in the fame horizontal plane, at the diftance of about an inch afunder. Of thefe 35, so only are allotted for half tones; there remain therefore 25 for the diatonic fcale. The loweft note correfponds to $G$ in the bafs clef; hence it extends upward to the octave about $C$ in alt. For uniformity, take the glaffes which are chofen gradually and regularly diminifhing in fize as they afcend in tone. This, however, is not abfolutely neceffary, as the tone of the glafs does not entirely depend upon its fize, but in a great meafure upon the proportion of its different parts to onc another : hence the glafs correfponding to one note may be finaller than a glafs correfponding to a note threc or four tones higher: lowever, where it is practicable, they fhould always be chofen gradually diminifing as theyafcend, both on account of the eiegance of appearance, and that an equality in point of loudnefs may be preferved; fur, as every body knows, an inftrument may be liable to great inequality in point of ftrength, though perfectly in tune. This munt have a very bad effect ; and therefore we find performers on the violin and otherinftruments of that kiad very folicitous about the propor

Harmoni- tional thicknefs of their frings. The glaffes being ca. chofen in the beft manner circumftances will permit, we proceed to arrange them. Here let me obferve, that in general the diameter of the largeft glafs at its mouth is about feven inches, and its folid contents about five Englith pints, while the higheft is of about $\frac{8}{4} \mathrm{inch}$, and its contents abour $\frac{2}{3}$ of a gill: this, however, is arbitrary, and depends upon the pitch of the inftrument. In arranging the glaffes, we fhall, to avoid confufion, take the diatonic fcale firft, and afterwards the half tones will be eafily underftood. The wooden feet before mentioned are to be fcrewed on a ftrong board of a proper fize, and they are difpofed at convenient intervals in rows perpendicular to the longeft fides of the rectangular board on which they ftand. In thefe feet the glafes are difpofed in the following manner: Beginning with the loweft note $G$, we fix that on the foot which ftands in the neareft angle of the board on the left hand, $A$ in the next bottom in the fame perpendicular line, $B$ in the third; when we come to $C$, however, we do not place it in the fame perpendicular line, bue in the neareft bottom of the fecond perpendicular row to the left hand, $D$ in the fecond of the fame row, $E$ in the third; F again in the nearen bottom of the third row, $G$ in the fecond of the fame row, $A$ in the third; $B$ again in the neareft bottom of the fourth row, $C$ in the fecond of the fame, and fo on. By this contrivance, it is eafy to fee an immenfe compafs is obtained! fo great a one indeed, that if the glaffes were difpofed according to the old method, regularly afcending in a line parallel to the front of the inftrument, to take in the fame compafs, it muft fretch to a confiderable length, no lefs than a length equal to the fum of ail the perpendiculars we before fpoke of, which in ordinary fize of the glafles would amount to upwards of 16 feet; the inconvenience of which it is unneceffary to dwell upon. As to the half tones, perhaps a more judicious and convenient arrangement may be thought of for them: but the prefent mode is far from inconvenient, except in fome keys; and it is fufficiently commodious for performing fuch airs as are beft fuited to the nature and defign of the inftrument. After explaining the arrangement, we hall fpeak fomewhat more exactly of them. Eb on the firft line of the treble tave ftands in the fourth bottom of the firf perpendicular row to the left hand; $\mathrm{F}_{\mathrm{t}}$ on the firf fpace ftands in the fourth place of the fecond row, Gq on the fecond line of the treble ftave ftands in the fourth of the third row, $\mathrm{C}_{5}$ on the third face of the fame ftave ftands in the fame manner in the fourth row, and fo on, afcending to F \& in the fifth row, G 9 in the fixth, $A$ \& in the feventh, $\mathrm{C}^{4}$ in the eighth. In the ninth perpendicular row, that is, the laft to the right hand in the diatonic fcale, ftands C alone ; but immediately behind is placed Bb of the middle line of the treble fave, and again behind it Dhof the fourth line of the treble flave, which finithes the whole. There is fomething fingular, and perhaps whimlical, in the diftribution of the half tones; but it is found fufficiently convenient; and if a better is thought of it may eafily be adopted. In the mean time I mutt obferve, that two of them, viz. $\mathrm{C}^{-}$and F ?, fanding immediately behind the $D$ and $G$ relpectively above them, are fingularly well fitted for performing running paffages either upor down in the key of G. Ex. gr. let us fuppofe that we

## 319 ] <br> HAR

have that very common $A, G, F$, $E$ femiquavers. HarmoniHere the performer touches $A$, which is in the firft place ca. of the 6th row, with hisleft hand, $G$ with the fore-finger of his right, $\mathrm{F}_{\mathrm{g}}$ with the middle, and E again with the left hand; in the fame manner may $\mathrm{E}, \mathrm{D}, \mathrm{C}_{\mathrm{G}}$. and B , be played, or upwards by inverting the motion : thus we can with the umoft eafe runeither up or down two very frequent paffages in a key, which might naturally be fuppofed difficult upon this inftrument, and that with any given rapidity. I with as much could be faid of all the other half tones of which, by the bye, fome are altogether wanting; it is obvious, however, that they may eatily be added, if we can find convenient places; and I apprehend even that verypracticable. Be chat as it may, nowwithftanding the feemingly inconvenicnt fituation of fome half tones, and the cotal want of others, pieces may be performed on this inftrument of confiderable rapidity. I myfelf, though very far from being an accomplifhed player, can with great cafe go through all the parts of Fifher's celebrated Rondeau; nay, I have heard the fifth concerto of Vivaldi played upon it with as much diftinctnefs as upon a violin. The glaffes are not neceflarily chofen perfectly in tune, but are tuned by the help of a quantity of water. Here however two cautions are neceffary: if, By mo means to take a glafs which is, when whthout water, flatter than the note you intend; as in that cafe you cannot remedy jt, the water making the tone ftill flatter, rather let it be fomewhat fharper, and you may tune it to the utmoft nicety by a litule water. The fecond caution is, not to choole a glafs which is very much fharper than the note required; as in that cafe, fo large a quantity of water will be required to tune it as will entirely fmother the tone.
"This inftrument is to be played fomewhat in the manner of the harmonica, viz. the fingers are to be well wetted; and by the application of them to the fide, affifted by a proper motion the found is prodaced. And here I would obferve that the proper motion is, to make the fingers follow the thumb, not the thumb follow the fingers in going round the glafs: it is neceffary alfo to preferve the circular motion very exactly, as the leaft deviation from it prodaces the moft horrible found that can be conceived. It is likewife to be obferved, that you muft touch the fmaller glaffes upon the very top of the brim : and for that purpore the palm of the hand molt be nearly parallel to the top of the glafs; but in coming to the larger glaffes, it is abfolutely neceffary to make the fingers to tonch the fide, not the top of the glafs; and the larger the glafs, the more diltant from the top mult they be tonched. Practice alone can determine this matter.
"From this difpolition of the glaffes, it is cafy to fee that the perfect chord of $\mathbf{C}$ is always moft completely in our power, namely, by ufing different fingers to the different notes at the fame time; and although a fall bafs cannot be executed upon this inftrument, we have always a great number of accompaniments which can cafily be introduced; more perhaps than upon any inftrament, the organ and others of that fpecies excepted. The thirds or fifths occalionably can be introduced; and when done with tafte and judgment, will fcarctly yield to a midding bafs. It to this be added a thrilling foftnefs of the tones, inimitable by any other fubftance, it will readily appear to be an inftrument more in the true flyle

## HAR

about that: And if he will fit at our inftrment, he Harmonimay, though at the expence of much eafe in point of ca, execution.

Harmony.
" Let us now confider fame objections that have been made to this inftrument. One is, that neceffity of ftanding, in order to do any thing capital upon it. But is not that the cafe in all inftruments, except where the performer lits of neceflity? Did ever any one fee Giardini or Fifher play a folo fitting? But for the fatisfaction of thefe torpid gentlemen, I can faithfully aflare them, 1 knew a lady who performed on this inftrument perfectly well, though the had lof the ufe of both her legs. A mone ferious and important objection lies both to this and the harmonica, viz. the want of a hake. How this is fapplied upon the harmonica, I cannot fay, as I never faw it even attempted: but on our inftrument, aldhough a very perfect thakecan fcarcely be produced, fomething fo Jike it may be done as will fairly excufe the want; and that is, by whirling the two ftands round the note concerned with the fhake with the utmot velocity, beginning the lower note a little fooner than the other. By this means, except in very large glaffes where the vibrations are too diftant in time, fach an intermisture of the two founds is produced, as extremely well imitates a fine gake, and the dexterous performer will make the beat in a turned fhake with a fpare finger. This operation requires fome dexterity; but this is a charge common to all mufical inftruments; and I quention not but that the Highland bagpipe itfelf requires fome fort of ikill.
"U Uon the whole, I am clearly of opinion, that the harmonica, and more efpecially this inftrument whicle has as yet got no name, is the molt exquifite and noble prefent that the lovers of true harmony have ever yet received; and it is with much aftonifhment I find this invaluable treafure almoft entirely confined to Ireland, a countty not very remarkable for mufical tafte or talents: But I hope foon to fee this elegant fpecies of mufic very generally known and practifed over all Europe ${ }^{23}$.

HARMONY. The fenfe which the Greeks gave to this word in their mutic is fo much lefs eafy to be determined, becaufe the word itfelf being originally a fubftantive proper, it has no radical words by which we might analyfe it, to difcover its etymology. In the ancient treatifes which remain to us, harmony appears to be that department whofe object is the agreeable fuccelfion of founds, merely confidered as high or low; in oppofition to the two others called rhythmica and metrica, which have their principle in time and meafure. This leaves our ideas concerning the aptitude of found vague and undetermined; nor can we fix thent without ftudying for that purpofe all the rules of the art; and even after we have done fo, it will be very difficult to diftinguifh harmony from melody, unlefs we add to the laft the ideas of rythmus and meafure; without which, in reality, no melody can have a diftinguining character: whereas harmony is characterifed by irs own nature, independent of all other quantities except the chords or intervals which com. pofe it.

It appears by a paffage of Nichomachus, and by others, that they likewife gave the name of barmony to the chord of an octave, and to concerts of voices and inftruments, which performed in the diftance of an oc-

Harmony. tave one from the orher, and which is more commonly called antiphone.

Harmony, according to the moderns, is a fucceflion of chords agteeable to the laws of modulation. For a long tume this harmony had no other principle but fuch rules as were almolt arbitrary, or folely founded on the approbation of a practifed ear, which decided concerning the agreeable or difagretable fuccencu of chords, and whofe determinations werc at laft reduced to calculation. But faher Nerfene and M, Saveur having found that cvery found, however fimple in appearance, was always accompanied with other founds lefs fenfibe, which confitute with itfelf a penfect chord-major; with this experiment M. Rameall fet out; and upon it formed the batis of his harmonic fyftem, which he has extended to a great many volumes, and which at laft M. D'Alembert nas taken the wonble of explaining to the puldic.

Signior Tartini, taking his route from an experiment which is newer and more delicate, yet nor lefs cerain, has reached conclutions fimilar enough to thofe of Ratheal, by purtuing a path whofe direction feems quite opposite. According to M. Rameau, the treble is generated by the bafs; Signior Tartini makes the bafs refult from the treble. One deduces larmony from melody, and the other fuppofes quite the contrary. To determine from which of the two fchools the beft performances are likely to proceed, no more is weceffary than to invenigate the end of the comporer, and difcover whether the air is made for the ascompaniments, or the accompaniments for the air. At the word System in Rouilican's Mufical Dietionary, is given a delineation of that publihed by Signior Tartini. Here he continues to peak of M. Rameau, whom he has followed through the whole work, as the artift of greatefl authority in the country wherc he writes.

He thinks himfelf obliged, however, to declate, That this fyftem, however ingenious it may be, is far from being founden upon hature, an affirmation which he inceffantly repeats: " That it is only catablifhed upon analogies and congruities, which a man of invention may overturn to morrow, by fubftituting others more natural: that, in fhort, of the experiments from whence he deduces it, one is detected fallacinus, and the other will not yield him the confequences which he would extort from it. In reality, when this author took it in his head to dignify with the title of de monffration the reafonings upon which he eftaolined his theory, every one turned the arrogant pretence into ridiçule. The Academy of Sciences loudly difapproved a title fo ill founded, and fo gratuitoully aflumed ; and M. Eftive of the Royal Socicty at Montpelier, has Hown him, that even to begia with this propolition, That according to the law of nature, founds are reprefented by their octaves, and that as the octaves may be qubftituted for them, lhere was not any one thing demonftrated, or even firmly eftablifhed in his pretended demonfration." He returns to his fyften.
"The mechanical principle of refonance prefents us with notbing but independent and folitary chords; it neither preferibes nor eftablifhes their ficceffion. Yet a regular facceffion is neceflary; a dietionary of felected words is not an oration, nor a collection of legitimate chords a piece of mufic: there mult be a Vol. VIII.
meaning, there muft be connections in mufic as well Harnony.
as in language: it is necellary that what has preceded fould tranfinit fomething of its nature to what is fubfequent, fo that all the pants conjoined may form a whole, and be ftamped with the genuine charatiter of unity.
"Now, the complea fenfation which refults from a perfect chord muft be refolved into the fimple fenfation of each particular found which compofes it, and into the fenfation of each particular interval which forms ic, afcertained by comparifon one with another. Beyond this there is nothing fenfible in any chord; from whence it follows, that it is only by the relation between founds, and by the analogy between intervals, that the connection naw in queltion can be eftablifhed; and this is the genuine, the only fource, from whence flow all the laws of harmony and modulation. If then, the whole of harmony were only formed by a fucceffion of perfect chords-major, it would be fufficient to proceed by intervals fimilar to thofe which compofe fuch a chord; for then fome one or more founds of the preceding chord being neceffarily protracted into that which is fubfequent, ail the chords would be found fufficiently connected, and the harmony would, at leaft in this fenfe, be one.
"But befides that thefe fucceffions muft exclude all melody by excluding the diatonic feries which forms its foundation, it would not arrive at the real end of the art ; becaufe, as mufic is a fy tem of meanings like a difcourfe, it ought, like a difcourfe, to have its periods, its phrafes, its furpenfes, its cadences, its punctuation of every kind; and becaufe the uniformity of a harmonic procedure implies nothing of all this, diatonic procedures require that major and minor chords fhould be intermixed; and the neceflity of difionances has been felt in order to diftinguifh the phrafes, and render the cadences fenfible. Now, a connected feries of perfect chords-major can neither be productive of perfect chords-minor nor of difonances, nor can fenfibly mark any mufical phraie, and the punctation maft there be found entirely defective.
" M. Ramean being ablolutely determined, in ins fyftem, to deduce from nature all the harnony practifed among ws, had recourfe for this effect, to another experiment of his own invention, of which I have formerly fpoken, and which by a different arrangement is taken from the firf. He pretended, that any fimple found whatever afforded in it multiplies a perfect minor or flat chord, of which it was the dominant or fifth, as it furnifhed a perfect chord-major by the vibration of its aliquot parts, of which it is the tonic or fundamental found. He has affirmed as a certain fact, that a vocal ftring caufed two others lower than itfelf to vibrate throtgh their whole extent, yet without making them produce any found, one to its twelfth major and the other to its feventeenth; and from this joined to the former fact, he has very ingenioully dedu. ced not only the application of the minor mode and of diffonances in barmony, but the mules of harmonic phrafes and of all modulation, fuch as they are found at the words Cboxd, Accompaniment, Funtamentia Bafs, Cadcnce, Diffonance. Modulation.
" But firft (continues Roufeau), the experiment is falfe. It is difcovered, that the ftrings tuned beneath the fundamental found do not entirely vibrate

Whenk

## HAR [ 322 ] HAR

Harmony. when this fundamental found is given ; but that they are divided in fuch a manner as to return its unifon alone, which of confequence can have no harmonics below. It is moreover difcovered, that the property of ftrings in dividing themfelves, is not peculiar to thofe which are tuned by a twelftl and feventeenth below the principal found; but that ofcillations are likewife produced in the lower ftrings by all its multiples. Whence it follows, that, the intervals of the twelfth and feventeenth below not being fingular phenomena of their kind, nothing can be concluded in favour of the perfect minor chord which they reprefent.
" Though the truth of this experiment were granted, even this would by no means remove the difficulty. If, as M. Ramean alleges, all harmony is derived from the refonance of fonorous bodies, it cannot then be derived only from the vibrations of fuch bodies as do not refound. In reality, it is an extraordinary theory, to deduce from bodies that do not refound the principles of harmony; and it is a principle in natural philofophy no lefs frange, that a fonorous body fhould vibrate without refounding, as if found itfelf were any thing elfe but the air impelled by thefe vibrations. Moreover, fonorous bodies do not only produce, befides the principal found, the other tones which with itfelf compofe a perfect chord; but an infinite number of other founds, formed by all the aliquot parts of the bodies in vibration; which do not enter into that perfect harmony. Why then fhould the former founds produce confonances, and why fhould the datter not produce them, fince all of them equally refult from nature?
"، Every found exhibits a chord truly perfect, fince it is compofed of all its harmonics, and fince it is by them that it becomes a found. Yet thefe harmonics are not heard, and nothing is diftinguifhed but a fimple found, unlefs it be exceedingly ftrong : whence it follows, that the only good harmony is an unifon; and that, as foon as the confonances can be diftinguifhed, the natural proportion being altered, the harmony has loft its purity.
" That alteration is in this cafe produced two different ways. Firft, by caufing certain harmonics to refound, and not the others, the proportion of force which ought to prevail in all of them is altered, for producing the fenfation of a fingle found; whence the unity of nature is deftroyed. By doubling thefe harmonics, an effect is exhibited fimilar to that which would be produced by fuppreffing all the others; for that cafe we cannot doubt, but that, along with the generating found, the tones of the other harmonics which would be permitted to found would be heard: whereas, in leaving all of them to their natural operations, they deftroy one another, and confpire together in forming and frengthening the fimple fenfation of the principal found. It is the fame effect which the full found of a ftop in the organ produces, when, by fucceflively removing the ftopper or regifter, the third and fifth are permitted to found with the principal ; for then that fifth and third, which remained abforbed in the other founds, are feparately and difagreeably diftinguifhed by the ear.
"Moreover, the harmonics which we caufe to found have other harmonics pertaining to themfelves, which cannot be fucli to the fundamental found. It is by
thefe additional harmonics that the founds which pro- Harmony. duce them are diftinguifhed with a more fenfible degree of harfhnefs; and thefe very harmonics which thus render the chord perceptible, do not enter into its harmony. This is the reafon why the mof perfect chords are naturally difpleafing to ears whofe relifh for harmony is not fufficiently formed; and I have no hefitation in thinking, that even the octave itfelf might be difpleafing, if the mixture of male and female voices did not inure us to that interval from our infancy.
" With diffonance it is ftill worfe; becaufe, not only the harmonics of the found by which the difcord is produced, but even the found itfelf, is excluded from the natural harmony of the fundamental : which is the caufe why difcord is always diftinguifhed amongft all the other founds in a manner fhocking to the fenfe.
" Evcry key of an organ, with the ftop fully $o_{-}$ pened, gives a perfect chord with its third major, which are not diftinguifhed from the fundamental found, if the hearer is not extremely attentive, and if he does not found the whole ftop in fucceffion; but thefe harmonic founds are never abforbed in the fundamental, but on account of the prodigious noife, and by fuch a fituation of the regifters as may caufe the pipes which produce the fundamental found to conceal by their force the other founds which produce thefe harmonics. Now, no perfon obferves, nor can oblerve, this continual proportion in a concert ; fince, by the manner of inverting the harmony, its greateft force muft in every inftant be transferred from one part to another; which is not practicable, and would deftroy the whole melody.
" When we play upon the organ, every key in the bafs caufes to refound the perfect chord major ; but becaufe that bafs is not always fundamental, and becaufe the mufic is often modulated in a perfect minor chord, this perfect chord-major is rarely ftuck with the right hand; fo that we hear the third minor with the major, the fifth with the triton, the feventh redundant with the octave, and a thoufand other cacophonies, which, however, do not much difguft our ears, becaufe habit renders them tractable; but it is not to be imagined that an ear naturally juft would prove fo patient of difcords, when firf expofed to the teft of this harmony.
"M. Rameau pretends, that trebles compofed with a certain degree of fimplicity naturally fuggeft their own baffes; and that any man having a juft, though unpractifed ear, would fpontaneoufly fing that bafs. This is the prejudice of a mulician, refuted by univerfal experience. Not only would he, who has never heard either bafs or harmony, be of himfelf incapable of finding either the bafs or the harmony of $M$. Rameau, but they whuld be difpleafing to him if he heard them, and he would greatly prefer the fimple unifor.
" When we confider, that of all the people upon earth, who have all of them fome kind of nufic and melody, the Europeans are the only people who have a harmony confifting of chords, and who are pleafed with this mixture of founds; when we confider that the world has endured for fo many ages, whilft, of all the nations which cultivated the fine arts, not one has found out this harmony: that not one animal, not one bird, not one being in natare, produces any other chord

Harmony. but the unifon, nor any other mufic but melody : that the eaftern languages, fo fonorous, fo milical; that the ears of the Greeks, fo delicatc, fo fenfible, practifed and cultivated with fo much art, have never conducted this people, luxurious and enamoured of pleafure as they were, towards this harmony which we imagined fo natural : that without it their mufic produced fuch aftonifhing effects; that with it ours is fo impotent: that, in hort, it was referved for the people of the north, whofe grofs and callous organs of fenfation are more affected with the noife and clamour of yoices, than with the fweetnefs of accents and the melody of inflections, to make this grand difcovery, and tovend it as the cffential principle upon which all the rules of the art were founded; when, in fhort, attention is paid to all thefe obfervations, it is very difficult not to fufpect that all our harmony is nothing but a Gothic and barbarous invention, which would never have entered into our minds, had we been truly fenfible to the genuine beanties of art, and of that which is unqueftionably natural.
" M. Ramean afferts, however, that harmony is the fource of the moft powerful charms in mofic. But this notion is contradictory both to reafon and to matter of fact. To fact it is contradictory; becaufe, fince the invention of counter-point, all the wonderful effects of mufic have ceafed, and it has loft its whole force and energy. To which may be added that fuch beauties as purely refult from harmony are only perceived by the learned; that they affect none with tranfport but fuch as are deeply converfant in the art ; whereas the real beauties of mufic, refulting from nature, ought to be and certainly are, equally obvious to the adept and the novice. Toreafon it is contradictory ; fince harmony affords us no principle of imitation by which mufic, in forming images and expreffing fentiments, can rife above its native excellence till it becomes in fome meafure dramatic or imitative uhich is the higheft pitch of elevation and energy to which the art can afpire; fince all the pleafures which we can receive from the mere mechanical influence of founds are extremely limited, and have very little power over the humau heart."

Thus far we have heard M. Rouffean, in his obfervations on harmony, with patience; and we readily grant, that the fyfem of barmony by M. Rameau is neither demonftrated, nor capable of demonftration But it will not follow, that any man of invention can fo eafily and fo quickly fubvert thofe aptitudes and analogies on which the fyftem is founded. Every hypothefis is admitted to poffefs a degree of probability proportioned to the number of phenomena for which it offers a fatisfactory folution. The firft experiment of M. Rameau is, that every fonorous body, together with its principal found and its octave, gives likewife its twelfth and feventeenth major above; which being approximated as much as poffible, even to the chords immediately reprefented by them, return to the third, fifth, and octave, or, in other words, produce perfect harmony. This is what nature when folicited, fpontancoully gives; this is what the human ear, unprepared and uncultiyated, imbibes with ineffable avidity and pleafure. Coufd any thing which claims a right to our attention, and acceptance from nature be impreffed with more genuine or more legible fignatures of
her fanction than this? We do not contend for the Harmony. truth of M. Rameau's fecond experiment. Nor is it neceflary we fhould. The firf expanded and carried into all its confequences, refolves the phenomena of harmony in a manucr fufficient to eftablifin its authenticity and influence. The difficulties for which it affords no folution are too few and too trivial cither to merit the regard of an artif, or a philofopher, as M. D'Alembert in his elements has clearly fhown. The facts with which M. Rouffeau confronts this principlc, the armies of multiplied harmonics generated in infinitum, which he draws up in formidable array againft it, only how the thin partitions which fometimes may divide philofophy from whim. For, as bodies are infinitely divifible, according to the philofoplyy now eftablifhed, or as, according to every philofophy, they muft be indefinitely divifible, each infinitefimal of any given mals, which are only harmonics to other principal founds, muft have fundamental tones and harmonics peculiar to themfelves; fo that if the reafoning of Roufieau has any force againft M. Ramean's experiment, the air muft be continually diftracted with a chaos of inappretiable harmonics, and melody itfclf muft be loft in the confufion. But the truth of the matter is, that, by the wife inftitution of nature, there is fuch a conformity eftablifhed between our fenfes and their proper objects, as muft prevent all thefe difagreeable effects. Rouffeau and his opponent are agreed in this, that the harmonics confpire to form one predominant found; and are not to be detected but by the nicent organs, applied with the deepert attention. It is equally obvious, that, in an artificial harmony, by a proper management of this wife precaution of nature, diffonances then:Selves may be either entirely concealed or confiderably foftened. fo that, fince by nature fonorous bodies in actual vibration are predifpofed to exhibit perfect harmony ; and fince the human ear is, by the fame wife regulation, fabricated in fuch a manner as to perceive it ; the harmonical chaos of M. Rouffeau may be left to operate on his own brain, where it will probably meet with the warmeft reception it can expeet to find*. Nor does it avail him to pretend, that before the harmonics can be diftinguifhed, fonorous bodies muft be impelled with a chords, and deftroys the purity of the harmony; for waste chords, and deftroys the purity of the harmony; for was writthis pofition is equally falfe both in theory and prac- ten. tice. In theory, becaufe an impulfe, however forcible, mult proportionally operate on all the parts of any fonorous body, fo far as it extends: in practice, becaufe the human ear actually perceives the harmony to be pure. What effects his various manceuvres upo the organ may have, we leave to fuch as have leifure and curiofity enough to try the experiments : but it is apprehended, that when tried, their refults will leave the fyftem of Rameau, particularly as remodelled by: D'Alembert, in its full force.

Of all the whims and paradoxes maintained ly this philofopher, none is more extravagant than his affertion, that every chord, except the fimple unifon, is difpleafing to the human ear: nay, that we are only reconciled to octaves themfelves by being inured to hear them from our infancy. Strange, that nature thould have fixed this invariable proportion between male and female voices, whilft at the fame time the infired the hearers with fuch violent prepoffefions a-

## HAR [ 324$] \quad H A R$

Tomony. gainft it as were invincible but by long atd confirmed habir! The tranllator of $D^{\prime}$ Alembert's Elements, as given under the article Mosic in this Dictionary, has been at peculiar pains to inveftigate his earlieft recollections upon this fabject ; and has had fuch opportaaities, both of attending to his original perceptions, and of recognifing the fidelity of his memory, as are not common. He can remember, even from a period of early childhood, to have been pleafed with the fimpleft kinds of artificial harmony; to have diftinguifhed the harmonies of fonorous bodies with delight; and to have been fruck with horror at the found of fuch bodies as, by their ftructure, or by the cohenfion of their parts, exhibited thefe harmonics falfe. This is the chicf, if not the only canfe, of the tremendous and difagreable fenfation which we feel from the found of the Chinefe ghong. The fame horrible cacophony is frequently, in fome degree, produced by a dram unequally braced : from this found the tranflator often remembers to have ftarted and fcreamed, when carried throngh the fircets of the town in which he was born in the arms of his nurfery maid; and as he is confcions, that the acoultic organs? of many are as exquilite as his own, he cannot doubt but they may have had the fame fenfations, though perhaps they do not recollect the facts. So early and fo nicely may the fenfations of harmony and difcord be diftingumed. But after all, it feems that harmony is no more than a modern invention, and even at this late period only known to the Europeans. We fhould, however, be glad to know, from what oracle our philofopher learned that harmony was not known to antiquiry. From what remains of their works, no proof of this polition can be derived; and we have at leaft mentioned one probability againft it in our notes to the Preliminary Difcourfe to the article music, (fee note b.) Bat tho' Rouffea's mighty objections were granted, that harmony can only be endured by fach ears as are habicually formed and cultivated; that the period of its prevalence has been flort, and the extent of its empire limited to Europe; ftill his concluion, that it is a Gothic and barbarous invention, is not fairly deducible even from thefe premifes. Muft we affirm that epic poetry has no foundation in nature, becade, during the long interval which happened from the beginning of the world to the deftruction of Troy, no epic Poem feems to have appeared? Or becaufe a narural and melliftuous verfification is lefs relifhed by an unpolifhed tatte, than the uncouth rhymes of a common ballad, fhall we infer, that the power of numbers is merely fuppofititious and arbitrary ? On the contrary, we will venture to affirm, that though harmony cannot, as Rameau fuppofes, be mathematically demonftrated from the nature and vibrations of fonorous bodies; yet the idea of its conftituent parts, and of their coalefcence, is no lefs eftablihed, no lefs precife and definite, than any mode or property of pace or quantity to be inveftigated by geometrical refearches or algebraical calculations. It is certain, that the mimetic or imitative power of mufic chiefly confifts in melody; bur from this truth, however evident, it cannot be fairly deduced, that harmony is abfolutely unfufceptible of imitation. Perhapsevery mufical found, even the moft fimple, and all modulations of found, arc more or
lefs remotely connected with fome fentiment or palfion Harmony. of the human heart. We know that there are infinc. tive expreffions of pain or pleafure in their various modes and degrees, which when uttered by any femitive, and perceived by any confcions being, cxcite in the mind of the percipicat a feeling fympatheric with that by which they are promped. We likewife hnow from experience, that all artificial founds modulated in the fame manner, have fimilar, though nof equal, effects. We have feen, that, in order to render harm,ny compatible with itfelf the melody of each part muft be congenial; and, for that reafon, one kindred melody refult from the whole. So far, therefore, as any compofer has it in his power to render the general melody homogeneons; fo far the innitation may be preferved. and even heightened : for fuch objects as are majeflic and anguft, or the feclings which they excite are more: aptly expreffed by a compofition of kindred founds, than by any fimple cone whatcver. They who rippofe the mimetic powers ef mafic to be confumated in the imitation of mere unmeaning founds or degrecs of motion, muft entertain limited and unworthy aleas of its province. It is naturally a reprcfentative almof of every fentiment or affection of the foul; and, when this end is gained, the art muft have reached its higheft perfection, and produced its nobleft effects. But thefe effects, however fenfible among the ancients, may in us be faperfeded by other caufes which remain yet mnexplored. Theatrical performances are likewife, by them faid to have produced the moft wonderful effects; yet we do not recognize amongt ourfelves, though we have dramaic entertainnent perhaps not inferior to theirs.

Ronflean proceeds to tell us that among the ancients the enharmonic fipecies of mulic was fometimes called barmony.

Direft Harnony, is that in which the bals is fundamental, and in which the upper parts preferve among themfelves, and with thar fundamental bafs, the nattiral and original order which ought to fubfift in each of the chords that compofe this harmony.

Inverted Harmonr, is that in which the fundamental or generating found is placed in fome of the upper parts and when fome other found of the chord is transferred to the bafs beneath the others.

Harmony of the Spberes, or Celeflial Harmonya fort of mulic nurch talked of by many of the ancient philofophers and fathers, fappofed to be produced by the fweetly tuned motions of the flars aid planets. This harmony they attributed to the various proportionate impreffion of the heavenly globes upon one another, acting at properintervals. It is impoffible, according to them, that fach prodigious large bodies, moving with fo much rapidity, fhould be filent: on the contrary, the atmofphere, continually impelled by them, muft yield a fet of founds proportionate to the impreffiow it receives; confequently, as they do not run the fame circuit nor with one and the fame velocity, the different tones arifing from the diverfity of motions, directed by the hand of the Almighty, mult form an admirable fymphony or concert.

They therefore fappofed that the moon, as being the loweft of the planets, correfposded to mi; Mer* cury, to fa; Venus to foi; the Sun, to la; Mars, to

Harmotes $f$; Jupiter, to $w t$; Saturn, to $r e$; and the orb of the II fixed ftars, as being the higheft of all, to $m i$, or the octave.
hakmostes, or Harmosta, in antiquity, a fort of magiftrate among the Spartans, whereof there were feveral, whofe butincis was to look to the building of citadels, and repairing the forts and fortifica. tions of the cities. -The word is apposns, formed of apuow, apto, concino," I adapt, concert," \&c.

HARMOSYNIANS, quposvor, in antiquiry, were maginfates among the Spartans, who, after the death of Lycurgus, were appointed to enforce the obfervance of that law of the Spartan legiflator which required married wo nen to wear a veil when they appeared in the freets, whereby they were diftinguifled fromfingle females, who were allowed to appear abroad with thicir faces uncovered.

HARNESS, a complete armour, or the whole equipage and accontrements of a cavalier heavily arned; as catque, cuirals, \&c. The word is formed of the French harnois; which fome derive from the Greek apvaxts, "r a lamb's fkin," becanfe they anciently covered themfelves therewith. Du Cange obferves, that the word harnefitm is ufed in the compupt Latin in the fame fenfe, and that it comes from the High Dutch barnafs or harnifch. Others derive it from the Italian armefe; others from the Celtic barnes, "a cuirafs."

Under kiag Richard II. it was exprefsly forbidden all men to tide inharnefs with launcegays. $V$ ide fat. 7 Ric. II. cap. 12. In the flatute 2 Hen. VI. cap. 14 . harnefs feems to include all kinds of furniture for offence as well as defence, both of men and horfe; as ffords, buckles for belts, girdles, \&c.

Harness is alfoufed for the furniture put on a horfe to draw in a conch or watrgon, or other carriage; fuch as collars, leathers, traces, \&c
haro, Hakou, or Harol, in the Roman cufoms. - Clamour de baro is a cry or formula of invoking the affiftanceof juftice againft the violence of fome offender, who apon hearing the word har is obliged to defift, on pain of being feverely punifhed for his outrage, and to go with the party before the judge.

The word is commonly derivedof ha and roul, as being fuppofed an invocation of the fovercign power; to affitt the weak againft the ftrong, on occafion of Raoul frift duke of Normandy, about the year 912, who rendered himfelf venerable to his fabjects by the feverity of his juntice; fo that they called on him even after his death when they fuffered any oppreffion. Some derive it from Harola king of Denmark, who in the year 826 was made grand confervator of juftice at Mentz. Others from the Daniflaa rau, q. d. "help tee;" a cry raifed by the Normans in flying from a king of Denmark named Ronx, who made himfelf duke of Normandy. The letters of the French chanceryhave ufually this claufe, Non ob/lant clagever de baro, \&ce.

The haro had anciently fuch vaft power, that a poor man of the city of Caen named Affelin, in virtuchereof, arrefted the corps of Willian the Conqueror, in the middle of the funcral proceffion, till fuch time as has fon Henry had paid the value of the land in queftion, which was that whercon the chapel was built wherein he was interred.

HAROLD, the name of two Englith lings. See Harold, England, $n^{\circ} 77,83$.

HARP, a mulical inftrument of the fringed kind, of a triangular figure, and held upright between the legs of the performer.

Papias, and Du Cange after him, will have the harp to have taken its name from the Arpi, a people of Italy, who were fuppofed the firft that invented it ; and from whom, they fay, it was borrowed by other nations. Menage, \&c. derive the word from the Latin harpa, and that from the German berp or harp. Others bring it from the Latin carpo, becaufe touched or thrumined with the fingers. Dr Hickes derives it from barpa or hearpa, which fignify the fame thing; the firlt in the language of the Cimbri, the fecond in that of the Anglo-Saxons. The Engligh prieft who wrote the life of St Dunftan, and wholived with him in the tenth century, fays, cap.ii. n. I2. Sumpfit fecumex mure citharamfuam, quam paternalingua hearpam vocamuts; which intimates the word tobe Anglo-Saxon.
The harp was the favourite mufical inftrument of the Britons and other northern nations in the middle ages; as is evident from their laws, and from every pafage in their hiftory, in which there is the leaft allufion to mufic. By the laws of Wales, a harp was one of the three things that were neecffary to conftitute a gentleman, i.e. a freeman; and none could pretend to that charaeter who had not one of thefe favourite inftruments, or could not play upon it. By the fame laws, to prevent flaves from pretending to be gentlemen, it was exprefsly forbidden to teach, or to permit, them to play upon the harp : and none but the king, the king's mulicians, and gentlemen, were allowed to have barps in their poffelfion. A gentleman's harp was not liable to be feized for debt; becaure the want of it would have degraded him from his rank, and reduced him to a flave. The harp was in no lefs efti. mation and univerfal ufe among the Saxons and Danes. Thofe who played upon this inftrument were declared gentlemen by law; their perfons were efteemed invio lable, and fecured from injaries by very fevere penalties; they were readily admitted into the ligheft company, and treated with diftinguilined marks ofrefpect wherever they appeartd.

There is fome diverfity in the fructure of harps. That called the triple barp has 97 Atrings or chords in three rows, extending from $C$ in the tenor cliff to double $G$ in alt, which make five otaves: the middle row is for the femitones, and the two euffide rows are perfect unifoirs. Onthe bafs fide; which is played with the right hand, there are 36 ftrings ; on the treble fide, 26 ; and in the middle row, 35 ftrings. There are two rows of pins or fcrews on theright fide; ferving to keep the ftrings tight in their holes, which arefaftened at the other end to three rows of pins on the upper fide: The harp, within the laft 40 years, has been in fome degree improved by the addition of cight frings to the unifon, viz. from $E$ to double $F$ in alt. This inftrumentis thruck with the finger and thumb of both hands. Its mufic is much like that of the fpinet all its ftrings going from femitonc to femitone; whence fome call it an inverted fpinet. It is capable of a much greater degree of perfection than the lute.

There are among us two forts of this inftrument

Harp.

## HAR

Katp. تiz. the Welch barp, being that juft defcribed; and the $I \because i j h$ harp. Plate CCXXVI. $n^{\circ}$ I. reprefents the harp of Brian Boiromh, king of all Ireland, fain in battle with the Danes A. D. IoI 4, at Clontarf. His fon Donagh having murdered his brother Teige, A. D. 1023 , and being depored by his nephew, retired to Rome, and carried with him the crown, harp, and other regalia of his father; which he prefented to the Pope in order to obtain abfolution. Adrian IV. furnamed Breakfpear, alleged this circumftance as one of the principal titles he claimed to this kingdom in his bull transferring it to Henry II. Thefe regalia were kept in the Vatican till the pope fent the harp to Henry VIII. with the title of Defender of the Faith; but kept the crown, which was of maffive gold. Henry gave the harp to the firft earl of Clanricard; in whofe family it remained till the beginning of this century, when it came by a lady of the De Burgh family into that of Mac Mahon of Clenaghin the county of Clare, after whofe death it paffed into the poffeffion of commiffioner Mac Namara of Limerick. In 1782 it was prefented to theright honourable William Conyngham, who depofited it in Trinity college library. It is 32 inches high, and of extraordinary good workmanhhip; the founding-board is of oak, the arms of red fally; the extremity of the uppermoft arm in part is capt with filver, extremely well wrought and chiffeled. It contains a large cryftal fet in filver, and under it was another ftone now loft. The buttons or ornamental knobs at the fides of this arm are of filver. On the front arm are the arms chafed in filver of the Or Brien family, the bloody hand fupported by lions. On the fides of the front arm within two circles are two Irifh wolf dogs cut in the wood. The holes of the founding board where the ftrings entered are neatly ornamented with efcutcheons of brafs carved and gilt: the larger found-ing-holes have been ornamented, probably with filver, as they have been the object of theft. This harp has 28 keys, and as many fring-holes, confequently there were as many ftrings. The foot-piece or reft is broken off, and the parts round which it was joined arevery rotten. The whole bears evidence of an expert artift.

King David is ufually painted with a harp in his hands ; but we have no teftimony in all antiquity that the Hebrew harp, which they call chinnor, was any thing like ours. On a Hebrew medal of Simon Mace cabæus we fee two forts of mufical inftruments; but they are both of them very different from our harp, and only conlift of three or four ftrings. All authors agree, that our harp is very different from the lyra, cithara, or barbiton, ufed among the Romans. Fortunatus, lib vii. carm. 8. witneffes, that it was an inftrument of the barbarians:

## Romanufque lyra, plaudat tibi barbarus harpa, Gracus Aebilliacba, srotia Britanna canat.

Of ancient harps; two are reprefented on the fame plate.- $\mathrm{N}^{\circ} 2$. is a trigonum or triangular harp. It is taken from an ancient painting in the mufeum of the king of Naples, in which it is placed on the fhoulder of a little dancing Cupid, who fupports the inftrumerit with his left hand and playsuponit with his right. The trigonum is mentioned by Athenæus, lib, iv. and by fulius Pollux, lib. iv. cap. 9. According to Athenæus, Sophócles callsit a Prygian inflrument; and one of his

## 326 ] <br> HAR

dipnofophifts tells us, that a certain mufician, named Alcxander Alexandrinus, was fuch anadmirable performer upon it, and had given fuch proofs of his abilities ar Rome, that he made the inhabitants $\mu$ uro $\mu \alpha y$, , " mufically mad.' $N^{2}$ 3. and 4. are varieties of the fameinftrument. No 5 . is the Theban harp, according to a drawing made from an ancient painting in one of the fepulchral grottos of the firft kings of Thebes, and communicated by Mr Bruce to Dr Burney*. The * Vide performer is clad in a habit made like a flirt, fuch as Burney' the women fill wear in Abyffinia, and the menin Nubia. Hif. $f f$ It reaches down to his ancles; his feet are without $M u f i c$, fandels, and bare; hisneck and arms are alfo bare; his p. 224. loofe white fleeves are gathered above his elbows; and his head is clofe flaved. Hisleft hand feems employed in the upper part of the infrument among, the notes in alto, as if in an arpeggio; while, ftooping forwards, he feems with his right hand to be beginning with the loweft ftring, and promifing to afcend with the moft rapid execution : this action, fo obvioully rendered by an indifferent artift, Thows that it was a common one in his time ; or, in other words, that great hands were then frequent, and confequently that mufic was well underftood and diligently followed.

Onthis inftrument Dr Burney makes the following obfervations: "The number of ftrings, the fize and form of this inftrument, and the elegance of its ornan ments, awaken reflections, which to indulge would lead us too far from our purpofe, and indeed out of our depth. The mind is wholly loft in the immenfe antitiquity of the painting in which it is reprefented. Indeed the time when it was executed is fo remote, as to encourage a belief, thatarts, after having been brought to a great perfection, were again loft and again invented long after this period.-With refpect to the number of ftrings upon this happ, if conjectures may be allowed concerning the method of tuning them, two might be offered to the reader's choice. The firft idea that pre* fented itfelf at the fight of 13 frings was, that they would furnifh all the femitones to be found in modern inftruments within the compafs of an octave, as from C to $c, \mathrm{D}$ to $d$, or E to $e$. The fecond idea is more. Grecian, and conformable to antiquity ; which is, that if thelongeftftring reprefented proflambanomenos, or D , the remaining in frings would fupply all the tones, femitones, and quarter-tones, of the diatonic, chromatic, and enlarmonic genera of the ancients, within the compafs of an octave: but for my part, I would rather incline to the firft arrangement, as it is more natural, and more conformable to the ftructure of our organs, than the fecond. For with refpect to the genera of the Greeks, though no hiftoric teftimony can be produced concerning the invention of the diatonic and chromatic, yet ancient writers are unanimous in afcribing to Olympus the Phrygian the firft ufe of the enharmonic: and though in the beginning, the melody of this genus was fo fimple and natural as to refemble the wild notes and rude effays of a people not quite emerged from barbarifm; yet in after-times it became overcharged with finical fopperies and fanciful beauties, arifing from fuch minute divifions of the fcale as had noother merit than the great difficulty of forming them. It feems a matter of great wonder, with fuch a model before their eyes as the Theban harp, that the form and manner of ufing

## H A R

ufing fuch an inftrument fhould not have been perpetuated by pofterity: but that, many ages after, another of an inferior kind, with fewer ftrings, flould take place of it. Yet if we confider how little we are acquainted with the ufe and even conftraction of the inftruments which afforded the greateft delight to the Greeks and Romans, or even with others in common ufe in a neighbouring part of Europe only a few centuries ago, our wonder will ceafe; efpecially if we reflect upon the ignorance and barbarifm into which it is poffible for an ingenious people to be plunged by the tyranny and devaftation of a powerful and crucl invader."

Bell-HARP, a mufical inftrument of the ftring kind, thus called from the common players on it fwinging it abour, as a bell on its bafis.

It is about three feet long; its ftrings, which are of no determinate number, are of brafs or fteel wire, fixed at one end, and ftretched acrofs the found-board by forews fixed at the other. It takes in four octaves, according to the number of the ftrings, which are ftruck only with the thumbs, the right hand playing the treble and the left hand the bals: and in order to draw the found the clearer, the thumbs are armed with a little wire pin. This may perhaps be the lyra, or cythara of the ancients; but we find no mention made of it under the name it now bears, which mult be allowed to be modern.

Harp of Eolus. See Acoustics, no 10.
HARPAGINES, in antiquity, were hooks of iron, hariging on the top of a pole, which, being fecured with chains to the mafts of hips, and then let down with great velocity into the enemy's veffels, caught them upinto the air. By way of defence againft thefe machines, they covered their fhips with hides, which broke and blunted the force of the iron. The harpagines, by the Grceks called Ap $\pi \alpha y$, , owe their invention to Anacharfis the Scythian plilofopher.

HARPagiUS. See Arpagius.
HARPALUS, a Greek aftronomer, who flourifhed about 480 B . C. corrected the cycle of eight years invented by Cleoftratus; and propofed a new one of nine years, in which he imagined the fun and moon returned to the fame point. But Harpalus's cycle wals afterwards altered by Metos, who added ten full years to it. See Chronology, $\mathrm{n}^{\circ} 27$.
harpies (apmitiai, Harpyif), in antiquity, a rapacious impure fort of monfters of the bird kind,
with wings, ears like bears, bodies like vulturs, faces like women, and feet and hands hooked like the talons of birds of prey.

The ancients looked on the harpies as a fort of genii or demons. Some make them the daughters of Tellus and Oceanus, the earth and ocean; whence, fays Scrvius, it is, that they inhabit an ifland, half on land and half in water. Valerius Flaccus makes them the daughters of Typhon.

There were three harpies, Aello, Ocypete, and Celœno, which laft Homer calls Podarge. Hefiod, in his Theogany, ver. 267. only reckons two, Aello and Ocypete, and makes them the daughters of Thamus and Electra, affirming that they had wings and went with the rapidity of the wind. Zephyrus begat of them
$327] \quad \mathrm{HAR}$
Balius and Xanthus, Achilles's horfes. Pherecydes relates, that the Boreades expelled them from the Egean and Sicilian feas, and purfued them as far as the iflands which he calls Plote and Homer Calyne: and which have fince been called the Struphades.

Voffius, De Idolo. lib. iii. cap. 99. p. 63. thinks, that what the ancients have related of the harpics, agrees to no other birds fo well as the bats found in the territories of Darien in South America. Thefe animals kill not only birds, but dogs and cats, and prove very troublefome to men by their peckings. But the ancients, as the fame Voffius obferves, knew nothing of thefe birds. By the harpies, therefore, he thinks, they could mean nothing elfe but the winds; and that it was on this account they were made daughters of Electra, the daughter of Oceanus. Such is the opinion of the fcholiafts of Apollonius, Hefiod, and Euftathius. Their names, Aello, Ocypete, Ce lœno, are fuppofed to fuggeft a farther argument of this.

Mr Bryant fuppofes that the harpies were a college of priefts in Bithynia, who on account of their repeated acts of violence and cruelty, were driven out of the country: their temple was called $A r p i$, and the environs Arpiai, whence the Grecians formed Aprutat; and he obferves farther, that $\operatorname{Har}_{\beta} y a, A_{\beta \pi} \pi \kappa \alpha$, was certainly of old the name of a place.

HARPING iron, See Harpoon.
HARPINGS, the fore parts of the wales which encompars the bow of a hip, and are faftened to the ftem, being thicker than the after part of the wales, in order to reinforce the fhip in this place, where the fuftains the greateft fhock of refiftance in plunging into the fea, or dividing it, under a great preffure of fail.

HARPOCRATES, in mythology, the fon of Ifis and Ofiris. This is an Egyptain deity, whofe diftinguifhing attribute is, that he is reprefented with his. fingers applied to his mouth, denoting that he is the god of filence. The ftatue of this idol was fixed in the entrance of molt of the Egyptian temples, and he was commonly exhibited under the figure of a young. man naked, crowned with an Egyptian mitre, holding in one hand a cornucopia, and in the other a flower of lotus, and fometimes bearing a quiver.

HARPOCRATION, (Valerius), a celebrated ancient rhetorician of Alexandria, who has left us an excellent Lexicon upon the ten orators of Greece. Aldus. firft publifhed this lexicon in the Greek at Venice in 1603. Many learned men have laboured upon it; but the beft edition was given by. James Gronovius at Leyden in 1696.

HARPOON, or Harping-iron, a fpearor javelin ufed to Atrike the whales in the Greenland finery.

The harpoon, which is fometimes called the harp-ing-iron, is furnifhed with a long ftaff, having at ona end a broad and flat triangular head, harpened at both edges, fo as to penetrate the whale with facility; to the head of this weapon is faftened a long cord, called the whale line, which lies carefully coiled in the boat, in fuch a manner as to run out without being interrupted or entangled. See Whale-Fisherr,

Cunt-HARPOON, a kind of fire-arm for difcharging. harpoons at whales, and thereby killing them more eafily and expeditioufly than formerly when the har-

## HAR

adnirable gift of fmelling, and wery bold in the purfuit of his game. See Cantis. lin poct, was the ton of John Harrington, ffl ; wh was committed to the Ton or by queen Mary for halding a correfpondence with her fitter Elizabeth; who, when the came to the crown, flood godmother to this: fon. Before he was 30 , he publithed a tranflation of Ariofto's Orlando Furioto, a work by whieh he was principally known; for though he afterwards publifhed fome epigrams, his taleut did not feem to have lain that way. He was created knight of the bath by James I.; and prefented a MS. to prince Henry; levelled chiefly at the married bihops. He is fuppofed to have died about the latter end or James's reigu.
Harrington (James), a mof eminent Englih writer in the 17 th century, bred at Oxford, travelled into Holland, France, Denmark, and Germany, artd learned the languages of thofe countries. Upon his recurn to England, he was admitted one of the privy. chamber extraordinary te King Charles. I. He ferved the king with great fidelity, ard made ufe of his intereft with his fricnds in parliament to procure matters to be aecommodated with all parties. The king loved his company except when the converfation happened to turn upon commonwealths. He found means to fee the king at St James's; and ateended him on the fcaffold, where, or a little before, he received a token of his majefty's affection. After the death of king Charles, he wrote his Oceana: a kind of political ronance, in inititation of Plato's Cominonwealth, which he dedieated to Oliver Cromwell. It is faid, that when Oliver perufed it, he declared, that " the gentleman had wrote very well, but muft not think to cheat him out of his power 'and authoriky; for that what he had wen by the fword, he would not fuffer himfelf to be fribbled out of." This work was attaeked hy feveral writers, againf whem he defended it. Befide his writings to promote republican prineiples, he inftituced likewife a nightly meeting offereral ingenions men in the New Palact-Yafd, Weftminfter; which club was called the Rota, and continued ill the fecluded members of parliament were reftored by general Monk. In 1667, he was committed to the Tower for treafonable defigns and pactices; and ehancellor Hyde, at a conference with the fords and commons, charged him with beivg conoerned in a plot. But a comnittee of the lords and commons could make nothing of that plot. He was conveyed to Se Nieelas's infand, and from thenee to Plymouth, where he fell into an uncommon diforder of the imagination. Having obtained his liberty by means of the earl of Bath, he was carried to London, and died in 1677. He publifhed, befides the above works, feveral others, which were firft collected by Toland, in one velume folio, in 1700 ; but a more complete edition was publifhed, in 1937, by the reve ${ }^{2}$ rend Dr Birph.

HARRIOT (Thomas), a celebrated algebraift, was born at Oxford in r 560 , where he was alfo educated. In 1579, he completed hissbatchelor's degree ; and, being already diftinguifhed for his mathematical learning, was foon after recommended to Sir Wahtes

Harris. Raleigh, as a proper perfon to infruct him in that fcience. He was accordingly received into the family of that gentleman; who, in 1585 , fent him with the colony, under Sir Richard Grenville, to Virginia ; of which country, having remained there about a year, he afterwards publifhed a topographical defcription. About the year 1588, Mr Harriot was introduced by his patron Sir Walter Raleigh, to Henry Percy earl of Northumberland, who allowed him a pention of 1201, per annum. He fpent many years of his life in Sion college; where he died in July 1621, of a cancer in his lip, and was buried in the church of St Chriftopirer, where a handfome monument was erected to his memory. Anthony Wood tells us, he was a deift, and that the divines looked upon his death as a judgment. Be his religious opinions what they might, he was doubtlefs one of the firft mathematicians of the age in which he lived, and will always be remembered as the inventor of the prefent improved method of algebraical calculation. His improvements in algebra were adopted by Des Cartes, and for a confiderable time impored upon the French nation as his own invention; but the theft was at laft detected, and expofed by Dr Wallis, in his Hiftory of Algebra, where the reader will find our author's invention accurately fpecified. His works are, I. A brief and true report of the New-foundland of Virginia; of the commodities there found, and to be raifed, \&c. 2. Artis analytica praxis ad equationes algebraicas nova expedita, et generali methodo refolvendas, epofthumis Thoma Har. rioti, \&c. 3. Ephemeris chyrometrica. Manufcript in the library of Sion college. He is faid to have left feveral other manufcripts which are probably loft.

HARRIS (William), a proteftant diffenting minifter ofeminent abilities and character, refided at Honiton in Devonhire. Sept. 20. 1765, the degree of D.D. was conferred on him by the univerfity of Glafgow, by the unanimous confent of the members of that body. " He publifhed an Hiftorical and Cricical Account of the Lives of James 1. Charles I. and Oliver Cromwell, in five vols 8 vo. after the manner of Mr. Bayle. He was preparing a like account of James II. He alfo wrote the life of Hugh Peters; befides many fugitive pieces occafionally, for the public prints, in fupport of liberty and virtue. All his works have been well received; and thofe who differ from him in principle, fill value him in point of induftry and faithfulnefs." We give this character in the words of his munificent patron Mr Hollis, who had prefented him with many valuable books relative to the fubjects of his hiftories; and was at the expence of procuring his degree. But the Dottor's works were differently thought of by the authors of the Critical Review (March ${ }^{7} 766$ ). "Indultry was their principal characterintic. They certainly have none of the vivacity which infpired Bayle, and in the judgment of difpafionate readers, impartiality is frequently violated." Dr Harris died at Honiton, Feb. 4. 1770.

HARRIS (James, Efq.), an Englifh gentleman of very uncommon parts and learning, was the fon of James Harris, Efq; by a fifter of lord Shaftefbury author of the Characteriftics. He was born in the Clofe at Salinbury r 709 ; and educated at the gram-mar-fchool there. In 1726, he was removed to WadVol, VIII.

## 3291

## HAR

ham college in Oxford, but took no degtee. He cul- Harris tivated letters, however, moft attentively; and alfo Harrifo mufic, in the theory and practice of which he is faid to have had few equals. He was a men ber for Chrifcharch Hants, which he reprefented in feveral fuccef: five parliaments. In 1763, he was appointed one of the lords commifioncrs of the admiraliy, and foon after removed to the board of treafury. In 1774 he was madefecretary and comptroller to the queen, which polt he held until his death. He died Dec. 21, 1780,in his 72 d year, after a long illnefs, which he bore with calmnefs and refignation.-He is the author of fome valuable works. 1. Three Treatifes : concerning Art; Mulic, Painting, and Poetry ; and Happinefs, 1745 , 8vo. 2. Hermes; or, a Philofophical knquiry concerning Univerfal Grammar. 3. Philofophical Arrangements. 4. Philological Inquiries, 1782 , 2 vols 8 vo. finifhed juft before his death, and publifhed fince. Thefe Inquiries fhow much ingenuity and learning; but being the amufement of his old age rather than an exertion of genius, they have not the philofophic tone of his former productions.

HARRIS, one of the Hebrides or Weftern Iflands of Scotland. It is 20 miles in length, and 10 in breadth. Upon the eaft fide it is moftly rock; but on the weft there are fome rolerable farms, and the number of people amounts to 2000. It has Lewis on the North, and North Uift on the fouth, from which it is feparated by a channel of four miles in width, called the Sound of Harris. This channel is navigable for veffels of burden, but it requires a fkilful pilot. It is the only paffage between the Butt of the Lewis and Bara for velfels of burden paffing to and from the weft fide of the Long $I a_{\text {and }}$. The found is greatly encumbered with rocks and illands, fome of which areconfiderable, as Bernera, Pabay, Enfay, Killegray. Thefe, with Scalpay, Taranfay, and Scarp, conspofe the inhabited iflands on the coaft of Harris. Some of them produce good crops of grain, and all of them good pafture. Harris and its illands fell from 400 to 500 ton of kelp annually; it abounds on the eaft fide in excellent loehs or bays, and its fhores on both fides form one continued fifhery. The finh on this coaft, and along the whole fhores of the Long I lland, are more numerous, and of a larger dimenfions, than thofe on the oppofite continent; on which account, two royal fifhing fations were begun in the reign of Charles I. one in Loch Maddie, and the other in the Sound of Harris.

HARRISON (William), a writer much eftecmed and patronifed by the literati of his time, was follow of New-college, Oxford, and had noother income than 40l. a year as tutor to one of the dake of Queenfbery's fons. In this employment he fortunately attracted the favour of Dr Swift, whofe folicitations with Mr St Joln obtained for him the reputable employment of fecretary to lord Raby, ambafiador at the Hague, and afterwards earl of Strafford. A letter of his whilft at Utrecht, dated Dec. 16, 1712 , is printed in the Dean's works. Mr Harrifon who did not long enjoy his rifing fortune, was difpatched to London with the Barrier-treaty; and died Feb. 14, 1712-13. See the Joarnal te Stella, of thet and the following day; where Dr Swift laments his lofs with the moft maffected finccrity. Mr Tickle has mentioned him with:

## HAR [ 330 ] HAR

Harrifon. refpect in his Profpect of Peace ; in Englifh Poets, Vol. AXVI. p. in 3 ; and Dr Young in the beautiful clofe of an Epittle to Lord Lanfoowne, Vol. LiI. p. 185, mott pathetically bewails his lofs. Dr Birch, who has given a curious note on Mr Harrifon's Letter to Swift, has confounded him with Thomas Harrifon, M. A. of Queen's-college. In Nichols's Select Col. lection are fome pleafing fpecimens of his poetry; which, with Woodfock Park in Dodfley's Collection, and an Ode to the Duke of Marlborongh, 1707 , in Dancombe's Horace, are all the poetical writings that are known of this excellent young man; who figured both as an humorift and politician in the fifth volume of the Tatler, of which (under the patronage of Bolingbroke, Henley, and Swift) he was profeffedly the editor. See the Supplement to Swift.-There was another $W$ illiam Harrifon, author of The Pilgrim, or the happy Convert, a Paftoral Tragedy, 1709.

Harrison (John), a moft accurate mechanic, the celebrated inventor of the famous time-keeper for afcertaining the lougitude at fea, and alfo of the compound, or, as it is commonly called, the gridiron pendulum ; was born at Foulby, in the parifh of Wragby, near Pontefract in Yorkfhire, in 1693 . The vigour of his matural abilities, if not even ftrengthened by the want of education, which confined his attention to few objects, at leaft amply compenfated the deficiences of it ; as fully appeared frem the aftonifh. ing progrefs he made in that branch of mechanics to which he devoted himfelf. His father was a carpen. ter, in which profeffion the fon affifted; occaionally alfo, according to the mifcellaneous practice of country artifts, furveying land, and repairing clocks and watches. He was, from his early childhood; attached to any machinery moving by wheels, as appeared while he lay fick of the fmall-pox about the fixth year of his age, when he had a watch placed open upon his pillow to amufe himfelf by contemplating the movement. In 1700 , he removed with his father to Barrow in Lincolnfhire; where, though his opportunities of acquiring knowledge were very few, he eagerly improved every incident from which he might colle $\mathcal{E}$ information; frequetitly employing all or great part of his nights in writing or drawing: and he always acknowledged his obligation to a clergyman who came every Sunday to officiate in the neighbourhood, who lent him a MS. copy of profeffor Saunderfon's Lectures; which he carefully and neatly tranferibed, with all the diagrams. His native genias exerted itfelf fuperior to thefe folitary difadvantages; for in the year r 726 , he had conftucted two clocks, montly of wood, in which he applied the efcapement and compound pendulnm of his own invention: thefe furpaffed every thing then made, fcarcely erring a fecond in a month. In 1728 , he came up to London with the drawings of a machine for determining the longi. tude at fea; in expectation of being enabled to execute one by the board of longi ude. Upon application to Dr Halley, he referred him to Mr George Grahan! ; who, difcovering he had uncommon merit, advifed him to make his machine before he applied to the board of longitade. He returined home to perform this safk; and in 1735 came to London again with his firf machine ; with which he was fent to

Litbon the next year for a trial of its properties. In this thort voyage, he corrected the dead reckoning about a degree and a half; a fuccefs that proved the means of his rectiving both public and private encouragement. About the year 1739, he completed his fecond machine, of a conftruction much more fimple than the former, and which anfwered much better : this, though not fent to fea, recommended Mr Harrifon yet Itronger to the patronage of his private friends and of the public. His third machine, which he produced in 1749 , was ftill lefs complicated than the fecond, and fuperior in accuracy, as erring only three or four feconds in a week. This he conceived to be the ne plus uiltra of his attempts; but in an endeavour to improve pocket-watches, he found the principles he applied to furpafs his expectation fo much, as to encourage him to make his fourth time-keeper, which is in the form of a pocket-watch, about fix inches diameter. With this time keeper his fon made two voyages, the one to Jamaica, and the other to Barbadoes: in both which experiments it corrected the longitude within the neareft limits required by the act of the 12 th of queen Anne; and the inventor therefore, at different times, though not without infinice trouble, received the propofed reward of 20,000 . Thefe four machincs were given up to the board of longitude. The three former were not of any ufe, as all the advantages gained by making them were comprehended in the laft; they were worthy, however, of being carefully preferved as mechanical curiofities, in which might be traced the gradations of ingenuity executed with the moft delicate workmanhip; whereas they now lie totally neglected in the royal obfervatory at Greenwich. The fourth machine, emphatically diltinguifhed by the name of The time-keeper, has been copied by the ingenious $\mathrm{Mr} \mathrm{K}_{\mathrm{ENDAL}}$; and that duplicate, during. a three years circumnavigation of the globe in the fouthern hemifphere by captain Cook, anfwered as well as the original. The latter part of Mr Harrifon's life was employed in making a fifth improved time-keeper on the fame principles with the pteceding one; which, at the end of a ten weeks trial, in 1772, at the king's private obfervatory at Richmond, erred only $4^{\frac{x}{2}}$ feconds. Within a few years of his, death, his conftitution vifibly declined; and he had frequent fits of the gout, a diforder that never attacked him before his 77 h y year: he died at his houfe in Red-Lion Square, in 1776 , aged 83 . The reclufe manner of his life in the unremitied purfuit of his favourite object, was by no means calculated to qualify him as a man of the world; and the many difcouragements he encountered in foliciting the legal reward of his labours, fill lefs difpofed him to accommodate himfelf to the liumours of mankind. In converfing on his profeflion, he was clear, diftinet, and modeft; yet, like many other mere mechanics, found a difficulty in delivering his meaning by writing : in which he adhered to a peculiar and uncouth phrafeology. This was but too evident in his Defoription concerning fuch mechanifm as will afford a nica or true nenfuration of time, \&c. 8vo. 1775 ; which his well-known mechanical talents will induce the public to account for from his unacquaintance with letters, from his advanced age, and attendant mental infirmities; among

Marrogate mong which may be reckoned bis obtinate refufal to accept of any aliftance whatever in this publication. This fmall work includes alfo an account of his new mufical fcale; or mechanical divifion of the otave, according to the proportion which the radius and diameter of a circle have refpectively to the circumference. He had in his youth been the leader of a diftinguifhed band of church-fingers; had a very delicate ear for mufic; and his experiments on found, with a moft curious monochord of his own improvement, are reported to have been not lefs accurate than thofe he was engaged in for the menfuration of tine.

HARKOGATE, a village in the Weft Riding of Yorkflire, in the parifh of Knareiborough, remarkable for its medicinal fprings. Thefe are threc in number, all different in their qualities, notwithytanding their contiguity. r. Tbe Tewet water or Sweet Spa, a vitriolic fpring of a fort of milky tafle ufed in gravelly cafes, was difcovered by Mr Slingfby 1638. 2. The ftinking or fulphur fpring, ufeful in droptical, fcorbutic, and gouty cafes, rifes in the town, and is received in four bafonsunder four different buildings; at one it is drunk, at the others ufed for hot or cold baths. It is perfectly clear ; but taftes and fmells like a compofition of rotten eggs, fea-water, and fulphur, and extremely falt. Bathing is the moft general mode of ufing it. It is the ftrongeft fulphur water in Great Britain ; and from the fuperior flrength of the impregnating fulphar, it does not lofe the fulphureous fmell even when expofed to a fcalding and almoft boiling heat ; and in diftilliug it, when three pints had been taken off from a gallon of it, the laft was as ftrong as the firft, and funk intolerably. It is difcutient and attenuating, and a warm bath of it is of great benefit in pains and aches, frains and lamenefs; diffolving hard fwellings, curingold ulcers and fcrophulous complaints and is a powerful cleanfer of the ftomach and bowels. 3. St Mungo's well, it is fo called from Kentigern, a Scots faint, much honoured hereabouts, whom his tutor Servanus billop of Orkney, out of affection for him, called Mongah, which in the Norilh or Norway language fignifies a dear friend.- The Harrogate feafon is from May to Michaelmas; and the company affemble and lodge in five or fix large houfes or inns on the heath, a mile from the village, each houfe having a long room and an ordinary : the beft company ufed to lodge at Knarelborough, which is threc miles off.

HARROW-on-the-Hitl, a town of Middlefex, fo called from its fituation on the higheft hill in the county, is to mile s northweft of London. This parifh is noted for a free fchool, founded in the reign of queen Elizabeth. A filver arrow is fhot for here once a-year, viz. Auguft 4 . by a felect number of the fcholars, who are dreffed for the purpofe in the habit of archers.

Harrow, in agriculture. See there, $\mathrm{n}^{\circ} 98$.
HART, a ftag, or male deer, in the fixth year. See Cervus.
Hart-Beeft, or Quanga. See Capra.
$H_{A R T}$ '-Horns, the horns of the common male-deer. -The fcrapings or rafpings of the horn of this animal are medicinal, and ufed in decoctions ptifans, \&c.

Harthorn $\mathrm{j}+1 \mathrm{l}$ y is nutritive and frengthening, and is fometimes given in diarrhœas; but a decoction of
burnt harthorn in water is more frequently ufed for Hnrffor, this purpofe, and is called hartforn drank.

The coal of harthorn, by being calcined with a long continued and frong fire, is changed into a very white earth, called bart/born calcined to whitenefs. This earth is employed in medicine as an abforbent, and adminiftered in dyfenteries and labour-pains, which are fuppofed to be caufed by acrid and ill-digetted matters This earth levigated is the bafis of Sydenham's white decoction, which is commonly prefcribed in thefe difeafes.

The falt of harthorn is a great fudorific, and given in fevers with fuccefs; and hart fhorn alfo yields, by diftillation, a very penetrative volatile firit.

HARTFORD, the capital of the county of the fame name, fignifying, as is commonly thought, the " ford of harts," ftands on the river Lea, 21 miles from London ; and is of confiderable antiquity. Here the Eaft-Saxon kingsoften kept their court ; and here, in 673, was held a fynod. King Alfred built a caftle here, by which the Danifh veffels were deftroyed, that came up from the Thames by its river as far as Ware, where the Danes had erected a fort, from which they made frequent fallies to plunder and deftroy the country. The prefent caftle confifts of a gate-houfe, or lodge of brick, and a range of brick buildings, which feem of the time of James or Charles I. and allo of a very ancient wall of ruble-ftone, with angular towers, fuppofed to have been ftanding ever fince its firft foundation. The manor of the town was all along the king's, of whom both the town and caftle were formerly held in capite. The barons took the latter from king John, but Henry III. recovered it. Edward III. gave the town a charter for markets on Thurfdays and Saturdays, and in this grant of it to John of Gaunt, it is called The Honour of Hartford. It fent members to parliament in the reign of Edward I. but after the 7 th $^{\text {ºf }}$ Henry V. on the petition of the bailiff and burgeffes to be exempted by reafon of their poverty, that privilege was difcontinued till the 22d of James I. Henry VI. who kept his Ealter here in 1429 , ordajned by his charter, confirming their market, that no other fhould be kept on the fame days, within feven miles, on pain of having the goods feized by the bailiffs of Hartford. This planor being then part of queen Margaret's jointure, the courts were held in her name, and fhe appointed a horfe fair to be kept in what part of the town the bailiff and conftables thought fit. The ftandard of weights and meafures was fixed here in the reign of Henry VII.; and Mary I. made this a corporarion by the name of bailiffs and burgefes, of whom the, latter were 16 by her charrer. In the $25 t^{t h}$ and 35th of Elizabeth, Michaclmas-term was kept here, by reafon of the plague at both times in London; and that queen, who fometimes refided in its caftle, and declared the borough as parcel of her duchy of Lancafter, granted it a new charter, by the ftyle of a bailiff, II capital burgeffes and 16 affiftants, with a mar-. ket on Saturday. James I. granted it a new charter, with the fyle of mayor, burgeffes, and commonalty, to have 10 capital burgeffes, and if affiftants, the mayor to be chofen out of the former by both of them; and a fair was then appointed here on Play 12. Here was once a monaftery, founded by a nephew of Wil-

## HAR

Hartiord- liam the Conqueror ; and here were formerly five fhire, churches which are now reduced to two. In St AnHartland. drew's there is a feat not only for the mayor andalderment, but another for the governors of Chrift-church hofpital in London, who have erected a houfe in this town on account of its healthy ail and dry fituation, to receive fuch children as wanted either health or room in that hofpital; and they leave built a gallery in the church, wherein 200 of their children may be accommodated. The town is now governed by a mayor, high-fteward, who is generally a nubleman, a recorder, 9 aldermen, a town-clerk, chamberlain, 10 capital burgetfes, and 16 affiftants, and has 2 ferjeants at mace. The chief commodities of its market are wheat, malt, and wool ; and it is faid to fend 5000 quarters of malt to London weekly by the river Lea Befides the abovementioned, here are two fairs on July 5 and November 8 , and 2 others for cattle, viz. the Satarday fortnight before Eafter, and its Midfummer fair is chiefly for horfes. Here is a handfome free grammar fchool, befides 3 charity. fchools; bat the fplendor of the place is much diminifhed fince the north road from London was tarned through Ware. The county goal, however, is ftill kept in the town, and the gaol-delivery in the caftle. It gives the title of earl to the noble family of Seymour-Conway.

HARTFORDSHIRE, a county of England, deriving its name from Hartford the capital; and that from the harts with which it anciently abounded, being then over-run with woods. It is bounded on the eaft by Effex, on the weft by Bedfordhire, and Buckinghamfhire, on the fouth by Middlefex, and on the north by Cambridgefire. This county is much indented by thofe that furround it: the longeft part is abour 35 miles, and the broadeft about 27; and the circumference is 190 , containing about 451,000 acres. It is divided into cight handreds, which coniain 19 market towns, 54 vicarages, 120 parifhes, and near 950 villiges, with about 16,500 houfes, and 90,000 inhabitants; and fends fix members to parliament, two knights for the fhire, with two burgeffes for St Albans, and as many for Hartford. Before the reign of queen Elizabeth, one Theriff ferved both for this hire and Effex; but in the ninth year of her rejgn, it had one allotted for itfelf. With regard to ccclefiaftical jurifdiction, it belongs partly to the diocefe of Lincoln, and partly to that of London. Though the foil in general, efpecially in the Chiltern and fouthern parts, is but very indifferent, and much inferier to that of the neighbouring counties; yet the air is fomuch fuperior, that lands in this hire generally fell at three or four years purchafe more than in many others on that account. But it mutt be owned, that the foil of Hartfordfhire has been much improved of late, by draining, fowing grafs-feeds, and other methods. There are few or no manafactures in the county; but its markets are much frequented, in confequence of its being near London, for malt and all forts of grain, which, with the many thoroughfares through it, make ample amends.

HARTLAND, a town in Devonfhire, near the Brifol channel, with a market on Saturdays, much frequented by the people of Cornwall, who come hither in boats. It gives its name to a point, called

332 I II A R
Hartland Point, at the entrance of Brifol chaninel. Hartlepoal W. Long. 4. 45. N. Lat. 51 . 9.

HARTLEPOOL, a fea-port town in the county of Durham. It is commodioufly feated on a promontory, and is almoft encompaffed by the fea. It is an ancient corporation, governed by a mayor and aldermell, with other fubordinate officers. It is at prefent a pretty large but peor piace. It depends chicfly on the fifhing trade; and its harbour is much frequented by coliers paffing to and from Newcaftle. W. Long. o. 55. N. 54.40 .

HARTLEY, a town of Northumberland, on the coaft, fituated northweft of Tynemouth, where Lord Delaval has conftructed a pretty haven, whence coals are fhipped for London. Here are large fall works and copperas works, and likewife conliderable glafs works; and there is here a canal cut through a folid rock to the harbour, 52 feet deep, 30 broad, and 900 long. Thefe works are the fole property of Lord Delaval, and yield a revenue of above 20,0001. per ann.

Hartiey (David), M. A. born at Ilingworth, where his father was a curate, received his academical education at Jefus college, Cambridge, of which he was a fellow. He firft began to practife phyfic at Newark, in Notringhamflire; from whence he remo. ved to St Edmund's Bury, in Suffolk. After this, he fettled for fome time in London ; and laftly went to live at Bath, where he died in 1757, aged 53, leaving two fons and a daughter. He publifhed "A view of the prefent evidence for and againf Mrs Stephens's* inedicines as a folvent for the ftone, contain-* See $S_{t e-}$ ing 155 cafes, with fome experiments and obferva-pbens's Mo tions;" London, 1739. He is faid to have alfo writ- dicines ten againft Dr Warren, of St. Edmund's Bury, in defence of inoculation; and fome letters of his are to be met with in the Philofophical Tranfactions. The doctor was cercainly a man of learning, and reputed a good plyffician ; but too fond of noftrums. But his moft conliderable literary production is a work intitled, " Cbfervations on man, his frame, his duty, and bis expectations, in two parts:" London, 1749,2 vols. 8vo. The firf part contains obfervations on the frame of the human body and mind, and on their mutual connections and induences. The fecond part contains obfervations on the duty and expectations of mankind.

HARTMAN (John Adolphus), a learned divine and hiftorian, was born at Munfter in 1680 . After being a Jefuit for feveral years, he became a Calvinift at Caffel, in 1715 ; and foon after was made profeffor of philofophy and poetry, and in 1722 profeffor of hiftory and eloquence, at Marpurg, where he died in 1744. The moft efteemed of his works are, r. The ftate of the fciences at Heffe, in German. 2. Hifloria Halfiaca, 3 vols. 3. Pracepta eloquentice rationa. lis, \&c.

He ought not to be confounded with George Hartman, a German mathematician, who, in 1540 , wrote a book on perfpective; nor with Wolfgang Hartman, who, in 1596 , compofed the Annals of Augiburg.

HARTOGIA, in botany: A genus of the pen. tandria order, belonging to the monœecia clafs of plants; and in the natural method ranking under the 48th order, Aggregata. The male calyx is pentaphyllons, the

## HAR [ 333 ] A R

Harufpicas petals five ; the female calyx triphyllous, with five perals, and five barren and five caftrated famima. There are three capfules; and the feeds are arillated, or in-
clofed in a deciduous cafe.
HARUSPICES, pretenders to divination by certain figns or omens among the Romans.-The Roman harufpices were at firft all taken from Hetruria, where their art had moft credit. Afterwards young Romans were fent into Hetruria, in order to be brongint up in the fcience. It confitted in foretelling future events by attending to various circumftances of the victims. Firit, It was an ill omen when the victim would not come to the altar without dragging, when it broke its rofe, Hed away, avoided the ftroke, ftrusgled much after it, made a great bellowing, ba a long adying, or bled but little. Secondly, Prefages were drawn from infpecting the noble parts of the victim when opened; as the heart, langs, fpleen, and efpecially the liver. If all thefe were found, if the top of the liver was large and well-made, and if its fibres were ftrong, it prefaged well for the affair in queftion. Thirdly, Knowledge was alfo drawn by the harafpices from the manner in which the fire confumed the victim. If the flame brightened immediately, was pure and clear, rofe up in a pyramid without noife, and did not go out till the victim was confumed, thefe were happy figns. Fourthly, The fmoke alfo was confidered, whether it whirled about in curls, or fpread iffelf to the right or the left, or gave a fmell different from the common one of broiled meat. Fifihly, It was a lucky omen if the incenfe they burned melted all at once, and gave a moft agreeable fmell.

HarUspicy. See Haruspice and Divination.

HARVEST, probably derived from a Saxon word fignifying berb feaft, is that feafon of the year when the corn is ripe and fit to be reaped and gathered into barns.

Hary est-Fly, in zoology, a large four-winged fly of the cicada kind, very common in Italy, and erroneoully fuppofed to be a grafshopper. See Cicada.

Harvest-Home, denotes the feaft often obferved at the clofe of harveft, and alfo the fong ufed on that occafion. See December.

HARVEY (Dr William), an eminent Englifh phyfician in the 17 th century, was incorporated Doctor of phylic in Cambridge, afterwards admitted into the college of phylicians in London, and was appointed lecturer of anatomy and chirurgery in that college. In thefe lectures he opened his difcovery relating to the circulation of the blood; which, after a variety of experiments, he communicated to the world in his $E x$ ercitatio anatomica de motu cordis et fanguinis. He was phyfician to king James I. and to king Charles I. and adhered to the royal caufe. His works have eternized his memory. In 65 r , he publifhed his Exercitationes de generatione aumalium, a very curious work; but it would have been more fo had not his papers been deftroyed during the civil wars. In 1654, he was chofen prefident of the college of phyficiansin his abfence: but his age and weaknefs were fo great, that he could noi difcharge the duty of that office; and therefore defired them to choofe Dr Pringle. As he had no children he fetcled his paternal eftate upon the college. He had three years before bailt a combination.
room, a library, and a mufeum; and in 1656, he brought the deeds of his eftate, and prefented them to

Harvey, the college. He was then prefent at the firft feaft, inftituted by himfelf, to be continued annually, together wich a commenoration fpeech in Latin, to be fpoken on the IEth of October, in honour of the benefactors to the college ; he having appointed a handfome ftipend to the orator, and alfo for the keeper of the library and mufeum, which are ftill called by his name. He died in 1657.

This great phylician had the happinefs, in his lifetire, to find the clamours of ignorance, envy, and prejudice againft his doctrine, totally filenced, and to fee it univerfally eitablifhed. It has, by length of time, been more and more confirmed, and every man now fees and knows it from his own experience. It appears to be of the utmoft importance in medicine; as it is perhaps impoffible to define health and ficknefs. in fewer words, than that the one is a free, and the other an obftructed, circulation.-Dr Harvey was not only an excellent phyfician, but an excellent man; his modefty, candour, and piety, were equal to his knowledge; the farther he penctrated into the wonders of nature the more he was inclined to venerate the Au, thor of it.

HARWICH, a town of Effex, in England, 72 miles from London. It is not large ; but is well bailt and populous, has a good maritime trade, is almoft encompaffed by the fea, and has ftrong works. It is walled in ; and the ftreets are paved for the moft part with clay, which tumbling downfrom the cliff, where is a petrefying water between the townand Beacon-Hill, foon grows as hard as ftone; and the inhabitants boaft the wall is as frong and the ftreets are as clean as thofe that are of real ftone. The harbour or bay is very large, fafe, and deep; and is commanded by a ftrong fort on the Suffolk fide, though not in that county. Here is a dock belonging to the government, with all convenience for building, cleaning, and refitting men of war. A little way from the town, on a high hill called Beacont-hill, is a very fine light-houre, which is feen at a great diftance, and is very ufeful on this dangerous coaft. At this place the packet boats whicit pafs between England and Holland are ftationed, and the town is much benefited by the paffengers. The bay is fo fpacious, by the influx of the Stour from Maningtree, and the Orwell from Ipfwich, and fuch ufe was made of it in the Dutch war, that 1 co fail of men of war have been feen there at one time, with their tenders, befides 300 or 400 fail of colliers; for it is a perfect harbour to within two miles of Ipfwich, and able to receive fhips of 100 guns all the way. The inns here are very good; but the accommodations dear, by teafon of the great concourfe of paffengers to and from Holland, which was the motive of fitting up floops to go thither directly from the Thames, when the ftage-coaches that ufed to ply two or three times a week between this place and London were laid down. This place was firft made a free borough, and had a grant of its market on Tuefdays in the reign of Edward II, Its government was fettled by charter of king James I. in a mayor, chofen y early, November 30, out of eight aldermen, who with 24 capital burgeffes, the electors, and the recorder, make the corporation, By this charter it had alfo a power to elect two bur,

## HAS 「 334,$\rfloor$ H.A S

Harwood geffes to parliament, the grant of its Friday matiet, and its two tairs on F:ay-day and October ä̈. Wnich are cach for three days. The town has alfo an ad-
mirally jurifdiction within its liberties, and the return of all writs, fines, \& c . Though the entrance into the fea here is between two and three miles wide at highwater, yet the channcl where the hips mult keep to come to the harbour, which is on the Suffolk fide, is deep and narrow; fo that all hips that come in or go out are commanded by the guns of Landguard-fort on that fide. This town was fortified herctofure on the land fide, but in the reign of king Charles I. the fortifications were demolifhed. It has fince been ordered to be refortified. -The church here, ever fince the reformation, has been a chapel to the motherchurch at Dover-Court.

HARWOOD, a fmall but pretty town in the north riding of Yorkhire, with a coftly fone-bridge of 11 arches over the Wherfe, which runs in a bed of fone, and is as clear as rock-water. Near it are the ruins of an ancient caftle, built foon after the conqueft; which remained a neat trong building in Cambden's time. It had a variety of mafters ; one of whom, in the reign of king John, obtained a grant for a market and fair here. In the reign of Edward III. it was valued at 400 marks a-year. This caftle was ruined in the civil wars. It has eight or nine dependent conftabularies, wherein are many antiquities. The remains of the caftle which feems to have been the keep, is in a condition to exiftlong. The caftle itfelf covered near an acre of ground. Near it is now Harwood-Houfe, one of the firft houfes in the county for elegance and fuperior embellifhments; built on part of the fite of Gaw -thorp-Hall, now no msre. In the charch are fome ancient monuments, particularly that of lord chief-juftice Gafcoigne, who committed the prince of Wales to prifon for ftriking him on the bench.

HASLEMERE, a town of Surry, in England, feated on the edge of the county near Hampihire, 43 miles from London, is an ancient place, and was once deftroyed by the Danes. It is a borough by prefcription, and has fent members to parliament ever fince the reign of Edward IV. who are chofen by a bailiff and burgage-teeners. It is faid to have had feven pa-rimh-churches formerly, though but one charch new, which is a chapel of eafe to Chidingfold : and that it ftood heretofore upon a hill more to the fouth than the prefent town.

HASSELQUISTA, in botany: A genus of the digynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 45 th order, Umbellata. The fruits are quite fmooth; the feeds of the radius oval, plane, marginated, and convex in the middle; thofe in the difk hemifpherical and urceolated or bladder-fhaped.

HASSELT, a handfome town of the United Provinces, in Overyffel, feated on the river Wecht, in E. Long. 6.5. N. Lat. 53. 46.

Hasseit, a town of Germany, in the circle of Weftphalia, and in the territory of Liege, fituated on the river Demer, in E. Long. 4. 49. N. Lat. 50.55.

HASSIDEANS, or Assideans. See AssideANS.

HASSOCK, a bafs made of rufhes, to kneel or reft the feet upon in churches.

HASP and Staple, in Scots law, the fymbol com
monly ufed in burgage tenements foy entering and infefting an heir, by delivering into his hands the hefp and staple of the door.

HaSTA, or HASTA Fura, among medalifts, figni. fies a kind of fpear or javelin, not flod or headed with iron; or rather an ancient fceptre, fome what longer than ordinary, occalionally given to all the gods.

The hafta is fuppofed a fymbol of the goodnefs of the gods, and of the conduct of providence, which is equally mild and forcible.

Hasta, in fome countries, is a meafure or quantity of ground amounting to thirty paces : thus called, according to M. Du Cange, from the hafta or rod wherewith it was meafured.

Hastated Leaf. See Botany, p. 442.
HASTING-pear, a name given by the gardeners to a fpecies of pear, called alfo by fome the gruen ch ( $\int=1$ pear. This is a moderately large pear, and is longifh towards the pedicle; its fkin is thin, and of a whitifh green ; the pulp is meltiag, and of a fugary flavour. It ripens in July.

HASTINGS, a town of Suffex in England, 64 miles from London. It is the chief of the cinqueports; and was formerly obliged to find 21 mips ; within 40 days after the king's fummons, well furnithed and armed for fervice, and to maintain the crews a fortnight at its own charge. This town is fuppofed to have taken its name from Haftings, the famous Danif pirate, whoufed to build fortreffes where he went afhore for his prey, to cover his men, and fecure his retreat. In king Athelftan's reign here was a mint. This town had charters from Edward the Confeffor, William I. and II. Henry II. Kichard I. Henry LII. Edward I. and Charles II. exempting it from toll, and impowering it to hold courts of judicature on life and death. It is incorporated by the ftyle of mayor, jurats, and commonalty. It has handfome houfes, and cuftom-houfe offices; but trequent forms have rendered it an indifferent harbour, though a vaft fum of money has been laid out at times to make it a good one. It has fent members to parliament ever fince Edward III. London is fupplied from hence with abundance of: fifh that are taken on the coaft. The town lies between two high cliffs towards the fea, and as high a hill on the land fide, having two ftreets, and in each a parifh-church, divided by a ftream of frefh water called the Bourne. About the year 1377, this town was burnt by the French: and after it was rebuilt, it was divided intorlie two parifhes. Here are two charity fchools, erected for the teaching of 200 or 300 children. There was a cafticon the hill, which overlooked the town, but it is now in ruins. The markets here are on Wednefdays and Saturdays : the fairs are on Tuefday and Wednefday in Whitfun-week, and July 26, October 23, and 24. Here was formerly a priory. Haftings was a barony in the Huntington family, now in the Rawdon family.

This town is remarkable for a battle fought in its neighbwurhood, between Harold king of England and William duke of Normandy, on the 15 th of October 1066, in which the former was defeated and killed; and by his death William, furnawed the Conqueror, became king of England: (See Enciand, ne 86.) -Thenight before the battle, the afpect of things was very different in the twu camps. The Englifh fpent the time in riot, jollity, and diforder; the Normans in prayer

IIata if
Haflings.

Haftings. and other duties of religion. The next day both armies prepared for battle. The duke divided his army into three lines : the firlt, headed by Montgomery, conlifted of archers and light-armed infantry : the fecond, commanded by Martel, was compoled of his braveft battalions, heavy-armed, and ranged in clofe order; his cavalry at whofe head he placed himfelf, formed the third line; and were fo difpofed, that they fretched beyond the infantry, and flanked each wing of the army. He ordered the dignal of battle to found; and the whole army, moving at once, and linging the hymu or fong of Roland the famous peer of Charlemagne, advanced, in order and with alacrity, towards the enemy.
Harold had feized the advantage of a rifing ground, and having befides drawn fome trenches to fecure his flanks, he refolved to ftand upon the defenfive, and to avoid all action with the cavalry, in which he was inferior. The Kentifh men were placed in the van, a poft which they had always claimed as their due; the Londoners guarded the ftandard; and the king himfelf, accompanied by his two valiant brothers, Gurth and Leofwin, difmounting from horfeback, placed himfelf at the head of his infanery, and expreffed his refolution to conquer or to perih in the action. The firft attack of the Normans was defperate, but was received with equal valour by the Engliin : and after a furious combat, which remained long undecided, the former, overcome by the difficulty of the ground, and hard preffed by the enemy, began firit to relax their vigour : then to give ground; and confufion was fpreading among the ranks, when William, who found himfelf on the brink of deftracion, haftened, with a felect band, to the relief of his difmayed forces. His prefence reftored the action: the Englifh were obliged to rerreat with lofs; and the duke, ordering his fecond line to advance, renewed the attack with frefl forces and with redoubled courage. Finding that the enemy, aided by the advantage of ground, and animated by the example of their prince, ftill made a vigorous refiftance, he rried a ftratag cm , which was very delicate in its management, but which feemed advifeable in his defperate lituation, when, if he gained not a decifive victory, he was totally undone : he commanded his troops to make a hafty retreat, and to allure the enemy from their gronnd by the appearance of flight. The artifice fucceeded againft thefe unexperienced troops; who, heated by the ation, and fanguine in their hopes, precipitately followed the Normans into the plain. William gave orders, that at once the infantry hould face about upon their purfuers, and the cavalry make an affault upo. their wings, and both of them purfue the advantage which the furprize and terror of the enemy muft give them in that critical and decilive moment. The Englifh were repulfed with great llaughter, and driven back to the hill; where being rallied again by the bravery of Harold, they were able, notwithtanding their lofs, to maintain the poft and continue the combat. The duke tried the fame ftratagem a fecond time with the fame fuccefs; but even after this double advantage, he ftill found a great body of the Englifh, who, maintaining themfelves in firmarray, feemed determined to difpute the victory to the laft extremity. He ordered his heavy-armed infantry to make the af.
fault upon them ; while his archers, placed behind, Hafting flould gall the eneiny, who were expofed by the fituation of the ground, and who were intent in defending themfelves againft the fwords and fears of the aflailants. By this difpofition he at laft prevailed. Harold was flain by an arrow, while he was combating with great bravery at the head of his men. His two brothers fhared the fame fate; and the Englifh, difcouraged by the fall of thefe princes, gave ground on all fides, and were purfued with great flaughter by the victorious Normans. A few troops, however, of the vanquifhed dared fill to turn upontheir purfuers; and taking them in deep and miry ground, obtained fome revenge for the flaughter and dilhonour of the day. But the appearance of the duke obliged them to feek their fafety by flight, and darkneis faved them from any farther purfuit by the enemy.

Thus was gained by William duke of Normandy, the great and decifive victory of Haftings, after a battle which was fought from morning till funfet, and which feemed worthy, by the heroic feats of valour difplayed by both armies, and by both commanders, to decide the fate of a mighty kingdom. William had three horfes killed under him ; and there fell near fifteen thoufand men on the fide of the Normans. The lofs was ftill more confiderable on that of the vanquifled; befides the death of the king and his two brothers. The dead body of Harold was bruaght to William, who refored it without ranfom to his mother.

HASTIVE, a French term, fometimes ufed in Englifh for early, forward, or fomething that comes betore the ordinary time or feafon. The hallive fruits are ftrawberries and cherries. We have haftive peas, \&c.

HAT, a covering for the head, worn by the men throughout the weftern part of Europe. Hats are faid to have been firft feen about the year i400, at which time they became of ufe for country wear, riding, \&c. F. Daniel relates, that when Charles II. made his public entryinto Rouen, in 1449, he bad on a hat lined wish red velvet, aud furmounted with a plame or cuft of feathers: he adds, that it is from this entry, or at leaft under this reign, that the ufe of hais and caps is to be dated, which henceforward began to take place of the chaperoons and hoods that had been worn before. In the procefs of time, from the laity, the clergy alfo took this part of the habit ; but it was looked on as a great abuíe, and feveral regulations were publiflied, forbidding any prieft or religious perfon to appear abroad in a hat withont coroners, and enjoining them to keep to the ufe of chaperoons, made of black cloth, with decent coronets : if they were poor, they were at leaft to have coroners faftened to their hats, and this upon penaliy of fufpenfion and excommunication. Indeed the ufe of hats is faid to have been of a longer llanding among the ecclefiaftics of Britanny, by two hundred years, and efpecially among the canons; but thefe were no other than a kind of caps, and from hence arofe the fquare caps worn in colleges, \&c. Lobineau obferves, that a bilhop of Dol, in the 12 th cen tury, zealous for good order, allowed the canons alone to wear fuch lats : enjoining, that if any other perfon came with them to church, divine fervice fhould immediately be fufpended.

Hats

Hats. Hats make a very confiderable article in commerct; the fineft, and thofe molt valued, are made of pure hair of an amphibious animal, called the caftor or beaver, frequent in Canada and other parts of North Ame. rica. See Beaver.

Method of making Hars. Hats are made either of wool, or hair of diverfe animals, particularly of the caftor, hare, rabbet, camel, \&c. The procefs is much the fame in all; for which reafon we hall content ourfelves to inftance in that of caftors.

The fkin of this animal is covered with two kinds of hair ; the one long, ftiff, glofy, and pretty thin fet; this is what renders the k in or fur of fo much value: the other is fhort, thick, and foft, which alune is ufed in hats.

To tear off one of there kinds of hair, and cut the other, the hatters, or rather the women employed for that purpofe, make ufe of two knives, a large one like a fhoemaker's knife for the long hair; and a fmaller, not unlike a vine knife, wherewith they fhave or frape off the forter hair.

When the hair is off, they mix the ftuff; to one third of dry caftor putting two-thirds of old coat, i. e. of hair which has been worn fome time by the favages, and card the whole with cards, like thofe ufed in the woollen manufactory, only finer; this done, they weigh it, and take more or lefs according to the fize or thickness of the hat intended. The ftuff is now laid on the hurdle, which is a fquare table, parallel to the horizon, having longitudinal chinks cut through it; on this hurdle, with an inftrument called a bow, much like that of a violin, but larger, whofe ftring is worked with a little bow fick, and thus made to play on the furs, they fly and mix together, the duft and filth at the fame time paffing through the chinks; this they reckon one of the moft difficult operations in the whole, on account of the juftnefs required in the hand to make the ftuff fall precifely together, and that it may be every where of the fame thicknefs. In lieu of a bow, fome hatters make ufe of a fieve or fearce of hair, through which they pafs the ftuff.

After this manner they form gores, or two capades, of an oval form, ending in an acute angle at top; and with what ftuff remains, they fapply and ftrengthen them in places where they happen to be flenderer than ordinary; though it is to be remembered, that they defignedly make them thicker in the brim, near the crown, than toward the circumference, or in the crown itfelf.

The capades thus finifhed, they go on to harden them into clofer and more confiftent flakes by preffing down a hardening fkin or leather thereon; this done, they are carried to the bafon, which is a fort of bench with an iron plate fitced therein, and a little fire underneath it; upon which laying one of the hardened capades, fprinkled over with water, and a fort of mould being applied thereon, the heat of the fire, with the water and preffing, imbody the matter into a light hairy fort of fuff or felt; after which, turning up the edges all round the mould, they lay it by, and thus proceed to the other: this finifhed, the two next are joined together, fo as to meet in an angle at the top, and only form one conical cap, after the manner of a manica Hippocratis, or flannel bag.

The hat thus bafoned, they remove it toa large kind of receiver or trough, refembling a mill-hopper, going floping or narrowing down from the edge or rim to the bottom, which is a copper kettle filled with water and grounds, kept hor for that purpofe. On the defcent or lloping fide, called the plank, the bafoned hat, being firft dipped in the kettle, is laid; and here they proceed to work it, by rolling and unrolling it again and again, one part after qnother, firft with the hand, and then with a little wooden roller, taking care to dip it from time to time, till at length by thus fulling and thickening it four or five hours, it is reduced te the extent or dimenfions of the hat intended. To fecure the hands from being injured by this frequent rolling, \&c. they ufually guard them with a fort of thick gloves.

The hat thus wrought; they proceed to give it the proper form, which is done by laying the conical cap on a wooden block, of the intended fize of the crown of the hat, and thus tying it round with a packthread, called a commander: after which, with a piece of iron, or copper bent for that purpofe, and called a ftamper, they gradually beat or drive down the commander all round, till it has reached the bottom of the block, and thus is the crown formed; what remains at bottom below the ftring being the brim.

The hat being now fet to dry, they proceed to finge it, by holding it over a flare of ftraw or the like ; then it is pounced, or rubbed over with pumice, to take off the coarfer knap; then rubbed over afrefh with fealfkin to lay the knap a little finer; and laitly, carded with a fine card to raife the fine coton, with which the hat is afterwards to appear.

Things thus far advanced, the hat is thus fet, upa: on its block, and tied about with a packthread as before, to be dyed. The dye being completed, the hat is returned to the hatter, who proceeds to dry it, by hanging it in the top or roof of a flove or oven, at the bottom of which is a charcoal fire; when dry, it is to be ftiffened, which is done with melted glue or gum fenegal, applied thereon by firf fimearing it, and beating it over with a bruth, and then rubbing it with the hand. The next thing is to fteam it on the fteaming bafon, which is a little hearth or fireplace; raifed three feet high with an iron-plate laid over it, exactly covering the hearth; on this plate they firft fpread cloths, which being fprinkled over with water to fecure the hat from burning, the hat is placed brim downwards thereon; when moderately hot, the workman ftrikes gently on the brim with the flat of his hand, to make the joinings incorporate and bind fo as not to appear; turning it from time to time, this way and that way, and at laft overturning and fetting it in the crown. When fteamed fufficiently, and dried, they put it again on the block, and brufh and iron it on a table or bench for the purpofe, called the fall-board; this they perform with a fort of irons like thofe commonly ufed in ironing linen, and heated like them; which being rubbed over and over each part of the hat, with the affiftance of the brufh, fmoothes and gives it a glofs, which is the laft operation; nothing now remaining but to clip the edges even with fififars, and fow a liming to the crown.

Dying.

## H A ${ }^{\top}$

Dyeing of Hats. The antmeions of Mr Colbert direct has to be frit fromoly galled, by boiling ghem a long time in a decoction of galls with a liule logwoon, that the dye may penetrate the botter into the ir fabfance; afier which a proper quantity of vitriol, and decoction of logwood, with a litito verdigris, are added, and the hats continued in this mixture alfo for a coniderdble time. They are afterwards to be put into a freth liquor of logwood, galls, vitiol, and verdigris; and where clec hats are of great price, or of a hair which dificulily takes the diye, the fame procefs is to be repeated a third time. For obtaining the molt periect colour, the hair or wool is to be dyed Whe previoully to its being formed into hats.- The preftat practice is more compendious, and affords, as we may daily fee, a very good black. According to Dr. Lewis, it does not materially differ from that of the Encyciopedte, which is as follows.

An hundret! pounds of lugwood, 12 poninds of gum, and lix pounds of galls, are boiled in a proper quantity of water for fome hours; after which, abont fix pounds of verdigris and ten of grecn vitriol areadded, and the liquor kepi juit fmmering, or of a heat alitthe betow boiling. Ten or twelve dozen of hats are immediately put in, each on its block, and kept down by cross bats for about an hour and an hilf : they are then taken out and aired, and the fame number of others putin their room. The two fets of hats are thus dipped and aired alternately, eight times each; the liquor being refrefhed each time with more of the ingredients, bat in lefs quantity than at firlt.

The procefs (fays Dr Lewis) affords a very good black on woollen and filk fluffs as well as on hats, as we may fee in the fmall pieces of both kinds which are fometimes dyed by the hatters. The workmen lay great frefs apon the verdigris, and affirm that they cannct dye ablack hat without it : it were to be wihed that the ufeot this ingredient were more common in the other branches of the black dye; for the hatters dye, both on filk and woollen, is reckoned a finerblack than what is commonly produced by the woollen and filk dyer.

Hats are alfomade for womens wear, not only of the above ftuffs, but of chips, fraw, or cane, by plairing, and fewing the plaits tugether; beginning with the centre of the crown, and working round till the whole is finimed. Hats for the fame purpole are alfo twove and made of horfe-hair, Gilk, \&c.

Hat is alfo figuratively ufed for the dignity of a cardinal, or a promotion to that dignity. In this fenfe they fay, "to expect the hat ; coclaim, or have pretenfions to, the hat," \&c.

Pope Innocent IV. firft made the hat the fymbol or cognizance of the cardinals, enjoining them to wear a red hat at the ceremonies and proceffions, in token of their being ready to fill their blood for Jeins Chrif.

HATCH, or Hatchway, a fquare or oblong opening in the DECK of a mip, of which there are feveral, forming the paffages from one deck to another, and into the hold or lower apartments. See Plate CLVI. where A reprefents the main-hatchway of the lower deck; NN the fore-hatchway; and OO the after-hatchway.-There are likewife hatches of a fmalle: kind, called foutles. See UU in the fame figure; as as alfo the article Scuttie.-Hatches is alfo, though Voi. Vill.
improperly, a name applied by failor; to the covers or Hatchel lius of the hatchway.

HATCHEL, or Hitcher, in the mamfagory of Hathin flax, hemp, \&c. a tool, not unlike a card, for drefing and combing them into fine hairs.

They confift of harp pointed iron pins, or teeth, fet orderly in a board.

Of thefe there are feveral forts, fome with finct and forterteen, others with then coarlet and longer. HATCHES, in mining, a term uled in Cornvali, to exprefs any of the openings of the earth either into mines or in fearch of them. The fruitlefs upentugs are called effay-batches; the real mouths of the veins, tia-batches; and the places where they wind up the buckets of ore, winc'-batches.

Hatches alfo denote flood gates fetia ariwer, \&c. to ftop the current of the water, particularly certain dans or mounds made of rubbih, clay, or earth, to prevent the water that ilfues from the fleam-works and tin-wafhes in Cornwall from running into the frell rivers.

HATCHET, a fmall light fort of an axe, with a bafil-edge on its left iide, and a fhort handle, as being to be utcd with one hand.-Hatchets are ufed by various artificers, and more particularly in hewing of wood.

HATCHING, the maturating of fecendated esors, whether by the iucubation and warmth of the parent bird, or by artificial heat, fo as to produce younge chickens alive.

The art of harching chickens by means of ovens has long been practifed in Egypt; but it is there only known to the inhabitants of a fingle village named Berme, and to thofe that live at a fmall diftance from it. Towards the beginning of autumn they fatter themfelyes all over the country; where each perfor among them is ready to undertake the manarement of an oven, each of which is of a different lize; bur, in general, they are capable of containing from forty to fourfcore thoufand eggs. The number of thefe ovens placed up and down the country is about 386 , and they ufually keep them working for about fix months: as, therefore, each brood takes up in an oven, as under a hen, only 21 days, it is eafy in every one of them to hatch eight different broods of chickens. Every Bermeat is under the obligation of delivering to the perfon who intrufts him with an oven, only two-thirds of as many chickens as there have been eggs put under his care; and he is a gaincr by this bargain, as more than two-thirds of the eggs ufually produce chickens. In order to make a calculation of the number of chickens yearly fo hatched in Egypt, it has been fuppofed that only two-thirds of the eggs are hatched, and that each broed confifts of at leaft 30,000 chickens; and thus it would appear, that the ovens of Egypt givelife $y \in a r l y$ to at leaft $92,640,000$ of thefe animals.

This ufeful and advantageous method of hatching eggs has been lately difcovered in France by the in genious Mr Reanmur ; who, by a number of experiments, has redaced the art to certain principles. He found by experience, that the heat neceffary for this purpole is nearly the fame with that marked $\hat{y}^{2}$ on his thermometer, or that marked 6 on F'ahrenheit's. This degree of heat is nearly that of the fkin of the hen, and, what is remarkable, of the fkin, of all other domeftic

$\underbrace{\text { Hatching. fowls, and probably of all other kinds of birds. The }}$ degree of heat which brings about the developement of the cygnet, the golling, and the turkey-pout, is the fame as that which fits for hatching: the canary fongfere, and, in all probability, the fimalleft hummingbird: the difference is only in the time during which this heat ought to be communicated to the eggs of different birds; it will bring the canary bird to perfection in If or 12 days, while the turkey-pout will require 27 or 28 .

After many experiments, Mr Reaumur found that foves heated by means of a baker's oven, fucceeded better than thofe made hot by layers of dung and the furnaces of glafs-houfes and thofe of the melters of metals, by means of pipes to convey heat into a room, might nodoubt, be made to anfwer the fame purpofe. As to the form of the floves, no great nicety is required. A chamber over an oven will do very well. Nothing more will be neceflary but to afcertain the degree of heat; which may be done by melting a lump of butter of the lize of a walnut, with half as much tallow, and putting it into a phial. This will ferve to indicate the heat with fufficient exactnefs: for when it is too great, this mixture will become as liquid as oil ; and when the heat is too fmall, it will remain fixed in a lump : but it will flow like a thick fyrup, upon inclining the bortle, if the fove be of a right temper. Great attention therefore hould be given to keep the heat always at this degree, by letting in frefh air- if it be too grear, or hutting the fove more clofe if it be too fmall : and that all the eggs in the ftove may equally fhare the irregularites of the heat, it will be neceffary to fhift them from the fides to the centre; and thas to imitate the hens, who are frequently feen to make ufe of their bills, to pufh to the outer parts thofe eggs that were nearef to the middle of their nefts, and to bring into the middle fuch as lay neareft the fides.

Mr Reaunar has invented a fort of low boxes, without bottoms, and lined with furs. There, which he calls artificial parents, not only fhelter the chickens from the injuries of the air, but afforda kindly warmth, fo that they prefently take the benefit of their fhelter as readily as they would have done under the wings of a hen. After hatching, it will be neceffary to keep the chickens, for fome time, in a room artfully heated and furnithed with thefe boxes: butafterwards they may be fafely expofed to the air in the court-yard, in which it may not be amifs to place one of thefe artificial parents to thelter them if there flould be occafion forit.

As to the manner of feeding the young brood, they are generally a whole day after being hatched, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, after which they will begin to fick up infects and grafs for themfelves.

But to fave the troable of attending them, capons may be taught to watch them in the fame manner as hens do. Mr Reaumur affires, that he has feen above 200 chickens at once, all led about and defended only by three or four fuch capons. Nay, cocks may be taught to perform the fame office; which they, as well as the capons, will continue to do all their lives after.
Hatching, or Haching, in defigning, \&xc. the
making of lines with a pen, pencil, graver, or the fatchinent like; and the interfecting or going acrofs thofe lines with others drawin a contrary way, is called counter- Hattemifs. batching. The depths and fhadows of draughts are ufually formed by hatching.

Hatching is of fingular ufe in heraldry, to diftinguinh the feveral colours of a thicld, without being ilfomined : thus gules or red is hatched by lines drawn from the top to the bottom; azure, by lines drawn acrofs the fhicld ; and fo of other colours.

HATCHMENT, in heraldry, the coat-of arms of a perfon dead, ufually placed in the frent of a houfe, whereby may be known what rank the deceafed perfon was of when living : the whole diltinguilhed in fuch a manner as to enable the beholder to know whether he,was a batchelor, married man, or widower; with the like diftinctions for women.

Bifbop's-Hatfield, a town of Hartfordhire in the great coach-road to the north, y miles from London. It was called Bilhop's-Hatfield, becaufe it did belong to the binhops of Ely. Theodore Archbinhop of Canterbury held a fynod here, anno 681, againft the Eutychean herefy. Here was once a royal palace, from whence both Edward VI. and Queen Elizabeth were conducted to the throne. King James I. exchanged the manor with Sir Robert Cecil, afterwards earl of Salifbury, for Theobald's, in the parifh of Chefhunt in this county ; and the lordfhip Hill remains in that noble family, who have a very fine feat here. The rectory, which is in that earl's gift, Is reckoned worth 800 pounds a-year. Here are two charity fchools; and there is a market on Thurfdays, with two fairs. in April and October.

HATFIELD and CHACE, a town in the weft riding of Yorkfhire, four miles from Doncafter. The chace is famous for deer-hunting. There are many intrenchments near thetown, as if it had been the camp of fome great army. It is faid that no rats were ever feen in this town.

Hatrield-broad-oak, or King's Hatfield, a town of Effex in England, feated on a branch of the river Lea, 30 miles from London, is fo called from the nature of the foil, from its tenure by king William the Conqueror and his fucceffors, and from a broad oak growing in the town. It has a market on Saturdays, and a far in Anguft.

HATTEM, a town of the United Provinces, in the duchy of Guelderland, feated on the river Uffol, in E. Long. 6. O. N. Lat. 53. 30.

HATTEMISTS, in ecclefiaftical hiftory, the name of a modern Dutch fect, fo called from Pontian Van Hattem, a minifter in the province of Zealand, to wards the clofe of the laft century, who being addicted to the fentiments of Spinoza, was on that account degraded from his paftoral office. The Verfchorifts and Hattemifts refemble each other in their religious fyftems, though they never fo entirely agreed as to form one commanion. The founders of there fects deduced from the doctrine of abfolute decrees a fy ftem of fatal and uncontrollable neceffity; they denied the difference between moral good and evil, and the corruption of human nature: from hence they farther concluded, that mankind were under no fort of obligation to correct their nanners, to improve their minds, or to obey the divine laws; that the whole of religion confifed

Hateck notin afing, but in fuifering; and that all the pee$\|$ cepts of fas Chritt are reducible to this one, that we Havanna. bear wiulh cheerfolnefs and patience the cvenus that hamer to us through the divine vill, ond mike it our co: 'ant and only ftudy to manabina permanent tranquility of mind. Thus inr they agreci, but the Hattemitts farther affirmed, that Chritt made no expiation forthe ins cfncu by his death, but had only fuggefted to ut by his mediation, that there was nothing in us that could oitend the Deity ; this, they Gay, was Chrifts manner of jutilying his fervants, and prefenting them biumelefs Lefore the tribunal of God. It was one of their diftinguifled tenets, that God does not punifl menfortheir lins, but by their fins. Thefe two fects, fays Moheim, ftill fubliit, though they no longer bear the names of their founders.

HATTOCK, a nlock of corn containing twelve fleaves; others make it only three heaves laid together.

HATUAN, a town and fort of Upper Hangary, in the comnty of Novigrod. It was taken by the Imperialits in 1635 . It is feated on a mountain, in E. Long. 19. 48. N. Lat. $47,52$.

HAVANNA, a feaport town of America, in the ifland of Cutha, and on the north-weft part of it, oppofite to Florida. It is famous for its harbour, which. is in every refpect one of the beft in the Weft Indies, and permaps in the worid. It is entered by a narrow paflage, upwards of half a mile in length, which afterwards expands into a large bafon, forming three Cul de Sacs, and is fufficient, in exient and depth, to contain 1000 fail of the largeft fhips, having almoft throughout lix fathom water, and being perfectly covered from every wind. The town was biilt by Diego de Velafquez, who conquered the ifland of Cuba. It was but a fmall place, and named originally the port of Carenas, but afterwards, when the city by its increafe of wealth grew confiderable, it was called St Chriftopher of the Havanna. In 1536, it was of fo inconinderable a value, that being taken by a French pirate, he ranfomed the place for the paltry fum of 700 pieces of eight. Some time after it was taken by the Englih, and a fecond time by the French; nor was its value underftood, or any care taken to put it in a pofture of defence, till the reign of Philip II.; though what was then done proved infufficient. But lince the acceffion of a branch of the Houfe of Bourbon to the Spanifh crown, more pains have been taken to render it a place of ftrength.

The Havanna ftands on the weft fide of the harbour, in a pleafant plain; and is the refidence of the governor and captain-general of Cuba, and of the royal officers, as well as of an alfeffor for the affiftance of the governor and captain general of the Weft Indies. The biflop of St Jago de Cuba likewife choofes to fix his relidence here. The buildings are elegant, built of fone, and fome of them moft fuperbly furnifhed. Here are eleven churches and monafteries, and two handfome hofitals. Near the middle of the town is a fpacious fquare, furrounded with uniform buildings. The churches are rich and magnificent ; the lamps, candlefticks, and ornaments for the altars being of gold and tilver ; fome of the lamps are of the mont curious workmanhip, and weigh near 100 weight. The Recollects church, which fands on the beft ground in

保, lassabeantiful chapels in it, and in the mo- Havanr natery arecenstor 50 fathers. The church of St Clara has feven altars adorned with plate, and the nunnery cuatains igo women and fervants, all clothed in bluc. The church belonging to the Augulines has 13 altars; that of St J and de Lios 9 , with an hofpital for foldicre of 12,000 pieces of eignt revenue. It is not a bifhop's fee, though the biliop of St Jago refides here, the re. venue of which prelate is not lefs than 50,000 pieces of eight a.year. In I 700 the inhabitants were computed at 26,000 , and we may very well imagine then to be increafed fince. They are a more polite and focial peoplethan the inhabitants of any of the Spanidh ports on the continent; and of late imitate the; French both in their drefs and manners. The city is fupplied with water by a imoll river called Lagida, which rifes from the hills on the fouth-weft fide of the town, and divises itfelf into three ftreams, one of which falls into the fea on the calt fide of the town, but the other two flow through the place, entering the walls near the middle of the city.
As to the fortifications, it was already remarked, that the entrance to the harbour is by a narrow gut near half a mile in length : this paffage is defended on the eaft fide by a frong caftle called EL Moro, fituated on a high rock; and on the walls and baftions are mounted 40 picces of cannon. Under the faces of the fouth-weft baftion of the Moro, and more within the entrance of the harbour, is a battery of ftone called the Twelve Apoffles, almott level with the water, and the guns of which carry each a ball of $3^{6}$ pounds. A little higher, and oppofite to the Point gate, is the La Divina Paftora, or the Shepberd's Battery, of 14 guns, level with the water. On the weft fide of the entrance, at the point, is a fquare fort called the Punta, with four baftions well mounted with cannon, about 200 yards diftant from the Punta gate of the town. On the battions of the town, next the harboar, are a number of cannon; and about the middle of the city is another, fort called E/ Fuerte, a fquare fort with four baftions, mounted with 22 pieces of cannon, of no great ftrength; but in this laft the governor relides, and in it the king of Spain's treafures are depolited till the arrival of the galleons. On the land fide, from the Punta gate to the dock-yard, there is a rampart with baltions, faced with fone, and earthen parapets with a ditch, which in feveral places has fallenin, and is almoft filled up, particularly behind the Punta and land-gates, near the ftone-quarries, which, if joined to oneano. ther, might be of great detriment to the place in cafe of a fiege, as a lodgment might be made in them. The ground here rifes with an eafy afcent to the land-gate; and is cither open pafture or garden ground, well fored with the cabbage-tree. Before the land-gate is a ravelin. The hill on a rifing ground from this gate (which is the highent part of the town) to the dockyard, is fteeper than on the other fide.

Such are the fortifications of the Havanna, which are the beft the Spaniards have in the Weft Indies, as indeed the place is of the greate importance. But though Arong, they have many defects, and from the fituation of the towis and forts, are commanded by many eminencies, of which an enemy could not fail to take advantage. On the caft fide of the harbour, the Cavannas, on a part of which the Moro is builr,

# H A V <br> [ 340 ] <br> H A V 

Havama - commatrds in a great meafure that fort, but abfoltitely commands the Punta ElFuerte, and the whole northeaft part of the city, which is the beft fortified. On the weft tide of the city runs a fuburb, called Guridatoupe, whofe church is fitwated on an eminence about half a mile from the land-gate, which it is on a luvel with, and higher than any other part of the futifications. From the north fide of this rifing ground, the Punta gate may be flanked; and from the fouth eaft fide the dock-yard is commanded. Along the north fide runs an aqueduct, which falling into the ditch at the landgate, runs down to the dock-yard, both for watering the flips and turning a faw-mill. About half a mile from the church, is a bridge made over a rivalet that runs into the bay about soo yards. That road leads to thecentre of the ifland, and extends to Beracoa, above 600 miles diftant. From this bridge to the Lazaretto, is about two miles, with a riling ground betwixt them. A trench thrown up between thefe two places would cut off the communication with the town by land. From thefe obfervations it will plainly appear, that the Havanna, though well forified, is not impregnable.

The Havanna has greatly contributed to the mari. time ftrength of the crown of Spain, many fiaps having been built here within thefe few years, from 60 to 80 guns, the inand furnifhing the fineft materials, fuch as oak, pine, cedar, and mahogany. The only defect of the harbour is the narrownefs of its entry : for though free from bars and hroals, yet only one hip at a time can enter it ; from which circumflance the galleons have more than once been infulted, and fone of them taken, at the mouth of the harbour, the forss. there not being able to afford them any affittance.

Upon the rupture with Spain in 1762, the Britifh miniftry fent a fquadron and army againft this place under the coramand of admiral Pocock and lord Albemarle. The Spaniards had in the harbour at the time a fleer of twelve fail of the line, two of them but junt launched, two more on the flocks nearly finifhed, and feveral merchant flips. The men of war were almoft ready for fea; but no account had reached the governor of the intended attack. The place, however, was gallantly defended, and futained a fiege of two months and eight days before it could be reduced; when a capitulation was figned, and along with the city was yielded a diftrict of 80 miles to the weftward. This conqueft was without doubt in itfelf the moft confiderable, and in its confequences the mof decifive, of any they had made fince the beginning of the war; and in no opertion were the courage, theadinefs and perfe. verance of the Britili troops, and the conduct of their leaders more confpicuous. The acquifition of this place united in itfelf all the advantages which can be acquired in war. It was a military atchievement of the higheft clafs. By its cffect on the enemy's marine it was equal to the greateft naval victory, and in the plunder it equalled the produce of a national fabfidy. Nine fail of the enemy's line-of batule frips were taken; three of their capital flips had been funk by themfelves at the beginning of the fiege; two more were in forwardnefs upon the focks, and were afterwards deftroyed by the captors. The cuemy on this occafion loft a whole fleet of thips of war, befides a number of confrderable merchant hips; and in ready
money, in tobaccocullected at the Havanna on account Havanion of the king of Spain, and in other valuable merchan dizes, the fum loft by the Spaniards perhaps did not fall fhort of there millims fterling.
The city of Havanaa was reftored by the peace of 1763 ; and is of the greatellimportance to Spain, being the rendezvous for all their fleets to return tion A merica to Earope, lying at the mouth of the gulph of Florida, through which they are all obliged to pais. Here the navy of Spain fationed in the wife hacies ride ; and here the galleons, the flota, and other merchant ilips from other ports both of the continent and iflands, meet in September, to take in provifions an water, with great past of their lading, and for the convenience of returning to Spain in a body. A continual fair is helf till their departure, which generally happens before the cud of the month, when proclamation is made, forbidding any perfon belonging to the fleet to ftay in town on pain of death; and accordingly, on firing the warning gun, they all retire on board.The commerce carricd on in this port, which is very confiderable, may be diftinguifhed into the paticular commerce of the ifland of Cuba, and that more general by the galleons and flota. The former confifts in hides, ufaally ftyled of the Havanna, which are excellent, and of great value ; fugar, tobacco, admirable in is kind, \&c. Though fraggers are prohibited to trade, yet a contraband commerce is carried on brifker here than at La Vera Cruz. Some little trade is carried on by other ports of Cuba, but it is very inconfiderable. As to the general commerce, this port is the place of rendezvous (as already mentioned) for all hips, particularly from Carthagena, Puerto Velo, and La Vera Cruz, which return to Spain from the Indies. The Havanna is regularly fupplied with Eyropean goods only by the regifter hips from Cadiz and whe Canaries. The flota and galleons bring there no more tban the refufe of their cargoes, which they had not been able to difpofe of at Carthagena, Puerto Vclo, or La Vera Cruz. When the fleet is in the harbour, provifions are exceffively dear on fhore, and money fo plenty, that a Spaniard expects half a piece of eight aday from a male flave, and a quarter from a female, out of what they earn for their labour. The flet generally fails from thence, through the channel of Bahama, in the month of September; and is the richeft in the world; fince, in filver and merchandife, there is feldom lefs than thirty millions of pieces of eight on board, or fix millions feven hundred and fify thoufand pounds ferling.-It is natural to imagine, that a port of fo much confequence as the Havanna ought to be well fortified. Since it has been reftored to Spain, many new works have been added, to prevent if poffible a fimilar difafter befalling it. W. Long. 82. 13. N. Lat. 23. 12.

HAVEL, a river of Brandenburg, which proceeds from a lake in the duchy of Mecklenturg, and rumning thro' the middje Marche, and thro' Brandenburg and other towns, runs north, and falls into the Elbe.

HAVELBERG, a town of.Gernany, in the circle of Lower Saxony, and in the electorate of Brandenburg, with a bifhop's fee, fecularized in favour of the houfe of Brandenburg. It is feated on thie river Havel, in E. Long. 12.43. N. Lat. 53. 4.

HAVEN, a fea-port or harbour for fiips. See

## H A U [341 $\quad$ H A U

Haver-

Port and Harbour. - The word is derived from the Saxon bavia, or the German bafen, or the French haure; which all fignify the fame thing.

HAVERCAMP (Siyibert), a celcbrated Dutch fcholar and crilic, profeffor of hiftory, eloquence, and the Greek tongue, at Leyden. He was particulatly fkilled in medals; and was the author of fome efteem. ed works in that way, befide giving good and clegant editions of feveral Greek and Latin authors. Ife died at Leyden in 1742 , aged 58 .

HAVERFORD-west, a town of Pembroke hire in South Wales, feated in W. Long. 5. N. Lat. 5 I. 50. It is a neat, well-built, populons place, on the fide of a hill, which forms a part of the weft bank of the river Dongledye, 256 miles from London. It is an incorprated town and county of itfelf, governed by a mayor, fherifif, town-clerk, two bailifts, ferjeants at mace, and other offeers. The mayor of the town is admiral, coroner, cfcheater, and clerk of the markets, within its precincts. The houfes are well built and well inhabited, and the people enjoy a good trade. Here the aflizes are held and the county-jail kept. The town enjoys feveral privileges, and has its own courts. There are three parifh-churches within the lown, and one in the fuburbs. Here is alfo a com. modions quay for flips of burden, a cuftomhoufe, and a fine ftone bridge over the Dongledye, with a good free-fchool, a charity-fchool for boys and girls, eand an almhoufe. It was formerly fortified with a rampart and caftle, now demolifhed.

HAVERHILL, a town of England, in the county of Suffolk, where there is a coniderable manufactory of checks, cottons, and fuftains. By the ruins of a chitrch and cafle fill to be feen, it appears to have been formerly a place of much greater confequence than at prefent. It has now only about 300 poor clayhoufes, and one wide ftreet not paved.

HAUL, an expreffion peculiar to feamen, implying to pull a fingle rope, without the affifance of blucks or other fach mechanical powers. When a rope is otherwife pulled, as by the application of tackles, or the connection with blocks, \&c. the term is changed into bowfing.
To HaUl the Wind, is to direet the fhip's courfe nearer to that point of the compais from which the wind arifes. Thus, fuppofing a chip to fail fouthweft, with the wind northerly, and fome particular occafion requires to haul the wind nore weftward; to perform this operation, it is neceflaty to arrange the fils more obliquely with her keel; to brace the yards more forward, by flackening the ftarboard and pulling in the larboard braces, and to haul the lower fleets further afi; and, finally, to put the helm a port, i.e. over to the larboard fide of the veffel. As foon as her head is turned directly tothe weftward, and her fails. are trimmed accordingly, fhe is faid to have hauled the wind four points; that is to fay, from fouth-weft to weft. She may ftill go two points nearer to the direction of the wind, by difpoling her fails according to their greatef obliquity, or, in the fea-phrafe, by trimzines all Jharp; and in this fituation heis faid to be clofe hanled, as failing weft-north-weft.

HAUM, Halm, or Havim, anong farmers, denotes the ftcm or ftalk of corn, peafe, beans, \&c, from the soot to the ear.

HAUNCH, or Hanch, the Hip, or that part of the body between the laft ribs and the thigh.

The haunches of a horfe are too long, if when ftanding in the fable he limpe, with his hind-legs far-

Haunct ther back than he ought ; and when the tup or anet of his tail is not in a perpendicular line to the ip of lis hocks, as it always does in horfes whofe liannches are of a jult length. There are fome horfes which though they have tou long haunches, yet conmonly walk well : fuch are good to climb hills, $\mathrm{b}: \mathrm{t}$ are not at all fure upon a defcent; for they cannor ply then hams, and never gallop flowly, but always nearly apo. a full fpecd. The art of riding the great horle has not a more neceflary leffon than that of puting a horfe upon his haunches; which, in other woids, is calle. coupling him well, or putting him well together, or compact. A horfe that cannot bend or lower his. haunches, throws himfelf too mach upon inis fhoulder, and lies heavy upon the bridle.

HAVRE, in geography, \&c. a Frencl. term figni. fying the fame with haven or larbour.

Havre de Grace, a fea-port town of Fance, anicapital of a diftrict of the fame name, is fe: ed in the province of Normandy, on the Englif Channel, in a large plain at the month of the river Scine. It is a fmall fortified town, nearly of a fquare figure, divided into two parts by the harbour, furrounded with a wall and other works, and defended by a very ftrong citadel. It is one of the moft important piaces in France, on account of its foreigntrade and convenient harbour; for which reafon it was made a diftinct government from the reft of Normandy. It was furprifed in 1562 by the Proteftants, who delivered it to queen Elizabeth; but it was loft next year. In 1694 it was bombarded by the Englifh, and alfo in the year 1758 . E. Long. o. it. N. Lat. 49. 29.

HAURANT, in heraldry, a term peculiar to fines; and Gignifies their flanding upright, as if they were refrefling themfelves by fucking in the air.

HAUTE FEUILLE (John), an ingenious mechanic born at. Orleans in 1647 . Though he embraced the ftate of an ecclefiafic, and enjoyed feveral benefiw ccs, he applied almof his whole life to mechanics, in which he made a great progreis. He liad a particular taftefor clock-work, and made feveral difcoveries in it that were of lingular ufe. It was he who found out the fecret of moderating the vibration of the balance by means of a fmall fecl Spring, which has fince been made ufe of. This difcovery he Jaid before the memio bers of the Acadeny of Sciences in 1674; and thefe watches are, by way of eminence, called penduhmowatclies; not that tbey have real pendulums, but be caufe they nearly approach to the jutnefs of pendu. lums. M. Huygens perfected this happy invention ; but having declared himfelf the inventor, and obtained from Louis XIV. a patent for making watches with Spiral fprings, the abbe Feville oppofed the regiftering of this privilege, and publifhed a picce on the fubjef againft M. Hoygens. He wrote a great number of other pieces, moft' of which are friall pamphlets confifting of a few pages, but very curious; as, I. Hises perpetual pendalum, quarto. 2. New inventions, quario. 3. The att of breathing under water, and the means of preferving a flame hut up in a fmall place. 4. Reflections on machines fur raifing water.

Matb, ; His opinion on the different femiments of Malleiranche and regis relating to the appenrance of the nwon when fecit in the horizon. 6. The magnetic balance.. 7. A places to the king on the longitade. 8. Letter on the fecret of the longitude. 9. A new fyften on the fux and reflux of the fa. Io. The means of making fenfible experiments that prove the motion of the earth; and many other pieces. He died in I 724.

HAUTBOY, a mudical inftrument of the wind kind, haped much like the flute; culy that it fpreads and widens towards the bottom, and is founded through a reed. The treble is twofect long ; the tenor goes a fifth lower when blown open : it has only eight holes; - but the bafs, which is frve feet long, has eleven.

The word is French, hautbois, 1, d. "high wood;" and is given to this inftrument becaufe the tone of it is higher than that of the violin.

HAW, a fort of berry, the fruit of feveral fpecies -of mefipilus, thence denominated hawthorns. Sce Mespilus.

Hav, among farriers, an excrefcence refemblinga gritle, growing under the nether eye-lid and eye of a Horfe, which, if not timely removed, will put it quite out. See Earriery, Sect. xv. 4.

Haw, a fmall parcel of land fo called in Kent, as a Hemphaw, or Beanhaw, lying near the houfe, and inclufed for thefe ufes. But Sir Edward Coke, in an ancient plea concerning Feverthan in Kent, fays bawes are houfes.

## $H_{a t h}$-Fizuch. See Loxia.

HAWGH, or How H , fignifies a green plot in a valley as they ufe it in the north of England.

HAWK, in ornithology. See Falco.
HAWKERS, anciently were fradulent perfons, who went from place to place buying and Celling brafs, pewter, and other merchandize, which ought to be mutered in open market. In this fenfe the word is mentioned anno 25 Hen . VIII. cap. 6 . and $33 \mathrm{eju} / \mathrm{denn}$. cap. 4. The appellation hawkers feems to have arifen from their nncertain wandering, like thofe who, with hawks, feek their game where they can find it.

The term is now ufed as fynonymous with pedlar; a perfon who travels about the conntry felling wares. Every hawker mift take ont an annual licence, for which he muft pay 4 l. and if he travels with a horfe, afs, or mule, for everyone of them 81 . If he travels without a licence, or contrary to it, he forfeits for every offence to the informer, and the poor of the parifh where difcovered, io 1 . The acts relating to hawkers do not extend to makers of goods or their agents ; or to thofe who fell goods in fairs or markets; to the fellers of fih, fruit, or other victuals; nor to the venders of books and newfpapers, 9 and no W. cap. 27. 3 and 4 Anne, cap. 4. But hawkers fhall not, by virtue of fuch licence, fell or offer to fale, any tea or fpirituous liquors, though with a permit, under the penalty of having the fame feized, and imprifonment and profecution of the offender, 9 Geo. II. cap. 35. Hawkers who were licenfed on June 23. 1785, may fet up any bufinefs in the place where they are refident inhabitants, though not bronght up thereto, and may employ therein perfons who have not been apprentices.

Hawners is a term alfo appied to thofe who go up Havifre and do. 11 London itrects and country towns, felling newfapers, pamphlets, \&c.
$\underbrace{\text { Hantiog. }}$
HA. VEESWOITH (John), a colebrated Englifh writer, was born abont the yeur 719 ; though bis epitaph, as we find it in the Guthleman's Magazine for Aug. $17^{9} \mathrm{I}$, makes hin to have been born in 1715 . He was brought up to a mechanical profeffion, that of a watchmaker as is fuppofed. He was of the Prefbytetian perfuation, and a member of the celebrated Tom Bradbury's meeting, from which he was expelled for fome irrcgulirities. He afterwards devoted himfelf to literature, and became an author of confiderable eminence. In tae early part of life his circumfances were rather confined. He refided fome time at Bromley in Kent, where his wife kept a boarding fchool. He afterwards became known to a lady who had great property and intereft in the Eatt India company, and through her means was chofen a direstor of that body. As an author, his Adventurer is his capital work; the merits of which, if we miftakenot, procured him the degree of LL.D. from Herring archbifop of Canterbury. When the detign of compiling a narrative of the difcoveries in the South Seas was on foot, he was recommended as a proper perfon to be employed on the occalion: but in truth he was not a proper perfor, nor did the performance anfwer expectation. Works of tafte and elegance, where imagination and the paffions were to beaffected, were his province; not works of dry, cold, accurate narrative. However, he executed his tafk, and is faid to have received for it the enormous fum of 60001 . He died in 1773 ; fome fay of high living; others, of chagrin from the ill reception of his Narrative: for he was a man of the keened fenfibility, and obnoxious to all the evils of fuch irritable natures. On a handfome marble moniment at Bromley in Kent is the fullowing infcription, the latter part of which is taken from the laf number of The Adventurer:

To the memory of
JOHN HAWKESWORTH, LL.D. .
Who died the r6th of November mDCCLXXIII, aged 58 years. That he lived ornamental and uleful To fociety in an eminent degree Was among the boafted felicities Of the prefent age;
That he laboured for the benefit of fociety, Let his own pathetic admonitions Record and realize.
"The hour is hafting, in which whatever praife " or cenfure I have acquired will be remembered
"s with equal indifference. Time, who is impatient
"s to date my laft paper, will hortly monlder the
" hand which is now writing it in the duft, and fill
" the brealt that now throbs at the reflection. But
" let not this be read as fomething that relates
" only to a nother; for a few years only can divide
" the eye that is now reading from the hand shat
" has written."
HAWKING, the exercife of taking wild-fowl by means of hawks. The method of reclaiming, manning, and bringing up a hawk to this exercife, is cal. led falcoury. See Falconry.

There

## H A W

Irawking. There are only two countries in the world where we have any evidence that the exercife of hawking was very anciently in vogue. Thele are, Thrace and Britain. In the former, it was purfued merely as the divertion of a parti:ular diftrid, if we may believe 1b.x.8. Pliny*, whofe account is rendered obscure by the darknefs of his own ideas of the mater. The primæval Britons, with a fondnefs for the exercife of hunting, had alfo a tafte for that of hawkinr, and every chicf among them mantained a contideralle number of birds for that fport. It appears alfo from a cu-
$\dagger$ Vol. I. p. 115. pallige in the pocms of Ollian t, that the fame diverfion was falionable at a very early period in Scolland. The poet tells us, that a peace was endea. voured to be gained by the proffer of 102 managed ftecds, 100 foreign captives, and " 100 hawks with fluttering wings, that fly acrofs the Rky." 'To the Romans this diverfion was farce known in the days of Vefpalian; yet it was introduced immediately af. terwards. Moti probably they adopted it from the Britons; but we certainly know that they greatly in proved it by the introdaction of fuaniels into the ifhand. In this ftate it appears among the Roman Britons in the fixth century. Giddas, in a remarkable parige in his firf epitte, fpeaks of Maglocunnus, on his relinquifhing the fphere of ambition, and taking refuge in a monatery; and proverbially compares him to a dove, that haftens away at the noily approach of the dogs, and witl various'turns and windings takes her fight from the talons of the hawk.

Inafter times, hawking was the principal amufement of the Englifh : a perion of rank farce firred out without his hawk on his hand; which, in old paintings, is the criterion of nobility. Harold, a feerwards king of England, when he went on a moft important embafly into Normandy, is painted embarking with a bird on his fift, and a dog under his arm : and in an ancient pitare of the nuptials of Henry VI. a nobleman is reprefented in much the fame manner; for in thofe days, it was thought fifficient for noblemento winde their horn, and to carry their bawk fair, and leave fludy and learning to the children of mean people. The former were the accomplithments of the times; Spenfer makes his gallant Sir Triftram boaft,

Ne is there hawk which mantleth her on pearch,
Whether high towring, or accuafting low,
Wut I the meafure of her flight doe fearch,
And all her prey, and all her diet know. B, vi. Cento. 2.
In fhort, this diverfion was, among the old Englifh, the pride of the rich, and the privilege of the poor ; no rank of men feems to have been excluded the anufement : we learn from the book of St Alban's, that every degree had its peculiar hawk, from the emperor down to the holy-water clerk. Vaft was the expence that fomerimes attended this fuort. In the reign of James I. Sir Thomas Monfon is faid to have given roool. for a caft of hawks: we are not then to wonder at the rigotir of the laws that tended to preferve a pleafure that was carried to fuch an extravagant pitch. In the $34^{\text {th }}$ of Edward III. it was made felony to fecal a hawk ; to take its eggs, even in a perfon's own ground, was punihable with imprifonment for a year and a day, befides a fine at the king's plafure: in queen Elizabeth's reigu, the imprifonment. was reduced to threc months; but the offender was to.
find fecurity fo: his good behaviour for feven years, or Hawkinglie in prifon till he did. Such was the cinvidble ftate of the times of old England; during the whole day, the gentry were given to the fowls of the air and the beats of the field; in the cevening, they celcbrated their exploits with the molt abandoned and brutifh fottithnefs; arthe fane ine, the inferior rank of people, by the moft anjult and arbitrary laws, wore liable to capital punibments, to fines, and lofs of liberty, for deflroying the nioft noxious of the feathered tribe.

According to Olearius, the divertion of hawhing is more followed by the Tartars and Perlians than ever it was in any part of Europe. IL n'y avoit point des butte (fays he) qui n'euft foin aigle ou fou-faucon.

The talcons or hawks that were in ure in the fe kingdoms, are now found to breed in Wiales, and in North Britain and its illes. The peregrine falcon in. habits the rocks of Caernarvonlhite. The fame fpecies, with the gyrfalcon, the gentil, and the goflawk, are found in Scolland, and the lanner in Ireland.

We may heretake notice, that the Norwegi m breed was, in old times, in high efteem in England; they were thought bribes wurthy a king. Jeoffrey Fitzpierre gave two good Norway hawks to king John, to obtain for his friend the liberty of exporting 100 wt . of chetfe: and Nicholas the Dune was to give the king a hawk every time he came into England, that he might have free liverty to traffic throughout the king's dominions.

They were alfo made the tenures that fome of the Blunt'sAnc. nobility held their eftates by, from the crown. Thus Tenures $2 a_{3}$. Sir John Stanley had a grant of the me of Man from Henry IV. to be held of the king, his heirs, and fuc. ceffors, by homige and the fervice of rwo falcons, payable on the day of his or their coronation. And Philip de Faftang held his manor of Combertoun in Cambridgetire, by the fervice of keeping the king's falcons.

Hawking, though an exercife now much difufed among us, in comparifon of what it anciently was, does yet fortifa great variety of fignificant terms, which till obtain in our language. Thus, the parts of a hawk have their proper names. - The legs, from the thigh to the foot, are called atoils; the lues, the petty fingles; the claws, the pounces.--The wings are called the fails; the long feathers thereof, the beams; the two lngeft, the principal featores; thofe next thercto, the flags.-The tail is called the train; the breaft-feathers, the mails; thofe behind the thigh, the pendant f:athers.-When the feathers are not yet full grown, fle is faid to be unfunmed; when they are complete, fhe is finmed: The craw, or crop, is called the gorge:-The pipe next the fundament, where the fæces are drawn down, is called the paunel:-The flimy fubtance lying in the pannel, is called the glut : -The upper and crooked part of the bill is called the beak; the nether-part, the clap: the yellow part between the beak and the eyes, the ficar or fere; the two fmall holes therein, the pares.

As to her furniture.:-The leathers, with bells buttoned on her legs, are called beruits. -The leathern thong, whereby thefalconer holds the hawk, is called the leafe or leafb; the little ftraps, by which the leafe is faftened to the legs, jeffes; and a line or pack thread faftened to the leafe, in difciplining her, a orvence.-

## $\mathrm{H} A \mathrm{~W} \quad[3+4] \quad \mathrm{HA} \mathrm{W}$

fawting. A cover for her head, to keep her in the dark, is called a bbod; a large wide hood, open behind, to be wore at firf, is called a rijtu hood: To draw the ftrings, that the hood may be in readinefs to be pulied off, is called unfly ili, g the hood.-The blinding a hawk juft token, by ruming a thread through ber eye-lids, and thus drawing them over the eyes, to prepare her for being hooded, is called feeling.-A figure or refemblance of a fowl, made of leather and feathers, is called a lure.-Her refting-place, when off the falconer's fift, is called the perch.-The place where her meat is laid, is called the hack; and that wherein the is fet, while her feathers fall and come again, the mew.

Something given a hawk, to cleanfe and purge her sgorge, is called cafting.- Small feathers given her to make her calt, are called plumages-Gravel given her to halp to bring down her ftomach, is called rangle: Her throsing up filth from the gorge after calting, is called slaming.-The purging of her.greafe, \&c. enfeaning. - A being ftuffed is called gurgiting. - The inferting a feather in her wing, in lieu of a brokenone, is called imping.- The giving her a leg, wing, or pinion of a fowl to pull at, is called tiring:-The neck of a bird rhe hawk preys on, is called the inke:-What the hatik leaves of her prey, is called the pill or pelf.

There are alfo proper terms for her feveral actions. - When the flutrers with her wings, as if ftriving to get away, either from perch or fift, the is faid to bate. -When ftanding too near they fight with each orher, it is called crabbing :-When the young ones quiver, and flake their wing in obedience to the elder, it is called cowring: -W hen fhe wipes her beak after feed. ;ing, the is faid to feak: -W hen the fleeps, fhe is faid ato jouk:-From the time of exchanging her coat, till the turos white again, is called her intermewing :Trading is called cawking: When fhe ftretches one cof her wings after her legs, and then the other, it is called mantling:-Her dung is calted muting : when She mutes a good way from her, the is faid to Jice; when the does it directly down, inftead of yerking: backwards, the is faid to Лime; and if it be in drops, it is called dropping.-When he as it were fneezes, it is called finiting.-When the raifes and fhakes herfelf, fhe is faid to rouze:-When, after mantling, fhe croffes her wings together over her back, fle is faid to warble.

When a hawk feizes, fhe is faid to bind:-When, after feizing, fhe pulls off the feathers, fhe is faid to plame. - When the raifes a fowl aloft, and at length defcends with it to the ground, it is called truffing.When, being aloft, he defcends to ftrike her prey, it is called ftooping.-When the flies oat too far from the game, he is faid to rake.-When, forfaking her proper game, the fies at pyes, crows, \&c. that chance to crofs her, it-is called check.-When, miffing the fowl, the betakes herfelf to the next check, fhe is faid to $f^{f} y$ oin bead.-The fow or game the fies at is called the querry. - The dead body of a fowl killed by the hawk, is called a pelt.-When fle flies away with the quarry, fhe is faid to carry. - When in ftooping fae tarns two or three times on the wing, to recover herfelf ere fhe feizes, it is called canceliering.-When fle hits the prey, yet does not trufs it, it is called ruff.- The making a hawk tame and gentle, is called reclaiming. -The bringing her to endure company, manning her.
-An old faunch hawk, ufed to ty and fur example to Hawking: a young one, is called a mak i-bawk.

The reclaiming, manni.g, aid bingillg up a havk to the fport, is not cafy to be bronght to any precite fet of rules. - It contifts in a number of little practices and obfervances, calculated to familarize the falconer to his bird, to procure the love thereof, \&c. See the article $\mathrm{F}_{\mathrm{al} \text { conky }}$.

When your bawk comes readily to the lure, a large pair of luring-bells are to be put upon her: and the more giddy-headed and apt to rake ont your bawk is, the larger mutt the bells be. Having done this, and fhe being harp-fet, tive ont in a fuir morning, into fome large teld unencumbered with trees or wood, with your hauk on your fift; then having loofned her hood, whilte foftly, to provoke her to Hy; unhood her, and let her fly with her head inte the wind; for by that means the will be the better able to get upon the wing, and will naturally climb-upwards, fying at circle. After the has flown three or four turns, then lure her with you: voice, cafting the lure about your head, having firlt tied a pullet to it; and if your falcon come in and approach near you, caft out the lure into the wind, and if the foop to it reward her.

You will often find, that when fhe flies from the fift, the will take ftand on the ground: this is a fault which is very common with foar-falcons. To remedy this, fright her up with your wand; and when you have forced her to take a turn or two, take her down to the lure, and feed her. But if this does not do, then you mult have in readinefs a duck fealed, fo that hie may fee no way but backwards, and that will, make her nount the higher. Hold this duck in your haud, by one of the wings near the body; then lare with the voice, to make the falcon turn her head; and when fhe is at a reafonable pitch, caft your duck up juft under her; when, if fhe ftrike, foop, or trufs the duck, permit her to kill it, and reward her by giving her a reafonable gorge. After you have practifed this two or three times, your hawk will leave the ftand, and, delighted to be on the wing, will be very obedient.

It is not convenient, for the firft or fecond time, to fhow your hawk alarge fowl; for it frequently happens, t'hat they efcape from the hawk, and fhe, not recovering them, rakes after.them: this gives the falconer trouble, and frequently occafions the lofs of the bawk. But if fhe happens to purfue a fowl, and being unable to recover it, gives it over, and comes in again direclly, then caft out a fealed duck; and if the ftoop and trufs it acrofs the wings, permit her to take her pleafure, rewarding her alfo with the heart, brains, tongue, and liver. But if you have not a quick duck, take her down with a dry litre, and let her plume a pullet and feed uponit. By this means a hawk wild learn to give over a fowl that rakes out, and on hearing the falconer's lure, will make back, and know to hold in the head.

Some hawks have a difdainfol coynefs, proceeding from their being high fed: fuch a hawk mutt not be rewarded though fle hould kill: but you may give her leave to plums a little; and then taking a heep's heart cold, or the leg of a pullet, when the hawk is bufy in pluming, let cither of them be conveyed into the body of the fowl, that it may favour of it; and

## H A W [ 345 ] H A Y

Hawkwod when the hawk haseaten the heart, brains, and tongue of the fowl, take out what is inclofed, call her to your fift, and feed her with it : afterwards give her fome of the feathers of the fowl's neck, to foower her, and make her caft.

- If your hawk be a fately high-flying one, the ought not to take more than one flight in a morning; and if the be made for the river, let her not fly more than twice: when fie is at the higheft, take her down with your lure; and when the has plummed and broken the fowl a little, feed her, by which means you will keep her a high-flycr, and fond 6 the lure.

HAWKWOOD (Sir John), a famous Englifh general, was the fon of a tanner at Heddingham-Sibil in Effex, where he was born in the reign of Edward III. He was bound apprentice to a taylor in London ; but being fortunately preffed into the army, was fentabroad, where his genius foon expanded itfelf, and furmounted the narrow prejudices which adhered to his birth and occupation. He fignalized himfelf as a foldier in France and Italy, and particularly at Pifa and Florence. He commanded with great ability and fucceis in the army of Galeacia duke of Milan: and was in fuch high efteem with Barnabas his brother, that he gave him Domitia his natural daughter in marriage, with an ample fortune. He died at Florence, full of years and military fame, in 1394.

HAWSE, or HAUSE, is generally underftood to imply the fituation of the cables before the fhip's ftem, when fhe is moored with two anchors out from forward, viz. one on the ftarboard, and the other on the larboard bow. Hence it is ufual to fay, Be bas a clear bawfe, or a foul hawfe. It allo denotes any fmall diftance a head of a fhip, or between her head and the anchors employed to ride her, as, "He has anchored in our hawfe, The brig fell athwart our hawfe," \&c.

A fhip is faid to ride with a clear hawfe, when the cables are directed to their anchors, without lying athwart the ftem, or croffing, or being twifted round each other by the lhip's winding about, according to the change of the wind, tide, or current.
A foul hawfe, on the contrary, implies that the cables lie acrofs the ftem, or bear upon each other, fo as to be rubbed and chafed by the motion of the veffel. The hawfe accordingly is foul, by having either a crofs, an elbow, or a round turn. If the larboard cable, lying acrofs the ftem, points out on the ftarboard fide, while the farboard cable at the fame time grows out on the larboard fide, there is a crofs in the hawfe. If, after this, the flip, without returning to her former pofition, continues to wind about the fame way, fo as to perform an entire revolution, each of the cables will be twifted round the other, and then directed out from the oppofite bow, forming what is called a round turn. An elbow is produced when the fhip ftops in the middle of that revolution, after haying had a crofs : or, in other words, if the rides with her head north ward with a clear hawfe, and afterwards turns quite round fo as to direct her head northward again, he will have an elbow.
Hawse-Holes, certain cylindrical holes cut through the bows of a fhip on each fide of the flem, through which the cables pafs in order to be drawn into or let Vol. VIII.
out of the veffel as occafion requires. They are fortified on each fide by the

HaUSE-Pieces, a name given to the foremoft timbers of a fhip, whore lower ends reft on the knackle-timber, or the foremoft of the cant-timbers. They are generally parallel to the flem, having their upper ends fometimes terminated by the lower part of the beakhead; and otherwife, by the top of the bow, particulaply in fmall hips and merchantmen.

HAWSER, a large rope which holds the middle degrẹe between the cable and tow-line, in any fhip whereto it belongs, being a fize finaller than the former, and as much larger than the latter.
HAY, any kind of grafs cut and dried for the food of catle.

The time of mowing grafs for hay muft be regulated according to its growth and ripenefs; nothing being more prejudicial to the crop than mowing it too foon; becaufe the fap is not then fully come out of the root, and when made into hay, the grafs fhrinks away to nothing. It muft not, however, be let fand too long till it have fhed its feeds. When the tops of the grafs look brown, and begin to bend down, and the red honeyfuckle flowers begin to wither, you may conclade it ripe for mowing.
Sain-Foin Har, is of feveral forts, which may be difinguifhed by the following terms, viz. I. The virgin. 2. The bloffomed. 3. The full-grown. And, 4. The threfhed hay. The firf of thefe is beyond comparifon the beft. It muft be cut before the bloffoms generally appear; for when it ftands till it is full blewn, the moft fpirituous and nourifhing parts of its juice are fpent, the fap is much impoveriflied, and the fain-foin can never recover that richnefs it had in its virgin fate. But this fine hay cannot well be had of uncultivated fain-foin; becaufe that may not be much above an handful high when it is in a condition to be cut; it would then make a very light crop, and would be a great while before it fprang up again: but the fich will have two or three tuns to an acre, and fpring again immediately for a fecond crop; fo that litile or none in quantity would be loft by fo great an improvement of its quality.

The fecond fort is that cut in the flower, which, thongh much inferior to the virgin-hay, far exceeds any other kind as yet commonly propagated in Britain; and if it be a full crop, it may amount to three tuns an acre. This is that fain -foin which is commonly made; and the lageer it is, the more nourifiniig it is for horfes.

The next fort of fain-foin is the full grown, cut when the blofloms are gone or going off; this alfo is good hay, though it falls fhort by many degrees of the goodnefs of the other two forts; but it makes a greater crop than either of them, becaufe it grows to its full bulk, and frrinks little in drying.

The laft fort is the threfhed hay; which, when not damaged by wet weather, has been found more nonrifhing to horfes than coarfe water-meadow hay : and, when it is cut fmall by an engine, is good for cattle, and much better than the chaff of corn. The beft time tocut it, is when the greateft part of the feed is well filled; the firft-blown ripe, and the laft-blown beginning to be full.

The goodnefs of the hay depends greatly upon the Uu manner

## H A Y

manner of ordering it. The beft hay in all-England is made of fain-foin, without ever fpreading it. This method thongh it be longer before it be finifhed, cofts lefs labour than the other. If fain-foin be laid up pretty green, ir will take no damage, provided it be fet in fmall round ricks, with a large banket drawn up in the middle of each, to have a vent-hole, through which the fuperfluous moifture of the hay may tranfpire. As foon as its heating is over, thefe ricks ought to be thatched; and all fain-foin ricks, that are made when the hay is full dried in the cocks, ought to be thatchedimmediately after the making them. That which is laid up moft dried, will come out of the rick of a green colour ; but that which has been much heated in the rick, will be brown.

The feed affords the owner another opportunity of making a profit of his fain-foin : but this, if the hoeing hufbandry were general would not be vendible in great quantities for planting; becaufe the ordinary cropiof an acre will produce feed enough to drill an hundred acres, which would not want planting for 2 long time. The other ufe then of this feed is for provender: and it has been affirmed by fome who have made trials of it, that three bufhels of good fain-foin feed given horres, will nourifh them as much as four bufhels of oats; and when well ordered, it is fo fweet, that moft forts of cattle are greedy of it.
$H_{a r}$-Making. See Agriculture, $\mathrm{n}^{0}$ 199, et feq.
Hay, a town of Brecknockfhire, in Wales, fcated near the confluence of the rivers Wye and Dulas. It was a town of good note in the time of the Romans; it being then fortified.with a caftle and a wall, which were ruined in the rebellion of Owen Glendower. It is at prefent a pretty good town; and the market is large for corn, cattle and provifions. W. Long. o. 56. N. Lat. 52 10.

Hay (William, Efq;), an agrecable Englifh writer, was born at Glenburne in Suffex, about 1700, as is conjectured; and educated at Headley-fchool. In 1730, he publinhed a poem, called Mount Gaburn, dedicated to the duclefs of Newcaftle; in which he deferibes the beauties of his native country, and celebrates the virtues of his friends. When lord Hardwick was called up to the houfe of lords in, 1734 , he was chofen to fucceed him in reprefenting the borough of Seaford among the commons: and he reprefented this borough for the remainder of his life. He defended the meafores of Sir Robert Walpole, and was the fuppofed author of a minifterial pamphlet, intitled, A Letter to a Freeholder on the late Reduction of the Land-tax to one Shilling in the Pound; which had been printed int r 732. In i 735, he publifhed remarks on the Lawis relative to the Poor, with propofals for their better Relief and Employment ; and at the fame tinie brought in a bill for the purpole. He made another attempt of this kind, but without effect. May 1738, he was appointed a commiffioner of the Victualling-office. In 1753, appeared Religio Phiofophi; or, the Principles of Morality aud Chriftianity, illuftrated from a View of the Univerfe, and of Man's Situation in it. This was followed, in I754, by his Effay on Deformity; in which he rallies his ownimperfection in this refpect with much livelinefs and good humour. "Bodily deformity (fays he), is very rare. Among. 558 gentle-
men in the Houfe of Commons, I am the only one that is fo. Thanks to my worthy conftituents, who never objected to my perfon, and I hope never to give them caufe to object to my behaviour." The fame year, he tranflated Hawkins Browne De Immortalitate Animi. 1755, he tranflated and modernized fome Epigrams of Martial; but furvived this publication only a fhort time, dying June I9. the fame year. A litule time before, he had been appointed keeper of the Records in the Tower ; and it is faid that his attention and affiduity during the few months he held that office were eminently ferviceable to his fucceffors.-He left a fon, who inherited the imperfect form of his father. This gentleman went into the fervice of the Eaft India company, where he acquired rank, fortune, and reputation; but being one of thofe who oppofed Coffim Alley Kawn, and unfortunately falling into his hands, was, with other gentlemen, ordered to be put to death at Patna, Oct. 5. 1763.

HAYES (Charles, Efq;), a very fingular perfon whofe great erudition was fo concealed by his modefty, that his name is known to very few, though his publications are many. He was born in $\mathbf{1 6 7 8}$, and became diftinguifhed in 1704 by A Treatife on Fluxions, folio : the only work to which he ever fet his name. In I710, came out a fmall 4 to pamphlet of 19 pages, intituled, A new and eafy Method to find out the Longitude from oblerving the Altitudes of the Celeftial Bodies : and, in I723, The Moon, a Philofophical Dialogue; tending to fhow, that the moon is not an opaque body, but, has original light of her own. During a long courfe of years, the management of the late Royal African company lay in a manner wholly upon Mr Hayes, he being annually either fub-governor or deputy-governor ; notwithftanding which, he continued his purfait after general knowledge. To a !kill in the Greek and Latin as well as modern languages, be added the knowledge of the Hebrew ; and publimed feveral pieces, relating to the tranlation and cbronology of the fcriptures. The African company being diffolved in 1752, he retired to Down in Kent, where he gave himfelf up to ftudy. May 1753, he began to compile in Latin his Chronographia Aliatica \& 压gyptiaca, which he lived to finifh, but not to publifh; which, however, was publifhed afterwards. Auguft 1758, he left his houfe in Kent, and took chambers in Gray-Inn, where he died, December 18.1760, in his 82d year. The title of his pofthumous works runs thus : Chronographice Afratica \& Egyptiace Specinen; in quo, r. Drigo Chronologiae Lxx Interpretum inveftigatur. 2. Confpectus totius operis exhibetur, 8vo.

## HAYNAULT. See Harnault.

HAYS, particular nets for taking rabbits, hares, \&c. common to be bought in hops that fell nets in London, and they may be had larger or fhorter as you thing fit ; from 15 to 20 fathoms is a good length, and for depth a fathom.

As rabhits often ftraggle abroad abour mid-day for frefh grafs, where you perceive a number gone forth to any remote bracks or thickets, pitch two or thiree of thefe hays about their burrows; lie clofe there : but in cafe you have not nets enongh to inclofe all their burrows, fome may be ftopped up with ftones, \&c. Then fet qut with the coney-dog to hunt up and down at a
goodi

## H A Z

Hayward good diftance, and draw on by degrees to the man who Hazle. is with you, and lies clofe by the hay, who may take Hazle.
them as they bolt into it.

HAYWARD, the perfon who keeps the common herd or cattle of a town. He is appointed by the lord's court; and his office is to fee that the cattle neither break nor crop the hedges of inclofed grounds.

Hayward (Sir John), an eminent Englifh hiftorian and biographer in the beginning of the 17 th century, was educated in the univerfity of Cambridge, where he took the degree of doctor of laws. In 1610, he was appointed one of the hiftoriographers of a college then at Chelfea; and in 5619 , received the honour of knighthood. He wrote, r. The lives of the three Norman kings of England, William I. and II. and Henry I. 2. The firft part of the life and reign of king Henry IV. 3. The life and reign of king Edward VI.; and feveral theological works. He died in 1627.

HAZAEL, an officer belonging to Benhadad king of Syria, caufed that prince to be put to death, and reigned in lis ftead. He defeated Joram, Jehu, and Jehoahaz, kings of Ifrael; and, after his death, was fucceeded by Benhadad his fon, 852 B. C.

HAZARD, or Chance, in gaming. See GaMiNG.
Hazard, a game on dice, without tables, is very properly fo called : fince it fpeedily makes a man, or undoes him.

It is played with only two dice, and as many may play at it as can ftand round the largeft round table.

Two things are chiefly to be obferved, viz. main and chance; the latter belonging to the caftor, and the former, or main, to the other gamefters. There can be no main thrown above nine, nor under five; fo that five fix, feven, cight and nine, are the only mains flung at hazard. Chances and nicks are from four to ten; thus four is a chance to nine, five to eight, fix to feven, feven to fix, eight to five; and nine and ten a chance to five, fix, feven, and eight : in hort, four, five, fix, feven, eight, nine, and ten, are chances to any main, if any of thefe nick it not. Now nicks are either when the chance is the fame;with the main, as five and five; or the like; or fix and twelve, feven and eleven eight and twelve. Here obferve, that twelve is out to nine, fever, and five; eleven is out to nine, eight, fix, and five; ames-ace and duce-ace, are out to all mains whatever.
hazle, or Hazel, in botany. See Corylus.
The kernels of the fruit have a mild farinaceous, oily tafte agreeable to moft palates. Squirrels and mice are fond of them, as wellas fome birds, fuch as jays, nutcrackers, \&c. A kind of chocolate has been prepared from them and there are inftances of their having been formed into bread. The oil expreffed from them is little inferior to the oil of almonds: and is ufed by painters and by chemifts for receiving and retaining odours. The charcoal made of the wood is ufed by painters in drawing.-Some of the Highlanders, where fuperftition is not totally fubfided, look upon the tree itfelf as unlucky; but are glad to get two of the nuts naturally conjoined, whichis a good omen. Thefe they call cno-chomblaich, and carry them as an efficacious charm againft witchcraft.

Evelyn tells us that no plant is more proper for
thickening of copfes than the hazle, for which lie directs the following expeditious method. Take a pole of hazle (afh or poplar may alfo be ufed) of 20 or 30 feet in length, the head a little loppedinto the ground, giving it a chop near the ground to make it fuccumb; this faftened to the earth with a hook or two, and coved with fome frefh mould at a competent depth (as gardeners lay their carnations), will produce a great number of fuckers; and thicken and furnifh a copfe fpeedily.

HazLE-Earth, or Hazley-Earth, a kind of red loam, which is faid to be an excellent mixture with other forts of earth ; uniting what is too loofe, cooling what is too hot, and gently retaining the moifure.

Witch-Hazel. Sec Hamamalis.
HEAD, the uppermoft or foremoft part of the body of an animal. See Anatomy, Part I. fect.ii.
$H_{E A D}-A c h$, a moft troublefome fenfation in the head, produced by various caules, and attended with difterent fymptoms, according to its different degrees and the place where it is feated. See (the Index fubjoined to) Medicine.

Dragon's HEAD, in aftronomy, is the afcending node of the moon or other planet.

HeAD of a Ship, an ornamental figure erected on the continuation of a fhip's ftem, as being expreffive of her name and emblematical of war, navigation, commerce, \&c.

Head, is alfo ufed in a more enlarged fenfe to fignify the whole front or fore-part of the flip, including the bows on each fide : the head therefore opens the column of water through which the hip paffes when advancing. Hence we fay, head-fails, head-fea, headway, \&c.

Thus, fig. I. Plate CCXXVI. rëprefents one fide of the fore-part or head of a 74 ganflip, together with part of the bow, keel, and gunnel. The names of the feveral pieces, exhibited therein, are as follow:

AA Fore-part of the keel. with $a$ a the two falfe kecls beneath it.
$A C$ the ftem.
a a The cat-head.
ob The fupporter of the cat head.
c $c$ The knight-head, or bollard-timber, of which there is one on each fide, to fecure the inner end of the bowfprit.
$d d$ The haufe-holcs.
e e The naval-hoods, i. e. thick pieces of plank laid upon the bow to frengthen, the edges of the haufe-holes.
$f$ The davit-chock, by which the davir is firmly wedged while employed to filin the anchor.
$g$ The bulk-head, which terminates the forecafte on the fore-fide, being called the beak-bead butk-head by hipwrights,

H The gun ports of the lower deck.
$b$ The gun ports of the upper deck and fore cafie.
I, I, The channcls, with their dead eyes and chainplates.
$i$ The gripe or fore-foot, which unites the keel with the ftem forming a part of either.
$k k$ Thefe dotted lines reprefent the thicknefs and defcent of the different decks from the fore-part of the fhip towards the middle. The loweft of the tbree doto Uu2
ted
$\|$
Head,

## HEA [ 348 ] E A

Head, ted lines/expreffes the convexity of the beams, or the difference between the height of the deck in the midde of its breadth and at the fhip's fide. This is alfo exhibited more-clearly in the MIDSHIP-Frame; where the red curve of the beam is delineated. N. B. Their lines muft be always parallel to the lines which terminate the gun-ports above and below.
$m m$ The timbers of the head, and part of the bowfprit.

X The rails of the head which lie acrofs the timbers.

QZ Fore-part of the main-wale.
RX Fore-part of the channel-wale.
UC The load water-line.
Fig. 2e prefents a head view of a fhip, with the ppojection of her principal timbers, and all her planks laid on one fide.

It is evident that the fore-part of a hhip is called its head, from the affinity of motion and pofition it bears to a fifl, and in general to the horizontal fituation of all animals whilft fwimming.

By the HEAD; the fate of a Mip, which is laden deeper at the fore-end than the after-end.
$H_{E A D}-B_{u r o w, ~ o r ~ H e a d-B o r o u g h, ~ f i g n i f i e s ~ t h e ~ p e r-~}^{\text {- }}$ fon who is the chief of the frank-pledge, and had anciently the principal direction of thofe within his own pledge. He was alfo called burrow-bead, bur/houlder, now borfbolder, third-borow, tything-man, chief-pledge, and borow elder, according to the diverfity of fpeech in different places. This office is now ufually called a bigh-conftable. The head-borow was| the chief of ten pledges; the other nine were called band borows, or plegii manuales, \&c.

HEAD-Mould-fhot, a difeafe in children wherein the futures of the 1 kull, generally the coronal, ride; that is, have their edges thot over one another: and are fo clofe locked togerher, as to comprefs the internal parts; the meninges, or even the brain itfelf. This difeafe ufually occafions convulfions, and is fuppofed to admit of no cure from medicine, unlefs room could be given by manual operation or a divulfion of the futures.

The head-mould-fhot is the diforder oppofite to the horfe-fhoe head.
$H_{E A D}$ Pence, an exaction of a certain fum formerly collected by the fheriff of Northumberland from the inhabitants of that county, without any account to be made to the king. This was abolifhed by the ftatute 23 Hen . VI. cap. 7.

HEAD-Tin, in metallurgy, is a peparation of tinore towards the fitting it for working into metal. When the ore has been pounded and twice wafhed, that part of it which lies upppermont, or makes the furface of the mafs in the tub, is called the bead tin: this is feparated from the reft, and after a little more walhing becomes fir for the blowing houfe:
$H_{E A D-F a f f, ~ a ~ r o p e ~ e m p l o y e d ~ t o ~ f a l t e n ~ a ~ f h i p ~ t o ~}^{\text {a }}$ a wharf, clain, or buoy, or to fome other veffel along fide.
$H_{E A D}$-Land, a name frequently given to a cape or promontory.

Head Drefs, amongfthe Jewih, Grecian, and Roman ladies, as among ourfelves, was various, according to the different periods of time, and the fluctuation of falhion. In general, it principally confifted of their hair differently tricked out. It was ufually divided
before, with a bodkin, into two equal parts; fometimes it was covered with a net, or put into a kind of purfe, or tied behind in the form of a knot, or bound back and plaited with ribbands. It was walhed with great care ; effence and perfumes were applied to it, and gold-duft fometimes made ufe of as powder. Pearls and jewels made a part of their ornaments; and pendants were worn in the ear. To cover the defect of hair, perukes were made ufe of by the gentlemen of Rome. And we read that Otho had a covering of falfe hair, becaufe he had not much of his own. See Hair-Jewers.

Both Grecian and Roman ladies wore têtes. But whether they ever built up their heads fo high as the Englifh, or their continental neighbours, will admit of a dilpute.

Headmost, the fituation of any fhip or fhips which are the moft advanced in a fleet, or line of battle.
$H_{E A D}-R o p e$, that part of the bolt-rope which terminates any of the principal fails on the upper edge. which is accordingly fewed thereto. See the article Bolt-ROPE.

HEAD-Sails, a general name for all thofe fails which are extended on the fore-maft and bowfprit, and employed to command the fore-part of the fhip: fuch are the fore-fail, fore-top-fail, fore-top-gallant-fail, jib , fore-ftay-fail, and the fprit-fail with its top-fail. This term is ufed in oppofition to after-fails, viz. all thofe which are extended on the mizen maft, and on the ftays between the mizen and main mafts.
$H_{E A D-t o-w i n d ; ~ t h e ~ f i t u a t i o n ~ o f ~ a ~ h i p ~ o r ~ b o a t, ~}^{\text {g }}$ when her head is turned to windward.
$H_{E A D}-W a y$, the motion of advancing at fea. It is generally ufed when a hip firft begins to advance; or when it is doubtful whether the is in a ftate of reftor motion. It is in both fenfes oppofed to retreating, or moving with the fern foremoft. See the articleSternway.

HEALfang, Healsfanc, or Halsfang, in ancient cuftoms, fignifies colliftrigium, or the pufinthment of the pillory. The word is compounded of two Saxon words; balp, neck, and pangen "s to contain :" Pona feiticet qua alicui collum ftringatur. The healfang, however, cannot fignify a pillory in the charter of Canutas, De foreftis, cap. xiv. Et pro culpa folvat regi duos folidos, quos Dani vocant halfehang.

Healfang is alfo taken for a pecmiary punifhment or mulet, to commute for ftanding in the pillory ; and is to be paid either to the king or the chief lord. Qui. falfum teftimonium dedit, reddat regi vel terra domino healfang.

HEALING, in its general fenfe, includes the whole procefs of curing or removing a diforder, and recovering health. In this fenfe medicine is defined the art of healing. In itsmore reftrained fenfe, as ufed in furgery, \&c. healing denotes the uniting or confolidating the lips of a wound or ulcer. The medicines proper for thisintention are called incarnatives, agglutinatives, vulneraries, \&c.

Healing, in architecture, denotes the covering the roof of a building. The healing is varions; as of lead, tiles, flate, Horfhamftone, fhingles, or reed and ftraw.

HEALTH, is a right difpofition of the body, and

Health
Head.
of all its parts; confifting in a due temperature, a right conformation, juft connection, and ready and free exercife of the feveral vital functions.

Health admits of latitude, as not being the fame in all fubjects, who may yet be faid to enjoy health.

That part of medicine which fhows the means of preferving health, is termed hygieine. See Medicine.

The Greeks and Romans deified Health, reprefenting it under the figure of a woman, whom they fuppofed to be the daughter of Æfculapius. We find the name of the goddefs Salus, or Health, on many medals of the Roman emperors, with different infcriptions; as, salus pubilca, salus reipublice, saius augusti, \&c.

Methods of preferving the Health of Mariners. See Mariner.

HEAM, in beafts, denotes the fame with after birth in women. Thyme, penny-royal, winter-favory, and common hore-hound, boiled in white-wine, and given to a mare, are efteemed good to expel the heam. Dittany, applied in a peffary, expels the heam, as well as the dead foal, fo alfo do fennel, hops, favin, angelica, \&c.

HEARING, the act or faculty of perceiving founds. Hearing is reckoned among our external fenfes. Its organ is the ear, and particularly the anditory nerve diffufed through the fame; and itsobject, certain motions or vibrations of the air. Hence hearing may be more fcientifically defined, a fenfation, whereby, from a due motion impreffed on the fibrillæ of the auditory nerve, and communicated thence to the fenfory, the mind perceives and gets the idea of founds. See Anatomy, no int.

Hearing in different animals. See ComparativeAnatomy, Entomology, and Ichthyology.

HEARNE (Thomas), a celebrated antiquarian, eminent for his writings and editions of MSS. His father was parifh-clerk of Little Waltham in Berkffire, where he was horn in 1680 . He had a liberal edacation by the patronage of a neighbouring gentleman; and even from a boy difcovered a ftrong propenfity to the ftudy of antiquities. He did great fervices to the Bodleian library, and died in 1735.

HEARSE, among hunters, a hind in the fecond year of her age. See Hunting.

Hearse is the name of a well known carriage, ufed for conveying the dead to the grave. The werd is alfo uled by Shakefpeare in his Henry VI. for a monument erected over a grave.

HEART, in anatomy, a mufculous part of the animal body, fituated in the thorax, on the anterior part of the diaphragm, berween the two laminæ of the mediaftinum, wherein the veias all terminate, and from which all the arteries arife; and which, by itsalternate contraction and dilatation, is the chief infrument of the
circulation of the blood, and the principle of life. See
Heart. Anatomy, no $121,122$.

Several ingenious perfons have from time to time attempted to make eftimates of the force of the blood in the heart and artcries; who have as widely differed from each other, as they have from the truth, for want of a fufficient number of data to argue upon. This fet the truly ingenious Dr Hales upon making proper experiments, in order to afcertain the force of the blood in the veins and arteries of feveral animals.
If, according to Dr Keil's eftimate, the left ventricle of a man's heart throws out in each fyftole an ounce or 1.638 cubic inches of blood, and the area of the orifice of the aorta be $=0.4187$, then dividing the former by this, the quotient 3.9 is the length of the cylinder of blood which is formed in paffing thro" the aorta in each fyftole of the ventricle; and in the 75 pulfes of a minute, a cylinder of 292.5 inches in length will pafs : this is at the rate of $\mathbf{1} 462$ feet in an hour. But the fyftole of the heart being performed in one third of this time, the velocity of the blood inthat inftant will be thrice as much, viz. at the rate of 4386 fect in an hour, or 73 feet in a minute. And if the ventricle throws out one ounce in a pulfe, then in the 75 pulfes of a minute, the quantity of blood will be gequal to 4.4 lb . 11 Ioz . and, in 34 minutes, 2 quantity equal to a middle-fized man, viz. $1581 b$. will pals through the heart. But if, with Dr. Harvey and Dr Lower, we fuppofe two ounces of blood, that is, 3.236 cubic inches, to be thrown out at each fyftole of the ventricle, then the velocity of the blood in entering the orifice of the aorta will be doable the former, viz. at the rate of 146 feet in 2 minute, and a quantity of blood equal to the weight of a man's body will pals in half the time, viz. 17 mi nutes.
If we fuppofe what is probable, that the blood will rife $7+\frac{1}{2}$ feet higle in a tabe fixed to the carotid artery of a man, and that the inward area of the left ventricle of his heart is equal to 15 fquare inches, thefe multiplied into $7+\frac{1}{2}$ feet, give 1350 cubic inches of blood, which preffes on that ventricle, when it firft begins to contract; a weight equal to 15.5 pounds.

What the doctor thus calcukates, from fuppofition, with regard to mankind, he actually experimented upon horfes, dogs, fallow-does, \&c. by fixing tubes in orifices opened in their veins and arteries; by obfer-ving the feveral heights to which the blood rofe in thefe tubes, as they lay on the ground; and by mear furing the capacities of the ventricles of the heart and orifices of the arteries. And, that the reader may the more readily compare the faid eftimates to gether, he has given a table of them, ranged in the following order.

Heart-burn, a difeafe ufually called cardialgia by phyffíans. In furfeits, or upon fwallowing without due mattication ; when meats are eat tough and fat or with farinaceous fubftances unfermented; or when by any accident the faliva is vitiated, too fcanty or not intimately mixed with the food, the fermentation. becomes tumaltuons, the fomach fwells with air, and this extraordinary commotion being attended with an unufual heat brings on the uneafinefs called the beart-burn; which is remedicd by whatever promotes a greater fectetion of faliva, or helps to mix it with our aliment. The teftaceous powders, as oyfter-fhells, crabs-eyes, chalk, \&c. are the ufual remedies for the heart-burn.

HEARTH, that part of the pavement of a room on which the fire is immediately placed.

HEARTH-Money. See ChimNET-Money.
HEAT, in phyfology, has a double meaning; being put either for that peculiar fenfation which is felt on the approach of burning bodies, or for the caufe of that fenfation; in which laft fenfe it is fynonymous with Fire. This mode of fpeaking, however, is inaccurate, and by confounding the effect with the caufe, fometimes produces obfcurity : it were to be wifhed therefore that the word heat was ufed only to denote the effect; and fire, or fome other term, to denote the caufe of that effect.

The difputes which formerly were fo much agitated in the learned world concerning the nature of heat, viz. whether it conlifted merely in the motion of the terreftrial particles of bodies, or in that of a fubtile fluid, are now mofly ceafed, and it is almoft univer-
fally believed to be the effect of a fluid. Unluckily, however, from the promifcuons ufe of the words fire and heat, an opinion feems to have gained ground, that there is in nature a fluid effentially hot; and that wherever the oppofite fenfation prevails, the former fluid is in part ablent. Hence have arifen numberlefs fpeculations concerring the atraction, abforption, and capacities of bodies for heat; all of which being builton a falfe principle, have ferved no other purpofe but to involve this part of natural philofophy in obfcurity and confulion. Under the articles Chemistry; Combustion, Eiectricity, \&c. it is fo fully fhown that beat properly fo calledisnot a fluid, but the miodification of a fluid, that it is fuperfluons to fay any more on the fubject at prefent. This leing admitted, it will evidently follow, that beat can neither be abforbed nor attracted ; neither can any body have a greater capacity for it than another, except in proportion to its bulk, which allows a larger quantity of the fluid to enter and to affame the particular motion which conftitutes heat. From fome of Dr Black's experinients indeed it would appear at firft view, that heat was abforbed, or attracted in the fricteft fenfe of the word: but this muft be attributed merely to the transferring of the modification of the fluid from one fublance to another, without regarding whether it is the identical quantity of fluid which acts as heat in one fubftance that is transferred to the other, or whether only by fome unknown means a fimilar motion is produced in another portion of the fame. At any rate, however, fome word muft be made ufe of to exprefs this operation ; and abforption or attrastion will anfwer the
purpofe as well as any others: but fill we ought to remember, that these are inaccurate; and when we begin to argue from them as if they fally and exactly fetermined the mode in which the fluid aets, or rather is afted upon (for both thefe words fuppofe heat to be paflive, and not active), we muft certainly err. As to the phrafes capacity for containing beat, abfolute beat, \&c. they are ftill more inaccurate than the words abforption and attraction, and cannot convey any diftinct idea; whence the fyftems founded upon the explanations of thefe terms, affunied gratis dictum without the leaft proof, have never been able to fupport themfelves; but are liable to endlefs and infuperable objections.

It is by no means indeed eafy, nay we may boldly fay that it is abfolutely impoffible, for human genius to inveftigate all the phenomena of this fubtile and invifible element. All that can be done is, to difcover a few general rules according to which the fluid acts in certain cafes. From thefe we can only reaton analogically to cafes where its action is lefs obvious. But we are not to expect that by reafoning in this nanner we can folve every phenomenon : nor can it be any recommendation to an hypothefis, merely that it folves fome phenomena, unlefs we were able by its means to folve them all; bnt this no wife man will pretend to do, nay, not even to know them all. It appears exceedingly erroneous therefore to invent folutions of certain phenomena, and then to argue for the truth of the hypothefis from the facility with which the phenomena are explained by it. The true and proper method of proceeding in this cafe is to lay down certain principles eftablifhed from the obvious phenomena of nature, and to reafon from them fairly as far as we can ; but where this ends, our knowledge mult ftop, and we cannot by any means proceed farther upon a fure foundation.

The only general principles as yet certainly eftablihed from obvious phenomena upon this fubject are the following: I. Heat and cold are found to expel one another. Hence we ought to conclude, that heat and cold are both pofitives; for a negative can neither be expelled nor accumulated. 2. Heat is vifibly occafioned by the rays of the fun concentrated, and likewife by the flid of electricity concentrated. If fire, therefore, properly fo called, be the caufe of heat, than which nothing can be more evident to our fenfes, we are certainly intitled to conclude, that both the light of the fun and the electric tluid are elontentary fire. Hence allo we conclude their identity ; for two different fubftances cannot by any meansproduce conitantly the fame effect when put in the fame circumftances; which both light and electricity do in this cafe, merely by concentraiion, or difcharging a great quantity of the fluid upon a fmall portion of any terreftrial body. 3. Heat expands bodies in every direction : whence we conclude, that the fluid, when producing heat, acts from a centre towards a circumference; and by analogy, that when it produces cold it acts from a circumference towards a centre. 4. It appears from undeniable experiments, that heat, fomehow or other, is the canfe of fluidity. As the action of the fluid has already been flown, when it produces heat, to be from a centre to a circumference, it follows, that when the expanfive action of the fluid is confined within the fiurface of any body,
this may be called its latent heat; becaufe it extends not beyond the furface, and therefore cannot affect the thermometer, or be known to us as heat by the fenfe of feeling. But when this expanfiye action is transferred from the internal parts of the fubitance to the furface, it then affects the thermometer and the body is faid to become hotter at the fame time that it congeals or is faid to be frozen. This is what fome philofophers call the convertion of the latent into fenfible heat ; others, the alteration of the capacity : but whatever term we give to the effeft, the caufe mult remain the fame, viz. the oppofite actions of the fame fluid; the expanfive power in fome cafes counteraeting or overcoming the condenfing one, and vice verfa. 5. Though fomerimes the expanfive action is fufficiently ftrong to produce fluidity naturally, and in moft cafes may be made fo ftrong artificially as to make bodies fluid, yet in all cafes it is not fo. A certain degree of expanfive power exifts in all bodies whatever, and this by philofophers is called the fpecific beat of the body. 6. Whatever is called the cooling of any body is only the diminution of the expanfive action uponits furface, or, if we may ufe the expreffion, on the furface of its particles. This is accomplifhed by an op;polite power or modification of the fluid taking place on the outfide ; but when this becomes fufficiently ftrong to penetrate the whole fubftance, it then expels part of the fluid acting in the oppofite direction, and then fome change takes place in the texture of the body. It is, however, impolfible to fpeak very perfpicuoufly upon this fubject, as the fubtility and invifibility of the fluid render all reafonings upon it very precarious. 7. It is altogether impofible to calculate: the quantity of abfolute heat contained in any fubftance, becaufe this depends on the proportion betwixt the quantity of fluid acting expanfively and that acting. in the oppofite direction in the fame. Thefe two muft fome way or other counterbalance each other thronghout the whole fyftem of nature ; and we may fay with certainty, that any fubftance in which the one exifts without the other, is none of thofe fubject to the inveftigation of our fenfes, and allfpeculations concerning it muft be vain. 8. When the fluid contained in any fabftance is vehemently agitated, this naturally: produces an exponfion in it ; and therefore bodies become hot by violent friction, percaffion, \&c. In thefe cales, however, we have no right to fay that the fluid is expelled, but only that its mode of action is altered; for this is conftantly fufficient to produce heat, and in: this indeed the very effence of heat confifts. 9. When the expanfive action ot elementary fire within any fubftance becomes greater than is confiftent with the cohefion of that fubfance, it is difipated or refolved into yapour. This, however, may be donte in fuch a manner that the heat ftill acts upon the feparated parts of the body without fpending any of its force upon external fubftances. Hence vapour continues to exift in a temperature much below that in which it was. originally produced ; nay, will fometimes be exceffively cold to the touch, when it really contains as much heat, though in a latent ftate, as before. 10. When: this latent heat is transferred to external bodies, the vapour then ceales to be'vapour, or is condenfed, and in fome cafes returns to its original ftate ; in others, it is productive of light and wehement fenfible heat:

## HEA [ $35^{2}$ ] HEA

Heat. whence all the phenomena of Disticlation, Evaporation, Flame, Ignition, Combustion, \&c.

Thefe are the principal faets which can be looked upon as eftablifhed with regard to heat confidered in a philofophical view. In common difcourfe it is always fpoken of as a certain fubftance diftinct from all others, and may properly enough be reckoned fo with regard to all the parpofes of life. In this fenfe, heat is accumulated by certain bodies in a much greater proportion than others. Dr Franklin made the experiment with pieces of cloth of various colours laid upon fnow and expofed to the funlhine, and in all cafes found that the pieces dyed with the darkeft colours funk deepeft in the fnow. Mr Cavallo examined the matter more accurately ; firft by obferving the height to which a thermometer with a blackened bulb rofe in comparifon with one of clear glafs, and then by comparing the heights of different thermometers whofe bulbs were painted of various colours. Having therefore conflructed two thermometers whofe fcales exactly correfponded with each other, he fixed them both upon the fame frame, about an inch afunder, having the balls quite detached from the frame; and in this manner expofed them to the light of the fun or of a lamp. When thefe were expofed to the fun or kept in the fhade, with the glafs of loth bulbs clear, they fhowed precifely the fame degree; and the difference between the degree fhown by the thermometers when expofed to the fun and when kept in the fhade, at about the fame time of the day, was very trifling.

The ball of one of the thermometers being painted black, and that of the other left clean, they howed different degrees of temperature on being expofed to the fun, the difference fometimes amounting to $10^{\circ}$ : but was never conftant; varying according to the clearnefs of the fun's light as well as of the air, and likewife according to the different degrees of temperature in the atmofpliere.

On keeping the thermometer with the painted ball on the infide of a window, Mr Cavallo obferved that ftrong day-light had an effect in raifing the mercury as well as the fun'slight. To afcertain this, he cleaned the buib of the painted thermometer, and blackened that of the other; but the effect was conftant, viz. the quickfilver in the tube of the thermometer, whofe ball was painted black, was conftantly higher than the other whenever they were expofed to the ftrong day: light. The difference was commonly about one-third of a degree, but fometimes it amounted to three-fourths, or even to a whole degree; and the experimentanfwered even when the fun was hid by clouds, which feems to indicate that every degree of light is accompanied with a correfponding one of heat.

By this confideration Mr Cavallo was induced totry whether, by directing the concentrated light of the moon upon the blackened bulb of a thermometer, it would be raifed higher than a clean one ftanding in .the fame. The experiment was feveral times tried with a large lens, and afterwards with a burning mirror of 18 inches diameter ; yet fometimes for want of proper means of obferving the height of the mercury in the tubes of the thernometers, fometimes for want of a continued clear light of the moon, or in fhort from fome unfavourable circumftance or other, he was never able to make a fair and decifive trial of this experiment.

Making trial of the heat of a lamp, he found that it alfo had a confiderable effect. The ball of one being blackened, and both fet at two inches diftance from the flame of a lamp, they both rofe from 58 to 65 ? deg. and the thermometer which was blackened to $67 \frac{2}{2}$. Another time the uncoloured thermometer rofe to $67{ }^{3}$, and the coloured one to $68 \frac{3}{3}$. From a number of trials it at laft appeared, that the difference at this diflance from the lamp amounted generally to about a degree. When the thermometers were removed farther than two inches from the lamp, the difference decreafed; and at the diftance of about 14 or 15 inches it vanifhed entirely.

On this occation Mr Cavallo had an opportunity of making a curious obfervation concerning the decreafe of heat at different diftances from the centre. "It is mathematically true, that emanations which proceed from a centre, and expand in a fphere, mult become more and more rare in proportion to the fquares of the diftances from the centre. Thus it is faid, that the intenfity of light proceeding from 2 luminous body at the double, treble, quadruple, \&c. diftance from that body, muft be refpectively four, nine, fixteen, times, \&c. lefs denfe. The fame thing may be faid of heat; but with refpect to the latter, it appeared, that its intenfity did not decreafe exactly in the duplicate proportion of the diftances from the flame of the lamp, but fhowed a very odd irregularity. It feemed to decreafe fafter than the duplicate proportion of the diftances for the fpace of two inches and a half or three inches, after which it decreafed much flower; but whether this proceeded from fome different flate of the arr's purity at different diftances from the flame of the lamp, or from the vapours coming from the flame, I cannot take upon me to deternine."

Mr Cavallo next made fome experiments upon thermometers, the balls of which were painted of varions colours. His view was to examine with precifion the degrees of heat imbibed by differently coloured fubftances, in order to determine whether they kept any proportion to the fpaces occupied by the prifmatic colours in the prifmatic fpectrum, or if they followed any other law. In thefe experiments he met with confiderable difficulties, chiefly arifing from the different nature of the colours with which the bulbs were painted. By reafon of this diverfity the bulbs could not be made equally fimooth, which occafioned a confiderable difference in the effect, as he found by painting two bulbs of thermometers with the fame colour, only making the one fmooth and the other rough.
To avoid this inconvenience, he attempted to make thermometers with tubes of differently coloured glafs; but when a ball was formed with any of thefe, the glafs of the ball was fo thin, that it differed very little from that which was entirely colourlefs. He then included the thermometers in boxes, where the rays entered through coloured glafles; but here the rays were not only far from being homogeneous, but there was fuch a difference in the tranfparency of fome of the coloured glafles, that this method, proved alfo ineffectual. The leaft ambiguous method therefore, was that of painting the balls of the thermometers with water-colours, taking care to lay them on as equally and fmooth as poffible. In this manner the experiments were repeated, ufing fometimes a dozen of thermometers

## HEA [ 353 ] HEA

Heat. mometers at once, whofe balls were painted wilh various colours, and were expofed to the fun ; but from a valt number of experiments, and fome weeks oblervation, it could only be deduced, that if the colours with which the balls of ine thermometers were painted had any coniderable relemblance to thole of the prifm, thole which were neareft to the violet fhowed a greater degree of heat than the others ; but they were all, even that painted with white lead, in fome intermediate degree between the blackened thermometer and that which was left quite clear. It the colours had not the proper denfity, the effects were different : thus, a thermometer painted with a light blue food lower than another painted with good carmine.

In the courfe of his thermomerrical experiments, Mr Cavallolikewifedifcovered a new method of determining the expanfion of mercury by weight, which feemed capable of being carried to a greater degree of exastnefs than any other hitherto propofed. Having firft blown a ball to a capillary tube, fuch as are commonly ufed for thermometers, he weighed it, and found the weight when empty to be 79.25 grains ; and he ublerves, that in this experiment it is a precalarion abfolutely neceffary to have the glafs as accurately cleaned as polible. Some mercury was then introduced into the ftem of the thermometer, taking care that none of it entered the ball; and by adapting a fcale of inches to the tube, obferved that 4.3 inches of it were filled with the mercury. The thermometer was now weighed again ; and from this the weight of the glafs being fubtracted, the remainder, viz. 0.24 . gr. Thowed the weight of that quantity of quickfilver which filled the 4.3 inches of the tube. Now the ball of the thermometer, and alfo part of the tube, were entirely filled with quicklilver; and in order to find out the weight of the mercury contained in it, the thermometer was weighed for the laft time; and the weight of the glafs being fubtracted from this, the remainder, viz. 3205 grains, thowed the weight of the whole quantity of quickfilver contained in the thermometer.

By comparing this inftrument with a graduated therinometer of Fahrenheit, and by applying a fcale of inches, he found, that $20^{\circ}$ on the new thermometer was equal to 1.37 inches. But 0.24 grains was the weight of as much mercury as filled 4.3 inches of the tube. Therefore, by the rule of proportion, it will be found that the weight of as much quickiilver as fills t .33 inches of the tube, $v i z$. the length of $20^{\circ}$, is equal to 0.0742 of a grain nearly, and that the weight of as mich quickfilver as fills a length of the tube equivalent to one degree, is equal to 0.00371 grains. Now it is clear, that the weight of the whole quantiiy of quickfilver contained in the thermometer is to she weight of as much as fills the length of one degree of the tube, as the bulk of the whole quantity of quick. filver in a given degree of heat to the increafe of bulk that the fame whole quantity of quickfilver acquires when heated but one degree; viz. 32.05 grains is to 0.00371 grains as I to $0.0011+$. By which experiment it appears, that one degree of Falirenheit's thermometerincreafes the budk of mercury not above eleven hundredth thoufandth parts. A fmall deviation from maihematical exactnefs is indeed produced by the difference of weight between the quickfiver of the tube Voi. VIMI.
when firf weighed and when it is afterwards heated to one degree ; but by an eafy calculation it will be found, that this difference is fo exceediagly finall that it cannot be perceived with our moft exact inftruments of either weight or meafure.

On repeating this experiment with other thermoncters, each procefs varied a little from the other; which irregularity, Mr Cavallo thinks, was certainly owing to the imperfection of his fcales: but by taking a mean of warious experiments, it appears, that one degree of heat, according to Fahrenlieit's thermometer, increafes the bulk of a quantity of quickfilverin the temperature of $50^{\circ}$ by about nine parts in 100,000; that is, if the bulk of any quantity of quickfilver in the temperature of $50^{\circ}$ be 100,000 , it will be 100,003 in the temperature of $51^{\circ}$.

In making experiments of this kind, it is neceffary to have the bores of the tubes abfolutely cylindrical ; and the fales frould be fo exact as to min with the hundredth part of a grain when charged with half ant ounce weight.

Heat of Burning Bodies. See Combustion.
Heat of Chemical Mixtures. This is a phenomenon neceflarily refulting from the change of form produced in the different fubftances which are mixed together; and the manner in which it happens may be eatily underftood from the example of oil of vitriol and water. If cqual quantities of concentrated vitriolic acid and water are mixed together, a very great degree of heat immediately takes place; infomuch that if the veffel which contains the mixture is made of glafs it will probably break; and after it is cold, the mixture will be found to have fhrunk in its dimenfions, or will occupy lefs fpace than the bulk of the water and acid taken feparately. In this cafe we know that the water, while in its fluid ftate, hath as much latent heat as it can contain; i.e.the elementary fire within it expands or feparates its parts from each other, as much as is conifitent with the conflitution of the body. If any more is added, it cannot be abforbed, or direct its force upon the particles of the water without raifing them in vapour : of confequence, part of this additional expanfive power will be employed in the formation of vapour, and the reft will be difcharged upon the neighbouriag bodies, $i, e$. will be converced into fenfible heat. The vitriolic acid, in its concentrated fate, contains a great quantity of latentheat, which is neceffary to preferve its fluidity. But when it is mixed with the fluid water, the latent heat contained in the latteris abundantly fufficient for both: of confequence, the great expanfive power in the oil of vitriol itfelf becomes now totally ufelefs, and therefore exerts its force upon the neighbouring bodies; and when the mixture returns to the original temperature of the oil of vitriol and water, it fhows a lofs of fubftance by its diminution in bulk.' This may ferve to explain all cafes in chemiftry where heat or cold is produced : and it will generally be found, that where bodies, $\cdot$ by being mixed together, produce heat, they fhrink in their dimenfons; but when they produce cold, they are enlarged.

## HEA

Keat. lying within the tropics were uninhabitable by reafon of their heat: but time has difcovered their miftake; and it is now found, that no part of the world is too hot for mankind to live in. The learned profeflor Boerhaave, in his chehiftry, relates certain experiment made with great accuracy by the celebrated Fahrenheit, and others, at his defire, on this fubject, in a fugar-baker's-office; where the heat, at the time of making the experiments, was up to r 46 degrees of Fahrenheit's thermometer. A fparrow, fabjected to the air thus heated, died afrer breathing very laborionfly, in tefs than feven mimutes. A cat refifted this great lieat fomewhat above a quarter of an hour ; and a dog about 28 minutes, difcharging before hirs death a confiderable quantity of a ruddy coloured foam, and exhaled a fench fo peculiarly offenfive, as to throw one of the affilantsinto a fainting fit. This diffolution of the humours, or great change from a natural ftate, the profeffor attributes not to the heat of the ftove alone, which wrould not have prodaced any fuch effect on the flefh of a dead animat; but likewife to the vittil motion, by which a ftill greater degree of heat, he fuppofes, was produced in the fluids circulating through the lungs, in confequence of which the oils, falts, and fpirits of the animal became fo highly exalted.

Meffeurs Du Humel and Tillet having been fent into the province of Angounois, in the years 1760 and 176 I , with a view of endeavouring to deftroy an infect which confumed the grain of that province, effected the fame in the manner related in the Memoirs for 1761 , by expofing the affeeted corn, with the infeets included in it, in an oven, where the heat was fufficient to kill them without injuring the grain. This operation was performed at Rochefoucault, in a large public oven, where, for economical views, their firft fep was to affure themfelves of the heat remaining in it on the day after bread had been baked in it. This they did, by conveying in a thermometer on the end of a fhovel, which, on its being withdrawn, indicated a degree of heat confiderably above that of boiling water: but Mr Tillet, convinced that the thermometer had fallen feveral degrees in drawing to the mouth of the oven, and appearing under fome embarraffment on that head, a girl, one of the attendants on the oven, offered to enter, and mark with a pencil the height at which the thermometer food within the oven. The girl fmiled on M. Tillet's appearing to Inefitate at this ftrange propofition; and entering the oven, with a pencil given her for that purpofe, marked the thermometer, after ftaying two or three minutes, ftanding at 100 degrees of Reaumur's feale, or, to make ufe of a fale better known in this country, at near 268 degrees of Fahrenheit's.. M. Tillet began to exprefs an anxiety for the welfare of his female affiftant, and to prefs her return. This female falamander, however, affuring him that the felt no inconvenience from her fitnation, remained there 10 minutes longer: that is, near the time when Boerhave's cat parted with her nine lives under a much lefs degree of heat, when the thermometer ftanding at 288 degrees, or 76 degrees above that of boiling water, fhe came out of the oven, her complexion indeed confiderably: heightened, but her refpiration by no means quick or laborious. After M, Tillet's return to Paris, thefe
experiments were repeated by Monf. Marantin, coatmilfaire de guere, at Rochefoucault, an intelligent and accurate obferver, on a fecond girl belonging to the oven, who remained in it, without much inconvenience, under the fame degree of heat, as long as her predeceffor; and even breathed in the air heated to about 325 degrees for the face of five minutes.
M. Tillet endeavoured to clear up the very apparent contrariety berween thefe experiments and thofe made under the direction of Boerhaave, by fubjecting various animals, under different circumftances, to great degrees of heat. From his experiments, in fome of which the animals were fwaddled with cloths, and were thereby enabled to refift for a much longer cime the effects of the extranrdinary heat, he infers, that the heat of the air received into the lungs was not, as was fuppofed by Boerhaave, the only or principal caufe of the anxiety, laborious breathis $g$, and death, of the animals on whom his experiments were made; but that the hot air, which had frec and immediate accefs to every part of the furface of their bodies, penetrated the fubftance on all fides, and brought on a fever, from whence proceeded all the fymprons: on the contrary, the girls at Rochefoucault, having their bodies in great meafure protected from this action by their clothes, were enabled to breathe the air, thus violently heated, for a long time without great inconvenience. In fact, we fhould think too, that the bulk of their bodies, though not thought of much confequence by M. Tillet, appears to have contributed not a little to their fecurity. In common refpiration, the blood, in its paffage through the lungs, is cooled by being brought into contact with the external infpired air: In the prefent experiments, on the contrary, the veficles and veffels of the lungs receiving at each infpiration an air heated to 300 degrees, maft have been continually cooled and refrefhed, as welk as the fabcutaneous veffels, by the fuccefive arrival of the whole mafs of blood contained in the interior parts of the body, whofe heat might be fuppofed at the beginining of the experiment not to exceed 100 degrees. Not to mention, that M. Tillet's two girls may not poflibly. have been fubjected to fo great a degree of heat as that indicated by the thermometer; which appears to us to have always remained on the fhovel, in contat with the earth.

Thefe experiments foon excised other philofophers to make fimilar ones, of which fome veryiremarkable ones are thofe of Dr Dobfon at Liverpool, whe gives the following account of them in the Philofophical Tranfactions, vol. lxv.
"I. The fweating-room of our public hofpital at Liverpool, which is nearly a cube of nine feet, lighted from the top, was heated till the quick filver food at $224^{\circ}$ on Fahrenheit's fcale, nor would the tube of the thermometerindeedadmit the heat to be raifed higher. The thermometer was fufperided by a ftring fixed to the wooden frame of the fky-light, and hung down about the centre of the room. Myfelf and feveral others were at this time inclofed in the ftove, without experiencing any oppreflive or painful fenfation of heat proportioned to the degree pointed ont by the thermometer. Every. metallic about us foon became very hos.
"6. II. My friend Mr Park, an ingenions furgeon of this place, wentinto the ftove heated to 202.. Af=

## HEA

ter ten minutes, I found the pulfe quickened to 120. And to determine the increate of the animal-heat, another thermometer was handed to him, in which the quick filver already ftood to $9^{8^{\circ}}$; but it rofe only to $99 \frac{1}{2}$, whether the bulb of the thermometer was inclofed in the palms of the hands or received in the mouth (a). The natural fate of this gentleman's pulfe is about 65.
"III. Another gentleman went through the fame experiment in the fame circumftances, and with the fame effects.
"IV. One of the porters to the hofpital, a healthy young man, and the pulfe 75, was inclofed in the fove when the quickfilver ftood at $210^{\circ}$; and he remained there with litule inconvenience for 20 minutes. The pulfe, now 164 , and the animal-heat, determined by another thermometer as in the former experiments, was ior!.
"V. A young gentleman of a delicate and irritable habit, whofe natural pulfe is about 80 , remained in the ftove ten minutes when heated to $224^{\circ}$. The palfe role to 145, and the animal-heat to 1020 . This gentleman, who had been frequently in the fove during the courle of the day, found himfelf feeble, and difpofed to break out into fwears for 24 hours after the experiment.
"VI. Two fmall tin veffels, containing each the white of an egg, were put into the fove heated to $224^{\circ}$. One of them was placed on a wooden feat near the wall, and the other fufpended by a fring zbout the middle of the ftove. After ten minutes, they began to coagulate; but the coagulation was fenfibly quicker and firmer in that which was fufpended, than in that which was placed on the wooden feat. The progrefs of the coagulation was as follows; it was firft formed on the fides, and gradually extended itfelf; the whole of the bottom was next coagulated; and laft of all, the middle part of the top.
" VII. Part of the fhell of an egg was peeled away, leaving only the film which furrounds the white ; and part of the white being drawn out, the film funk fo as to form a little cup. This cup was filled with fome of the albumen ovi, which was frequently detached as much as poffible from every thing but the contact of the air and of the film which formed the cup. The lower part of the egg ftood upon fome light tow in a common gallipot, and was placed on the wooden feat in the ftove. The quickfilver in the thermometer fill continued at $224^{\circ}$. After remainIng in the ftove for an hour, the lower part of the egg which was covered with the fhell was firmly coagulated, but that which was in the little cup was fluid and uranfparent At the end of another hour it was fill fluid, except on the edges where it was thinneft; and here it was fill tranfparent; a fufficient proof that it was dried not coagulated.
"VIII. A piece of bees-wax, placed in the fame fituation with the albumen ovi of the preceding experiment, and expofed to the fame degree of hear in
the ftove, began to melt in five minutes: another piece fufpended by a ftring, and a third piece put inte the tin veffel and fufpended, began likewife to liquefy in five minutes."

Even thefe experiments, though more accurate than the former, do not fhow the utmoft de grees of heat which the human body is capable of enduring. Some others, fill more remarkable (as in them the body was expofed to the heat without clothes), by Drs Fordyce and Blagden, are alfo recorded in the Philofophical Tranfactions. They were made in rooms heated by flues in the floor, and by pouring upon it boiling water. There was no chimney in them, nor any vent for the air, excepting through crevices at the door. In the firft room were placed three thermometers, one in the hotteft part of it, another in the cooleft part, and a third on the table, to be ufed occafionally in the courfe of the experiment. Of thefe experiments, the two following may be taken as a fpe. cimen.
"About three hours after breakfaft, Dr Fordyce having taken off all his clothes, except his hirt, and being furnifhed with wooden ghoes tied on with lift, went into one of the rooms, where he flayed five minutes in a heat of $90^{\circ}$, and begun to rweat gently. He then entered another room, and ftood in a part of it heated to $110^{\circ}$. In about half a minute his hirt became fo wet that he was obliged to throw it afide, and then the water poured down in freams over his whole body. Having remained in this heat for ten minutes, he removed to a part of the room heated to 1202; and after ftaying there 20 minutes, found that the thermometer placed under his tongue, and held in his hand, ftood juft at $100^{\circ}$, and that his urine was of the fame temperature. His pulfe had gradually rifen to 145 pulfations in a minute. The external circulation was greatly increafed, the veins had become very large, and an univerfal rednefs had diffufed itfelf all over the body, attended with a ftrong feeling of heat ; his refpiration, however, was little affected. He concluded this experiment by plunging in water heated to $100^{\circ}$; and after being wiped dry, was carried home in a chair ; but the circulation did not fubfide for two hours.
" Dr Blagden took off his coat, waiftcoar, and frirt, and went into one of the rooms, as foon as the thermometer had indicated a degree of heat above that of boiling water. The firft impreffion of this hot air upon his body was exceedingly difagreeable, but in a few minutes all his uneafinefs was removed by the breaking out of a fweat. At the end of 12 minutes he left the room very much fätigued, but no otherwife difordered. His polle beat 136 in a minute, and the thermometer had rifen to 220 degrees.

In others of thefe experiments it was found, that a heat even of $260^{\circ}$ of Fahrenheit's thermometer could be fubmitted to with tolerable eafe. But it muat be obferved, that in thefe great heats every piece of metal they carried about with them became intolerably

X x 2
hot.
(A) The fcale of the thermometer, which was fufpended by the ftring about the middle of the room, was of metal; this was the only one I could then procure on which the degrees ran fo high as to give any fcope to the experiment. The fcale of the other thermometer, which was employed for afcertaining the variations in the animal-hear, was ef ivory.

## HEA

* 

Heat. liot. Small quantities of water placed in metalline veffels quickly boiled; but in a common earthen veffel it required an hour and an half to arrive at a tenperature of $140^{\circ}$, nor could it ever be brought near the boiling point. Neither durft the people, who with impunity breathed the air of this very hot room at 264 degrees, bear to put their fingers into the boiling water, which indicated only a heat of $212^{2}$. So far from this they could not bear the touch of quiekfilver heated only to $120^{\circ}$, and could not bur juft bear fpirit of wine at $130^{\circ}$.

Auimul-Heat. Of this there are various degrees; fome animals preferving a heat of roo or more in all the different temperatures of the atmofphere; others keep only a few degrees warmer than the medium which firrounds them; and in fome of the more imperfect animals, the heat is fcarcely one degret above the air or water in which they live.

The phenomenon of animal-heat hath, from the earlieft ages, been the fubject of philofophical difcuffion; and, like moft other fubjects of this nature, its caufe is not yet afcertained. The beft treatifes that have appeared on the fubject are thofe of Dr Dugud Lellie, publifhed in $177^{8}$; and Mr Adair Crawford, in 5779 . From the firft of thefe performances, the following account of the different opinions on this I fabject is extracted.

## Opinions

of the anci- nutely in ancients pofferled not the requinites for mients con- to fyinveltigatigg tic fled every phenoneron prone cerning animal: heat to fuperfticion, attributed every phenomenen which eluded their inveftigation, to the influence of a fupernatural power. Hippocrates, the father and founder of medicine, accounted animal heat a myftery, and be-
flowed on it many attributes of the Deity. In treating of that fubject, he fays in exprefs terms, "what we call heat, appears to me to be fomething immortal, which underftands, fees, hears, and knows every thing prefent and to come." -Arifote feems to have confidered the fubject particularly, but nothing is to be mes with in his works that can be faid to throw light uponit.-Galen tells us that the difpute between the philofophers and phyficians of his time was, "whether animal-heat depended on the motion of the heart and arteries; or whether, as the motion of the heart and arteries was innate, the heat was not alfo innate." Botle thefe opinions, however, he rijcets; and attempts a folution of the queftion on his favourite fyfem, namely, the peripatetic philofophy: but his leading principles being erroneous, his deductions are of courfe inadmiffible.
" To enter into a minute detail of all the opinions offered by the moderns on the caufe of animal-heat, would far exceed our limits. Moft of them, however, may be referred to one or other of the three general caufes of hear, viz. mixture, fermentation, and mechanical means, each of which we fhall particularly confider.
" I. Chemica! mixture. When chemical philofophy firft came into vogue, and prevailed in the theory as well as practice of medicine, almoft every operation in the animal machine was faid to be the effect of ferment or mixture. From obferving, that on the mixing of certain bodies far below the temperature of the human body, a degree of heat fometimes rifing to actual inflammation was produced ; they, without fur-
ther inveftigation, pronounced mixtare the fole caufe of animal heat. Various, however, were the opinions, not only refpecting the place where the mixture happened, but alfo concerning the nature of the fiuids of which it confifted. Van Helmont, Sylvius, and feveral others, fuppofed that the mixture took place in the inteftinal tube ; and afcribed it to aneffervefence between the pancreatic juice and the bile. Orhers difcovered acids in one place, and alkalies in another ; but the general opinion for near two centuries was, That acefcent fluids taken in, meeting with others of an alkaline nature already prepared in the body, gave rife to the degree of heat peculiar to animals. But thofe who are in the leaft acquainted with the laws of the animal economy, need not be told that thefe opi-s nions are mere conjectures, founded on facts graruim toully aflamed. No experiments have fhown either an aeefcency or alkalefcency in the bils that is fufficient to unite with the other animal juices, and generate the heat of animals. But though we fhould admit the fuppofition in its full extent, ftill it would by no means be fufficient to account for the ftability of ani-mal heat in different climates and feafons; its equability all over the body when in health; its parrial in. creafe in topical inflammations : or hardly indeed for any one phenomenon actending its production.
"Since, then, it appears that the fluids fuppofed to be mixed, the place in which the mixture is made, and every other citcumftance relating to it, are neither afcertained nor feconded by analogy, norie will, we prefume, befitate to reject every hyporhefis of the caufe of animal heat founded on the cffects of mixture.
" 2. Fermentation. When a more accurate and extendive knowledge of the various operations of nature had convinced phyfiologifts of the abfurdity of explaining the vital functions of animals, and the feveral changes which takes place in the living body by the effect of chemical mixture, fermentation was fabtituted in its ftead. All had obfe: ved, that fermentation was generally accompanied by heat; and few were ignorant, that that identical procefs, or one extremely fimilar to it, was conftantly going forward in living animals; and it was not without fome appearance of truth, that phyfiologifts attributed animal heat to that caufe.
"Formerly there were various modifications of this opinion; but of late it has been chiefly confined to one fpecies of fermentation, viz. the putrefactive, which indeed is more confentaneous to experience and found philofoply. For althongh animal fubftances are either direaly or indirectly produced from vege. tables, as all animals live on vegetables, or on animats. that have lived on them; and though they may be alltimately refolved into the fame principles; yet they are certainly combined in a different manner: for they conftituce compounds, the natures of which are effentially. different; and the three ftages of fermentation, the vinous, acetous, and putrid; the laft is the only one to which they flow a tendency. Milk indeed tends to the acetous, and even to the vinous fermentation; bat as. it can hardly be confidered as perfectly animalized, it ought not to be confidered as an exception to the ge. neral pofition. And though it be readily admitted, that animal matter is extremely apt to patrefy, and that even

## HEA

Heat. in the living body there is a tendency to that proce $f_{5}$; yet it may be hown, that the degree to which it takes place can have little or no hare in generating the heat of animals. In the firft place, the eftect of any degree of putrefaction in producing heat, is to this day fo ill afcertained, that, with many ingenious philofophers, it is altogether problematical, whether or not animal fubftances, during the putrefactive procefs, do ever generate heat. Neither M. Beaume, nor Dr Pearfon, who made feveral accurate experiments with a view to afcertain this point, could, by the affiftance of the moft fenfible thermometers, difcover the leaft difference between the temperance of the putrefying mixtures and the furrounding medium ; and were the putrefaction of animal fubftances readily attended with the generation of heat, we might expect to find it greater in proportion to the bulk of the putrefying mafs. This, however, is not the cafe; for it has often been found, that the largeft maffes of animal matter, fuch as the carcafe of a large whale, laid out and expofed to the air in fuch a putrid condition as to affect all the neighbourhood with an intolerable ftench, did not to the perfons handling it feel fenfibly hotter than the circumambient air. But what at once overturns every thing that can be advanced in favour of the generation of animal heat on the principles of putrefacion is, that heat is fo far more confiderable in a living than in a dead body; and no rational phyfiologift will deny, that the putrid fermentation is going forward more rapidly in the latter than in the former.
" 3. The mechanical generation of heat. This opinion firft took its rife from an obfervation, that animal heat generally keeps pace $u$ ith the ftate of the circulation: while the aftion of the heart and arteries continues mimpaired, a high degree of animal heat is produced; but when that action becomes more langaid, the heat of the amal is diminifhed alfo. This, till very lately, was the favourite opinion of phyficians, and was introduced immediately after Harvey had difcovered the circulation of the blood, and indeed feems to be fupported by many ftriking facts. Phyfologifts looked upon it as a matter almoft capable of mathematical demonftration; yet they conld not agree whether the heat of animals is occalioned by the friction of the blood againg the veffels which contain it, or by the internal friction and agitation of the particles among one another. Various hypothefes accordingly were framed, and many ingenious arguments brought in fupport of them : bat all fuppofitions of the mechanical kind are overthrown by fome thermometrical obfervations of De Haen and others, from which it appeared, that the heat of thebody was fometimesgreater than is ufual with healthy people, at the time the perfon was juft expiring, whenthe action of the veffelswas very weak; nay, eren after he was dead, when it had entirely ceafed. The abovementioned phyfician relates two very remarkable cafes of this kind. In the one, he found that the temperature of his patient, which dufing the courfe of an inflammatory fever had never exceeded ro3 degrees, at the time he expired, and for two minutes after, food at ro6. From the other it appeared, that the heat of a perfon who was dying of a lingering diftemper, rofe in the laft agony from 180 to $10 r_{\text {, }}$ and continued there ftationary for two
hours; and, even at the expiration of 15 hours, had only fallen to $85^{\circ}$, though the furrounding mediam did not cxceed $60^{\circ}$. The example alfo of thofe who are fuffocated by fixed air, entirely overturn not only the mechanical fyftem, but almoft every other which. hath yet appeared on the fubject. [see the article Blood, $\mathrm{n}^{2} 3$ r.]
"Onc or other of the abovementioned hypothefes BrCullen"? continued to be adopied by phyficians, till Dr Cullen opinion attempted a fulution on a new fet of principles; but, with obattentive to the diffidence with which novel opinions ought to be broached, he delivered his as little more than a mere conjecture. * May it not (fays he) be fuppofed, that there is fome circumftance in the vital principle of animats, which is in common to thofe of the fame clafs, and of like economy; and which determines the effect of motion upon the vital principle to be the fame, though the motion acing upon it mave be in different circumftances?'-The doctor was driven to this fuppofition from the difficulty he found in explaining how fo many animals of a different age, fize, and temperament, fhould poffefs very nearly the fame degree of beat; and. in which it is impoffible to flow, that the motion of the blood in all its circamftances is exactly the fame; or that in the different animals in which the degree of heat is confiderably different, the motion of the circulating mafs is in each correfpondent to the difference of temperature. But, granting that the degree of heat does not always ob. tain in an exact ratio with the motion of the blood, and that it is an infuperable objection to its mechanical generation ; yet there appear no plaufible grounds for fuppoling that the effect of motion may be the fame, while the motion acting upon it is in different circumfances. By this Dr Cullen means, that the different temperatere of different animals is owing to a difference of the vital principle, infomuch that the ve. locity of the blood may be the fame in a frog as in a man; and yet, in confequence of the different vital principle, the heat produced may be different. The facts upon which he feems to lay the greateft ftrefs are, That neither where the furrounding medium confiderably furpaffes the temperature of the living body, nor where it is far below it, is there any fenfible change in the heat of animals. Thefe, and fome fimilar facts, in appearance countenance his hypothefis; yet we have no folid reafon for imagining the principle of life to be different in different animals. And how are we to. conceive, that the fame degree of motion thouldin one clafs of animals always produce a certain degree of heat, and in another clafs as regularly a different one? A propofition of fuch a nature fhould, no doubt, require the moft obvious facts and conclufive arguments. to eftablifh it; but, in the prefent inftance, we do not perceive any probable reafon, even from analogy . Befides, to fay that the principle of life can generate heat or cold, independent of chemical and mechanical means, is contrary to experience, and feems in itifle abfurd.
"In the 66th volume of the Philofophical Tranfactions, Dr Hunter, after reciting fome experiments. concerning animal heat, afferts, That certain animals: entircly deftitute of nerves, are endowed with a powerof generating their own heat; and this he brings as.

## HEA [ HEA

Heas. 2n argumenium crucis againft thofe who account the nervous fyftem the feat of animal-heat. If this is really a fact, it muft, no doubt, have all the weight he afcribes to it ; but it is plain that no ftrefs can be laid upon it, umlefs it was better afcertained, which it is evident it can never be. For though we can pofitively affert that nerves exift where we fee them, yet we cannot affem with equal certainty that they do not alfo exift where we are not able to difcover them. For all anatomifs allow, that thereare thoufands of nervous filaments fo fincly interwoven into the compofition of the more perfectanimals of every fize, that they elude not only the knife and naked eye, but even the beft optical inftruments hitherto invented. Since then we admit the prefence of nerves in one tribe of animals, though we can.only perceive them in their effects; what folid reafon have we to deny them in another, in which we have che very fame evidence, viz. certain indications of fenfe and motion?
"Another theory, and perhaps the beft fupported which hath yet appeared upon the fubject, is that of Dr Black. That excellent chemift having obferved, that not only breathing animals are of all others the warmcf, but abro that therefubfifts fuch a clofe and ifriking connection between the ftate of refiration and the degree of heat in animals, that they appear be in an exact proportion to one another, was led to believe, that animal-heat depends on the ftate of refpiration; that it is all generated in the langs by the action of the air upon the principle of inflammability, in a manner little diffimilar to what he fuppofed to occur in actual inflammation ; and that it is thence diffufed by means of the circulation over the relt of the vitad syftem.
" This opinion is fupported by many forcible argaments. 1 . It is pretty generally known to naturalifts, that a quantity of mephitic phlogifticated air is conftantly exhaling from the lungs of living animals.Since, therefore, atmofpherical air, by.pafling through the lungs, acquires the very fame properties as by paffing through burning fuel, or by being expofed to any other procefs of phlogiftication, it is obvious, that the change which the common air undergaes in both cafes nuft be attributed to one and the fame caufe, viz. its combination with phlogifton. 2. It has likewife been urged in favour of the fame hypothefis, that the celerity with which the principle of inflammability is feparated in refpiration, is very clofely connected with the degree of heat peculiar to each animal. Thus, man, birds, and quadrupeds, vitiate air very fatt ; ferpents, and all the amplibious kind, very flowly; and the latter are of a temperature inferior to the former, and breath lefs frequently. 3. The moft cogent arguments that have been brought in fupport of this opinion are, that no keat is generated till the function of refpiration is eftablifted; and that the fetus in utero derives all its heat from the mother."

Upon this theory our author makes the following obfervations, which we fhall give in his own werds. 66 Thefe arguments may, perhaps, on a fuperficial view of the queftion, appear conclufive; but a found
the doctrine they are meant to eftablifh; and the fub fequent animadverfion on Dr Black's theory at large, will, it is hoped, fuffice to fhow, that it is not only founded on dubious and controvertible principles, but that it is, in every point of light, clogged with unfurmountable difficulties.
"I. Many and various are the proofs which evince the improbability of the lungs being the fource or ela-
boratory of animal-heat: for, though it be granted, the improbability of the lungs being the fource or ela-
boratory of animal-heat: for, though it be granted, that there fublifts a wery friking connection betwees the ftate of refpiration and the degree of heat in animals, and that they are even in proportion to one ano-
ther; yet it by no means enfues, that the former is mals, and that they are even in proportion to one ano-
ther; yet it by no means enfues, that the former is pofitively the caufe of the latter. For, were that
really the cafe, it is obvious, that thofe animals which really the cafe, it is obvious, that thofe animals which are deftitute of the organs of refpitation would generate no heat. That, however, is not true in fact: for thofe fifhes which are even deftitute of gills, appear
from various experiments to be warmer than the ordithofe fifies which are even deftitute of gills, appear
from various experiments to be warmer than the ordinary temperature of the element in which they live; an irrefragable proof that the function of refpiration is not abfolutely neceflary to the production of heat in animals.

* II. If the heat of living anmals be generated falely in the longs, two things neceflarily follow; the firft, That it can only be communicated to the other parts of the body, through the channel of the arterial fyftem; the fecond, That the heat muft decreafe as it recedes from ins fupfofed cenur. And a clear and fa-
tisfactory tvibence of both thefe poins will, no doubt, tisfactor y twiun are of both thefe poims will, no doubt, be deenad requitite :o render br Black's opinion in
 meciing with thote whitue and convincing proofs which we hed 1 con to expod, that we are not preSented with a in planible argament in tavour of einted with a
either of the planible atament in tavour of
On the contrary, it is more conformable to facts, that the wenal trood is, if not warmformable to facts, that the venal buod is, if net warm-
er, at leaft as warm as the arterial. Dr Stevenion, an ingenious and accurate phyfiologint, with a view to afcertain this matter, haid bate the jugular vein and carotid artery of a calf, and shen tied and cut them aff at once, in order to let equal quantities of blood flow, in a given time, into veffels of an equal capacity, in in a given time, into veffels of an equal capacity, in meter; the refult of the experiment was, that the thermometer immerfedinthe venous blood rofe feveral
degrees above that place in the arterial. But though thermometer immerfedinthe venous blood rofe feverd
degrees above that place in the arterial. But though it is probable that there is not fuch a difference as that experiment feems to make, yet feveral reafonsincline experiment feems to make, yet ieveral realonsincline
me to think, that the venous blood, infead of being colder, as Dr Black maintains, is in fact, fomewhat warmer than the arterial ; and what entirely overturns his opinion is, that no experiment, though many have been made, has ever fhown that the temperature of been made, has ever hown that the temperature of
the blood is higher in the left wentricie of the heart than in the right, which mur neceffarily be the cafe, than in the right, which mula neceffarily be the cafe,
were all the heat of the animal body generated in the lungs. © III. Having thus rendered it improbable that the generation of animal-heat fhould be entirely confined to the lungs, we fhall ventare to fep farther, and endeavour to how, that the vitol fluid, fo far from acquiring all its heat in the pulmonary fyftem, communicates ne inconfiderable portion of what it had $r e-$

Heat,

 reafoner, who fhall coolly and imparially weigh every circumftance, will, I am confident, allow that they miny afford a very ambiguous and imperfect evidence of
ceived in the courfe of the circulation to the air at-

Heat. ternately entering into that organ and infing from it. Various, are the arguments which tend to evince this opinion. Were the blood heated in the lungs, we fhould certainly need lefs of their function in a warm than in a cold atmofphere: but we are taught by cxperience, that when the air is extremely hot, and we wifh to be cooled, we breathe full and quick; and that when it is intenfly cold, our refpiration is flow and languid; which, were the blood heated in the lungs by the action of the air upon it, furely fhould not be the cafe. It is therefore more confonant with reafon and experience, that the air which we infpire, by carrying off a quantity of evolved phlogition from the lungs rather contributes to diminilh than increafe the neat of breathing animals. Refpiration, for this reafon, has been very properly compared, by an ingenious phyfiologitt, Dr Duncan of Edinburgh, to the blowing of bellows on a hot body. In both cafcs a confiderable degree of heat is communicated to the air : but in neither can the air be faid to generate any heat; for if it did, the heat of breathing animals fhould increafe in proportion to the quantity of air inhaled, and a piece of inert matter heated to a certain degree fhould become hotter by ventilation.
${ }^{6}$ IV. The foetus in utero, according to Dr Black's hypothefis, generates no heat. The arguments by which he fupports that pofition, how ingenious foever they may be, feem not fufficiently cogent to produce conviction; and as the queftion from its nature hardly admits of any direct experiment, our reafoning upon it muft neceffarily be analogical. Hence arifes our embarrafinent ; for, as the difcovering of analogies depends on the quicknefs and fertility of fancy, and the truth of all analogical ratiocination on the acutenefs and nicety of judgment, two powers of the foul feldom united in an eminent degree, we cannor wonder that arguments of this kind, which to one man feem unanfwerable, fhould to another appear futile.
"The only plaufible objection to the generation of heat in the foetus, is, the fuppofition that it would in a hort time accumulate in fuch a manner as to become incompatible with life.
"This argument, however, is more fpecious than folid; for, granting that the circulation which is earried on between the foetus and the mother, uranfaits very nearly the temperature of her blood, that by no means entirely fuperfedes the neceffity of heat being generated in it. Various reafons lead to this opi-nion.-It is an axiom, that heat decreafes as it recedes from the fource from which it fprang. Now, if we admit for a moment-Dr Black's opinion, and believe the heat of animals to be generated folely, in the lungs, is it not obvious, that before it reaches the uterus, paffes through the very minute tubes by which that organ is connected to the placenta, circulates through the umbilical veffels, and pervades the extreme parts of the foetus, it muft be too much diminifhed to fupport that equilibrium, which obtains in very part of the living fyftem. Befides, as the fcetus in utero may properly enough be accounted a part of the mother,
the fame objections that are brought againt eine generation of heat in it would hold equally good againft the produstion of heat in any part or organ of her body, except the lungs. But fuch a multitude of accurate thermometrical obfervations have evinced the partial increafe of heat in local inflamations, that no room is left to doubt, that in every individual part of the vital frame heat is generated; and if the fortus be, from any caufe whatever, liable to topical inflammation, a thing which no phyfiologit has ever pretended to deny, what hadow of reafon is there for doubting that fuch affections are accompanied with the fame effects before as after birth, and confequently with a partid increafe of heat ?"
6.

Our author having now, as he fuppofes, refuted Dr Duthe opinions of others, afier fhowing that hear, though gud's theogenerated, cannot accumulate in the fœus, proceeds to ory-
lay down his own theory, which depends on the following principles.
r. That the blood does contain phlogifton.
2. That this phlogifton is evolved, extricated, or brought into a ftate of activity and motion by the action of the blood-veffels to which it is fubjected in. the courfe of circulation.
3. That the evolution of phlogifton is a caufe which. throughout nature produces hear, whether that heat be apparently excited by mixture, fermentation, per-cuffion, friction, inflammation, ignition, or any fimi... lar caufe.
4. That this heat, which mult be produced in con. fequence of the evolution of the phlogifton from the blood of different animals, is in all probability equal to the higheft degree of heat which thefe animals in any cafe poifers ( B ).
The firft and fecond of thefe propofitions will rea- objections dily be granted : but the third is liable to a very great to it. objection, namely, that from putrefying, bodies, phlogitton is evolved in quantity fufficient to reduce to their metallic form the calces of fome metals expofed to the vapour, as Dr Dugad hath acknowledged; yet he hinnfelf affirms, that no fenfible heat is produced by putrefying animal fubftances. To this he is obliged to reply, that phlogifton is extricated nore flowly from mixtures undergoing the putrid fermentation, than from fuch as are undergoing the vinous and acetous ones; and that. the volatile alkali produced from putrefying fubflances likewife hinders the action of the phlogifton. But the firft part of this anfwer is not proved, and is what he himfelf. calls only a probable conjecture. Neither doth the fecond appear to be well founded : for putrefying fubftances, urine excepted, afford but little volatile alkali; and even putrid urine itfelf, which affords fuch a large portion, is not colder than other putrid matters.

It is however needlefs to infift farther on this theory, fince his fundamental principle, namely, That the venous blood is warmer than the arterial, hath been fhown ato be falle by Mr Adair Crawford, of whofe hypothefis we mult now give an account.

This gentleman, who, in his general doctrine of heat; feems to agrec with Dr Irvin of Glafgow, begins with ory.
(B) Thefe theories, inferted in the laft edition of this work, we thought it proper to retain, as there feems fill a poffibi/ity of the phlogiftic doctrine regaining its ground, though now threatened with being expelled fromth'e fyftem of nature. A particular account of the difpute concerning Phiogision is given under that article...
an exptanation of his terms. The words heat and fire, he tells us, are ambiguous. Heat in common language has a double fignification. It is ufed indifcriminately to exprefs a fenfation of the mind, and an unknown principle, whether we call it a quatity or a fuffance, which is the exciting caufe of that fenfation. The latter, he, with Dr Irvin, calls abfolute beat; the furmer, fenfible heat. The following are the general facts upon which his experiments are founded.
r. Heat is contained in great quantities in all bodies wben at the common temperature of the at mofphere.
2. Heat has a conftant tendency to diffufe itfelf over all bodies, till they are broughe to the fame degree of fendible heat.
3. If the parts of the fame homogeneous body have the fame degree of fenfible heat, the quantities of abfolute heat will be proportionable to the bulk or quantity of matter. Thus the quantity of abfolute heat contained in two pounds of water, muft be conceived to be double of that which is contained in one pound, when at the fame temperature.
4. The mercurial thermometer is an accurate meafure of the comparative quantities of abfolute heat which are communicated to the fame homogencous bodies or feparated from them, as long as fach bodies continue in the fame forn. If therefore the fenfible heat of a body, as meafured by the mercurial thermometer, were to be diminifled the one half, or the one third, or in any given proportion, the abfolute heat would be diminifhed in the fame proportion.
5. The comparative quantities of abfolute heat which are communicated to different bodies, or fepated from them, cannot be determined in a direct manner by the thermometer. Thus, if the temperature of a pound of mercary be raifed one degree, and that of a pound of water one degree, as indicated by the thermometer, it does not by any means follow, that equal quantities of abfolute heat have been communicated to the water and the mercury. [See Heat and Thermometer.]-If a pint of mercury at $100^{\circ}$ be mixed with an equal bulk of water at $50^{\circ}$, the change produced in the heat of the mercury will be to that produced in the water as three to two: from which it may be inferred, that the abfolute heat of a pint of mercury is to that of an equal bulk of water as two to three; or, in other words, that the comparative quantities of their'abfolute heats are reciprocally proportionable to the changes which are produced in their Tenfible heats, when they are mixed together at different temperatures. This rule, however, does not apply to thofe mixtures which generate fendible heat or cold by chemical action.

From the above pofition, fays Mr Crawford, it follows, that equal weight of heterogencous fubtances, as air and water, having the fame temperature, may contain unequal quantities of abfolute heat. There mult, therefore, be certain effential differences in the natere of bodies, in confequence of which fome have the power of collecting and retaining the element of fire in greater quantities than others, and thefe differences he calls throughout his treatife the capacities of bodies for containing heat.

Having premifed thefe general faes, our author gives an account of a number of experiments made,
in order to afcertain the quantity of abfolute heat contained in different bodies. Thefe experiments were inade by mixing the bodies to be examined with water, heated to different degrees; and by the temiperature of the mixture, be found the proportion of the capaci:y of the bodies for containing heat, to water, and, of confequence, to one another. Thus he found the capacity of wheat for containing heat to be to that of water as 1 to 2.9 ; and, of confequence, the abfolute heats of the two fubftances to be in the fame proportion. The abfolute heat of oats to that of water he found as I to $2 f$; of barley, as I to 2.4 ; of beans, as I to 1.6 ; of fleh; as I to I .3 ; of milk, as $I$ to I.I ; and of a mixture of venous and arterial blood from a fheep, as 25.4 to 24.4. By other experiments he determined, that the abfolute heat of venous blood was to that of water only as roo to II2, whereas the abfolute heat of arterial blood was to that of water as 100 to 97.08 .

By experiments made with air of different kinds contained in bladders, and immerfed in water, he found that the abfolute heat of atmofpherical air was exceedingly great, being to that of water as 18.6 to I ; that of dephlogifticated air was fill greater, being to the heat of common atmofpherical air as 4.6 to I . The heat of phlogilicated and fixed air was much lefs; that of the latter, particularly, being to the heat of atmo. fpherical air only as 1 to 67.

From other experiments made on metals, Mr Crawford concludes, that the abfolute heat of tin, in its metallic ftate, is to that of water as ito 14.7 ; but the heat of calcined tin is to that of water as i to ro.4. In like manner, the heat of iron was to that of water only as x to 8 ; but that of the calx of iron was to the heat of water as I to 3.1 , \&c. And from thefe experiments he is of opinion, that the more phlogiton that is added to any body, the lefs is its capacity for containing heat.

From thefe experiments our anthor deduces the following theory of animal heat.-" It has been proved, that the air, which is exfpired from the lungs. of animals, contains lefs abfolute heat than that which is inhaled in infpiration. Ir has been fhown, particularly, that in the procefs of refpiration, atmof pherical air is converted into fixed air; and that the abfolute heat of the former is to that of the latter as 67 to 1 .
"Since therefore the fixed air which is exhaled by exfiration is found to contain only the one fixty-feventh part of the heat which was contained in the atmofpherical air previous to infpiration, it follows, that the latter mult neceffarily depofit a very great proportion of its abfolute beat in the lungs. It has moreover been fhown, that the abfolute heat of florid arterial blood is to that of venous as $1 \frac{x}{2}$ to 10 . And hence, as the blood, which is returned by the pulmonary vein to the heart, has the quantity of its abfolute heat increafed, it is evident that it muft have acquired this heat in its paffage through the lungs. We may conclude, therefere, that in the procefs of refpiration, a quantity of abfolute heat is feparated from the air and abforbed by the blood.
"That heat is feparatedfrom the air in refpiration, is farther confirmed by the experiment with phlogifli. cated air; from which, compared with Dr Priefley's

## HEA <br> $[361 \mid]$ <br> HEA

Heat.
difcoveries, it is manifeft, that the power of any fpecies of air in fupporting animal life, is nearly in proportion to the quantity of abfolute heat which it contains, and is confcquently proportionable to the quantity which it is capable of depofiting in the lungs.
" The truth of this conclafion will perhaps appear in a clearer light from the following calculation, by which we may form fome idea of the quantity of heat yielded by atmofpherical air when it is converted into fixed air, and alfo of that which is abforbed daring the converfion of venous into arterial blood.
" We have feen that the fame lieat which raifes atmofpherical air one degree, will raife fixed air nearly 67 degrees, and confequently that the fame heat which raifes atmofpherical air any given number of degrees, will raife fixed air the fame number of degees multiplied by 67 . In the Peterfburgh experiment of frcezing quickfilver, the heat was diminifhed 200 degrees below the common, temperature of the atmofphere. We are therefore certain, that atmofpherical air, when at the common temperature of the atmofphere, contains at leaft 200 degrees of heat. Hence, if a certain quantity of atmofpherical air, not in contact with any body that wonld immediately carry off the heat, fhould fuddenly be converted into fixed air, the heat which was contained in the former would raife the latter 200 degrees multiplied by 67 , or 13400 degrees. And the heat of red-hot iron being ro50, it follows that the quantity of heat, which is yielded by atmofpherical air when it is converted into fixed air is fuch (if it were not diffipated) as would raife the air fo changed to more than 12 times the heat of red-hot iron.
" If therefore the abfolute heat which is difengaged from the air in refpiration, were not abforbed by the blood, a very great degree of fenfible heat would be produced in the lungs.
\% "Again, it has been proved, that the fame heat which raifes venous blood 155 degrees, will raife arterial only 100 degrees; and confequently, that the fame heat which raifes venous blood any given number of degrees, will raife arterial a lefs number in the proportion of 100 to II 5, or 20 to 23. But we know that venous blood contains at leaft 230 degrees of heat. Hence, if a certain quantity of venous blood, nor in contact with any bady that would immediately fupply it with heat, thould fuddenly be converted into arterial, the heat which was contained in the former would raife the latter only $\frac{20}{2} \frac{0}{3}$ or 230 degrees, or 200 degrees; and confequently the fenfible heat would fuffer a diminution equal to the difference bet ween 230 and 200 , or 30 degrees. But the common temperature of blood is $9^{6}$ : when therefore, venous blood is convertèd into arterial in the lungs, if it were not fupplied by the ar with a quantity of heat proportionable to the change which it undergoes, its fenfible heat would be diminifhed 30 degrees, or it would fall from 96 to 66 .
"T hat a quantity of heat is detached from the air, and communicated to the blood, in refpiration, is moreover fupported by the experiments with metals and their calces; from which it appears, that when bodies are joined to phlogifton, they lofe a portion of their abfolute heat; and that, when the phlogifton is again
difengaged, they reabforban equal portion of heat from the furrounding bodies.
" Now it has becn demonftrated by Dr Prieftley, that in refpiration, phlogifton is feparated from the blood, and combined with the air. During this procefs, therefore, a quantity of abfolute heat muft neceffarily be difengaged from the air by the action of the phlogifton ; the blood, at the fame moment, being left at liberty to unite with that portion of heat which the air had depofited.
"And hence animal heat feems to depend upon a procefs fimilar to a chemical elective attraction. The air is received into the lungs, containing a great quantity of abfolute heat. The blood is returned from the extremities, highly impregnated with phlogifton. The attraction of the air to the phlogifton is greater than that of the blood. The principle will, therefore, leave the blood to combine with the air. By the addition of the phlogifton, the air is obliged to depofit a part of its abfolute heat; and as the capacity of the blood is at the fame noment increafed by the feparation of the phlogifton, it will inftantly unite with that portion of heat which had been detaclied from the air.
"We learn from Dr Prieftley's experiments with refpect to refpiration, that arterial blood has a ftrong attraction to phlogifton : it will confequently, during the circulation, imbibe this principle from thofe parts which retains it with leaft force, or from the putrefcent parts of the fyftem; and hence the venous blood, whminor when it returns to the lungs, is found to be highly impregnated with phlogifton. By this impregnation, its capacity for containing heat is diminifhed. In proportion, therefore, as the blood, which had been dephlogifticated by the procefs of refpiration, becomes again combined with phlogifton in the courfe of the circulation, it will gradxally give out that heat which it had received in the lungs, and diffufe it over the whole fyftem.
" Thus it appears, that, in refpiration, the blood is continually difcharging phlogifton and abforbing heat ; and that, in the courfe of circulation, it is continually inbibing phlogfton and emitting heat.
"It may be proper to add, that as the blood, by its impregnation with phlogifton, has its capacity for containing heat diminifhed; fo, on the contrary, thofe parts of the fyftem from which it receives this principle, will have their capacity for containing heat increafed, and will confequently abforb heat.
" Now if the changes in the capacities, and the quantities of matter changed in a given time, were futh that the whole of the abfolute heat feparated from the blood were abforbed, it is manifeft that no part of the heat which is received in the lungs would become fenfible in the courfe of the circulation.
" That this, however, is not the cafe, will, I think, be evident from the following confiderations :
"We know that fenfible heat is produced by the circulation of the blood; and we have proved by experinent, that a quantity of abfolute heat is communicated to that fluid in the lungs, and is again difengaged from it in its progrefs through the fyftem. If; therefore, the whole of the abfolute heat, which is feparated from the blood, were abforbed by thofe parts

Hoat,

Heat. of the fyftem from which it receives the phlogifton, it would be neceffary to have recourfe to fome other caufe, to account for the fenfible heat which is produced in the circulation. But by the rules of philofophifing, we are to admit no more caufes of natural things than fuch as are both true and fufficient to expiain the appearances; for nature delights in finplicity, and affects not the pomp of fuperfluons caufes.

We may, therefore, fafely conclude, that the abfolute hear which is feparated from the air in refpiration, and abforbed by the blood, is the true caufe of aninial heat.
" It mult neverthelefs be granted, that thefe parts of the fyftem which communicate phlogifton to the blood, will have their capacity for containing heat increafed; and therefore, that a part of the abfolute heat which is feparated from the blood will be abforbed.
"But from the quantity of heat, which becomes fenfible in the courfe of the circulation, it is manifeft that the portion of heat which is thus abforbed is very inconfiderable.
" It appears therefore, that the blood, in its progrefs through the fyftem, gives out the heat which it had received from the air in the lutags; a fmall portion of this heat is abforbed by thofe particles which impart the phlogifton to the bload; the reft becomes redundant, or is converted into moving and fenfible heat."

Mr Crawford's. theory, which doth not effentially ftill uncer- differ from Dr. Black's, feems to be the beft that hath tain.
yet appeared. There is however, one difficulty which feems common to them all, and which, even on Mr Crawford's principles, feems not to admit of folution. If arimal heat entirely depends on fomething peculiar to a living body, why doth it fometimes continue after life hath ceafed ?: If heat depends on the evolution of phlogition by the action of the blood-veffels, according to Dr Dugud, why fhould it remain when thefe veffels ceafe to act, as, according to Dr Dugud himfelf, it fometimes doth ? If, according to Mr Crawford, it is every moment atracted from the air, why is it not always in proportion to the refpiration? Or, if fixed air contains fuch a fmall proportion of abfolute heatas, by MrCraw ford's experiments, it feems to do, why doth it impart fuch a ftrong and lafting degree of heat to the bodies of thofe who are killed by it? Sce BEOOD, $\mathrm{n}^{\circ} 3 \mathrm{~B}$.

Other objections have been made by Mr Pearfon, which are related in the Medical Journal. They are founded on fome appearances found on the diffection of morbid bodies; where it has been foand that the pulmonary artery, and even the lungs themfelves, have been totally deftroyed by difeafe, and yet the perfon has furvived for fome time. In thefe cafes, however, it is probable, that the blood had fill an opportunity of abforbing the vital principle from the air, which might make thofe produce heat alfo by fome mecha. nifn unknown to us. The whole of Dr Crawford's doctrine of latent heat has alfo been attacked in a Treatife by Mr Leopold Vacca Berlinghieri. His objections are derived fron the calculations of Dr Crawford himelf; but our limits will not admit of our entering into this difpute.

Luterial Heat of the Earth. That there is a very
confiderable degree of heat always felt in digging to great depths in the earth, is agreed upon by all naturalifts : but the quantity of this heat hath feldom been meafuredin any part; much lefs is it known, whether in digging to an equal depth in different parts of the earth, the heat is found always the fame. In digging mines, wells, \&c. they find that at a little depth below the furface it feels cold. A little lower it is colder ftill, as being beyond any immediate influence of the fun's rays; infomuch that water will freeze almoft at any feafon of the year; but when we go to the depth of 40 or 50 feet, it begins to grow warm, fo that no ice can bear it; and then the deeper we go, ftill the greater the heat, until at laft refpiration grows diffcult, and the candles go out.

This heat of the earth hath been varionlly explained. Some have had recourfe to an immenfe body of fire lodged in the centre of the earth, which they confider as a central fun, and the great principle of the generation, vegetation, nutrition, \&c. of foffil and vegetable bodies. But Mr Boyle, who had been at the bottom of fome mines himfelf, fufpects that this degree of heat, at leaft in fome of them, may arife from the peculiar nature of the minerals generated therein. To confirm this, he inftances a mineral of a vitriolic kind, dug up in large quantities in many parts of England, which by the bare effudion of common water will grow fo her that it will almoft take fire.- Thefe hypothefes are-liable to the following objections. 1. If there is within the earth a body of actual fire it feems difficult to how why that fire fhould not confume and moulder away the outer fhell of earth, till either the earth was totally deftroyed, or the fire extingufhed. 2. If the internal heat of the earth is owing to the action of water upon mineral fubftances, that action through time murt have ceafed, and the hear have totally vanifhed; but we have no reafon to think that the heat of the earth is any thing lefs juit now than it was a thonfand years ago. The phenomenon is eafily explained by the propofitions laid down under the article Heat. If heat is nothing elfe than a certain mode of action in the ethereal fluid, or the matter of light by which it flows out from a body in all directions as radii drawn from the centre to the circunference of a circle; it will then follow, that if an opaque body abforbs any confiderable quantity of light, it muft neceffarily grow hot. The reafon of this is plain. The body can hold no more than a certain quantity of ethereal matter ; if more is continually forcing itfelf in, that which has already entered mult goout. But it cannot eafily get out, becaufe it is hindered by the particles of the body among which it is detained. It makes an effort therefore in all directions to feparate the particles from each other; and hence the body expand's, and the effort of the fluid to efcape is felt when we put our hands on the body, which we then fay is hot. Now, as the earth is perpetually abforbing the cthercal matter, which comes from the fun in an immenfe ftream, and which we call his light, it is plain, that every pore of it muft have been filled with this matter long ago. The quantity that is lodged in the earth, therefore, muft be continually endeavoiring to feparate its particles from each other, and confequently muft make it hot. The atmofphere, which is perpetually receiving that portion of the ethereal matter which

Iteat.

## HEA

Heat, which iffues from the earth, counteracts the force of Heath, the internal heat, and cools the external furface of the earth, and for a confiderable way down; and hence the earth for 20 or 30 feet down, fhows none of that heat which is felt at greater depths. See Heat.

Heat, in medicine. Great heats are not fo much the immediate, as the remote, caufe of a general ficknefs, by relaxing the fibres, and difpofing the juices to putrefaction; efpecially among foldiers and perfons expofed the whole day to the fun; for the greateft heats are feldom found to produce epidemic difeafes, till the perfpiration is fopped by wet clothes, fogs, dews, damps, \&c. and then fome bilious or putrid diftemper is the certain confequence, as fluxes and ardent intermiting fevers. Neverthelefs, it muft be allowed, that heats have fometimes been fo great as to prove the more immediate caufe of particular diforders; as when centinels have been placed without cover or frequent reliefs in fcorching heats; or when troops march or are exercifed in the heat of the day; or when people imprudently lie down and fleep in the fun. All thefe circumftances are apt to bring on diftempers, varying according to the feafon of the year. In the beginning of fummer, thefe errors produce inflammatory fevers; and in autumn, a remitting fever or dyfentery. To prevent, therefore, the effects of immoderate heats, commanders have found it expedient fo to order the marches that the men come to the ground before the heat of the day; and to give ftrict orders that none of them fleep out of their tents, which in fixed encampments, may be covered with boughs to fhade them from the fun. It is likewife a rule of great importance to have the foldiers exercifed before the cool of the morning is over; for by that means not only the fultry heats are avoided, but the blood being cooled, and the fibres braced, the body will be better prepared to bear the heat of the day. Laftly, in very hot weather, it has often been found proper to fhorten the centinel's duty, when obliged to ftand in the fun.

Heath, in botany. See Erica.
Berry-bearing Heath. Sec Empetrym.
HEATH (James), an Englifh hiftorian, was born 1629 at London; where his father, who was the king's cutler, lived. He was educated at Weflminfter fchool, and became a ftudent of Chrift-church, Oxford, in 1646. In 1648, he was ejected from thence by the parliament vifitors for his adherence to the royal caufe; lived upon his patrimony till it was almont fpent; and then marrying was obliged to write books and correct the prefs in order to maintain his family. He died of a confumption and dropfy at London in Auguft 1664, and left feveral children to the parifh. His principal publications were, I. A brjef Chronicle of the late Inteftine War in the Three Kingdoms of England, Scotland, and Ireland, \&c. r66i, 8vo; afterwards enlarged by the author and completed from 1637 to 1663, in four parts, 1663 , in a thick $8 v o$. To this was again added a continuation from 1663 to 1675 by John Philips, nephew by the mother to Milton, 1676 , folio. 2. Flagellum: or, The Life and Death, Birtl and burial, of Oliver Cromwell, the late Ufurper 1663. The third edition cane out with additions in 1665 , 8 vo. 3. A New Book of Loyal Englifh Martyrs and Confeffors, who have endured

the Pains and Terrors of Death, Arraignment, \&ec. for the Maintenance of the juft and legal government of thefe Kingdoms both in Church and State, 1663, iamo. The reafon why fuch writers as our author continue to be read, and will 1 ro iably always be read, is not onlybecaufe Hifforia quoquo modo fcripta delcctat. but alfo becaufe in the meaneft hiftorian there will always be found fome facts, of which there will he no caufe to doubt the truth, and which yet wit rot be found in the beft. Thus Heath, who perhaps had nothing but pamphiets and news papers to compile from, frequently relates facts that throw light upon the hiftory of thofe times, which Clarendon, though he drew every thing from the moft authentic records, has omitted.
Heath (Thomas), an aldermen of Exeter, and father of John Heath, Efq ; one of the judges of the Common pleas, was author of An Eifyy towards a new Englih Verfion of the Book of Job from tho original Hebrew, with fame account of his Life, 1755 , 8vo.- His brother Benjamin, a lawyer of eminence, and town-clerk of Excter, was likewife an author; and wrote, I. An Effay towards a demonftrative Proof of the Divine Exiftence, Unity, and Attributes; to which is premifed, A fhort defence of the Argument commonly called à priori, 1740. 2. The Cfafe of the County of Devon with refpect to the Confequences of the New Excife Duty on Cyder and Perry. Publifhed by the direction of the Committee appointed at a General meeting of that County to fuperintend the Application for the Repeal of that Duty, 1763 , 4 to. 3. Nota five Lectiones ad Tragicorum Gracorum veterum, $E f c h y l, \& c .1752,410 ;$ a work which places the author's learning and critical fizill in a very confpicuous light. The fame folidity of judgment apparent in the preceding, diftinguined the author's laft produc. tion. 4. A Revifal of Shakefpeare's, Text, wherein the alterations introduced into it by the more modern editors and critics are particuliarly confidered, 1765 , 8 vo.

HEATHENS, in matters of religion. See PAgans.
HEAVEN, literally fignifies the expanfe of the firmament, furrounding our earth, and extended every way to an immenfe diftance.
Heaven, among Chriftian divines and philofophers, is confidered as a place in fome remote part of infinite fpace in which the omniprefent Deity is faid to afford a nearer and more immediate view of hinfelf, and a more fenfible manifcitation of his glory, than in the other parts of the univerfe. This is often called the empyrean, from that fplendor with which it is fuppofed to be invefted; and of this place the infpired writers give us the moft noble and magnificent defcriptions.

The Pagans confidered heaven as the refidence only of the celeftial gods, into which no mortals were ad. mitted after deach unlefs they were deified. As for the fonls of good men they were contigned to the elyfian felds. see Elislan-Fields.

Heaven, amongaftroiomers, catled alfu the æthereal and ftarry heaven, is that immenfe reoion where the fars, planets, and comets, are difpofed. See Astronomt, palfim.

## HEB [ 364. $]$ H E B

Heaven Hebdoma
$\qquad$ dary.

This is what Mofes calls the firmanent, fpeaking of it as the work of the fecond day's creation; at leaft it is thus the word $\begin{aligned} & \text { y } \\ & \text { is unally } \\ & \text { is rendered by his inter- }\end{aligned}$ preters; though foncwhat abufively, to countenance their own notions of the heavens, being firm or folid. The word it is certain, properly fignifies no more than expanfe or extenfion; a term very well adapted by the prophet to the impreffion which the heavens make on our fenfes; whence in other parts of feripture, the heaven is compared to a curtain or a tent fretched out to dwell in. The LXX firft added to this idea of expanfion that of firm or folid; rendering it by sepsoura, according to the philofopliy of thofe times; in which they bave been followed by the modern tranflators.

Thelater philofophers, as Des Cartes, Kircher, \&c. have eafily demonftrated this heaven not to be folid, but fluid ; but they ftill fuppofe it full, or perfectly denfe, without any vacuity, and cantoned out into many vor-tices.-_But others have overturned not only the folidity, but the fuppofed plenitude, of the heavens. Sir Ifac Newton has abundantly fhown the heavens void of almoft all refiftance; and, confequently, of almoft all matter: this he proves from the phenomena of the celeftial bodies; from the planets perfifting in their motions without any fenfible diminution of their velocity; and the comets freely pailing in all directions towards all parts of the heavens.

Heaven, taken in a general fenfe, for the whole expanfe between our earth and the remoteft regions of the fixed ftars, may be divided into two very unequal parts, according to the matter found therein; viz. the atmofphere, or aerial heaven poffeffed by air ; and the athereal heaven, poifeffed by a thin, unrefinting medium, called ather.

HEAVEN is more particuliarly ufed, in aftronomy, for an orb, or circular region, of the æthereal heaven. The ancient aftronomers affumed as many different heavens as they obferved different motions therein. Thefe they fiuppofed all to be folid, as thinking they could not otherwife fuftain the bodies fixed in them; and Tpherical, tlrat being the moft proper form for motion. Thus we had feven heavelns for the feven planets; viz. the heavens of the Moon, Mercury, Venis, the Sun, Mars, Jupiter, and Saturn. The eighth was for the fixed fars, which they particularly called the frmanent Piolemy adds a ninth heaven, which he called the primum mobile. After him two cryftalline heavens were added by king Alphonfus, \&c. to account for fome irregularitics in the motions of the other heavens: and lafty an empyrean heaven was drawn over the whole, for the refidence of the Deity; which made the number twelve. But others admitted many more heavens according as their different views and hypothefes required. Eudoxes fuppofes 23, Calippus 30, Regiomontanus 33, Ariftorle 47, and Fracaftor no lefs than 70. It inuft be added, however, that the aftronomers did not much concern themfelves whether the heavens they thus allow of were real or not; prowided they ferved a purpofe in accounting for any of the celeftial motions, and agreed with the phenomena.
hebdomadary; Hebdomadarius, or HebDOMADIUS, a member of achapter or convent, whofe week it is to officiate in the choir, to rehearfe the anthems and prayers, and to perform the ufnal
functions which the fuperiors perform at folemn feafts. Hebdome and other extraordinary occafions. The word is form- $\|$ ed of the Greek Ebso $\mu a 5$, which lignifies the number $\underbrace{\text { Hebraifm. }}$ feven: of inta, fevers.

The hebdomadary generally collates to the benefices which become vacant during his week; though it is ufially looked apon as an abufe.

In cathedrals, the hebdomadary was a canon or prebendary, who had the peculiar care of the choir, and the infpection of the officers for his week.

In monalteries, the hebomadary is he who waits at table for a week, or other ftated period; directs and affitts the cook, \&c.

HEBDOME, a folemnity of the ancient Greeks, in, honour of Apollo, in which the Athenians fung hymns to his praife, and carried in theirliands branches of laurel The word lignifies the feverith day, this folemnity being obferved on the feventh day of every lunar month.

HEBE, in ancient mythology; a goddefs, the idea of whom, among the Romans, feems to have been much the fame with that of eternal youth, or an immortality of blifs; agreeably to 'which, fie is reprefented on a gem, in the great duke's collection at Florence, with a young airy look, and drinking out of a little bowl; or, according to Milton's expreffion, "Quaffing immortality and joy." She is fabled to have been a daughter of Jupiter and Juno. According to fome fhe was the daughter of Juno only, who conceived her after eating lettuces. As fhe was fair and always in the bloom of youth, fhe was called the goddefs of youth, and made by her mother cup-bearer to all the gods. She was difniffed from her office by Jupiter, becaufe fhe fell down in an indecent pofture as The was pouring nectar to the gods át a grand feftival; and Ganymedes, the favourite of Jupiter, fucceeded her as cup-bearer. She was employed by her mother to prepare her chariot, and to harnefs her peacocks whenever requifite. When Hercules was raiied to the rank of a god, he was reconciled to Juno by marrying her daughter Hebe, by whom he had two fons, Alexiares and Anicetus. As Hebe had the power of reftoring gods and men to the vigour of youth, fhe, at the inftance of her hufband, performed that kind office to Iolans his friend. Hebe was worhipped at Sicyon, under the name of Dia, and at Rome under. tinat of Juventus.

HEBENSRETIA, in botany: A genus of the angiofpermia order, belonging to the didynamia clafs of plants; and in the namral method ranking under. the 48 th order, aggregate. The calyx is emarginated, and divided below; the corolla unilabiate; the lip rifing upwards, and quadrifid; the capfule difpermous; the ftamina inferted into the margin of the limb of the corolla.

HEBER, the fon: of Salah, and father of Peleg; from whom the Hebrews derived their name, according to Jofephus, Eufebius, Jerome, Bede, and moft of the interpreters of the facred writings; but Huet biflop of Avranches, in his Evangelical Demonftration, has attempted to prove, that the Hebrews took their name from the word heber, which fignifies beyond, becaufe they came from beyond the Euphrates. Heber is fuppofed to have been born 228ryears B. C. and to have lived 464 years.

HEBRAISM, an idiom, or manner of fpeaking, peculiar

## HEB

Hebrew. peculiar to the Hebrew language. See the next article.

HEBREW, fomething relating to the Hebrew. Sce Hebrews. Thus we fay, Hebrelv. Bible. See Bibue.

Hebuew character. There are two kinds of $\mathrm{He}-$ brew characters: the ancient, called alfo the fquare : and the modern, or rabbinical characters.

1. The fquare Hebrew takesits denomination from the figure of its charaćters, which ftand more fquare, and have their angles more exact and precife than the other. This character is ufed in the text of the holy fcripture, and their other principal and moft important writings. When both this and the rabbinical character are ufed in the fame work, the former is for the text, or the fundamental part; and the latter for the acceffory part, as the glofs, notes, commentaies, \&c.

The beft and mon beautiful characters of this kind, are thofe copied from the characters in the Spanifl manufcripts; next, thofe from the Italian manufcripts; then thofe from the French; and lafly, thofe of the Germans, whofe characters are much the fame, with refpect to the other genuine fquare Hebrew characters, that the Gothic or Dutch characters are with refpect to the Roman.

Several authors contend, that the fquare character is not the real ancient Hebrew character, written from the beginning of the language to the time of the Babylonifh captivity; but that it is the Affyrian, or Chaldee character, which the Jows aftumed, and accuftomed themfelves to during the captivity; and retained afterwards. They fay, that the Jews, during their captivity, had quite difufed their ancient character ; fo that Ezra found it neceffary to have the facred books tranfcribed into the Chaldean fquare character. Thefe authors add, that what we call the Samaritan character, is the genuine ancient Hebrew. Of this opinion are Scaliger, Bochart, Cafaubon, Voffus, Grotius, Walton, Capellius, \&c. and among the ancients Jerome and Eafebius. On this fide it is urged, that the prefent characters are called Affyrian by the ancient Jewifh writers of the Talmud, and therefore muft have been brought from Affyria; but to this argument it is replied, that there were two forts of characters anciently inufe, viz. the facred or prefent fquare character, and the profane or civil, which we call Samaritan ; and that the facred is called Affyrian, becaufe it firft began in Affyria to come into common ufe. It is farther alleged, that the Chaldee letters, which the Jews nowufe, were unknown to the ancient Jews before the captivity; from Dan. i. 4. Moreover, it is inferred from 2 Kings, xvii. 28. whence we learn that a Jewifh prieft was fent to teach the Samaritansthe worflip of Jehovah ; on which occafion he mult have taught them the law ; and yet no mention occurs of his teaching them the language or character that thelaw was then written in, the character which the Samaritans ufed. But the chief argument is taken from fome ancient Jewith fhekles, with a legend on one fide "The fhekel of Ifrael," and on the other "Jerufalem the holy, "both in Samaritan characters. Thefe fhekles, it is faid, moft have been coined before the divifion of the : wo kingdoms of Judah and Ifrael, or at leaft before the Affyrian captivity, becaufe the Samaritans neverafterwards reckoned Jerufalem holy.

On the other fide, or'for the primitive antiquity of Hebtem. the fquare character, are the two Baxtorfs, Leufden, Calovius, Hottinger, Spanheim, Lightfoot, \&c. They urge, from Mathew v.i8. that jod is really the leaft of the confonants in the prefent Hebrew, whereas it is one of the largeft characters in the Samaritan alphabet; but Walton replies, that if our Saviour here fpeaks of the leaft letter of the alphabet, we can only infer that the Chaldee character was ufed in our Saviour's time, which is not denied by thofe who maintain the Samaritan to be the original. They alfo allege, that the Jews were too obftinate and fuperflitious to allow their facred character to be altered; but if this was done under the direction and authority of Ezra, the argument will be much invalidated. Farther, they fay that Ezra conld not alter the ancient character, becaufe it was impoffible to make the alterations in all their copies. This argument, however, is contradicted by fact; fince the old Engliin black letter is actually changed for the Roman. They fay, likewife, that Ezra was not difpofed to profane the facred writings with a heathen claracter : but this fuppofes that Ezra was fo fuperftitious as to imagine, that there was fome peculiar fanctity in the fhape of the letters. Moreover, the advocates for this opinion appeal to ancient coins found in Judæa, with a legend in the Chaldce or Affyrian character. But the genuinefs of thefe coins is much fufpected.

The learned Jefuit Souciet maintains, with great addrefs, that the ancient Hebrew character is that found on the medals of Simon, and others, commonly called Samaritanmadals; but which, he afferts, were really Hebrew medals, ftruck by the Jews, and not the Samaritans.

Buxtorf endcavours to reconcile thefe two opinions, by producing a variety of paffages from the rabbies to prove, that both thefe characters were anciently ufed; the prefentfquare character being that in which the tables of the law, and the copy depolited in the ark, were written; and the other character being ufed in the copies of the law which were written for private and common ufe, and in civil affairs in general; and that after the captivity, Ezra anjoined the former to be ufed by the Jews on all occafions, leaving the latter to the Samaritans and apoftates. But it can hardly be allowed by any who confider the difference between the Chaldee and Samaritan characters, with refpect to convenience and beauty, that they were ever ufed at the fame time. After all, it is of no great moment which of thefe, or whether either of them, were the original characters; fince itappears, that no change of the words has arifen from the manner of writing. them, becaufe the Samaritan and Jewifh Pentateuch almoft always agree after fo many ages. It is moft probable that the form of thefe characters has varied in different periods; this appears from the teftimony of Montfancon, in his Hexapla Origenis, vol. i. p. 22. \&c. and is implied in Dr Kennicor's making the characters in which manufcripts are written one teft of their age.
2. The modern, rabbinical, is a good neat cham racter, formed of the fquare Hebrew, by rounding it, and entrenching moft of the angles or corners of the letters, to make it the more eafy and flowing. The letters ufed by the Germansare very' different from the

## H E B

Hebrew. rabbinical character ufed every where elfe, though all formed alike from the fquare character, but the German in a more flovenly manner than the reft.-The rablins frequently make ufe either of their own, or the fquare Hebrew character, to write the modern languages in. There are even books in the valgar tongues printed in Hebrew characters; inftances whercof are feen in the French king's librazy.
Hebrew Language, that fyoken by the Hebrews, and wherein the Old Teftament is written.

This appears to be the moft ancient of all the languages in the world, at leaft we know of none older ; and fome learned men are of opinion, that this is the language in which God fpoke to Adam in Paradife. Dr Sharpe adopts the opinion that the Hcbrew was the original language ; not indeed that the Hebrew is the' unvaried language of our firft parents, but that it was the general language of men at the difperfion ; and however it might have been improved and altered from the firft fpeech of our firft parents, it was the original of all the languages, or almoft all the languages, or rather dialects, that have fince arifen in the world.

Tlie books of the Old Teftament are the only pieces to be found, in all antiquity, written in pure He brew; and the language of many of thefe is extremely fublime: it appears perfectly regular, and particularly fo in its conjugations. Indeed, properly fpeaking, it has but one conjugation; but this is varied in each feven or eight different ways, which has the effect of fo many different conjugations, and affords a great varicty of expreflions to reprefent by a fingle word the different modifications of a verb, and many ideas which in the modern and in many of the ancient and learned languages cannot be expreffed without a peri. phrafis.

The prinitive words, which are called roots, have feldom more than three letters or two fyllables.

In this language there are 22 letters, only five of which are ufually reckoned vowels, which are the fame with ours, viz. $a, e, i, o, u$; but then each vowel is divided into two, a long and a fhort, the found of the former being fomewhat grave and long, and that of the later fhort and acuse: it muft however be remarked, that the two laft vowels have founds that differ in orher refpects befides quantity and a greater or lefs clevation. To thefe 10 or 12 vowels may be added others, called femi-vowels, which ferve to connect the confonants, and to make the eafier rranfitions from one to another. The number of accents in this languge are indeed prodigious: of thefe there are near 40, the ufe of fome of which, notwithftanding all the inquiries of the learned, are not yet perfectly known. We krow, in general, that they ferve to diftinguifh the fentenceslike the points called comanas, femicalons, \&c. in our language; to determine the quantity of the fyllables; and to mark the tone with which they are to be fpoken or fing. It is no wonder, then, that there are more accents in the Hebrew than in the other languages, fince they perform the office of three different things, which in other languages are called by different names.

As we have no Hebrew but what is contained in the Scripture, that language to us wants a great many
words; not only becaufe in thofe primitive times the languages were not fo copious as at prefent; but alfo on this account, that the infpired writers had no occafion to mention many of the terms that might be in the language.

The Chaldee, Syriac, Ethiopic, \&c. Ianguages, are by fome held to be only dialects of the Hebrew; as the French, Italian, Spaniih, \&c. are dialects of the Latin. It has been fuppofed by many very learned men, that the Hebrew characters or letters were often ufed hieroglyphically, and that each had its feveral diftinct fenfe underftood as a hieroglyphic. Neuman', who feems to have taken infinite pains to find out this fecret meaning of thefe letters, gives the following explication: \& aleph, he fays, is a character denoting motion, readiners, and activity ; ב beth, fignifies, i. Matter, body, fubftance, thing; 2. Place, fpace, or capacity ; and, 3. In, within, or contained : a gimelftands, for flexion, bending, or obliquity of any kind : 7 daleth, fignifies any protrufion made from without, or any promotion of any kind : ה he, ftands for prefence, or demonftrative effence of any thing : yau, ftands for copulation or growing together of things: idfain; expreffes vehement protrufion and violent comprefion, fuch as is occafioned by at once violently difcharging and conftringing a thing together; it alfo fignifies fometimes the ftraightening of any figure into a narrow point at the end; ncheth, expreffes affociation, fociety, or any kind of compofition or combination of things together : vteth, ftands for the withdrawing, drawing back, or recefs of any thing : $\quad$ jod, fignifies extenfion and length, whether in matter or in time : ב caph, expreffes a turning, curvednefs, or concavity: ל lamech, ftands for an addition, accefs, impulfe, or adverfation, and fometimes for preffure : n mem, expreffes amplitude, or the amplifying any thing in whatever fenfe ; in regard to continuous qualities, it fignifies the adding length, breadth, and circumference; and in disjunct qualities it fignifies multitude: , nun, fignifies the propagation of one thing from anather, or of the fame thing from one perfon to another : o famech, expreffes cincture and coarctation : y ain, ftands for obfervation, objection, or obviation : $\ddagger p c$, ftands for a crookednefs or an angle of any figure: $s t$ tfade, expreffes contiguity and clofe fucceffion: p koph, expreffes a circuit or ambit: 7 refh, expreffes the egrefs of any thing, as alfo the exterior part of a thing, and the extremity or ead of any thing: $\boldsymbol{e}$ fin, lignifies the number three, or the third degree, or the utmoft perfection of any thing: $n$ tax, exprcffes a fequel, continuation, or fucceffion of any thing.

According to this explication, as the feveral particular letters of the Hebrew alphabet feparately fignify the ideas of motion, matter, fpace, and feveral modifications of matter, fpace, and motion, it follows, that a language, the words of which are compofed of fuch expreffive characters, muft noceffarily be of all languages the moft perfect and expreflive, as the words formed of fuch letters, according to their determinate feparate fignifications, muft convey the idea of all the matters contained in the fenfe of the feveral characters, and be at once a name and a definition, or fuccinct defcription of the fubjed, and all things mate-
rial as well as firitual, all objects in the natural and moral world, muft be known as foon as their names are known, and their feparate letters confidered.

The words $u$ ti $\%$ and thummin are thus eafily explained and found, perhaps the moft appofite and expreflive words that were ever formed.

Rabbinical, or modern Hebrew, is the language uled by the rabbins in the writings they have compofed. The bafis or body hereof is the Hebrew and Chaldee, with divers alterations in the words of thefe two languages, the meanings whereof they have confiderably enlarged and extended. Abundance of things they have borrowed from the Arabic: the reft is chiefly compofed of words and expreflions, chiefly from the Greek, fome from the Latin; and others from the other modern tongues; particularly that fpoken in the place where each rabbin lived or wrote.

The rabbinical Hebrew muft be allowed to be a very copious language. M. Simon, in his Hift. Crit. du Vicux Teffam. liv. iii. chap. 27. obferves, that there is farce any art or fcience but the rabbins have treated thereaf in it. They have tranflated mof of the ancient philofophers, mathematicians, aftronomers, and phyficians; and have written themfelves on moft fubjects : they do not want even orators and pocts. Add, that this language, notwithftanding it is fo crowded with foreign words, has its beauties vifible enough in the works of thofe who have written well in it.

HEBREWS, the defcendants of Heber, commonly called fews. See Heber and Jews.

Hebrews, or Epiftle to the Hebrcws, a canonical book of the New Teftament.

Though St Paul did not prefix his name to this epiftle, the concurrent teftimony of the beft authors ancient and modern, afford fuch evidence of his being the author of it, that the objections to the contrary are of little or no weight.

The Hebrews, to whom this epiftle was wrote, were the believing Jews of Paleftine; and its defign was to convince them, and by their means all the Jewilh converts wherefoever difperfed, of the infufficiency and abolifment of the ceremonial and ritual law.

HEBRIDES, the general name of fome iflands lying to the north-weft of Scotland, of which kingdom they conftitute a part. They are fituated between the 55 th and 59 th degrees of latitude, are fuppofed to be about 300 in number, and to contain 48,000 inhabitants. The names of the largeft are Skie, Muli, Ilay and Arran. Of thefe illands Mr Pennant hath given the following hiftory.
"All the accounts left us by the Greck and Roman writers are inveloped in obfcurity: at all times brief even in their defcriptions of places they had eatieft accefs to, and might have defcribed with the moft fatisfactory precifion; but in remote places, their relations furnifh little more than hints, the food for conjecture to the vifonary antiquary.
"That Pytheas, a traveller mentioned by Strabe, Thad vifited Great Eritain, I would wifh to make only apocryphal. He afferts that he vilited the remoter parts; and that he had alfo feen Thule, the land of romance anongft the ancients; which all might pretend to have feen; but every voyager, to fwell his fame, made the illand he faw laft the Ultima Thule of his travels. If Pytheas had reached tirefe parts, he might have ob-
ferved, flonting in the feas, multitudes of gelatinous Hebrider. animals, the modufic of Linnæus, and out of thefe have formed hisfable. He made his Thule a compafition of neither earth, fea, nor air; but like a compofition of them all: then, catching his fimile from what floated before him, compares it to the lungs of the fea, the Arifotelian idea of thefe bodies; and from him adopted by naturalifts, fucceffors to that great philofopher. Strabo very juftly explodes thefe abfurd tales; yet allows him merit in defciibing the climate of the places he had feen. As a farther proof of his having vilited the He brides, he mentions their friendly 1 ky , that prohibits the growth of the finer fruits: and that the natives are obliged to carry their corn under helter, to beat the grain out, left it fhould be fpoiled by the defeet of fun and violence of the rains. This is the probable part of his narrative; but when the time that the great geographer wrote is confidered; at a period that thefe iflinds had been neglected for a very long fpace by the Romans, and when the difficulties of getting among a fierce and unfriendly nation muft be almolt infuperable, doubts innumerable refpecting the veracity of this relater mult arife. All that can be admitted in favour of him is, that he was a great traveller: and that he might have either vifited Britain from fome of the nations commercing with our ifle; or received from them accounts, which he afterwards dreffed out, mixed with the ornaments of fable. A traffic muft have been carried on with the very northern inhabitants of our iflands in the time of Pytheas; for one of the articles of commerce mentioned by Strabo, the ivory bits, were made either of the teeth or the walrus, or of a fpecies of whale native of the northern feas.
"The geographer Mela who flourifhed in the reign of Claudius, is the next who takes notice of our leffer iflands. He mentions the Orcades confifting of 30: the Æmodæ of feven. The Romans had then made a conqueft of the former, and might have feen the latter: but from the words of the hiftorian, it is probable that the Sherland iflands were thofe intended; for he in. forms, that the ${ }^{6}$ emodre were carried out over againft Germany :' the fite of the Hebrides will nor admit this defcription, which agrees very well with the others; for the ancients extended their Germany, and its imaginary iflands, to the extreme north.
"Pliny the elder is the next that mentions thefe remote places. He lived later than the preceding writers, and of courfe his information is fuller ; by means of intervening difcoveries, he has added ten more to the number of the Orcades; is the firlt writer that mentions the Hobudes; the iflands in queltion; and joins in the fance line the Æmoda, or, as it is in the beft editions more properly written, the Acmodo, or extreme point of the Roman expeditions to the north, as the Shetland illes in the higheft probability were. Pliny and Mela agrec in the rumber of the 座modæ, or Acmodæ; the former makes that of the Hœbudes 30 ; an account extremely near the truth, dedueting the little inles, or rather rocks, that furround mon of the greater, and many of them fo indiftinct as fcarcely to be remarked, except on an actual furrey.
"Solinus fucceeds Pliny. If he, as is fuppofed, was cotemporary with. Agricola, he has made very ill ufe of the light he might have received from the expeditions of that greax general : his officers might have

Hebrides. furninhed the hiftorian with better materials than thofe he has commanicated. He has reduced the number of the Hobbudes to five. He tells us, that " the inhabitants were unacquainted with corn : that they lived only on filh and milk : that they had one king, as the iflands were only feparated from each other by narrow fraits : that their prince was bound by certain rules of government, to do jeftice ; and was prevented by poverty from deviating from the true courfe, being fupported by the public, and allowed nothing that he could call his own, not even a wife; but then he was allowed free choice, by turns one out of every diftrict, of any female that caught his affection; which deprived him of all ambition about a fucceffor.
"G By the number of thefe iflands, and by the minute attention given by the hiftorian to the circumftance of their being feparated from each other by narrow ftraits, I fhould imagine, that which is now called the Long Ifland, and includes Lewis, North Uift, Benbecula, South Uif, and Barra, to have been the five Hœbudes of Solinus; for the other great iflands, fuch as Skie, \&c. are too remote from each other to form the preceding very characteriftic defcription of that chain of iflands. Thefe might naturally fall under the rule of one petty prince; almoft the only probable part of Solinus's narrative.
"A After a long interval appears Ptolemy, the E. gyptian geographer. He alfo enumerates five Ebudæ; and has given each a name: the Weftern Ebuda, the Eaftern, Ricina, Maleos, Epidium. Cambden conjectures them to be the modern Skie, Lewis, Rathry or Racline, Mull, and Ilay: and I will not controvert his opinion.
" The Roman hiftorians give very little light into the geography of thefe parts. Tacitus, from whom moft might have been expected, is quite filent about the names of places; notwithftanding he informs us, that a fleet by the command of Agricola performed the circumnavigation of Britain. All that he takes notice of is the difcovery and the conqueft of the Orkneys; it fhould feem, that with the biographers of an ambitious nation, tothing feemed wortly of notice but what they could dignify with the glory of victory.
"It is very difficult to affign a reafon for the change of name from Ebude to Hebrides: the laft is modern; and feems, as the annotator on Dr Macpherfon fuppofes, to have arifen from the error of a tranfcriber, who changed the $u$ into $r i$.
" From all that has been collected from the ancients, it appears that they were acquainted with little more of the Hebrides than the bare names: it is probable that the Romans, either from contempt- of fuch barren fpors, from the dangers of the feas, the violence of the tides, and the horrors of the narrow founds, in the inexperienced ages of navigation, never attempted their conqueft, or faw more of them than what they had in fight during the few circumnavigations of Great Britain, which were expeditions more of oftentation than of utility.
" The inhabitants had probably for fome ages their own governors; one little king to each inland, or to each groupe as neceffity required. It is reafonable to fuppofe, that their government was as much divided as that of Great Britain, which, it is well
known, was under the dircction of numbers of petty Hebrides, princes before it was reduced under the power of the Romans.
"No account is given in hiftory of the time thefe inlands were annexed to the government of Scotland. If we may credit our Saxon hiftorians, they appear to have been early under the dominion of the Picts; for Bede and Adamuanus inform us, that foon after the arri:val of St Columba in their country, Brude, a Pictifn monarch, made the faint a prefent of the celebrated illand of lona. But neither the holy men of this ifland, nor the natives of the reft of the Hebrides, enjoyed a permanent repofe after this event. The firf invafion of the Danes does not feem to be eafily afcertained. It appears that they ravaged Ireland, and the ifle of Rathry, as early as the year 735. In the fol, lowing century, their expeditions became more frequent: Harold Harfager, or the light-haired, purfued, in 875, feveral petty princes, whom he had expelled out of Norway; who had taken refuge in the Hebrides, and molefted his dominions by perpetual defcents from thofe iflands. He feems to have made a rapid conqueft: he gained as many victories as he fought battles; he put to death the chief of the pirates, and made an indifcriminate flaughter of their followers. soon after his return, the iflanders repoffeffed their ancient feats : and, in order to reprefs their infults, he fent Ketil the flat nofed with a fleet, and fome forces for. that purpofe. He foon reduced them to terms, but made his victories fubfervient to his own ambition : he made alliances with the reguli he had fubdued; he formed intermarriages, and confirmed to them their old dominions. This effected he fent back the fleet to Harold; openly declared himfelf independent; made himfelf prince of the Hebrides; and caufed them' to acknowledge him as fuch by the payment of tribute and the badges of vaffalage. Ketil remained, during life, mafter of the illands; and his fubjects appear to have been a warlike fet of freebooters, ready to join with any adventurers. Thus when Eric, fon of Harold Harfager, after being driven out of his own country, made an invafion of England, he put with his fleet into the Hebrides, received a large reinforcement of people fired with the hopes of prey; and then proceeded on his plan of rapine. After the death of Ketil, a kingdom was in aftertimes compofed out of them, which, from the refidence of the little monarch in the ille of Man, was flyled that of Man. The illands became tributary to that of Norway for a confiderable time, and princes were fent from thence to govern; but at length they again hook off the yoke. Whether the lictle potentates ruled independent, or whether they put themfelves, under the protection of the Scottifh monarchs, does not clearly appear ; but it is reafonable to fuppofe the laft, as Do-nald- Bane is accufed of making the Hebrides the price of the affiftance given him by the Norwegians againft his own fubjects. Nutwithitanding they might occafionally feek the protection of Scotland, yer they never were without princes of their own: policy alone directed them to the former. From the chronicles of the kings of Man we learn, that they had a fuccefion of princes.
"In 1089 is an evident proof of the independency of the illanders on Norway; for, on the death of Lag-

Hehrides. nan, one of their monarchs, they fent a deputation to O'Brian king of Ireland, to requeft a regent of royal blood to govern them during the minority of their young prince. They probably might in turn compliment in fome other refpects their Scottilh neigh bours: the illanders mult have given then fome pretence to fovereignty ; for,
"In 1093, Donald-bane, king of Scotland, calls in the affiftance of Magnus the Barcfooted, king of Norway, and bribes him with the promife of all the ilands. Magnus accepes the terms; but at the fame time boafts, that he does not come to iavade the territories of others, but only to refume the ancient rights of Norway. His conquefts are rapid and complete; for, befides the illands, by an ingenious fraud he adds Cantyre to his dominions.
"The Hebrides continued governed by a prince dependent on Norway, a fpecies of viceroy appointed by that court ; and who paid, on affuming the dignity, ten marks of gold, and never made any other pecuniary acknowledgment during life : but if another viceroy was appointed, the fame fum was exacted from him. Thefe viceroys were fometimes Norwegians, fometimes natives of the illes. In ro97we find, that Magnus deputes a nobleman of the name of Ingemund: in after times we learn, that natives were appointed to that high office. Thas were the Hebrides governed, from the conqueft by Magnus, till the year 1263, when Acho, or Haquin, king of Norway, by an unfortunate invafion of Scotland, terminating in his defeat at Largs, fo weakened the powers of his kingdom, that his fucceffor Magnus IV. was content to make a ceffion of the iflands to Alexander III.; but not without fipulating for the payment of a large fung, and of a tribute of 100 merks for ever, which bore the name of the annual of Norway. Ample provifion was alfo made by Magnus in the fame treaty, for the fecurity of the rights and properties of his Norwegian fubjects, who chofe to continue in the illes; where many of their pofterity remain to this day.
© Notwithftanding this revolution, Scotland feems to have received no real acquifition of frength. The inands ftill remained governed by powerfal chieftains, the defcendants of Somerled, thane of Heregaidel, or Argyle, who, marrying the daughter of Olave, king of Man, left a divided dominion to his fons Dugal and Reginald : from the firft were defcended the Macdougals of Lorn; from the laft, the powerfol clan of the Macdonalds. Thelordhip of Argyle, with Mull, and the illands north of it, fell to the fhare of the firft; Ilay, Cantyre, and the fouthern ifles, were the portion of the laft : a divifion that formed the diftinction of the Sudereys and Nordereys, (as farther noticed in the article Io na.)
"Thefe chieftains were the fcourges of the kingdom : they are known in hiftory but as the devaftations of a tempeft; for their paths were marked with the mof barbarous defolation. Encouraged by their diftance from the feat of royalty, and the surbulence, of the times, which gave their monarchs full employ, they exercifed a regal power, and often affumed the title; but àre more generally known in hiftory by the ftyle of the lords of the ifles, or the earls of Rofs; and fometimes by that of the Great Macdonald.
" Hiftorians are filent about their proceedings, Vol. VIII.

## 369 ] <br> HEB

from the retreat of the Danes, in 1263 , till that of Hebrides. 1.35, when John, lord of the ifles, withdrew his allegiance. In the beginning of the next century his fucceffors were fo independent, that Henry IV. entered into a formal alliance with the brothers Donald and John. This encouraged them to commit freh hoftilities againt their natural prince. Donald, under preance of a clain to the earldom of Rofs, invaded and made a conqueft of that county; but penetrating as far as the fhire of Aberdeen, after a fierce but undecifive battle with the royal party, thought proper to retire, and in a little time to fwear allegiance to his monarch James I. But he was permitted to retain the county of Rofs, and affume the title of earl. His fucceffor Alexander, at the head of $10,000 \mathrm{men}$, attacked and burnt Irvernefs; at length, terrified with the preparations made againft him, he fell at the royal feet, and obtained pardon as to life, lout vias committed to ftrict confinement.
"Hiskinfman and deputy, Donald Balloch, refenting the imprifonment of his chieftain, excited another rebellion, and deftroyed the country with fire and fword: but on his fight was taken and put to death by an Irink chieftain, with whom he fought protection.
" There barbarous inroads were very frequent with a fet of banditti, who had no other motive in war but the infamous inducement of plunder.
"In the reign of James II. in the year 146 I , Do. nald, another petty tyrant, and earl of Rofs, and lord of the ines, renewed the pretence of independency ; furprifed the caftle of Invernefs; forced his way as far as Athol; and obliged the earl and conntefs, with the principal inhabitants, to feek refuge in the church of St Bridget, in hopes of finding fecurity from his cruelty by the factity of the place: but the barbarian and his followers fer fire to the church, put the ccclefiaftics to the fword, and, with a great booty, carried the earl and countefs prifoners to his canle of Claig, in the illand of llay. In a fecend expedition, immediately following the firft, he fuffered the penalty of his impiety: a tempeft overtook him, and overwhelmed moft of his affociates; and he, efcaping to Iuvernefs, perithed by the hands of an Irifh harper : his furviving followers returned to Ilay, conveyed the earl and countefs of Athol to the fanctuary they had violated, and expiated their crime by reftoring the plunder, and making large donations to the mrine of the offended faint.
" John, fucceffor to the laft earl of Rofs, entered into alliance with Edward IV. and fent ambaffadors to the court of Eugland, where Edward empowered the bifhop of Durham and earl of Winchefter to conclude a treaty with him, another Donald Balloch, and his fon and heir John. They agreed to ferve the king with all their power, and to become his fubjects: the earl was to have 100 marks fterling for life in time of peace, and 200l. in time of war ; and thefe iflands al. lies, in cafe of the conqueft of Scotland, were to have confirmed to them all the poffeffions benorth of the Scottifh fea; and in cafe of a truce with the Scottifh monarch, they were to be inchuded in it. But about the year 1476 , Ediward, from a change of pon litics, courted the alliance of James III. and dropt his new allies. James, determined to fubdue this rebel-

$\underbrace{\text { Hebrides. licious race, fent againft them a powerful army under }}$ the earl of Ainol; and took leave of him with this good wilh, Furth, Fortune, and fillthe fetters; as much as to fay, " Go forth, be fortunate, and bring home many captives:" which the fanily of Athol have ufed ever fince for its motto. Rofs was terrified into fubmiflion ; obtained his pardon ; but was deprived of his carldom, which by act of parliament was then declared unalienably annexed to the crown : at the fame time the king reftored to him Krapdale and Cantyre which the earl had refigned; and invefted him anew with the lordihip of the iffes, to hold them of the king by fervice and relief.
"Thus the great power of the ifies was broken : yet for a confiderable time after, the petty chieftains were conimally breaking out into finall rebellions, or harraffed each other in private war ; and ty ranny feens but to have been multiplied. James V. found it neceffary to make the voyage of the illes in perfon in 1536 , feized and brought away with him feveral of the moft confiderable leaders, and obliged them to find fecurity for their own good behaviour and that of their vaffals. The names of thefe chieftains were (according to Lindefay), Mydyart, Mac-connel, Macloyd, of the Lewis ; Mac-niel, Mac-lane, Mac-intofh Fohn Mudyart, Mac-kay, Mac-kenzie, and many others: but by the names of fome of the above, there feem to have been continental as well as infular malecontents. He examined the titles of their holdings; and finding feveral to have been ufurped, reunited their lands to the crown. In the fame voyage he had the glory of caufing a furvey to be taken of the coafts of Scotland; and of the iflands, by his pilot Alexander Lindefay; which were publifhed in 1583, at Paris, by Nicholas de Nicholay geographer to the French monarch.
"The troubles that fucceeded the death of James occafioned a neglect of thefe infulated parts of the Scotifl dominions and left them in a ftate of anarchy. In 16 54, the Mac-donalds made a formidable infurrection, oppugning the royal grant of Cantyre to the earl of Argyle and his relations. The petty chieftains continued in a fort of rebellion; and the fword of the greater, as afual in weak governments was employed againt them: the encouragement and protection given by them to pirates, employed the power of the Campbells during the reign of James VI. and the beginning of that of Charles I. (A).
"B But the curbulent fpirit of the old times contimued even to the prefent age. The heads of clans were by the divifions, and a falle policy that predominated in Scotland during the reign of. William III. flattered with an unreal importance; inftead of being treated as bad fubjects, they were ceurted as defirable allies: inftead of feeling the hand of power, money was allowed to bribe them into the loyalty of the times. They would have accepted the fubfidies, not withftanding they detefted the prince that offered them. They were taught to believe themfelves of fuch confequence, that in thefe days rurned to their deftraction. Two re-
cent rebellions gave the legillature a late experience of Hebrides. the folly of pernitting the feudal fy ftem tu exift in any part of its dominions. The act of 1748 , for abolilhing heritable jurifdictions, at once deprived the chieftains of all power of injuring the public by their commotions. Many of thefe Reguli fecond this effort of legiflature, and neglect no opportunity of rendering themfelves hatcful to their unhappy vaffals, the former inftruments of their ambition."
"The fituation of thefeiflands in the great Arlautic Smollet's Ocean renders the air cold and moift in the greater Mod. HiA. part of them. In the moft northerly illes, the fan, at i. 430, \&cc. the fummer folnice, is not above an hour under the horizon at midnight, and not longer above it at mid-day in the depth of winter. The foil of the Hebrides varies allo in differentifles, and in different parts of the fame ifland: fome are mountainous and barren, producing little elfe than heath, wild myrtle, fern, and a little grafs; while others, being cultivated and manured with fea-weed, yield plentiful crops of oats and barley.
" Lead mines have been difcovered in fome of thefe inlands, but not worked to much advantage; others have been found to contain quarries of marble, linieftone, and free-ftone; nor are they deftitate of iron, talc, cryftals, and many curious pebbles, fome of which emulate the Brafilian topaz.
" With refpect to vegetables, over and above the plentiful harvefts of corn that the natives earn from agriculture, and the pot-herbs and roots that are planted in gardens for the fuftenance of the people, thefe illands produce fpontaneoufly a variety of plants and fimples, ufed by the inlanders in the cure of theifdifeafes; but there is hardly a fhrub or tree to be feen, except in a very few fyots, where fome gentiemen have endeavoured to rear them with much more tronblethan fuccefs.
"The animals, both of the land and fea, domeftic and wild, quadrupeds, fowls, and fifhes, found in and about thefe illands, are of the fame fpecies, fize, and configuration, with thofe of the $\mathrm{O}_{\mathrm{RKNE}} \mathrm{ys}$.
" The people inhabiting thefe illands are of the fame race with thofe who live in the Highlands of Scotland; fpeak the fame language, wear the fame habit, and obferve the fame cuftoms. [See the article Highiands.]
"The com modities which may be deemed the ftaples of this coantry arc black cattle, fheep, and filh, which they fell to their fellow-fubjects of Scotland. Part of the wool they work up into knit-flockings, coarfe. cloth, and that variegated ftuff called tartan. They likewife falt mutton in the hide, and export it in boats or barklings to different parts of the main-land. Cod, ling, mackarel, whiting, haddock, and foles, are here caught in abundance, together with a fmall red cod, remarkably voracions, of a very delicate flavour: there are likewife two kinds of white fifh, which feem to be peculiar to this coaft, known by the names of lithe and cea, efteemed good eating. But the greateft treafure the ocean pours forth is the prodigious quantity of her-
rings,
(A) In the beginning of the laft centurythe iflanders were contiunally harafing Ireland with their plandering invafions, or landing there to fupport rebellions: atlength it was made treafon to receive thefe Hebridians Redhanks as they were flyled.

## HEB

Hebrides. rings, which, at one feafon of the year, fwarm in all thecreeks and bays along the wefteru fhore of Scotland. Thefe are counted the largeft, fatteft, and fineft herrings caught in any part of the northern feas. This fithery employs a great number of hands, and brings a confiderable advantage to the hingdom. The fifh are caught, cured, barrelled up, and exported : but whether from want of fkill, or a proper falt for pickling, the Scotch-cured herrings of this coaft, though fuperior to all others in their natural ftate, are commed inferior to thofe which are dreffed and pickled by the Durch fifhermen.
" How mean and contracted foever the commerce and produce of thefe iflands may be at prefent, they are perhaps more capable of improvement in both articles than any part of the Britifh dominions in Europe. The inhabitants are folittle fkilled in hufbandry, that the foil, though generally good in the low grounds, yields nothing buf fcanty crops of oats and barley; and great tracts of land lie altogether uncultivated. If a very fmall number of judicious farmers would fettle in fome of the moft confiderable iflands, they would foon raife fuch harvefts as would enrich chemfelves; employ and maintain all the idle people, a great number of whom are obliged to repair to foreign countries for fobliftence ; afford fufficient bread for the inhabitants, and even fupply the barren parts of the oppofite continent. The foil in many places would produce wheat, and almoft every where would give good pafturage, infomuch that, with proper culture, the people might provide hay and fodder for their cattle, which during the feverity of the winter die in great numbers for want of provilion. Improvements of this kind would be the more eafily made, as the fea-fhore abounds with thells for lime and fea-weeds for manure; and the labourers would be eafily fublifted by the fifh that fwarm not only in the ocean which furrounds thefe illands, but likewife in the numerous lakes and rivers of fref water. Martin declares, that he knew ioo families in this country maintained by as many little farms, the rent of each not exceeding 5 s. one heep, and a few pecks of oats.
"The commerce of thefeillands might be extended in fuch a manner as to render them a ftaple of trade, and an excellent nurfery for feamen. They are furnifhed with an infinite number of bays, creeks, and harbours, for the convenience of navigation : the inhabitants are numerous, ftrong, active, and every way qualified for the life of a mariner. The fea affords myriads of fifh for exportation : the lands might afford plenty of pafturage for black cattle, horfes, and fheep, as well as plenteons harvefts of corn and other grain : woollen and linen manufactures might be profecuted to great advantage, where labour is cheap and provifions are reafonable. The iflands afford good ftone and lime; and fome parts of the oppofite main-land, timber for building. They have plenty of fuel, not only for the ordinary purpofes of life, but alfo for falt-pans, which might be erected on different parts of the coaft; and for burning fea-ware for the ufe of a glafs or foap manufacture. Finally, the fituation of thefe illands is fo commodious for trade, that the navigator is immedintely in the open fea, and almoft in the neighbourhood of Denmark, Sweden, Hamburgh, Holland; nay, with a favourable wind, he can reach the

## 371

]
H E B
coafts of France and Spain in a week's failing; if he Hebrides, is bound for the Britilh plantations, or indeed for any Hebron. part of the known globe, he is at once difencumbered of the land, and profecutes his voyage through the open fea without obftruction or difficuly."

To the negleeted ftate of thefe illands, and to their great importance in various natural refpects, the attention of government has been called within thefe few years by the reprefentation and efforts of different patriotic noblemen and gentlemen, and a regular eftablifhment has been formed under the name of the Britilh Society for extending the Fiheries and improving the Sea coafts of the Kingdom; in confequence of which many ufeful plans for the improvement of thafe inlands have been adopted, and are gradually carrying into execution.
New Hebrides, a clufter of illands lying in the Great South Sea, or Pacific Ocean. The northern iflands of this archipelago were firft difcovered by that great navigator Quiros in 1606 , and not without reafon confidered as a part of the fouthern continent, which at that time, and till very lately, was fuppofed to exift. They were next vifited by M. de Bongainville in 1768 , who, befides landing on the illand of Lepers, did no more than difcover that the land was not connected, bat compofed of iflands, which he called the Great Cyclades. Captain Cook, befides afcertaining the extent and fituation of thefe illands, added the knowledge of feveral in this group which were before unknown. He explored the whole clufter; and thinking himfelf thereby intitled to affix to them a general appellation, he named them the New Hebrides. They are fituated between latitudes of $14 \mathrm{deg} .25 . \mathrm{min}$. and 20 deg. 4 min . fouth; and between 166 deg .4 I min. and 170 deg. 21 min. eaft longitude; and cxtend 125 leagues in the direction of north-north-weft and fouth-fouth eaft. The moft northern part of this archipelago was called by M. de Bonganville the Peak of the Etoile. The whole clufter confifts of the following: illands; fome of which have rcceived names from the different European navigators; others rerain the names which they beat among the natives, viz. Tierra del Efpiritu Santo, Mallicollo, St. Bartholomew, Me of Lepers, Aurora, Whitfuntide, Ambrym, Immer, Apee, Three Hills, Sandwich, Montagu, Hinchinbrook, Shepherd, Eorramanga, Irronan, Annatom, and Tanna:

HEBRON (anc. geog.), a very ancient city fituated in the hilly country of the tribe of Jubah to the fouth. Its more ancient name was Kiriath Arba, or Cariath Arba. In antiquity this city vied with the moft ancient cities of Egypt, being feven years prior to Zoan, tranlated Tanis by the Seventy. Jofephus makes it not only older than Tanis, but even than Memphis. It food to the weft of the lake Afphaltites, and was for fome time the royal refidence of David. After the captivity it fellinto the bands of the Edomites, as did all the fouth country of Judea. It is now called $A a-$ broun, fituated feven leagues to the fouth of Bethlehem. The Arabs call it El-kalit, " the well beloved;" which is the epithet they ufually apply to Abraham, whote fepulchral grotto they fill how. Habroun is feated at the foot of an eminence, on which are fome wretched ruins, the mifhapen remains of an ancient caftle. The adjacent country is a fort of obleng hollow, five or fix

Z z 2
leagues

## $\mathrm{HEC} \quad\left[\begin{array}{ll}372\end{array}\right] \quad \mathrm{HEC}$

Hebron leagues in length, and not difagroeably vaied by rocky hillocks, groves of fir-trees, ftunted oaks, and a few plantations of vines and olive trees. Thefe vineyards are not cultivated with a view to make wine, the inhabitants bcing fuch zealous Mahometans as not to permit any Chriftians to live among them: they are only of ufe to procure dried raifins, which are badly prepared, though the grapes are of an excelleat kind. The peafants cultivate cotton likewife, which is Spun by their wives, and fold at Jerufalem and Gaza. They have alfo fome foap manufactories, the kali for which is fold them by the Bedouins; and a very ancient glafshoule, the only one in Syria. They make there a great quantity of coloured rings, bracelets for the wrifs and legs, and for the arms above the elbows, befides a variety of other trinkers, which are fent even to Conftantinople. In confequence of thefe manufactures, Mr Volney informs us, Habroun is the moft powerful village in all this quarter ; and is able to arm 800 or 900 men , who adhere to the faction Kaifi, and are the perpetual enenies of the people of Bethlehem. This difcord, which has prevailed throughout the country from the earlieft times of the Arabs, caufes a perpetual civil war. The peafants are inceffantly making inroads on each other's lands, deftroying their corn, dourra, fefanum, and olive trees, and carrying eff their fieep, goats, and camels. The Turks, who are every where negligent in repreffing fimilar diforders, are the lefs attentive to them here, lince their authority is very precarious. The Bedouins, whofecamps occupy the level country, are continually at open hoftilities with them ; of which the peafants avail themfelves to refift their authority, or do mifchief to each other, according to the blind caprice of their ignorance or the intereft of the moment. Hence arifes an anarchy which isftill more dreadful than the defpotifm which prevails elfewhere, while the mutual devafations of the contending parties render the appearance of this part of Sy ria more wretched than that of any-other.

HEBRUS (anc. geog.), the largeft river of Thrace, rifing from mount Scombrus; running in two channels till it comes to Philipopolis, where they unite. It empties itfelf at two mouths into the Agean Sea, to the north of Samothrace. It was fuppofed to roll its waters upon golden fands. The head of Orpheus was thrown into it after it had been cut off by the Ciconian women.

HECATE (fab. hift.), a daughter of Perfes and Afteria, the fame as Proferpine or Diana. She was called Luna in heaven, Diana on.earth, and Hecare or Proferpine in hell; whence her name of Diva tri. formis, tergemina, triceps. She was fappofed to preinde over magic and enchantments. She was generally regrefented like a woman, with the head of a horfe, a dog, or a boar ; and fometimes he appeared with three different bodies, and three different faces, with one neck. Dogs, lambs, and honey, were generally offered to her, efpecially in ways and crofs roads; whence fle obtained the name of Trivia. Her power was extended over heaven, the earth, fea, and hell ; and to her kings and nations fuppofed themfelves indebted for their profperity.

HECAT riSiA, a yearly feftival obferved by the Stratonicenfians in honour of Hecate. The Arhenians paio alfo paricular worthip to this goddefs, who was
deemed the patronefs of families and of children. From Hecaton, this circumftance the flatues of the goddefs were erected before the doors of the houfes; and upon every new moon a pablic fupper was always provided at the expence of the richeft people, and fet in the ftreets, where the pooreft of the citizens were permitted to reiire and feaft upon it, while they reported that He cate had devoured it. There were allo expiatory of ferings, to fupplicate the goddefs to remove whatever evils might impend on the head of the public, \&x.

HECATOMB, in antiquity, a facrifice of an hundred beafts of the fame kind, at an hundred altars, and by an hundred priefts or facrificers. The word is formed of the Greek exato $\mu \beta_{H}$, which properly fignifies a fumptuous or magnificent facrifice.-Others derive it from the Greek exarov. centum, "a hundred,"' and Gen bos, "bullock," \&c. ; on which footing the hecatomb fhould be a facrifice of 100 bullocks.-Others derive the word from enator and arss pes, "foot;" and on that principle hold, that the hecaromb might confift of only 25 four footed beafts. They add, that it did not matter what kind of beafts were chofen for victims, provided the quota of feet were but had,

Pythagoras is faid to have facrificed a hecatomb to the mufes of 100 oxen, in joy and gratitude for his difcovering the demonfration of the 47 th propofition of the firft book of Euclid, viz. that in a rectangled triangle the quare of the hypochenule is equal to the fquares of the two other fides.

For the origin of hecatombs: Strabo relates, that there were 100 cities in Laconia, and that each city ufed to facrifice a bullock every year for the common fafety of the country; whence the inftitution of the celebrated facrifice of 100 victims called hecatombs. Others refer the origin of hecatombs to a plague, where-with the roo cities of Peloponnefus were afflicted; for the removal whereof, they jointly contri--buted to fo fplendid a facrifice.

Jalius Capitolinus relates, that for a hecatomb they crected roo altars of turf, and on thefe facrificed 100 fheep and ioo hogs. He adds, that when the emperors offered facrifices of this kind, they facrificed 100 lions, 100 eagles, and 100 other beafts of the like kind.

HECATOMB $\nsubseteq O N$ was the firft month of the Athesian year, confifting of 30 days; beginning on the firft new moon after the fummer folftice, and confequently anfwering to the latter part of our June and the beginning of July. It had its name from the great number of hecatombs facrificed in it. See Hecatomb.

HECATOMPOLIS (anc. geog.), a furname of the ifland of Crete, from its 100 cities. The territery of Laconia alfo had anciently this name for the fame reafon ; and the cultom of thefe 100 cities was to facrifice a hecatomb annually.

FIECATOMPYLOS (anc. geogs), the metropolis of Parthia, and royal refidence of Arfaces, fituated at the fprings of the Araxes. Thebes in Egypt had alfo the fame name from its 100 gates.

HECK, an engine to take fifh. A falmon heck is a grate for catching that fort of fifl.

HECKLE, among hemp-dreffers. Sce Haichel. HECLA, a vulcano of Iceland, and one of the moft furious in the world; fituated on, the fouthern part of theifland. See Icemand.

It was vifited in the year 1772 by Dr Ven Troil. a Swedid

## H E C

Hecla. Swedih gentleman along with Mr (now Sir Jofeph) Banks, Dr Solander, and Dr James Lind of Edinburgh. On their firft landing they found a tract of land 60 or 70 miles in extent entirely ruined by lava, which appeared to have been in the highen ftate of liquefaction. Having undertaken a journey to the top of the mountain, they travelled 300 or 360 miles over an uninterrupted tract of lava; and had at length the pleafure of being the firft who had arrived at the fummit of the mountain.
Hecla, according to the account of thefe gentlemen, is fituated in the fouthern part of the illand, about four miles from the fea-coaft, and is divided into three parts at the top, the middle point being the higheft ; and, according to an exact obfervation with Ramfelen's barometer, is 5000 feet above the level of the fea. They were obliged to quit their horfes at the firft opening from which the tirc had burlt. They defcribe this as a place with lofty glazed walls and high glazed cliffs, unlike any thing which they had ever feen before.
A listle higher up they found a large quantity of grit and ftones; and ftill farther on another opening, which, though not deep, defcended lower than that of the highett point. Here they imagined they plainly difecrned the effects of boiling water; and not far from thence the mountain began to be covered with fnow, excepting fome fpots which were bare. The reafon of this difference they foon perceived to be the hot vapour afcending from the mountain. As they afcended higher they found thefe fpots become larger; and about 200 yards below the fummit, a hole about 2 yard and an half in diameter was obferved, from whence iffued fo hot a fteam, that they could not meafure the degree of heat with the thermometer. The cold now began to be very intenfe; Fahrenheit's thermometer, which, at the foot of the mountain was at 52 , now fell to 24 ; the wind alfo became fo violent, that they were fometimes obliged to lie down for fear of being blown down the moft dreadful precipices. On the very fummit they experienced at the fame time a high degree of heat and cold; for, in the air, Fahrenheit's thermometer ftood confantly at 24 , but when fet on the ground, rofe to 153; the barometer ftood at 22.247. Though they were very much inclined to remain here for fome time, it conld by no means be done with fafety; for which reafon they were obliged to defeend very quickly,

The mountain feems to be made up, not of lava, but of fand, grit, and athes; which are thrown up with the ftones partly difcoloured, and partly melted with fire. Several forts of pumice ftones were found on it, among which was one with fome fulphur. Somerimes the pumice was fo ranch burnt, that it was as light as tow. Its form and colour was fonetimes very fine, but at the fame time fo foft, that it was difficult to remove it from one place to another. The common lava was found both in large pieces and frnall bits; as likewife a quantity of blark jafper burned at the extremities, and refembling trees and branches. Some flate of a frong ted colour was obferved among the fones thrown out by the volcano. In once place the lava had taken the form of chimney-fiacks half broken down.-As they defcended the mountain they obferved three open. ings. In one, every thing looked as red as brick; from another, the lava had fowed in a ftream aboat 50 yards

## 373 」

H E D
broad, and after proceeding for forne way, had divided into three large branches. Further on they perceived an opening at the botttom of which was a mountain in form of a fugar-loaf, in throwing up of which the fire appeared to have exhaufted itfelf.

We have already obferved, that our travellers were the firft who afcended to the top of this mountain. The reafon that no one before them had ever done fo was partly founded in fuperftition, and partly the fteep. nefs and difficulty of the afcent, which was greatly facilitated by an eruption in 1766. Moft kinds of lava found in orher volcanic countries are to be met with about Hecla, or other Iceland volcanoes; as the grey, dark perforated kind, fimilar to the Derbyhire loadftone; the Iceland agate, pumex vitreus both the niger and viridis. Some have conjectured this to be the lapis obfideanus of the ancients, which they formed into ftatues.

The lava is feldom found near the openings whence the eruptions proceed, but rather loofe grit and anhes; and indeed the greater part of the Icelandic mountains confift of this matter ; which, when it is grown cold, generally takes an arched form. The upper cruft frequently grows hard and folid, while the nelted matter beneathit continues liquid. This forms great cavities, whofe walls, bed, and roof, are of lava, and where great quantities of ftalactite lava are found. There are a vaft number of thefe caves in the ifland, fome of which are very large, and are made ufe of by the inhabitants for fheltering their cattle. The largeft in the illand is 5034 feet long, and from 50 to 54 ill breadth, and between 34 and 36 in height, - There are fome prodigious clefts left by the eruptions, the largeft of which is called Almeneggaa, near the water of Tingalla, in the fouthweftern part of the illand. It is 105 feet broad and very long. The direction of the chafm itielf is from north to louth. Its weftern wall, from which the other has been perpendicularly divided, is ro7feer fix inches in height, and confifts of many ftrata, of about 10 inches each in height, of lava grown cold at different times. The eaftern wail is only 45 feet four inches in height, and that part of it which is directly oppofite to the higheft part of the other fide is no more than 36 feet 5 inches high.

HECTIC Fever. See (the Index fubjoined to)

## Medicine.

HECTOR, the fon of Priam and Hecuba, and the father of Aftyanax, is celebrated for the valour with which he defended the city of Troy againftheGreeks. He was killed by Achilles, who dragged his body, fafterred to his chariot, thrice round the walls of Troy, and afterwards reftored it to Priam for a large ranfom. See Troy.

HEDERA, Ivy, in botany : A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method giving name to the 46 th order, Hederacea. There are five oblong petals; the berry is penafpermons, girt by the calyx.

Species. I. The helix, or common ivy, grows natorally in many parts of Britain; and where it meets with any fupport, will rife to a great height, fending out roots on every fide, which ftrike into the joints of walls or the bark of trees. If there is no fupport, they trail on the ground, and take reot all their learth, fo that aey clofely co:er tie furface, and are airicult to eradicat:

## HED [ 374 ] HED

eradicate. While thefeftalks are fixed to any fupport, or trall upon the ground, they are flender and flexible; but when heydhave reached to the top of their fup. port, they horten and become woody, forming themfelves into large buhy heads, and their leaves are larger, more of an oval hape, and not divided into lobes like the lower laves, fo that it hath a quite different appearance. There are two varieties of this feecies, one with filver-ftriped leaves, the other with yellowifh leaves on the tops of the branches; and thefe are fometimes admitted into gardens. 2. The quinquefolia, or Virginia creeper, is a native of all the northern parts of America. It was firt carried to Europe from Canada; and lias been long caltivated in the Britih gardens, chiefly to plant againft walls or buildings to cover them: which thefe plants will do in a fhort time ; for they will fhoot almoft 20 feet in one year, and will mount ap to the top of the higheft building: but as the leaves fall off in autumn, the plants make but an indifferent appearance in winter, and therefore are proper only for fuch fituations as will not admit of better plants; for this will thrive in the midft of cities, and is not injured by fmoke or the clofenefs of the air.

Culture. The firft fpecies is eafily propagated by its trailing branches, and will thrive in almoft any foil or fituation. The fecond may be propagated by cuttings; which if planted in autumn in a fhady border will take root, and by the following autumn will be fit to plant in thofe places where they are defigned to remain.

Ufes. The roets of the jvy are ufed by leather-cutters to whet their knives upon. Apricots and peaches covered with ivy during the month of February, have been obferved to bear fruit plentifully. The leaves have a naufeous tafte; Haller fays, they are given to children in Germany as a fpecific for the atrophy. The common people of England apply them to iflues; and an ointment made from them is in great efteem among the Highlanders of Scotland as a ready cure for burns. The berries have a little acidity. When fully ripe, a dofe of them has been recommended in the plague. In warm climates, a refinous juice exfudes from the ftalks, which is faid to be a powerful refolvent and difcutient, and an excellent ingredient in plafters and ointments adapted for thofe purpofes. Horfes and cheep eat the plant; goats and cows refufe it.-Cafpar Bauhine and Tournefort mention a fort of ivy that grows in many of the iflands of the Archipelago, to which they have given the name of the poet's ivy, becaufe the ancients are faid to have made crowns of this plant for adorning the brows of their poets. By others it is called bedera dyonyfias, becaule they made ufe of the fame fort of ivy in their public rejoicings and feafts in honour of Bacchus. The berries are of a fine gold colour, whence this fecies has been termed by others chryfocarpos.
 of the 46 th order in Linnæus's fragments of a natural method, confifting of ivy, and a few other genera, which from their general habit and appearance feent nearly allied to it. See Botany, p. 468.

HEDGES, in agriculture, are either planted to make fences round inclofures, or to divide the feveral parts of a garden. When they are defigned as out-
ward fences, they are planted either with hawthorn, Hedges. crabs, or black-thorn: but thofe hedges which are planted in gardens, either to furround wildernefsquarters, or to fcreen the other parts of a garden from light, are planted according to the fancy of the ownier; fome preferring ever-greens, in which cafe the holly is beft; next the yew, then the laurel, lauruftinus, phyllyrea, \&c. Others prefer the beech, the hornbeam, and the elm.

Before planting, it is proper to confider the nature Generaldiof the land, and what fort of plants will thrive beft retions for in it; and alfo, what is the foil from whence the plants are to be taken. As for the fize, the fers ought to be about the thicknefs of one's little finger, and cut within about four or five inches of the ground ; they ought to be frech taken up, fraight, fmooth, and well rooted. Thofe plants that are raifed in the nurfery are to be preferred.

In planting outfide hedges, the turf is to be laid, with the grafs-fide downwards, on that fide of the ditch the bank is defigned to be made; and fome of the beft mould fhould be laid upon it to bed the quick, which is to be fet upon it a foot afunder. When the firft row of quick is fer, it muft be covered with monld; and when the bank is a foot high, you may lay another row of fets againft the fpaces of the former, and cover them as you did the others: the bank is then to be topped with the bottom of the ditch, and a dry or dead-hedge laid, to thade and defend the underplantation. Stakes thould then be driven into the loofe earth, fo low as to reach the firm ground: thefe are to be placed at about two feet and an half diftance : and in order to render the hedge yet ftronger, you may edder it, that is, bind the top of the ftakes with fmall long poles, and when the ediering is finifhed, drive the ftakes anew.

The quick muft be kept conftantly weeded, and fe- of manag. cured from being cropped by cattle; and in February ging the it will be proper to cut it withinan inch of the ground, hawthorn, which will caufe it ftrike root afrefh, and help it much in the growtt.

The crab is frequently planted for hedges; and if of the crab the plants are raifed from the kernels of the fmall wild crabs, they are much to be preferred to thofe raifed from the kernels of all forts of apples without diftinction ; becaufe the plants of the true fmall crab never fhoot fo ftrong as thofe of the apples, and may therefore be better kept within the proper compafs of an hedge.

The black-thorn, or floe, is frequently planted for Black ${ }^{4}$ hedges: and the beft method of doing it, is to raife thorn. the plants from the ftones of the fruit, which fhould be fown about the middle of January, if the weather will permit, in the place where the hedge is intended; but when they are kept longer out of the ground, it will be proper to mix them with fand, and keep them in a cool place. The fame fence will do for it when fown, as when it is planted.

The holly is fometimes planted for hedges; but $\mathrm{Holl}^{\mathbf{5}}$, where it is expofed, there will be great difficulty in preventing its being deftroyed : otherwife, it is by far the molt beautiful plant; and, being an ever-green, will afford much better fhelter for cattie in winter than any other fort of hedge. The beft method of raifing thefe hedges; is to fow the fones in the place where the
hedge

## HED

Hedges
hedge is intended; and, where this can be conveniently done, the plants will make a much better frogrefs than thofe that are tranfplanted: but thefe berries thould be buried in the ground feveral monchs before they are fown. The way to do this, is to gather the berries about Chriftmas, when they are ufually ripe, and put them intolarge flower-pots, mixing fome fand with them; then dig holes in the ground, into which the pots muft be funk, covering them over with earth, about ten inches thick. In this place they muft remain till the following October, when they fhould be taken up, and fown in the place where the hedge is intended to be made. The gromd flould be well trenched, and cleared from the roors of all bad weeds, bufhes, trees, \&c. Then two drills fhould be made, at about a foot diftance from eaclo other, and about two inches deep, into which the feeds thould be fcattered pretty clofe, left fome fhould fail. When the plants grow up, they muft be carefully weeded : and it they are deligned to be kept very neat, they fhould be cat twice a year, that is in May and in Augult; but if they are only deligned for fences, they need only be theered in July. The fences for thefe hedges, while young, thould admir as much free air as pollible: the beft furt are thofe made with pufts and rails, or with ropes drawn through holes made in the pofts; and if the ropes are painted over with a compolition of melted pitch, brown Spanifh colour and oil, well mixed, they will laft feveral years.

Hedges for ornament in gardens are fometimes planted with ever-greens, in which cafe the holly is preferable to any other : next to this, mont people prefer the yew; bar the dead colour of its leaves renders thofe hedges lefs agreeable. The laurel is one of the moft beantiful ever-greens; but the fhoots are fo luxuriant that it is difficult to keep it in any tolerable flape; and as the leaves are large, to prevent the difagreeable appearance given them by their being cut through with the fleers, it will be the beft way to prone them with a knife, cutting the fhoots juft down to a leaf. The lauruftinus is a very fine plant for this purpofe; but the fame objection may be made to this as to the laurel : this, therefore, ougbt only to be praned with a knife in April, when the flowers are going off; but the new fhoots of the fame fring mult by no means be hortened. The fmall leaved and rough-leaved lauruftinus are the beft plants for this purpofe. The true phillyrea is the next beft plant for hedges, which may be held up to the height of 10 or 12 feet; and if they are kept narrow at the top, that there may be not too much width for the fnow to lodge upon them, they will be clofe and thick, and make a fine appearance. The ilex, or ever-green oak, is alfo planted for hedges, and is a fit plant for thofe defigned to grow very tall.-Thedeciduous plantsufually planted to form hedges in gardens are, The hornbeam, which may be kept neat with lefs trouble than mont other plants. The beech, which has the fame good qualities as the hormeam; but the gradual falling of its leaves in winter caufes a continual litter. The fmallleaved Englifh elm is a proper tree for tall hedges, but thefe frould not be planted clofer than eight or ten feet. The lime-tree has alfo been recommended for the fame purpofe; but after they have ftood fome years, they grow very thin at bottom, and

## 3751 HED

their leaves frequently turn of a black difagreeable Hedges, colour.

Many of the flowering firrubs have alfo been planted in hedges, fuch as rofes, honey fuckles, fweet-briar, \&c. but thefe are difficult to train: and if they are cut to bring them within compafs, their flowers, which are their greateft beauty, will le entirely deftroyed. A correfipondent of the fociety for improving agriculture in Scolland, however, informs us, that he tried with fuccefs, the eglantine, fweet-briar, or dog-rofe, when all the methods of making hedges practifed in Effex and Hamphire had been tried in vain. His method was to gather the hips of this plant, and to lay them in a tub till March ; the feeds were then eafily rubbed out; after which they were fowed in a piece of ground prepared for garden peas. Next year they came up; and the year after they were planted in the following manner. After marking out the ditch, the plants were laid about 88 inches afunder upon the fide grafs, and their roots covered with the firlt turfs that were taken off from the furface of the intended ditch. The earth fide of thefe turfs was placed next to the roots, and other earth laid upon the turfs which had been taken out of the ditch. In four or five years chefe plants made a fence which neither horfes nor cattle of any kind could pafs. Even in two or three years none of the larger cattle will attempta fence of this kind. Sheep indeed will fometimes do fo, but they are always entangled to fuch a degree, that they would remain there till they died unlefs relieved. Old briars dag ap and planted foon make an excellent fence; and, where thin, it may be eafily thickened by laying down branches, which in one year will make thoots of fix or feven feet. They bear clipping very well.

Dr Anderfon, who hath treated the fubject of hedg- Dr Andering very particularly, is of pinion, that fome other fon's direcplants befides thofe abovernentioned might be ufefully tions. employed in the conftruction of hedges. Anmong thefe he reckons the common willow. This, hefays, by no means requires the wemefs of foil which is common- Efays on ly fuppofed. " It is generally imagined (fays he), Asriculture, that the willow can be made to thrive ho where except i . 54, \& c . in wet or boggy ground : but this is one of thofe valgar errors, founded upen inaccurate obfervation, too often to be met with in fubjects relating to rural affairs; for experience has fufficiently conviaced me, that this plant will not only grow, but thrive, in any rich well-cultivated foil (unleis in particular circumftances that need not here be mentioned), even although it be of a very dry nature. It conld not, however, in general be made to thrive, if planted in the fame manner as thorns; nor would it in any refpect, be proper to train it up for a fence in the fame way as that plant. The willow, às a fence, conld feldom be fuccefsfully of 9 employed, but for dividing into feparate inclofures any low. extenfive field of rich ground: and, asit is always neceffary to put the foilinto as good order as poffible before a bedge of this kind is planted in it, the eatieft method of putting it into the neceffary high tilth, will be to mark off the boundaries of your feveral fields in the winter, or early in the fpring, with a defign to give a complete fallow to a llarrow ridge, fix or eight feet broad, in the middle of which the hedge is intended to be planted the enfaing winter. This ridge ought to be frequently ploughed daring the fammer-feafon,

## HED

Hedges, and in autumn to be well marured with dung or lime, or both. (for it cannot be made too rich), and be qeatly formed into a ridge before winter.
"Having prepared the ground in this manner, it will be in readinefs to receive the hedge, which ought to je planted as early in winter as: ann be got conveniently done; as the willow is much hurt by being planted late in the fipring. But before you begin to make a fence of this kind, it will be neceffary to provide a fufficient number of plants: which will be done by previoutly rearing them in a nurfery of your own, as near the field to be inclofed as you can conveniently have it ; for as they are very bulky, the carriage of them would be troublefome if they were brought from any confiderable diftance. The beft kinds of willow for this ufe, are fuch as make the longeft and ftrongeft hoots, and are not of a brittle nature. All the large kinds of hoop willows may be employed for this ufe; bat there is another kiud with fronger and more taper fhoots, covered with a dark green bark when young, which, upon the older hoots, becomes of an anh-gray, of a firm texture, and a little rough to the touch. The leaves are not fo long, and a great deal broader than thofe of the common hoopwillow, pretty thick, and of a dark-green colour. What name this feecies is ufually knowri by, I cannot tell; but as it becomes very quickly of a large fize at the root, and is frong and firm, it oughe to be made choice of for this purpofe in preference to all other kinds that I have feen. The fhoors onght to be of two or three years growth before they can be properly ured, and fhould never be lefs than eight or nine feet in length. Thefe ought to be cut over clofe by the ground immediately before planting, and carried to the field at their whole length. The planter having ftretched a line along the middle of the ridge which was prepared for their reception, begins at one end thereof, thrufting a row of thefe plants firmly into the ground, clofe by the fide of the line, at the diftance of 18 or 20 inches from one another; making them all flaunt a little to one fide in a direction parallel to the line. This being finifhed, let him begin at the oppo. fite end of the line, and plant another row in the intervals between the plants of the former row ; making thefe incline as much as the others, but in a direction exaetly contraty; and then, plaiting thefe bafket-ways, work them into lozenges like a net, faftening the tops by plaiting the fmall twigs with one another, which with very lietle trouble may be made to bind together very firmly. The whole, when finifined affumes a very beantifal net-like appearance, and is even at firf a tolerable good defence: and, as thefe plants immediately rake root and quickly increafe in fize, it becomes, after a few years, a very frong fence which nothing can penetrate. This kind of hedge I myfelf have employed; and find that a man may plant and twift properly about a hundred yards in a day, if the plants be laid down to his hand: and, in a fituation fuch as I have defcribed, I know no kind of fence which could bereared at fuch a fmall expence, fo quickly become a defence, and continue folong in good order. But it will be greatly improved by putring a plant of elegantine between cach two plants of willow, which will quickly climb up and be fupported by them; and, by its numerous prickles would effec-
ally preferve the defencelefs willow from being browf. Hedges: ed upou by cattle.
"As it will be neceffary to keep the narrow ridge, upon which the hedge is planted, in culure for one year at leaft, that the plants of elegantine may not be choked by weeds, and that the roots of the willow may be allowed to fpread with the greater eafe in the tender mold produced by this means, it will be proper to firthe earth once or twice by a gentle horfe-hoein the beginning of fummer ; and, in the month of June, it may be fowed with turnips or planted with coleworts, which will abindantly repay the expence of the fallow."

10
The fame author aliog gives the following ufeful di- of planting: rections for planting the hedges in fituations very much hedges in expofed to the weather, and recovering them when on expofed $\mathfrak{f i}$. the point of decaying. "Thofe wholive in an open and tuations, uncultivaied country, have many difficulties to encoun- $\begin{gathered}\text { and rec } \\ \text { rect }\end{gathered}$ ter, which others who inhabit more warm and flelter- them when ed regions never experience; and, among thefe difil- decayed, culties, may be reckoned that of hardly geting hedges Vol IJ. to grow with facility. For, where a young hedge is $p, 16, \& c$, much expofed to violent and continued gufts of wind, no art will ever make it rife with fo much freedon, or grow with fuch luxuriance, as it would do in a more hreltered fituation and favourable expofure.
" But although it is impoffible to rear hedgges in this fituation to fo much perfection as in the others, yet they may be reared even there, with a little attention and pains, fo as to become very fine fences.
"It is advifable in all cafes, to plant the hedges upon the face of a bank; but it becomes abfolutely neceffary in fuch an expofed fituation as that I have now defcribed : for the bank; by breaking the force of the wind, fcreens the young hedge from the violenceof the blaft, and allows it te advance, for fome time at firft, with much greater luxuriance than it otherwife could liave done.
" Bat as it may be expected foon to grow as high as the bank, it behoves the provident hufbandman to prepare for that event, and guard, with a wife forecaft againt the inconvenience that may be expected to arife from that circumftance.
" With this view, it will be proper for him, inftead of making a fingle ditch, and planting one hedge, to raife a pretty high bank, with a ditch on each fide of it, and a hedge on each face of the bank; in which fituation, the bank will equally fhelter each of the two hedges while they are lower tinan it; and, when they at length become as high as the bank, the one hedge will in a manner afford fhelter to the other, fo as to enable them to advance with much greaterluxuriance than dither of them would have done fingly.
"To effectuate this ftill more perféctly, let a row of fervice-trees be planted along the top of the bank, at the diftance of 18 inches from each other, with 2 plant of eglantine between each two fervices. This plant will advance, in fome degree, even in this expofed fituation; and by its numerous fhoots, covered with large leaves, will effectually fcreen the hedge on each fide of it, which, in its turn, will receive fome fupport and ficlier from them; fo that they will be enabled to advance all together, and form, in time, 2 clofe, ftrong, and beantiful fence.
"The fervice is a tree but little known in Scotland; although

## H E D

Hedgese althongh it is one of thofe that ought perhars to be often calivated there in preference to aniy oflher tree whatever, as it is more hardy, and, in an expofed fituation, atfords more ficlter to other plants than almof fny other aree 1 know : for it fends out a ghe gat maty Atrong branches from the under part of the fiem, which, in time, atfume an upriglat direction and continue to advance with vigour, and carry many leaves to the very bottom, almoft as long as the tree exifts; fo that if it is not pruned, it rifes a large clofe buht, till it atains the height of a foreft tree.
"It is of the fame genus with the rawn-tree-and has a great refemblance to it both in flower and fruit; its branches are more waving and pliant-its leaves undivided, broad and round, formewhat refembling the elm, but white and mealy on the upper dide. It deferves to be better known that it is at prefent.
" But if, from the poomefs of the fuil in which your hedge is planted, or from any other caufe, it chould fo happen, that, after a few years, the hedge becomes fickly, and the plants turn poor and ftinted in appearance, the eafieft and onlyeffectual remedy for that difeafe, is to cut the ftems of the plants clean over, at the height of an inch or two above the groind; after which they will fend forth much ftronger thoots than they ever would have done without this operation. And if the hedge be kept free of weeds, and trained afterwards in the manner above deferibed, it will, in almoft every cafe, berecovered, and rendered frefh and vigorous.
"This amputation ought to be performed in autumn, or the beginning of winter ; and in the foring when the yourg buds begin to fhow themfelves, the Rumps ought to be examincd with care, and all the buds lie rabbed off, excepting one or two of the ftrong. eft and belt placed, which hould be left for a ftem. For if the nunierous buds that fpring forth, round the item are allowed to foring up undifturbed, they will become in a few y car's as weak and finted as before; and the hedge will never afterwards be able to attain' any confiderable height, ftrength, or healthfulnefs. I have feen many hedges, that liave been repeatedly ent over totally ruined by this circumfance not having: been attended to in proper time.
" If the ground for 1 ' 6 or 20 feet on each fide of the ?iedge be fallowed at the tine that this operation is performed, and get a thorough drefling with rich manures, and be kept in high order for fome years afterwards by good culture and meliorating crops, the hedge will profeer much better than if this had been omitted, efpecially if it has been planted on the level ground, or on the bank of a fhallow ditch."

Mr Miller greatly recommends' the black alder as fuperior to any other that can be employed in moft foils. It may either be propagated by layers or truncheons about three fect long. The beft time for planting thefe laft is in February or the nonth of March. They oughe so be tharpened at their largeft end, and the ground well loofened before they are thruft into it, left the bark hould be tom off, which might occafion their mifcariage. They fhould be fet at leat' two feet deep, to prevent their being blown out of the ground by volent winds after thicy have made Atrong hoots; and they howld be kept clear of tall weeds until: they have got goon heads, after which

Voi. VIIl.
they will réquire no farther care. When raifed by laying down the branches, it ought to be done in the nouth of October; and by that time twelvenonth they will have roots fufticient for tranfplanting, which. muit be done by digrging a hole and loofering the carth in the place where the plant is to fland. The foung fets muft be planted at leaft a foot and a half deej; and their t.sp fhould be cut off to within about nine inches of the ground; by which means they will fhoot out many branches. This tree may be trained into very thick and clofe hedges, to the height of 20 feet and upwards. It will thrive exceedingly on the fides of brooks; for it grows beft when part of its roots are in water; and may, if planted there, as is ufual for willows, be cut for poles every fifth or fixth year. Its wood makes excellemt pipes and ftaves; for it will lat a great while under ground or in water: and it is likewife in great eftimation among ploughwrights, turnérs, \&c. as well as for making feveral of the utenfils neceffary for agriculture. Its bark alfo dyes a good black.

The birch is another tree recommended by Mr Mil- of the let as proper for hedges; and in places where the young birch. plants can beeafily procured, he fays that the plantation of an acre will not coft 40 fhillings : the after expence will not exceed 20 fhillings; fo that the whole will not come to above three pounds. Afh-trees ought never to be permitted in -hedges, both becaufe they injure the corn and grafs by their wide extended roots, and likewife on account of the property their leaves lrave of giving a rank tafte to butter made from the niilk of fuch cattle as feed upon the leaves. No afhtrees are permitted to grow in the good dairy-counties.
Where there are plenty of rough flat fones, the of hedges ferices which bound an eftate or farm are frequently raifed on tiade with them. In Devonfire and Cornwall it is the top of common to build as it were two walls with thefe ftones. ${ }^{\text {Ancen }}$ laid upon one another ; firft two and then one between : as the walls rife they fill the intermediate fpace with earth, beat the fones in flat to the fides, which makes them lie very firm, and fo proceed till the whole is raifed to the intended lieight. Quick hedges, and even large timber trees, are planted upon thefe walls, and thrive extremely well. Such inclofures are reckoned the beft defence that can be had for the ground and catle; though it can fcarce be fuppofed but they muft be difagreeable to the eye, and fand in need of frequent repairs by the ftones being forced out of the way by cattle. The beft way to prevent this is to build fach wall in the botom of a ditch made wide enough on purpofe, and floped down on each fide. Thus the deformity will be hid; and as the cattle cannot ftand to face the wall fo as to attempt to leap over it, the ftenes of which it is compored will be lefs liable to be beaten do wn. The earth taken out of the ditch may be fpread on the adjacent ground; and its fides planted with fuch trees or underwood as will beft foit the foil. By leaving a fpace of feveral feet on the infide for timber, a fapply of that valuable commodity maybe had withöat doing any injuable to conflod of the more valuable paftire.

The following is an excellent method of making a cellent durable and beautifill fence in gr.ify places. Dig fence in pieces of turffour or five inches thick, the breadrh of graffy pla

## HED

Hedges. the frade, and ahout a foot in length. Lay thefe turfs even by a line on orre fide, with the grafs outw ard, at the diftance of ten or twelve inches within the mark at. which the ditch afterwards to be dug in the folid groand is to begin. Then lay, in the fame manner, but with their grais fides turned out the contrary way, another row of turf, at fuch a diftance as to make a breadth of foundation proportioned to the intended height of the bank. Thus, even though the ground hould prove defective, the bank would be prevented from giving way. A ditch may then be dug of what depth and breadth you pleafe; or the ground may be lowered with a flope on each fide; and in this cafe there will be no lofs of pafture by the ferice; becaufe it may be fowed with hay-feeds, and will bear grafs on both fides. Part of the earth taken out of the ditches or flopes will fill the chafin between the rows. of turf, and the reft may be fcattered over the adjacent ground. Three, four, or more layers of turf, may be thus placed upon one another, and the interval between them filled up as before till the bank is brought to irs defired height; only obferving to give each fide of it a gentle fope for greater ftrength. The top of this bank fhould be about two feet and a half wide, and thie whole of it filled up with earch except a fmall hollow in the middle to retain fome rain. Quickfets fhould then be planted along this top, and they will foon form an admirable hedge. By this means a bank four feet high, and a flope only two feet deep, will make, befidestliehedge, a fence fix feet high, through which no cattle will be able to force thicir way: for the roots of the grafs will bind the turf fo together, that in one year's time it will become entirely fołid; and it will yet be much ftronger when the roots of the quick fhall have thot out anong it. The only precautions neceffary to be obferved in making this bank are, I . Not to make it when the ground is too dry; becaufe, if a great deal of wet fhould fuddenly follow, it will fwell the earth fo much as perhaps to endanger the falling of fome of the outfide: which, however, is eafily remedied if it fhould happen. 2. If the flope be fuch as fheep can climb up, fecure the young quicks, at the time of planting them, by a fmall dead hedge, either on or near the top, on both fides. If any of the quicks fhould die, which they will hardly be more apt to do in this than in any other fituation, unlefs perhaps in extremely dry feafons, they may be renewed by fome of the methods already men-tioned.-Such fences will anfwer even for a park; efpecially if we place pofts and rails about two feet high, a litle floping over the fide of the bank, on or near its top: no deer can creep through this, nor even be able to jump over it. It is likewife one of the beft fences for fecuring cattle; and if the quicks on the bank be kept clipped, it will form a kind of green wall pleafing
15 to the eye.
Elms re-
comanended.
raifed having no tap-roots, but flooting their fibres Hodges. horizontally in the richelt partof the foil, will be moré vigorous, and may be more fafely and eatily tranfplanted, than when raifed from feeds, or in any other method. The plants thus raifed for elm fences have greatly the advantage of others; as five, lix, and fome. times more, flems will arife from the fame chip; and fuch plants, if cut down within three iniches of the ground, will multiply their fide fhoors in proportion, and make a hedge thicker, without running to yaked wood, than by any other method yet practiled. If kept clipped for three or four years, they will be almoft impenetrable.

In the fecond volume of the fame work, we meet obfervawith feveral obfervations on quick-hedges by-a.gentle tions on man mear Bridgewater. He prefers the white and black quick thorns to all other plants for this purpofe ; but is of hedges. opinion, that planting timber-tres in them at proper intervals is a very eligible and proper method. He raifed fome of his plants from haws in a nurfery; others he drew up in the woods, or wherever they could be found. His banks were flat, and three feer wide at the top, with a floping fide next the ditches, which laft were dug only two feet below the furface, and one foot wide at bottom. The turfs were regularly laid, with the grafs downwards, on that fide of the ditch on which the hedge was to be raifed, and the beft of the mould laid at top. Thie fets were ftraight, long, fmooth, and even growing ones, planted as foon as poffible after taking up. They were planted at a foot diftance; and about every 40 feer young fruit-trees or thofe of other kinds, fuch as afh, oak, elm, beech, as the foil fuited them: A fecond row of quickfets were then laid on another bed of frefh earth ar the fame time, and covered with good mould; after which the bank was finifhed and fecured properly from injuries by a dead hedge well wrought together, and fattened by ftakes of oak-trees on the top of the bank at three feet diftance. Wherever any of the quick fets had failed or were of a dwindling appearance, he had them reptaced with freth ones from the nurfery : as well as finch of the young trees as had been planted on the top of the bank, and cleared the whole from weeds. Thofe moft deftructive to young hedges are the white and black bryony, bindweed, and the traveller's joy. The root of white bryony is as big as a man's leg, and runs very deep: that of black bryony often grows to 30 feet long, and with a kind of tendrils takes hold of the root of the young quick, and chokes it. This root muft be dug very deep in order to deftroy it. The third is ftill more deffructive to young quicks than the other two, overfhadowing the hedge like an arbour. Its root is fmaller than that of the two former, but muft be dug out very clean, as the leaft piece left will fend up frein fhoots. It is very deftructive to hedges to allow cattle to browze upon them, which they are very apt to do; but where cattle of fome kind muft be allowed accefs to them, horfes will do by far the leaft mifchief.
With regard to the advantage arifing from hedge's, Cider fruitour author obferves, that " if they were of no farther trees reufe than as mere fences, it would be the farmer's in- commendtereft to keep them up carefully; for the better they. ${ }^{\text {ed }}$ in are, the more fecure are his cattle and crops. But if a hedgeso. judicious mixture of cider fruit-trees were planted in hedges,

Hedges. hedges, the profit arifing from them only would abundantly repay the colt of the whole without any lofs of ground. It may poffibly be objected by fome, that the hedges would often be hurt by the boys climbing up to get the fruit; but thofe who make it nould remember, or be told, that the beft kinds of cider-fruit are fo hard and auftere at the time of their being gathered, that nobody can eat them, and even hogs will hardly tonch them. But the greateft benefit, where no fruit teees are planted, arifes from the thorns and wood which quick hodges yield for the fire me other purpofes.'
The author of the Effays on Hubbandry recommends the hornbeam plant as one of the left yet known for making fences, according to the method practifed in Germany, where fuch fences are common. "When the German hufbandman (fays he) erects a fence of this nature, he throws up a parapet of earth, with a ditch on each fide, and plants his hornbeam fets in fuch a manner, that every two plants may be brought to interfect each other in the form of St Andrew's crofs. In that part where the two plants crofs each other, he gently fcrapes off the bark, and binds them with ftraw thwart-wife. Here the twe plants confolidate in a kind of indiffoluble knot, and pufh from thence horizontal lanting hoots; which form a fort of living palifado or Chevaux de frife; fo that fuch a protection may be called a rural fortification. The hedges being proned annually, and with difcretion, will in a few years render lhe fence impenetrable in every part.

19
Dr Ander-
fon's me-
thod of mending decayed ${ }^{\prime}$ kedges.
"It fometimes happens (fays Dr Anderfon) that a hedge may have been long neglected, and be in general in a healthy ftate; but full of gaps and openings, or fo thin and ftraggling, as to form but a very imperfect fort of fence. On thefe occations, it is vain to hope to fill up the gaps by planting young quicks; for thefe would alwayss be outgrown, clioaked, and ftarved, by the old plants : nor could it be recovered by cntting clear over by the roots, as the gaps would ftill continue where they formerly were. The only methods that I know of rendering this a fence are, either to mend up the gaps with dead wood, or to plafh the hedge ; which laft operation is always the moft eligible where the gaps are not too large to admit of being cured by this means:
© The operation I here call plafbing, may be defired, "a wattling made of living wood.". To form this, fome ftems are firft felected, to be left as ftakes at proper diftances, the tops of which are all cut over at the height of four feet from the root. The fraggling frde-branches of the other part of the hedge are alfo lopped away. Several of the remaining plants are then cut over clofe by the ground, at convenient diftances; and the remaining plants are cut perhaps half through, fo as to permit them to be bent to one fide. They are then bent down almoft to a horizontal pofition, and interwoven with the upright ftakes, fo as to retain them in that pofition. Care ought to be taken, that thefe be laid very low at thofe places where there were formerly gaps; which ought to be farther ftengthened by fome dead ftakes or truncheons of willows, which will frequently take root in this cafe, and continue to live. And fometimes a plant of eglantine will be able to overcome the difficulties it there meets with, ftrike
root, and grow up fo as to ftrengthen the hedge in a Heciges. moft effectual manner.
" The operator begins at one end of the field, and proceeds regularly forward, bending all the ftems in one dirction, fo that the points rife above the roots of the others, till the whole wateling is completed to the fame height as the uprights.
"An expert operator, will perform this work with much greater expedition than one who has not féein it done could eafily imagine. And as all the diagonal wattlings continue to live and fend out hoots from many parts of their ftems, and as the apright fhoots that rife from the ftumps of thofe plants that have been cut over quickly rulh up through the whole hedge, thefe ferve to unite the whole into onc entire mafs, that forms a ftrong, durable, and beautiful fence.
"This is the beft method of recovering an old neglected hedge that hath as yer come to my knowledge.
"In fone cafes it happens that the young fhoors of a hedge are killed every winter ; in which cafe it foon becomes dead and unlightly, and can never rife to any confiderable height. A remedy for this difeafe may therrefore be wifhed for.
"Young hedges are obferved to be chiefly affected with this diforder ; and it is almoft always occalioned by an injudicious management of the hodge, by means of which it has been forced to fend ont too great a number of hoots in fummer, that are thus rendered fo finall and weakly as to be unable to refift the fevere weather in winter.
"It often happens that the owner of a young hedge, with a view to render it very thick and clofe, cuts it over with the fhears a few inches abovethe ground the firlt winter after planting; in confequence of which, many finall fhoots fpring out from each of the ftems that has been cut over : - Each of which, being afterwards cut over in the fame manner, fends forth a ftill greater number of fhoots, which are fmaller and fmaller in proportion to their number.
"If the foil in which the hedge has been planted is poor, in confequence of this management, the branches; after a few ycars, become fo numerous, that the hedge is unable to fend out any fhoots at all, and the utmoft exertion of the vegetative powers enables it only to put forth leaves. There leaves are renewed in a fickly flate for fome years, and at laft ceafe to grow at allthe branches become covered with fog, and the hedge perifhes entirely.
"But if the foil be very rich, "notwithftanding this great multiplication of the ferms, the roots will ftill have fufficient vigour to force out a great many fmall fhoots, which advance to a great length, but never attain a proportional thicknefs. And as the vigour of the hedge makes them continue to vegetate verylate in autumn, the frofts come on before the tops of thefe dangling fhoors have attained any degree of woody firmnefs, fo that they are killed almoft entirely by it : the whole hedge becomes covered with thefelong dead fhoots, which are always difagreeable to look at, and ufually indicate the approaching end of the hedge.
"The canfes of the diforder being thus explained, it will readily occur, that the only radical care is amputation ; which, by giving an opportunity to begia 3 A 2
with

## HED $\quad[380] \quad$ H E D

Hedges. With traising the hedge anew, fives allo an opportunity of avoiding the errors that occafioned it. In this cafe, care ought to be taken to cut the plants as clofe to the ground as poffible, as there the ftems will be lefs numerous than at any greater hoight. And particular attention ought to be had to allow very few fhoots to arife from the ftems that have been cut over, and to guard carefully againft fhortening them.
"But as the roots, in the cafe here fuppofed, will be very ftrong, the goots that are allowed to fpring from the ftems will be very vigorois, and there will be fome danger of their continuing to grow later in the feafou than they ought in fafery to do; in which ca'e, fome part of the top of the hivot may perinaps be killed the firf winter, which onghtif ponible to be prevented. Thiscan only be effectually done by giving a chack to the vegetation in autumn, fo as to allow the young fhouts to harden in the points before the winter approaches. If any of the leaves or branches of a tree are cut away while it is in the flate of vegetation, the whole plant feels the lors, and it fuffers a temporary check in its growth in proportion to the lofs that it thus fuftains. To, check, therefore, the vigorons vegetation ar the end of autumn, it will be pradest to choofe the begiming of September for the time of lopping off all the fupernumerary branches from the young hedge, and for clipping off the fide branches that have fprung out from it ; which will, in general, be fufficient to give it fuch a chocl in its growh at, that fequon, as will prevent any of the hoots from advancing atterwards. If the hedge is extremely vigorous, a few buds may be allowed to grow upou the large fumps in the fipring, with a view to be cut off at this feafon, which will tend to thop the vegetation of the hedge ftill more effectually.
"By this mode of managrement, the hedge may be preferved entire through the firft winter. And as the thoots become lefs vigorons every fucceffive feafon, there will be lefs dificulty, in preferving them at any furare period. It will always be proper, howiever, to trim the dides of a very vigorous hedge for fome years while it is yonng, abput the fame feafon of the year, which will tend powerfully to prevent this malady. But when the hedge has advanced to any confiderable height, it will be equally proper to clip it during any of the winter-montlis, before Candlemas."

Lord Kames, in his work intilled the Gentleman Farmer, gives feveral directions for the raining and mending of hedges confiderably different from thofe above related, For a dee:-park be recommends awall of fone coped. with turf, having laburnuins planted Fence for a clole to it. The heads of the plants are to be lopped deer-park. off, in order to make the branches extend laterally, and interweave in the form of a hedge. The wall will prevent the deer from breaking throngh; andif the hedge be trained eight feet high, they will not attempt to leap over. He prefers the laburnum plant, hecaufe no beaft will feed upon it except a hare, and that only when young and the buh tender. Therefore, no extraordinary care is neceffary except to preferve thicm, fron the hare for four or five years. A row of alders may be planted in front of the laburnums, which no hate norany other bealt will tonch. The wall he recommends to be built in the folfowiur manner, as being boil cleaper and more durable thanonc conftruc.
ted entireiy of fonc. Raife it of none to the height Hedges. of two fect and a half from the ground, after whichit is to be coped with fod as follows. firft lay on the wall, with the grally lide under, fod cut with the fpade four or five inches decp, and of a length equal to the thicknefs of the wall. Next, cover this fod with loofe earth romaded like a ridge. Third, prepare thin fod, caft with the paring tpade, fo long as to extend, beyond the thickrefo of the wall, two fincheson each fide. With the ce cover the lwo carths keeping the gratiy fide above; place them fo much on the edge, thit each fod fhall cover part of another, leaving only about two inches without cover: when 20 or 30 yards are thus finilhed, let the fod be beat with mallets by wo men, one on each fide of the wall, friking both at the fame time. By this operation the fod becomes a compact body that keeps in the moifture, and encourages the grafs to grow. Laftly, cot off the ragged ends of the fod on each fide of the wall, to make the covering, neat and regular. The month of October is the proper feafon for this operation, becaufe the fun and wind, during funmer, dry the fod, and hinder the grafs from vegetating, Moift foil affords, the beft fod. Wet foil is commonly too fat for binding; and, at any rate, the watery-plants it produces will not thrive in a dry, fituation. Dry foil, on the other hand, being commonly ill bound with roots, fhakes to pieces in handling. The ordinary way of coping with fod, which is to lay them flat and fingle, looks as if intended to dry the fod and kill.the grafs; not to mention. that the fod is liable to be blown off the wall by every high wind.

Where the wallitfelf is to be ufed as a fence without of ${ }^{2,2}$ wall any hedge, a. ditch is to be made on each fide, begin- ufed as: $\frac{1}{}$ ning a foot from the root of the will, and floping out-fence with; ward to the depth of three feet, or at leaft two aid an out any: half. The ditch fhould be equally lloped on the other hedge. fide, fo as to be four feet wide. A rood of this fence, iucluding every article, may be done for thrce fhillings or thereabouts; and a field of I o acres this inclofed for about 301 . which by a fone wall would coft upwards of 501 . It will alfo ftand many years without any need of reparation ; while fone walls require no lefs than $2 \frac{1}{3}$ per cent. of the original colt expended annually to keep them up.

The advantages of a thorn hedge, according to qur Advanauthor, are, that it is a very quick grower, when tages of 2 planted in a proper foil ; hooting up fix or feven feat thornin a feafon. Tnough tender, and apt to be hurt by hedge. weeds when young, it turns ftrong, and, may be cut into any thape. Even when old, it is more difpofed than other trees tolateral hoots; and laftly, its prickles make it the moft proper of all for a fence. None of thefe thons ought to be planted in a hedge till five years of age, and it is of the atmont importance that they be properly trained in the nurfery. The beft foil for a nufery, his Lordflip oblerves; is ketween richand poor. In the latter the plants are dwarfigh; in the former, being luxuriant and tender, they are apt to be hut during the feverity of the weather; and thefe imporfections are incapable of any remedy. An effential requifite in a nurfery is free ventilation. "How common (fays his Lordhip) is it to find murferies in hollow heltered places, furrounded with walls and high plantations, more fit for pine-apples than

## H E.D

Hedges.
barren trees! The plants thruft out long fhoots, but feeble and tender: when expofed in a cold fituation, they decay, and fometimes die. But there is a reafon fer every thing : the nurferyman's view is to make pront by faving ground, and by impoling on the purclafer tall plants, for which he pretends to devand double price. It is f., difficult to purchafe wholefone and well nurfed plants, that every gentlemant farmer

25
Of raifing
them 'rom " As thorns will grow pleafantly from roots, I the roots of old hedgey, raifing them from the wounded roots that munt be cut off when thorns are to be fet in a hedge. Thefe roots cut into firvall pars, and put in a bed of frefl earth, will produce plants the next fpring no lefs vigorous than what are produced from feed; and thus a perpetual fucceffion of plants may be obtained without any more feed. It ought to be a rule, never to admit into a hedge plants under five years old; they deferve all the additional finm that can be demanded for them. Young and feeble plants in a hedge are of flow growth; and, befides the lufs of time, the pailing neceffary to fecure them from catle muft be renewed more than once before they, become a fence. A thorn hedge may be planted in every month of winter and fpring molefs it be froft. But I have always obferved that thouns planted in Otober are more heallhy, puft more vigoroully, and fewer decay, than at any other time. In preparing the thorns for planting, the roots ought to be left as entire as polfible, and nothing cut away
26
Propermethod of planting, but the ragged parts.
"As a thom hedge finfers greatly by weeds, the ground where they are planted ought to be. made perfeetly clean. The common method of planting is to leave eight. or nime inches along fide of che intended ditch, termed afcarfoment; and behind the fcarfement to lay the furface foil of the intended ditch; cut into fquare fodstwo, or three inches deep, its grafly furface under. Upon that fod, whether clean or dirty, the thorns are laid, and the earth of the ditcl above them. The grafs in the fearfement, with what weeds are in the moved earth, foon grow up, and require double diligen ea to prevent the young thorns from beisg choked. The following method deferves all the additional trouble it requires. Leaving a fcarfement as above of 10 inchos, and alfo a border for the thorns, broad or narrow according to their fize; $1 . y$ behind the border the furface: of the:intendod ditch, champed fmall with the fpade, and upon it lay the monldery carth that fell from the fade in cutting the faid forface: Cover the fcarfement and border with the under earth, threeinchestlick at leaft : laying a little more on the border to raife it higer than the fcarfement, in order to give room for weeding. After the thorns are prepared by fmoothing their rugged roots with a knife, and lopping off their heads to make them grow buhy, they are laid fronting the ditch; with their roots ou the border, the head a little higher than the root. Care muft be:taken to fpread the roots amonge the fur-face-carth taken oat of the ditch, and to cover them with the mouldery earth that lay immediately below: This article is of importance, becanfe the mouldery carth is the fineft of all. Cover the ftems of the thoms with the nex: ftratum of the ditch, leavingalways an noch at the top free. It is no matter how poor this
ftratum be, as the plants draw no nourifhment from Hedges. it. Go on to finifh the ditch, prelinig down carefully every row of earth thrown up behind the hedge, which makes a good folid mound impervious to rain. It is a fafeguard to the young hedge to raife this mound as perpendicular as polible ; and for that reafon, it may be proper, in loofe fuil, when the mound is raifed a foot or fo, to bind it wich a row of the tough fod, which will fupport the earth above till it become folid by lying. In poor foil more care is necelliry. Behind the line of the ditch the groandinended for the farfement and border fhoule be fammer fallowed, manured, and cleared of all grafs roots; and this culture will make up for the inferiority of the foil. In very poor foil, it is vain to think of plantiare a thorn hedge. In fuch ground there is a necellity for a ftone fence.
" The only reafon that can be given for laying thorns as above de\{cribed; is to give the ronts face to pafh in all directions; even upward into the momd of earth. There may be fome advantages in this; but, in my apprehention, the difadvantage is much greater of heaping fo much earth upon the roots as to exclude not only the fun, but the rain which runs down the floping bank, and has no accefs to the roots. InAtcad of laying the thorns fronting the ditch, would it not do better to lay them parallel to it; covering the roots with three or four inches of the beft earth, which wond:make a hollow between the plants and the floping:baak? The hollow would intercepe cvery drop of rain that falls on the bank, to fink gratualiy among the roots. Why at any rate fhould a thorn be put in. to the ground floping ? This is inot the practice with regard to any other tree: and I have heard of no experiment to perifade me that a thorn thrives better lopiar than erect. There occurs, indeed onc objection againt planting thorns crect, that the roots have no room to extend themielves on that fide where theditch is. Sut does it not hold, that when, in their progrefs, roots meet with a ditch, they do not palh onward; but, changing their direction, pulh downward at the fide of the ditch? If fo, thefe downward roots will fupport the ditch, and prevent it from being monldered down by froft. One ching is evident without experiment, that thorns planted erect may fooner be made a complete fence than when laid floping as ufual. In the latter cafe, the opcrator is confined to thorns that do not exceed.a foot or 25 inches; but thorns five or fix feet high mayy be planted erect; and a hedge of fuch thorrs, well cultivated in the nurfery, will in. three years arrive to greater perfection that a hedge managed in the ordinatry way will do in twice that time.

After the hedge is firimed, it is abfolutely necelfary to fecure it for fome time from the depredations of catle; and this is by no means an eafy matter. ©The ordinaty method ot a paling (fays his lordnip) is no fufficient defence againft cattle : the moft gentle make it a rubbing poof, and the vicious wantonly break it down with their horns. The only effectual remedy is expenfive; viz.two ditches and two hedges, with a: mound of earth between them: If this remedy, how ever, be not palatable, the paling ourht at leat to be of the frongeft kind. I recommend the following ats the beft Iam acquainted with : Drive into the ground frong ftakes thee fuct and an half long, winh intervals
from

## H E D [ 382$] \quad$ H E D

Hedges. from eight to twelve inches, according to the fize of the cattle that are to be inclofed ; and all precifely of the fame height. Prepare plates of wood lawed out of logs, every plate three inches broad and half au inch thick. Fix them on the head of the ftakes with a nail driven down into each. The fakes will be united fo firmly, that one cannot be moved without the whole: and will be proof.accordingly againft the rubbing of cattle. But, after all, it is no fence againft vicious cattle. The only proper place for it is the fide of a high road, or to fence a plantation of trees. It willindeed be a fufficient fence againft theep, and endure till the hedge itfelf becomes a fence. A fence thas completed, including thorns, ditching, wood, nails, \&c. will not mach exceed two fhillings every fix yards."
Of training Hhislordhiy difcommends the ordinary method of tup hedgas. training hedges by cutting off the top and fhortening the Lateral branches in order to make it thick and bufly. This, as well as the method of cutting off the ftems two or three inches above the ground, indeed produces a great number of fhoots, and nakes a very thick fence, but which becomes fo weak when bare of laves, that cattle break through it in every part. To determine the beft method of proceeding in this cafe, his lordhip made an experiment on three hedges, which were twelve years old at the time he wrote. The firf was annually pruned at the top and fides; the fides of the fecond were pruned but not the top; and the third was allowed to grow without any proning. The firft, at the time of writing, was about four feet broad, and thick from top to bottom; but weak in the ftems, and unable to refift any horned beaft: the fecond was ftrong in its ftems, and clofe from top to bottom: the third was allo ftrong in its ftems, but bare of branches for two feet from the ground; the lower ones having been deprived of air and rain by the thick thade of thofe above them. Hence he directs that hedges hould be allowed to grow till the ftems be five or fix inches in circumference, which will be in ten or twelve years; at which time the hedge will be fifteen feet or more in height. The lateralbranches next the ground muft be pruned within two feet of the ftem ; thofe above muft be made fhorter and fhorter in proportion to their diftance from the ground; and at five feet high they muft be cat clofe to the ftem, leaving all above full freedom of growth. By this drelfing the hedge takes on the appearance of a very fteep roof. and it ought to be kept in that form by pruning. This form gives free accefs to rain, fun, and air: every twig has its fhare, and the whole is preferved in vigour. When the ftems have arrived at their proper buik, cut them over at five feet from the ground where the lateral branches end. This anfwers two excellent purpofes : the firft is to ftrengthen the hedge, the fap that formerly afcended to the top being now diftributed to the branches: the next is, that a tall hedge ftagnates the air, and poifons both corn and grafs near it. A hedge trained in this manner isimpenetrable even by a bull.
29 . With tegard to the practice of plafbing an old hedge Plathing of recommended by Dr Anderfon, his lordihip obferves hedges dif- that "f it makes a good interim fence, but at the longcommeude ran is deftructive to the plants; and accordingly there ed. is ficarcely to be met with a complete good hedge
where plaining lias been long practifed. A thorn is a Hedgem ${ }^{\text {r }}$ tree of long life. If, inftead of being maffacred by plathing, it were raifed and dreffed in the way here defcribed, it would continue a firm hedge perhaps 500 years. " A hedge onght never to be planted on the top of Hedges the mound of earth thrown up from the ditch. It ought to be has indeed the advantage of an awful fituation; but planted on being planted in bad foil, and deftitute of moifture, it the fide of camot thrive : it is at beft dwarfifh, and frequently and no decays and dies. To plant trees in the line of the treesallowhedge, or within a few feet of it, ought to be abfo- ed in them. lutely prohibited as a pernicious practice. It is amazing that people fhould fall into this error, when they ought to know that there never was a good thornhedge with trees in it. And how fhould it be otherwife ? An oak, a beech, an elm, grows fafter than a thorn. When fuffered to grow in the midft of a thornhedge, it fpreads its roots every where, and robs the thorns of their nourifhment. Nor is this all: the tree, overfladowing the thorns, keeps the fun and air from them. At the fame time, 110 tree takes worle with being overflhadowed than a thorn.
" It is fearce neceffary to mention gaps in a hedge, of filling becaufe they will feldom happen where a hedge is up gaps. trained as aboverecommended. But in the ordinary method of training, gaps are frequent, partly by the failure of plants, and partly by the trefpaffing of cattle. The ordinary method of filling up gaps is to plant fweet briar where the gap is fmall, and a crab where it is large. This method I cannot approve for an obvious reafon; a hedge ought never to be compoled of plants which grow unequally. Thofe that grow faft, overtop and hurt the low growers; and with refpect, in particular, to a crab and fweet briar, neither of them thrive under the lhade. Itis a better method to remove all the withered earth in the gap, and to fubftitute freh fappy moud mixed with fome lime or dung. Plant upon it a vigorous thorn of equal height with the hedge, which in its growth will equal the thorns it is mixed with. In that view there fhond be a nurfery of thorns of all fizes, even to five feet high, ready to fill up gaps. The beft feafon for this operation is the month of October. A gap filled with fweet briar, or a crab lower than the fiedge; invites the cattle te break through and trample the young plantsunder font ; to prevent which, a pailing raifed on both fides isjnot fufficient, unlefs it be raifed as high as the hedge.
" Where a field is too poor to admit of a thorn- In what hedge, if there be no quantity of ftones eafily procu- cafes whins rable, whins are the only refource. Thefe are com- are necefmonly placed on the top of a dry earth-dyke, in which ${ }^{\text {fary. }}$ fituation they feldom thrive well. The following feems preferable. Two parallel ditches three feet wide and two deep, border a fpace of twelve tect. Within this fpace raife a bank at the fide of each ditch with the earth that comes out of it, leaving no interval between the two banks. Sew the banks with whin feed, and plant a row of trees in the interval. When the whins are pretty well grown, the hedge on one of the banks may be cut down, then the other as foon as it becomes a fence, and fo alternately. While the whins are young, they will not be difturbed by cattle, if paffages be left to go out and in. Thefe paffages

## HED

Hedgea. may be clofed up when the hedge is fufficiently Arong to be a funce. A whin-hedge, thus managed, will laft many years, even in ftrong froft, unlefs very feverc. There are many whin-hedges in the flire of Kincardine not to 1 kiltully managed, and yet the poffefors appear not to be afraid of froft. Such fences ought to be extremely welcome in the fandy grounds of the hire of honay, where there is fcare a flone to be found. The few earth-fences that are there raifed, compofed moftly of fand, very foon crumble down."

Mr Bakewell's fencas.

In the forth volume of Mr Young's Northern Tour, the author cecommends the tranfplanting of old hedges, which his correfpondent Mr Beverly fays he has tried with prodigious fuccefs.

Mr Bakewell, we are told, is very curious in his fences, and plants his quicksin a different manner from what is common in various parts of the kingdom. He plants one row at a foot from fet to fet, and making liis ditch, lays the earth which comes out of it to form a bank on the fide oppolite to the quick. In the common method the bank is made on the quick fide above it. Reafons are not wanting to induce a preference of this method. The plants grow only in the furface of the carth uncovered from the atmof phere, which muft neceffarily be a great advantage ; whereas, in the ufual way of planting, the eazth, which is always the beft, is loaded by a thick covering obliquely of the earth out of the ditch. If the roots hoot in the beft foil, they will be out of the reach of the influences of the air; the confequence of which is, that they cannot have folarge a face of that earth as if fet on the flat. The way to have a tree or a quick thrive in the beft manner poffible, is to fet it on the fuface, without any ditch or trench, that cuts off half its pafture. But if a ditch is neceflary, the next beft way muft of courfe be ftill to keep it on the flat furface; and the worft way to cover up that furface, by loading it with the dead earth our of a trench. To fay that there are good hedges in the common method is not a conclufive argument, unlefs both were tried on the fame 34 foil and expofure.

In the 7 th volume of the fame work, a correfpondent, who figns himfelf M. M. obferves, that notwithftanding all the improvements that have been made in the conftruction of hedges and fences, there are many foils in England, which, from their fandy and gravelly natures, are little adapted to any of the plants in common ufe, and are therefore fubject to all the inconveniences of dead hedges and gaps. Of this, kind are all the fandy. and gravelly inclofures, which conftiture fo large a part of many diftricts in the illand. For thefe our author recommends a triple row of furze; though notwidhitanding its advantages, he fays tt is liable to be deftroyed by fevere winters, contrary to the affertion of lord Kames above-related. "It is liable (fays he) to be fo completely aut off by a fevere winter, that l have feen tracks of many handred acreslaid open in the fpace of a few weeks, and reduced to as defencelefs a fate as the furrounding waftes. On fuch foils therefore he recommends the holly ; the only difadvantage of which; he fays, is its flow growth. On moft of thefe foils alfo the black thorn will rife fpontaneoufly; and even the quick, though lowly, will advance to a fufficient degree of perfection. The

## HED

birch, however, he particularly recommends, as grow- Hedges. ing equally on the dricft and on the wetteft foils; propagating itfelf in fuch numbers, that were they not deftroyed, all the fandy waftes of this kingdom would be quickly. covered with them. He recommends particularly the keeping of a nurfery for 35 fuch platrts ${ }^{2}$ are commonly ufed for hedges. "I gene- of a Froper rally (fays he) pick out a bit of barren land, and af- nurferyter ploughing it three or four times to bury and deftroy the heath, I find it anfwer extremely well for a nurfery. Into this fpot I tranfplant quick, hollies, and every tree which 1 ufed for fences er plantations. By eftablifhing fuclra nurfery, a gentleman will always be able to command a fufficiency of ftrong and hardy plants which will not deceive his expectations. I look upon thorns of five or fix yearsold, which have been twice tranfplanted from the fced-bed, to be the beft of all; but as it may be neceffary to fill up cafual gaps in hedges that have been planted feveral years, a provifion chonld be made of plants of every age, to 12 or 14 years old. All plants which are intended to be moved, thould be tranfplanted every two or at molt threeyears; without this attention, they attach them-. felves fo firmly to the foil as renders a fubfequent operation dangerous. All whotranfiplant quicks or hollies ought to begin their labours as early as convenfient in the antumn; for I have found by repeated experience that neither of thefe plants: fucceed fo well in the fpring."

Where the ferces of a track of ground are in a very of repairruinous condition, it is abfolucely neceffary to fcower ing ruinous: the ditches, throw up the banks, and fecure the whole hedges. immediately by the firmeft dead fences we can procare. If there is a total want of living plants, the cultivator can do nothing but plant new hedges; but if, as is generally the cafe, the banks are furninhed with a miltitude of old ftems, though totally unconnected as a fence, the time and labour requifite for the intended improvement will be confiderably abridged. All the ftraggling branches which add no folidity to the fence: are to be cut off; after which the reft of the ftems muft be fhortened to the height of three or four feet. The method of cutting down every thing to the ground, which is now fo general, our author highly, condemns. "Such a fence (fays he) has within it no principle of ftrength and connexion; it is equally expofed in every part to depredations of cattle and fportfmen; and even fhould it efcape thefe, the firft fall of fnow will nearly demolifh it. On the contrary, wherever thefe vegetable palifades can be left, they are impenetrable either for man or horfe, and form to many points of union which fupport the reft."

Another method of ftrengthening defective fences, is to bend down fome of the lateral fhoots in a horizostal direction, and to fipread them along the line of the farm like efpalier trees in a garden. A fingle ftem, when it rifes perpendicularly, will not fecure a fpace of more than two or three feet, but when bent longitadinally, they will form a barrier at leaft fuficient to repel all cattle but hogs, for 12 or 14 feet on each fide. By bending down our author does not $3 \%$ the common plafhing method, which is very injurious hedges difto the :plants ; but the fpreading two or three of the commendmoft convenient branches along the hedge, and faften- ed. . ing them down eikher by pegs or tying, without in-

## HED <br> [

tation of the plant. All the fhoots laid down in this manner fhould be allowed to remain for feveral years, poled direction. Thofe who make the experiment for the firft time will be aftonifhed how finall a number of plants may be made to fill a bank, with only rrifing intervals. The birch is particularly ufeful for this purpofe ; being of fo flexible a nature, that fhoots of 10 or 12 feet in length may be eatily forced into a horizont: direction; and if the other fhoots are promed away, all the juices of the plant will be applied to nourim the felected few : by which means they will in a few years acquire all the advantages of pofts and rails, with this material difference, that inftead of decaying, they become anmally bettor. It is befides the property of all inclined branches to fond up a mulitude of perpendicular fhoots; fo that by this horizontal inclination, if judicionfly made, you may acquire almoft all the advantages of the thickeft fence; but when the ftems are too old and brittle to bear this operation, it will be advifable to cut off all the ufelefs ones clofe to the ground, and next fpring they will be fucceeded by a numberof young and vigorons ones. Select the beft of thefe to be traned in the manner already dirceted, and extirpate all the reft, to increafe their vigour. The fhoots of fuch old ftems as have been joft mow defcribed will attain a greater fize in three or four years than any young ones that can be
planted will do in twelve.
Another method which our author has practifed with the greateft fuccers is the following. The tender fhoots of mont trees, if bended downwards and covered with earth, will put forth roots, and being divided from the parent ftem at a proper time become freh plants; an operation well known to gardeners, under the nanie of laying. This may beas advantageous to the farmer, if he will take the very moderate trouble of laying down the young and flexible branches in his fences. Moff fpecies of trees, probar bly all, will be propagated by this method; but particularly the withy, the birch, the holly, the white thorn, and the crab, will alfo take root in this method, though more flowly; the latter being an excellent plant for fences, and not at all nice in the foil on which it grows. The advantage of laying down branches in this manner over the planting of young ones is, that when you endeavour to fill up a gap by the latter method, they advance very flowly, and are in danger of being flifled by the fhade of the large trees; whereas, if you fortify a gap by fpreading the branches along it in the manner' jaft mentioned, and at the fame time infert fome of the moft thriving, fhoots in the groind, they will advance with all the vigour of the parene plant, and you may allow them to grow until they are fo fully rooted as to be free from danger of fuffocation.
It frequently happens, that the fences of an eftate have been neglected for many years, and exhibit nothing batt ragged and deformed ferms at great intervals. In this cafe it will be-proper to cut them all off level with the ground: the confequence of this is, that next year they will put forth a great number of fhoots, which may be laid down in every direction, and trained for the improvenent of the fence. When this operation is performed, however, it ought always to be done with an ax, and not with a faw ; it being fonnd that the latter inftrument generally preve ats the yege-
that they may be firmly rooted. Thus they will make prodigious advances; and it is to be obferved, that the more the parent plant is divefted of all fuperfluous branches, the greater will be the nourihment tranfmitted to the fcions.

Our author, however, is inclined to fufpect that the molt perfect form of an hedge, at leaft in all but thofe compofed of thoras and prickly plants, is to train up as many ftems as will nearly touch eac other. The force of every fence conlifts chiefly in the upright ftems: where theie are faficiently near and frotg, the hedge refifts all oppofition, and will equalty repel the violence of the bull, and the inlidions artacks of the hogs. It is abfolutely preper that all hedges flould be infpected once a-year; when not only the ditch ought to be thrown out, and the bank fapportcd, but the feraggling floots of all the live plants oughit to be pruned. By thefe are meant all fach as project over the ditch beyond the line of the hedge, and which add nothing to its freigth, though they deprive the uffefal feems of part of their nourinhment. Where an hedge is compofed of plants of inferisr value, it will be proper to train thofe in the manner juft now recommended, and to plant the bank with quick or holly. When thefe laft have attained a fufficient fize, the others may be extirpated; which is beft done-by cutting down all the fhootsrepearedly in the fummer, and leaving the rooss to ror in the hedge.
$\stackrel{46}{48}$
In the 13 th volume of the Annals, W. Erkine, Eff; Mr Er gives an account of a method of fencing very much re-fkine's mefembling that recommended by lord Kames, and which thod of has been alrcady defcibed. Tlat genteanan is of contruaopinion, that in fome cates dead flone walls, as thicy are ing hedgen called, are more advantageous than hedges. "That hedges (fyys he) are more ornamental, cannot be denied; and they are generally allowed to afford more fhelter: but the lengith of time, the conftant ateention, and continual expence of defending them until they bear even the refemblance of a fence, induces many people in thofe places where the materials are ealily procured, to prefer the dry fone walls; fon tho' the firft cof is confiderable, yet as the farmer rcaps the immediate bentfit of the fence (which is undouktedly the moft fecure one), they are thought on the whole to be the leaft expenfive; befides, the cattle in expofed fituations, and efpecially in thefe northerin parts, are fo imparieut of confinement at the commencement of the long, cold, wet nights, that no hedges I have ever yet feen, in any part of dis ifland, are fufficient to keep them in."

From confiderations of this kind, the late Sir Geonge Suttic of Eaft Lothian was induced to think of a fence which might join the ftrength of the wall to the ornament of the hedge. His thorns were plantedin the ufual manner on the fide of the ditch : but inftead of patting behind them a poft and rail or paling on the top of the bank, he crected a wall two feet and a half high ; and being well fituated for procuring lime, he ufed it in the conflruction of thefe walls which Mr Erkine greatly recommends; " as the fatisfaction they afford, by requiring no repairs, and the duration of them, more than repay the expence: but where the

## HED

Hedg: price of lime is hia, they may be built without any cencut, and aniwer the purpofevery well if the work is properly executed.'

In making a new fence of this kind, the furface of the ground thould be pared off the breadth of the ditch, and likenife for two feet more, in order to prevent as much as poilible the thorns from being injured by the growth of grafs and weeds. The ditch fhould be five teet broad, two and an half in depth, and one foor broad at the botom. Leave one foot for an edging or fcarfenent, then dig the earth one fpit of a fpade for about one foot, and put anout three inches of good cuith below the thorn, which flould be laid nearly horizontal, but the point rather inclining upwards, in order to let the rain drip to the roots; then add a foot of good earth above it ; leave three or four inches of a fcarfement before another thornis planted; it muft not be directly over the lower one, but about nine inches or a foot to one fide of it : then threw a foot of good earth on the thorn, and trample it well down, and level the top of the bank for about three feet and an half for the bafe of the wall to reft on. This bafe fhould be about nine or ten inches, but muft not exceed one foot from the thorn. The wall uught to be about two feet thick at the bottom and one foot at the top; the cope to be a tingle flone laid flat; then covered with two fods of turf, the grafs of the undermoft to be next the wall, and the other fod mult have the grafs fide uppermolt : the fods flould be of fome thicknefs, in order to retain moiftute; fo that they may adisere together, and not be eatily difplaced by the wind: the height of the wall to be two feet and an half, exclulive of the fods; which together fhould be from four to fix inches, by which means the wall would be near to three fett altogether. The expence of the fences cannot fo eafily be counted, on account of the difference of the prices of labour in different parts. Mr Erkine had them done with lime, every thing included, from $10 \frac{1}{2}$ d. to 13 d. per 11 ( ( hich is equal to 37 inches 2 parts), according to she cafe or difficulty of working the quarry, and the diftance of it from the place where the fence is erected. The lime cofts about 6 d . per boll of about 4.0872667 bufhels; and from 15 to 16 bolls of lime are ufed to the rood of 36 fquare ells Scots meafine ; and there arc upwards of 43 Scotch ells, or 44 Englifh yards. When the common round or flint ftones are made ufe of, as they require more lime, it is neceflary to ufe 30 or 35 bolls of lime to the rood. The thorns are fold from five to ten fhillings' per thoufand, according to their age, reckoning fix fcore to the hundred. Making the ditch, laying the thorns, and preparing the top of the wall, generally colt from 7 d . to 8 d . every: fix ells About 50 carts of fones, each cart carrying from 7 to 9 cwt . will build a rood; the carriage at 2 d . per cart for half a mile's diftance.

Warmth is undoubtedly as beneficial to hedges as trees; and the walls give an effetual helter, which in expofed fituations is abfolutely neceffary for rearing young hedges; and they likewife preferve a proper degree of moifture about the roots. If the hedges have been planted for fix or feven years before the wall is built, cut them over to two or three inches above the ground with a fharp toot, either in October or November, or early in the fpring; and erect the

Vol. VIII.
wall as quickly in that feafon as pomble (the fpring in this country can farcely be faid to begin till the end of March). It is almoft impofible to imagine the rapidity with which hedges grow in favourable fituations. Mr Erfkire had one cur over in the fpring, and by the end of the year it was almoft as high as the wall. In three years he fuppofed, that not even the Highland fhecp, who cafily overleap a wall of four feet and an half in height, would have been able to break through it.

Notwithftanding the reafons that have been given Realons for already againft the planting of timber trecsin hedges, planting we find the practice recommended by fome authors as oak treesia one of the beft fituations for raifing flip-timber. The hedges. reafons are, that the roots have free range in the adjoining inclofures, and the top is exp led to the exercife of the winds; by which means the trees are at once enabled to throw out ftrong arms, and have a large fpreading head at the fame time; fo that we thus at once obtain quicknefs of growth, with ftrength and crookednefs of timber. Well trained timber trees it is alleged are not prejudicial to hedges, though pollards and low fpreading trees are deftructive to the hedge-wood which grows under them ; neither are hightrees prejudicial to corn-fields like high hedges and pollards, which prevent a proper circulation of air; and in Norfolk, where the cultivation of grain is carried on in great perfection, fuch lands are faid to be wood-bound. But when an hedge is trimmed down to four or five feet high, with oaks interfperfed, a circulation of air is rather promoted than retarded by it; and a trimmed hedge will thrive quite well under tall ftemmed trees, paricularly oaks. For arable inclofures, there, hedges are recommended of four or five fcet high, wi:h oak-timbers from 15 to 25 feet ftem. Higher hedges are more eligible for grafs lands: the graffes affect warmith, by which their growth is promoted, and confequently their quantity is increafed, though perhaps their quality may fuffer fome injary. A tall fence likewife aftords fhelter to cattle, provided it be thick and clofe at the bottom; but otherwife, by admitting the air in currents, it does rather harm than good. The thade of trees is equally friendly to cattle in fammer; for which reafon it is recommended in grafs inclofures to allow the hedge to make its natural frioots, and at the fame time to have oak-trees planted in it at proper intervals. Upon bleak hills, and in expofed fituations, it will be proper to have two or even three rows of hedgewood, about four feet diftant from each other ; the middle row being permitted to reach, and always to remain at its natural height: whilft the fide rows are cut down aliernately to give perpetual fecurity to the bottom, and affre a contant fupply of materials for dead hedges and other parpofes of underwood.

Much has been faid of the excellency of the holly as a material for ledges; and indeed the beauty of Bed me of the plant, with its extreme clofenefs, and continuing planting green throughout the winter evidently give it the pre- and raifing ference to cill others; and could it be raifed withequal holly for eafe, there is no doubt that it would come into uni- hedges. verfal practice. Befides the above properties, the hully will thrivealmof upon any foil ; but thin-foiled ftony heirhts feem to be fis natural fituation; and jt may properly enough be faid, that holly will grow

## HED

Hedges wherever corn will. Its longevity is likewife exceflive; and being of flow growth, it does not fuck the land, as the farmers exprefs it, or deprive the crop of its nourifhnent, as other hedges do. The difficulty of raifing holly may be obviated by planting it under crabs, which have a tendency to grow more upright than hawthorns, and confequenily affording more air, will not impede its progrefs though they afford helter. It may even be raifed alone without any great difficalty; only in this cafe the dead fence, to fecure it, mult be kept up at leaft ten or twelve years, inftead of fix or feven, as in the other cafe; and indeed, confidering the advantages to be derived from fences of this kind, they feem to merit all the additional trouble requifite.

The holly may be raifed either under the crab or hawthorn in two ways, viz. by fowing the berries when the quick is planted, or by inferting the plants themfelves the enfuing midfumper. The former is by much the more fimple, and perhaps upon the whole the better method. The feeds may either be fcattered among the routs of the deciduous plants, or be fown in a drill in front: and if plants of holly be put in, they may either be planted between thofe of the crab, or orherwife in front in the quincunx manner.

Where furze or whins are to be ufed either as a fence by themfelves or an affiftant to another, it is better to ufe the French feed than that produced in this conntry, as the former feldom ripens in this country, and confequently cannot like the latter over-run the adjacent inclofure. It may be had at the feedfhops in London for about 15 d . per pound, and one pound will fow 40 ftatute rods. When ufed as an affiftant to an hedge, it is more proper to fow it on the back of the bank than on the top of it; as in this cafe it is more apt to overhang the young plants in the face of the bank; whilft in the other it is better fituated for guarding the bank, and preventing it from being torn down by cattle. The method of fowing is as follows: Chop a drill with a fharp fpade about twothirds of the way up the back of the bank, making the cleft gape as wide as may be without breaking off the lip; and having the feed in a quart bottle, flopt with a cork and goofe quill, or with a perforated wooden fopper, trickle it along the drill, covering it by means of a broom drawn gently above and over the mouth of the drill. Clofing the drill with the back of the fpade, fluts up the feeds too muclifrom the air, and thus keeps them too long from rifing.
Hedge-Hog. See Erinaceus.
Hedge Sparrow. See Motacilla.
HEDYCARYA, in botany: A genus of the polyandria order, belonging to the diocia clafs of plants. The calyx of the male is cleft in eight or ten parts; there is no corolla, nor are there any filaments; the antheræ are in the bottom of the calyx, four furrowed, and bearded at top. The calyx and corolla of the female are as in the male ; the germs pedicellated ; the nuts pedicellated and monofpermous.
HEDYOTIS, in botany : A genus of the monogynia order, belonging to the tetrandria clafs of plants; and in the natural method ranking under the 47th order, Stillata. The corolla is monopetalous and fun-
nel-flaped; the capfule is bilocular, polyfpermous, in- Hedyfarum ferior.

HEDYSARUM, in botany : A genus of the decandria order, belonging to the diadelphia clafs of plants; and in the natural method ranking under the 32d order, Papilionacea. The carina of the corolla is tranverfely obtufe; the feed-veffel a legumen with monofpermous joints. There are 59 fpecies of this plant, of which the moft remarkable are, 1 . The gyrans, or fenfitive hedy farum, a native of the Eaft Indies, where it is called burrum chundalli. It arrives at the height of four feet, and in autumn produces bunches of y ellow flowers. The root is annual or biennial. It is a trifolious plant, and the lateral leaves are fmaller than thofe at the end, and all day long they are in conftant motion without any external impulfe. They move up and down and circularly. This laft motion is performed by the twifting of the foot ftalks; and while the one leaf is rifing, its affociate is generally defcending. The motion downwards is quicker and more irregular than the motion upwards, which is fteady and uniform. There motions areoblervable for the fpace of 24 bours in the leaves of a branch which is loppped off from the flirub if it is kept in water. If from any obstacle the motion is retarded, upon the removal of that obftacle it is refumed with a greater degree of velocity. 2. The coronarium, or common biennial French honey-fuckle, hath large deeply ftriking biennial roots; upright, hollow, fmooth, very branchy ftalks, three or four feet high, garnifhed with pinnated leaves; and from between the leaves proceed long fikes of beautiful red flow. ers, fucceeded by jointed feed-pods.

Culture. The firf fpecies being a native of hot climates, requires, the common culture of tender exotics: the fecond is eafily raifed from feed in any of the common borders, and is very ornamental.

HEEL, in anatomy, the hind part of the foot. See Anatom $\mathrm{A}, \mathrm{n}^{2} 66$.
$H_{E E L}$ of a Horfe, the lower hinder-part of the foot comprehended between the quartersand oppofite to the toe. The heel of a horfe fhould be high and large, and one fide of it hould not rife higher than the other upon the paftern. To recover the heels of a horfe that is hoof-bound, you fhould take out his fole and keep his heels very wide, by which they will be reftored in a month.

Heel of a Horfeman. This being the part that is armed with the fpur, the word is ufed for the fpur itfelf; "This horfe underftands the heel well." To ride a herfe from one heel to another, is to make him gofide-ways, fometimes to one heel and fometimes to another.

Heer, in the fea-language. If a fhip leans on one fide, whether the be aground or afloat, then it is faid fhe heels a-ftarboard, or a-port; or that he heels offwards, or to the fhore ; that is, inclines more to one fide than to another.

HEELER, or Bloody $H_{\text {eEL }}$ Cock, a fighting cock, that ftrikes or wounds much with his fpurs.

The mafters know fucli a cock, even while a chicken, by the friking of his two heels together in his going.

HEEM (John David), an able painter, lorn at Utrecht in 1604. He excelled in painting flowers, fruit,

## HE I $[387] \quad$ H E I

Heemkirk fruit, vafes, and initruments of mufic, which he peril formed in fuch a perfect manner, that a perfon was apt $\underbrace{17 \text { sidegger. }}$ to attempt taking them in his hand. His colouring is agreeable, and the infects in his pictures appear alive. He died at Antwerp in 1674.

Cornelius de Heem, his fon, was alfo a good painter, though inferior to his father.

HeEMSKIRK. See Hemskirk.
HEGIRA, in chronology, a celebrated epoch among the Mahometants. The word Arabic, formed of חהדר hagirah, fight; of fo fy, quit one's country, family, friends, \&c.

The event which gave occafion to this epocha, was Mahomet's flight from Mecca. The magiftrates of that city, fearing hisimpoftures might raife a fedition, rcfolved to expel him : this, accordingly, they effected in the year of our Lord 622, on the evening of the 15 th or 16 th of July. See Arabia, $\mathrm{n}^{8} 44$.

To render this epocha more creditable, the Mahometans affeet to ufe the word hegira in a peculiar fenfe for an act of religion, whereby a man forfakes his country, and gives way to the violence of perfecutors and enemies of the faith : theypadd, that the Corafhites, being then the ftrongelt party in the city, obliged their prophet to fly, as not being able to endure his abolifhing of idolatry. This flight was not the firft of Mahomet's, but it was the moft famous. It happened in the i4th year from his affufning the character of prophet and apoftle, and promulgating his new religion.

The orientals do not agree with us as to the time of the hegira. Among the Mahometans, Amafl fixes it to the year of Chrint 630, and from the death of Mofes 2347; and Ben Caffem to the year of the world 5800 : according to the Greek computation, among the Chriftians, Said Ebn Batrik refers the heyira to the year of Chrif 614, and of the creation 6II4.

Khondemir relates, that it was Omar, the fecond caliph, that firft eftablifhed the hegira as an epocha, and appointed the years to be numbered from it: at the time he made this decree, there was already feven years clapfed. This eftablifliment was made in imitation of the Chriftians, who, in thofe times, reckoned their years from the perfecution of Dioclefian.

But there is another Hegira, and that earlier too though of lefs eminence. Mahomet, in the i $4^{\text {th }}$ year of his miffion, was obliged to relinquifh Medina: the Coraflites had all along oppofed him very vigeroufly, as an innovator and difturber of the public peace; and many of his difciples, not enduring to be reputed followers of an impoftor, defired leave of him to abandon the city, for fear of being obliged to renounce their religion. This retreat makes the firft hegira. There twe hegiras the Mahometans, in their language, call begiratan.

The years of the hegira confift only of 354 days. To reduce thefe years to the Julian kalendar, i. c. to find what Julian year a given year of the hegira an. fwers to, reduce the year of the hegira given into days, by multiplying by 354 , divide the product by 365 , and from the quotient fubtract the intercalations, i.e. as many days as there are four years in the quotient; and laftly, to the remainder add 622. See Year.

HEIDEGGER (John James), was the for of a clergyman, and a native of Zurich in Switzerland, where he married, but left his country in confequence of an in-
trigue. Having had an opportunity of vifiting the prin - Heidegger cipal cities of Europe, he acquired a tafte for tlegant and refinod pleafures, as they are called, which, united to a ftrong inclination for voluptuoufnefs, by degrees qualified him for the management of public amofements. In 1708, when he was near 50 years old, he went to England on a negociation from the Swifs at Zurich; but, failing in his embally, he entered as a private foldier in the guards for protection. By his fprightly engaging converfation and infinuating addrefs, he foon worked himfelf into the good graces of the young people of fathion ; from whom he obtained the appellation of "the Swifs Count." He had the addrefs to procure a fubfeription, with which, in 1709 , he was enabled to furnifh out the opera of "Thomyris," which was written in Englifh, and performed at the queen's theatre in the Haymarket. The mulic, however, was Italian; that is to fay, airs felected from fundry of the foreign operas by Bunoncini, Scarlati, Steffani, Gafparini, and Albinoni. Heidegger by this performance alonc was a gainer of 500 gnineas. The judicious remarks he made on feveral defects in the conduct of the operas in general, and the hints he threw out for improving the entertaiments of the royal theatre, foon eftablifhed his character as a good critic. Appeals were made to his judgment; and fome very magnificent and elegant dccorations introduced upon the ftage in confequence of his advice, gave fuch fatisfaction to George II. who was fond of operas, that, upon being informed to whofe genius he was indebted for thefe improvements, his Majefty was pleafed from that time to countenance him, and he foon obtained the chief management of the operahoufe in the Haymarket. He then fet about improving another fpecies of diverfion, not lefs agreeable to the king, which was the mafquerades, and over thefe he always prefided at the king's theatre. He was likewife appointed mafter of the revels. The nobility now careffed him fo much, and had fuch an opinion of his tafte, that all fiplendid and elegant entertainments given by them upon particular occalions, and all private affemblies by fubfeription, were fubmitted to his direction. From the emoluments of thefe feveral employments, he gained a regular confiderable income, amounting, it is faid, in fome years, to 50001 . which he fpent with much liberality ; particularly in the maintenance of a fome what tooluxurious table; fo that it may be faid he raifed an income, bat never a fortune. At the fame time his charities ought not to pafs unnoticed, which were frequent and ample. After a fuccefsful mafquerade, he has been known to give away feveral hundred pounds at a time. "You know poor objects of diftrefs better than I do," he would frequently fay to a particular acquaintance; " be fo kind as to give away this money for me." This well known liberality, perhaps contributed much to his carrying on that diverfion with fo little oppofition as he met with. He died in 1749, at the advanced age of 90 years.

As this perfon was long the Arbiter Elegantiarum of England, and is alladed to in many publications of his time, fome account of him, it was thought, might be inere expected: but to add all the anecdotes that have appeared concerning him, would enlarge this article beyond the limits to which it is entitled. One

Heiden- or two of the moft remarkable, however, are tubheim, joined in a note (A), as they may afford entertain. $\underbrace{\text { Heidleberg ment to many of our readers. }}$

HEIDENHEIM, a town of Germany, in Swabia, and in the territory of Brentzhall, with a handfome palace or caftle, belonging to the houfe of Wirtem. berg. E. Long. Io. 19. N. Lat. 48. 37.

HEIDLEBERG, a confiderable and populous town of Germany, capital of the Lower Palatinate, with a celebrated univerfity. It is noted for its great ton, which holds 800 hogtheads, generally kept full of good Rhenifh wine. It ftands in a pleafant rich country, and was a famous feat of learning: but it has undergone fo many calanities, that it is nothing now ro what it was formerly. It was firft reduced to a heap of ruins in 1622 by the Spaniards; and the rich library was tranfported partly to Vienna, and partly to the Vatican at Rome. After this it enjoyed the benefit of peace, till the Proteftant electoral houfe became extinct, and a bloody war enfued, in which not only the cafte was ruined, but the tombs and bodies of the eleofors we ere fiamefally violated and pillaged. This happened in 1693 ; and the people of the Palatinate were obliged to leave their dwellings, and to go for refuge into foreign countries. To add to thefe
misfortunes the elector refided at Manhein, and car- Height, ried moft of the people of ditinction along with him, Heinecius fo that it is uncertain whether Heidleberg will ever $r e$ cover itfelf or not, though they have begun to rebuild fome of the fortifications. The great ton was broke to pieces in 1693 by the French, and at great expence in 1729 was repaired. The town flands on the river Neckar, over which there is a handfome bridge. E. Long. 8. 48. N. Lat. 49. 25.

HELGHT, in general, ignifies the difference between the ground and the top of any object meafured perpendicularly.

Methods of meafuring Heights. See Geometry, Trigonometry, Barometer, Mountain, \&c.

HEILA, a town of Royal Pruffia, in Caflubia, feated at the mouth of the river Viftula, on the Baltic Sea, and fubject to Poland, 12 miles north of Dantzic. E. Long. 19.25. N. Lat. 54.53.

HEILEGEN-have, a fea-port town of Germany, in Lower Saxony, and in Wageria, feated on the Baltic Sea, over againft the illand of Termeren. E. Long. II. 15. N. Lat. 57. 30.

HEINECCIU'S (John Gotlieb), one of the greateft civilians of the 18 th century, was born at Eifen. berg, in the principality of Altenburg, in 1681. Af-
(A) Heidegger's countenance was peculiarly unpleafing, from gn unufual harthats of features. There is a mezzotinto of him by J. Faber, I 742 , from a painting by Vanloo, a ftriking like. nefs; and his face is introduced in more than one of Hogarth's prints.-Heidegger was, however, the firft to joke upon his own uglinefs; and he once laid a wager with the earl of chefterfield, that within a certain given time his lordfhip would not be able to produce fo hideous a face in all London, difter ftriet fearch, a woman was found, whofe features were at firft fight thought fronger than Heidegger's; but upon clapping her head-drefs upon himfelf, he was univerfally allowed to have won the wager. Jolly, a well-known taylor, carrying his bill to a noble duke; his grace, for evafion, faid " lamn your ugly face, I never will pay you till you bring me an uglier fellow than yourfelf!" Jolly bowed and retired, wrote a letter, and fent it by a fervant to Heidegger ; faying, "His grace wifhed to fee him the next moraing on particular bufinc fs." Heideg. ger attended, and Jolly was there to meet him; and in confequence as foon as Heidegger's vifit was over, Jolly received the cafh.

The late facetious duke of Montagu (the memorable author of the lottle Conjuror at the theatre in the Haymarket) gave an entertainment at the Devil-tavern, Temple-bar, to feveral of the nobility and gentry, feleSting the moft convivial, and a few hard-drinkers who were all in the plot. Heidegger was invited, and in a few hours after dinner was made fo dead drunk that he was carried out of the room, and laid infenfible upon a bed, A profound tleep enfued, when the late Mrs Salmon's daughter was introduced, who took a mould from his face in platier of Paris. From this a mink was made, and a few days before the next mafyuerade (at which the king mromifed to be prefent, with the countefs of Yarmouth) the duke made application to Heidegger's valet de-chambre, to know what fuit of clothes he was likely to wear; and then procuring a fimilar drefs, and a perfon of the fame ftature, he gave him his inftruc" tions. On the evening of the mafquerade, as foen as his majefty was feated (whe was always known by the conductor of the entertainment and the officers of the court, though concealed by. his drefs from the company), Heidegger, as ufual, ordered the mufic to play " God fave the king;" but his back was no fnoncr tarned, than the falfe Heidegger ordered them to Arike up "Charly o'er the water," The whole company were inftantly thunderftruck, and all the courtiers not in the plot were thrown into a ftupid confternation. Heidegger flew to the mufic-gallery, fwore, famped, and raved, accufing the mulicians of drunkernafs, or of being fet on by fome fecret enemy to ruin him. The king and the countefs laughed fo immoderately, that they
hazarded a difcovery, While Heidegger faid in the gallery, "God fave the king" was the tune; but when, after fetting matters to rights, he retired to one of the dancing-rooms, to obferve of decoruas was kept by the company, the counterfeit flepping forvard, and placing himfelf unon the floor of the theatre, juft in front of the muft-gallery, called oat in a mof audible voice, initating Heidegger, damed them for blockheads, had he not juft told them to play "Charly o'er the water?" A paufe enfued; the muficians, whe knew his character, in their turn thought hime either drunk or mad'; but as he continued his vociferstion, "Charly" was played again. At this repetition of the fuppofed affront, fome of the ufficers of the guards, who always attended upon thefe occafions, were for afcending the gallery and kicking the minfians out; but the late duke of amberland, who could hatdiy contain himfelf, interpofed. The company were thrown into great confufion "Shame! Shame!" refounded from ail parts, and Heidegger once more flew in a violent rage to that part of the theatre facing the gallery. Here the duke of Montagu, artfully ad. drefling himfelf to him, told him, "The king was in a violent paffion; that his beft way was to go inftantly and make an apology, for certainly the muficians were mad, and afterwards to difcharge them." Almont at the fame inftant, he ordered the falfe Heidegger to do the fame, The fiene now became truly comic in the circle before the king. Heidegger had no fooner made a genteel apology for the infolence of his muficians, but the falfe Heidegger ndvanced, and, in a plaintiff tone, cried out, "Indeed, Sir, it was not my fault, but that devil's in my likenefs." Poor Heidegger turned round, fared, ftaggered grew pale, and could not utter a word. The duke then humanely whifpered in his ear the fimm of his plot, and the counterfeit was ordered to take off his malk. Here ended the frolic; but Heidegger fwore he would not attend any public amufement, if that witch the wax-work woman did not break the mould, and melt down the mak before his face.

Being one at fupper with a large company, when a queftion was debated, Which nation in Hurope had the greateft in. genuity? to the furprife of all prefent, he claimed that charactes for the Swifs, and appealed to himfelf for the truth of it, *I was born a Swifs (faid he), ant came to England without a farthing, where I have found means to gain 5.0001 a-year, and to fpend it. Now 1 defy the mof able Englifiman to go to Switzerland, and either to gain that income or to fpend it there." -Heidegger is faid to have had fo remarkable a nemory, that he once walked from Charing-crofs to Temple-bar, and back again; and when he came home, wrote down every figa on each fide of the freet.

## HEI $[389] \quad H E L$

Heinetken, ter having ftudied at Goll $r$ and Leipfick, he was deHenfius, figned for the uiniftry, and began to preach ; but difliking that profefion, he lad it afide, and applied himfelf entirely to the ftudy of philofophy and the civil lav. .In ryio, he became profeffur of philofophy at Hall; and in 172 I , he was made profeflor of civil law, with the tithe of an:erfellor of the court. His great reputation mide the flates of friefland invite him to Franneker in 1724 ; but three years after, the king of Pruffia prevailed on hisa to accept of a profeflorfhip of law at Francfort on the Oder, where he diftinguifhed himfelf till the year 1733. Becoming again prefeffor at Hall, he remained there till his dearh, which happened in 1741 , notwith tanding his being invited to Marpurg, Denmark, and three academies in Holland. He wrote many works, all of them much efteemed. The principalare, I. Antiquitatum Romanarum jurifprudentium illuftratumfyntagma. It was this excellent abridgment that gave rife to his reputation in foreign countries. 2. Elenizuta juris civilis fecundum ordinenu inflitutionum do pandectarums. 3. Fundamenta flyli cultoris. There are few works fo ufeful as this for forming a Latin ftyle. 4. Elomenta philofophice rationalis if moralis, quibus premilfa hifloria philofophica.. 5. Hiftoria juris civilis Romani ac Cermanici. 6. Elementa juris naturse © gentium, \&c.

HEINETK EN (Chrifian), an extraordinary child, the prodigy of the North, was born at Lubeck in 1721. He fooke his maternal tongue fuently at ro. months. At one year old, he knew the principal events of the pentateuch ; in two months more he was mafter of the entire biftory of the Old and New-Tefta. ments: at two years an an half, he anfwered the principal queftions in geography and in ancient and modern hiftory; and hefpoke Latin and Frenchwith great faciliy before the comonencement of his fourth year. His conflitution was fo delicate, that he was not weaned till a few months before his death. M. Martini of Lubec publiflied a pamphlet in 1730, in which he endeavoured to give natural reafons for the extraordinary capacity of this infant, who died in his fifth year.

HEINSIUS (Danitl), profefor of politics and hiftory at Leyden, and Librarian to the univerfity there, was born at Gand in Flanders in 1580 . He becante a fcholar to Jof ph Scaliger at Leyden, and was indebted to the encouragement and care of that great man for the perfection to which he attained in literature, and which at the beginning of his life there was little reafon to hope from him. He diftinguifhed himfelf as a critic by his labours on many claflical authors; and was highly honoured as well abroad as at home: Guftavus Adolphus king of Sweden gave him a place among his counfellors of tate; the republic of Venice made hima knight of the order of St Mark; and pope Urban VIII. made him great offers, if he would come, as he expreffed it, " to refcue Ronie from barbarifm." He died in 1666 , leaving feveral works of his own, both in poetry and profe.

Heinsigs (Nicholas), the fon of Daniel Heinfias, was boun at Leyden; and became as great 2 Latin poet, and a grearer critic, than his father. His poems have been feveral times priated, but the beft edition is that of Amfterdam in 1666. He gave editions of feWal of the clafics, with notes; his Claudian is dedi.
cated in a Latin poens to queen Chriftina of Sweden, and his Ovid to Thuanus. At his death, which happened in 168 I , he difclaimed all his works, and expreffed the utmoft regret at having left behind hin fo many "monuments of his vanity," as he called them. He was as much diftinguifhed by his great employments in the ftate, as by his talents, learning, and good qualities.

HEIR, in law, fignifies the perfon who fucceeds another by defcent to linds, tenements, and hereditaments, being an eftate of inheritance, or an eftate in fee; becaufe nothing paffes by right of inheritance but infee. See the articles Consanguinity, Descent, Fee, Succession; and Law, $\mathrm{N}^{\circ}$ Ixxvi:\& clxxx. et fuq,

Heir-Apparent, is a perfor fo called in the lifetime of his anceftor, at whofe death he is heir at law.
$H_{\text {IIR }}$-Prefumptive, is one who, if the ancenor fhould die immediatly, would, in the prefent circumftances of things, be his heir ; but whofe right of inheritance may he defeated by the contingency of fome nearerheir being born.

HEIR-Loom, (formed of heir and the Saxon 100 m ; denoting limb ormembers) in our law-books, fignifies fuch goods and perfonal chattels asare not inventoried after the owner's deceafe, but neceffarily come to the heir along with the houfe.

Heir-loom comprehends divers implements; as ta* bles, preffes, cupboards, bedfteads, furnaces, wainfcot, and Huch like; which in fome countries have belonged to a houfe for certain defcents, and are never invento. ried after the deceafe of the owner as chattles are, but accrue by cuftom, not by common law, to the hetr, with the houfe itfelf. The ancient jewels of the crown are held to be heir-looms, and are not devifable by will, but defcend to the next fucceffor.

HEIRESS, a female heir to one who has an eftate in lands, \&c. See Heir.

Stealing an Heiress. See.Forcible Marriage.
HEIRSHIP moveables, in Scots.law, the Ueft of certain kinds of moveables, which the heir of line is intitled to take, befides the heritable eftate. See: Law, ${ }^{\circ}$ clxxx. 7.

HEISTERIA, in botany : A genus of the monogynia order, belonging to the decandria clafs of plants; and in the natural method ranking under the i2th order, Holoracea. The calyx is quinquefid, the petals five; the fruit is a plum on a very large coloured calyx.

Helena, or St Helena, an iAand in the At. lantic Ocean, belonging to the Englifh Eaft India company, and fituated in W. Long 6.30. S. Lat. 16. The greateft length of the ifland is about eight miles, and its circumference about 20 . It hath fome high mountains, particularly one called Liara's peak, which is covered with woods to the very top. Other hills there are which bear evident marks of a volcanic origin; and fome have huge focks of lava, and a kind of half-vitrified flags. The conntry, according to Mr Forfter, has a fine appearance; the foil is in many places a rich mould, from fix to ten inches deep, ind a variety of plants thrive in it laxuriantly. He found many plants here whieh he had not obferved in other parts of the world. Anong thefe were fome called by the natives eabbage-trees, gum-trees, and red woodo The former thrive in moiftplaces; but the latter are al-
ways:

## HEL [ 390 ] HE L

Helena. ways found on the ridges of hills, where the foil is dry. The cabbage-tree has rather large leaves; but after many inquiries Mr Forfter could not find that it was ufed for any other purpofe than that of fuel, and no reafon could be affigned why it had obtained that name. It mult not be confounded with the cabbage-tree of America, India, and the South Seas, which is a fpecies of palm.

The inland is laid our entirely in gardens and parturage. Peaches are the only European fruits that thrive here. Cabbages and other greens, which thrive extremelywell, are devoured by caterpiliars; and every feecies of corn is deftroyed by rats. All the paftures were over-ran with furze; which, though in our country a very ufelefs and even pernicious plant, was of fingular advantage to the inhabitants of St Helena. Before the introduction of that plant, the ground was parched by the intenfe heat, and all kiads of grafs and herbage were fhrivelled up. But the furze.builhes, which throve as it were in defpight of the fon, preferved a degree of moifture in the ground; by which means the grafs fprung ap vigoroully, and the country became covered with a rich and beautiful fod. The furze is now no longer wanted, and the people afliduoully root it out for fuel. The number of people on St Helena does not exceed 2000 perfons, including 500 foldiers and 600 flaves; and it is faid that the number of females born on the illand confiderably exceeds that of the males. By the arrival of the India fhips, which they fupply with refrefhments, they are in return provided with all forts of manufactures and other neceffaries; and the Company annually order one or two of their hips to touch there in their way to India, in order to fend them a fufficient quantity of European goods and provifions. Many of their llaves are employed in catching fifh, which are very plentiful; and, by the help of thefe, together with their poultry, cattle, roots, and falt provifions, they fublift through the year. Their life (fays MrForfter) feems to pafs along very happily; free from the multitude of cares which diftrefs their countrymen in England, and bleffed with quiet and content.

St Helena was firft difcovered by the Portuguefe in 1502, on St Helen's day; whence its name. They focked it with different kinds of ufeful animals; but whether they ever, fertled a colony on it or not, is uncertain. The Portuguefe having either abandoned or never taken poffeffion of it, the Dutch became its mafters ; and kept poffeffion of it till the year 1600 , when they were driven out by the Englifh. In I673, the Dutch took it by furprife; but a fhort time after it was recovered by the brave captain Munden, who alfo took three Dutch Eaft Indiamen then lying in the harbour. On this occafion the Hollanders had fortified the landing-place, of which there is only one on the inand; and erected batteries of great guns to prevent a defcent : but the Englifh having knowledge of a fmall creck, where, only two men abreaft could creep up, climbed to the top of the rock in the night; and appearing the next morning behind the batteries, the Dutch were fo terrified, that they threw down their arms, and furrendered at difcretion. This creek has been fince fortified, and a battery of large cannon placed at the entrance of it ; fo that now the ifland is
rendered perfectly fecure againft all regular approaches or fudden attacks.

HELEN, (in fab. hift.) the daughter of Tyndarus and Leda, was married to Menelaus king of Sparta, but Was folen from him by Thefeus, 1235 B. C. She was reftored foon after ; but carried off again by Paris, the Trojan prince; which occafioned the famous Trojan war. See Troy.
St. Helen's. See Helena.
HELENIUM, bastard sun-flower: A genus of the polygamia fuperflua order, belonging to the fyngenefia clafs of plants; and in the natural method ranking under the 49 th order, Compofita. The receptacle is naked in the middle; under the radius paleaceous; the pappus confilts of five fhort awns; the calyx is fimple and multipartite; the florets of the radius femitrifid.

Species. r. The autumnale, with fpear-fhaped narrow leaves. 2. The latifolinm, with pointed, fpearAhaped, fawed leaves - Both thefe are natives of North America, where they grow wild in great plenty. They rife to the height of feven or eight feet in good ground. The roots, when large, fend up a great number of ftalks, which branch toward the top; the upper part of the ftalk fuftains one yellow flower, fhaped like the fun-flower, but much fmaller, having long rays, which are jagged pretty deep into four or five fegments.

Gulture. Thefe plants may be propagated by feeds, or by parting their roots; the latter is generally practifed in this country. The beft feafon to tranfplant and part the old roots is in October when their leaves are paft, or in the beginning of March juft before they begin to fhoot. They delight in a foil rather moift than dry, provided it is not too ftrong, or does not hold the wet in winter.

HELENUS (fab. hift.), a celebrated foothfayer, fon of Priam and Hecuba. He was greatly refpected by all the Trojans. When Deiphobus was given in marriage to Helen in preference to himfelf, he refolved to leave his country, and retired to mount Ida, where Ulyffes took him prifoner by the advice of Calchas. As he was well acquainted with futurity, the Greeks made ufe of prayers, threats, and promifes, to induce him to reveal the fecrets of the Trojans; and either the fear of death, or gratification of refentment, feduced him to difclofe to the enemies of his country, that Troy could not be taken whilft it was in poffefion of the Palladium, nor before Polydectes came from his retreat at Lemnos and affifted to fupport the fiege. After the ruin of his conntry, he fell to the fhare of Pyrrhus the fon of Achilles, and faved his life by warning him to avoid a dangerous tempeft, which in reality proved fatal to all thofe who fet fail. This endeared him to Pyrrhus; and he received from his hand Andromache the widow of his brother Hector, by whom he had a fon called Ceftrinus. This marriage, according to fome, was confummated after the death of Pyrrhus, who lived with Andromache as with a wife. Helenus was the only one of Priam's fons who furvived the ruin of his country. After the death of Pyrrhus he reigned over parr of Epirus, which he called Cbaonia in memory of his brother Chaon, whom he had inadvertently killed. Helenus received Æneas as

HEL
Helepolis he voyaged towards Italy, and foretold him fome of 4 the calamities which attended his fleet. The manner $\underbrace{\text { Heliafte. }}$ in which he received the gift of prophefy is doubtful.

HELEPOLIS, in the ancient art of war, a machine for battering down the walls of a place befieged, the invention of which is afcribed to Demetrius Po-liorcetes.-Diodorus Siculus fays, that each fide of the Helepolis was 405 cubits in breadth, and 90 in height ; that it had nine ftages, and was carried on four ftrong folid wheels eight cabits in diameter ; that it was armed with large battering rams, and had two roofs capable of fupporting them; that in the lower ftages there were different forts of engines for cafting ftones; and in the middle they had large catapultas for difcharging arrows, and fmaller ones in thofe above, with a number of expert men for working all thefe machines.

HELIADES, in mythology, the daughters of the Sun and Clymenes, according to the poets. They were fo afflicted, as they fay, with the death of their brother Phaeton, that the gods, moved with comparfion, transformed them into poplars on the banks of the river Eridanus.

HELLÆA, in Grecian antiquity, was the greateft and moft frequented court in Athens for the trial of civil affairs. See Heliaste.

HELIACAL, in aftronomy, a term applied to the rifing and fetting of the ftars; or more ftrictly fpeaking, to their emerfion out of and immerfion into the rays and fuperior fplendor of the fun.-A ftar is faid to rife heliacally, when, after having been in conjunction with the fun, and on that account invifible, it comes to be at fuch a diftance from him as to be feen in the morning before fun-rifing; the fun, byhis apparent motion, receding from the far towards the eaft. On the contrary, the heliacal fetting is when the fan approaches fo near a ftar as to hide it with his beams, which prevents the fainter light of the ftar from being perceived; fo that the terms apparition and occuliation would be more proper than rifing and fetting.

HELIANTHUS, the great sunflower: Agenus of the polygamia fruftanea order, belonging to the fyngenefia clafs of plants; and in the natural method ranking under the 49 th order, Compofite. The receptacle is paleaceous and plane; the pappus diphyllous; the calyx imbricated; the feales ftanding a little out at the tops. There are 12 fpecies, moft of which are now very common in Britain, though all of them are natives of America. They are all very hardy, and will profper in almoft any foil or fituation. They may be propagated either by feeds or by parting their roots.

HELIASTA, in antiquity, the judges of the court Heliea. They were fo called, according to fome authors, from a Greek word which fignifies to affemble in a great number; and, according to others, from another word which fignifies the fan, becaufe they held their affemblies in an open place. They compofed not only the moft numerous, but likewife the moft important of the Athenian tribunals; for their province was either to explain the obfcure laws, or to give new vigour and authority to thofe which had been violated. The Thefmothetæ convoked the affembly of the Heliafto, which fometimes amounted to 1000 , fometimes to 1500 , judges. M. Blanchard is of opi-
nion, that to make this number, the Thefmothetre He liaf:e, fometimes fummoned thofe of each tribe who had laft $\underbrace{-}$ quitted the public offices which they had excrecifed in another court.

However that may be, it appears that the affemblies of the Heliafte were not frequent, as they would have interrupted the jurifdiction of the ftated tribunals and the common courle of affairs.

The Thefmothetæ paid to each member of this affembly, for his attendance, three oboli: which are equal to two Roman fefterces, or to half a drachma. Hence Ariftophanes, terms them the brothers of the triobulus. They were likewife condemned to pay a fine if they came too late; and if they did not prefent themfelves till after the orators had begun to fpeak, they were not admitted. Their attendance was requitted out of the public treafury, and their pay was called mifthos heliafticus.

The affembly met, at firft, according to Arifto: phanes, at the rifing of the fun. If the judges were obliged to meet under cover on account of froft and fnow, they had a fire; but there is not a paffage in any ancient author which informs us of the place where thefe affemblies were held either in the rigorous or in the mild feafons. We only learn, that there was a double enclofure around the affembly, that it might not be difurbed. The firft was a kind of arborwork, from fpace to fpace, feparated by doors, over which were painted in red the ten or twelve firft letters of the Greek alphabet, which directed the entrance of the officers who compofed the tribunal, each of them entering under the letter which diftinguifhed his tribe. The beadles of the court, to whom they fhowed the wands which hadbeen fent them by the Thefmothetr as a fummons to meet, examined its mark, to fee if it wasauthentic, and then introduced them. The fecond inclofure, which was at the diftance of 20 feet from the former, was a rope or cord; that the people who ftood round the firft inclofure, and were defirous to fee what paffed within the fecond, might not be prevented from gratifying their curiofity at a proper diftance. Thus the attention of the judges was not interrupted by the concourfe of the multitude, many of whom were heated by views of intereft or of party

To each of the members of the affembly were diftributed two pieces of copper; one of which was perforated, not certainly that it might be diftinguithed from the other by feeling, for thefe affemblies met at the rifing and were difolved at the fetting of the fun. Thofe pieces of copper had been fubltituted for little fea fhells, which were at firf in ufe. The king was prefent at the affembly, at whofe command it had been fummoned. The Thefmothetæ read the names of thofe who were to compofe it, and each man took his place as he was called. The Thefmothetæ were then fent for, whofe function it was to obferve prodigies and to fuperintend the facrifices; and if they gave their fanction, the deliberations were began, It is well known, that the officers called Exegetie were often corrupted by thofe who were interefted in the debates of the affembly; and that they excited fuch tumalts as were raifed by the Roman tribunal in the popular affemblies, contoked by the confuls.

Of all the monuments which remain relating to the Heliafte, the moft curious is the oath which thole

## HEL

Treliata. judges took befroce the Thefinothetz: Demorthenes hath preferved it in his cration againg Timocrates, who haviag been bribed by thofe who had been intrufted with the effects taken on board a veffel of Naucratis, and refufed to give an account of them, got a law paffed, by which an enlargement was granted to prifoners for public debts on giving bail. Demofthencs, in making his oration againft that law, ordered the oath of the Heliafte to be read alond, as a perpetual auxiliary to his arguments, and happily calculnted to intereft the multitude and inflame their paffions. This oath we hall quote, that our readers may know how refpectable a tribural that of the He liafixe was, and the importance of their decifions.
"I will judge according to the laws and decrees of the people of Athens, and of the fenate of 500 , I will never give ny vote for the eftablith ment of a tyrant, anor of an oligarch. Nor will I ever give my approbation to an opinion prejudicial to the liberty or to the union of the people of Athens. I will not fecond thofe perfons who may propofe a reduction of private debts, or a diftribution of the lands or houfcs. of the Athenians. I will not recal exiles, nor endeavour to procure a pardon for thofe who fhall be condemined to die. Nor will I force thofe to retire whom the laws and the fuffrages of the people fhall pernit to remain in their country. I will not give my. vote to any candidate for a public function who gives not an account of his conduet in the office which he has previoully filled ; nor will I prefume to folicit any truft from the cemmonwealth, without fubjecting my felf to this condition, which I mean as obligatory to the nine archons, to the chief of religious matters, to thofe who are balloted on the fame day with the nine archons, to the Herald, the ambaffador, and the other officers of their court. I will not fuffer the fame man to hold the fame office twice, or to hold two offices in the fame year. I will not accept any prefent, either myfelf or by anoother, either directly or indirectly, as a member of the Helidftic affembly. I folemnly declare that I am 30 years old. I will be equally attentive and impartial to the accufer and the accufed ; I will give my fentence rigoroufly according to evidence. Thius I fwear, by Jupiter, by Neptune, and by Ceres, to act. And if I violate any of my engagenents, I imprecate from thefe deities rain on my felf and my family; and I requeft them to grant me every kind of prof perity, if if am faithful to my oath."

The reader fhould perufe what follows this oath to fee with what eloquence Demofthenes ayails himfelf of it, and how he applies its principles to the caufe which he defends.

Here we have one of the motives of the meeting of this affembly. Ariftocle informs us of another, which was by the public authority deputed to them, to elect a magiffrate in the room of ene dead. It is furprifing, athat Paufanias, who enters fo often into details, gives us no particular account of this aflembly. All that he fays of it is, that the moft numerous of the Athenian affemblies was called Helicè.
We are told by Diowenes Laertins, in his life of Solon, that it was before one of there Heliaftic affemblies that Pififtratus prefented himfelf, covered with wounds and contulions (for thus he had treated himfelf and the mules which drew his car), to exscite the
indignation of the people againe his pretended enemies, who, jealous, as he alleged, of the popularity he hid acquired by allerting the rights of his poorer fellow citizens, in oppofition to the men in power, had attacked him while he was bunting, zind had wounded him in that barbarous manner. His defigrr fucceeded : a guard was appointed him; by the affiftance of which he acquired the fovercigity or tyranmy of Athens, and kept it 33 years. The power of the affembly appeared remarkable on that occafion; fors Solon, who was prefent, oppofed it with all his efferts, but did not fucceed.

As to the manner in which the judges gave their fuffrages, there was a fort of veflel covered with an ofier mat, in which were placed two urns, the one of copper, the other of wood. In the lid of thefe urns there was an oblong hole, which was large at the top, and grew narrower downwards, as we fee in fome old boxes of churcbes. The fuffrages which condemned the accufed perfor were thrown into the wooden: urn, which was termed kyrics. That of copper, named akyrios, received thofe which abfolved him.

Ariftotle obferves, that Solon, whore aim was to make his people happy, and who found an aritocracy eftablifhed by the election of the nine archons (annual officers, whofe power was almoft abfolure), tempered their fovereignty, by, infituting the privilege of appealing from them to the people, who were to be affembled by lot to give their fuffrage; after having taken the oath of the Heliafto, in a place near the Panathenæum; where Hiffus had, in former days, calmed a fedition of the people, and bound them to undnimity by an oath. It:has likewife been remarked that the god Apollo was not invoked, in the oath of the Heliattem, as in the oaths of the other judges. We have obferved, that he who took the oath of the He . liafte, engaged that he would not be corrupted by folicitation or money. Thofe who violated thisipart of their oath were condemned to pay afevere fine. The decemvirs at Rome made fuch corruption a capital crime. But Afcanius remarks, that the punifhment denounced againft them was mitigated in later rimes; and that they were expelled the fenate, or banifhed for a certain time, according to the degree of their gailt.

HELICON, in ancient geagraphy, the name of a mountain in the neighbourhood of Parnaffus and Cy theron, facred to Apollo and the mufes, who are thence called Heliconides. It is fituated in Livadia, atid now called Zagura or Zaguya.-Helicon was oae of the molt fertile and woody mountains in Greece. On it the fruit of the adrachnus, a fpecies of the arbitus or of the ftrawberry-tree, was ancommonly fweet; and the inhabitants affrmed, that the plants and roots were all friendly to man, and that even the ferpents had their poifon weakened by the innoxions qualities of their food. It approached Parnaffis it tonched on Phocis; and refembled that monntain in loftinefs, extent, and magnitude.--Here was the hady grove of the mufes and their images; with fatues of Apollo and Bacchus, of Linus and Orphess, and the illuftrious poess who had recited their verfes to the harp. Among the rripods, in the fecond century, was that confecrated by Hefiod. On the left-hand going to the grove was the fountain Agmupe; and about twenty fadia, or two miles and a half higher ap, the

Heliafx, Helicon.

## HEL

Heliconia violet-coloured Hippocrene. Round the grove were houles. A feftival was celebrated there by the Thefpiéains with games called Mufea. The valiies of Heer. licon are defrribed by Wheler as green and flowery in the fpring; and enlivened by pleafing cafcades and itreans, and by fountains and wells of clear water. The Bxotian cities in general, two or three excepted, were reduced to inconfiderable villages in the time of Strabo. The grove of the mufes was plundered under the aufpices of Conftantine the Great. The Heliconian goddeffes were afterwards confumed in a fire at Conftantinople, to which city they had been removed. Their ancicnt feat on the mountain, Aganippe and Hippocrene, are unafcertained.

HELICONIA, in botany; a genus of sine monogynia order, belonging to the pentandria clafs of plants. The fpatha is univerfal and partial ; there is no calyx ; the corolla hasthree petals, and the nectarium twoleaves; the capfule is three-grained.

HeLicteres, the screw-tree: A genus of the decandria order, belonging to the gynandria clafs of plants; and in the natural method ranking under the 37 th order, Columnifera. The calyx is monophyllous and oblique; there are five petals, and the nectarium confifts of five petal-like leaflets; the capfules are intorted or twifted inwards. - There are four fpecies, all natives of warm climates. They are fhrubby plants, rifing from five to fourteen feet in height, adorned with flowers of a yellow colour. They are propagated by feeds; but are tender, and in Britain maft be kept in a ftove during the winter.

HELIOCARPUS, in botany: A genus of the digynia order, belonging to the dodecandria clafs of plants; and in the natural method ranking under the 37th order, Columniferce. The calyx is tetraphyllous; the petals four ; the ftyles fimple ; the capfule bilocular, compreffed, and radiated lengthwife on each fide.

HELIOCENTRIC latitude of a Planet, the inclination of a line drawn between the centre of the fin and the centre of a planet to the plane of the ecliptic.

Heliocentric Place of a Flanet, the place of the ecliptic wherein the planet would appear to a fpectator placed at the centre of the fun.

HELIOCOMETES, a phenomenor fometimes obferved about fun-fetting ; being a large luminous tail or column of light proceeding, from the body of the fun, and dragging after it, not unlike the tail of a comet; ' whence the name.

HELIODORUS of Phoenicia, bifhop of Tricain Theffaly, better known hy the romance he compoled in hisyonth intitled Fthiopics, and relating the amours of Theagenes and Chariclea. Some fay he was depofed by a fynod, becaufe lee would not confent to the fuppreffing that romance. The fable has a moral tendency, and particularly incuicates the virtue of chaftity. As it was the firft of this fpecies of writing, he is Ityled the Father of Rumances. He was alfoa good Latin poet. He lived in the $4^{\text {th }}$ century.

HELIOMETER, formed of $n \lambda / o s$ fun, and $\mu=-\% \omega I$ meafiere, the vame of in inftrument called alfo aftrom:tor, invented by M. Bouguer in ${ }^{1747 \text {, for meaforinc, }}$ with particular exactnefs the diameters of the ftars, and efpecielly thofe of the fin and monn.

Thisinftrument is a kind of telefope, confifing of two object-glafres of equal focal diftance, placed one of them by the fide of the otber, fo that the fame eyeVox. VIII.

393 ] EI E L
glafs ferves for both. The tube of tinis inftrmant is or a conic form, larger at the upper end, which $x$ ceives the two object-glaffes, than at the lower, which is furnifhed with an eye-glas and micrometer. By the conftruction of this inftrument two diftinet inares of an object are formed in the focus of the eye-riafs, whole diftance, depending on that of the two obje.tglafles from one another, may be meafured with great accuracy: nor is it neceffary that the whole dific of the fun or moon come within the field of view; fince, if the images of only a fmall part of the dife be formed by each objest.glafs, the whole diamerer may be eafily computed by their pofition with refpect to one another: for if the objcet be large, the images will approach, or perhaps lie even over one another; and the objcet-glaifes being moveable, the two images may always be brought exactly to touch one another, and the diameter may be computed from the known diftance of the centres of the two glaffes. Befides, as this inftrument has a common micrometer in the focus of the eye-glafs, when the two images of the fun or monn are made in part to cover one another, that part whici: is common to both the images may be meafured with great exactnefs, as being viewed upon a gronnd that is ouly one half lefs luminous than itfelf: whereas, in general, the heavenly bodies are viewed upon a dark ground, and on that account are imagined to be larger than they really are. By a fmall addition to this inftru* ment, provided it be of a moderate length, M. Bouguer thought it very poffible to meafure angles of three or? degrees, which is of particular confequence in taking the diftance of ftars from the moon. With this inftur. M. Bouguer, by repeated obfervations, fonnd that the fun's vertical diameter, tho' fomewhar diminifhed by aftronomical refraction, is longer than the horizontal diameter; and, in afcertaining this phenomenon, he alfo found, that the upper and lower edges of the fun's difc are not fo equally defined as the other parts; on this account his image appears fomewhat extended in the vertical direction. this is owing to the decompofition of light, which is known to confift ofrays differently refrangible in its paffage through our atmo. fphere. Thus the blue and violet rays which procecd from the upper part of the difce at the fame time with thofe of other colours, are fomewhat more refraced than the others, and therefore feem to us to have proceeded from a higher point; whereas on the contrary, the red rays proceeding from the lower edge of the difc, being lefs refracted than the others, feem to proceed from a lower point ; fo that the vertical diameter is extended, or appears longer, than the horizontal diameter.

Mr Servington Savery difcovered a fimilar method of improving the micrometer, which was communicated to the Royal Society in 1743. See Micrometera.

HELIOPHILA, in botany: A genus of the filiquofa order, belonging to the tetradynamia clafs of plants; and in the natural method ranking under the 39th order, Siliquofre. There are wo nectariarecurvated towards the veficular bafe of the calyx.

HELIOPIIOBI, a name given to the white new groes or albinos, from their averion to the light of the fun. Sce Albino.

HELJOPOLIS (anc. eong.), focalld by ferodotus and Diodorus Siculus, by Nofes $0 n$, and in Jeremiah Betlfomes; a city of Egypt, to the fouth-eal of the Delta, and eaft of Memphis; of a very old 3 C ftanding,

## Helionte- <br> ter <br> He'iepolis

Heliofcope ftanding, its origin terminating in fable. Here ftood the temple of the fun, held in religions veneration. The city ftood on an extraordinary mount, but in Strabo's time was defolate. It gave name to the Nomos Heliopolites.-There was another Heliopolis in Cœelofyria, near the fprings of the Orontes; fo called from the worfhip of the fun, which was in great, vogue over all Syria.
HELIOSCOPE, in optics, a fort of telefcope, peculiarly fitted for viewing the fun without hurting the eyes. Sce Telescore.
As the fun may be viewed through coloured glafles without hurt to the eyes, if the object and eye glafles of a telefcope be made of coloured glafs, as red or green, fuch a telefcope will become an heliofcope.
But Mr Huygens only ufed a plain glafs, blackened at the flame of a candie on one fide, and placed between the eye-glafs and the eye; which anfwers the defign of an heliofcope very well.

HELIOSTATA, in optics, an infrumentinvented by the late learned $\operatorname{Dr} \mathrm{S}$. Gravefande; who gave it this name from its fixing, as it were, the rays of the fun in an horizontal direction acrofs the dark chamber all the while it is in ufe. See Optics (Index.)

HELIOTROPE (beliotropium), among the ancients, an inftrument or machine for fhowing when the fan arrived at the tropics and the équinoctial line. This name was alfo ufed for a fün-dial in general.
Heliotrope is alfoa precious ftone, of a green colour, ftreaked with red veins. Pliny fays it is thus called, becaufe, when caft into a veffel of water, the fiun's rays falling thereon feem to be of a blood colour; and that, when out of the water, it gives a faint reflection of the figure of the fun ; and is as proper to obferve eclipfes of the fun as a heliofcope. The heliotrope is alfo called oriental jafper, on a ccount of its ruddy fpots. It is found in the Eaft Indies, as alfo in Ethiopia, Germany, Bohemia, \&c. Some have afcribed to it the faculty of rendering people invifible, like Gyges's ring.
HELIOTROPIUM, rurnsole: A genus of the polygynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 4 rft order, $A f p e r i f o l i z e$. The corolla is falver-fhaped and quinquefid, with leffer dents interjected alternately; the throat clofed up by fmall arches formed in the corolla iffelf. There are a number of fpecies, all of them natis es of warm countries. Only one, called the tricoccum, growsin Europe ; and is a native of France, Spain, and laly. It is only remarkable for the property of its berries, of which an account is given under CoLourMaking, no 36 .

HELIX, in geometry, a fpiral line." Sec Spiraf. -The word is Greek, ex $1 \times \xi$, and literally fignifies " a wreath or winding :"

In architecture, fome authors make a difference between the helix and the fpiral. A ftair-cafe, according to Daviler, is in a helix, or is helical, when the fairs or fteps wind round a cylindrical newel; whereas the fpiral winds round a cone, and is continually approaching nearer its axis.
Heimx is alfo applied, in architecture, to the caulicules or little volutes under the flowers of the Corin. thian capital ; called alfo utilla.
HeIIX, in anatomy, is the whole circuit or extent
of the auricle or border of the ear outwards. In op- Helis. pofition to which, the inner protuberance furrounded thereby, and anfwering thereto, is called anthelix. Seo Anatomy, $\mathrm{n}^{\circ} \mathrm{I} 4 \mathrm{I}$.

Heire, the Snail, in zoology, a genus belonging. to the order of vermes teftacea. The fhell confints of one fpiral, brittle, and almoft diaphanous valve; and the aperture is narrow. There are 60 fpecies, principally diftinguiifed by the figure of their fhells. They are of various fizes, from that of a fnall apple to lefs than half a pea. Some of them live on land, frequenting woods and gardens, or inhabiting clefts of rocks and dry fand-banks. Others of them are aquatic, inhabiting ponds, deep rivers, and the ocean. The principal fpecies are,
I. The jacintha, with a violet-coloured fhell, is remarkable for the extreme thinnefsof its texture, which breaks with the leaft prefure, and feems therefore entirely calculated to keep the open fea, or at leaft to fhun rocky fhores. It inhabits the feas of Europe, efpecially the Mediterramean; thofe of Afia and Africa; and allo the ocean. The living animal, when touched, exfudes a juice which ftains the hands of a violet colour. Dr Hawkefworth in his account of Cooke's voyage, miftakes this fhell for that which yielded the purpura of the ancients. But whoever looks into Pliny, can never have the leaft idea that the thin fhell aforementioned could be the fame with it. They had feveral fhells which yielded the purple dye : but there were all rock fhells*, and very different both in figure and *See Buse hardnefs from the little helix jacintha; which is not cinum and calculated for the neighbourhood of rocks, as already Murex. mentioned. Vid. Plin. lib. v. cap. I. and lib. ix. cap.60, 6I. See alfo Don Ant. Ulloa's Voyage to South America, book iv. ch. 8 .
2. The pomatia, or exotic finail, with five fpires, moft remarkably ventricofe, and fafciated with alighter and a deeper brown, is a native of France, where it inhabits the woods'; but has been naturalized in England, where it inlabits the woods of the fouthern counties. It was introduced, as it is faid, by Sir Kenelm Digby ; whether for medical purpofes, or as food, is uncertain : tradition fays, that to cure his beloved wife of a decay was the object. They are'quite confined to the fouthern counties. An attempt was made to bring them into Northamptondire, but they would not live there.-Thefe are ufed as a food in feveral parts of Europe dering Lent ; and are preferved in an efcargatoire, or a large boarded place in, with a floor covered half a foot deep with herbs, in which the fnails nefle and fatten $\dagger$.- They were alfo a favourite difh $\dagger$ Addifon's with the Romans, who had their cochlearia, a nurfery Travo 272. fimilar to the above. Fulvius Hirpinus $\ddagger$ was the firft $\ddagger$ Pliny, $h$. . inventor of this Inxury, a little before the civil wars $c .56$. between Cæfar and Pompey. The fnails were fed with bran and fodden, wine. If we could credit Varroll, $\| L$. iii: they grew fo large, thax the fhells of fome would hold $\int_{\text {. }}$ I4. ten quarts! People need not admire the temperance of the fupper of the young Pliny $\delta$, which confinted of only a lettuce a piece, three frails, two eggs, a barley-cake, fweet wine and fnow,-in cafe his finails bore any proportion in fize to thofe of Hirpinus.-Its name is derived not from any thing relating to an orchard, but from topac, an operculum, it having a very flrong one. This feems to be the fpecies defcribed by

Pliny,

## HEL [ 395 [ HE L

Helix. Pliny, fib. viii. c. 39. which he fays was fcarce; that it covered itfelf with the opercle, and lodged under ground ; and that they were at firft found only about the maritime Alps, and more lately near Velitræ. [See Plate CCXXXIV. the figure half the natural fize.]
3. The hortenfis, or garden-fnail, is in form like the laft, bat lefs, and not umbilicated and clouded, or mottled with browns. It abounds with a vifcid flimy juice, which it readily gives out by boiling in milk or water, fo as to render them thick and glutinous. The decoctions in milk are apparently very nutritious and demulcent, and have been recommended in a thin acrimonious ftate of the lhumours, in confumptive cafes and emaciations.

The eyes of fnails are lodged in their horns, one at the cud of each horn, which they can remact at pleafure. The manner of examining thefe eyes, which are four in number, is this: when the horns are out, cut off nimbly the extremity of one of them; and placing it before the microfcope, you may difcover the black fpot at the end to be really a femiglobular cye. -The diffection of this animal is very curious; for by this means the microfcope not only difcovers the heart beating juft againft the round hole near the neck, which feems the place of refpiration; but alfo the liver, fpleen, ftomach and inteftines, with the veins, arteries, mouth, and teeth, are plainly obfervable. The guts of this creature are green, from its eating of herbs, and are branched all over with fine capillary white veins; the month is like a hare's or rabbit's, with four or fix needle-tecth, refembling thofe of leéches, and of a fubftance like horn.--Snails are all hermaphrodites, having both fexes united in each individual. They lay their eggs with great care in the earth, and the young ones are hatched with fhells completely formed. Cutting off a finail's head, a little ftonc appears, which is fuppofed to be a great diuretic, and good in all nephritic diforders. Immediately under this itone the heart is feen beating ; and the auricles are evidently diftinguifhable, and are membranous, and of a white colour; as are alfo the veffels which proceed from them.

Snails difcharge their excrements at a hole in their neck; they alfo breathe by this hole, and their parts of generation are fitnated very near it. The penis is very long, and in fhape refembles thar of a whale. In the procefs of generation, it has been obferved, that with the male and female part there iffues, at the aperture of the neck, a kind of fpear, fhaped like the head of a lance, and terminating in a very acute point: and when the two finails turn the clefts in the nocks towards each other, the fpear iffuing from one pricks the other, and then either drops to the ground or is carried off by the fanail it has pricked. This fnail inftantly withdraws, but foon after rejoins the other which it pricks in its turn; and after fuch mutual puncture, the copulation never fails of being confummated. Snails are faid to couple three times at the diftance of about fifteen days from cach other. nature producing a new fpear for each time of copulation, which lafts ten or twelve hours. Atthe end of about eighteen days they bring forth their eggs by the aperture of the neck.

So fmall an animal as the finail is not free from the plague of fupporting other fmaller animals on its body; and as in other animals we find thefe fecondary ones either living only on their furface, as lice, \&c. or only
in the inteftines, as worms, it is very remarkable that this creature infefts the finail in both thefe manners; being found fometimes on the furface of its body and fometimes within its inteftines. There is a partof the common garden fnail, and of other of the like kinds. commonly called the collar. This furrounds the neck of the fnail, and is confiderably thick, and isthe only part that is vifible when the animal is retired quietly into its fhell. In this ftate of the animal thefe infeets, which infeft it are ufually feen in confiderable numbers marching about very nimbly on this part; befides, the fnail, every time it has occalion to open its anus, gives them a place by which to enter into its intefines, and they often feize the opportunity.

Snails are great deftroyers of fruit in our gardens, efpecially the better forts of wall-fruit. Lime and afhes fprinkled on the ground where they moft refort will drive them away, and deftroy the young brood of them : it is a common practice to pull off the fruit they have bitten; but this fhould never be done, for they will eat no other till they have wholly eat up this if it be left for them.

HELL, the place of divine punifhment after death.
As all religions have fuppofed a future ftate of exiftence after this life, fo all have their hell or place of torment in which the wicked are fuppofed to be punifhed. The hell of the ancient heathens was divided into two manfions; the one called Ely/ium, on the right hand, pleafant and delightful, appointed for the fouls of good mon ; the other called Tartarus, on the left, a region of mifery and torment appointed for the wicked. Thelatter only was hell, in the prefent reftrained fenfe of the word. See Elysium.

The philofophers were of opinion, that the infernal regions were at an equal diftance from all the parts of the earth; neverthelefs it was the opinion of fome, that there were certain paffages which led thither, as the river Lethe near the Syrtes, and the Acherufian cave in Epirus. At Hermoine it was thought, that there was a very fhort way to hell ; for which reafon the people of that country never put the fare into the mouths of the dead to pay their paffage.

The Jews placed hell in the centre of the earth, and believed it to be fituated under waters and mountains. According to them, there are three paffages leading to it: the firft is in the wildernefs, and by that Korah, Dathan, and Abiram, defcended into hell; the fecond is in the fea, becaufe Jonah, who was thrown into the fea, cried out to God out of the belly of hell; the third is in Jerufalem, becaufe it is faid the fire of the Lord is in Zion, and his furnace is in Jerufalem. They likewife acknowledged feven degrees of pain in hell, becaufe they find this place called by feven different names in fcripture. Though they believed that infidels, and perfons eminently wicked, will continue for ever in hell; yet they maintained, that every Jew who is not infected with fome herefy, and has not acted contrary to the points mentioned by the rabbins, will not be punifhed therein for any other crimes above' a year at moft.

The Mahometans believe the eternity of rewards and punifhments in another life. In the Koran it is faid, that hell has feven gates, the firft for the Muffulmans, the fecond for the Chriftians, the third for the Jews, the fourth for the Sabians, the fifth for the Magians,

## H E L

Herl the fixth for tinc Pagans, and the feventh for the hypocrites of all religions.

Among Chrintians, there are two controverted que- nions in regard to hell; theone concerns locality, the 'other the duration of its torments. I. The locality of hell, and the reality of its fire, began firft to be controverted by Origen. That father, interpreting the feripture account metaphorically, makes hell to confift not in external punifhments, bat in a confcioufinefs or fenfe of guilt, and a remembrance of paft pleafures. Among the moderns, Mr Whifon advanced a new harothes. Acoording to him the comets are fo many hells appointed in their orbits alternately to carry the damned into the confines of the fun, there to be foorclied by its violent heat, and then to return with them beyond the orb of Saturn, there to farve them in thefe cold and difinal regions. Another modern author, not fatisfied with ainy hypothefis hitherto advanced, affigns the fun to be the local hell. 2. As to the fecond queftion, viz. the duration of hell torments, we have Origen again at the head of thofe who deny that they are eternal ; it being that father's opinion, that not only men, but devils, after a due courfe of punithment fuitable to their refpective crimes, thall be pardoned and reftured to heaven. The chief principle upon which Origen built his opinion, was the nature of punifhment, which he took to be emendatory, applied only as phyfic for the recovery of the patient's health. The chicf objection to the eternity of hell torments among modern writers, is the difproportion between temporary crimes and eternal pun_flments. Thofe who maintain the affirmative, gromed their opinions on fcripture accomuts which reprefeut the pains of hell under the figure of a worm whichnever dies, and a fire which is not quenched; as alfo upon the words, "Thefe fhall go away into everlafting puailhment, but the righteous into life ternal."

HELLLENICUS of Mitylene, a celebrated Greek hittorian, born before Herodotus, flourifhed about $480 \mathrm{~B} . \mathrm{C}$. He wrote a hiftory of the ancient kings and founders of cities, but which hath not come down to us.

HELLAS, (anc. geog.) an appellation comprifing, according to the more ancient Greeks and Romans Achaia and Peloponnefus, but afterwards reftrained to Achaia. It was bounded on the weft by the river Achelous, on the north by mounts Othrys and Octa, on the eaft by the Egean fea, and on the fouth by the Saronic and Corinthian bays, and by the ifthmus which joins it to Peloponnefus. It was called Hellas from Hellen the fon of Deucalion; or from Hellas, a diftrict of Theffaly; whence Hellenes the gentilitious name, denoting Greeks. Now called Livadia.

HELLE, (fab. hift.) a daughter of Athamas king of Thebes by Nephele. She fled from her father's houfe with her brother Phryxus, to avoid the cruel oppreffion of her mother-in-law Ino. According to fome accounts fhe was carried through the air on a golden ram, which her mother had received from Neptune, and in her paffage fle became giddy and fell from her ieat in that part of the fea which from her received the name of Hellefpont. Others fay, that the was carried on a cloud or rather upona flip, from which fhe fell into the fea and was drowned Phryxus after he had
given his fifter a burial on the neighburing coalts, Hellcbore purlued his journey, and arrived in Colchis.

Helleborws, HellegGhis. Sec Helieborde. Whit-Hlllebore. Sec Veratrum.
HELLEtORUS, hellebore: A genus of the polygynia order belonging to the pentandria clafs of plants; and in the natural method ranking under the 26th order, Maitifiliqua. There is no calyx but five or more petals; the nectaria are bilabiatec and tabular ; the capfules polyfpermous, and a little encect.

Species. The molt remarkable fecicisof this plant is the niger, commonly called Chriftitas rofe. It hath roots compofed of many thick flefty fpreadine tires, crowned by a large clufter of lobed leaves, confifting each of feven or eight obtufe flethy lobes, united to one foot ftalk; and between the leaves feveral thick flefhy flower-ftalksthree or four inches high, furmounted by large beautiful white flowers of five roundifh petals, andnumerous filaments, appearing in winter, abour orfoon after Chriftmas.

Cutture. This plant may be propagated either by feeds or parting the roots. It profpers in the open borders, or may be planted in pors to move when in bloom in order to adorn any particular place; but it always flowers faireft and moft abundantly in the front of a warm funny border. The plants may be removed, and the roots divided for propagation, in September, October, or November; but the fooner in autumn it is done, the ftronger will the plants flower at their proper feafon.

Ufes. The roo of this plant was anciently ufed as a cathartic. The tafte of it is acrid and bitter. Its acrimony, as Dr Grew obferves, is firft fclt on the tip of the tongue, and then fpreads iffelf immediately to the middle, without being much perceived in the intermediate part. On chewing the root for a few minutes, the oungue feems benumbed, and affected with a kind of paralytic fupor, as when burnt by eating any thing too hot. The fibres are more acrimonious than the head of the root from whence they iffuc. Black hellebore root, taken from 15 to 30 grains, proves a ftrong cathartic; and, as fuch has been celcbrated for the cure of maniacal and other diforders proceeding from what the ancients called the atrabilis; in which cafes medicines of this kind are doubtlefs occafionally of ufe though they are by no means poffeffed of any fecific power. It does not however appear, that our black hellebore acts with fo much violence as that of the ancients; whencemany have fupppofed it to be a different fpecies of plant : and indeed the deferiptions with the ancients have left us of the hellebore, do not agree with thofe of any of the forts ufually taken notice of by modern botanifts. Another fpecies has been difcovered in the eaftern countries, which Tournefort diftinguifhes by the name of bclleborus niger orientalis, anpliffimo folio, caule proalto flore purpurafcente, and fuppofes it to be the true ancient hellebore, from its growing in plenty about mount Olympus, and in the illand of Anticyra, cclebrated of old for the production of this antimaniacal drug: he relates, that a fcruple of this fort, given for a dofe, occafioned convulfions.Our hellebore is at prefent looked upon principally as an alterative; and in this light is frequently employed in imall doles, for atienuating vifcid humours, promoting the uterine and urinary difcharges, and opening

## HEL [ 397 I HEL

Hellen inveterate obitructions of the remoter glards. It often proves a powerful mmenagoruc in plethoric habits, where fleel is ineffectual or improper. In fome parts of Germany, a fpecies of black hellebore has been made ufe of, which frequently produced violent, and fomctimes deleterious, effects. It appears to be the fctid kind of Limmeus, called in Enghilh fetti'rwort, fetteruort, or ballard hellevore. The roots of this may be diftingufhed from thofe of the true kind, by their being le is black.

HELLEN, the fon of Deucalion, is faid to have given the name of Hellenifts to the people beice called Greeks, 152 I B. C. Sce Greece.

HELLENISM, in matters of language, a phrafe in the idiom, genius, or conftruction of the Greek tongue.

This word is only ufed when fpeaking of the authors who, writing in a different language, exprefs themfelves in a phrafology peculiar to the Greek.

HELLENISTIC language, that ufed by the Grecian Jews wholived in Egypt and other parts where the Greek tongue prevailed. In this language it is faid the Septuagint was writen, and alfo the books of the New Teftament; and that it was thus denominated to fhow that it was Greek filled with Hebrarfms and Syriacifms.

HELLENISTS (Helleniffes), a term occurring in the Greek text of the New Teltament, and which in the Englifh verion is rendered Grecians.

The critics are divided as to the dignificance of the word. Cecumenius, in his Scholia on Acts vi. i. obferves, that it is not to be underfood as lignifying thofe of the rcligion of the Greeks, but thofe who fpoke
 gate verfion, indeed, render it likeours, Graci; but Meffieurs Du Port Royal more accurately, Fuifs Grecs, Greek or Grecian Jews; it being the Jews who fpoke Greck that are here treated of, and who are hereby diftingufhed from the Jews called Heorews, that is, who fyoke the Hebrew tongue of that time.

The Hellenifts, or Grecian Jews, were thofe who lived in Egypt and other parts where the Greek tongue prevailed. It is to them we owe the Greek verfion of the Old Teftament commonly called the Siptuagint, or that of the feventy.

Salmafius and Voffius are of a different fentiment with regard to the Hellenifts. The latter will only have them to be thofe who adhered to the Grecian interefts.

Scaliger is reprefented, in the Scaligerana, as aflerting the Hellenifts to be the Jews who lived in Greece and other places, and who read the Greek Bible in their fynagogue, and ufed the Greek language in facris; and thus they were oppofed to the Hebrew Jews who performed their public worfhip in the Hebrew tongue; and, in this fenfe St Paul fpeaks of himfelf as a Hebrew of the Hebrews, Phil. iii. 5. i.e. a Hebrew both by nation and language. The Hellenifts are thus proprly diftinguifhed from the Hellenes or Greeks, mentioned John xii. 20. who were Greeks by birth and nation, and yet profelytes to the Jewinh religion.

HELLENODIC压, Exanvoifxdi, in antiquity, the directors of the Olympian games. At firft there was only one, afterwards the number increafed to two and to three, and at length to nine. They affembled in a place called examodixaroy in the Elean forum, where
they were obliged to rcfide ten months before the cclebration of the games, to take care that fach as oftered themfelvs to contend, performod the ir $\pi \rho o \gamma^{2} \mu \mathrm{ra} \mathrm{\sigma} \mu \alpha-$ ra, or preparatory exercifes, and to be inftructed in all
 " kcepors of the law." And the better to prevent all unjuft praciices, they were further obliged to take an oath, that they wonld act impartially, would take no bribes, nor difcover the reafon for which they dilliked or approved of any of the contenders. At the folem. nity they fat naked, having before them the victorial crown till the exercifes were finifhed, and then it was prefented to whomfoever they adjudged it. Neverthelefs, there lay an appeal from the hellenodice to the Olympian fenate.

HELLESPONT, a narrow frait between Afa and Europe, near the Propontis, which received its name from heile who was drowned there in her voyage to Colchis. It is celebrated for the love and deach of Leander, and for the bridge of boats which Xerres built over it when he invaded Grece. The folly of this great prince is well known in beating and fettering the waves of the fea, whofe impetuodity feattcred his hips, and rendered all his labours ineffectual. It is naw called the Dardenelles. It is abont 33 miles long, and in the broadeft partsthe Afiatic conft is about one mile and a half diftance from the European, and only half a mile in the narroweft, according to modern inveftigation, and the cocks are heard crowing from the oppofite fhores.

HELLEN'S (St) a town of the Inc of Wight in Eaft-Medina, has a bay which runs a conliderable way within land, and in a war with France is often the ftation and place of rendczoous for the Englifl navy. At the mouth of the bay is that clufter of rocks called the Mixen. It had an old church fituated at the extremity of the coaft, which was endangered to be wafhed away, as was a great part of the church-yard, which occationed a new church to be bnilt in 1719 . The priory to which the old church belonged is now converted into a gentleman's feat ; is in a remarkably pleafant fituation, and commands a fine profpect of Portfinouth and the Road at Spithead. St Helen's appears to have been of more confideration in former times than at prefent.

HELM, a fong and flat picce of timber, or an affenblage of feveral pieces fufpended along the hinder-part of a hhip's ftern-poit, where jt turns upon hinges to the right or left, ferving to direct the courfe of the veffel, as the tail of a firh guides the body,

The helm is ufually conpoled of three parts, viz. the rudder, the tiller, and the whecl; except in fmall veffels, where the whec is unneceflary.

As to the form of the rudder, it becomes gradually broader in proportion to its diftance from the top, or to its depth under the water. The back, or inner part of it , which joins to the ftern-poft, is diminifhed into the form of a wedge throughout its whole length, fo as that the rudder may be more eafily turned from one fide to the other, where it makes anobtafe angle with the keel. It is fupported upon hinges; of which thofe that are bolted round the ftern-poft to the after-extremily of the hip, are called googings, and are furnithed with a large hole on the after part of the fternpoft. The other parts of the hinges, which are bolted

Hellefyoze

## H E L [ 398 ] E L

Helm. to the back of the rudder, are called pintles, being ftrong cylindrical pins, which enter into the googings, and reft upon them. The length and thicknefs of the rudder is nearly equal to that of the ftern-poft.

The rudder is turned upon its hinges by means of a long ftrap of timber, called the tiller, which is fixed horizontally in its upper end within the veffel. The movements of the tiller to the right and left, accordingly, direct the efforts of the rudder to the government of the thip's courfe as the advances, which, in the fea-language, is called fleering. The operations of the tiller are guided and affifted by a fort of tackle, communicating with the fhip's fide, called the tillerrope, which is ufually compofed of untarred rope-yarns for the purpofe of traverfing more readily through the blocks or pullies.

In order to facilitate the management of the helm, the tiller-rope, in all large veffels, is wound about a wheel, which acts upon it with the power of a crane or windlafs. The rope employed in this fervice being conveyed from the fore-end of the tiller $k$, to a fingle $\dagger$ See $D_{\text {eck. }}$. block $i$, on each fide of the fhip $\dagger$, is farther commuPl, CLVI. nicated to the wheel, by means of two blocks fufpended near the mizen-maft, and two holes immediately above, leading up to the wheel, which is fixed upon an axis on the quarter-deck, almoft perpendicularly over the fore-end of the tiller. Five turns of the tiller-rope are ufually wound about the barrel of the wheel; and, when the helm is amid-fhip, the middle turn is nailed to the top of the barrel, with a mark by which the helmfman readily difcovers the fituation of the helm; as the wheel turns it from the farboard to the larboard fide. The fpokes of the wheel generally reach about eight inches beyond the rim or circumference, ferving as handles to the perfon who fteers the veffel. As the effect of a lever increafes in proportion to the length of its arm, it is evident that the power of the helmfman to turn the wheel will be increafed according to the lengith of the fpokes beyond the circumference of the barrel.
Plate CCXXVI, with in BD , fig. I. it receives an immediate hock from the water, which glides along the fhip's botton in running aft from A to B; and this fluid pufhes it towards the oppofite fide, whilf it is fetained in this pofition : fo that the ftern, to which the rudder is confined, reccives the fame impreffion, and accordingly turns from $B$ to $b$ about fome point $c$, whilft the head of the fhip paffes from $A$ to $a$. It mult be obferved, that the current of water falls upon the rudder obliquely, and only frikes it with that part of its motion which acts according to the fine of incidence, pufhing it in the direction NP, with a force which not only depends on the velocity of the fhip's courfe, by which this current of water is produced, bit alfo upon the extent of the fine of incidence. This force is by confequence compofed of the fquare of the velocity with which the fhip advances, and the fquare of the fine of incidence, which will neceffarily be greater or fmaller according to circumftances; fo that if the veffel runs three or four times more fwiftly, the abfolute fhock of the water upon the rudder will be nine or 16 times fronger under the fame incidence: and, if the inci-
dence is increafed, it will yet be augmented in a greater proportion, becaufe the fquare of the fine of incidence is more cnlarged. This impreffion, or what is the fame thing, the power of the helm, is always very feeble when compared with the weight of the veffel ; but as it operates with the force of a long lever, its efforts to turn the Mip are extremely advantageous. For the helm being applied for a great diftance from the centre of gravity $G$, or from the point about which the veffel turns horizontally, if the direction PN of the impreffion of the water upon the rudder be prolonged, it is evident that it will pais perpendicularly to $R$, widely diftant from the centre of gravity $G$ : thus the abfolute effort of the water is very powerful. It is not therefore furprifing that this machine impreffes the fhip with a confiderable circular movement, by pulhing the ftern from $C$ to $b$, and the head from $A$ to $a$; and even much farther whilf the fails with rapidity, becaufe the effect of the heln always keeps pace with the velocity with which the veffel advances.
Amongft the feveral angles that the rudder makes with the keel, there is always one polition more favourable than any of the others, as it more readily produces the defired effect of turning the fhip, in order to clange her courfe. To afcertain this, it muft be confidered, that if the obliquity of the rudder with the keel is greater than the obrufe angle ABD, fo as to diminifh that angle, the action of the water upon the rudder will increafe, and at the fame time oppofe the courfe of the fhip in a greater degree; becaufe the angle of incidence will be more open, fo as to prefent a greater furface to the fhock of the water, by oppofing its paffage more perpendicularly. But at that time the direction NP of the effort of the helm upon the fhip will pafs with a fmaller diftance from the centre of gravity $G$ towards $R$, and lefs approach the perpendicular NL, according to which it is abfolutely neceffary that the power applied fhould act with a greater effect to turn the veffel. Thns it is evident, that if the obtufe angle $A B D$ is too much inclofed, the greateft impulfe of the water will not counterbalance the lofs fuftained by the diftance of the direction NP from NL, or by the great obliquity which is given to the fame direction NP of the abfolute effort of the helm with the keel AB. If, on the contrary, the angle $A B D$ is too much opened, the direction NP of the force of the action of the helm will become more adrantageous to turn the veffel, becaufe it will approach nearer the perpendicular $N \mathrm{~L}$; fo that the line prolonged from $N P$ will increafe the line GR, by removing $R$ to a greater diftance from the centre of gravity $G$ : but then the helm will receive the impreflion of the water too obliquely, for the angle of incidence will be more acute; fo that it will only prefent a fmall portion of its breadth to the fhock of the water, and by confequence willonly receive a feeble effort. By this principle it is eafy to conceive that the greateft diftance GR from the centre of gravity $G$, is not fufficient to repair the diminution of force occafioned by the too great obliquity of the fhock of the water. Hence we may conclude, that when the water either ftrikes the helm too direetly, or too obliquely, it lofes a great deal, of the effect it ought to produce. Between the two extremes there is therefore

Helm;

# HEL 

for a mean pofition, which is the moft favourable to its operations.
The diagonal NP of the rectangle IL reprefents the abfolute direction of the effort of the water upon the helm. NI expreffes the portion of this effort which is oppofed to the dhip's head-way, or which puthes her aftern, in a direction parallel to the keel. It is cafily perceived, that this part NI of the whole power of the helm contributes but lirtle to turn the veffel; for, if IN is prolonged, it appears that its direction approaches to a very fmall diftance GV from the centre of gravity $G$; and that the arm of the lever $B N=G V$, to which the force is applied, is not in the whole more than equal to half the breadth of the radder : but the relative force NL, which acts perpendicular to the keel, is extremely different. If the fird NI is almoft ufelefs, and even pernicious, by retarding the velocity; the fecond NL is capable of a very great effect, becaufe it operates at a confiderable diftance from the centre of gravity $G$ of the hip, and acts upon the arm of a lever GE, which is very long. Thus it appears, that between the effects NL, and NI which refult from the abfolute effort NP, there is one which always oppofes the fhip's courfe, and contributes little to her motion of turning; whilft the other produces only this movement of rotation, without operating to retard her velocity.

Geometricians have determined the moft advantageous angle made by the helm with the line prolonged from the keel, and fixed it at $45^{\circ} 44^{\prime}$, prefuining that the fhip is as narrow at her floating-line, or at the line deferibed by the furface of the water round her bortom, as at the keel. But as this duppofition is abfolutely falfe, inafmuch as all veffels augment their breadth from the keel upward to the extreme breadth where the floating-line or the higheft water-line is terminated ; it follows, that this angle is too large by a certain number of degrees. For the rudder is impreffed by the water, at the height of the floaing-linc more directly than at the keel, becanfe the fluid exactly follows the horizontal outlines of the botton ; fo that a particular pofition of the helm might be fuppofed neceffary for each different incidence which it encounters from the keel upwards. But as a middle polition may be taken between all thefe points, it will be fufficient to conlider the angle formed by the fides of the fhip, and her axis, or the middle line of her length, at the furface of the water, in order to determine afterwards the mean point, and the mean angle of incidence.

It is evident that the angle $54^{\circ} 44^{\prime}$ is too open, and very unfavourable to the hip's head-way, becaufe the water acts upon the rudder there with too great a fine of incidence, as being equal to that of the angle which it makes with the line prolonged from the keel below: but above, the fhock of the water is almoft perpendicular to the rudder, becaufe of the breadth of the bottom, as we have already remarked. If then the rudder is only oppofed to the fluid by making an angle of $45^{\circ}$ with the line prolonged from the keel, the impreffion, by becoming weaker, will be lefs oppofed to the fhip's head-way, and the direction NP of the abfolute effort of the water upon the helm drawing nearer to the lateral perpendicular, will be placed more advantageoufly, for the reafons above mentioned. On
the other hand, experience daily teftifies, that a hip ftecrs well when the rudder makesthe angle DBE equal to $35^{\circ}$ only.

It has been already remarked, that the effect of moving the wheel to govern the helm increafes in proportion to the length of the fpokes; and fo great is the power of the wheel, thar if the helmfinan employs a force upon its fpokes equivalent to 30 pounds, it will produce an effect of 90 or 120 pounds upon the tiller. On the contrary, the action of the water is collected into the middle of the breadth of the rudder, which is very narrow in comparifon with the length of the tiller ; fo the effort of the water is very little removed from the fulcrum $B$ upon which it turns; whereas the tiller forms the arm of a lever 10 or 50 times longer, which alfo increafes the power of the helmfman in the fame proportion that the tiller bears to the lever upon which the impulfe of the water is directed. This force then is by confequence ro or 15 times ftronger; and the effort of 20 pounds, which at firft gave the helmfman a power equal to 90 or 120 pounds, becomes accumulated to one of 900 or 1800 pounds upon the rudder. This advantage then arifes from the fhortnefs of the lever upon which the action of the water is impreffed, and the great comparative length of the tiller, or lever, by which the rudder is governed; together with the additional power of the wheel that directs the movements of the tiller, and ftill farther accumulates the power of the helmfman over it. Such a demonftration onght to remove the furprife with which the prodigious effect of the helm is fometimes confidered, froman inattention to its mechanifm : for we need only to obferve the preffure of the water, which acts at a great diftance from the centre of gravity $G$, about which the hip is firppofed to turn, and we fhall eafily perceive the difference there is between the effort of the water againft the helmifman, and the effect of the fame impulfe againft the veffel. With regard to the perfon who fteers, the water acts only with the arm of a very fhort lever NB, of which B is the fulcrum ; on the contrary, with regard to the hip, the force of the water is impreffed in the direction NP, which paffes to a great difance from $G$, and acts upon a very long lever EG, which renders the action of the rudder ex tremely powerful in turning the veffel; fo that, in a large fhip, the rudder receives a fhock from the water of 2700 or 2800 pounds, which is frequently the cafe when the fails at the rate of three or four leagues by the hour ; and this force being applied in E, perhaps 100 or 110 feet diftant from the centre of gravity $G$, will operate upon the flip, to turn her about, with 170,000 or 308,000 pounds; whilft, in the latter cafe, the helmfinan acts with an effort which exceeds not 30 pounds upon the fpokes of the wheel.

After what has been faid of the helm, it is eafy to judge, that the more a fhip increafes her velocity with regard to the fea, the more powerful will bethe effect of the rudder ; becaufe it acts againft the water with a force, which increafes as the fquare of the fwiftrefs of the fluid, whether the fhip advances or retrests'; or, in other words, whether fhe has head-way or ftern-way; with this diftinction, that in thefe two circumfances the effects will be contrary. For if the veffel retreats, or moves aftern, the helm will be impreffed from I to $N$; and inftead of being pufhed according to $N P$, it

## HEL

Hefmet
will reccive the effort of the watcr from $N$ towards $R$; fo that the ftem will he trmported to the fame movement, and the head turned in a contrary direction.

When the heln operates by itfelf, the centre of rotation of the hip, aind her movement, are determined by eftimaing the force of this machine; that is to fay, by multiplying the furface of the rudder by the fquare of the flip's velocity.

There are feveral terms in the fea-language relating to the helm; as, Bear up the beln'; that is, Let the hip go more large before the wind. Helm a midfhip, or risht the helm: that is, Keep it even with the middle of the hip. Port the helm. Put it over tothe left lide of the fhip. Starboard the helm, Put it on the right fide of the fhip.

HELMET an ancient defenfive armonr worn by horfemen both in war and in tournaments. It covered both the head and face, only leaving an aperture in the front fecured by bars, which was call. td the vifor

In atchievements, it is placed above the efcutcheon for the principal ornament, and is the true mark of chivalry and nobility. Helmets vary according to the different degrees of thofe who bear them. They are alfo ufed as a bearing in coats of arms. See Heraxdry.

HELMINTHOLITHUS, in natural hiftory, a name given by Linnæus to petrified bodies refembling worms.

Of thefe he reckons four genera. 1. Petrified lithophyta, found in the mountains of Sweden. 2. Petrified hiells. 3. Petrified zoophytes. 4. Petrificd reptiles.

HELMONT (John Baptift Van), a celebrated Flemifi gentleman, was born at Bruffels in 1577. He acquired fuch 1 kill in natural philofophy, phyfic, and chemiftry, that he was accounted a magician, and thrown into the inquifition: but having with difficulty juftified himfelf, as foon as he was releafed he retired to Holland; where he died in 1644 . He publithed, 1. De magnetiea corporum curatione. 2. Febriun doctrina inaudita. 3. Ortus medicina. 5. Paradoxa de aquis fpadanis; and other works, printed together in one volume folio.

Heemont, a fimall town in the Netherlands, in Dutch Brabant, and capital of the Diftrict of Peeland, with a good caftle. It is feated on the river Aa, in Elong. 5. 37. N. Lat. 51. 3r.

HELMSTADT, a town of Germany, in the duchy of Brunfwick, built by Charlemagne, in E. Long. II. 10. N. Lat. 52. 20.

Helmestadt, a ftrong maritime town of Sweden, and capital of the province of Holland, feated near the Balic Sea; in E. Long. 2I. 5. N. Lat. 56. 44.

HeLONIAS, in botay: A genus of the trigynia order, belonging to the hexandria clafs of plants; and in the nutural method ranking under the roth order, Coronaria. The corolla is hexpetalous; there is no calyx; and the capfule is tribocular.

HELOISE, famous for her unfortmate affection for her tutor Abelard, and for her Latin letters to him after they had retired from the world. She died abbefs of Paraclet in 1163 . Sce Abelard.

HELOS, (anc. geog.), a maritime town of La-' conia, finnated between Trinafus and-Acriæ, in Pau-
fanias's tinc in rains. The diftrict was called Hefore, and the people Heloter, Helotce, Helei, and H:leat.f, by Stephianus; and Itota, by Livy. Being fubdued by the Lacedxmonians, they were all redaced to a flate of public flavery, or made the laves of the pub. lic, on thefe conditions, viz. that they neither conld recover their liberty, nor be fold out of the territory of Sparta. Hence the term $\varepsilon$ encotsusv, in Harpocration, for being in a feate of flavery; and hence alfo the Lacedemonians called the flaves of all nations whatever belotes. Heloticus is the epithet.

HELOTS, in Grecian antiquity, the flaves of the Spartans. See Hexos.-The freenien of Sparta were forbidden the exercife of any mean or mechanical employment, and therefore the whole care of fupplying the city with neceffaries Jeveloped upon the Helots.

## HELSINBURG. Sce Eilsinburg.

HELSINGIA, a province of Sweden, bounded on the north by Jempterland and Medelpadia, on the eaft by the Bothnic galf, and on the foath and weft by Dalecarlia and Geftricia. It is full of mountains and foreils, and the ininabitants are almoft conflantly em. ployed in hunting and fiming. It has no cities: the principal towns are, Hudwickvald, Alta, and Dilfbo.
hillsingic character, a peculiar kind of character found infcribed on fones in the province of Helfingia. The Runic and Hellingic characters may be eafily transformed into each other.

HELSTON, a town of Cornwall in England, feated on the river Cober, near its influx into the fea. It is one of thofe appointed for the coinage of tir and the place of affembly for the weft divifion of the thire. By a grant of Edward III. it has a market on Saturday, and fairs on March 13 th, July 20 th, September gith, November 8th, the fecond Saturday before St Thomas's day, and the Saturday before Midlent-Sunday, YaimSunday, and Whit-Monday. It had formerly a priory and a caftle, and fent members to pariament in che reign of Edward I. but was not incorporated till the 27 th of queen Elizabeth, who appointed a mayur, to be chofen on Seprember 29. and four aldermen, who are to be of the commion-councilmen, and to chufe 24 alfiftants; it was re-incorporated Auguit 16.1774. Here is a large market-houfe and a guild-hall, and four ftreets that lie in the form of a crofs, with a little channel of water running through each. The fteeple of the church, with its fire, is 90 feet high, and a feamark. A little below the town there is a tolerable good harbour, where feveral of the tin-mips take in their lading. King John exempted this place from paying toll any where but in the city of London; and from being impleaded any where but in their own borongh. It contains about 400 houfes, is well inhabited, and fends two members to parliament.

HELVELIA, in botany ; a genus of the natural order of fungi, belonging to the cryptogamia clafs of plants. The fungus is of the flape of a top.

HELVETIC, fomething that has a relation to the Switzers, or inhabitantsof the Swifs cantons, who vere anciently called $H$ elvetii,-The Helvetic body comprehends the republic of Switzerland, confifing of 12 cantons, which make fo many particular conmonwealths. By the laws and cuftoms of the Helvctic body, all differences berween the feveral ftates and republics are to be decided within themfelves, without the intervention

## HEL [ 40r] HEM

of any foreign power. The government 6 this body is chiefly demoratic, with fome mixture of the arifto. cratic.

HELVETII, a people of Belgica, in the neighbourhood of the Allobroges and the Provincia Romana; famed fur bravery and a turn for war. Called Civitas Helvetia, and divided into four Pagi or Cantons : fitu. ated to the fouth and weft of the Rhine, by which they were divided from the Germans ; and extending towards Gaul, from which thiy were feparated by nount Jura on the weft, and by the Rhodanus and Lacus Lemanus on the fouth, and therciore called a Gallic nation (Tacitus, Cæfar, Strabo, Ptolcmy, Pliny.) Formerly a part of Celtic Gaul, but by Augultus afligned to Belgica.

HELVETIUS (Adrian), an eminent phyfician, born in Holland. After having ftudied phylic at Leyden, he went to Paris, where he acquired great reputation in his profelfion. He introduced in France the ufe of Ipecacuanha in the cure of dyfenterics; a remedy which he at firft kept fecret, but was ordered to make it public, and on that account received a gratification from the king of 1000 louis d'ors. He was made infpector-general of the hofpitals in Flanders, phyfician to the duke of Orleans, regent of France, \&c.; and died at Paris, 1727, aged 65. He wrote a treatife on the moft common difeafes, and the remedies proper for their cure (the beft edition of which is that of 1724 , in two volumes octavo); and other works.

Helvetius (John Claude), fon of the above, was born in 1685 , and died in 1755 . He was firf phyfician to the queen, and greatly encouraged by the town as well as court. He was, like his father, infpecior. general of the military hofpitals. He was of the Academy of Sciences at Paris, of the Royal Society in London, and of the Academies of Pruffia, Florence, and Bologne. He is the author of I . Idée Générale de l'économic animale, $1722,8 v 0.2$. Principia Phy fico-Medica, in ty ronum Meducincegratiam conforipta, 2 vols. 8 vo .

We may juft mention alfo, that he is the father of the Monf. Helvetius, who wrote the celebrated book Del'Efprit; and whom Voltaire calls " a trae philofopher;" but whofe book was ftigmatized by the authors of the Fournal de Trevoux, and fuppreifed by the government.

HELVICUS (Chriftopher), profeffor of divinity, Greek, and the Oriental tongues, in the univerfity of Giffen, died in the fower of his age in 1017; after baving publifhed feveral books, and projected more. The Hebrew language was fo familiar to him, that he fpoke it as fluently as his mother tongue. He was not only a good grammarian, but alfo an able chronologer. His chronological tables have been greatly efteemed, thongh they are not free from errors.

HELVIDIANS, a fect of ancient heretics, denominated from their leader Helvidins, a difciple of Auxentius $t^{\text {ho }}$ Arian, whofe diftinguifhing principle was, that Mary, the morher of Jefus, did not coutinue a virgin, bur had other children by Jofeph.

HELVOET-slurs, a fea-port town of the United Netherlands, feated on the illand of Voorn, in the province of Holland, and where the Englifh packetboat always goes. It is but a fmall place, confifting on!y of a handfome quay, and two or three little

Areets. But it is very well fortified, and cheemed the fafeft harbour in the country. The largeft men of war may come up to the middle of the town; and yet it has but very little trade, becanfe the merchants choofe to live higher up the country. E. Long. 4. 0. N. Lat. 5I. 44.

HENATH, or Hamath, (anc. geog.), the name of a city (whofe king was David's fiiend, 2 Sam. ix.) to the fouth of Lebanon; from which a territory 1 las called Nemath, on the north of Camann and fouth of Syria, as appears by the fies, Numb. xiii. I Kiugs vii. Ezek. xlvii. Whether one or morecities and diftricts of this name lay in this tract, neither intepre. ters nor geographers are agreed. The eaftern part was called Hematb-zoba, 2 Chron. viii. unlefs we fuppofe that there was a city in Zoba of this name fortitied by Solomon. In defining the boundary of paleftine, it is often fail, from the enterizg of Hamatio; as a province to be entered into through a ftrait or defile. And if there was fuch, the nextqueltion is, From what metropolis it was called Hemath? Antioch, capital of Syria, is fuppofed to be called Hemath or Anatha, (Jonathan, Targum, \&c.); and again, Epiphania, (Jofephus.) Both were to the north of Lebanon; confequently not the Hemath of Scripture, the immediate boundary of Paleftiae to the north, and lyiarg to the fouth of Lebanon.

## Hematites. See Hematites.

HEMELAR (John), an eminert antiquarian, and canon of Antwerp, in the 17 th century, was born at the Hague; and wrote a work, entilled Expofitio $N_{u}$ mifmatum imperatorum Romanorum á fulio Lia fare ad Heraclium; which is very fcarce, though it has had feveral editions.

HEMEROBAPTISTS, a fect among the ancient Jews, thus called from their wafhing and bathing every day, in all feafons ; and performing this cuftom uith the greateft folemnity, as a religious rite necelfary to falvation.

Epiphanius, who mentions this as the fourth herefy among the Jews, obferves, that in other points thefe heretics had much the fame opinions as the Scribes and Pharifees : only that they denied the refurrection of the dead, in common with the Sadducees, and retained a few other of the improprieties of thefe laft.

The fects who pafs in the Ealt under the denomination of Sabians, calling themfelves Mendai Izahi, or the difciples of $70 h n$, and whom the Europeans entitle the Cbriftians of St Jobn, becaufe they yet retain fome knowledge of the gofpel, are probably of Jenilhorigin, and feen to have been derived from the ancient Hemerobaptifts; at leaft it is certain, that that John, whom they confider as the founder of their fect, bears no fort of fimilitude to John the Baptif, but rather refembles the perfon of that name whom the ancient writers reprefent as the chief of the Jewilh Hemerobaptifts. Thefe ambiguous Chriftians dwell in Peria and Ara. bia, and priscipally at Baffora; and their religion confifts in bodily wafhings, performed irequenty, and with great folemnity, and attended with certain ceremonies which the priefts mingle with this fuperftitiw ous fervice.

HEMEROBIUS, in zoology : A genus of infeces of the nemropera order ; the characters of whin are 3 D
thefe,

Hemerocallis, Hemerodromi,

cexxxiv
thefe. The mouth is furnimed with two teeth; the palpi are four ; the wings are deflected, but not plaited; and the antennæ are briftly, and longer than the breaft. There are i 5 fpecies, principally ditinguifhed by their colours.-This infect takes the name of hemerobius from the fhortnefs of its life, which, however, continues feveral days. In the ftate of larva ir is a great devourer of plant-lice, for which it has had beftowed upon it the
Barbut's
Infects. appellation of lion of the plant-lice. The hemerobii, even after their cransformation, preferve their carni-
verous inclination. Not fatisfied with making war upon the plant-lice, who tamely let themfelves be devoured, they do not fpare each other. The eggs of this infect are born upon fmall pedicles, which are nothing but a gum fpun out by the hemerobins by raifing up the hinder part of itsabdomen, and by that means the egg remains fattened to the upper part of the thread. Thofe eggs are depofited upon leaves, and fet in the form of bunches. They have been taken for parafitic plants. The larva, when hatched, finds there its food in the midft of the plant lice. In 15 or 16 days it has attained to its fall growth. With its fpinning wheel at its tail, it makes itfelf a fmall, round, whire, filky cod, of a clofe texture. In fummer, at the end of three weeks, the hemerobius iffues forth with its wings ; but when the cod has not been fpun till autumn, the chryfalis remains in it the whole winter, and does not undergo its final metamorphofis till the enfuing fring. The flight of this infect is heavy : fome fpecies have an excrementitious fmell. One goes by the name of the water-hemerobius, becaufe it lives moftly at the water-fide.

HEMEROCALLIS, DAY-LIIy, or lily afphodel: A genus of the monogynia order, belonging to the hexandria clafs of plants; and in the natural method ranking under the loth order, Coronaria. The corolla is campanulated, with the tube cylindrical ; the ftamina declining downwards.

Species. 1. The flava, or yellow day-lily, hath frong fibrous roots, fending up large hollow keelfhaped leaves, two feet long, upright, leaflefs firm ftalks, two feer high; dividing at top into feveral footthalks, each terminated by one large lilaceous yellow flower of an agreeable odour. Of this there is a variety called the bemerocallis minor, or fmall y ellow daylily. 2. The fulva, reddifh, or copper-coloured daylily, hath roots compoied of ftrong flefhy fibres and large oblong tubes; radical, keel-fhaped, hollow, pointed leaves, a yard long, reflected at top; with leaflefs ftalks three or four feet ligh, and large copper coloured hilaccous flowers. Thefe have large ftamina, charged with a kind of brown-coloured farina; which on being touched or finelled to, is difcharged in great plenty all over the hands and face.

Culture. Both thefe fpecies are hardy, and will thrive any where. They may be eafily progagated by parting their roots in autumn, or almoft any time atter flowering, or before they begin to flower.
HEMERODROMI, (compounded of $x \mu_{\varepsilon \rho z}$ "day," and $\delta p a \mu \mathbb{Q}$ " courfe," \&6.) among the ancients, were centinels or guards, appointed for the fecurity and prefervation of cities and other places. They went out of the city every morning as foon as the gates were opened, and kept all day patrolling round the place; fome. times alfo making excurfons farther into the country,
to fee that there were no enemies lying in wait tofurprife them.

Hemerodromi were alfo a fort of couriers among the ancients, who only travelled one day, and then delivered their packets or difpatches to a frefh man, who run his day, and fo on to the end of the journey. The Greeks had thefe fort of couriers, which they derived from the Perfians, who were the inventors thereof, as appears from Herodotus. Auguftus had the fame; at leaft he eftablifhed couriers, who, if they did not relieve each other from day to day, yet did it from fpace to fpace, and that fpace was not very great.

HEMEROTROPHIS, in antiquity, a meafure of capacity, the fame with the chonix. It was fo called from its holding one day's food. The word is compounded of $n \mu s p a$ a day, and $\tau \rho \circ \phi n$ food.

HEMI, a word ufed in the compofition of divers terms. It fignifies the fame with femi or demi, viz. " half;"'being an abbreviature of nusous hemi/ys, which fignifies "the fame." The Greeks retrenched the laft fyllable of the word nuraus in the compofition of words ; and after their example, we have done fo too in moft of the compounds borrowed from them.

HEMICRANIA, in medicine, a fpecies of cephalalgia, or head-ach; wherein only one fide of the head is affected; and owing to a congeftion of blood in the veffels of that half.

HEMICYCLE, Hemicycium, compounded of nurous half, and xuxios circle, a femicircle.

Hemicycie is particalarly applied in architecture, to vaults in the cradle form; and arches or fweeps of vaults, conflituting a perfect femicircle. To conftruct an arch of hewn ftone, they divide the hemicycle into fo many vouffoirs; taking care to make them an uneven number, that there be no joint in the middle, where the key fone fhould be. See Key and Bridge.

Hemicyclium was alfo a part of the orcheftra in the ancient theatre. Scaliger, however, obferves, it was no ftanding part of the orcheftra; being only ufed in dramatic pieces, where fome perfons were fuppofed to be arrived from fea, as in Plautus's Rudens.

The ancients hadalfo a fort of fun-dial, called bemicyclium. It was a concave femicircle, the upper end or cufp whereof looked to the north. There was a fyle, or gnomon, iffuing from the middle of the hemicycle, whereof that point correfponding to the cen tre of the hemicycle reprefented the centre of the earth; and irs thadow projected on the concavity of the hemicycle, which reprefented the face between one tropic and another, the fun's declination, the day of the month, hour of the day, \&c.

HEMIMERIS, in botany; a genus of the angiofpermia order, belonging to the didynamia clafs of plants. The capfule is bilocular, with one of the cells more gibbous than the other; the corolla is wheelfhaped; with one divifion greater, and inverfe heartthaped; the interftice of the divifions nectar-bearing.

HEMINA, in Roman antiquity, a liquid meafure, which, according to Arbuthot, was equal to half a wine pint Englifh meafure; its contents being 2.818 folid inches.

HEMIOBOLON, a weight often mentioned by the ancient writers in medicine, and expreffing the half of their obolus, or the twelfth part of a dram, that is, five grains.

HEMI

Hemerodromi H lon.

HEM
Hemionitis HEMIONITIS, in botany : A genus of the natuII ral order of filices, belonging to the cryptogamia clafs Hemp. of plants. The fructifications are in lines decuffating or croffing each other.

HEMIPLEGIA, or Hemiplexia, among phyficians, a palfy of one half of the body. See (the Index fubjoined to Medicine.

HEMIPTERA, derived from nurous half, and $\pi$ repor wing, in the Linnæan fyftem, the fecond order of infeets, comprehending twelve genera, viz. the blatta, mantis, gryllus, fulgora, cicada, notone Cta, nepa, czmex, aphis, chermes, coccus, and thrips, and a great number of fpecies. See Entomology, Insects, and Zoolocy.

Hemisphere, (Hemispherium, compounded of nu/rus half, and oqexpa Sphere, in geometry, is one half of a globe or fphere, when divided into two by a plane pafling through its centre.

Hemisphere, in aftronomy, is particularly ufed for one halt of the mundane fphere.

The equator divides the fphere into two equal parts, called the northern and fouthern hemi/pheres. The horizon alfo divides the fphere into two parts, called the upper and the lower bemifpheres.

Hemisphere is alfo ufed for a map, or projection, of half the terreftrial globe, or half the celeftial fphere, on a plane. Hemifpheres are frequently called planiSpheres.

HEMISTICH, in poetry, denotes half a verfe, or a verfe not completed.

Of this there are frequent examples in Virgil's $\mathscr{E}$ neid; but whether they were left anfinifhed by defign or not, is difputed among the learned: Such are, Ferro accinEfa vocat, 压n. II. v.614. And, Italiam non fponte fequor, Æn. IV. V. 36 I .

In reading common Englifh verfes, a fiort paufe is required at the end of each hemiftich or half verfe.

HEMITONE, in the ancient mufic, was what we now call a half note or femitone.

HEMITRITÆUS, in medicine, a kind of fever, denoting the fame as femi-tertian, returning twice every day. The word is Greek, and compounded of vuraus "half," and $\tau p i \tau a, G$ " third or tertian."

HEMLOCK, in botany. See Cicuta and Conium.

Hemoiptoton. See Oratory, no 77.
HEMP. See Cannabis.-It does not appear that the ancients were acquainted with the ufe of hemp, in refpect of the thread it affords. Pliny, whof peaks of the plant in his natural hiftory, lib. xx. cap. 23. fays not a word of this; contenting himfelf with extolling the virtues of its ftem, leaves, and root. In effect, what fome writers of the Roman antiquities remark, viz. that the hemp neceffary for the ufe of war was all fored up in two cities of the weftern empire, viz. at Ravenna and Vienne, under the direction of two procurators, called procuratores linificii, mult be underfood of linum or flax.

The ufe of hemp is fo extenfive and important, that vaft quantities of it are annually imported into feveral kingdoms from thofe countries where it grows in greateft plenty, of which Ruffia is one. In the year I $763^{\prime}$, the quantity imported into England alone a-
Annals of Agriculture. vol. xiii. p. 508. mounted to 11,000 tons. Sir John Sinclair informs us, that in the year 1785, the quantity exported from Peterfburg in Britifh hips was as follows.

Now, allowing 63 poods to a ton, the quantity juft mentioned will amount to 17,695 tons; and fuppoling it to take five acres to produce a ton of hemp, the whole quantity of ground requifite for this purpole would a mount to 88,475 acres.

By other accounts, the annual exports of hemp to Annals of England is valued at 400,0001 ; but by a computa- Agricuiture. tion of the whole imported into Britain and Ircland in I 788, it would feem that a confiderably greater quantity muft fall to the fhare of England. In that year the quantity amounted to no lefs than 58,364 tons: which at 201 . per ton amounted to $1,269,28 \mathrm{ol}$. We cannot wonder at this vaft confumpt, when it is confidered that the fails and cordage of a firlt rate man of war require $180,000 \mathrm{lb}$. of rough hemp for their conftructioh; but even this will fcarce account for the enormous confumpt in France, which in the year in 73 is faid to have amounted to upwards of 400 millions of pounds, or 200,000 tons; of which more than one third was imported.

Only the coarfer kinds of hemp are employed in making cordage, the better forts being ufed for linen, which though it can never be made fo fine as that from flax, is yet incomparably ftronger, and equally fufceptible of bleaching both in the old and new way. Cloths made of hemp have alfo this property, that their colour improves by wearing, while that of limen decays. The prices of hemp linen are varions; from iod. to 4s $6 d$. per yard. The low-priced kinds are very generally worn in Suffolk (where hemp is cultivated) by hufbandmen, fervants, \&c. thofe from is. 6d. to 25. by farmers and tradefmen; and thofe from 2s. 6d. to 45. 6d. are frequently preferred by gentlemen to flaxlinen, on account of their ftrength and warmth. The Englifh hemp is much fuperior in ftrength to that which grows in any other country. Next to it is the Ruffian, from which facking is ufually made, as it is fometimes allo from the offal of the Englifl kind, but none of the Suffolk hemp is ever made into cordage, on account of its finenefs. A confiderable quantity of Ruffia fheering is imported into England merely on account of its frength, and is much coarfer at the price than any other foreign linen.

Befides thefe ufes of henop, it is faid to poffers a property as a plint which renders it almoft invaluable; viz. that of driving away almoft all infects that feed upon other vegetables. Hence in fome places of the continent they fecure their crops from thefe mifchievous attacks, by fowing a belt of hemp round their gardens, or any particular fot which they wifle to preferve.

The important wfes of hemp, and the fuperiority of that produced in Britain to otherkinds, have rendered the culture of it an object of attention to government. Accordingly in the year 1787 , a bounty of threepence per ftone was allowed on all the hemp raifed in England ; and probably with a view to encourage the growth of Englifh hemip, duties have been laid on 3 D 2
that

## HEM [ 404 ] E M

Hemp. that which comes from abruad. Dreffed hemp in a Britifh flip pays 21. 4s. per cwt. import duty; in a foreign one 21.6 s .9 d . ; and in both cafes a drawback of Il. igs. is allowed. Undreffed hemp in a Britifh fhip pays 3 s .8 d. ; and in a foreign one 3 s. IId. In both cafes the drawback is 3s. 4d. The export of Britifh hemp is free.

The ufual height of the plant when growing is from five to fix feet, but this varies very confiderably according to circumftances. That which is cultivated near Bifchwiller in Alface is fometimes more than 12 feet high, and upwards of three inches in circumference, the falks being fo deeply rooted that a very ftrons man call farce pull them up. Mr. Arthur Young, in a tour through Catalonia in Spain, fays, that where the counrry is well watered, the crops of hemp are extraordinary; and that the plauts generally rife to the height of feven feet. In Italy hemp is generally enltivated, though the Bolognefe only can pretend to any fuperiority in the management of it. It is there fown upon their beflands, which are rich frongloams; and on which they are at all poffible pains to procure a fine friable furface. For manure they ufe dang, pieces of rotten cloth, feathers, and horns brought from Dalmatia. The plant, however, may be cultivated upon ground of every kind; the poorer land producing that which is finer in quality though in fmaller quanrity; whercas ftrong and rich land produces a great quantity, but coarfer. It does not exhauft the land on which it grows like flax, whence it is probable, that if properly managed, and care taken in the calcivation; it might be found to fuperfede flax entirely. A Sulfex manafacturer, who writes on this fubject in the Annals of Agriculture, informs us, that it may be raifed for many years fucceffively on the fame ground, provided it be well manured. An acre requires from nine to twelve pecks, according to the nature of the foil; the latter being the molt ufual, though a variation in the quality of the foil makes an alteration both in the quantity and quality of the hemp. An acre produces on an average 36 or 38 ftone. The abbe Brulle, in a treatife upon the Cul. ture and Management of Hemp, printed by order of the lords and committe of council for trade and foreign plantations, informs us, that the feafon for fowjng it extends from the 25 th of March to the 15 th of Junce. The feed ought always to be fown thin, not exceeding two buhels to an acre; and if you have the advantage of a drill plough, fill lefs uill anfwer: As there are two kinds of hemp, the male and female, of which the formerouly prodaces feed, fome regard muft be had to this circumftance. In Suffex the male and female are pulled together about 13 weeks after the fowing, but in the fins they are frequently feparated. This laft method is recommended by the abbe Brolle, who, for the more eafy accomplifhment of it, directs that little paths fhould be made lengthwife through the field at about feven feet diftance from each other, to allow a paffage for the perfon who pulls up the female hemp from among the other ; the latter requiriag to ftand more than a month after for the purpofe of ripening the feeds. The female hemp is known to be ripe by the fading of the flowers, the falling of the farina fecundans, and fome of the falks turning yellow. After the whole of this kind is pulled, it muft
be manufactured according to the directions to be afterwards given, and ought to be worked if poflible while green; the hemp thus produced being much finer than that which is previoutly dried. The reafon of this is, that the plant contains a great quantity of glutinous matter; which being once dried, agglutinates the fibres in fuch a manner that they can never be afterwards perfectly feparated. The female hemp, however, is always in fmaller quantity than the male; and therefore where the crop is large it will be impoflible to work the whole as faft as it is pulled or cut. It is known to be ripe by the ftems becoming pale; but it muft be remembered, that hemp of any kind will be much lefs injured by pulling the plants before they are ripe than by letting them ftand too long.

The male hemp being fripped of its leaves, \&c. as afterwards dire $\hat{\text { eted, will foon be dry for foring by }}$ the heat of the atmofphere, though fometimes it may be neceffary to ufe artificial means; but where thefe are ufed, the utmoft care mult be taken, hemp when dry being exceedingly inflammable. The fored or dricd hemp muft be fteeped and treated in every oiher refpect as though it had been green; whence it is evident that this operation ought never to be ufed but in cafes of neceflity It is likenife impoffible to make hemp which has been dried previous to its being fteep. ed fo white as that which has been worked green.

With regard to the perfection of hemp-feed for a Mill's Huf fubfequent feafon, it would feem proper to fer apart a bandry, piece of ground for this purpofe ; for M. Aimen, from vol, $\mathrm{v}_{6}$. 40 plants raifed in the common way, had only a pound and a half of feed, though the plants from which it was taken might be deemed fine; whereas, from a fingle plant which grew by itfelf, he had feven pounds and an half. Some are of opinion, that by putting the cluners which contain the hemp-feed to heat and fweat, the quality is improved; as many of thofe feeds which wouldotherwife witherand die, may thes arrive at perfection. This, bowever, feems to be very problematical; as there are no experiments which flow that feeds, when feparated from the vegetable producing them have any power of meliorating themfelves.

After the hemp is pulled, it muft be taken in large handfuls, cutting off the roots (though this is not abfolutely neceffary), the leaves, feeds, and lateral branches, being dreffed off with a wooden fword or ripple. It is then to be made up into bundles of twelve handfuls each, in order to be fteeped, like flax, in water. This, or fomething fimilar, is abfolutely neceffary, in order to feparate the bark, which is properly the hemp, from the reed or woody part. In Suffolk, this operation is called water retting; but fometimes a mere expofure to the air is fubltinted in its place, turning the hemp frequently during the time it is expofed. This is called dew-retting; but the former method is univerfally decmed preferable. Such hemp as is defigned for feed is feldom water-retted, though in the opinion of the manufacturer already quoted, it would be better if it were fo. Dew-retted hemp is generally flacked and covered during the wiater; in January and Febrnary is is fpread upon meadow land, and whitens with the frof and fnow; though it is always much inferior to the other; and proper for coarier yarns only.

The length of time required for feeping hemp is various.

Hemp.
various, and a complete knowledge of it can only be attained by practice. In Suffolk it is uftal to continue the immerfion four, five, or fix days; ftanding water is preferred, and the fame water will teep hemp three times during the feafon, but the firft has always the beft colour. The abbé Bralle prefers clear and ronning water, efpecially if overhung with trecs. The bundes are to be laid croffwife upon each other; taking particular notice of the manner in which they lie when put in, that they may be taken out without - difficulty. His time of fteeping is from fix to 11 days; and here we mult obferve, that it is much better to let it remain too long in the water than too fhort a time. The flendereft hemp requires the moft foaking. The operation is know to be finithed by the reed feparat. ing eafily from the bark.

After the hemp is thoroughly fteeped, the next operation is to feparate the bark from the reed or woody part; and this may be done in two ways, viz. either pulling out the reed from every falk with the hand, or drying and breaking it like flax. The abbe Brulle is very particular in his directions for this laft operation, which he calls reeding, and which may be performed either in a trough under water or upon a table. The whole, however, may be reduced to the following, viz. preffing down the bundtes either in the trough or on a table by proper weights, to keep the hemp fteady on the middle and top end. Then beginning at the upper part of the bundle, pullout the reeds one by one. As you proceed, the rind which remains will prefs clofely upon the remaining unreeded hemp, and keep it more fteady; fo that you may take two, four, or even fix ftalks, at a time. The weight is then to be removed from the top, and all the pieces of reed which remain there having broken off in the former operation, are to be taken out. Lally, the middle weight is to be taken off, and any fmall pieces which remain there taken out. If the reeding is performed on a table, the bundle muft be weeded frequently, though flightly; a continual dropping of water would perhaps be the beft method.

After the hemp is recded, it mult next be freed from the mucilaginous matter with which it fill abounds. This is done by pouring water through ir, fqueezing our the liquid after every affufion, but taking care not to let the threads twift or entangle each other, which they will be very apt to do. The abbe is of opinion, that foft foap hould be diffolved in the laft water, in the proportion of an ounce to three pounds of dry hemp; which though not abfolutely neceflary, contri. butes much to the foftening and rendering the hemp eafy and pleafant to drefs.

Hemp is broken by machinery, after being fteeped, in a manner fimilar to flax ; but the infruments ufed for this purpofe in Suffolk are all worked by the hand. That which breaks in the operation is called forts, and is about half the value of the long hemp. The beft water-retted hemp fells for about 8 s .6 d . per ftone; the other kind from one to two hillings lower.

Beating of hemp is the next operation, which formerly was performed eniirely by hand, but now in moft places by a water-mill, which raifes three heavy beaters that fall upon it alternately; the hemp being turned all the while by a boy in order to receive the ftrokes equally. The finer it is required to make the
tow, the more beating is neceffary. It is then dreffed or combed by drawing it through heckles formed like the combs of wool-manufacturers, only fixed. Sometimes it is divided into two or three forts of tow, and fometimes the whole is worked together into onefort; the prices varying from 6 d . to 1 s .6 d . per pound.

The hemp thas manufatured is fold to fpinners, who reel their yarn as follows.

It is next delivered to the bleachers, who return it bleached on receiving 20 or 21 clues for every 120 bleached. The prices of the hemp-yarn are as follow: I Clue from a pound - 7 d . or $6 \frac{5}{2} \mathrm{~d}$.

| $\underline{1} \frac{1}{2}$ from do. |  | $8 \frac{1}{2} \mathrm{~d}$. or 8 d. |
| :---: | :---: | :---: |
| 2 from do. | - | d, |
| ${ }_{2}{ }^{\frac{1}{7}}$ from do. | - | $10 \frac{1}{2}$ d. or $10 d$. |
| 3 from do. | - | 12 d . |

Chinefe Hemp, a newly difcovered fpecies of cannabis, of which an account is given in the 7 ad volunic of the Philofophical Tranfaetions, p. 46. In that paper Mr Eitz-Gerald, vice-prefident of the focicty for encouraging arts, mentions his having received the feeds from the late Mr Elliot: which being fown, according to his directions, produced plants 14 feet high, and nearly feven inches in circum ference. Thefe being pulled up in November, and fteeped for a fortnight in water, were placed againft a fouthern wall to dry. After this the hemp was found to feparate ealily from the woody part; and fo great was the produce, that 32 plants yielded three pounds and a quar. ter. In confequence of this fuccefs, Mr Fitzgerald applied to the directors of the India company to procure fome of the feeds from China; whith being complied with, the fociety were furnihed, in 1785 , with fome more of the feeds, which were diftributed to feveral of the members; but, notwithntanding their endeavours, few of the plants appear to have ripened. their feeds in that country. Two of the fpecies of hemp, tried by the duke of Northumberland, rofe to the height of 14 feet feven inches, and wonld have been much larger, had they not been hart by an high wind: another kind arofe only to that of three feet and an half, the ftem about the fize of a common wheat ftraw; but though it flowered well, did not produce any feed. Thefe kinds were fown in a hot-bed where the heat was very frong, on the 1 th of April. They appeared above ground in four days, and were tranflianted into pots on the 25 th. They were then put under an hot-bed frame where the heat had been gone off, to harden them for the naturak ground, in which they were planted on the 3oth, by turning them whole out of the pots; letting them, three together, be planted at ewo feet dilance every way; covering them at times for about ten days, until they were fuppofed to be rooted. Only a few feeds were preferved from plants which had been kept conftantly in a flove.

Other trials were attended with little better fuccefs; but, in 1786 , the Rev. Dr Hinton of Northe wold near Brandon, made a fuccefsfule experiment with - fome feeds he received from the fecretary of the fociety. They were fown on the 17 th of May, and ap-

Hemp peared on the 6th of June. The plants were few and fickly; and notwithitanding fome fine fhowers, they continued to languin fo much that the experiment was entirely abandoned, and buckwheat was harrowed into the ground for a fallow crop. In the beginning of October, however, the perfons employed in cutting the buckwheat difcovered fome feed in the heatds of a fewfraggling hemp plants which had been fuffered to grow in the crop; which being carefully threfhed, afforded three pints of feed tolerably bright and heavy. Thefe feeds were fown on the roth of May 1787. On the igth they appeared above the ground numerous and healthy. The male hemp was drawn on the 13 th of Auguft, but the female not till the 9 th of Oqober; the fpot on which the plants were fown meafured only 322 fquare yards, and produced of marketable hemp no lefs than 95 ftone 7 pounds 12 ounces; being upwards of one-third more than the beft crops of Englifh hemp are ever known to produce. Thus it appeared, that the feeds of the Chinefe hemp had retained their fuperiority over thofe of the Englifh; though how long they would continue to do fo cannot be determined but by experience. For this experiment Dr Hinton received a filver medal from the fociety. Few of the feeds either of Chinefe, or any other hemp, will vegetate if two years old at the time of fowing ; and to this circumftance the Doctor atiributes the failure of other trials of Chinefe hemp.

Hemp-Agrimony, a fpecies of cupatorium. See Eupatorium.

HEMPSTEAD, a town of Hartfordhire in England, fands among hills, upon a finall river called the Gade, and is feven miles to the weft of St Alban's, five miles fouth-eaft of Berkhamfted, and 20 northweft of London. The church bas a handfome tower with a tall fpire, and a good ring of bells: It was, in the time of the Saxons, called by the name of Henamfted, or Hean-Hemfted, i. e. High-Hemftead. In William the Conqueror's time, by the name of Hemelamftede. Henry VIII. incorporated this village by the name of a bailiff; and he empowered the inhabitants to have a common feal, and a pye-powder conrt during its markets and fairs. It has becn reckoned one of the greateft markets for wheat in this county, if not in England, 20,0001. a week being often returned in it only for meal. Fleven pair of mills ftand within four miles of the place, which bring a great trade to it ; but the road is thereby fo continually torn, that it is one of the worft turnpike ways to Lendon.

HEMSKERCK (Egbert), called the Old, a cele. brated Flemilh painter of drolls and converfations, of whon, though fo univerfally known, we have no in. formation as to the time in which he flourifhed, or the fchool in which he was tanght. Though the tatte of his compofitions is but low, yet it ought to be confidered that he took his fubjects from nature; from perfons in the meaneft occupations, whofe drefs, actions, and maners, could not furnifh the imagination with any ideas of elegance: and to exprefs their paflions and undifguifed humours, feems to have been the utmoft of his ambition. By frequenting fairs, merrymeetings. gaming-houfes, and inns, he acquired a furprifing power of connecting humorous circuniftances.

He defigned and drew correftly, and his pictures have Hemkerck a ftrong effect from his accurate management of the chiaro obfcuro. Some of his pictures have fuffered from unfkilful cleaners, and many things are fold as his which difhonour him; but his genuine works, well preferved, have a clearnefs and force equal to any of the Flemifh artifts.

Hemskerck (Egbert), called the roung, was the difciple of Peter Grebber, but imitated the manner of Brouwer and of the elder Hemfkerck. He was born at Haerlem in 1645, but fettled at London, where for a long time his works were exceedingly efteemed, though they are now much funk in their value. He had a whimfical imagination, and delighted in compofing uncommon and fanciful fubjeets; fuch as the temptation of St Anthony, nocturnal intercourfes of witches and fpectres, enchantments, \&c. which he executed with a free pencil and a fpirited touch. It was cuftomary with him to introduce his own portrait among the converfations he defigned; and for that purpofe had a fmall looking-glafs placed near his cafe. He died in 1704.

$H_{B N}$-Mould-foil, in agriculture, a term ufed by the hufbandmen in Northamptonfhire, in England, and other counties, to exprefs a black, hollow, fpongy, and mouldering earth, ufually found at the bottom of hills. It is an earth much fitter for grazing than for corn, becaufe it will never fettle clofe enough to the grain to keep it fufficiently fteady while it is growing up, without which the farmers obferve, it either does not grow well ; or, if it feems to thrive, as it will in fome years, the growth is rank, and yields much ftraw, but little ear. It is too moift, and to that is principally to be attributed this ranknefs of the crop in fome years; and the occafion of its retaining fo much moifture is, that it ulually has a bed of ftiff clay, which will not let the water run off into the under ftrata.
In fome places they alfo give this name to a black, rich, and denfe earth, with ftreaks of a whitifh mould in many parts. This fort of hen-mould is ufually found very rich and fertile.

HENAULT (Charles John Francis), was fon of John Remi Henault lord of Mouffy, and born at Paris in 1685 . He early difcovered a ferightly benevolent difpofition, and his penetration and aprnefs foon diftinguifhed itfelf by the fuccefs of his ftudies. Claude de Lille, father of the celebrated geographer, gave him the fame leffons in geography and hiftory which he had before given to the duke of Orleans afterwards regent; and which have been printedin feven volumes; under the title of "Abridgment of Univerfal Hiftory." On quitting college, Henault entered the Oratory, where he foon attached himfelf to the fudy of eloquence: and; on the death of the abbe Rene, reformer of La Trappe, he undertook to pronounce his panegyric; which not meeting the approbation of father Maffilon, he quitted the Oratory after two years, and his father bought for him, of Marefchal Ville roi, the "lieutenancedes chaffes," and the government of Corbeil. At the marhal's he formed connections, and even intimate friendihips, with many of the nobility,

## HEN

Henault. and paffed the early part of his life in agreeable amufements, and in the livelieft company, without having his religious fentiments tainted. He affociated with the wits till the difpute between Roffean and de la Motte foon gave him a difgult for thefe triting focietics. In 1707 , 'he gained the prize of eloquence at the French Academy : and another next-year at the Academy des jeux Floraux. About this time M. Reaumar, who was his relation, came to Paris, and took leffons in geometry under the fame mafter, Guinée. Henault introduced him to the Abbé Bignon, and this was the firft ftep of his illuftrious courfe. In I7I3 he bronght a tragedy on the flage, under the difguifed name of Fafelier. As he was known to the public only by fome flighter pieces, "Cornelia the Veftal" met with no better fuccefs. He therefore locked it up without printing. In his old age his paffion for thefe fubjects reviving, and $\mathrm{Mr} \mathrm{Ho}-$ race Walpole being at Parisin 1768 , and having formed a friendfhip with him as one of the moft amiable men of his nation, obtained this piece, and hadit printedat a prefs which he had at his country feat, from whence a beautiful edition of Lucan had before iffued. In 1751 M. Henault, under a borrowed name, brought out a fecond tragedy, intitled, "Marius," which was well received and printed. He had been adinitted counfellor in parliament in 9 706, with a difpenfation on account of age; and ini 7 ioprefident of the firftchamber ofinquefts. Thefe important places, which he determined to fill in a becoming manner, engaged him in the mott folid ttudies. The excellent work of M. Domat charmed him, and made him eager to go back to the fountain head. He fpent feveral years in making himfelf mafter of the Roman law, the ordonnances of the French king, their cuftoms, and public laws. M. de Morville, procureurgeneral of the great council, being appointed ambaffador to the Hague in 1718, engaged M. Henault to accompany him. His perfonal merit foon introduced him to the acquaintance of the moft emineur perfonages at that time there. The grand penfionary, Heinfius, who, under the exterior of Lacedemonian fimplicity, kept up all the haughtinefs of that people, loft with him all that hauteur which France itfelf had experienced from him in the negociations of the treaty of Utrecht. The agitation which all France felt by Law's fyftem, and the confequent fending of the parliament into exile, was a trial to the wife policy of the prefident Henault. His friend ${ }^{\text {dip }}$ for the firft prefident, De Mefmes, led him to fecond all the views of that great magiftrate : he took part in all the negociations, and was animated purely by the public good, without any private advantage. On the death of the cardinal du Bois, in 1723 , he fucceeded in his place at the French Academy. Cardinal Fleury recommended him to fucceed himfelf as director, and he pronounced the eloge of M. de Malezieux.

Hiftory was M. Henault's favourite ftudy; not a bare collection of dates, butaknowledge of the laws and manners of nations; to obtain which he drew inftruction from private converfations, a method he fo ftrongly recommends in his preface, after having thus difcuffed the moft important points of public law, he undertook to collect and publifh the refalt ofhis inquiries, and he is defervedly accounted the firft framer of chronological abridgments;inwhich, without ftopping ardetach-
ed facts, he attends only to thofe which form a chain of events that perfect or alter the government and character of a nation, and traces only the fprings which exalt or humble a nation, extending or contracting the face it occupies in the world. His work has had the fortune of thofe literary phenomena, where novelty and merit united exciteminds eagerafter glory, and fire the ardour of young writers to prefs after a guide whom few can overtake. The firl edition of the work, the refult of $40 y$ ears reading, appeared in 1744 , under the aufpices of the chancellor Daguefleau, with the modeft tille of an E(fay. The fuccefs it met with furprifed him. He made continual improvements in it, and it has gone through nine editions, and been tranflared into Italian, Englifh, and German, and even into Chinefe. As the beft writings are not fecure from criticifm, and are indeed the only ones that deferve it, the author read to the academy of Belles Lettres a detence of his abridgement. All the ages and events of the French monarchy being prefent to his mind, and his imagination and memory being a vall thearre whereon he beheld the different movements and parts of the actors in the feveral revolutions, he determined to give a fpecimen. of what paft in his own mind, and to reduce into the form of a regular drama, one of the periods of French hiftory, the reign of Francis II. which, though happy only by being hort, appeared to him one of the molt important by its confequences, and moft eafy to be confined within the flage bounds. His friend the chancellor highly approved the plan, and wifhed it to be printed. It accordingly went through five editions; the harmony of dates and facts is exactly obferved in ir, and the paffions interefted withour offence to hiftoric truth.

In 1755, he was chofen an honorary member of the academy of Belles Lettres, being then a member of the academies of Nanci, Berlin, and Stockholm. The queen appointed him fuperintendant of her houfe. His natural fprightlinefs relieved her from the ferious attendance on his private morning lectures. The company of perfons moft diftinguilued by their wit and birth, a table more celebrated for the choice of the guefts than its delicacies, the little comedies fuggefted by wit, and executed by reflections, united at his houfe all the pleafures of an agreeable and imnocent life. All the members of this ingenious fociery contributed to render it agreeable, and the prefident was not behind any. He compofed three comedies: La Petite Maifor, La Faloux de Soi meme, and Le Reveil d'Epimenide. The fubject of the laft was the Cretan philofopher, who is pretended to have hept 27 years. He is introduced fancying that he had flept but one night, and aftonifhed at the change in the age of all around him : he miftakes his miftrefs for his mother ; but difcovering his miftake, offers to marry her, which the refufes, though he ftill conimues to love her. The queen was particularly pleafed with this piece. She ordered the prefident to reftore the philofopher's miftrefs to her former youth : he introduced Hebe, and this epifode produced an agreeable entertainment. He was now in fuch favour with her majefty, that on the place of fuperintendant becoming vacant by the death of M. Bernard de Conbert mafter of requefts, and the fum he had paid for it being loft to the family, Henaule folicited it in favour of feveral perfons, till at laft the

## HEN <br> HEN

Fenault queen beftowed it on himfelf, and confented that he flould divide the profirs with his predeceffors's widow. On the queen's death he held the fame place under the dauphinefs.

A delicate conftitution made him liable to much illnefs; which, however, didnot interrupt the ferenity of his mind. He made feveral journeys to the waters of llombieres: in one of thefe be vifited the depofed king Staniflaus at Luneville; and in another accompanied his friend the marquis de Pauliny, ambaffador to Switzerland. In 1763 he drew near his end. One morning, after a quier night, he felt an oppreffion, which the faculty prononuced a fuffocating cough. His confefor being fent to him, he formed his refolution without alarm. He has fince faid, that he recollected having then faid to himfelf, "What do I regret?" and called to mind that faying of Madame de Sevigne, "I leave here only dying creatures." He received the facraments. It was believed the next night would be his laft; but by noon next day he was out of danger. "Now (faid he) I know what death is. It will not be new to me any more." He never forgor it during the following feven years of his life, which, like all the reft, were gentle and caln. Full of gratirude for the favours of Providence, refigned to its decrees, offering to the Author of his being a pure and fincere devotion; he felt his infirmities without complaining, and perceived a gradual decay with unabated firmnefs. He died Dec. 24. 177r, in his 86 th year. He married in 17143 daughter of M. le Bas de Montargis keeper of the royal treafure, \&c. who died in 1728 withour leaving any iffue.

HENDECAGON, in geomerry, a figure that hath cleven fides and as many angles.

HENED-TENNY, in old writers, a cuftomary payment of money inftead of hens at Chriftmas. It is mentioned in a charter of king Edward III. Mon. Angl. tom. ii. p. 327. Du-Cange is of opinion it may be ben-penny, gallinagium, or a compofition for eggs; but Cowel thinks it is mifprinted bened-penny for heved-penny, or head-penny.

HENLEY, a town of Oxfordfhire in England, feated on the river Thames, over which there is a handfome bridge. It fends malt, corn, and other things, to London in barges. W. Long. o. 4o. N. Lat. 51.34 .

Heniey, a town of Warwickflice in England, feated on the river Alne, in W. Long. i. 45 . N. Lat. 52. 18.

Henley (John), better known by the appellation of Orator Henley, a very fingular character, was born in T. Welton-Moubray, Leicefterfire, in 1691. His father, the Rev. Simon Henley, and his grandfather by his mother's fide (John Bowel, M. A.), were both vicars of that parifh. Having paffed his exercifes at Cantbridge, and his examination for the degree of B. A. with the particularapprobation of Mr Ficld, Mir Smales, and the mafters of the college, hereturned to his native place, where he was firf defired by the truftees of the Fchool in Melton to affift in, and then to take the direction of that fchool; which he increafed and raifed from a declining to a flourifhing condition. He efta. blifhed here a practice of improving clocution by the public fpeaking of paffages in the claffics, morning and ifternoon, as well as orations, \&c. Here he was invited
by a letter from the Rcy. Mr Neweombe to be a candidate for a fellowhip in St John's, but as he had long been ablent, and thereforeleffened his perfonal intereft, he declined appearing for it. Herelikewife he began his "Univerfal Grammar," and finifhed ten languages, with differtations prefixed, as the moft ready introduction to any tonguewhatever. In the beginning of this interval he wrotehis poem on "Efther," which was approved by the town, and well received. He was ordained a deacon by Dr Wake, then bifhop of Lincoln; and after having taken his degree of M.A. was admitted to prieft's orders by Dr Gibfon, his fucceffor in that fee. He formed an early refolution to improve himfelf in all the advantages of books and converfation the moft effectually, on the firft opportunity, at London. Buthe laid the bafis of future proficiency in affinting at the cu. racy of his native town; where he preached many occafional fermons, particularly one at the affizes at Leicef. ter: he then gave a voluntary warning for thechoice of a new mafter and curate, and came to town recommended by above 70 letters from the moft confiderable men in the country, both of the clergy and laity; but againd the inclination of his neighbours and his fchool, which was now, as from his firft entrance upon it, ftill advancing : and his method being eftablifhed and approved, one of his own fcholars was appointed to fucceed him. -In town he publifhed feveral pieces, as a tranla. tion of Pliny's Epiftes, of feveral works of Abbe Vertot, of Montfaucon's Italian Travels in folio, and many other lucubrations. His moft generous patron was the earl of Macclesfield, who gave him a benefice in the country, the value of which to a refident would have been above 8ol. a year; he had likewife a lecture in the city; and preached more charity fermons about town, was more numeroully followed, and raifed more for the poor children, than any other prcacher, however dignified or diftinguifhed. But when he preffed his defire and promife from a great man of being fixed in town, it paffed in the negative. He took the people (it feems) too much from their parifh-churches; and as he was not fo proper for a London divine, he was very welcome, norwithftanding all difficulties, to be a rural paftor. But it was not for a fecond ruftication, as he informs us $\dagger$, that he left the fields and the fwains of Arcadia to vifit the great city-: and as he knew it was as lawful to take a licence from the king and parlia Tranfact. king and pania- p. 12. \&sc. ment at Hicks's-hall as at Doctors Commons (fince the minifterial powers of this kingdom are and onght to be parliamentary only), he freely, without compulfion, or being defired or capable of being compelled to refide in the country, gave up his benefice and lecture, certainties for an uncertainty; believing the public would be a more hofpitable proteçor of learning and fcience, than fome of the upper world in his own order.

Mr Henley, in anfwer to a cavil (that he borrowed from books), propofed, "that if any perfon would ingle out any celebrated difcourfe of an approved writer, dead or living, and point out what he thought excellent in it, and the reafons; he wonld fubmit it to the world, whether the moft famed compofition might not be furpaffed in their own excellency, either on that or any different fubject."

Henley preached on Sundays upon theological matters, and on Wednefdays upon all other fciences. He declaimed

Henley declaimed fome years againft the greateft perfons, and II occafionilly, fays Warburton, did Pope that honour. The poet in return thas blazons him to infamy:
" But, where cach fcience lifts its modern type.
"Hiftoryher pot, Divinity his pipe,
"While proud Philofophy repines to fhow,
" Difhoneft fight! his breeches rent below ;
" Imbrown'd with native bronze, lo Henley flands,
"Tuning his voice, and balancing his Fands.
"How fluent nonfinfe trickles from his tongue!
" How fwect the periods, neither faid nor fung!
"Still break the benches, Henley ! with thy ftrain,
" While Kennet, Hare, and Gibfon preach in vain.
"O great reftorer of the good old flage,
" Preacher at once and Zany of thy age!
" $O$ worthy thou of Egypt's wife abodes,
"A decent prieft where monkies were the gods!
" But Fate with butchers plac'd thy prieflly itall,
" Meek modern faith to murder, hack, and maul;
" And bade thee live to crown Britannia's praife,,
" In Toland's, Tindal's,and in Woolfton's days."
This extraordinary perfon (who died October 14. 1756) ftruck medals, which he difperfed as tickets to his fubfcribers: a ftar rifing to the meridian, with this motto, Ad fumma; and below. Invenian viam, aut faciain. Each auditor paid is. He was author of a wcekly paper called The Hyp Doctor, for which he had rool. a year given him. Henley ufed every Saturday to print an advertifement in the Daily Advertifer, containing an account of the fubjects he intended to difcourfe on the enfuing evening at his oratory near Lincoln's-inn-fields, with a fort of motto before ir, which was generally a fneer at fome public tranfaction of the preceding week. Dr Cobden, one of Geo. II.'s chaplains, having, in 1748, preached a fermon at St James's from thefe words, "Take away the wicked from before the king, and his throne ghall be eftablifhed in righteoufnefs ;" it gave fo much difpleafure, that the Doctor was ftruck out of the lift of chaplains; and the next Saturday the following parody of his text appeared as a motto to Henley's advertifement :
" Away with the wicked before the king,
" And away with the wicked behind him;
" His throne it will blefs
" With righteoufnefs,
"And we fhall know where to find him."
His audience was generally compofed of the loweft ranks; and it is well known that he even collected an infinite number of fhoe-makers, by announcing that he could teach them a fpeedy mode of qperation in their bufinefs, which proved only to be, the making of hoes by cutting off the tops of ready-made boots.
henna, or Aefenna. See Lawsonia.
HENNEBERG, a county of Germany, in the circle of Franconia. It is bounded on the north by Thuringia, on the weft by Heffe, on the fouth by the bifhoprick of Wertfburg, and on the eaft by that of Bamberg. It abounds in mountains and woods; and it is populous, and pretty fertile. Mainingen is the capital town.

Henneberg, a town of Germany, in the circle of Franconia, which gives title to a county of the fame name with a caftle. E. Long. 9. 17. N. Lat. 50. 40.

HENNEBON, a town of France in Bretagae, in the diocefe of Vannes. It is inhabited by rich merchants and is feated on the river Blavet, in W. Long. 2. 13. N. Lat. 47. 48.

HENOTICUM, (Hyotrxor, q. d. "reconciliative;" of evow "I unite") in church hiftory, a famous edict of the emperor Zeno, publifhed A. D. 482 , and intended

Vol. VIII.
to reconcile and reunite the Eutychians with the Ca- Henricians tholics. It was procured of the emperor by means of Acacius, patriarch of Conftaminople, wirh the afliftance of the friends of Peter Mongins and Peter Trullo. The fing of this ediet lies here; that it repeats and confirms all that had been enacted in the councils of Nice, Conftantinople, Ephefus and Chalcedon, againft the Arians, Neftorians, and Eutychians, without making any particular mention of the council of Chalecdon. It is in form of a letter, addreficd by Zeno to the bifiops, priefts, monks and people of Egypt and Libya. It wasoppofed by the catholics, and sondemned in form by pope Felix II.

HENRICIANS, in ecclefiaftical hiftory, a fect fo called from Henry its founder, who, though a monk and hermit, undertook to reform the fuperftition and vices of the clergy. For this purpofe he left Laufanne in Switzerland, and removing from different places, at length fettled at Thouloufe in the year i 147 , and there exercifed his minifterialfunction, till being overcome by the oppolition of Bernard abbot of Clairval, and condemned by pope Eugenias III. at a council aliembled at Rheims, he was committed to a clofe prifon in 1148 where he foon ended his days. This reformer rejected the baprifm of infants; feverely cenfured the corrupt manners of the clergy: treated the feftivals and cercinonies of the church with the ummoft contempt and held clandeftine affemblies for inculcating his peculiar doctrines.

HENRY, or Cape-Henry, the fouth cape of Virginia, at the entrance of Chefapeak-bay. W. Long. 74. 50. N. Lat. 37. 0.

Henry, the name of feveral emperors of Gernany, and kings of England and France. See Engiand, France, and Germany.

Henry IV. emperor of Germany in 1056 ftyled the Great, was memorable for his quarrels with pope Gregory II. whom at one time he depofed, for having prefumed to judge his fovercign; but at another, dreading the effects of the papal anathemas, he had the weaknefs to fubmit to the moft humiliating perfonal folicitations and penances to obtain abfolation; which impolitic meafure increafcd the power of the Pope, and alienated the affections of his fubjects: thus circumftanced, he reaffumed the hero, but too late; marched with an army to Rome, expelled Gregory, depofed him, and fet up another pope. Gregory died foon after : but Urban II. and Pafcal II. fucceffively, excited his ambitious fons, Conrad and Henry, to rebel againfthim, and the latter was crowned emperor by the title of Henry V. in 1106 ; and he had the inhomanity to arreft his father, and to deprive him, not only of all his dignities, but even of the neceflaries of life. The unfortunate Henry IV. was reduced to fuch extremities (after having fought 62 battles in defence of the German empire), that he folicited the bifhop of Spire to grant him an underchaunter's place in his cathedral, but was refufed. He died the fame year at Liege, aged 55, a martyr to the ignorance and fuperfition of the age, and to his own blind confidence in favourites and miftreffes.

Henry IV. king of France (in 1589) and Navarre, juftly Ayled the Great, was the fon of Anthony de Bourbon, chief of the Branch of Bourbon (fo called from a fief of that name which fell to them by marriage with the heirefs of the eftate). His mother was 3 E

Henry. the daughter of Henry d'Albert, king of Navarre; a woman of a mafculine genius; intrepid, fimple, and ruftic in her manners, but deeply verfed in politics, and a zealous Proteftant. Forefeeing that her party would want fuch a protector (for her huiband was a weak indolent prince), fhe undertook the care of the education of the young hero: his diet was coarfe; his clothes neat, but plain; he always went bare-headed; fle fent him to fchool with the other children of the fame age, and accuftomed him to climb the rocks and neighbouring mountains, according to the cuftom of the country. He was born in 1553; and in 1569, the 16th year of his age he was declared the Defender and Chief of the Proteftants at Rochelle. The peace of Sr Germain, concluded in 1570, recalled the lords in the Proteftant intereft to court; and in 1572, Henry was married to Margaret de Valois, fifter to Charles IX king of France. It was in the midft of the rejoicing for thefe nuptials that the horrid maffacre of Paris took place. Henry was reduced, by this infernal ftroke of falfe policy, to the alternative of changing his religion or being put to deach : he chofe the iormer, and was detained prifoner of fate three years. In 1587 he made his efcape; put himfelf at the head of the Eluguenot party, expofing himfelf to all the rifks and fatigues of a religious war, often in want of the neceflaries of life, and enduring all the hardihips of the common foldier: but he gained a victory this year at Courtras, which eftablifted his reputation in arms, and cndeared him to the Proteftants. On the death of Henry III. religion was urged as a pretext for one half of the officers of the French army to reject him, and for the leaguers not to acknowledge him. A phanton, the cardinal de Bourbon, was fet up againft him ; but his noft formidable rival was the duke de Mayenne: however, Henry, with few friends, fewer important places, no money, and a very finall army, fupplied every want by his activity and valour. He gained feveral vietories over the duke: particularly that of Ivri in 1590 memorable for his heroic admonition to his foldicrs: "If you love your enfigns, rally by my white plume, you will always find it in the road to honour and glory." Paris held out againft him, notwithtanding his fucceffes; he took all the fuburbs in one day: and might have reduced the city l,y famine, if he lad not humanely fuffered his own army to relieve the befieged; yet the bigotted friars and priefts. in Paris all turned foldiers, except four of the Mendicant order; and made daily military reviews and proceflions, the fword in one hand and the crucifix in the other, on which they made the citizens fwear rather to die with famine than to admit Henry. The fcarcity of provifions in Paris at laft degenerated so an univerfal famine: bread kad been fold, whilltt any remained, for a crown the pound, and at laft it was made from the bones of the charnci-houfe of St Innocents; human flefh becanie the food of the obftinate Parifians, and mothers ate the dead bodies of their children. In fine the duke of Mayenne, feeing that neither Spain nor the league would ever grant him the crown, determined to aflift in giving it to the lavful heir. He engaged the fates to hold a conference with the chiefs of both parties; which ended in Henry's abjuration of the Proteftant religion at St Dennis, and his confecration at Chartres in 1593. The follosving year Paris opened its gates to him ; in

1596, the duke of Mayenne was pardoned; and in 1598 , peace was concluded with Spain, Henry now thewed himfelf doully worthy of the throne, by his encouragement of commerce, the fine arts, and manufactures, and by his patronage of men of ingenuity and found learning of every country : but though the fermentations of Romin bigotry were calmed, the leaven was not deftroyed; fcarce a year paffed with out fome attempt being made on this real father of his people; and at laft the monfter Ravaillac flabbed him to the heart in his coach, in the ftreets of Paris, on the 14th of May 1610 , in the 57 th year of his age and 22d of his reign.

Henry VIII. king of England, was the fecond fon of Henry. VII. by Elizabeth the eldeft daughter of Edward IV. He was born at Greenwich, on the 28 th of June 149 I . On the death of his brother Arthur, in 1 502, he was created prince of Wales; and the following year betrothed to Catharine of Arragon, prince Arthur's widow, the Pope having granted a difpenfation for that purpofe. Henry VIII. acceded to the throne, on the deatl of his father, the 22d of April 1509, and his marriage with Catharine was folemnized about two montlis after. In the beginning of his reign he left the government of his kingdom entirely to his minifters ; and fpent his time chiefly in tournaments, balls, concerts, and other expenfive amufements. We are told that he was fo extravagant in his pleafures, that, in a very fhort time, he entirely difipated $1,800,0001$. which his father lad hoarded. This will feem lefs wonderful, when the reader is informed, that gaming was one of his favourite diverfions. Neverthelefs he was not fo totally abforbed in pleafure, bur he found leifire to facrifice to the refentment of the people two of his father's minifters, Empfon and Dudley. A houfe in London, which had belonged to the former of thefe, was in 15 Io given to Thomas Wolfey, who was now the king's almoner, anid who from this period began to infinuate himfelf into Henry's favour. In 1513 , he became prime minifter, and from that moment governed the king and kingdom with abfolute power. In this year Henry declared war againf France, gained. the battle of Spurs, and took the towns of Terouenne and Tournay ; but before he embarked his rroops, he beheaded the earl of Suffolk, who had been long confined in the tower. In 1521 , he facrificed the duke of Buckingham to the refentment of his prime minifter Wolley, and the fame ycar obtained from the Pope the: title of Defender of the Faith.

Henry, having been 18 years married, grew tired of his wife, and in the year 1527 refolved to obtain a divorce; butafter many fruitlefs folicitations, finding it impoffible to perfuade the Pope to annul his marriage with Catharine, he efpoufed Ann Bullen in. the year 1531 . During this interval his favourite Wolfey was-difgraced, and died; Henry threw off the Papal yoke, and burnt three Proteflants for herefy.. In 1535, he put to death Sir Thomas Moore, Fiiher, and others, for denying his fupremacy, and fuppreffed all the leffer monafteries.

His moft facred majefty, having now poffefled his fecond queen about five years, fell violently in love with lady Jane Seymour.' Ann Bullen was accufed of adultery with her own brother, and with three other perfons: fhe was beheaded the I gth of May:

## HEN

1536. He married Jane Seymore the day following. In 1537, he put to death five of the noble family of Kildare, as a terror to the Irifl, of whofe difloyalty he had fome apprehenfions; and in the year following he executed the marquis of Exeter, with four other perfons of diftinction, for the fole crime of correfponding with cardinal Pole. In 1538 and 1539 , he fuppreffed all the monafteries in England, and feized their revenues for his own ufe. The queen having died in childbed, he this year married the princefs Ann of Cleves: but dilliking her perfon, immediately determined to be divorced; and his obfequious parlianent and convocation unanimoully pronounced the marriage void, for reafons too ridiculous to bc recited : but this was not all: Henry was fo incenfed with his minifter and quondam favourite, Cromwell, for negociating this match, that he revenged himfelf by the hand of the executioner. Yet this was not the only public murder of the year 1540 . A few days after Cromwell's death, feveral perions were burnt fordenying the king's fupremacy, and other articles of herefy.

His majefty being once more at liberty to indulge himfelf with another wife, fixed upon Catharine Howard, niece to the duke of Norfolk. She was declared queen in Auguft 1540; but they had been privately married fome time before. Henry, it feems, was fo entirely fatisfied with this lady, that he daily bleffed God for his prefent felicity ; but that felicity was of fhort duration: he had not been married above a year, before the queen was accufed of frequent proftitution, both before and fince her marriage : fhe confeffed her guilt, and was beheaded in February 1542. In July 1543 , he married his fixth wife, the lady Catharine Parr, the widow of John Nevil lord Latimer, and lived to the year 1547 without committing any more flagrant énormities : but finding himfelt now approach towards diffolation, he made his will; and, that the laft fcene of his life might refemble the reft, he determined to end the tragedy with the morder of two of his beft friends and moft faithful fubjects, the duke of Norfolk and his fon the earl of Surrey. The eart was beheaded on the rgth of January; and the duke was ordered for execution on the 2gth, but fortunately efcaped by the king's death on the 28th. They were condemned without the fhadow of a crime; but Henry's political reafon for putting them to death, was his apprehenfion that, if they were fuffered to furvive him, they wonld counteract fome of his regulations in religion, and might be troublefome to his fon. Henry died on the 28th of Jannary, 1547, in the 56th year of his age, and was buried at Windfor.

As to his character, it is pretty obvious from the facts above related. Lord Herbert palliates his crimes, and exaggerates what he calls his virtues. Bilhop Burnet fays, " he was rather to be reckoned among the great than the good princes." He afterwards acknowledges, that " he is to be numbered among the ill princes;" but adds, "I cannot rank him with the worft." Sir Walter Raleigh, with infinitely more juftice, fays, "if all the pictures and patierns of a mercilefs prince were loft to the world, they might again be painted to the life out of the hiftory of this king." He was indeed a mercilefs tyrant, a fcurvy politician, a foolifh bigot, a herrible affaffun. See England, $\mathrm{n}^{0} 253-292$.

Henry of Huntingdon, an Englifh hiftorian, of Henry. the 12 th century, was canon of Lincoln, and afterwards archdeacon of Huntingidon. He wrote, i. A hiftory of England, which ends with the year II54. 2. A continuation of that of Eede. 3. Chronological tables of the kings of England. 4. A fmall Treatife on the contempt of the world. 5. Several books of epigrams and love verfes. 6. A poem on herbs; all which are written in Latin.-His invocation of Apoll, and the goddefles of Tempe, in the exordiun of his poem on herbs, may not be unacceptable as a fipecimcai of his poetry.

Vatum magne parens, herbarum Phobe repertor,
Vofque, quibus refonant Tempe jocofa, Dex!
Si mihi ferta prius hedera florente parallis,
Ecce meos flores, ferta parata furo.
Henrr of Sufa, in Latin de Segufio, a famous civilian and canonift of the 13 th century, acquired fuch reputation by his learning, that he was called the fource and P lendor of the law. He was archbihop of Embrun about the year 1258, and cardinal bifhop of Oftia in 1262. He wrote $A$ fummary of the canory and civil law; and a commentary on the book of the decritals, compofed by order of Alexander IV.

Henry the Minflrel, commonly called B/ind Har$r y$, an ancient Scottill author, diftinguifhed by no particular furname, bat well known as the compofer of an hiftorical poem reciting the atchievements of $\mathrm{sin}^{2}$ William Wallace. This poem continued for feveral centuries to be in great repute; but afterwards funk into neglect, until very lately that it has been agaifi releafed from its obfcurity by a very neat and correct edition publifhed at Perth under the infpection and patronage of the earl of Buchan.

It is difficult to afcertain the precife time in which this poet lived, or when he wroce his hiftory, as the two authors who mention him fpeak fanewhat differently. Dempfter, who wrote in the beginning of the laft century, fays that he lived in the year 1361 : but Major, who was born in the year I 446, fays that he compofed his book during the time of his infancy, which we muft therefore fuppofe to have been a few years pofterior to 1446; for if it had been compofed that very year, the circumftance would probably have been mentioned. As little can we fuppofe, from Mir Dempfter's words, that Henry was born in 136 I; fo: though he fays that he lived in that year, we nuft naturally imagine rather that he was then come to the years of maturity, or began to diftinguifh himfelf in the world, than that he was only born at that time. The author of the differtation on his life, prefixed to the new edition of the poem, endeavours to reconcile matters in the following manner: " It is not indeed impoffible that he might be born in or about tliat year ( 136 I ). In the tine of Major's infancy he might be about 83 years of age. In that cafe, it may be fuppofed that it was the work of his old age to collect and put in order the detached pieces of his Hiftory of Wallace, which he had probably compofed in thofe parts of the country where the incidents were faid to have happened."

We are entirely ignorant of the family from which Henry was defcended; though, from his writings, we fhould be led to fuppofe that he had received a liberal education. In them he difoovers fome hoowledge in

3 E 2
divinity,

## H E N [ 4127$] \quad$ H E N

divinity, claffical hiftory, and aftronomy, as well as of the languages. ln onc place lye boalts of his celibacy, which feems to indicate his having engaged himfelf in fome of the religious orders of that age. From what Major fays further of him, we may fuppore his proteflion to have been that of a travelling bard; though it does not appear that he was killed in mufic, or lad any other proteffion than that juft mentioned. His being blind from his birth, indeed, makes this not improbable; though even this circumftance is not inconfiftent with the fuppofition of his being a religious mendicant. "the particulars (fays Major) which he heard related by the vulgar, he wrote in the valgar verfe, in which he excelled. By reciting his hiltories bcfore princes or great men, he gained his food and raimenr, of which he was worthy." It is thus probable that he would be a frequent vifitor at the Scottifh court; and would be made welcome by thofe great families who could boaft of any alliance with the hero himfelf, or took pleafure in hearing his exploits or thofe of his companions.

With regard to the authenticity of his hiftories, Major informs us only that " he does notbelieve every thing that he finds in fich writings;" but from other teftimonies it appears, that he confulted the very beft authorities which could at that time be had. Though, according to the molt early account of Henry, it appears to have been at leaft 56 years after the death of Wallace that Henry was born, yet he is faid to have confulted with feveral of the defcendants of thofe who had been the companions of that hero while he atchieved his moft celebrated exploits, and who were ftill capable of afcertaining the veracity of what he publifled. The principal of thefe were Wallace of Craigie and Liddle of that Ilk; who, he fays, perfuaded him to omit in his hiftory a circumftance which he ought to have inferted. Befides thefe, he confulted with the principal people of the kingdom; and he utterly difclaims the idea of having adhered entirely to any unwritten tradition, or having been promifed any reward for what he wrote. His chief authority, according to his own account, was a Latin hifory of the exploits of Sir William, written partly by Mr John Blair and partly by Mr Thomas Gray, who had been the companions of the hero himfelf. Henry's account of thefe two authors is to the following purpofe: "They became acquainted with Wallace, when the latter was only about 16 yea:s of age, and at that time a ftudent at the fchool of Dundee; and their acquaintance with lim continued till his death, which happened in his 29th ycar. Mr John Blair went from the fchools in Scotland to Paris, where he ftudied fome time; and received prielts orders. He returned to Scotland in 1296, where he joined W allace, who was bravely afferting the liberties of his country. Mr Thomas Gray, who was parfon of Libberton, joined Wallace at the fame time. They were neen of great wifdom and integrity, zealous for the frecdom of Scotland; and were prefent with Wallace, and affifting to him, in moft of his niilitary enterprifes. They were alfo his fpiritual counfellors, and adminifteres to him godly confort. The hiftory written by the fe two clergymen was attefted by William Sinclair bifhop of Dunkeld, who had himfelf been witnefs to many of Wallace's actions. The bifhop, if he had lived longer, was to have fent
their book to Rome, for the purpofe of obtaining the fanction of the pope's authority."

The book which Henry thus appeals to as his principal authority is now loft, fo that we liave no opportunity of comparing it with what he has written. The character given by Dempfter of Henry, however, is more favourable than that by Major. He tells us, that " he was blind from his burth; a man of a Yingularly happy gentius; he was indeed another Homer. He did great honour to his native country, and raifed it above what was common to it in his age. He wrote, in the vernacular verfe, an elaborate and grand work, in ten books, of the deeds of William Wallace." In this account there is a miftake; for the poem contains eleven or twelve books: but Dempfter, who wrote in a foreign country, and had not a printed copy of Henry's work by him when he wrote his euloginun, is excufable in a miftake of this kind.

With regard to his poetical merit, it muft undoubtedly rank very far below that of Homer; whom indeed he farcely refembles in any other refpect than that he went about as Homer is faid to have done, reciting the cxploits of the heroes of his country, and that he was blind. In this laft circumftance, however, he was ftill worfe than Homer; for Henry was born blind, but Homer became blind after he had been advanced in years. Hence Henry, even fuppofing his genius to have been equal to that of Homer, inuft have lain under great difadvantages; and thefe are very evident in his works. The defcriptive parts are evidently deficient, and the allufions taken principally from the way in which nature affects thofe fenfes of which he was poffeffed. Thus, fpeaking of the month of March, he calls it the month of right digefiion, from the fuppored fermentation then begun in the earth. Of April he fays that the earth is then able, or has obtained a power of producing its different vegetables; and of this productive power he appears to have been more fenfible than of the effects which commonly frrike us moft fenfibly. "By the working of nature (fays he), the fields are again clothed, and the woods acquire their worthy weed of green. May brings along with it great celeftiai gladnefs. The heavenly haes appear upon the tender green." In another place he defcribes the deity of fome river, whom he calls Nymp baus, "building his bower with oilandbalm, fulfilled of fweer odour." By reafon of thefe difadvantages, he feldom makes ufe of fimilies with which Homer abounds fo much; and few miraculous interpofitions are to be found in his poem, though the prophecies of Thomas Lermont, commonly called The Rhymer, and a prophetic dream of Wallace himfelf, are introduced, as well as the ghoft of Fawdon, a traitor who had joined Wallace, and whom the latter in a fit of padfion had killed. In other refpects, the fame inextinguifhable thirft of blood which Homer afcribes to his hero Achilles is afcribed to Wallace, though in all probability the mind of Wallace was too much enlightened to admit of fach fentiments. A vaft degree of courage and perfonal ftrength are afcribed to him, by means of which the exploirs of the whole army are in effect transferred to a fingle perfon. As long as he is inverted with the command, the Scots are victorious and irrefiftible; when deprived of it, they are enflaved and undone. After ftruggling for fome time againft an inveterate

## HEN [ 413 ] HEN

Henry: and powerful faction difdaining to feign fubmiffion, he is taken by treachery, and dies a martyr to the fre edom of his country. The poem, on the whole, is valuable, on account of our being able to trace, by its means, the progrefs which the Einglifh language had made at that time in Scotland; the manners of the Scots in that age; as the favourite drefs of green which at that time was the tafte of the inhabitants of Scotland, \&c. With regard to the authenticity of his relations, it is impolible to fuppofe any other thing than that they are partly true and partly falfe. The general thread of the ftory may undoubtedly, be looked upon to be genuine, though embellifhed with poetical fictions and exaggerations; and his conftant appeals to the book already mentioned, though it is now loft, muft be looked upon as a ftrong teftimony in his favour : for we cannot fuppofe that at the time he lived, when we may fay that the tranfactions which he relates were recent, he would have had the confidence to appeal to a book which had not been generally known to have an exiftence; and its being now loft can never be any argument againft it, when we confider the difficulty there was of preferving books before the invention of printing; the confufions in which Scotland was frequently involved; and that the exploits of Wallace, who mult be fuppofed to have bien a kind of rival to the great Bruce, could not be fo agreeable to the court as thofe of the more fuccefsful hero ; and thereforc the hiftory of them might be fuffered to fall into oblivion, though written in elegant Latin, while a moft ridiculous poem in that language on the battle of Bannockburn has been preferved to this day.
$H_{\text {entr }}$ Pringe of Wales, eldeft fonofking James VI. of Scotland by his queen Anne fifter of the king of Denmark, and one of the moft accomplifled princes of the age in which he lived, was born on the agth of February 1594. The birth of the prince was announced by embaffies to many foreign powers, with invitations to be prefent at the ceremony of his baptifm, which was thus delayed for a confiderable time. Mr Peter Young, who, along with the celebrated George Buchanan, had been preceptor to his majefty, was fent to the courts of Denmark, Brunfwic, and Mecklenburg, the duke of Mecklenburg being great-grandfather to the prince by the mother's fide; the laird of Eaft Weems to France and England; and Sir Robert Keith and captain Murray provoft of St Andrew's, to the States General, who at that time were ftruggling againft the Spanifh tyranny, and not yet declared a free ftate. All thefe ambaffadors were cordially received, and others appointed in return except by the courts of France and England. Henry IV. at that time king of France, though the Scots ambaffador had formerly been one of his own fervants, neither made any prefent, nor appointed an ambaffador. Queen Elizabeth had defigned to act in the fame manner till fhe heard of the behaviour of Henry; after which fhe honoured James by appointing an ambaffador of very high rank, Robert earl of Suffex. This ambaffador, however was fo long of making his appearance, thal the queen imagined the ceremony would be overbefore his arrival, for which reafon fhe fent a meffage to the earl, commanding him in that cafe not to enter Scotland nor deliver her prefent. But James had been more obfequious; and not only delayed the ceremony
till the Englifh ambaffador arrived, but diftinguifhed Henry. him from the reft by having a canopy carried over his head at the proceffion, fupported by the lairds of Cefsford, Buccleugh, Duddope, and Traquair. The ceremony was performed with great nuagnificence; after which the ambaffadors prefented their gifts. That from the United States was the moft valuable. It confifted of two gold cups worth 12,400 crowns, with a box of the fame metal, weighing in all about 400 ounces, containing befides the grant of a penfion of 5000 florins annually to the prince for life. The Eniglifh ambaffador gave a cupboard of plate curioufly wrought, and valued at 3000 . fterling; and the Danifh ambaffador two gold chains, one for the queen and another for the prince. The baptifm was celebrated on the 6th of Seprember 1594, and the child named Frederick-Henry and Henry-Frederick.

The young prince was now committed to the care of the earl of Mar, who was affifted in this important charge by Annabella countefs-dowager of Mar, daughter of William Murray of Tullibardine, and paternal anceftor of the prefent duke of Arinol. This lady was remarkable for the feverity of her temper, fo that the prince met with little indulgence while under her tuition ; notwithftanding which he fhowed great affection for his governefs all the time the had the care of him. Next year, however ( 1595 ), the queen engaged the chancellor, lord Thirleftane, in a fcheme to get the prince into her own power ; but the king having found means to diffuade her majefty from the attempt, howed afterwards fuch marks of difpleafure to the chancellor, that the latter fell into a languidling diforder and died of grief.

In his fixth year prince Henry was committed to the care of Mr Adam Newron a Scotfman, eminently fkilled in moft branches of literature, but particularly diftinguifhed for his knowledge of the Latin language. Under his tutorage the prince foon made great progrefs. in that language, as well as in other branches of knowledge; infomuch that before he had completed bis fixth. year his father wrote for his ufe the treatife intinled Bafilikon Doron, thought to be the beft of all his works.

In his feventh year, prince Henry began his corre. fpondence with foreign powers. His firft letter was to the States of Holland; in which he expreffed his, regard and gratitude for the good opinion they had conceived of him, and of which he had been informed by feveral perfons who had vifited that country; conclinding with a requeft that they wotald make ufe of his intereft with his father in whatever he could ferve them, promifing alfo his fervice in every other refpect in which he could be ufeful, until he hould be able to. give farther inftances of his good-will and affection.

At this early period the prince began to add to his literary accomplifhments fornc of the more martial kind, fuch as riding, the exercife of the bow, pike, \&c.as well as the ufe of fire-arms; and indeed fuch was the attachment he fhowed throughout his whole lifetime to military exercifes, that had he attained the years of maturity, there can fcarce be a doubt that he would have diftinguifhed himfelf in a moft eminent manner. In all his exercifes he made furprifing progrefs; and not only in thofe of the military kind, but in finging, dancing, \&c. On his ninth birth-day he fent a letter in Latin to the king, informing him that he had read

Henry.
world with a polite dedication to the prince, whon he highly compliments on account of the progrefs he had made in learning. In IGO9 a book was fent over to him from France by Sir George Carcw, the Britifh ambaffador there, tending to difprove the doctrine of the Catholics concerning the Church of Rome being the firft of the Chriftian Churches. The fame year the learned Thomas Lydyat publifhed his Emendatio Temporum, which appeared under the patronage of the prince; and with this performance his highnefs was fo well pleafed, that he took the author into his family to read to him, and made him his chronographor and cofnographer. Panl Buys or Bufius alfo fent him a letter with a dedication of the fecond part of his Pandects ; in which he beftows upon him the ligheft compliments on the great expectations which were formed of him, and of the hopes entertained by the reformed Clriftian churches that he would prove a powerful fupport to their caufe, and an antagonift to the errors of Rome. In 16ir Dr Tooker, in his dedication of an Anfwer to Becanus a Jefuit, who had written againft a piece done by his majefty himfelf, fyles his highnefs "the Mæcenas of all the learned." Another treatife againft the fame Becanus was alfo printed this ycar, and dedicated to the prince

Many other authors, whom our limits will not allow us to take notice of, were fond of dedicating their performances to his highnefs; nor was his correfpondence lefs extenfive than his condition. We have already taken notice of his having written his firft public letter to the ftates of Holland. He was congratulated by the elector palatine, afterwards married to the princefs Elizabeth, on the difcovery of -the gun-powder-plot. On the fame occafion alfo Lord Spencer wrote him a letter, accompanying it with the prefent of a fword and target " inftruments (fays he) fit to be about you in thefe treacherous times; from the which, I truft God will ever protect your moft royal father, \&c." Previous to this he had correfponded in Latin with the doge of Venice, the landgrave of Heffe, and the king of Denmark : in French with the duke of Savoy, and in Latin with the duke of Brunfwic and Uladillaus king of Poland; befides a number of other eminent perfons too tedious to enumerate.

The great accomplifments of Henry foon caufed him to be taken notice of by the moft eminent princes in Europe. In 16 c 6 Henry IV. of France ordered his ambatiador to pay him feccial regard on all occafions. He defired him likewife to falute the prince in the name of the dauphin, afterwards Louis XIII. and to inform him of the regard the latter had for him. A meffage was alfo fent by the fame ambaffador to M. de St Anthoine, appointed to be riding mafter to his highnefs, enjoining him to do his duty in that office; and affnring him that his majefty would be as much pleafed with it as if the fervice had been done to himfelf. To thefe meffagesthe prince returned very proper anfwers; and afterwards performed his excrcife in the riding-fchool before the ambaffador himfelf, that the latter night fend an account thereof to his mafter. On this occalion be mounted two horfes, and acquitted himfelf fo well that the ambaffador, in a letter to M. de Villeroy, the French fecretary, gave him the character of "" a prince who promifed very much, and whofe friendhip could not but be one day of advantage." Having then
fer forth the propriety of cultivating a good underfanding with him, he tells the fecretary, that the danphin might make a return for fome dogs which the prince had fent him, by a fuit of armour well gilt and enamelled, together with piftols and a fword of the fame kind; alfo two horfes, one of tham a barb.This year alfo the prince waited on his uncle the ising of Denmark, who had come to England on a vifit to King James ; and this monarch was fo much pleafed with his company, that he prefented him ar parting with his vice-admiral and beft fighting thip, valued at no lefs than 25001 . alfo with a rapier and hanger, valued at 2000 marks. The ftatcs of Holland were equally ready to fhow their attachment. On the 25 th of Auguft this year they fent a letter to the princein french, accompanied with the prefent of a fet of table linen, which they thought, as being the produce of their own country, would be agreeable to him; and they. requefted his love and favour towards their flate: in return for which they promifed to be always ready tofhow their regard for him, and to do him all porible fervice; as the ambaifador himfelf was ordered more particularly to declare. About this time the prince himfelf wrote a letter to Henry IV. acknowledging the kindnefs which his majefty had fhown him for feveral years, and confirmed of late by the latter offering: him under his own royal hand his friendhip and that of the dauphin.

While James was this year employed in hunting, the French ambaffador, who had been obliged to quit London on account of the plague, took frequent op. portunities of waiting upon his highners, as did alfo the Spanifh ambaflador, whofe oftenfible reaton was to inform him about fome horfes which were to bo fent him from Spain. The prince's partiality towards France, however, was fo evident, that the French ambaffador, in a letter dated 3 Ift October 160.6, mentions that "as far as he could difcover, his highnefs'sinclination was entirely towards France, and that it would be wrong to neglect a prince who promifed fuch great things. None of his pleafures (continued he) favourthe leaft of a child. He is a particular lover of horfes. and whatever belongs to them : but is not fond of hunting ; and when he goes to it, it is rather for the pleafure of galloping than that which the dogs give him. He plays willingly enongh at tennis, and another Scottifh diverfion very like mall; but this always with perfons elder than hinfelf, as if he defpifed thofe of his. own age. He fudies two hours a-day, and cinploys the rcft of his time in toffing the pike, or leaping, or fhooting with the bow, or throwing the bar, or vaulting, or fome other exercife of the kind, and he is never idle. He fhows himfelf likewife very good-natured to his dependents, fupports their intereft againft any perfons whatever, and puhes whatever he under takes for them or others with fuch zeal as gives fuccefs to it. For, befides his exerting his whole ftrength to compafs what he defires, he is already feared by. thofe who have the management of affairs, and efpecially by the earl of Salifbury, whorappears to be greatly apprehenfive of the prince's afcendant: as the priuce, on the other hand, flows little efteem for his lordmip." In this letter the anbaffador further goes on to remark, that fome of the prince's attendants liad formerly been made to expect penfions from France; and:

## H E N

Henry. he was of opinion that they ought to be gratified on account of the intereft they had with the prince. He adds, that the qneen had lefs affection for Prince Henry than for his brother the duke of York, afterwards Charles I.; which the prince feemed to have difcovered, and fometimês ufed expreffions to that purpofe; that the king alfo feemed to be jealous of his fon's accomplifhments, and to be difpleafed with the quick progrefs he made.

In 1607 the prince received the arms and armour which Henry IV. fent him as a prefent; and thefe being accompanied with a letter, the prince returned an anfwer by a Mr Douglafs; who was introduced to the king of France by the ambaffador Sir George Carew. His majefty, contrary to cuftom, opened the prince's letter inmediately; and was fo much furprifed at the beauty of the character, that he could not be fatisfied that it was the prince's hand until he compared the figrature with the reft of the writing. In his letter to the Britifh court on this occafion, the ambaffador fets forth in flrong terms the' affection exprefled hy the French monarch for the prince; "accounting of him as of his own fon, as he hoped that his good brother of Great Britain would do the like of the dauphin." The French ambaffador alfo gave a character of his highnefs fimilar to that already nentioned ; remarking, that the prince had great accomplifluments and courage; would foon make himfelf talked of, and poffibly give jealoufy to his father, and apprehenfions to thofe who had the greateft afcendant at court." With regard to the penfions to his attendants, he was at firf of opinion that they ought to be granted; but afterwards altered his mind, perceiving that there was little probability of the prince being influenced by any of his attendants, as he was much more inclined to be guided by his own jadgment than by the fuggeftions of others -In the month of July this year the Dutch ambaffa. dors came recominended to Price Henry by the States, who wrote to him that they had ordered their ambaffadors to kifs his highnefs's hands on their part, and defired him to continue his friendhip to their republic, and to allow their ambaffadors a favourable audience, and the fame credit as to thempelves.
All this attention paid him by foreign powers, all his attention to his own improvements in learning and the military art, and all the temptations which we cannot but fuppofe a youth in his exalted ftation to have been expofed to, feem never to have flakeu the mind of this magnanimons prince in the leaft, or to have at any time made him deviate from the frict line of propricty. We have already mentioned his attachment to the proteftant religion; and this appears not to have been grounded upon any prejudice or opinion inculcated upon his infant mind by tnofe who had the care of him, but from a thorough conviction of the truth of the principles which he profeffed. On the difcovery of the gunpowder-plot, he was fo impreffed with gratiunde towards the Supreme Being, that he never afterwards onitted being prefent at the fermon preached on the occalion. In his 1 th year the prince fhowed himfelf capable of diftingunhing the merit of religious difcourfes, and paid particular regard to fuch divines as were moft remarkable for their learning and abilities. Among others, he honoured with his attention the learned and eloquent Mr Jofeph Hall, then rector
of Halfead in Suffolk, afterwards dean of Worcefter, and fucceffively bihhop of Excter and Norwich. His highnefs was fo much pleafed with a book of Meditations publifhed by that divine, that he preffed him to preach before him; and having heard two of his fermons, he engaged him as one of his chaplains; inviting him afterwards to ftay conftantly at his court, while the other chaplains waited only in their turns; promifing, moreover, to obrain from the king fuch preferments as fhould fully fatisfy him. Mr Hall, however, from a reluctance to leave his new patron Lord Denny afterwards earl of Norwich, did not accept of thefe honourable and advantageous propofals.
In his family the prince took the utmoft care to preferve decency and regularity. He ordered hoxes to be kept athis three houfes of St James's, Richmond, and Nonfuch, for the money required of thofe who were heard to fwear: the fines levied on fuch offenders being given to the poor. He had, indeed, a particular averfion to the vice of fwearing and profanation of the name of God. When at play he never was heard to do fo ; and on being afked why he did not fwear at play as well as others? he anfwered, that he knew no game worthy of an oath. The fame anfwer he is faid to have given at a hunting-match. The ftag, almoft quite fpent, croffed a road where a butcher was paffing with his dog. The flag was infantiy killed by the dog, at which the huntfmen were greatly offended, and endeavoured to irritate the prince againft the butcher: but his highnefs anfwered coolly, "What if the butcher's dog killed the ftag; what could the butcher heip it? They replied, that if his father had been fo ferved, he would have fworn fo that no man could have endured. "Away," cried the prince, " all the plearure in the world is not worth an oath."

The regard, which Prince Henry had for religion was manifeft from his attachment to thofe who behaved themfelves in a religious and virtuous manner. Among thefe was Sir John Harrington, whofe father liad been knighted by queen Elizabeth, and created by King James a baron of England in 1603 by the title of Lord Harrington of Exton in Rupland. He was entrufted with the care of the Princefs Elizabeth after her marriage with the elector palatine, whom he attended to Heydelberg in 1613, and died at Worms on the 24 th of Auguft following. His fon, who in the year 1604 had been created knight of the Bath, was as foon as he came to the years of difcretion remarkable for his piety ; infomuch that he is faid to have kept an exact diary of his life, and to have examined himfelf every week as to the progrefs he had made in piety and virtue, and what faults he had committed during that time. He was affable and courteous to all, and remarkzble for his humanity to thofe in diftrefs; all which good qualities fo endeared him to the prince, that he entered into as frict a friendfhip with him as the difproportion between their ttations would allow. There are fidid feveral letters extant which paffed between them, chiefly upon claffical fubjects. This worthy and accomplifhed nobleman died in February 1614.
In his friendflip Prince Henry appears to have been yery fincere, andinviolably attached to thofe whom he once patronifed. He had a great regard for the unfortunate Lady Arabella Stewart, fifter of Henry Lord

## HEN [417] HEN

Weary Darnley, the king's father ; and there is fill extant letter from this lady to the prince in return for forme kindness he had bellowed on a kinfinan of hers at her recommendation. He exprelfed much companion for her misfortunes; fie having excited the king's jealoufy on account of her marriage with Mr William Seymour, afterwards earl and marquis of Hertford, and reftored in 1660 to the dukedom of Somerfer. But on her attempting to efcape from the house in Highgate where he was confined, and to go abroad with her hufband, his highnefs expreffed forme refentsent againft her; though in all probability his apprehentions as well as thole of the king, were illfounded.

As early as the year 1605 , the prince, though then only in his isth year, manifested his gratitude and attachment to thole who had ferved him, in the inftance of his tutor Mr. Newton already mentioned. That gentleman had been promifed by his majefty the deanery of Durham upon the demife of the archbifhop of York. On this promile Mr Newton had relied for two years; and as fool as the prelate died, his highnets took care to put the king in mind of his promife ; in consequence of which, Mr Newton was installed in his office on the 27 th of September 1606.

Mr Pets, the gentleman who first inftructed the prince in naval affairs, having been involved with many others in an inquiry concerning their conduct in their reflective employments in the roy al navy, the prince flowed a laudable define of protecting their innocence. The inquiry was fec on foot by the earl of Northampton, lord privy feal and warden of the cinque ports, who had received a commifion from the king for the purpofe. It was carried on by his agents, however, with foch violence and malice, as nor only occafioned great trouble and expence to the parties concerned, but almoft ruined the navy, befides augmenting his majetty's expences much more than formerly. Mr Petit's trial began on the 28th of April 1609 ; at which time the reports being very favourable to him, the king determined to examine into the fate of the matter him. felf. For this purpose he went to Woolwich on the 8 th of May, attended by the prince ; and appointed Sir Thomas Chaloner, his highness's governor, and Mr Henry Briggs, then profeffor of geometry in Grefham college, to decide the controverfy which was then agitated about the proportion of the chips. The meafurers declared in favour of Mr Yet; on which the prince exclaimed, "Where be now thole perjured fellows, that dare thus to abufe his majefty with false informations? Do they not worthily deferve hanging?" During the whole time he food near Mr Yet to encourage him ; and when the king declared himfelf fatisfied of his innocence, the prince took him up from his knees, expreffing his own joy for the fatisfation which his father had received that day; protecting that he would not only countenance Mr Pett for the future, but provide for him and his family as long as he lived.

The courage, intrepid difpofition, and martial turn of this prince, were manifeft from his infancy. Ir is related of Alexander the Great, that at a very early period of his life he flowed more fill than all his facher's grooms in the breaking of his favourite horfe Bucephalus. An anecdote fomewhat fimilar is re-

Vol. WILI.
corded of prince Henry. He was hardly ten years of age, when he mounted a very high Spirited borfe, in fire of the remonstrances of his attendants; furred the animal to a full gallop; and having thoroughly wearied him, brought him back at a gentle pace, alking his fervants at his return, "How long fall I continue in your opinion to be a child?" From the very first time that he embarked on board the fall veffel formerly mentioned, he continued to pay the utmoft attention to naval affairs. In Aagait 1607 , he visited the royal navy at Woolwich, where he was received by Mr lett, and conducted aboard the Royal Anne, where he had 3I large pieces of ordnance ready to be fired. This was done unexpectedly as foo as the prince reached the poop; at which he expreffed great-fatisfaction. After vifiting the dock-yard, and furveying what was done of a chip then building for himfelf, he went afore, and having partaken of an entertainment prepared for him by Mr Pett, he was by him conducted to the mount, where the ordnance were again charged and ready to be placed for firing. The prince indited upon an immediate difcharge, but fayfere himfelf to be perfuaded againft it by Mr Pert's reprefentation of the danger of firing fo many ordnance loaded with hot while his highness food clove by ; on a fignal given by him, however, by holding up his handkerchief, after he had removed to a proper difrance with his barge, the ordnance were difcharged as he had defied. In his roth year he paid feveral vifits to Woolwich, in order to fee the abovementioned Ship which was building for himfelf. When finifled,

Henry:

fenry. with three whole decks, at the rate of feven pounds per ton; that he thould build a hip of 600 ton with in a certaintime, \&c. Mr. Pett was employed to fee that this contract was fulfilled on the part of Mr Burrel. Among the prince's papers, a lift of the royal navy was found after his death, with an account of all the expences of fitting out, manning, \&c. which muft now be accounted a valuable addition to the naval hiflory of thofe times. His paffion for naval affairs naturally led him to a defire of making geographical difcoveries; of which, however, only two inftances have reached our times. One was in 1607 , when he received from Mr Tindal his gunner, who had been employed by the Virginia cempany, a draught of James's river in that conntry, with a letter dated 22d June the fame year. In this letter Mr Tindal remarks, that his fellow-adventurers had difcovered that river; and that no Chriftian had ever been there before; that they were faftly arrived and fettled; that they found the country very fruitful; and that they had taken real and public poffeflion in the name and to the ufe of the king his highnefs's father. The other inftance was in the year 1612 , the fame in which he died, when he employed Mr Thomas Button, an eminent mariner, to go in queft of a north-weft paffage. Mr Button accordingly fet fail with two hips named the Refolution and $D_{i f c o v e r y ; ~ t h e ~ f a m e ~ d e f i g n a t i o n s ~ w i t h ~ t h o f e ~ i n ~}^{\text {f }}$ which the late Captain Cook made his laft voyage. Both of them were victualed for 18 months; but wintering in thefe northern regions, they did not return till after the prince's deceafe, fo that Captain Button was never fent on another voyage: neverthelefs, he returned fully convinced of the exiftence of fuch a paffage; and even told the celebrated profeffor Briggs of Grefham college, that he had convinced the king of his opinion.

The martial difpofition of the prince, which was confpicuous on all occafions, eminently difplayed itfelf on the occafion of his being invefted in the prin cipality of Wales and duchy of Cornwall, which took place in the year r6io. Previous to this ceromony, he, under the name and character of Maliades lord of the ifles, caufed a challenge to be given, in the romantic ftyle of thofe times, to all the knights in GreatBritain. The challenge, according to cuftom, was accepted; and on the appointed day, the prince, affifted only by the duke of Lenox, the earls of Arundel and Southampton, Lord Hay, Sir Thomas Somerfet, and Sir Richard Prefton who inftracted his highnefs in arms, maintained the combat againft 56 earls, barons, knights, and efquires. Prince Henry himfelf gave and received 32 pufhes of the pike, and about 360 ftrokes of fwords, performing his part very gracefully, and to the admiration of all who faw him, he being not yet 16 years of age. Prizes were beftowed upon the earl of Montgomery,, Mr Thomas Darry, and Sir Robert Gordon, for their behaviour at this combat. The ceremony of inftallation was performed on the $4^{\text {th }}$ of June 6 rio, at which time every kind of magnificence was difplayed that could be devifed. Among other pageants ufed on this occafion was that of Neptune riding on a dolphin and making feeches to the prince; alfo of a fea goddefs upon a whale. After the ceremony the prince took his place on the left band of his majefly; fitting there in his royal robes,
with the crown on his head, the rod in one hand, and in the other the patent creating him Prince of Wales and dake of Cornwall. A public act was then read, teftifying that he had becn declared prince of Great Britain and Wales. He was afterwards ferved at table with a magnificence not unworthy of royalty itfelf; the whole concluding with a grand mafquerade and tournament.

In one inflance, the extreme defire which prince Henry had in being inftruted in military affairs, carried him beyond thofe bounds which European nations have prefcribed to one another. In 1607 the prince de Joinville, brother to the duke of Guife, came to England, having been obliged to leave France in confequence of his having made love to the countefs de Moret the king's miftrefs. After having been for a few weeks magnificently entertained at court, he departed for France in the beginning of June. The prince took an opportunity of fending to Calais in the train of the prince an engineer in his own fervice, whotook the opportunity of examining all the fortifications of the town, particularly thofe of the Rix-banc. This was difcovered by the French ambaffador, who immediately gave notice of it to the court, but excufed the prince, as fuppoling that what he had done was more out of curiofity than any thing elfe; and the court feemed to be of the fame opinion, as no notice was ever taken of the affair, nor was the friendifhip betwixt king Henry and the prince in the fmalleft degree interrupted. The martial difpofition of his highnefs was greatly encouraged by fome people in the military line, who put into his hands a paper entitled "Propofitions for War and Peace." Notwithftanding this title, however, the aim of the author was evidently to promote war rather than peace ; and for this the following arguments were ufed. 1. Neceffity; for the prefervation of our own peace, the venting of factions fpirits, and inftructing the people in arms. 2. The benefits to be derived from the foils of the enemy, an augmentation of revenue from the conquered countries, \&c. This was anfwered by Sir Robert Cotton in the following manner. I. That our wifeft princes had always been inclined to peace. 2. That foreign expeditions were the caufes of invafions from abroad and rebellions at home, endlefs taxations, vaffalage, and danger to the ftate from the extent of territory, \&c. It does not appear, however, that the prince was at all moved by thefe pacific arguments : on the contrary, his favourite diverfions were tilting, chargingon horfeback with piftols, \&c. He delighted in converfing with people of fkill and experience in war concerning every part of their profeflion; caufed new pieces of ordnance to be made, with which he learned to fhoot at a nark ; and was fo careful to furnifh himfelf with a breed of good horfes, that no prince in Europe could boaft of a finperiority in this refpect. He was folicited by Sir Edward Conway to direet his attention to the affairs of the continent, where Sigifmund III. of Poland threatened, in conjunction with the king of Denmark, to attack Guftavus Adolphus the young king of Sweden; but the death of the prince, which happened this year, prevented all interference of this kind.

To his other virtues Prince Henry added thofe of frugality without avarice, and generofity without ex-
travagance

## HEN 「 419 」

Henry. travagance. As early as the year 1605 he began to flow all attention to his intereft as duke of Cornwall, and to take proper meafures for fecuring his revenues there. In r6io he fettled and appointed the officers of his houfhold, making his cloice with the greateft prudence, and giving orders for the management and regulation of his affairs with all the wifdom and gravity of an old counfellor. Some lands were now allotted to him for his revenues ; and inftead of diminifhing his income during the flort time he was in poffeffion of them, they were found at his death to be Come thoufands of pounds better than when he obtained them. At this time he howed much reluctance to gratify any of his fervants except by promifes, as not thinking himfelf yet authorifed to give any thing away: but a hort time before his death, he conferred penfions on fome of them ; and there is no reafon to doubt, that had his life been prolonged be would have rewarded them all according to their merit.

Though Prince Henry never interfered much in public bufinefs, yet in any little tranfactions he had of this kind, he always difplayed great firmnefs and refolution, as well as abfolute propriety of conduct. In a letter from Sir Alexander Seton, carl of Dunfermling, he is commended for the firmnefs and refolution with which he repelled the calumnies of fome who "had ralhly, and with the higheft intemperance of tongue, endeavoured to wound the Scottifh nation." By this he alluded to fome very grofs and fcurrilous invectives thrown out againft the whole body of the Scots by Sir Chriftopher Pigot, in a debate in the houfe of commons on an union between the two kingdoms. This gentleman declared his aftonifhment at the propofal of uni ing a good and fertile country to one poor, Barren, and in a manner difgraced by nature ; and for affociating rich, frank, and heneft men, with fuch as were beggars, proud, and generally traitors and rebels to their kings; with many other fhameful expreffions of the fame kind. His majefty was highly offended with the whole council ; and Sir Chriftopher, after being obliged in parliament to retract his words, was expelled the houfe and imprifoned; in confequence of which, the king was addreffed by the ftates of Scotland, who thanked him for the zeal he had manifefted for the honour of the country. In another inftance, where the priace wifhed Mr Fullerton, a Scotfman, to fuperfede Sir Robert Car, one of the attendants of bis brother the duke of York, contrary to the inclination of the king and earl of Salifbury, his highnefs carried his point by perfuading Sir Robert of himfelf to give up the place in queltion.

Under this year, 1611 , the elegant Latin hiftorian of Great Britain from 572 to 1628, Robert Johnfton, places a fory, which, though unlupported by any au. thority but his own, and improbable in itfelf, muft not be omitted here. The prince, according to this writer, requefted the king that he might be appointed to prefide in the council. This demand was feconded by the king's favourite Car, Vifcount Rochefter, who urged his majefty to lay his fon's petition before the council. But the earl of Salifbury, jealous of the growing power of Rochefter, and a thorough mafter of artifice and diffimulation, ufed all his efforts to defeat whatever meafures were propofed by his rival: and being akked foon after his opinion upon this point,
whether it was for the public intereft that the prince fhould prefide in the council? anfwered, that he thought it dangerous to divide the government, and to invét the fon with the authority of the father. Many others of the privy council having delivered their opinions on the fame queftion, that of the eart of Salifbury was adopted by the majority. But his lordfhip ioon took an opportunity, in a fecret conference with the prince, to lament his own lituation, and to perfuade his highnefs that Lord Rochefter had the only intluence in the palace, and privately counteracted all his detigns. The, prince, on his part, refented the denial of his requef, and his exclufion from public bulinefs. It was not long before Lord Rochefter difcovered the earl of Sa . lifbury's practice againft him with the prince; to whon he therefore went to clear himfelf. But his highnefs turned from him with great indignation, and would not hear his juftification. The queen likewife, higlly difpleafed with the vifcount, refufed to fee him, and fought all means of leffening his power. This forwardnefs imputed to the prince by the hiftorian, in endeavouring to intrude himfelf into the management of public affairs, is not (as Dr Birch remarks) at all fuitable to the character of his highnefs, or to any other accounts which we have of him ; nor onght it to be believed upon the credit of a writer who cites no aurhority for it, nor indeed for fcarce any other affertions in his hiftory, how extraordinary foever they appear to be, and who frequently ventures to enlarge upon fubjects which it was impoffible for him to have known. However, it is not much to be doubted, that the prince had no great efteem for Lord Rochefter, whofe rife to the power of a favourite and a minifter he fo much dilliked, if we may believe a falirical writer of Memoirs*, that he was reported either to have ftruck his lord hip on the back with a racket, or very hardly forborne it. And another hiftorian, not much lefs fatirical, Arthur Willon $\dagger$, mentions the bickerings betwixt the prince and the vifcount ; and that Sir James Elphinfton obferving his highnefs one day to be p difcontented with the vifcount, offered to kill him ; for which the prince reproved him, and fid that if there were caufe he would do it himfelf. But to wave fach very fufpicious authorities, it will be fufficient, in order to judge of his highnefs's opinion of the vifcount, and his adminiftration at the very height of it, to hear what himfelf fays in a letter to Sir Thomas Edmondes of the ioth of September 1612: "As matters go now here, I will deal in no bufineffes of importance for fome refpects."

It is not to be fuppofed but that the marriage of a prince fo accomplithed and fo much admired would engage the attention of the public. This was indeed the cafe. The queen, who favoured the intereft of Spain, propofed a match with the infanta, and the king of Spain himfelf feemed to be inclined to the match. In r6i a a propofal was made for a donble marriage betwixt the prince of Wales and the cldeft daughter of the houfe of Savoy, and between the prince of Savoy and the Lady Elizabeth; but thefe overtures were very coolly received, being generally difagreeable to the nation. Sir Walter Raleigh, at that time prifoner in the Tower, wrote two excellent treatifes againft thefe matches; in one of which he fiyles the prince The mof excellent and hopeful, as he does alfo in the in-

* Francia Ofborne's T'raditiona Memoirs King $\mathfrak{F}$ amt fect. 38. p. 530. Life al Reign of K. Fames.

Fitmy.
introduction to his Obfervations on the royal navy and fea-fervice. Aboltt the year 1612 , his marriage became an object of general attention. In this aftair the king feems to have inclined to match his fon with the princels who promifed to bring the largelt dowry; the nation at large to have been influenced by motives of religion; and the prince himfelf to have remained entirely paflive, and to have been willing to beftow his jerfon with the moft perfect indifference on whatfoever princeís fhould be chofen for him. This appears from a letter to the king dated 5 th Ostober 1612, in which he confiders the match with the fecond princefs of France as in a manner concluded. Propofals had indeed been made of fending her over to England for her education, the being only nine years of age at that time; but Villeroy the French minifter was of opinion, that this ought to be delayed for a year longer. The reafons affigned by the prince for wifhing her coming to England at that time were merely pelitical: 1. Becaufe the French court, by having the princefs in their power, might alter her mind as they pleafed; 2. That there would thes be a greater likelihood of converting her to the proteftant religion; and, 3 . That his majefty's credit would be better preferved when both daughters (the eldeft being promifed to the prince of Spain) flould be delivered at the fame time, though the conclufion of the one marriage might be much later than of the other. With regard to the exercife of her religion, the prince expreffed himfelf rather in fevere terms, wifhing his majefty only to allow her to ufe it in " her moft private and fecret chamber." He then argues with the moft philofophic indifference of the propriety of a match with the French princefs rather than with one of the houfe of Savoy : concluding at laft in the following words; © If I have incurred in the fame error that I did laft by the indifference of my opinion, I humbly crave pardon of your majefty, holding it fitter for your majefty to refolve what courfe is moft convenient to be taken by the rules of the fate, than for me who am fo little acquainted with fubjects of that nature : and befides, your majefty may think, that my part to play, which is to be in love with any of them, is not yet at hand." On the whole, it appeared, that there never was any real defign in the king or prince to bring this matter to a conclufion; and that the propofal had been made only with a view to break off the match of the eldeft drughter with the prince of Spain, which could not now be done.

Prince Henry, notwithftanding his indifference in matrimonial matters, applied himfelf with the umoft affiduity to his former employments and exercifes, the continual fatigue of which was thought to impair his lrealth. In the igth year of his age his conflitution feemed to undergo a remarkable change : he began to appear pale and thin, and to be more retired and ferious than ufual. He complained now and then of a giddinefs and heavy pain in his forehead, which obliged him to froke up his brow before he put on his hat: he frequently bled at the nofe, which gave great relief, though the difcharge ftopped fome time before his death. Thefe forebodings of a dangerous malady were totally neglected borly by himfelf and his attendants, even after he began to be feizedat intervals with fainting fits. Notwithitanding thefe alarming fymp-
toms, he continued his ufual employments. On the arrival of Count de Naflau in England, he waited upon him as though nothing had been the matter: and when the fubject of the princefs Elizabeth's marriage came to be canvaffed, he interefted himfelf deep. ly in the affair, and never defifted till the match with the elector palatime was concladed. In the begiming of June i6i2, the prince went to Richmond, where he continued till the progrefs; and notwithftading the complaints abovementioned, he now took the opportunity of the neighbourhood of the Thames to learn to fwim. This practice in an evening, and after fupper, was difcommended by feveral of his atttendants : and was fuppofed to have ftopped the bleeding at the nofe, from which he had experienced fach falutary. effects. He could not, however, be prevailed upon to difcontinue the practice; and took likewife great pleafure in walking by the river-fide in moon-light to hear the found and echo of the trumpets, by which he was undoubtedly too much expofed to the evening. dews. Through imparience to meet the king his father, he rode 60 miles in one day; and having refted himfelf during the night, he rode the ne xt day 36 miles to Belvoir Caftle, where he met the king at the: time appoinced. During the heat of the feafon alfo he made feveral other fatiguing journeys, which maft. undoubtedly have contributed to impair his health. At the conclufion of the progrefs, he gave a grand entertainment to the court from Wednefday till Sun. day evening, when the king and queen with the prin cipal nobility attended at fupper. Next day he haftened to his heufe at Richmond, where he expected the elector palatine, and began to give orders for his reception, alfo to take meafures for rewarding his fervants. To fome of thofe he gave penfions, and promifed to gratify the reft as foon as poffible. Erom this time, however, his health daily. declined. His. countenance became more pale, and his body more emaciated: he complained now and then of drewfinefs; which frequently made him afk his attendants concerning the nature and cure of an epidemic fever, probably. of the putrid kind, which at that time prevailed in England, and was fuppofed to have been brought thither from Hungary. He now began frequently to, figh, as is ufial for perfons afflicted with diforders of that kind. The malady increafed in the begining of. October, though he ufed his utmoft endeavours to conceal it, and occupied himfelf as ufual ; only that now, inftead of rifing early in the morning as before, he would commonly keep his bed till nine. On the roth of that month he had two flight fits of an ague, which obliged him to keep his chamber; and on the 13th his diftemper feemed to be augmented by a violent fiarrhœa, which, however, gave fo much relief next day, that he infifted upon being removed from Richmond to St James's, in order to receive the elector palatine. On his arrival there, fome of his attendauts began to be alarmed by the figas of ficknefs which appeared upon him, though he himfelf made nocomp aint, and even allowed his phyfician to go to his. own houfe. The elector arrived on the 16 th, and the prince waited upon him at Whitehall; but his difeafe. had now gained fo much ground, that his temper underwent a very confiderable alteration, and he became peevih and difcomented with almolt every thing:

## H E N

Eeary. neverthelefs he ftill continued to give orders about what related to the ceremony of his litter's marriage ; and kept company as much as he could with the eletor and the count de Nalfiu, with whofe converfation he feemed to be particularly delighted. So great was his activity even at this time, that he played a match at temnis on the 24 th of Ottober. At this time he expofed himfelf in his hirt, feemingly without any inconvenience ; but at night he complained of a greater degree of laflitude than ufual, and of a pain in his head. Next day, being Sunday, he attended divine fervice and heard two fermons; after which he dined with his majefty, feemingly with a good appetite, but the palenefs and ghaftly appearance of his countenance was much remarked. About three in the afternoon he was obliged to yield to the violence of his diftemper; being feized with a great faintnefs, hivering, and head-ach, with other fymptoms of a fever, which from that time never left him. Several phyficians were called ; but they differed much in their opinions, ifindeed any agreementamongft them, confidering the fate of medicine at that time, could have been of fervice. On the firft of November he was blooded ; an operation which Dr Butler one of his phyficians had hitherto oppofed, but now confented to in compliance with his fellows. The impropriety of it was manifeft by the thin and difolved fate of the blood which was taken away, and ftill more by his becoming much worfe next day. As at that time the Peruvian bark, the great antidote in putrid difeafes, was unknown, and no proper methods of treatment feem to have been employed, it is not to be wondered that he funk under the difeafe. Among other abfurd remedies ufed on this occafion was " a cock cloven by the back, and applied to the foles of his feet." He expired on the 6 thof November 1612, at the age of 18 years 8 months and 17 days. On opening his body, the lungs were found black, fpotted, and full of corrupted matter ; the diaphragm was alfo blackened in many places; the blood veffels in the hinder part of the head were diftended with blood, and the ventricles full. of water : the liver was in tome places pale and lead-coloured; the gall-bladder deftitute of bile, and diftended with wind; and the fpleen inmany places unnaturally black. His funeral was not folemnized till the 7 th of December following. Many funeral fermons were publifhed in honour of him, and the two univerfities publifhed collections of verfes on this occafion. The moft eminent poets of that age alfo exerted themielves in honour of the deceafed prince; particularly Donne, Brown, Chapman, Drummond of Hawthornden, Dominic Baadius of Leyden, \&c.

His highnefs's family continued together at St James's till the end of December 1612 , when it was diffolved; and upon the day of their diffolution, Mr Jofeph Hall, hischaplain, preached to them a mof pathetic farewell fermon, on Revel. xxi. 3. In this he fpeaks of his deceafed mafter in the higheft terms of commendation; as the glory of the nation, ornament of mankind, hope of pofterity, \&c.: and that he, who was compounded of all lovelinefs, had infufed an harmony into his whole family, which was "the mofe loving and entire fellowfip that ever met in the court of any prince." The exhortation with which the reacher concludes, is; "Go in peace, and live as

## 42 I] <br> HEN

thofe that have loft fuch a mafter, and as thofe that
Henry. ferve a Mafter whom they cannot lofe."
Prince Henry was of a comely ftature, abont five feet cight inches; of a ftrong, flraight, well-made body, with fomewhat broad floulders and a fmall waift ; of an amiable and majeftic countenance: his hair of an auburn colour: he was long-faced, and had a broad forehead, a piercing eyc, a moft gracions fmile, with a terrible frown. He was courteous, loving, and affable; naturally modeft, and even thame-faced; moft patient, which he fhowed both in life and death; flow. to anger, fo that even when he was offended he would govern it and reftrain himfelf to filence. He Was merciful tooffenders, after a little punihment to make them fenfible of their faults. His fentiments of piety Itrong and habitual; and his zeal for the interefts of religion was fuch, that he would, if he had lived, have ufed his endeavours for reconciling the divifions among its profeffors. He ufually retired three times a-day for his private devotions, and was farce once a month abfent from the public prayers, where his behaviour was highly decent and exemplary, and his attention to the preacher the moft fixed imaginable. He had the greateft efteem for all divines whofe characters and conduct correfponded with their profeffion; but could not conceal his indignation againft fach as acted inconfiftently with it, and he above all things abhorred flattery and vain-glory in them. He had a thorough deteftation for popery, though he treated thofe of that religion with great courtefy; fhowing, that his hatred was not levelled at their perfons, but their opinions. And lie was fo immoveable in his attachment to the proteftant religion, that not long before his death, as Sir Charles Cornwallis + aflures us, $+D i f$ courfet he made a folemn proteftation that he would never of the mofs join in marriage with one of a different faith.
The prince was fo exact in all the duties of filial piety, and bore fo true a reverence and refpect for the king his father, that though fometimes, out of his own inclination, or by the excitement of others, be moved his majefty in fome things relating to the public, or his own particular interents, or thofe of others; yet upon the lealt word, look, or figu given him of his majefty's difapprobation, he would inftantly d: ak from purfuing the point, and return either with fatisračion upon finding it difagree. able to the king, or with fuch a refolved patience that he neither in word or action gave fo much as any appearance of being difpleafed or difcontented. He ad. hered ftrictly to juftice on all occafions; and never fufo fered himfelf to determine rafly, or till after a due examination of both parties. This love of juitice fhowed itfelf very early by favouring and rewarding. thofe among his pages, and other young gentlemen placed about him, who, by men of great judgment, were thought to be of the beft behaviour and mof mes. rit. And when he was but a little above five years of age, and a fon of the earl of Mar, fome what younger than himfelf, falling out with one of his hignefs's pages, did him fome wrong, the prince reproved him for it; faying, " I love you, becaufe you are my lord's fon, and my confin: but if you be not better condi: tioned, I will love fuch a one better :'" naming the child who had complained of him. He was of fingular

## HEN [ 422$]$ HEN

Henry. integrity, and hated flattery and difimulation; the latter of which he efteemed a bafe quality, efpecially in a prince; nor could he ever conftrain himfelf to treat thofe kindly who did not deferve his love. A nobleman in the higheft favour with the king had written to him, by fpecial command of his majefty, a letter, wherein he recommended to his highnefs a matter of very great confequence, to be inftantly anfwered; and in his fubfeription had ufed thefe words, "Yours before all the world." His highnefs directed Sir Charles Cornwallis to draw up an anfwer, who, having written it, added fome words of favour to the nobleman to precede the prince's figning. His highnefs having read and confidered the letter, allowed it entirely without alteration : But with regard to the words of fubfription, notwithftanding the great hafte which the difpatch required, he ordered it to be new written, and the words objected to by him to be left out ; alleging, that he to whom he wrote had dealt with him untruly and unfaithfully, and that his hand fhould never affirm what his heart did not think. His temperance, except in the article of fruit, was as eminent as his abhorrence of vanity and oftentation, which began to how themfelves when he was very young. When he was taught to handle the pike, and his mafter inftructed himi both by word and example to ufe a kind of ftatelinefs in marching and holding of his hand ; though he learned all orher things, he would not conform himfelf to that aftected falfion: and if fometimes, upon earneft intreaty, he offered to ufe it, he would laugh at himfelf, and prefently return to his own more modeft and decent manner. And thoagh he was a perfect mafter of dancing, he never practifed it except when he was ftrongly preffed to it. The fame modefty appeared in whatever he faid or did: But it was no impediment to his generous and heroic. difpotition, which made him perform all his exercifes beft before much company and the greateft perfonages. His clothes were ufually very plain, except on occafions of public ceremony, or upon receiving foreign ambaffadors, when he would affume a magnificence of drefs, and an air of majefty, which immediately after he laid afide. Having once worn a fuit of Welch frize for a confiderabie time, and being told that it was too mean for him, and that he onght not to keep even a rich fuit folong; his anfwer was, that he was not afhamed of his country cloth, and wifhed that it would laft for ever.

In quicknefs of apprehenfion and memory few of the fame age ever went beyoud this prince; and fewer ftill in a right judgment of what he was taught. When he began to have fome knowledge of the Latin tongue, being defired to choofe a motto out of feveral fentences colleeted by his tutor for his ufe, after reading over many good ones, he pitched upon that of Silius Italicus, Fax mentis honeflac gloria. And being afked by the king one day, which were the beft verfes that he had learned in the firft book of Virgil's Æneid, he anfwered thefe:

## Rex erat BHeas nobis, quo juftior alter

 Nec pietate fuit, nec bello major $\mathcal{E}$ armis.Reading likewife another verfe of the fame poet, Tros Tyriufve mibi nullo difcrimine agetur,
he faid he would make ufe of it with this alteration, Anglus Scotuffue miliz nulla difcrimine agetur.

Befides his knowledge of the learned languages, he Henty: fpoke the Italian and French; and had made a confiderable progrefs in philofophy, hiltory, fortification, mathematics, and cofmography; in the two lan of which he was inftructed by that excellent mathematician Mr Edward Wright. He loved and endeavour ed to do fomewhat of every thing, and to be excellent in the moft excellent. He greatly delighted in all rare inventions and arts, and military engines both at land and fea; in fhooting and levelling great pieces of ordnance ; in the ordering and mardhalling of armies; in building and gardening; in mufic, fculpture, and painting, in which laft art he brought over feveral works of great mafters from all countries.

He had a juft opinion of the great abilities of Sir Walter Raleigh; and is reported to have faid, that " no king but his father would keep fuch a bird in a cage." And it is effirmed, that his highnefs, but a few months before his death, obtained the lands and caftle of Sherburn in Dorfetfhire, the confifcated eftate of Sir Walter, with an intention of returning it to him. That eminent writer, foldier, and ftatefman, had a reciprocal regard for the prince, to whom he had defigned to addrefs a difcourfe "Of the Art of War by Sea," which his highnefs's death prevented the author from finifhing. He had likewife written to the prince another " Difcourfe of a Maritimal Voyage, with the paffages and incidents therein :" Bat this has never yet appeared in print. He had alfointended, and, as he expreffes it, hewn out a fecond and third volume of his General Hiftory, which were to have been directed to his highnefs: "6 but it has pleared God (fays he) to take that glorious prince out of this world, to whom they were directed; whofe unípeakable and never. enough lamented lofs hath tanght me to fay with Job, Verfa eft in luctum cithara mea, borganum meum int vocem flentium."

In the government of his houhold and management of his revenues, though he was fo very young, his example deferved to be imitated by all other princes. He not only gave orders, but faw almoft every thing done himfelf; fo that there were fearce any of his do. meftics whom he did not know by name. And among thefe there was not one even furpected papift; his directions being very peremptory for fetting down the names of all communicants, that he might know if there were any of his family who didablent themfelves from the communion. His family was large, confifting of few lefs than 500 , many of them young gentlemen born to great fortunes, in the prime of their years, when their paffions and appetites were ftrong, their reafon weak, and their experience little. But his judgment, the gravity of his princely afpect, and his own example, were fufficient reftraints upon them; his very eye ferved inftead of a command; and his looks alone had more effect than the fharpeft reprehenfions of other princes. If any difputes or contefts arofe among his fervants, he would pat a fop to them at the beginning, by referring them to fome of his principal officers, whom he thought moft intelligent in points of that nature, and to underftand beft what compenfation was due to the injured, and what reproof to the offender; fo that in fo numerous a family there was not fo much as a blow given, nor any. quarrel carried to the leaft height.

## Memoirs on

the Reign
of King
Эames,
fect, 45.

Though he loved plenty and magnificence in his houre, he reftrained them within the rules of frugality and moderation, as we have already noticed. By this economy he avoided the neceffity of being rigid to his tenants, cither by raifing their farms or fines, or feeking or taking advantage of forfeitures. Nor was he tempted to make the profit which both law and right afforded him, of fuch who had in the time of former princes purchafed lands belonging to his duchy of Cornwall, which could not by law be alienated from it ; for he gave them, upon refuming thefe lands, a reafonable fatisfaction. Neither did his economy refrain him from being liberal where merit or diftrefs called for it; at the fame time he was never known to give, or even promife, any thing, but upon mature deHiberation. Whatever abufes were reprefented to him, he immediately redreffed, to the entire fatisfaction of the perfons aggrieved. In his removal from one of his houfes to another, and in his attendance on the king on the fame occafions, or in progrefles, he would fuffer no provilions or carriages to be taken up for his ufe, without full contentment given to the parties. And he was fo folicitous to prevent any perfon from being prejudiced or annoyed by himfelf or any of his train, that whenever he went out to hawk before harveft was ended, he would take care that none fhould pafs thro' the corn; and, to fet them an example, would himfelf ride rather a furlong about.

His fpeech was flow, and attended with fome impepediment, rather, as it was conceived, by cuftom and a long imitation of fome who firft inftructed him, than by any defeet of nature, as appeared from his having much corrected it by ufing at home amonglt his fervants, firtt hort difcourfes, and then longer, as he found himfelf enabled to do it. Yet he would often fay of himfelf, that he had the moft unferviceable tongue of any man living.

He had a certain height of mind, and knew well how to keep his diftance; which indeed he did to all, admitting no near approach either to his power or his fecrets. He expreffed himfelf, upon occafions oftered, to love and efteem moft fuch of the nobility as were moft anciently defcended, and moft nobly and honeftly difpofed. He had an entire affection for his brother the duke of York and his fifter Elizabeth ; though fometimes, by a kind of rough play with the former, and an appearance of contradieting the latter in what he difcerned her to defire, he took a pleafure in giving them, in their tender years, fome excrcife of their patience. A writer $\dagger$ of lefs authority than Sir Charles Cornwallis, from the latter of whom we have thefe particulars; adds, that the prince feemed to have more affection for his fifter than his brother, whom he would often taunt till he made him weep, telling him, that he fhould be a bifhop, a gown being fitteft to hide his legs, which were fubject in his childhood to be crooked.

With regard to any unlawful paffion for women, to the temptations of which the prince's youth and fituation peculiarly expofed him, his hiftorian, who knew him, and obferved him much, affures us, that having been prefent at great feafts made in the prince's houfe, to which be invited the mont beautiful ladies of the court and city, he could not difcover by his highnefs's behaviour, eyes, or countenance, the leaft appearance
of a particular inclination to any one of them ; nor was he at any other time winefs of fuch words or actions as could juftly be a ground of the leaft furpicion of his virtue ; though he obferves, that fome perfons of that time, meafuring the prince by themfelves, were pleafed to conceive and report otherwife of him. It is indeed afferted, by the writer of Aulicus Coquinaria, believed upon good grounds to be William Saunder. fon, Efq; author of the "Complete Hiftory of Mary Queen of Scotland, and her fon and iucceffor King James," that the prince made court to the Countefs of Elfex (afterwards divorced from the Earl, and married to the Vifcount Rochefter), before any other lady then living. And Arthur Wilfon mentions the many amorous glances which the prince gave her, till difeovering that fhe was captivated with the growing fortunes of Lord Rochefter, and grounded more hope upon him than the uncertain and hopelefs love of his highnefs, he foon flighted her. The learned and pious antiquary, Sir Simonds D'Ewes, in a manufcript life of himfelf written with his own hand, and brought down to the year 1637 , is pofitive, that " notwithftanding the inettimable Prince Henry's martial defires and initiation into the ways of godlinefs, the countefs, being fet on by the earl of Northampton her father's uncle, firft canght bis eye and heart, and afterwards proftituted herfelf to him, who firft reaped the fruits of her virginity. But thofe fparks of grace which even then began to how their luftre in him, with thofe more heroic innate qualities derived from virtue, which gave the law to his more advifed actions, foon raifed him out of the flumber of that diftemper, and taught him. to reject her following temptations with indignation and fupercilioufnefs." But thefe authorities, Dr Birch obferves, ought to have little weight to the prejudice of the prince's character, againft the direct teftimony: in his favour from fo well-informed a writer as SirCharles Cornwallis.

The immature death of the prince concurring with the public apprehenfions of the power of the papitts, and the ill opinion which the nation then had of the court, gave immediate rife to fufpicions of its being. haftened by poifon. And thefefufpicions were heightened by the very little concern fhown by fome perfens in great ftations. "To tell you (fays Richard earl of Dorfet in a letter to Sir Thomas Edmondes, of the 23d of November 16:2) that our rifing fun is fet ere fcarcely he had hone, and that with him all our glory lies buried, you know and do lament as well as we, and better than fome do, and more truly; or elfe you are not a man, and fenfible of this kingdom's lofs." And it is certain, that this lofs made fo little impreffion upon the king and his favourite, that the lord vifcount Rochefter on the 9 th of November, three days after it, wrote to Sir Thomas Edmondes to begin a negociciation for marriage between Prince Charles and the fecond daughter of France. But the ambailador, who had more fenfe of decency, thought it improper to enter upon fuch an affair fo foon after the late prince's. death. Mr Beaulieu, fecretary to Sir Thomas Edmondes, in a letter of the 12 th of November 1612, to, Mr Trumbull, , then refident at Broffels, after fyling; the prince " the flower of his houle, the glory of his. country, and the admiration of all ftrangers, which in all places bad imprinted a great hope on the minds of

## HEN [ 424$]$ HEN

ITeny.

## +

the wcll aftected, as it had already fricken tercor into the hearts of his encmies," adds, "who perhaps (for of this lamentable accident we have yet no particular relation) fearing the growing virtues of that young prince, have ufed the traiter ous venom of their abominable practices to cut him off in his youth. And this I do not apprehend without caufe, confidering the feveral advertifements which I faw a month ago coming out of England, Holland, and Calais, of Atrange rumours which were in thefe parts, of fome great and imminent practice in hand, for the fuccefs whereof it was writren, that in fome places our adverfaries had -made folemn prayers : and out of Calais it was efpecially advertifed, that in your parts they were in expectation of the death of fome great prince. But alas! we did little apprehend, that fuch ominous prognoftications would have lighted upon the perfon of that vigorous young prince, whele extraordinary great parts and virtues made many men hope and believe, that God had referved and deftined him, as a chofen inftrument, to be the ftandard-bearer of his quarrel in the fe miferable times, to work the reftoration of his church, and the deftruction of the Romill idolatry."

With the above notion his royal highnefs's mother the queen was peculiarly impreffed, according to Dr Welwood; who, in his Notes on Arthur Willon's Life of King James I. in the Complete Hiftory of England, p. 714 . informs us, though without giving any authority, that when the prince fell into his laft illnefs, the queen fent to Sir Walter Raleigh for fome of his cordials, which fle herfelf had taken fome time before in a fever with remarkable fuccefs. Raleigh fent it, together with a letter to the queen, wherein he expreffed a tender concern for the prince; and, boafting of his medicine, ftumbled unluckily upon an expreffion to this purpofe, "that it would certainly cure him or any other of a fever, except in cafe of poifon." As the priace took this medicine, and died notwithftanding its virtues, the queen, in the agony of her grief, thowed Raleigh'sletter; and laid fo much weight on the expreflion about poifon, that as long as fhe lived fhe could never be perfuaded but that the f Court and prince had died by that means. Sir Anthony Weldon* Cbaracter of fuggefts that the prince was poifoned. The fame no$K$. Fames, tion is countenanced by Wilfon in his Hiftory $\dagger$; and p. 77, 78. if P. 62; $_{3} 63$ who likewife, in another work, his Memoirs, after Styling the prince "c the darling of mankind, and a youth of vaft hopes and wonderful virtues,' remarks, that it was the general rumour at the time of his death, that his highners was poifoned ; and that there is in print a fermon preached at St James's upon the diffoIution of his family, that boldly infinuated fome fuch thing. By this fermon Dr Welwood muft mean that of Mr Hall cited above; in which, however, at leaft as it is reprinted in the London edition of his works in 1617 in folio, there is not to be found any expreffion that carries the leaft infinuation of that kind. The writer of the memoirs adds, that Sir Francis Bacon, in his fpeesh at the trial of the earl of Somerfet, had fome reftections upon the intimacy of that Lord with Sir Thomas Overbury, which feemed to point that way; there being feveral exp:effions left out of the printed copy that were in the fpeech. Bifhop Burnet Likewife tells us, that he was affured by Colonel Titus,
that he lad heard king Charles 1. declare, that the prince his brother was poifoned by the means ot the

Kenty, Vifcount Rochefter, afterwards earl of Somerfet. but it will be perhaps fufficient to oppofe to all fuch fuggeftions the unanimous opinion of phyficians who attended the prince during his ficknefs, and opened his body after his death: from which, as Dr Welwood himfelf obferves, tiere can be no inference drawn that he was poifoned. Te which may be added tine allthority of Sir Charles Cornwallis $\ddagger$, who was well iu- $\ddagger$ Life ant formed, and above all fufpicion in this point, and who Death of pronounces the rumours fpread of his hignefs's having Henry, been poifoned vain ; and was fully convinced that his $\mathbf{p} .8 \mathrm{I}_{\mathrm{y}} 8 \mathrm{8}$. death was natural, and occafioned by a violent fever.

Heney (Philip), a pious and learned nonconformift minifter, was the fon of Mr John Henry, page of the back-ftairs to James dake of York, and was born at Whitehall in I63I. He was admitted into Weftmin-fter-fchool at about 12 years of age; became the favourite of Dr Bulhby, and was employed by him, with fome others in collecting materials for the Greek grammar he afterwards publihed. From thence he removed to Chrift-church, Oxford; where, having obtained the degree of mafter of arts, he was taken inte the family of judge PuIefton, at Emeral in Flintihire, as tucor to his fons, and to preach at Worthenbury. He foon after married the only daughter and heirefs of Mr Daniel Matthews of Broad-oak, near Whitchurch, by whom he becane poffeffed of a competent eftate. When the king and epifcopacy were reitored, he refuled to conform, was ejected, and recired with his family to Broad-oak : here, and in the neighbour-. hood, he fpent the remainder of his life, about 28 years, relieving the paor, employing the induftrious, inftructing the ignorant, and exercifing every opportunity of doing good. His moderation in his non. conformity was eminent and excmplary ; and upon all occafions he bore teftimony againft uncharitable and fchifmatical feparation. In church government he wilhed for archbifhop U fher's reduction of epifcopacy. He thought it lawful to join in the common prayer in public affemblies; which, during the time of his filence and reftraint, he commonly attended with his family with reverence and devotion.

Henry (Matthew), an eminent difenting minifter and author, was the fon of the former, and was born in the year 1662 . He continued under his father's care till he was 18 years of age; in which time he became well fkilled in thelearned languages, efpecially in the Hebrew, which his father had rendered familiar to him from his childhood; and from firft to laft the ftudy of the feriptures was his moft delightful employment. He completed his education in an academy kept at Illington by Mr Doolittle, and was afterwards entered in Gray's-Inn for the fudy of the law; where he became well acquainted with the civil and municipal law of his own country, and from his application and great abilities it was thought he would have become very eminent in that profeffion. But at length, refolving to devote his life to the fudy of divinity, in 1686 he retired into the country, and was chofen paf. tor of a congregation at Chefler, where he lived abour 25 years, greatly efteemed and belovec by his people. He had feveral calls from London, which he conftantly declined ; but was at laft prevailed upon to accept an -unanimous
HEN [ 425$]$ HE N

Henry. unanimous invitation from a congregation at Hackney He wrote, 1. Expolitions of the Bible, in 5 vols folio. 2. The life of Mr Philip Henry. 3. Directions for daily communion with God. 4. A method for prayer. 5. Four difcourfes againft vice and immorality. 6. The communicant's companion. 7. Family lymns. 8. A fcriptural carechifm. And, 9. A difcourfe concerning the nature of fchifm. He died of an apoplexy at Nantwich, when upon a journey, in 1714; and was interred at Trinity-church in Chefter.

Henry (Dr Robert), author of the "" Hiftory of Great-Britain, written on a new plan,' was the fon of James Henry fatmer at Muirtown in the parifh of St Ninian's, North Britain, and of Jean Galloway daughter of Galloway of Burrowmeadow in Stirlingihire. He was born on the 18 th of February 1718 ; and having early refolved to devote himfelf to a literary profeffion, was educated firlt under a Mr John Nicolfon at the parifh fchool of St Ninian's, and for fome time at the grammar-fchool of Stirling. He completed his courfe of academical Audy at the univerfity of Edinburgh, and afterwards became mafter of the grammar-fchool of Annan. He was licenfed to preach on the 27 th of March 1746, and was the firft licentiate of the prefbetery of Annan after its erection into a feparate prefbytery. Soon after, he received a call from a congregation of Prefbyterian diffenters at Carlifie, where he was ordained in November 1748 . In this fation he remained 12 years, and on the 13 th of Auguft 1760 became pattor of a dif. fenting congregation in Berwick upon Tweed. Here -he married, in 1763 , Ann Balderfton daughter of Thomas Balderfton furgeen in Berwick ; by whom he had no children, but with whom he enjoyed to the end of his life a large fhare of domettic happinefs. He was removed frem Berwick to be one of the minifters of Edinburgh in November 1768 ; was minitter of the charch of the New Grey Friars from that time till November 1776 ; and then became colleagut-minifter in the old church, and remained in that fation till his death. The degree of Doctor in Divinity was conferred on him by the univerfity of Edinburgh in 1770; and in 1774 he was unanimoufly chofen moderator of the general affembly of the church of Scotland, and is the only perfon on record who obtained that diftinction the firft time he was a member of affembly.

From thefe facts, which contain the outlines of Dr Henry's lifc, few cuents can be expected to fuit the purpofe of the biographer. Though he mult have been always diftinguifhed among his private friends; till he was tranflated to Edinburgh he had few opportunities of being known to the public. The compofition of fermons muft have occupied a chief part of his time during his refidence at Carlille, as his induftry in that ftation is known to have rendered his labours in this deparment edy to him during the refl of his life. But even there he found leifure for other fludies; and the knowledge of claffical literature, in which he eminently excelled, foon enabled him to acquire an extent of information which qualified him for fomething more important than he had hitherto in his view.

Soon after his removal to Berwick, he publifhed a
north of England. This idea was probably fingefted by the profperity of the fund which had almoft 30 years before been eftablifhed for a provifion to minifters widows, \&c. in Scotland. But the fituations of the clergy of Scotland were very different from the circumftances of diffening minifters in Fingland. Annuities and provifions were to be fecured to the families of diffenters, without fubjecting the individuals (as in Scotland) to a proportional annual contribution, and without fuch means of creating a fund as could be the fubject of an act of parliament to fecure the annual payments. The acutencfs and activity of Dr Henry furmounted thefe difficulties ; and, chiefly by his exertions, this ufeful and benevolent inftitation commenced about the year 1762. The management was entrufted to him for feveral years; and its fuccefs has exceeded the moft fanguine expectations which were formed of it. The plan itfelf, now fufficiently known, it is unneceffary to explain minutely. But it is mentioned here, becaufe Dr Henry was accuftomed in the laft years of his life to fpeak of this inftitution with peculiar affection, and to reflect on its progrefs and utility with that kind of fatisfaction which a good man can only receive from "c the labour of love and good works."
It was probably about the year 1763 that he firft conceived the idea of his Hiftory of Great Britain : a work already eftablifhed in the public opinion ; and which will certainly be regarded by pofterity, not only as a book which has greatly enlarged the fphere of hiftory, and gratifies our curiofity on a variety of fubjects which fall not within the limits preferibed by preceding hiftorians, but as one of the moft accurate and authentic repofitories of hiftorical information which Britain has produced. The plan adopted by Dr Henry, which is indifuutably his own, and its peculiaradvantages, are fufficiently explained in his general preface. In every period, it arranges, under feparate heads or chapters, the civil and military hiftory of Great Britain ; the hiftery of religion; the hiftory of the conftitution, government, laws, and courts of juftice; the hiftory of learning, of learned men, and of the chief feminaries of learning ; the hiftory of arts; the hiftory of commerce, of fhipping, of money or coin, and of the price of commodities; and the hiftory of manners, virtues, vices, cuftoms, language, drefs, diet, and amufements. Under thefe reven heads, which extend the province of an hiforian greatly beyond its ufual limits, every thing curious or interefting in the hiftory of any country may be comprehended. But it certainly required more than a common fhare of literary courage to attempt on fo large a fcale a fubject fo intricate and extenfive as the hiftory of Britain from the invafion of Julias Cæfar. That Dr Henry neither over-rated his powers nor his induftry, could only have been proved by the fuccefs and reputation of his works.

But he foon found that his refidence at Berwick was an infuperable obfacle in the minute refearches which the execution of his plan required. Mis fituation there excluded him from the means of confulting the original authorities; and though he attempted to find accefs to them by means of his literary friends, and with their affiftance made fome progrefs in hisits ufual limits, every thing curious or interefting in
the hiftory of any country may be comprehended. But
it certainly required more than a common fhare of li-
terary courage to attempt on folarge a fcale a fubject
fo intricate and extenfive as the hiftory of Britain from
the invafion of Julias Cæfar. That Dr Henry neither
over-rated his powers nor his induftry, could only
have been proved by the fuccefs and reputation of his
works.

## HEN

Henry, to his own fatisfaction, and was at laft compelled to relinquifh it.

By the friendfhip of Gilbert Laurie, Efq; late lord provoft of Edinburgh; and one of his majefty's commiftioners of excife in Scotland, who had married the hifter of Mrs Henry, he was removed to Edinburgh in 1768 ; and it is to this event that the public are indebted for his profecution of the Hiftory of Great Britain. His accels to the public libraries, and the means of fupplying the materials which thefe did not afford him, were from that time ufed with fo much diligence and perfeverance, that the firft volume of his Hiltory in quarto was pablifhed in 1771 , the fecond in 1774 , the third in 1777, the fourth in 1781 , and the fifth (which brings down the Hiftory to the acceffion of Heary VII.) in 1785 . The fubject of thefe volumes comprehends the moft intricate and obfare periods of Britifh hiftory; and when we confider the fcanty and fcattered materials which Dr Henry has digefted, and the accurate and minute information which he has given us under every chapter of his work, we muft have a high opinion both of the learning and induftry of the author, and of the vigour and activity of his mind : effecially when it is added, that he imployed no amanuenfis, but completed the manufcript with his own hand; and that, excepting the firlt volume, the whole book, fuch as it is, was printed from the original copy. Whatever corrections were made on it, wereinferted by interlineations, orin revifing the proof-fheets. He found it neceffary, indeed, to contine himfelf to a firf copy, from an unfortunate tremor in his hand, which made writing extremely inconvenient, which obliged him to write with his paper on a book placed on his knee inftead of a table, and which unhappily increafed to fuch a degree that in the laft years of his life he was often unable to take his victuals without affiftance. An attempt which he made after the publication of the fifth volume to employ an amannentss did not fucceed. Never having been accuftomed to dictate his compolitions, he fonnd it impoffible to acquire a new habit; and though he perfevered but a few days in the attempt, it had a fenfible effect on his health, which he never afterwards recovered.-An author has no right to claim indulgence, and is ftill lefs entitled to credit, from the public for any thing which can be afcribed to negligence in committing his manufcripts to the prefs; but confidering the difficulties which Dr Henry furmounted, and the accurate refearch and information which diftinguig his hiftory, the circumftances which have been mentioned are far from being uninterefting, and muft add confiderably to the opinion formed of his merit among men who are jadges of what he has done. He did not profefs to ftudy the ornaments of language; but his arrangement is uniformly regular and natural, and his ftyle fimple and perfpicuous. More than this he has not attempted, and this cannot be denied him. He believed that the time which might be fpent in polifhing or rounding a fentence was more ufefully employed in inveftigating and afcertaining a faet: And as a book of facts and folid information, fupported by authentic documents, his hiftory will ftand a comparifon with any other hiftory of the fame period.

But Dr Henry had other difficulties to furmount than thofe which related to the compofition of his
work. Not having been able to tranfact with the bookfellers to his fatisfaction, the five volumes were

Henry. originally publifhed at the rikk of the author. When the firft volume appeared, it was cenfured with an unexampled acrimony and perfeverance. Magazines, reviews, and even newfpapers, were filled with abufive remarks and invectives, in which both the author and the work were treated with contempt and fcurility. When an author has once fubmitced his works to the public, he has no right to complain of the juft feverity of criticifm. But Dr Henry had to contend with the inveterate fcorn of malignity. In compliance with the ufual cuftom, he had permitted a ferinon to be publifhed which he had preached before the fociety in Scotland for propagatingChriftian knowledge in 1773 ; a compofition containing plain good fenfe on a common fubject, from which he expected no reputation. Thib was eagerly feized on by the adverfaries of his Hiftory, and torn to pieces with a virulence and afperity which no want of merit in the fermon could juftify or explain. An anonymous letter had appeared in a newfpaper to vindicate the Hiftory from fome of the unjuft ceafures which had been publifhed, and afferting from the real merit and accuracy of the book the anthor's title to the approbation of the public. An anfwer appeared in the courfe of the following week, charging him, in terms equally confident and indecent, with having written this letter in-his own praife. The efforts of malignity feldom fail to defeat their purpofe, and to recoil on thofe who direct them. Dr Henry had many friends, and till lately had not difcovered that he had any enemies. But the author of the anonymous vindication was unknown to him, till the learned and refpectable Dr Macqueen, from the indignation excited by the confident petulance of the anfwer, informed him that the letter had been writen by him. Thefe anecdotes are fill remembered. The abufe of the Hiftory, which began in Scorland, was renewed in fome of the periodical publications in South Britain; though it is juftice to add (withour meaning to refer to the candid obfervations of Englifh critics), that in both kingdoms the afperity originated in the fame quarter, and that paragraphs and criticifms written at Edinburgh were printed in London. The fame fpirit appeared in Strictures publifhed on the fecond and third volumes; but by this time it had in a great meafure loft the attention of the public. The malevolence was fufficiently underftood, and had long before become fatal to the circulation of the periodical paper from which it originally proceeded. The book, though printed for the author, had fold beyond his mont fanguine expectations; and had reccived borh praife and patronage from men of the firf literary characters in the kingdom: and though, from the alarm which had been raifed, the bookfellers did not venture to purchafe the property till after the publication of the fifth volume, the work was eftablifhed in the opinion of the public, and at laft rewarded the author with a high degree of celebrity, which he happily lived to enjoy.

In an article relating to Dr Henry's life, not to have mentioned the oppofition which his Hiftory encountered, would have been both affectation and injuftice. The facts are fufficiently-remembered, and are unfortunately too recent to be more minutely explained.

## HEN

Henry
That they contribured at firft to retard the fale of the work is undeniable, and may be told without regret now that its reputation is eftabliflied. The book has raifed itfelf to eminence as a Hiftory of Great Britain by itsown merits; and the means employed to obftruct its progrefs have only ferved to embellifh its fuccefs.

Dr Henry was no doubt encouraged from the firlt by the decided approbation of fome of his literary friends, who were allowed to be the moft competent judges of his fubject; and in particular by one of the moft eminent hiltorians of the prefent age, whofe hiftory of the fame periods jufly poffefles the higheft reputation. The following character of the firft and fecond volumes was drawn up by that gentleman, and is well intitled to be inferted in a narrative of Dr Henry's life. "Thofe who profefs a high efteem for the firft volume of Dr Henry's hiftory, I may venture to fay, are almofit as numerous as thofe who have perufed it, provided they be competent judges of a work of that nature, and are acquainted with the difficulties which attend fuch an undertaking. Many of thofe who had been fo well pleafed with the firft were impatient to fee the fecond volume, which advances into a field more delicate and interefting ; but the Doctor hath fhown the maturity of his judgment, as in all the reft, fo particularly in giving no performauce to the public that might appear crude or hafty, or compofed before he had fully collected and digefted the materials. I venture with great fincerity to recommend this volume to the perufal of every curious reader wha defires to know the fate of Grear Britain in a period which has hitherto been regarded as very obfcure, ill fupplied with writers, and not polfeffed of a fingle one that deferves the appellation of a good one. It is wonderful what an inftrmetive, and even entertaining, book the Doctor has been able to compofe from fuch unpromifingmaterials: Tantum feries juncturaque pollet. When we fee thofe barbirous ages delineated by fo able a pen, weadmire the oddnefs and lingularity of the manners, cuftoms, and opinions, of the times, and feem to be introduced into a new world ; but we are ftill more furprifed, as well as interefted, when we reflect that thofe frange perfonages were the anceftors of the prefent inhabitants of this ifland.-Tbe object of an antiquary hath been commonly diftinguifhed from that of an hiftorian ; for though the latwer fhould enter into the province of the former, it is thought that it chould only be quanto baffa, that is, fo far as is neceffary, without comprehending all the minute difquifitions which give fuch fupreme pleafure to the mere antiquary. Our learned author hath fully reconciled thefe two characters. His hiftorical narrative is as full as thofe remote times feem to demand, and at the fame time his inquiries of the antiquarian kind omit nothing which can be an object of doubt or curiolity. The one as well as the other is delivered with great perfpicuity, and no lefs propriety, which are the true ornaments of this kind of writing. All fuperfluous embellifhments are avoided; and the reader will hardly find in our language any performance that unites together fo perfectly the two great points of entertainment and inftruction." -The gentleman whowrote this character died before the publication of the third volume. The progrefs of his work introduced Dr Henry to more extentive patronage, and in particular to the
notice and efteem of the earl of Mansfield. That venerable nobleman, who is fo well intitled to the gratitude and admiration of his country, thought the merit of Dr Henry's hiftory fo conliderable, that, without any folicitation, after the publication of the fourth volume he applied perfonally to his majefty to beftow on the author fome mark of his royal favour. In confequence of this Dr Henry was informed by a letter from Lord Stormont, then fecretacy of fate, of his Majefty's intention to cenfer on him an annual penfion for life of rool. "confidering his diftinguifhed talents and great literary merit, and the importance of the very ufeful and laborious work in which he was fo fuccefsfully engaged, as titles to his royal countenance and fayour." The warrant was iffued on the 28 th of May 1781; and his right to the penfion commenced from the 5 th of April preceding. This penfion he enjoyed till his death, and always confidered it as inferring a new obligation to perfevere fteadily in the profecution of his work. From the earl of Mansfield he received many other teltimonies of efteem both as a man and as an author, which he was often heard to mention with the moft affectionate gratitude. The octavo edition of his hiftory, publifhed in 1788 , was infcribed to his lordihip. The quarto edition had been dedicated to the king.

The property of the work had hitherto remained with himfelf. But in April 1786, when an octavo edition was intended, he conveyed the property to Meffrs Cadell and Strachan; referving to himfelf what fill remained unfold of the quarto edition, which did not then exceed eighty-one complete fets. A few copies were afterwards printed of the volumes of which the firft impreffion was exhaufted, to make up additional fets : and before the end of 1786 , he fold the whole to Meffrs Cadell and Strachan. By the firft tranfaction he was to receive 10001 . and by the fecond betwixt 3001 . and 4001 .; about 14001 . in all. Thefe fums may not be abfolately exact, as they are fet down from memory; but there cannot be a miftake of any confequence on the one fide or the other. -Dr Henry had kept very accurate accounts of the fates from the time of the original publication; and afterhis laft tranfaction with Meffrs Cadell and Strachan, he found that his real profits had amounted in whole to about 3300 pounds : a ftriking proof of the intrinfic merit of a work which had forced its way to the public efteem unprotected by the intereft of the book fellers, and in fpite of the malignant oppolition with which the firt volumes had to ftruggle.

The profecution of his hiftory had been Dr Henry's favourite object for almoft 30 years of his life. He had naturally a found conftitution, and a more equal and larger portion of animal fpirits than is commonly porfeffed by literary men. But from the year 1785 his bodily frength was fenfibly impaired. Not with ftanding this, he perfifted feadily in preparing his fixth volume, which brings down the hiftory to the acceffion of Edward VI. and has left it in the hands of his executors almof completed. Scarcely any thing remains unfinifhed but the two thort chapters on arts and manners ; and even for thefe be has left materials and authorities fo diftingly collected, that there can be no great difa. culty in fupplying what is wanting. It is boped that this volume may be ready for publication fome time in

## H E P [ 428$] \quad$ H E P

the winter or fpring 1792 ; and that it will be found intitled to the fame favourable reception from the pablic which has been given to the former volumes. It was written under the difadvantages of bad health and great weaknefs of body. The tremulous motion of his hand had increafed fo as to render writing much more difficult to hin than it.had ever been : but the vigour of his mind and his ardour were unimpaired; and inde, pendent of the general character of his works, the pofthumous volume will be a lafting monument of the ftrength of his faculties, and of that literary induftry and perfeverance which ended only with his life.

DrHenry's original plan extended from the invafion of Britain by the Romans to the prefent times. And men of literary curiolity mult regret that he has not lived to complete his defign; but he has certainly finithed the molt difticult parts of his fubject. The periods after the acceffion of Henry VI. afford materials more ample, better digefted, and much more within the reach of common readers.

Till the fummer of 1790 he was able to purfue his ftudies, though not without fome interruptions. But at that time he loft his health entirely ; and, with a conftitution quite worn-out, died on the 24 th of November of that year, in the 73 d year of his age. -He was buried in the church-yard of Polmont, where it is propofed to erect a monament to his memory.

HENTINGS, in agricilture, a term ured by the farmers for a particular method of fowing before the plough; the corn being caft in a ftraight line juft where the plongh is to come, is by this means prefent ly ploughed in. By this way of fowing they think they fave a great deal of feed and ather charge, a dexterous boy being as capable of fowing this way out of his hat as the moft fkilful feedfman.

Henting is alfo a term ufed by the ploughmen, and others, to lignify the two furrows that are tarned from one another at the bottom, in the ploughing of a ridge. The word feems to be a corruption of ending, becaufe thofe furrows made an end of ploughing the ridges. The tops of the ridges they call veerings.

HEPAR SULPHURIS, or Liver of Sulphur, a combination of alkaline falt and fulphar. See CheMISTRY, ${ }^{\circ}$ TO2T-1025.

By means of the fume arifing on the decompofition of hepar fulphuris by an acid, Mr Bergman hath found a method of imitating the hot or fulphureous mineral waters, to as great perfection as the cold ones are now imitated by fixed air. The procefs confifts fimply in adding the vitriolic acid to hepar fulphuris, and impreguating water with the peculiar fpecies of air that arifes from this mixture; in the fame manner as when water is impregnated with the fixed air arifing from the mixture of that or any other acid with chalk. This bepatic air, as the author calls it, is very readily abforbed by water; to which it gives the fmell, tafte, and all the other fenfible qualities of the fulphureous waters. A Swedifh cantharus of diftilled water, containing $12 \frac{3}{2}$ Swedifh cubic inches, will abforl about 60 cubic inches of this hepatic air ; and on dropping into it the nitrons acid, ir will appear, that a real fulphur is contained, in a ftate of perfect folution, in this water, to the quantity of eight grains. It does not appear that any other acid, except what the author
calls the dophlogificated narine acis, will prodace this eftect.-When any paricicular fulphureous water is to be imitated, we farce need to obferve, that the, faline, or other contents peculiar to it, are to be added to the artificial hepatic water. Inftead of the liver of fulphur, the operator may ufe a mixture of threc-parts of filings of iron and two parts of fulphur melted to. gether:

It may, perhaps, be thought, that water thus prepared, does not differ from that in which a portion of the hepar fulphuris has been diflolved; but it appears evidently to differ from it in this material circumfance ;-that in the folution of hepar fulphuris, the fulphur is held in folution by the water, through the means of the alkali combined with it : whereas, in Mr Bergman's procefs, it does not appear probable that the hepar fulphuris rifes fubftantially in the form of air: for, in that cafe, its prefence in the hepatic water might be detected by means of the weakelt of the acids (even the mephitic), which would precipitate the fulphur from it. Nor can it be fuppored that any portion or conftituent part of the alkali itfelf (except a part of its remaining fixed air) can come over. The water, therefore, maft owe its impregnation to the fulphur, raifed, in fome peculiar manner, into the ftate of an elaftic vapour ; permanent, wher the experiment is made in quick-filver ; but condenlible in water, and rendered foluble in that fluid through the means of fome unknown principle combined with ir, and which the author fuppofes to be the matter of heat, conbined with it through the medium of phlogifton.

HEPATIC, in medicine and anatomy, any thing belonging to the liver.

Hepatic Air, a permanently elaftic fluid, of a very difagreeable odour fome what like that of rotten eggs, obtained in plenty from combinations of fulphur with earths, alkalies, metals, \&c. and fometimes from combinations of alkalies with fubftances which do not appear to contain any fulphur.

The nature of this fluid has been particularly examined by Mr Kirwan, of whofe experiments we have an account in the 76 h volume of the Philofophical Tranfactions, and of which the refults are as follow.
r. By weighing it in a glafs botule exhanfted in the moft perfect manner by an air-pump, its fpecific gravity is found to be to that of common air as 10,000 to 9038.
2. Though inflammable, it never detonates with common air; nor can it be fired in a narrow-monthed veffel, unlefs mixed with a confiderable proportion of this air. Mr Scheele found that it would take fire when mixed with two-thirds of commen air ; but M. Sennebier informs us, that it cannot be fired by the electric fpark even when mixed with any quantity of refpirable air. Mr Kirwan found one part of the hepatic air, and one and a half of common air, to burn blae without flahing or detonating; and that, during the combution, fulphur is conftantly depofited, anda fmell of vitriolic acid perceived. Mixed with an equal part of nitrous air, it burns with a bluih, green, and yellow lambent flame: it depofits fulphur alfo; and in proportion as the latter is depofited, a candle dipped in the air burns more weakly, and is at laft extinguifhed. Two parts of nitrous and one of hepatic air burn partially

## HEP

Hepatic Air.
tially with a green hame; the refidum exinguifhing a candle, which reddens on coming into contaet with the atmofphere. One part of common air being admitted to equal parss of nitrous and hepatic air, fulphar was inftantly precipitated, and therlirec meafures reduced to 2.4 ; which burned on the furface with a greenifl flame, but extinguilhedthe candle whonfonk decper. F'our parts of hepatic, with one of common air, burned rapidly with a blue flame; and a mixtare of equal parts of dephlogitticated and hepaticairs which had tood eight days, went off with a reporr like a piltul, and fo inftantanconfly that the colour of the flane could fcarcely be difcerned.
3. Hepatic air turns the tincture of litmus red, which Bergman fuppofes it would not do if it were wathed; but Mr Kirwan found no alteration after paffing two meafures through water, or even afier builing the air out of water impregnated with it. Nay, the fame hepatic air which had once reddened limus, contimued to do fo after being pat to a frem quantity of the tincture.
4. There is a confiderable difference in the mifcibility of hepatic air with water according to the materidls from which the former is made. By light agitation, water in the temperature of $66^{\circ}$ imbibes two thirds of its bulk of air extrasted from alkaline or calcareous hepar by means of marine acid. An equal quantity of water diffolves three -fourths of its bulk of hepatic air extracted by the fame acid from martial hepar ; eight-tenths of that extracted by means of the concentraced vitriolic acid, or the dilate nitrous or facharine acids in the temperature of $60^{\circ}$; feven-tenths of that extracted by fedative acid; nine-tenths of that made with the acetous acid, and of that afforded by oil of olives; and laftly, its own bulk of that produced from a mixture of fugar and fulphur. In general, however, that produced by the greateft degree of heat feemed to be the moft eafily mifcible; though in fome infances, particularly that of acetous hepatic air, this does not take place.
5. The union between hepatic air and water is not permanent. Even when the water has been boiled in order to expel the air it naturally contains previous to its union with the hepatic air, the fluid grows very foon turbid, and depofits the hepatic air in the form of fulphur, though the bottle be ever fo well corked, or ftand inverted in water or mercury. The abforption of the air by water, however, does not feem to occafon any decompofition in the former, as the quantity left will be abforbed like the former by adding more water. It cannot be expelled from water till ic comes near the boiling point.
6. No kind of hepatic air, except that produced from charcoal, precipitates lime from lime-water; and even this does it only in a very flight degree, unlefs a large quantity of air pafs through a fmall one of water.
7. The moft fenfible teft of the prefence of hepatic air is the folution of filver in the nitrous acid. This, according as the nitrous acid is more or lefs faturated with filver, becomes black, brown, or reddifh brown, by the contact with hepatic air, however mixed with common air or any other permanently elaftic fluid. When the acid is not faturated, or is in large proportion, the brown or black precipitate, which is nothing but fulphurated filver, is redillolved.

## 429

8. All hepatic air fuffers fome diminution by fand. ing over mercury, and blackens the furface of the metal; particularly that made from charcoal.
9. Mixtures of hepatic air with common, dephlogilticated, and phlogiflicated airs, continucd for a long time cither togally undiminifhed or very little fo, as did thofe alfo with inflimmable marine acid air and fixed air; only blacking the furface of the mercury.
10. Twomeafures of hepatic air being introduced to two of vitriolic air, a whitifh yellow depolition immediately covered the top and fides of the jar, and both airs were without any agitation reduced to little nore than one meafure. As the glafs, however, was obfcured by a whitilh fcurt over its whole infide, it was found necelfary to repeat the experimen. One cubic inch of hepatic air was then added to five of vitriolic air ; and, in lefs than a minnte, without any agitation, the fides of the glafs were covered with a whitith fcum apparently moift, and a diminution of more than one ounce meafure took place. In four hours after a fecond meafure of hepaticair was introduced; which was followed by a fecond depofition of whitifh matter and diminution of the air. Next day three other meafures were added at the interval of four hours between each ; when, finding ftill a farther diminution, another meafure was added next day. The whole quantity of in ounce meafures was thus reduced at laft to three, which feemed to be little elfe than phlogificated air. The water in which the fulphur precipitated from the hepatic air was wafhed, and appeared to contain fome vitriulic acid and fixed air.
11. A mixture of two meafures of nitrous, and as much hepatic air, was little altered at firtt even by agitation ; bat, on ftanding 36 hours, both were reduced by fomething more than one third of the whole. The mercury was not blackened, but particles of ycllow fulphur were depolited both upon the fides of the glafs and the furface of the metal. The air which remained had ftill an hepatic fmell, and was fomewhat more diminifhed by water : a candle burned naturally in the unabforbed part. The water had all the properties of that which had abforbed hepatic air. On adding nime cubic inches of nitrons air to eight of hepatic, a yellowifh cloud inftantly appeared, a dlight white foum was depofited on the fides of the jar ; and the whole feemed to be diminifhed about two cubic inches, the temperature of the room being then $72^{\circ}$. In 48 hearsthe whole was reduced to fix cubic inches, and the top and fides of the jar covered with a cake of white fulphur; the heat of the room-being conftantly between 60 and $70^{\circ}$. The refiduam was examined in 24 hours after, and had a pretty ftrong fmell of alkaline air. A candle burned in it naturally; and it did not affeet tincture of litmus, lime-water, or acetous barytes. It was not affected by any kind of air excep: the dephlogifticated kind, and this prodaced only a flight rednefs and diminution; it produced alfo a flight white precipitate in folution of filver. Hence it appeared that this was dephlogifficated nitrous air, or, as our author thinks, it ought rather to be called deaczdiffed nitrous air.
12. Mr Kirwan fappofing that an uncombined acid in the nitrous air was the canfe of precipitation, he deprived fome nitrous air of this acid as perfectly as poffible before mixing it with hepatic air ; which was

## HEP <br> HEP

Hepatic done by admitting alkaline anr to it, and then wafhing Air. out the ammoniacal compound in diftilled water. By being deprived of its acid it loft about one-fixth of irs bulk; and it was diminihed by common air in the fame manner that nitrous air ufually is. Seven cubic inches of hepatic air were then adnitted all at once to eight of the purified nitrous air. No cloud or other mark of any precipitation appeared : but in fix hours the whole was reduced to five cubic inches, the temperature of the room being $76^{8}$; but the diminution went no further in 18 hours after. A much whiter fulphur was depofited than in the former experiment; and both in this and the former, that part which was intercepted by the riling of the mercury betwixt the metal and the fide of the jar was of a yellow and red fhining colour, and not black, as that depofited in mercury ufually is. The refiduum flathed with fuch violence as to extinguifh a candle dipped into it, the flame being exceedingly white and vivid; though it did not detonate in the leaft, but rather appeared like dephlogifticated air. The jar out of which it had been transferred had a ftrong alkaline finell. It was not in the leaft diminifhed by nitrous air, even when heated to 150 degrees. Water poured into the jar in which the fulphur was depofited, produced a bluifh white cloud in folation of filver, though infipid to the tafte; whence it appears, , hat whatever this air may be, it had been deacidified by hepatic air fill more perfectly than that in which a candle burns naturally, but was by no means dephlogifticated.
13. Perfectly pure alkaline and hepatic airs mixed together would probably deftroy each other ; but Mr Kirwan never had it in his power to do this entirely. Six meafures of hepatic air from liver of fulphur, and fix of alkaline air, immediately throw up a white cloud, leaving a whitifh fcum on the fide of the jar, and are reduced to about one ounce meafure. On adding water this is reduced to about one half; and a candle burns naturally in it. This refiduum, however, was afterwards found to be only the common air of the veffels.
14. One meafure of oil of vitriol, of the Specific gravity of i.863, abfurbed two meafures of hepatic air all to one-tenth; the acid being whitened by a copious depofition of fulphur.
15. A meafure of red nitrous acid, of the fyecific gravity of 1.430 , was introduced to an equal meafure of hepatic air: red vapours inftantly arofe; and only one-tenth or one-twelfth of a meafure remained in an aerial form ; bur as the acid acted on the mercury, it was neceffary to ufe water, by which the whole was abforbed. No fulphur was precipitated on this occafion. The experiment was repeated in another manner, but with little fuccefs; fo that Mr Kirwan, finding it fo difficult to ufe the concentrated nitrous acid, deiermined to try its effects upon hepatic air by diluting the acid to fuch a degree that it could not act upon mercury withont the afliftance of heat. In this cafe the acid was whitened, eight-tenths of the air abforbed, and the refiduum detonated. A ftill greater quantity was abforbed when the experiment was made with hepaticair made from liver of fulphur ; but the refiduum, inftead of detonating, burned with a blue and greenifh flame, depofiting fulphur upon the fides of the jar. This dilute acid abforbed about three
times its bulk of hepatic air; but on expelling the Hepatic fame from it again by heat, the fixth part only was obtained, and in this a candle burned naturally.
16. Two meafures of alkaline hepatic air were abforbed by one of ftrong marine acid to one-fitth of a meafure, after a llight agitation. On adding a third meafiure of hepatic air, the whole was abforbed to half a meafure. The fulphur precipitated in this experiment was attracted by the mercury, and blackened it; which did not happen in the former cales, by reafon of the Aronger atcraction of the acid for the fulphur. The refiduam burned as pure hepatic air.
17. Diftilled vinegar ablurbs nearly its own bulk of hepatic air, and becomes nightly whitened; but by agitation it may be made to take up abont twice its bulk, and then becomes very turbid.
18. One meafure of cauftic vegetable alkali, the fpecific gravity of which was 1.043 , abforbed nearly four meafures of alkaline hepatic air, which rendered it brown at firf, but after fome time it grew clear and depofited fulphur, blackening the furface of the mercury.
19. One meafure of cauftic volatile alkali, of the fpecific gravity of $0.93^{87}$, abforbed 18 of hepatic air. A greater quantity of alkali would abforb more hepatic air, fix meafures of the alkaline air uniting to feven of the hepatic ; and thus the ftrength of alkaline liquors, and their real contents, may, according to our author, be determined better than by any other me. thod. The fmoking liquor of Boyle (a ftrong volatile tincture of fulphur) may be eafily prepared by putting volatile alkaliin the middle veffel of Dr Nooth's apparatus, and decompofiug liver of fulphur, or artificial pyrites in the lowernoft one by means of marine acid.
20. Olive oilabforbs nearly its uwn bulk of hepatic air; and gets a greenifh tinge from it.
21. Oil of turpentine abforbs more than its own bulk of this air, but then becomes turbid. A white cloud appears when water is put to the mixture.
22. Spirit of wine, of the Specific gravity of o.835, abforbed nearly three times its bulk of hepatic air, and became brown. Thus fulphur may be combined with fpirit of wine more eafily than by the method ufed by Count Lauragais, the only one hitherto known. Water partly precipitates the fulphur.
23. New milk fearcely abforbs one-tenth of its bulk of this air, and is not in the leaft coagulated.
24. With an equal bulk of vitriolic ether the bulk of the air is at firft increafed; but afterwards one-half is abforbed, and a flight precipitation appears. The fmell is compounded of that of ether and hepatic air ; but on adding water it becomes very offenfive, refembling that of putrefying animal fubftances.
25. On adding a meafure and an half of nitrous folution of filver to one of hepatic air, the lutter was abforbed immediately, and without any agitation, the folution at the fame time becoming black. The remaining air admited a candle to burn naturally $i n$ it. Hepatic air was likewife abforbed, but with mor edifficulty, and in fmaller quantity, by the vitriols of iron and filver; the latter was blackened; the former becane white at firft, but darker by agitation; the refiduam burned blue, as hepatic air ufually does.

## HEP [431] HEP

26. Sulphurated fpirit of wine precipitates limewater, which highly rectified fpinit of wine will alfo do by itfelf. It alfo precipitates and gives a brown colour to acetons baro felenite, which is liken ife done by firit of wine : the folution of tilver is turned black or brown by it. Sulphur is precipitated from it by concentrated vitriolic acid, which cannot be done either by the nitrous or muriatic acids.
27. Water faturated with hepatic air turns the tincture of limmas red ; does not affect lime-water ; forms a cloud in the folation of acetous baro-felenite, thongh not in that of the marine : it does not alter the folutions of other earths. It produces a white precipitate in the folution of vitriol of iron, or folution of that metal in fpirit of falt : in nitrous folution of copper it throws down a brown precipitate, and the colour of the liquid is changed from blue to green; the precipitate being rediffolved by agitation. In folution of vitriol of copper it forms a black precipitate. It throws down a yellowifh white precipitate in folution of tin in aqua-regia; a black one from folution of gold; a red and yellow one from that of antimony; and one of red mixed with white from folution of platina. Black precipitates are formed with nitrous folutions of lead and filver; but if thefe are not perfectly faturated with metal, the folutions will be brown, or reddilh brown, and may be rediffolved by agitation. Nitrous folution of mercury is precipitated of a yellowifh brown; corrofive fublimate of a yellow mixed with black, but which becomes white by agitation. Nitrous folution of bifmuth becomes reddifh brown, and even affumes a metallic appearance. Solution of cobalt becomes dark; that of arfenic in nitrous acid becomes yellow, mixed with red and white; forming realgar and orpiment. On dropping into hepatic water oil of vitriol of the fpecific gravity of 1.863 , the mixture becomes flightly turbid; but on dropping into it the volatile vitriolic acid, a bluih white and much denfer cloud is formed. A copious white precipitation is occafioned by the frong nitrous acid, whether phlogifticated or not ; but dilute nitrous acid produces no change. Green nitrous acid, the fpecific gravity i. 328, inftantly produces fulphur. A flight cloud is produced by ftrong marine acid; but neither diftilled vinegar nor acid of fugar has any fuch effect. According to Mr Bergman, hepatifed water, in a well clofed veffel, will difolve iron in a few days; but the experiment did not fucceed with Mr Kirwan, neither could be diffolve any other metal in this water, though the fulphur united with many of them into an infoluble mafs; whence our author conclades, that metallic fubftances cannot be found in hepatifed waters.
28. Colourlefs alkaline liquors acquire a brownifh tinge from hepatic air ; the refiduum they leave being of the fame nature with what they abforb. A cauntic fixed alkaline liquor, faturated with this air, precipitates barytes from the acetous acid of a yellowith white colour; decompofing likewife other earthy folutions, and the precipitate varying according to their purity; a teft which our author fappofes may be improved to fuch a degree as to fupply the place of the Pruffian alkali. It precipitates alfo folution of vitriol of iron as well as marine falt of iron, of a black colour ; but the latter generally whitens by agitation. Solutions of filver and lead are alfo precipitated black with fome mix-
ture of white : that of gold is alfo blackened ; and fom lution of platina becomes brown. Solutions of copper let fall a reddifh black or brown precipitate. Sublimate yields a precipitate partly white and black, and partly orange and greenith. A nitrous folution of arfenic forms a yellow and orange precipitate ; and that of regulus of antimony in aqua regia, an orange precipitate mixed with black. Nitrous folution of zinc yields a dirty white recipitate; that of bifmuth a brown mixed with white; and that of cobalt a brown and black precipitate. Pruffian alkali yields a purple precipitate, which is eafy rediffolved. Tincture of radihes, our author's teft for alkalies, was turned green.
29. On adding a few grains of iron, copper, lead,tin, zinc, bifmuth, regulus of antimony, and arfenic, to a folution of liver of fulphur, all the metals were found to attract fulphur from the fixed alkali, excepring zinc and tin. Iron, arfenic, regulus of amtimony, and lead, were moft altered; copper next, and bifmuth the leaft. No part of the metals appeared to be diffolved.
30. Water faturated with the condenfed refidumm of alkaline and hepatic air, i. e. with the pureft volatile liver of fulphur, does not precipitate marime felenite. though it forms a llight brown and white cloud in that of marine baro-felenite, It throws down a black precipitate in folution of vitriol of iron, and a black and white one in that of marine falt of iron; but by agita. tion this became entirely white. Vitriol of copper, and nitrous falt of the fame metal, are both precipitated of a brown and red colour. Tin diffolved in aqua-regia yields a yellowifh precipitate;gold, a dilute yellow and reddih brown; platina, a flefh-coloured precipitate; and regulus of antimony, a yellowilh red. Silver is precipitated black, as well as lead, from the nitrous and acetous acids. Corrofive fublimate became red for a moment; but in a little time its precipitate appeared partly black and partly white. A fimilar precipitate is afforded alfo by the nitrous folntion of bifmurh; but partly mixed with a reddifh-brown colour, and has fomething likewife of a metallic appearance; the precipitate of cobalt is black, or deep brown. Solutions of arfenic yield precipitates of a y ellow colour, and more or lefs red; thofe of zine of a dirty white.-All thofe colours, however, vary, as the liquors are more or lefs faturated previous to and after their mixture, and the time they have ftood together.

From thefe experiments Mr Kirwan concludes, that hepatic air confifts merêly of fulphur rarefied by elementary fire, or the matter of heat. Some have fuppofed that it confifts of liver of fulphur itfelf volatilifed; but this our author denies, for the following reafons: 1 . It is evidently, tho' weakly, acid; reddening litmos precipitating acetous baro-felente, though none of the other folutions of earths. 2. It may be extracted from materials which either contain no alkali at all, or next to none ; as iron, fugar, oil, charcoal, \&c. 3. It is not decompofed by marine or fixed air ; by which neverthelefs liver of fulphur may be decompofed.

Our author informs us, that he was formerly of opinion that fulphur was held in folution in hepatic air, either by means of vitriolic or marine air: bur neither of thefe is effential to the conftitution of hepatic air as fuch, fince it is producible from materials that contain neither of thefeacids; and from whatever fubftance

Hepatic it is obtained, it always affords the fame character, viz.
an acid as we may fuppofe fulphur itfle to be. This fubftance indeed, even in its concrete fate, manifefts the properties of an acid, by uniting with alkalies, calcarcous and ponderous earths, as well as with moft metals, which a very weak acid mighr be fuppofed to do.

As phofphorus bears a confiderable refemblance in its conftitution to fulphar, Mr Kirwan determined to make fome experiments uponit in fimilarcircumftances. He therefore gently heated 10 or 12 grains of phofphorus, mixed with about half anounce of cauftic fixed alkaline folution, in a very fmall vial furnifhed with a bent tube, and received the air over mercury. Two fimall explofions took place on the firft application of hear, attended with a yellow flame and white fmoke, which penetrated through the mercury into the receiver. This was followed by an equable production of air ; but at laft the phofphorus began to fwell and froth up, burf with a loud explofion, and a violent flame immediately iffued from it. Only about eight cubic inches of air were obtained. Thefe were but very lightly diminifhed by agitation in water ; after which a cloudinefs took place, but the air foon recovered its tranfparency. Water impregnated with it flightly reddened tincture of litmus, but did not affect Prulfian alkali. It 'had no effect upon the nitrous folutions of copper, lead, zinc, or cobalt ; nor on thofe of iren or tin in marine acid and aqua-regia ; nor on the vitriolic folutions of iron, copper, tin, lead, zinc, regulus of antimony, arfenic, or manganefe ; nor on the marine folutions of iron, copper, lead, zinc, cobalt, arfenic, or manganefe. The nitrous folution of filver was precipitated of a black colour, and the vitriolic of a brown : nitrous folution of mercury, made without hear, precipitated a brown or black powder ; but vitriol of mercury firft became reddith, and afterwards white : corrofive fublimate a yellow mixed with red and white. Gold diffolved in aqua-regia is precipitated of a purplifh black; and in the vitriolic acid of a brownith red black; but regalus of antimony diffolved inaqua-regia is precipitated of a white colour. Nitrous folution of bifmuth let fall a fediment at firlt white, and afterwards brown; vitriol of bifmuth and marine falt of bifmuth were alfo precipitated brown, the latter being rediffolved by agitation. Nitrous folution of arfenic alfo became brown, but the precipitate was rediffolved by agitation. On impregnating water with this air, without allowing the air to burn over it, the liquid farcely made any alteration in tineture of litmus, nor did it precipitate lime-water; but caufed a black precipitate in folnion of filver ; a white one in folution of regulus of antimony in aqua-regia, and a whitilh yellow one in that of corrofive fablimate.

On letting up a meafure of water to this air, and through that fome bubbles of common air, every bubble flamed, and produced a white fmoke until about half the quantity of common air was introduced that had been ufed of phofphoric; but without any apparent increafe of the original bulk. The flame produced a fmall commotion each time, and fmoke defcended after the inflammation into the water; the fmoke ftillcontinuing to be produced on the introduc. tion of common air, after the flame had ceafed. Bubbles of phofphoric air, efcaping'through mercury in-
to the atmofphere, flame, crackle, and nmell, exactly like the electric fpark. This property of phofphoric hepatic air was known to M . Gingembre in the year 1783.

On letting up half a meafure of nitrous to one of phofphoric air, a white fmoke appeared, with a very flight diminution; the tranfparency being foun reftored, and a light fcum depofited on the fides of the jar. No fmoke or diminution was produced by adding another half meafure of nitrous air ; but on adding water, and agitaing the air in it, much more was abforbed. Ont turning up the jar, the nitrous air firft efcaped in form of a red vapour, and this was followed by a whition fmoke. The water had a phofphoric fmell, and precipitated the folution of filver brown.

An equal meafure of alkaline air farce diminifled phofphoric air; and on adding water, little more feemed to be taken up than the alkaline air, though a fmoke appeared on turning up the jar, but withont any flame. Warer thas impregnated fmelled exaclly like onions, and turned the tincture of radifhes green. Solution of filwer was precipitated of a black colour; that of copper in the nitrous acid, of a brown; the precipitate being rediffolved by agitation, and the liquor then alfuning a green colour. Corrofive fublimate let fall a yellow precipitate mixed with black. Iron was precipitated white both from the vitriolic and marine acids; but a pale yellow folution of it in the nitrous acid was not affected, and a red folution in the fame acid was only clotted. Regulus of antimony was precipitated of a white colour from aquaregia, cobalt of a flight reddifh from the nitrous acid, and bilmuth of a brown colour from the fame. Neither the nitrous folutions of lead or zinc were affected; nor thofe of tin in the marine acid or in aqua-regia. Fixed air, mixed with an equal proportion of phofphoric air, produced a white fmoke, fome diminution, and a yellow precipitate. On agitating the mixture in water the fixed air was taken up all to one-tenth; the refiduum fanoked, but did not take fire.

Some precipitate per fe being introduced to a fmall portion of phofphoric air, the former foon grew black, and a white fmoke appeared. In two days the precipitate became folid, acquiring a pale white colour, fhining like fteel. The air loft its inflammability; though Mr Kirwan fuppofes that this might be owing to fome other caufe: for two days after this air was made, a yellow fcum was obferved on the fides of the jar in which a quantity of it had refted all night over water; and the f pontaneouns inflammability was loft next morning. The temperature of the air was then $53^{\circ}$; and when it inflamed before $68^{\circ}$.

From thefe experiments our author concludes, that phofphoric air is nothing elfe but phofphorus itfelf in an aerial ftate; differing from fulphureous or hepatic air, in this, that it requires much lefs latent heat to throw it into an aerialftate, and therefore may be difengaged from fixed alkalies withont any acid.

Hepatic air may be obtained in a great number of different ways, and from a variety of fubitances. The mof common method in which it has been procured, is by decompofing the hepar falphuris or combination of fulphur and fixed alkaline falt by means of an acid. Mr Kirwan has examined the circumfances attending the formation of liver of fulphur ; making the firft ex-

Hepacis Air.

## HEP

Fletatic Air.
periment by metting together equn! parts of the mineral alkati and flowers of fulphur in a covered cricible. On flighty heating the mixture, it emitted a bluifh fmoke, which gradually beranc whiter as the heat was augmented; and at laft, when the bottom of the crucible became flightly red, the fmoke was ferfeaty white and inflammahle. Fo inveftigate the nature of this fmoke, a pure fixed alkali was made by deflagrating equal parts of cream of tartar and nitre in a red-hor crucible in the ufual way. This alkali, in a very dry ftate, was mixed with a mall quantity of flowers of fulphur, and the mixture diftilled in a fmall coated retort; the air being received over quickfilver.

On the firft application of heat, one cabic incli and an half of llightly phlogifticated air was obtained, but without any fixed air. This was the common air contained in the veffels, but altered by beigg in contact with the alkali and fulphur. On angmenting the hear, about 18 inches of air were obtained, of a reddifh colour, feemingly a mixture of nitrous and common air; àting flightly on mercury. After this, 20 cubic inches of the fame kind mixed $\mathrm{w}^{3}$ in fome fixed air were obtained. Thefe were fucceeded by 64 inches of fixed air almoft perfectly pure. The bottom of the retort was now red hot; fome fulplur was fublimed in the neck, and when all was cold, an hepar fulphuris was found in the bulb.

From this experiment Mr Kirwan concludes, that the blue fmoke abovementioned confifts chiefly of fixed air and the white fulphur; but that neither hepatic nor vitriolic air are formed unlefs the retort be large enough to admit as much air as is necelfary for burning part of the fulphur. He concludes alfo, that hepar fulphuris will yield no hepatic air unlefs with the help of an acid; and I believe this (fays he) to be true, when the experiment is made in the dry way, and nearly fo in the moilt way: for having added 200 grains of fulphur to a concentrated folution of ftrong cauftic vegetable alkali by a ftrong and long-continued heat, I obtained only one cubic inch of hepatic air ; yet it is well known, that a ftrong folution of liver of fulphur conftantly emits an hepatic fmell, cven in the temperature of the atmofphere; and the fubftance fo emitted contains as much hepatic air as difcolours filver and lead, and even their folutions; which fhows that an incomparably fmall quantity of this air is fufficient to produce the effect. To difcover whether this extrication of hepatic air might be caufed by the depofition of fixed air from the atmofphere, I threw fome pulverifed calcareous hepar into aerated water, and by the application of heat endeavoured to obtain hepatic air, but in vain : and indeed the very circumftance that the hepatic fmell and its effects are always ftrongeft the firft inftant that a bottle of the hepatic foIntion is opened, feems to indicate that fixed air is no way concerned in its production. The beft liver of fulphur is made of equal parts of falt of tartar and fulphur ; but as about one fifth of the falt of tartar con: fifts of air which efcapes during the operation, it feems that the proportion of fulphur predominates in the refulting compound; yct as fome of the fulphur alfo fublimes and luurns, it is not eafy to fix the exact proportion. One hundred grains of the beft, that is to fay the reddeft liver of fulphur, afford with dilute marine acid about 40 inches of hepatic air in the tem-

Vol. VIII.
perature of $60^{\circ}$; a quantity cquivalent to alout 13 Hepatic grains of fulphur, as will be feen in the fequel."

Air.
Hepatic air is bef produced by marine acid: the concentrated nitrous acid prodaces nitrous air; but if diluted with 20 times its bulk of water, it produces the hepatic kind by the adfiftance of heat. Concentrated vitriolic acid poured upon liver of fulphir affords but little hepatic air without the afliftance of heat; though it conftandly decompofes the hepar : " and (adds our author) it is partly for this reafon that the proportion of air is fo fimall ; for it is during the gradual decompofition of fulphureous compounds thar hepatic air is produced." Hepatic air, but not in a pure ftate, is extricated by diftilled vinegar ; its finell being mixed with that of the vegetable acid. Some quantity of this air is produced by the faccharine acid in the temperature of $59^{\circ}$, and by fedative falt in that of boiling water or nearly fo ; but neither the arfenical nor aerial acids produce any.

Having prepared fome hepar fulphuris with an over proportion of fulphur, an hepatic air was procured by means of concentrated vitriolic acid: but fo loaded with fulphur, that it depofited fone in the tube through which it was tranfmitted, and on the upper part of the glafs receiver. On transferring it to another receiver, though then perfectly clear and tranfparent, in quantity about fix cubic inches, yet next morning it was reduced to one inch, the infide of the glafs being covered with a thick coat of fulphar ; the fimall quantity of elaftic fluid which remained being changed from hepatic to vitriolic air. "Hcnce (fays Mr Kirwan) it appears, firft, that a fpecies of elaftic fluid may exift in a ftate intermediate between the aerial and vaporous, which is not permanently elaftic like air, nor immediately condenfed by cold like vapour ; but which, by the gradual lots of its fpecific hear, may be reduced to a concrete form. 2. That fo large a quantity of fulyhur may be combined with virriolic air, as to enable it to exhibit the properties of hepatic air for 'fome time at leaft. A mixture of three parts of palverifed quicklime and one of fulphur, heated to whitenefs in a covered crucible for one bour, became of a ftony hardnefs; and, being treated with marine acid, afforded hepatic air. On heating a piece of this fone in pure water, it becomes bluifh; and hence the origin of blue marles generally found near hot fulphurated waters. A calcareous hepar mayalfo be formed in the moift way."

Magnefia deprived of its fixed air, and heated in the fame manner with fulphur, afforded no hepatic air. It was procured, however, from a mixture of three parts of iron-filings and one of fulphur melted together, and treated with marine acid. This fulphurated iron diffolved in marine acid affords almoft entirely hepatic air, and very little of the inflammable kind. Equal parts of iron filings and fulphur mixed together, and made info a pafte with water, after heating and becoming black, afforded hepatic air when an acid was poured on it; but this was mixed with inflammahle air, probably proceeding from uncombined iron. After a few days this mixture loft its power of producing hepatic air Mr Bergman has alforemarhed, that combinations of fulphur with fome other metals yield hepatic air.

Hepatic air was obtained by pouring fome olive-oil upon a few grains of fulphor, and heating the mixtare 3 H in

Hepatic in a vial with a bent tube. It was likewife obtained
in a great pleury from equal parts of fulphur and pow-
dered charcoal, ont of which the air had previoully been expelled as much as poffible: "yet (fays our author) it is hardly polfible to free charcoal wholly trom foreign air, for it foon reattracts it when expofed to the atmofphere."

Six grains of pyrophorus mixed with alum and fu.gar effervefced with marine acid, and afforded two cubic inches and an half of hepatic air. This pyrophorus had been made fix years before, and was kept in a tube hermetically fealed, and for feveral fummers expofed to the light of the fur. It was fo comburtible, that fone grains of it took fire while it was introduced into the vial out of which the hepatic air had been expelled.

A mixture of two parts of white fugar (previoully melted in order to free it of water) with one part of fulphur, when heated to about 600 or 700 degrees, gave out hepatic air very rapidly. This air had a fmell very mach refembling that of onions, but contained neither fixed air nor any other acid. Sugar and fulphur melted together gave out no hepatic air when treated with acids. Water, fpirit of wine, and marine acid, decompore this mixture, diffolving the fugar, and leaving the fulphur.

Twelve grains of fulphur heated in a retort, filled with metallic inflammable air, afforded no hepatic air; though the retort fmelled of it when cold, and for fome time after.

Eighteen grains of liver of fulphur expofed for four days to fix cubic inches of fixed air, the thermometer at $70^{\circ}$, was fomewhat whitened on the furface; the air not having an hepatic fmell, but rather that of bread. It feemed to have taken up fome fulphur, which was feparated by lime-water. It was not in the leaft diminithed ; and therefore feems to have received an addition of hepatic air, or rather of fulphur.

On expofing a quantity of fulphureo-martial pafe to fixed air for five days, the latter was not at all diminifhed, but reccived a flight addition of inflammable air. The pafte itfelf, taken out of this air and expofed to the atmofphere, heated very ftrongly.

Three grains of fulphur expofed to twelve inches of marine air was not dimininhed in four days. On adding a cubic inch of water to this air, it was all abforbed to one inch, which had an hepatic fmell, as had alfo the water, the latter evidently containing fulphur.

Hepatic air is found naturally in coal-pits, and has been difcovered by Mr Bergman to be the principle on which the fulphureous properties of many mineral waters depend. There is alfo great reafon to think that it is the peculiar production of the putrefaction of many, if not all, animal fubftances. Rotten eggs and corrupted water are known to emit this fecies of air, and alfo to difcolour metallic fubftances, in the fame manner. M. Vieliard has lately difcovered feveralother indications of this airin putrefied blood. In the 8oth volume of Philofophical Tranfactions, p. 39r. Dr Crawford gives an aceount of fome experiments, from which it appears, that a kind of hepatic airis contained in the virus of cancers. Having obtained a portion of this ichor from a cancerous breaft, he divided it into three parts, which were put into feparate vials after being properly diluted with water. To one
of thefe he added fome vegetable fixed alkali, to another a little concentrated vitriolic acid, and to the third fome fyrup of violers. No change was produced by the vegetable alkali; but on the addition of the acid, a deep brown colour was produced, and a brifk effervefcence took place at the fame time that the peculiar odeur of the cancerous matter was greatly angmented, and diffured iffelf to a confiderable diftance. A faint green colour was communicated to the third portion which had the fyrup of violets.
As the cancerous mater on which thefe experiments werc made had been previonlly kept fome days, Dr Crawford fufpected that it might thus bave acquired its alkaline property : as Mr Geber has hown, that animal fubftances, when newly putrefied, do not contain any alkali. He repeated the experiment, therefore on fome matter recently produced from a cancerous penis. A manifeft effervefcence, though lefs than the foregoing, alfo took place in this cafe; the liquor acquired a brown colour, and the fetor increafed. A portion of the fame matter, diffufed through diftilled water, comm e icated a green colour as before; but in fome cafes the change was fcarcely perceptible, though in all the experiments which were made the exiftence of an alkali one way or other was manifefted.

The air extricated from the cancerous matter feemed by its fmell to refemble rotten eggs more than any other fpecies; but to inveftigate the matter fully, fome portion of the virus was diffufed through diftilled water, the liquor filtered, and a finall quantity of nitrous folution of filver dropped into it. An afh-coloured precipitate foon appeared diffufed like a cloud through the liquid, and at the end of two hours the colour of the mixture was changed to a deep brown. The fetid fmell was now rendered much fainter, and was entirely deftroyed by an addition of concentrated nitrous acid, or by dephlogifticated firit of falt ; either of which fubftances would allo have deftroyed the fmell of hepatic air.

On adding the vitriolic acid to common pus, no effervefcence was produced, nor was the colour of the liquor clanged, neither did any fenfible precipitation take place for feveral hours. On repeating the experiment, however, with matter obrained from a venereal bubo, the liquid became flighty turbid on the addition of nitrated filver, and at the end of two hours it had acquired a brownifh caft. The fame cffects took place with the matter which iffued from a carious bone; but in both cafes the precipitation was much lefs than with the cancerous matter.

To procure fome quantity of the air in its feparate ftate, a quantity of reddifh cancerous matter was mixed with about thrice its weight of diftilled water. On adding a little vitriolic acid to this mixture, an effervefcence enfued, and the air was received in a vial over mercury. When one-half of the mercury was expelled from the vial, the latter was inverted over diftilled water; and che portion of mercury that remained in it being fuffered to defcend, and the water to rife into its place, the vial was clofely corked. The air and water were then brikly agitated together; and clae vial being a fecond time inverted over diftilled water, the cork was removed. It now appeared, by the height to which the water rofe, that part of the air had been abforbed; and on dropping in a little nitra-

Hepatic Air. $\rightarrow$

## HE P [ 435$] \quad$ H E P

Hepatic ted filver into it, a purplifh cloud, inclining to red, Air. was produced. In this experiment, the change of co-
lour was ar firlt fcarcely perceptible, but became very diftinct in a few minutes. The quantity of aerial Huid, however, which can thus be extricated by the addition of acid without heat is not very confiderable : if heat be applied, a larger quantity of elaftic fluid will be produced, having the fmell of cancerous matter; but in that cafe it will be mixed with vitriolic acid air.

To obtain this air in as pure a ftate as poffible, a portion of the cancerous virus, properly diluted with diftilled water, was introduced into a fmall vial, a little vitriolic acid added, the veffel filled with diftilled water, and a crooked tube alfo filled with water fitted to its neck. The extremity of the tube being then introduced into the neck of a bottle inverted in water, and the flame of a candle applied to the bottom of the vial, air began to rife in white bubbles, having a very fetid fimell fimilar to that of cancerous matter ; and the water impregnated with it occafioned a dark brown precipitate in a folution of nitrated filver. On feparating the crooked tube from the vial, a very of fenfive white vapour, refembling in finell the air produced in the foregoing experiment, arofe from the mixture, and continned to afcend for near half an hour. A portion of the liquor filtered, and mixed with a little concentrated nitrous acid, had its finell entirely deftroyed; a liyght effervefcence being produced, and a flaky fubftance feparated from the liquor and floating through it.

On examining the alkaline matter which had been feparated from the cancerons virus, it was found, as had indeed been concluded a priori, to be the volatile alkali. It feemed probable that this alkali was united to the fixed air with which the cancerous matter was impregnated, becaufe the peculiar fimell of the matter was greatly augmented by the addition of the vitriolic acid; and this was confirmed by the following experiments.
I. A portion of cancerous matter was diffufed through diftilled water, and diftilled in a fmall retort with a graduated heat until the bottom of the veffel became red hot. The common air, which firft came over, was greatly impregnated with the fmell of the cancerous matter : however, its qualities were not greatly impaired by the teft of nitrous air; two meafures of it, with one of nitrous air, occupying the face oflittle lefs than two meafures. When the water began to boil, a large quantity of aqueous vapour arofe; which, as foon as it came into contact with the air, produced a white fmoke. The fmell was now perceived to be fimilar to that of boiled animal fubitances: but no permanently elaftic fluid was mixed with the aqueous vapour. When the greater part of the water was evaporated the jar containing the firft portion of air was removed, and the neck of the retort introduced beneath an inverted velfel filled with mercury. A confiderable quantity of air fmelling like burnt bones was now extricated, which was mixed with a yellow empyreumatic oil. On agitating fome of it with water, part of the air was imbibed. Nitrated filver, dropped into the water thus impregnated, produced a reddifh precipitate.
2. One meafure of the air obtained in the foregoing
experiment was mixed with an equal quantity of alka- Hepatie line air. In three hours the whole occupied only the bulk of one meafure and two-tenths, and an oily fcum was now left upon the inner furface of the tube; and in eight days the interior furface of the tube was covered with flender films of a yellowifh colour fpread irregularly upon it. The upper furface of the mercury within the tube was corroded; in fone places having a.reddifh burnifhed appearance, in others it was changed into an ath-coloured powder interfperfed with brown fpots. On removing the tube from the mercury, the air that remained in it had a ftrong fetid fmell, refembling that of burned bones.
3. To difcover whether other animal fubftances yield an aerial fluid fimilar to that produced from the cancerous virus, a portion of the flefh of the neck of a chicken was diftilled in a finall coated glafs-retort till it became red hot. A thin phlegm of a yellowifh colour firft came over: this was fucceeded by a yellow empyreumatic oil; and at the fame time a permanently elaftic fluid, fmelling like burned feathers, began to be difengaged. A flip of paper tinged with litmus, and reddened by acetous acid, being held over this fluid, prefently became blue. The remainder of the air was very fetid, and highly inflammable. By agitation in water one-half of it was abforbed; the remainder was inflammable, and burned firft with a flight explofion, and afterwards with a blue lambent flame. On dropping a nitrous folution of filver into the water impregnated with this air, the mixture depofited a brown precipitate.
4. On treating putrid veal by diftillation with a graduated heat, the products were found to be nearly fimilar to thofe already mentioned. The air obtained was highly inflammable, about one-half of it was abforbed by water ; and the liquid thus impregnated let fall a brown precipitate on the addition of nitrous folution of filver. On adding fome dephlogifticated marine acid to another portion of this liquor, a brifk effervefcence took place and a whitifh gelatinous matter was 反eparated; and this fubftance being evaporated to drynefs, became black on the addition of the concentrated vitriolic acid. On agitation with water, part of the air was abforbed as in the former experiment, and the remainder burned with a lambent flame. This air, however, extricated from putrid veal, had lefs of an empyreumatic fmell than that which was difengaged from frefh animal fubftances being rather like that of putrefying animal matters.

From thefe experiments our author concludes that the air extracted from animal fubstances confints of two diftinct fluids, the one foluble and the other infoluble in water. The infolnble part burns with a lambent flame, and has all the characters of leeavy inflaminable air; but the foluble part reiembles that which is produced from cancerous matter by the vitriolic acid; having a fetid odour de compofing nitrated filver, combining with cauftic volatile alkali, and poffefing many of the properties of common hepatic air. In many particulars, however, the animal hepatic air differs from the common. The fmell is confiderably different, and in the decompofition of animal hepatic air no fulphar is feparated: but a kind of flaky matter which is evidently an animal fubftance, as turning black by the vitriolic acid. The following experiment is a decifive
proof:

## HEP <br> HEP

Hepatic proof that no fulphur is contained in animal bepatic Air. air. "Equal parts of pure air, and of air extricated
from fresh beef by diftillation, were fired by the elec. tric fhock in a ftrong glafs tube; over mercury. A little diftilled water was then introduced through the mercury into the tube, and was agitated with the air which it contained. A portion of this water being filtered, and a fmall quantity of muriáted barytes be ing dropped into it, the mixture remained pertedy uranfarent. Hence it appears, that the air extricated by diftillation from frefl beef does not contain fulphur, as that fubftance would have been changed by buming into the vitriolic acid, and the murjated barytes would have been decompofed. The fame experiment was frequently repeated with air extricated by diftilation from the purid as well as from the frefi mufcular fibres of animals; but in no inftance could the leaft veltige of vitriolic acid be difcovered.
5. To analyfe in a more perfect mamer thefe kinds of animal airs, and to determine their products when combined with pure air, about an ounce of the lean of frefh mutton was expoled to a red heat in a fmall coated glafs retort. Very near one half of the air produced towards the eud was abforbed by water, and two-thirds of that which came over about the middle. A feparate portion of the air, difengaged towards the end of the diftillation, being allowed to remain over mercury for feven hours, it was fomd gradually to diminifh in bulk; and a fluid, having the colour and fmell of a thin empyremmatic oil, was collected at the bottom of the jar. This appearance, however, is not confant : the air, when placed over mercury, fometimes diminifles, and at other times retains its original bulk. Only one eighth part of this air was abforbed by water. " Hence (fays the Loctor) it appears, that a portion of the air extricated from animal fubftances by beat, refembles a fpecies of hepatic air which was firft difcovered by Mr Kirwan, and which exilts in an incermediate itate between the acrial and the vaporous; this fluid not being permanently elaftic like air, nor immediately condenfed by cold like vapoar, but gradually alluming the nonelaftic form, in confequence probably of the tendency of its feveral parts to unite with one another."
6. To determine the proportion of fixed air contained in that produced from the lean of animal fubftances, a quantity of air extracted from mutton was received over mercury in a large vial with a narrow neck. When the vial was little more than half filled, the remaining portion of the mercury was difplaced by introducing water that had been previonfly boiled. The vial being then clofely corked, the air and water were brikkly agitated together; and the liquor, thus impregnated with the foluble part of the animal air, was pit into a vial, to the bottom of which heat was applied. Thus a part of the air was again difengaged, and received in a tube inverted over mercary; and the procefs continued till the liquor no louger rendered lime-water turbid. On'agitating the air a fecond time with water and comparing the bulk after agitation with that before it, it appeared that the quantity abforbed was about one-fourth part. From this experiment alfo it appeared, that animal hepatic air, when once abforbed by water, is not capable of being again difen. gased by a boiling heat; for after the fixed air
had all becn expelled, the liquor was made to bail Henat ncatly for hati an hour, but no permanently elaftic fluid could be difengaged; that portion of the liquon which remained had a faint yellow colour and frelled Atrongly of amimal hepatic air, depoliting alfo a brown precspitate upon the addition of nitrated filver. "s it appears theriore (fays the Dogor), that the foluble part of the air difeneaged from animal fubfances by heat, confifs of three diftinct flaids; of alkaline air, fixed, and animal hepatic air. It feemed extren cly probable, that thefe three aerial fluids, flowly combining together, formed the oily empyreumatic fubftance which was collected at the bottom of the jar, while the air was undergoing the diminution defcribed above. In chis conclufion 1 was confirmed by trials that were made with the empyreumatic oil that came over in the latter part of the diftillation; for when it was examined by chomical tefts foon after it was obtained, it was found to contain fixed air, volatile alkali, and animal hepatic air."
7. To determine the produts refulting from the combuftion of pure air with the animal hepatic air, one portion of the air extracted from the lean of mutton was agiated with water, the other was not. One meafure of the former was introduced over mercury into a ftrong ghafs tube, and then mixed with one meafure and an half of pure air. A fmall fhock being made to pafs through it, a violent explofion took place; and the face occupied by the air in the tube was reduced from an inch and two tenths to nine tenths of an inch. On agitating the refidum with water, fix tenths were abforbed, and the portion abforbed appeared to be fixed air by its precipitating lime water. Five parts of nitrous air being mixed with an equal quantity of the infoluble refiduam, a diminution of three parts took place; whence it appears that one fifth of the infoluble refiduum was pure air. Hence it appears that fixed air was produced by the inflam--mation of dephlogifticated and animal hepatic air.
8. One meafure of that portion of animal air which had not been agitated with water was mixed with a meafure and ail half of pure air, and fired by the ciectric fhock. Previous to the deflagration, the two airs occupied the fpace of 1.15 inches, but afterwards it was reduced to I.I. On agitation with water about one third was abforbed; a portion of the infoluble refiduum burned with a faint blue flame.
9. As it appeared from thefe experiments, that a meafure and an half ef dephlogifticated air was not fufficient to faturate one of the animal air that had not been agitated with water, the experiment was repeated in the following manner. Two parts of pure air, with one of the animal kind, occupied the fpace of eight tenths of an inch, but when fired by the electric mock, the refiduum food at a little lefs than half an inch; and this refidum was almoft wholly abforbed on agitation with lime-water. By a fubfequent trial it was found, that nearly one-half of the animal air ufed in this experiment was foluble in water. When equal parts of pure and animal air were burned together, a confiderable increafe of bulk almoft invariably took place; and when the animal was to the pure air as 25 to 15 , the bulk of the mixture was increafed one half. The refiduam of the air was inflam mable.
10. To inveftigate the caufe of this angmentation

## H'E

Hepatic of bulk, three meafurcs of animal were mixed with Air. two of pure air ; and Several ftrong electr:c fhocks were made to pafs throngh the mixarire, but withont being able to fet it on fire. On adding half a mea* furc nore o! pure air, it took fire ; and the bulk was annmonted from .9 to 1.3 inches. Three meafures of the refoduan were then mixed with three of pure air, and we mixare fired by the cluctric fhoch; the bulk of the mixture being reduced from one inch to . 56 . On agitation with Jime-water, two-thirds were abforbed, and theremainder confifted almolt en.i. ely of purc air.
ix. Having accidentally taken two or three fmall fhocks through fome alkaline air, and not obferving any fenfible increafe of bulk, the Dotor mixed it with an equal quantity of pure air, not apprehending that any decompofition had taken place. Contrary to expecta ion, however, the two fluids entered rapidly into combination with each other the moment that the electric fhock was made to pafs through them. The jar, which he held loofely in his hand, as it was invertedover the jar, was carried obliquely upward with great violence; the ftand of the prime conductor was broken, and the cylinder fhivered into a thoufand picces. The experiment, however, was afterwards fafely repeated with a very ftrong apparatus; the jar being preffed down with a plate of iron for the purpofe of retaining it in its place.
"It appeared (fays the Doctor), that when the alkaline and pure air were immediately inixed togeher, and a fimall hock was made to pafs through them, they would not take fire; but when three or four hocks were previoully taken through the alkaline air, and the latter was afierwards mixed with an equal quantity of pure air, they exploded with great violence. One-fixth of the refiduum was alkaline, the remainder phlogifticated air."

Several other experiments are related by the Doctor in this paper, which tend to fhow that animal hepatic air is extricated in large quantity by the procefs of putrefaction. By diftilling a green cabbage leaf, he alfo obtained an aerial fluid, in moft of its properties refembling animal hepatic air. The fetid finellof this gas is deftroyed by fuffering it to remain in contact With pure air for feveral weeks; and fo effectually by the vapour of dephlogifticated marine acid, that he was indaced to try the efficacy of this fluid as an application to cancers. In fome cafes it appeared to be of fervice, though fome ulcerated cancers were fourd fo irritable, that they could bear no application whatever. The liquid itfelf appears to be unfafe when taken inwardly. Dr Cri.wford having taken 20 drops of it largely diluted with water, found himfelf affected with an obtufe pain and fenfe of conftriction in his fumach and bowels, which refinted the ufe of emetics and laxatives, but yielded to fulphureous water. He found afterwards, that the manganefe which had been ufed in the dilitlation of the acid, contained a fraall quantity of lead. He relates alfo, on the authority of Dr Ingenhoufz, thata Dutchman of his acquaintance tome time ago drank a confiderable quantity of the dephlogifticated marine acid; the effects it produced wiefo viclent, that he narrowly efcaped with his lite. Thefe deleteric us qualities our atithor afcribes to lead ; though it can by no neams be proved that manganefe :

## 437 ] <br> HEP

is more innocent : and it is alfo exceedingly probable Hepatica that fome of this femimetal rifes in the preparation of what is called the dephlogificated or oxygenatedmarine acid.
$H_{\text {epatic }}$ Aloes, the infpiffated juice of a fpecies of Aioe.

Hepatic Stone. See Lever Stone.
Hepatic Water. See Hepar Sulphuris.
HEPATICA, in botany, a foecies of Anemone.
HEPATITIS, in medicine, an inflammation of the liver. See Medicine Index.

HEPATOSCOPIA (formed of ntap liver, and exo $\pi \varepsilon \omega$ I confider), in antiquity, a fecies of divination, wherein predictions were made by infecting the livers of animals.

Hevatoscopia is alfo ufed as a gentral mame for divination by intrails.

HEPHASTIA, in Grecian antiquity, an Athenian feftival in honour of Vulcan, the chief ceremony of which was a race with torches. It was performed in this manner: The antagonifts were three young men, one of whom, by lot, took a lighted torch in his hand, and began lis courfe; if the torch was extinguifhed before he finifhed the race, he delivered it to the fecond; and he in like manner to the third : the victory was his who firt carried the torch lighted to the end of the race: and to this fucceffive delivering of the torch we find many allufions in ancient writers.

HEPHTHEMIMERIS (compofed of $\varepsilon \pi \tau \alpha$ feyen, nurous half, and $\mu$ ep Qu part), in the Greek and Latin poetry, a fort of verfe confifting of three feet and a fyollable ; that is, of feven half feet.

Such are moft of the verfes inl Anacreon :

And that of Ariftophanes, in his Plutus:

They are alfo called trimetri catalecfaci.
Hephtaemimeris, or Heppthemimeres, isalfo acæfura after the third foot; that is, on the feventh half foot. It is a rule, that this fyllable, though it be fhort in itfelf, muit be made long on account of the cæfura, or to make it an hepthemimeris. As in that verfe of Virgil.

Et furizs agitatus amor, et confcia virtus,
It may be added that the cæfura, is not to be on the fifth foot, as it is in the verfe which Dr Harris gives us for an example :

Ille latus niveum molli fultus Hyacintba.
This is not a hepthemimeris caefura, but a henneamimeris, i.e. o! mine half feet.

HEPTACHORD, in the ancient poctry, fignified verfes that were fung or played on feven chords, that is, on feven different notes. In this fenfe it was applied to the lyre when it hat bat feven ftrings. One of the intervals is alfo called an bettachord, as containing the fame number of degrecs between the extremes.

HEPTAGON, in geometryp a figure confifting of feven fides, and as many angles, In fortification, a place is termed an beftagon, that has feven baftions for its defence.

HEPTAGOINAL, Number , in arjthmetic, a fort of poly conal numbers, wherein the difference of the terms of the corre fonding arithmetical progreffion is

## HER <br> H ER

Heptandria 5. Onc of the properties of thefe numbers is, that if they be multiplied by 40, and 9 be added to the proHeracleo duct, the fum will be a fquare number.
nites.
nites. HEPTANDRIA, in bntany (froin $\varepsilon \pi \tau \kappa j / p t e m$, and aup a mann); the feventh clafs in Linnæus's fexual method, confiting of plants with hermaphrodite flowers, which have feven ftamina or male-organs. The orders are four, derived from the number of ftyles or female-organs.

HEPTANGULAR, in geometry, an appellation given to figures which have feven angles.
 ven," and apx", impet ium, "government"), a government compoled of feven perfons, or a country governed by feven perfons, or divided into feven kingdoms.

The Saxon heprarchy included all England, which was cantoned out into feven petty independent kingdoms, peorled and governed by different clans and colonies ; viz. thofe of Kent, the South Saxons, Weft Saxons, Eaft Saxons, Northumberland, the Eaft Angles, and Mercia. The heptarchy was formed by degrees from the year 455 , when firft the kingdom of Kent was erected, and Hengift affumed the title of king of Kent immediately after the battle of Eglesford; and it terminated in 827 or 828 , when king Egbert reunited them into one, made the heptarcliy into a monarchy, and affumed the title of king of England. It mult beobferved, however, that though Egbert became monarch of England, he was not perfectly abiolute. The kingdom which he actually poffeffed confifted of the ancient kingdoms of Weffex, Suffex, Kent, and Effex, that had been peopled by Saxons and Jutes. As for the other three kingdoms, whole inhabitants were Angles, he contented himfelf with preferving the fovereignty over them, permitting them to be governed by kings who were his vaffals and tributaries.

The government of the heptarchy, reckoning from the founding of the kingdom of Mercia; the laftof the feven Anglo-Saxon kingdoms, lafted 243 years; but if the time fpent by the Saxons in their conquefts from the arrival of Hengift in 449 be added, the heptarchy will be found to have lafted 378 years from its commencement to its diffolution. The caufes of the diffolution of the heptarchy were the great inequality among the feven kingdoms, three of which greatly furpaffed the others in extent and power; the defanlt of male heirs in the royal families of all the kingdoms, that of Weffex excepted; and the concurrence of various circumftances which combined in the time of Egbert.

HERACLEA, an ancient city of Turkey in Europe and in Romania, with the fee of an archbifhop of the Grecian Church, and a fea-port. It was a very famous place in former times, and there are fill fome remains of its ancient fplendor. Theodore Lafcaris took it from David Comnenus, emperor of Trebifond; when it fell into the hands of the Genoefe, but Mahomet II. took it from them; fince which time it has been in the poffeffion of the Turks. It is near the fea. E. Long. 27. 48. N. Lat. 40. 27.

HERACLEONITES, a fect of Chriftians, the followers of Heracleon, who refined upon the Gnoftic divinity, and maintained that the world was not the immediate production of the fon of God, but that he was only the occafional caufe of its being created by
the demiurgus. He Heracleonites denied the autho- Heracleana rity of the prophecies of the old Teftament, main-Heradidas. taining that they were mere random founds in the air; and that St John the Baptill was the only true voice that directed to the Mefitiah.

Heracleum, Madness: A genus of the digynia order, belouging to the pentandria clafs of plants ; and in the natural method ranking under the 45 th order, Umbellater. The fruit is elliptical, emarginated, compreffed, and ftriated, with a thin border. The corolla is difform, inflexed, and emarginated; the invocrum dropping off. There are five fpecies, of which the moft remarkable is the ifpondylium, or cowparfnip. This is commonin many parts of Britain, and other northern parts of Europe aud Afia.-Gmelin, in his Flora Siberica, p. 21 4. tells us, that the inlıabitants of Kamfchatka, about the beginning of July, collect the foot-1talks of the radical leaves of this plant, and after peeling off the rhind, dry them feparately in the fun, and then, tying them in bundles, dry them carefully in the fhade : in a fhort time afterwards, thefe dried ftalks are covered over with a y ellow faccharine efflorefcence, tafting like liquorice : and in this fate they are eaten as a great delicacy. The Ruffians not only eat the ftalks thas prepared, but procure from them a very intoxicating firit. They firf ferment them in water with the greater bilberrjes (vaccinium uliginofum), and then diftil the liquor to what degree of ftrength they pleafe; which Gmelin fays is more agrecable to the tafte than fuirits made from corn. This may therefore prove a good fuccedancum for whiky, and prevent the confumption of much barley, which ought to be applied to better purpofes.-Swine and rabbits are very fond of this plant. In the county of Norfolk it is called bogweed.

HERACLIDF, the defcendants of Hercules, greatly celebrated in ancient hiftory. Hercules at his death left to his fon Hyllus all the rights and demands which he had upon the Peloponnefios, and permitted him to marry Iole as foon as he came of age. The pofterity of Hercules were not more kindly treated by Euriftheus than their father had been, and they were obliged to retire for protection to the court of Ceyx, king of Trachinia. Euriftheus purfued them thither; and Ceyx, afraid of his refentment, begged the Heraclidæ to depart from his dominions. From Trachinia they came to Athens, where Thefeus the king of the country, who had accompanied their father in fome of his expeditions, received them with great humanity, and affifted them againft their common enemy Euriftheus. Euriftheus was killed by the hand of Hyllus himfelf, and his children perinhed with him, and all the cities of the Peloponnefus became the undifputed property of the Heraclidæ. Their triumph, however, was hort; their numbers were leffened by a peftilence; and the oracle informed them, that they had taken poffeffion of the Peloponnefus before the gods permitted their return. Upon this they abandoned Peloponnefias, and came to fetrle in the territories of the Athenians, where Hyllus,obedient to his father's commands, married Iole the danghter of Eurytus. Soon after he confulted the oracle, anxious to recover the Peloponnefus; and the ambiguity of the anfwer determined him to make a fecond attempt. He challenged to fingle combat $A$ treus, the fucceffor of Euriftheus on the throne of My-

Heraclides, cenæ; and it was mutually agreed that the undifturbHeraclitus. ed poffeffion of the Peloponncfus thould be ceded to whofoever defeated his advertary. Echemus accepted the challenge of Atreus, and Fyllus was killed, and the Heraclidæ a fecond time departed from Peloponnefus. Cleodæus the fon of Hyllus made a thind attempt, and was equally unfuccefsful; and his fon Ariftomachus fome time after met with the fame unfavourable reception, and perithed in the ficld of batile. Arifodemus, Tememus, and Chrefphontes, the three fons of Ariftomachus, encouraged by the more expretive word of an oracle, and defirous to revenge the death of their progenitors, allembled a numerous force, and with a fleet invaded all Pcloponnefus. Their expedition was attended with much fuccels; and after fome decilive battles, they became mafters of all the peninfula. The recovery of the Pfloponnefus by the defcendants of Hercules forms an interefting epoch in ancient hiftory, which is univerfally believed to have liappened 80 years ifter the Trojan war, or I 190 years before the Chriftian æra. This conqueft was totally atchieved about 120 years after the firft attempt of Hyllus, who was killed about 20 years before the Trojan war. As it occafioned a world of changes and revolutions in the affairs of Greece, infonuch that farce a ftate or people but were turned upfide down thereby, the return of the Heraclid $x$ is the $e_{f}$ acha of the beginning of profane hiftory: all the time that preceded it is reputed fabulous. Accordingly, Ephorus, Cumanus, Califthenes, and Theopompus, only begin their hiftories from hence.

HERACLIDES of Pontus, a Greek philofopher, the difciple of Speufippus, and afterwards of Ariftotle, flourilhed about 336 B. C. His vanity prompted him to defire cne of his friends to put a ferpent into his bed juft as he was dead, in order to raife a belief that he was afcended to the heavens among the gods; but the chear was difcovered. All his works are loft.

HERACLITUS, a famous Ephefian philofopher, who flourifhed about the 6وth Olympiad, in the time of Darius Hyftafpes. He is faid to have contimally bewailed the wicked lives of men, and, as often as he came anong them, to have fallen a-weeping ; contrary to Democritus, who made the follies of mankind a fubject of laughter. He retired to the temple of Diana, and played at dice with the boys there; faying to the Ephefians who gathered round him, "Worft of men, what do ye wonder at? Is it not better to do thus than to govern you?" Darius wrote to this philofopher to come and live with him; but he refufed the offer: at laft, out of hatred to mankind, he retired to the mountains, where he contracted a droply by living on herbs, which deftroyed him at 60 years of age. His writings gained him fo great reputation, thar his followers were called Heracitians. Laertius fpeaks of a treatife upon natare, divided into three books, one con-
cerning the univerfe, the fecond political, the third Heraclius theological. This book he depofited in the temple of Diana; and it is faid, that he affected to write obfcurely, left it thould be read by the valgar, and become contemptible. The fundamental doctrine of his philofophy was, that fire is the principle of all things; and the ancient philofophers have collected and preferved admirable apophthegins of this philofopher.

HERACLIUS, emperor of the eaft, a renowned warrior, died A. D. 64I. He carried on long and bloody wars with the Saracens, by whom he was almoft always defeated. Sce Arabia, no 67-93.

HERALD, fays Verftegan, is derived from the Saxon word Herchault, and by abbreviation Heralt, which in that language fignifies the champion of an army; and growing to be a name of office, it was given to him who, in the army, had the fpecial charge to denounce war, to challenge to battle and combat, to proclaim peace, and to execute martial meffages. But the bufinef's of heralds in Britain is as follows, viz. To marfhal, order, and conduct all royal cavalcades, ceremonies at coronations, royal marriages, inftallations, creations of dukes, marquifes, carls, vifcounts, barons, baronets, and dubbing of knights; embaffies, funeral proceffions, declarations of war, proclamations of peace, \&c.: Torecord and blazon the arms of the nobility and gentry; and to regnlate any abufes therein through the Englifh dominions, under the authority of the Earl Marihal, to whom they are fublervient. The office of Windfor, Chefter, Richmond, Somerfet, York, and Lancafter-heralds, is to be affiftants to the kings at arms, in the difterent branches of their office; and they are fuperior to each other, according to creation, in the above order.

Heralds were formerly held in much greater efteem than they are at prefent; and were creared and chriftened by the king, who, pouring a gold-cup of wine on their head, gave them the herald-name: but this is now done by the earl-marihal. They could not arrive at the dignity of herald without having been feven years purfuivant ; nor could they quit the office of herald, but to be made king at arms.

Richard III. was the firft who formed them, in England, into a college ; and afterwards great privileges were granted them by Edward Vl. and Philip and Mary.

The origin of heralds is very ancient. Stentor is reprefented by Homer as herald of the Greeks, who had a voice louder than 50 men together. The Greeks called them xepures, and supxiфuiaxzs; and the Romans, feciales. The Romans had a college of heralds, appointed to decide whether a war were juft or unjuft; and to prevent its coming to opell hoftilities, till all means had been atempted for deciding the difference in a pacific way.

## H E R A L D R Y,

AScience which teaches how to blazon or explain in proper terms, all that belongs to coats-ofarms; and how to marfhal, or difpole regularly, divers urms on a field. It alfo teaches whatever relates to the
marhalling of folemn cavalcades, proceffions, and other public ceremonies at coronations, inftallations, creations of peers, nuptials, chriftening of princes, funerals, \&c.

## 440

Definition, Arms, or coats of arms, are hereditary marks of origin, \&c. honour, madc up of fixed and determined colours and of Heral- figures, granted by fovereign princes, as a reward for dry. military valour, a hhining virtuc, or a fignal public fervice; and which ferve to denote the defcent and alliance of the bearcr, or to diftinguifl fates, cities, focieties, \&c. civil, ecclefiafical, and military.

Thus heraldry is the fcience, of which arms are the proper object ; but yet they differ much both in their origin and antiquity. Heraldry, according to Sir George Nackenzie, " as digefted into an art, and fubjected to rules, muft be afcribed to Charlemaign and Frederick Barbaroffa, for it did begin and grow with the feudal law." Sir Johin Ferne is of opinion, that we did borrow arms from the Egyptians; meaning, from their bieroglyphicks. Sir William Dugdale mentions, that arms, as marks of honour, were firft ufed by great commanders in war, neceflity requiring that their perfons fhould be notified to their friends and followers. The learned Alexsnder Nifbet, in his excellent fy fem of heraldry, fays, that arms owe their rife and beginning to the light of nature, and that figns and marks of honour were made ufe of in the firft ages of the world, and by all nations, however fimple and illiterate, to diftinguith the noble from the ignoble. We find in Homer, Virgil, and Ovid, that their heroes had divers'fignres on their fhields, whereby their perfons were diftinetly known. Alexander the Great, defirous to honour thofe of his captains and foldiers who had done any glorious action, and alfo to excitc an emulation among the reft, did grant them certain badges to be borne on their armour, pennons, and banners; ordering, at the fame time, that no perfon or potentate, through his empire, flould attempt or prefume to give or tolerate the bearing of thofe figns upon the armour of any man, but it hould bea power referved to himfelf; which prerogative has been claimed ever fince by all other kings and fovereign .princes within their dominions.

After thefe and many other different opinions, all that can be faid with any certainty is, that in all ages, men have made ufe of figures of living creatures, or fymbolical figns, to denote the bravery and courage either of their chief or nation, to render themfelves the more terrible to their enemies, and even to diftinguinh themfelves or families, as names do individuals. The famous C. Agrippa, in his treatife of the vanity of fciences, cap. 81. has collected many inftances of thefe marks of diftinction, anciently borne by kingdoms and flates that were any way civilized, viz.
$\left.\begin{array}{l}\text { The Egyptians } \\ \text { The Athenians } \\ \text { The Go:hs } \\ \text { The Romans } \\ \text { The Franks } \\ \text { The Saxons }\end{array}\right\} \stackrel{0}{0}\left\{\begin{array}{l}\text { an Ox, } \\ \text { an Owl, } \\ \text { a Bear } \\ \text { an Eagle, } \\ \text { a Lion, } \\ \text { a Horfe }\end{array}\right.$

The laft is ftill borne in the arms of his prefent Britannic majefly. As to hereditary arms of families, William Cambden, Sir Henry Spelman, and other judicions heralds, agree, that they begain no fooner than towards the latter end of the ith century. According to Father Menefrier's opinion, a French writer whofe authority is of great weight in this matter, Henry l'Oifeleur (the Falconer) who was raifed

L D R.Y.
to the imperi-l throne of the Weft in 920, by regui- Heranat ting tounaments in Geamany, gave occation to the amis, \&c. eftablifhment of family-arms, or hereditary marks of honour, which undeniably are more ancient and better obferved among the Germans than in aty other nation. Moreover, this laft author afferts, that with tournaments firft came ap coats-of-arms; which were a fort of livery made up of feveral lifts, fillets, or narrow pieces of ftuff of divers colours, from whence came the fers, the bend, the pale, \&c. which were the original charges of family-arms; for they who never had been at tournaments, had not fuch marks of diftinction. They who inliffed themfelves in the Croifades, took up alfo Several new figures kitherto unknown in the armorial enfigns; fuch as alerions, bezants, efcalop-fhells, martlets, \&c. but more particularly croffes, of different colours for diftinction's fake. From this it may be concluded, that heraldry, like moft human inventions, was infenfibly introduced and eftablifhed; and that, after hating been rude and unfettled for many ages, it was at laft methodifed, perfected, and fixed, by the Croifades and tournaments.

Thefe marks of colour are called armas, from their being principally and firft worn by military men at war and tournaments, who had them engraved, emboffed, or depicted on fhiclds, targets, banners, or other martial inftruments. They are alfo called coats-of-arms, from the cuftom of the ancients embroidering them on the coats they wore over their arms, as heralds do to this day.

Arms are diftinguifhed by different names, to denote the caufes of their bearing; fuch as,

| A | M S |
| :---: | :---: |
| Dominion, | Of Patronage, |
|  |  |
| Of Communit | Of |

Arms of dominion or fovereignty are thofe which emperors, kings, and fovereign ftates, do conftantly bear; being, as it were, annexed to the territories, kingdoms, and provinces, they pofiefs. Thus the three lions are the arms of England, the fleurs-de-lis thofe of France, \&c.

Arms of pretenfion are thofe of fuch kingdoms, provinces, or territories, to which a prince or lord has fome claim, and which he adds to his own, although the faid kingdoms or territories be poffeffed by a foreign prince or other lord. Thus the kings of England have quartered the arms of France with their own, ever fince Edward III. laid claim to the kingdom of France, which happened in the year 1330, on account of his being fon to Ifabella, fifter to Charles the Handfome, who died without iffue.

Arms of concefion or augmentation of honour, are either entire arms, or elfe one or more figures, given by princes as a reward for fome extraordinary fervice. We read in liftory, that Robert Bruce king of Scotland, allowed the earl of Wintoun's anceftor to bear, in his coat-armour, a crown fupported by a fword, to fhow that he, and the clan Seaton, of which he was the head, fupported his tottering crown. The late Queen Anne granted to Sir Cloudelly Shovel, rearadmiral of Great Britain, a cheveroi between two fleurs-de-lis in chief, and a crefcent in bafe, to denote

## Chap. I.

H E R A L D R Y.
Of the three great vietories he had gained; two over the hield, \&c. French, and one over the Turks.

Arms of community, are thofe of bifhoprics, cities, univerfities, academies, focieties,companies, and other bodies corporate.

Arms of patronage, arc fuch as governors of pro. vinces, lords of manors, patrons of benefices, \&c. add to their family-arms, as a token of their fuperiority, rights, and jurifdiction. Thefe arms have introduced into heraldry, caftles, gates, wheels, ploughs, rakes, harrows, \&c.

Arms of family, or paternal arms, are thofe that belong to one particular family, that diftinguifh it from others, and which no perfon is fuffered to affume with out committing a crime, which fovereigns have a right to reftrain and punifh.

Arms of alliance, are thofe which families, or private perfons, take up andfoin to their own; to denote the alliances they have contracted by marriage. This fort of arms is either impaled, or borne in an efcutcheon of pretence, by thofe who have married heireffes.

Arms of fuccefion, are fuch as are taken up by them who inherit certain eftates, manors, \&c. either by will, entail, or donation, and which they either impale or quarter with their own arms; which multiplies the titles of fome families out of neceffity, and not through eftentation, as many imagine.

Thefe are the eight claffes under which the divers forts of arms are generally ranged; but there is a fort which blazoners call alfumptive arms, being fuch as are taken up by the caprice or fancy of upftarts, though of ever fo mean extraction, who, being advanced to a degree of fortune, affume them without a legal title. This, indeed, is a great abufe of heraldry; and common only in Britain, for on the continent no fuch practice takes place.

We now proceed to confider the effential and integral parts of arms, which are thefe:

$$
\begin{aligned}
& \text { The Escutcheon, } \quad \text { The Charges, } \\
& \text { The Tinctures, } \quad \text { The Ornaments. }
\end{aligned}
$$

## C H A P I.

## Of the Shield or Escutcheon.

The Shield or Efcutcheon is the field or ground whereon are reprefented the figures that make up a coat of arms : for thefe marks of diftinction were put on bucklers or fhields before they were placed on banners, fandards, flags, and coat-armour; and wherever they may be fixed, they are fill on a plane or faperficies whofe form refembles a thield.

Shield, in heraldry called efcutcheons or foutcheons, from the Latin word fcutum, have been, and ftill are, of different forms, according to different times and nations. Amongft ancient fhields, fome were almoft like a horfe-fhoe, fuch as is reprefented by ${ }^{\circ}$ r. in the figure of Efcutcheons; others triangular, fomewhat

Plate. CCXXVII habited Mefoporamia, now called Diarbeck, made ufe of this fort of flaield, which it is thought they had of the Trojins. Somerimes the fhield was heptagonal, that is, had feven fides, as $n^{\circ} 3$. The firft of this fhape is faid to have been ufed by the famous triumvir M. Antony. That of knights-banneret was fquare, like a bannner, as $n^{\circ} 4$. As to modera efcutcheons, thofe of Vol. Vill.
the Italians, particularly of ecclefiaftics, are generally
oval, as n ${ }^{2}$ 5. The Englifh, French, Germans, and other nations; have their efcutcheons formed different ways, according to the carver's or painter's fancy: fee the various examples contained from $n^{0} 6-16$ of the figure. Bat the efcutcheons of maids, widows, and of fuch as are born ladies, and are married to private gentlemen, is of the form in a lozenge: Seen ${ }^{\circ} 17-20$ Sir George Mackenzie mentions one Muriel, countefs of Strathern, who carried her arms in a lozenge, anno 1284 , which fhows how long we have been verfant in heraldry.

Armorifts diftinguifh feveral parts or points in efcutcheons, in order to determine exactly the pofition of the bearings they are charged with; they are here denoted by the firft nine letters of the alphabet, ranged in the following manner :

$$
\begin{aligned}
& \text { A_the dexter chief. } \\
& \mathrm{B} \longrightarrow \text { the precife middle chief. } \\
& \mathrm{C} \text { ——the finifler chief. } \\
& \text { D_the honour point. } \\
& \text { E——the fefs point. } \\
& \mathrm{F} \text { - -the nombril point. } \\
& \text { G_-the dexter bafe. } \\
& \mathrm{H} \text { —_the precife middle bafe. } \\
& \text { I-_the finifter bafe. }
\end{aligned}
$$

The knowledge of thefe points is of great importance, and ought to be well obferved, for they are frequently occupied with feveral things of different kinds. It is neceffary to obferve, that the dexter fide of the efcutcheon is oppofite to the left hand, and the finifter fide to the right hand of the perfon that looks on it.

## C H A P. II.

## Of Tinctures, Furs, Lines, ahd DiffeRENCES.

## Sect. I. Of Tinctures.

By tintfures is meant, that variable hue of arms which is common both to fhields and their bearings. According to the French heralds, there are but feven tinctures in armory; of which two are metals, theother five are colours.

When natural bodies, fuch as animals; plants, cele Aial bodies, \&c. are introduced into coats of arms, they frequently retain their natural colours, which is expreffed in this fcience by the word proper.

Befides the five colours abovementioned, the Eng. lifh writers on heraldry adnit two others, viz.

$$
\left.\begin{array}{l}
\text { Orange, } \\
\text { Blood-colour, }
\end{array}\right\} \text { termed }\left\{\begin{array}{l}
\text { Tenny. } \\
\text { Sanguive. }
\end{array}\right.
$$

But thefe two are rarely to be found in Britifh bearings.

Thefe tinctures are reprefented in engravings and 3 I drawings
$\begin{array}{llllllll}H & E & R & A & L & D & R & Y\end{array}$

The drawings (the invention of the ingenious Silvefter Pe rinctures. tra Sancta, an Italian author of the laft century) by dots and lines, as in fig. ii. $\mathrm{n}^{\circ} \mathrm{I}-9$.
$O_{r}$ is expreffed by dots.
Argent needs no mark, and is therefore plain. Azure, by horizontallines.
Gules, by perpendicular lines.
$V e: t$, by diagonal lines from the dexter chief to the intifter baíe points.
Purpure, by diagonal lines from the finifter chief to the ciexter bafe points.
Sable, by perpendicular and horizontal lines croffing each orher.
Tenny, by diagonal lines from the finifter chief to the dexter bafe points, traverfed by horizontal lines.
Sanguine, by lines croffing each other diagonally from dexter to finifter, andfrom finifter to dexter.
Sir George M'Kenzie obferves, that "fome fantaftic heralds have blazoned not ouly by the ordinary colours and metals; but by flowers, days of the week, parts of a man's body, \&cc. and have been condemned for it by the heralds of all nations. Yet the Englifh have fo far owned this fancy," (the moft judicious of them, as Mr Cartwright and others, reprobate it as abfurd), "that they give is for a rule, that the coats of fovereigns thould be blazoned by the planets, thofe of noblemen by precious fones; and have fuited them in the manner here fet down:

| Or | Topaz | Sol. |
| :--- | :--- | :--- |
| Argent | Pearl | Luna. |
| Sable | Diamond | Saturn. |
| Gules | Ruby | Mars. |
| Azure | Sapphire | Jupiter. |
| Vert | Emerald | Venus. |
| Purpure | Amethyft | Mercury. |
| Tenny | Jacinth | Dragon's-head. |
| Sanguine | Sardonix | Dragon's-tail. |

" But I crave leave to fay, that thefe are but mere fancies; and are likewife unfit for the art, for thefe reafons: rit, The French (from whom the Englifh derive their heraldry, not only in principles, but in words of the Erench language) do not only not ufe thefe different ways of blazoning, but treat them en ridicule. 2dly, The Italian, Spanifh, and Latin heralds ufe no fuch different forms, but blazon by the ordinary metals and colours. 3dy, Art fhould imitate nature ; and as it would be an unnataral thing in common difcourfe not to call red red becaufe a prince wears it, fo it is unnatural to ufe thefe terms in heraldry. And it may fall out to be very ridiculous in fome arms: for inftance, if a prince had for hisarms an afs couchant under his burden gules, how ridiculous would ir be to fay he had an afs couchant Mars?-A hundred other examples might be given; but it is enough to fay, that this is to confound celours with charges, and the things that are borne with coleurs. 4thly, Ir makes the art unpleafant, and deters gentlemen from ftudying it, and flrangers fromuderftanding what our heraldry is; nor cosld the arms of eur princes and nobility be tranflated in this difguife into Latin or any other language. But that which convinces moft that this is an error is, becaufe it makes that great role unneceffary, whereby colour caunot be
put upon colour, nor metal upor metal : but this can- The Furs. not hold but where metals and colours are expreffed." ———nThe Englifh heralds give different names to the roundlet ( $\mathrm{n}^{\circ} 10$ ), according to its colour. Thus, if it is
$\left.\begin{array}{l}\text { Or, } \\ \text { Argent, } \\ \text { Azure, } \\ \text { Gules, } \\ \text { Vert, } \\ \text { Purpure, } \\ \text { Sable, } \\ \text { Tenny, } \\ \text { Sanguine, }\end{array}\right\}$ it is called a $\left\{\begin{array}{l}\text { Bezant. } \\ \text { Plate. } \\ \text { Hurt. } \\ \text { Torteau. } \\ \text { Pomey. } \\ \text { Golpe. } \\ \text { Oellet. } \\ \text { Orange. } \\ \text { Guze. }\end{array}\right.$

The French, and all other nations, do not admit fuch a multiplicity of names to this figure ; but call them Bezants, after an ancient coin fruck at Conftantinople, once Byzantiunt, if they are Orand Torteaux; if of any other tincture, exprefling the fame.

## Sect. II. Of Furs.

Furs reprefent the hairy fikin of certain beafts, prepared for the doublings or linings of robes and garments of flate: and as fhields were anciently covered with furred fkins, they are therefore ufed in heraldry not only for the linings of the mantles, and other ornaments of the flields, but alfo in the coats of arms themfelves.

There are three different kinds in general ufe, viz.
I. Ermine; which is a field argent, powdered with black fpots, their tails terminating in three hairs. (Fig. ii. $\mathrm{n}^{0}$ II.)
2. Counter-ermine, where the field is fable, and the powdering white. ( $\mathrm{n}^{\circ} 12$. )
3. $\operatorname{Vair}\left(\mathrm{n}^{\circ} 15\right.$.), which is expreffed by blue and white fkins, cut into the forms of little bells, ranged in rows oppofite to each other, the bafe of the white ones being always next to that of the blue ones. Vair is ufually of fix rows ; if there be more or fewer, the number ought to be expreffed ; and if the colours. are different from thofe abovementioned, they muft likewife be expreffed.

The Englif multiply the furs, as well as the names. of the tinctures, though no other nation has adopted fuch varieties. Thus they give us,

1. White, which is the natural colour of the ermine; but it is ufed on no other occafion but in the defcriptions of mantles.
2. Ermines, which is the fame with contra-ermine.
3. Erminois; the field is Or , the powdering Sable, ( $\mathrm{n}^{\circ}$ 13.) For the ufe of this fur Guillim cites Bara, p. I4. but no fuch fur is to be found in Bara.
4. Pean; the field is Sable, the powdering Or, ( $n^{\circ}$ 14.) The French ofe ne fuch term : but they call adl furs ordoublings des pannes, or pennes; which term has poffibly given rife to this miftake, and many others, in thofe who do not underftand the French: language.
5. Erminites; the fame as Ermine, with the addition of a red hair on each fide of the black. Sir Geo. M•Kenzie calls thefe diftinctions " but fancies, for erminites fignifies properly little ermines."
6. Counter-vair; when the bells of the fame tineture

Tig. G. CHIEAS dc

Mig.G. PALEF \&C.

Thackara \& Vallanace sc,
of Lines. are placed bafe againft bafe, and point againft point, ( $\mathrm{n}^{\circ} 16$.)
7. Potent-counter potent, anciently called Vairy-cup$p y$, as when the field is filled with crutches or potents counter-placed, ( $\mathrm{n}^{\mathrm{o}}$ 17.)

It may not be improper to obferve, that the ufe of the tinctures took its rife from the feveral colours ufed by warriors whilf they were in the army, which S. de Petra Sancta proves by many citations. And becaufe it was the cuftom to embroider gold and filver on filk, or filk on cloth of gold and filver, the heralds did therefore appoint, that in imitation of the clothes fo embroidered, celour fhould never be ufed upon colour, nor metal upon metal.

## Sect. III. Of the Lines ufed in the parting of Fields.

Escutcheons are either of one tineture, or more than one. Thofe that are of one only, that is, when fome metal, colour, or fur, is fpread all over the furface or field, fuch a tinclure is faid to be predominant: but in fuch as have on them more than one, as moft have, the field is divided by lines; which, according to their divers forms, receive various names.

Lines may be either ftraight or crooked. Straight lines are carried evenly through the efcutcheon : and are of four different kinds; viz. a perpendicular line |; a horizontal,-; a diagonal dexter, $\lambda$; a diagonal inifter, $/$.

Crooked lines are thofe which are carried unevenly through the efcutcheon with rifing and falling. French armorifts reckon II different forts of them; Guillim admits of feven only; but there are 14 diftinct kinds, the figures and names of which are as in fig. I. (A), $n^{2}$ I-14. viz.

1. The engrailed. 2. The invected. 3. The wavy. 4. The embattled, or crenelle. 5. The nebule. 6. The raguly. 7. The indented. 8. The dancette. 9. The dove-tail. 10. The grafted. ri. The embattled aronde. 12. The battled embattled. I3. The patee or deve-tail. 14. Champaine.

The principal reafon why lines are thus ufed in heraldry, is to difference bearings which would be otherwife the fame; for an efcutch con charged with a chief engrailed, differs from one charged with a chief wavy, as much as if the one bore a crofs and the other 2 faltier.

As the forementioned lines ferre to divide the field, it muft be obferved, that if the divifion confints of two equal parts made by the perpendicular line, it is called parted per pale; by the horizontial line, parted per fefs; by the diagonal dexter, parted per bend; by the diagonal finifter, parted per bend finifter; examples of which will be given in the fequel of this treatife.

If a field is divided into four equal parts by any of thefe lines, it is faid to be quartered; which may be done two ways, viz.

Quartered or parted per crofs; which is made by a perpendicular and horizontalline, which, croffing each other at the centre of the field, divide into four equal
parts called quarters. See Plate CCXXVII. under fig. i. (A).

Quartered or parted per faltier; which is made by two diagonal lines, dexter and finifter, that crefs one another in the centre of the field, and likewife divide it into four equal parts. Ibid.

The efcutcheon is fometimes divided into a greater number of parts, in order to place in it the arms of the feveral families to which one is allied; and in this cafe it is called a genealogical atchievement. There divifions may confift of $6,8,12$, and 16 , quarters [as under fig, i. (A)], and even fometimes of $20,32,64$, and upwards; there being examples of fuch divifions frequently exhibited at pompous funerals. An extraordinary inftance of this kind was lately exhibited at the pompous funeral of the late worthy vifcountefs Townfend, whofe corpfe was brought from Dublin caftle in Ireland to Rainhamhall in Norfolk, one of the principal tenants on horfeback carrying before the hearfe a genealogical banner, containing the quarterings of his lordflip's and her ladyfhip's family, to the amount of upwards of i6* coats. Sir George Booth, rector of the valuable living of Afhton under Line, bears fix diftinet coats , of arms in his hield; viz. thofe for Booth, Barton, Venables, Mountfort, Afhton, Egerton; and has befides a right to 37 other coats : but Sir William Dugdale very juftly objects to fo many arms being cluftered rogether in one fhield or banner, on account of the difficulty of difcerning and knowing afunder one coat of arms from another.

## Sect. IV. Of the Differences of Coats of Arms.

Armorists haveinvented divers differences or characteriftical marks, whereby bearers of the fame coat of arms are diftinguihed each from others, and their nearnefs to the principal bearer demonftrated. According to J. Guillim, thefe differences are to be confidered either as ancient or modern.

## Art. I. Of Ancient Differences.

Those he calls ancient differences confift in bordures (A); which is a bearing that goes all round, and parallel to the boundary of the efcutcheon, in form of a hem, and always contains a fifth part of the field in breadth. Bordures were uled in ancient times for the diftinguilling not only of one nation or tribe from another, but alfo to note a diverfity between particular perfons defcended of one family and and from the fame parents. This diftinction, however, was not exprefsly fignified by invariable marks; nor were bordures always appropriated to denote the different degrees of confan. guinity: for, as Sir Henry Spelman obferves in his A/pilogia, p. 140 , ancient heralds, being fond of per: fpicuous differences, often inverted the paternal tincture, or fometimes inferted another charge in the efcutcheon, fuch as bends, cronets, cantons, or the like; which irregularity has, I fuppofe, induced modern armorifts to invent and make ufe of others."

There are bordures of different forms and tinctures, as in the examples, fig. iii.

312
No. 1.
(A) Bordures are Aill introduced in Englih coats of arms, but for particular reafons, which heralds can beft explain. They are by the French frequently taken for a principal figare, and numbered among the ref of the ordinaries.

## H. R A L D K .

Ancient Differences right 1 Sill T Borona

CCXXVIII
N I. is "Sable, a Bordure Argent;" borne by the right hon. Sackville Tufton, eall of Thanet. - When a boadure is plain, you are not to mention it, as it is always underitood fo in heraldry, though it be not ex- preffed; but if it has aily other form, you are to fignify it.
2. "Gules, a Borture engrailed Argent ;" borne by the righe hon. Chatres Gray, ford Gray. - This is calle tong"ailed, froun the French word engrêlé, which fignites a thing the hail has fallen upon and broken off the edges, leaving it with little femicircles frack out of ic.
3. "Gules, a Bordure engrailed Or;' borne by the right hon. George Talbot, earl of Shrewibury. You nuft obferve, that, in a bordure or ordinary formed of the fe lines, the points are reprefented on all fides towards the field, and the femicircles turned towards the bordure or ordinary.
4. "Argent, a Bordure invected Azure."-This is quite contrary to the laft; for as the other turns its points from the bordure into the field, fo contrary wife this does, by the inverfion of the points from the field into the bordure. Such a charge or any o her formed of thefe lines is feldom to be met with in Englifh coats of arms.
5. "Gules, a Bordure indented Argent."-The word indented requires very little explanation, the fignification being obvious to all perfons, from its figure, which is compofed of tracks refembling teeth, called in Latin dentes.
6. "Azure, a Bordure Ermine."
7. "Vert, a Bordure Vair."
8. "Ermine, a Bordure compony, or gobony, Or and Sable."-This is fo termed from its being compofed of fmall and equal pieces. J. Guillim calls this bordure gobonated, which implies the fame meaning; but the word being obfolete, is not ufed by modern heralds.
9. "Quarterly, Azure and Gules, a Bordure compony Argent and Azure;" borne by his grace Henry Somerfet, duke of Beaufort, \&c.

Io. "Azure, a Bordure counter-compony Argent and Gules."-OOberve, that the counter-compony does always confift of two tracks and no more.
II. "Or, a Bordure checky Argent and Sable."This has a great refemblance with the laft bordure, having only one track more; therefore you muft take care before you blazon, to number them, or elfe you may eafily err in taking the one for the other.
12. "Gules, a Bordure Argent charged with eight Trefoils llipped proper, that is, Vert."-All nations ufe few terms in blazoning bordures; but Englifh armorifts, in order poffibly to raife the dignity of this fcience, have perplexed it, and rendered it unintelligible to all foreigners, by introducing into it feveral naftical names, among which may be reckoned the following ones, viz. They call a bordure, if charged with eight plants, fruits, flowers, or leaves, verdoy of fuch vegetables; or enaluron of fuch birds; enurny of beafts; perflew of furs; and entoyre of inanimate things of what kind foever.
13. "Gules on a Bordure Azure, eight Stars Or."
14. "Argent, a bordure compony of the laft and Gules, the firit charged with Rofes of the fecond,
barbed and feeded yroper."-This bordure is borne by his grace Charles Lenox, duke of Richmond, \&c.
15. "Ermine, within a Bordure engrailed Gulcs;" the coat of arms of the right hon Henry Eenedict Barnewall, vifcount Kingland, \&cc. of Ireland.-This ancient and noble famuly is of French extracion, and allied to the dukes of Little Bretagne, where the name continues fill in great repute.
16. "Argent, a Bordure engrailed Sable charged with eight Befants;" borne by the right hon. Cole, lord Ranelagh, of Ireland.
17. "Party per pale Argent and Gules, a Bordure charged with eight Efcalops counterchanged;"' the coat of arms of the right hon. Willian Maule, carl of Panmure, \&c. of Ireland. This very ancient family is originally French, and derives its furnane from the town and lordihip of Maule in Normandy, where the fame arms are fill to be feen in the parifh-church.
18. "Azure, a Bordure quarterly, the firft and fourth Ermine, the fecond and thiid counter-compony Argent and Azure."

I9. "Purpare, a Bordure compony Or and Gules, each of the laft charged with a Befant."
20. "Quarterly Or and Gules, within a Bordure Vert, charged with eight Efcalops Or."

We fhall conclude this head with obferving, that a bordure is never of metal upon metal, and feldom of colour upon colour, but rather of the tincture which the principal bearing or charge is of. Thus Sir - Dalziel of Glenae, whofe predeceffor was a younger brother of the noble family of Carnwath, has, within a Bordure Argent, the paternal coat of the ancient name of Dalziel, viz. "Sable, a hanged man with his arms extended, Argent;" formerly they carried him hanging on a gallows. This bearing, though to very fingular for a coat of arms, was given as a reward to one of the anceftors of the late Robert Dalziel, earl of Carnwath, to perpetuate the memory of a brave and hazardous exploit performed in taking down from 2 gallows the body of a favourite and near relation of king Kenneth II. hung up by the Picts; which fory. is thas related by Alexander Nifbet: "The king being exceedingly grieved that the body of his minion and kinfman fhould be fo difgracefully treated, he proffered a great reward to any of his fubjects who would adventure to refcue his corpfe from the difgrace his cruel enemies had unjufly put upon it: bnt when none would undertake this hazardous enterprife, at laft a valorous gentleman came and faid to the king, Dalziel, which fignifies, "I dare;" and he did actually perform that noble exploit to the king's fatisfactionand his own inmortal honour, and in memory of it got the aforefaid remarkable bearing; and afterwards his pofterity took the word Dalziel for their furname, and the interpretation of it, Idare, continues even to this day to be the motto of that noble family." We can have no better proof of the truth of this tradition than this, that the heans of this ancient family have for many ages carefully retained this bearing without any alteration or addition.

## Art. 2. Of Modern Bifferences.

THE modern differences which the Englifh have adopted not only for the diftinguilhing of fons ifued

## Chap. II.

Modern out of onefamily, but alfo to denote the difference and $\underbrace{\text { Differences fubordinate degrees in each houfe from the original }}$

Plate' CCXXVII For the heir or firft fon, the Label. 2d fon, the CCXXVII Crefcent. 3 d fon, the Mullet. 4th fon, the Martlec. (A) sth fon, the Annulet. Gth fon, the Flower-de-luce. 7th fon, the Rofe. 8th fon, the Crofs moline. 9th fon, the Double quarter-foil.

By thefe differences, the fix fons of Thomas Beauchamp, the r 5th earl of Warwick, who died in the 34th year of king Edward III. are diftinguilhed in an old window of the church of St Mary at Warwick; fo that although they are called modern differences; their ufage with the Englifh is ancient.

It mon be offerved, that, of all the forementioned marks of diftinction, nonc but the label is affixed on the coars of arus belonging to any of the royal family; which the introducers of this peculiarity have, however, thought proper to difference by additional pendants and diflinct charges on them.

As to the difinction to be made in the arms of the offspring belonging to each of the abovementioned

Plate brothers, it is expreffed by figures on the top and margin of the table contained in fig. iv. For inftance,
The heir or firft fon of the fecond houfe, beareth a crefcent charged with a label during his father's life only. The fecond fon of the fecond houfe, a crefcent charged with another crefcent. The third fon of the fecond houfe, a crefcent charged with a mullet. The fourth fon of the fecond houfe, a crefcent charged with a martlet. The fifth fon of the fecond houfe, a crefcent charged with an annulet. The fixth fon of the fecond houfe, a crefcent charged with a flower-deluce; and fo on of the other fons, taking care to have them of a different tincture.

In what part of the efcutcheon thefe differences fhould be borne is not certain ; for Guillim, Morgan, and others, give us many different examples of their pofition. The honour-point would be the propereft place, if the arms would admit of it; but that is not always the cafe, as that part may be charged with fome figure in the paternal coat, which cannot with propriety receive the difference. There are inftances where thefe are borne as perfeci coats of arms, as the examples fubjoined to the Table of Houfes fufficiently fhow; which are to be blazoned thus:

The firt is "Azare, a Label Argent."-When fuch a label is borne as a difference, the pendanse, according to G. Leigh, fignify that he is but the third perfon ; the dexter pendant reforring to his father, the finifter to his mother, and the middle one to himfelf.

The fecond is "Argent, a Label of five points Azure ;" borne by the name of Hentington. If a label has more or lefs than three pendantsor points, they are to be expreffed as in the foregoing example.

The third is "Azure, a Crefcent Argent." borne by the name of Lucy.-The reafon G. Leigh affigus for the fecond fon's having a crefcent for a difference, is to thow that he fhenld increafe the family by aciding to it riches and reputation.

The fourth is "Argent, a Mullet Sable, on a Chief Azare, a Fleur-de-lis Or;" borne by the name of Rogers, in Gloucefterfhire.-A mullet or fpur was appointed for the third fon's difference, as the laft-

L D. R Y.
mentioned author fays, to fhow that he fhould follow Mudern chivalry.

The fifth is "Azure, a Fleur-de-lis Argent;" borne by the right hon. Henry Digby, Unon Digby of Geathil, in King's-Connty, Ireland.

Thefe few examples, among many more that might be given, demonftrate the impropricty of adopting thele modern differences, as they are called, for marls of cadency to diftinguifh the different branches of a family : for it is impoliible to diftinguith the uncle or grand-uncle from the kephew or grand-nephew, if each of them are fecond, third, or fourth fons; and in the courfe of fucceflion thefe differences would multiply to fuch a number, that it would be impolible to delineate them diftinctly in moft cafes. But as they are given by moft of the Englifh writeri on heraldry, though no forcign nation ufes them, it was thought profer to infert them here.
sifters, except of the blood-royal, have no other mark of difference in their coats of arms, but the form of the efcutcheon (as obferved before); thereforethey are permitted to bear the arms of their father, even as the eldeft fon does after his father's decedie. The reafon of which is by Guillim faid to be, that when they are married, they lofe their furname, and receive that of their hufbands.

Next to thefe diminutions, G. Leigh, J. Guillim, and after them Dr Harris in his Lexicon Technicum, fet forth at large divers figures, which they pretend were formerly added to the coats of fuch as were to be punifhed and branded for cowardice, fornication, flander, adultery, treafon, or murder, for which they give them the name of abatenuents of bonour; but as they produce but one inftance of fach whimfical bearings, we have not inferted them here. Beffdes arms being marks of honour, they cannot admit of any note of intamy; nor would any body now-a-days bear liem if they were fo branded. It is true, a man may be degraded for divers crimes, particularly high treafon; but in fuch cafes the efcutcheon is reverfed, trod apon, and torn in pieces, to denote a total extinction and fuppreffion of the honour and dignity of the perfon to. whom it belonged.

## C H A P. III,

## Of the Charces.

Armorists call a charge whatfoever is contained in the field, whether it occupy the whole or only a part thercof. All charges are diftinguihed by the name, of honourable ordinaries, fub-ordinaries, and sommon charges.

Honourable ordinaries, the principal charges in heraldry, are made of lines only, which, according to their difpofition and form, receive different names.

Sub-ordinaries are ancient ineraldric figures, frequently ufed in coars of arms, and which are diftinguithed by terms appropriated to each of them.

Common charges are compored of natural, artificial, and even chimerical things; fuch as plants, creatures ${ }_{2}$ vegetables, inftruments, \&c.

## Sect. I. Of Honourable Ordinaries.

The moft judicious armorils admit only of nine honourable ordinaries, $v \mathrm{ciz}_{\text {a }}$

Honour-" able Ordi-] naries.

The Chief
The Plate
The Bend
The Bend finifter The Fefs

Ofthefe, but fix have diminutives, which are called as follows: That of the chief is a fillet; the pale has a pallet and endor $\bar{e}$, the bend, a bendlet, coft, and ribband; the bend finifter has the fcarp and baton; the bar, the clofet and barulet; the cheveron, a chevronel and cozple-clofe. All which will be treated of in order.

## Art. I. Of the Chief.

The chief is an ordinary determined by an horizontal line, which, if it is of any other form but ftraight, muft be expreffed. It is placed in the upper part of the efcutcheon, and containeth in depth the third part of the field. Its diminutive is a fillet, the content of which is not to exceed one-fourth of the chief, and ftandeth in the loweft part thercof. This ordinary is fubject to be charged with variety of figures; and may be indented, wavy, nebule, \&c. as in the examples, fig. $v$.
Plate
No I. is Or, "، a Chief indented Azure;" borne cexXVIll by the right hon. Edmund Butler, vifcount Mountgarret, \&c. of the kingdom of Ireland. This great and illuftrious family of the Butlers, fo renowned for the many valiant and loyal perfons it has produced, is defcended from the ancient counts of Brion in Normandy ; but fince king Henry II, conferred the office of chief butler of Ireland upon one of the family, he and his fucceffors have aflumed the name of Butler.
2. "Azure a Chief engrailed Or."
3. "Argent, a Chief invected Vert."
4. "Vert, a-Chief undy Or."
5. "Azure, a Chief nebule Argent."
6. "Or, a Chiet checky Azure and Argent."
7. "Ermine, a Chief quarterly Or and Gules;" borne by the name of Peckham.
8. "Argent, a Chief Sable, in the lower part thereof a Fillet of the Field."
9. "Azore, fretty Argent, a Chief Or;" borne by the right hon. Hayes St Leger, vifcount Doneraile, \&c. of the county of Cork in Ireland. This ancient and noble family is of French extraction; and is defcended from Sir Roger St Legere, knight, who in ro66, accompanied William Duke of Normandy in his expedition into England; and the family have a tradition, that he, with his own hand, fupported the faid duke when he quitted the fhip to land in Suffex.
to. "Argent, on a Chief engrailed Azure, a Tortoife paffant Or ;' borne by the name of Bidgood.
in. "Argent, on a Chief Gules, two Spur revels Or;" borne by the right hon. John St John, lord St John of Blethoe, \&c. Of this ancient family, whichderive their furname from a place called $S t$ $70 h_{n}$ in Normandy, was John de St Johrs, Efq; who having a principal employment in the army of the Norman duke, attended him in his expedition into England.
12. "Argent, on a Chief Vert, two Spears Heads erect of the Field, the points imbrued Gules;" borne

L D R Y.
Chap. III
by the right hon. George Brodrick, Vifcount Middte. Honourton, \&c. of the kingdom of Ireland. This family is able Ordilineally defcended from George de Brodrick, who natres. came into England in the reign of William II.
13." Or, on a Chief Sable, three Efcalops of the field," for the name of Grabays; and borne quartered in thearms of his Grace William Graham, duke, marquis, and earl of Montrofe, \&c. with Argent three Rofes Gules. According to the Scots writers, this great and noble family is defcended from the renown. ed Greme or Grame, who, in the 404, was general of king Fergus II's, army, and, in 420, forced his way through the wall built by the Romans between the rivers Forth and Clyde to keep out the Scots from molefting them in their poffeffions, and the faid breach has ever fince been called Grawe's-dike:
14. "Argent, on a Chief indented Gules, three Cromes pattee of the Field ;" borne by the right hon. John Perceval, earl of Egmont, \&c. This very ancient and noble family is fuppofed, from circumftances little Short of pofitive proof, to have fprung from a younger branch of the fovereign dakes of Bretagne in France, of the fame name. They were tranfplanted into Normandy before the conqueft, poffeffed of great eftates and power, and invefted with the office of chief butler. Upon the Norman invafion, two of this family came over into England with the Conqueror, from one of which the defcent of the prefent earl of Egmont is deduced by the cleareft and moft indifputable proofs of hiftorians and records.
15. "Azure, on a Chief indented Or, three Spurrevels Gules;" borne by the right hon. Charles Moore, earl of Drogheda, \&c. of the kingdom of Ircland. This noble family, which is of French extraction, came into England foon after the conqueft, and made their firft refidence ith the manor of Moore-court, in the coùnty of Kent.
16. "Ermine, on a Chief indented Azure, three ducal coronets Or ;" borne by the name of Lytton.
17. " Azure, on a Chief Or;three martlets Gules," for the name of Wray; and borne by Sir Cecil Wray, Bart. of Lincoln/hire.
18. "Ermine, on a Chief Gules; five Lozenges of the firft;" borne by the name of Dixin.
19. "Argent, fretty Gules, on a Chief of the fecond, Three Leopard's Faces Or;'' borne by the right hon. Henry Liddel, lord Ravenfworth. This noble lord is defcended from the ancient lords of Liddlecaftle, in the county of Durham, where they have been proprietors of great coal-mines time out of mind.
20. "Ermine, a Chief party per pale Azure and Or; on the dexter the Sun in its fplendor, on the finif. ter a Crofs pattee Gules." The arms of the bihopric of Raphoe, in the kingdom of Ireland.

## Art. II. Of the Pain.

The Pale is an ordinary, confifting of two perpendicular lines drawin from the top to the bafe of the E fcutcheon, and contains the third middle part of the field. Its diminutives are, the pallet, which is the half of the pale; and the endorfe, which is the fourth part of a pale. This ordinary and the pallet may receive any charge, but the endorfe fhould net be charged. The endorfe, befides, is never afed, according to $J$ s

Chap. III.
$\begin{array}{llllllll}H & E & R & A & L & D & \mathbf{Y} .\end{array}$
20. "Azure, en a Pale walled with three pieces on each fide Or, an Endoric Sable;" borne by the name of Sublet de Noyers, 2 family of difinction in France.

Art.iIf. Of the Bend and Bend-sinisier.
$T_{\text {he }}$ Bend is an ordinary formed by two diagonal lines, drawn from the dexter-chief to the finititer-bafe; and contains the fifth part of the field in breadth, if uncharged: but if charged, then the third. Its diminutives are, the bendlet, which is the half of a bend; the coft or cotice, when two of them accompany á bend, which is the fourth part of a bend; and the ribband, the moiety of a coff, or the cight part of the field.

There is alfo the bend-finifter, which is of the fame breadth as the bend, but drawn the contrary way: this is fubdivided into a fcrape, which is the half of the bend, and into a baton, which is the fourth part of the bend, but does not extend itfelf to the extremitics. of the field, there being part of it feen at both ends. See the examples, fig. vii.

Ex. I. "Argenr, a Bend wavy Sable;" borne by the right hon. John Wallop, earl of Portfmouth, \&c. This noble earl is defcended from the Wallops of Hamphire, a Saxon family, who were poffeffed of lands to a confiderable value in the connty at the time of the conqueft.
2. "Checky Or, and Azure, a bend of Ermine;" borne by the right hon. John Ward, vifcount Dudley and Ward, \&c. The anceftors of this noble lord were anciently of the county of Norfolk, of which was Simon Ward, who had large poffeffions in the reign of Edward 1. and was in France and Scotland in the reigns of king Edward II. and III.
3. "Azure, a Bend engrailed Argent, bétween two. Cotices Or;" borne by the right hon. Matthew Fortefcue, lord Fortefcue, as allo by the right hon. Hugh Fortefcue-Aland, baron Fortefcue, in the kingdom of Ireland, this laft nobleman bearing a crefcent in his arms for difference. The family of Fortefcue is, defcended from Sir Richard le Forte, a perfon of extraordinary ftrength and courage, who accompanied William duke of Normandy in his invafion of England; and bearing a ftrong thield before the duke, at the battle of Haftings, had three horfes killed under him, and from that fignal event the name and motto, of the family were aflimed; for the Latin word foutum, or the old French word ef cue "a hield" being added to forte "Atrong," compofe their name; and the motto is, Forte fautum falus ducum.
4. "Sable,, a Bend Argent between two Cotices; indented Or :" borne by the name French.
5. "Paly of fix Or and Sable, a Bend counterchanged ;" borne by the right hon. Frederick Calvert, baron Baltimore. The original of this family is from an ancient and noble houfe of that furname in the earldom of Flanders, whereof Sir George Calvert, knight, among other honourable employments, was fecretary of fate to king James I. by whom he was created a baron, Feb. 20. 1624, and from whom he had a grant: to him, and his heirs, of the province of Maryland and Avalon in America.
6. "Party per Bend creneHe Argent and Gules;" borne by the right hon. Edmund Boyle, earl of Cork and Orrery, \&c. in the kingdom of Ireland. This, noble lord is faid to be defcended from Sir Philip.

Boyle,

## of the

 INnd, \&c.Boyle, a knight of Arragon, who, in the reign of king Henry VI. tilted at a tournament"with Sir Jofeph Aftley, knight of the Garter.
7. "Argent, three Bendlets enhanfed Gules:" as the Englifh exprefs it, but the phrafe enhanfed is ufed by no other nation, The proper blazon of this arm is, Parted per bend, ift hendy of fix gules, and argent; $2 d$ of the laft. Borne by the right bon. William Byron, lord Byron. From Doomfday-book it appears, that this family was poffeffed of numerous manors and lands in the reign of the Conqueror ; and that Sir John Byron, one of his lordfhip's anceftors, attended king Edward III. in his wars in France.
8. "Ermine, a Bend voided Gules ;" borne by the name of Ireton.
9. "Argent three Bendlets wavy Azure;" borne by the name of Wilbrabam.
10. "Bendy of fix pieces of Argent and Azure." Obferve, that when the fhield is filled with an equal number of bendlets of metal and colonr, it is called bendy; but if the number of them is unequal, they are to be blazoned by the name bendlets, and their number fpecified.

Ir. "P Party per Bend Azure and Argent, two Bendlets engrailed counterchanged;" borne by the name of Frenes.
12. "Quarterly, Or and Gules, a Bend over all Vair;'' borne by his grace Lionel Cranfield Sackville, duke of Dorfet and carl of Middlefex, \&c. The anceftors of this family were lords of the town and feigniory of Sackville in Normandy, and came over with the Conqueror when he invaded England in 1066.
13. "Gules on a Bend Argent, three Trefeils nlipped proper;'" borne by the right hon. George William Hervéy, earl of Briftol, \&c. This noble lord derives his pedigree from Robert Fitz-Hervey, a younger fon of Hervey duke of Orleans, who came over from France with William the Conqueror.
14. "Argent, on a bend Gules cotifed Sable, three pairs of Wings conjoined of the firlt;" borne by the right hon. Richard Wingfield, vifcount Powerscourt, in the kingdom of Ireland. This noble lord is denominated from the manor of Wingfield in Suffolk, where they had a feat before the Norman conqueft, called Wingfield-caflle.
15. "Gules on a Bend contre Ermine cotifed Or, three Boars Heads couped Argent ;" borne by the right hon. George Edgcumbe, lord Edgcumbe, \&c. The anceftors of this noble lord received their name from the manor of Edgcumbe in Devonfhire. One of this lord's anceftors was Sir Richard Edgcumbe, who came over to England with the earl of Richmond, having a great hare in the victory he obtained over king Richard III. at Bofworth, by which the earl made his way to the throne of England.
16. "Argent, a Bend finifter Gules."
17. "Or, a Bendlet Gules."
18. "Argent, a Ribband Gules." -The name of this bearing correfponds well with its form, being both long and norrow, which is the flape of a ribband.
19. "Azare, a Scrape Or."-This bearing, as Guillim obferves, is that kind of ornament called now-a-days a Scarf, which is ufed by officers on duty, and ufually worn after the fame manner.

## L D R Y.

20. This contains three Batons. The firft is com- The Fefs pony ermine and azure ; fet over the royal arms, for and liar. his grace William Fitzroy duke of Cleveland. The fecond is compony argent and azure ; fet over the royal arms, for his grace Auguftus Henry Fitzroy, duke of Grafton. The third is gules, charged with three rofes argent, feeded and barbed proper; fet over the royal arms, for his grace George Beauclerk, duke of St Albans. The grandfathers of thefe noble dukes being natural fons of king Charles II, is what entitles them to the royal arms.

## Art. IV. Of the Fess and Bar.

The Fefs is an ordinary which is produced by two parallel lines drawn horizontally acrofs the centre of the field and contains in breadth the third part thereof. Some Englifh writers fay it has no diminutive, for the bar is a diftinct ordinary of itfelf.

The Bar, according to their definition, is formed of two lines, and contains bat the fifth part of the field : which is not the only thing wherein it differs from the fefs; for there may be more than one in an efcut. cheon, placed in different parts thereof, whereas the fefs is limited to the centre-point; but in this the French differ from them. The bar has two diminutives; the barulet, which contains the half of the bar; and the clofet, which is the half of the barulet. When the hield contains a number of bars of metal and colour alternate, of even number, that is called barry of fo many pieces, expreffing their number. See the examples, Plate CCXXIX. fig. viii.
$\mathrm{N}^{\circ} 1$. is "Argent, a Fefs indented Sable;" borne by the right hon. John Weft, earl Delawarr, \&c. This noble family is defcended from the Wefts, a great family in the weft of England; but in the reign of Edward II. they appear to have been feized of ma* nors and lands in the county of Warwick. Sir Thomas de Weft, knight, one of his lordfhip's anceftors, being at the battle of Creffy, and there taking John the French king prifoner, had granted him for that remarkable action, an angmentation to his atchievement, viz. a crampette or, diftinguilhed by the chape of a fword in the middle; the chape being given him by the faid king, as an acknowledgment of his becoming his prifoner : his cognizance was a rofe parted per pale, argent, and gules; which two badges are fill borne in the atchievement of the prefent lord Delawarr.
2. "Argent, a Feís wreathed Azure and Gnles;" borne by the right hon. John Carmichael, earl of Hyndford. Of this ancient family, which is faid to affume their furname from the lands of Carmichael, in the county of Lanark, in Scotland, where they ftill have their chief feat, was Sir John Carmichael, who accompanied Archibald, earl of Douglas, to the affiftance of Charles VI. of France, againft the Enga lifh; and fignalizing his valour at the battle of Baughey in April 1421, and breaking his fpear when the French and Scots got the victory, had thereupon added to his paternal cuat, a dexter arm holding a broken fpear, which is now the creft of the family.
3. "Party per Fefs Or and Argent, a Fefs nebule Gules;" borne by the name of Antefbed.
4. "Party per Fefs indented Or and Azure;" borne by the name of Saunders.

## The Fefs

 and Bar.5. "Checky Or and Az"e on a Fefs Gules, a Crefcent argent for difference;" borne by the risht hon. Hogh Clifined, lord Clifford, of Chudley. This noble lord is defcended from Walter de Clifford, of Clifford Caftle, in the connty of Hereford, who came over iuto England with the Conqueror ; of which family was fair Rofamond, miftrefs to king Henry II.
6. "Argent on a Fefs Azure, rbree Lozenges Or;" bere by the right hon. Bafil Ficlding, earl of Denbigh and Defmond, \&cc. This noble earl is defcended from the earls of Hapforg, in Germany. Geoffroy, earl of Hapfburg, being oppreffed by Rodolph emperor of Gcrmany, came over into England, and one of his fons ferved king Henry IIl. in his wars, whofe anceftors laying claim to the territories of Luffenburg and Rhin-Filding, in Germany, he took the name of Fielding.
7. "Or, on a Fefs Gules, three Fleur-de-1is of the firft; borne by the name of Lemnard. This is in the firft and fourth quarters of the right hon. Thomas Barret Lennard lord Dacre's arms.
8. "Emmine, on a Fefs Gudes, a Lion paffant Or;" borne by the right hon. John Froby, baron Carysfort, $\& \mathrm{c}$. in the kngglom of Ireland.
9. "Sable, a Fefs Ermine, between three Crefcents Or;" borne by the right hon. George-Wiliam Coventry, earl of Coventry, Ec. This noble earl is defcended from John Coventry, a native of the city of Coventry, and afterwards mercer and lord-mayor of London, in the reign of Henry V.; from whom defcended Thomas Coventry, one of the juftices of the court of Common-pleas, in the reign of queen Elizabeth; whofe fon Thomas was recorder of London, and afterwards lord keeper of the great feal in the reign of king Charles I.
10. "Sable, a Fefs checky, Or and Azure, between three Befants;" borne hy the Jight hon. Ridgcway Pitt, carl and baren of Londonderry, \&c. Of this noble family, which werc anciently of Bandfort, in the county of Dorfor, was Thomas Pitt, Efq; who, in the reign of queen Anne, was made governor of fort St George in the Eaft Indics, where he refided many ysars, and purchafed a diamond, which he fold to the king of France for 125,000 . Sterling, weighing 136 carars, and commonly know at this day by the name of Pitt's diamond.
ir. "Or, on a Fefs Sable, between three Mrifo. vy Ducks proper, a Rofe of the Field;" borne by the right hon. John Batcman, vifcount Bateman, \&c. Of rhis noble family, which was anciently feated at Halefbrook, near St Omers in Flanders, was Giles Bateman, Efq; whofe fon was a merchant of London, and was father to Sir James Bateman, knight, who, in 1712, was chofen member of parliament for Ilchefter in the county of Somerfet, and re-chofen in 1713.
11. "Sable, on a Feis Argent, between three Leopards paflant gurdant Or, three kfalops Gules;" bornc by the right hon. Wills Hill, earl of Hillfoorough, \&c. Of this family, which in the reign of queen Elizabeth, were of nute in the county of Downe, was Sir Mofes Eill, who, during O'Neile's rebelliom, was one ot thole grentlemen who abociated under the earl of Effex to fippectsit; and aterwards ferved under Arthur lord Chichefer, lord deputy, and by king James I. was appointed prowof-marhal of the whole province of Ulfic: in Irelad.

Vol, VIII.
13. "Gules, two Bars Or;" borne by tice right The Fefs hon. Simon Harcourt, eral of Harcourt, \&c. This and Bax. noble carl is defcended from the Harcourts of Normandy, who took their name from a place called Harcoit, in that province, where the family ufually refided. Gervaife, count de Harcourt, with his two fons Jeffrey and Arnold, came over with the conqueror, when he invaded England in 1066.
14. "Ermine, two Bars Gules; bonc by the right hon. Thomas Nugent, earl of Wefmeath, and baron Delvin.

I;. "Argent, two Bars indented Sable;" borne by the right hon. Godart Ginkle, earl of Athlone. Godart, who was the firtt earl, was defcended of a very aticient family in the United Provinces of Holland, where he was baron de Reede and Ginkle, ixc. in 1691, he was alieutenant-general of king Willian's forces in Ireland; where in June the fame ycar, he took Ballymore for the Englifh; and, in July following, the Irifh town of Athlone, which latt exploit is one of the greateft recorded in hiftory.
16. "Argent, three bars gemels Gules;" bome by the right hon. Richard Barry, earl of Barrymore, Gc. This noble family, who have been renowned for rheir loyalty and valour, are faid to derive their farname from the ifland of Bary, in the comnty of: Glamorgan, in Wales; and from their riches and eftates have beencalled by the people Barrymore or the Great Barry
17. "Or a Fefs couped Gules, between two Lions patant Sable;" borne by the right hon. Samuel Maham, lord Mafham, \&cc. This noble lord is defcend ed from Sir John Mahham, who flourifhed in the reign of king Henry VI. and was buried at Thornen ham, in the comnty of Suffolk, in 1455 .
18. "Argent, a Lion rampant guardant Gules, debruifed by a Fefs Azure, between three Etoiles iffuing out of as many Crefcents of the fecond;" borne by the right hon. Robert Dillon, earl of Rofommon, \&c. in the kingdom of Ireland. This noble family is derived from Logan, furnamed Dilane, or Delion, which fignifies brave and valiant, to whom the duke of Aquitaine gave his danghter in marriage, in whofe right, after her father's death, he becance prinec and fovercign of Aquitaine, which continued in his poflerity till Henry II. married Alionora, daughter and heir to William V. duke of Aquitaine, and about II 72 obtained that principality by fuperior force; and, to prevent any difturbance, brought Sir Kenry Delion or Dillon, and his brother Thomas, then infants, to England, their father being hain.
19. "Or, two Bars Azure, a Chief quarterly of the fecond and Gules, the ift and $4^{\text {th }}$ charged each with two Fleur-de-lis of France; the $2 d$ and 3 d with a Lion of England; borne by his grace John Manners, duke of Rutland, marquis of Granby, \&ic. This chicf was anciently Gules; and the charge thereon is an honorary augmentation, hhowing his grace's defcent from the blood-royal of king Edrard iv.
20. "Barry of ten pieces Argent and Azure, over all fix Efcutcheons; 3,2, 1, fible, eachi charged with a Lion rampant of the firft, armed, and langued Gules, a Crefcent for difference;" borne by the ritht hon. James Cecil, earl of Salifoury. \&c. This noble earl is defcended from the famous Whitaan Crour lord Burleigh, ffatefman in the reign of Edward VI. $3 K$
and

Of the and Elizabeth. This great man left two fons, ThoChaveron. $\rightarrow-$ mas and Robert, who were both made earls in one day, May 4. 1603. Robert, the younger fon, anceftor of the prefent noble lord, was created earl of Salifbury in the morning; and Thomas, the eldeft, earl of Exeter in the afternoon.

## Art. V. Of the Cheveron.

The Cheveron, which reprefents two rafters of a houfe well jointed together, or a pair of compafles half open, takes up the fifth part of the field with the Englifh, but the French give it the third. Its diminutives are, The chseveronel, which contains the half of a cheveron; and the couple-clofe, which is the half of a cheveronel, that is, its breadth is but the fourth pare of a cheveron. Leigh obferves, that this laft diminutive is never borne butin pairs, or with a cheveron berween two of them. The French have but one diminution of this ordinary called Etaye containing the third part of its breadth.

Examples of Cheverons are given in fig. ix. viz.
Plate CCXXIX I. "Argent, a Cheveron Gules between three Torteanx;" borne by the right hon. Bennet Sherrard, earl of Harborough, \&c. This noble earl is lineally defcended from scherard, who was poffeffed of manors and lands to a great value in the counties of Cheflire and Lancafhire in the reign of Willian the Conqueror. Geoffroy, another of this earl's anceftors, was three times fheriff of Rutlandhire, in the reigns of king Edward IV. and king Richard III.
2. "Sable, a Cheveron between three Etailes Argent;" borne by the right hon. Marmaduke Langdale, lord Langdale. This noble lord is defcended from the Langdales of Yorkhire, who refided at the town of Langdale, from whence they took their name, in the reign of king John; but his anceftor, who makes the grea:eft figure in hiftory, is Sir Marmaduke Langdale who raifed forces in the north of England in defence of king Charles I. was victorious in numberlefs battles and fieges; and when his najefty, by the united forces of England and Scotland, was at length overpowered, he attended king Charles II. in his exile, and returned to England with his majefty at the reftoration.
3. "Sable, a Cheveron between three Leopards Heads Or ;" borne by the right hon. William Wentworth, earl of Strafford, \&c. All genealogifts agree, that the name of Wentworth is of Saxon original, and taken from the manor of Wentworth in Yorkihire, where, in the reign of William the Conqueror, lived Reginald de Wenteworde, as it is fpelt in doomfdaybook.
4. "Argent, a Cheveron between three Griffons paffant Sable, a Crefcent for difference;' borne by the right hon. Heneage Finch, earl of Ailesford, \&c. This family is defcended from Herbert FitzHerbert, earl of Pembroke, and chamberlain to king Henry I. They took the name of Finch in the reign of king Edward I. One of the anceftors of the prefent earl was the right hon. Heneage Finch, earl of Nottingham, who was conftituted lord high-chancellor of England in 1675 ; and lord high-fteward on the trials of Philip earl of Pembroke, and William vifcount Stafford, in 1680.
5. "Azure, a Cheveron Ermine, between threc

L D R Y.
Chap. III.
Efcalops Argent;' borne by the right hon. Gcorge of the Townihend, vifcount Townhend, \&c. This family cheveron. is of Norman extraction, and came into England about the time of the conqueft. Charles, lord vifcount Townfhend, grandfather of the prefent vifcount, was appointed principal fecretary of fate in the reign of king George 1. in 1720, and continined fo to the end of his majefty's reign; when, upon religning the feals, they were retumed to him again by his late majefty king George II. who continued him in that honourable office to the year 1730 .
6. "Azure, a Cheveron between three Mullets Or;" borne by the right hon. John Chetwind, vil. count Chetwind, \&c. of the kingdom of Ireland. Of this family, which hath been of great antiquity in the county of Salop, taking their furname from Chetwynd in that county, was Adam de Chetwynd, who married Agnes daughter of John lord Lovel, baron of Dockinges, and lord of Minfter Lovel in Oxford hire; and by her had iffue Sir Johin de Chetwynd, who, in the 37th of Henry III. had a charter of free-warren, thro' all his demefine in the connties of Salop, Stafford, and Warwick.
7. "Argent, a Cheveron Gules, between three fquare Buckles Sable;" borne by the right hon. Matthew Ducie-Morton, lord Ducie, \&c. This noble lord is defcended from the Ducies in Normandy. After they came into England, king Eaward I. conferred on them the lordfiip of Morton in Staffordfhire, and feveral other lordfips and manors, which the family enjoyed for many years. Sir Robert Dacie, one of his lordinip's anceftors, was lord-mayor of London in the reign of king Charles I. and though he lent his majefty L. 80,000 , which was loft by the king's being driven out of London, he died, however, worth L. 400,000 .
8. 'A Argent, a Cheveron Checky Gules, and of the Field, between three Bugle-horns ftrung Sable, garnifhed of the fecond;" borne by the right hon. lord Hugh Semple, lord Semple. The principal family of this name was Semple of Elliotfon in Renfrew, where they had large peffeflions and offices, as ftewards and bailiffs under the family of Stewart, proprietors of that county before they came to the crown. The firft lord Semple was Sir Robert, who, being much in favour with king James IV. was by him created lord Semple in $14^{8} 9$.
9. "Argent, a Cheveron engrailed between three Lions paffani Sable;" borne by the right hon. and the reverend Philip Smithe, vifcount Strangford. One of this lord's anceftor's was John Smithe, Eff; who acquired a confiderable eftate whilft he was farmer of the cuftoms in the reign of Henry VIII. He left two fons, John and Sir Thomas; which laft was fent ambaffador by king James I. to the emprefs of Ruffa.
10. "Quarterly Argent and Azure, a Cheveron engrailed counter-changed; borne by the name of Chamber.
11. "Party per Cheveron engrailed Gules and Argent, three Talbots Heads erafed counter-changed;" borne by the right hon. Anthony Duncombe, lord Feverfham, \&c. His lordhip is defcended from the Duncembes of Barley-end in Buckinghamfhire. Sir Charles Duncombe, uncle to the prefent lord, was lord-mayor of London in 1709 ; and this nobleman was
created

## Chap. III.

knight of the garter in 1726, and created carl of Orford, F ebruary 9. 1741-2.
19. "Azure; three Cheveronels interlaced Or, and a Chief of the laft;" borne by the name of Fitz. Hugh.
20. "Argent, three Cheveroncls Gules, in Chiefa Label Azure ;" borne by the right hon. William Wildman Barrington, vifcount Barrington, \&c. This family is of Norman extraction ; in which dutchy, whilft it continued annexed to the Englifh crown, there were to be feen the remains of a cafle bearing the name of Chute or Shute, and formerly in the family, with other monuments in feveral towns of that duchy. John Shute, the late vifcount Barrington, was in 1708 made a commiffioner of the cuftoms, and fucceeded to the eftates of Francis Barrington, Efq ; and of John Wildman of the country of Berks, who made him their heir; and, in purfuance of the will of the furmer, he took the name and arms of Barrington. On June ir. 1720, he was created vifcount Barrington.

## Art. VI. Of the Cross.

The $C_{r o f}$ is an ordinary formed by the meeting of two perpendicular with two horizontal lines in the fefs-point, where they make four right-angles; the lines are not drawn throughout, but difcontinued the breadth of the ordinary, which takes up only the fifth part of the field when not charged; but if charged, then the third. It is borne as well engrailed, indented, \&c. as plain.
There is fo great a variety of croffes ufed in ineraldry, that it would be a very difficult tafk to treat of them all. Guillim has mentipned 39 different forts; Dela Columbiere, 72 ; Leigh, 46 ; and Upton declares he dares not afcertain all the various crofes borne in arms, for that they are almoft innumerable: therefore, as all their forms cannot be cxpected here, we will only take iutice of fuch as are moft commonly feen at prefent in coats-of-arms. See Fig. x.
The firft is " Quarterly, Ermine and Azure, a Crofs Or:" borne by his arace Thomas Oforne ate Crofs Or,", \&orne by his grace Thomas Ofborne duke cexxix-
of Leeds, \&\&. This noble dake is defcended from the honourable family of the Ofbornes of Afhford, in the county of Kent; Sir Thomas Ofborne, the grandfather to the prefent duke, was advanced to the peerage by King Charles II.
2. " Gules, a Crofs engrailed Argent, a Lozenge in the dexter-chief of the fecond;" borne by theright hon. Edward Leigh, lord Leigh. This family took their furname from the town of High-Leigh in Cheflire, where they refided before the Norman conquef. Sir Thomas Leigh, the firft lord of this family, was created baron Leigh of Stonely, by king Charles I. on July. I. 1643.
3. "Gules, a Crofs Argent fretty Azure ;" borne by the right hon. Nicholas Taaffe, vifcount Taaffe, of Corran, \&c. in Ireland. Of this noble and ancient family was Richard Taffe, who lived in 1282 ; as in r 306 did John Taaffe, who was archbihop of Armagh; and, in 1479 , the order of the Garter being eftablihed in Ireland, Sir Nicholas Taaffe was one of the firft members ; and. John, his fon and heir, was created a baron and vifcount by Charles I. Auguft .
12. "Paly of fix, Argent and Gules, on a Cheveron Azure, three Crofs-croflets Or ;" borne by the name of Carpenter, baron Carpenter, of Killaghy in Ireland. This anoient and noble family are of great antiquity in the county of Hereford, and have been lords of the manor of the Home in the parifl of Delwyn, near the Weobly, for above 300 years. George, the firft lord Carpenter, was fo created May 4. 1719.
13. "Azure, on a cheveron Or, between three Befants, a Bay Leaf Proper ;" borne by the right hon. James Hope, earl of Hopeton, \&c. This noble family is defcended from Henry Hope, a native of Holland, who, about two centuries ago, came over and fettled in Scotland. Charles Hope, Efq ; grandfather of the prefent earl, was created an earl by queen Anne, April 15. 1703.
14. "Vert, on a Cheveron between three Unicorns Heads erafed Argent, horned and manned Or, three Mullets Sable;" borne by the name of Ker, being the ift and 4th quarters in the arms of his grace John Ker, duke of Roxburgh, \&c. This ancient family is faid to come from Normandy. John Ker, marquis of Beaumont and Cesford, the firft duke of Roxburgh, was fo created April 27. 1707.
15. "Azure, on a cheveron Or, between three Bears heads couped Argent, muzzled Gules, a Roebuck's head erafed, between two Hands holding Daggers all proper ;" borne by the right hon. Donald Mackay, lord Reay. This family is faid to derive their defcent from Alexander, a younger fon of Ochonacker, who, about the end of the twelfth century, came from Ireland; and the fourth in defcent from him was Donald of Strathnavern, whofe fon was named $Y$ Miore : and from him began the furname of Mac Y, Mackie, or Mackay. Donald, the firft lord of this family, was created baronet in 1625 , and on June 20. 1628, was created baron Reay of the county of Caithnefs, by Charles I.
16. "Ermine, on a Cheveron Azure, three Foxes Heads erafed Or, and in a Canton of the fecond a Fleur-de-lis of the third;" borne by the right hon. Stephen Fox earl of Ilchefter, \&c. Of the family of Fox there have been many perfons of note living in the counties of Dorfet, Somerfet, Wilts, and Hatits, particularly Richard Fox, bifhop of Winchefter. His lordhip was createdlord Ilchefter and baroń Strangeways, May ir. 1741, i4 Geo. II. and earl of Ilchefter in June 1756 .
17. "Or, two Cheveronels Gules;" borthe by the right hon. John Monfon, lord Monfon. This nuble lord is defcended from John Monfon, who flourihed in the reign of king Edward III. from whom defcended another John, who attended king Henry V. in his wars in France. Sir John Monfon, bart. father of the prefent lord, was created lord Monfon, May 28. 1728.
18. "Or, on a Fels, between two Cheveronels Sable, three Crofs-crollets of the firft;" borne by the right hon. George Walpole, earl of Orford, \&c. This family took their na e from Walpole in Norfolk, where they refided before the conqueft. Sir Robert Walpole was, in king George II.'s reign, elected
1628.

$$
3 K_{2} \quad 4 . " \text { Sable, }
$$

"Sable, a Crof ramly Or;" bome by the name the Crofs. of Sturvay.
5. "Argent, on a Crofs Sable, a Leopard's face Or;" borne by his orrace Henry Brydges duke of Chandos, \&c. The anceftors of this noble family taok their name from the city of Bruges in Flanders; and one of them came over wih William the Conqueror, and"had a confiderable hare in the viSory obtained near Haftings in Suifex, 1066 . James, the father of the prefent dake, was created vifcomnt Wilton and earl of Cacrnarvon, OEtober 19.1714; and marquis of Caernarvon and duke of Chandos,--30. r 719.
6. "Or, on a Crofs Sable, a patriarchal Crofs of the Field ;" borne liy the right hon. Thomas Vefey, baron of Knapton in the ki-2rdom of Ircland. The truly noble family of Vefcey or Vefey, derives its origin from Charles the Great, king offrance, and emperor of the weft, who died at Aix-la-Chapelle in Germany, Jan. 28.814. His lordhip's father was created a peer April 10.1750.
7. " Argent, on a Crofs Gules, five Efcalops Or;" borne by the right hon. William Villiers earl of Jer--fey, \&c. This noble earl is defcended irom the family ot Villiersin Normandy, fome of whom came over to England with the Conqueror ; Cevaral manors and lands in England being foon after granted to Pagan de Villiers, one of this earl's anceftors. ## Art. ViI. Of the Saltier.

$T_{\text {He }}$ Saltier, which is formed by the bend and bendfinifter croffing each other in right angles, as the interfecting of the pale and fefs forms the crofs, contains the fifth part of the field; but if charged, then the third. In Scotland, this ordinary is frequently called a St Audrew's crofs. It may like the others, be borne engrailed, wavy, \&c. as alfo between chatges or charged with zuy thing. See examples fig. xi.

Chap. III.
$\mathrm{N}^{\circ} \mathrm{r}$. is "Argent, a Salticr Cules;" bome by his
of the Saltier.

Plate
CCXXIX. grace James Fitz-Gerald, duke of Lcincefter, \&c. This noble lord is defeended from Otho, on Other, a rich and powerful lord in the time of king Alfred, defcended from the dukes of Tufcany; who priling from Florence into Normandy, and thence into Tighnd, there the family flourifhed, until Richard Strongbow, carl of Pembroke, their kinfman, engaged them to partahe inhis expedition to Ircland, in which Mausice ritc-Gerald embarked, and was one of the prin, cipal conquerors of that kingdom, tbr which tee was revarded with a great eftate in lands in the province of Lcinfter, and particularly the barony of Otraley, and the caftle of Wicklow ; and died, covered with honours, in the year ir 77, 24 Henry II.
2. "Gules, a Salticr Argent, between twelve Crofs crotlets Or ;" borne by the right hon. Other-Lewis Windfor Hickman, earl of Plynouth, \&c. This noble earl is defcended from Robert Fitz-Hickman, lord of the manor of Bloxtian, Oxfordfhire, in the 56 Hen . IIl 1272; and he is maternally defcended from the noble family of the Windfors, who were barons of the :ealm at the time of the conqueft.
3. "Vert, a Salcier wavy Emine;" borne by the name of Wakeman of Hock ford, in Gloncefterthire.
4. "Ermine, a Saltier counter-compony Or and Gules;" borne by the name of Uimnftone.
5. "Argent, a Saltier Azure with a Eezant in the centre;" horne by the right hon. Philip Yorke, earl of Hardwicke, \&c. He was in October 1733 conftituted lord chief-juftice of the king's bench, and November 23. in the fame year, created baron Hardwicke of Hardwicke.
6. "Argent on a Saltier Gules an Efcalop Or ;" the arms of the bifhoprick of Rochefter-This diocefe, the leaft in England, comprehends only a fmall part of Kent, in which there are 150 churches and chapels; and the two parifhes in Hellam in Cambridgethire, and Frekenham in Suffolk. It has only one archdeacon, that of Rochefter. For many years it was in the immediate patronage of the archbilhop of Canterbury.
7. "Party per Salticr, Azure and Argent, on a Salticr Gules, a Crefcent of the fecond for difference;" quartered by the right hon. William Hall Gage, vifcount Gage, of Caftle-Inland in Ireland. This noble family is of Norman extraction, and derives defcent from de Gaga or Gage, who attended William I. in his expedition to England; and, after the conqueft thereof, was rewarded with large grants of lands in the foreft of Dean, and county of Gloncefter, near which foreft he fixed his refidence, by building a feat at Clerenwell, in the fame place where the houfe of Gage now ftands: he alfo built a great houfe in the town of Cirencefter, at which place he died, and was buried in the abbey there. Sir Thomas Gage, the eighth baronet, was created baron of Caftle-Bar, and vifcount Gage, 172 I .
8. "Gules, on a Saltier Argent, a Rofe of the firft barbed and feeded proper;" borne by the right hon. George Neville, lord Abergavenny, premier baron of England.
9. "Or, on a Saltier Azure, nine Lozenges of the firft;" the paternal arms of the right hon. John Dalrymple, earl of Stair, \&c. Of this family, which rook their furname from the bareny of Dalrymple, ly-
ing on the riser Dun in Ayrfhire, Scoliand, wae Adam de Dalrymple, who lived in the reignol Alexander III. 1o. "Argent, on a Saltier engreiled Sabic, nine Annulets Or;" borne by the name of $L$ eak.
II. "Gules, a Saltier betwe forar Crefocme Or:" borne as the fecond and third quarters in the cont ofarms of the right l:onourable Charles Kinmard, lord Kinnaird. George Kinnaird, Efq; one of the prefent lords's ancehors, being of great ferrice to king Charles II. during the ufurpation of Oliver Crunned, he was by that prince, at his reftoration, mate one of the privy council: and December 28.1682, created a baron.
12. "Argent, a Salcier engrailed betwecn four Ro. fes Gules," for Lemnox ; and borne at firft and fourth quarters in the coat-of-arms of the right hon. Francis Napicr, lord Nafier. This family is faid to be defcended from the ancient thanes or ftewards of Leninox in Scolland, but took their furname of Napier from the following event. King David II. in his tars with the Englifh, about the year 1344, convocating his fubjects to battle, the earl of Lemox fent his fecond fon Donald, with fuch forces as his duty obluged him ; and, coming to an engagement, where the Scots gave ground, this Donald, taking his father's ftandard from the bearer, and valiantly charging the enemy with the Lennox men, the fortune of the battle changed, and they obtained the victory; whereupon cvery one advancing, and reporting their acts, as the cuftom was, the king declared they had all behaved valiantly, but that there was one among them who had na pier, that is, no equal; upon which the faid Donald took the name of Napier, and had, in reward for his good fervices, the lands of Gosfield, and other eftates in the county of Fife.
13. "Gules, a Saltier Or, furmounted of another Vert," for the name of Audrews; and borne by sir William Andrews, bart. of Denton in Northamptonhire, who is defcended from Sir Robert Andrews of Normandy, knight, who came into England with William the Conqueror. Sir William Andrews, the firft baronet of this family, was created December II. 1641.
14. "Azure, a Saltier quarterly quartered Or and Argent." The arms of the epifcopal fee of Bath and Wells.-The diocefe of Bath and Wells contains all Somerfethire, except a few churches in Britol. And in it there are three archdeaconries, viz. thofe of Wells, Bath, and Taunton. The namber of parifhes is 388 , though, according to fome, the total number of the churches and chapels amounts to 503 :
15. "Party per Saltier Argent and Gules, a Saltier counter-changed."
16. "Party per Pale indented Argent and Sable, a Saltict counter-changed;" borne by the name of Scote.
17. "A Argent, three Saltiers coaped and engrailed Sable;" borne by the name ef Benton.
18. "Argent, a Saltier Gules, and a Chief Ermine;" borne by the right hon. Francis Thomas Fitzmaurice, earl of Kerry, ac. This very ancient and noble family is a brancly of the family of Kildare, who are originally defecnded from the great duke of Tufcany, and of which was Otho, a noble baron of Italy, whofe fon Walter, attending the Norman conqueror

Sub- into England, was made conftable of the caftle of $\underbrace{\text { Ordinaries. Windfor. Raymond, one of the prefent earl's ancef- }}$ tors, had a principal hand in the reduction of Ireland to the fubjection of Henry II. and Dermoid MacCarty, king of Cork, fought his aid againft his fon Cormac'O'Lehanagh, which he undertook, and delivered the king from his rebellious fon; for which that prince rewarded him with a large tract of land in the county of Kerry, where he fettled his fon Maurice, who gave his name to the county, which he called Clant Maurice, and is enjoyed by the prefent earl of Kerry, who is vifcount Clan Maurice. Thomas the firf earl, and father of the laft, was the 2nft lord Kerry, who was created earl, January 17. 1722.
19. "Sable, a Saltier Argent, on a Chief Azure, three Fleurs-de-lis Or;" borne by the right hon. John Fitz-Patrick, earl of Upper Offory, and baron of Gowran in Ireland. This moft ancient and princely famiily is defcended from Heremon, the firtt monarch of the Milefian race in Ireland; and after they had affumed the furname of Fitz-Patrick, they were for many ages kings of Offory, in the province of Leinfter. John, the firft earl of this family, fucceeded his father Richard, as lord Gowran, June 9. 1727, was created earl October 5. 1751, and died 1758.
20. "Party per Pale Argent and Gules, three Saltiers counter-changed;" borne by the name of Lane. Thefe arms are allo borne, without the leaft alteration, by the name of Kingfman; for which fimilitude we can no otherwife account, than by fuppofing there has been fome miftake made through many tranferiptions.

## Sect. II. Of Sub-Ordinaries.

Besides the honourable ordinaries and the diminutions already mentioned, there are other heraldric figures called fub-ordinaries, or ordinaries only, which, by reafon of their ancient ufe in arms, are of worthy bearing, viz. The Gyron, Franc-quarter, Canton, Pairle, Fret, Pile, Orle, Inefcutcheon, Treffure, Annulet, Flanches, Flafques, Voiders, Billet, Lozenge, Gutts, Fufil, Ruftre, Mafcle, Papillone, and Diaper. See Plate CCXXVII. fig. i. (A.)

The Gyron is a triangular figure formed by two lines, one drawn diagonally from one of the four angles to the centre of the hield, and the other is drawn either horizontal or perpendicular, from one of the fides of the fhield, meeting the other line at the centre of the field.

Gyronny is faid, when the field is covered with fix, eight, ten, or twelve gyrons in a coat-of-arms: but a French author would have the true gyronny to conifit of eight pieces only, as in the fig. which reprefents the coat-of-arms of Flora Campbell countefs of Loudon, $\& c$. whofe anceftor was created baron of Loudon in 1604 by James VI. and earl of the fame place, May 12 . 1633 , the 9 th of Charles I.

The Franc-quarter is a fquare figure, which occupies the upper dexter quarter of the fhield. It is but rarely carried as a clarge. Silveftra Petra Sancta has given us a few inftances of its ufe.

The Canton is a fquare part of the efcutcheon, fomewhat lefs than the quarter, but without any fixed proportion. It reprefents the banner that was given to ancient knights-bannerets, and generally fpeaking, poffefles the dexter-chief-point of the fhield, as in the
fig. ; but fhould it poifefs the finifter corner, which is subbut feldom, it muft be blazoned a canton-finifter. Ordinaries.

James Coats reckons it as one of the nine honourable ordinaries, contrary to mont heralds opinion. It is added to coats-of-arms of military men as an angmentation of honour : thus John Churchill, baron of Eyemouth in Scotland, and one of the anceftors of the prefent duke of Marlborougl, being lieutenant general to king James II. received from him a canton argent, charged with the red crofs of England, added to his paternal coat, " which is Sable, a lion rampant Argent."
The Fret is a figure formed by the conjunction of the upper half of the faltier with the under half of the pale.
The pairle is a figure reprefenting two little fticks, in faltier, with a mafcle in the centre interlaced. J. Gibbon terms it the heralds trae-lovers knot; but many diffent from his opinion.
Fretty is faid, when the field or bearings.are covered with a fret of fix, eight, or more pieces, as in the fig. The word fretty may be ufed without addition, when it is of eight pieces; but if there be lefs than that number, they muft be fpecified.
The pile, wliich confifts of two lines, terminating in a point, is formed like a wedge, and is borne cagrailed, wayy, \&c. as in the fig: It iffues in general from the chief, and extends towards the bafe; yet there are fome piles borne in bend, and tffuing from other parts of the field, as may be feen in Plate CCXXX. fig. xii. $\mathrm{n}^{0}{ }^{1} 2$. \& c.

The Orle is an ordinary compofed of two lines going round the fhield, the fame as the bordure, but its breadth is but one half of the latter, and at fome diftance from the brim of the flield, as in the fig.
The Inefcutcheon is a little efcutchcon borne within the frield; which, according to Guillim's opinion, is only to be fo called when it is borne fingle in the fefs-point or centre ; fee the fig. on Plate CCXXVII. but modern heralds, with more propriety give the name of inefoitcheon to fuch as are contained in Plate CCXXX. fig. xii. $1^{\circ} 2$. and call that which is fixed on the fefs-point efoutcheon of pretence, which is to contain the arms of a wife that is an heirefs, as mentioned above.
The Trifure is an ordinary commonly fuppofed to be the half of the breadth of an orle, and is generally borne flowery and counter-flowery, as it is alfo very often double, and fomerimes treble. See the fig. (Plate CCXXVII.). This double treffure makes part of the arms of Scotland, as marflazled in the royal atchievement, Plate CCXXXil. fig. xxi. no ${ }^{7}$. and was granted to the Scots kings by Charlemagne, being then emperor and king of France, when lie entered into a league with Achaius king of Scotland, to fhow that the French lilies fhould defend and guard the Scottifh lion.

The Annulet, or ring, is a well-known figure, and is frequently to be found in arms through every king Plate dom in Europe.

The Flanches are formed by two curved lines, or femicircles, being always borne double. See the figure. C. Leigh obferves, that on two fuch Flanches two fundry coats may be borne.

The Ordinarics. circular lines do not go fo near the centre of the field; (fee the figure.) J. Gibbon would have thefe two ordinaries to be both one, and wrote flakk; alleging, that the two other names are but a corruption of this laft ; but as G. Leigh and J. Guillim make them two diftinct and fubordinate ordinarics, we have inferted them here as fuch.

The Voiders are by Guillim confidered as a fubordinate ordinary, and are not unlike the flafques (fee the figure), but they occupy lefs of the field.

The Billet is an oblong fquare figure, twice as long as broad. Some heralds imagine that they reprefent bricks for building; others more properly confider them as reprefenting folded paper or letters.

The Lozenge is ordinary of four and equal parallel fides, but not rectangular; two of its oppofite angles being acnte, and the other two obtufe. Its Shape is the fame with thofe of our window-glaffes, before the fquare came fo much in fafhion. See the fgure.

Gutts or drops, are round at bottom, waved on the fides, and terminate at the top in points. Heralds have given them different names according to their different tinctures: thus, if they are.
$\left.\begin{array}{l}\text { Yellow } \\ \text { White } \\ \text { Red } \\ \text { Blue } \\ \text { Green } \\ \text { Black }\end{array}\right\}$ they are called $\left\{\begin{array}{l}d^{\prime} \text { Or } \\ d^{\prime} \text { Eaut } \\ d e \text { Sang } \\ \text { de Larmes } \\ \text { de Vert } \\ \text { de poix }\end{array}\right.$

The Fufil is longer than the lozenge, having its upper and lower part more acute and harp than the other two collateral middle parts, whichacutenefs is occafioned by the fhort diftance of the fpace between the two collateral angles; which fpace, if the futil is rightly made, is always thorter than any of the four equal geomerrical lines whereof it is compofed. See the fig. ibid.

The ruftre is a lozenge pjerced romen in the middle (fee the figure). They are called by the Germans rutten. Meneftrier givesan example of them in the arms of Lebaret in France, argent three ruftres azure.

The Mafcle is pretty mach like a lozenge, but voided or perforated throughits whole extent, fhowing a narrow border, as in the figure. Authors are divided about its refemblance: fome taking it for the mafh of a net, and others for the fpots of certain flints found about Rohan; and as no writer has given a clearer account in fupport of this laft opinion than Colombiere author of La Science Heraldique, we fhall tranfcribe it for the fatisfaction of the curious.
"Rohan (fay's he) bears Gules, nine Mafcles Or 3, 3, 3. Opinions have varied very much about the originalof the mafcles or mathes as being fomewhat like the mafhes of nets: but for my own part, having. often obferved that thofe things which are remarkable and fingular in fome countries, have fometimes occafioned the lords thereof to reprefent them in their efutcheons, and to take them for their arms, I am of opinion, that the lords of Rohan, who I believe, are the firft that bore the fe figures in their arms, tho' defcended from the ancient kings and princes of Bretagne, took them, becaufe in the moft ancient vifcounty of Rolian, afterwards erected into a dutchy, there are
abundance of ftrong fints, which being cut in two, Subthis figure appears on the infide of them; as alfo the Ordinarics. carps, which are in the filh-ponds of that duchy, bave the fame mark upon their fcales: which being very extraordinary and peculiar to that country, the ancient lords of the fame had good reafon, upon obferving that wonder, to take thofe figures for their arms, and to tranfinit them to their pofterity, giving them the name of macles, from the Latin word macula, fignifying a foot; whence fome of that houfe have taken for their motto, Sine macula macla, that is, A mafcle without a fpot."

Papillone is an expreflion ufed for a field or charge that is covered with figures like the fcales of a fifh. Monf. Baron gives as an example of it the arms of Monti Gueules Papelone d'Argent. The proper term for it in Englifh wonld be fallop-work.

Diapering is faidof a field or charge fhadowed with flourifhings or foliage with a colour a little darker than that on which it is wrought. The Germans frequently ufe it; but it does not enter into the blazoning or defcription of an arms, it only ferves to embellifh the coat.

If the fore mentioned ordinaries have any attributes, that is, if they are engrailed, indented, wavy, \&c. they muft be diftinctly fpecified, after the fame manner as the honourahle ordinaries.
See examples of fubordinaries, \&c. fig. xii.
i. "Gules, an Orle Ermine;" borne by the name of Humframville.

Plate.
2. "Argent, three Inefcutclieons Gules;" borne by the name of Hay, and the ad and 3 d quarters in the coat-of-arms of the right hon. Thomas Hay, earl of Kinnoul, \&c.-The firft of the name of Hay that bore thefe arms, got them, as Mr Nifbet obferves, becaufe he and his two fons, after having defeated a party of the Danes at the battle of Loncarty, anno 942, were brought to the king with their hields all ftained with blood.
3. "Argent, a Fret Sable ;" born by the right lron. Lionel Talmifh, earl of Dyfart, \&c. This family was advanced to the peerage by King Charles I. in 1646 .
4. "Or, fretty of Gules, a canton Ermine," borne by the right hon. Henry Noel, earl of Gainforough, $\& c$. This nobleman is defcended from - Noel who came into England with William the Conqueror, and in confideration of his fervices, obtained a grant of feveral manors and lands of very great value. Sir Edward, who was knighted by King James on his acceffion to the throne, and created a baronet June 29 , 1611, was the firft advanced to the honour of baron Noel, March 23. 1616.
5. "Girony of eight Pieces or and Sable;" the Ift and 4th quarters of the coat-of-arms of the right hon. John Campbell, earl of Breadalbane, \&c. This ancient and noble family is defcended, in a regnlar fucceffion, from Duncan the firft Lord Campbell, anceftor of the family of Argyle. John, the firft earl, in confideration of his perfonal merit, was, from a baronet, created lord Campbell, vifcount Glenorchie, and earl of Breadalbane, Jan. 28. 1677, by Charles.II,
6. "Lozengy.Argent and Gules;") borne by the right hon. George Fitz-William, earl Fitz-William, \&c. This noble earl is defcended from Sir William

SubOrdinarics.

Fitz-Wiliam, marfhal of the army of William the Conqueror at the battle of Haftings in Suflex, by which victory that prince made his way to the throne.
7. "S Sable, a Mafcle within a Treffure flowery Argent;'" borne by the name of Hoblethorne.
8. "Gules, three Mullets Or, within a Bordure of the latter, charged with a donble Treffure flowery and counter-flowery with Fleurs-de-lis of the firft;" borne by the noble family of Sutherland, \&c. This family in the peerage, is anongtt the ofdeft in Britain, if not in all Europe; the title of earlbeing conferred on one of their anceftors in 1067.
9. "A Azure, a Pile Ermine," fo: the name of Wyche ; and is quartered as firft and fouth in the coat-of-arms of Sir Cyril Wyche, bart.
ro. " Or, on a Pile engrailed Azure, three Crofscroflets fitchy of the firft;" borne by the name of Rigdun.
ir. " Or, on a Pile Gnles three Lions of England between fix Fleurs-de-lis Azure ;" the firft and tourth quarters of his grace Edward Seymont, duke of Somerfet, \&c. granted him by King Henry VIII, on his marriage with the lady Jane Seymour.
12. "Ermine, two Piles iffing from the dexter and finifter fides, and meeting in bafe Sable;" for the name of Holles.
13. "Argent, three Piles, one iffuing from the Chief between the others reverfed, Sable;" for the nane of Hulje, and borne by Sir Edward Hulfe, bart. r4. "Azure, a Pile wavy bendways Or;" borne by the name of Aldham.-There is no mention made of its iffuing out of the dexter-corner of the efcutcheon, for this is fufficiently determined by the term bendways.
15. "Or, three Piles in Bend, each point enfigned with a Fleur-de-lis Sable:'" borne by the name of Norton.
16. "A Argent, three Piles mecting near tine point of the Bafe Azure;" borne by the name of Bryan.
17. "Party per Pale and per Bend Or and Azare counterchanged;" borne by the name of 70 bnfon.Tits bearing is equal to two gyrons; fee p. 454. col. 1 .
13. "Party per Pale and per Cheveron Argent and Gules counterchanged.'
19. "' Party per Pale chappé Or and Vert couniscilanged." This is a bearing feldom to be met with.
20. " Party per Fefs Gules and Argent, a Pale comterchanged;' borne by the name of Lavider.
Sect. Ill. Of Cormion $C_{\text {Hif }}$ Ges borne ian Coats-of-arms.
It has been already obferved, that in all ages men have made ufe of the reprefentation of living creatures and other fymbolical figns to diftinguinh themfelves in war; and thefe marks, which were promifcuonly ufed for hieroglyphics, emblems, and perfonal devices, save the firft notion of heraldry. But nothing Ghows the extent of human wit more than the great vaitety of thefe marks of diftinction, lince they are compofed of all forts of figures, fome natural, orthers artificial, and many chimerical ; in alluGon, it is to be fupppofed, to the ftate, quality, or inclination of the bearer.
$L \quad D \quad R \quad Y$.

## Chap. III.

Hence is is that the fun, moon, ftars, comcts, me- Natural teors, \&c. have been introdaced to denote glory, gran- Figures. deur, power, \&c. Lions, leopards, tygers, ferpents, ftags, \&c. have been employed to fignify courage, flrength, prudence, fwiftnefs, \&c.

The application to certain exercifes, fuch as war, hunting, mulic, \&c. Was fumifhed lances, fwords, pikes, arms, fiddles, \&c. Architecture, columns, cheverons, \&c.; and the other arts feveral things that relate to them.
Human bodies, or diftinct parts of them, alfo clothes and ornaments, have for fome particular intention, found place in armory; trecs, plants, fruits, and flowers, have likewife been admitted to denote the rarities, advantages, and fingularities, of different countries.

The relation of fome creatures, figures, \&c. to particular names, has been likewife a very fruitful fource of variety in arms. Thus the family of Conningfoy bears three coneys; of Arundel, fix fwallows; of Urfon a bear; of Lucie, three pikes, in Latin tres lecios pifcss; of Starkey, a ftork; of Caftleman, a caftle, triple-tos ered ; of Shutlleworth, three weaver's fhurtles, \&c.
Befides thefe natural and artificial figures, there are chimerical or imaginary ones ufed in heraldry, therefult of fancy and caprice; fuch as centaurs, hydras, phenixes, griffons, dragons, \&c. Which great variety of figures fhows the impolfibility of comprehending all common charges in a work of this nature : therefore fuch only flall be treated of as are moft frequently borne in coats-of-arms.
Art. I. Of Natural Figures borne in coats-of-arms.
Among the multitude of natural things which are ufed in coats-of-armis, thofe moft ufually borne are, for the fake of brevity as well as perfpicuity, difiributed into the following clafes, viz.

Celeftial fgures; as the fun, moon, ftars, \&c. aid their parts.
Effigies of men; women, \&c. and their parts.
Beafts; as, lions, ftags, foxes, boars, \&c. and their parts.

Birds; as, eagles, fwans, forks, pelicans, \&c. and their parts.
Fifhes; as, dolphins, whales, fturgeons, trouts, \&c. and their parts.
Reptiles and Infects; as, tortoifes, Cerpents, grafshoppers, \&c. and their parts.
$V$ egetables; as, trees, plants, flowers, herbs, \&c. and their parts.

Stimes; as, diamonds, rubies, pebbles, rocks, \&c.
Thefe eharges have, as well as ordinaries, divers attributes or epithets, which exprefs their qualities, pofitions and difpofitions. Thus the fun is faid to be in bis glory, eclipfed, \&c. The moon, in hir complimsnt, increfcent, \&c. Animals are faid to be , ampant palfant, \&c. Birds have alfo their denominarions, fuch as clofe, difplayed, \&c. Filhes are defcribed to be bauriant, naiant, \&c.

## 1. Examples of Gelefial Figatres.

Celeftial quarters of the coat-of-arms of the moft noble William-
Figares. John Ker, marquis of Lothian, \&c. It is needlefs to exprefs the colour of the fun, nothing being capable to denote it but gold.
2. "Azure, one Ray of the Sun, bendways Gules, between fix Beams of that Luminary Argent ;" borne by the narme of Aldam. There is no mention made of their iffuing out of the dexter-corner of the efcutcheon; for this is implied in the terin bendways, for the reafon mentioned before.
3. " Argent, five Rays of the Sun infuing out of the finifter-corner Gules; borne by the name of MudtBideler, a family of diftinction in Franconia.
4. "Or, a Sun eclipfed." This bearing is feldom to be met with, except in emblematic or hieroglyphic figures; and might be expreffed Sable, becaufe that hae is accidental and not natural.
5. "Gules, the Moon in her complement Or, illu. ftrated with all her light proper.". This is fufficient without naming the colour, which is Argent.
6. "Azure, a Moon decrefcent proper;" borne by the name of Delatuna.
7. "Gules, a Moon increfcent Or ;" borne by the name of $D_{\theta f \text { cus. }}$.
8. "Argent, a Moon in her detriment, Sable." This word is ufed in heraldry to denote her being eclipfed.
9. "Azure, a Crefcent Argent:;" borne by the name of Lucy. This bearing is alfo ufed as a difference, it being affigned to the fecond fon, as beforementioned.
10. "Gules, three Crefcents Argent ;" borne by Oliphant, lord Oliphant (at prefent dormant). Amongft the anceftors of this noble family was David de Oliphant, one of thofe barons who, in II 42, accompanied King David I. into England with an army, to affift his niece Matilda againft King Stephen ; but after raifing the fiege of Winchefter, the faid King David was fo clofely purfued, that, had it not bcen for the fingular conduet of this brave perfon, the king Would have been taken prifoner.
ri. "Azure, a Creficent between three Mullets Argent;" borne by Arbuthnot, vifcount and baron Arbathnot. In the yoar in 05 , the firft of this family marrying a daughter of the family of oliphard, fheriff of the county of Kincardin, with her he had the hands of Arbuthnot in that county, from whence he took his furname. Robert Arbuthnot was the firft of this family who, for his loyalty to King Charles I. was, Nov. 16. 164 r , dignified with the title of baron and vifcount Arbutbnot.
12. "Gules, a Star iffuing from between the Horns of a Crefcent Argent."
13. "Azure, a Star of 16 points Argent;" borne by the name of $H_{u i t}$ iton.
14. "Argent, three Mullets pierced Sable ;" borne by the name of $W$ ollafiton.
15. "Azure, fix Mullets 3, 2, I, Or ;" borne by the name of Welfh.
16. "Ermine, a Mnllet of fix points Gules, pierced;" borne by the name of Hefleribilil-W Wen a mullet has more, than five points, their number muft, in blazoning, be always named.
17. "Argent, a Rainbow wilh a Cloud at each end proper." This is part'of the cref to the earl Voi. VHI.

Hopeton's coat-of-arms, which is inferted in fig. ix. Effigies of $n^{\circ}$ I 3. The whole of it is a globe fplit on the top, and Men. above it is the rain-bow, \&c.
18. "Party per Fefs crenelle Gules and Azure, three Suns proper ;'' borne by the name of Pierfon.
19. "Guiles, a Mullet between three Crefcents Argent," borne by the name of Oliver.
20. "Gules, a Chicf Argent, on the lower part thereof a Clond, the Sun's refplendent rays iffuing throughout proper ;" borne by the name of Leefon.
II. Examples of Effigies of Men, dc. and their parts.
I. "Azure, the Virgin Mary crowned, with her Fig. ra: Babe in her right arm, and a fceptre in her left, all Or;" the coat of arms of the binopric of Salifbury.
2. "Azure, a Prefbyter fitting on a Tomb-ftone, with a Crown on his head and Glory Or, his right hand extended, and holding in his left an open Book Argent, with a Sword crofs his mouth Gules:" the coat of arms of the bifhopric of Chichefter.
3. "Azare, a Bifhop habited in his pontificals, fitting on a chair of ftate, and leaning on the finifter fide thereof, holding in his left hand a Crofier, his right being extended towards the dexter chief of the efcutcheon, all Or, and refting his feet on a cumion, Gules, taffeled of the fecond;' the coat of arms of the biShopric of Clogher in Ireland.
4. "Azure, a Bifhop habited in his pontificals, holding before him, in a Pale, a Crucifix proper ;" the coats of arms of the bilhopric of Waterford in Ireland.
5. "Or, a Man's Leg couped at the midit. of the thigh Azure;" borne by the name of Haddon.
6. "Azure, three finifter Hands couped at the wift, and erected Argent;" borne by the ancient family of Malmains.
7. "Argent, three finifter Hands couped at the wrift, and erected Gules ;' borne by the name of Mxy-nard.-By thefe two laftexamples it apy:ears, that different coats of arms may be cafily made from the fame figure or figires, by varying the colours only, without the addition of any other charge, counter-changings, partings, \&c.
8. 'AArgent, a Man's Leg erafed at the midft of the thigh Sable;" borne by the name of Prime.
9. "Gules, three Legs armed proper, conjoined in the Fefs-point at the upper part of the thighs, flexed in triangle, garnifhed and fpurred, Or." This is the coat of arms of the Ine of Man; and is quartered by the Moft noble John Murray, duke of Athol, titular lord or king of that ifle.
10. "Gules, three dexter Arms vembraced fefsways in Pale proper;" borne by the name of Armftrong. This coat is very well adapted to the bearer's name, and ferves to denoce a man of excellent conduct and valour.
II. "Or, three Legs couped above the knee Sable;" borne by the name of $H 9 \sqrt{y}$.
12." Vert, three dexter Arms conjoined at the fhoulders in the Fefs-point, and flexed in triangle Or, with fifts clenched Argent ;" borne by the name of Tremain.
12. Argent, a Man's Heart Gules, within two equilateral triangles interlaced Sable;" borne by the name of Villages, a family of diftinction in Provence."
14. "e Azure, a finifter Arm, iflaing out of the

3 L
dexter-

## lofitions of dextet-chief, andextended towards the finifter-bafe

 $\underbrace{\text { Lions. Argcnt." }}$I5. "Argent, a dexter Hand couped at the wrift and erected, within a bordure engrailed Sable;" borne by the name of Mantey.
16. "A Argent, a Man's Heart Gules, enfigned with a Crow Or, and on a Chief Azure, three Mullets of the firf.'" The paternal coar of the name of Douglas, and quartered in the arms of the dukes of Framilton and Queenfberry ; as alfo in thofe of the carls of Morton and March, and the lord Mordington.
17. "Gules, a Saracen's Head affrontée erafed at the neck Argent, environed about the temples with a wreath of the fecond and Sable;" borne by the name of Alorgith.
18. "Argent, three Blackanoors Heads couped proper, banded about the head Argent and Gules ;" borne by the name of Tanner.
19. "Gules, three Befants, each charged with a main's face affrontée proper "' borne by the name of Gatnin.
20. "Or, a Blackamoor's Head couped proper, banded about the head Argent ;" borne by the name of UJtoc.

Obferve, that when half of the face, or little more, of human figures, is feen in a field, it is then faid to be in profile ; and when the head of a man, woman, or other animal, is reprefented with a full face, then it is termed affrontée.

## III. Examples of the different Pofitions of Lions, \&c.in Coats-of-Arms.

Flate I. "Or, a Lion rampant Gules ;" quartered by CCXXXI, Percy, duke of Northmmberland; \&c.
fig. 5 .
2. "Azure, a Lion rampant-guardant Or;" borne by the name of Fitz-Hammond.
3. "Gules, a Lion rampant-reguardant Or ;" quartered by Cadogan, lord Cadogan, \&c.
4. "Ernine, a Lion faliant Gules;" bone by the nance of Worley.
5. "Azare, a Lion ftatant-guardant Or ;" borne by the name of Bromfield.
6. "Or, a Lion paffant Gules; borne by the name of Gamıs.
7. "A Argent, a Lion paffant-guardant Gules, crowned Or;" quartered by the right hon. James Ogilvy, earl of Finlater, \&c.
8. "Gules, a Lion fejant Argent."
9. "Or, a Lion rainpant double-headed Azure;" forne by the name of Mafon.

IU. " Sable, two Lions rampant-combatant Or, armed and langued Gules; " borne by the name of Carter. II. " Azure, two Lions rampant-adoflée Or." This coat of arms is faid to have been borne by Achilles at the fiege of Troy.

I2. "Sable, two Lioncels connter-paffant Argent, the uppermof towards the finifter fide of the efcutcheon, both collared Gules;" borne by the name of Glegg.-It is the natural difpoftion of the Lion not to bear a rival in the field: therefore two lions cannot be borne in one coat of arms, but muft be fuppofed to be Lion's whelps called lioncels; except when they are parted by an ordinary, as in fig. viii. $n^{\circ} 17$. or fo difgofed as that they feem to be diftinctly feparated from each other, as in fig. xy. $\mathrm{n}^{\circ} 20$. In the two foregoing

L D R Y.
Chap. 111.
examples they arecalled $l$ :ons, becanfein the roth they Poftions of feem to be ftriving for the fovereiguty of the ficld which they would not do unlefs they were of full growth: Iions. and in the inth they are fuppofed to reprelent two valiant men, whofe difute being accommoduted by the prince, are leaving the field, their pride tot fuffering them to go both one ".ly.
13. "Argent, a Demi-lion rampant Sable; borne" by the name of Mirvin.
14. "Gules, a Lion conchant between iix Crofscrollets, three in Chief, and as many in Bufe, Argent;" for the bame of Tynte; andis the firft and fourth quarter of the arms of Sir Charles-Kemys ' Fynte, bart.

I 4. " Azure, a Lion dormant Or."
15. "Or, ont of the midft of a Fefs Sable, a Lion rampant-raidfant Gules;" borne by the name of Emme. This form of blazon is pecnliar to all living things that fhall be found iffuing out of the midft of fome ordinary or other charge.

I 7. "Azure, three Lioncels rampant Or ;" borne by Fienes, vifcount and baron Saye and scle.
18. "Gules, a tricorporated Lion iffuing from three parts of the Efcutcheon, all meeting under one Head in the Fefs-point Or, jangued and armed Azure;" borne by the name of Crouchback. This coat appertained to Edmund Crouchback earl of Lancafter, in the reign of his brother king Edward I.
19. "Gules, a befant between three Demi-lions rampant Argent ;' borne by Bennet, earl of Tankerville, \&c. This noble earl is defcended from the family of the Bennets in Berkfhire, who fluorimed in the reign of King Edward III. Charles, lord Offulfon, grandfather of the prefent earl, was created earl of Tanke:ville on October I9. 1714 , by George I.
20. "Party per Pale Azure and Gules, three Lions rampant Argenr ;" borne by Herbertearl of Pembroke, \&c. This noble family is defcended from Henry FitzRoy, natural fon to Henry I. Sir William Herbert, one of the anceftors of the prefent earl, was mafter of the horfe to king Henry VIII. lord prefident of the marches of Wales, and knight of the garter. He was alfo, by that king, advanced to the dignity of haron Herbert of Caerdiff, Qct. 10, 1551 . and the very next day created earlof Pembroke.-Obferve, that if a lion, or any other beaft, is reprefented with its limbs and body feparated, fo that they remainupon the field at a fmall diftance from their natural places, it is then termed Dohaché or couped in all its parts; of which very remarkable bearing there is an inftance in armory, which is, "Or, a Lion rampant Gules, dehaché, or couped in all its parts, within a double Treffure flowery and counterflowery of the fecond;" borne by the name of Maitland.
IV. Examples of cther Quadrupeds, and their Parts, borne in Coats-of-Arms.

1. Sable, a Camel ftatant Argent;" borne by the Fig. i6. name of Camel.
2. "Gules, an Elephant ftarant Argent, taked Or."
3. "Argent, a Boar ftatant Gules, armed Or ;"; borne by the name of Trewarthen.
4. Sable, a Bull paffant Or;" borne by the name of Fitz-Geffrey.
5." Sable, three Nags Heads erafed Argent;" borne

Different borne by Blayney, baron Blayney of Monaghan, in Irc-
Animals. land. This noble family is defcended in a direct line from Cadwallader, a younger fon of the prince of Wales; and the firft pecr was Sir Edward Blayney, knight, who was created a baron by king Janes 1 . July 29. 162 I .
6. "Argent, three Boars Heads erafed and erect Sable, langued Gules," for the name of Booth.
7. "Azure, threc Boars Heads erafed Or ;" quartered by his grace Alexander Gordon duke of Gordon, \&c. Of this great and noble family which took their furname from the barony of Gotdon in the county of Berwick, there have been, befides thofe in North Britain, feveral of great diftinction in Mufcovy; and in the time of king Malcolm IV. I 160 , this family was very numerous, and flourifhed in the county aforefaid.
8. "Argent, three Bulls Heads crafed, Sable, armed Or;" bornc by Skeffington, earl of Maffarecne, \&c. of Ireland. This ancient and noble family derives its name from the village of Skeffington, in the county of Leicefter, of which place Simon Skeffington was lord in the reign of Edward I. and from him defcended Sir William Skeffington, knt. made fo by king Henry VII. 9. "Argent, two foxes connter-faliant, the dexter furmonnted of the finifter Gules; for the name of Kadrod-Hard, an ancient Britifh family, from which is defcended Sir

Wynne, bart. who bears this quartered, fecond and third, in his coat of arms.
re. st Argent, three Bulls paffant Sable, armed and unguled Or;" for Ahley, and quartered by the right hon. Anthony-Afhley Cooper, earl of Sbaftefbury, \&c. This noble earl is defcended from Richard Cooper, who flourifhed in the reign of king Henry VIII. and purchafed the manor of Paulet in the county of Somerfet, of which the family are ftill proprictors. But his anceftor who makes the greateft figure in hiftory is Sir Anthony-Afhlcy Cooper, who was created baron Afleley of Winbourn April 20. 165 5, and afterwards earl of Shaftefbury April 23. 1672.
ri. "Ermine, threc Cats palfant in Pale Argent;" for the name of Adams.
12. "Gules, two Grehounds rampant Or, refpeeting each other;" borne by the name of Dogget.
13. "Or, an Afs's Head erafed Sable;" borne by the name of Hackwell.
14. "Gules, three Lions gambs erafed Argent;" for the name of Newdigate.
15. "Argent, three Lions Tails erected and erafed Gules;" borne by the name of Cork.
16. "Azure, a Buck's Head caboffed Argent;" borne by Legge, earl of Dartmouth, \&c. This noble family is defcended from Signior de Lega, an Italian nobleman, who flourifhed in Italy in the year 1297. What time the family came into England is uncertain; but it appears they were fettled at Legge-place near Tunbridge in Keat, for many generations; and Thomas, one of their anceftors, was twice lord-mayor of London, viz. in 1346 and 1353.
17. "Argent, two Squirrels fejant a donee Gules," for the name of Samwell.
18. "Gules, a Goat paffant Argent;" Forne by the name of Baker.
19. "Sable, a Stag ftanding at gaze Argeat;" bone by the name of fones, of Alonmouthhires.
20. "Azure, three Holy Lambs Or;" borne by Birds, the name of Rour.
V. Examples of Birds, Fifhes, Reptiles, \&c.

1. "Ermine, an Eagle difplayed Sable;" borne by Fig. 17. the name of Beddingfield.
2. "Gules, a Swan clofe proper;" borne by the name of Leigham.
3. "Argent, a Stork Sable, membered Gules;" borne by the name of Starkey.
4. "Gules, a Pelican in her neft with wings elevated, feeding her young ones Or ; valned proper ;" borne by the name of Carne.
5. "Argent three Peacocks in their pride proper ;" borne by the name of Pawne.
6. "Sable, a Gofhawk Argent, perching upon a ftock in the Bafe-point of the Efcutcheon of the fecond armed, jelfed, and belled Or ;" borne by the name of Weele.
7. "Or, a Raven proper;" borne by the name of Corbet.
8. "Argent three Cocks Gules, crefted and jowlopped Sable, a Crefcent furmonnted of a Crcfcent for difference;" borne by Cockayne, vifcount Cullen, of Donegal in Ireland. Of this ancient family was Andreas; Cockayne of Afhburne in the county of Derby, who lived in the 28th year of Edward I. Charles, fon to Sir William Cockayne lord-mayor of London, 1619, was the firft who was advanced to the peerage, by Charles I. Auguft in. 1642.
9. "Sahle, a Dolphin naiant embowed Or;"borne by the name of Symonds. This animal is borne by the eldeft fon of the French king, and next heir to the crown, no other fubject in that king dom being permitted to bear it. In England, where that rale cannot take place, there are feveral families that have dolphins in their coats-of-arms.

Io "Argent, three Whales Heads ereftand erafed Sable;" borne by the name of Whatley.
ri. "Gules, three Efcallops Argent;" borne by Keppel, earl of Albemarle, \&c. This family is defcended from Arnold Jooft van Keppel, a nobleman of the province of Gelderland in Holland, who came over into England with the prince of Orange in 1688 , to whom he was then a page of honour, and afterwards matter of the robes, and was by him created a peer of England, by the title of earl of Albemarle, in the duchy of Normandy in France, Febraary 10. 1696.
12." Azure, three Trouts fretted in Triangle Argent;" bornc by the name of Troutbeck.
13. "Vert, a Grafshopper paffant Or."
14." Azure, three Bees two and one volant in pale Argent;" borne by the name of Bye.

I5. "Vert, a Tortoife palfant Argent;" borne by the name of $G$ orw $d y$.
16. "c Gnles, an Adder nowed Or ;" borne by the name of Naithily. Adders, finakes, and ferpents are faid to reprefent many things, which being according: to the fancy of the ancients, andafew modernaathors who have adopted their opinions, it is needlefs to enlarge upon. It is certain they often occur in armory; but the nobleft is that of the duchy of Milan, via. "Argent, a Serpent gliding in Pale Azure, crowned Or, vorant an Infant iffung Gules." The occafon of this bearing was this: Otho, firft vifcount of Mila:,

3 L 2
gaing
$\mathrm{H}_{\mathrm{G}} \quad \mathrm{E} \quad \mathrm{R} \quad \mathrm{A}$
Reptiks, geing to the Holy Latd with Godfrey of Bouillon,
Plants, \&ec, defe.ted and flew in fingle combat the great giant Volux, a man of an extraordinary flature and frength, Who had cballenged the bravelt of the Chriftian army. The vifcount having killed him, took his armour, and among it his helmet, the creit whereof was a ferpent fwallowing an infant, worn by him to frike terror into thofe who thould be fo bold as to engage him.
17. "Ermine, a Rofe Gules barbed and feeded proper;" borne by Bofcawen vifcount Falmoutli, \&c. This noble lord is defeended from Richard Bofcawen, of the town of Bufcawen, in the county of Cornwall, whe flourinhed in the reign of king Eward VI. Hugh, the firfl peer of this ancient family, was created baron of Bofcawen-Rofe, and vifccunt Falmourh, on the 1 zth of June 1720 , 6 th of George I.
18. "Azure, three Laurel-leavesfipped Or;", borne by the name of Levifon, and quartered by the right hon. Granville-Levefon Gower, earl of Gower, \&c:
19. "Azure, three Garbs Gr;" borne by the name of Cuming. Thefe are fheaves of wheat; but though. they were barley, rye, or any other corn whatfoever, it is fufficient, in blazoning, to call them: Garbs, telling the tincture they are of.
20. "Gules, thrte Cinquefoils Argent;" borne by Langbart, baron of Cavan, \&c. in Ireland. Of this ancient family, which is of French extraction, was Sir Oliver, who, in the reign of queen Elizabeth, attending the earl of Effex to Spain, was there knighted by him, and afterwards returning with that earl into Ireland, was, for his fingular fervice in the north againto'Neal earl of Tyrone, made camp-mafter general, andprefident of Comaught; and February 17. 1617, was created lard Lambart and baron of Cavan by king James I.

It muft be obferved, that trees and plants are fometimes faid to be trunked, eradicated, fractuated, or raguled, according as they are reprefented in arms.
Art. 2: Of Artificial Figures borne in Coats of Arms.

After the various productions of nature, artificial figures, the objects of arts and mechanics, claim the next rank. They may be diftributed into the following.claffes, viz.

Warlike inflruments; as fwords, arrows, battcringrams, gaunters; helmets, fpears, pole-axes, \&c-

Ormaments ufed in royal and religious ceremonies; as crowns, coronets; mitres, wreaths, crofiers, \&c.

Architecture ; as towers, caftles, arches, columns, plummets, battlements, churches porteullifes, \&c.

Navigation; as fhips, anchors, rudders, pendants, fails, oars, mafts, flags, galleys, lighters, \&c.

All thefe bearings have different epithets, ferving either to exprefs their pofition, difpofition, or make: viz. fwords are faid to be erect, pommeled, hilted, \&sc.; arrows, armed, feathered, \&e.; towers covered, embattled, \&c; and fo on of all otlicrs, as willappear by the follo wing examples.
Fig. 18.
I. " Sable, three Swords, their pgints meeting in the Bafe Argent, pommeled and hilted Or, a Crefcent in chisf of the fecond for difference;" borne by Powlet, duke of Bolton, \&c. This noble duke is defcended from Hercules lord of Tournon in Picardy, who came over to England with Jeffrey Plantagenet earl of Anjou, third fon of king. Henry II. and among other lands had the

lordfhip of Panlet in Somerfethire conferred on him. Artificial William Powlet; the firft peer of this illiuftrious and Figures. loyal family, was treafurer of the houfthold to king. Ficnry Vill. and by him cricated baron St John of Bafing, in the county-of Southampton,, March $9.153^{8}$.
2. "Argent, three Battering-rams barways in. Pale, headed:Azure and hooped Or, an Annulct for difference;" borne by Bertie, earl of Abington, \&c. The firtt of the family of Bertie that bore the title of earl of Abington was James Bertie lord Norris of Rycote, being created earl, November 30. 1682, by Charles II.
3. "Azure, three lefr-hand Gauntlcts with their backs forward Or;" borne by Fane, earl of Weftmoreland, \&ic. This noble earl is defcended fromithe Fanes, an ancienc family, which refided at Badfal in Kent, from which defcended Francis Fane, fon and heir of Sir Thomas Fane, knight, by Mary his wife, fole daughter and heirefs to Henry Nevil Iord Abergavenny, afterwards created baronefs. Defpenfer. The faids Francis was a knight of the Bath; and in the reign: of king James I. was created baron Burgherfh and carl of Weftmoreland December 29. 16:24.
4. "Azare, three Arrows their points in bafe Or;" borne by Archer, lord Archer, \&c. This noble lord is defcended from John de Archer, who came over from Normandy with. William the Conqueror; and this family is one of the moft ancient in Warwiekfhire, being fetrled at Umberflade in that county ever fince the reign of Henry II. His lordhip is the firft peer; and was created lord Archer and baron of Umberflade by king George 11. July 14. 1747.
5. "Gules, two Helmets, in chief proper, garnifted.Or, in a Bafe of a Garb of the third;" borme by Cholmondeley, earl of Cholmondeley, \&c. This nobleearl is defcended from the ancient family of Egertor in Chefhire, which flourifhed in the time of the conqueft, from whom alfo the duke of Bridgewater is defcended: The firft Englifh peer of this branch was Hugh. vifcount Cholmondeley of Kells, in Ireland, who, joining with thofe who oppofed the arbitrary meafures of king James II. was on the accelfion of king William and queen Mary created lord Cholmondeley of Nampt-wich, in the county of Chefter:
6. "Argent, a Ship with its Sails furled up Sable;" quartered by Hamilton, earl of Abercom, \&e. The defcent of this noble family is from that of the duke of Hamilton, for James, the fourth lord Hamilton and fecond earl of Arran, marrying lady Margaret Douglas daughter of James the third earl of Morton, by her had four fons, James, John, Cland, and David; whereof Claud was progenitor of the lord we are now fpeaking of; and in confideration of his merit and loyalty to Mary queen of Scots, James VI. created him lord Pailley in 159 I , as alfo carl of A bercorn, baron of Ha milton, \&c. July 10 1606.
7. "Or, an Anchor in pale Gules;" quartered by: the moft noble George Joliniton, marquis of Annandale, \&c. The Johnftons are an ancient and warlike family, and derive their furname from the barony of Johnfon in Annandale.
8. "Sable, three Spears heads erect Argent, imbrued Gules; on a chief Or, as many Pole-axes Azure;" borne by King, lord King, \&c. Peter King, Efq; the firft lord of this ancient family, was chofen recorder of the city of London, July 27.1708, and on the 12 th of September

Artifcial September following had: the honour of knighthood
Figures. conferrad on him. He was conflituted lord-chici-juftice of the common pleas in the firft year of king Gcorge I. $17 \times 4$; on the 5 th of April following was fworn of his majefty's mott hon. prisy council; and on. May 19. 1723, was created a peer of Great Britain by the titlo of lord King, baroul of Ockham.
9. "Gules, thrce Clarions Or ;" quartercd by Carteret, earl of Granville, \&c. this ancient and worthy family derives its pedigree from Offerey de Carterct, who attended William the conqueror in his defcent upon England, and contributed to the victory be obtained over king Harold, ar Haftings in Suffex, ro66, he had manors and lands in England conferred on him by that prince, as a reward for his eminent fervices George the firt earl was, in confideration of his own merit and the fervices of his anceftors, created a peer oi Grear Britain, October 19. 168 I .
10. "Argent, a Maurch Sable ;" bonne by Haftings, earl of Huntingdon, \&c. The prefent noble earl is defcended from lifugh de Haftings a younger fon of the ancient and noble family of the Haftings, earl of Pembroke, of which family was. Williannde Haftings, fteward of the houfehold to king Henry I. -William, the firft lord Flaftings, was created a baron on July 6. 1461 , by king Edward IV.
II. "Azure, a circular Wreath Argent ad Sable, with four Hawk's Bells joined thereto in quadrature Or;"" bonne by Jorelyn, vifcount Jocelyn, \&c. This noble family is of grear antiquity; for, after the Romans had been mafters of Britain 500 years, wearied with the wars, they took their final farewelof it, and carried a way with thein a great many of their brave old Britififoldiers, who had ferved them at their wars both at home and abroad, to whom they gave Amorica in France, for their former fervices, which country wasfrom them afterwards called Little Britain. It is fuppofed that there were fome of this family amongt them; and that they gave the name of focelyy to a town in this country, which ftill preferves that name : and it is thought probable that they returned with william the Conqueror; for we find, in ro66, mention made of Sir Gilbert Jocelyn. This preferte nobleman the firf lord of the family, was created baron Newport, of Newport in Ireland, on November 29. 1743, and vifcount in November 1751.
12. "Gules, thrce Towers Argent;" quartered by Fowler, vifcount Afhbroak, \&c. William Fowler, Efq. was advanced to the peerage by king George II. and created baron of Cafte-Durrow, in the county of Kilkenny, Oetober 27. 1733; and his fon was created vifcount Aftrook. of Afhbrook in Ireland, on Sept. 30. 1751. now extinct.
13. "Gules, two Keys in Saltier Argent, in Chicf a Royal Crewn proper ;" the arms of the archbiflopric of York.
14. " Gules, two Swords inSaltier Argent, pommeled and hilted Or ;" the arms of the bifhopric of London.
15. "Sable, a Key in Bend, furmounted by a Crofier in Bend finifter, both Or;" the arms of the bifhopric of St Afaph.
16. "Gules, two Keys adoffee in Bend, the uppermoft Argent, the ocher Or, a Sword interpofed
$\mathbf{L} \quad \mathbf{D} \quad \mathrm{Y}$.
between them in bendfinifter of the fecond, pomme-Chimerical led and hilted of the third ;" the arms of the bilhop- Figures. ric of Winchefter.

I 7 "Gules, three Mitres with their pendants Or;" the arms of the bilhopric of Chefter.
18. "Sable, three Ducal Coronets paleways Or ;" the arms of the bifhopric of Brifol.
19. "Gules, a Sword erectin a pale Argent, pommeled and hilted Or, furmounted by two Keys in Saltier of the latt;" the arms of the bifnopric of Exeter.
20. "Gulcs, three Ducal Coronets, Or;" the arms of the bifhopric of Ely.

## Art. III. Of Chimerical Figures.

The laft and the oddcit kind of bearings in coats of arms, is comprehended under the name of chinerical figures; that is to fay, fuch as have no real exiftence, but are mere fabulous and fantaltical inventions. Thefe charges, griffons, martlets, and unicorns excepted, are fo uncommon in Britifh coats, that in order to make up the fame number of examples hitherto contained in each collection, feveral foreign bearings are introduced here; which, however, as they are conform to the laws of heraldry, will alfo contributo both to entertain and inftruct the reader. Thefe moft in ufe are the following, viz.

Angels, Cherubims, Tritons, Centaurs, Martlets, Griffons, Unicorns, Dragons, Mermaids, Satyrs, Wiverns, Harpies, Cockatrices, Phenixes.

Thefe, like the foregoing charges, are fubject to various politions and difpolations, which, from the principles already laid down, will be plainly underflood: See the examples, fig. xix.
$\mathrm{N}^{\circ} \mathrm{I}$. is "Gules, an Angel ftanding affrontée, with his hands conjoined and clevated upon his breaft, habited in a long Robe clofe girt Argent, his Wings difplayed Or ;" borne by the name of Brangor de Cerevifia, a foreign prelate, who affifted at the council of Conftance, I-412. This example is quoted by Guillim, Sect. III. Chap. i.
2. "Sable, a Cheveron between three Cherubim Or;" borne by the name of Chaloner, of Yorkthire and Chefhire.
3. "Azure, a Fefs indented between three Cherubim Argent." 'Thefe arms were granted to John Ayde, Eff ; of Doddington in Kent, by Sir William Segar, garter.
4. "Gules, a Cherub having three pair of Wings, the uppermoft and lowereft counter-croffed Saltierways, and the middlemof difplayed Argent;" borne by the name of $B u o o a f b c o$, a forcign prelate. This example is copied from Menefrier's Methode du Blafon, p. 120, $\mathrm{N}^{\circ}$ viii.
5." Azure, Griffon fegreant Or, armed and langued Gules, between three Crefcents Argent ;'. quartered by Bligh, lord Clifton, \&c. The anceftor of this noble family, who lived in London, going over to Ireland in the time of Oliver Cromwell, as an agent to the adventurers there, acquired a good eftate, and laid the foundation for the grandeur of this family.
6. "Gules, three Marlets Or ;" borne by the name of Macgill. Guillim obferves, that this bird, which is reprefented without feet, is given for a difference to younger brothers, to put them in mind, that, in order

Chimerical to raife themfelves they are to trult to their wings of $\underbrace{\text { Figures. virtue and merit, and not to their legs, having but little }}$ land to fet their feet on.
7. " Azure, threc Mullets Argent within a double Treflitre counter-flowery Or, in the centre a Martletof the laft;' borne by Murray, lord Eibank. Sir Gidcon Murray, knighted by king James VI. by whom he was made treafurer depute, was third fon of Sir Andrew Murray of Blackbarony. His fon Patrick, in refpect of his loyalty to Charles I. was on May 16. 1628 made a baroner, and in 1643 created lord Elibank.
8. "Sable, a Cockatrice difplayed argent, crefted, membered, and jowllopped Gules."
9. "Argent, a Mermaid Gules, crined or holding in her right hand a comb, and in her left a Mirror, both proper ;" borne by the name of Ellis.
ro. "، Argent, a Wivern, his wings elevated, and his Tail nowed below him Gules;" borne by the name of Drake.
if. "Or, a Dragon paffant Verr."
12. "Gules, a Centaur or Sagittary in full fpeed. reguardant proper." This was the coat of arms of Stephēn furnamed of Blois, fon to Adela daughter of Willian the Conqueror, and of Stephen earl of Blois; and on this defcent grounding his pretenfion to the crown of England, he was proclaimed king in 1135, and reigned to the 25 th of October it 54 .
13. "Argent, an Unicorn fejant Sable, unguled and horned Or ;" borne by the name of Harling.

I 4. "Argent, a Dragon's Head erafed Vert, holding in his noonth a finifter Hand couped at the Wrift Gules" bornc by the name of Willians.
15. "Gules, three unicorns Heads couped Or;" borne by the name of Paris.
16. "' Argent, a Wivern volant Bendways Sable;" borne by the name of Raynon.

I 7. " Azure, a Lion fejant guardant winged $\mathrm{Or}_{1}$, his Head encircled with a glory, holding in his forepaws an open Book, wherein is written, Pax tibi, Míarce, Evangeliffa meus; over the dexter fide of the Book a Sword erect, all proper." Thefe are the arms of the republic of Venice.
18. "Azure, a bull faliantand winged Or;" borne by the name of Cadenet, a family of diftinction of Provence.
19. "Argent, a Wivern with a human Face affrontee hooded, and winged vert;" borne by the name of Buferaghi, an ancient and noble family of Luques.
20. " Azure, a Harpy difplaycd, armed, crined, and crowned Or." Thefe are the arms of the city of Noremberg in Germany,

To the forementioned figures may be added the montegre, an imaginary creature fuppofed to have the body of a 'yger with a fatyr's head and horns; alfo thofe which have a real exiftence, but are faid to be endowed with extravagant and imaginary qualities, wiz. the falamander, beavtr, cameleon, \&c.

## C H A P. IV.

## Of the External Ornaments of Escut CHEONS.

The ornaments that accompany or furround efcutcheons were introduced to denote the birth, dignity,
or office, of the perfons to whom the coat-of-arms ap- Crowns. pertaineth; which is practiled both among the laity and clergy. Thofe moft in ufe are of ten forts, viz. Crowns, Coronets, Mitres, Helmets, Mantlings, Cliapeaux, Wrvaths, Crefts, Scrolls, Supporters.

Sect. I. Of Crowns.
The firft crowns were only diadems, bands, or fillets : afterwards they were compofed of branches of divers trees, and then flowers were added to them.

Among the Greeks; the crowns given to thofe who carried the prize at the Hthmian games, were of pine ; at the Olympick, of laurel; and at the Nemean, of fmallage.

The Romans had varions crowns to reward martial exploits and exrraordinary fervices done to the republic; for which fee the detaclied article Crown in this Dictionary, and Plate CL.

Examples of fome of thefe crowns are frequently met with in modern atchievements, viz. I. The mutal crown in that of lord Montfort, which was conferred on Sir John Bromley, one of his lordfhip ${ }^{2}$ s anceftors, as an augmentation to his arms, for his great courage at the battle of Le Croby. Part of the creft of Lord Archer is allo a mural crown. And there are no lefs than ten Englifh baronets, whofe arms arc ornamented with tine faine crown. 2. The naval or roftral crown is - fill uled with coats of arms, as may be feen in thofe of Sir William Burnaby, bart. now admiral of the red fquadron, and of John Clerke, Efq; as part of their crefts. 3. Of the caftrenfe or vallery crown, we have inftances in the coat-of-arms of Sir Reginald Grahan and of Ifaac Akerman, Efq. 4. The creft of Grice Blackeny, Efq; is encompaffed with a civic crown, 5. The radiated crown, according to J. Yorke, was placed over the arms of the kings of England, till the time of Edward III. It is ftill ufed as a creft on the . arms of fome private families; thofe, for example, burne by the name of Whitficld, are ornamented with it. The ccleftial crown is formed like the radiated, with the addition of a ftar on each ray; and is only ufed upon tomb-ftones, monuments, and the like.Others of the ancient crowns are ftill borne, as crefts, by feveral families.

But modern crowns are only ufed as an ornament, which emperors, kings, and independent princes fet on their heads, in great folemnities, both to denote their fovereign authority, and to render themfelves more awful to their fabjects. Thefe are the moft in ufe in heraldry, and are as follows:

The imperial crown ( $\mathrm{n}^{\circ}$ I.). is made of a circle of Plate gold, adorned with precions ftones and pearls, height- CCXXXII ened with fleurs-de-lis, bordered and feeded with fig. 20. pearls, raifed in the form of a cap voided at the top, like a crefcent. From the middle of this cap rifes an arched fillet enriched with pearls, and furmounted of a mound, whereon is a crofs of pearls.

The crown of the kings of Great Britain (2.) is a circle of gold, bordered with ermine, enriched with pearls and precious fones, and heightened up with four croffes pattee and four large fleur-de-lis alternately; from thefe rife four arched diadems adorned with pearls, which clofe under a mound, furmounted of a crofs like thofe at bottom. Mr Sandford, in his Genealogical Hiftory, p. 38ı. remarks, that Ed-

[^37]
## Chap. IV.

Crowns. ward IV. is tife firft king of England rhat in his feal, or on his coin, is crowned with an arched diad cm .

The crown of the kings in France (3.) is a circle enameled, adorned with precious ftoncs, and heightened up with eight arched diadems, riling from as miny flewis-de-lis, that conjoin at the top under duuble theur-de-lis, all of gold.

The crowns of Span, Portugal, and Poland, are all three of the fame form, and are, amengit others, thus deferibed by colonel Parfons, in his Genealogical Tables of Eutope, viz. A ducal coronet, heightened up with eight arched diadems that fupport a mound enfigned with a plain crofs. Thofe ot Denmark and Sweden are both of the fame form, and confift of eight arched diadems, rifing from a marquis's coronet, which conjoin at the top under a mound enfigned with a crofsbuttony.

The crowns of moft other kings are circles of gold, adorned with precious ftones, and heightened up with large refoils, and clofed by four, fix, or cight diadems, fupporting a moand, furmounted of a crofs.

The Great Turk (4) bcars over his arms a turband, enriched with pearls and diamonds, under two coronets, the firft of which is made of pyramidical points heighterned up with large pearls, and the uppermoft is farmounted with crefcents.

The Pope, or bilhop of Rome, appropriates to himfelf a Tiara ( $\mathrm{n}^{\circ} 5$. ), or long cap of golden cloth, from which hang two pendants embroidered and fringed at the ends, femée of croffes of gold. The cap is inclofed by three marquis's coronets; and has on its top a moind of gold, whereon is a crofs of the fame, which crofs is fometimes reprefented by engravers and painters pometted, recroffed, flowery, or plain.-It is a difficult matter to afcertain the time when thefc haughty prelates aflumed the three forementioned coronets. A patched up fucceffion of the holy pontiffs, engraved and publilhed a few years ago by order of Clement XIII. the late Pope, for the edification of his good fubjects in Great Britain and Ireland, reprefents Marcellus, who was chofen bifhop of Rome anno 310, and all his fucceffors, adorned with fuch a cap: but it appears, from very good authority, that Boniface VIII. who was electedinto the fee of Rome anno 1295 , firft compaffed his cap with a coronet; Benedict XII. in 1335, added a fecond to it; and John XXIII. in 141t, a third; with a view to indicate by them, that the Pope is the fovereign prieft, the fupreme judge, and the folelegillator amongft Chriftians.

## Sect. II. Of Coronets.

The Coronet of the prince of Wales, or eldeft fon of the king of Great Britain ( $\mathrm{n}^{\circ} 7$. ), was anciently a circle of gold fet round with four croffes-patee, and as many fleurs-de-lis alternately; but fince the reftoration, it has been clofed with one arch only, adomed with pearls, and furmounted of a mound and crofs, and bordered with ermine like the king's.

Befides the aforefaid coronet, his royal highnefs the prince of Wales has another diftinguifhing mark of honour, peculiar to himfelf, called by the vulgar the prince's arms, viz. A plume of three oftrich-feathers, with an ancient coronet of a prince of Wales. Under it, in a fcroll, is this motto, Ich Dien, which in the

## L D R Y.

German or old Saxon language fignifics, "I ferve;" Corcncts. (feen ${ }^{\circ} 6$ ). This device was at firft taken by Edward prince of Walos, commonly called the black prince, after the famous battle of Creffe, in 1349, where having with his own hand killed John king of Bohennia, he took from his head fiuch a plume, and put it on his own.

The coronet of all the immediate fons and brothers of the kings of Great Britan, is a circle of sold, bordered withermine, beightened up with four fleurs-de-lis and as many croffes-pattee-alternate, (fee $n^{\circ} 8$ ). -The particular and diftinguilhing form of lach coronets as are appropriated to princes of the bloodroyal, is defcribed and fettled in a grant of Charles II. the $13^{\text {th }}$ of his reign.

The coronet of the princeffes of Great Britain is a circle of gold, bordered with ermine, and heightened up with crofles-pattee, fleurs-de-lis, and frawberry leaves alternate ( $\mathrm{n}^{\circ} 9$.) : whereas a prince's coronet has only fleurs-de-lis and crofles.

A duke's coronet is a circle of gold bordered with ermine enriched with precious ftones and pearls, and fet ronnd with eight largeftrawberry or partly leaves; ( $\mathrm{n}^{0} \mathrm{I} 0$ ).

A marquis's coronet is a circle of gold, bordered with ermine, fet round with four ftrawberry leaves and as many pearls on pyramidical points of equal height, altcrnate ; ( $\mathrm{n}^{\circ} \mathrm{II}$ ).

An earl's c ronet is a circle of gold, bordered with ermine, heightened up with eight pyramidical points, or rays, on the tops of which are as many large pearls, and are placed alternately with as many firawberryleaves, but the pearls much ligher than the leaves; ( $\mathrm{n}^{\circ} \mathrm{I} 2$ ).

A vifcount's coronet differs from the preceding ones as being only a circle of gold bodered with ermine, with large pearls fer clofe together on the rim, without any limited number, which is his prerogative above the baron, who is limited; (fee $n^{\circ} 13$ ).

A baron's coronet, ( $n^{\circ}$ 14). which was granted by king Charles II. is formed with fix pearls fet ar equal diftance on a gold circle bordered with ermine, four of which only are feen on engravings, paintings, \&c. to thow he is inferior to the vifcount.

The eldeft fons of peers, above the degree of a baron, bear their' father's arms and fupporters with a label, and ufe the coronet appertaining to their father's fecond title; and all the younger fons bear their arms. with proper differences, but ufe no coronets.

As the crown of the king of Great Britain is not quite like that of other potentates, fo do moft of the coronets of foreign noblemen differ a little from thofe of the Britifh nobility : as for example, the coroner of a French earl is a circle of gold with 18 pearls fet on the brim of it: a French vifcount's coronet is a circle of gold only enamalled, charged with four large pearls; and a French baronet's coronet is a circle of gold enamelled and bound about with a double bracelet of pearls; and thefe coronets are only ufed on French noblemens coats-of-arms, and not worn on their heads, as the Britifh noblemen and their ladies do at the king's coronation.

Sect. III. Of Mitres.
The archbillops and bihops of England and Ireland

Helmets. land place a mitre over their coats-of-arms. It is a round cap pointed and cleft at the top, from which hang two pendants fringed at both ends ; with this difference, that the bifhop's mitre is only furrounded with a fillet of gold, fet with precious fonces, (fee fig. $23 . n^{\circ} 6$ ). Whereas the archbifiop's iffues out of a ducal coronet, fee fig. $20 . n^{\circ} 15$ ).

This ornament, with other mafquerade garments, is fill worn by all the archbithops and bifhops of the church of Rome, whenever they officiate with folemnity; but it is never ufed in England, otherwife than on coats-of-arms, as before mentioncd.

## Sect. IV. Of Helmets.

The helmet was formerly worn as a defenfive weapon, to cover the bearer's head: and is now placed over a coat-of-arms as its chief ormament, and the true mark of gentility. There are feveral forts diftinguilhed, ift, by the matter they are made of; 2dly, by their form ; and, 3 dly, by their pofition.

1ft, As to the matter they are, or rather were, made of ; The helmets of fovercigns were of burnifhed gold damafked : thofe of princes and lords, of filver fyured with gold; thofe of knights, of fteel adorned with filver; and thofe of private gentlemen, of polifhed fieel.

2 dly, As to their form : Thofe of the king and the royal family, and noblemen of Great Britain, are openfaced and grated, and the number of bars ferves to diftinguif the bearess quality; that is, the helmet appropriared to the dukes and marquifes is different from the king's, by having a bar exactly in the middle, and two or each fide, making butt free bars in all, (fee fig. 21. $n^{\circ}$ 1). whereas the king's helmet has fix bars, viz. three on each fide, (ibid, $\mathrm{n}^{8} 7$.) The other grated helmet with four bars is common to all degrees of peerage under a marquis. The open-faced helmet without bars denotes baronets and knights. The clofe helmet is for all efquires and gentlemen.

3 diy, Their pofition is alfo looked upon as a mark of diftinction. The grated helmet in front belongs to fovereign princes. The grated helmet in profile is common to all degrees of peerage. The helmet ftanding direct without bars, and the beaver a little open, denotes baroners and knights. Lafly, the fideftanding helmet, with the beaver clofe, is the way of wearing it amongft efquires and gentlemen. See $n^{\circ} 1,2,3,4$, and 7 ; inferted in fig. 21 . Ornaments.

## Sect. V. Of Mantlings.

Mantlings are pieces of cloth jagged or cut into flowers and leaves, which now-a days ferve as an: ornament for efcutcheons. They were the ancient coverings of helmets to preferve them, or the bearer from the injuries of the weather, as alfo to $p$ event the inl confequences of their too much dazzling the eye in action. Bat Guillim very judicioufly oblerves, that their fhape muft have undergone a great alteration fince they have been out of nfe, and th refore might more properly be termed fourifhings than mantlings. See the examples annexed to the helmets reprefented in fig. 21.

The French heralds affure us, that thefe mantlings were originally no other than fhort coverings which commanders wore over their helmets, and that, going

## L D R Y.

into battles with them, they often, on their coming chapeaux, away, brought them back in a ragged manner, oc- Wreaths, cationed by the many cuts they had received on their heads: and therefore the more hacked they were, the more honourable they were accounted; as our colours in time of war are the more efteemed for having been fhot through in many places.
Sometimes fkins of beafts, as lions, bears, \&c. were thus bome to make the bearer look more terrible; and that gave occalion to the doubling of mautlings with furs.

## Sect. VI. Of Chapeaux.

A Chapeay is an ancient hat, or rather cap, of dignity worn by dukes, generally fcarlet-coloured velvet on the outfide, lined and curned up with fur ; of lase frequently to be net with above an helmer, inftead of a wreath, under gentlemens and noblemens crefts. Heretofore they were feldom to be found, as of right appertaining to private families; but by the grants of Robert Cooke, Clarencieux, and other fucceeding heralds, thefe, together with ducal coronets, are now frequently to be met with in families who yet claim not above the degree of gentlemen. See the reprefentation of the chapeau, no 5. fig. 21.

## Sect. VII. Of Wreaths.

The Wreath is a kind of roll made of two fkains of filk of different colours twifted together, which ancient knights wore as a head-drefs when equipped for tournaments. The colours of the filk are always taken from the principal metal and colour contained in the coat-of arms of the bearer. They are till accounted as one of the leffer ornaments of efcatcheons, and areplaced between the holmet and the creft, (fee fig. ar. $n^{\circ} 6$ ). In the time of Henry I. and long after, no man, who was under the degree of a knight, had his creft fet on a wreath; but this, like other prerogatives, has been enfringed fo far, that every body now-a-days wears a wreath.

## Sect. VIII. Of Grefts.

$\mathrm{T}_{\mathrm{H}} \mathrm{C}$ Creft is the highen part of the ornaments of a coat-of-arms. Itis called creff, from the Latin word criffa, which fignifies comb or tuft, fuch as many birds have upon their heads, as the peacock, pheafant, \&c. in allurion to the place on which it is fixed.

Crefts were formerly great marks of honotir, becaufe they were only worn by herocs of great valour, or by fuch as were advanced to fome fuperior military command, in order that they might be the better difinguifhed in an engagement, and thereby rally their men if difperfed: but they are at prefent confidered as a mere ornament. The ereft is frequently a part either of the fupporters, or of the charge borne in the efentcheon. Thas the creft of the royalatchievement of Great Britain is a " Lion guardant crown'd," as may be feen in fig. $2 \mathrm{x} . \mathrm{n}^{\circ} 7$. The creft of France is a double Fleur-de-luce." Out of the many crefts borrowed from fupporters, are the following, viz. The duke of Montagu's, " A Griffon's head coup'd Or, back'd and wing'd Sable :" the marquis of Rockingham's, "A Griffon's head argent, gorg'd with a ducal coronet;" the earl of Weftmoreland's; "A Bull's head Argent, py'd Sable, armed Or; and lord

Archer's

Rules of Reraldy.

## H E R A

C H A P. V.
Of the Rules or Laws of Heraldry.
The feveral efcutcheons, tinetures, charges, and ornaments of coats-of-arms, and their various properties being now explained; it may not be improper to fubjoin fuch rules for blazoning the fame, as the ancient ufage and laws of heraldry have eftablifhed amongft us.
J. The firft and moft general ruie is, to exprefs one's felf in proper terms, fo as not to omit ally thing that ought to be fpecified, and at the fame time to be clear and concife withour tautology; as in Ex. xiv. p. 446. and alfo in Ex. ix. p. 453. wherein thefe expreflions of the Field, or of the Fi.ft, prevent the reN tition of the forementioned tincture.
II. One muft begin with the tineture of the field, and then proceed to the principal charges which porfefs the moft honourable place in the hield, fuch as Fefs, Cheveron, \&c. always naming that charge firft which lies next and immediately upon the field; as in Ex. xv. p. 45 I .
III. After naming the tincture of the field, the honourable ordinaries, or other principal figures, you maft feecify their attributes, and afterwards their metal or colour, as in Ex. xvi. p. 458.
IV. When an honourable ordinary, or fome one figure, is placed upon another, whether it be a Fefs, Cheveron, Crofs, \&c. it is always to be named after the ordinary or figure over which it is placed, with one of thefe exprefilions, furtout, or over all, as in Example xx. p. 449.
V. In the blazoning of fuch ordinaries as are plain, the bare mention of them is fufficient; but if an ordinary fhould be made of any of the crooked lines mentioned above, its form mult be fpecified; that is, whether it be Engrailed, Wavy, \&c. as in Ex. i. ii. iii. \&c. p. 446.
VI. When a principal figure poffeffes the centre of the field, its pofition is not to be expreffed : or (which amounts to the fame thing) when a bearing is named, without fyecifying the point where it is placed, then it is underfood to poffefs the middle of the hield; as in Ex. xv. p. 459.
VII. The number of the points of mullets or ftars muft be fpecified when more than five; and alfo if a mullet or any other charge be pierced, it mult be mentioned as fuch, to diftinguifh it from what is plain; as in Ex. xii. and xiv. p. 457.

VIIl. When a ray of the fin, or other fingle figure, is borne in any othet parr of the efcutcheon than the centre, the point it iffues from mull be named; as in Ex. iii. p. 457. col. I.
IX. The natural colour of trees, plants, fruits, birds, \&c. is no otherwife to be expreffed in blazoning but by the word proper, as in Exam. ii. vii. p. 459: but if difcoloured, that is, if they differ from their natural colour, it muft be particularized; as in Ex. i. ii. \&c. p. 458.
X. When three fignres are in a field, and their pofition is not mentioned in the blazoning, they are always underftood to be placed two above, and one below; as fig. xxii. $n^{\circ} 3$.
XI. When there are many figures of the fame fpecies borne in a coat-of-arms, their number muft be
$L \quad D \quad R \quad Y$.
Chap. V.
obferved as they ftand, and diftinetly expreffed ; as in MarmalEx. i. P. 460. But for the better underftanding of this laft rule, we have inferted examples of the different difpofitions of figures, wherein they are properly reprefented, viz. Two may be ranged in Pale, in Fefs, \&c. See fig. xxiii. $\mathrm{n}^{\infty} 1$ and 2.

Three, may be 2 and I , allo in bend, \&c. See $\mathrm{n}^{\circ}$ 3 and 4

Four, are placed 2 and 2, or cantoned, as in no 5.

Fioe, 1, 3, 1, in Crofs; or 2, 1, 2, in Saltier. See no 6 and 7.

Six, 3, 2, 1, in Pile; or, 2, 2, 2, Paleways. See $\mathrm{n}^{\circ} 8$ and 9. Eight, in Orle, or on a Bordure. See $\mathrm{n}^{\circ}$ ıo. Nine, 3, 3, 3, Barways ; or 3, 3, 2, 1, in Pile. See $n^{2} I I$ and 12.
$T_{e n,}$ 4, 3, 2, 1, in Pile; or elfe $4,2,4$, Barways. Sce $n^{\circ} 13$ and 14 .

Twelve, are placed 4, 4, 4, Barways. See $n^{\circ} 15$.
There are other pofitions called irregular; as for example, when three figures which are naturally placed 2 and 1 , are difpofed 1 and $2, \& c$. It muft alfo be obferved, that when the field is ftrewed with the fame figures, this is expreffed by the word femée: but, according to a French armoritt's opinion, if the figures ftrewed on the field are whole ones, it muft be denoted by the words fans nombre; whereas, if part of them is cut off at the extremities of the efcutcheon, the word femér or femi is then to be ufed.

## © H A P. VI.

## Of Marshalling Coats-of-arms.

By marfhalling coats-of-arms, is to be underftood the art of difpofing of divers of them in one efcutcheon, and of diftributing their contixgent ornaments in proper places.

Various caufes may occafion arms to be thus conjoined, which J. Guillim comprifes under two heads, viz. manifeft and obfcure.

What this learned and judicious herald means by manifeft caufes in the marhalling of coars-of-arms, are fuch as betoken marriages, or a fovereign's gift, granted either through the fpecial favour of the prince, or for fome eminent fervices. Concerning marriages it is to be obferved,
I. When the coats-of-arms of a married couple, defcended of diftinct families, are to be put together in one efcutcheon, the field of their refpective arms is conjoined Paleways, and blazoned partedper Pale, Baren and Femme, two coats; firft, dec. In which cafe the baron's arms are always to be placed on the dexter-fide, and the Femme's arms on the finifter fide, as in $n^{\circ} 1$ cexxxit and 2, fig. xxiii. Of arnes zparfhalled, which are,

1. The coat-of-arms of the rev. Edward Barnard, D. D. chaplain in ordinary to his majefty, provoft of Eton-college, canon of Windfor, \&c. impaled with that of S. Haggat, his late fpoufe.
2. The coat-of-arms of the rev. Thomas Dampier, D. D. chaplain in ordinary to his majefty, prebendary of Durham, canon of Windfor, \&c. impaled with that of F. Walker, his fpoufe.

If a widower marry again, his late and prefent
wife's arms are, according to G. Leigh, "to be both ling.
placed on the finifter fide, in the efcutheon with his
own, and parted per Pale. The firft wife's coat dhall ftand on the chief, and the fecond on the Bafe: or he may fet them both in Pale with his own, the firft wife's coat next to himfelf, and his fecond the outermoft. If he fhould marry a third wife, then the two firft matches hould ftand on the Chief, and the third Mall have the whole Bafe. And if he takes a fourth wife, the muft participate one-half of the Bafe with the third wife, and fo will they feem to be fo many coats quartered." But it muft be obferved, that thefe forms of impaling are meant of hereditary coats, whereby the hufband ftands in expectation of having the hereditary poffeffions of his wife united to his patrimony.
II. In the arms of femmes joined to the paternal coat of the baron, the proper differences by which they were borne by the fathers of fuch women mult be inferted.
III. If a coat-of-arms that has a Bordure be im. paled with another, as by marriage, then the Bordure mult be wholly omitted in the fide of the arms next the centre.
IV. The perfon that marries an heirefs, inftead of impaling his arms with thofe of his wife, is to bear them in an efcutcheon placed in the centre of his fhield, after the fame manner as the baronet's badge is marfhalled in no 3, and which, on account of its fhowing forth his pretenfion to her eftate, is called an efoutcheon of prctence, and is blazoned furtout, i.e. over-all, as in the efcutcheon borne in the fourth quarter of the royal atchievement. But the children are to bear the hereditary coat-of-arms of their father and mother quarterly, which denotes a fixed inheritance and fo tranfmit them to pofterity. The firf and fourth quarters generally contain the father's arms, and the fecond and third the mother's; except the heirs fhould derive not only their efate, but alfo their titie and dignity, from their mother.
V. If a maiden or dowager lady of quality marry a commoner, or a nobleman inferior to her rank, their coats-of-arms may be fet afide of one another, in two feparate efcutcheons, upon one mantle or drapery, and the lady's arms ornamented according to her title; fee $n^{8} 4$ and 5 , which reprefent the coat-of-arms of Gen. C. Montague, and lady Elizabeth Villiers vifcountefs Grandifon.
VI. Archbifhops and bihops impale their arms differently from the fore-mentioned coats, in giving the place of honour, that is, the dexter.fide, to the arms of their dignity, as it is expreffed in $n^{8} 6$, which reprefents the coat-of arms of Dr Philip Yonge, ford bilhop of Norwich. It may be obferved of the above prelates, that they thus bear their arms parted per Pale, to denote their being joined to their cathedral church in a fort of firitual marriage.

With refpect to fach armorial enfigns as the fovereign thinks fit to angment a coat-of=arms with, they may be marhalled various ways, as may be feen by the arms of his grace the duke of Rutland, inferted in fig. viii. $\mathrm{n}^{\circ} \mathrm{r}$ g, and the example contained in fig. xii. $\mathrm{n}^{\circ} \mathrm{II}$.

To thefe augmentations may be added, ift, The baronet's mark of diftinction, or the arms of the pro-

## L D R Y.

vince of UlAter in Ireland, granted and made hereditary in the male line by king James I. who erected this dignity on the $22 d$ of May rbri, in the $9^{\text {th }}$ year of his reign, in order to propagate a plantation in the forementioned province. This mark is Argent, a finifter Hand, couped at the Wrift, and erected Gules; which may be borne either in a canton, or in an efcutcheon, as will beft fuit the figures of the arms. See fig. xxiii. $\mathrm{n}^{\circ} 3$. which reprefents the coat-of-arms of Sir William Lorrayne, of Kirk-harle, Northumberland, and are thus blazoned: Quarterly, Sable and Argent, a plain Crofs counter-quartered of the Field. The Creft,-A laurel-tree couped, two branches fprouting out proper, and fixed to the lower part thereof with a Belt Gules, edged and buckled Or. This, according to tradition in the family, was granted for fome worthy action in the field.

2dly, The ancient and refpectable badge of the moft noble order of the Garter, inftituted by king Edward III. 1349, in the 27th year of his reign; and which, ever fince its inflitution, bas been looked upon as a great honour beftowed on the nobleft perfons of England and other countries. This honourable augmentation is made to furround, as with a garter, the arms of fuch knights, and is infcribed with this motto, Honi foit qui maly penfe: See n² 7. which reprefents the coat-of-arms of his grace the duke of Montagu, earl of Cardigan, baron Brudenel of Stan-ton-Wivil, conftable and lieutenant of Windfor-caftle, knight of the moft noble order of the Garter, and baronet, prefident of St Luke's Hofpital, and F. R. S.

This nobleman, whofe arms were Argent, a Cbeveron Cules between three Morions proper, has, fince the deceafe of John duke of Montagu, taken the nameand arms of Montagu, on account of his being married to lady Mary Montagu, youngeft daughter and one of the co-heireffes of his grace.

So far the caufes for marfhalling divers arms in one Shield, \&c. are manifeft. As to fuch as are called obfoure, that is, when coats-of-arms are marflalled in fuch a manner, that no probable reafon can be given why they are fo conjoined, they muft be left to heralds to explain, as being the propereft perfons to unfold thefe and other myfteries of this fcience.

## C H A P. VII.

Of Funeral Escutcheons.
After having treated of the effential parts of the coats-of-arms, of the various charges and ornaments ufually borne therewith, of their attributes and difpo. fitions, and of the rules for blazoning and marfhalling them, we fhall next defcribe the fevetal faneral efcutcheons, ufually called batchments; whereby may be known, after any perfon's deceale, what rank either he or fhe held when living; and if it be a gentleman's hatchment, whether he was a bachelor, married man, or widower, with the like diftinctions for gentlewomen.

The hatchmenr, $N^{2}$ I. reprefents fuct as are af- Plate fixed to the fronts of houles, when any of the nobi- cexxxmi. lity and gentry dies; the arms therein being thofe fig, xxiv. of a private gentleman and his wife parted per pale; the dexter fale, which is Gules, three Bars Or, for $3 \mathrm{M}_{2}$
the

Of Efcut- the hufband; having the ground without the efcutcheons. cheon black, denotes the man to be deadz; and the
ground on the finifter-fide being white fignifies that the wife is living, which is alfo demonftrated by the fimall hatchment, $\mathrm{n}^{\circ}$ 2. which is here depicted without mantling, helmet, ‘and creft, for perficicuity's fake only.

When a married gentewoman dies firf, the hatchment is difinguifhed by a contrary colour from the former; that is, the arms on the finifter-fide have the ground without the efcutcheon black; whereas thofe on the dexter fide, for her furviving hulband, are upon a white ground: the hatchment of a gentlewoman is, moreover, differenced by a cherub over the arms inftead of a creft. See $\mathrm{n}^{\circ} 3$.

When a batchelor dies, his arms may be depicted fingle or quartered, with a creft over them, but never inpaled as the two firft are, and all the ground without the efcutcheon is alfo black. See no 4 .

When a maid dies, her arms, which are placed in a lozenge, may be fingle or quartered, as thofe of a batchelor; bur inftead of a creft, have a cherub over them, and all the ground without the efcutheon is alfo black. See $\mathrm{n}^{\circ} 5$.
When a widower dies, his arms are reprefented impaled with thofe of his deceared wife, having a helmet, mantling, and creftover them, and all the ground without the efcutcheon black. $N^{\circ} 6$.

When a widow dies, her arms are alfo reprefented impaled with thofe of her deceafed hufband, but in. clofed in a lozenge, and, inftead of a creft, a cherub is placed over them; all the ground without the efcutcheon is alfo black. See $\mathrm{n}^{8} 7$.

If a widower or batchelor fhould happen to be the laft of his family, the hatchment is depicted as in $n^{9} 6$. and that of a maid or widow, whofe family is extinct by her death, is depicted as in $n^{8} 7$. with this difference only, that a death-head is generally annexed to each hatchment, to denote, that death has conquered all.

By. the forementioned rules, which are fometimes reglected through the ignorance of illiterate people, may be known, upon the fight of any hatchment, what branch of the family is dead; and by the helmet or coronet, what title and degree the deceafed perfon was of.

L D R Y.
Chap. VII.
The fame rules are obferved with rerpect to the ef- Of Efcutcutcheons placed on che hearle and horfes ufed in pompous funerals, except that they are not furmounted with any creft, as in the forcging examples of hatchments, but are always plain. It is neceifary, however, to enfign thofe of peers with coronets, and that of a maiden lady with a knot of ribtands.
In Scotland, a funeral efcutcheon not only fhows forth the arms and condition of the defunct, but is allo a proof of the gentility of his defcent ; and foch perfons for whom this fpecies of efcutcheon can be made out, are legally intitled to the character of a gentleman of blood, which is the higheft fpecies of gentility. The Englifh hatchment above def́cribed exhibits no more than a right to a coat-of-arms which may be acquired by purchafe, and is only the firft ftep towards eftablihing gentility in a family.

The funeral efcutcheon, as exhibited in Scotland, France, and Germany, is in form of a lozenge, above fix feet fquare, of black cloth; in the centre of which is painted, in proper colours, the complete atchievment of the defunct, with all its exterior ornaments and additional marks or badges of honour; and round the fides are placed the fixteen arms of the families from which he derives his defcent, as far back as the grandfather's grandfather, as the proofs of his gentility: they exhibit the armorial bearings of his father and mother, his two grandmothers, his four greatgrandmothers, and his eight great. grandmothers mothers; if all thefe families have acquired a legal right. to bear arms, then the gentility of the perfon whofe proof it is muft be accounted complete, but not otherwife. On the four corners are placed mort-heads, and the initials of his name and tilles or defignation; and the black interfices are lemee or powdered with tears, as in the figure, $n^{\circ} 8$. which is the efcutcheon of the right hon. James 5th earl of Balcarras, chief of the ancient furname of Lindefay.

On the morning of the interment, one of thefe is placed on the front of the houfe where the deciafed lies; and another on the church in which he is to be buried, which after the burial is fixed above the grave. The pall, too, is generally adorned with thefe proofs of gentility, and the horfes of the hearfe with the de-funct's arms.

## HERB, in boany ; a name by which Linnæus lenominates that portion of every vegetrable which arifes from the root; and is terminated by the fructification. It comprehends, 1 . The trunk, lalk, or ftem. 2. The leaves. 3. Thofe minute external parts called by the fame author the futcra or fupports of plants 4 . The buds, or, as he alfo terms them, the winterquarters of the future vegetable. <br> Herb-Chriftopher. See Actea. <br> Herb-Robint, (a fpecies of Géranium); a plant in great reputation with fome farmers on account of its prevaili ig virtues againft faling the blood and the bloody-flux in cattle, in which cafes it is faid to be the beft among a great variety of means commonly ufed on theferoccafions. <br> HERBACEOUS plants, are thofe which have fucculent itcins or ftalks that lie down to the ground every year. Oi herbaceous plants, thofe are annual which perifh ftem and root and all every year ; biennial, which fublift by the roots two years; perennial which are perpetuated by their roots for a feries of years, a new ftem being prodaced every fpring. <br> HERBAGE, in law, fignifies the palture provided. by nature for the food of cattle; alfo the liberty to feed eattle in the foreft, or in another perfon's ground. <br> HERBAL, fignifies a book that treats of the claffes, genera, fpecies, and virtues of plants. <br> Herbal is fometimes alfo ufed for what is more ufually called bortus ficcus. See Hortus. <br> HERBELOT (Bartholomew d'), a French writer, eminent for his original learning, was born at Paris in 1625. He travelled feveral times into Italy, where he obtained the efteem of fome of the moft learned men of the age. Ferdinand II. grand duke of Tur cany, gave him many marks of his favour : a library being expofed to fate at Florence, the dake defired him to examine the manufcripts in the original languages, to felect the beft of them, and to mark the price; which being done, the generous prince purchafed them, and made him a prefent of them. M. Colbert being at length informed of Herbelot's meric, recalled him to Paris, and obtained a penfion for him of 1500 livres: he afterwards became fecretary and interpreter of the oriental languages, and royal profeffor of the Syriac tongue. He died at Paris in 1695. His principal works are intitled Bibliotheque Orientale, which he firft wrote in Arabic, and afterwards tranf. lated into French. It is greatly eftecmed. M. Herbelot's modefty was equal to his erudition ; and his ancommon abilities were accompanied with the utmoft probity; piety; and charity, which he practifed thros the whole courfe of his life. <br> HERBERT (Mary), countefs of Pembroke, was <br>  <br> church at London ; fome time after whin? he obtained a canonry in the cathedral of Canterbury, and cnjoyed it till his death. fifter to the famous Philip Sidney, and wife of Henry earl of Pembroke. She was not only a lover of the mufes, bat a great encourager of polite literature ; a character not very common among ladies. Her brother dedicated his incomparable romance Arcadia to her, from which circumftance it hath been called $T$ he Countefs of Pembroke's Arcadia. She tranlated adramatic piece from the French, intitled Antonius, a tra-d gedy; though it is faid fae was aflifted by her lord'ss ed. She died in 1621 ; and an exalted character of her is to be found in Francis Olborne's memoirs of king James I. <br> Herbert (Edward), lord Herbert of Cherbury in Shropfhire, an emisent Englih writer, was born in 158I, and cducated at Oxford; after which he travelled, and at his return was made knight of the Bath. James I. fent him ambiflador to Louis XIII. in behalf of the Proteftants who were befieged in feveral cities of France ; and continued in this ftation till he was recalled, on account of a difpute between him and the conftable de Laines. In 1625 he was advanced to the dignity of a baron in the kingdom of Ircland, by the title of lord Herbert of Catte Illand; and in 163 I to that of lord Herbert of Cherbury in Shropfhire. After the breaking out of the civil wars, he adheredto the pariament; and in 1644 obtained a penfion, on account of his having been plundered by the king's forces. He wrote a Hiftory of the Life and Reign of Henry VIII. which was greatly admired : a treatife De veritote; and feveral other works. He died at. Londonin i648. <br> " Lord Herbert (fays Mr Granger) fands in the firft rank of the public minifters, hiftorians, and philofophers of his age. It is hard to fay whether his perfon, his underftanding, or bis courage, was the moft extraordinary; as the fair, the learned, and the brave, held him in equal admiration. But the fame man was wife and capricions; redreffed wrongs and quarrelled for punctilios; hated bigotry in religion, and was himfelf a bigot to philofophy. He expofed himfelf to fuch dangers as other men of courage would have carefully declined: and called in queftion the fundamentals of a religion which none had the hardinefs to difpate befides himfelf." <br> Herbert (George), an Englifh poet and divine, was brother of the preceding. He was born in 5593 , and was educated at Cambridge. In 16 ig he was chofen pablic orator of that univerfity, and afterwards obtained a finecure from the king. In 1626 he was collated to the prebend of Layton Ecclefia, in the diocefe of Lincoln; and in 1630 was inducted into the rectory of Bamerton, near Sarum. The grear lord Bacon had fach an opinion of his judgment, that he would? not fuffer his works to be printed before they had paffed his examination. He wrote a volume of devout poems, called The Temple, and another entitled The Prieft of the Temple. This pious divine died about the year 1635 . <br> Herbert (William); earl of Pembroke, was borm at Wilron in Wilthire, 1580 ; admitted of Newcollege in Oxford in I 592, where he continued about two years. In 1691 , he fucceeded to his father's ho. <br> chaplain, Dr Babington, afterwards bifhop of Excter. She turned the pfalms of David into Englifh metre; but it is doubtful whether thefe works were ever printnours and eftate ; was made K. G. in 1604 ; and governor of Portmonth fix years after. In 1626, he was elected chancellor of the univerfiyy of Oxford; and about the fame time made lord fteward of the king's houfhold. He died fuddenly at his houfe called Baynard's callie, in London, April 10, 1630; according to the calculation of his nativity, fays Wood, made feveral years before by Mr Thomas Allen of Gloucer. ter-hall. Clarendon relates concerning this calcalation,

 . that".

Hersert that fome confiderable perfons connected with lord Pembroke being met at Maidenhead, one of them at fupper drank a health to the lord feward : upon which another faid, that he believed his lordfhip was at that time very merry; but he had now outlived the day, which it had been prognofticated upon his nativity he would not outlive; for he had ontlived it now, for that was his birth-day, which had completed his age to 50 years. The next motning, however, they received the news of his death. Whether the noble hiftorian really believed this and other accounts relating to aftrology, apparitions, proyidential interpofitions, \&x. which he has inferted in his hiftory, we do not prefume to fay: he delivers them, however, as if he did not actually difbelieve them. Lord Pembroke was not only a great favourer of learned and ingenious men, but was himfelf learned, and endned with a con-- fiderable thare of paetic genius. All that are extant of his productions in this way were publifled with this title: " Poems written by William Earl of Pembroke, \&c. many of which are anfwered by way of repartee by Sir Benjamin Rudyard, with other Poems written by tiem occafionally and apart, $1660,8 \mathrm{vo}$.

Herbert (Sir Thomas), an eminent gentleman of the Pembroke family, was born at York, where his father was an alderman. William earl of Pembroke fent him to travel at his expence in 1626 , and he fpent four years in vifiting Afia and Africa: his expectations. of preferment ending with the death of the earl, he went abroad again, and travelled over feveral parts of Europe. In 1634, he publifhed, in folio, a Relation of fome years Travel into Africa and the Great Afia, efpecially the Territories of the Perfian Monarchy, and fome parts of the Oriental Indies and Illes adjacent. On the breaking out of the civil war he adhered to the parliament ; and at Oldenby, on the removal of the king's fervants, by defire of the commiffioners from the parliament, he and James Harrington were retained as grooms of his bed-chamber, and attended him even to the block. At the reftoration he was created a baronet by Charles II. for his faithfol fervices to his father during his two laft years. In 1678 he wrote Threnodia Carolina, containing anz acconnt of the two laft years of the life of Charles I. and he affifted Sir William Dugdale in compiling the third volume of his Monafticon Anglicanum. He died at York in 1682 , leaving feveral MSS to the public library at Oxford, and others to that of the cathedral at York.

HERBIVOROUS ANimals, thofe which feed onby on vegetables.

HERCULANEUM is the name of an ancient city of Campania in Italy, which was deftroyed by an. eruption of Vefuvius in the firft year of the emperor Titus, or the 79th of the Chriftian era, and lately rendered famous on account of the curious monuments of antiquity difcovered in its ruins; an account of which has been publifhed by order of the king of Naples, in a work of fix volumes folio.-The epocha of the foundation of Herculaneum is unknown. Diomy fius Halicarnaffenfis conjectures that it may be referred to 60 years before the war of Troy, or about I 342 years before Chrift; and therefore that it lafted about 1400 years.

The thicknefs of the heap of lava and ames by which the city was overwhelmed, has been much in-
crealed by fiery ftreams vomited fince that cataltrophe; Herculaand now forms a mafs 24 feet deep of dark grey neum. ftone, which is eafily broken to pieces. By its nonadhefion to foreign bodies, marbles and bronzes are preferved in it as in a cafe made to fit them, and exact moulds of the faces and limbs of fatues are frequently found in this fubftance. The precife fituation of this fubterraneous city was not known till the year i 7 I 3 , when it was accidentally difcovered by fome labourers who, in digging a well, fruck upon a fatue on the benches of the theatre. Many others were afterwards dug out and fent to France by the prince of Elbœuf. But little progrefs was made in the excavations till Charles in fant of Spain afcended theNeapolitan throne; by whofe unwearied efforts and liberality a very confiderable part of Herculaneum has been explored, and fuch treafares of antiquity drawn out as form the molt curions mufeum in the world. It being too arduous a tafk to attempt removing the covering, the king contented himfelf with cutting galleries to the principal buildings, and canfing the extent of one or two of them to be cleared. Of thefe the theatre is the moft confiderable. On a balluftrade which divided the orcheftra from the fage was found a row of ftatues ; and, on each fide of the pulpitum, the equeftrian figure of a perfon of the Nonia family. They are now placed under porticoes of the palace; and from the great rarity of equeftrian ftatues in marble would be very valuable objects, were their workmanfhip even lefs excellent than it is: one of them in particular is a very. fine piece of fculpture. Since the king of Spain left Naples, the digging has been continned, but with lefs fpirit and expenditure : indeed the collection of curiofities brought out of Herculaneum and Pompeii is al. ready fo confiderable, that a relaxation of zeal and activity becomes exrufable. They are now arranged in a wing of the palace; and confift not only of fatues, bufts, altars, infcriptions, and other ornamental ap. pendages of opulence and luxury; but alfo comprehend an ercire affortment of the domeftic, nufical, and chirurgical inftruments ufed by the ancients; tripods of elegant form and exquifite execution, lamps in endlefs variety, vafes and bafors of noble dimenfions, chandeliers of the moft beautiful hapes, pateras, and other appurtenances of facrifice, looking-glaffes of polifhed metal, coloured glafs fohard, clear, and well ftained, as to appear like emeralds, fapphires, and other precious ftones; a kitchen completely fitted up with copper-pans lined wich filver, kettles, cifterns for heating water, andevery utenfil neceffary for cunlinary purpofes; fpecimens of various forts of combuftibles, reraining their form though burnt to a cinder ; corn, bread, fifh, oil, wine, and flower : a lady's toilet, fully ${ }^{-}$ furnifhed with combs, thimbles, rings, paint, ear rings, \&c. A mong the fatues, which are numerous, counoiffeurs allow the greateft fhare of merit to a Mercury and a fleeping faun : the bufts fill feveral rooms; but very few of the originals whom they were meant to imitate are known. The floors are paved with ancient Mofaic. Few rare medals have been found in thefe ruins; the moft curious is a gold medallion of Auguftus ftruck in Sicily in the 15 th year of his reign. The frefco paintings, which for the fake of prefervation have been torn off the walls and framed and glazed, are to be feem in another part of the palace. " The

HerculaHercule Hercules.
*The elegance of the attitudes, and the infinite variety of the fubjects (Mr Swinburne obferves), ftamp them as performances worthy of the attention of artifts and antiquarians; but no pictures yet found are mafterly enough to prove that the Grecks carried the art of painting to as great a height of perfection as they did that of fatuary. Yet can we fuppofe thofe authors incapable of appreciating the merits of an Apelles or Zeuxis, who with fo much critical difcernment have pointed out the beauties of the works of a Phidias or a Praxiteles, beauties that we have itill an opportunity of contemplating ? would they have beftowed equal praifes upon both kinds of performances if either of them had been much inferior to the other ? I think it is not probable ; and we moft prefume that the capital productions of the ancient painters, being of more perifhable materials than bufts and ftatues, have been deftroyed in the fatal difafters that have fooften afficted both Greece and Italy. Herculaneum and Pompeii were but towns of the fecond order, and not likely to poffefs the mafter-pieces of the great artifts, which were ufually deftined to adorn the more celebrated temples, or the palaces of kings and emperors." A more valuable acquifition than bronzes and pictures was thought to be made, when a large parcel of manuferipts was found among the ruins. Hopes were entertained that many works of the claffics, which time has deprived us of, were now going to be reftored to light, and that a new mine of fience was on the point of being opened. Bat the difficalty of unrolling the burnt parchment, of pafting the fragments on a flat furface, and of decyphering the obfcure letters, have proved fuch obftacles, that very little progrefs has been made in the work. A prieft invented the method of proceeding; but it would require the joint $l_{d}$ bours of many learnedmen to carry on fo nice and tedious an operation with any fucceefs. The plan is dropped; and the manufcripts now lie in dutty heaps, as ufelefs to the learned world as they had been for the preceding feventeen centaries.

HERCULES, in fabulous hiftory, a moft renowned Grecian Hero, who after death, was ranked among the gods, and received divine honours. According to the ancients, there were many perfons of the fame name. Diodorus mentions three, Cicero fix, and fome authors exend the number to no lefs than forty-three. Of all thefe, one generally called the Theban Hercules, is the moft celebrated; and to him, as may eafily be imagined, the actions of the others have been attributed. He is reported to have been the fon of Jupiter by Alcmena (wife to Amphitryon king of Argos), whom Jupiter enjoyed in the hape of her hulband while he was ablent; and in order-te add the greater frength to the child, made that amorous night as long as three. Amphitryon having foon after accidentally killed his uncle and father-in -law Electryon, was obliged to fly to Thebes, where Hercules was born. The jealoufy of Juno, on account of her hufband's amour with Alemena, prompted her to deftroy the infant. For this purpofe fle fent two ferpents to kill him in the cradle, but young Hercules ftrangled them both. He was early inftructed in the liberal arts, and Caftor the fon of Tyndarus tanght him how to fight, Eurytus how to thoot with a bow and arrrows, Autolicus to drive a chariot, Linus to play on the lyre, and Eumolpus to
fing. He, like the reft of hisilluftrions contemporaries, Hercules. foon after became the pupil of the centaur Chiron, and under him he perfected and rendered himfelf the moft valiant and accomplifhed of the age. In the i8th year of his age he refolved to deliver the neighbourhood of mount Cithæron from a hagelion which preyed on the flocks of Amphytryon his fuppofed father, and which laid wafte the adjacent country. He went to the court of Thefpius king of Thefpis, who fhared in the general calamity; and he received here a tender treatment, and was entertained during 50 days. The 50 daughters of the king became mothers by Hercules during his flay at Thefpis, and fome fay that it was effected in one night. After he had deftroyed the lion of mount Ci thæron, he delivered his country from the annual tribute of 100 oxen which it paid to Erginus. Such public fervices became univerfally known ; and Creon, who then fat on the throne of Thebes, rewarded the patriotic deeds of Hercules by giving him his daughter in marriage, and entrufting him with the government of his kingdom.

Euryftheus, the fon of Amphitryon, havingfucceeded his father, foon became jealous of Hercules; and fearing left he might by him be deprived of his crown, leit no means untried to get rid of him. Of this Hercules was not infenfible, becaufe he was perpetually engaging him on fome defperate expedition; and therefore went to confult the oracle. But being anfwered that it was the pleafure of the gods that he hould ferve Euriftheus 12 years, he fellinto a deep melancholy, which at laft ended in a furious nadnefs; dnring which, among other defperate actions, he put away his wife Megara, aud murdered all the children he had by her. As an expiation of this crine, the king inapofed upon him twelve labours furpaffing the power of all other mortals to accomplifh, which neverthelefs our hero performed with great eafe. The favours of the gods had indeed completely armed him when he undertook his labours. He had received a coat of armour and helner from Minerva, a fword from Mercury, a horfe from Neprune, a aield from Jupiter, a bow and arrows from Apollo, and from Vulcán a golden cuirafs and brazen buikin, with a celebrated club of brafs according to the epinion of fome writers.

The firft labour impofed upon him was the killing of a lion in Nemea, a wood of Achaia; whofe hide was proof againft any weapon, fo that he was forced to feize him by the throat and Itrangle him. He carried the dead beaft on his floulders to Mycenæ, and ever after clothed himfelf with the Ikin. Eury th heus was fo aftonithed at the fight of the beaft, and at the courage of Hercules, that he ordered him never to enter the gates of the city when he returned from his expeditions, but to wait for his orders without the walls. He even made himfelf a brazen veffel into which he retired whenever Hercules returned-The fecond labour was to deftroy the Lernæan hydra, which had feven heads according to Apollodorus, 50 according to Simonides, and 100 according to Diodorus. This celebrated monfter he firf attacked with his arrows; but foon after he came to a clofe edgagment, and by means of his heavy club he deftroyod the heads of his enemy. This, however, was productive of no advantage; for as foon as one head was beaten to pieces by the club immediately two Sprang up ; and the labour

## HER

Hercules. of Hercules would have remained unfinifhed, had not he commanded his friend Iolas to burn with a hotiron the root of the head which he had crulbed to pieces. This facceeded; and Hercules became victurious, opened the belly of the monfter, and dipped his arrows in the gall to render the wounds which he gave fatal and incurable.-He was ordered in his third labour to bring alive and anhurt into the prefence of Euryftheus a ftag, famous for its incredible fwiftnefs, its golden horns and brazen feet. This celebrated animal frequented the neighbourhood of CEnoe ; and Hercules was employed for a whole year in continually purfuing it ; at laft he caught it in a trap, or when tired, or, according to others, by flightly wounding it andleffening its fwiftnefs.-The fourth labour was to bring alive to Euryftheus a wild boar which ravaged the neighbourhood of Erymanthus. In this expedirion he deftroyed the centaurs, and caught the boar by clofely purfuing him through the deep fnow. Euryfthens was fo frightened at the fight of the boar, that according to Diadorus, he hid himfelf in his brazen veffel for 'fome days.-In his fifth labour Hercules was ordered to clean the ftables of Augeas, where 3000 oxen had been confined for many years.-For his fix th labour he was ordered to kill the carnivorous birds which ravaged the country near the lake Stymphalis in Arcadia. -In his feventh labour he brought alive into Peloponnefus a prodigious wild bull whichlaid wafte the inland of Crete.-In his eight labour he was employed in obtaining the mares of Diomedes, which fed upon human flefh. He killed Diomedes, and gave him to be eat by his mares, which he brought to Euryftheus. They were fent to mount Olympas by the king of Mycenæ, where they were devoured by the wild beafts; or, according to others, they were confecrated to Jupiter, and their breed fill exifted in the age of Alexander the Great.-For his ninth labour, he was commanded to obtain the girdle of the queen of the Ama-zons-In his enth labour he killed the monfter Geryon king of Gades, and brought to Argos his numerous flocks which fed upon human flefh. This wasin Iberia or Spain; in the furtheft parts of which he erected his two pillars, as the unof limits of the then known world. Thefe ten labours he atchieved, as the fable fays, in about eight years. In this laft expedition he is likewife affrmed to have killed Antæus, a famous giant of a monftrous fize, who, when weary iwith wreftling or labour, wasimmediatelyrefrefhed by itouching the earth. Hercules overcame him in wreftling, and flew him; and after him the tyrant Bufiris, in his way through Egypt. This bloody man ufed to facrifice all his guefts and.frangers upon his altars; and defigning to have done the fame by Hercules, was gain by him, together with all his attendants.-His eleventh labour was the carrying away the Hefperian golden apples kept by a dragon: (See Hesperides). -The twelfth and laft, and moft dangerous of his labours, was to bring upon the earth the three-headed dog Cerberus. Defcending into Hell by a cave on mount Tænarus, he was permitted by Pluto to carry a way his friends Thefeus and Pirithons, who wete condemned to punifhment in hell, and Cerberus alfo was granted to his prayers, provided he made ufe of no arms but only force to drag him away. Hercules, as
fome report, carried him brought him before Euryitheus.

Nany other expluits are faid to have been performed by Hercules; in particular, he accompanied the Argoanuts to Colchis beture he delivered himfelf up to the king of Niycenæ. He affited the guds in their wars againft the giants, and it was through him alone that Jupiter obtained a victory. He conquered Laomedon, and pillaged Troy. When Iole, the daughter of Eurytus king of CEchalia, of whom he was deeply enamoured, was refufed to his intreaties, he became the prey of a fecond fit of infanity, and he murdered. Iphitus, the only one of the fons of Eurytus who favoured his addreffes to Iole. He was fome time after purified of the murder, and his infanity ceafed; but the gods perfecuted him, and he was vifited by a diforder which obliged him to apply to the oracle of Delphi for relief. The coldnefs with which-the Pythia received him irritated him, and he refolved to plunder Apollo's temple and carry away the facred tripod. Apollo oppofed him, and a fevere conflict was begun, which nothing but the interference of Jupiter with his thunderbolts could have prevented. He was upon this told by the oracle that he muft be fold as a flave, and remain three years in the noft abject fervitude to recover from his diforder. He complied ; and Mercury; by order of Jupiter, conducted him to Omphale, queen of Lydia, to whom he was fold as a flave. Here he cleared all the country from robbers; and Omphale, who was aftonifhed at the greatnefs of his exploits, married him. Hercules had Agelaus and Lamon by: Omphale, from whom Crœfus king of Lydia was defcended. He became alfo entmoured of one of $\mathrm{Om}=$ phale's female fervants, by whom he had Alceus. After he had completed the years of his Ilavery, he returned to Peloponnefus, where he re-eltablifhed on the throne of Sparta Tyndarus, who had been expelled by Hippocoon. He became one of Dejanira's fuitors, and married her after he had overcome all his rivals. He was obliged to leave Calydon his father-in-law's' kingdom, becaufe he had inadvertently killed a man with ablow of his fift ; and it was on account of this expulfion that he was not prefent at the hunting of the Calydonian boar. From Calydon he retired to the court of Ceyx king of Trachinia. The king re-' ceived him and his wife with great marks of friendfip, and purified him of the murder which he had committed at Calydon. Hercules was ftill mindful that he had once been refufed the hand of Iole; he therefore made war aganft her father Eurytus, and killed him with three of his fons. lole fell into the hands of her father's murderer, and found that the was loved by Hercules as mech as before. She accompanied him on mount Eta, where he was going to raife an altar and offer a folemn facrifice to Jupiter. As he had not then the fhirt and tunic in which he arrayed himfelf to offer a facrifice, he fent Lichas to Trachin to his wife Dejanira, in order to provide himfelf a proper drefs. Dejanira had fometime before been attempted bythe Cenraur Neffus, as he was ferrying her over the river Euenus ; and Hercules beholding it from the fhore, had given him a mortal wound with an arrow. The monfter finding himfelf dying, advifed her to mix fome oil with the blood which flowad from his wound,

## HER [ 473 ] HER

Fercules. and to anoint her hufband's hirt with it, pretending that it would infallibly fecure him from loving any other woman; and fhe too well apprifed of his inconftancy, had actually prepared the poifoned ointment accord-ingly.-Lychas coming to her for the garments, unfortunately acquainted her with his having brought away Iole; upon which he in a fit of jealoufy, anoint ed his flirt with the fatal mixture. This had no fooner touched his body, than he felt the poifon diffure itfelf through all his veins; the violent pains of which caufed him to difband his army, and to return to Trachin. His torment fill increafing, he fent to confult the oracle for a cure, and was anfwered, that he fhould caufe himfelf to be conveyed to mount Octa, and there rear up a great pile of wood, and leave the reft to Jupiter. By the time he had obeyed the oracle, his pains being become intolerable, he dreffed himfelf in his martial habit, flung himfelf upon the pile, and defired the byftanders to fet fire to ir. Others fay that he left the charge of it to his fon Philoctetes; who having performed his father's command, had his bow and arrows given him as a reward for his obedience. At the fame time Jupiter, to be as good as his word, fent a flafh of lightning, which confamed both the pile and the hero; infomuch that Iolaus, coming to take up his bones, found nothing but ahes: from which they concluded, that he was paffed from earth to heaven, and joined to the gods. His friends thowed their gratitude to his memory by raifing an altar where the burning pile had ftood. Menœetius the fon of Actor offered him a facrifice of a bull, a wild boar, and a geat, and enjoined the people of Opus yearly to obferve the fame religious ceremonies. His worlhip foon became as univerfal as his fame; and Juno, who had once perfecuted him with fuch fury, forgot her refentment, and gave him her daughter Hebe in marriage. Hercules has received many firnames and epithets, eitherfrom the placewhere hisw orfhip was eftablithed, or from the labours which he atchieved. His temples were numerous and magnificent, and his divinity revered. No dogs or flies ever entered his temple at Rome; and that of Gades, according to Strabo, was always forbidden to women and pigs. The Phœenicians offered quails on his altars; and as it was fuppofed that he prefided over dreams, the fick and infirm were fent to fleep in his temples, that they might receive in their dreams the agreeable prefages of their approaching recovery. The white poplar was particularydedicated to his fervice.

It is obferved that there are none even of the twelve great gods of antiquity that have fo many ancient monuments relating to them as Hercules. The famous ftatue of Hercules in the Farnefe palace at Rome, is well known to the connoiffeurs : this reprefents him refting after the laft of his twelve labours above recited, leaning on his club, and holding the apples of the Hefperides in his hand. In this fatue, as in all the other figures of him, he is formed, by the breadth of his fhoulders, the fpacioufnefs of his chell, the largenefs of his fize, and the firmnefs of his mufcles, to exprefs ftrength and a capacity of enduring great fatigue, which conftituted the chiefidea of virtue among the ancient heathens. His other attributes are his lion's fkin, his club, and his bow.-Hercules is reprefented by the ancients as an exemplar of virtue: Vol. VIII.
however, the Herculesbibax, or drunken Hercales, is Hercynia no uncommon figure; and his amours are deforibed both by the poets and artifts. Thus, the Cupids are made to take away his club, and he is exhibited in the pofture of bending under a little boy; by which actions we perceive that he who conquered all difficulties was a flave to love. His children are as numerous as the labours and difficulties which he underwent : and indeed they became fo powerful foon after his death, that they alone had the courage to invade all Peloponnefus. Sce Heraciida.

The apotheofis of Hercules, or the eftablifhment of his altars in the principal cities of Greece, is fixed by Thrafybulus 29 years before the taking of Troy:

Hercules has been paricularly honoured by the Greeks under the name of Mufagetes, "the conductor of the Mufes;'" and at Rome under that of Hercules Mufarum. He is reprefented on medals with a lyre in his hand; and the reverfe is marked with the figure of the nine mufes, with their proper fymbols.

Hercules, in aftronomy, one of the connellations of the northern hemifphere. - The fars in the conftellation Hercules in Ptolemy's catalogue are 29 ; in Tycho's 28 ; in the Britannic catalogue, 113.

Hercules's Pillars, in antiquity, a name given to two lofty mountains, fituated one cin the mof fouthern extremity of Spain, and the other on the oppofite part of Africa. They were called by the ancients Abyla and Calpe. They are reckoned the boundaries of the labours of Hercules; and according to ancient tradition, they were joined together till they were fevered by the arm of the hero, and a communication opened between the Mediterranean and Atlantic fas.

HERCYNIA silva (anc. geog.), the largef of forefts. Its breadth was a journey of nine days to the beft traveller. Taking its rife at the limits of the Helvetii, Nemetes, and Rauraci, it run along the Danube to the borders of the Daci and Anartes, a length of 60 days journey, according to Cæfar, who appears to have been well acquainted with its true breadth, feeing it occupied all Lower Germany. It may therefore be confidered as covering the whole of Germany; and molt of theother forefts may be confidered as parts of it, though diftinguifhed by particular names : confequently the Hartz, in the duchy of Brunforic, which gave name to the whole, may be confidered as one of its parts. The name Hartz denotes "refinons," or " pine-trees." By the Greeks it is called Orcyuizes, as a name common to all the forelts in Germany ; in the fame manner as Hercynius was the name given by the Romaus; and both from the German Hartz.

HERD, among hunters, an affemblage of black or fallow beafts in contradiftinction to flock. See Flock.-In the hunting language there are various terms afed for companies of the divers kinds of game. We fay a berd of harts or bucks, a beoj of rocs, a rout of wolves, a richefs of martins, \& c .

HEREDITAMENTS, whatever noveable things a perfon may have to himfelf and his heirs by way of inheritance; and which, if not otherwife bequeathed, defcend to him who is next heir, and not to the exe. cutor as chattels do.

HEREDITARY, an appellation given to whatever belongs to a family by right of fuccetion from heir to heir.

3 N
He

## HER [474] HE R

Hereditary Hereditary is alfo figuratively applied to good or ill qualities fuppofed to be tranfmitted from father to fon: thus we fay virtue and piety are hereditary qualities in fach a family; and that in Italy the hatred of families is hereditary. And indeed the gout, king's evil, madnefs, \&c. may really be hereditary difeafes.

Hereditary Right, in the Britifl conftitution. The grand fundamental maxim upon which the jus corona, or right of fucceffion to the throne of Britain depends, Sir William Blackfone takes to be this: That the crown is, by common law and conftituional cuftom, hereditary; and this in a manner peculiar to iffelf: but that the right of inheritance may from time to time be changed or limited by act of parliament ; under which limitations the crown fill continues hereditary.
I. The crown is in general hereditary, or defcendible to the next heir, on the death or demife of the laft proprietor. All regal governments muft be either heredirary or clective : and as there is no inftance wherein the crown of England has ever been afferted to be elective, except by the regicides at the infamous and unparalleled trial of king Charles I. it muft of confequence be hereditafy. Yet in thus afferting, an hereditary right, a jure dizino title to the throne is by no means intended. Such a tille may be allowed to have fubfifted under the theocratic eftablifhments of the children of Ifrael in Paleftine : but it never yet fubfifted in any other country; fave only fo far as kingdoms, like other human fabrics, are fubject to the general and ordinary difpenfations of Providence. Nor indeed have a jure divine and an hereditary right any neceflary connection with each other; as fome have very weakly imagined. The titles of David and Jehu were equally jure divino as thofe of either Solomon or Ahab; and yet David flew the fons of his predeceffor, and Jehu his predeceffor himfclf. And when our kings have the fame warrant as they had, whether it be to fit upon the throne of their fathers, or to deftroy the honfe of the preceding fovereign, they will then and not before poffers the crown of England by a right like theirs, immediately derived from heaven. The hereditary right, which the laws of England acknowledge, owes its origin to the founders of our confitution, and to them only. It has no relation to, nor depends upon, the civil laws of the Jews, the Greeks, the Romans, or any other nation upon earth; the municipal laws of one fociety having no connection with, or influence upon, the fundamental polity of another. The founders of the Englifh monarchy might perhaps, if they had thought proper, have made it an elective monarchy ; but they rather chofe, and upon good reafon to eftablifh originally a fucceffion by inheritance. This has been acquiefced in by general confent, and ripened by degrees into common law : the very fame title that every private man mas to his own eftate. Lands are not naturally defcendible, any more than thrones: but the law has thought proper, for the benefit and peace of the public, to eftablifin hereditary facceffion in the one as well as the other.

It maft be owned, an elective monarchy fecms to be the moft obvious, and beff fuited of any to the rational principles of government, and the freedom of human Hatore: and accordingly we find from hiftory, that, in the infancy and firft rudiments of almof every fate,
the leader, chief magiftrate, or prince, hath ufually Hereditary been elective. And, if the individuals who compofe that fate could always continue true to firft principles, uninfluenced by paffion or prejudice, unaffailed by corruption, and unawed by violence, elective fucceffion were as much to be defired in a kingdom as in other inferior commanities. The beft, the wifeft, and the braveft man, would then be fure of receiving that crown which his cndowments have merited ; and the fenfe of an unbiaffed majority would be dutifully acquiefced in by the few who were of different opinions. But hiftory and obfervation will inform us, that elections of every kind (in the prefent fate of human nature) are too frequently brought about by influence, partiality and artifice: and, even where the cafe is otherwife, thefe ; practices will be often fafpected, and confequently charged upon the fuccefsful, by a fplenetic difappointed minority. This is an evil to which all focieties are liable; as well thofe of a private and domeftic kind, as the great community of the public, which regulates and includes the reft. But in the former there is this advantage, That fuch fifpicions, if falfe, proceed no farther than jealoufies and murmurs, which time will effectually fupprefs; and, if true, the injuftice may be remedied by legal means, by an appeal to thofe tribunals to which every member of fociety has (by becoming fuch) virtually engaged to fubmit. Whereas, in the great and independent faciety, which every nation compofes, there is no fuperior to refort to but the law of nature; no method to redrefs the infringements of that law, but the actual exertion of private force. As therefore between two nations, complaining of mutual injuries, the quarrel can only be decided by the law of arms; fo inone and the fame nation, when the fundamental principles of their common union are fuppofed to be invaded, and more efpecially when the appointment of their chief magiftrate is alledged to be unduly made; the only tribunal to which the complainants can appeal is that of the God of battles, the only procefs by which the appeal can be carried on is that of a civil and inteftine war. An hereditary fucceffion to the crown is therefore now eftablifhed in Britain, and moft other conntries, in order to prevent that periodical bloodhed and mifery, which the biftory of ancient imperial Rome, and the more modern experience of Poland and Germany, may how us are the confequences of elective kingdoms.
2. But, fecondly, as to the particular mode of inheritance, It in general correfponds with the fcodil path of defcents, chalked out by the common law in the fucceffion to landed eftates; yet with one or two material exceptions. Like them, the crown will defcend lincally to the iffue of the reigning monarch ; as it did from kiog John to Richard II. through a regular pedigree of fix lineal generations: As in them the preference of males to females, and the right of primogeniture among the males, are ftrictly adhered to. Thus Edward V. fucceeded to the crown, in preference to Richard his younger brother, and Elizabeth his eldeft fifter. Like them, on failure of the male line, it defcends to the iffue female; according to the ancient Britifh cuftum remarked by Tacitus, Solent fominarum ductu bellare, ct fexuminimperiis non difcernere. Thus Mary I. fuccecded to Edward. VI. and the line of Margaret queen of Scots, the danghter of Henry VII.

## HER

$\underbrace{\text { Mereditary }}$ fucceeded, on failure of the line of Henry VIII. his fon. But among the females, the crown defcends by right of primogeniture to the eldeft danghter only and her iffue; and not, as in common inheritances, to all the daughters at once; the cvident neceflity of a fole fucceffion to the throne having occationed the royal law of defcents to depart from the common law in this refpect: and therefore queen Mary, on the death of her brother, fucceeded to the crown alone, and not in partnerlhip with her fifter Elizabeth. Again, the doctrine of reprefentation prevails in the defcent of the crown, as it does in otherinheritances; whereby the lineal defcendants of any perfon deceafed ftand in the fame place as their anceftor, if living, would have done. Thus Richard II. fucceeded his grandfather Edward III. in right of his father the black prince; to the exclufion of all his uncles, his grandfather's younger children. Laftly, on failure of lineal defeendants, the crown goes to the next collateral relations of the late king ; provided they are lineally defcended from the blood-royal, that is, from that royal fock which originally acquired the crown. Thus Henry I. fucceeded to William II. John to Richard I. and James I. to Elizabeth ; being all derivedfrom the Conqueror, who was then the only regal flock. But herein there is no objection (as in the cafe of common defcents) to the fucceffion of a brother, arr uncle, or other collateral relation, of the half-blood; that is, where the relationfhip proceeds not from the fame couple of anceftors (which conftitutes a kinfman of the whole blood), but from a fingle anceftor only; as when two perfons are derived from the fame father, and nor from the fame mother, or vice verfa: provided only, that the one anceftor, from whom both are defcended, be that from whofe veins the blood royal is communicated to each. Thus Mary I. inherited to Edward VI. and Elizabeth inherited to Mary; all born of the fame father, king Henry VIII. but all by different mothers. See the articles Consanguinity, Descent, and Succession.
3. The doctrine of hereditary right does by no means imply an indefeafible right to the throne. No man will affert this, who has conlidered our laws, confitution, and hiftory, withont prejudice, and with any degree of attention. It is unqueftionably in the brealt of the fupreme legillative aurhority of this kingdon, the king and both houfes of parliament, to defeat this hereditary right; and, by particular entails, limitations, and provifions, to exclude the immediate heir, and vefthe inheritance in any one elfe. This is frictly confonant to our laws and conftitution; as may be gathered from the expreffion fo frequently ufed in our ftatute-book, of "the king's majelty, his heirs, and fucceffors." In which we may obferve, that as the word heirs neceffarily implies an inheritance or hereditary right generally fubfifting in the royal perfon; fo the word fuccelfors, diftinctly taken, muft inply that this inheritance may fometines be be broken through; or, that there may be a fucceffor, withour being the hicir of the king. And this is fo extremely reafonahe, that without fuch a power, lodged fomewhere, cur polity would be very defective. For, let us barely fuppofe fin melancholy a cafe, as that the heir-apparent flould be a hunacic, an fdiot, or otherwife incapable of reiguing ; how miferable would the condition of the
nation be, if he were alfoincapable of being fet afide! Hercditary -It is therefore neceffary that this power flhould be lodged fomewhere; and yet the inheritance and regal Hereford. dignity would be very precarious indeed, if this power were exprefsly and avowedly lodged in the hands of the fubject only, to be excrted whenever prejudice, caprice, ordifcontent, fhould happen to take the lead. Confequently it can no where be fo properly lodged as in the two houfes of parliament, by and with the confent of the reigning king; who, it is not to be fappofed, will agree to any thing improperly prejudicial to the rights of his own defcendants. And therefore in the king, lords, and commons, in farliament aflembled, our laws have exprefsly lodged it.
4. But, fourthly, However the crown may be limited or transferred, it ftill retains its defcendible quality, and becomes hereditary in the wearer of it. And hence in our law the king is faid never to die iu his political capacity; though, in common with other men, he is fubject to mortality in his natural : becaufe immediately upon the natural death of Henry, William, or Edward, the king furvives in his fucceffor. For the right of the crown vefts, co inflanti, upon his heir ; either the bares natus, if the courfe of defcent remains unimpeached, or the bares factus, if the inheritance be under any particular fetulement. So that there can be no interregnum; but, as Sir Matthew Hale obferves, the right of fovereignty is fully invefted in the fucceffor by the very defcent of the crown. And therefore, however acquired, it becomes in him abfolurely hereditary, unlef's by the rules of the linitation it is otherwife ordered and determined; In the fame manner as landed eftates, to continue our former contiparifon, are by the law heredirary, or defcendible to the heirs of the owner ; but ftill there exifts a power, by which the property of thofe lands may be tranf. ferred to another perfon. If this transfer be made fimply and abfolutely, the lands will be hereditary in the new owner, and defcend to his heir at law : but if the transfer be clogged with any limitations, conditions, or entails, the lands nuft defcend in that channel, fo limitted and prefcribed, and no other. See Succession.

HEREDITAS jacens, in Scots law. An eftate is faid to be in heridatate jacente, after the proprietor's death till the heir's entry.

HEREFORD, which in Saxon figniffes the ford of the arny, the capital of Herefordnime in England, fituated in W. Long 2. 35. N. Lat. 52. 6. It is fuppofed to have rifen out of the ruins of Kenchenter, in its neighbourhood, which Cambden believes to have been the Ariconium of Antonnius. It is very pleafantly lituated among meadows and corn-fields, and is almoft encompaffed with rivers. It feems to have owed its rife, or at leaft its increafe, to the building and dedicating a church there to Ethelbert king of the Eaft-Angles, who was murdered in the neighbourhood, aud afterwards taken into the catalogue of martyrs; foon after it became a bifhop's fee, and in confequence of that a contiderable place. In 055 it was facked, the cathedral deftroyed, and its billiop Leogar carried away captive by Griffin prince of South Wales, and Algar, an Englifliman, who had rebelled againft Edward the Confeffor: Harold fortified it witha broad an!! high rampart ; and it appears

## HER

Herford, by Doomiday-book, that there were no more than Hereford- 300 men within and without the wall. A very large fhire. and ftrong caftle was built by the Normans along the Wye, and the city walled round. The prefent fately cathedral was founded in the reign of Henry I. by bifhop Reinelm, but enlarged and beautified by his fucceflors. It fuffered much in the barons wars; and was often taken and retaken in the war between king Charles I. and the parliament. This city is pretty large, and had once fix churches; but two were deftroyed in the civil wars. It is not very populons nor well built, many of the houfes being old. Its manufactures are gloves and other leathern goods; andits corporation confifts of a mayor, fix aldermen, a highfteward, deputy-fteward, and town-clerk, who have a fword-bearer, and four ferjeants at mace. Each of the companies enjoys diftinct laws and privileges by their charter, and each has its hall. The cathedral, which was built in 1050, and deftroyed by the Welfh in 1060 , but rebuilt in the reign of the conqueror, or, as fome fay, in that of Henry I. is a beautiful and magnificent flructure, but being greatly decayed, part of it was deftroyed by the fall of the tower in September 1786 , and the fpire on another tower was taken down to be rebuilt at the fame time. Here is an hofpital well endowed for 16 poor people; and two charity fchools, one for 60 boys, the other for 40 girls. The chapter-houle, which was once a very elegant building, built about the year 1079, is now in ruins. Here were formerly two or three priories. Almoft the only drink here is cyder, which is both cheap and good, the very hedges in the country being planted with apple-trees. The city gave long the tidle of earl to the noble family of the Bohuns; then of duke to Henry of Lancafter, afterwards Henry IV. king of England; after him, of earl to Stafferd earl of Buckinglam; then of vifcount to D'Evereax earl of Effex, which a collateral branch of this family ftill enjoys, and is thereby the premier vifcount of England.

Hertfordshire, a county of England, nearly of a circular form, bounded on the eaft by Worcefter and Gloucefter, on the fouth by Monmouthinire, on the weft by Radnorfhire and BrecknockMire, and on the north by Shrophire. Its length from north to fouth is 46 miles, its breadth from eaft to weft 40 , and its circunference 220. It contains 8 market-towns, 87 wicarages, 176 parifhes, and 391 villages, 15,000 houfes, and 97,600 inhabitants. It is divided into 1 I hundreds, and fends eight members to parliament, namely, two knights for the fhire, and two for each of the following towns, Hereford, Lemfter or LeominIter, and Weobly.

The air of this county is allowed to be as pleafant, fweet, and wholefome, as that of any other in England, there being nothing either in the foil or fituation to render it otherwife. The foil throughout is excellent and inferior to none, either for grain, fruit, or pafture, fupplying the inhabitants plentifully with all the neceffaries of life : but that by which it is diftingaifhed from moft others, is its fruit, efpecially apples, of which it produces foch quantities, that the cyder made of them is not only fufficient for their own confumption, though it is their ordinary drink, but alfo in a great meafure for $t$ hat of Londonand other parts. That in particular which is made from the applecalled
redfreak, is much admired, and has a body almoft Herenhauequal to that of white-wine. The county is well fupplied with wood and water; for, belides, leffer ftreams, thereare the rivers Frome, Loden, Lag, Wye, Wadel, Arrow, Dare, and Monow; the laft of which is large, and all of them are well ftored with filh, particularly the Wye, which breeds falmon. It lies in the diocefe of Hereford, and Oxford circuit.

HERENHAUSEN, a palace of Germany near Hanover, belonging to the king of Great Britain. Here are lodgings for all the court; and a garden of yaft extent, in which are fine waterworks, a labyrinth, and many other curiofities worthy the obfervation of a traveller.

HERENTHALS, a town of Brabant in the Auftrian Netherlands, in the quarter of Antwerp; feated on the river Nethe, in E. Long. 4. 51 . N. Lat. 5 t .9.

HERESY, in law, an offence againft Chriftianity, confifting in a denial of fome of its effential doctrines, publicly and obftinately avowed; being defined, "fententia rcrum divinarum humanofenfu excogitata, palame docta et pertinaciter defenfa." And here it muft be acknowledged that particular modes of belief or unbelief, not tending to overturn Chriftianity itfelf, or to fap the foundations of morality, are by no means the object of coercion by the civil magiftrate. What doctrines fhall therefore be adjudged herefy, was left by our old conftitution to the determination of the ecclefiaftical judge ; who had herein a moft arbitrary latitude allowed him. For the general definition of an heretic given by Lyndewode, extends to the fmalleft deviations from the doctrines of the holy church: " hareticus eft qui dubitat de fide catholica, et qui negligit fervare ea, qua Romana ecclefia ftatuit, feu fervare decreverat." Or, as the fatute 2 Hen. IV. c. 15. expreffes in Englifh, " teachers of erroneous opinions, contrary to the faith and blefled determinations of the holy church." Very contrary this to the ufage of the firft general councils, which defined all heretical doctrines with the utmoft precifion and exactnefs. And what ought to have alleviated the punillment, the uncertainty of the crime, feems to have enhanced it in thofe days of blind zeal and pious cruelty. It is true, that the fanctimonious hypocrify of the canonifts went at firft no farther than enjoining pennance, excommunication, and ecclefiaftical deprivation, for herefy; tho' afterwards they procceded boldly to imprifonment by the ordinary, and confifcation of goods in pios ufus. But in the mean time they had prevailed upon the weaknefs of bigotted princes to make the civil power fubfervient to their purpofes, by making herefy not only a temporal, but even a capital, offence; the Romifh eccleliaftics determining, without appeal, whatever they pleafed to be herefy; and fhifting off to the fecular arm the odium and dradgery of executions ; with which they themfelves were tootender and deli. cate to intermeddle. Nay, they pretended tointercede and pray, on behalf of the conviched herelic, ut citra mortis periculum fententia circa eam moderetur: well knowing that at the fame time they were delivering the unhappy vietim to certain death. Hence the capital punifhments inflited on the ancient Donatifts and Manichrans by the emperors Theodolius and Juftinian: hence alfo the conflution of the emperor Frederic mentioned by Lyndewode, adjadgingall perfons with-

## Black. Gomment.

# HER 

Hercfy, out diftingtion to be burnt with fire who were convicted of herefy by the ecclefiaftical judge. The fame emperor, in another conftitution, ordained, that if any temporal lord, when admoniflied by the church, hould neglect to clear his territories of heretics within a year, it fhould be lawful for good catholics to feize and uccupy the lands, and utterly to exterminate the heretical poffeffers. And upon this foundation was built that arbitrary power, fo long claimed and fo fatally exerted by the Pope, of difpofing even of the kingdoms of refractory princes to more duriful fons of the church. The inmediate event of this conftitution was fomething fingular, and may ferve to illuftrate at once the gratitude of the holy fee, and the juft punifhment of the royal bigot ; for, upon the authority of this very conflitution, the pope afterwards expelled this very emperor Frederic from his kingdom of Sicily, and gave it to Charles of Anjou.

Chriftianity being thus deformed by the dæmon of perfecution upon the continent, we cannot expect that our own illand flould be entirely free from the fame fcourge. And therefore we find among our ancient precedents a writ de haretico comburendo, which is thought by fome to be as ancient as the common law itfelf. However, it appears from thence, that the conviction of herefy by the common law was not in any. petty ecclefiaftical court, but before the archbifhop himfelf in a provincial fynod; and that the delinquent was delivered over to the king to do as he fhould pleafe with him : fo that the crown had a controul over the fpiritual power, and might pardon the convict by iffuing no procefs againft him; the writ de heretice comburendo being not a writ of courfe, but iffuing only by the frecial direction of the king in council.

But in the reign of Henry IV. when the eyes of the Chrifian world began to open, and the feeds of the Proteftant religion (though under the opprobious name of Lollardy) took root in this kingdom; the clergy, taking advantage from the king's dubious citle to demand an increafe of their own power, obtained an act of parliament, which fharpenied the edge of perfecurion to its utmoft keenefs. For, by that flatute, the diocefan alone, without the intervention of a fynod, might conviet of heretical tenets; and unlefs the convict abjured his opinions, or if after abjuration he relapfed, the fheriff was bound ex officio, if required by the bifhop, to commit the unhappy victim to the flames, without waiting for the confent of the crown. By the flatute 2 Hen. V. c. 7. lollardy was alfo made a temporal offence, and indictable in the king's courts; which did not thereby gain an exclufive, but only a concurrent, jurifdiction with the bithop's confiftery.

Afterwards, when the final reformation of relig:on began to advance, the power of the ecclefiafics was foméwhat moderated; for though what herefy is, was not then precifely defined, yet we are told in fome points what it is not : the flatute 25 Hen. VIII. c. 14 . declaring, that offences againft the fee of Rome are not herefy; and the ordinary being thereby reftrained from proceeding in any cafe upon mere fufpicion; that is, unlefs the party be accufed by two credible witneffes, or an indietment of herefy be firft previoully found in the king's courts of common law. And yet the firit of perfecution was not yet abated, but ouly diverted into a lay channel. For in fix years afterwards, by
flatute 31 Hcn . Vill. $c$. I4. the bloody law of the fix articles was made, which eftablifhed the lix moft contefted points of popery, tranfubftantiation, conminnion in one kind, the celibacy of the clergy, monallic vows, the facrifice of the mafs, and auricular confeffion; which points were "determined and refolved by the moft godly ftudy, pain, and travail of his majefy; for which his moft humble and obedient fubjects, the lords $\int$ firitual and teniporal and the commons, in parliament affembled, did not only render and give unto his highnefs their moft bigh ard hearty thanks;" but did alfo enact and declare all oppugners of the firft to be herctics, and to be burnt with fire ; and of the five laft to be felons, and to fuffer death. The fame ftatute eftablifhed a new and mixed jurifdiction of clergy and laity for the trial and conviction of heretics; the reigning prince being ther equally intent on defroying the fupremacy of the bifhops of Rome, and eftablifhing all other their corruptions of the Chriftian religion.

Without perplexing this detail with the valious repeals and revivals of thefe fanguinary laws in the two fucceeding reigns, let us proceed to the reign of queen Elizabeth; when the reformation was tially eftablifhed with temper and decency, unfullied with party-rancour, or perfonal caprice and refentment. By ftatute I Eliz. c. i. all former flatutes relating to herefy are repealed, which leaves the jurifdiction of herefy as it ftood at common law ; viz. as to the infliction of common cenfures, in the ecclefiaftical courts; and in cale of burning the heretic, in the provincial fy nod only. Sir Mathew Hale is indeed of a different opinion, and holds that fuch power refided in the diocefan alfo; tho' he agrees, that in either cafe the writ de haretico comburendo was not demandable of common right, but grantable or otherwife merely at the king's difcretion. But the principal point now gained was, that by this ftatute a boundary is for the firft time fet to what thall be accounted herefy; nothing for the futare being to be fo determined, but only fuch tenets, which liave been heretofore fo declared, 1 . By the words of the canonical fcriptures; 2. By the firft four general councils, or fuch others as have only ufed the words of the holy Scriptures ; or, 3. Which hall hereafter be fo declared by the parliament, with the affent of the clergy in convocation. Thus was herefy reduced to a greate: certainty than before; though it might not have been the worfe to have defined it in terms fill more precife and particular ; as a man continued ftill liable to be burnt, for what perhaps he did not underftand to be herefy, till the ecclefiaftical judge fo interpreted the words of the canonical fcriptures.

For the writ de beretico comburendo remained ftill in force ; and we have inflances of its being put in exe. cution upon two Anabaptifts in the feventeenth of $E$ lizabeth, aud two Arians in the ninth of James I. But it was tetally abolifhed, and herefy again fubjected only to ecclefiatical correction, pro falute animee, by virtuc of the ftatute 29 Car. II. c. 9 : for, in one and the fame reign, our lands were delivered from the flavery of military tenure; our bodies from arbitrary imprifonment by the habeas corpus aet; and our minds from the iyranny of fuperftitious bigotry, by demolifhing this laft badge of perfecution in the Englifi law.

Every thing is now as it fhould be, with refpeet to the fpiritual cognizance, and firisual punifment of herefy:

Herefy. $\underbrace{-}$

train; and for the other he fhall feize, and not diftrain. If the lord purchafe part of the tenancy, heriot-fervice is extinguifhed; but it is not fo of keriot-cuftom.

HERISSON, in fortification, a beam arnied with a great number of iron fpikes with their points outwards, and fupported by a pivol on which it, turns. Thefe ferve as a barrier to block up any paffage, and are frequently placed before the gates, and more efpecially the wicket-dours, of a town or fortrefs, to fecure thofe paffages which muft of neceffity be often opened and Thut.

HERITABLE rigrts, in Scots law, fignify all rights affecting lands, houfes, \&c. or any immoveablo fubject.

HERITAGE, in Scots law, lands, houfes, or any immoveable fubject, in contradiftinction to moveables or moveable fubjects. It alfo fometimes fignifies fuch immoveable property as a perfon fucceeds to as heir to another, in contradiftinction to that which he himfelf purchafes or acquires in any other manner, called conqueft.

HERM厌A, in antiquity, ancient Greek feftivals in honour of the god Hermes or Mercury. One of thefe was celebrated by the Pheneata in Arcadia; a fecond by the Cyllenians in Elis; and a third by the Tanagræans, where Mercury was reprefented with a ram upon his floulder, becaque he was faid to have walked thro' the city in that pofture in time of a plague, and to have cured the fick; in memory of which, it was cuftomary at this feltival for one of the moft beartiful youths in the city to walk round the walls with a ram upon his houlder.-A fourth feftival of the fame name was obferved in Crete, when it was ufual for the fervants to fit down at the table while their mafters waited; a cuftom which was alfo obferved at the Roman Saturnalia.

HERMAN (Paul), a famous botanift in the 17 th century, was born at Hall in Saxony. He practifed phyfic in the ifle of Ceylon, ond was afterwards made profeflor of botany at Leyden, where he died in 1695. He wrote a catalogue of the plants in the public garden at Leyden, and a work intitled Florce LugdunoBatavia flores.

HERMANN (James) a learned mathematician of the academy at Berlin, and a member of the academy of fciences at Paris, was born at Bafil in 1678 . He was a grear traveller, and for fix years was profeffor of mathematics at Padua. He afterwards went to Mufcovy, being invited thither by the Czar in 1724. At his return to his native country, he was made profeffor of moraliy $y$ and natural law at Bafil ; and died there in i 733. He wrote feveral mathematical works.

HERMANNIA, in botany : a genus of the pentandria order, belonging to the monodel enia clafs of plants; and in the natural method ranking under the 37 th order, Columnifera. The capfule is quinquelocular; the perals at the bale are femitubulated and oblique.

Species. 1. The lavendulifolia, hath a hrubby ftalk and flender branches, very bubly, about a foot and an half high, finall, fpear-fhaped, obtufe and hairy leaves, with clafters of fmall yellow flowers along the fides of the branches, continuing from Junc to Autumn. 2. The althæifolia hath a fhrubby falk, and foft woolly branches, growing two feet high; with numerous yellow flowers in loofe fikes growing at the end of the
brafches,

Herman. branches, and making their appearance in July. 3. The ftadt groffularifolia hath a firabby falk and fipreading II branches, growing three or four feet high, with bright Hermaphrodite. yellow flowers coming out in great numbersat the ends of all the floots and branches in April or May. 4. The
androgyni, q. d. men-women. See the article Andro= cynes.

In a treatife by Mr Hunter, in the 69th volume of the Philofophical Tranfactions, hermaphrodites are divided into natural and unnatural or monitrous. Thefirft belongs to the more fimple orders of animals, of which there are a mach greater number than of the more perfect. The unnatural takes place in every tribe of animals having diftinct fexes, but is more common in fome than in others. The human fpecies, our atthor inngines, has the feweft; never having feen them in that fpecies, nor in dags; but in horfe, theep, and black cattle, they are very frequent.

From Mr Hanter's account, however, it does not appear that fucha creature as a pérfect hermaphrodite has ever exifted. All the hermaphrodites which he had the opportunity of feeing had the appearance of females, and were generally faved as fach.. In the horfe they are very frequent; and in the moft perfect of this kind he ever faw, the tefticles had come down out of the abdomen into the place where the udder Should have been, and appeared like an udder, not fo pendulous as the fcrotumin the male of fuch animals. There were alfo two nipples, of which horfes have no perfect form; being blended in them with the fheath or prepuce, of which there was none here. The external female parts were exagly fimilar to thofe of a perfect female ; but inftead of a common-fized clitoris, there was one about five or fix inches long; which when erect, ftood alinoft directly backwards.

A foal afs very fimilar to the above was killed, and: the following appearances were obferved on diffection. The tefticles were not come down as in the former, poffibly becaufe the creature was too young. It had alfo two nipples; but there was no penis paffing round the pubes to the belly, as in the perfect male afs. The external female parts were fimilar to thofe of the fheafs. Within the entrance of the vagina was placed the clitoris; but much longer than that of a true female, being about five inches long. The vagina was open a little farther than the opening of the urethra into it, and then became obliterated ; from thence, up to the fundus of the uterus, there was no canal. At the fundus of the common uterus it*was holow, or hed a cavity in it, and then divided into two, viz. a right and aleft, called the borns of the uterus, which were alfo pervious. Beyond the termination of the two. horns were places the ovaria, as in the true female; but the Fallopian tubes could not be found.-F'ron the broad ligaments, to the edges of which the horns of the uterus and ovaria were attached, there paffed towards each groin a part fimilar to the round ligaments in the female, which were continued inta the rings of. the abdominal mufcles; but with this difference, that there were continued with them a procefs or theca of the peritonæum, finilar to the tunica vaginalis communis in the male afs; and in thefe thecra were found the tefticles, but no vafa deferentia could be obferved pafling from them.

In moft fecies of animals, the production of hermophradites appears to be the effect of chance; but in the black cattle it. feems to be an eftablifhed principle of their propagation. It is a well-known fact, and, as far as harh yet been difcovered, appears:

Herma-
phrodite.
alnifolia hath a fhrubby falk and branches growing irregolarly four or five feet high, with pale yellow flowers in fhort fipes from the fides and ends of the branches appearing in April or May. 3. The hyffopifolia hath a fhrubby upright ftalk, branching out laterally fix or feven feet high, with pale yellow flowers in clufters from the fides of the branches, appear. ing in May and June. There are 14 other fpecies.

Culture. All thefe plants are natives of Africa, and therefore muft be kept in a green-houfe during the winter in Britain. They are propagated by cuttings of their young fhoots, which may be planted in pots of rich earth any time from April to July.

HERMANSTADT, a handfome, populous, and frong town of Hungary, capital of Tranfilvania, with a bifhop's fee. It is the refidence of the governor of the province; and feated on the river Ceben, in E. Long. 23. 40. N. Lat. 46. 25.

HERMANT (Godfrey), a learned doctor of the Sorbonne, born at Beauvais in i6r7. He wrote many excellent works; the principal of which are, I. The lives of St Athanafius, St Bafil, St Gregory Nazianzen, St Cliryfoftom, and St Ambrofe. 2. Four pieces in defence of the rights of the univerfity of Pa ris againft the Jefuits. 3. A French tranlation of St Chryfoftom's Treatife of Providence, and St Bafil's A. fcetics. 4. Extracts from the councils; pablifhed after his death, under the title of Glavis difcipline ecclefiafica. He died fuddenly at Paris in 1690.

HERMAPHRODITE, is generally underftood to fignify a human creature poffeifed of both fexes, or who has the parts of generation both of male and female. The term however is applied alfo to other animals, and even to plants.-The word is formed of the Greek Ep $\mu \propto \phi \rho 0$ is ios, a compound of Eppes Mercury, and Aqpofisn Venus; q.d. a mixture of Mercury and Venus, i. e. of male and fcmale. For it is to be obferved, Hernaphroditus was originally a proper name; applied by the heathen mythologifts to a fabulous deity, whom fome reprefent as a fon of Hermes, Mercury, and Aphrodite, Venus; and who, being defperately in love with the nymph Salmafis, obtained of the gods to have his body and hers united into one. Others fay, that the god Hermaphroditus was cenceived as a compofition of Mercury and Venus; to exhibit the union between eloquence or rather commerce, whereof Mercury was god, with pleafure, whereof Venus was the proper deity. Laftly, others think this junction inrended to fhow that Ventas (pleafure) was of both fexes; as in effect, the poet Calvas calls Venas a god. Pollentemque Deum Venerem.
As alfo Virgil, Eneid. lib. ii.
Di/cedo, ac ducente Deo flammam inter at boftes.
Expedior
M. Spon obferves, Hefychius calls Venus Aphroditos: and Theophraftus affirms, that Aphroditos or Venus, is Hermaphroditus; and that in the illand of Cyprus the bas a ftatue, which reprefents her with a beard like : man.-The Greeks alfo call herkap hroditos avdpozeroo

Herma. to be univerfal, that when a cow brings forth two phrodite. calves, one of them a ball, and the other a cow to ap-
pearance, the cow is unfit for propagation, but thic bull-calf becomes a very proper bull. They are known not to breed; they do not even fhow the leaft inclination for the bull, nor does the bull ever take the leaft notice of them. Among the country people in England, this kind of calf is called a free martin; and this fingularity is juft as well known among the farmers as either cow or bull. When they are preferved, it is for the purpofes of an ox or fpayed heifer; viz. to yoke with the oxen, or fattea for the table. They are much larger than either the bull or the cow, and the horns grow longer and bigger, being very fimilar to thofe of an ox. The bellow of a free-martin is alfo fimilar to that of an ox, and the neat is fimilar to that of the ox or fpayed heifer, viz. much finer in the fibre than either the bull or cow; and they are more fufceptible of growing fat with grood food. By fome they are fuppofed to exceed the ox and heifer in delicacy of tafte, and bear a higher price at market; this, however, does not always hold, and Mr Hunter gives an inftance of the contrary. The Romans, who called the bull taurus, fpoke alfo of taura in the feminine gender different from cows. Stephens obferves, that it was thought they meant by this word barren cows, who obtaincd the name becaufe they did not conceive any more than bulls. He alfo quotes a paffage from Columella, lib. vi. cap.22. "And, like the täura, which occupy the place of fertile cows, fhould be rejected or fent a way." He likewife quotes Varro, De re ruffica, lib. ii. cap. 5. "The cow which is barren is called taura." From which we may reafonably conjecture, that the Romans had not the idea of the circumftances of their production.

Of thefe creatures Mr Hunter diffected three, and the following appearances were obferved in the mont perfect of them.-The external parts were rather fmaller than in the cow. The vagina paffed on as in the cow to the opening of the urethra, and then it began to contract into a fmall canal, which paifed on to the divifion of the uterus into the two horns; each horn paffing along the edge of the broad ligament laterally towards the ovaria. At the termination of thefe horns were placed both the ovaria and tefticles, borh of which were nearly abont the fize of a fmall nutmeg. No Fallepian tubes could be found. To the tefticles were vala deferentia, but imperfect. The left one did not come near the tefticle; the right only came clofe to it, but did not terminate in the body called epididymis. They were botl pervious, and opened into the vagina near the opening of tie urethra.-On the pofterior furface of the bladder, or between the uterus and bladder; were the two bags called the veficula $/ e$ minales in the male, but much finaller than what they are in the bull : the ducts opened along with the vafa deferentia.

Concerning hermaphrodites of the human fpecies, much has been written, and many laws enacted about them in different nations; but the exiftence of them is ftill difputed. Dr Parfons has given us a treatife on the fubjeet, in which hecendeayours to explode thenotion as a vulgar error. According to him, all the her. maphrodites that have appeared, were only women whofe clitoris from fome caufe or other was overgrown;
and, in particular, that this was the cafe with an An- Herman gola woman flown ar London as an hermaphrodite $\underbrace{\text { phrodite. }}$ fome time ago.
Among the reptile tribe, indeed, fuch as worms, fnails, leeches, \&c. hermaphrodites are very frequent. In the memoirs of the F'rench academy, we have an account of this very extraordinary kind of hermaphrodites, which not only have both fexes, but do the office of both at the fame time. Such are earth-worms, round-tailed worms found in the inteftines of men and horfes, land-fuails, and thofe of frefh waters, and all the forts of leeches. And, as all thefe are reptiles, and without bones, M. Poupart concludes it probable, that all other infects which have thefe two characiers are alfo hermaphrodites.

The method of coupling practiíed in this clafs of hermaphrodites, may be illaftrated in the inftance of earth-worms. Thefe little creatures creep, two by two, out of the holes proper to receive them, where they difpofe their bodies in fich a manner, as that the head of the one is turned to the tail of the other. Being thus ftrecthed lengthwife, a little connical button or papilla is thruft forth by each, and received into an aperture of the other. Thefe animals, being male in one part of the body, and female in another, and the body flexible withal, M. Homberg does not think it imporfible but that an earch-worm may couple with itfelf, and be both father and mother of its young ; an obfervation which, to fome, appears highly extravagant!
Anong the infects of the foft or bonelefs kind, there are great numbers indeed, which are fo far from being hermaphrodites, that they are of no fex at all. Of this kind are all the caterpillars, maggots, and worms, produced of the eggs of flies of all kinds: but the reafon of this is plain ; thefe are not animals in a perfect ftate, but difguifes under which animals lurk. They have no bufinefs with the propagating of their fpecies, but are to be transformed into animals of another kind, by the putting off their feveral coverings, and then only they are in their perfect ftate, and therefore then only fhow the differences of fex, which are always in the diftinct animals, each being only male or female. Thefe copulate, and their eggs prodace thefe creatures, which fhow no fex till they arrive at the perfect flate again.

Hermaphrodite Flowers, in botany. Thefe are fo called by the fextualifts on account of their containing both the anthere and ftigma, the fuppofed organs of generation, within the fame calyx and petals. Of this kind are the flowers of all the claffes in Linnæus's fexual nethod, except all theclaffes monecia and diecia; in the former of which, male and female flowers are produced on the fame root ; in the latter, in diftinct plants from the fame feed.-In the clafs of polygamia, there are always hermaphrodite flowers mixed with male or female, or both, either on the fame or difinet roots. In the plain-tree the flowers are all hermaphrodite; in fome, however, the anthere or male organ, in others the fligma or female organ, proves abortive. The flowers in the former clafs are nyled $f e$ male hermaptrodites; in the latter, male hermap hrodites. - Hermaphrodites are thus as frequent in the vegetable kingdom as they are rare and farce in the animal one.

HER.

Hormas, Hermes.

HERMAS, an ecclefiaftical author of the firf century; and, according to Origen, Eufebius, and Jcrome, the fane whom St Paul falutes in the end of his epiftle to the Romans. He wrote a book in Greek fome time before Domitian's perfecution, which happened in the year 95. This work is intitled The Paftor, from his reprefenting an angel fpeaking to him in it under the form of a fhepherd. The Greek text is loft, but a very ancient Latin verfion of it is fill extant. Some of the fathers have confidered this book as canonical. The beft edition of it is that of 1698 ; where it is to be found among the other apoftolical fathers, illuftrated with the notes and corrections of Cotelerius and Le Clerc. With them it was tranflated into Englith by Archbifiop Wake, the beft edition of which is that of 1710 .

Hermas, in botany; A genus of the monœecia order, belonging to the polygamia clafs of plants. The umbel in the hermaphrodite is terminal; there is an univerfal involucrum and partial ones. The rays of the fmall umbels are lobed; the central one flower-bearing; there are five petals, and as many barren ftamina; the feeds are two.fuld and fuborbicular. In the male the lateral umbels have univerfal and partial involucra; the fmall umbels are many-flowered; there are five petals, and five fertile ftamina.

HERMES, or Herma, among antiquaries, a fort of fquare or cabical figure of the god Mercury, ufatly made of marble, though fometimes of brafs or other materials, without arms or legs, and planted by the Greeks and Romans in their crofs-ways,

Servius gives us the origin thereof, in his comment on the eighth book of the Æneid. Some fhepherds, fays he, laving one day caught Mercury, called by the Greeks Hermes, alleep on a mountain cut off his hands; from which he, as well as the mountain where the action was done, became deneminated Cyllenius, from suanos maimed: and thence, adds Servius, it is that certain ftatues without arms are denominated Hermefes or Herme. But this etymology of the epithet of Cyllenius contradicts moft of the other ancient authors; who derive it hence, that Mercury was born at Cyllene, a city of Elis, or even on the mountain Cyllene itfelf, which had been thus called before him.
Suidas gives a moral explication of this cuftom of making ftatues of Mercury without arms. The Hermefes, fays he, were fratues of fone placed at the veftibules or porches of the doors and temples at Athens; for this reafon, that as Mereury was held the god of Speech and of truth, fquare and cubical fatues were peculiarly proper; having this in common with truth, that on what fide foever they are viewed, they always appear the fame.

It muft be obferved, that Athens abounded more than any other place in Hermefes : there were abundance of very fignalones in divers parts of the city, and they were indeed one of the principal ornaments of the place. They were alfo placed in the high-roads and crofs-ways, becaufe Mercury, who was the courier of the gods, prefided over the highways; whence he had his furname of Trivius, from trivium; and that of Viacus, via.

From Suidas's account, above cited, it appears, that the termstermini, ufed among usin the door-cafes, balconies, \&c. of our buildings, take their origin from

Vol. VIII.
thefe Athenian Hermefes; and that it was more proper Hermetic to call them bermetes than termini, becaule, though the Romantermini were fquare fones, whereon a head was frequently placed, yet they were rather ufed as landmarks and mere ftones than as ornaments of building. See the articles Mercury and Thoth.

HERMETIC, or Hermetical-Art, a name giveil to chemiftry, on a fuppofition that Hermes Trifmegiftue was the inventor thereof, or that he excelled therein. See Thoth.

Hermetical Philofophy is that which undertakes to folve and explain all the phenomena of nature, from the three chemical principles, falt, fulphur, and mercury.
Hermetical Pbyfic, or Medicine, is that fyftem or hypothefis in the art of healing, which explains the caufes of difeafes, and the operations of medicine; on the principles of the hermetical philofophy, and particularly on the fyftem of alkali and acid.

Hermetical Seat, a manner of fopping or clofing glafs veffels, for chemical operations, fo very accurately, that nothing can exhale or efcape, not even the moft fubtile fpirits. It is porformed by heating the neck of the veffel in the flame of a lamp till it be ready to melt, and then with a pair of pincers twifting it clofe together. This they call putting on Hermes's feal. There are alfo other ways of fealing veffels hermetically; viz. by fopping them with a plug or ftopple of glads, well luted into the neck of the veffel ; or, by curning another ovam philofophicum upon that wherein the matter is contained.
hermharpocrates, or Hermarpocrates, in antiquity, a deity, or figure of a deity, compofed of Meroury, and Harpocrates the god of Silence.
M. Spon gives us a hermharpocrates in his Rech. Cur. de l'Antiquité, p. 98. fig. I 5 . having wings on his feet like Mercury, and laying his finger on his mouth like Harpocrates. It is probable they might mean, by this combination, that filence is fometimes eloquent.

HERMIANI, or Hermiatite, a fect of heretics in the fecond century, thus called from their leader Hermias. They were alfo denominated Seleuciani.

One of their diftinguifhing tenets was, that God is corporal. Another, that Jefus Chrift did not afcend into Heaven with his body, but left it in the fun.

HERMIONE (anc. geog.) a confiderable city of Argolis. It was in ruins (except a few temples) in the time of Paufanias; who fays that the new city was at the diftance of four ftadia from the promontory on which the temple of Neptune ftood. It gave name to the Sinus Hermionicus, 2 part of the Sinus Argolicus.

HERMIT, or Eremit, Eremita, a devout perfon retired into folitnde, to be more at leifure for prayet and contemplation, and to difencumber himfelf of the affairs of this world.-The word is formed from the Greek epn $\mu\left(G_{0}\right.$, defert or wildersefs; and, according to the etymology, fhould rather be wrote Eremit.

Paul furnamed the Hermit, is ufually reckoned the firf hermit; though St Jerome at the beginning of the life of that faint fays, it is not known who was the firf.-Some go back to John the Baptift, others to Elias : others make St Anthony the founder of the eremetical life; but others think that he only rekind-

Mernit led and heightened the fervour thereof, and hold that II the difciples of that faint owned St Paul of Thebes Hermoge- for the firlt who practifed it. The perfecutions of nians. Decius and Valerian are fuppofed to have been the occafion.-Several of the ancient hermits, as St Anthony, \&c. though they lived in deferts, had yet numbers of religious accompanying then.

There are alfo various orders and congregations of religions diftinguifhed by the title of bermits; as, hermits of St Auguatine, of St John Baptift, of St Jerom, of St Paul, \&c.

Hermit (Gaytier Peter the), a French officer of Amiens in Picardy, who quitted the military profeffion, and commenced hermit and pilgrim. Unfortunately he travelled to the Holy Land about the year 1093; and making a melancholy recital of the deplorable fituation of a few chriftians in that country to Pope Urban II, and at the fame time enthufiafically lamenting that Infidels fhould be in poffeffion of the famous city where the Author of Chriftianity firft promulgated his facred doctrines, Urban gave him a fatal conmiffion to excite all Chriftian princes to a general war againft the Turks and Saracens the poffefors of the Holy Land. See Crusades.

HERMHTAGE properly fignifies a little hut or habitation, in fome defert place, where a hermit dwells.

Hermitage is allo popularly attributed to any religious cell, built and endowed in a private and reclufe place, and thus annexed to fome large abbey, of which the fuperior was called bermita.

HERMODACTYL, in the materia medica, a root brought from Turkey. It is of the fhape of a heart flatted, of a white colour, compact, yet eafy to cut or pewder; of a vifcous fwectifh talte, with a light degree of acrimony: Hermodactyls were of great repute among the ancients as a cathartic ; but thofe we now meet with in the fhops have very little purgative virtue; Neumann declares he never found them to have any effect at all.-The hermodactyl is the root of the Colchicum variegatum, according to fome; others fuppofe it to be the root of the Iris tuberofa.

HERMOGENES, the firft and maft celebrated architect of antiquity, was, according to Vitruvios, born at Alanbada, a city in Caria. He built a-temple of Diana at Magnefia; another of Bacchus at Tros; and was the inventor of feveral parts of architecture. He compofed a book on the fubject, which is loft.

Hermogenc:-Tarfenfis, a rhetorician and orator, and who was in every refpect a prodigy. At i 7 years of age he publifhed his fyftem of rhetoric, and at 20 his philofophic ideas: but at 25 he forgot every thing he had known. It is faid, that his body being opened after his death, his lieart was found of an extraordinary dize, and all over hairy. He died about 168 B. C.

HERMOGENIANS, a fect of ancient heretics; denominated from their leader Hermogenes; who lived towards the clofe of the fecond century. Hermogenes eftablifhed matter as his firft principle; and regarding matter as the fountain of all evil, he maintained that the world, and every thing contained in it, as allo. the fouls of men and other firits, were formed by the Deity from an uncreated and eternal mals of corrupt
matter. The opinions of Hermogenes, with regard to the origin of the workd and the nature of the foul, were warmly oppofed by Tertullian.

Hermogenians were divided into feveral branches under their refpective chieftains, viz. Hermiani, Seleu cians, Materiari, \&c.

HERMON, or AERMON (anc. geog.) ; a mountain of the Amorites, called Sanior by the Phonicians, and Sanir or Senir by the Amorites, on the ealt of Jordan. It is alfo called Sion, (Mofes) ; but muft not be confounded with the Sion of Jerufalem. By: the Sidonians it was called Scirion; in the vulgate, it is called Sarion. Johnua informs us, that it was the dominion of Og king of Bafhan; which muft be underftood of its foath fide. It is never particularly mentioned by profane writers; being comprifed under the appellation Libanus; or Antilibanus, with which mountain it is joined to the eaft. It is alfo called Hermonim plurally, Pfalm. xlii. 6. becaufe it was extenfive, and contained feveral mountains.

HERMUS, (anc. geog.), a river of Ionia; which rifing near Dorylæum, a town of Phrygia, in a mountain facrēd to Dindymene or Cybcle, tonched Myfia, and ran through the Regio Combufta, then through the plains of Smyrna down to the fea, carrying along with it the Pactolus, Hyllus, and other lefs noble rivers. Its waters were faid to roll down gold, by Virgil and other poets.

HERNANDRIA, Jack-IN-a-box-thee: A genus of the triandria order, belonging to the monoecia clafs of plants; and in the natoral method ranking under the 38 th order, Tricocce. The male calyx is tripartite; the corolla tripetalous; the female caly $x$ is truncated, quite entire; the corolla hexapetalous; the plum hollow, and open at the mouth or apper part, with a loole kernel.

Species. 1. The fonora, or common jack in-a-box, is a native of both the Indies. It grows 20 or 30 feet high; and is garnifhed with broad peltated leaves, and monccious flowers, fucceeded by a large fwollen hollow fruit formed of the calyx; having a hole or open at the end, and a hard nut within. The wind blowing into the cavity of this fruit makes a very whifling and rattling noife, whence comes the name. 2. The ovigera grows many feet high, garninhed with large oval leaves not peltated; and monœcious flowers, fucceeded by a fwollen fruit at the end, and a nut within.

Ufes. The fonora, in Java, affords a fure antidore againft poifon, if you either put its fmall roots on the wounds or eat thern; as was difcovered to Rumphius by a captive woman in the war between the people of Macafar and the Dutch in the year 1667 . The foldiers of the former always carry this root about them, as a remedy againft wounds with poifonous arrows.

Gutture. Both thefe plants being tender exotics, muft be planted in pots of rich earth, and always. kept in a hot-houfe; in which notwithftanding all the care that can be taken, they feldom flower, and never grow beyond the heiglit of common fhrubs, tho' in the places where they are natives they arrive at the height of trees. They are propagated by feeds procured from the Weft-Indies.

HERNE, a town of Kent, 6 miles from Canterbury, 12 from Margate, and 14 from Eeverfham. It formerly

## HER

Hernia, Hero.
merly had a marktt, and has now a fair on EafterTuefday. The church is a large ancient fructure, with a tower of flint, and has fix tialls ofthe cathedral kind, with divifions of the choir from the nave by a carved freen of oak. The church is 113 feet long. The fone front is very ancient. Here thegreat Dr Ridley, the Englifh martyr, was vicar. Here is a commodious bay, frequented by colliers, \&c.

HERNIA, in medicine and furgery, a defcent of the inteftines or omentum out of their natural place ; or rather, the tumour formed by that defcent, popularly called a rupture. The word is Latin, hernia, and originally fignifies the fame with tumor foroti, called alfo ramex. Prifcian obferves, that the ancient Marfi gave the appellation bernia to rocks; whence fome will have hernias thus called propter duritiem, on account of their hardnefs. Scaliger choofes rather to derive the word from the Greek qpos, ramus, branch. See (Index to) Surgery.

HERNIARIA, RUPTURE-wort : A genus of the digynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 1 Ith order, Sarmentacece. The calyx is quinquepartite ; there is no corolla; there are five barren famina, and a monofpermous caplule.

Species. There are four fpecies, of which the only remarkable one is the glabra, or fmooth rupture-wort, a native of many parts of England. It is a low trailing plant, with leaves like the fmaller chickweed; the lowers come out in clufters from the fide of the Italks at the jeints, and are of a yellowith colour.

Ufes, \&c. This plant is a little faltifh and aftrinsent. The juice takes away fpecks in the eye. Cows, fheep, and horfes, eat the plant ; goats and fwine refufe it.

HERO, in Pagan mythology, a great and illurtrious perfon, of a mortal nature, though fuppofed by the populace to partake of immortality, and after his death to be placed among the number of the gods. The word is formed of the Latin heros, and that of the Greek nfwesfemi-deus, "demi-god."-The Greeks crected columns and other monuments over the tombs of their heroes, and eftablifhed a kind of worthip in honour of the manes both of their heroes and heroines. The Romans alfo raifed fataes in honour of their heroes; but there were fix of their heroes of a fuperior order, and whowere fuppofed to be admitted into the community of the welve great gods : thefe were Hercules, Bacchus, Efculapius, Romulus, Caftor, and Pollux. Writers have diftinguifhed between the worThip which the ancients paid to their heroes and that offered to their gods. The latter, it is faid, confifted of factifices and libations; the former was only a kind of funeral honour, in which they celebrated theirexploits, concluding the rehearfal with feafts.

Hero is alfo ufed in a more extenfive fenfe, for a great, illuftrious, and extraordinary perfonage; particularly in refpect of valour, courage, intrepidity, and other military virtues.
F. Bouhonrs makes this diftinction between a great man and a hero, that the latter is more daring, fierce, and enterprifing; and the former more prudent, thoughtful, and referved. In this fenfe we properly fay, Alexander was a hero, Julius Cæfar a great man.

483 ] HER
Hero of a poem or romance, is the principal perfo- Hcro nage, or he who has the chief part in it. Thus the hero of the Iliad is Achillcs; of the Odyffey, Ulyflus; of the Æneid, Eneas; of Taffo's Jerufalem, Godfrey of Boulogn ; of Milton's Paradife Loft, Adam; though Mr Dryden will have the devil to be Milton's hero, becaufe he gets the better of Adam, and drives him out of Paradife.

Hero, in fabulous hiftory, a famous prieftefs of Venus, lived at Abydos, in a tower fitgated on the banks of the Hellefpont. She being beloved by Leatnder, wholived at Seftos on the other fide of the ftrait, he every night fwam over to vilit her, being directed by a light fixed on a tower. But the light being put out in a formy night, the youth miffed his way, and was drowned ; on which Hero threw herfelf into the fea, and perifhed.
Hero, the name of two celebrated Greek mathematicians.; the one called the old, and the other the young, Hero. The younger was a difciple of Ctefibias. They are known by two works tranlated into Latin by Barochius: Spiralium liber, by Hero fenior; and TraCtat. artis et machin. nilitar. by Herojunior. They flourifhed about 130 and roo B. C.

HEROD, falfely ftyled the Great, king and execrable tyrant of Jadæa; who, on the ftrength of 2 mifinterpreted prophecy, caufed all the male children of Bethlehem and its neighbourhood to be maffacred by his foldiers at the time of the birth of Chrint, in the vain hope of deftroying the Saviour of mankind. He died, eaten with worms, two or three years after the birth of our Saviour, at the age of 71, after a reign of 40 years. He had ordered that all the perfons of quality, whom he kept in prifon, fhould be maffacred the moment the breath was out of his body, in order that every confiderable family in the kingdom might fhed tears at his death; but that inhuman order was not executed.

HERODIAN, an eminent Greek hiftorian, who fpent the greateft part of his life at Rome, flourifhed in the third century, in the reigns of Severus, Caracalla, Heliogabalus, Alexander, and Maximin. His hiftory begins from the death of Marcus Aurelius the philofopher; and ends with the death of Balbinus and Maximin, and the beginning of the reign of Gordian. It is written in very elegant Greek; and there is an excellent tranflation of it into Latin, by AngeIus Politianus. Herodian has been pablifhed by Henry Stephens in 410 , in 158 r ; by Boecler, at Straforg, in 1662, 8 vo ; and by Hndfon, at Oxford, in 1699; 8vo.

HERODIANS, a feet among the Jews at the time of our Saviour ; mentioned Math. xxii. 16. Markiii. G.

The critics and commentators are very much divided with regard to the Herodians. St Jerom, in his Dialogue againft the Luciferians, takes the name to have been given to fuch as owned Herod for the Mefiah : and Tertulian and Epiphanius are of the fame opinion. But the fame Jerom, in his Comment on St Matthew, treats this opinion as ridiculous ; and haintains, that the Pharifees gave this appellation by way of ridicule to Herod's foldiers who paid tribute to the Romans; agreaable to which the Syrian interpreters render the word by the domefics of Herod', i. c. "" his

[^39]
## HER <br> 484 HER

Herodotus, courtiers." M. Simon, in his notes on the 22d chapter of Matthew, advances a more probable opinion. The name Herodian he imagines to have been given to fuch as adhered to Herod's party and intereft; and were for preferving the government in his family, about which were great divifions among the Jews.-F. Hardouin will have the Herodians and Sadducees to have been the fame.-Dr Prideaux is of epinion that they derived their name from Herod the Great, and that they were dintinguifhed from the other Jews by their concurrence with Herod's fcheme of fubjectIng himfelf and his dominions to the Romans, and likewife by complying with many of their heathen ufages and cuftoms. This fymbolizing with idolatry upon views of intereft and worldly policy, was probably that leaven of Herod, againt which our Saviour cautioned his difciples. It is farther probable that they were chiefly of the fect of Sadducees; becaufe the leaven of Herod is alio denominated the leaven of the $\mathrm{S}_{\mathrm{a}}$ dducees.

HERODOTUS, an ancient Greek hiftorian of Halicarnaffus in Caria, fon of Lyxus and Dryo, was born in the firt year of the 74th Olympiad, that is, about 484 B. C. The city of Halicarnalfus being at that time under the tyranny of Lygdamis grandfon of Artemifia queen of Caria, Herodotus quitted his country and retired to Samos; from whence he travelled over Egypt, Greece, Italy, \&c. and in his tra vels acquired the knowledge of the hiftory and origin of many nations. He then began to digeft the materials he had collected into order, and compofed that hiftory which has preferved his name among men ever fince. He wrote it in the ille of Samos, according to the general opinion.-Lucian informs us, that when Herodotus left Caria to go into Grecee, he began to confider with himfelf,

What he fhould do to be for cyer known
And make the age to come his own,
in the moft expeditious way, and with as little tronble as poffible. His hiftory, he prefumed, would eafily procure him fame, and raife his name among the Grecians in whofe favour it was written: but then he forefaw that it would be very tedious to go through the feveral cities of Greece, and recite it to each refpective city ; to the Athenians, Corinthians, Argives, Lacedemonians, \&c. He thought it moft proper therefore to take the opportunity of their affembling all together; and accordingly recited his work at the Olympic games, which rendered him more famous than even thofe who had obtained the prizes. None were ignorant of his name, nor was there a fingle perfon in Greece who had not feen lim at the Olympic games, or heard thofe fpeak of him who had feen him there.

His work is divided intanine books; which, according to the computation of Dionyfius Halicarnaffenfis, contain the moft remarkable occurrences within a period of 240 years; from the reign of Cyrus the firft king of Perfia, to that of Xerxes when the hiftorian was living. Thefe mine books are called after the names of the nine mufes, each book being diftinguifhed by the name of a mufe; and this has given birth to two difquiffions among the learned: 1 . Whether they were fo called by Herodotus himfelf; and, 2. For what reafon they were fo called. As to the firft, ir is generally agreed that Herodotus did not impofe thefe names himfelf; but it is not agreed why they were
impofed by others. Lucian tells us, that thefe names were given them by the Grecians at the Olympic games, where they were firft recited, as the beft compliment that could be paid the man who had taken pains to do them fo much honour.

There is afcribed alfo to Herodotus, but falfely, a Life of Homer, which is ufually printed at the end of his work-He wrote in the Ionic dialect, and his fyle and manner have ever been admired by all people of tafte. There have been feveral editions of the works of this hiftorian ; two by Henry Stephens, one in 1570, and the other in 1592 ; one by Gale at London in 1679; and one by Gronovius at Leyden in 1715, which is the laft and beft, though not the beft printed.

HEROIC, fomething belonging to a hero, or heroine. Thus wefay, heroic actions, beroic virtue, heroic flyle, beroic verfe, heroic poet, heroic age, "\&c.
Heroic Age, is that age or period of the world wherein the heroes, or thofe called by the poets the children of the gods, are fuppofed to have lived-The heroic age coincides with the fabulous age.
Herorc Poem is that which undertakes to defcribe fome extraordinary action, or enterprize. Homer, Virgil, Statius, Lucan, Taffo, Camoens, Milton, and Voltaire, have compofed beroic poens. In this fenfe, heroic poem coincides with epic poem.
HsRoIC Verfe, is that whèrein heroic poems are ufually compofed; or, it is that proper for fach peems. In the Greek and Latin, hexameter verfes are peculiarly denominated beroic perfes, as being alone ufed by Homer, Virgil, \&c. Alexandrine verfes, of 12 fyllables, were formerly called beroic verfes, as being fuppofed the only verfe proper for heroic poetry; bat later writers ufe verfes of ten fyllables.
heroine, Heroina, or Herois, a woman that has the qualities and virtues of a hero, or that has done fome heroic action.

Heron, in ornithology. See Ardea.
This bird is a very great devourer of fing, and will do more mifchief to a pond than even an otter. Some fay that an heren will deftroy morefinh in a week than an otter will in three months; but that feems carrying the matter too far. People who have kept herons, have bad the curiofity to number out the fill they fed them with inte a tub of water; and counting them again afterwards, it has beeni found that a heron will eat 50 moderate-fized dace and roaches in a day. It has been found that in carp-ponds vifited by this bird, one heron will eat up 1000 fore carp in a year, and will hunt them fo clofe that very few can efcape. The readieft method of deftroying this mifchievous bird is by fifhing for him in the manner of pike, with 2 baited hook. The bait confifting of fmall roach or dace, and the hook faftened to one end of a frong line, made of filk and wire twifted together. To the other end of the line is faftened a fone of a pound weight; and feveral of thefe baited lines being funk by means of the ftone in different parts of the pond, in a night or two the heron will not fail of being taken by one or other of them.

HERPES, in medicine, a bilious poftule, which breaking out in different manners npon the fkin, accordingly receives different denominations. See (the Index fubjoined to) Medicing.

HERRERA TORDESilias (Anthony), a Spanifh hiftorian, was fecretary to Vefpalian Gonzara vice-

## H E R

Herrera, roy of Naples, and afterwards hiftoriographer of the

## Herring.

 Indies, under king Philip II. who allowed him a confiderable penfion. He wrote a general hiftory of the Indies, in Spanifh, from 1492 to 1554 ; and of the world (not fo much efteemed), from 1554 to 1598. He died in 1625 , aged about 66.Herrera (Ferdinand de), an eminent Spanifh poet, of the 16 th century, was born at Seville, and principally fucceeded in the lyric kind. Befides his poems, he wrote notes on Garcilaflo de la Vega, and an account of the war of Cyprus; and the battle of Lepanto, \&c.

HERRING, in ichthyology, a fpecies of Clupea.
The name berring is derived from the German heer, an army, which exprefes their number, when they migrate into our feas. Herrings are found in great plenty from the higheft northern latitudes as low as the northern coafts of Fraftce. They are alfo met with in vaft hoals on the coalt of America, as low as Carolina: they are found alio in the fea of Kamtfchatka, and poffibly reach Japan: but the winter rendezvous is within the aretic circle; whether they retire after fpawning, and where they are provided with plenty of infect food. For an account of the remarkable migration of herrings, and the hiftory of the filhery, \&c. fee Clupea and Herring-Fisherr.

They are in full roe at the end of June, and continue in perfection tillthe beginning of winter, when they begin to depofite their fpawn.

There are different names given to preferved herrings, according to the different manners wherein they are ordered: as, I. Sea-fficks; which are fach as are caught all the fifhing feafon, and are but once packed. A barrel of thefe hold fix or eight hundred; eight barrels go to the tun by law; a hundred of herrings is to be a hundred and twenty; a laft is ten thoufand, and they commonly reckon fourteen barrels to the laft.
3. There are others, repacked on fhore, called repacked herings; feventeen barrels of fea-fticks commonly make from twelve to fourteen of repacked herrings. The manner of repacking them is, to take out the herrings, wath them out in their own pickle, and lay them orderly in a frefh barrel : thefe have no falt put to them, but are clofe packed, and headed up by a fworn cooper, with pickle, when the barrel is half full. The pickle is brine; fo frong as that the herring will fwim in it.
3. Summers, are fuch as the Dutch chafers or divers catch from Jund to the 15 th of July. Thefe are fold away in fea-ftocks, to be feent prefently, in regard of their fatnefs; becaufe they will not endure repacking. They go one with another, full and fhotten; but the repacked herrings are forted, the full herrings by themfelves.
4. The Jotten and fick herrings by themfelves; the barrel whereof is to be marked diftinety.
5. Crux herrings: which are fuch as are caught after the 1 th th of September. Thefe are cured with that kind of falt called falt upon falt, and are carefully forted out, all full herrings, and ufed in the repacking.
6. Corved berrings. Thefe ferve to make red herrings, being fuch as are taken in the Yarmonth feas, from the end of Augult to the middle of October : provided they can be carried afhore within a week, more or lefs, after they are taken. Thefe are never
gipped, but rowed in falt, for the better preferving Herring. of them, till they can be brought on hore ; and fuch as are kept to make red herrings are walhed in great vats in frefh water before they are hung up in the herringhangs or red-herring houfes.
As for the manner of falting herrings. The nets being haled on board, the fifhes are taken out, and put into the warbacks, which ftand on one fide of the veffel. When all the nets are thus unloaded, one fills the gippers bafkets. The gippers cut their throats, take out their guts, and fling out the full herrings into one bafket, and the fhotten into another. One man takes the full balket when they are gipped, and carries them to the tower back, wherein there is falt. One boy rows and ftirs them about in the falt, and another takes them, thus rowed, and carries them in bafkets to the packers. Four men pack the herrings into one barrel, and lay them one by one, Itraight and even ; and another man, when the barrel isfull, takes it from the packers. It is left to ftand a day, or more, open to fettle, that the falt may melt and diffolve to pickle; after which it is filled up, and the barrel headed. The pickle is to be ftrong enough to fuftain a herring; otherwife the filh decay in it. See HerringFishery.

Herring (Thomas), archbillop of Canterbury, was the fon of the rev. Mr John Herring, rector of Walfoken in Norfolk, where he was born in 1693. He was educated at Jefus-college, Cambridge; was afterwards chofen fellow of Corpus Chrifti college, and continued a tator there upwards of feven years. Having entered into prieft's orders in 1719 , he was fucceffively minifter of Great Shelford, Stow cum Qui, and Trinity in Cambridge; chaplain to Dr Fleetwood, bihop of Ely; rector of Rectingdon in Ef. fex, and of Barly in Hertfordfhire ; preacher to the Society of Lincoln's Inn, chaplain in ordinary to his late majefty, rector of Bleechingly in Surry, and dean of Rochefter. In 1737 he was confecrated bihop of Bangor, and in $\mathbf{r} 73$ tranflated to the archiepifcopal fee of York. On the death of Dr Potter in 1747, he was tran lated to the fee of Canterbury ; but in 1753 he was feized with a violent fever, which brought him to the brink of the grave; and after langaining about four years, he died on the 3 th of March $1757^{\circ}$. He expended upwards of fix thoufand pounds in repairing and adorning the palaces of Croydon and Lambeth. This worthy prelate, in a moft eminent degree, poffeffed the vircues of public life; his mind was filled with unaffected piety and benevolence, he was an excellent preacher, and a true friend to civil and religions liberty. After his death was publifhed a volume of his fermons on public occafions.

Herrnhut, or Herrnhuth, the firft and moft confiderable fettlement of the United Brethren, commonly called Moravians, fitmated in Upper Lafatia, upen an eftate belonging to the family of Nicholas Lewis, count Zinzendorf, about 50 miles eaft of Drefden. See the article United Brethren.

The building of this place was begun in 1727, by fome emigrants from Moravia, who forfook their pof feffions on account of the perfecution they fuffered, as Proteftants, from the Roman Catholics; and being well received by count Zinzendorf, cleared a fpot of ground allotted to them by him opon the rife of an hill
called

## HER

$\underbrace{\mathrm{H} \text { :rrnhut. called the Hutberg, or Watch-hill, from which they }}$ took occafion to call the new fettlement Herrnhut, or the Watch of the Lord.-More emigrants taking refuge with them, and many other perfons joining their congregations, the buildings increafed confiderably; and at prefent Herrnhut is a regular and well. built village, containing about 1300 inhabitants, all members of the Charch of the United Brethren. Belides the minifter and his affiftants, a warden is appointed, who prefides in the veftry, and fuperintendsthe temporary concerns of the fettement. The Brethren diftinguifh themfelves by a plain and uniform drefs, the women having retained the drefs of the countries from which the firft emigrants proceeded, not from any fiperfitious attachmeltt to old forms, but from a defire to preclude vanity and urelefs expence.-As moft of the fettlements of this community refemble each other, both in the difpofition of their buildings, and in their internal regulations, we will give a fhort fketch of Herrnhit, as the pattern from which the reft were copied, though there are others in which the buildings are more regularly planned.- The chapel, which is fituated in a large fquare, is a facious and neat building, furnihed with a good organ, and moveable forms, but no pews. The men fit on one fide, and and the women on the other, entering at feparate doors. Befides the ufual Sunday's fervice, the con* gregation meets here every evening, and the children every morning. The dwellings of the minitter and warden of the congregation form one, and a fchool-houfe the other, wing to the chapel. From the chapel, an avenue of trees leads to the buryinggreand, which is a large fquare field on the decliyity of the Hutberg, and at fome diftance from the village. Several walks, bordered ly trees, and furnifhed with feats, furround and interfect it. The grave-ftones and graves are all of equal fize, and placed in regular rows; only the vault of Count Zinzendorf, as lord of the manor, is larger than the reft. Burials are performed with great foleminity, but no mourning dreffes ufed.

On one fide of the fquare, in which the chapel ftands, is a large building, inhabited by the fingle men, with work-hlops, out-houfes, and gardens, exclufive of the dwelling rooms. The main building contains a neat chapel, in which a hort morning and cvening fervice is performed for the inhabitants; a dining-hall; and a dormitory, in which each has a feparate bed. The latter is a lofy room, furnilied with large windows and ventilators, fo as to admit and preferve a pure air. For the fick apartments are allotted, and fick waiters appointed. The numa ber of inhabitants in one room is proportioned to its fize, but there are many who have rooms to them* felves. No one lives here by compulfion, each in. habirant p ys for rent and board a moderate fum, fixed by a committee of overfeers in which the warden of the houfe prefides; whofe bulinefs it is to maintain good order, attend to the external welfare of the houfe and its inhabitants, and by his advice and activity, to prevent every evil arifing from external fources. Befides the warden an unmarried clergyman refides in the houfe, appointed to attend to the moral conduct and firitual concerns of all the fingle men belonging to the congregation. He hears their complaints, affilts them with good advice, and ufes
all his infuence for their benefit, and for the preven- Hermhut. tion of any evil that would undermine their Spiritual happinefs. On the other fide of the Cquare is another large building, inhabited by fingle women; with a chapel, dinily-hall, dormitory, and a large garden. The internal' regulations are exactly the fame with thofe of the houfe of the fingle men. There are likewife homfes for widowers and widows, who find in them an agreeable retreat; with board and lodging. The poor are cared for and maintained; for which purpofe, feveral charitable inftitutions exift in the congregation. The manor-houfe, the houfe of count Reufs, the hop and linen warchoufe, are the moft confiderable buildings in Herrnhut; the family houfes are built in regular ftreets opening into the fquare. Both the ftreets and houfes are kept clean ; and befides a watchman at night, an officer is appointed to attend to good order in the day. All frangers are treated with civility; but neither drunken nor dif. orderly vifitors, nor beggars, are fuffered to infeft the ftreets. The latter receivean alms, and are then de: fired to proceed. The principal trade carried on at Herrnhut is in linen; befides which, the work done there by taylors, glovers, hoemakers, cabinet-makers, filverfmiths, and orher artificers, is well known for its good quality. They have their firft prices, and never make any abatement. Every workman receives his wages, $n 0$ community of goods exifting among the brethren, as is falfely fuppofed; and the coneributions towards the fupport of the eftablifhment at large, the miffions, and other charitable inftitutions are voluntary. The building and increafe of this fettlement occalioned no fmall furprife in the adjacent country, and both in 1732,1736 , and 1737 , commif. froners were appointed to examine into the doctrines and proceedings of the Brethren at Herrnhut. The commiffioners made a favourable report; and ever fince both Herrnhut, and other fettlements of the United Brethren in Saxony have been protected, and feveral immunities offered them by the court, but not ace cepted. Herrnhat was vifited in 1766 by the late emperor, Jofeph II. after his return from Dreiden, by the prefent king of Pruffia, and by feveral royal perfonages, who expreffed their fatisfaction in examining its peculiar regulations. The United Brethren have fettlements in Saxony, Silefia, and other parts of Germany, in Holland, Denmark, England, Ireland, and America. In England, their principal fettlements are at Fulnec near Leeds, and Fairfield near Manchefter. In Greenland, Nerth and South America, the Weft Indies, and Rulia, they have miflions for the pro. pagation of Chriftianity among the Hearhen, and in many parts lave had confiderable fuccefs." See Bufching's account of the rife and progrefs of the Church of the Brethren, Halle 178 r . Crantz's Hifory of the Brethren, London 1780.

Herrnaut (New), the firft miffion fettlement of the United Brethren in the illand of St Thomas in the Weft Indies, under the Danim governmear, begun in the year 1739, their miffionaries having endeavoured to propagate Chriftianity among the negro flaves ever fince 1731 ; and fuffered many hardnips and perfe* cutions, from which there converts were not exempted. Many of the planters finding in procefs of time, that the Chriftian flaves were more tractable, moral

## H: ER

Herrnhat, andinduftrious than the heainen; rot only countenanced but encouraged their endeavours. Thefe were Hertzberg: allo greatly facilitated by the protection of the king of Denmark, Cbriftian VI. The fettlement confits of a fpacious negro church, a dwelling-houle for the miffionaries, negro hats, out-houles, and gardens. From this place the illand of St Cr eix and St Jan , were firt fupplied with miffionaries; and the Brethren have now two fettlements in each. The negro converts belonging to their church amoint in thofe three illands to near 8000 fouls.

Herrnhet (New), is alfo the name of the oldeft miffion fettlement of the United Brethren, in Greenland. It is fituated on Ball's river, a few miles from the fea, near Davis's ftraights, on the weftern coaft of Greenland, not far from the Danifh colony Godhaab. The two firft miffionaries were fent from Herrnhut in the year 1733, and their laudable intentions favoured by Chriftian VI. kingof Denmark. They had to ftruggle in this uncultivated, frozen, and favage country with inconceivable hardihips, and found at firt great difficulty in acquiring the language of the natives. However, after fix years labour and perfeverance, they had the fatisfaction to baptize four perfons, all of one family; and from that time the miffion began to profper, fo that in the fucceeding years two other fetttements were begun, called Lichtenfels and Lichtenan: all of them continue in profperity. About 1300 of the natives have been chriftianized fince the beginniug of this miffion. See Crantz's Hiffory of Greenland, London, 1777.

HERSE, in fortification, a lattice, or portcullis, in form of an harrow, befer with iron fpikes. The word berfe is French, and literally fignifies " harrow;" being formed of the Latin berpex or irpex, which denotes the fame.

It is ufually hung by a rope faftened to a moulinet; to be cur, in cale of furprife, or when the fird gate is broken with a petard, that the herfe may fall and fop up the paffage of the gateor otherentrance of a fortrefs.

The lierfe is otherwife called a farrafin, or cataradt; and when it confifts of ftraight ftakes, without any crofs pieces, it is called orgues.

Herse, is alfo a harrow, which the befieged, for want of chevaux de frife, lay in the way, or in breaches, with the points up, to incommode the march as well of the horfe as of the infantry.

HERSILLON, in the military art, a fort of plank or beam, ten or twelve feet long, whofe two fides are drove full of fikes or nails, to incommode the march of the infantry or cavalry. The word is a diminutive of her $/ e$; the herfillon doing the office of a little herfe. See Herse.

## HERTFORD. See Hartford.

HERTHA, or Herthus, in mythology, a deity worhipped by the ancient Germans. This is mentioned by Tacitus, in his book De Moribus Germanorum, cap. 40. Voffus conjectures, that this goddefs was Cybele, but the was more probably Terra or the Earth; becaufe the Germans ftill ufe the word bert for the earth, whence alfo the Englifh earth. Some have fuppofed that Stonehenge was a temple confecrated to the goddefs Herta.

HERTZBERG, a confiderable town of Germany, in the electorate of Saxony, and on the confines of Lufalia. E. Long. 13. 37. N. Lat. 5 1. 42.

## H E R

HERVEY (James), a late divine of exemplary piety, was born in 1714 , and fucceeded his father in the livings of Wefton Flavell and Collingeree in North- other, he attended alternately with his carate; till being confined by his ill health, he refided conflantly at Wefton; where he diligently purfued the labours of the miniftry and his ftudy under the difadvantage of a weak conftitution. He was remarkably charitable; and defired to die juft even with the world, and to be, as he termed it, his own executor. This excellent divine died on Chriftmas-day 1758 , leaving the litule he poffeffed to buy warm clothing for the poor in that fevere feafon.-No work is more generally or defervedly known than his Meditations and Coutemplations: containing Meditations among the Tombs, Reflections on a Flower-garden, a Defcant on Creation, Contemplations on the Night and ftarry Heavens, and a Win ter-piece. The fublime fentiments in thefe pieces have the peculiar advantage of being conveyed in a flowing, elegant language, and they have accordingly gone thro ${ }^{*}$ many editions. He publifhed befides, Remarks on Lord Bolingbroke's Letters on Hiftory; Theron and Afpafio, or a Series of Dialugues and Letters on the nog important Subjects; fome fermons, and other tracts.
$H_{E R V E Y}$-Ifand, one of the South-Sea illands, difcovered by Captain Cook, September 23. 1773, who gave it that name in honour of the earl of Briftol. It is a low illand, fituated in W. Long. 158. 54.S. Lat. 19.8.

HESBON, Esebon, or Hefebon (anc. geog.), the royal city of the Amorites, in the tribe of Reuben, according to Mofes: Though in Jofhua xxi. 39. where it is reckoned among the Levitical cities, it is put in the tribe of Gad; which argues its fituation to be on the confines of both.

HESIOD, a very ancient Greek poer; but whether cotemporary with Homer, or a little older or younger than he, is not yet agreed among the learned; nor is there light enough in antiquity to fettle the matter exactly. His father, as he tells us in his Opera et dies, was an inhabitant of Cuma, one of the Eolian ifles, now called Taio Nova; and removed from thence to Afcra, a little village of Bœotia, at the foot of mount Helicon, where Hefiod was probably born, and called, as he often is, Afcreus, from it. Of what quality his father was, is nowhere faid; but that he was. driven by his misformes from Cumæ to Afcra, Hefiod himfelf informs us. His father feems to have profpered betterat Afcrathan he did in his own country; yet Hefiod could arrive at no higher fortu:ge than keeping fheep at the top of mount Helicon. Here the mufes met with him, and entered him into their fervice:

> Erewhile as they the fhepherd fwain behold, Feeding beneeth the facred mount his fold, With love of charming fong his breaft they fir'd, There me the heav'nly mufes firt infpir'd;
> There, when the maids of Jove the filence broke,
> To Hefiod thus, the fhepherd fwain, they fpoke, \&cc.

To this account, which is to be found in the begine. ning of his Generatio Deorum; Ovid alludes in thefe two lines:

> Neci mibi funt vifi Clio;' Chiufque forores; Servanti pecudes vallibus, Afcrà, tuis.
> Nor Clio nor her fifters have I feen,
> As Hefiod faw them in the Afcran green.

## HES <br> [ 48 <br> HES

Hefper On the death of the father, an eftate was left, which ought to have been equally divided between the two brothers Hefiod and Perfes; but Perfes defrauded him in the divition; by corrupting the judges. Hefiod was fo farfrom refenting this injuftice, that he exprefles a concern for thofe miftaken mortals who place their happinefs in riches only, even at the expence of their virtue. He lets us know, that he was not only above want, but capable of allifting his brother in time of need; which he often did though he had been fo ill ufed by him. The laft circumftance he mentions relating to himfelf is his conqueft in a poetical contention. Archidamus, king of Eubœa had inftituted funcral games in honour of his own memory, which his fons afterwards took care to have performed. Here He. fiod was a competitor for the prize in poerry; and won a tripod, which he confecrated to the mules. Hefiod having entered himfelf in the fervice of the mufes, left off the paftoral life, and applied himfelf to the ftudy of arts and learning. When he was grown old, for it is agreed by all that he lived to a very great age, he removed to Locris, a town about the fame di-* ftance from mount Parnaffus as Afcra was from Helicon. His death was trägical. The man with whom he lived at Locris, a Milefian born, ravihed a maid in the fame houle; and though Hefiod was entirely ignorant of the fact, yet being malicioully accufed to her brothers as an accomplice, he was injurioully flain with the ravifher, and thrown into the fea. The Theogony, and Works and days; are the only undoubted pieces of this poet now extant : though it is fuppofed that thefe poems have not defcended perfect and finifhed to the prefent time. A good edition of Hefiod's works was publifhed by Mr Le Clerc at Amfterdam in 1 yor.

Hesper, Hesperus, in afronomy, the evening ftar; an appellation given to Venus when fhe follows or fets after the fun. The word is formed of the Greek E $\sigma \pi$ spos; and is fuppofed to have been originally the proper name of a man, brother of Atlas, and father of the Hefperides.

Diodorus, lib. iii. relates, that Hefperus having afcended to the top of mount Atlas, the better to obferve and contemplate the ftars, never returned more; and that hence he was fabled to have been changed into this ftar.

HESPERIA, an ancient name of Italy; fo called by the Greeks from its weftern fituation. Hefperia was alfo an appellation of Spain ; but with the epithet zuttima (Horace), to diftinguifh it from Italy, which is called Hefperianagna (Virgil), from its extent of empire.

HESPERI cornu, called the Great Bay by the author of Hanno's Periplus: but noft interpreters, following Mela, underftand a promontory ; fome Cape Verd, others Palmas Cape: Voffius takes it to be the former, fince Hanno did not proceed fo far as the latter cape.

HESPERID届, in botany, (from the He/porides) golden or precious fruit : the name of the igth order in Linnæus's Fragments of a Natural Method. See Botany, p. 46 I .

HESPERIDES, in the ancient mythology, were the daughters of Hefper or Hefperus, the brother of Atlas. According to Diodorus, Hefperns and Atlas
two brothers, who poffeffed great richesin the weftern Hefperidet parts of Africa. Hefperus had a daughter called Herperia, who married her uncle Atlas, and from this marriage proceeded feven daughters, called $\mathrm{He} / \mathrm{per}$ ides from the name of their mother, and Atlantides from that of their father. According to the poets, the He/perides were three in number, Ægle, Arethula, and Hefperthufa. Hefiod, in his Theogony, makes them the daughters of Nox, Night, and feats them in the fame place with the Gorgons; viz. at the extremities of the weft, near mount Atlas; it is on that account he makes them the daughters of Night, becaufe the fun fets there. The Hefperides are reprefented by the ancients as having the keeping of certain golden apples, on the other fide the ocean. And the poets give them a dragon to watch the garden where the fruit grows: this dragon they tell us Hercules flew, and carried off the apples. - Pliny and Solinus will have the dragon to be no other than an arm of the fea, wherewith the garden was encompalfed, and which defended the entrance thereof. And Varro fup. pofes, that the golden apples were nothing but hheep. Others, with more probability, fay they were oranges.

The gardens of the Hesparides are placed by fome authors at Larach, a city of Fez ; by others, at Bernich, a city of Barca, which tallies better with the fable. Others take the province of Sufa in Morocco for the illand wherein the garden was feated. And, Iaftly, Rudbecks places the Fortunate Iflands, and the gardens of the Hefperides, in his own country, Sweden.

HESPERIDUM insuif (anc. geog.), iflands near the Hefperi Cornu; but the accounts of them are fo much involved in fable, that nothing certain can be affirmed of them.

HESPERIS, Rocket, Dame's Violet, or queen's gilliflower: A genus of the filiquofa order, belonging to the tetradynamia clafs of plants; and in the natural method ranking under the 39 th order, Siliquofa. The petals are turned obliquely; there is a glandule with in the fhorter famina; the filiqua almolt upright; the ftigma forked at the bafe, connivent, or clofing at the top : the calyx clofe.

Species 1. The matronalis, or common fweet fcented garden-rocket, hath fibrous roots, crowned witha tuft of long, fpear fhaped, rough leaves; upright, fingle, hairy falks two feet high; garnifhed with oval, lanceolate, flightly indented, clofe-fitting leaves; and the ftalk and branches terrinated by large and Iong fpikes of fweet-fcented flowers of differentcolours and properties in the varieties, of which there are a great number. All the varieties of this feecies are fo remarkable for imparting a fragratt odour, that the ladies were fond of having them in their apartments. Hence they derived the name of dame's viotet; and, bearing fome refemblance to a fock-gilliflower, were fometimes alfo called queen's.gilliflower; but are now molt commonly called rocket. 2. The inodora, or fcentlefs rocket, hath a fibrous root; upright, round, firm ftalks, two feet high, garnifhed with fpear-fhaped, acute-pointed, fharply indented, clofe-fitting, leaves; and all the branches terminated by large fpikes of fcentlefs flowers, with obtufe petals, of different colours and properties in the varieties. This fpecies

## HES

Hefperus, makes a fine appearance, but hath no fcent. 3. The Hefle. tri/tis, or dull-flowered night-fmelling rocket, hath fibrous roots; upright, branching, fpreading, briftly ftalks, two fect high; fpear-haped pointed leaves; and fikes of pale purple flowers, of great fragrancy in the evening.

Culture. All the fpecies are hardy, efpecially the firft and fecond, which profper in any of the open. borders, and any commen garden-foil; but the third, being rather impatient of a fevere froft, and of much moifture in winter, fhould have a dry watm fituation, and a few may be placed in pots to be fheltered in cafe of inclement weather. They may be propagated either by feeds, by officts, or by cuttings of the ftalks.

HESPERUS, in fabulous hiftory, fon of Cephalus by Aurora, as fair as Venus, was changed into a ftar, called Lucifer in the morning, and Hefperus in the evening. See Hesper.

HESSE, a country of Germany, in the circle of the Upper Rhine; bounded on the fouth by the bifhopric of Fulda; on the eaft by the principality of Hersfeld, Thuringia, and Eichsfeld, as alfo by that of Calenburg; on the north-fide by the bifhopric of Pa derborn and Waldek, the duchy of Weftphalia, and the county of Witgenftein; and on the weft by NaffauDillenburg, the county of Solins, and Upper-Ifenburg. In the above limits, the county of Kazzenellnbogen and fome other territories are not included. The whole country, in its utmoft length, is near 100 miles, and in fome places near as much in breadth. The air is cold, but wholefome; and the foil fruitful in corn, wine, wood, and pafture. The country abounds alfo in cattle, fifl, and game; fait-fprings, baths, and mineral waters. The hills, which are many, yield filver, copper, lead, iron, alum, virriol, pir-coal, fulphur, boles, a porcelain earch, marble, and alabafter. In the Eder gold is fometimes found; and at Frankenberg a gold mine was formerly wrought. Befides many leffer ftreams, Heffe is watered by the following rivers, wiz. the Laen, the Fulda, the Eder or Schwalm, the Weroa or Wefer, and Diemel. The Rhine alfo and the Mayne pafs through the country of Katzenellnbogen. This country, like moft others in Germany, has its ftate, confifting of the prelates, as they are called, the nobility, and the towns. The diets are divided into general and particular, and the latter into the greater and fmaller committees. The houfe of Hefle is divided into two principal branches, viz. Caffel and Darmftadt, of which, Philipf(dale Rhinfeldts, and Homburg, are collateral branches; the two firft of Heffe-Caffel, and the laft of Heffe-Darmftadt. Their rights and privileges are very confiderable. In particular, they have feveral votes at the diets of the enmpire ; and caufes, not exceeding 1000 florins, are determined by the courts of the country, withouf appeal. The princes of Heffe-Caffel are not of age till they are 25 , but thofe of Heffe-Darmftadt are fo at 18 . The right of primogeniture hath been eftablifhed in both houfes. The revenues of Darmftadt are faid to amount to near 100,000l. a-year, and thofe of HeffeCaffel to near 200,000l. The fmall county of Schaumberg alone yields a revenue of 10,0001 . and that of Katzenellnbogen, with the forefts of Richardfwalde, it is faid, was farmed near 200 years ago at 12,0001 . Vol, VIII.

## $489]$

The prince of Hefle-Caffel has 40 or 50,000 men in his dominions fit to bear arms; and the troops that he hires out have often brought him in large fums, efpecially from Great Britain. He keeps a ftanding a:my of 15,000 men. This family is allied to moft if not all the Proteftant princes in Europe. The branches of Caffel, Homburg, and Philipidale, are Calvinifts ; that of Darmitadt, Lutherans; and that of Rhinfeldts, Roman Catholics. The prefent prince of Heffe-Caffel, indeed, in the year 1749 , embraced the Roman Catholic religion; but in 1754 drew up, and confirmed by oath, an inftrument, of which all the Proteftant princes are guarantces, declaring that the eftablifhed religion of his dominions fhould continue int every refpect as before, and that his children fhould be brought up and inftructed therein. Here, as in the other Proteftant Lutheran countries of Germiany, are confiftories, fuperintendants, and infpectors of the church. In the whole langraviate are three univerfities, befides Latin fchools and gymmafia, for the education of youth. The manufactures of Heffe are linen cloth, hats, ftockings, gloves, paper, goldfmiths wares; and at Caffel a beautiful porcelain is made. They have alfo the fineft wool in Germany; but are reproached with want of induftry, in exporting inftead of manufacturing it themfelves.-This is fuppofed to have been the country of the ancient Catti, mentioned by Tacitus, \&c. who, in after-ages, were called Chat $i=$, Chaff, Haff, and Heff. The two chief branches of Cafrel and Darmftadt have many rights and pi ivileges in common, which we have not room to fpecify. Both of them have a feat and vote in the college of princes at the diet of the empire, and thofe of this circle. Each of thefe princes, befides their guards and militia, inaintains a confiderable body both of horfe and foot.

HESSIAN FLY, a very mifchievousinfect whichlately made its appearance in N.America; whofe depredations have materially injured the crops of wheat. It is, in its perfect ftate, a fmall winged infect ; but the mifchief it does is while in the form of a caterpillar; and the diffisulty of deftroying it is increafed by its being as yet unknown where it depofits its eggs, to be hatched before the firft appearance of the caterpillars. Thefe mifchie vous infects begin their depredations in autumn, as foon as the wheat begins to fhoot up through the ground. They devour the render leaf and ferm with great voracity, and continue to do fo till fopped by the froft; but no fooner is this obitacle removed by the warmth of the fpring, but the fly appears again, laying its eggs now, as has been fuppofed, upon the ftems of the wheat juft beginming to fpire. The caterpillars, hatched from thefe eggs, perforate the ftems of the remaining plants at the joints, and lodge themfelves in the hollow within the corn, which fhows no fign of difeafe till the ear begins to turn heavy. The ftems then break; and being no longer able to perform their office in fupporting and fupplying the ears with nourrimment, the grain perifhes about the time that it goes into a milky fate. Thefe infects attack alfo rye, barley and timothy-grafs, though they feem to prefer wheat. The deftruction occafioned by them is defcribed in the American Mufeum for February 1787 , is in the following words: "It is well known that all the crops of wheat in all the land over which it has cxtended,

Het., Heffiais $1 \%$.

Hefran liave fallen before it, and that the farmers beyond it
Fly. diead its approach; the profpect is, Liat unlefs means are difcovered to prevent its progrefs, the whole continent will be over-run;-a calamity more to be dreaded than the ravages of war."

This terrible infect appeared firft in Long Illand during the American war, and was fuppofed to have been brought from Germany by the Heliians; whence it had the name of the Heffian fy. From thence it has proceeded indand at the rate of about 15 or 20 miles annually; and by the year 1789 had reached 200 m les from the place where it was firft obferved. At that time it continued to proceed with unabating increafe; being apparently fopped neither by rivers nor mountains. In the fly fate it is likewife exceedingly troublefome ; by getring into houfes in fwarms, falling iato victuals and drink; filling the windows, and dyying perpetually into the candles. It ftill continued to infeft Long Illand as much as ever; and in many places the culture of wheat was entirely abandoned.

The American States are likewife infefted with another mifchievous infect, named the Virgiwian-wheatfly. This, however, has not yet paffed the river Delaware; though there is danger of its being gradually inured to colder climates fo as to extend its depredations to the northern States alfo. But it is by no means the fame with the Heffian fly. The wheat-fly is the fame with that whofe ravages in the Angumois in France are recorded by M. du Hamel; it eats the grain, and is a moth in its perfect ftate. On the other hand, the Heilian fly has been hitherto unknown to naturalifts; it eats only the leaf and ftalk; and, in its perfect ftate, is probably a tenthredo, like the black negro-fly of the turnip.

As of late years great quantities of wheat were exported from America into Britain, it became an object worthy of the atrention of government to confider how far it was proper to allow of fuch importation, Left this deftractive infect might be brought along with the grain. The matter, therefore was fully canvalfed before the privy council; and the following is the fubftance of the information relative to it ; and in confequence of this, the importation of American wheat was forbidden by proclamation.

1. By a letter, dated 22d April 1788 , Mr Bond, con. ful at Philadelphia, informed the marquis of Caermarthen, that there was a defign to export wheat from thence to England; that the fly had made great depredations ; and that there might be danger of its thus being conveyed acrofs the Atlantic. He added, that it was not known where the eggs of the infect were depolited, though it was fuppofed to be in the grain. Steeping the feed in elder juice he recommended as an effectual remedy and prefervative of the crop.
2. In confequence of this information his Lordflip wrote to Sir Jofeph Banks, prefident of the royal fociety, defiring him to enquire as much as pofible concerning the infect, both with regard to its natural hiftory, and the method of preventing its ravages. In this refearch, however, that learned gentleman mifwook the infect called the flying weevil for the He flasn-fly.

## - See <br> Waval:

ent infeet, viz. the flying weveit; that the danger of
importing this infect was much gitater then that of the importing this infect was much greater then that of the Heflian fly. The corn already brourht fromi Ameri-

Hefliam
Fly. ca, he was of opinion, might eafily be examined and a difcovery made whether the fly had been chere. Among other methods which might be ufed for this purpofe, that of putting the corn anong water was one, when the infected grains would rife to the top, and might then be opened and examined. Some flight trials of that kind he had alreedy made; and found manifeft figns of the fly in fome grains which he had opened.
3. A farther account of the infect was given by Dr Mitchel, in confequence of the abovementioned letter from the marquis of Caermarthen. According to him it was firft difcovered in the year 1776, on. Staten Iland, and the weft end of Long Iilane ; fince that time it proceeded regularly througt the fouthern diftrict of the fate of New York, part of Connecticut ; and at thetime of giving the account, July 1788 , had got into New Jerfey. As it appeared about the time that the Heffian troops arrived, an opinion had gone abroad that they brought it along with them; but the Doctor was of opinion that it is a native arrimal, nourifhed by fome indigenous plant, but which then, for the firft time, came among the wheat, and found it proper food. He had feen the caterpillar, chryfalis, and fly, but never could find the egg, or difcover where it is depolited. The caterpinlar appears, as has already been faid, in autumn, and, after having devoured the tender ftalk, foon becomes a chryfalis, coloured like a flax-feed; which, being fixed between the leaf and the ftalk, injures the plant by its mechanical preffure: from this proceeds the fly, which is either able of iffelf to fuftain the intenfe winter frofts, or lays eggs capable of doing it. Early in the fpring, the caterpillar appears again, even when the heat is farce fufficient to make the wheat grow; its ravages, therefore, are at this period particularly. deftructive; and it paffes through its metamorphofes with fucli fpeed, as to produce a third generation while the wheat is yet tender and juicy; however, as the corn has by this time grown confiderably, the third generation is not to deftructive as the fecond. It hurts chiefly by rendering the ftraw weak, and liable to break down when loaded afterwards by the weight of a full ear; " and fometimes (fays the Doctor) it will be infefted by the fourth fwarm before harveft."
4. In another communication of Sir Jofeph Banks, dated July 24. 1778 , he makes fome general obfervations on the nature of thofe caterpillars from which flying infects praceed; and to which clafs both the flying weevil and Heffian fly belong. Nature, he obferves, has provided againft the kinds of danger thefe tender infects are moft likely to meet with. Thus, in climates where the winters are fevere, the eggs of the moft tender infects refift the force of the ufual froft; in feafons of remarkable feverity, indeed, fome are deftroyed; but a fufficient number always efcape for propagating the fpecies. The young caterpillar, if hatched before its proper food bo ready, will furvive even weeks before it perifies for want of nouriffiment; and in fome few inftances where it is hatched in the autumn, it is directed by inftinet to fpin a web, in which it remains torpid and without food daring the whoie winter

## HES [ 491] HES

winter. The chryfalis, though deprived of loco-motion, is capable of refifting various dangers arifing from cold, heat, wet, \&c. and the length of time which the animal remains in that fate is capableof very confiderable extention. The complete animal, tender as it appears, and intended to exift no longer than is neceffary to fultil the bulmefs of propagation, which, in fome fpecies is gone through in a few days, neverthelefs is capable, in fone inftances, of enduring the utmont variation of climate ; and if, by accidental circumftances, the fexes are prevented from meeting, its fhort life is extended to many times the amount of its ufual duration.

The obfervations on the fly made by Sir Jofeph in this paper, are not different from thofe already related; only he difents from the opinion of Mr Bond, that the eggs are laid on the grain ; thinking it more probable from analogy, that they are depofited on the ftraw; and being fhaken off from thence by the ftrokes of the flail in thredhing, are mixed with the corn; from whence it muft be very difficult to feparate them. Hence he concluded, that there was an apparent and wery great rifk of importing the eggs along with the corn ; and there was no doubt, that when once they had got a footing, they would eftablifh themfelves in Britain as well as in America. It muft be obferved, however, that none of the grain which was examined thowed any figns of this fly, its eggs, or caterpillars; fuch infects as were found in fome deceafed fpecimens being only the weevils commonin England as well as in other countries; though fome which were infpected in the month of Auguft this year contained the chry falis of fome infects, which Sir Jofeph Banks was of opinion might be the flying weevil ; and as he did not know whether thefe would revive or not, he gave it as his opinion, that the cargo in which they were found onght not to be fuffered to come into the kingdom.
5. In order to procure all the intelligence that could be had concerning thefeinfects, the duke of Dorfet addreffed a letter to the royal fociety of agriculture in France, to know whether any of them exift in that country. The report of the fociery was accompanied with a drawing of two infects; one of which was fuppoled to be the caterpillar of the Heffian fly, from its attacking the wheat only when in the herb; beginning its ravages in autumn, reappearing in the fpring, and undergoing the metamorphofis already mentioned. "That infect (fay the fociety) whofe havoc has been well known in America only fince 1776, does not appear to differ from it, as well as we can judge from a very fhort defcription of thofe which have been obferved in the north, and of which the hiftory is contained in the different volumes of the academy of fciences of Stockholm. We know that there exift in France caterpillars whofe manner of living refembles that of thofe infects; but the mifchief which they do to corn having never been coniderable enough to attract the attention of governmeut, and not having been ourfclves engaged in following in deail the hiftory of that fpecies of caterpillar; we regret not beingable to fay any thing particular upon that fubject." Thereft of the report contains an acconnt of the tiying weevil.
6. Further recourfe was now had to America for information. The marquis of Cacrmarthen wrote to Sir Joln Temple at New York, the Britifh conful ge-
neral; and this gentleman applied to colonel Morgan Heffan who had been more curions with refpect to this infect than any other perfon with whom he was acquainted. His account was, that the Heflian fly was firft introduced into America by means of fome flraw made ufe of in package, or otherwife landed on Long Inand at an early period of the late war; and its firit appearance was in the neighbourhood of Sir Willim Howe's debarkation, and at Flat Bufh. From thence it fpread in every direction, but at firft very lowy; and it was not till the year 1786 that they reached Mr Morgan's farm, fituated not quite 50 miles from New York. No damage was done the firft feafor:, and very little the fecond; but in 1788 they were materially damaged, and in fome places totally deftroyed all round. "' The name of Heffian fly (fays Mr Morgan) was given to this infect by myfelf and a friend early after its firft appearance on Long Ifland." In a letter to General Wafhington, dated July 3 ift I 788, Mr Morgan treats particularly of the infect irfelf, and mentions feveral experiments made by himfelf to oppofe its depredations. The refult of thefe was that good culture of ftrong foil, or well manured lands, may fometimes produce a crop of wheat or barley, when that lowed on poor or middling foil, without the other advantages, will be totally deftroyed. "But (fays he) as the infect lives in its aurelia ftate in ftraw and liter through the winter, I find that unmixed barnyard manure fpread on the land in the fpring multiplies the fly to an aftonifhing degree; hence the farmer will fee the neceffity of mixing his yard with earth and marle in heaps; adding, where he can do it, a quantity of lime, and changing the heaps, after they have undergone the neceffary fermentation, that their parts may be well incorporated, and anew digeftion brought on, which will effectually deftroy the infect. Rollingr of wheat juft before the firft froft, in autumn, and foon after the laft in fpring, or before the wheat begins to pipe or fpindle, has alfo a good effect. In the firt place, it is a part of good culture; and, fecondly, the roller crufhes and deftroys a great proportion of the infect. Top-dreffings of lime, or of live afles, are ufeful as manures, and may (when applied about the times I have mentioned as proper for rolling) be offenfive to the infect; but if ufedin fufficient quantity to deftroy them, would, I believe, deftroy the wheat alfo. In the year I 782 , a particular fpecies of wheat was introduced on Long Ifland, which is found to refift the fly, and to yield a crop when all other whears in the fame neighbourhood are deftroyed by it. But as this wheat has been incantioully fowed in fields with other kinds, it has generally become fo mixed by the farmers, as to iuffer in its claracter in proportion to this mixtare; inafmuch, that fome farmers, from inattention to thiscircumftance, havecondemnedit altogether. Fortunately, however, fomecrops have been prelerved from this degeneration; and I was fo lucky as to procure the whole of my laft year's feed ofthe pureft kind; the confequence of which has been a good crop, whilft my neighbours ficlds, fowed with other kinds of wheat, have been either totally deftroyed or materially injured. I have fatisfied myfelf that this fpecies of wheat was brought to New York in 1782; that a cargo of it was then fent to Meffrs Underhill's mill to be mamafactured inte flour ; and that, from feed faved ont

## HES [492] HES

Heflian of this parcel, the yellow-bearded wheat was propagaFly.
in the webs, many of them dead, but fome alive, and ftruggling to difengage themfelves; from hence I concluded that there was a propenfity in the fly to get into the mow ; but whether with a purpofe of mere fhelter and nurture, or with a view to depofit its eggs, I ani at a lofs to decide."
9. Nr Bond now refers to fonae obfervations by a Mr Potts and a Mr Cleaver, which, with feveral other papers on the fubject, he had inclofed in his letter to the marquis. The former was a farmer in the eounty of Chefter, who ftacked his wheat in autumn 1788 , at a time when the fly had not been feen in or near that county. About fix or feven weeks after the harveft he had occafion to threfh fome of his wheat; and with a view to prevent its fcattering and wafting, he threw the fheaves from the rick upon a large fheet. On taking up the fheaves to carry them to the threfhing? floor, he perceived a great number of fies, anfwering precifely the defcription of the Heffiau fly, lying upon the fheet, fome dead and others in a torpid ftate; from whence he concluded that the fly had got a footing in his rick; but from any examination either of the ftraw or grain, no trace of the eggs being depofited was difcovered. Mr Cleaver, a farmer in the fame county, apprehending that the fly might approach his neighbourhood, fowed fome wheat in his garden, which grew fo as to appear above ground in lefs than a fortnight, when a violent north-ealtwind came on; and immediately after he perceived fmall clouds of flies over and about the wheat he had fown. He examined the grain in a few days; and found that numbers of the flies had depofited their eggs in the heart of the main ftalk, and many of them lay dead on the ground where the wheat was fown, and near it. Many of the eggs were found in the ftalk; and fome fmall white worms prodaced from other eggs were lately difcovered in the ftalk very near the root of the wheat. Wherever thefe worms were found, the whole of the individual falk was perceptibly. changing in point of colour, tending to a yellowifh caft; the top hanging down quite fhrunk and withered. In fome of the wheat which was carefully examined, the eggs were found within the ftalk of a very minute fize and whitifh colour, with fomething of a yellowifh tinge. In thofe where the worm was formed, it was carefully wrapped up furrounded by different coats of the hoot in which it lay, as if it, had been kilifully and tenderly rolled up for its pre* fervation; around it the ftalk was plainly eaten away fometimes nearly through. The worm Arongly refembles the fkipper in cheefe, fomewhat thinner, and rather longer, of a whitifh caft. The ground on which this wheat was fown was rich garden ground, high and dry; the natural foil a ftrong red clay; few of the fhoots, of which there were many in one clufter in proportion to their number, were hurt by the fly. This was imputed to the ftrength of the foil, which producing a robuft powerful growth, refifted, in a great degree, the attack of the fly, though the weak flioots fuffered generally.
ro. A fimilar account of the Heffan fly is given by Mr Jacobs, an experienced farmer in the the county of Montgomery. From his obfervations the egg is ufually depofited in the funnel or fheath a little above the firft joint. When the eggs are laid in the autumn or

Heffian fpring, they are utterly deftrucive of the growth of Fly. the wheat; but when they are depofited fhortly before the harveft, the grainor even the ftalk is fcarcely affected, efpecially inrich ground. The egg, he fays, is at firft very minute; it grows rapidly, becomes full and large, and turns to a brown hue, in fize and colour very like a flax feed. A material difference was alfo perceived between rich and poor ground with refpect to the ravages of the fly; but none between moint and dry foils. He is alfo of opinion that the yellowbearded wheat will refift the attacks of the fly; and that rolling and feeding the wheat will be of great fervice. 11. A farmer in Jerfey, who dates his letter from Hunterdon, Jan. 30.1787 , obferves that though the fly is fuppofed to advance about 15 milcs annually, and neither waters nor mountains obftruet its paffage; yet when difturbed, he never faw them take a flight of above five or fix feet; neverthelefs they are fo active, that it is very difficult to catch them. They firtt appear towards the end of September ; and foon after their eggs appear hatched, in colour and lize fike a flax-feed: they are very low at the joints fome even in the ground ; and here they harbour all winter. On the firft appearance in any diftrict, their numbers being fmall they feldom cut off the crop in this ftate, which is often the cafe the fecond or third year. In the fpring, after warm weather they again appear as a finall worm, and deftroy the crop. The remedies propofed by this farmer are, fowing upon rich ground cider, and rolling. A gentleman whofe account was dated on the firft of Noveinber 1786, fays, that their eggs refemble what is cemmonly called the fy-blow on meat, being very fmall, and only in one place. Soon after the other blades of wheat proceeding from the fame kernel inclofe the firft, the egg is covered, and agreceable to the ufual progrefs of infects arrives at the ftate of a worm, and defcends towards the root, where it confumes the tender blade, fometimes deftroying the whole crop in the fall; but if by reafon of the fertility of the foil, and other concurrent circumftances, the vegetation is fo rapid as to baffle their efforts, fome of the latter-laid eggs, when at the worm ftate, entrench themfelves in the ground to the depth of an incl or more, where he had found them after fevere frofts changed from a white to a greenifh colour and atmolt teanfparent ; from this they proceed to the aureli. ftate, and thus continue probably in the ground till the fpring, when the fly is again produced, which again laysits eggs, and finithes the work begun in the fall to the total deftruction of the crop. Another piece of intelligence he gives, but not from his own obfervation, that by feeding the wheat very clofe in the winter and fpring if the land is rich, it will again fpring up, and the worms do not much injure the fecond growth. By another correfpondent we are informed, that maritime places are lefs liable to be infefted with the fly than the interior parts of the country; and therefore recommends as an experiment, that fine falt fhould be fprinkled on the wheat juft before, or very foon after, tine appearance of the fly. By others elder has been much recommended, as well as rolling, though the bearded wheat already mentioned feems to be the only effectual remedy.
12. By another communication from Mr Morgan
to the Philadelphia Society for promoting agriculture, he informs us, inat he had made himfelf acquainted with the fly by breeding a number of them from the chryfalis into the perfect fate. The fly is at firft of a whixe body with long black legs and whijkers, fo fmall and motionlefs as not to be cafily perceived by. the naked eye, though very difcernible with a microfcope; but they foon become black and very nimble, both on the wing and feet, being abont the fize of a fmall ant. During the height of the brood in June, where 50 or 100 of the nits have been depofited on one ftalk of wheat, he has fometimes difcovered, even with the naked eye, fome of them to twift and move on being difturbed : this is while they are white; but they do not then travel from one falk to another, nor to differept parts of the fame ftalk. The ufual time of their fring hatching from the cryfalis is in May. " Thofe (fays he) who are doubtful whether the fly is in their neighbourhood, or cannot find their eggs or nits in the wheat may fatisfy themfelves by opening: their windows at night and burning a candle in the room. The fly will enter in proportion to theirnumbers abroad. The firft night after the commencement of wheat harveft, this feafon, they filled my diningroom in fuch numbers as to be exceedingly troublefome in the eating and drinking veffels. Without exaggeration I may fay, that a glafs tumbler from which beer had been juft drank at dinner, had 500 flies in it in a few minates: The windows are filled with them when they defire to make theirefcape. They are very diftinguifhable from every other by their horns or whifkers." With regard to the care, it feems to be confirmed that the fowing of that called the vellow bearded wheat can only be depended upon. Theflyindeed will refide in ficlds of this wheat, and lay its eggs upon the falks; bur no injnry was ever known to happen except in one fingle inftance, whereit was fown in a field along with the common fort, and that in a very fmall proportion to it. By anotheraccount, however, we are told that this yellow-bearded wheat is equally liable to be deftroyed, in the autumn with the common kind; fo that the only method of fecuring the crop is by fowing it late in the feafon, when the fly is moftly over.
13. The umoft pains were taken by the Britifh government to find out whether this deftructive infect exifts in Germany or any of the northern countries of Europe; but from the accounts received, it appears that it has not hitherto been obferved, or at leaft if it exifts the danage done by it is too inconfiderable to attract notice.
14. From the whole correfpondence on this fubject, which from the abridgement juft now given of it is evidently fomewhat difcordant, Sir Jofeph Banks drew up a repors for the privy council dated March 12. 1789, in which he ftates the following particulars; I. The appearance of the fly in Long Inland was obferved in 1779. We muft fappofe this to be meant that its deftructive effects became then firft perceptible; for it feems andoubtedly to have been known in the year r776. 2. The opinion of colonel Morgan, that it was imported by the Heflians, feems to be erroneous as no fuch infect can be found to exift in Germany or any other part of Europe. 3. Since its firft
firft appearance in Long Inand it has advanced at the rate of 15 or 20 miles a year, and neither waters nor mountains have impeded its progrefs. It was feen crofing the Delaware like a cloud from the Fall's Townthip to Makefield; had reached Saratoga, 200 miles from its firft appearaince, infefting the counties 'of Middlefex, Somerfet, Huntington, Morris, Suffex, the neightourhood of Philadelphia, all the wheat countties of Connecticut, \&c. committing the moft dreadful ravages; attacking wheat, rye, barley, and timothy grafs. 4. The Americans who have fuffered by this infect, fpeak of it in terms of the greateft horror. In colonel Morgan'sletter to fir John Temple, he ufes the following expreffions. "Were it to reach Great Britain, it would be the greatelt foourge that inand ever experienced ; as it multiplies from heat and moifture, and the moft intenfe frofts have no effect on the egg or aurclia. Were a fingle ftraw, containing the infect, egg, or aurclia, to be carried and fafely depofited in the centre of Norfolk in England, it would multiply in a few.years, fo as to deftroy all the wheat and barley crops of the whole kingdom. There cannot exift fuch an aterocious villain as to commit fuch an act intentionally. 5. No fatisfactory account of the mode in which this infeet is propagated has hitherto been obtained. Thofe who fay that the eggs are depofited on the fock from fix or eight to 50 , and by theirgrowth comprefs and tinder the falk from growing, are evidently erroneous, and the authors of them Wave plainly miftaken the animal itfelf for its eggs. It is fufficieat to remember, that eggs do not grow or ncreafe in bulk, to prove that what they obferved was mot efgs. 6. The landholders opinion, that the : eggs are deprofited on the ripe grains of wheat, though contradicted by colonel Morgan, is not difproved, as the colonel advances no argument againft it. 7. A Tetter dated New York, September I. i 786, fays that the eggs are depofited on the young blade refembling what we call a fy-blow in meat; very fmall, and but one in a place: but this though the only natural mode of accomnting for the appearance of the infect, had it been true, muft undoubtedly have been confirmed by numbers of obfervations. 8. Even though this fhould be found hereafter to be the cafe, there will ftill remain a danger of the aurelias being beaten off by the flail from the ftraw in threhing the wheat, and imported into Britain along with it; the prefence of thefe flies in barns having been fully proved by the obfervations of Meffrs Potts and Bond. 9. None of the remedies propofed againft this deftructive infect have been in any degree effectual, excepting that of fowing the yellow bearded wheat the ftraw of which is fufficiently ftrong to refift the imprefion of the infect, and even if its eggs are depofited upon it, receives little injury in point of produce in grain: this provides, however, no remedy for the lols of the 'barley crop, nor for that which mult be incurred by fowing the yellow-bearded wheat on lands better fuited by nature for the produce of other kinds; it appears alfo that this very kind is liable to degenerate, and probably from a different caufe than that propofed by colonel Morgan, viz. the mixture with common wheat. 10 Though the agricultural Society at Philadelphia, as well as colonel Morgan have declared their opinions decifively that no danger can arife from wheat import-
ed into Britain, as the infect has no immediate con- Heffian nection with the grain; yet with nearly if not exactly the fame materials before him which thefe gentlemen were furnifhed with, Sir Jofert Bants could not avoid drawing a conclufion directy contrary ; and he contcludes his report with the words of Mr Bond in a letter to the marquis of Caermarthen. "Satisfactoryas it would be to my feelings to be able to fay with precifion, that I apprehend no danger of extending the mifchief by feed, my duty urges me to declare, that I have not heard or feen any conclufive fact by which I could decide in a matter of fuch importance; and till that teft occurs, the wifdom of guarding againft fo grievous a calamity is obvious."

On the 27 th of April the fame year, another paper, by way of appendix to the foregoing was given in by fir Jofeph Banks. In this he again obferves, that none of the defcriptions of any European infect hitherto publifhed anfwer exactly to the Heffian fly. In, a letter from Mr Bond to the marquis of Caermarthen he mentions another kind of infect in the ftate of Maryland, called by way of eminence the fy ; and which in fome things refembles the Heffian fly, though it cannot be accounted the fame. It makes its way into the mow, and bites the ends of the grain perceptibly; and no doubt depolits its eggs in the grain itfelf: fince it has been obferved, that wheat recently threfhed, and laid in a dry warm place, will foon be covered with an extreme clammy craft, which binds the wheat on the furface together in fuch a way as to admitits being lifted in lumps; but the wheat beneath will not be hurt to any confiderable depth. Such is the quality of this fly, that if the hand beinferted in ${ }^{*}$ to the heap affected by - it, watery blifters are immediately raifed; and the farmers and flaves, riding upon bags of thisinfected wheat, never fail to be feverely bliftered thereby. "This infect (fays he) is called in Maryland the Revolution fly, by the friends of the Britifh government ; but from all I can learn it is not the fame infect which originated on Long Inland, and is called the Heffan fy (by way of opprobrium) by thofe who favoured the revolation. All the papers I have read on the Heffian fly are very inaccurate, not to fay contradictory; and 1 am convinced it is by no means a fettled point at this moment in what manner
 policy which induced government to open the --ports being founded on an appearance of a fcarcity of corn, that evil may be remedied by the admiffion of flour inftead of grain; and tho' the countries from whence the flour is carried will have the advantage of the manufacture, ftill that cannot be reckened as an object, whenoppofed in the fcale to an evil of fuch immenfe magnitude as the introduction of fo deftructive an infect may occafion. The ravages here are beyond conception ruinous. Many farmers have had their crops fo completely cut off as to be left without breadcorn or even feed-corn. If the mealure of confining the importation to flour alone fhould be adopted great attention fhould be paid to the quality of the flour admitted into the Britifh ports. An infinite deal of the wheat of the laft harveft is of a very wretched qua. lity ; and ftratagems will be practifed to give an extenfive vent to fo effentinl a ftaple of the middle ftates of America."

HET
Hefychiss In another leter to the fame nobleman, Mr Bond Il exprefles himfelf to the following purpofe. "I have Heteroge- not been able to collest any decided information which neity. fixes the effential point, how far the infect may be communicated by leed. It is a matter at this time quite undecided here: nor have I heard or obferved any very conclufive reafon to fuppofe that the fly makes its way generally into barns and ricks. A very intelligent fanmer in the county of Bucks, informed me that it was the prevailing opinion there, and fo Ifound it, that the fly did not cither in the field or in the mow affect the grain of the wheat: a neighbour of his, in threfling the little wheat he had faved laft harveft, oblerved the fly rife from the fraw in great numbers wherever it was frruck by the flail; but though it was at firft prefumed that the fly had infinuated ir-felf into the mow for the purpofe of depofiting its eggs in the grain or in the ftraw, no trace of the egg could be difcovered from the appearance of any mucus or duft, either in the grain or in the ftraw; hence it was inferred that all the michief was done in the field."

HESYCHIUS, the moft celebrated of all the ancient Greek grammarians whofe works are now extant, was a Chriftian; and, according to fome, the fame with Helychius parriarch of Jerufalem, who died in 609. He wrote a Greek lexicon; which, in the opinion of Cafaubon, is the moft learned and ufeful work of that kind produced by the ancients. Schrevelins 'publifhed a good edition of it in 1668 , in 40 , with notes ; but the beft is that of John Alberti, printed ar Leyden in 1746, in two vols follio.
HETERIARCH, Heteriarcha, in antiquity; an officer in the Greek empire, whereof there were two fpecies; the one called fimply heteriarch, and the other great heteriarch, who had the direction of the former.
The word is Greek, sta'pap $\alpha \alpha$, formed of the Greek *rapos focius, "companion, ally," and apx imperium; "command." Their principal function was to command the troops of the allies; befides which, they had fome other duties in the emperor's court, defcribed by Codin, De Officiis, cap. 5. n. 30, 3I, 32, 37.
heteroclite, Heterocliton, in grammar, an irregular or anomalous word, which either in declenfion, conjugation, or regimen, deviates from the ordinary rules of grammar. The word is Greek, exepa*גı cov; formed of sefpos alter, " another different," and жлıvш, " I decline." $^{\prime}$
Heteroclite is more peculiarly applied to nouns which vary or are irregular in point of declenfion ; having fewer cafes, numbers, \&cc. than ordinary ; or that are of one declenfion in one number, and another in another: as, Hoc vas, vafis; hac vafa, vaforum.

HE TERODOX, in polemical theology, fomething that is contrary te the faith or doctrine eftablifhed in the true churcll. The word is formed of the Greek
 nion." Thus, we fay a beterodox opinion, a beterodox divine, \&c. The word ftands in oppofition to orthodox.
HETEROGENEITY, in phyfics, the quality or difpofition which denominates a thing heterogeneous. The word is alfo ufed for the hererogencous parts

## 495 ] <br> HET

themfelves; in which fenfe, the heterogencities of a Heterogebody are the fame thing with the impurities thereof.

Heterogeneous, or Heterogeneal, literally imports fomething of a different nature, or that confifts of parts of different or difimilar kinds; in op pofition to homogeneous. The word is Grcek; formed of erspce altor, "different," and yetos genus, " kind;" q. d. compored of different kinds of parts.

Heterogeneous Light, is by Sir Ifaac Newton faid to be that which conliftsof rays of different degrees of refrangibility. Thus the common light of the fun or clouds is hoterogeneous, being a mixture of all forts of rays.

Heterogeneous Nouns, one of the threevariations in irregular nouns; or fuch as are of one gender in the lingular number, andof nother in the plirral.-Hetero. geneons, under whichare comprehended mixed nouns, are fix-fold. I. Thofe which are of the mafculine gender in the fingular number, and neater in the plaral; as, hic tartarus, bac tartara. 2. Thofe which are mafculine in the fingular number, but mafonline and neuter in the plural; as, hic locus, bi loci fo bec loca. 3. Such as are feminine in the fingular number, but neuter in the plural; as, bac carbafus, \& hac carbafa. 4. Such nouns as are neuter in the fingular number, but mafculine in the plurad; as, hoc cahum, hi coela. 5. Such as are neuter in the fingular, but neuter and mafculine in the plural: as, boc raftrum, bi raftri, $\sigma$ bac raftra. And, 6. Such as are neuter in the fingular, but feminine in the plural namber; as, hoc epulunt. ha epula.

Heterogeneous Qamities, are thore which are of fuch different kind and confideration, as that one of them, taken any number of times, never equals or exceeds the other.

Heterogeneous Surds, are fuch as have different radical figns; as, $\sqrt{ }$ aa, and ${ }^{3} \sqrt{ } 66 ; \times \sqrt{ } 9$, and ${ }^{7} \sqrt{ } 19$.

HETEROSCII, in geography, a term of relation, denoring fuch inhabitants of the earth as have theirfhadows falling but one way, as thofe who live between the tropics and polar circles; whofe fladows at: noon in north latitude are always to the northward, and in fouth latitude to the fouthward.

HETH, the father of the Hittices, was the eldeft fon of Canaan (Gen. X. I 5.), and dwelt foothward of the promifed land, at Hebron or thereabouts. Ephron, an inhabitant of Hebren, was of the race of Heth, and this whole city in Abraham's time was peopled: by the children of Heth. There are fome who main-. tain that there was a city called Heth, but we find nofootteps of it in the fcripturc.

HETRURIA, and ETRURIA, a celebrated countryof Itaty, on the weft of the Tyber. It originally contained 12 different nations, which had each their re-frective monarch. Their names were Veientes, Cliafini, Perufini, Cortonenfes, Arretini, Vetuloni; Vola terrani; Rufellani, Volfcinii; Tarquiaii, Falifci, and Cæretani. The inhabitants were particularly famous for their fuperftition and ftrict confidence in omens, dreams, anguries, \&c. They all proved powerful andrefolute enemies to the rifing empire of the Romans. and were conquered only after much effufion of blood:

HEVEI (anc. geog.), one of the feven people who occupied Canaan ; a principal and numerous people, and. the fame with the Kadmunai, dwelling at the foot of

Hermon:

HEU
marfhes, with a handfome caftle, in E. Long. 5. 3. N. Lat. 5 I .47.

HEWSON (William), a very ingenious anatomift, was born in 1739. He became adiftant to Dr Hunter, and was afterwards in parmernip with hin ; bur, on their difagreement, read anatomical lectures at his own houfe (in which he was fecoaded by Mr Falconer). He wrote Inquiries into the Properties of the Blood, and the lymphatic Syfem, 2 vols; and difputed with Dr Monro the difcovery of the lymphatic fyftem of veffels in oviparous animals. He died in 1774.
HEXACHORD, in ancient mulic, a concord called by the moderns a fixth.

HEXAGON, in geometrya figure of fix fides and angles; and if thefe fides and angles are equal, it is called a regular hexagon.

HEXAHEDRON, in geometry one of the five platonic bodics, or regular folids, being the fame with a cube.

HEXAMETER, in ancient poetry a kind of verfe confifting of fix feet; the firft four of which may be indifferently either fpondees or dactyles; the fifth is generally a dactyl and the fixth always a fpondee. Such is the following verfe of Horace:

$$
\stackrel{1}{2} \stackrel{3}{4} \stackrel{4}{5} \stackrel{6}{4}
$$

HeXamilion, Hexamili, or Hexami/ium, a celebrated wall, built by the emperor Emanuel in I 413 over the ifthmas of Corinth. It took its name from ${ }_{\xi} f_{i x} x$, and $\mu \cdot \lambda \iota o v$, which in the vulgar Greek fignifies a mile, as being fix miles long.

The defign of the hexamilion was to defend Peloponnefus from the incurfions of the barbarians. Amurath II. having raifed the fiege of Conftantinople in the year 1422, demolifhed the hexamilion, though he had before concluded a peace with the Greek emperor. The Venetians reftored it in the year 1463 ,by 30,000 workmen, employed for 15 days, and covered by an army commanded by Bertoldo d'Efte general of the land forces, and Louis Loredano commander of the fea.-The infidels made feveral attempts upon it : but were repulfed, and obliged to retire from the neighbourhood thereof : but Bertold, being killed at the fiege of Corinth, which was attempted foon after, Bertino Calcinato, who took on him the command of the army, abandoned, upon the approach of the beglerbeg, both the fiege and the defence of the wall which had coft them fo dear ; upon which it was finally demolifhed.

HEXANDRIA, in botany, (from $\varepsilon \xi, f(x$, and avas a man); the name of the fixth clafs in Linnæus's fexual method, confifting of plants with hermaphrodite flowers, which are furnifhed with fix ftamina or male organs, that are of an equal length. See BotaNY, P. 430.

HEXAPLA (formed of $\varepsilon \bar{\xi} f x$, and amioce $I$ open, $I$ unfold), in charch hiftory, a Bible difpofed in fix columns; containing the text and divers verfions thereof compiled and pablifhed by Origen, with a view of fecuring the facred text from future corruptions, and to correct thofe that had been already introduced.

Eufebius. Hift. Eccl, lib. vi. cap. i6. relates, that Origen, after his return from Rome under Caracalla, applied himfelf to learn Hebrew, and began to collect
the feveral verfions that had been made of the facred writings,

Hewfon Hexapla.
$\qquad$

Heuchera Hermon and partly of Libanus, or between Libanus Filufen and Hermon (Judges iii. 3.) To this Bochart refers
$\rightarrow$ or Hern noting a wild beaft, fuch as is a ferpent. Cadmus, who is faid to have carried the ufe of letters to Greece, feems to have been a Kadmonean; of whom the Greeks fay that he came to their country irom Phœenicia.

HEUCHERA, in botany; a genus of the digynia order, belonging to the pentandria clafs of plants. There are five petals; the capfule is biroftrated and bilocular.

HEVELIUS, or Hevelke, (Juhn), an eminent aftronomer, was born at Dantzic in 1611 . He ftudied in Germany, England, and France, and every - where obtained the efteem of the learned. He was the firft that difcovered a kind of libration in the moon, and made feveral imporrant obfervations on the other planets. He alfo difcovered feveral fixed fars, which he named the firmament of Sobiefki, in honour of JohnIII. king of Poland. His wife was alfo well akilled in aftronomy, and made a part of the oblervations publifhed by her hufband. In 1673 he publifhed a defrription of the inftruments with which he made his oisfervations, under the title of Machina Crelefis : and in 1679 he publifled the fecond part of this work; but in September the fame year, while he was at a feat in the country, he had the misfortune to have his houfe at Dantzic burnt down. 'By this calamity he is faid to have fuftained a lofs of feveral thoufand pounds; having not only his obfervatory and all his valuable inftuments and apparatus deftroyed, but alfo a great number of copies of his Machina Celeftis; which accident has made this fecond part very fcarce, and confequently very dear. In the year 1690 were publifhed Firmamentun Sobiefcianum and Prodomus aftronomica G. nova tabula folares, una cum ratalogo fixarum, in - which he lays down the neceffary preliminaries for taking an exact catalogne of the fars. But thefe works - are pofthnmous; for Hevelius died in 1687, on his birth-day, aged 76. He was a man greatly efteemed by his countrymen, not only on account of his great reputation and fkill in aftronony, but as a very excellent and worthy magiftrate. He was made a burgo-- mafter of Dantzic ; whichoffice he isfaid to have executed with the utmoft integrity and applaufe. He was alfo very highly eftecmed by foreigners; and not only by thofe fkilled in aftronomy and the fciences, but by foreign princes and potentates: as appears abundantly from a collection of their letters which were printed at Dantzic in the year 1683.
heurnius, or Van Heurn, (John), a learned .phyfician, was born at Utrecht in 1543; and ftudied at Louvain, Paris, Padua, and Pavia. At his return to his native country he became magiftrate of Amfter--dam ; after which he was profeffor of phyfic ar Leyden, and rector of the univerfity of that city, where he died in ibor. He wrote, among other works, feveral treatifes on the difeafes of different parts of the body, and feveral commentaries on the works of Hiprocrates. Otho Heurnius his fon was alfo profeffor of phyfic at Leyden, and wrote fome books.

HEUSDEN, a ftrong town of the United Profinces, in Holland, feated on the river Maefe, among

## H E X $\quad[497] \quad$ H E Y

Hexapla.
writings, and of thefe to compofe his Tetrapla and Hexapla; others, however, will not allow him to have beguntill the time of Alexander, after he had retired into Paleltine, about the year 23 r .

To conceive what this Hexapla was, it muf be obferved, that, befides the tranfation of the facred writings, called tine Septangint, made ander Ptolemy Philadelphus, above 280 years before Chrift, the Scripture had been fince tranflated into Greek by other inter. preters. The firlt of thofe verfions, or (reckoning the Septurgint) the (econd, was that of Aquila, a profc. lyte Jew, the firft edition of which he pablifhed in the I 2 : 1 year of the emperor Adrian, or about the year of Chrift 28 ; the third was that of Symmachus, publihned, as is commonly fuppofed, under Marcus Aurelius, but, as fonte fay, under Septimius Severus, about the year 200 ; the fourth was that of Theodotion, prior to that of Symmachus, under Commodus, or abour the year 175 . Thefe Greek verfions, fays Dr. Kennicott, weremade by the Jews from their corrupted copies of the Hebrew, and were defigned to ftand in the place of the Seventy, againft which they were prejudiced, becanfe it feemed to favour the Chriftians. The fifth was found at Jericho, in the reign of Cara. calla, about the year 257 ; and the fixth was difcovered at Nicopolis, in the reign of Alexander Severus, abont the year 228 : laftly, Origen himfelf recovered part of a feventh, containing only the Pfalms.

Now Origen, who had held frequent difputations with the Jews in Egypt and Palefine, obferving that they always obje丹ted againft thofe paffages of Scrip. ture quoted againft them, and appealed to the Hebrew text ; the better to vindicate thofe paffages, and confound the Jews by howing that the Seventy had given the fenfe of the Hebrew, or rather to how by a number of different verfions what the real fenfe of the Hebrew was, undertook to reduce all thefe feveral verfions into a body along with the Hebrew text, fo as they might be eafily confronted, and afford a mutual light to each other.

He made the Febrew text his ftandard; and allowing that corruprions might have happened, and that the old Hebrew copies might and did read differently, he contented himfelf with marking fuch words or fentences as were not in his Hebrew text, nor the latter Greek verfions, and adding fuch words or fentences as were omitted in the Seventy, prefixing an afterifk to the additions, and an obelifk to the ochers.

In order to this, he made choice of eight columns : in the firft he gave the Hebrew text in Hebrew characters; in the fecond the fame text in Greek claracters; the reft were filled with the feveral verfions abovementioned; all the columns anfwering verfe for verfe, and phrafe for phrafe; and in the Pfalmsthere was a minth column for the feventh verion.

This work Origen called $\mathrm{E} \xi \alpha \pi \lambda \alpha$ Hexsipla, q. d fextuple, or work of fix columris, as only regarding the firft fix Greek verfions. See Tetrapia.

Indeed, St. Fpiphanius, taking in likewife the two colamns of the text, cills the work Oafapla, as confifting of eight columns.

This celelyated work, which Mortfaucon imagines confifted of fifty large volumes, pcrifhed long ago, probably with the library at Cafarea, winere it was preferved, in the year 653 ; thongh feveral of the ancient writershave preferved us pieces thereof : partiVol. VIIl.
cularly St Cluryfoftom on the Plalms, Philoponus in Hezafty his Hexameron, \&e. Some modern writers have earnefly endeavoured to collect iragments of the Hexapla, particularly Flaminius Nobilius, Drufius, arid $\mathrm{K}^{\prime}$. Montfaticon, in two fulio voinmes, printed at Paris in 17 r 3 .

HEXASTYLE, in architecture, a building with fix columns in front.

HEXHAM, a town of Northumberland, ituated near the conflux of the north and fouth Tyne. It is commonly reckoned to be the Alexadinums of the Romans, where the firft cohort of the spaniards were in garrifon. It was made a bifhop's fee by Ethelureda, wife of king Egfred, in the year 675. Its firf bi. Shop St Wilfred built here a molt magnificent cath dral and monantery, and it was poffeffed by feven bin fhops fucceffively; but being very much infefted by the Danes, the fee was removed to York. The town andipriory were deftroyed by the Scots in 1296 , and pillaged again in 1346 . There was a remarkable and bloody battle fought near this town between the houfes of Lancafter and York, wherein the former were defeated, chiefly by the extraordinary bravery and conduct of John Nevil, lord Montacute, who was for that reafon created earl of Northumberland. 'The. prefent town is not populous, and the itreets are narrow, with ill built houfes. The market-plice, near the centre of the town, is a fpacions fquare, and is fupplied by a fountain with water. Among the remains of ancient ftruetures, is a gateway of Saxon architecture, leading to the priory, but of a much older date. There are two ancient towers in the town, one a: which is ufed as a feflions-houfe, and was formerly an exploratory tower; the other is on the top of a hill towards the Tyne, of remarkable architecture, which has been much higher than at prefent, and has two dungeons within it, befides feveral chambers with very little narrow windows. The town has a charity or grammar fchool. It was in 1571 annexed to the county of Cumberland; but only in civil matters; for its eccleflaftical jurifdiction is not the fame with the reft of the county, it being fill a peculiar belonging to the archbinhop of York; and the vulgar fill call the neighbouring country Haxhamhire. It is a corporation governed by a bailiff choten yearly. Newcanle is about 15 miles diftance. The markets here are Tuefday and Saturday ; fairs on Augult 5. and November 8. A rivulet, called Hexbold, runs by the town, which fometimes overflows fuddenly.

HEYDON, a little, pleafant, well-built town of Yorkflire, in that part called Holderstelfe, feated on a river that falls into the Humber. It has now but one church, tho' there are the remains of two more; and had formerly a confiderable trade, which is now loft, on account of its being fo near Hull. The houfes being rebuilt, adds to the beanty of the place. It is a corporation; and is governed by a mayor, a recorder, nine aldermen, and two bailiffs, who have the power of choofing fherifts, and are juftices of the peace. It fends two members to parliament. $W$. long. 0.55. N. Lat. 53. 46.
Heydon (John), who fometimes affumed the nane of Eugenizs TheodiduC7us, was a sreat pretcnder to fkill in the Roficrucian philofophy and the celeftial ligns, in the reign of king Charles f ; and wrote a confiderable number of chemical and aftrological works, with $3 Q^{\circ}$ very

Heylin very fingulartitles. This ridiculous author was mach $\underbrace{\text { Heywood. reforted to by the duke of Buckingham, who was in- }}$ fatuatcd with judicial aftrology. He employed him to calcolate the king's and his own nativity, and was affured that his flars had promifed him great things. The duke alfo employed Heydon in fone treafonable and feditious practices, for which he was fent to the Tower. He loft mach of his former reputation by telling Richard Cromwell and Thurloe showent to him difguifed like cavalicrs, that Oliver would infallibly be hanged by a certain time; which he outlived feveral years.

HEYLIN (Dr Peter), an eminent Englih writer, was born at Burford, in Oxfordhire, in 1600 . He Rudied it Hart Hall, Oxford; where he took his de. grees in arts and divinity, and became an able geographer and hiftorian. He was appointed one of the chaplains in ordinary to king Charles 1. was prefented to the rectery of Hemingford in Huniingdonthise, made a prebendary of Weftminfter, and obtained feveral other livings: but of thefe he was deprived by the pariament, who alfo fequeftered his eftate ; by which means he and his family were reduced to great neceffity. However, upon the reftoration, he was reftored to his fpiritualitics; but never rofe higher than to be fubdean of Weftminfter. He died in 1662 ; and was interred in St Peter's church in Weftminfter, where he had a neat monumenterected to his memory. His w ritingsare very numerous : the principal of which are, 1. Hicuccofinus, or a Defcription of the Great World. 2. Cofmographia. 3. The Hiftory of St George. 4. Ecclefia Vindicata, or the Church of England Juftified. 5. Hiftorical and Mifcellancous Trafts, \&c.

HEYWOOD (John), one of the moft ancient dramatic poets, was born ar Nurth-Mins, near St Alban's in Hertfordhire, and educated at Oxford. From thence he retired to the place of his nativity, where he had the grood fortnne to become acquainted with Sir Thomas More, who, it feems, had a feat in that neighbourhood. This parron of genius introduced this comic joet to the princefs Mary, and afterwards to her father Henry, who, we are told, was much delighted with his wit and fkill in mufic, and by whom he was frequently rewarded. When his former patronefs, queen Mary, came to the crown, Heywood becine a favourite at court, and continued often to entertain her majefty, exercifing bis fancy before her, even to the time that fhe lay languifing on ber deathbed. On the acceffion of Elizabeth, being a zealous Papift, he thought fit to decamp, with other favourites of her decealed Majefty. He fettled at Mechlin in Flanders, where he died in the year 1565.-John Heywood was a man of no great learning, nor were his poetical talents by any means extraordinary; but he poffeffed talents of more importance in the times in which he lived, namely, the talents of a jefter. He wrote feveral plays; 500 epigrams; A Dialogue in Verfe concerning Englifh Proverbs; and The Spider and Fly, a Parable, a thick 4 to. Before the title of this laft work is a whole-length wooden print of the author; who is allo reprefented at the head of every chaprer in the book, of which there are 77.-He left two fons, who brit: became Jefuits and eminent men: viz. Ellis Heywood, who conrinued fome time at Florence under the patronage of cardinal Pole, and became fo good a
mafter of the Italian tongle, as to write a a treatife in Heywood that language, intitled li Moro; he died at Lonvain about the year 5572 . His other fon was Jdfuer Heywood, who was obliged to relign a feilowhip at Ox. ford on acconat of his immor-lities: he cranfated three tragedies of Seneca, and wrote various poems and devifes; fome of whith were printed in a volume intitled The Paradife of Dainty Derifes, 4to, 1573. He died at Naples in 1597.

Heywood (Eliza), one of the moft voluminous novel writers that Britain ever prodaced; of whon we know no more than that her father was a tradefinan, and that he was born about the year 169 . In the early part of her life, her pen, whether to gratify ber own difpofition on the prevailing tafte, dealt chietly in licentious tales, and memoirs of perfonal feandal; the celebrated Atalantis of MrsManley ferved her for a model; and The Court of Garinnania, The utw Utopia, with fome other pieces of a like nature, were the copies her genius produced. She alfoatcempted dramatic writing and performance, but did not fucceed in either. Whatever it was that provoked the refentment of Pope. he gave full fcope to it by diftinguifhing her as one of the prizes to be gained in the gat, es introduced in honour of Dullnefs, in his Dunciad. Neverthelefs, it feems undeniable, that there is much fpirit, and mach ingenuity, in her manner of treating finbjects, which the friends of virtue may perhaps wifh fhe had never meddled with at all. But, whatever offence fhe may have given to delicacy or morality in her early works, the appears to have been foon convinced of, and endeavonred to atone for, in the latter part of her life; as no author then appeared a greater advocate for virtue. Among her riper productions may be fpecified, The Female Spectator, 4 vols; The Hiftory of MJs Bet/y Thoughtlefs, 4 vols; Femnay and femny Feffany, 3 vols; The invifible Spy, 4 vols; with a pamphlet intilled $A$ prefent for a fervant-maid. She died in 1759.

HIAMEN, or Ehouy. See Emouy.
HIATUS, properly fignifies an opening, chafm, or gap; but it is particularly applied to thofe verfes where one word eads wirh a vowel, and the following word-begins with one, and thereby occalion the mouth to be more open, and the found to be very harlh.

The term hiatus is alfo ufed in fpeaking of manu. fcripts, to denote their defeets, or the parts that have been loft or effaced.

Hibiscus, Syrian mallow: A genus of the polyandria order, belonging to the monodelphia clafs of plants; and in the natural method ranking under the 37 th order, Columniferce. The caly $x$ is double, the exterior one polyphyllous, the capfule quinquelo. cular and polyfpermous.

Speczes. Of this genns there are 36 fpecies; the moft remarkable are, I.The Syriacus, commonly called althra a frutex, is a native of Syria. It rifes with fhrubby ftalks to the height of eight orten feet, fending out many woody branches covered with a fmooth grey bark, garnifhed with oval fpear-haped leaves, whofe upper parts are frequently divided into three lobes. The flowers come out from the wings of the ftalk at every joint of the fame year's hoot. They are large, and Chaped like thofe of the mallow, having five large, roundif petals which join at their bafe, fpreading open at the top, in the thape of an open

## H I 13

Hihifcus, bell. Thefe appearin Auguft; and if the feafon is not too warm, there will be a fucceflion of flowers till September. The fiowers are fucceeded by hort capfules, with five cells, filled with kidney-fhaped feeds; but unlefs the feafon proves warm, they will not ripen in Britain. Of this fpecies there are fonr or five varieties, differing in the colour of their flowers: the moft common hath pale purple flowers with dark bottoms; another hath bright parple flowers with black bottoms; a third hath white flowers with purple bottoms; and a fourth variegated flowers with dark bottoms. There arealfo two with variegatedleaves, which are by fome much efteemed. All thefe varieties are very ornamental in a garden. 2. The Rofa Sinenfis, with an arborefcent ftem, and egg-pointed fawed leaves. It is a native of the Ealt-Indies, whence it has got the name of China rofe; but the feeds having been carried by the French to their Weft-India fettlements, it hath thence obrained the name of Martinico refle. Of this there are the double and fingle flowering kinds; the feeds of the firft frequently produce plants that have only fingle flowers, but the latter feldom vary to the double kind. 3. The mutabilis, or changeable rofe, has a foft fpongy ftem, which by age becomes ligneous and pithy. It rifes to the feight of 12 or 14 feet, fending out branches towards the top, which are hairy, garnifhed with heart-fhaped leaves, cut into five acute angles on their borders, and nightly fawed on their edges; of a lucid green on the upper fide, but pale below. The flowers are produced from the wings of the leaves; the fingle are compofed of five petals which fpread open, and are at firft white, but afterwards change to a bludh rofe colour, and as they decay turn purple. In the Weft-Indies, all thefe alterations happen on the fame day, and the flowers themfelves are of no longer duration; but in Britain the changes are not fo fudden. The flowers are furrounded by fhort, thick, blunt, capkules, which are very hairy; having five cells, which contain many fmall kidney-haped feeds, having a fine plume of fibrous down adhering to them. 4. The albemorchus, or mufk-feeded hibifcus, is a native of the Weft-Indies, where the Erench cultivate great quantities of ir. The plant rifes with an herbaceous falk three or four feet high, fending out two or three fide branches, garnifhed with large leaves cur into fix or feven acute angles, fawed on their edges, having long footfalks, and placed alternately. The ftacks and leaves of this fort are very hairy. The flowers come out from the wings of the leaves upon pretty long footftalks which ftand erect. They are large, of a fulphur colour, with purple bottoms; and are fucceeded by pyramidical five-cornered capfules, which open in five cells, filled with large kidney-fhaped feeds of a very muky odour. 5. The tiliacens, or maho-tree; is a native of both the Indies. It rifes with a woody, pithy ftem, to the height of ten feet, dividing into feveral branches towards the top, which are covered with a woolly down, garnifhed with heartfhaped leaves ending in acute points. They are of a lucid green on their upper fide, and hoary on the under fide, full of large veins, and are placed alternately. The flowers are produced in loofe fikes at the end of ile branches, and are of a whitifh yellow colour. They are fucceeded by thort acuminated capfules, opening:
in five cells, filled with kidney-haped feeds. 6. The Hibifcus. trionum, Venice mallow, or flower of an hour, is a native of fome parts of ltaly, and has long been cultivated in the gardens of England. It rifes with a branching ftalk a foot and a half high, having nany fhott fpines, which are foft and do not appear unlels clofely viewed: the leaves are divided into thrce lobes, which are deeply jagged alnof to the midrib. The flowers come out at the joints of the ftalks, upon pretty long foot-ftalks. They have a double empalement; the outcr being compofed of ten long narrow leaves, which join at their bafe : the inner is of one thin leaf fwollen like a bladder, cut into five acute fegments at the top, having many longitudinal purple ribs, and is hairy. Both thefe are permanent, and inclofe the capfule after the flower is paft. The flower is compofed of five obtufe petals; which fpread open at the top; the lower part forming an open bell-maped fower. Thefe have dark purple bottoms, but are of 2 pale fulphur-colour above. In hot weather the flowers continue but a few hours open; however, there is a fucceffion of flowers that open daily for a confiderable time. 7. The efculentus, or eatable hibifcus, rifes to five or fix feet; has broad five parted leaves, and yellow large flowers. The pod or okra is from two to fix inches long, and one inch diameter. When ripe, it opens longitudinally in five different places, and difcharges a number of heari-flaped feeds.

Ctilture. The firf fort may be propagated either by feeds or cuttings. The feeds may be fown in pots filled with light earth about the latter end of March, and the young plants tranfplanted about the fame time next year. They will fucceed in the full ground ; but muft be covered in winter whilft young, otherwife they are apt to be deftroyed. The fecond, third, fifth, and feventh forts are propagated by feeds; which muft be fown in a hot-bed. The young plants are to be tranfplanted into fmall feparate pors, and treated like other render vegetables, only allowing them a good fhare of air. The fourth fort is annual in Britain, though biennial in thofe places where it is native. It is propagated by feeds, and muft be treated in the manner directed for Amaranth. The fixth fort is propagated by feeds, which fhould be fown where the plants are defigned to remain, for they do not bear tranfplanting well. They require no other culture than to be kept free from weeds, and thinned where they are too clofe; and if the feeds are permitted to fatter, the plants will come up fully as well as if they had been fown.

Ufes. The fourth fort is coltivated in the Weft-Indies by the French for the fake of its feeds. Thefe are anually fent to France in great quantities, and form a confiderable branch of trade, but the purpofes which they an! wer are not certainly known. The inner rind of the fifth fort is very ftrong, and of great efteem, which the following recital from Dampier may ferve to illuftrate: They (the Muketo Indians) make their lines, both for fifbing and ftriking, with the bark of Maho, which is a fort of tree or fhrub that grows plentifully all over the Wef-Indies, and whofe bark is made up of ftrings or threads very ftrong; you may draw it off either in ftakes or finall threads, as you have occafion.-It is fit for any manner of cordage, and pri-

## H I D

vatceis often make their rigging of it. See further the article Bark.
Hidalgo,
The feventh fort is a native of the Weft-Indies, where it is cultivated in gardens and enclofures as an article of food.-The whole of it is mucilaginous, efpecially the pods. "Thefe (Dr Wright informs us) are gathered green, cut into pieces, dried, and fent home as prefents, or are boiled in broths or foups for food. It is the chief ingredient in the celebrated pep-per-jot of the Weft-Indies, which is no other than a rich olla: the other articles are either flefh meat, or dried fifh and capficum. This difh is very palatable and nourihing. - As a medicine okra is employed in all cafes where emollients and lubricants are indicated."

HICETAS of Syracufe, an ancient philofopher and aftronomer, who taught that the fun and ftars were motionlefs, and that the earth moved round them. This is mentioned by cicero, and probably gave the firft hint of the true fyftem of Copernicus. He flourilhed 344 B . C.

HICKES (George), an Englifh divine of extraordinary parts and learning, born in 1642. In 1681 he was made king's chaplain, and two years after dean of W orcefter. The death of Charles II. ftopped his farther preferment ; for though his church principles were very high, he manifefted too much zeal againft Popery to be a favourite with James II. On the revolution, he with many others was deprived for refufing to take the oaths to king William and queen Mary; and foon after, archbihop Sancroft and his collcagues confidering how to maintain epifcopal fuccetfion among thofe who adhered to them, Dr Hickes carried over a lift of the deprived clergy to king James; and with his fanction a private confecration was performed, at which it is faid lord Clarendon was prefent. Among the reft Dr Hickes was confecrated fuffragan bithop of Thetford, and died in $1715 .-\mathrm{He}$ wrote, t . Infitinticnes Gramnatica Anglo Saxonicce, et MasfoGothica. 2. Antiqua literatura feptentrionalis. 3. Two treatifes, one of the Chriftian priefthood, the other of the dignity of the epifcopal order. 4. Jovian, or an anfwer to Julian the apoftate. 5. Sermons; with many temporary controverfal pieces on politics and religion.

HICKUP, or HrcouGh, a fpafmodic affection of the ftomach, efophagus, and mufcles fubfervient to deglutition, arifing fometimes from fome particular injury done to the ftomach, œfophagus, diaphragm, \& c. and fometimes from a general affection of the nervous fyftem. See (the Index fubjoined to) Medicine.

HIDAGE (Hidagizm), was an extraordinary tax payable to the kings of England for every hide of land. This taxation was levied not only in money, but in provifion, armour, \&c.; and when the Danes Janded in Sandwich in 994, king Ethelred taxed all his lands by hides; fo that every 3 ro hides found one thip furnifhed, and every eight hides furnimed one jack and one faddle, to arm for the defence of the kingdom, \&c.-Sometimes the word bidage was ufed for the teing quit of that tax : which was alfo called bidegild; and interpreted from the Saxon, "a price or ranfom fraid to fave one's skin or bide from beating."

HIDALGO, in modern hiftory, a title given in Spain to all who are of noble family.

The Hidalgos claim a defcent from thore valiant fol-
diers who retired into Caftile, and the mountains of Hidalgo. Afturias, and uther remote parts of Spain, on the invafion of the Mours, where having fortified the mfelves, they fucceflively deleanded into the plins, in proportion to the fuccef of their arms : from the notoriety of their perfons, or the lands they became poffeffed of, they acquired the appellation of Hidalgos zotorios, $H i$ dalgos de folar conocido or de cafa folaringa. Of fiefe, according to Hernando Mexia, there are three fort:; the firlt being lords of places, villages, tonns, or caftles, from whence they took their firnames, as the Guzmans, Mendozas, Laras, Guivaras, and others; the fecond, who recovered any fortrefs from the Muors, as the Ponces of Leon, and others; and the third fort, from the places where they refided, or held jurifdiction, as Rodrigo de Narvaez was called of Antequera, from being Alcayde there. But this definition is not confidered as exact or conclulive by Otalora, another civilian, who fays that the true meaning of Hidalgos de folar conocido is explained by the laws of Caftile to be a well known manfion or poffeffion, the nature of which is particularly explained in the laws of Parditas, lib. 5. tit. 35. which defcribes three forts of tenures called Devifa, Solariega, and Behetria. By the firft, lands are devifed by the anceftor; folar is a tenure upon another perfon's manor, and obliges the owner to receive the lord of the fee when neceffity obliges him to travel; and Behetria is in the nature of allodium. In proportion as thefe Aborigines gained ground on the Moors, and increafed in their numbers, many private perfons diftinguilhed themfelves by their valour, and obtained teftimonies of their fervices, called cartas de merced, which ferved them as a foundation of their birth and good defcent, without which documents their pofterity could not make it appear ; and if from a laple of time, or other unavoidable accidents, fuch proof fhould happen to be loft or deftroyed, the law affords them a remedy under thefe circumfances, by a declaration, importing, that fuch perfons as are fuppofed to have had fuch certificates, may be relieved by making it appear that their anceftors, time immemorial, have always been held and repused as Hidalgos, and enjoyed the privileges of fuch, from a ftrong ; prefumption in their favour; the poffeffion of land having equal force to any other document; which is fully fet forth in the Pragmatica of Cordova. To thefe execntory letters are granted, cartas executorias, expreffive of their privileges: and for the better regulation of thefe matters, proper officers are appointed in the chancery courts, called alcaldes de lor hidalgos, who ought to be bidalgos themfelves, and hold jurifdiction in thefe cafes, and no others : but even here innovations have taken place; for as thefe grants flow from the fovereign, who is the fountain of honour, fome are declared Hidalgos'de fangre, by right of defcent, and others de privilegio, or by office, in which the will of the fovereign has made amends for any deficiency of hlood.

There is a fet of people near Segovia, at a place called Zamarramala, who are exempt from tribute on account of the care they take in fending proper perfons every night to the caftle of Segovia to keep continel-one cries out Vela, vela, hao, and the other blows a horn, from whence they have been titled $h i$ dalgos by the born. In Catalonia thofe gentlemen who

# H I D 

are Ryled Hombre de Pareja, are confidered the fame as hidalgos in Caftile, and were fo called from the word parcjar, to equip, this name being given as a diftinction by Borelo the 4th count of Barcelona, at the fiege of that city, in 965 , who fummoning all hi vaffals to come to his afiftance againft the Moors, nine hundred horfencn well monnted and equipped joined him, and with their aid he took the city ; and this appellation has been given in honourable remembrance of this loyal action.

Thefe noble hidalgos enjoy many privileges and diftinctions; of which the following are the principal.

1. The firft and greatelt privilege which they hold by law is to enjoy all potts of dignity and honour in the church and fiate, with liberty, when churchmen, of having a plurality of benefices. They are qualified for receiving all orders of knighthood, and are to be preferredin all embalfies, governments, and public commillions.
2. When they are examined as witneffes in civil and criminal cafes, their depofitions are to be taken in their own houfes, without being obliged to quit them to go to thofe of others.
3. In all churches, proceffions, and other public acts or aftemblies, they are to have the next place of honour and precedency after the officers of juftice, conforming themfelves to particular cuftoms.
4. They are not obliged to accept of any challenge for combat, fuppofing fuch were allowed of, but from thofe who are their equals.
5. Though it is forbidden to guardians to purchafe the eftates of minors, this does not extend to Hidalgos, in whom the law does not fuppofe any frand, and they may purchafe them publicly.
6. They are permitted to be feated in courts of juftice in prefence of the judges, from the refpect and honour due to them. They have alfo feats in the courts of chancery, in confideration of their birth, which gives then a right to be near the perfons of princes.
7. Their perfons are free from arreft for debt, nor can any attachment be laid on their dwellinghoufes, furniture, apparel, arms, horfes, or mules in immediate ufe: nor can they make a ceffion of their eftates, nor be diftreffed in fuits of law, farther than their circumftances will admitof, but are to be allowed a reafonable and decent maintenance for their fupport.
8. In cafes of imprifonment for criminal matters, they are to be treated differently from others. They are generally confined to their own houfes with a fafe guard, or under arreft upon their honour, or allowed the city or town they lived in, and in particular cafes are fent into caftles.
9. When punifhments are inflicted for criminal cafes, they are to be lefs fevere to them than to others, as they are not to fuffer ignominious punifhments, fuch as public fhame, whipping, gallies, nor are they to be hanged, but beheaded, excepting in cafes of treafon or herefy. In cafes that do not imply a corporal punifhment but a pecuniary one, they are treated with more rigour, and pay a larger fine than others.
10. They are not to be put to the rack or torture, excepting for fuch heinous crimes as are particularly fpecified by the laws.

1r. When there are title-deeds or other wistings or papers in which two or more perfons have an equal right or property, and require a particnlar charge, they are to be given up by preference to the cuftody of an Hidalgo, if any of the parties are fuch.
12. The daughter of an Hicalgo enje ys $\epsilon$ very privilege of her birth, though married to a commoner ; and a woman who is not an Hidalgo enjoys all thefe privileges when the is a $n$ idow, following the fortune of her hurband.-But if the widow is an Hidalgo, and the late hurband was a commoner, the falls into the ftate of her hufbund afrer his death, though he had the privileges of her birth during his life.
13. They are free from all duties, called Pechos, $F$ :didos, Monedas, Marteniegas, Contribuciones, as we:l royal as civil, and all other levies of whatever kind they may be, with a refervefor fuch as are for the public benefit, in which they are equally concerned, fuch as the repairing the highways, bridges; fountains, walls, deftruetion of locufts, and other vermin.
14. They are free from perfonal fervice, and from going to the wars, excepting when the king attends in perfon; even then they are not to be forced, but invited, and acquainted that the royal ftandard is difplayed.
15. No perfons whatever can be quartered upon, or lodged in their houfes, except when the king, queen, prince or infantes are on the road, as in fuch cafes even the houles of the clergy are not exempt.
16. They cannot be compelled to accept of the office of receiver of the king's rents, or any other employment which is confidered as mean and deregatory to their dignity and rank.
17. By a particular cuftom confirmed by royal authority in that part of Caftile beyond the Ebro, baftards fucceed to their parents, and enjoy their bonours contrary to the royal and common law.
18. If a lady, who marries a commoner, fhould be a queen, duchefs, marchionefs, or countefs (for they have no baron in Caftile), the not only does not lofe her rank, but conveys her titles to her hufband, who holds them in right of his wife.

Thefe are the general privileges which the Hidalgos enjoy; there are fome others of lefs confequence, as well as particular grants to certain perfons and families. An ancient and ridiculous cuftom is faid to be obferved by noble ladies who are widows of plebeians, in order to recover their birthright, for which parpofe they carry a pack-faddle on their fhoulders to their nufband's grave, then throwing it down and ftriking it three times, fay, «Villein, take thy villeiny, for I will abide by my nobility:' and then they recover their privileges again.

HIDE, the fkin of beafts; but the word is particularly applied to thofe of large cattle, as bullocks, cows, horfes, \&c.

Hides are either raw or green, juft as taken off the carcafe ; falted, or feafoned with falt, alum, and faltpetre, to prevent their fouiling; or curried and tanned. Sce Tanning.

Hide of Land, was fuch a quantity of land as might be ploughed with one plough within the compafs of a year, or as much as would maintain a family; fome call it 60 , fome 80 , and others 100 acres.

Hide-Bound. See Farriery, xxiii.
HIERACIUM

## $\mathrm{HIE} \quad[502] \quad \mathrm{H} I \mathrm{E}$

Sicraciun HERACIUM, HAWEWEED: A genus of the po$\|$ lygamia aqualis order, belcneing to the fyngeneia Hierapolis claf's of plants; and in the natural method ranking under the 49 th order, Compofita. The receptacle is naked, the calys imbricated and ovate ; the pappus fimple and felfie.

Species. I. The aurantiacum, commonly called grim the collier, hath many oblong oval entire leaves, crowning the root; on upright, fingle hairy, and almonleaflefs ftalk, a foot high, terminated by reddifh orangecoloured flowers in a corymbus. Thefe flowers have dark and ah coloured calices; whence the name of grimethe collier. 2. The pilofella or moufe-ear, hath blofoms red on the out-fide, and pale yellow within; the cups fet thick with black hairs. The flowers open at eight in the morning, and clofe about two in the afternoon. 3. The umbellatun grows to the height of chree feet, with an erect and firm ftalk, terminated with an umbel of yellow fiowers.

Culture. The firft is the only fpecies cultivated in gardens. It is propagated by feeds, or parting the roots. The feed may be fown in autumin or fering. In June, when the plants are grown two or three inches high, they may be picked ont and planted in beds, where they muft remsia till the next autumn, and then tranfplanted where they are to remain.

Properties. The fecond fpecies is commonly in dry paftures in England; ir has a milky juice, but is lefs bitter and aftringent than is ufual with plants of that clafs. It is reekoned hurtful to theep. An infect of the cochineal genus (Coccus Polonnicus) is often found at the roots, (ACF.UPfal. 1752.) Goats eat it ; fheep are not fond of it ; horfes and fwine refufe it. - The third fecies is a native of Scotland, and grows in rough fony places, but it is not very common. The flowers are fometimes ufed for dying yarn of a fine yellow colour.

HIERACITES, in church-hiftory, Chrifian heretics in the third century: fo called from their leader Hierax, a philofopher of Egypt ; who taught that Melchifedek was the. Holy Ghoft, denied the refurrection, and condemned marriage.
hieranosis, or Morbus Sacer. See (the Indexf fubjoined to) Medicine.
Hierapicra. See Pharmacy, no 826.
HIERAPOLIS, (anc. geog.), a town of Phrygia, abounding in hot fprings; and having its name from the number of its temples. There are coins exhibiting figures of various gods who had temples here. Of this place was Epictetus che toic philofopher.-It is now called Pambouk; and is fituated near the Scanander, on a portion of Mount Mefogis, diltant fix miles from Laodicea. - Its fite appears at a diftance as a white lofy cliff; and upon arriving at it, the view which it prefents is fo marvellous (fays Dr Chandlen), that the defcription of it, to bear even a faint refemblance, on $\begin{gathered}\text { ht } \\ \text { to appear romantic. Dr Chandler's defcription }\end{gathered}$ is is follows:
Travels in " The vaft lope which at a diftance we had taken for 4/ic $M_{\text {iner, }}$ chalk, was now beheld with wonder, it feeming an im1. $229^{\circ}$
fmall channel on the top. A woman was wafhing linen Hierapolis. in it, with a child at her back; and begond were cahins of the Turcomans, ftanding diftinct, mich nearer that any we had feen, each with poultry feeding, and a fence of reeds in front.
"It is an old obfervation, that the conntry about the Mreander, the foil being light and friable, and full of falts gentrating infammable matter, wasurdermined by fire wad water. Hence it abounded in hot fprings, which, after paling under-ground from the refervoirs, appeared on the nountain, or were found bubbling up in the plain or in the mud of the river: and hence it was fubject to frequent earthquakes, the nitrous vapour compreffed in the cavities, and fublimed by heat or fermentation, burfting its prifon with loud explofions, agitating the atmofphere, and flaking the eartb and waters with a violence as extenfive as deftructive; and hence, moreover, the peftilential grottos, which had fubterrancous communications witheachother, derived their noifome effluvia; and ferving as.fmaller vents to thefe furnaces or bollows, were regarded as apertures of hell, as paffages for deadly fumes rifing up from the realms of Plato. One or more of the monntains perhaps has burned. It may be fufpected, that the furface of the country has in fome places been formed from its own bowels; and in particular, it feems probable, that the hill of Laodicea was originally an eruption.
"' The hot waters of Hierapolis have produced that mod extraordinary phænomenon, the cliff, which is one entire incruftation. They were anciently renowned for this fpecies of transformation. It is related, they changed fo eafily, that being condncted about the vineyards and gardens, the channels became long fences, each a fingle ftone. They produced the ridges by our tent. The road up to the ruins, which appears as a wide and high caufeway, is a petrification ; and overlooks many green fpots, once vineyards and gardens feparated by partitions of the fame material. The furface of the flat, above the cliff, is rough with fone and with channels, branching out in various directions, a large pool overflowing and feeding the numerous rills, fome of which fpread over the flope as they defcend, and give to the white fony bed a humid look, refenbling falt or driven fnow when melting. This craft, which has notafte or finell, being an alkaline, will ferment with acids; and Picenini relates, that trial of it had been made with fpirit of vitriol. The waters, though hot, were ufed in agriculture.
"Tamerlane, when he invaded this country, encamped for the fummer at Tangazlik, where many of his men were deftroyed by drinking of a fpring which ftagnated and perrified. The Turkifh name Pambouk fignifies cotton; and, it has been faid, refers to the whitenefs of the incruftation.
"The fnepherd poet of Smyrna, after mentioning a cave in Phrygia facred to the Nymphs, relates, that there Luna had once defcended from the flsy to Endymion, while he was leeping by his herds; that marks of their bed were then extait under the oaks; and that in the thickets round it the milk of cows had been fpilt, which men fill behold with admiration (for fuch was. the appearance if you faw it very far off); but that from thence flowed clear or warm water, which in a little while concreted round about the channels, and formed a ftone pavement. The writer defcribes the cliff of Hierapolis,

## HiE

tees which they poffefs. The people, in fome of their Hierapolis infcriptions, are ftyled the mofl fplendid, and the fenate the moft powerfut.
"'The pool before the theatre has been a bath, and marble fragments are vilibleat the bottom of the water, which is perfectly tranfparent, and of a briny talte.
"Hierapolis was nuted, befides its hot waters, for a platonium. This was an opening in a fimall brow of the adjacent mountain, capable of admitiing a man, and very deep, with a fquare fence before it, inclofing about half an acre; which face was filled wilh black thick mift, fo that the botrom could be fcarcely difcerned. The air, to thofe who approached it, was innocent on the outfide of the fence, being clear of the mift in fereae weather, it remaining then within the boundary; but there death abode. Bulls, as at Nyfa, dropt down, and were dragged forth without life; and some fparrows which Strabo let fly inftantly fell fenfelefs. But eunuchs, the priefts of Magna Mater, or Cybele, could go in quite to the aperture, lean forward, or enter it unharmed; but they held their breath, as their vifages teftified, and fometimes until in danger of fuffocation. Strabu, the relater, was in doubt whether all eunuchs could do this, or only they of the temple; and whether they were preferved by Divine Providence, as in cafes of enthafiafm, or were poffelfed of fome powerfal anidotes. But it was fikely this milt was the condenfed fteam of the hot waters, made noxious by the qualinies of the foil ; and that the whole fecret of the priefts confifted in carrying their iaces ligh in the air, as another fpectator lias obferved they aiways did; and in avoiding refpiration when they tooped. I had hoped the defcription of this fpot would have enabled me to find it, but I fearched about for it unfuccefsfally.
"We defcended to our tent at the approach of even. ing, by a feep track down the ciiff, beginning beyond the pool, in which we alfo bathed wihpleafare, of the fide next the gymnafim. Our way was often rough and nippery, refemblingice, and our hories with dificulty preferved their footing. When arrived at ourtent, I renewed my enquiries for the plutonium; and an old Turk, with a beard as white as fnow, told me he knew the place, that it was often fatal to their goats ; and accounting for the effeet, faid, it was believed to be the labitation of a dæmon or evil firit. We af: cended again early in the morning to the theatre, where he had promifed to join us; and a live fowl was intended to be the martyr of experiment." But our author was interrupted by fome banditti, and obliged to leave Hierapolis in hafte.

HiERARCHY, among divines, denotes the fubordination of angels.

Some of the rabbins reckon four, othersten, orders or ranks of angels; and give them differche names according to their different degrees of power and knowledge.

Hierarchy, likewife denotes the fubordination of the clergy, ecclefiaftical polity, or the conftitution and government of the Chriftian church confidered as a fociety.

HIERES, the name of fome fmall illands lying near the coaft of Provence in France, oppolite to the towns of Hieres and Toulon, where the Englifl Heet lay many menths in 1744, and blocked up the French and Spanilh flects in the harbour of Toulon.

Higres, a town of Provence in France, feated on the Mediterranean fea. It is a pretty little town, and was formerly a colony of the Marfilians ; and pilgrims ufed to embark here for the holy land. But its harbour being now choaked up, it is confiderable only for its falt works. E. Long.6. 13. N. Lat. 43. 7.

HIERO I. and II. kings of Syracufe. See Syracuse.

HIEROCLES, a cruel perfecuter of the Chrifians, and a violent promoter of the periecution under Dioclefian, flouriihed in 302. He wrote fome books againft the Chriftian religion; in which he pretends fome inconfifteacies in the Holy Scriptares, and compares the miracles of Apollonius Tyanæus to thofe of our Saviour. He was refuted by Lactantius and Eufebius. The remains of his works were collected into one volume octavo, by bithop Pearfon; and publifhed in 1654, with a learned difertation prefixed to the work.

Hrerocles, a Platonic Philofopher of the fifth century, tanght at Alexandria, and was admired for his eloquence. He wrote feven books upon Providence and Fate; and dedicated them to the philofopher Olympiodorus, who by his embaffies did the Romans great fervices under the emperors Honorius and Theodofusthe younger. But theie books are loft, and we only know them by the extracts in Photius. He wrote alfo a commentary upon the golden verfes of Pythagoras ; which is ftill extant, and has been feveral times publifhed with thofe verfes.

HIEROGLYPHICS, in antiquity, myftical characters, or fymbols, in ufe among the Egyptians, and that as well in their writings as inferiptions; being the figures of various animals, the parts of human bodies, and mechanical inftruments. The word is compofed of the Greek "to engrave;" it being the cuftom to have the walls, doors, \&c. of their temples, obeliks, \&c. engraven with fuch figures.

Hieroglyphics are properly emblems or figns of divine, facred, or fopernatural things, by which they are dininguifhed from common fymbols, which are figus of fenfible and natural things.

Hermes Trifnegiftusis commonly efeemed the inventor of hieroglyphics: he firft introduced them into the heathen theology, from whence they have been tranfplanted into the Jewifh and Chriftian.

Sacred things, fays Hippocrates, fhould only be communicated to facred perfons. Hence it was that the ancient Egyptians communicated onone but their kings and priefts, and thofe who were to fucceed to the priefthood and the crown, the fecrets of nature, and the focrets of their morality and hiftory; and this they did by a kind of cabbala, which, at the fame time that it initructed them, only amuled the reft of the people. Hence the ufe of hieroglyphics, or myftic figures, to veil their morality, politics, \&c. from profane eycs. This author, it may be obferved, and many others, do not keep to the precife character of a hieroglyphic, but apply it to profase as well as divine things.

Hieroglyphics are a kind of real characters, which do not only denote, but in fome meafure exprefs, the things. Thus, according to Clemens Alexandrinus, Strom. v. a lion is the hieroglyphic of ftrength
and fortitude ; a bullock, of agriculture ; a horre, of liberty ; a fuhinx, of fubtiliy, \&c.

Such is the opinion that has generally been embraced, both by ancient and modern writers, of the origin and ufe of hicroglyphics. It has been almoft uniformly maintained, that they were invented by the Egyptian priefts inorder to conceal their wifdom from the isnowledge of the vulgar ; but the late bifhop Warburton hath, with much ingenuity and learning, ende ivoured to how that this account is erroneous.

According to this writer, the firt kind of hieroglyphics were mere pictures, becaufe the molt natural Way of communicaling our conceptions by marks or figures was by tracing out the images of things; and this is actually verified in the cafe of the Mexicans, whofe only method of writing their laws and hiftory was by this picture-writing. But the hieroglyphics invented by the Egyptians were an improvement on this rude and inconvenient eflay towards writing, for they contrived to make them both pictures and characters. In order to effect this improvement, they were obliged to proceed gradually, by firt making the principal circumftance of the fubject fand for the whole; as in the hieroglyphics of Horapollo, which reprefent a batcle of two armies in array by two hands, one holding a fhield and the other a bow: then putting the inftrument of the thing, whether real or metaphorical, for the thing itfelf, as an eye and fceptre to reprefent a monareh, a fhip and pilot the governor of the univerfe, \&c. : and finally, by makingone thing fand fur or reprefent another, where their obfervations of nature or traditional fuperfitions led them to difcover or imagine any refemblance : thus, the univerfe was defigned by a ferpent in a circle, whofe varirgated fpots denoted the fars; and a man who had nobly farmounted his misfortunes, was reprefented by the fkin of the byæna, becaufe this was fappofed to furnif an invulnerable defence in battle.

The Chinefe writing, he obferves, was the next kind of improvement in the ufe of hieroglyphics. The Egyptians joined characterific marks to images ; the Chinefe threw out the images and reained only the contracled marks, and from thefe marks proceeded letters. The general concurrence of different people in this method of recording th ir thoughts can never be fuppofed to be the effect of imitation, finifter views, or chance; but muft be confidered as the uniform voice of nature fpeaking to the rude conceptions of mankind: for not only the Chinefe of the Eaft, the Mexicans of the Weft, and the Egyptians of the South, but the Scythians likewife of the North, and the intermediate inhabitants of the earth, viz. the Indians, Phœnicians, Ethiopians, \&c. ufed the fame way of writing by picture and hieroglyphic.

The bifhop farther hows, that the feveral fpecies of hieroglyphic writing took their rife from nature and neceffity, and not from choice and artifice, by tracing at large the origin and progrefs of the art of fpeech. He proceeds to hlow how in procefs of time the Egyptian hieroglyphics came to be employed for the velicle of myftery. They ufed their hieroglyphics two ways; the onemore fimple, by putting the part or the whole, which was the curiologic hieroglyphic ; and the other more artificial, by putting one thing of refembling qualities for another, called the tropical hieroslyphic:

Hierogly-
phics.'

## H I E <br> 505 ] HIE

Hicrogty phics. cle and fometimes by a cynocephalus. They employed their proper hicroglyphics to record openly and plainly their laws, policies, puolic morals, and hifory, and all kinds of civilmatters: this is evident from their obelifks, which were full of hieroglyphic characters, defigned to record riegular events, memorable actions, and new inventions: and alfo from the celcbrated infcription on the temple of Minerva at Sais, where an infant, an old man, a hawk, a fifh, and a river-horfe, exprefled this moral fentence; "All you who come into the world and go out of it, know this, that the gods hate impulencc." However, the tropical hieroglyphics which were employed to divulge, gradually produced fymbols which were deligned to fecrete or conceal: thus Egypt was fometimes expreffed by the crocodile, fometimes by a burning cenfer with a beart upon it; where the implicity of the firft reprefcutation and the abftrufenefs of the latter fhow, that the one was a tropical hieroglyphic for communication, and the ouher a tropical iymbol invented for fecrecy.

Enigmatic fymbols were afterwards formed by the affenblage of different things, or of their properties that were lefs known; and though they might have been intelligible at firft, yet when the art of writing was invented, hieroglyphics were more generally difufed, the people forgot the lignification of them, and the priefts, retaining and culerating the knowledge of them becaufe they were the repofitories of theirlearning and hiftory, at length applied them to the purpore of preferving the feerets of their religion,

Symbols were the true original of antmal wormip in Egypt, as Sir John Marfham conjectured, Can. Chron. p. 58 . becaule in thefe hieroglyphics was recorded the hiftory of their greater deities, their kings, and lawgivers, reprefented by animals and other creatures. The fymbol of each god was well known and familiar to his worfhippers, by means of the popular paintings and engravings on their temples andother facred monuments; fo that the fymbol prefenting the idea of the god, and that idea exciting fentiments of religion, it was natural for them, in their addreffes to any particular god, to turn to his reprefentative mark or fymbol; efpecially when we confider farther, that the Egyptian priefts feigned a divine original for hieroglyphic characters, in order to increafe the veneration of the people for them. Thefe would of courfe bring on a relative devotion to thefe fymbolic figures, which, when it came to be paid to the living animal, would foon terminate in an ultimate worfhip.

Another confequence of the facrednefs of the hiero. glyphic characters was, that it difpofed the more fuperititions to engrave them on gems, and wear them as amulers or charms. This magical abufe feems not to have been much earlier than the eftablifhed worthip of the god Serapis, which happened under the Ptolemies, and was firft bronght to the general known ledge of the world by certain Cliriftian heretics and natives of Egypt, who had mixed a number of Pagan Cuperftitions with their Chriftianity. Thefe gems, called abraxas, are frequently to be met with in the cabinets of the curious, and are engraven with all hinds of hieroglyphic characters. To thefe abraxas facceeded the talifmans.

Vol. VIII.

HIEROGRAMMATISTS, (Hierogrammatei), i. e. boly regifers, were all order of priefts among the ancient Egyptians, who prefided over learning andreligion. They had the care of the hieroglyphics, and were the expofitors of relifions doatrines and opinions. They werelooked $u_{j}$ on as a hind of prophets; and it is pretended, that one of them predicted to an Egyp. tian king, that an Ifraelice (meaning Mofes), eminent for his qualifications and atchievements, would leffen and deprefs the Egyptian monarchy.-The hierogrammatei were always near the king, to ailift him with their informations and comfels. The better to tit them for this, they made ufe of the kill and knowledge they had acquired in the ftars and the motions of the heavenly lights, and evein of the writings of thein predeceffors, wherein their functions and duties were delivered. They were exempted from all civil employments, were reputed the firft perfons in dignity nexr the king, and bore a kind of fceptre in form of a ploughfiare.-After Egypt became a province of the Roman empire, the hierogrammatei fank into neglect.

HIEROMANCY, in antiquity, that part of divim nation which predicted future events from obfervins the various things offered in facrifice. See Divination and Sacrifice.

HIEROMNEMON, among the ancient Greeks, fignified a delegate chofen by lot, and fent to the great coancil of the Amphictyons, where he was to take care of what concerned religion. The hieromnemonjes were reckened more honourable than theother members of that affembly, the general meetings of which were always fommmoned by them, and their names were prefixed to the decrees made by that council.

Hieromnemon (compofed of repos" facred," and нunpar "one who advertifes or puts in mind of," an officer in the ancient Greek church, whofe principal function was to ftand behind the patriarch at the facraments, ceremonies, \&c. and fhow him the prayers, pfalms, \&c. which he was to rehearfe. He alfo clothed the patriarch in his pontifical robes, and affigned the places of all thofe who had a right to be around him when feated on his throne, as the maiter of the cercmonies now does to the pope.

HIERONYMUS, See Jfrome.
hierophantes, or Higrophanta, (front, reposholy, and queva I appear), in antiquity, a prieft among the Athenians.

The hierophantes was properly the chief perfon that officiated in the eleufinia, that great folemnity facred to Ceres.

This office was firt execnted by Eumolpus, and continued in his family for 1200 years, though when any perfon was appointed to this dignity he was required alway ro live in celibacy.

St Jerome fays, that the hierophantes extinguified the fire of aft by drinking cicuta or the juice of hemlock, or even by making themfelves eunachs. Apollodorus obferves, thatit was the hierophantes who inftructed perfons initiared into their religion in the myfteries and duties thereof, and that it was hence he derived his name; for the fame reafon he was called prophetes, "the prophet." He had officers under him to de the fame thing, or to affin him therein, whe 3 R
were

Hiero

## H I G

Hierophy- were alfo called prophetes and exeges,, i. e. " exlax plainers of divine things."

To the hierophantes it belonged to drefs and adorn the ftatues of the gods, and to bear them in proceflions and folemn ceremonies.

HIEROPHYLAX, an officer in the Greek church, who was guardian or keeper of the holy utenfils, veftments, \& c. anfwering to our facrifta or veftry-keeper.

HIGH, a term of relation, importing one thing's being fuperior or above another: thus we fay, a high mountain, the high court of parliament, bigh relievo, \&c.

Hich, in mulic, is fometimes ufed in the fame fenfe with loud, and fometimes in the fame ferife with acute.
$H_{I G H}$ Dutch, is the German tongue in its greatelt purity, \& \& c. as fpoken in Mifnia, \&c.
HIGHOperation, in chirurgery, is a method of extracting the fone; thus called, becaufe the ftone is taken out at the upper part of the bladder. See Surgery.
High Places, were eminences on which the heathens ufed to worthip their gods, chofen for that purpofe is being fuppofed to be nearer heaven their conftant refidence. The Jews are frequently blamed for their attachment to high-places, after the manner of the Gentiles; though their profeuchee were frequently upon mountains with groves planted about them. Where high-places are reprobated in fcripture, therefore, we thould underfand them as apufed and proftituted to idolatrous purpofes. Before the temple was built, there was indeed nothing in the high-places very contrary to the law, provided God only was adored there, and that no incenfe or vistims were offered to idols. Under the judges they feem to have been tolerated; and Samuel offered facrifices in feveral places befides the tabernacle, where the ark was not prefent. Even in David's time, they facrificed to the Lord at Shilo, Jerufalem and Gibeon; but after the temple was built, and a place prepared for the fixed fettlement of the ark, it was no more allowed of to facrifice out of Jerufalem. Solomon, in the begiming of his reign, went a pilgrimage to Gibeon ; but from that time we fee no lawful facrifices offered out of the temple.

High Prieft. See Pontifex and Priest.
HIGH Way, a free paffage for the king's fubjects; on which account it is called the king's bigh way, tho' the freehold of the foil belong to the owner of the land. Thofe ways that lead from one town to another, and fuch as are drift or cart ways, and are for all travellers in great roads, or that communicate with them, are high ways only; and as to their reparation, are under the care of furveyors.

HIGH-way-men, are robbers on the high way; for the apprehending and taking of whom, a reward of 40 l . is given by the ftatute of 4 and $5 \mathrm{~W} . \& \mathrm{M}$. to be paid within a month after conviction by the fheriff of the county; to which the ftatute 8 Geo. II. cap. 16 . fuperadds iol. to be paid by the hundred indemnified by fuch taking.

HIGHMAN ferrers, an ancient borough of Northanptonfhire in England, which has its name from the family of the Ferrers, to whom it formerly belonged, and who had a caftle in its neighbourhood. It fends one member to parliament. E. Long. I. 40. N. Lat. 52. 20.

HIGHGATE, 2 village five miles north of Lon-
don. It has its name from its high fituation, and from Highlanda gate fet up there about 400 years ago, to receive toll for the bifhop of London, when the o!d miry road from Gray"s-inn Lane to Barnet was turned through the bifhop's park. There was a hermitage whete the chapel now ftands; and one of the hermits caufed a cauferway to be made betwe en Highgate and Hilington, with gravel dag out of the top of the hill, where there is now a pond. Near the chapel, in 1562 , lord chief baron Cholnondely built and endowed a free fchool, which was enlarged in 1570 by Edwin Sandy's bifhop of London.-This village is a noted and airy retirement for the gentry and wealthy cirizens; and is a place of good accommodation, befides its affording a delightful and pleafant profped over the city and adjacent comintry.

HIGHLANDERS, a general appellation for the inhabitants of the mountainous parts of any conntry. In Britain, the name is appropriated to the people who inhabit the muntainous parts of Scolland, to the north and north- xeft, including thofe of the Hebrides or Weftern Illes.- They are a branch of the ancient Celtæ; aild undoubtedly the defcendants of the firft inhabitants of tritain, as appears from the many monuments of their language fill retained in the moft ancient names of places in moft parts of th.e ifland. The Highlanders, or, as they are often termed by ancient authors, the Caledonians, were always a brave, warlike, and hardy race of people; and, in the remoteft times, feem to have poffeffed a degree of refinement in fentiment and manners thea unknown to the other nations that furrounded them. This appears not only from their own traditions and poems; but alfo from the teftimony of many ancient authors. This civilization was probably owing in a great meafure to the order of the bards, or Druids, and fome other inftitutions peculiar to this people.

The ancient Highlanders lived in the humting fate till fome time atter the era of Fingal, who was one of their kings towards the clofe of the third century. For fome ages after that, they turned their chief attention to the paftoral life, which afforded a lefs precarious fubfiftence. Till of late, agriculture in moft parts of the Highlands made but little progrefs.

The Highlanders always enjoyed a king and government of their own, till Kenneth MsAlpine (anno 845), after having fubdued the Pictilh kingdom, transferred thither the feat of royalty. This event proved very unfavourable to the virtues of the Highlanders, which from this period began to decline. The country, no longer awed by the prefence of the fovercign, fell into anarchy and confufion. The chieftains began to extend their authori:y, to form factions, and to foment divifions and feuds between contending clans. The laws were either too feeble to bind them, or too remote to take notice of them. Hence fprung all thofe evils which long difgraced the comntry, and difturbed the peace of its inhabitants. Robbery or plunder, providing it was committed on any one of an adverfe clan or tribe, was countenanced and authorifed; and their reprifals on one another were perpetual. Thus quarrels were handed down from one generation to another, and the whole clan were bound in honour to efpoufe the canfe of every individual that belouged to it. By this means the genius of the people was
greatly

## HIG [ 507 ] H I G

Highlan- greatly altered ; and the Highlanders of a few age ders. back were alnooft as remarkable for their irregular and diforderly way of lite as their predeceffors were for their civilization and virtue. It is from not attending to this diftin Stion between the ancient Highlandersand their pofterity in latter times, that many have doubted the caitence of thofe exalted virtues afcribed by their poets to the more ancient inhabitants of the country. But now that the power of the chicfrains is again abolifhed, law eftablifhed, and property fecured, the genius of the people (where at is not hindered by fome other cxtraneous caufe) beyins again to how itfelf in its genuine colours; and many of their ancient virtues begin to fhine with conficuous luftre. Juitice, generolity, honefty, friendilhip, peace, and love, are perhaps no where more cultivated than among this people. But one of the ftrongeft features which marked the character of the Highlanders in every age, was their hofpitality and benevolence to ftiangers. At night the travellcr was always fure to find a hearty welcome in whatever houfe he hould goto; and the hoft thought himfelf happier in giving the entertainment than the gueft in receiving it. Even with regard to their enemies, the laws of hofpitality were obferved with the moft facred regard. They who fought againft each other in the day, could in the night feaft and even Aeep together in the fame houle. From the fame principle they were, in moft other cafes fo faithful to their truft, that they racely betrayed any confidence repofed in them. A promife they thought as binding as an oath, and held it equally inviolable and facred.
The Caledonians in all ages have been much addicted to poctry and mufic. The poems of Offian, fo univerfally repeated, and fo highly efteemed by every Highlander, are a trong proof wf the carly proficiency of this people in the poetical art. Even to this day, notwithftanding the many difadvantages they labour under, the moft illiterate of either fex difcover frequently a gemius for poetry, which often breaks!forth in the moft natural and fimple ftrains, when love, grief, joy, or any other fubject of fong, demands it. Whereever their circumftances are fo eafy as to allow them any refpite from toil, or any cheerfulnefs of firits, a good portion of their time, efpecially of the winternights, is fill devoted to the fong and tale. This laft fpecies of compofition is chitfly of the novel kind, and is handed down by tradition like their poems. It was the work of the bards; and proved while they exifted, no contemptible entertainment. But fince the extinction of that order, both the Gaelic poems and tales are in a great meafure either loft or adulterated -The genias and character of the Gaelic poetry is well known. It is tender, fimple, beautiful, and fublime.

Among the ancient Highlanders, the harp was the chief inftrument of mufic. It fuited the mikdnefs of thenr manaers, and was well adapted to the peace and quiet which they enjoyed under their own kings. In a later period, however, when the conftant quarrels of their chiefs, and the endlefs feuds of contending clans turned all their thoughts to war, it was forced to give place to the bag-pipe, an inftrument altogether oi the martial kind, and therefore well fuited to the ftate of the country at that time. But ever fince the catie
which had brought this inftrument in vogue has ceafed Hichlanto operate, the attention to it has been on the decline; fo that he hirp, with very little cncouragement, might again refume the feat from which it wasonce expelled. - The moft, and efpecially the oldeft of the Highland mufic, having been compofed to the harp, is of a foft, tender, and elegiac caft, as beft fuited to the genius of that inftrument. Thefe pieces are generally expreflive of the paffion of love and grief. Other pieces, which were compofed in their fate of wa:, and adapted to a different inftrumenr, are altogethe: bold and martial. And many are of a fprighty and cheerful cant, the offspring of mirth, and the fport of fancy in the feafon of feftivity. Many of thefe laft are of the chorus kind; and are fung in almoft all the exercifes in which a number of people are engaged, fuch as rowing, reaping, fulling, \&c. The time of thefe pieces is adapted to the exercifes to which they are refpectively fung. They greatly forward the work and alleviate the labour. The particular mutic which is generally ufed by the Highlanders iu their dances is well known by the name of Strathfpey reels.

The language of the Highlanders is ftill the Gaelic: which, with many of their cuftoms and mauners has been fecured to them by their mountains and faftneffes, amidft the many revolutions which the reft of the ifland has undergone in fo long a courfe of ages. The Gaelic feems to be the oldeft and pureft dialect which pemains of the Celtic, as appears from its approaching the neareft to the names of places, \&c which that language leftin moft countries where it prevailed, and from its moftobvious affinity to thofe tongues, ancient or moden, which have been in any meafure derived from the old Celtic. The Gaelic has all the marks of an original and primitive language. Moft of the words are expreflive of fome property or quality of the objects which they denote. This, together with the variety of its founds (many of which, efpecially of thofe that exprefs the foft and mournful pafions, are peculiar to itfelf), rendersit highly adapted for poctry. It is generally allowed to have been the language of court, in Scotland till the reign of Malcom Canmore. The Gaelic epithet of Cian more, or " large head," by which this king is diftinguilhed, feems to intimate fo much. In fome particular parliaments at leaft, it was fpoken much later, as in that held by Robert the Bruce at Ardchattan. That it has been formerly a good deal cultivated, appears from the fyle and complexion of its poems and tales, and from feveral ancient MSS, that have come down to the prelent times.: To ftrangers the Gaelich as a forbiding afpect, on account of the number of its quiefcent confonants (which are retained to mark the derivation of words and their variation ( in cafe and tenfe), bat its found is abindantly minfical and harmonious; and its genius ftrong and mafculine. Its alphabet confifts of 18 letters of which one is an afpirate, 12 are confonants, and five are vowels.

The Highlanders are beginning of late to apply to learning, agriculture, and efpecially to commerce, for which their country, every where indented with arms of the fea, is peculiarly favourable. Cattle is the chief faple of the country; but it produces more grain than would fupply its inhabitants, if fo much of it were not coufunced in whilky. The natives

Highmore. are beginningro avail themfelves of their nines, woods, wool, and fifheries; and by a vigorous applicarion, with the due encouragement of government, may become a profperous and ufeful people.
The Highlanders are of a quick and penetrating genius, ftrongly tinctured with a curiofity or thirft of knowledge, which difpofes them to learx any thing very readily. They are aetive and induftrious, where oppreffion does not difcourage them by fecluding even the hope of thriving. They are remarkably bold and adventurous, which qualifies them for being excellent feamein and foldiers. They are generally of a middle fize, rather above it than otherwife; their eyes are brifk and lively, their features diftinctly marked, and their perfonstight and well made. Their commenance is open and ingenuous, and their temper frank and communicative.
HIGHMORE, (Jofeph, Efq;) an eminent paintcr, was borne in the parifh of St James's, Garlickhithe, London, June 13, 1692, being the third fon of Mr Edward Highmore, a coal-merchant in Thames-ftreet. Having fuch an carly and ftrong inclination to painting that he could think of nothing elfe with pleafure, his father endeavoured to gratify him in a propoflal to his uncle, who was ferjeant-painter to king $W$ illia m, and with whom Mr (afterwards Sir James) "Thornhin had ferved his apprenticechip. But this was afterwarus for good reafons declined, and he was articled as clerk to an attorney, Jaly 18, 1707; but fo much againf his own declared inclination, that in about three years he began to form refolutions of indulging his natural difpofition to his favourite art, having continually employed his leifure hours in defigning, and in the ftudy of geometry, perfpective, arclitecture, and anatomy, but withont any inftructors except books. He had afterwards an opportunity of improving himfelf in anatony, by attending the lectures of Mr Chefelden, befides entering himfelf at the painters academy in Great Queen-ftreet, where he drew ro years, and had the honour to be particuiarly noticed by Sir Godfrey Kneller, who diftinguifhed him by the name of ow the young Lawyer." On June inth 1714, his clerkhip expired ; and on March 26th 1715 , he began painting as a profeffion, and fettled in the city. In the fame year Dr Brook Taylor publifhed his " Linear Perfpective; or a new method of reprefenting juftly all manner of objects as they appear to the eye in all fituations." On this complete and univerfal theory our artift grounded his fubfequent practice; and it has been generally allowed, that fcw, if any of the profefm fion at that time, were fo thorough mafters of that excellent but intricate fyftem. In 1716, he married Mifs Sufanna Hiller, daughter and heirefs of Mr Anthony Hiller of Effingham in Surrey; a young lady in every refpect worthy of his choice. For Mr Chefelden's " Anatomy of the human body," publifhed in1722, he made drawings from the real fubjects at the time of diffection, two of which were engraved for that work, and appeared, but without his name, int tables xii. and xiii. In the fame year on the exhibition of "The Confcious Lover," written by Sir Richard Steele, Mr Highmore addreffed a letter to the author on the limits of filial obedience, pointing out a material defect in the character of Bevil, with that clearnefs and precifion for which, in converfation and wri-
ting, he wasalways remarkable, as the perill by no Highnoremeans engrofled nis whole attention. His reputation and buinefs increafing, he took a more confficuous ftation, by removing to a houre in Lincoln's-Imn Fields, in March 1723-4; and an opportunity foon offered of introducing him advantageouly to the nobility, \&c. by bis being defired, by vir Pine the cngraver, to make the drawings for his prints of the knights. of the bath, on the revival of that order in 1725. In confequence, feveral of the knights had their portrai is allo by the fame hand, fome of them whole lengths; aind the duke of Richnond, in paricular, was attended by his three efquies, with a perfpective view of king. Henry VIIth's chapel. This capital picture is now at Godwood. And our artift was fent for to St James's by George I. to draw the late duke of Cumberland, from which Smith fcraped a mezzotinto.

In 1728, Mr Hawkins Browne, then of Lincoln'sInn, who had ever a juft fenfe of his talents and abili-ties, addreffed to him a poetical epiltc "On Defign and Beauty;" and, fome years after, an Elegant Latin Ode, both now collected in his poem's. In the fummer of 1732 , Mr Highmore vifited the continent, in company with Dr Pemberton, Mr Benjamin Rohins, and two other friends, chiefly with a view of fecing the gallery of pictures belonging to the clector Palatine a Dufieldorp, collected by Rubens, and fuppofed the beft in Europe. At Antwerp alfo he bad peculiar pleafure in contemplating the works of his, favourite mafter. In their return they vifited the principal towns in Holland. In 1734, he made a like excurfion, but alone, to Paris, where he received great civilities from his comntrymen then there, particularly the duke. of Kingfton, Dr Hickman (histutor), Robert Knight, Efq; (he late cafhier), \&c. Here he had the fatisfaction of being fhown, by cardinal de Polignac, his famous group of antique ftatues, the court of Lycomedes, then juft brought from Rome, and fincé parchated by the king of Prnifia, and deftroyed at Charlottenbourg in r 760 by the Ruffians. In 1742, he had the honour to paint the late prince and princefs. of Wales for the duke of Saxe Gotha; ashe had fome years after the late queen of Denmark for that court ${ }_{\text {on }}$ The publication of "Pamela," in 1744, gave rife to a fet of paintings by Mr Highmore, which were engraved by two French engravers, and publifhed by fubfription in 1745. In the fame year he painted the only original of the late general Wolfe, then about 18. His Pamela introduced him to the acquaintance and friendhip of the excellent author whofe picture he drew, and for whom he painted the only original of Dr Young. In 1750 he had the misfortuce to lofe his wife. OII the firf inftitution of the academy of painting, feulpture, \&c. in 1753, he was elected one of the profeffors; an honour which, on account of his many avocations, he defired to decline. In 1754 he publifhed "A critical examination of thofe two Paintings [by Rubens] on the cieling of the Ban-queting-houfe at Whitehall, in which Architecture is introduced, fo far as relates to Perfpective; together with the Difcuffion of a Queftion which has been the Subject of Debate among Painters:" printed in 4to. In the folution of this queftion, he proved that Rubens and feveral other great painters were miftaken in the practice, and Mr Kirby and fe-

HIG
Highnore. veral other authors in the theory. And in the 17 the volume of the "Monchly Review," he animadverted (anonymoully) on Mr Kirby's unwarrantable treatment of Mr Ware, and detected and expofed his errors, even when he exulis in his own fuperior fcience. Of the many portraits which Mr Highmore painted, in a large practice of 46 years (of which feveral have been engraved), it is impoffible and ufelefs to difcufs particulars. Some of the moft capital in the hiftorical branch, which was then much leis cultivated than it is at prefent, fhall only be mentioned, viz. "Hagar and Ifmael," a prefent to the Founding-hofpital: "The good Samaritan," painted for Mr Shepherd of Campfey Afh: "the finding of Mofes," purchafed at his fale by colonel (now general) Lifter :"The Harlowe family, as defcribed in Clariffa," now in the poffeffion of Thomas WatkinfonPayler, Efq; at Heyden in Kent: "Clariffa," the portrait mentioned in that work : "The Graces unveiling Nature," drawn by memory from Rubens: "The Clementina of Grandifon, and the queen mother of Edward IV. with ber younger fon, \&c. in Weftminfter-abbey;" the three laft in the pófeffion of his fon.

In 1761, on the marriage of his daughter to the Rev. Mr Duncombe, fon to one of his oldelt friends, he took a refolution of retiring from bufinefs, and dirpofing of his collection of pistures, which he did by anction, in March 1762 , and foon after removed to his fon-in-law's at Canterbury, where he paffed the remainder of his life without ever revifiting the metropolis. But though he liad laid down the pencil, he never wanted employ ment: fo active and vigorous was his mind, that with a conftitutional flow of fipirits, and a relifh for inftructive fociety; he was never lefs "alone than when alone;" and befides his profeffional purfuits abovementioned, to philofophy, both natural and moral, and alfo divinity, he laudably dedicated lis time and attention. No man had more clearnefs and precifion of ideas, or a more ardent defire to know the truth; and, when known, confcientioully to purfue it. With ftrong pàffons, ever guided by the ftricteft virtue, he had a tender, fufceptible heart, always open to the diftreffes of his fellow-creatures, and always ready to rclieve them. His capital work of the literary kind, was his "Practice and perfpective, on the principles of Dr Brook Taylor, \&c.'’ written many years before, but not publifhed till r 763 , when it was printed for Nourfe, in one vol. 4to. This not only evinced his fcientific knowledge of the fubject, but r -moved by its perficuity, the only objection that con be made to the fyftem of Dr Taylor. It accordingly teceived from his friends and the intelligent public, the applaufes it deferved. In 1765 he publifhed (without his name) "Obfervations on a Pamphlet intitnled, "Chriftianity not founded on Argument;" in which, after fhowing that it is a continued irony, and lamenting that fo ample a field fhould be offered the author of it for the difplay of His fophiftry; he gives up creeds, articles, and catechifms, as out-works raifed by fallible men, and, confining himfelf to the defence of the gofpel; or citadel, fhows, that pure primitive Chriftianity, though affaulted ly infidels, will ever remain impregnable. His opinion of Rabens may be feen in the Gentleman's Magazine for 1766 , p. 353 , under the title of * Remarks on fome paffages in Mr Webb's inquiry
into the Beantics of Painting; \&c." In the fame Highmore year he pablifhed, with only his initials, "J. H."" two finall volumes of "Eflay", moral, religious, and mifcellaneous ; with a Tranilation in profe of Mr Browne's Latin Poem on the Immortality of the Soul," felected from a lar e number written at his leifure, at differents periods of life. "As fuch (fays Dr Hawkefworth) they do the anthor great credit. They are not excurfions of fancy, but cfforts of thought, and indubitable indications of a vigorous and active mind." In the Gentleman's Magazinë for 1769 , p. 287, he communicated "A natural and obvious Manner of conftructing Sun-dials, deduced from the Situation and Motion of the Earth with refpect to the Sun," explained by a fcheme. And in that for 1788, p. 526, his remarks on colouring, fuggefted by way of a note on the "Epiftle to an eminent Painter," will how that his talents were by no means impaired at the age of 86. Indeed he retained them to the laft, and had even ftrength and firit fufficient to cnable him to ride out daily on horfeback the fummer before he died. A ftrong conftitution, habitual tenuperance, and conftant attention to his health in youth as well as in age, prolonged bis life, and preferved his faculties to his 88th year, when he gradually ceafed to breathe, and, as it were, fell alleep on March 3.1780. He was interred in the fouth aifle of Canterbury cathedral, leaving one fon, Anthony, educated in his own profef. fion; and a de shter, Sufanna; mentioned above.

His abilities as a painter appear in his works, which: will not only be admired by his contenuporarics, but by their pofterity; as his tints, like thofe of Rubens and Vandyck, inftead of being impaired, are improved by time, which fome of them have now withfood above 60 years. His jdea of beauty, when he indul: ged his fancy, was of the higheft kind ; and his know. ledge of perfeective gave him great advantages in fa-mily-pieces, of which he painted more than any one. of his time. He could take a likencis by memory as well as by a fitting, as appears by his picture of the duke of Lorrain (the late emperor), which Faber engraved; and thofe of king George II. (in York-af-fembly-room) ; queen Caroline, the two Mirs Gunnings, \&c. Like many other great painters, he had "s a poet for his friend," in the late Mr Brownc ; to which may be added a poem addreffed to him in 1726 , by the Rev. Mr Bunce, at that time of Trinity-hall, Cambridge, who fucceeded Mr Highnore, and in I 780 was vicar of St Stcphen's near Canterbury.

HIGHNESS, a quality or title of honour given to princes.-The kings of England and Spain had formerly no other title but that of bighonefs; the firft till the time of James I. and the fecond till that of Charles V. The petty princes of Italy began firft to be complimented with the title of bighnefs in the year 1630.-The duke of Orleans affumed the ritle of royal bighnefs in the year 1631, to diftinguifh himielf from. the other princes of France.

The duke of Savoy, late king of Sardinja, bore the title of royal bighnefs, on account of his pretenfions to the kingdom of Cyprus. It is faid that duke only wok the title of royal highnefs, to put himfelf above the duke of Florence, who was called great dukc; but the great duke afterwards affumed the title of royal highnefs, to puthimfelf on a level with the dake of Savoys:

## H I L <br> H I L

The prince of Conde firft took the title of mof $f_{5-m}$

Hilaria rene bighnefs, leaving that of fimple hightrefs to the natural princes.

JIL ARIA, in antiquity, feafts celebrated every year by the Romans on the 8th of the calends of April, or the 25 th of March, in honour of Cybele the mother of the gods.

The hilaria were folemnized with great pomp and rejoicing. Every perfon drefied himfit as he pleafed, and took the marks or badges of whatever dignity or quality he had a fancy for. The ftatue of the goddefs was carried in proceffion through the ftreets of the city, accompanied by multitudes in the moft fplendid attire. The day before the feftival was fent in tears and mourning. Cybele reprefented the earth, which at this time of the year begins to feel the kindly warmth of the fpring; fo that this fudden tranfition from forrow to joy was an emblem of the viciffeude of the feafons which fucceeded one another.

The Romans took this feaft originally from the Greeks, who called it arabaots, q. d. afcenfits; the eve of that day they fpent in tears and lamentations, and thence denominated it rarabarss, defcenfus.

Afterwards, the Greeks took the name inapra from the Romans; as appears from Photius, in his extract of the life of the philofopher Ifidore.

Cafaubon maintains, that befides this particular fignification, the word hilaria was alfo a general name for any joyful or feftival day, whether public or private and domeftic. But Salmatius does not allow of this.

Triftan, tom. i. p. 482, diftinguifhes between hilaria and hilarix. The former, according to him, were public rejoicings; and the latter, prayers made in confequence thereof; or even of any private feaft or rejoicing, as a marriage, \&ec. The public lafted feveral days; during which, all mourning and funeral ceremonies were fufpended.

HILARIUS, an ancient father of the Chriftian church, who flourifted in the 4 th century. He was born, as St Jerome informs us, at Poictiers, of a good family; who gave him a liberal education in the Pa gan religion, and which he did not forfake till he was arrived at maturity. He was advanced to the bifhopric of Poictiers in the year 355 , according to Baronius; and became a moft zealous champion for the orthodox faith, particulary againft the Arians, who were at that time gaining ground in France. He affembled feveral councils there, in which the determinations of the fynods of Rimini and Seleucia were condemned. He wrote a treatife concerning fynods: and a famous work in 12 books on the Trinity, which is much admired by the orthodox believers. He died in the latter end of the year 307. His works have been many times publifhed; but the laft and beft edition of them was given by the Benedietines at Paris in 1693.

HILARODI, in the ancient mufic and poetry, a fort of poets among the Greeks, who went about finging little gay poems or fongs, fomewhat graver than the Ionic pieces, accompanied with fome inftrument. From the ftreets they were at laft introduced into tragedy, as the magodi were into comedy. They appeared dreffed in white, and were crowned with gold. At firft they wore fhoes; but afterwards they affumed the crepida, being only a fole tied over with 2 Atrap.
hilary-term. See Term
HILDESHEIM, a fmall diftrict of Germany, in the circle of Lower Saxony. It lies between the duchies of Lunenburg and Brunfwick; and may be about 25 from eaft to weft, and 36 from north to fouth. It is watered by the rivers Leine and Innerfty. The foil is fertile ; and its principal places are Penne, Sarfed, Bruggen, and Alveld. Hildelbeim, from whence it takes its name, is governed as an imperial city. Its bifhop is now elector of Cologne.

Hildesheim, a ftrong city of Germany, in Lower Saxony, with a Roman-catholic bimop's fee whofe bifhop is fovereign. It is a free imperial city, tho' in fome things dependent on the bifhop. It is a large town well built and fortified. It is divided into the Old Town and the New, which have each their feparate council. It is feated on the river Ineft, in E. Long. 10. 0.N. Lat. 52. 17.

HILL, a term denoting any confiderable eminence on the earth's furface. It is fometimes fynonymous with the word mountain; though generally it denotes only the leffer eminences, the word momntain being particularly applied to the very largeft. See Mountain.

Hril (Aaron), a poet of confiderable eminence, the fon of a gentleman of Malmefbury-abbey in Wiltfhire, was born in 1685 . Hisfather's imprudence having cut off his paternal inheritance, he left Weftminfter fchool at i 4 years of age; and cmbarked for Conftantinople, to vifit lord Paget the Englifh ambaffador there, who was his diftant relation. Lord Pagetreceived him with furprize and pleafure, provided him a tutor, and fent him to travel: by which opportunity he faw Egypt, Paleftine, and a great part of the eaft; and returning home with his noble patron, vifited moft of the courts of Europe. About the year 1709, he publifhed his firft poem intilled Camillus, in honour of the earl of Peterborough who had been general in Spain; and being the fame year made mafter of Drury-lane theatre, he wrote his firft tragedy, Elfred, or the fair Inconftant. In 1710, he became nafter of the opera-houfe in the Hay-market; when he wrote an opera called Rinaldo, which met with great fuccefs, being the firft that Mr Handel fer to mufic after he came to England. Unfortunately for Mr Hill, he was a projector as well as poet, and in 1715 obtained a patent for extracting oil from beech-nuts; which undertaking, whether good or bad, mifcarried after engaging three years of his attention. He was alfo concerned in the firft attempt to fettle the colony of Georgia; from which he never reaped any advantage : and in 1728 he made a journey into the Highlands of Scotland, on a fcheme of applying the woods there to fhip-building; in which alfo he loft his labour. Mr Hill feems to have lived in perfect harmonywith all the writersofhistime, except Mr Pope, with whom he had a fhort paper-war, occafioned by that gentleman's introducing him in the Duncaid, as one of the competitors for the prize offered by the goddefs of Dullnefs, in the following lines:

> "Then Hill effay'd; fcarce vanifh'd out of fight,
> "He buoys up inftant, and returns to light;
> "He bears no token of the fabler freams,
> "He mounts far off among the Swans of Thames."

This, though far the gentleft piece of fatire in the whole poers.

Hill. poem, and conveying at the fame time an oblique compliment, roufcd Mr Hill to take fome notice of it; which he did by a poem written duang his peregrination in the north, intuled, "The prorecs of wit, a caveat for the ufe of an eminent writer;" which he begins with the following eight lines, in which Mr Pope's too well-known difpolition is elegantly, yet very fevcrely characterized :
". 'runeful Alexis on the Thames' fair fide,
"The Tit I dies play-thing and the Mufe's pride -
" With merit popular, and with wit polite,
"Eafy tho' vain, and elegant tho" light;
"Defir:ng and defer ving others praife,
" Worly accepts a Fame he ne'er repays:
" Unionan to cherifh, facakingly approves;
"And wants the foul to freced the worth he loves."
The fueakingly approves, in the coupler, Mr Pope was much affected by: and indeed through their whole controver fy afterwards, in which it was generally thonght that Mr Hill had much the advantage, Mr Pope feemsrather to exprefs hisrepentance by denying the offence, than to vindicate himfelf fuppoling it to have been given. Befides the above poems, Nir Hill, among many others, wrote one, called The northern flar, apon the actions of Czar Peter the Great; for which he was feveral years afterwards complimented with a gold medal from the emprefs Catharine, according to the Czar's defire before his death. He likewife altered fome of Shakefpeare's plays, and tranlated fome of Voltaire's. His laft production was Merope; which was brought upon the ftage in Drury-lane by Mr Garrick. He died on the 8th of February 1749, as it is faid, in the very minute of the carthquake; and after his deceafe four volumes of his works in profe and verfe were publifhed in octavo, and his dramatic works in two volumes.

Hill (Sir John), a voluminous writer, was originally bred an apothecary, but his marrying early and withont a fortune, made him very foon look round for ether refources than his profeffion. Having, therefore, in his spprenticefhip, attended the botanical lectures of the company, and beitig poffeffed of quick natural parts, he foon made himfelf acquainted with the theoretical as well as practical parts of botany : from whence beingrecommended to the late duke of Richmond and lord Petre, he was by them employed in the infpection and arrângement of their botanic gardens. Affifted by the liberality of thefe nobleman, he executed a fcheme of travelling over the kingdom, to collect the moft rare and uncommon plants; which heafterwards publifhed by fubccription : but after great refearchesand uncommon induftry, this undertakingturn$c$ dout by no means adequate to his expectation. The ftage next prefented itfelf, as a foil in which genius might ftand a chance of flourifhing : but after two or three unfuccefsful attempts, it was found he had no pretenfums either to the fock or buikin; which once more reduced him to his botanical purfuits, and his bufinefs as an apothecary. At length, abont the year 1746, he tranllated from the Greek, a fmall tract, written by Theophraftus, on Gems, which he publifhed by fubfeription; and which being wellexeculed, procured him friends, reputation, and money. Encouraged by this, he engaged in wirks of greater extent and importance. The firft he undertook was $\therefore$ general natural hiftory, in 3 vols folio. He next engaged, in conjunction uith George Lewis Scott, Efq; infurnifhing a Supplement.
to Chambers's Dictionary He at the fame time farted the Britilh Magazine ; and while he was engaged in a great number of thefe and other works, come of winch feemed to claim the continued attention of a whole life, he carried on a daily effay, under the title of Infpectur. Amidet this hurry of bufinefs, Mr Hill was fo laborious and ready in all hisundertainings, and was withal fo exact an oconomift of his time, that lie fancely ever miffed a public amuement for many yars: where, while he relased from the feverer purfuirs of ftudy, he gleaned up articles of information for his periodical works. It wonld not be eafy to urace Mr Fill, now Dr Hill (for he procured a diploma from the college of St Andrew's), through all his varions purfuics in life. A quarrel he had with the Royal Society, for being refufed as a member; which provoked him to ridicnlethat learned body, in A review of the works of the Royal Society of London, 4to, 175 I ; together with his over-writing himfelf upon all fubjects withoutreferve; made him fink in the eftimation of the public riearly in the fame pace as he had afcended. He tound as ufual, however, refources in his own invention. He applied himfelf to the preparation of cer. tain fimple medicines; fuch as the effence of waterdock, tincture of velerian, balfam of honey, \&c. The well-known fimplicity of thefe medicines made the public judge favourably of their effects, infomuch that they had a rapid fale, and once more emabled the doctor to figure in that fyle of life ever fo congenial to his inclination. Soon after the publication of the firft of thefe medicines, he obtained the patronage of the eart of Bute, through whofe intereft he acquired the management of the royal gardens at Kew, with an handfome falary: and to wind up the whole of an extraordinary life, having, a little before his death, feized an opportunity to incroduce hikifelf to the knowledge of the king of Sweden, that monarch invefted him with one of the orders of his court, which title he had not the happinefs of enjoying above two years. He died towards the clufe of the year 1775 .

HILLEL, fenior, of Babylon, prefident of the fanhedrim of Jerufalem. He formed a celebrated fchool there, in which he maintained the oral traditions of the Jews againit Shamai, his colleague, whofe difciples adhered only to the written law; and this controverfy gave rife to the fects of Pharifees and Scribes. He was likewife one of the compilers of the Talmud. He alfo laboured much ar giving a correct edition of the facred text; and there is attributed to hiin an ancient manufcript bible, which boars his name. He flourifhed about 30 years. $\mathbf{B}$. C. and died in a very advanced age.

Hiliel, the nafi, or prince, anothcrlearned Jew, the grandfon of Judas Hakkadoh, or the Saint, the author of the Milhna, lived in the fourth century. He compofed a cycle ; and was one of the principal doctors of the Gemara. The greateft number of the Jewifh writers attribute to him the correct edition of the Hebrew text which bears the name of Hiliel, which we have already mentioned in the preceding article. There have been feveral other Jewifh writers of the fame name.

HILLIA, in botany: A genus of the monogynia order, belonging to tbe frexandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The calyx is hexaphillous ; the corolla;

## $\mathrm{H}^{\prime} \mathrm{I} \mathrm{N}$

Hambo
wha cleftin $6 x$ parts, and very long ; the berry inferior, bilocular, and pulyfermous.

HILLSBOROUGH, a borough, far, and pofttowr, in the rounty of Down, and province of Ulfter, 69 miles from Dublin. Here isa fine feat of the earl of Hillborough. The town is pleafantly lituated and alnof ue $s$ built, in view of Lifburn, Belfatt, and Carrickfergusbay; the church is magnificent, having an elegant fuire, as lofty as that of St Parrick's in Dublin, and feven painted windows. Here is an excellent inn, and a thriving mamufacture of mulins. It has three fairs, and fends two melnbers to parliament. This place gives title of earl to the family of Hillf: borough. N. Lat. 54. 30. W. Long. 6. 20.

Mileseorouga, in North Carolina. See North Carolina.

HILUM, anong botanints, denotes the eye of a bean.

HIMERA (anc. geog.), the name of two rivers in Sicily; one running northwards into the Tufcan fea, now cilled Fiume di Termini; and the other fouthwards into the Lybian; dividing Sicily into two parts, being the boundary berween the Syracufans to the eaft - and Carthaginians to the weft; not riling from the fame, but from different fprings.

Himera (anc. geog.), a town of Sicily, at the month of the Himera, which ran northwards, on its left or weft fide : A colony of Zancle : afterwards de: ftroyed by the Carthaginians (Diodorus Siculus).

HIMERENSES Thermae (anc. geog.), a town of Sicily, on the eaft fide of that Himera which runs to the north. After the deftrution of the town of Hiniera by the Carthaginians, fuch of the inhabitants as aremained, fettled in the fame territory, not far from the ancient town. Now Termini. Made a Roman colony by Augultus.

HIN, a Hebrew meafure of capacity for things liquid, containing the fixth part of an ephah, or one gallon two pints Englith meafure.

HINCKLEX, a market-Lown of Leicefterfhire, built on a tifing ground, nearly on the borders of Leicefterfinire, from which it is feparated by the Roman Watling-ftreet road. It is diftant from Coventry and Leicefter 15 míles each, and 102 from London. It has been mach larger than it is at prefent, the back lanes between the orchardshaving cvidentlybeen ftreets originally; and the traces of the town-wall and ditch are in many places yer vifible. There are veltiges of rwo Romain works, viz. the mount near the river, and the ruins of a bath near. St Nicholas church, where teffelated pavements have been dug up. The Jewery wall is frid to have been the temple of Janus. The caftle was inhabited by John of Gaunt ; but is now no more, the fcite being converted into garden ground, the cafte-hill confiderably lowered, and a gentleman's houfe erected on the fpot'in 1770. The fteeple of the prefent church was built with fome of the fones of -the caftle. The town is now divided into the borough, and the bond without the liberties. It has a good market on Mondays, and a fair in Auguft. The chief manufacture is ftockings and fine ale. The town is faid to contain about 750 houfes. There are two churches, one chapel, and a place of workhip for the Roman Catholics, befides four meeting-houfes. The church is a neat large old ftructure with a modern tower and a fpire, the body of it was built in the i 3th century, and near it are three mineral fprings. This
town is faid to be the middle and higheft ground in England; and from it 50 churches may be feen, befides gentlemens feats. It received great damage by a fire Sept. 5. 1728.

HIND, a female tag in the third year of its age. See Cervus.

HINDON, a fnall town of Wilthire in England, which fends two members to parliament. It is fituated in E. Long. 2. 14. N. Lat. 5 I. 12.

HINDOOS, or GENToos, the inhabitants of that part of India known by the name of lindoftan or the Mogul's sumpire, who profefs the religion of cise Bramins, fuppofed to be the fame with that of the ancient Gymnofophifts of Ethiopia.
From the earliett period of hinory the le people feem to have maintained the fame religion, laws, and cuftoms, which they do at this day ; and indecd they and the Chinefe are examples of prefervance in thefe refpects altogether unknown in the weftern world. In the time of Diodorus Siculus they are faid to have been divided into feven cafts or tribes; but the intercourie berwixt Europe and India was in his time fo fmall, that we may well fuppole the hiftorian to have been miftaken, and that the fame teuaciry for which they are fo remarkable in other refpects has manifefted itfelf alfo in this. At prefent they are divided only into four tribes; 1. The Bramin ; 2. The Khatry ; 3. The Bhyfe; and, 4. The Soudera. All thefe have diftinet and feparate offices, and cannot, according to their laws intermingle with each other ; but for certain offences they are fubje $\mathcal{C}$ to the lofs of their caft, which is reckoned the higheit punifment they can fuffer ; and herree is formed a kind of fifth caft named Pariars on the coaft of Coromandel, but in the Shanfcrit or facred language Chandalas. Thefe are efteemed the dregs of the people, and are never employed but in the meanettoffices.. There is befides a general . divifion whichpervades the four caltsindifcrininately; and which is taken from the worflip of their gods $V i / b$ nou and Sheevah; the worthippers of the former being named Vi/hnou-buskit; of the latter, Shecvahbukbt.

Of thefe four cafts the bramins are accounted tie foremoft in every refpect; and all the laws have fach an evident partiality towards them, as cannor but induce us to fuppofe that they have had the principal hand in framing them. They are not, however, allowed to affume the fovereignty : the religious ceremonies and the inftruction of the people being their peculiar province. They alone are allowed to read the $V e d a$ or facred books; the Khatries, or caft next in dignity, being only allowed to hear them read; while the other two can only read the Saftras or commentaries npon them. As for the poor Chandalas, they darè not enter a temple, or be prefent at any religious ceremony.
In point of precedency the bramins claim a fuperiority even to the princes; the latter being chofen out of the Khatry or fecond caft. A rajah will receive with refpect the food that is prepared by a brahman, but the latter will eat nothing that has been prepared by any member of an inferior caft. The punifliment of a bramin for any crime is much milder than if he had belonged to another tribe; and the greateft crime that can be committed is the murder of a bramin. No magiftrate muft defire the death of one of thefe facred perfons, or cat of one of his limbs. They mult

## H I N <br> H I N

an inferior deity named Brimha. They inform us, that Brama, or Brahma, the fupreme God, having created the world by the word of his mouth, formed a female deity, named Bawancy, who in an enthufiafm of joy and praife brought forth three eggs. From thefe were produced three male deities, named Brimha, I'ifhnou, and Sheevah. Brimha was endowed with the power of creating the things of this world, Vihnou with that of cherifhing chem, and Sheevah with that of re. fraining and correcting them. Thus Brimha became the creator of man; and in this character he formed the four calts from different parts of his own body, the Bramins from his mouth, the Khatry from his arms, the Banians from his belly and thighs, and the Soodera from his feet. Hence, fay they, thefe four different cafts derive the different offices affigned them ; the Bramins to teach; tlie Khatry to defend and govern ; the Banians to enrich by commerce and agriculture ; and the Soodera to labour, ferve, and obey. Brama himfelf endowed mankind with paf, fions, and underftanding to regulate them; while Brimha, having created the inferior beings, proceed. ed to write the Vedams, and delivered them to be read and explained by the bramins.

The religion of the Hindoos, though involved in fuperftition and idolatry, feems to be originally pure; inculcating the belief of an eternal and omnipotent Being; their fubordinate deities Brimha, Vifhnon, and Shee vah, being only reprefentatives of the wifdom, goodnefs, and power, of the fuprene God Brama. All created things they fuppofe to be types of the attributes of Brama, whom they call the principle of truth, the JPirit of wifdom, and the fupreme being; fo that it is probable that all their idols were at firft only defigned to reprefent thefe attributes.

There are a variety of fects among the Hindoos : Different two great claffes we have mentioned already, viz. the fecti. worfhippers of Vifhnou and thofe of Sheevah; and thefe diftinguifh themfelves, the former by painting their faces with an horizontal line, thelatter by a perpendicular one. There is, however, very little differ. ence in point of religion between thefe or any other Hindoo fects. All of them believe in the immortality of the foul, a ftate of future rewards and punifhments, and tranfmigration. Charity and hofpitality are inculcated in the frongeft manner, and exift among them not only in theory, but in practice. "Hofpitality (fay they) is commanded to be exercifed even towards an enemy, when he cometh into thine houfe; the tree doth not withdraw its thade even from the woodcuiter. Good men extend their charity even to the vileft animals. The moon doth not with-hold her light even from the Chandala." Thefe pure doetrines, however, are intermixed with fome of the vileft and moft abfurd fuperftitions; andalong with the true God they worfhip a number of inferiur ones, of whom the principal are:

4
I. Bawancy, the mother of the gods, already men. Account of tioned, and fuperior to all but Brama himfelf; but all their printhe other goddeffes are reckoned inferior to their cipal deigods or lurds. ties.
2. Brimha, in the Schanfcrit language, faid to mean "the wifdon of God;" and who is fuppofed to fly on the wings of the hanfe or flamingo; an image of which is conllantly kept near that of the god in the temple ${ }_{3} \mathbf{S}$ where

H I N
Hindoos. where he is wormipped. He has a crown on his head, and is reprefented with four hands. In one of thefe he holds a fceptre, in another the facred books or Vedam, in the third a ring or circle as the emblem of eternity, fuppofed to be employed in affifting and protecting his works.
3. Serafwatej, the goddefs or wife of Brimla, prefides over mufic, harmony, eloquence, and invention. She is alfo faid to be the inventrefs of the letters called Devanagry, by which the divine will was firf promulgated among mankind. In the argument of an hymn addreffed to this goddefs, fhe is fuppofed to have a number of inferior deities acting in fubordination to her. Thefe are called Rags, which prefide over each mode, and likewife over each of the feafons. Thefe feafons in Hindoftan are fix in number; viz. I. The Seefar, or dewy feafon. 2. Heemat, or the cold feafon. 3. Vafant, the mild feafon or fpring. 4. Grefshma, or the hot feafon. 5. Varfa, the rainy feafon. 6. Sarat, the breaking up or end of the rains.

The Rags, in their mufical capacity, are accompanied each with five Ragnies, a kind of female deities or nymphs of harmony. Each of thefe has eight fons or genii; and a dillinct feafon is appointed for the mufic of each rag, during which only it can be fung or played; and this at difinctand flated hours of the day or night. A feventh mode of mufic belonging to Deipec, or Gupid the inflamer, is faid once to lave exifted, but now to be loft; and a mufician, who attempted to refore it, to have been confumed with fire from heaven.
4. ViJ/hnou, the noft celebrared of all the Indian deities, is fuppofed to fly or ride on the garoora, a kind of large brown kite, which is found in plenty in the neighbourhood; and on which Vihnou is fometimes reprefented as fitting; though at others he is reprefented on a ferpent with a great number of different heads. At fome of his temples the bramins accuftom all birds they can find, of the feecies abovementiened, to come and be fed; ealling them by friking upon a brafs plate. This deity is faid to have had ten different incarnations to deftroy the giants with which the earth was infefted; and in there he is reprefented in as many different figures, all of which are to the laft degree fantaftic and monftrous. His common form is that of a man with four hands, and a number of heads fet round in a circle fuppofed to be emblems of omnifcience and omnipotence. In his firf incarnation he is reprefented as coming out of the mouth of a fifh, with feveral hands containing fwords, \&c. In another he has the head of a boar with monftrous tufks, bearing a city in the air, and flands upon a vanquifhed giant with horns on his head. In others of his incarnations, he has the head of a horfe or other animals, with a great number of arms brandifhing fwords, \&c.
In fome parts of his character this deity is reprefented not as a deftroyer, but a preferver of thankind: and he is then diftinguifhed by the name of Hary. Bifiop Wilkins defcribes an image of him in this character at a place named fehan-query, a fmall rocky illand of the Ganges in the province of Bahar. This image is of a gigantic fize, recumbent on a coiled ferpent, whofe numerons heads are twifted by the artift into a kind of canopy over the fleeping god, and from each

## 514] H I N

of its mouth iffued a forked tengue, as threatening Hindoor. deftruction te thofe who fhould dare to approach.
5. Sheevah is reprefented under a human form, though frequently varied, as is alfo his name; but he is moft frequently called Sheevah and Mahadeg. In his deftroying character he is reprefented as a man with a fierce look, with a fnake twiffed ruand his neck. He is thoight to prefide over good and evil fortune, in token of which he is reprefented with a crefcent on his head. He rides upon an ox.
6. Vikrama, the god of victory, is faid to have had a particular kind of facrifice offered to him fomewhat like the fcape goat of the Jews, viz. by letring a borfe loofe in the foreft, and net employing him again.
7. Yam Rajah, or Darham Rajah, is reprefented as the judge of the dead, and ruler of the infernal regions, in a manner fimilar to the Minos and Pluto of the ancient Greeks. He is the fon of Sour, "the fun," by Bifookama daughter of the great architect of the heavenly manfions, and patron of artificers. He rides upon a buffalo, with a fceptre in his hand, having two affiftants, Chiter and Gopt; the former of whom reports the good, and the latter the bad actions of men. Thefe are attended by two genii, who watch every individual of the human race; Chiter's fpy being on the right, and Gopt's on the left. The fonls of deceafed perfons are carried by the fambouts or meffengers of death into the prefence of Darham, where his actions are inftantly proclaimed, and fentence paffed accordingly. The infernal minfions are named by the Hindoos Narekha, and are divided into a great number of places, according to the degrees of punifhment to be endured by the criminal ; bute cternal pument for any offence is fuppored to be inconfiftent with the goodnefs of God. Intead of this, the Hindoos fuppofe, that after the fouls of the wicked have been punifhed long enough in Narekha, they are fent back into the world to animate other bodies either of men or beafts, according to circumftances. Thofe who have lived a life parcly good and partly bad, are likewife fent back to this world; and thefe trials and tranfmigrations are repeated till they be thoroughly purged of all inclination to fin. But as for thofe boly men who have fpent their lives in piety and devotion, they are inftantly convéyed by the genii to the manfions of celeftial blifs, where they are abforbed into the univerfal fpirit; a flate according to every idea we can form equivalent to annihilation!
8. Ki ifen and the nine Copia, among the Hindoos, correfpond with Apollo and the nine mufes of the Greeks. This deity is reprefented as a young man fometimes playing on a flute. He has a variety of names, and is fuppofed to be of a very a morous complexion, having once refided in a diftrict named Birge, where he embraced almoft all the women in the country. From his refidence here, or from thefs amorous. exploits, he is fometimes called Birge-put.
9. Kame-deva, the god of love, is faid to be the fon of Maya, or the general attractive power; married to Retty, or Alfection. He is reprefented as a beautiful youth, fometimes converfing with his mother or confort in his temples or gardens; at other times riding on a parrot by moonlight: and Mr Fofter informs us, that on the taking of Tanjore by the Englif, a cu-
rions

## H I N

 rious picture was found, reprefenting him riding on an elephant, the body of which was compofed of feven young women twifted together in fuch a manneras to reprefent the enormons animal. This is fuppofed to be a device of a limilar nature with that of the Greeks, who placed their Eros upon a lion; thus intimating, that love is capable of taming the fierceft of animals. The bow of this deity is faid to be of fugar-cane or of flowers, and the ftring of bees: he has five arrows, each of eliem tipped with an Indian bloffom of an heating nature. His enfign is a fifle on a red ground, carried by the foremoft of his attendant nymphs or dancing girls.10. Lingant, correrponding to the Priapus or Phallus of the ancients, is worhipped by the Hindoos in order to obtain fecundity. This deity is adored the more fervently, as they depend on their children for performing certain ceremonies to their manes, which they imagine will mitigate their punifhment in the next world. The devotees of this god go naked, but are fuppofed to be fuch fanctified perfons, that women may approach them without any danger. They vow perperual chaftity ; and death is the confequence of a breach of their vow. Hufbands whofe wives are barren invite them to their houfes, where certain ceremonies, generally thought to be effectual, are performed.

Befides thefe, there are a number of other gods whofe character is lefs eminent, though we are by no means acquainted, nor are the Hindoos themfelves perhaps, with the particular rank which each deity carries with refpect to another. Some of thefe deities are, it. Nared, the fon of Brimha, and inventor of a fretted inftrument named Vene. 12. Lechemy, the goddefs of plenty, and wife of Vifhnou. 13. Cow$r y$, Kaly, from Kala "c time;" the wife of Sheevah, and goddefs of deftruction, 14. Varvona, the god of the feas and waters, riding on a crocodilc. 15. Vayoo, the gods of the winds, riding on an antelope with a fabre in his hand. 16. Agnee, the god of fire, riding on a ram. 17. Vafoodka, a goddefs reprefenting the earth. 18. Pakreety, or nature, reprefented by a beautiful young woman. 19. Sour or Shan, the fur ; called alfo the king of the flars and planets, reprefented as fitting in a chariot drawn by one horfe, fometimes with feven, and fometimes with twelve heads. 20. Sangia, the mother of the river Jumna, and wife of the finn. 2 I. Chandava, the moon, in a chariot drawn by antelopes, and holding a rabbit in her right hand. 22. Vreeka/paty, the god of learning, attended by beautiful young nymphs named Veedyadhares, or profeffors of fcience. 23. Ganes, the god of prodence and policy worfhipped before the undertaking of any thing of confequence. 24. Fame, reprefented by a ferpent with a great number of tongues; and known by feveral names. 25. Darma-deva, the god of virtue, fometimes reprefented by a white bull. 26. Virfavana or Cobbair, the god of riches, reprefented by a man riding on a white horfe. 27. Dhan-wantary, the god of medicine.

Befides thefe fupreme deities, the Hindoos have a number of denigods, who are fuppofed to inhabit the air, the earth, and the waters, and in fhort the whole world; fo that every mountain, river, wood, town, village, \&c. has one of thefe tutelar deities, as was the

## 515] H I N

cafe among the weftern heathens. By mature thefe Hindoos. demigods are fubject to death, but are fuppofed to obtain immortality by the ufe of a certain drink named Anrut. Their exploits in many inftances refemble thofe of Bacchus, Hercules, Thefeus, \&c. and in a beautifal epic poem named Rancyan, we have an account of the wars of Rain, one of the demigods, with Ravana tyrant of Ceylon.

All thefe deities are worfhipped, as in other coun- Manner of trics, by going to their temples, fafting, prayers, and worhip. the performance of ceremonies to theirhonour. They pray thrice a day, at morning, noon, and evening, turning their faces towards the eaft. They ufe many ablutions, and, like the Pharifees of old, they always wath before meals. Running water is always preferred for this purpofe to fuch as fagnates. Fruits, flowers, incenfe and money, are offered in facrifice to their idols; but for the dead they offer a kind of cake named Peenda: and offerings of this kind always take place on the day of the full moon. Nothing fanguinary is known in the worflip of the Hindoos at prefent, though there is a tradition that it was formerly of this kind ; nay, that even human facrifices were made ufe of : but if fuch a cuftom ever did exift, it muft have been at a very diftant period. Their facred writings indeed make mention of bloody facrifices of various kinds, not excepting even thofe of the human race : but fo many peculiarities are mentioned with regard to the proper victims, that it is almoft impoffible to find them. The only inftance of bloody facrifices we find on record among the Hindoos is that of the buffaloe to Bawaney, the mother of the gods.

Among the Hindoos there are two kinds of worhip, diftinguighed by the name of the worfhip of the invifible God and of idols. The worfhippers of the invifible God are, Arictly fpeaking, deifts : the idolaters perform many abfurd and unmeaning ceremonies, too tedious to mention, all of which are conducted by a bramin ; and during the performance of thefe rites, the dancing women occafionally perform in the court, finging the praifes of the Deity in concert with various inftruments. All the Hindeos feem to worfhip the fire ; at leaft they certainly pay a great veneration to it. Bifhop Wilkins informs us, that they are enjoined to light up a fire at certain times, which mult be produced by the friction of two pieces of wood of a particular kind; and the fire thus produced is made ufe of for confuming their facrifices, burning the dead, and in the ceremonies of marriage.

Great numbers of devotees are to be met with every Their de where through Hindoftan. Every caft is allowed to votees. affume this way of life excepting the Chandalahs, who are excluded. Thofe held moft in efteem are named Seniaffes and Jogeys. The former are allowed no other clorhing but what fuffices for covering their nakednefs, nor have they any wordly goods befides a pitcher and ftaff; but though they are ftrictly enjoined to meditate on the truths contained in the facred writings, they are exprefsly ferbidden to argue about them. They muft eat but once a day, and that very faringly, of rice or other vegetables: they muft alfo fhow the moft perfect indifference about hunger, thirf, heat, cold, or any thisg wh tever relative to this world; looking forward with continnal defire to the feparation of the foul from the body. Should any of them fail in this

## H I N

Hiudocs. extravagant felf-denial, he is rendered fo much more criminal by the attempt, as he neglected the duties of ordinary life tor thofe of another which he was not able to accomplith. The Yogeys are bound to much the fame rules; and botil fubject themfelves to the moft extravagant penances. Some will keep their arms conftantly ftretched over their heads till they become quite withered and incapable of motion; others keep them croffed over their breaft daring life; while others, by keeping their hands conftantly fhat, lave them quite pierced through by the growth of their nails. Some chain themfelves to trees or partieular fpots of ground, which they never quit; others refolve never to lie down, but fleep leaning againft a tree ; but the moft curious penance perhaps on record is that of a Yogey, who meafured the diftance between Benares and Jaggernaut with the length of his body, lying down and riling alternately. Many of thefe enthuliafts will throw themfelves in the way of the chariots of Vilhnou or Sheevah, which are fomerimes brought forth in proceffion to celebrate the feaft of a temple, and drawn by feveral hundreds of men. Thus the wretched devorees are in an inftant crufhed to pieces. Others devote themfelves to the flames, in order to fhow their regard to fome of their idols, or to appeare the wrath of one whom they fuppofe to be offended.

A certain fet of devotees are named Pandarams; and another on the coaft of Coromandel are named CaryPatra Pandarams. Theformer rab themfelves allover with cow-dung, running about the coantry finging the praifes of the god Sheevah whom they worthip. The latter go about afking clarity at doors by ftriking their hands together, for they never fpeak. They accept of nothing but rice; and when they have got as much as will fatisfy their hunger, never give themfelves any trouble about more, but pafs the reft of the day in the thade, in a flate of fuch fupine indolence as fcarce to look at any object whatever. The Tadinumsare another fet of mendicants, who fing the incarnations of Vifhnon. They have hollow brafs rings round their ancles, which they fill with pebbles; fo that they make a confiderable noife as they walk; they beat likewife a kind of tabor.
8
The greateft fingularity in the Hindoo religion, Mildrefs of howewer, is, that fo far from periecuting thofe of the Hindoo: contrary perfuafion, which is too often the cafe with religion. other profeffors, they abfolutely refufe even to admit of a profelyte. They believe all religions to be equally acceptable to the Supreme Being; affigning as a reafon, that if the Author of the univerfe preferred one to another, it would have been impofible for any other to have prevailed than that which he approved. Every religion, therefore, they conclude to be adapted to the country where it is eftablifhed; and that all in their original purity are equally acceptable.

- Among the Hindoos, marriage is confidered a sa Their mar- religions duty; aud parents are Atrictly commanded to -iages. marry their children by the time they arrive at eleven years of age at fartheft. Polygamy is allowed; bur this licence is feldom made ufe of, unlefs there flould be no children by the firft wife. In cafe the fecond wife alfo proves barren, they commonly adopt a font from among their relations.
The Hindoas receive no dower with their wives;
but, on the contrary, the intended hufband makes a Hiadoos. prefent tothe father of his bride. Neverthelefs, inmany cafes, a rich man will choofe a poor relation for his daughter; in which cafe the bride's father is at the expence of the wedding, receives his fon-in-law into his houfe, or gives him a part of his fortune. The bridegroom then quits the dwelling of his pa:ents with certain ceremonies, and liveswith his father-in-law. Many formalities take place between the parties even after the match is fully agreed upon; and the celebration of the marriage is attended with much expence; mag. nificent proceflions are made, the bride and bridecgroom fitting in the fame palankeen, attended by their friends and relations; fome riding in palankeens, fome on horfes, and others on elephants. So great is their vanity indéed on this occafion, that they will borrow or hire numbers of thefe expenfive aniimals to do honour to the ceremony. The rejoicings laft feveral days; dnring the evenings of which, fire-works and illuminations are difplayed, and dancing women perform their feats ; the whole concluding with alms to the poor, and prefents to the bramins and principal guefts, generally confifting of hawls, pieces of mullin, and other cloths. A number of other ceremonies are performed when the parties come of age, and are allowed to cohabit together. The fame are repeated when the young wife becomes preguant; when fhe paffes the feventh month without any accident; and when fhe is delivered of her child. The relations affemble on the tenth day after the birth, to aflift at the ceremony of naming the child; batif the bramins be of opinion that the afpect of the planets is at that time unfavourable, the ceremony is delayed, and prayers offered up to avert the misfortune. When the lucky moment is difcovered, they fill as many pots with water as there are planets, and offer a facrifice to then; afterwards they fprinkle the head of the child with water, and the bramin gives it fuch a name as he thinks beft adapted to the time and circomftances; and the ceremony concludes with prayers, prefents to the bramins, and alms to the poor. Mothers are obliged to fuckle their own children; nor can this duty be difpenfed with except in cafe of ficknefs. New ceremonies, with prefents to the bramins, take place, when a boy comes of age to receive the fring which the three firlt cafts wear round their wain.

Boys are taught to read and write by the bramins, who keep fchools for that purpofe throughout the country. They ufe leaves inflead of books, and write with a pointed iron inftrtment. The leaves are generally thofe of the palm-tree, which being fmooth and hard, and having a thick fubftance, may be kept for almoft any length of time, and the letters are not fubject to grow faint or be effaced. The leaves are cut into lips about an inch broad, and their books confift of a number of thefe tied together by means of a hole in one end. Sometimes the Ietters are rubbed over with a black. powder, to render them more legible. When they write upon paper, they make ufe of fimall reed. Sometimes they are initiated in writing by making letters apon fand frewed on the floor; and they are taught arithmetic by means of a number of fmall pebbles. The education of the girlsis much more linited; feldom. extending farther than the articles of their religion. Among thefe people the cuftom of burning the dead

## H I N <br> HIN

Hindoos. prevails univerfally; and the horrid practice of wives burning themfelves alung with their deceafed hufbands was formerly very common, though now much lefs fo. At prefent it is totally prohibited in the Britifh dominions ; and cven the Mohammedans endeavour to difcountenance a practice fo barbarous, though many of their governors are accufed of conmving at it through motives of avarice. At prefent it is moft common in the country of the Rajahs, and among women of high rank.

This piece of barbarity is not enjoined by any law exinting among the Hindoos; it is only faid to be proper, and rewards are promifed in the next world to thofe who do fo. But though a wife choofes to outlive her hufband, fhe is in no cafe whatever permitted to marry again, even though the marriage with the former had never been completed. It is unlawful for a woman to burn herfelf if fhe be with child at the time of her huf. band's deceafe, or if he died at a diftance from her. In the latter cafe, however, fhe may do fo if fhe can procure his girdle or turban to be put on the funeral pile along with her. Thefemiferable enthufiafts, who devote themfelves to this dreadful death, fuffer with the greateft conftancy ; and Mr Holwel gives an account of one who, being told of the pain the muft fuffer ( uith a view to diffuade her), put her finger into the fire and kept it there for a contiderable time; after which the put fire on the palm of her hand, with incenfe upon it, and fumigated the bramins who were prefent. Sometimes a chapel is erected on the place where one of thofe facrifices has been performed; fometimes it is inclofed, flowers planted upon it, and images fet up.In fone few places the Hindoos bury their dead; and fome women have been known to fuffer themfelves to be buried alive with their deceafed hufbands : but the inftances of this are fill more rare than thole of burning.-No woman is allowed any inheritance among the Hindoos; fo that if a man dies withour male iffue, his eftate goes to his adopted fon or to his neareft relation.

The Hindoos, though naturally mild and timid, will on many occafions meet death with the moft heroic intrepidity. An Hindoo wholies at the point of death, will talk of his deceafe with the utmoft compofure; and if near the river Ganges, will defire to be carried our, that he may expire on its banks. Such is the exceffive veneration they bave for their religion and cuftoms, that no perfon will infringe them even to preferve his own life. An Hindoo, we are told, being ill of a purrid fever, was prevailed upon to fend for an European phyfician, whoprefcribed him the bark in wine; but this was refufed with the greateft obfinacy even to the very laf, though the governor himfelf joined in his folicitations, and in other matters had a confiderable influence over him. In many inflances thefe people, both in ancient and modern times, have been known, when clufely befieged by an eneny whom they conld not refift, to kill their wives and children, fet fire to their houfes, and then violently rufh upon their adverfaries till every one was deftroyed. In the late war, fome Seapoys in the Britifh fervice, having been concerned in a mutiny, were condemned to be blown away. from the mouths of cannon. Some grenadiers cried ont, that as they had all along had the poft of honour, they faw no reafon why they fhould be denied it now;
and therefore defired that they might be blown away Hindo firft. This being granted, they walked forward to the guns with compofure, begged that they might be fpared the indignity of being tied, and, placing their breafts clofe to the muzzles, were fhot away. The commanding officer was fo much affected with this infance of heroifm, that he pardoned all the reft.
In ordinary life the Hindoos are cheerful and lively; Their $\xi$ fond of converfation and amufements, particularly dan- eral cha cing. They do not, however, learn or practife dancing ter. themfelves, but have women taught for the purpofe; and in beholding thefe they will fpend whole nights. They difapprove of many parts of the education of European ladies, as fuppofing that they engage the attention too much, and draw away a woman's affection from her hufband and children. Hence there are few women in Hindoftan who can either read or write. In general they are finely flaped, gentle in their manners, and have foft and even mufical voices. The women of Kafhmere, according to Mr. Forfter, have a bright olive complexion, fine features, and delicate hhape; a pleafing freedom in their manners, without any tendency to immodefty.

The drefs of the modeft women in Hindoftan con Drcfs fifts of a clofe jacket, which covers their brealts, but the won perfectly fhows their form. The fleeves are tight, and reach half way to the elbows, with a narrow border painted or embroidered all round the edges. Inftead of a perticoat, they have a piece of white cotton cloth wrapped round the loins, and reaching near the ancle on the one fide, but not quite follow on the other. A wide piece of mullin is thrown over the right houlder; which, paffing under the leftarm, is crolled round the: middle, and hangs down to the feet. The hair is ufually rolled up into a knot or bunch towards the back part of the head; and fome have curls hanging before and behind the ears. They wear bracelets on their arms, rings in their ears, and on their fingers, toes and ancles; with fometimes a fmall one in their noftril.

The drefs of the dancing women, who are likewife votaries of Venus, is very various. Sometimes they wear a jama, or long robe of wrought munlin, or gold and filver tiffue ; the hair plaited and hanging down behind, with fpiral curls on each Gide of the face. They are tanght every ac com plifhment which can be fappoled to captivate the other fex ; and form a clafs enitirely different from the reft of the people, and live by theirown rules. Their clothes, jewels, and lodging, are confidered as implements of their trade, and muft be allowed them in cafes of confifcation for debt: They may drink fpiritnous liquors, and eat any kind of meat except beef : their dances are faid to refemble pretty exactly thofe of the ancient Bacchanalinns reprefentedin fome of the ancient paintings and bas reliefs. In fome of their dances they attach gold and filver bells to the rings of the farme metals they wear on their ancles.

The men generally have their heads and beards, Drefs of leaving only a pair of fmall whinkers and a lock on the the mena back part of their head, which they take great eare to preferve. In Kahmere and fome ather places, they let their beards grow to the length of two inches. They wear turbans on their heads ; but the bramins who officiate in the temples commonly go with their heads uncovered, and the upper pars) f the body naked :

H I N

Hindoos. round their fhoulder they hang the facred ftring called Zennar, made of a kind of perennial cotton, and compofed of a certain number of threads of a determined length. The Khatries wear alfo a fring of this kind, but compofed of fewer threads; the Bhyfe have one with ftill fewer threads, but the Sooderas are not allowed to wear any ftring. The other drefs of the bramins confift of a piece of white cotton cloth wrapped about the loins, defcending below the knee, but lower on the left than on the right fide. In cold weather they fometimes put a red cap on their heads, and wrap a flawl round their bodies.-The Khatries, and moft other of the inhabitants of this country, wear alfo pieces of catton cloth wrapped round them, which cover the apper as well as the lower part of the body. Ear-ringsand bracelets are worn by the men as well as women : and they are fond of ornamenting themfelves with diamonds, rubies, and other precious ftones, when they can procure them. They wear llippers on their feet of fine woollen cloth or velvet, frequently embroidered with gold and filver; thofe of princes being fometimes adorned with precious fones. The lower claffes wear fandals or flippers of coarfe woollen cloth or leather. Thefe flippers are always put off on going into any apartment, being left at the door, or given to an attendant ; neverthelefs the Hindoos make nocomplaints of the Europeans for not putting off their hoes when they come into their houfes, which muft certainly appear very uncouth to them.
Hindoo families are always governed by the eldeft male, to whom great refpect is fhown. Filial veneration is carried to fuch a height among them, that a fon will not fit down in the prefence of his father until ordered to do fo: and Mr Fofter obferves, that during the whole time of his refidence in India, he never faw a direct inflance of undutifulnefs to parents; and the fame is related by other writers.

The houfes of the Hindoos make a worfe appearance than could be fuppofed from their ingenuity in other relpects. In the fouthern parts of the country, the houfes are only of one ftory. On each fide of the door, towards the ftreet, is a narrow gallery covered by the flope of the roof which projects over it, and which, as far as the gallery extends, is fupported by pillars of brick or woed. The floor of this gallery is raifed about 30 inches above the levelof the ftrect, and the porters, or bearers of palankeens, with the foot foldiers named Peons, who commonly hire themfelves to noblemen, often lie down in this place. This entrance leads into a court, which is alfo furrounded by a gallery like the former. On one fide of the court is a large room, on a level with the fioor of the gallery; open in front, and fread with mats and carpets covered with white cotton cloth, where the mafter of the houfe receives vifits and tranfacts bufinefs. From this court there are entrances by very fmall doors to the private apartments. In the northern parts, houfes of two or three ftories are commonly met with. Over all the country alfo we meet with the rains of palaces, which evidently fhow the 17 Learning of the Bramins,
leave India on account of the murder of their king near the banks of the Ganges, migrated into that country. The ancient bramins, however, may juftly be fuppofed to have cultivated fcience with much greater fuccefs than their defcendants can boaft of, confidering the ruinous wars and revolutions to which the country has been fubjected. Metaphyfics, as well as moral and watural philofophy, appear to have been well underftood among them; but at prefent all the Hindoo knowledge is confined to thofe whom they call Pundits, "doetors or learned men." Thefe only underftand the language called Schanforit or Sanforit,(from two words fignifying perfection); in which the ancient books were written.

The metaphyfics of the brarsins is much the fame metaphywith that of fome ancient Greek philofophers. They fics. believe the human foul to be an emanation from the Deity, as light and heat from the fun. Gowtama, an ancient metaphy fician, difting gifhes two kinds of fouls, the divine and vital. The former refembles the eternal fpirit from which it came, is immaterial, indivifible, and without paffions; the vital foul is a fubtile element which pervad $\epsilon$ all things, diftinct from organifed matter, and which is the origin of all our defires. The external fenfes, according to this author, are reprefentations of external things to the mind, by which it is furnifhed with materials for its various operations; but unlefs the mind ad in conjunction with the fenfes, the operation is loft, as in that abfence of mind which takes place in deep contenplation. He treats likewife of reafon, memory, perception, and other abfract fubjects. He is of opinion, that the world could not exift withoat a firft caufe ; chance being nothing but the effect of an unknown caufe : he is of opirion, however, that it is folly to make any conjectures concerning the beginning or duration of the world. In treating of providence, he denies any immediate interpofition of the Deity; maintaining, that the Supreme Being having created the fy fem of nature, allowed it to proceed according to the laws originally impreffed upon it, and man to follow the impulfe of his own defires, reftrained and conducted by his reafon. His doctrine concerning a future ftate is not different from what we have already flated as the belief of the Hindoos in general. According to bifhop Wilkins, many of them believe that this world is a fate of rewards and punihments as well as of probation ; and that good or bad fortune are the effects of good or evil actions ccmmitted in a former ftate.

The fcience for which the bramins, however, were Their as mot remarkable, is that of aftonomy; and in this their trenomy. progrefs was fo great, as even yet to furniih matter of admiration to the moderns. - The Europeans firf became acquainted with the Indian aftronomy in 1687 , from a Siamefe MS. containing rules for calculating the places of the fan and moon, brought home by M. Loubere the French ambaffador at Siam. The principles on which the tables in this MS. were fonded, however, proved to be fo obfcare, that it required the genius of Caffini to inventigate them. The mifionaries afterwards fent over two other fets of tables from Hindo. ftan; but no attention was paid to thens till M. le Gentil returned from obferving the tranfit of Venus in. 1769. During the time of his flay in Hindoftan, the bramins had been much more familiar with him on account of his aftronomical knowledge, than they ufaally were

## H I N [ 519$]$ H I N

Hindoos. with Europeans ; and he thus had an opportunity of obtaining conliderable infight into their methods of calculation. In confequence of this inftruction he publifhed tables and rules, according to the Indian method,

Edin. Pbil Iranf. in the academy of fciences for 1772 ; and in the explanation of thefe M. Bailly has employed a whole volume. The objects of this aftronomy, according to Dr. Playfair, are, . Tables and rules for calculating the places of the fun and moon. 2. Of the planets. 3. For determining the phafes of eclipfes. They divide the zodiac into 27 conftellations, probably from the motion of the moon through it in 27 days; and to this lunar motion the Doctor afcribes the general divition of time into weeks, which has prevailed fo univerfally throughout the world. The days of the week were dedicated to the planets, as by the ancient heathens of the weft, and in precifely the fame order. The ecliptic is divided into figns, degrees, and minutes, as with us: and indeed their calculations are entirely fexagefimal, the day and night being divided into 60 hours; fo that each of their hours is only 24 of our minutes, and each of their minutes 24 of our feconds.

The requilites for calculating by the Indian tables are, I. An obfervation of the celeftial body in fome paft mement of time, which is commonly called the Epoch of the tables. 2. The mean rate of the planet's motion. 3. The correction on account of the irregular motion of the body, to be added or fubftracted from the mean place, according to circumftances. They calculate the places of the fun and moon, not from the time of their entrance into Aries, but into the moveable Zodiac. Thus the beginning of the year is continually advancing with regard to the feafons; and in 24,000 years will have made the complete round. The mean place of the fun for any time is deduced on the fuppofition that 800 years contain 292,207 days; from whence, by various calculations, the length of the year comes out only $\mathrm{r}^{\prime} 53^{\prime \prime}$ greater than that of De la Caille; which is more accurate than any of our ancient aftronomical tables. In the equation of the fun's centre, however, they commit an error of no lefs than $16^{\prime}$ : but Dr.Playfair is of opinion that this cannot be afrribed wholly to their inaccuracy, as there was a time when their calculation approached very near the truth; and even at prefent the error is lefs than itappears to be.

The motions of the moon are deduced from a cycle of 19 years; during which fhe makes nearly 235 revolutions, and which period conftitutes the fanous cycle fuppofed to have been invented $b$. Meton the Athe. nian aftronomer, and from him called the Metonic Cy. cle. They are likewife furprifingly exact in calculating the moon's apogee and fome of the inequalities of her motion ; they know the apparent motion of the fixed ftars eaftward, and the Siamefe tables make it only four feconds too quick; which ftill hows a great accu-acy of calculation, as Ptolemy the celebrated aftronomer made an error of no lefs than it feconds in calculating the fame thing. M. Caffini, however, informsus, that thefe rables are not calculated for the meridian of Siam, but for a place $18^{\circ} 15^{\prime}$ to the weftward of it, which brings us very near the meridian of Benares, the ancient fat of Indian learning. This likewife agrees with what the Hindoos call their firf meridian, which paffes through Ceylon, and the banks
of the river Remananur. It muft be obferved, how- Hindoos ever, that the geography of the Hindoos is much more inaccurate than their aftronomy.

The date of the Siamefe tables is not very ancient; and that of the tables abovementioned fent from Hindoftan by the miffionaries is fill more modern. Thefe, however, are written in fuch an enigmatical manner, that the miffionary who fent them was unable to tell their meaning ; and Dr Playfair fuppofes that even the Bramins themfelves were ignorant of it. Neverthelefs they were decyphered by M. le Gentil ; who thinks that they have the appearance of being copied from inferiptions on fone. The minutes and feconds are not ranged in vertical columms, but in rows under one another, and without any tille to point out their meaning or connection.
The tables of Tirvalore are among the moft remarkable of all we are yet acquainted with. Their date, according to Dr Playfair, correfponds with the year 3 LO 2 B . C. thus ruming up to the year of the world 902, when Adam was fill in life. This era is famous in Hindoftan under the name of Calyougham: and as this extrardinary antiquity cannot but create fome fufpicion, Dr Plaýfair has been at fome pains to determine whether it is real or fictitious, i.e. whether it has been determined by actual obfervation, or derived by calculation from tables of more modern date. The refult of his labours is, that we are to account the Calyougham as determined by obfervation; and that had it been otherwife, we muft have been furnifhed with infallible methods of detecting the fallacy. His reafons for this opinion are,

1. The tafk would have been too difficult, even for modern aftronomers, to make theneceffarycalculations, without taking into account the difturbances arifing from the action of the heavenly bodies upon one another, and with which we cannot fuppofir the ancient aftronomers to have been equally well acquainteduith the mocerns. By reafon of thefe variations, as well as from the fmall errors unavoidable in every calculation, any fet of aftronomical tables will be found prodigionfly iniccurate when applied to any period very far diftant from the time of obfervation. Hence, fays our author, "it may be eftablifhed as a maxim, that if there be given a fyftem of aftronomical tables, founded on obfervations of an unknown date, that date may be found by taking the time when the tables reprefent the celeftial motions moft exactly."-This indeed might be done, provided we were furnilhed with any fet of perfectly accurate tables with whi h we could compare the fufpected ones; and Dr Playfair thinks it "a very reaforable poftulatum," that our modern aftronomical tables, though not perfectly accurate, are yet capable of determining the places of all the celeftial bodies without any fenfible error for a longer period than thar of the Calyougham.
2. By calculation from our modern tables, it appears that the place of the ftar Aldebaran, at the commence. ment of the Calyougham, differs only 53' from what the Indian tables make it. He thinks this coincidence the more remarkable, as the bramins, by reafon of the inacuracy of their own date, would have erred by four or five degrees, had they calculated from their moft modern tables dated in 149 I .
3. At the commencement of this epoch (which, according

## H I N [ 520 ] H I N

Hindons. cording to M . Bailly, happened at midnight between the 17 th and 18 th of February 3102 B . C.) the fun was in $10^{\circ} 3^{8} \quad 3^{8 \prime} 13^{\prime \prime}$, by the Indian tables. But the mean longitude of the fun, according to the tables of M. de la Caille, for the fame time, comes out to be only $10^{\prime} 1^{8} 5^{\prime} 57^{\prime \prime}$, fuppofing the preceffion of the equinoxes to have been the fame at that time as now. M. de la Grange, however, has demonftrated, that, in former ages, the preceflion of the equinoxes was lefs than at prefent; whence there arifes an equation of $1^{\circ} 45^{\prime} 22^{\prime \prime}$ to be added to the fun's place already mentioned; and thusit willdiffer only 47 ' from the radical place in the tables of Tirvalore. Notwithftanding this reafoning, however, Dr Playfair thinks that no ttrefs is to be laid upon this argument, as it depends on the truth of a conjecture of M. Bailly that - the place of the fun abovementioned was not the mean but the true one.
4. The mean place of the moon at Benares, calculated from Mr Meyer's tables, for the 18th of February 3102 B . C. will be $10^{\prime} 0^{\circ} 55^{\prime} 16^{\prime \prime}$, provided her motion had all that time been equable; but the fame aftroniomer informs us, that the motion of the moon isfubject to a fmall but uniform acceleration, about 9 in 100 years; which in an interval of 4801 years, muft have amounted to $50.45^{\prime \prime} 44^{\prime \prime}$; which added to the preceding, gives $10^{\circ} 6^{\circ} 37^{\prime}$ for the true place of the moon at the commencement of the Calyougham. Now the place of this luminary, at that time, by the tables of Tirvalore, is $10^{\circ} 6^{\circ}$; the difference is lefs than two thirds of a degree, which, for fo remote a period, and confidering the acceleration of the moon's motion, for which no allowance could be made in an Indian calculation, is a degree of accuracy that nothing but actual obfervation could have produced.-This conciufion is confirmed by a computation of the moon's place from all the tables to which the Indians could have any accefs, and of which the enormous errors would inflantly fhow the deception. Thus, by the tables of Ptolemy, the place of the fun would be $10^{\circ}$ $21^{\prime} 15^{\prime \prime}$ greater; and that of the moon $11^{2} 5^{\prime} 7^{\prime \prime}$ greater than has jun been found from the Indian tables. By thofe of Ulug Beg, the place of the fun would be $1^{\circ} 30^{\circ}$, and that of the moon $6^{\circ}$, different from what it is by the Indian tables: and in like manner our author fhews that the Indian calculations could not be derived from any other fet of tables extant. In like manner, he fhows that, with regard to the mean place of the moon, there is a coincidence for a period of more than 4000 years between the tables of Meyer and thofe of India named Cbrifnabouram; which, though they bear a more modern date than thofe of Tirvalore, are thas probably more ancient. "From this remarkable coiticidence (fays Dr Playfair), we may conclude, with the highef probability, that at leaft one fet of thefe obfervations on which the tables are founded, is not lefs ancient than the era of the Calyougham : and though the poffibility of their being fome ages Jater than that epoch is not abfolutely excluded, yet it may, by frict mathematical reafoning, be inferred, that they cannot have been later than 2000 years before the Chriftian era.
5. Since the time that Mr Bailly wrote, every argument refpecting the acceleration of the moon's motion has become more worthy of attention, and more conclufive. For the acceleration is no longer a mere
empirical equation introduced to reconcile the ancient Hiadons. obfervations with the modern, nor a fact that can only be accounted for by hypothetical caufes, fach as the refiftance of the ether, or the time neceffary for the tranfmiffion of gravity ; but a phenomenon which M. de la Place has with great ability deduced from the principle of univerfal gravitation, and fhown to be neceflarily connected with the changes of eccemuricity in the earth's orbit difcovered by M.de laGrange : fo that the action of the moon is indirectly produced by the action of the planets, which alternately increafing and diminiifhing this eccentricity,fubjects the moon to different degrees of that forco by which the fun diffurbs the time of her revolution round the earth. It is therefore a periodical inequality, by which the moon's motion, in the courfe of ages, will be as much retarded as accelerated; but its changes are fo flow, that her motion has been conftantly accelerated, even for a much longer period than that to which the obfervations of India extend-To M. de la Grange alfo we are indebted for one of the moft beautiful of the difcoveries in phyfical aftronomy, viz. That all the variations in our fyftem are periodical; fo that, though every thing, almoft without exception, be fubject to change, it will, after a certain interval, return to the fame fate in which it is at prefent, and leave no room for the introduction of diforder, or of any irregularity that might conftantly increafe. Many of thefe periods, however, are of vaft duration. A great number of ages, for inftance, muft elapfe, before the year be exactly of the fame length, or the fun's equation be of the fame magnitude, as at prefent. An aftronomy, therefore, which profeffes to be fo ancient as the Indian, ought to differ confiderably from ours in many of its elements. If, indeed, thefe differences are irregular, they are the effects of chance, and muft be accounted errors; but if they obferve the laws which theory informs us they do, they munt be held as the mof undoubted marks of authenticity.
6. Neither thefe tables of Tirvalore, nor the more ancient ones of Chrifnabouram, are thofe of the greateft antiquity in India. The bramins conftantly refer to an aftronmy at Benares, which they emphatically ftyle the ancient s and which, they fay, is not now underfood by them, though they believe it to be much more accurate than that by which they calculate.
From thefe and other fimilar arguments, Dr. Playfair draws the following conclufions with refpect to Indian aftronomy. 1. The obfervations on which it is founded, were made more than 3000 years before the Chriftian era; and in particular the places of the fun and moon, at the beginning of the Calyougham, were derermined by aciual obfervation. 2. Though the aftrenomy now in the hands of the bramins is fo ancient in its origin, yet it contains namy rules and tables that are of later confruction. 3. The batis of their four fyftems of aftronomical tables is evidently the fame. 4. The confruction of thefe tables implies a great knowledge of geometry, arithmetic, and even the theretical pat 21 theoretical part of aftronomy. All this, however, Controver we find controverted, or at leat rendered fomewhat ted by $\mathrm{Mr}_{\text {r }}$. doubtful, by William Marfden, Efq. who has written Marfen. a paper on the chronology of the Hindoos in the Philofophical Tranfactions for 1790 . "The Kalee Yoog (fays he), or principal chronological era, began in the year 3102 B. C. according to the common method of computation,

## HIN [ 52 I$]$ H I iv

Hindoos. computation, or in 3 ror accordi:g to the aftromical method, on the 18 ch of February, at filn-rife; or at midnight, according to different accounts, under their firft meridian of Lauku.-At that period it is said to be afferted by their aftronomers, that the fun, moon, and all the planets, were in conjunction according to their mean places. The reality of this fact, but with confiderable modification, has received a refpectable fanction from the writings of an ingenious and celebrated member of the French acadeny of fciences, who concludes that the aclual obfervation of this rare phenomenon, by the Hindoos of that day, was the occafion of its eftablifiment as an aftronomical epoch. Although M. Bailly has fupported this opinion with his ufual powers of reafoning, and although abundant circumftances tend to prove their early fkillin this fcience, and fome parts of the mathematics connected with it; yet we are conftrained to queftion the verity or poffililitity of the obfervation, and to conclude rather that the fuppofed conjunction was, at a latter period, fought for as an epoch, and calculated retrofpectively. That it was widely mifcalculated too, is fufficiently evideat from the compuation which M. Bailly himelf has given of the longitudes of the planets at that time, when there was a difference of no lefs than $73^{\circ}$ between the places of Mercury and Venus. But fifteen days after, when the fun and moon were in oppofition, and the planets far enough from the fun to be vifible, he compates that all, except Venus, were comprehended within a fpace of $17^{R}$; and on this he grounds his fuppofition of an actual obfervation.
" In their carrent tranfactions the inhabitants of the peninfula employ a mode of computation of a different rature, which, though not unknown in other parts of the world, is confined to thefe people among the Hindoos. This is a cycle, or revolving period, of 60 folar $y$ :ars, which has no farther correfpondence with their other eras than that of their years refpectively commencing on the fame day. Thofe that conftitute the cycle, inftead of being numerically counted, are dintingniihed from each oth er by appropriate names, which in their epiftes, bills, and the like, are inferted as dates, with the months, and perhaps the age of the moon annexed ; but in their writings of importance and record, the year of Salaban (often called the Saka year) is fuperadded; and this is the more effential, as I do not find it cuftomary to number the cycles by any progreffive reckoning. In their aftronomical calculations we obferve, that they fometimes complete the year of their craby multiplying the number of cycles elapfed, and adding the complement of the cycle in which it commenced, as well as the years of the current cycle ; but from hence we are led to no fatisfactory conclafion concerning this popular mode of eftimating time. The prefuraption is in favour of its being more ancient than their hiftorical epochs, The prefent cycle, ofwhich forty-threecomplete years were expired in April 1790, began in 1747, with the year of Salaban 1669, and of the grand era $484^{\circ}$. M. le Gentil, to whom Europe is chiefly indebted for what is known of Hindoo aftronomy, has fallen into an unaccountable error with regard to the years of this cycle, and their correfpondence with thofe of the Kalee Yoog, as appears by the comparative table he has given

Voi. VIII.
oithem, and other paffers of his work. He feras to have t.aken it forgranted, without due examination, that the year 3600 of the latter munt have been produced by the multiplication of the cycle of 60 into itfelf: and confequently that the firft year of this grand era muft likewife have been the firft of the cycle. But this is totally inconfiftent with the fas ; the Kale: Yoog began the thitteenth year of the cycle of 60; and all the reafoning founded on the felf-production and harmony of thefe periods muft fall to the ground."

From vhat Mr Marfen here fets forth, it is plain that we mat make very confiderable abatements in on: confidence of the extrome antiquity of the Hindoos obfervations. Indeed we can fcarce conceive a potfibility of reconciling fuch extravagant antiquity with the authentic hiftories of which we are poffeffed, or with thofe of fcripture. The want of an ancient hiftory of Hindoftan leaves us indeed in the dark, and gives room for ingenious and fpeculative men to indulge themfelves in marvellous reveries concerning their antiquity. But the flood, we know, which if it exifted at all, could not be but general over the whole earth *, * See the muft have deftroyed every monument of art and fci- article $D_{e}$. ence ; and it is furely more reafonable to believe, that lugce. ' M. le Gentil, or the moft learned man in the prefent age, has been miftaken (even though we fhould not be able to determine the particular manner), than at once to deny the authenticity of all hiftory borh facred and profare, and attempt to evade evidence which no power of reafoning can ever fer afide.

It is, however, undeniable, that the progrefs of the Great kkill Hindoos in geometry as well as aftronomy has been of the Hinvery great in ancient times. Of this a molt remark. doos in able inftance is given by Dr Playfair, in their finding geometry, out the proportion of the circumference of a circle to its diameter to a great degree of accuracy. This is determined, in the Ayeen Akbary, to be as 3927 to 1250 ; and which, to doit arithmetically in the fimpleft manner poffible, would require the infcription of a polygon 768 fides ; an operation which cannot be performed without the knowledge of fome very curious properties of the circle, and at leaft mine extractions of the fquare root, each as far as ten places of decimals. This proportion of 1250 to 3927 is the fame with that of ito 3 .1416; and differs very litule from that of $1 I_{3}$ to 155 difcovered by Metrus. He and Victa were the firft who furpaffed the accuracyof Archimedes in the folution of this problem; and it is remarkable that thefe two mathematicians flourifhed at the very time that the Ayeen Akbary was compofed among the Hindoos.-In geography, however, they are much deficient : and it is very difficult to find out the true fitation of the meridians mentioned by their authors from what they have faid concerning them.

The art of painting among the Hindoos is in an im- Painting perfect fate; nor are there any remains of antiquity Sculpture which evince its ever being more perfect than it is juft \&c. now. Their principal defect is in drawing, and they feem to be almoft totally ignorant of the rules of perfpective. They are mach better flilled in colouring; and fome of their pictures are finilhed with great nicety. Their fculptures are likewife rude, and greatly refemble thofe of the Egyptians. They feem to follow no regular rules in architecture: their temples in3 T deed

Hindoos. deed are filled with innumerable columns, bnt mof of them witheut any juft flape or proportion. They are principally remarkable for their immenfe fize, which gives them an air of majefty and grandeur.

The mnfic of the Hindoos is but litule known to Eturopeans; and the art feems to have made but little progrefs among them in comparifon with what it has done in the weftern countries; though fome of the Indian airs are faid to be very melodions. Their mufical inftrumentsare very numerous: in war they ufe a kind of great kettle drum named nagar, carried by a camel, and fometimes by an elephant. The dole is a long narrow drum flung round the neck; and the tam-tam is a flat kind of drum refembling a tabor, but larger and louder. They ufe alfo the cymbal, which they name talan; and they have various forts of trumpets, particularly a great one named tary, which emiss a moft doleful found, and is always ufed at funerals, and fometimes to announce the death of perfons of diftinc-
25 tion
The jugglers among the Hindoos are fo expert, that many of the miffionaries have afcribed their tricks to fupernatural power; and even fo late a traveller as Mr Grofe feems to be not of a very different opinion $\dagger$. Like the Egyptians, they feem to have the power of difarming ferpents of their poifon; and there are many ftrollers who go about with numbers of thefe animals in bags, having along with them a fmall bagpipe called magouty, which they pretend is ufeful to bring them from their lurking places. They take the ferpents, though of the moft poifonous kinds, out of the bags with their naked hands, and throw them on the ground, where they are taught to rear and move about to the found of their mufic. They fay that this is accomplifhed by means of certain incantations.
$26^{1}$
Antiquity of fire-arms among the Hindoos.

The ufe of fire-arms appears to have been of great antiquity in India. They are prohibited by the code of Gentoo laws, which is certainly of a very ancient date. The phrafe by which they are denominated is agneeafter, or weapons of fire; and there is alfomention made of Set agnee, or the weapon that kills an hundred men at once. It is impoffible to guefs at the time when thofe weapons were invented among the Hindoos; but we are certain, that in many places of the eaft, which have neither been frequented by Mohammedans nor Europeans, rockets are almoft univerfally made ufe of as weapons of war. The Hindoo books themfelves afcribe the invention of fire-arms to Bae $b k$ ookerma, who formed all the weapons made ule of in a war betwixt the good and evil fpirits. Fireballs, or blue lights, employed in befieged places in the night-time, toobferve the motions of the befiegers, are met with every where through Hindoftan, and are conftructed in full as great perfection as in Europe. Fireworks alfo are met with in great perfection; and, from the earlieft ages, have conftituted a principal article of amufement among the Hindoos. Gun-powder, or a compofition fonewhat refembling it, has been found in many other places of the eaft; particularly China, Pegu, and Siam ; but there is reafon to believe that the invention came originally from Hindoftan. Poifoned weapons of all kinds are forbidden in this conntry.

The Hindoos are remarkable for their ingenuity iir all kinds of handicraft; but their utenfils are fimple,
and in many refpects inconvenient, fo that incredible labour and patience are neceiary for the accompliflment of any piece of work; and for this the Hindoos are very remarkable. Lacquering and gilding are ufed all over the country, and muft have been ufed in very early ages; though in fome places the lacquering is brought to much greater perfection than in others.

The principal article of food throughout all Hindoftan is rice, and of confequence the cultivation of it forms the principal object of agriculture. In this the moft important requifite is plenty of water; and when there happens to be a fcarcity in this refpece, a famine munt be the confequence. To prevent this as far as poffible, a vaft number of tanks and water-courfes are to be met with throughout the country, though in fome places thefe are too much neglected, and gradually going to decay. After the rice is grown to a certain length, it is pulled up, and tranfplanted into fields of about 100 yards fquare, feparated from each other by ridges of earth; which are daily fupplied with water let in upon them from the neighbouring tanks. When the water happens to fall below the level of the channels made to receiveit, it is raifed by a fimple machine named picoti, the conftruction of which is as follows. A piece of timber is fixed upright in the ground, and forked fo as to admit another piece to move tranverfely in it by means of a ftrong pin. The tranfverfe timber is flat on one fide, and has pieces of wood acrofs it in the manner of fteps. At one end of this timber there is a large bucket, at the other a weight. A man walking down the fteps throws the bucketinte the well or tank; by going up, and by means of the weight, he raifes it; and another perfon ftanding below empties it into a channel made to convey the water inte the fields. The man who moves the machine may fupport himfelf by long bambooos that are fixed in the way of railing from the top of the piece of upright timber towards the wall.

A number of other kinds of grain are to be met with in Hindoftan, but wheat is not cultivated farther fouth than $1^{\circ} 8^{\circ}$ latitude. It is imported, however, to every part of the country by the Banjaries. Thefe are Account of ar people belonging to no particular caft, who the Banjam live in tents, and travel in feparate bodies, each of ries which is governed by its own particular regulations. They frequently vifir towns on the fea-coaft, with bullocks loaded with wheat and other articles; carrying away in exchange fpices, cloths, but efpecially falt, which they carry into the inland parts of the country. Some of their parties have feveral thoufands of oxere belonging to them. They are rarely molefted, evers in time of war, otherwife than by being fometimes. preffed into the fervice of an army to carry baggage or provifions; but for this they are paid, and difmiffed as foon as the fervice is over. The Hindoos themfelves are prohibited from going out of the country, under the fevereft of all penalties, that of loling their caft. Norwithftanding this, however, it is certain that they do fettle in foreign parts in the character of merchants and bankers. Perhaps thefe may have a toleration from the principal bramin, or there may be an exemption for people of their profeffion; but this: is not known. At any rate, wherever they go, they appear inviolably attached to their religious ceremonies, and refufe to eat what is prohibited to them in
theis

Mnndoos, their own country. The Ryots, or people who calti-

30
Miferable tate of thable fituation; their only food being fome coarfe the rice and pepper, for which they are obliged to en-bufband- dure all the inclemencies of a burning fun, and the wea. inconveniences which attend alternately wading in water and walking with their bare feet on the ground heated intenfely by the folar rays; by which they are frequently bliftered in a miferable manner. All this, however, they fubmit to with the utmoft pati. ence, and without making any complaint, expecting to be releafed from their fufferings by death; though even then their religion teaches them to hope for nothing more than what they call abforption into the effence of the Deity; a ftate almoft fynonomous with what we call annihilation.

HINDOSTAN, a celebrated and extenfive country of Afia, bounded on the north by Great and Little Thibet; on the fouth, by- the hither peninfula of India, part of the Indian Sea, and Bay of Bengal ; on the weft, by Perfia; and on the eaft, by Thibet and the farther peninfila. It is fituated between $84^{\circ}$ and $102^{8}$ of eaft longitude, and between $21^{\circ}$ and $36^{\circ}$ of north latitude; being in length about 1204 miles, and in breadth 960 ; though in fome places much 11 lefs.
Derivation This country was in early times diftinguifhed among of the names. the Greeks by the name of India, the moft probable derivation of which is from Hind the Perfian name. We are affured by Mr Wilkins, that no fuch words as Hindoo or Hindoftan exifts in the Sanfcrit or learned language of the country; in which it is named bharata, a word totally unknown to Europeans. The firft accounts we have of Hindoftan are from Herodotus, who lived 113 years before the expedition of Alexander the Grear. His accounts, however, convey very little information, as he appears only to have heard of the weftern part of the country, and that on account of its being tributary to Perfia. He informs us, that Darius Hyftafpes, about 508 B. C. had fent Scylax of Caryandria to explore the river Indus. He fet fail from Calpatyrus, a town near the fource of the Indus, and the territories of Pactya (which major Rennel fuppofes to be the modern Pebkely (, and continued his courfe caftward to the fea; then altering his courfe to the weft, he arrived at that place where the Phœenicianshad formerly failed round the continent of Africa; after which Darius fubdued the Indians, and became mafter of that fea. The northern inhabitants of India, he fays, refembled the Bactrians in their manners, and were more valiant than the reft; thofe far to the fouthward were as black as the Ethiopians, killed no animals, but lived chiefly upon rice : and clorhed themfelves with cotton. By the expedition of Alexander, the Greeks acquired a little more knowledge of the country of Hindoftan, though he did little elfe than march over the tracts defcribed by Herodotus. He was informed of the exiftence of the river Ganges, which had not been known to Herodotus; and the ftory of his fuppoling that he had difcovered the fource of the Nile, when near the head of the Indus, is well known, as well as his furprife and confternation when he arrived at the month of that river, on account of the high tides. Major Rennel is of opinion that both
thefe fories are falfehoods. He thinks it impoffible Hindoftan. that Alexander could have been ignorant of the writings of Herodotus, who gave an account of the difcoveries of Scylax; and with regard to the other circumftance he expreffes himfelf as follows. "The ftory of Alexander's furprife at feeing the tides in the Indus, appears to me equally improbable; feein? that the fame Herodotus, book iii. fpeaks very particularly of the tides in the Red Sea, and defcribes them as being not only ferong, but ebbing and flowing every day. (That moft intelligent and ingenious traveller M. Volney informs us, that the tide ebbs and flows three feet and an half at Suez.). Arrian takes no notice of the tides untilAlexander's fleethadarrived near the mouth of the river. It is true, the tide in the Indus does not go up fo high as in other rivers of equal bulk, and that ran on fo fmall a defcent ; but neverthelefs, as the tide is perceptible at 50 or 60 miles above the river's mouth, we may conclude, that it could hardly efcape the notice of Alexander and his people in their voyage from Pattala to the fea, fuppoling they had not been apprifed of the circumftance. Befides, Arrian's account of the tide which did fo mach mifchief to the fleet, is defcriptive of the bore, or fadden influx of the tide, in a body of water elevated above the common furface of the fea; fuch as occurs in the Ganges, \&c. He fays, thofe hips which lay upon the fand were fwept away by the fury of the tide; while thofe that fuck in the mud were fet afloat again without any damage. To the generality of readers no reafon will appear why the circumitances of the fhips fhould be different in the mud and on the fand : the fact is, that the bottoms of channels in great rivers are muddy, while their fhallows are formed of fand; and it is the nature of the bore to take the fhorteft cut up a river, inftead of following the windings of the channel; confequently it muft crofs the fand-banks it meets in its way, and will alfo prove more deftructive to whatever it meets with a-ground than what is a-float." For an account of the exploits of Alexander in Hindoftan, fee the article Macedon.

The Grecian expedition into India foon excited a general curiofity in the Europeans to become acquainted with a country fo wealthy and fo remote. Megafthenes, the ambaffador of Seleucus, refided long at Palibothra the capital of an Indian nation, and from him the ancient writers learned moft of what they knew concerning that part of the world. He lived about 300 years before the Chriftian era, and kept a journal during the time he refided in India.

For fome hort time the weftern provinces of India continued fubject to the Syrian empire founded by Seleucus; but he quickly ceded thefe diftant countries to one Sandrocotius, whe gave him only 500 elephants in exchange. Soon after this the province of Bactria likewife became independent; and thus the connection berwixt India and the weftern parts of the world was entirely diffolved, and we are almoft entirely ignorant of the tranfactions of that country till the time of the Mohammedan conquefl. That the extenfive country we now call $H$ indo ft an was divided among many difterent nations, we have no reafon to doubt; bat major Rennel is of opinion, that however this might be the cafe,
${ }^{4}$ from the time of Alexander to that of the Mogul Mohammedana;
there was generally a large empire or kingdom, which
H I N $\quad 524]$ HIN .

Hindonan. occupied the principal part of that immenfe valley through which the Ganges took its courfe ; the capital of which has fuctuated between Delhi and Patna, as the limits of the empire heve varied. This was named the kingdom of the Parlij or Gangaridee in the times of Alexander and Megadithenes. Mijor Rennel is of opinion that it extended weftward to the Panjab country; and he alfo thinks it prubable that the capital named Falibothra ftood on the fame fpor which is now occupied by the city of Patna. The kingdom, according to this fuppofnion, would occupy part of Bengal; and he thinks that it could not bel, fs than that of France. It was on the borders of this kiny,dom that Alexander"s army mutinied and refufed to proceed any farther. Arian informs us, that the people were rich, excellent foldiers, and good hufbandmen; that they were governed by nobility, and
5 that their rulers impofed nothing harfl upon them. Hindoo hi- antiquity but weare informed by major Rennel ght ftory to be " there is no known hiftory of Hindoftan (that refts credited. on the foundation of Hindoo materials or, records) exant before the period of the Mahommedan conquefts; for either the Hindoos kept no regular hiftories, or they were all deftroyed, or fecluded from common eyes by the Pundits. We may judge of their traditions by. that exifting concerning Alexander's expedition; which is, that he fought a great battle with the emperor of Hindoftan near Delhi, and though victorious; retired to Perfia acrofs the northern monntains; fo that the remarkable circumfance of his failing down the Indus, in which he employed many months, is funk altogether. And yet, perhaps, few events of ancient times reft on better foundations than this part of the hiftory of Alexander, as appears by its being fo highly celebrated, not only by cotemporaries, but by feveral of the mof eminent anthors for fome centuries following. The only traces of Indian hiftory we meet with are in the Perfian hiftorians. In the beginaing of the 17 th century, Mahommed Ferinta compoied an hiftory of Hindoftan, moft of which was given in that of colonel Dow, publifhed upwards of 30 years ago ; but with regard to the early part of it, major Rennel is of opinion that it cannot at all be depended upon.

The authentic hiftory of Hindoftan commences with Expeditionsol Mah mudGazni into India. the conquents of Mahmud or Mahmood Gazni, about the year 1000. His kingdom had arifen out of that of the Saracens, who under the khaliff Al Walid had extended their conquefts immenfely both to the eaft and weft. Mahmud was the third from Abiftagi a governor of Khorazan, who had revolted from the king of Bakharia. He puffeffed great part of the country formerly known by the name of Badtia. Gazni, Gazna, or Ghizni, was the capital; a city which ftood near the fource of the Indas, though Balkh Hikenife claimed this honour. Subuctagi, the father of Mahmad, had projected the conqueft of the weitern part of India; but dying before he could put his defigns in execution, Mahmud took upon himfelf the conduct of the expedition; but previous to his invalion of India, he frengthened himfelf by the conqueft of the whole of the ancient Bactria. His firft invafion took place in the year 1000 ; during which he made no far:her progrefs than the province of Moultan. That part of the country was inhabited by the Kuttry and

Rajpoot tribe, the Malli and Catheri of Alexander, Hindoftan. whoftill retained their ancient fpirit, and made a very ftout refiftance to the armies of that farious enthufiaft. As he was prompted to this undertaking no leis by a defire of exterminating the Hindoo religion than by that of conqueft, a league was at laft formed againit him among the Indian princes from the banks of the Ganges to the Nerbodda. Their allied forces, however, were defeated, and the year 1008 was marked by the deftruction of the famous temple of Nagracut in the Panjab country. Havi:.g fatiated himfelf with plander on this occafion, Mahmud returned to his own country; bat in IoIr invaded Hindoftan once more, deftroying Tanafar a city on the weft of Delhi, and a more celebrated place of worfhip than Nagracut itfelf. Delli was reduced on this occafion; and in feven years after Canoge was taken; the temples of Matra or Merhura, the Methora of Pliny, a city of great antiquity, and remarksble for a place of wormip near Agra, were likewife demolifhed; but he failed in his attempts on the Rajpoots of Agimere, either through their own valour or the ftrength of their country. His 12th expedition took place in the year 1024, when he deftroyed the celebrated temple of Sumnaut in the peninfula of Guzerat, adjoining to the city of Puttan on the fea-coaft, and not far from the ifland of Diu, now in the hands of the Portuguefe. In this expedition he proved very fuccefsful, reducing the whole peninfula of Guzerat, with many cities, the temples of which he conftantly deftroyed; and indeed feemed no lefs pleafed with the overthrow of the Hindoo religion than with the conqueft of the country. At his death, which happened in ro28, he was porfeffed of the eaftern and by far the largeft part of Perfia, and nominally of all the provinces from the weftern part of the Ganges to the peninfula of Guzerat ; as well as thofe lying between the Indus and the mountains of Agimere; but the Rajpoots in that country fill preferved their independency, which they have done all along, even to the prefent time.

In the year 1158 the empire of Gazna fell to pieces Divifion of from the fame caufes by which all other large and un- the empire wieldy ftates have been deftroyed. The weftern and of Gazna, largeft part, whichin fill retained the name of Gazna, and various was feized upon by the family of Gaurides, fo named in Hindofrom Gaur or Ghor, a province beyond the Indian in tan by difCaucafus; while thofe contiguous to both fhores of ferent adthe Indus were allowed to remain in the poffeffion of venturers. Chufero or Cufroe, whole capital was fixed at Lahore. In IIIf the pofterity of this prince were driven out of their territories by the Gaurides; by which means the Mahommedans became neighbours to the Hindoos, and in a fhort time began to extend their dominions to the eaftward. In 1194 Mahommed Gori penerrated into Hindoftan as far as Benares, and repeated the fame fecnes of devaftation which had formerly taken place under Mahmud Gazni. At this period major Rennel is of opinion, that the purity of the language of Hindottan began to decline; and continued to de fo till it became what it is at prefent; the original dialcet being what is called the Sanfcrit, and which is now a dead language. Mahommed Gori alfo reduced the fonthern part of the province of Agemere, and the territory to the fouth of the river Jum11a, taking foffeffion of the ftrong fortrefs of Gualior.

After

## HIN

Hindofan. After his death in 1205 , the empire of Gazna was again divided; and the Patan or Alghan empire was founded by Cuttub, who had the Indian part, the Perfian remaining to Eldoze. Cuttub fixed his imperial refisence at Delhi ; and in 1210 the greateft part of Hindoftan Proper was conquered by the emperor Altumilh, the fucceffor of Cuttub. After his tame the government of Bengal was always beftowed upon one of the reigning emperor's fons; and during his reign the bloody conqueror Jenghiz Khan put an end to the other branch of the Gazuian empire, known by the name of Khara/m; of which revolution an account is given under the article Gazna ; but Hindoftan was at
8
Firft invafion of the
Moguls. that time left undifturbed. In 1242 the Moguls began to make irruptions into Indoflan, but did not at this time make any permanent conqueft. The country was now in much the fame flate in which it had been before the invation of the Mahommedans, viz. divided into a great number of flates tributary to the emperor, but in a great meafure independent; and which did nut fail to revolt whenever a faveurable opportunity offered. The kingdom of Malwa, which had been reduced by Curtub in 1205, fhook off the yoke in the year 1265 , and the Rajpoots were on every occafion ready to revolt, notwith ftanding that their country lay in the neigbourhood of the capital. The moft dreadful maffacres, rebellions, and confufion, now took place, which from that period ahmoft to the time that the Britifh government commenced, make up the hiftory of Hindoftan. The empire being parcelled out anoong a fet of rapacious governors, the people were reduced to the laft degree of mifery, and were at laft fo far milled as to imagine that it was their intereft to take up arms in order to render thefe governors independent. Had the emperors of Hindoftan confulted their true intereft, they would have given up the provinces which lay beyond the upper part of the Indus and the deferts of Agimere ; as thefe formed a barrier which could not ealily be paffed by any invader. By neglecting this precaution, however, they at laft gave an opportanity to the Moguls to penetrate into their country ; and thefe, after feveral invafions, became at laft fo formidable, that they were permitted by the emperors, in the year 1292, to fettle in the country. At this time the reigning emperor was Ferofe II. of the tribe of Cbilligi or Killigi, fo named from Killige near the mourtains of Gaur ; andin 1293 this em-
9 coun- peror projected the conqueft of the Deccan; by which try of Dec- was meant at that time all the territory lying to the can con- fouthward of the Nerbudda and Mahanada and Catquered. tack rivers ; an extent of dominion almof equat toall that he already poffefed in Hindoftan.. Ferofe was incited to attempt this by the riches of one of the princes of Deccan ; and the perfon who propofed it was one Alla, governor of Gurrah, a country nearly bordering upon that which he was about to invade. Alla, having accomplithed his undertaking, during which he anaffed an incredible quantity of treafure, depofed and murdered the emperor, affuming to aimfelf the fovereignty of Hindo an. He then began a new plan of conqueft ; and the firft intrance of his fuccefs was the reduction of Guzerat, a flrong fortrifs, which had hitherto remained independent, and, while it continued fo, was a ftrong obfta le to his defigus upon the Deccan. He next reduced Rantanipour and

## 525 ] <br> H I N

Cheitore, two of the ftrongeft furts in the Rajpoot Hindoftan country. In 1303 the city of Warangole, capital of a kingdom of the Deccan, named Tellingana, was reduced; but in the midft of the fe conquefts the Moguls invaded the country from an oppoditequarter, and plundered the fuburbs of DtIhi. Notwithftanding this check the enperor refamed his plan of conqueft; the remainder of Malwa was fubdued; and in 1306 the conqueft of the Deccan was again undertaken. The conduct of the war was now committed to Cafoor ; who not only carried his army into Dowlatabad, but in I3ro, penetrated into the Carnatic alfo. The extent of his conqeefts in that country is not known; and indeed his expeditions feem to have been made with a view rather to plunder than to atchieve any permanent conqueft. The quantity of riches he amafled was fogreat that the foldiers are faid to have carried away only the gold, leaving filver behind them as too cumberfome. As the treafure carried off on this occafion had been accumulating for a number of ages, it is probable that the conntry had long remained in a fate of tranquility.

Cafoor ftill proceeding in his conquefts, ravaged a fecond time the northern part of the Deccan, and obliged the inhabitants of Tellingana and the Carnatic to become tributary to him. Rebellions took place in 1322; but the country was again reduced in 1326, and the whole Carnatic ravaged from one fea to the other. This year Alla died, and his facceffurs, not being poffeffed of his abilities, were unable to retain the dominions he had left. Under the emperer Mohammed III. the people of the Deccan again revolted, and drove the Mohammedans fo completely out of thefe countries, that nothing remained to them but the fortrefs of Dowlatabad. In I 344 the cily of Bifro Revelts and confixfion thro'out the whole emnagar, properly Bijinagur, was tomnded by Belladeo the king of Deccan, who had headed the inhabitants in their late revolt. Mohammed in the mean time attempted to extend his dominions towards the eaft; but whilehe employed himfelf in this, manyprovinces were loft by rebellions in Bengal, Guzerat, and the Pánjab. His fucceffor, Ferole III. who afcended the throne in 1351, feemed more defirous of improving the remains of his empire than of extending it : and, during his reign, which continued for 37 years, agriculture and the arts were the favourite oujects of his purfuit. After his death, in 1388 , a rebellion and civil war took place, and continued for feveral years; and matters were brought to a crifis in the time of Mahmud III. who fucceeded to the throne in 1393 ; and, during this time the empire of Hindoftan exhibited the fingular circumftance of two emperors refiding in the fame capital, and in arms againft each other. While matters remained in this fituation, amerlanc afterha ving fubdued all the weftern part of Tartary and cres of Afia, turned his arms againft Ifinduftan in the year Tamerlane 1 398. His conqueft was eafy, and his behavirur fuch as rendered him worthy of the name by which he is yet knewn in Hindoftan, "the deftroying prince." After having brought into captivity a vaft number of the poor inhabibants, he caufed a gene al maffacre to be commenced left they fhould join the enemy in cafe of any fudden emergency; and in confequence of this. crucl order, upwards of 100,000 wete pat to death in one hour. In the beginning of the year socg he was met by the Indian army, whom he defeated with great

Aatibiter,

HIN
Hindofan. flaughter, and foon after made himfelf mafter of the imperial city of Delhi. At this time the capital confitted of three cities, named Old Delbi, Seyri, and $\mathcal{F} e$ han Penah. Seyri was furrounded with a wall in the form of a circle; and Old Delhi was the fame, but much larger, lying to the fouthweft of the other. Thefe two were joined on each fide by a wall; and the third, which was larger than the other two, lay between them. As the city made no refiftance, there could not be a pretence for ufing the inhabitants with any cruelty; and thus matters paffed on quietly till the 12th of January, when the Tartar foldiers infulted fome of the inhabitants at one of the gates. The Emirs were ordered to put a ftop to thefe diforders, but found it impoffible. The Sultanas, having a curiofity to fee the rarities of Delhi, and particularly a famous palace adorned with 1000 pillars built by an ancient Indian king, went in with all the court; and the gate being thus left open for every body, above 15,000 foldiers got in rnperceived. But there was a far larger number of troops in a place between the cities abovementioned, who committed fuch diforders, that an infurrection commenced ; fome of the inhabitants attacking them, while others, in defpair, fet fire to their houfes, and burnt themfelves with their wives and children. The foldiers, taking advantage of this confufion, pillaged the houfes; while the diforder was augmented by the admiflion of more troops, who feized the inhabitants of the neighbouring cities that had fled to Delhi for helter. The Emirs caufed the gates to be Chut; but they were quickly opened by the foldiers, who rofe in arms againf their officers; fo that, by the morning of the next day, the whole army was entered, and the city totally deftroyed. Some foldiers carried off no fewer than 150 llaves, men, women, and children; nay, fome of their boys had 20 laves a-piece to their fhare. The other fpoils in jew'cls, plate, and nanufactures, were immenfe ; for the indian women and girls were alladorned with precious ftones, and had bracelets and rings on their hands, feet, and even toes, fo that the foldiers were loaded with them. On'the i 5 th the Indians attempted to defend themfelves in the great mofque of old Delhi ; but being attacked by the Tartars, they were all flaughtered, and towers erected. A dreadful carnage now en. fued throughout the whole city, though feveral days elapfed before the inhabitants could be forced to quit it entirely; and as they went, the Emirs took many of them into their fervice. The artifans were alfo diftributed among the princes and commanders, all but the mafons, who were referved for the emperor, in order to build him a large fone mofque at Samarcand.

After this terrible devaftation, Tamerlane marched into the different provinces of Indoftan, every where defeating the Indians who oppofed him, and llaughtering the Ghebrs or worfhippers of fire. On the 15 th of March he retired, and thus fet the miferable inhabitants free from the moft bloody conqueror that had ever invaded them. He did not, however, difturb the fucceffion to the throne, but left Mahmud in quiet poffeffion of it, referving to himfelf only that of the Panjab country. The death of Mahmud, which happened in 1413 , put an end to what is called the Patan dynafty, founded by Cuttub in 1205. He was fucceeded by Chizer, whoderived his pedigree from the im-

## H I N

poftor Mohammed, and his pofterity continued to en- Hindotan. joy it till the year 1450; when Belloli, an Alghan of the tribe of Lodi, took poffeffion of ir, the reigning prince Alla II. having abdicated the government. Under him all Hindoftan was divided into feparate ftates; and a prince, whofe title was the king of the $E a / f$, who refided at Jionpour in the province of Allahabad, became fo formidable, that the king of Delhi had only a fhadow of authority remaining to him. A confiderable part of the empire, however, was recovered by the fon of Belloli; who, in the year 1501 , fixed his royal refidence at Agra. During his reign the Portuguefe firft accomplifhed the paffage to India by the Cape of Good Hope, but they had no connection with any other part of Hindoftan than fome maritime places in the Deccan which had always been indepen. dent of the court of Delhi. In 1516, during the reign of Ibrahim II. matters fell into fuch confufion that Sultan Baber, a defcendant of Tamerlane, found means to conquer a very confiderable part of the empire. His firft expedition took place in theyear 1518 ; and in the year 1525 he made himfelf mafter of Delhi. In his laft invafion he is faid to have brought with him only 10,000 horfe; having been furnimed with the reft by the difaffected fabjects of the emperor. During the five years that he reigned, his chief employment was the reduction of fome of the eaftern provinces, but he had not time to compofe the difturbances which took place throughout the whole of his dominions. On his death the feeds of rebellion, which Balier had not been able to exterminate, produced fo many revolts and infurrections, that his fon Humaioon, though a prince of great abilities and virtue, was driven from the throne, and obliged to take fhelter among the Rajpoot princes of Agimere, where he lived in great diftrefs, During the time of his exile his fon Ackbar was born, whom Mr Rènnel looks upon to be one of the greateft princes that ever fat on the throne of Hindoftan. The fovereignty was held in the mean time by an ufurper, named Sheerkham, who in 1545 was killed at the fiege of Cheitore, and buried in a magnificent maufoleum, of which Mr Hodges lately exhibited a drawing in England. His territories, at the time of his death, extended from the Indus to Bengal ; but fo unfettled was the government, that after his deceafe no fewer thanfive fovereigns appeared in the fpace of nine years. This induced a ftrong party in Hindoftan to recal Humaioon; but he lived only one year after his return.

In 1555, Humaioon was fucceeded by his fon Ack- Reign ot bar, at that time only 14 years of age. During his Acrbar, long reign of 5 I years, he eftablinhed the empire on a great more fure foundation than it had probably everbeen be- pripce fore; though even at this time Mr Rennel is of opinion, that all the tranquillity enjoyed by the people was merely that there was no actual rebellion. The firft years of his reign were fpent in reducing the provinces which had revolted from Agimere ro Bengal; and the obedience of thefe he took care to fecure as well as poffible by a careful choice of governors; particularly by an unlimited toleration in religious matters, and an attention to the rights and privileges of the people. In I585, he refolved toinvade the Deccan, which had hitherto refifted the power of the Mogul princes. The war continued for 20 years; during all which timeno

Hindofan. farther progrefs was made than the reduction of the wettern part of Berar, Candeif, Tellingana (a divifion of Golconda), and the northern part of Amednagur ; the capital of which, alfo named Amednagur, was taken in 1601 , after a long and bioody fiege, and an unfuccefsful attempt of the princes of the Deccan to relieve it. Under his fucceifor Jehan Guire, the project was but bellion of Shah Jehan the emperor's fon; and the influence of Noor Jehan his miftrefs perplexed the councils of the nation. In the prince's reign Sir Thomas Roe, the firft Englith ambaifidor, arrived at the court of Hindoftan. The Portuguefe had now acquired confiderable poffeffions in Guzarat and Bengal, but only thofe in the former province attracted the attention of the court; fo that the Perfian hiftorian takes no notice of thofe in Bengal. In the reign of Shah Jehan, who fucceeded his father Jehan Guire in 1627, the conqueft of the Deccan was more vigoroully puthed than before ; and the war carried on in fuch a deftructive manner, that moft of the princes in thofe parts were fain to make fubmiffion to the emperor. During this reign a war took place with the Portugnefe, which ended in the expulfion of the latzer from Hoogly on the Ganges. In his private character Shah Jehan was a very debauched and wicked prince, which gave occafion to one of his
14 fons named Aureng-zib or Aureng-zebe, to dethrone him. Theempire This prince attained his end by a train of deep hyporaifed to its crify and diffimulation ; covering his ambition with a greateft height by Aurengzebe.
pretence of religion, and under that pretence committing the greateft crimes. He engaged in a war with two of his brothers, both of whom he defeated by unforefeen accidents, when he himfelf feemed to be on the brink of deftruction. Having at laft got them into his power, he put them both to death, and then lamented their misfortane. One of his brothers who aflifted him, was rewarded firft with imprifonment, and then with death. Bythe year 1660 , he had attained full poffeffion of the fovereignty, and from that time to the year 1678 there reigned a profound tranquillity throughont the whole empire. In the latter part of his reign he undertook the conqueft of the Deccan, to which he was fuppofed to be incited by the refolution and growing power of Sevagee, the founder of the Mahratta ftate; and who, in that character, appeared almoft as a rival to Aurengzebe himfelf. Having quelled a rebellion of the Patans, who lived beyond che Indus, he perfecuted the Hindoos to fuch a degree, that the Rajpoot tribes in Agimere commenced a war againft him. On this occation he headed his armies alfo in perfon; but having the misfortune to be hemmed in among the m untains, he would certainly have been taken prifoner, had not the enemy thought proper to allow him to efcape. They allowed alfo the emprefs to make her efcape after hie had been actually taken. In r681 he renewed his incurfions into that country, took and deftroyed Checture, committing otherdevaftations, and every where deftroying theHindoo temples and objects of wornhip; but notwith ftanding all his efforts, he was at laft obliged to abandon his enterprife, and allow them to remain in peace. From the year 1678 to the time of his dearh in 1707 , he is faid to have been chiefly employed in the Deccan, the greateft part of which he reduced, and for the lant
five years of his life is faid to have been actually em- Hindofta ployed in the field. This long abfence from his capital could not but be productive of bad confequences. Rebellions broke out in varions parts of the empire; and during this period, the Jats or Jauts firft made their appearance in the province of Agra. They were at firft only a fet of banditti; but have lince grown to be a very confiderable ftate, and once were of fome confequence in Upper Hindoftan. After the Ioth year of Aurengzebe's reign, however, we know very little of his tranfactions, as he would not allow any hiftory of it to be written. At the time of his death the empire extended from the roth to the 35 th degree of latitude, and almoft as many degrecs in longitude. " His revenue (fays major Rennel) cxceeded 35 mil lions of pounds Sterling, in a country where the products of the earth are about four times as cheap as in England. But fo weighty a fceptre could be wielded only by a hand like Aurengzebe's : and we accord. ingly find, that in a courfe of 50 y ears after his death, a fucceffion of weak princes and wicked minifters reduced this aftonifhing empire to nothing."

Aurengzebe left four fons; Maufum, afterwards emperor, under the title of Bahader Shah; Azem, Kaum decline ur Bufh, and Acbar, who had been obliged to fly to Per- der his fue fia zo years before on account of his being engaged ceffors. in rebellion againft his father. A civil war inftantly commenced between Azen and Manzum; the event of which was decided in a great battle, where 300,000 combatants were brought into the field on each fide. In this battle Azem was defeated and killed; after which Manzuma afcended the throne by the title of Bahader Shal. He was a prince of confiderable abilities; but the diforders of the empire were already rifen to fuch a height, that during his fhort reign of five years, he found it impoffible to compofe them. He was firlt engaged in war with his brother Kanm Bulh, whom he alfo defeated and killed; after which his attention was engaged by the Seiks, a new fet of religion ifts, who, during the reign of Shah Jehan, had filent ly eftablifhed themfelves along the foot of the eaftern mountains. They now appeared in arms in the province of Lahora, and ravaged the whole country from. thence totie banks of the Jumna. The emperormarched againft thefeadverfaries in perfon, and with great: difficulty brought them under fubjection. He then took up his refidence at Lahore, where he died after a flort illnefs, without having ever vifited the impe.rial cities of Agra or Delhi.

After the death of Bahader Shah the empire was: again contefted among his four fons. Of thefe the fecond, named Azem Oofhaun, took poffeflion of the treafures; but was oppofed by his three brothers, who agreed to divide the empire among them. Azem was: defeated and killed in a battle, gained chiefly by the valour and conduct of the youngeft named Shah Feban . who feemed refolved to abide by the agreement, and as: a proof of his fincerity, ordered the treafures to be divided. This was prevented by the intrigues of Zoolfecar khan, an omrah in high rruft. A new civil war commenced, in which Shah Jehan was killed. The two remaining brothers tried their fortune in a third battle, which left jehaunder, the eldeft, in poffeffion of the throne. In nine months he was dethroned ly FerakSers,

# HIN 

Hirdoftan, rakfere, or Furrokfere, fon tothe deceafed Azem Oohaun ; having, during his fort reign, difplayed al. molt unparalleled meannefs of fpirit.

This revolution was accomplifhed by the afliftance of two brothers, Houflein Ali Khan and Abdoolla Khan, who had extenfive governments in the eaftern provinces. The calamities of the empire were not at all abated during this reign. In 1713 the Seiks appeared again in arms; and in 1776 were grown fo formidable, that the emperor himfelf was obliged to march againft them ; but we are totally ignorant of the particulars of this campaign. About this time the Englifh Eaft India company obtained the famous Firman or grant, by which their goods of export and import were exempted from duties or cuttoms; which was regarded as the company's commercial charter in India, while they ftood in need of protection from the princes of that country.

Ferokfere was depofed, and his eyes put out by the two brohers who had raifed him to the throne; and in the courle of the fame year two other emperors, whom they afterwards fet up, were depofed and nurdered; and thus, in cleven years after the death of Aureng. zebe, in princes of his line, who had either mounted the throne or been competitors for it, were exterminated, while the government declined with fuch rapidity, that the empire feemed ready to be difmembered to a greater degree than it had even been before the invafion of Tamerlane. In. 1718 the two brothers raifed to the throne Mahommed Shah, the grandfon of Bahader Shah ; but this prince having got fufficient warning ly the fate of his predeceffors, took care to rid himfelf of thefe powerful fubjects, though this could not be accomplifhed without a civil war. New enemies, however, ftarted up. Nizam-al-Muluk, viceroy of theDeccan, had been for fome time augmenting his power by every poffible method, and was evidently afpiring at independence. Having received fome affronts from the two brothers, who for fome time had ruled every thing with an abfolite fway, he thought proper to retire to his government. In 1722 he was invited to court, and offered the place of vizier or prime minifter, but declined accepting it, while the growing and formidable power of the Mahrattas furnifhed him with a pretext for augmenting his army. At laft, having by the year 1738 attained a fufficient degree of ftrength to accomplifh his purpofes, and confident of his having a large party at court, he came thither attended by a great body of armed followers. Finding, however, that the intereft of the emperor was ftill
17 too powerful for him, he invited the celebrated Perfian Invafion of ufurper Nadir Shah; commonly known by the name Nadir shah of Khouli Khan to invade Hindoftan. The invitation was accepted, and Nadir entered the country without oppolition. The imperial general Douran being killed in a kirmifh, no decilive engagement took place; and the Perfian chief, though far advanced inro Hindoftan, yet looked upon matters to be fo uncertain, that he offered to evacuate the country and retire for 50 lacks of rupees, about half a million fterling. The intrigues of the Nizam and his party hindered the emperor from complying with this moderate demand; inftead of which he abfurdly threw himfelf apon the ufurper's mercy, who then took poffeffion of Delhi, demanding
a ranfom of 30 millions fterling. At an interview with Hindoftan. the emperor, he feverely reprimanded him for his mifconduct ; however, he told him, that as he was of the race of Timur (Tamerlane), who had notoffended the reigning family of Perfia, he wonld not take the empire from him; only as he had put him to the trouble of coming fo far to fettle his affairs, he infifted that his expences hould be paid. The unfortunate emperor made no anfwer to this Speech; but Nadir took care to enforce the latter part of it. Some time after the departure of the emperor, Nadir went to the camp to pay him a vifit; where he feized upon 200 cannon, with fome treafure and valuable effeets, fending them off immediately to Candahar. He then marched back to Delhi, where a mob arofe about the price of corn. As Nadir Shah was endeavouring to quell it, a muket was defignedly fired at him, by which he narrowly efcaped being killed. Exafperated at this, he commanded an indifcriminate maffacre to be made, which his cruel foldiery inftantly put in execution with the greateft of Delhi alacrity, and 120,000, or, according to others, 150,000 flaughtered of the miferable inhabitants were flaughtered without mercy. This was followed by a feizure of all the jewels, plate, and valuable articles which conld be found, befides the exaction of the 30 millions, which was done with the utmoft rigour ; infomuch that many of the inhabitants chofe ratier to put an end to their own lives than to bear the torments to which they were fubjected in cafe of inability to pay the fum impofed on them. During thefe horrid fcenes, Nadir caufed the marriage of his fon to be celebrated with a grand daughter of Aurengzebe; and after having extorted every thing which he demanded, at laft took leave of the emperor with every mark of friendinip. He put the crown upon his head with his own hands; and after having given him fome falutary advice relative to the government of his empire, he fet out from Delhi on the 6th of May 1739.

By this invafion the empire fuftained prodigious lofs. Since the arrival of Nadir in Hindoftan, about 200,000 people had been deftroyed, and goods and treafure carried off to the amount of 125 millions fterling. Mohammed had ceded to the ufurper all the provinces of Hindoftan fituated to the weft of the Indus. His departure left the Nizam in poffeffion of all the remaining power in the empire, which he inftantly made ufe of to eftablill himfelf jn the fovereignty of the Deccan. The province of Bengal had already become independent under Aliverdy Cawn, in the year $173^{8}$; and not long after, it was invaded by a vaft army of Mahrattas under fanction of the emperor's name; who being unable to fatisfy them in the arrears of tribute he had been obliged to confent to pay, fent them into Bengal to collect for themfelves. About the fame time, the Rohillas, a tribe from the mountains which lie between India and Perfia, erected an independent ftate on the eaft of the Ganges, within 8o miles of Delhi.

The total difolution of the empire feemed now to be faft approaching. In the confufion which took place after the murder of Nadir Shah, Abdallah, one of his generals, feized upon the eaftern part of Perfia, and the adjoining provinces of India, which had been ceded to Nadir by Mohammed Shah; which he formed into a kingdom fill known by the name of Canda-

Hindonan. Far or Aldalit of which a more particular account is given in the fublequent part of this article.

This yoar Mohammed Shah died, after a reign of 29 yeats; v:lich confidering the fate of hisimmediate predeceliors, and the anarchy miverfally prevalent throughout Itiadoftan, maft be accounted very wondorfuil. He was fuccected by his fon Ahmed Shah; during whofe reign, which lafted about fix years, the total divition of the remainder of the empire took place. Nothing now remained to the family of $\Gamma$ Tamerlane but a findll tract of territory round the city of Delhi, now no longer a capital, and expofed to the repeated depucciations of invaders, with confequent maffacfes and famines. The lalt army which could with propriety betermed imperial, was defeated by the Rohillas in 749 ; by which their independence was fully eftablifhed in the eaftern parts of the province of Delli. 'The Jauts, or Jats, a Hindoo tribe, eftablifhed thenfelves in the province of Agra; the Deccan and Sengal were feized upon by their viceroys, Nizam and Aliverdy. Oude was feized on by Seifdar Jang (father 10 the late Sujah Dowlah) ; Allababad by Mohammed Kooli. Maliva was divided between the Poonah Mahrattas and feveral native princes and Zemindars: Agimere reverted of courfe to its ancient lords, the Rajpoot princes; and the Mahrattas, in addition to their pioper fhare of Maliva, poffeffed the greateft part of Guzerat, Berar, and Oriffa ; befides their ancient dominions in the Deccan. Thefe people were now beconce fo powerfil, that they were alternately courted and employed by the contending parties, like the Swifs in Europe; with this difference, that the Swifs are paid by thofe who cmploy them, whereas the Mahrattas always take care torepay thenfelves. Abdalla having eftablifhed his empire in the manner aboverelated, entered Lahore and Moultan, or the Panjab, with a view to conqueft. "The whole country of Hindoftan was in commotion (fays Major Rennel) from one entrance to the other, each party fearing the machinations or attacks of the other ; fo that all regular government was at an end, and villany was practifed in every form. Perhaps in the annals of the world it has feldom happened that the bonds of government were fo fuddenly diffolved, over a portion of country containing at leaft 60 millions of infabitants."

20
Fird interference of the French and Finglifh in the as faits ofHindoflan.

In 1748 the Nizam died at the age of 104, and was fucceeded by his fon Nazirjung, to the prejudice of his eldeft brother Gazi, vizier to the nominal emperor. The contefts that followed on this occafion for the throne of the Deccan, and nabobfhip of Arcot, firft engaged the French and Englifh as anxiliaries on oppolite fides. This was followed by a long feries of hoftilities, which terminated in the total expulfion of the French from Hindoftan, the entire hamiliation of the Mogul, and his being reduced to the ftate of a mere cool of the Englifh Eaft Indian company; tegether with the fubjection of a vaft tract of country to the latter. Thefe tranfactions have occafioned very confiderable revolutions, not only in the country properly called

which Hin
doftan is divided

Hindoftan, but in other places of that extenfive trat called the E af Indies: for fome account of which fee the arricle India.
The vaft country of Hindoftan is at prefent divided among the following powers.

1. Timur Shah, fon of Ahned Shah, or Abdallah,

Vol. VIII.

## 529 H I N

poffeffes an extent of territory to the north-weftward Hindona: before we come to the river ludus. This country, cxtending all the way betwixt India and Perfa, is known by the name of Duran or Turan; and was pofieffed by the Afghans, of whom Abdallah became the fovereign. He was defcended from an illuftious family; and having the misfortune of being taken prifoner by Huffein Khan, then chief of Kindahar, along with his brother Zulfecur Khan, they were releafed by the celcbrated Nadir Shah in his paffage through that country to Hindoftan; but as that conqueror ftill looked upon them with a jealous eye on account of their great influence with their countrymen, both were fent to Mazandaran in Perlia. Here Zulfecur Khan, the brother of Ahmed, died; and, Iome time after, we find the latter promoted to the command of a body of Afghan cavalry in the Perfian army. He continued attached to the interefts of Nadir whilethat conqueror lived; and even attempted, thongh ineffectually, to revenge his death. Proving unfuccefsfal in this attempt, he returned to hisown country; and, arriving at Kandahar, was faluted chief of the Afghans. In the courfe of a few months he became mafter of all the countries which the Mogal had been obliged to cede to Nadir Shah; and, encouraged by the diftracted ftate of the affairs of Hirdoftan at that time, he croffed the Indus, and plundered the country to the foutheaft. An indecilive battle fought with the Indian army under the command of the prince royal and vizier, in which the latter was killed, obliged Ahmed to return to his own territories; but he foon undertook another expedition, in which he conquered the province of Lahore. In 5755 he returncd; and after ftaying fome time at Lahore, marched to Delhi the capital; having been invited thither, as was fuppofed, by the Mogul himfelf, in order to get rid of the tyranny of his vizier. The latter wasaccordingly deferted in a battle by orders of the emperor, and obli. ged to furrender himfelf prifoner: but inftead of being put to death, he had the addrefs to ingratiate himfelf with the conqueror ; and the unfortunate Allumghire, the Mogul, was obliged to fubmit to be ruled by him as before. Ahmed took care to indemnify himfelf for his trouble, by laying the city of Delhi under a heavy contribution; and having ftaid for about a month, during which time he concluded a marriage betwixt his fon Timar and the emperor's niece, he marched againft a tribe of Hindoos named the fauts, and conquered the greateft part of the province of Agta. In this expedition he fuiprifed the city of Matra, famous for being the birth-place of Krifben, the Apollo of the Hindoos; and facrificed to the Gopia, the mufes of the conntry. He failed in his attempt to furprife Agra through the refolution of Fazil Cawn the governor; after whieh he led back his troops to Delhi, where he married the daughter of Mohammed Shah the late emperor, whon Allumghire had in vain folicited for himfelf.
.
Haviny ietted his fon Timurin the government of Lahore, Ahmed quitted. Hindoltan, and retur ed to his dominions, where he found every thing in confufion. Timur, who daring his farher's abfence had been frequently difturbed by the Seiks, a tribe of Hindoos who profefs deifn, was in 1760 driven out by a vaft army of Mahrattas commanded by Roganaut Row

## H I N

Hindofian. the Paiffiwa's brother, of whon fo mucli mention has already been made. Next year, however, Ahmed croffed the indas, and eafily recovered his former territuries; foon after which he became head of a league formed among fome of the indian princes, in order to oppofe the overgrown power of the Mahrattas. In this enterprafe he proved fuccefsful ; and overthrew the Mahrattas in a decifive and very bloody battle, in which more than 50,000 of them were killed on the fpot. The purfuit lafted feveral days, and their vaft army was totally difperfed; Ahmed being every where received with acclamaions as the deliver of the faithful. In 1762 he again croffed the Indus, with a view to conquer, or rather to exterminate, the Seiks, whofe incurfions had become very troublefome, and even dangerous, to his kingdom. Having defeated their army, and forced them to take reiuge in the woods and ftrong holds, he fet a price on the heads of all thofe who profeffed their tenets; and that with fuch fuccefs, that heaps of them are faid to have been piled up in all the principal towns in thefe parts. At laft, hearing that they had affembled ingreatnumbers to celebrate an annual feftival, he marched with an army to furprife them. The Seiks, however, were well provided for his reception, and an obftinate battle enfued. During the time of the engagement an eclipfe of the fun happened, which though difregarded by the Sciks, greatly difmayed the fuperfirious Mohammedans. Ahmed was tlrerefore defeated; and though he frequently returned, was never able thoroughly to fubdue that people. At laft, having been long affict ed with an alcer in his face, he died on the 15 th of July 1773, at a place named Kubtoba, anong the mountains of Kandahar, to which he had retired for the fake of coolnefs, and was fucceeded by his fon Timur, who fill continues to enjoy the fovereignty. The dominions of this prince extend a very confiderable way to the northward of the Indus, but he porfeffes nothing in Hindoftan befides the province of Kafhmire.
2. The Seiks inhabit a country on the other fide of the Indus, and making part of Hindoftan properly fo called. They derive theirorigin from a Hinidoonamed Nanuck of the caft of Khatry. His father, named Baba Caloo, poffeffed a fmall diftrict in the province of Lahore named Telvandi, where Nannck was born in the year 1470. Like other founders of new feets or nations, he is faid during his infancy io have given many indications of his future fuperiority to the reft of mankind. He feems, however, to have received no farther education than what was common to young men of his calt; viz. reading, writing, and arithmetic, and hearing the faftras or commentaries on the facred hooks. In his early youth he was married to a woman of his own caft, by whom he had two fons. Being a convert to the worfhip of the Invifible, or deifm, he aceuftomed himfelf to declaim againft the folly of worfhipping idols, and the impiety of paying adoration to any but the fupreme Being. At the age of 25 he left his family to vifit Bengal and the eaftern parts of Hindoftan; in a fecond journey he vifited the fouth, and in a third he went as far as Perfia and Arabia. On his return from this laft journey, he exprefled a defire of remaining in his native country; and was furnifhed, according to his wifh, with a piece of ground on the
banks of the river Bavy, about 8 omiles north-eaftward Hindoftan. from the city of Lahore. Here he took up his relidence for the reft of his days; choofing to be free from the cares of this world, he dwelt at a diftance from his wife and children, who came occafionally to vilit him. Having acquired great reputation for his piety, wifdom, and learning, he died at the age of 70 ; and fince his death the place of his abode has obtained the name of Dibra Daira, or "the place of worfhip." His eldeft fon founded a fect of devotees named Nanuck Shoiy: but his fecond emplojed himlelf in the ufual occupations of mankind. On account of the oppreffion of the Mohammedan governors, however, he removed from Telvandi, the eftate of his anceftors, and fettled at Kartarpoar, which his defcendants ftill poffers. They are refpected by the Seiks on account of their being the poftericy of Nanuck, but are not held in any vencration on a religious account.

The doctrines of Nanuck were taught by a favourite difciple of his named Lhina, but on whom he b ftowed on his death-bed the appellation of Angud. By him the doctrines of the fect were collected in a work named Fothy, or "the book;" and an hiflory of the life of vanuck himfelf was given in another named Fenum Sakky. Both thefe were written in a particular kind of character called Guur Mcuekty, and faid to have been invented by Nanuck himfelf. Angud named for his fucceffor anotherdifciple called Amerdofs; and this method of continuing the fucceffion feems to have been practifed as long as the dificiples continued to owil one fupreme chief.

For many years che Seiks lived in peace, and gained the good-will of the Mohammedan governors by their quiet and inoffenfive behaviour. By degreas their numbers and their power greatly increafed, but in proportion to their good fortune, they feem to have loft cheir virtue; fo that their gourous, or chiefs, who had hitlrerto borne the character of. apoftles, at laft food forth as military leaders. The firft of the fe was named Taigh, whofe fucceffor, named Covand Sing, was the tenth and laft of the gourous. He engaged in a rebellion againft the government; but was at laft obliged to fubmit, and even attended the emperor Bahader Shah in perfon. At laft he was affafinated by a Petan foldier, not without a fufpicion of the emperor himfelf being concerned. As he did not name a fucceffor, his followers chofe a chief for themfelves named Banda, who foon began to make depredations on his neighbours; but being at laft taken prifoner, and fent to Delhi with his family and many of his countrymen, they were all put to an ignominious death. By this execution the Seiks were fo much exafperated, that they fwore eternal vengrance againft the Mohammedans, and have ever fince manifefted a moft implacable hatred againft them. Taking advantage of the diftraction of the Mogul empire by the invafion of Nadir Shah, they conquered feveral provinces. Wherever they came they threw down the mofques, and obliged every one to quit the country whorefufed to erabrace their tenets. Their war wirk Ahmed Shah has been already mentioned. Since lis death they have recovered all the territories they lont during their conteft with him; and now poffe fs the greateft part of Moultan, as well as feveral diftricts in the province of Delhi: including in their territories

## H I N

Hindofan. the whole of that rich country named the Panjab, on account of five rivers which defcend from the northern mountains, and inclofe or interfect it, running afterwards into the Indus.

The Seiks, as has already been mentioned, worhip one God. but without image, or believing in any mediator. They eat all kinds of meat except beef; fparing the black cattle, in all probability on accoumt of their utility. Pork is very genesally eaten probably on account of its being forbidden by the Mohammedans. They are commonly dreffed in blue, a colour reckoned unlucky by the other Hindoos. Their drefs confifts of blue trowiers of cotton, a fort of plain generally chequered with blue and thrown over the right houlder with a blue turban. Their government is ludgedin an affembly of different chiefs; but who, as judividuals, are independent of one another, and have feparate territories They meet annually, or oftener if occaion requires, at a place called Antherfer, which is held in a kind of religious veneration; where there is a large tank lined with granite and furrounded with buildings, and beautifully ornamented. Their force is very confiderable, amounting to no fewer than 200,000 cavalry. However, they can feldom be brought to act in concert, unlefs the whole nation be threatened with fome imminent danger. They are a ftrong hardy race of men, and capable of bearing much fatigue; and fo expert in war, that of late almolt all the neighbouring countries have been laid under contribution by them, feveral petty chiefs having confented to pay them a fmall annual tribute in order to avoid their incurfions. When in the field, none but the principal officers have tents, and thofe extremely frmall, fo that they may be fruck and tranfported with the greater quicknefs and facility. In cold weather the foldiers wrap themfelves during the night in a coarfe blanket, which in the time of marching is folded and carried on their horfe. Their country is well culivated, populous, and abounding in cattle; particularly horfes, whichare reckoned the beft in all Hindoftan. This may probably be owing to the ftuds which were formerly eftablifhed in different places of the province of Lahote on account of the Mogul himfelf. Stalions were fent thither from Perfia and Arabia, and there was a fixed order to fend to the ftuds in Lahore all luch Arabian and Perfian horfes as by any accident fhould be rendered unfit for mounting. Notwithftanding their deifm, the Seiks are faid to have a fuperftitious veneration for their fword; infomuch, that before one of them will eat with a perfon of another religion, he draus his fword, and pading it over the victuals, repeats fome words of prayer, after which he will freely partake of them. Contrary to the practice of all the ocher Hindoos, they dillike the fmoking of tobacco, but many of them fmoke and chew bang, which fometimes produces a degree of intoxication.
3. The provinces of Delhi have, in the courfe of a few years, frequently changed their mafters, but have farce at any period during that time been under the anthority of the fovereign. Their laft governor was named Nadjiff Khan, under the title of generalifino of the emperor. He wasinvolved in the ruin of Mohammed Kouly Khan, coufin to Soujah al Dowlah; after which he wert to Collim Aly Khan nabob of

Bengal; after whofe expulfion he retired with a patty Hindofta of horfe to Bundelcund into the fervice of Rajalı Coman Sing. He next joined the Englifh; and at laft became the general of Shah Allum. With a body of Engliih feapoys who had been put under his command, and fome other troops whom he had taken into his'fervice, he fubdued the countries near Delhi, conquered almolt all the territories of the Jauts, reducing the cities of Agra, Dieg, and oher principal towns. Thefe conquefts were indeed effected in the name of the Mogul, but he derived little benefit from them; Nadjiff being the real mafter, and keeping poffeffion of them till his death, which happened in 1782; and fince that time the countries wefpeak of have been involved in aficene of continual anarchy and bloodfhed.
4. Next to the provinces of Delhi are the dominions of the independant rajahs, whofe dominions lie contiguons to one another. The principal are thofe of Joinagar or Jaypour, Joadpour, or Marwar, Oudjapour or Chitore, and Jefalmire. Thefe countries are under a kind of feudal conftitution, and every village is obliged to furnih a certain number of horfemen at the horteft warning. The people are brave, hardy, and very much attached to their refpective chiefs; and their army is very formidable, amounting when collected to about 150,000 horfemen.
5. The Jauts were a tribe who followed the occupation of agriculture in the northern parts of Hindortan. About 40 years ago they were formed into 2 nation by Tackou Souragemul, proprietor of an inconfiderable diftrict. After making himfelf mafter of all the countries dependent on Agra, of the town itfelf, and many other important places he was killed in battle with Nanjib ul Dowlah, the Rohilla chief, in 1763. Since that time the power of this people has been fo much reduced by domeftic contentions and foreign wars, that the prefent rajah poffefes only a ftrong town named Bartpoor, with a fmall diftrict around it. .The Jauts, however, it is faid, are now manifefting a martial difpofition, and thus may poffibly be foon in a condition to recover their former extent of territory.
6. The moft confiderable of all the Hindoo powers are the Mahrattas, with whom the Europeans firf became acquainted in their original territories of Malabar. The firft of their chiefs was named Seeva, or Seeva jee; who is faid to have been defcended from the ancient Hindoo emperors, and whofe father was lord of a fmall diftrict, for which he paid tribute to the Mohammedan king of Viziapour. For fome reafon unknown to us he was at laft arrefted by order of that king, and died in confinement; but his fon Secva-jee took up arms in defence of his country, and made himfelf mafter of feveral important places, with a confiderable tract of territory, which were afterwards ceded to hiun by the queen-regent, the king of Viziapour having died foon afrer the commencement of the war.

Seeva-jee having thus eftablifhed himfelf, became formidable to his neighbours. Many of the Hindoo princes put themfelves under his protc.tion, and he at length ventured to make wat upon the erimeror Aurengzebe. In this he proved unfucceffful, was taken prifoner, and carried to Delhi. Having found means, however, to make his efcape, he quickly recommenced hoftilities;

## H I N <br> [ $53^{2}$ ] <br> HIN

Hindofan, and the emperor, who, was now far advanced in life, lind named the Bremerteddy horfe which is greatly Hindotam: thought proper to conie to an accommodation with fo troublefome an enemy. On this occafion the Mahrartas pretend that their prince obtained a grant of roper cent. on all the revenues of the Deccan; which has often ferved as a pretence to invade that country, and levy contributions on the fouthern nabobs. Since that time the Mahratas have become fo powerful, that all the princes of Findoftan are alarmed when they put themfelves in motion. Their territories extend abont 1000 miles in length and 700 in breadth; and they are governed by a number of feparate chiefs, all of whom acknowledge the Ram Rajah as their fovereign and all except Moodajee Boollah acknowledge the Pailhwa as his vicegerent. The capital of the fovereign, was Sattarah ; but the Paifhwa generally refides at Poonah, one degree to the fonthward, and about 100 miles diftant fiom Bombay. The country extends along the coaft nearly from Goa to Cambay. On the fouth it borders on the territories of Tippe Saib; on the eaft it has thole of the Nizam and the rajah of Berar, and on the north thofe of the Mahratta chiefs Sindia and Holkar.
7. The rajah of Berar, befides that country, has the greateft part of Orixa. His dorminions extend about 600 miles in lengtin from eaft to weft, and 250 from north to fouth. The eaftern part of the Orixa extends along the fea-coaft for about iso Englint miles, and divides the Britifh polfeffions in Bengal from thofe commouly called the Northern Gircurs. On the weft histerritories border upon thofe of the Paifhwa; on the fouth, upon thofe of the Nizam, Mahomet Hyat a Patan chief, Nizam Shah, and Ajid Sing. The rajah himfelf refides at Nagarpour, about midway betwixt Calcutta and Bombay.
8. Madaje Sindia has the greateft part of the government of Malva, coget'. $r$ with the province of Cardeifh. The remainder is under the government of Holkar ; who, as well as Sindia, pretends to be defcended from the ancient kings of Malva. The principal refidence of Sindia is at Ugein near the city of Mundu, which was once the capital of thefe kings. Holkar refides at Indoor, a town little more than 30 miles to the weftward of the former. The dominions of theie, and fome other princes of fmaller note, extend as far as the river Jumma.

The two laft mentioned princes, though properly Mahrattas, own no allegiance to the Ram Rajah or great chief to whom the main body are nominally fubject. Some time ago the Mahrattas aimed at the conqueft of all Hindoftan, and even avowed a defign of expellingall the Mohammedan princes; but their power was effectually checked by the Britifh, and theirdiffenfions among themfelves put an end to all fchemes of that kind. Still, however, they were ready to wateh every opportunity of invading the territories of their neighbours; and their refources being fo confiderable, they were defervedly accounted a very formidable enemy. The ftrength of their army confifts chiefly in cavalry; both men and horfe are capable of enduring a great deal of fatigue. Bodies of 50 or 60,000 cavalry lave been known to travel 50 miles a day for many days together; which confidering the exceffive heat of the country, muft certainly appear very furprifing. The conntry abounds yery much in horfes, and there is one
efteemed, and fold at a very high price. The common horfe of thefe parts is lean and looks ill, but is abundantly fit for the parpofes of was. The only weapon ufed by the horfemen is a fabre; in the ufe of which they are fo dexterous, thar it is fuppofed the beft Eurpean huffar would not be more than a match for a. Mahratta horfeman. There are condiderable ftuds in every provi..ce belonging to the Paifhwa and difforent chiefs, and there are likewife many gurdis or great herds of horfes belonging to particutar perfons, " who turn thofe they have no occafion for loofe in the open plains.

The Mahratta horfemen are dreffed in a quilted jacket of cotton, which is fuppofed to be one of the beft defences againft a fword that can eally be contrived of equal lightnefs; but the heat of the climate frequently renders it neceffary to be taken off. The reft of their drefs confilts of a pair of trowfers, and a kind of broad turban which defcends low enough to cover the neck and houlders. In cales of emergency the horfemen carry provilion both for themfelves and their hortes in a fmail bag tied upon the fadles; the food of the rider confiits only of a few fmall cakes with a litule flour or rice, and fome falt and fices; the horfe is fed with a kind of peas named gravi, or with balls made of the four of thefe peas mixed with butter, prepared atter a certain manner, and named ghee; together with fome garlic and hot fpices. Thefe balls are given by way of cordial, and have the property of invigorating the anmal after extraordinary fatigue. Sometimes it is faid that they add a fmall quantity of bang; a kind of drug which poffelfes an exhilarating virtue, and produces fome degree of intoxication. The Nahratta cavalry fellom make any ufe of tents: even the officers frequently loave no other accommodation than a fmall carpet to fit and lie on; and a fingle camel is able to carry the whole baggage ofthe gencral. The officers, however, are generally well mounted, and have fpare horfes in the field.

All the fubjects and vaffals of the Mahratta princes are generally ready to follow them into the field; and in any cafe in which the honour or intereft of the nation appears to be concerned, they generally unite in the common caufe. Before they invade any country, the general is at great pains to inform bimfelf of the nature and fituation of it; and they have now made incurfions into fo many different parts of Hindoftan, that there are but few countries there witly which they are not very well acquainted. Their great fobriety, and the fatigue they are capable of undergoing, render them very dangerous encmies. In allthitir cxpeditions the foldier firft provides for his horfe, and then goes to his own meal; after which he lits down contended by the fide of the animal, and is ready to mount him at the firf found of the nagar or great drum. They have their horfes under the noft ex. cellent management; and by perpetually careffing and converfing with them, the animals acquire a degree of docility and fagacity unknown in other countries. When on an expedition, the horfes are accuftomed to eat grais pulled up by the roots, which is faid to be very nutritive, and to be deftitute of that purgative quality which belongs to the blade alone. When they make an inÿafion, the devaftation is terrible; the cattle

## H I N

Hindoftan. are driven off, the harveft deftroyed, the villages burned, and every human creature deftroyed who comes in their way. Notwithfanding this barbarity in time of war, however, they are very humanc in time of peace, living in gre tharmony among themfelves, and being alrays ready to entertain and affift ftrangers. Many of the cruelties they commit may be juftlyreckoned the eticets of retaliation for other cruclies exercifed uron them by their adverluries. Thus in 1771, after having given Hyder Ally a great defear, they cut offthe ears and nofes of a whole regiment of prifoners, and in that condition fent them back to their commander in relun for his having done the fame to a few prifoners he had talien fome time before.

The revenue of the Pailhwa is very confiderable; being not lefs than ten millions fterling; but after deducting the expence of collection, and the expence of troops kept in readinefs for the fervice of the ftate, it is fuppofed that he cannot receive more than four millions. From this agdin we muft deduct the expences of the troops inmediately belonging to the Painfa himielf, and which may amount to about three millions fterling ; fo that there remains a farplus only of one millon after paying all the neceffary expences of government. This neverthelefs has been managed with fich cconomy, that though long and expenfive wars were carried on after the death of Narrain Row, the ftate was not only clear of debt, but there was a furplas of two millions in the ueafary, which Rago. bah diffipated.
9. The Deccan, as left in $174^{8}$ by Nizam al Mulek, was by far the moft important and extenfive foubadary or viceroy hip in the empire. It then furpaffed in fize the largeft kingdom in Europe; but fince that time many provinces have been conquered by the Mahrattas, and the northern Circars by the Britith. The poffeffions of the Nizam are allo diminifhed by the ceffion of the Carnatic to the nabob of Arcot; great part of the territories of Tippoo Saib; and many other provinces of lefs note. Still, how ever, the Nizam poffeffes very confiderable tetritories; but his financesare in fuch a wretched condition, and his provinces fo ill governed, that he is accounted a prince of no confequence, though otherwife he might be reckoned one of the moft confiderable powers of Hindoftan.
10. The dominions of Tippoo Saib, the fon and fucceffor to Hyder Ally, are bounded on the north by the territories of the Pailhwa; on che fouth by Travancore, the territory of an independent Hin don prince; on the weft by the fea; and on the eaft by a greatridge of mountans, which feparate them from tive territorics of the nabob of Arcot. The country lying to the caftward of thefe mountains is called the Carnatic Payen Ghat, and to the weftward the Carnatic Bhalla Ghat. The latier belongs to Tippoo saib; and the two together make up the country formerly named the Garnatic, though the name is now reftricted to the PayenGhat. The fituation of the Bhalla Ghat is confiderably nore elevated than the other; by which means. the temperature of the air is much cooler. On the coaft of Coromandel there is a pile of ruins called by the natives Malavipatam, and by the Britifh the feven pagodas. Concerning this there is a tradition, that it once flood at a confiderable diftance from the fea: though moft of theruins are now covered with water

## H I N

and there is likewife a tradition, that the mountains Hindotan we fpeak of once formed the boundary of the ocearn. The revenue and ftrength of Hyder Ally are faid to have been greatly exaggeraied; the former amounting to no mote than fout millions annually, though by his economy and good management he madc it anfwer every parpote both in time of war and peace. He was at great pains to introduce the buropean difcipline anong his troops; but notwibhanding all his endeavours, he w's far from being able to make them cope with the Britilh. The advantages he gained were owing to his vaft fuperiority in cavalry, and the celerity of his marches; which would have been counteracted had his adverfaries been poffeffed of a good body of cavalry; and it is probable that the event of the war would lave beeu decided in a fingle campaign. His for Tippoo Saib is faid to be a man of lefs abilities than his father; thongh more violent in his difpolition. Againft this prince hoftilities have lately been commenced by the Britith in conjunstion with the Mahrattas, between whom an alliance had been formed. But this event has not yet been attended with any confequences that merita detail.

With regard to the prefent government of Hin-Governdoftan, our limits will not allow us to enter particu- ment of larly upon it, nor indeed is it perhaps of any impor- Hindoftan, tance, as the country is divided into fo many different kingdoms; the fovereigns of which, however they may differ in other reípett, feem all to agree in defpotifm and oppreflion of their fubjects. As a very confiderable part is now under the dominion of Britain, it may be neceffary to take fome notice of the beliaviour of the Britons in that part of the world, efpecially: as an idea of their exceffive defpotifn and opprefion. of the natives has of late prevailed fo mach, that the national character has fuffered confiderably by it. This has arifen partly from the great pains taken to propagate it, and partly from the ignorance of thofe among whom the report was circulated; and the exaggerated accounts and contentions of the members of the government themfeives, have contributed no lefs to confirm and heighten the prejudice of the public.

The Britifh territories in the eaft indies were ori- Defence of ginally under the jurifdition of a governor and 13 the Britifh members; but this number has fluctuatéd occalionally governfrom 14 to 4 , at which it was fixed by act of parliag ment in the ment. In this council all matters, whether relating to eaf. peace or war, government or commerce, were debated, the governor having no other fuperiority than that of giving the canting vote. In other refpects the whole executive power was lodged in his hands, and all the correfpondence with the native princes of India was carried on by his means, the difpatches to them being figned by him fingly; and all the princes and great men who vifited the prefidency were firft received by him, and then introduced to the counfellors. He was military governor of Fort William, and commander in chief of the prefidency; whence, as by his office he was invefted with a conliderable degree of power, he became an object of fome envy and jealonfy to the members of the council and other confiderable pcople in that part of the world. In confequence of this, the government was divided intotwo parties, one fiding with the governor, and the other oppofing him; in confequence of which, the debares were frequently carried

## H I N

${ }^{*}$ indoftan. ried on with fuch heat and violence, that the records of the conpayy are frequently ftuffed with nothing but accounts of the conditions of thefe jarring parties. This indeed may be looked upon as one of the principal caufes by which the reputation of the Britifl government in the eaftern parts of the world has fuffered ; for as there are very frequently opinions diametrically oppofite toons another recerded upon the fame fubject, the contending parties in the Britifh parliament had always fufficient authority for what they faid, let them take which fide they would; and thus the characters of all concerned in the Eaft India government were, by one perion or other, fet forth in the moft opprobrious light.

Another fource of reproach to the Britifl government in India, was that the court of directors in England became infected with the fame firitit of party and contention which pervaded all other departments of the flate. Lord Clive and Mr Sullivan were the two .great leaders in thefe party-difputes; and as the intereft of the one or the other prevailed, different perfons were appointed to the adminiftration, and different meafures adopted. The event of all this was, that whenever a new adminiftration was formed, the firf object was to condemn the meafures of thofe who had gone before them. Thus, in the year 1764, when Lord Clive was made governor of Bengal, the new directors reprefented the affairs of the company as in the worft fituation imaginable, from which they could only be extricated by the abilities of Clive. On the arrival of the latter in the eaft, he took care to write home reports to the fame purpofe, and to condemn in the mof violent manner every thing that lad been done ; the whole body of the company's fervants were cenfured indifcriminately without being allowed any means of defence, as they were in truth ignorant of the charges brought againft them. When the affairs of the company were brought under a parliamentary review in the year 1774, the government was brought under a new regulation, - It now confifted of a gover-nor-gencral and four counfellors; three of whom were fent from England; two being military gentlemen of high rank, and the third a gentleman employed in the war-office. On their arrival they proceeded in the fame manner that Lord Clive had done before them : they pronounced in the moft decifive manner, that the company's affairs were in a ruinous ftate; and that every feccies of corruption had been practifed by the former government. This general accufation, unfupported by any kind of evidence, was the conftant theme of the difpatches fent by them to England; and thus has the reputation of the Britilh government fuffered exceedingly through the unwarrantable liberties which its own fervants have been allowed to take with one anothcr. It mult alfo be confidered, that from the remote fitnation of India, and the unavoidable ignorance of its affiars on that account, it was cafy for any perfon, whofe malicious purpofes it might fuit, to prejudice the public againft the fervants of the company to as great a degree as he pleafed. Hence fome perfons, foured by difappointment, or envious of the fuppofed emoluments of others, reprefented matsers in fuch an unfair light to their correfpondents in England, that the moft unjuft and Chameful charges wvers frequently brought againdt innocent perfons,

## 534 ] H I N

which they could neither prevent nor defend them- Hindofan: felves againf. The dreadtul famine which took place in Bengal in the year 1769, offered to thefe malevolent perfons a moft fruitful fource of calumny; and many individuals were accufed of having brought on this dreadful calamity, which arofe entirely from a natural caufe, viz. the tailure of the rains, and which no human power could have prevented or removed.

Opinions of this kind have not only been circulated through the illand of Britain in the moft open manner, but have even appeared in fome very refpectable publications. Thus in Mr Smith's Treatife on the Wealth of Nations, when fpeaking of the oppreffion arifing from monopolies, and comparing their effects in different flates: "The Englifh company (fays he) have not yet had time to eftabliih in Bengal fo perfectly defructive a fyftem. The plan of the government, however, has had exactly the fame tendency. It has not been uncommon, I am well affured, for the chief, that is, the firft clerk of a factory, to order a peafant to plow up a rich field of poppies, and fow it with rice or fome other grain. The pretence was to prevent a fcarcity of provifions ; but the real reafon, to give the chief an opportunity of felling at a better price a large quantity of opium he had on hand. Upon other occafions the order has been reverfed, and a rich field of rice or other grain has been plowed up to make room for a plantation of poppies, when the chief faw that extraordinary profit was to be made by opium." To this, however, the following anfiver has appeared in a late publication, intitled $A$ fhort Review of the Britifh government in India. "The poppy is a plant which requires a peculiar foil, and particular care in the culture of it. The medium price of the land on which it is cultivated is about 11 or 12 rupees a begah, or one third of an Englifh acre. It is fowed at the beginning of Ottober, wheu the feafon of the periodical rain expires. The plant begins to be fit for incifion, in order to extract its juice, of which opium is made, about the end of December, and continues fo till March. It requires a dry foil, and can be brought to maturity only in the dry feafon, when the periodical rains have ceafed. Paddy or riee lands let on a medium at three rupees a begah. Rice is fowed about the end of May, juft before the periodical rains commence. One crop is raifed about the end of September; and another, which is the laft, and by far the greateft, about the end of December. It requires a foil faturated with waier, and lics foaked in it for a confiderable time. On this acount it is fowed juft before the periodical rains commence; and nine-tenths of the quanitity of rice produced in the cempany's provinces grow in the kingdom of Bergal, which is fo low and flat, that the grounds are either over flowed by the rivers Ganges and Burrampooter, with their tributary ftreams, or foaked with the rain which falls and ftagnates upon them. It is therefore exident, that the foil and the feafon, which alone can fractify the paddy or rice; would rot and dieftroy the poppy; and it is therefore as evident, that it is utterly imporn fible, from the nature of the two plants, that the one can be plowed up to fow the other."

With regard to the adminiftration of the Britifh affairs in the Eaft Indies, it muft be remarked, that the company now act in a very different capacity from

Hisdoflan. what they originally did. From a focicty of merchants, they are now become overeigns of the coultry to which they trade. The latter character was quite fore gntw them : and they haye accordingly looked upon that of merchants to be the principal one, while that of fovercigns was to be only a kind of appendage to it. Thus, inftead of actingtor the intereft of the country they govern, and which as fovereigns they naturally ough to do, they have acted in many cafes directly oppofite to it, which, as merchants, is alfo their natural intereft. Hence alfo, when the adminituaton in India did any ching in obedience to the orders of the directors, which orders being dictated by merchants, weie prejudicial to the interefts of the country, that injury has been fometimes unjuftly attributed to their fervants, who acted merely in obedience to the orders they received. On the other hand, when the India adminiftration acted with the generous fpirit of fovereigns, they were fometimes blamed by the directors, who judged as merchants, and fometimes by the miniftry, who were always ready upon the fmalleft pretence to interfere in their affairs.

At the time when the Britifh adminiftration firf commenced in Hindoftan, the Hindoogovernors were univerfally named Rajuhs; but though many of the Hindoo families yet bear that title, it does not appear to refemble, in any manner of way, our ticles of nobility, or in be a dignity which can be conferred by any of the princes, or even by the Mogul himfelf. Hence in that part of the world there are no ancient nobility the titles being conferred merely by ufarpers, who have neither right nor title derived from any thing but violence.

In this conntry we find the title of Zemindar, very common; a word compounded of two others, fignifying, in the Perfic language, a landholder. It appears to have been introduced by the Mohammedans, and to have been a kind of temporary office, prefcribing the performance of certain duties, and requiring fecurity for the perfonal appearance of the Zemindar. He is obliged to attend the exchequer of the king's chief collector, at the commencement of cuery new year, to fettle his revenues; and he is not allowed to enter upon the duties of his office for the year without a fpecial order for that purpofe. On the death of a Zemindar, the candidate for facceffion muft petition the fovereign, engaging himfelf to perform all the ftipulated duties, and to pay the cuftomary fees; nor can he enter upon his office without a fpecial inveftiture. As the Zemindars were by virtue of their office invefted with confiderable power; they foon becamenot only defpotic in their own domiuions, but by deprees began to encroach on the power of the fovereign himfelf. After the irruption of Nadir Shah cvery thing was thrown into confufion; the viceroys. threw off obedience to the emperor, the nabobs threw offall obedience to them, and ufurped their power ; at which time it is probable that the Zemindars likewife affumed powers to which they were by no meansentitled from their office. Notwithftanding this, howcver, they were fometimes treated by the Mohammedan governors as mere $r$ v venue-officers, and ufed very harfhly. At fome times there were a fet of people bound for the Zemindars under the title of $W$ oodedars; and thefe had either a joint power with the former; or:
were fuperior to them in the collection of the reve- Hind ofan nues; and fomctimes they were fuperfeded by officers appeinted inmediately by government itfelf, under the various names of Aumils, Tabfilders, or Sezawruls. -The Zemindaries arenoi limited in extent or value; there being fome in Bengal which yield a revenue as high as $35^{\circ}, 0001$. fterling, while ochers fcarcely amount to 3501 . ; but all the great Zemindars, and many of thofe in middling circumftances, having procured for themfelves the title of Rajah, affect mach pomp and ftate in their different diftricts, and keep their inferiors. in as great a fubjection as the Mohammedan governors keep them. Some of them allo have their power augmented by being of the bramin caft; and by the reverence fuppofed to be due to religion on that account, joined with the power conferred upon them by the fovereign, they are in general rendered exceedingly defpotic, $s$ ith an almoft unlimited authority to plander their tenants; in which they were indulged by the Nabobs from the miotive of plandering them again. From the confultations of the felect-committee in 1769, we are informed that the Zemindars have a power of levying fines at pleafure; that they raife large funs from duties collected in the market; and that they frequently oblige the ryots or hufbandmen to work for nothing. In fhort, the fame claims made by the European barons on their vaffals in the times of the fendal fy ftem, are now made by the Zemindars on the common people of Hindoftan. If one of them is to.be married, if he has a child born, if honours are to be conferred upon him ; nay, if he is even to be fined for his own mifconduct, the poor ryot mult always contribute his fhare. Mr Scrofton, in his hiftory of Hindoftan, fets forth the fituation of the inhabitants in the following words:-" Unhappily .for the Gentoos, themfelves are made the minifters ofop. preffion over each other; the Moor rien, haughty, lazy, and voluptuous, make the $n$, of whom they have no jealoufy, the minifters of their oppreffion, which further anfwers the end of dividing them, and prevents their uniting to fing off the yoke: and by the ftrange intoxication of power, they are found fill more rapacious and cruel than their foreign mafters: and what is more extraordinury, the bramins fill exceed the reft in every abufe of power, and feem to think, . if they bribe God by beftowing a part of their plander on cows and faquirs, their iniquities will be pardoned."

From this accome of the fituation of the people* of Hindoftan under their, native rulers, it is by no. means probable that they could make a worfe exchange by falling under the jurifdiction either of the Mohamme- dans or Europeans. A notion indeed hath been induftri- : oufly propagated, that the Britith government has behaved with the greateft cruelty in collecting the revenues, and that they have even invented tortures to make the rich pcople difeover their treafures; but on examining the matter impartially, the reverfe of this is found to be true. At the time that the Britifh government interfered in the affairs of Hindonan, the provinces were found to be in a ruinous ftate, in confequence of the wars which had taken place in the country. Even in the mof fettled fate, and when the adminiftration was moft regular, the gevernment was altogether defpotic, and the mode of collecting its revenues extremely, ar-
bitrary,

Hincoftan bitraty; the punhments inflisted very cruel ; and the :hole fyitem of government fuch as would be reckoncd quite thocking in Europe. It is only within thefe few ycars that the Britifl could effectually interpofe in be half of the tatives ; and in that hort time it has prownced a very conliderabie reformation. It is certain, that the Britifh government has difouraged opprufue meafures as much as poffible; abolinhed the cracl ardes of panifhnentufed by the Mahommedans; and by inftituing a more regular plan of juftice, bas procured eafe and fecurity to che nacives, and preferved them in a ftate of tranquillity altogether unknown to them before its commencement. Miany inftances of the greateft cruelry exercifed upon the Žemindars and other ceflectors a:e to be mer wiih in the hifory of Bengal, written by a native hiforian, and tranflated by Glacivin: yet the perfon who exercifed thefe cruelties was dignified with the iilles of lia faithful fervant of the Emp.re, and the Clory of the State; which fhows that the poople were abolutcly familiarifed with cruelty, and did not know what it was to be under a lenient government. Since the Britihh had the dominion, matters have been totally reverfed, and the Hindoos, inftead of being areated with cruelty, perfecuted on account of their religion, and compelled to renounce it, have beeu uffd at leaft with comparative lenity, and great andulgence has been fhown to them even in. their moft abfurd practices and fuperfitions. When the Britifl government firf accepted the office of Dewanny, or colle ction of the revenues, it was not in their pow er to interpofe with anykind of efficacy for the relief of the inhabitants ; becaule it was at firft thought proper to allow the taxes to be collected by natives, who would undoubtedly follow their ancient modes of collection. Even at that time, however, the mildnefs of the Britifh governors had fome effect upon the Ahatics; fo that the people in general were treated with more lenity than formerly: and in the year 1772, when the conncil of Bengal openly affumed the office of Dewan themfelves, an inimediate fop was put to all thofe arbitrary and oppreflive methods which had been formerly in ufe. Formerly fome Zemindars had been flogged even to death, by an inftrument called a Korah : but from the moment that the Britill council took the collection into their own hands, not only this inftrument was laid afide, but all linds of corporal panifhnent; by which means the feverity of the Mohammedan government has been entirely abolifhed, and no otber punifhments inflited in cafes of infolvency than fuch as are in ufe in Britain. Still, however, in fuch extenfive dominions, where a great thare of power muft be one way or other committed to the natives, it is impoffible but fome arbitrary acts mutt be committed, as the natives are always prone to acts of defpotifm whenever they can commit them with impunity; but examples of this kind cannor with any degree of candour be brought as a general charge againft the Britilh government in India.-Mr Scrofton gives the following account of the wretched fate of the provinces now under the Britifh jurifdiction at. the time they were ceded to them by the Mogul. "When the governors of the provinces found the weaknefs of the Mogul, and each fet up as fovereign in his own province, although they could not break thro' thefe immutable laws, they invented new taxes under
new names, which dcubled or trebled the vakue of the Hindofan. original ones, and which the landholder was obliged to levy upon his tellancs. The old fock of weath for fome time furported this; but when that fitiled, and the tenants wetc sill preffed ior more, they borrowed money of ufurers at an cxorbiant incter, ff; and the grovernment fill continuing thife demands, the lords of the lands were obliged to do tice fame : but as all thistook place while the valne of lands did not incte: fe, the confequence was, that at laft, unable to pay the intereft of the mortgages, the renis were feized by rapacis is ufurers. The government finding the revenues fall fhortcr every year, at luft fent colicetors and farmers of the revenures into the provinces. Thus the lord of the land was divefted of power over his country, and the tenants expoied to mercilefs plundercrs ; till the farmer alid manufacture:, finding that the more they laboured the more they paid, the manutacturer would work no more, and the farmer would cultivate no more than was jout fufficient for the fubfitence of his family. Thas this once flourifining and plentiful country has, in the courfe of a few years, been reduced to fuch mifery, that many thoufands are continually perilhing through want. The crown lands are ftili worfe off, let out to the higheit bidder; and the Jaglieer lands alone remain unplundered. Hence that equal diftribation of wealth that males the happinefs of a people, and fpreads a face of cheerfulnefs and plenty through all ranks, has now ceafed; and the riclies of the country are fettled partly in the hands of a few ufirers and greedy courtier:, and the ret is carried out of the country by the foreign troops taken into pay to maintain the governors in their ufurpations. This unhappy decay the India company has already experienced in the decay of their trade, and the rife and price of their manufactures; and will I fear, experience more and more annually."

With regard to the depofitions of the Nabobs by the Britifh, which has been ufed as a great argument againft the general fpirit of the Britifl government in thofe parts, it muft be remembered, in the firft place, that thefe Nabobs were mere ufurpers, who had not the leaft title to their dominions, and confequently could not, in point of right, complain more reafonably of being deprived of their dominions than, the perfons from whom they had taken them might do of their injuftice in driving them oat. Their behaviour in government alfo was fuch, that it was impoffible it could have fublifted for any length of time without the abfolute ruin of the countries they polfeffed. Thus, in the cafe of Jaffier Aly Cawn, Mr Vanfittart declared the country to be in fo confufed and impoverifhed a ftate, that in all human appearance another month could not have been run through before he would have been cat off by his own Seapoys for want of pay, and the city become a fcene of plunder and diforder. On this account he was degraded, though without any of thofe circunftances of cruely which generally characterife the revolutions in thispart of the world. The adminiftration was transferred to his fon-in-law Mcer Coffin, who being an enemy to the Britifh government alogether, a war followed, terminating in his expulfion. This was followed by the invafion of Sujah Dowlah, and by fcenes of horrid barbarity and devaftation; when in 1765 Lord Clive

## $\mathrm{HIN} \quad\left[\begin{array}{ll}537\end{array}\right]$

Hiadoftan. took upon him the office of Dewan, or minifter who fin periatends the lands and collections of the revenue. An account of his proceeding has already been given; but whatever applaufe he might gain, and in fome refpects defervedly at the time, it is now faid, with fome probability, that he raifed the expectations of the people of England by far too high. The feeds of the fuccceding evils were already fown. Many fources of wealth were dried up. Raw-filk, cloths, and other manufactures, had formerly been exported to Guzerar, Lahore, and even Ifpahan. This had ceafed on the invation of Nadar Shah ; and the influx of wcalth from the European nations had ceafed before the Britifl government in Bengal had an exiftence. It was computed that Coffim Aly Cawn robbed the country of near five millions fterling in jewels and fpecie. China, Madras, and Bombay, were fupplied from Bengal to the amount of more than two millions; and feveral other circumftances befides thefe contributed to diminifh the riches and opylence of the country. In the mean time the internal adminiftration of the country had been extremely defective. The Zemindars being under very lithe reftraint, acted in a very arbitrary manner within their own diftricts; and the tenants had no redrefs againft the impofitions aad exactions which were laid upon them. Meir Coffim appointed Aumils to the collection of the revenues ratherthanZemindars. The Aumils derive their authority directly from the perfon who has the command of the country for the prefent time, and confequently arc more eafily callicd to an account than the Zemindars. At laft, however, thefe Aumils, having obtained too great an inHaence in the country, Lord Clive thonght proper to change the plan of collection. Three natives were now appointed, in the nabob's name, to fuperintend this department ; and one Englifh gentleman, through whom the bufinefs was tranfacted, had his refidence at the nabob's court, and commanicated the intelligence to Calcutta. The principal acting minifter in this plan, however, thought proper to change the mode of collection once more, and to re-appoint the Aumils ; in confequence of which the revenue became greatly diminifhed, and they were befides complained of as greatly oppreffing the people. To remedy thefe evils, it was firft propofed by Mr Verelft to fend fome of the company's fervants into the internal parts of the country with the title of fupervifors; but the defeef of adminiftration were now beyond their power to remedy; the revenue was not only greatly diminifhed, but the expence of government exceedingly augmented; and in the year 1771 the company were alarmed by accounts that bills had been drawn upon them to the amoant of $1,200,0001$. At this time Mr Haitings was appointed to be governor of Bengal; and the confufed fate in which matters were at the commencement of his adminiftration will eafily appear from the following part of a letter from the government of Bengal, dated in the month of November 1772. "Every zemindary was left to its own particular cuftoms. The articles which compofed the revenue, the form of keeping the accounts, the computation of time, even the technical terms, which ever form the greatef obfcutity in every fcience, differed as much as the foil and productions of the province. The nabobs exacted what they could from the zemindars and great farmers of the reVox. VIII.
venue, whom they left at liberty to phonder all bclow, Findentan. referving to themfelves the liberty of plunderingthem in their turn, when they were fuppofed to have en. riched themfelves with the fpoils of the country. The matidelies, whoflood between the aboband zeniindars, and betwean them and the people, had cach their fhares of the public wealth. Thefe profits werc confidered as illegal enbezzlements, and therefors were taken with every precaution whieh could enfure fecrccy; and being, conlequently, fixed by wo rule, de. pended on the temper, abilities, or power, of edch individual for the amount. It thereforebecame a duty to every man to take the mof effectual meafures to conceal the value of his property, and evace every i.. quiry into his conduct ; while the Zemindars and orher landholders, who had the advantages of long poffeflion, availed themfelves of it by complex civifions of the lands, and intricate modes of collection, to per* plex the officers of government, and confine the know. ledge of the rents to themfelves. The internal management of each diftrict varied nolefs than that of the whole province. The lauds fubject to the fame collection and internixed with each other, were fome held by farm, fome fuperintended by hickdors or agents on the part of the collector, and were left to the Zemindars themfelves, under various degrecs of control." For fome political reafons the company, though they had acquired the Dewanny, had not yet chofen to alfume the executive part of the office thenfelves, but committed it to the management of natives, as has already been mentioned, and their plans had been found extremely defective. By the time that Mr Haftings had been invefted with the government, the conrt of directors had refolved to change their plan, and openly affume the office of the Dewanny; and the rules eftablifhed by that gentleman for the collection of the revenues, his mode of adminiftering juftice, and his police for the government of the country, are fill obferved with very little variation.

The plan for collecting the revenues confifted, in the firft place, in rendering the accounts as fimple and intelligible as poffible; in the next, in eftablifhing fixed rules far the collection; and in the third, making the mode of them uniform in all parts of the provinces; and in the fourth, providing for the equal adminiftration of juftice. The power of the Zemindars was now circumfcribed, and their extortions thoroughly put a fop to ; many vexatious taxes and tolls were abolifhed, and a new mode of collecting the cuftoms was eftablifhed, to the great relief of the merchants : and fo well were all the parts of this plan found to be adapted to the purpofes they were defigned to anfwer;' that it has hitherto been made the model of all fubfequent regulations.

One great objection to the India government is, that the Englifh law, which undoubtedly is better calculated than any other for fecaring the liberties of the people, has not yet been adopted in India; whence it is thought that the company's fervants have fill lhow* ed a difpofition to opprefs rather than to relieve, the oppreffed inhabitanes of Hindoftan. But in anfwer to this it is faid, that the difference betwixt the two conntries is fo great, that there can be no comparifon betwixt the one and the other, nor can the conftitution of England be in any degree adapted to that of the
3. $\mathbf{X}$
ather.

Hindoflan.other. The religion, laws, manners, and cuftoms, of both Eindoos and Mohammedans, are foeflentially different from thofe of this country, that it is impoffible to affimilate them, thould ever any thing of the kind be attempted. The only true method therefore of judging whether the prefent fate of Hindoltan is preferable to what it formerly was, is to compare it with what it was under the beft Mogul emperors; and in this comparifon it muft certainly appear that the preference is greatly in favour of the Britifh adminiltration. In Major Rennel's work we are informed, that during the reign of Ackbar," whom he ftyles "the glory of the houfe of Timur," the country had never enjoyed fo much tranquillity ; " but this tranquillity would hardin be deemed fuch in any other quarter of the world, and muft therefore be underftood to mean a ftate fhort of actual rebellion, or at leaft commotion." The fame author, feaking of the fate of the Britim empire there, ufes the following words: "The Bengal provinces, which have been in our actual poffeffion near 23 years, have, during that whole period, enjoyed a greater fhare of tranquillity than any other part of India, or indeed than thofe provinces had ever experienced fince the days of Aurengzebe." To this we may add, that the provinces have not only experienced a perfect freedom from external invalions, but likewife enjoy a degree of internal tranquillity altogether unknown before, by the fubjection and civilization of a fet of banditti who inhalited the hills of Rajemahl, and infefted the travellers who paffed that way ; a wandering tribe of religious mendicants, who were wont to commit the greateft enormities.

Another advantage the inhabitants of this country reap from the Britifh government, is the fecurity from violence and oppreffion either by the Mohammedan fuperiors or by one another. Under the article Hindoo we have already mentioned the particular circumflance that thefe people are liable to the punifhment of lofing their caft from a variety of caufes, and that this is looked upon by them to be the moft grievous calamity they can fuffer. The Mohammedan governors frequently took advantage of their fuperfition in this refpect to opprefs them; and this circumftance alone frequently produced the mof horrid confufion. In the inftructions given to the fopervifors, Mr Verclif informs them, that "it is difficult to derermine whether the original cuftoms, or the degenerate manners of the Muffelmen, have moft contributed to confound the principles of right and wrong in thefe provinces. Certain it is (adds he), that almoft every decifion of theirs is a corrupt bargain with the higheft bidder. Compenfation was frequently accepted of even for capital crimes, and fines became at laft an intolerable grievance; nay, fo venal were the jodges at that time, that it became at laft a fettled rule to allow each of them a fourth part of any property in difpute as a compenfation for his trouble.- It is impoffible to fap. pofe that fich monftrous abufes continue under the Britifh government : on the contrary, we mult readily believe, what the gevernorsthemfelves aflert, that immediately after the provinces fell under Britill jurifdiction, both Hindoos and Mohammedans have been left to the freeexercife of theirreligion, laws, and cuftoms. The Hindoos themfelves acknowledge this, and are as well pleafed with the mildnefs of theBritifa
government, as they are difpleafed with the fuperftion Hindofan. and cruelty of the Mohammedans. Under the Britill government we cannot fuppofe but that commerce, to which the inhabitants of this country are fo much addicted, will be much more encouraged than by the avaricious and barbarous Mohaminedans. The latter had impofed fo many reftraints upon trade of all kinds, by the multitude of taxes collected at the landing-places, watch-houfes; markets, \&c. that ir was almoft imporfible to carry it on with any advantage. Among other falutary regulations, however, enacted by the Britifh government in I772, many of thofe taxes upon commerce were abolihed, and a plan laid for effectually liberating the inhabitants from thofe fhackles by which their commerce had been fo long fettered.- Regard has allo been paid to the inftruction of the people in ufeful knowledge; and the feminary eftablifhed at Calcutta by Sir William Jones, certainly does much honour to the founder. Some regard had indeed been paid to this by the Mohammedanemperors; but at the time that the Britifh government commenced, thefe had been entirely neglected, their endowments refumed by government, and even the buildings fallen into ruin.

From a comparifon of any govermment to which the Hindoos have hitherto been fubject, with that of Britain, indeed. it is evident that the preference muft be given greatly in favour of the latter. At the time when the Britifh firft vifited that country, they were not under the jurifdiction of their native fovereigns, nor had they been fo for along time before. The Moguls were not only foreigners, but a moft cruel and deteftable race of men ; and it was by ufurpations of their own rebellious fubjects that the anarchy and confufion was introduced, in which the country was involved for fo long a time. The Britifh are foreigners as well as the Moguls; but the latter, who profefs the intulerant fuperfticion of Mohammed, fuffer their conduct to be influenced by it in fuch a manner as to treat the natives with the atmoft crueley. The greateft evil perhaps which refults from the Britifh government is, the exportation of great fums of money to a foreign country ; but this evil, with refpect to the provinces poffeffed by the Britifh, exifted alfo under the Mohammedan government. The Niogul emperors refided at Delhi, which is far diftant from the provinces of Bengal, Bahar, and Oriffa, the territories now poffeffed by Britain; fo that the greatef part of the treafure fent to that capital was totally loft to them. In the time of Aurengzebe, the emperor's tribute amounted to three millions fterling ; and of this a confiderable part was fpecie; but lince that time the tribute was fixed at only 1,250,000l. and even this was a vaft fum ; to which if we add that carried out of the country by commanders of mercenary troops who were all foreigners, it is not unreafonable to fuppofe that under the Mogul government matters were fill worfe, even in this refpect, than under that of Britain.

We fhall conclude this apology for the Britifh government, with the following extract from the treatife lately quoted, A fhort Review of the Britilh Government in India. "A more deteftable or detefted race of people never appeared than the Mohammedan conquerors of India; whether we confider the brutality of their paffions, the bigotry of their religion, the corrap-

## H I N

Findolan. tion of theirmanners, the bat barity of theire eheatim, or the ty anny of their government: in all theferefyects they were the terror and abhorrence of the Ifindoos, whole country they invaded, and whole dominion they ufurped.
"The fanaicimorance of the favage caliph which dictated his barbarous reafon for deftroying the Alex. andrian liorary, had neither been tutored nor refined by the Tartar education of Timer and his predecellors. The fume fuperfitions bigotry which incited the Arabian caliphs to deitrov the monuments of weftern learning, likewife impelled the Tanar khans to overthrow the religious temples of the eaftern worfing. At the commencement of the whentury Mahmood entered Hindoftan, and in the courfe of 12 expeditions he deftroyed the famons temples of Nagracut, Tannafar, Matra, and Sumnant. In the latter end of the next century, Mahmood Gori penetrated as far as the city of Benares, and commitred outrages as Mahmood had done before at Nagracit and Sumnaut. Tamerlane poffeffed as much of this turious zeal as any of his favage predeceffors; andit the enthufiafm of this deftructive religion had not occaliona ly abated among fome of his fuccefiors, they would farce have left a Hindoo temple or prieft in the country they fubdued.
"E Enough, however, had been done to fix an indelible ftain on the memory of thofe intolerant tyrants, and to make a lafting impreffion on the minds of the Hindoos, who, to the lateft period of the Mogul goverument, were kept in conitant dread of doctrines, which, to their apprehenfions, feemed to infpire the Mohammedans with facrilegious cruclty. Idolatry is as great an abomination to a Muffulman as it was to the Jews when they moft ftrictly revered the divine command which prohibits it; and moft of the Hindoo ceremonies being confidered by the Mohammedans as acts of idolatry, and all their pagodas as temples of idols, a religious principle excited mutual fentiments of abhorrence and antipathy between the conquerors and their fubjects. The reft of the character of the Mohammedans may be fummed up in the concife and emphatic words of Mr Scrafton, who fays, 'Their diftinguifhing qualities are perfidy and fenfuality.'
"But not withitanding thefe facts, and that the hiftory of their government is a difgufting repetition of oppreffion, maffacres, and rebellion, the fafhion of the times has been to praife it, and to reprefent the fituation of the Hindoos as ealy and happy under it, till they were difturbed in this peaceful fate of repofe and fecurity by the Englifh; who have been defcribed (with unparalleledinjuftice) as a fet of rapacious tafkmafters. It furely requires a very fmall degree of reflection to perceive, that fuch reprefentations of the two governments mult, from the very nature of things, be falfe.
"The Mohammedan conquerors came into India from a barbarous region, with minds and manners as uncultivated as the wilds from which they iffued. The only notion they had of government was abfolute power in the fovereign, and abfolate fubmiffion in the fabject. The tenets of their religion, fo far from foftening the ferocity of their nature, ferved only to whet the edge of their perfecution towards the fuffering Hindoos, whom they haralfed without mercy, and deftroyed without remorfe. The Britifh conquerors came from a
country famed for arts and fciences; the generous prin- Hiadota ciples of public liberty had been inftilled into their minds from their earlicit infancy; the mide tenets of Chriftiunity cherifled and commanded every charitable duty; and they had been taught by precept and ex. ample, to rule widh equity, and to obey with freedom. Can it be fuppofed that, under thefe circumfances, the two nations fhould have totally changed characters on their coming into India? That the barbsrons and ferocious Tartar flould become mildand culightened; that the cultivated and generous Brizon thould have degenerated into a cruel tyrant; and that the Britifh governors fhould have rendered the filatio: of their Hindoo fabje ts worle than it was under the kogul emperors? Reafon revolts at the idea; aid nothing bat the rankeft prejudice could either fargent or adont it."

With regard to the geography of this country, Mr Rennel obferves, that though by the modern Europeans, Hindoftan has been underftuod to mean the tract fituated between the rivers Indus and Ganges on the eaft and weft, the mountains of Thibet and Tartary on the north, and the ocean on the fouth, the exient of Hindollan, properly fo called, is much more circumfcribed; and the name ought only to be applied to that part which lies to the northward of $21^{\circ}$ or $22^{\circ}$ latitude. The reputed fouthern bonndary of Hindoftan is the Nerbudda river as far as it goes, and the northern frontiers of Bengal and Bahar compofe the remainder. The countries to the fouth of this line are called Deccan by the Indian geographers, and comprehend about one half of the territory generally knowa by the name of the Mogul Enpire. Our author therefore choofes to diftingaifh the northern partby the name of Hindoflase Proper ; which has indeed the Indus and mountains of Thibet and Tartary for its weftern and northern boundaries, but the Burrampooter river is rather to be confidered as the eaftern boundary than the Ganges; the latter interfecting fome of the richef provinces in the empire. According to this' fuppofition, Hindoftan Proper will equal infize the countries of France, Germany, Bohemia, Hungary, Switzerland, Italy, and the Low Countries; the Deccan and peninfula being about equal to the Britifh illands, Spain, and Turkey in Europe.

Towards the north, Hindoftan is very cold and barren; but towards the fouth, very hot, and fertile in corn, rice, fruits, and other vegetables. The northern provinces are very mountainous and fandy: while the fouthern are for the moft part level, and weil watered with feveral rivers.

The moft remarkable mountains are thofe which furround it on three fides. Thofe on the weft, feparating it from Perfia, called, in general, Soleymant Kay, or the mountains of Soleyman, are of a vaft height as well as breadth, and are only paffable in cercain places, through which roads have been made for the fake of commerce. The chief are thofe which lead to Kabul, Gazna, and Kandabar. This great chain of mountains is inhabited by different nations, the principal of which are the Afghans, or Patans, and the Baluches, who have extended thenifelves on the fide of India, as well as Perfia. The mountains on the north are called Nagrakut, Hima, or Mû, Tag, which has an affnity with Imaus, and by other names, which are given alfo in common to the mountains on each fide,

## $\mathrm{HIN} \quad[54$

Hindoftan, feparating Hindofan from Thibet. The very profeet of thefe mountains is frightul, being nothing bat hi. deous precipices, perpetnelly covered with frow, and not to be croffed without the greateft danger, and difficulty.

The moft remarkable rivers of Hindoftan are the Indus and Gainges. The former is called by theorientals, Send, Sind, or Sindi. It rifes in the mountairs to the north or north-eaft of Hindoflan; whence, after a long courfe, firft to the fouth, and then to the fouth-weft, it falls into the Perfian fea, below Lower Badner, by feveral meuths. In its courfe it receives feveral other large rivers, as the Nilâh, Jamal, Behat, and Lakka.

The Ganges, called in the Indies Ganga, tifes in the kingdom of Thibet: entering Hindoftan abcot the goth degree of latitude, it runs firff fouth-eaft ward by the cities of Bekâner; Minapor, Halabas, Benares, and Patna, to Raj ih Mabl, where it divides into two branches. The eaftern having paffed by Dâkka, the capital of Bengal, enters the gulph of that name about Chatignan. The weftern defcending by K offum Bazar and Hughly, falls into the gulph below Shandernagor, towards Pipelí.

Riany of the Jews and ancient Chrinians believed this river to bet the Pifon, one of the four mentioned in fripture as the boundaries of the terreftrial paradife. The Indians retain the greatef reverence for its waters, going in crowds from the remoteft parts of the country to wah in them, from a perfuafion that they deface from all the fpots of fin. The reafon of this is, becaufe they imagine this river does not take its fource from the bofom of the earth, but defcends from heaven into the paradife of Devendre, and from thenee into Hindoftan. Nothing is more childifh than the fables of the Bramins on this fubjea, yet the people fwallow them all. The Mogul and prince of Golconda drink no other water than that of the Ganges: foreigners, on the contrary, pretend that it is very unwholefome, and that it cannot be fafely drank till it is firft boiled. There are a great number of fuperb pagodas on the banks of the Ganges, which are immenfely rich. At certain fentivals, there has been fometimes a concourfe of 100,000 people who came to bathe in it. But what principally diftinguithes this river, befides its greatnefs and rapidity, is the gold it brings down in its fands and throws on its banks; and the precious ftones and pearls it prodaces, not only in itfelf, but in the gulph of Bengal, into which it difcharges its waters, and which abound therewith. The Chun or Jemma, the Guderafu, the Perfilis, Lakia, and feveral other rivers, difcharge themfelves into it during its coarfe.

The weather and feafons are, in general, very regular in this facious country; the winds blowing confantly for fix months from the fouth, and fix months from the north, with very little variation. The months of April, May, and the beginning of June, till the rains fall, are fo extrenely hot, that the reflection from the ground is apt to blifter one's face; and but for the breeze or fmall gale of wind which blows every day, there would be no living in that country for people bred in northern climates; for, exeepting in the rainy feafon, the coldeft day is hotter there at noon than the hotteft day in England. How-
ever, very furprifing changes of heat and cold fome. Hindofan. times happen within a few hours; fo that a fiffing hot day is fucceeded by a night cold enough to pro. duce a thin ice on the water, and that night by a noon as fcorching as the preceding. Sometimes, in the dry feafon, before the rains, the wind blows with fuch extreme violence, that they carry valt quantities of duft and fand into the air, which appear black, like clouds charged with rain; but fall down in dry fhowers; filling the eyes, ears, and noftrils of thofe among whom they defcend, and penetrate every cheft, cabinet, or cupboard, in the houfes or tents, by the key-hole or crevices.

From Surat to Agra, and beyond, it feldom or never rains, excepting in one feafon of the year: that is, from the middle of June to the middle of September. Thefe rains generally begin and end with moft furious forms of thunder and lightning. During thefe three months it rains ufually every day, and fometines for a week together without intermiffion: by this means the land is enriched, like Egypt by the Nile. Although the land looks before like the barren fands of the Arabian defarts; yet, in a few days-after thofe fhowers begin to fall, the furface appears covered with verdure. When the rainy feafon is over, the fky becomes perfectly ferene again, and fcarce one cloud appears all the other nine months: however, a refrelling dew falls every night during that dry interval, which cools the air, and cherifhes the earth.

The prodace of Hindonan is very rich in every kind, whether it be foffil, vegetable, or animal. Befides other precious fones found in it, there is a diamond mine at the town of Soumerputr in Bengal. Quarries of Theban fone are fo plentiful in the Mogul's empire, that there are both mofques and pagodas built entirely of it. Some travellers tell us, there are mines of lead, iron, and copper, and even filver; but thofe of the laft, if there be any, need not be opened, fince the bullion of all nations is funk in this empire, which will take nothing elfe in exchange for her commodities, and prohibits the exporting it again. They till the ground with oxen and foot-ploughs, fowing in May and the beginning of June, that all may be over before the rains, and reaping in November and December, which with them are the mof temperate months in the year. The land is no where inclofed, excepting a little near towns and villages. The grafs is never mowed to make hay, but cut off the ground, either green or withered, as they have occafion to ufe it. Wheat, rice, barley, and other grain, grow here in plenty, and are very good. The country abounds no lefs in fruits, as pomegranates, citrons, dates, grapes, almonds, and cocoa-nuts; plums, thofe efpecially called mirabolaus; plantanes, which in flape refemble a nender cucumber, and in tafte excel a Norwích pear; mangos, an excellent fruit, refembling an apricot, but larger; ananas or pine-apples; leimons and oranges, but not fo good as in other countries; variety of pears and apples in the northern parts; and the tamarindtree, the fruit of which is contained in a pod refembling thofe of beans. There are many other kinds of fruit-trees peculiar to the country. But the valuable trees are the cotton and mulberry, on account of the wealth they bring the natives from the manufactures of callicoes and filks. They plant abundance of fugar-

Hindofan canes here, as well as tobacso ; but the latter is not fo rich and ftrong as that of America, for want of knowHimom. ing how to cure and order it.

Hindofan affords alfo plenty of ginger, together with carrots, potatoes, onions, garlic, and other roots known to us, befides fmall roots and herbs for fallads; but their flowers, though beautiful to look at, have no Icent, excepting rofes, and fome few other kinds.

There is a great variety animals in this country, both wild and tame; of the former are elephants, rhinocerofes, lions, tygers, leopards, wolves, jackals, and the like. The jackals dig up and eat dead bodies, and make a hideons noife in the night. The rhinoceros is not common in the Mogul's empire; but elephants are very numerous, fome 12,14 , or 15 feet high. There is plenty of venifon, and game of leveral kinds; as red-decr, fallow-deer, clks, antelopes, kids, hares, and fuch like. None of thefe are imparked, but all in common, and may be any body's who will be at the pains to take them. Among the wild aniinals alfo may be reckoned the mulk-animal, apes, and monkeys.

Hindoftan affords variety of beafts for carriage, as camels, dromedaries, mules, affes, horfes oxen, and buffaloes. Moft of the horfes are white, and many curiouly dappled, pied, and fpotted all over. The flef of the oxen is very fweet and tender. Being very tame, many ufe them as they do borfss to ride on. Inftead of a bit, they put one or two fmall frings through the griftle of the noftrils, and faftening the ends to a rope, ufe it inftead of a bridle, which is held up by a bunch of grifly flefh which he has on the forepart of his back. They faddle him as they do a horfe; and, if fpurred a little, he will go as faft. They are generally made ufe of all over the Indies; and with them only are drawn waggons, coaches, and chariots. Some of thefe oxen will travel 15 leagues in a day. They are of two forts; one fix feet high, which are rare; another called dwarfs, which are only three. In fome places, where the roads are fony, they fhoe their oxen when they are to travel far. The buffalo's finin makes excellent buff, and the female yields very good milk ; but their flefl is neither fo palatable nor wholefome as beef. The fheep of Hindoftan have large heavy tails, and their fleih is very good, bat their wool coarfe.

The country is much infefted with reptiles and infects; fome of a noxious kind, as fcorpions, fnakes, and rats; but the lizards, which are of a green colour, are not hurtful. Snakes and ferpents, we are told, are fometimes employed to difpatch criminals, efpecially. fuch as have been guilty of fome arrocious crime, that kind of drath being attended with the moft grievous torture. The moft troublefome infects in this hat comurry are flies, mufketoes, and chinches or tugs, the firf by day, and others in the night; when they offend no lefs by their ftench than th ir bite.

HINE, or HIND, a hufbandman's fervant. Thus the perfon who overfees the reft, is called the inafter's hine.

HINNON, or the Valley of Hinvom, (anc. greg.), a place that lay to the fouth of Jerufalem It was 21fo called the valley of Toph.t, nd was remarkable for the cruel and barbarous worthip of the god Molech,
where parents made their children pafs through the fire in henour of that idol.
HiP, in the materia nedica, the frait of the dogrofe or wild brier. See Rosa.-They contain a fourifl fweetifh pulp; with a rough prickly matter inclofing the feed3, from which the pulp ought to be carefully feparated beforeit be taken internally: the Wirtenberg college obferves, that from a neglect of this caution, the pulp of hips fometimes occalions a praritus and uneafinefs about the anus; and the conferve of it has beenknown to excite violent vomiting. The conferve is the only officinal preparation of this fruit. And as it is not fuppofed to poffefs any particular medical virtue, but is merely ufed to give form to other articles, the Edinbargh college have, perhaps wilhour any material difadvantage, entirely omitted ir.
HIPPARCHUS, a great aftronomer, born at Nice in Bithynia, flourihled between the 153 th and 163 d Olympiads. His commentary upon Aratus's plenomena is fill extant. Rohault was very much miftaken when he afferted, that this aftronomer was not acquainted with the particular motion of the fixed ftars from weft to eaft, by which their longitade changes. By foretelling eclipfes, he taught mankind not to be frightened ar them, and that even the gods were bound by laws. Pliny, who tells this, admircs him for making a review of all the ftars; by which his defcendants would be enabled to difcover whether they are born and die, whether they change their place, and whether they increafe and decreafe.

HIPPA, in botany, a genus of the polygamia neceflaria order, belonging to the fyngenctia clafs of planis. The receptacle is naked; there is no pappus; the feeds are naked, with very broad margins; the calyx is hemifpheric, and fubimbricated; the radias confifts of ten corollulx, obfcure, and ra'her cleft into three.
hippobosca, or Horse-fly, in zonlogy: a genus of infects, belonging to the order of diptera. The beak confifts of two valves, is cylindrical, obtufe, and hanging; and the feet have feveral claws. There are four ipecies, diftinguifhed by their wings, \&c.The moft remarkable is the equina, the peft of horfes and cows. This infect is b:oad, flat, fhining, and as it were fcaly. Its head, thorax, and abdomen, are yellow, undulated wilh brown; and the legs are interfected with yellow and brown. The wings, croffed one over the orher, exceed the length of the body ligy above one half; they are tranfparent, tinged with a little yellow towards their outward edge, and have a fpot near that edge of a brown colour. Thele infects are very difficult to be killed on account of the hard cruftaceons fhell which covers them; and they fix fo. clofe and faft to the poor animals with their claws, that they can iot rub or bite them off without wounding themfelves.

HIPPOCAMPUS, in ichthyology. See Syngnan thus.

HiPPOCASTANUM, or common horfe-chefnut. See 厄iscuicus.-It may ie here dded, that from feve-
 it appears that tie fruit of the horfechefut afforis a wholefome nourihment for cattle, and mey even be employed with faccefs for fattening them. It is faid to render the tallow of thofe fattened with it partica-

## H I P [ 542$]$ H I

Hippe- larly firm. The milk yielded by cows fed upon it, is
alfo faid to be thicker and richer than that produced from any other kind of food. - The fruit of this tree has been likewife ufed as food for fheep and poultry, and as foap for wafhing. It was much employ. ed in powder as a iternutatory by an itinerant oculift, and has been recommended by fome others in certain flates of ophthalmia, headach, \&c.in which errhines are indicated. Its effeets as a fternutatory may alfo be obtained by ufing it under the form of infulion or decoction drawn up into the noftrils. And it is entirely with a view to its errhine power that it is now introduced into the pharmacopœia of the Edinburgh college. But befides this, the bark has alfo been reprefented by fome as a cure for intermittent fevers; and it is probably with this intention that this part of the hippocaftanum is introduced as an official article in the Pharmacopœia Rofica.

HIPPOCENTAUR (formed of $\pi \pi \pi *$ "horfe," map rew pungo, "I fpur,"" and raupos" bull," in antiquity, a fabulous monfter, fuppofed to be half horfe and half man.

What gave occafion to the fable was, that a people of Theffaly, inhabiting near mount Pelion, became thus denominated, becaufe they were the firf that tanght the art of monnting on horfeback; which occafioned fome of their neighbours to imagine, that the horfe and man made but one animal.

The hippocentaurs fhould feem to have differed from the centaurs, in this, that the latter only rode on bullocks, and the former on horfes, as the names themfelves intimate.
HIPPOCRAS, a medicinal drink, compored of wine, with fpices and other ingredients infufed therein; much ufed among the French by way of a cordial dram after meals.

There are various kinds of hippocras, according to the kind of wine and the other addditional ingredients made ufe of; as white hippocras, red hippocras, claret hippocras, frawberry hippocras, hippocras without wine, cyder hippocras, \&c.

That directed in the late London Difpenfary, is to be made of cloves, ginger, cinnamon, and nurmegs, beat and infufed in canary with fugar; to the infufion, milk, a lemon, and fome flips of rofemary, are to be put, and the whole ftrained through a flannel. It is recommended as a cordial, and as good in paralytic and all nervous cafes.

HIPPOCRATIA, in botany : A genus of the monogynia order, belonging to the triandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The calyx is quinquepartite; the petals five, the capfules three in number, and the latter of an obcordate hape.

HIPPOCRATES, the greateft phyfician of antiquity, was born in the inland of Cos in the 8orh Olympiad, and flourifhed at the time of the Peloponnefian war. He was the firft that we knew of wholaid down precepts concerning phyfic; and, if we may believe the author of his life, whogoes under the name of Soranus, drew his original from Hercules and Æfculapius. He was firft a pupil of his own father Heraclides, then of Herodicus, then of Georgias of Leonnium the orator, and, according to fome, of Democritus of Abdera. After being inftructed in plyfic, and in the liberal arts
and lofing his parents, he left his own country, and Hippacrapractifed phy fic all over Greece; where he was fo much admired for his kill, that he was publicly fent for with Euryphon, a man fuperior to him in years, to Perdiccas king of Macedonia, who was then thought to be confumptive. But Hippocrates, as foon as he arrived, pronounced the difeafe to be entirely mental, as in truth it was. For upon the death of his father Alexander, Perdiccas fell in love with Philas his father's miftrefs: and this Hippocrates difcerning by the great change her prefence always brought upon him, a cure was foon effected.

Being intreated by the people of Abdera to come and cure Democritus of a fuppofed madnefs, he went; bur, upon his arrival, inftead of finding Democritus mad, he found all his fellow citizens fo, and Democritus the only wife man among them. He heard many lectures, and learned much philofophy from him; which has made Cornelius Celfus and fome others inagine, that Hippocrates was the difciple of Democritus, though it is probable they never faw each other till this interview which was occafioned by the Abderites. Hippocrates had alfo public invitations to other countries. Thus, when a plague invaded the Illyrians and Pæonians, the kings of thofe countries begged him to come to their relief: he did not go ; but learning from the meffengers the courfe of the winds there, he concluded that the diftemper would come to Athens; and, foretelling what would happen, applied himfelf to take care of the city and the ftudents. He was indeed fuch a lover of Greece, that when his fame had reached as far as Perfia, and upon that account Artaxerxes had intreated him by his governor of the Hellefpont, with. a promife of great rewards, to come to him, he refufed to go. He alfo delivered his own country from a war with the Athenians, that was juft ready to break out; by prevailing with the Theffalians to come to their affiftance, for which he received very great honours from the Coans. The Athenians alfo confcred great honours upon him : they admitted him next to Hercules in the Elenfinian ceremonies; gave him the freedom of the city ; and voted a public maintenance for him and his family in the prytanæum or council-houfe at Athens, where none were maintained at the publie charge but fuch as had done fignal fervice to the ftate. He died among the Lariffeans, fome fay in his goth year, fome in his 85 th, others in his 104th, and fome in his rogth. The beft edition of his works is that of Foefins, in Greek and Latin. Hippocrates wrote in the Ionian dialect. His aphorifms, prognoftics, and all that he has written on the fymptoms of difeafes, juftly pafs for mafter-pieces. See Hiffory of Medicine.

HIPPOCRENE (anc. geog.), a fountain of mount Helicon, on the borders of Boeotia, facred to the Mufes. Some, as Ovid, make Hippocrene and Aganippe the fame. See Aganippe.

HIPPOPHAGI (anc. geog.), a people of Scythia, fo called from their living on horfe-flefh : the fare at this day of the Tartars their defcendants. Alfo a people of Perfia (Ptolemy).

HIPPOCREPIS, COMMON HORSE-SHOE VETCH, in botany: A genus of the decandria order, belonging to the diadelphia clafs of plants; and in the natural method ranking under the 32d order, Papilionacea. The legumen is comprefled and crooked, with many

Hippo
Tippocre-
pis.

Hippo-
incifions on the interior future. There are three fpecies, two natives of the warm parts of Europe, and one of Britain. They are all low herbaceous trailing plants, with yellow flowers. They are propagated by feeds; but having no great beauty are feldom kept in gardens.

HIPPODROME, Hippodromus, (compofed of $\pi \pi \pi 05$ " horfe," and $\delta_{p o p o s}$ "courfe," of the verb dpene carro, "I run"), in antiquity, a lift or courfe wherein chariot and horfes races were performed, and horles exercifed.
The Olympian hippodrome or-horfe-courfe was a fpace of ground of 600 paces long, furrounded with a wall, near the city Elis, and on the banks of the river Alpheus. It was uneven, and in fome degree irregular, on account of the fituation; in one part was a hill of a moderate height, and the circuit was adorned with temples, altars, and other embellihments. See Stadium. There is a very famous hippodrome at Conftantinople, which was began by Alexander Severus, and finifhed by Conftanime. This circus, called by the Turks atmeican, is 400 paces long, and above 100 paces wide. At the entrance of the hippodrome there is a pyramidal obelink of granite in one piece, about 50 feet high, terminating in a point, and charged with hieroglyphics. The Greek and Latin infcriptions on its bafe fhow, that it was erected by Theodofius; the machines that were employed to raife it are reprefented upon it in baffo-relievo. There are fome veftiges in England of the hippodromus, in which the ancient inhabitants of that country performed their races; the moft remarkable is that near Stonehenge, which is a long tract of ground, about 350 feet, or 200 druid cubits wide, and more than a mile and three quarters, or 6000 druid cubits in length, inclofed quite round with a bank of earth, extending directly eaft and weft. The goal and career are at the eaft end. The goal is a high bank of earth, raifed with a lope inwards, on which the judges are fuppofad to have fat. The metæ are two cumali, or fmall barrows, at the weft end of the courfe. Thefe hippodromes were called in the language of the country rhedagua, the racer rhedagwr, and the carriage rbeda, from the Britifh word rhedeg "to run." One of thefe hippodromes, about half a mile to the fouthward of Leicefter, retains evident marks of the old name rhedagua,, in the corrupted one of rawdikes. There is another of thefe, fays Dr Stukeley, near Dorchefter; another on the banks of the river Lowther, near Penrith in Cumberland, and another in the valley juit without the town of Royfton.

HIPPOGLOSSUS, in ichthyology; a Species of Pleuronectes.

HIPPOLYTUS, $a$ fon of Thefeas and Hippolyte, famous in fabulous hiftory for his virtue and his misfortunes. His ftepmother Phædra fell in love with him, and when he refufed to pollute his father's bed, fhe accufed him to Thefeus of offering violence to her perfon. Her accufation was readily believed, and The. feus intreated Neptune to punifin the incontinence of his fon. Hippolytus fled from the refentment of his father; and as he purfued his way along the fea fhores, his borfes were fo frightened at the noife of fea calves whichNeptune had purpofely fent there, that they ran among the rocks till his chariot was broken and his
body torn to pieces. Temples were raifed to his me. mory, particularly at Trœzene, where he received divine honours. According to fome accounts, Diana reftored him to life.
hippomane, the manchineel-tree: A genus of the adelphia order, belonging to the monœecia clafs of plants; and in the natural method ranking under the 38th order, Tricocce. The male has an amentum and bifid perianchium, without any corolla; the female perianthium is trifid; there is no corolla; the ftigma is tripartite ; and the plum or capfule tricocous. Species. I. The mancinella, with oval fawed leaves, is a native of all the Weft-India I Ilands. It hath a fmooth browning bark; the trunk divides upwards into many branches, garnilhed with oblong leaves about three inches long. The flowers come out in fhort fpikes at the end of the branches, but make no great appearance, and are fucceeded by fruit of the fame flape and fize with a golden pippin. The tree grows to the fize of a large oak. 2. The biglandulofa, with oblong bay leaves, is a native of South America; and grows to as large a fize as the firf, from which it differs moftly in the fhape of its leaves. 3. The fpinofa, with holly leaves, is a native of Campeachy, and feldom rifes above 20 feet high; the leaves greatly refemble thofe of the common holly, and are fet with fharp prickles at the end of each indenture. They are of a lucid green, and continue all the year.

Culture. Thefe plants being natives of very warm climates, cannot be preferved in this country without a flove; nor can they by any means be made to rife above five or fix feet high even with that affilance. They are propagated by feeds; but muft have very little moifure, or they will certainly be killed by it.

Froperties. Thefe trees have a very poifonous quality, abounding with an acrid milky juice of a highly catiftic nature. Strangers are often tempted to eat the fruit of the firft feccies; the confequences of which are, an inflammation of the mouth and throat, pains in the ftomach, \&c. which are very dangerous tulefs remedies are fpeedily applied. The wood is much efteemed for making cabinets, book-cafes, \&c. being very durable-taking a fine polif, and not being liable. to become worm eaten: but as the trees abound with a milky cauftic juice already mentioned, fires are made round their trunks, to burn out their juice; otherwife thofe who fell the trees would be in danger of lofing their fight by the juice flying in their eyes. This juice raifes blifters on the fkin wherever it falls, turns. linen black; and makes it fall out in holes. It is alfo dangerous to work the wood after it is fawn out ; for if any of the faw-duft happens to get into the eyes of the workmen, it caufes inflammations and the lofs of fight for fome time; to prevent which, they generally cover their faces with fine lawn during the time of working the wood. It is with the juice of this tree that the Indians ufed to poifon theirarrows.

HIPPOMANES, a fort of poifon famous among: the ancients as an ingredient in amorous philters or lave-charms. The word is Greek , waropanys, compofed of "two.c. "c a horle," and payca " fury or mad nefs."

Authors are are not agreed about the nature of the: hippomanes. Pliny defcribes it as a blackifh caruncle found on the head of a new-born colt; which the dam

Hippo. mane, Hippomantes.

## Plate

 cexxsav.ripponax
bites off and eats as foon as fle is delivered. He adds, that if the be prevented herein by any one's cutting it off before, the will not take to nor bring up the young. Virgil, and dfter him Servius and Columella, defcribe it as a poifonons matter trickling from the pudendum of a mare when proud, or longing for the horfe. At the end of Mr. Bayle's Dictionary is a very learned differtation on the hippomanes, and all its virues both real and pretended.

HIPPONAX, a Greek poet, born at Ephefus 540 years before the Chriftian era. He coltivated the fame fatirical poetryas Archilochus, and was not inferior to him in the beaury or vigour of his lines. His fatirical raillery obliged him to fly frem Ephefus. As he was naturally deformed, two brothers, Buphalns and Anthermus, made a fatue of him ; which, by the uglinefs of its featmres; expofed the poet to univerfal ridicule. Fipponax refolved to revenge the injury ; and he wrote fuch titter invectives and fatirical lampoons againft them, that they hanged themfelves in defpair. (Cic. ad. Fami!. vii. cp. 24.)

HIPPOPHAE, sea-buckthorn: A genus of the tetrandria order, beloriging to the diœcia clafs of plants; and in the natural method ranking under the 16th order, Calycifora. The male calyx is bipartice ; there is no corolla; the female calyx is bifid ; there is no corolla; there is one ftyle, and a monofpermous berry.

Species. I. The rhamnoides hath a fhrubby ftem, branching irregularly eight or ten feet high, having a dark brown bark. It is armed with a few thorns; hath fpear-fhaped, narrow, feffile leaves, of a dark green above, and hoary underneath. 2. The canadenlis hath a flrubby brown ftem, branching eight or ten feet high, with oval leaves, and male and female fowers on different plants.

Gulture, \&c. Both thefe fpecies are very hardy, and may be propagated in abundance by fuckers from the roots, by layers, and by cuttings of their young hoots. They are retained in gardens on account of theirtwocoloured leaves in fummer ; and in winter, on account of the appearance of the young floots, which are covered with turgid, irregular, faly buds. Goats, fheep, and horfes, eat the firft fpecies ; cows refufe it.

HIPPOPODES, Hipporedes, or Hippopodia, compofed of $i \pi \pi 0 s$ hor $f t$, and noss foot, in the ancient geo. graphy, an appellation given to a certain people fituated on the banks of the Scythian fea, as being fuppofed to have had horfes feet. The hippopodes are mentioned by Dionyfius, Geogr. v. 3 ro. Mela, lib. iii. cap. 6. Pliny, lib. iv. cap. 13. and St. Auguftine, $D e$ Givit. lib. xvi. cap. 8. But it is conjectared, that they had this appellation given them on accomnt of their fwiftnefs or lightnefs of foot. Mr Pennant fuppofes them to have been the inhabitants of the Bothnian Gulph, and that they were the fame fort of people as theFinniLignipedes of Olaus. They wore fnow fhoes; which he thinks might fairly give the idea of their being, like horfes, hoofed and hoed.

HiPPOPOTAMUS, the river-horse; agenus of quadrupeds belonging to the order of belluæ, the characiers of which are thefe: It has four fore-teeth in the upper jaw, difpofed in pairsat a diftance from each other; and four prominent fore-tectlin the underjaw,
the intermediate ones being longeft: There are two Hippopotufks in each jaw, thofe of the under one very long tamus and obliquely truncated; in both they fand folitary, and are recurvated : The feet are hoofed on the edges.
There is but one known fpecies, viz.the amphibius, or river-horfe, (Plate CCXXXVI.) The head of this animal is of an enormons fize, and the mouth vally wide. The ears are finall and pointed, and lined within very thickly with thort fine hairs. The eyes and noft rils are fmall in proportion to the bulk of the ani.mal. On the lips are fome ftrong hairs fcattered in patches here and there. The hair on the body is very thin, of a whitifh colour, and fearce difcernibleat firf fight. There is no mane on the neck, as fome writers feign, only the hairs on that part are rather thicker. The fkin is very thick and ftrong, and of a dufky colour. The tail is about a foot long, taper, compreffed, and naked. The hoofs are divided intofour parts. The legs are flort and thick. In bulk it is fecond only to the eleplrant. The length of a male has been found to be 17 feet, the circumference of the body 15 , the height near 7 , the legs near 3 , the head above $3 \frac{1}{2}$, and the girth near 9. The mouth, when open, is above 2 feet wide; and furnifhed with 44 teeth of different figures (including the cutting reeth and the canine). The cutting, and particularly the canine teeth of the lower jaw, are very long, and fo hard and frong that they ftrike fire with fteel. This circumftance, it is probable, gave rife to the fable of the ancients, that the hippopotamus vomited fire from his mouth. The fubftance of the canine teeth is fo white, fo fine, and fo hard, that it is preferable to ivory for making artificial teeth. The cutting teeth, efpecially thofe of the under jaw, are very long, cylindrical, and chamfered. The canine teeth are alfo long, crooked, prifmatic, and fharp, like the tufks of the wild boar. The grinders are fquare or oblong, like thofe of man, and fo large that a fingle tooth fometimes weighs three pounds. The tufks, according to Dr Sparman, are 27 inches long. -With fuch powerful arms, and fuch a prodigious ftrength of body, the hippopotamus might render himfelf formidable to every other animal. But he is naturally of a mild difpofition, and is only formidable when provoked. His bulk is fo great, that twelve oxen have been found neceffary to draw one athore which had been fhot in a river above the Cape; and Haffelquift fays, its hide is a load for a camel. Tho' he delights in the water, and lives in it as freely as upon land; yet he has not, like the beaver or otter, membranes between his toes. The great fize of his belly renders his fpecific gravity nearly equal to that of water, and makes him fwim with eafe.

There animals inhabit the rivers of Africa, from the Niger to Berg River, many miles north of the Cape of Good Hope. They formerly abounded in the rivers nearer the Cape, but are now almoft extirpated; and to preferve the few which are left in Berg River, the governor has abfolutely prohibited the fhooting them without particular permifion.--They arenot found in any of the African rivers which run into the Mediterranean except the Nile, and even there only in Upper Egypt, and in the fens and lakes of Ethiopia which that river paffes through. From the unwieldinefs of his body and the hormefs of his legs, the hippopo.

Thackanci i lintlame Jo.

## H I P

Hippope. tamus is not able to move faft uponland, and is then tamus. extremely timid. When purfued, lie takes to the
water, plunges in, links to the bottom, and is feen walking there at fulleafe ; he cannot, however, continue there long without of ten rifing towards the furface; and in the day time is to fearful of being difcovered, that when he takes in frefla air the place is hardly perceptible, for he docs not venture even to put his nofe out of the water, Inrivers unfrequented by mankind, he is lefs cantious, and puts his whole head out of the water. If wounded, he will rife and attack boats or canoes with great lury, and often linl them by bitinglarge pieces out of the fides: and frequently pcople are drowned by thefe animals; for they are as bold in the watcr as they are timid on land. It is reported that they will at once bite a man intwo.-In fhallow rivers the hippopotamus makes deep holes in the bottom, in order to conceal his great bulk. When hequits the water, he ufually puts out halt his body at once, and fmells and looks around; but fometimes rufhes oll wilh great impetuofity, and tramples down cvery thing in lis way.-During the night he leaves the riversin order topafture; when he cats fugar-canes, ruthes, millet, rice, \&c. confuming great quantities, and doing much damage in the cultivated ficlds. But as he is fo timid on land, it is not dificalt to drive him off.——The Egyptians (Mr Haffelquift informs us) " have a curjous mannier of freeing themfelves in fome meafure from this deftruciive animal. They remark the places he frequents moft, and there lay a large quantity of peafe; when the beaft comes on fhore hungry and voracious, he falls to eating what is neareft him: and filling his belly with the peafe, they occafion an unfupportable thirft : he then retarns immediately into the river, and drinks upon thefe dry peafe large draughts of water, which faddenly caufes his death ; for the peafe foon begin to fwell with the water, and not long after the Egyptians find him dead on the fhore, blown up, as if killed with the ftrongeft poifon." The river-horfe alfo feeds on the roots of trees, which he loofens with his great teeth; but never eats fifh, as is afferted by Dampier. It was reported to Mr Haffelquift, that the river-horfe isan inveterate enemy to the crocodile, and kills it whenever it meets it ; and that this, with jome other reafons, contributes much to the extirpation of the crocodile; which otherwife, confidering the many eggs they would lay, would utterly deftroy Egypt. But Mr Pennant treats the alleged enmity of the hippopotamus and crocodile as a vulgar error ; an eye- witnefs, he tells us, declaring he had feen them fwimming together without any difagreement.-The hippopotami neep in the reedy iflands iu the midle of the ftream, and on which they bring forth their young. A herd of females has but a fingle mule; they bring one young at a time, and that on the land, but fuckle it in the water.-They are capable of being tamed. Belon fays, he has feen one fo gentle as to be let loofe out of a ftable and fed by its keeper without attempting to injure any one. They are gemerally taken in pitfalls, and poor people eat the flefh. In fome parts the natives place boards full of tharp irons in the corn-grounds; which thefe beafts ftrike into their feet and fo become an eafy prey. Sometimes they are ftruck in the water with harpoons faftened to cords, and 10 or 12 canoes ate employed in the chace.

Vol. VIII.

The hipropotamus was knowin to hie Romans: Hippom Scaurus treated the people with the fight of five ctocodiles and one hippopotame during his ædilefhip, and exhibited them in a temporary lakc. Augultios produced one at his triumph over Cleopatra.

This animal is the behemoth of Job ; who admirably deferibes its manners, food and haunts. " 1 . Behold now behcmoth, which I made near thec: he eateth grafs as an ox. 2. Lo! now his ftrength is in his loins, and his force is in the navel of his belly. 3. His bones are as ftrong pieces of brafs; his bones are like bars of iron. 4. He lycth under the thady trees, in the covert of the reed and fens. 5. Behold! he drinketh up a river : he trufteth he can draw ap Jordan into his mouth." The firft, the learned Bochart obferves, implies the locality of its fituation; being an inhabitant of the Nile, in the neighbourhoni of $\mathrm{U}_{\mathrm{z}}$, the land of Job. The fecond deforibes its great frength; and the third, the peculiar hardnels of its bones. The fourth indicates its refidence amidft the vaft reeds of the river of Egypt, and other African rivers overfhadowed with thick forefts. The firth, the claracteriftic widenefs of its mouth; which is hyperbolically defcribed as large enough to exhauft fuch a ftream as Jordan.

That this article may include every fort of information which could be collecked concerning a creature fo highly noted and of fuch ancient fame, we fhall add the following particulars extracted from Sparman's Voyage to the Cape of Good Hope, where thefe animals are called fea-coros.
" Towards evening (Jan. 24. r776), we came to a pit in the river, which onr guides knew ufed to te frequented by fea-cows. For this reafon, ail the different ways by which thefe animals might come up from the river, were befet by us feparately ; our hunt-ing-party confifting in the whole of feven perfons, viz. five of us Chriftians, together with my Hottentot and another belonging to the farmers. Befides this, the reft of the Hottentots were ordered to go to the windward and to the more open places; and by fmacking their whips, and making other noifes, to trighten and drive the animal towards us as foon as it hould make its appearance : in confequence of which meafures, it appeared to us, that when at length obliged to go on fhore in queft of its food, it muft neceffarily come to the hiding-place of fome one of the hunters. Every one of thefe places were juft at the edge of the river, between the reeds which grew on the dry parts of the siver, or on thofe fpots which the ivater hadleft, and at the fame time clofe to the very narrow paths which the animal had made for itfelfat each place: in confequence of which difpofition, it would inevitably pals not above fix inches, or a foot at moft, from the mouth of the fportiman's piece. Confequently our whole dependance was upon two circumftances; viz. that our guns hould not mifs fire, and that the fhot fhonld not fail to prove mortal. In the former cafc, the fportfman muft have inevitably paid for his temerity with his life; though in the latter he had reafon to hope, from inftances of what had happene to others, that the fire, together with the report from the piece, as well as the ball itfelf, would confufe the animal, fo as to prevent it from immediately making towardsits cnemy. The banks of the pit which we then befet
were

## H I P <br> 546 <br> HIP

Hippopo tamus.
werc in moft places fteep and perpendicular, and the pit itfelf was alinof three quarters of a mile long: but my poft and that of my fellow traveller (Mr Immelman) happened to be at the diftance of not above 30 or 40 paces from each other. To thefe very places too, after we had waited at them an hour and an half in the moft profound filence, the enormous animals did not fail to refort. They had already, while on the other fide of the river, got feent of the Hottentots; and now thowed by their fwimming up and down and blowing themfelves, as well as by a flort but acute and piercing grunt or neighing noife, that they had a great fuppicion of thefe paffes.I believe Mr Immelman was not lefs eager and anxioas that myfelf, eacho o us expecting every moment to have a $b$ ut with a lhage enermous beaft which we knew had given certain proofs of its being able to bite a man afunder. Yet were we each of us at times no lefs fearfulleft the other fhould have the honour of killing game of fuch confequence. The hippopotanus, however, leftus, and had made its appearance in the fame manner where the farmers were flationed; notwithftanding which, at that very inftant we heard it fhot at by one of the Hottentots.-The fable darknefs of the night, and the glittering of the Hotentot's piece, together with the loudnefs of the report from it, occationed by the weight of the charge, and the vibrations of the echo prolonging the found along the neighbouring chain of monntains, all confpired to compore a moft awful and fuperb fpectacle, which was ftill heightened by the expectation of feeing an animal fall fuperior in bulk to the elephant. This finblime fpectacle was immediately followed by a ridiculous kind of farce performed by a troop of baboons; which, from their calling and anfwering each other along a ftraight line, we could difcover to be encamped on a fteep rocky mountain in the ncighbourhood, with regular out-pofts in the trees on each fide of ic. After an interval of a couple of minutes, filence again took place, till two o'clock, when the other Hottentot fired his piece; and another alarm, though of fhorter duration, went through the baboons out-pofts and head-quarters.
"The next morning, for the arrival of which we ardently longed, in order to fatisfy our curiofity, our Hottentot foortfmen related to us the following particulars concerning the adventures of the night. Involved indarknefs, covered up to the eyes in reeds, and overfhadowed with branches of trees, they could only get a glimpre of the animal, and confequently could not aufwer for their fhots having taken place: and one of them acknowledged, that he was a little confufed, as he could not well fee what he was abotit; and for the fame reafon fired his piece too foon, before the animalhad well rifen out of the water. The other indeed had had an opportunity, both with the ball and fhot that made up the charge, of wounding the animal, which went on its road, and paffed directly by him ; but he could not fee which part of the animal prefented itfelf before the muzzle of his piece. As foon as he had fired, he flank away, and directly afterwards heard the beaft take to the water. The reft of the Hottentots had obferved one of thefe animals, probably a different one from this, run up on a fhallow along the river fide, and thus make its efcape, without their having been able to preyeat it, After this. we faid here till the afternoon, in
hopes that the wounded animals would die and rife to the top of the water. But we ftaid in vain; and to as little purpofe would it probably have been had we waited fill loinger, as there grew by the fide of the river a great number of trees, to the roots of which thefe creatures, it is faid, in the agonies of death, make themfelves faft by means of their long and crooked tufks. On the other hand, fuppofing thefe two fea-cows to be but lightly wounded, they would be cautious how they made their appearance; and indeed, in all probability, it would have been a dangerous fervice to the fportfman who hould have ventured to have followed them any farther. Betides, the water had now, in the fpace of a few hours, rifen confrderably, and had overflowed many foots fit for lying in ambuh ; for which reafon we departed to another hippopotamus pit lefs than this. Here too we laid, by way of fnare, a large blunderbufs. The Hottentots occupied one poft; two of our company guarded another: other two (an old farmer and his fon) ftationed themfelves at the third, and placed me in the middle of them. Juft in this part the banks of the river were of a confiderable height, and the river itfelf was dried up near an cxtenfive fhallow, where it was fpread out in to a little plain covered with pebble-ftones and gravel. We three then fet ourfelves down clofe by the fide of each other, in a path made by the fea-cows, making ourfelves pretty certain, as the place was flat, and confequently it was light here, of being able, if any hippopotamus flould chance to come upon the fhallow and look about it, to fee it plain enongh to kill it with a volley of three flot. But to the great endangering of our lives, we on a fudden found the animal nuch quicker in its motions, as well as bolder, than we had thought it ; for while I was fitting half fleeping, and moralizing on the fubject, fruck with the confideration that we with our guns had at that prefent moment the dominion over Job'sleviathan or behemoth; while, on the other hand, the flies or fmall mufquitos had the dominion over us (fomuch, indeed, that 1 was obliged to wrap up my face up in a handkerchief), a fca-cow came rufhing upon us out of the river, with a hideous cry, as fwift as an arrow out of a bow, at the fame time I heard the farmer call out. "Heer Jefus !" But fortunately at the very inftant he difcharged hispiece, which flafhing full in the animal's face contributed perhaps more than the ball to make it ftart back; when fetting up another cry, it threw itfelf into the water again with as great precipitation as it came out.
"A At this I was not a little alarmed, yet, what is very fingular, not at the danger which was real, of being trampled under foot, or being bitten afunder by the beaft, but in confequence of my apprehenfions which were merely imaginary, of being drowned : for the rattling noife, arifing from the creature's running out of the water and along the ftony beech, immediately fuggefted to me the idea that the river had on a fudden overflowed its banks; a fuppofition to which I was the more inclined, as I knew that this accident happens very frequently here. And as the hippopotamus, when it is newly come up ont of the water, and is wet and flimy, is faid to gliften in the moon-fhine like a fifh, it is no wonder that as foon as I took my handkerchief from before my eyes, it hould appear to

Hippopo. tamus.

# HIP 

Hespopon se, at fonear a view as I had of it, like a high column stamus. of water, which fecmed to threaten to carry us off and drown us in a moment : for which reafon Iran, or rather flew, towards the higher ground, leaving both my guns and my brother fentinels behind me. But as juft at this fpot I was prevented by the fteepnefs of the river's banks from afcending the lieights, and neverthclefs perceived that neither nyy companions nor myfelf were drowned, it ran in my head, for the face of feveral feconds, that we were all of us either dreaming or delirious. The farmer's fon had fallen afleep, and ftill continued to fleep very foundly. As to the farmer himfelf, who, panting. and breathlefs, cvery now and then looked up to heaven, and at the fanue time, with much aukwardnefs and buftle, was endeavouring to make his efcape, I made all the hafte I could to difengage him from a large wrapper, which, as wellon account of his gout as by way of keeping off the flics, he had wrapped round his legs. I rhen aiked him what courfe the water had taken when it overflowed ? and he, after a long paufe, anfwered only by afking me in his turn if I was not mad ? upon which I was almoft ready to put the fame queftion to myfelf. And even at laft, when all this was unriddled to me I could not lelp doubting of the truth of it, till I found the farmer's gun was really difcharged : for the rattling among the fones and the fquafining in the water, occalioned by the fea-cow, was what I firft heard, and what made me take to my legs; fo that I did not attend in the leaft either to the report of the gun or the cry of the animal, though the fe latter appeared to the reft of our party the moft terrible; fo mach, indeed, that they occafioned Mr Immelman, together with the farmer's fon-in-law, to fly from their poft; though they had feen nothing of all that had happened, and could not eafily have come to any harm.-We concluded the chace; and fpent the remainder of the night in laughing at each other, in chattering, and forming various conjectures on the fubject of the precipitation and impetuous fury of the fea-cow; which, howover, was probably as much alarmed and frightened as we ourfelves could poffibly be : we even fmoked a couple of pipes while we liftened to the roaring of the lion, and waited for the approach of the morning. Several Hottentots then told us, that foon after the noife and tumult we have been defcribing had ceafed, they had feen a fea-cow making its way out of the river towards that fide of it which was unguarded.
"On the 25 th, from fome traces of the fea-cows which we found in the duft near another fpot, we concluded that many of thefe huge amphibious animals had lately taken up their quarters in a certain pit thereabouts; which we accordingly prepared to lay fiege to in every poffible way. In the mean time, we faw a young lion make its efcape into a clofe thicket on the fide of this fame pit, where it might be perfectly fafe from us and our hounds. Not much approving of this animal's being fo near a neighbour to us, we thonght it beft for feveral of us markfmen to be together at each hiding-place; at the fame time ordering our Hottentots, partly by making a neife and uproar, partly by the means of making large fires, to frighten the fea-cows from attempringany of the other paffes. Thefe animals had probably been befetinthe fame manner feveral tumes before; as this
night we fearcely heard any thing of then. In the Hippopo. mean while, however, we flattered ourfelves, thatby tanus. continuing to block them up, we hould at leaft by ftarving them force them to quit their afylum, and expofe themfelves on the land to the fire of our gins.
" On the 26th likewife we were on the look-ont after thefe animals, between the hours of ten and eleven in the forenoon, and alfo juft before dufk, though upon a quite different plan fron what we had before, as we meant now to hit them on their fnouts the inftant they hould fick them up within the reach of our guns out of the water in order to take breath, or more properify (as it is not unaptly called by the colonifs) to blow themfelves. In order that the fhot might prove mortal, we were obliged, however, on this occalion, to direct it in fuch a manner, that the ball foould pafs through the cavity of the nofe into the brain. It was merelyupon this plan that we wentout after the fea-cows before we arrived at Agter Brunieshoogte, and were ftrengthened by the farmer's party. But we constantly found thefe animals too hy to allow us to put our defigns in execution : for althongh, in thofe places where they had not been frightened or wounded, they will often in the middle of the day raife their heads and part of their bodies above the furface of the water, they at this time fcarcely ventured juft to put one of their noftrilsonly out of it, in order to breathe almeft imperceptibly; and this only for the moft part in thofe fpots in which they were theltered from us by the hanging branches of trees. Notwithftanding this difadvantageous fituation, they, in confequence of the acutenefs of their fmell, feemed ftill to difcern us, efpecially when we were to the windward of them; as in that cafe they infantly withdrew to another part.
"T The fame thight we betook eurfelves again to our pofts; and at half an hour after eight, it being already very dark, a fea-cow began at intervals toputits head up above the water, and utter a hharp, piercing, and, as it were, a very angry cry, which feemed to be between grunting and neighing. Perhapsthis cry may be beft expreffed by the words hëurkhburkh, huh-huh: the two firft being uttered flowly, in a hoarfe but fharp and tremulous found, refembling the grunting of other animals; while the third, or compound word, is founded extremely quick, and is not unlike the neighing of a horfe. It is trae, it is impoflible to exprefs thefe inarticulate founds in writing; but perhaps one may make nearer approaches to it than one can to the gutturopalatial Lounds of the Hottentot language. At eleven o'clock came the fame or elfe fome other hippopotamus, and in like manner vifited the pofts we occupied. He did not, however, dare to come up, though to our extreme mortification we heard him come and nibble the boughs which hangover the furface of the water, as well as a little grafs and a few low flurubs which grew leere and thereon the infide of the river's banks. We were however, in hopes that this way of living would not long fuffice animals, one of which only required almolt a larger portion than a whole teamofoxen. Thus far at leaft is certain, that if one fhould calculate the confumption of provifions made by a fea-cow from the fide of its fances, and from that of its body and of its belly, which hangs almoft down to the ground, together with the quantity of

## H I P [ 548 H I P

Hippopo- grals which I have at different times obferved to have tamus
been confumed by one of thefe animals in fpots whither
it has come over night to graze, the anount would appear almoft incredible.
"W Waffed the following night at the fame pofts as we occupied on the night preceding, the fea-cows acting much in the fame manner as before. On the 28th, after fun rife, juft as we were thinking of going from our pofts home to our waggons, there comes a female hippopotamus with her calf, from fome other pit or river, to take up her quarters in that which we were then blockading. While the was waiting at a rather fteep part of the river's banks, and fooking back after her calt, which was lame, and confequently came on but flowly, fhe rectived a fhot in her fide, upon which the directly plunged into the river: but was not mortally wounded; for Flip (the farmer's fon), the drowfieft of all frblunary beings, who had thot her, and that inftant co.ld bardly be awakened by two Hotrentots, was fill half alleep when He fired his picce. And happy was it for him that the cnormous beaft did not make towards his hiding or rather fleeping place, and fend him into the other world to fleep for ever. In the mean while his hot was fo far of fervice, that one of my Hottentots ventured to feize the calf, and hold it faft by its hind-legs till the reft of the hunting party came to his affiftance. Upon which the calf was faft bound, and with the greatef joy borne in triumph to our waggons: though while they were taking it over a fhallow near the river, the Hottentots were very much alarmed left the wounded mother and the other fea-cows fhould be induced by the cries of the calf to come to its refcue; the creature, as long as it was bound, making a noife a good deal like a hog that is going to be killed, or has got faft between two pofts. The found, however, proceeding from the hippopotamus calf was more fhrill and harfh. It fhowed likewife a confiderable fhare of ftrength in the attempt it made to get loofe, and was found to be quite unmanageable and unwitldy: the length of it being already three feet and a half, and the height two feet; though the Hottentots fuppofed it to be no more than a fortnight, or at moft three weeks, old. When at laft it was turned loofe, it ceafed crying; and when the Hottentots had paffed their hands feveral times over its nofe, in order toaccuftom it to their effluvia, began directly to take to them.
"While the calf was yetalive, I made a drawing of it, a copy of which may be feen in the Swedith Tranfactions for 1778 . After this it was killed, diffected, and caten up in lefs than three hours time. The reafon of this quick difpatch was partly the warmth of the weather, and partly our being in abfolute want of any other frefh provifions. We found the flefh and fat of this calf as flabby as one might have expected fromits want of age, and confequently not near fo good as that of the old fea-cows; of which I found the flefh tender, and the fat of a tofte like marrow, or at leaft not fo greafy and ftrong as other fat. It is for this reafon likewife that the colonifts look upon the flefh and fat of the feacow as the wholefomeft meat that san be eaten : the gelatinous part of the feet in particular, when properly dreffed, being accounted a great delicacy. The dried tongues of thefe animals are alfo.
confidered even at the Cape as a rare and favory difl. Hippopn. On my return to Sweden, I had the honour to furnigh his majefty's table with a dried ied-cow's tongue, two feet and eight inches long. With refpeet to form, the tongue of a full-grown hippopotamus is very blant at the tip, and is in fact brodeft at that part; if at the fame time it is flanted off towards one fide, and marked with lobes, as I was informed it is, this circumfance may, perhaps, proceed from the friction it fuffers againft the teeth, towards the fide on which the animal chiefly chews; at leaft fome traces of this oblique form were difcoverable on the dried tongue I am fpeaking of.
"'The hide of the adult hippopotamus bears a great refemblance to that of the rhinoceros, but is rather thicker. Whips likewife made of his hide are fironger, and after being ufed fome time, are more pliable than thofe made of the hide of the rhinoceros ufually are, though they are not fotranfparent as thefc latter are when new.
"The food of the hippopotamus confints entirely of herbs and grafs, a circumftance of which we are informed by Father Lobo; and which may partly be inforred from what I have already faid on the fubject, as well as from the figure of the ftomach belonging to the fotus of a hippopotamus given in Meffrs de Buffon and Daubenton's clegant work. I therefore do not look upon it as very probable, that thefe animals, agreeably to the affertions of M. de Buffon, p. 93. or of Dampier in his voyage, fhould huht after fifh by way of preying upon them; efpecially as in fome of the rivers of the fouthern part of Africa, where the fea-cows are feen daily and in great abundance, there is not a filh to be feen; and in others only a few baftard fpringers, as they are called (cyprinus gonnorynchus), which are fcarcely as big a common herring. It is faid, that a fmall fpecies of carp is ftill more rarely to be met with here. It is true, that the fea-cows fometimes frequent the mouths of the rivers here, which are full of fea-filh, and even fometimes the fea itfelf: we know, however, that thefe huge quadrupeds are notwithftanding this obliged to go from thence upon dry-land in queft of food. Neither is it probable that they can drink the fea-water; as an infance was related to me of the contrary in a hippopotamus, which having been difturbed in the rivers, hald taken refoge in the fea, and yet wasobliged to go athore every night and drink frefh water from a well in the neigh-. bourhood, till at laft it was fhot by fome people that lay in wait for it there. That the hippopotamufes actually lived in falt-water, I have feen evident proofs at the nouths both of Kronome and Camotour rivers, parti-cularly in the latter, on my journcy homewards; where many of thele animals blowed themfelves in broad-day-light, and thruft their heads up above the water; and one of them in particular, whicin had been wounded by an ill directed fhot on the nofe, neighed from anger and refentment. In Krakekamma I faw on the beach manifeft traces of a hippopotamus which had come out of the fea, but had retired thither again directly. That veryattentive navigator Captain Burtz informed me, that he had frequently feen on the caflern coaft of Africa fea-horfes (meaning probably the hippopotamus) raife their heads above the farface of the water, in order to blow themfelves and neigh. I

## HIP

1fippopotasus.
have been induced to be rather circumftantial on this fubject, as M. Adanfon had taken into his head, in $V$ yage au Senegal, to limit the abode of the hippopotamus to the frefh water rivers only in Africa; and M. de Bufton has taken upon him to fupport this opinion, and to render Kolbe's teftimony to the contrary liable to futpicion.
"An old experienced huntfman told me, that he had once feen two hippopotamules copulate, which they did in the fame manner as common cattle. On this occafion the beafts food in a hallow part of the river, where the water reached up to their knees.
" The method of catching the hippopotamus confifts (befides fhooting it) in making pits for it in thofe parts which the animal paffes in his way to and from the river ; but this method is peculiar to the Hottenrots; and is only practifed by them in the rainy feafon, as the ground in fummer is too hard for that purpofe. It is faid that they have never facceeded in killing this huge aquatic animal with poifoned darts, though this way of killing game is practifed with advantage by the Hottentots for the deftruction both of the elephant and rhinoceros. The colonifts likewife were not entirely unacquainted with the method mentioned by M. Haffelquift, as being common in Egypt, viz. to ftrew on the ground as many peafe or beans as the animal can poifibly eat, by which means it burfts its belly and dies. But as this method is very expenfive, and they can generally have this animal tor a fingle charge of powder and a in ball, fhot in a proper direction, they chiefly and almoft folely have recourfe to this cheaper expedient.
"T The hippopotamus is not fo quick in its pace on land as the generality of the larger quadrupeds, though perhaps it is not fo flow and heavy as $M$. de Buffon defcribes it to be; for both the Hottentots and colonifts look upon it as dangerous to meet a hippopotamus out of the water, efpecially as, according to report, they had lad a recent inftance of one of thefe animals, which, from certain circumftances, was fuppofed to be in rutt, having for feveral hoars purfued a Hottentot, who found it very difficule to make his efcape. The people of this country did not entertain that opinion of the medical virtucs of the hippopotamus, as they did of certain parts of the elephant and rhinoceros; excepting one colonift, who imagined he had found the os petrofum of this animal reduced to powder, and taken in the quantity that would lie on the point of a knife, excellent in convulfions, and particularly in the convalfions (ftuypen) of children. That the flef isreckoned very wholefome food, I have already mentioned.
"Having already exceeded the limits I had pre". feribed to myfelf, I do not intend to dwell here on the anatomy of the hippopotamus we caught, particularly, as the internal conformation of the calves is fome what different from that of the adult animal: I hall therefore only briefly mention the following particulars; the ftomachs were four in number, and confequently one more than in the fotus examined by M. Daubenton, which was kept in fpirits. Compare Buffon, Tom. xii. Tab.iv. fig. 2. The two firft ftomachs were each of them about feven inches long and three inches in diameter; the third was nine inches in length, and a little wider than
the two former; the fourth was feven inches long, Hippopor and at the upper part five inches broad, decreafed tamus. by degrecs on one fide till it terminated in the pylorus, which had an aperture an inch in width, being about half as wide again as the cardia. I did not obferve any fuch valves as M. Daubenton has delineated. The fis $:^{2}$ fomach we found moftly cunpty, it containing only a few lumps of cheefe or curd; it likewife differed from the reft by the fuperior finenefs of its internal coat. The internal membrane of the fecond flomach was rather coarfer, and had many fmall holes in it; it likewife contained feveral clods of cafeous matter, toge.rather with a grear quantity of fand and mud. The. third ftomach had very vifible folds, both longitudinal and tranfverfal, on the infide of it, and contained cafeous lumps of a yellow colour and harder confiftence than the others, together with feveral leaves quite whole and freh, and at the fame time fome dirt. . The interior membrane of the fourth ftomach was very fmooth, though it was not without folds; in the ftonach itfelf there was a good deal of dirt, with a fmall : quantity of curds, which, were whiter than they u ere in any of the other ftomachs. This fourth ftomach in a great meafure covered the reft, being fituated on the right fide of the animal, and was found to lave the upper part of the melt adherng to its fuperior and interior edge. This latter vifcus which was ore foot: long and three inches broad, diverged from it downwards on the left fide. The inteftinal canal was 109 feet long; the liver meafured 14 inches from right to left, and 7 or 8 from the hind part to the fore part. On its anterior edges it had a large notch, being in other refpects undivided and entire; it was of an ob: lique form, being broadeft towards the left fide where I difcovered a gall-blad:ler five inches in length. In the uterus there was nothing particularly worthy of obferva- . tion. I found two teats, and the heart furrounded with much fat; the lengeh of this mufcle was five inches, and the breadth about four inches and a half. The communication between the auricles, called the for amen ovale was above an inch in diameter. Each long was eleven inches long and undivided: but at the fuperior and exterior part of the right lung there were two globules or proceffes elevated half an anch above the furface; and on the fide correfponding to it, in the left lung, and in the upper part of it, there was a little excrefcence, terminating in a point; fomewhat below this, yet more for wards, there was found likewife a procefs half an inch in height. Directly over the lower part of the communication formed between the right and left lung, there was a kind of creft or comb, meafuring an inch from the top to the bafis.
"One of my brother fportfmen faid, he had once obferved a peculiar kiad of vermin on the body of one of thefe amphibions animals; but on the calf we had caught we found nothing but a fpecies of leech, which kept only about the anus, and likewife a good way up in the ftrair gut, where, by a timely abftraction of the blood, they may be of ufe to thefe large amphibious animals; and particularly may act as prefervatives againft the piles, repaying themfelves for their trouble in kind. Moft of them were very fmall; but on the other hand there was a confiderable number of them. The only large one 1 faw of this fecies, being fome-

H I P
Fippopota- what more than an inch in length, I defcribed and mus. $\underbrace{\text { Hippuris. }}$ nade a drawing of: this is inferted by the name of the Hyrudo Capenfis, corpore fuprà nigricante, nedio longitunaliter fub-brumaeo, fubtus pallide fufco, in the celegant Treatife on Worms, which M. Adolphus Nodeer firf fecretary of the patriotic fociety, is preparing for the prefs. Inftead of the lighter coloured Itreak upon the back, there was difcoverable in fome of thefe leeches one and fometimes more longitudinal brownifh lines, which grew fainter and fainter towards the extremities.
" The huge animal of which we have been fpeaking, has doubtlefs obtained its prefent name of hippopotamus, which fignifies river-horfe, merely in confequence of the neighing found it makes; as otherwife in its form it bears not the leaft refemblance to a horfe, but rather to a hog. Neither does it in the leaft refemble the ox; fo it could be only the different fomachs of this animal which could occation it to be called fea-cow at the Cape; and perhaps it is for the Eome reafon that the Hottentots call it the $t^{\prime}$ gao, which nearly approaches to $t^{\prime} k a u$, the name by which the buffalo is known among thefe people.
"From the account given by Bellonius of a tame hippopotamus, which he defcribes as a bealt of a very mild and gentle nature, as well as from the difpofition of the calf we had juft caught, it follows, that this animal might be eafily brought over to Europe, where it has been formerly exhibited at two different times in the public fpectacles at Rome. For this purpofe the capture might eafieft be made at Konaps-river, where thefe animals, according to the accounts given me by the Caffres, refide in grear abundance; and milch cows might bekept ready at hand, in order to rear the calf in cafe it was a fuckling. Indeed I am apt to fuppofe that one a little older than this would not be very nice in its food; as that which we caught was induced by hunger as foon as it was let loofe near the waggon, to put up with fomething not extremely delicate, which had been juft dropped from one of our oxen. This perhaps may appear very extraordinary in an animal with four ftomachs; but there have been inftances of this kind known in common cattle, which in Herjedal are partly fed with horfe dung. (Vid. A. A. Hulphers's Befkrifning om Norrland *, 3:je

- Hulphers'
$D_{\text {ficription }}$ of Nerwuay

Saml. om Herjedalen, p.27-87.) I have been likewife affured, that this method of feeding cattle has been practifed with great advantage in Uplandia, when there has been a fcarcity of fodder : and that afterwards thefe fame cattle, even when they have not been in want of proper fodder, have taken to this food of their own accord, and eaten it without any thing clfe mixed with it."

HIPPURIS, MARE's-tail: A genus of the monogynia order, belonging to the monandria clafs of plants; and in the natural method ranking under the 15 th order Inundata. There is no calyx, nor any petals; the ftigma is fimple ; and there is one feed. There is only one fpecies, a native of Britan, and which growsin ditches and ftagnant waters. The flower of this plant is found at the bafe of each leaf, and is as fimple as can be conceived ; their being neither empalement nor bloffom; and only one chive, one pointal, and one feed. It is a very weak altrin-
gent. Goats eat it ; cows, heep, horfes, and fwine, refufe it.

HIRAA, in botany; a genus of the tryginia order, belonging to the decandria clafs of plants. The calyx is pentaphyllous; the petals roundifl and unguiculated : there are three bilibiated feeds.

HIRAM, a king of Tyre, contemporary with Solomon, whom he fupplied with cedar, gold, filver, and other materials for building the temple. He died I 000 years B. C.

Hiram of Tyre, an artift who affifted in the conftruction of Solomon's temple, andother public buiddings at Jerufalem, flourifhed Ior 5 B. C.

HIRCANIA (anc. geog.) See Hyrcania.
HIRCH-horn, a town of Germany, in the circle of the lower Rhine, with a ftrong caftle. It is feated on the fide of a hill on the river Neckar, and belongs to the elector Palatine. E.Long. 9. o. N. Lat. 49. 28.

HIRE (Philip de la), an eminent French mathematician and aftronomer, born at Paris in 1640 . His father, who was painter in ordinary to the king, defigned him for the fame profeflion : but he devoted himfelf to mathematical ftudies, and was nominated together with M. Picard to make the neceffary obfervations for a new map of Ftance by the directionsoif M. Colbert. In r683. he was employed in continuing the famous meridian line begun by M. Picard ; and was next engaged in conftructing thofe grand aqueducts which were projected by Lonis XIV. He died in 1718, after havillg written a great number of works, befides feveral occafional papers difperfed in journals, and in memoirs of the A cademy of Sciences.

HIRING, in law. See Borrowtng and Hiring.
HIREINI (anc. geog.), a people of Italy, next to the Samnites, to the fouth eaft, and defcendants from them; fituated to the north of the Picentini, and to the weft of the Apuli, having on the north the Apennin and a part of Samnium. The name is from Hzrpus, a term denoting a wolf in their languge; either becaufe under the conduct of this animal the colony was led and fettled, according to Strabo; or becaufe, like that prowling animal, they lived on plunder, according to Servius.

HIRSEBURG, a town of Silefia, in the territory of Jauer, famous for its mineral baths. It is feated on the river Bofar in E. Long. 17. 50. N. Lat. 50. 50.

HIRSCHEELD, a town of Germany, in the circle of the upper Rhine, and capatal of a principality of the fame name, depending on a famous abbey which was fecularized in favour of the houfe of Caffel. It is feated on the river Fulda, in E. Long. 9. 52. N. Lat. 51. 46.

HIRTELLA, in botany: A genus of the monogynia orderbelonging to the pentandria clafs of plants, and in the natural method ranking with thofe of which the order is doubtful. There are five petals : the filaments are very long, perfifting, and fpiral; the berry is monofpermous; the ftyle lateral.

HIRUDO, the LEECH; a genus of infects belonging to the order of vermes inteftina. The body moves either forward or backward. There are feveral fpecies, principally diftinguifhed by their colour. The moft remarkable are the following.
x. The

Hirudo. I. The medicinalis, or medicinal leech, the form of

Platc cexuxiv.

Barluz's
Genera
Vermium, y. 21.
which is well known, grows to the length of two or three inches. The body is of a blackifh brown colour, marked on the back with fix yellow fpots, and edged with a yellow line on each fide; but both the fpots and the lines grow faint, and almoft difappear, at fome feafons. The head is fmaller than the tail, which fixes itfelf very firmly to any thing the creature pleafes. It is viviparous, and produces bur one young one at a time, which is in the month of July. It is an inhabitant of clear ruming waters, and it is well known for its uie in bleeding. 2. The fanguifuga, or horfeleech, is larger than the former: Its fkin is finooth and gloffy ; the body is depreffed ; the back is dunky ; and the belly is of a yellowifh green, having a yellow lateral margin. It inhabits ftagnant waters. 3. The geometra, or geometrical leech, grows to an inch and and a half in length; and has a finooth and a glofly fkin of a duiky brown colour, but in fome feafons greenifh fpotted with white. When in motion, its back is elevated into a kind of ridge; and it then appears as if meafuring the fpace it paffed over like a compafs, whence jts name. Its tail is remarkably broad; and it holds as firmly by it as by the head. It is common on ftones in fhallow running water; and is often found on trout and other filh after the fpawning feafon, 4. The muricata, or muricated leech, has a taper body, rounded at the greater extremity, and furnifhed. with two fmall tentacula or horas ftrongly annulated and rugged upon the rings, the tail dilated. It inhabits the Atlantic Ocean, and is by the filmermen called the fea-leech. It. adheres to fifh, and generally leaves a black mark on the fpot.

The organs of generation in leeches are formed like thofe of the fea and land fnails. See Helix. -The leech's head is armed with a fharp inftrment that makes three wounds at onct. Chey are three fharp tubercles, frong enough to cut through the fkin of a man, or even of an ox or horfe. Their month is as it were the body of the pump, and their tongue or flelly nipple the facker; by the working of this piece of mechanifm, the blood is made to rife up to the conduit which conveys it to the animal's fomach, which is a membranaceous 1 kin divided into 24 fmall cells. The blood which is fucked out is there preferved for feveral months without coagulating, and proves a fore of provifion to the animal. The nutritious parts, pure and already digefted by animals, have no call to be difengaged from heterogencous fubftances; nor indeed is there an anus difcoverable in the leech, mere tranfpiration feems to be all that it performs, the matter fixing on the furface of its body, and afterwards coning off in fmall threads. Of this an experiment may be tried by putting a leech into oil, where it keeps alive for feveral days; upon being taken our and put into water, there appears to loofen from its body. a kind of flough thaped like the creature's body. The organ of refpiration, though unafcertained, feems to be fituated in the mouth; for if, like an infer, it drew its breath through vent holes, it would not fubfift in oil, as by it they wonld be ftopped up.

It is only the firft fpecies that is ufed in medicine; being applied to tender parts upon the veffels in order to draw off the infpiffated blood with which they are evercharged, or to phlebotomize young children. If
the leech does not faften, a drop of milk is put on' the Hirundos. fpot it is wifhed to fix on, or a little blood is drawn by means of a flight puncture, after which it immediately fettles. Prudence requires it fhould be held faft with a piece of rufh, left it fhould find its way into the anus when ufed for the hemorrhoids, or penetrate into the cefophagus if employed to draw the gums; otherwife it would make the greateft havock either in the fornach or intetines. In fuch a cafe, the beft remedy is to drink falt water, which is the method practifed to make it lofe its hold when itfucks longer than was intended. Oil of tartar, volatile alkali, pepper, and acids make it alfo leave the part on which it was applied. If, on the contrary, it is intended it fhould draw a larger quantity of blood, the end of its tail is cut off. It then facks continually to make up the lofs it fuftains. The difcharge occafioned by the puncture of a leech is eafily fopped with brandy or other ftyptics.

At Ceylon, travellers who walk bare legged are molefted by the great numbers of lecches concealed under the grads.-All leeches vary in their colours at fome feafons, but they are generally of a dufky greeninh brown or yellow, and often variegated. They are faid to be very reftlefs before a change of weather, if confined in glaffes.
HIRUNDO, in ornithology, a genus of birds of the order of pafferes. There are 37 fpecies, chiefly diftinguifhed by their colour. The moft remarkable are,

1. The rultica, common or chinnney-fwallow, is diftinguined from all the orber fpecies by the fuperior forkinefs of its tail, and by the red foot on the forehead and under the chin. The crown of the head, the whole upper part of the body, and the coverts of the wings are black, gloffed with a rich purplith blue, moft refplendent in the male: the breaft and belly white, and in the male tinged with red: the tail is black; the two middle feathers are plain, the others marked tranfverfely near their ends with a white fpot: the exterior feathers of the tail are much longer in the male than in the female. The food of this fwallow is the fame with the others of is kind, viz. infects. For the taking of thefe, in their fwifteft flight, nature has admirably contrived their feveral parts : their months are very wide to take in flies; \&c. In their quickeft motion; their wings are long, and adapted for diftant and continual fight, and their tails are forked, to enable them to turn the readier in purfuit of their prey. This fpecies is the firft comer of all the Britifh hirundines; and appears in general on or about the 13 th of April, though now and then a ftraggler is feen much earlier. This hirundo, though called the chimney-fwallow; by no means builds altogether in chimneys, but often within barns and ont-houfes againft the rafters; and fo the did in Virgil's time:

> Garrula quàm tignis nidlos fufpendat birunde..

In Sweden fhe builds in barns, and is called ladiu fivala, the barn fwallow. Befidesin the warmer parts of Europe, there are no chimneys to houfes except they are Eng: lifh built: in thefe countries fhe conftructs her neft in porches and gateways, and galleries, and open halls. Here and there a bird may affect fome odd peculiar-

## II IR

H:undo. place: bat in general this fpecies breeds in chimneys; and loves to haunt thofe flacks where there is a conitant fire, no doubt, for the fake of warmth. Not that it can fublift in the immodiate fhaft where there is a fire; but prefers onc adjoining to that of the kitchen, and difregards the perpefual fmoke of that funnel. Five or fix or more feet down the chinney does this litule bird begin to form her neft abont the middle of May, which confifts, like that of the houfe-martin, of a cruft or fhell compofed of dirt or mud, mixed with flort pieces of ftraw to render it tough and permanent; with this difference, that whereas the fhell of the martin is nearly hemifpheric, that of the fwallow is open at the top, and like half a deep dith: this neft is lined with fine graffes, and feathers which are often collected as they float in the air. Wonderful is the addrefs (Mr White obferves) which this adroit bird fhows all day long in afcending and defcending with fecurity through fo narrow a pais. When hovering over the mouth of the funnel, the vibrations of her wings acting on the confined air occalion a rumbling like thunder. It is not improbable that the dam fubmits to this inconvenient fituation fo low in the flaft, in order to fecure her brood from rapacious birds, and particularly from owls which frequently fall down chimneys, perhaps in attempting to get at thefe neftings.

This bird lays from four to fix white eggs, dotred with red fpecks; and brings out her firft brood about the laft week in June, or the firft week in July. The progreflive method by which the young are introduced into life is very amufing: Firft, they emerge from the flaft with difficulty enough, and often fall down into the rooms below: for a day or fo they are fed on the chimney-top, and then are conducted to the dead leaflefs bough of fome tree, where, fitting in a row, they are attended with great affiduity, and may then be called perchers. In a day or two more they become flyers, but are ftill unable to take their own food: therefore they play about near the place where the dams are hawking for flies; and, when a mouthful is collected, at a certain fignal given, the dam and the neftling advance, rifing towards each other, and meeting at anangle; the young one all the while uttering fuch a little quick note of gratitude and complacency, that a perfon muft have paid very litule regard to the :wonders of Nature that has not often remarked this feat. The dam betakes herfelf immediately to the bufinefs of a fecond brood as foon as fhe is difengaged from her firft; which the at once affociates with the firft-broods of houfe-martins; and with them congregates, dluftering on funny roofs, towers and trees. This hirundo brings out her fecond brood towarels the middle and end of Auguft. All the fummer long is :the fwallow a moft inftructive pattern of unweariedinduftry and affection; for from morning to night, while there is a family to be fupported, the fpends the whole day in fkimming clofe to the ground, and exerting the moft fudden turns and quick evolations. Avenues, and long walks under hedges, and pafture-fields, and mown meadows where cattle graze, are her delight,
efpecially if tinere are trees interfperfed; becaufe in Hirmio. fuch fots infects mont abound." When a fly is taken a fmart fnap from her bill is heard, refembling the noife at the thutting of a watch-cafe; but the motion of the mandibles are too quick for the eye.

The fwallow, probably the male bird, is the excubitor to houfe-martins and other little birds, announcing the approach of birds of frey. For as foon as an hawk appears, with a fhrill alarming note he calls all the fwallows and martins about him; who parfue in a body, and buffet and litike their enemy till they have driven him from the village, darring down from above on his back, and riling in a perpendicular line in perfect fecurity. This bird alfo will found the alarm, and ftrike at cats when they climb on the roofs if houfes or otherwife approach the nefts. Each fpecies of hirundo drinks as it flies along, lipping, the furface of the water ; but the fwallow alone, in general, wafhes on the wing, by dropping into a pool tor many times together: in very hot weather houfe-martins and bank-martins dip and wafl a little.- The fwallow is a delicare fongfter, and in foft funny weather fings bath perching and flying; on trees in a kind of concert, and on chimney-tops: it is allo a bold flyer, ranging to diftant towns and commons even in windy weather, which the other fiecies feem much to dillike; nay, even frequenting expofed fea-port towns, and making little excurfions over the falt water. Horfemen on wide downs are often clofely attended by a little party of fwallows for miles together, which plays before and behind them, fweeping around and collecting all the fculking infects that are roufed by the trampling of the horfes feet: when the wind blows hard, without this expedient, they are often forced to fettle to pick up their lurking prey.

This fpecies feeds much on little coleoptera, as well as on gnats and flies; and ofren fettles on dug ground, or paths, for gravel to grind and digeft its food. Mr White informs us, that before they depart, for fome weeks, to a bird, they forfake houfes and chimneys, and rooft in trees; and ufually withdraw about the beginning of October; though fome fcw ftragglers may be feen at times till the firft week in November. Mr Pennant fays, that for a few days previous to their departure, they affemble in vaft flocks on houfe tops, churches, and trees, from whence they take their flight (a). They are fuppofed to take up their win-ter-quarters in Senegal and parts adjacent; and feem to poffefs in turn the whole of the old continent, being known from Norway to the Cape of Good Hope on the one hand, and from Kamtfchatka to India and Japan on the other. . They are alfo found in all parts of N. America, migrating north and fouth, as in Ettrope. Kalm fays, that in America they build in houfes and under the outfides of the roofs; alfo on the mountains, in fuch parts of them as project beyond the botsom, as well as under the corners of perpendicular rocks.
2. The tahitica, or Otaheite fwallow, is five inches in length ; its body is of a brown-black colour with a
flining
(a) See Migration.-Concerning the annual difappearance of thefe birds, however, naturalifts have entertained different opinions; a detail of which, as the fabject is curious, and would form too long a digreffion in this place, is referved for a feparate article. See Swallow.

## HIR [553] H I.R

Hanudo. fiining bluila glofs, the breaf of a fulvous purple, the abdomen of a footy brown; the bill, tail, and legs are black. It inhabits the monntainums parts of Otaheite. Sce Fig. I.
3. The efculenta, or edible fwallow, according to Buffon, is lefs than the wren, and only two inches and a quarter in length. The bill is black; the upper parts of the body are brown, the under whitifh ; the tail is forked, ad each feather of it tipped with white : the legs are brown. See Fig. 2.

Mr Lathan thinks, that the fize as above deforibed is by mach too fmall, as Mr Marfden fays that the biid "، appears to be the common martin ;"-" and (fays Mr Latham) we are much inclined to think that it is at leaft of that fize, from the eggs whichaccompany the nef now in the Ditid mufeum, which are as big as thofe of the martin, and of the fame colour. However, we cannot difpute the point." Tho meqt curious part of the natural hiftory of this hird confifts in the neft, which is compoied of fuch materials as render it not only edible, but one of the greateft daintics of the Afiatic epicures.

Thefenefs (of which a particular acsount is given under the article BIRDS-n:fis) are found in valt numbers in certain caverns, in various illes in the Soolo Archipelago, fituated between longitude in 7 and 120 , latitude 5 and 7 ; paricularly in rirce fmall ifles or rather rocks; in the caverns of which the nefts are found fixed to the ficies in aftonifing numbers. They are alfo found in amazing quantities on a fmall inland called.Toc, in the ftraits of Sunda; the caverns of which are lined with the nefts: but nor here in greater abundance than about Croce, near the fouth end of Sumatra, four miles up a river of that name. But they are not peculiar to the above places: for they are likewife common from Java to Cochinchina: on the north, and from the point of Sunatra weft, to Ncw Guinea on the eaft: where the fea is faid to be covered with a vifrous fubftance like half-melted glue, which the bird is fippofed either to take up from the furface with itsbill during, Hight, or to pick it from the rocks whenleft there by the waves.-Othcfenefts, it is faid the Dutch alone export from Batavia rooopickles ( b ) every year, whirhate brought from the ifles of Cochinchina, and thofe lying to the caft of them. It is much to be wondered, that, among other laxuries imported by us from the eaft, the ufe af thefe nefts flould not have found a way to our tables ; as being yet fo farce in England as to be kept as rarities in the cabinets of collectors. The bird itfelf at Sumatra is known by the name of Layonglaynng.
4. The bortonica, or wheat-fwallow, is abont the fize of the fuift : the plumage above is llackifl brown; beneath grey, marked with longitudinal brown foots: the tail is even at the end : the bill and lege are black. This fpecies inhabits the Ihe of France; frequentug places fown wholwheat and glades of soods ; affecting elevated fituations, ared frequitinly foen perched ontree; and fones. It follows herds of cattle for the fake of the fies which frornand them; and is frequently feen in the wake of inipsin great numbers, in Vor. $\backslash 111$.
the road near the ille, no doubt for the fonc pore. Hirunde.
It is offen obferved of evenings about the clets in the monntains, where it is fid to fafs ine night; and where it makes itsueft, which is compofed of flaw and feathers. It laystwo eggs, of a grey colour, duited with brown.
5. The francica, or grey-rumped fialiow, is in length four inches and a quarter ; having the upper parts of the body blackifl, the rump and under parss whitith or grey. This fpecies alfo inhabits the lile of France, but not in great numbers ; and is found chinfy in the nci,hbourhood of frefh waters. It flies fwift ; and is fridom obferved to perch. It is fuppofed to reft in the woods at night, being feen about the fkitts of them towards evening. It is generally very lean, and not good food.
6. The urbica, or martin, is inferior in fize to the chimney-fwallow, and its tail much lefs forked. The head and upper part of the body, except the rump, is black gloffed with blue : the breaft, belly, and rump, are white: the feet are covered with a flort white down. This is the fecond of the fwallow kind that appears in England : and of its manners andeconomy we have the following curious account in the Rev. Mr White's Natural Hiftory of Selborne. "They begin to appear about the r6th of April ; and for ionse time they in general pay no attention to the butinefs of nidification; they play and Sport about, either to recruit from the fatigue of their journcy, if they do migrate at all ; or clle that their blood may, recover its troe tone and texture after it lias been folong benumbed by the feverities of winter. About the middle of May, if the weatherbe fine, the martin begius to think in carneft of providing a manfion for its family. The cruft or flelio of this neft feems to be formed of fuch dirt or loam as comes moft readily to hand, and is tempered and wrought together with little bits of broken ftraws to render it tough and renacions. As this bird often builds againft a perpendicular wall withoot any project ing ledge under, it requires its utmof eftorts to get the freft foundation fimiy fixed, fo that it may fofely carry the fuperftracture. On thisoccation the bird not only clings with its claws, but partly fipports itielf by frongly inclining its tail againft the wall, making that a fulcrum ; and thus feadied, it works and plafters the materials into the face of the brick or fone. But then, that this work may not, while it is foft and green, pull itfelf down by its own weight, the provident architeet has prusence and forbearance cnough not to advance her work roo faft; but by building only in the morning, and by dedicating the reft of the day to food and anufement, gives it fufficient time to diy and harden. About hail an inch feens to be a fufficicut layer for a day. Thus careful workmen, when they build mad. walls (informed at firft perhops by this little bird)raife buta moderate layer at a tine, and then defift; left the work fhould become top-leavy, and fo be rnined by its own weight. By this method in about 10 or 12 days is formed an hemifpheric neft, with a finall aperture towar's the top, ftrong, compact, and warm; and perfeely fitted for all the parpofes for which it was intend32
(b) Thejichle, or pekul, is abone 25 poninds; or, as Dampier fays, 300 pickles are equal to 396 puands Englifh weight.-Sce Voy. vol. ii. p. 132.

## HIR [ 554$]$ I R

Hirundo. cu. But then nothing is more common than for the houfe fyarrow, as foon as the thell is finilhe , to feize on it as its own, ro cject the owner, and to line it after its own manner. Aiter fo much labour is befowed in erecting a manfion, as nature feldom works in vaia, martins will breed on fur feveral years together in the Kame neft, whercit happens to be well fhelteredand fecure from the injuries of the weather. The flell or cruft of the neff is a fort of ruftic-work, full of knobs and frotaberances on the outfide: ncr is the infide of thofe that I have examised froothed with any exaitnefs at all ; but is rendered foft and warm, and fit for incubation, by a lining of frall ftraws, graffes, and feathers; and fometimes by a bed of mofs interwoven wihh wool. In this nelt they tread or engender, frequently during the time of building; and the hen lays from three to five white eggs. At firft, when the young are hatched, and are in a naked and helplefs condition, the parent birds, with tenderaffiduity, carry out whatcomes away from their yonng. Was it not for this affectionate cleanlinefs, the neflings woild foon be burnt up and deftroyed in fo deep and hollow a neft by their own cauflic excrement. In the quadruped creation the fame neat precaution is made ufe of, parricularly among dogs and cats, n here the dams lick away what proceeds from their young. But in birds there feems to be a particular provifion, that the dung of neftings is enveloped in a tongh kind of jelly, and therefore is the eafier conveyed off without foiling or daubing. Yet, as nature is cleanly in all her ways, the young perform this office for themfelves in a little time, by thrufting their tails Dut at the aperture of their neft. As the young of fmall birds prefently arrive at their nixus, or ""full growth," they foon become impationt of confinement, and fitall day with their heads out at the orifice, where the dams, by clinging to the nen, fupply then with food from norsing to-night., For a time the young are fed on. the wing by their parents; but the fear is done by fo quick and almoft imperceptible a fight, that a perfon muft have attended very exactly to their motions, before lie would te able to perceive it. As foon as the young are akle to fiift for themfelves, the dams imne enintely turn their thoughts to the bufinefs of a feand brood: while the firft flight, flaken off and rejected by heir murfes, congregate in great flocks, and are the birus thar are feen cIultering and hovering on finny mornings and evenings round towers and fleeples and on the ronfs of churches and houfes. 'Thefe congregatings iffally bexin to take place about the firft week in Auguift; and therefore we may conclude that by that time de firit flight is pretry well over. The young of this tpecies do no quit their abodes all together, but the nore forward birds get abroad fone days before the reft. Thefeapproaching the eaves of buildings, and playing abont beforethem, make pe ple think that feveral old ones attcud one neft. They are often capriciuns in fxing on a netting-pla, beginning many edifices, and leaviag them unfinithed; but when once a uett is completed in a heltered plice, ii ferves for feveral feakns. Thofe which breed in a ready fininied houfe, get the flart in hatching of thofe that build new by to days or a fortnight. Thefe induntious artificers are ar their labours in the long days before four in the znorning: when they fix their materials, they plafter sbem on with their chins, moving their heads with a yi-
bratory motion. -They dip and wafl as they fly fome- Hirunde. times in very hot weather, but not fo frequently as fwallows. Martins love to frequent towns, efpecially if there are great lakes and rivers at hand. They are by far the leaft agile of the Britifh hirundines: their wings and tails are fhort, and therefore they are not capable of fuch furprifing turns, and quickand glancing evolntions as the fwallow. Accordingly, they make ufe of a placid eafy motion, in a middle region of the air, feldom mounting to any great height, and never fweeping long together over the furface of the ground or water. They do not wander far for fooll ; but affeet fleltered diftricts, over fome lake, or under fome hanging wood, or in fome hollow vale, efpecially in windy weather. They breed the lateft of all the fwallow kind: in 1772 they had neflings on to October the 2 : tt, and are never withour untedged young as late as Michaelnas.-As the fummer declines, the congregating flocks increafe in numbers daily, by the con-ftant acceffion of the fecond broods; till at laft theys fwarm in myriads upon myriads round the villages on the Thames, darkening the face of the fky as they frequent the aits of that river, where they rooft. They retire, the bulk of theur I mean, in vaft Hocks together about the beginning of Ociober; but have appeared of late years in a conliderable flight in this neighbour. hood, for one day or two as late as November the 3 d and 6th, after they were fuppofed to have been gone for more than a fortnight. They therefore withdrawt: with us the lateft of any fpecies. Unlefs thefe birds are very flort-lived indeed; or unlefs they do not returra to the diflrict wherethey are bred, they muft undergo. vaft devaftations fome how, and fome where; for the birds that return yearly bear no manner of proportion to the birds that recire."
7. The rufa, or rufous-bellied fwallow, is of the fame fize with the former; and has the upper parts of the body of a gloffy black; the under rufous, growing. paler towards'the vent : the forchead is whitillt; and the bill and legs are dufky. Thefe are found at Cay. cme, and not unfrequently as far nurth as NewYork. They build in houfes, without any mixture of mud; fabricating the neft with mofs, dried plants, and horts bits of ticks, all united with a fort of gam, fo as fearce to be broken, and line! with feathers; fufpending it from the beams and raiters, fides of walls, and eaves of houles. It is fometimes a foot and a half in length; and is fixed by one of its fides, the opening being made near the bottom. The female lays four or five eggs; and the young go out as foon as their wings will fapport them.
8. The riparia, fand-martin, or fhore-bird, is 4 th inches indength, with the whole upper parts of the body of a monle-colour, the throat and under parts white, the bill and leas blackith. It is common about the banks of tivers and fand-pits, where it terebrates a ronnd and regular hole in the fand or earth, which is ferpentine and horizontal, and about two feet deep. Ar the imer end of this barrow does the bird depolit, in a good degree of fafery, her ruse neft, confintins of fine graftes aud feathers, ufually goofe-feathers, very inartificially laid together. "Though at firft (fays inf White) one would be difinclined to believe that this weak bird, with her foft and tender bill and cla:s, hould ever be able to bore the ftuh-
bera.

## H I R

Fir undo. born fand $b: n$ ? without cmirely difabling herfelf; yet with thefe fecble inftruments haveifeen a pair of them make great difyatch; and could remark how much they had fcooped that day by the freth fand which ran down the bank, and was of a different colour from that which lay loofe and bleached in the fun. In what fpace of time thefe little artifts are able to mine and finifh thefe cavities I have never been able to difcover: but it would be a matter worthy of obfervation, where it falls in the way of any naturalift to make his remarks. This I have often take notice of, that feveral holes of different depths are left unfinifhed at the end of fummer. 'So imagine that thele hegimnings were intentionally made in order to be in the greater forwardnefs tor next fpring, is allowing perhaps too much forefight and rerum prudentia to a limple bird. May not the caufe of thefe latebre being left muninilhed arife from their meeting in thofe places with Arata too harfh, hard, and folid, for their purpofe, which they relinquifh, and go to a freeth fpot that works morefrce. ly? Or may they not in other places fall in with a foil as much too looic and monldering, lisble to flounder, and threatening to overwhelin them and their labours? One thing is remarkable-that, after fome years, the old holes are forfaken and new ones bored; perhaps becaufe the old habitations grow foul and fetid from long ufe, or becaufe they may fo abound with fleas as to become untenantable. This fpecies of fwallow morcover is ftrangely annoyed with fleas; and we have feen fleas, bed-fleas (pulex irritans), fwarming at the mouths of thefe holes, like bees on the fools of their hives.

The fand-martin arrives much about the fame time with the fwallow; and lays, as the does, from four to fix white eggs. But as his fpecies is cryptogame, carrying on the bufinefs of nidification, incubation, and the fupport of its young in the dark, it would not be eafy to afcertain the time of breeding, were it not for the coming forth of the broods, which appear much about the time, or rather fome what carlier than thefe of the fwallow. The neftlings are fupported in common, like thofe of their congeners, with gnats and other fmall infects; and fometimes they are fed with libellule (dragon flies) almoft as long as themfelves. This hirundo is faid to lay only once in a year, and to produce its young more early than the reft of its tribe : though from this laft circumftance it would feem probable that they breed at leaft a fecond time like the houfe-martin and fwallow. It does not always take pains to make an lole for a neft, frequently laying in cavities of quarries, and in hollows of trees, where it is convenient. When they happen to breed near hedges and enclofures, they are often difpoffefled of their breeding holes by the houfe-fparrow, which is on the fame account a fell adverfary to houfe martins. Thefe birundines are nu fongters, but rather mute, making only alittle harfh noife when a perfon approaches their nelts. They feem not to be of a fociable turn, never with us congregating with their congeners in the autumn. They have a peculiar manncr of flying; fitting about with odd jerks and vacillations, not unlike the motions of a butterfly. Doubtlefs the fight of all hiratedines is influcnced by and adapted to the peculiar fort of infects which furnifh their food. Hence (fays Mr white) it wonld be worth enquiry to examine what paricular
genus of infects affords the paincipal food of each re- Hiruado. fipective feecies of fwatuiv.
9. The montana, or crar- (wallor, is abont the fice of the martin, and in is upper plamage like the fand-martin: the under part of the body i: rafoas; the tall is farcely forked; the legs ane covered wit: grey down mixed with brown; the bill and the claws are black. Thefe birds iuhabit the rocks and cras about Savoy; arriving there the nidace of $A$ apil, an 1 departing the 15 th of Augut, for the moft patt; now and then fome ftragglers remain to the icth of Octo: ber. This fpecies is alfo found in the moantains of Auvergne and Dauphine; and fpecimens have beca received from Gibraliar.
ro. The purpurea, or purple frallow, is in lengit feven inches, and the whole body is of a deep vi\%let, very glofly : the quills and tail are of the fame colotr, but fill deeper, and the laft forked: the legs and cluws are blackifh, and the bill is black. The colour of the female is duky brown, with a fight tinge of violet. This fpecies is found in fummer in Carolina and Virginia; coming in May, and retiring al the approach of winter. The common people are very fond of them; and make litule conveniences of boards on the outlide of their houfes for the birds to build in, like as is done for fparrows in England; being defirous to keep them near, as they are of much ufe in alamin: the poultry of the approach of the hawk and cthet birds of prey; not only fhrieking violently on the appearance of thefe enturies, but attacking them with all the efforts of the martins in Europe. Sec fig. 4.

1r. The apus, orfwift, is a large fpecies, iveing near eight inches long, with an extent of wing near eighteen inches, though the weight of the bird is only one ounce. Their feet are fo fmall, that the action of walking and rifing from the ground is extremely difficult; fo that nature has made it full amends, by furnifing it with ample means for an eafy and continual flight. It is mory on the wing than any other fwallow; its flight is more rapid, and that attended with a flarill fcream. It rens by clinging againft fome wall, or other apt body; from whence Klein ftyles this fpecies birundo muraria. It breeds under the eaves of houfes, in fteeples, and other lofty buildings; and makes its neft of graffes and feathers. The feet of this fpecies are of a particular ftructure, all the toes fanding forward : the leaft confifts of only one bone; the uthers of an equal number, viz. two each ; in which they differ from thofe of all other birds : a conftruction, however, nicely adapted to the purpofes in which their feet are employed.
The fwift is a fummer inhabitant of Britain. It comes the lateft, and departs the fooneft, of any of the tribe; not always ftaying to the middle of Augut, and often not arriving before the beginning of shay. A pair of thefe birds were found adhering ly their claws, and in a torpid ftate, in Fet. 1766 , unter the roof of Longnor-chapel, Shrophire; on being brought to a fire, they revived, and moved about the rom.

The fabulous hiftory of the manucodiata, or biva of paradife (fays Mr Pennant), is, in the hiftory of this ipecies, in a great meafure verified. It was believed to have no feet; to live upon the celeftial dew; to foat perpétually on the atmofphere; and to perform all its functions in that element. The fwitactavily

Horundo. perfor ns what has been in thefe enhightened times difproved of the former, except the fimall time it takes in heeping, and what it devotes to incubation; every other action is done on the wing. The materials of its nelt is collects either as they are carried about by the winds, or ficks them up from the furface in its fweeping light. Its food is undeniably the infects that fill the air. Its drink is taken in tranfient fips from the water's furface. Even its amorous rites are performed on high. Few perfons who have attended to them in a fine fummer's morning, but mut have feen them make their aerial courfes at a great height, encircling a certain face with an eafy feady motion. On a fudden they fali into tach others embraces, then drop precipitate with a loud fhriek for numbers of yards. This is the critical conjuncture; and to be no more wondered at, than that infects (a fimilar inftance) foould difcharge the fame duty in the fane element.

The fwifi is a moft alert bird, rifing very early, and retiring to rooft very late; and is on the wing in the height of fummer at leatt fixteen hours. In the longeft days it does not withdraw to reft till a quarter before rine in the evening, being the lateft of all day birds. Juft before they retire, whole groupes of them affemble high in the air, and fqueak, and thoot about with wonderful rapidity. But this bird is never fo much alive as in fuliry thundery weather, when it expreffes great alacrity, and calls forth allits powers, In hot moruings, foveral getting together in little parties, defl round the feeples and charches, fqueaking as they go in a very clamorous manner : thefe, by nice ebfervers, are fappofed to be males ferenading their fluing hens; and nor withour reafon, fince they felbons ligueak till they come clofe to the walls or eaves, and fince thofe within utter at the fame time a little inward note of complaceucy. When the hen has fat hard all day, fle rufhes forth juft as it is almolt dark, and ftretches and relieves her weary limbs, and fratches a fcanty meal for a few minntes, and then returns to her duty of incubation. Swifts, when wantonly and cruelly hot while chcy have young, difcover a little lump of infects in their mouths, whioh they pouch and hold under their tongue. In general, as already obferved, they feed in a much higher diftrict than the other fpecies; they alforange to vaft diftances; fince locomotion is nolabour to them, who are endowed with fuch wonderful powers of wing. At fome certain times in the fummer, however, they have been obferved hawking very low for hours together over pools and ftreams; and upon inquiring into the object of their-purfuit that induced them to defcend fo much below their nfual range, it has been found that they were taking phryg anee, epbenera, and libellulee (cadew-flies, mayflies, and dragon-flies), that were juft emerged out of their aurelia ftate. It appeared then no longer a wonder that they fhould be fo willing to foop for a prey that afforded them fuch plentiful and fucculent nourifhment. - -Swifts fometimes purfue and frike at hawks that come in their way; but not with that vehemence and fury that fivallows exprefs on the fame occafion. They are out all day long in wet days, feeding about and filfegrding fill rain : from whence rwo things may be gathered; firft, that many infects abide high in the air, even in rain : and next, that the feathers of thefe birds muft be well preened to refit fo much wet.

Windy weaher, and paricularly with leeavy nowers, they didile, and on luch days withdraw, and are fcarce ever feen. - There is a circumitance refpecing the colour of ififts (Mr white remaks), which fecms not to be unworthy our attention. When they arrive in the fpring, they are all over of a glofy dark footcolour, except their chins, which are white; but, by being all diny long in the fun and air, they become quite weather-beaten and bleachedbefore they depart, and yet they return gluly again in the frisg. Now, if they purfue the fun into lower latiades, as fome Suppole, in order to enjoy a perpetail fummer, why do they not return bleached? Do they not rether perhaps retire to reft for a featon, and at that juncture monlt and change their feathers, fince all other birds are known to moult foon after the feafon of breecing?
"Swifts (continues our anthor) are very anmalous in many particulars, diffenting from all hacir congeners not only in the number of their young, but in breeding once in a fummer; whereasallucu:her Britifl hirundines breed invariably twice. Is is paft all doubt that fwifts can breed bui once, fince they withdraw in a fhort time after the fight of their young, and fome time before their congeners bring out their fecond broods. We may here remark, thes, as fivifts breed but once in a fummer, and only two at a time, and the other hirundines twice, the latter, wholay from four to fix eggsincreafe at an average five times as faft as the former; But in nothing are fwifts more fingular than in their carly retreat. They retire, as to the main body of them, by the tenth of Augulf, and fometines afew days fooner: and every ftreger invariably withdraws by the 20th, while their congeners, all of them, fay till the beginning of October; many through all that month, and fome occafionally to the begimning of November. This early retreat is mytterious and wonderful, ince that time is often the fweeteft feafon in the year. But what is more extraordinary, they begin to retire fill earlier in the moft foutherly parts of Andalufia, where they can be noways influenced by any defect of heat ; or, as one might fippofe defect of food. Are they regulated in their motions with us by a failure of food, or by a propen. fity to moulting, or by a difpofition to reft after fo rapid a life, or by what? This is one of thefe incidents in natural hiftory that not only baflles our refearches, but almoft cludes our gueffes!"

Swifts never perch on trees or roofs, and to never congregate with their congeners. They are tearlefs while haunting their nefting places, and are not to be fcared with a gan; and are often beaten down with poles and cudgels as they ftoop to go under the eaves. Mr White informs us, that having untiled part of a roof over the neft of a fwift, the dam notwithtanding fat in the neft: fo ftrongly was he affected by natural $\sigma$ topra for her brood, which fie fuppofed to ', e in danger, that, regardlefs of ber own faftety, the would not flir, but lay fullenly by them, peminting herfelf to be taken in hand. Swifis are much infefted with thofe pefts to the genus called bippobofice biruntitinis; and often wriggle and foratch themfelves, in their flight, to get rid of that clinging amoyance. And young ones, over ran with thefeinfeets, are fometimes found under their nefts, fallen to the ground; the number of vermintendering their abode infupportable.

Swifts

## HIR [ 557 HIR

Hirundo. Swifts are no fongters, and have only onc harih fereaming note ; yet thereare ears to which it is not difplealing, from an agreeable atrociation of ides, innce that note never occurs but ia the moft lovely fummer weather. They never fettle on the ground but through acciden; neither can they walk, but ouly crawl; but they lave a ftrong grafp with their feet, by which they cling to walls, as aldady noticed. Their bodies being fart, they can enter a very narrow crevice; and where they cannot pafs on their bellies, they will turn up edgewife.-In London a party of firits frequents the tower, playing and feeding over the river juft below the bridge: others haunt lome of the churches of the boroagh next the fields; but do not venture, like the houfe-martin, into the clufe crowded part of the town. The Swedes lave beftowed a very perinent name on this firallow, calling it ring. fwala, from the perpetual rings or circles that it takes round the feene of its nidification.-As thefe birds are apt to catch at every thing on the wing, many have taken them by a bait of a coclichater tied to a thread, which they have fwallowed as freely as a fifh theirs. In the ille of Zant, the boys are faid to get on an elevated place, and merely with a hook baired with a feather, have canght five or fix dozen of them in a day. Belides Britain, the fwift is known to inhabit the whole of the European continent; and has alfo been noticedat the Cape of Good Hope, and Carolina in North America. Hence, mof likely, a general inhabitant of both the old and new continent.
12. The ambrofiaca, or ambergris fwallow, is about the lize of a wren, with gray plamage and a very forked tail; the bill is blackifl, and the legs are brown. It inhabits Senégal, and is faid to finell very ftrong of ambergris.
13. The pelafgia, or aculeated fwallow, is fomewhat lefs than our chimney-fwallow: its plamage is brown, but at the throat whitifh, and all the tail-feathers are terminated by a bare pointed fhaft. It inhabits Carolina and Virginia in the funmer time, and builds in chimneys. See fig. 3 .
14. The melba, or white bellied fwift, is in length 8: inches, and weighs two ounces five drams : the bill is half an inch, fomewhat bent, and black: the upper parts of the body are of a grey brown: the wings and tail deepeft, with a glofs of red and green in fome lights: the throat, brealt, and belly, are white; on the neck is a collar of grey brown, mixed with blackifh: the fides are dufky, and white mixed; lower part of the belly, and under tail-coverts, the fame as the back: the legs are flefh-coloured, and covered with fcathers on the fore part nnd infie: all the toes are placed forward, as in the fwift. This bird inbabits the mountainous parts of Spain; building in the holes of rocks. It is found alfo on the borders of the Rhone, in Savoy, the ifle of Malia, Alps of Switzerlatid, and rock of Gibbraltar. It comes into Savoy the beginning of April, and frequents the ponds and marfhes for 15 or 20 days; after which it retires to the mountainous parts to breed. It flies higher than the fwitt ; but feeds on the fame food, and its flefh is accounted a delicate morfel. This fpecies is not numerous. Scopoli fays it builds on the fummit of the mountains of Tyrol.
15. The cayennenfis, or white-coloured fyallow, is
about the fize of the martin: the head and bill are biack; the chin and throat white, pailing from the laft in a narrow collar round the neck: bewean the lill and eye is a freak of white, which forks offinto two; one paffing a littlcabove and the or her a little way beneath the eye: the reft of the plonnage is black, witha glofs of violet; but the greater coverts, nearelt the body, are brown, edged with white: the quills and tails are black; the Jaft forked: the legs are black; and all the four toes placed before as in the fwift; and covered with feathers to the claws.- This birdmakes its neft in the houfes at Cayenne. It is of a large fize, in fhape of a truncated cone; five inches one way by three the other, and nine inches in length. It is compofed of the down of dogs-bane, well wove together; the cavity divided obliquely about the middle, lengthways, by a partition, which fureade itfelf over that part of the nef where the eggs lie, which is pretty near tue bafe : a fmall parcel of the fame foft down, forming a kind of plag, is placed over the top, ferving to keep the young brood from the imprefion of the air ; from which ue may fuppofe them to be very tender.
í. The erychrocephala, or red-headed fwallow, has a red head, with a hoore flat dasy bill : the back is dafky, the feathers edged with white : the under parts of the body are white, the tail coverts pale brown: the wings are both duky; as is alio the tail, which is a little forked. It inhabits India; and is only the fize of a fmall humming bird.
17. The nigra, or black fwallow, meafures near fix inches in lengith: the colour of the bied is wholly black, and the tail is forked. It inhabirs st. Domingo and Cayenne; but is not numerous. It is often feen to perch on dead trees; and only inhabits dry favannas inland. It fcoops out a hole in the earth, half a foot in length, the mouth of it very fmall, fo as juft to permit entrance : in this cavity it conftracts the neft and rears the young.
18. The dominicenfis, or St Domingo fwallow, is 7 inches in length, and wholly black, with the glofs of polifhed fteel, excepr the belly and under tail coverts, which are white : the tail is very little forked : the legs, bill, and claws are brown. It inhabits St Domingo, and other of the Weft India illands, in May, June, and Joly; aud is faid to imitate a lark in its fong.

To this article we may not improperly fubjein the following paper (from the Gentleman's Magazine) on the utility of encouraging the breed of fwallows, 1 wifts, and martins. "The advantages that accruc to man, from the docility with which the domefticated animals accommodate themfelves to his ufes, are obvions. But there are others, who attend on him of their own accord, whofe beneficial exertions are little known er obferved. Among thefe 1 thall at prefeat only notice the family of fwallows (hirundizes); of the four kinds of which bird found in our inland three attach themfelves to his dwelling, as if peculiarly folicitous for his welfare. This connection feems fo reciprocal, that where men do not inhabit, few fwallows can find proper conveniences for their fummer-refidences; and as their food confifts wholly of infects, the moft diligent inquirer hath not been able to difcover that they injure in the flightef degree the productions of the field orgarden; a circumftance nearly
lingular

Hirunic. fingular to thefe birds. The charge which Virgil, copying the Grecian writas, binge ag int them, of killing bees, is in this country grounditis, and I apprehend it to befo in every other:

> Abfint-Meropefque alireque volucres, It manihus Procne peckus figata cruentis; Omnia nam late vaftant, ipfafque volantes Ore ferunt, lulcem nidis inmmitibus efcam.'

Geerg. l. 4.v.23. For the mouths of the fwallow tribe are by no neans adapted to catch ninging infects with impunity. The birds who prey on bees have a long extended bill conArutied for that puryofe, very difterent from that of the fwallow.
"By the myriads of infects which every fingle brood of fwallows deftroy in the courfe of a fummer, they defend us in a great meafure from the perfonal and domeftic annoyance of flies and gnats; and what is of infinitely more confeguence, they keep down the numbers of our minute enemies, who, cither in the grab or winged fate, would otherwife render the labours of the hufbindman fruitlefs. Since then twallows are guardians of our corn, they fhould every where be protected by the fame popular veneration which in Egypt defends the lbis and the ftork in Holland. We more frequently hear of unproductive harvefts on the continent than in this country; and it is well known that fwallows are caughtand fold as food in the markets of Spain, Frace, and laly. When this practice has been very general and fuccersful, I have little doubr tinat it hath at times contributed to the fcarcity of corn. In England we are not driven to fuch refources to furnifh our tables. But what apology can be made for thofe, and many there are, whofe education and rauk fhould have taught them more innocent amufements, who wantonly murder fwallows, under theidle pretence of improving their fkill in fhooting game? Setring afide the cruelty of ftarving whole nefts of young by killing the dam ; they who follow this barbarous divertion would do well to reflect, that by every fwallow they kill, they affift blafts, mildews, and vermin, in caufing a fcarcity of bread. Every lord of a manor ihould reftrain his $g$ me $\cdot$ keeper from this execrable prattice; nor fhould he permit any perforn to fport on his lands who does not refrain from it. For my part, I am not aflamed to own that I have tempted martins to build around my houfe, by fixing efcallop flells, in places convenient for their perdant beds and procreant cradles; and have been pleafed to obferve with what caution the little apchitect raifed a buttrefs under each fhell before he ventured to form his neft on it.
"W What has induced me to fend yon thefe ftrictures at this time, are the accounts of the ravages committed on the cultivation of corn in the United States of North America, by an infect called the Heffan-Fly. (See the article $H_{\text {bSSIAN }}$ Fly.) How far there is danger of this defolating fcourge being imported into this country by the admifition of American wheat, I muft leave to abler entomologifts to decide. But that this deftrugive infect hould, as hath lately been afferted, cotally difappear in one feafon, after lasing for a number of years fucceffively laid waftewide extendeddif. trifts, is a phenomenon hardly to be affented to by
thofe who have tatned their minds to inquiries of this fort.
"Might I not here enlarge on the importance of refearches into the works of the ereation, when we fee ftatefmen, as in the prefent inftance, making folemn applications to thofe who are fudions of nature, reque ing their direction how to avoid the cakmity apprehended from a fly? And may we not then add, that the minuteft obfervations of this kind are only decmed rivial by the indolent and uninformed.
" I recollect but a fingle complaint againft the fwallow, and that this is made by Anacreon, Od. 12. who bitterly reproaches this hird for difturbing him by its twittering while he was dozing. away the intoxication of the preceding night. Yet, had the poet been temperate, like Milton, he would with pleafure have arifen from his bed at the charm of earlieft birds.
"With what joy the Grecians welcomed the return of the fwallow, appears by the very ancient carol preferved by Athenxus; of which the following is a tranflation :-
"The fwallow! the fwallow! fhe eoes with her bring Soft feafons and all the delights of the furing :
The fwallow! the fwallow ! we're fure we are right,
For her vack is all black, and her belly all white.
From your fores, ye good houfewives, produce, if you pleafe,
Lumps offigs, jugs of wine, and foms wheat and fome cheefe.
With fome hen eggs the fwallow will well be content.
Muft we go then, or fhall we have any thing fent ?
" We will not allow you to do as you choofe,
To give or give not, to comply or refufe;
isut will certaisly take from its hinges the door,
Or bear off the good dame as the fits on the floor; $\}$
She is little and light, we can manage her fure.
Open. open the door to the fwallow-for we
Are play ful young children, not men-you may fee."
HISPA, in zoology ; a genus of infects belonging to the coleoptera order, the characters of which are thefe: The antenno are fufform, growing gradually larger from cach extremity towards the middle; and are fituated between the cyes : the thorax and elyua are cevered with protuberances or fpines. The larva of this infect feems to be yet wholly unknown. There are but two fpecies of the perfect animal met with in Europe; one of which, the atra, is found in Britain, and is ahover of a deep unpolinted black, and has the upper part of its body entirely covered with long and ftrong fpines, which render it brilly like the flell of a chefnut. There is even a fpine at the cafe of the antennex; the thorax has a row fet tranfverfely, whicis are forked; and the elytra are furnihned with a very great number that are fingle. Its being thas covered with $\mathrm{r}_{\mathrm{P}}$ ines, makes it refemble a hedge-hog in miniature. It is rather hard to catch, letting itfelf fall down on the ground as foon as approached. It bears its antennæ upright before it.

HISPALIS, a town of Bratica, in the Farther Spain; an ancient mart or trading town on the Bætis, navigable quite up to it for fhips of burthen, and thence to Corduba for river barges. Called Culonia Romelenfis. It has alfo a conventus juridicus, a conrt of juftice, or allizes, (Pliny). Now called Seville, W. Long. $6^{\circ}$. N. Lat. 37.

HISPANTA, called Hc/pria Ulitma, (Horace), becaufe the weftmon part of Earope; alfo lberia from the river Iberus. Its name Hi/pania, or Spania,

Hirunde
Hifraiz.

Plate CCXXXV

## H I S

Hirpaniola. (Greek), is of Phœnician original, from its great number of rabbits: the Phonicians, who fettled feveral colonies on the coaft calling it Spanjab from thefe ani. mals. It has the fea un every fide, except on that next to Gaul, from which it is feparated by the Pyrences. The Romans at firft divided it into the Farther and Hither Spain, under two preetors. In that fate it continued down to Auguttus: who divided the reather Spain into Bxtica, which he left to the people to be governed by a pro-conful ; and into Lulitania, which he added to his own provinces : calling the Hither Spain Tarraconenfis. Hifpania vas a country celebrated for its fertility, of which it has greatly fallen fhort in modern times. The pcople were of a warlike tarn, (Strabo) ; and their bodies being formed for hardfhips and labour, they cver preferred war to peace, and were remarkably prodigal of life (Jurtin, Sil. Italicus.) Spain produced feveral great men, both in a literary and a political capacity. See Spain.

HISPANIOLA, called allo St Dominco, the argen of the Antilles or Caribbee illands, extending about 420 miles from eaft to weff, and 120 in breadth from north to fouth; lying between $17^{\circ} 37^{\prime}$ and $20^{\circ}$ of N. Lar. and between $67^{\circ} 35^{\prime}$ and $74^{\circ} 15^{\prime} \mathrm{W}$. Long. The climate is hot, but not reckoned unwholfome; and fome of the inhabitants are faid to arrive at the age of 120 . It is fometimes refrefled by breezes and rains; and its falubrity is likewife in a gre te meafure owing to the beantiful variety of hills and valleys, woods, and rivers, whichevery where prefent themfelves. It is indeed reckoned by far the fineft and moft pleafant ifland of the Antilles, as being the beft accommodated to all the purpofes of life when duly cultivated.

This illand, famous for being the earlieft fettlement of the Spaniards in the new world, was at firft in high eftimation for the quantity of gold it fupplied : this wealth diminifhed with the inhabitants of the country, whom they obliged to dig it ont of the bowels of the earth; and the fource of it was entirely dried up, when they were exterminated, which was quicklydone by a feries of the moft fhocking barbarities that ever difgraced the hillory of any nation. Benzoni relates, that of two millions of inhabitants, contained in the ifland when difcovered by Columbus in I 492, fearee 153 were alive in 1545. A vehement defire of opening again this fource of wealth infpired the thought of getting flaves from Africa; but, befides that the fe were found unfit for the labours they were deftined to, the multitude of mines, which then began to be wrought on the continent, made thofe of Hifpaniola no longer of any importance. An idea now fuggefted itfelf, that their negroes, which were healthy, ftrong, and patient, might be ufefully employed in huibandry; and they adopted, through necefility, a wife refolution, which, had they known their own intereft, they would have embraced by choice.

The produce of theirindultry was at firf extremely finall, becanfe the labourers were few. Chanles V. who, like mof fovereigns, preferred his favourites to every thing, had granted an exclulive right of the flave trade to a Flemifh nobleman, whomade over his pivilege to the Genoefe. Thofe avaricious republieans conducted chis infamons commerce as all mono-
polies are conducted; they refolved to feli ciear, ani Hifpanich they fold but few. When time and competition had fixed the natural and neceflary price of hives, the number of them increafed. It may eatily be imagined, that the Spaniards, who had beenaccuftomed to treat the Indians as beafts, did not entertain a higher opinion of thefe negro Africans, whom they fubftiluted in their place. Degraded fill farther in their eyes by the price they had paid for them, even religion could not refrain them from aggravating the weight of their fervitude. It became intolerable, and thefe wretched flaves made an effort to recover theunalicnable rights of mankind. Their attempt proved unfuccefsful; but they raped this benefit from their defpair, that they were afterwards treated wi:h lefs inhmanity.

This moderation (if tyranny cramped by the apprehenfion of revolt can deferve that uane) was artended with good confequences. Cultivation was purfued with fome degree of fuccefs. Soon after the middle of the 16 th centary, the mother comtry drew annally from this colony ten millions weingtof fugar, a large quantity of wood for dying, tobacco, cocoa, caffa, ginger, cotton, and peltry in abundance. One might imagine, that fuch favourable beginnings would give both the detire and the means of carrying them forther ; but a train of events, more fatal each than the other, ruined thefe hopes.

The firt misfortune arofe from the depopulation of the illand. The Spanifl conquefts on the continene flould naturally have conrributed to promote the fuccefs of an inaud, which nature feemed to hove formed to be the centre of that valt dominion ariling around it, to be the flaple of the different colonies. But it fell out qui.c otherwife : on a view of the immenfe fortunes raifing in Mexies, andother parts, the richeft inhabitants of Hifpanisla began to defpife their fettlemeus, and quited the true fource of riches, which is on the furface of the earth, to go and ranfack the bowels of it for veins of gold, which are quickly exhanfed. The government endeavoured in vain to put a ftop to this emigration ; the lawswere always either artfully claded, or openly violated.

The weaknefs, which was a neceflary confequence of fuch a conduct, leaving the coafts without defence, encouraged the enemies of Spain to ravage them. Even the capital of this illand was takenand pilluged by that celebrated Englifh failor, sir Francis Drike. The cruizers oflefs confequence contented thendelves with intercepting vefels in their paflage throughthofe latitudes, the beft known at that time of any in the new world. To complete thefe misfortunes, the Caftilians themfelves commenced pirates. They attacked no. hips but thofe of their own nation; which were morerich, worie provided, and wor fe defended, than any ethers. The cuftom they had of fitting ont hips. clandeftinely, in order to procure llaves, preventid them from being known; and the allifance they furchafed from the hips of uar, commillioned to provect. the trade, infured to them imponity.

The foreign trade of the colony was its only refource in this difters; and that was illicit: but as it contmued to be carried on, notwithfanding the vi, ilance of the govesors, or, perliaps, by thes cominatec,

## H I S

Ilifpanions. the policy of an exafictated and flort-fighted count exerted itfelf in demolihing moft of the ica-ports, and driving the miferabe inbabitans into the i.land country. This act of violence thew them into a fute of dijection ; which the incurions and fettlement of the French on the illand afterwards carried to the utmoft pitch. The latter, after having made fom unfuccefsful attempts w fertle on the ifland, had part of it yielded to them in 6697 , and now enjoy by far the beft fhare.

Spain, totally taken up with that val empire which fle had formed on the contile it, ufed no painstr diffipate this letion. y. Slie ever refifed to liften to the folicitations of hes tlemith Cubjects, who earnefly prefled that chey might have permiffion to clear thofe fertile lands. Rathei than run the rik of feeing them carry on a contraband trade on the coafts, he chofe to bury in oblivion a fettlement which had been of confequence, and was likely to become fo again.

This colony, which had no longer any intercourfe with the mother country but by a fingle hip of no great burthen, that arrived from thence every third year, confifted, in I 717, of 18 , 4 Io inhabitants, including Spaniards, Meftees, Negroes, or Mulattoes. The complexion and character of thefe people differed according to the different proportions of American, European, and African blood they had received from that natural and tranfient union which reftores all races and conditions to the fame level. Thefe demi-favages, plunged in the extreme of floth, lived upon fruits and roots, dwelt in cottages without furniture, and moft of them witbout clothes. The few among them, in whom incolence had not totally fuppreffed the fenfe of decency and tafte for the conveniences of life, purchafed clothes of their neighbours the French in return for their cattle, and the money fent to them for the mantenance of two hundred foldiers, the priefts, and the govemmont. It doth not appear that the company, formed
at Barce? m: in 4757 , wit: exclufive privileges for the re-chablibment of St Domingo, hath as yet mude any confitcrable piogref. They fend out only two fmall vellels amually, which are freighted back with ix thoufand indes, and fome other commodities of litele vame. See St Domingo.

HISTER, in Zoology ; a genus of the coleoptera order of infetes. The firft articulation of the antennæis con? prenicd and curved ; the laft is confiderably larger than the others, and appears to be a folid knob: the head is drawn within the body; the mouth is forcipated; the elytruare fiorter than the body; and the fore. legs are dentated. The body of thefe creatares is polifhed and very fining, and their form amont fquare; the thorax large, and highly polihed : anteriorly it is made with a hope, in the cavity of which is lodged the head, the pofition of which is often only difcovered by the projection of the maxillæ; for the head, for the molt part, is fo withdrawn under the thorax, that the infert looks as if it had nonc. The elytra are as if it were cut off towards the extremity, and do not cover the whole of the abdomen. They are extremely fmonth, and only have a few itriz, fcarce perceptible, lituated chichy towards their outward fide. Laftly, the hinder part of the abdomen, which projecis beyond the elytra, is round and blant. Thefe infects are fonetimes found in cow-dalig, and oficu on fand. They vary prodigionlly in fize; but differ very little either in form or colour, they being all very dark. The larvæ, as well as the perfect infegs, are frequently met with in the dung of horfes, cows, 2 cc .

HISTORIOGRAPHER, a profeffed hiftorian, or writer of hiftory. See the next article.

The hiftoriographer to his Britannic majefty is an officer under the lord chamberlain; his falary 2001. per commm. There is an office of-tbe fame kind in Scothad, with the fame falary.

$$

HISTORY, in gencral, fignifies an account of fome remarkable facts which bave happened in the world, arranged in the true order in which they actually took place, logether with the caufes to which ticey were owing, and the different effects they have produced, as far as can be difcovered.-The word is Greek Isopta ; and literally denotes a fearch of curious things, or a defire of knowing, or even a rehearfal of thins we have feen; being formed from the rerblse:s, which properly fignifies to know a thing by having feenit. But the idea is now mach more exiongive, and is applied to the knowledge of things taken from the report of others. The origin is from the verb ssnet, "I know;" and hence it is, that among the ancients feveral of their great men were called polyhiftores, i. e. perfons of various and general knowledge.

Sometimes, however, the word bifory is ufed to fignify a defcription of things, as well as an account of facts. Thas Theophraftus calls his work, in which he has treated of the nature and properties of plants, an billory of plants; and we have a treatife of Arifocle,
intitled an biffory of animals; and to this day the defcription of plants, animais, and minerals, are called by the general name of natural hiffory.

But what chiefly merits the name of hiftory, and Hiftory what is here confidered as fuch, is an account of the how diviprincipal tranfactions of mankind fince the beginning ded. of the world; and which naturally divides itfelf into two parts, namely, civil and coclefiafical. The finf contains the hiftory of mankind in their various relations to one another, and their behaviour, for their own emolument, or that of others, in common life ; the fecond confiders them as acting, or pretending to act, in obedience to what they believe to be the will of the Supreme Being.-Civil hiftory, thercfore, includes an account of all the different fares that have exiled in the world, and likewife of thofe men who in diferent ages of the world have moft eminently di inguifhed themfelves eirther for their good or evilactions. This laft part of civil hifory is ufally termed Brography.

Hiftory is now confidered as a very confiderable branch of polite literature : few accomplifhments are more valued than an accurate knowledge of the hifto-

Sect. I.
Civil Hillory. 2 of the ftudy of hifory.
ries of different nations; and farce any literary production is more regarded than a well-written hiftory of any nation.

With regard to the fudy of hiftory, we mult confider, that all the revolutions which have happened in the world, have been owing to two caufes. I. The connections between the different ftates exifting together in the world at the fame time, or their different fituations with regard to one another; and, 2. The different characters of the people who in all ages conftituted thefe frates, their different geniufes and difpufitions, \&c. by which they were either prompted to undertake fuch and fuch actions of themfelves, or were eafily induced to it by others. The perfon who would ftady hiftory, therefore, ought in the firft place to make himfeif acquainted with the tate of the world in general in all different ages; what nations inhabited the different parts of it ; what their extent of territory was; at what particular time they arofe, and when they declined. He is then to inform himfelf of che various events which have happened to each particular nation; and in fo doing, he will difcover many of the caufes of thofe revolutions, which before he only kriew as facts. Thus, for inftance, a perfon may know the Roman hiftory from the time of Romulas, without knowing in the leaft why the city of Rome happened to be built at that time. This cannot be underfood without a particular knowledge of the former fate of Italy, and even of Greece and Afia; feeing the origin of the Romans is commonly traced as high as Eneas, one of the heroes of Troy. But when all this is done, which indeed requires no finall labour, the hiftorian hath yet to ftudy the genius and difpofitions of the different narions, the characters of thofe who were the principal directors of their actions, whether kings, minifters, generals, or priefts; and when this is accomplinhed, he will difcover the caufes of thofe tranfactions in the different nations which have given rife to the great revolutions abovementioned: after which, he may affume the character of one who is perfectly verfed in hiftory.

The firl outline of hiftory, as it may be called, is moft eafily obtained by the infpection of an hiftorical chart; and that fubjoined to the prefent treatife will anfwer the poupofe as well as any. Along wirh this it will be proper to perufe a fhort abridgment of general hinory, from the creation of the world to the prefent time; but in this way there have been but very few attempts attended with any tolerable fuccefs. The following is collected from refpectable authorities, and may ferve to help the ideas of the reader on this fubject.

## Sect. I. Civil Hiftory.

History, though feemingly incapable of any natural divifion, will yet be found, on a nearer infpection, to refolve irfelf into the following periods, at each of which a great revolution took place, either with re-
divided. gard to the whole world, or a very confiderable part of it. 1. The creation of man. 2. The flood. 3. The beginning of profane hiftory, i. e. when all the fabuknus relations of heroes, demi-gods, \&c. were ex- pelled from hiftorical narrations, and men began to selate facts with fome regard to trath and credibility. Vox. VIII.
4. The conqueft of Babylon by Cyrus, and the deAtruction of the Babylonian empire. 5. The reign of Alexander the Great, and the overthrow of the Parfian empire. 6. The deftruction of Carthage by the Romans, when the latter had no longer any rival capable of oppofing their defigns. 7. The reign of the emperor Trajan, when the Roman empire was brought to its atmoft extent. 8. The divifion of the empire under Comftantine. 9. The deftruction of the weftern empire by the Hernli, and the fettlement of the different Earopean nations, 10 . The rife of Mahomet, and the conquefts of the Saracens and Turks. Ir. The crufades, and all the fpace intervening between that time and the prefent.

Concerning the number of years which have elapfed fince the creation of tie world, there have been many difputes. The compilers of the Univerfal Hiftory determine it to have taken place in the year 4305 B. C. fo that, according to them, the world is now in the 6096 th year of iss age. Others think it was created only 4000 years B . C. So that it hath not yet attained its 6000 th year. Be this as it will, however, the whole account of the creation refts on the truth of the Moraic Mofaic hiftory ; and which we mult of neceflity ac-count of cept, becaufe we can find no other which does not the creation cither abound with the groffeft abfurdities, or lead us into abfolate darknefs. The Chinefe and Egyptian pretenfions to antiquity are fo abfurd and ridiculous, that the bare reading muft be a fufficient confutation of them to every reatonable perfon. See the articles China and Ecprt. Some hittorians and philofophers are inclined to difcredit the Mofaic accounts, from the appearances of volcanoes, and other natural phænoinena: but their objections are by no means fufficient to iavalidate the authority of the facred writings; not to mention that every one of their own Cyftems is liable to induperable objections. See the artic!e Earth. It is therefore reafonsble for every perfon to accept of the Mofaic account of the creation as trath; but an hiftorian is under an abfolute neceffity of doing it, becaufe, without it, he is quite deftitute of any fandard or fcale by which he might reduce the chronology of different nations to any agreement; and, in flort, without recciving this accuont as trae, it would be in a manner impoffible at this day to write a general hiftory of the world.
I. The tratiactions during the firft period, viz. from the creation to the flood, are very much unknown, nothin befg indeed being recorded of them but what is to creation to be found in the firft fix chapters of Genefis. In general, the flood. we know, that men were not at that time in a favage Aate; they had made fome progrefs in the arts, had invented mutic, and frind out the method of working metals. They feem alfo to have lived in one valt community, without any of thofe divifions into different nations which have fince taken place, and which evident. ly proceeded from the confulion of languages. The mof material part of their hiftory, however, is, that having once begun to tranfgrefs the divine commands, they proceeded to greater and greater lengths of wichedneis, till at laft the Deity thought proper to fend a flood on the earth, which deftroyed the whole haman race except eight perfons, viz. Noah and his family. This terrible cataftrophe happened, according to the Hebrew copy of the Bible, 1556 years aftet 4 A
the
the only probahle one.

Civil Hitory.

Civil the creation ; according to the Samaritan copy, $1307^{\circ}$. Hiltary. For the different conjectures concerning the natural 6 caufes of the flood, fee the article Deluge.
From the 2. For the hiltory of the fecond period we mult again flood to the have recourfe to the Scriptures, almoft as much as for beginning that of the firt. We now fiad the human race reduof profane ced to eight perfons poffeffed of nothing but what they hifory.

* See Ararato had faved in the ark, and the whole world to be flored with animals from thofe which had been preferved along with thefe eight perfons. In what country their original fettement was, no mention is made. The ark is fuppofed to have refted on Mount Ararat in Armenia*: Lut it is impoffible to know whether Noah and his fons made any fay in the neighbourhood of this momtain or not. Certain it is, that, fome time after, the whole or the greateft part of the human raec were affembled in Babylonia, where they engaged in building a tower. This gave offence to the Deity ; fo that be punifhed them by confounding their language ; whence the divifion of mankind into different nations.

According to a common opinion, Noah when dying Ieft the whole world to his fons, giving Afia to Shem, Africa to Ham, and Europe to Japhet. But this hath not the leaft foundation in Scripture. By the moft probable accounts, Gomer the fon of Japhet was the father of the Gomerians or Celtes ; that is, all the barbarous nation's whoinhabited the northern parts of Europe under the various names of Gauls, $C_{i m}$ brians, Goths, \&c. and who alfo migrated into Spain, where they were called Geltiberians. From Magog, Mefhech, and Tubal, three of Gomers brethren, proceeded the Scythians, Sarmatians, Tartars, and Moguls. The three other fons of Japher, Madai, Javan, and Tiras, are faid to have been the fathers of the Medes, the Ionians, Greeks, and Thracians.

The children of Shem were Elam; Ahur, Arphaxad, Lud, and Aram. The firft fettled in Perlia, where he was the father of that mighty nation: The defcendants of Afhur peopled Alfyria, (now Curdeffan) : Arphaxad fetcled in Chaldæa. Lud is fuppefed by Jofephus to have taken up his refidence in Lydia; though this is much controverted. Aram, with more certainty, is thought to haye fettled in Mefopotamia and Syria.

The children of Ham were Cufh, Mizraim, Phut, and Canaan. The firft is thonght to have remained in Babylonia, and to have been king of the fouthcaftern parts of it afterwards called Khuzeftan. His defcendants are fuppofed to have removed into the caftern parts of Arabia; from whence they by degrees migrated into the correfponding parts of Africa. The fecond peopled Egypt, Ethiopia, Cyrenaica, Libya, and the reft of the northern parts of the fame continent. The place where Phat fettled is not known: but Canaan is univerfally allowed to have fetrled in Phonicia; and to lave founded thote rations who inlyabited Judea, and were afterwards exterminated by the Jews.

Almoft all the countries of the world, at leaf of the caftern continent, being thus furnifhed with inhabitants, it is probable that for many years there would be few or no quarrels between the different nations. The pancity of their numbers, their diftance from one
another, and their diverfity of language, would contribute to keep them from having much communication with each other. Hence, according to the different circumlances in which the different tribes were placed fome would be more civilized and others mote barbarous. In this interval, alfo the different natiens probably acquired different characters, which afterwards they obitinately retained, and manifefted on all occafions; hence the propenfity of fome nations to monarchy, as the Aliatics, and the entholiatic defire of the Greeks for liberty and republicanifm, \&c.
The beginning of nonarchical government was very Foundation early; Nimrod the fon of Cufh having found means to of the kingmake himfelf kiag of Babylonia. In a fhort time A. thar emigrated from the new kingdom ; builtNineveh, afterwards capital of the Affyrian empire; and two other cities called Rezen and Reboboth, concerning the fituation of which we are now much in the dark. Whether Afhar at this time fet up as a king for himfelf, or whether he held thefe cities as vaffal to Nimrod, is now unknown. It is probable, however, that about the fame time various kingdoms were founded in different parts of the world ; and which were great or fmallaccording to different circumfances. Thus the fcripture mentions the kings of Egypt, Gerar, Sodom, Gomorrah, \&c. in the time of Abraham; and we may reafonably fuppofe, that thefe kings reigned over nations which had exilted for fome confiderable time before.

The firf confiderable revolution we read of is the Migration migration of the Ifraelites out of Egypt, and their of the eftablifhment in the land of Canaan. For the hiftory of Ifraelites thefe tranfactions we muft refer to the Old Teltament, where the reader will fee rhat it was attended with the moft terrible cataftrophe to the Egyptians, and with the utter exiermination of fome nations, the defeendants of Ham, who inhäbited Judea. Whether the overthrow of Pharoah in the Red Sea could affect the Egyptian nation in fuch a manner as to deprive them of the greateft part of their former learning, and to keep them for fome ages after in a barbarous ftate is not eafily determined; but unlefs this was the cafe, it feems exceedingly difficult to account for the total filence of their records concerning fuch a remarkable event, and indeed for the general confofion and uncertainty in which the early hiftory of Egypt is involved. The fettlement of the Jews in the promifed land of Canaan is fuppofed to have happened about 149 B . C. For near 200 years after this period we find no ac- Hiftory of? count of any other nations than thofe mentioned in the Greeks. fcripture. About 1280 B. C. the Greeks began to make other nations feel the effects of that enterprifing and martial firit for which they were fo remarkable, and which they had undoubtedly exercifed upon one and which they had undoubtedly exercifed upon one
another long before. The firt enterprife was an invafion of Colchis (now Mingrelia), for the fake of the
golden flece. Whatever was the nature of this exfion of Colchis (now Mingrelia), for the fake of the
golden flece. Whatever was the nature of this expedition, it is probable they fucceeded in it; and it is likewife probable, that it was this fpecimen of the
riches of Afia which inclined them fo mach to Afiatic is likewife probable, that it was this fpecimen of the
riches of Afia which inclined them fo mach to Afiatic expeditions ever after. All this time we are totally.
in the dark about the tate of Afia and Africa, except expeditions ever after. All this time we are totally
in the dark about the tate of A fia and Africa, except in fo far as can be conjectured from feripture. The ancient empires of Babylon, Afyria, and Perfia, pro-

Civll bably nill continued in the former continent, and Hintory. Egypt and Ethiopia feem to have been confiderable kingdoms in the latter.

Abont 1184 years B. C. the Greeks again dininguifhed themfelves by their expedition againf Troy, a city of Phrygia Minor; which they plundered and burnt, malfacring the inhabitants with the moft unrelenting crucley. Ancas, a Trojan prince, efcaped with fome followers into Italy, where he became the remote founder of the Roman empire. At this time Greece was divided into a number of fmall principalities, moft of which feem to have been in fubjection to Agamemnon king of Mycene. In the reign of Atreus, the father of this Agamemnon, the Heraclid $x$, or defcendants of Hercules, who had been formerly banihed by - Euryftheus, were again obliged to leave this country. Under their champion Hyllus they claimed the kingdom of Mycenz as their right, pretending that it belonged to their great anceftor Hercules, who was unjufly deprived of it by Euryftheus*. The controverfy was decided by fingle combat; but Hyllus being killed, they departed, as had been before agreed, under a promife of not making any attempt to return for 50 years. About the time of the Trojan war, alfo, we find the Lydians, Myfians, and fome other nations of Afia Minor, firft mentioned in hiftory. The names of the Greek ftates mentioned during this uncertain period are, r. Sicyon. 2. Leleg. 3. Meffina. 4. Athens. 5. Crete. 6. Argos. 7. Sparta. 8. Pelafgia. 9. Theflaly. 10. Attica. II. Phocis. 12. Lucris. 13. Ozela. 14. Corinth. 15. Eleufina. 16. Elis. 17. Pilus. 18. Arcadia. 19. Egina. 20. Ithaca. 21. Cephalonc. 22. Phthia. 23. Phocidia. 24. Ephyra. 25. Eolia. 26. Thebes. 27. Califta. 28. Etolia. 29. Doloppa. 30. Oechalia. 31. Mycenæ. 32. Eubœa. 33. Mynia. 34. Doris. 35. Phera. 36. Iola, 37. Trachina. 38. Thrafprocia. 39. Myrmicionia. 40. Salamine. 4r. Scyros. 42 . Hyperia or Melite. 43. The Vulcanian ifles. 44. Megara. 45. Epirus. 46. Achaia. 47. The illes of the Egean Sea. Concerning many of thefe we know nothing befides their names : the moft remarkable particulars conceraing the reft may be found under their refpective articles.

About 1048 B. C. the kingdom of Judea under king David approached its utmoft extent of power. In
counted for. In former times whatcver wars might have taken place between neighbouring nations, we have no account of atry extenfive empire in the whole world, or that any prince undertook to reduce far difant nations to his fubjection. The empire of Egypt indeed is faid to have been extended immenfely to the eaft, even before the days of Sefoftris. Of this country, however, our accounts are fo imperfeet, that fcarce any thing can be concluded from them. But now, as it were all at once, we find almoft every nation aiming at univerfal monarchy, and refufing to fet any bounds whatever to its ambition. The firft flock given to the Jewilh grandeur was the divifion of the kingdom into two through the imprudence of Rehoboam. This rendered it more eafily a prey to Shilhak king of Egypt; who five years after came and pillaged Jerufalem, and all the fortified cities of the kingdom of Judah. The commerce to the Ealt-Indies was now difcontinued, and confequently the fources of wealth in a great meaíure fopped; and this added to the perpetual wars between the kings of Ifrael and Judah, contributed to that remarkable and fpeedy decline which is now fo eafily to be obferved in the Jewifa affairs.
Whether this king Shifhak was the Sefoftris of profane writers or not, his expedition againft Jerafalem as recorded in frripture feems very much to refemble the defultory conqueft afcribed to Sefoftris. His infantry is faid to have been innomerable. Compofed of different A frican nations; and his cavalry 60,000 , with. 1200 chariots; which agrees pretty well with the mighty armament afcribed to Sefortris, and of which an account is given under the article Egypt, $\boldsymbol{n}^{\circ} 2$. There indeed his cavalry are faid to have been only 24,000 ; but the number of his chariots are increafed to 27,000; which laft may not nureafonably be reckoned an exaggeration, and thefe fupernumerary chariots may have been only cavalry : but unlefs we allow Sefoftris to be the fame with Shithak, it feems impor. fible to fix on any other king of Egypt that can be fuppofed to have undertaken this expedition in the days of Solomon.

Though the Jews obtained a temporary deliverance from Shifiak, they were quickly after attacked by new enernics. In 941 B. C. one Zerah an Ethiopian invaded Judæa with an army of a million of infantry and 300 chariots; but was defeated with great haughter by Afa king of Judah, who engaged hin with an army of 580,000 men. About this ime alfo we rians.别. About this time alfo we rians. find the Syrians grown a confiderable people, and bitter enemies both to the kings of Ifrael and Judah; aiming in fact at the conqueft of both nations. Their kingdom commenced in the days of David, under Hadadezer, whofe capital was Zobah, and who probabiy was at laft obliged to become David's tributary, after hsving been defeated by him in feveral engagements. Before the death of David, however, one Rezon, who it feems had rebelled againtt Hadadezer, having found means to make himfelf mafter of Damafous, erected there a new kingdom, which foon became very powerful. The Syrian princes being thas in the neighbourhood of the two rival ftates of Trael and Judah (whofe tapitals were Samaria and Jerulalem), found it an eafy matter to weaken them both, by pretending to affit the one againft the other; but a detail of the its moft flourihing condition, however, it never was remarkable for the largenefs of its territory. In this refpect it fcarce exceeded the kingdom of Scotland; though, according to the accounts given in fcripture, the magnificence of Solomon was fuperior to that of the moft potent monarchs on earth. This extraordinary wealth was owing partly to the fyoils amaffed by king Davidin his conquefts over his various enemies, and partly to the commerce with the Eaft-Indies which Solomon had eftablifhed. Of this commerce he owed his thare to the friendihip of Hiram king of Tyre, a city of Phœenicia, whofe inhabitants were now the moft famed for commercial $\mathfrak{k i l l}$ in maritime affairs of any in the whole world.
After the death of Solomon, which happened about 975 B. C. the Jewih empire began to decline, and foon after many powerful flates arofe in different par:s of the world. The difpofition of mankind in general feems now to have taken a new turn, not tafily ac-

H I S T O R
tranfacions between the jews and Sytians is only to be found in the Old Teltament, ro which we reter. In 740 B . C. however, the Syrian empire was tomally deftroyed by Tiglath Pilefer king of Angria; as was alfo the kingloni of Samaria by Shalmanefer his fucceffor in 721 . The people were elther maffacred, or carried into captivity into Media, Perfia, and the countrics about the Calpian Sea.

While the nations of the eaft were thus deftroying each other, the foundations of very formidable empires were laid in the weft, which in procels of time were to fwallow up almoft all the eaftern ones. In Africa, Cartlage was founded by a Tyrian culony, about 869 B. C. according to thofe who aforibe the ligheft antiquity to that city; but, according to others; it was founded only in 769 or 770 B. C. In Europe a very confiderable revolution took place abour 900 B. C. The Heraclidx, whom we have formerls jeen expelled from Greece by Atreus the father of Agamennon, after feveral unficcefsful attempts, at laft conबuered the whole Peloponnefus. From this time rine Grecian lates became more civilized, and their hifioty lefs obfcure. The inftitution, or rather the revival and continuance of the Olympic games, in 776 B. C. alfo greatly facilitated the wrining not only of their hiftory, but that of other nations; for as each Olympiad confifted of foat years, the chronology of every important even: became indubitably fixed by referring it to fuch and fach an Olympiad. In $748 \mathrm{~B} . \mathrm{C}$. or the laft year of the feventh Olympiad; the foundations of the city of Rome were lald by Romulus; and, 43 years after, the Spartan ftate was new modelled, and reccived from Lycurgus thofe laws, by obferving of which it afterwards arrived at fuch a pitch of fplendor.

With the begimning of the 28 th Olympiad, or 568 B. C. commences the third general period above mentioned, when profanc hiftory becomes fometwat more clear, and the relations concerning the different nations may be depended noon with fome degree of certainty. The getritral ftate of the world was at that time as follows.-The northern parts of Europe were cither thinly inhabited, or filled with unknown and barbarous nations, the anceftors of thofe who afterwards defroyed the Roman empire. France and Spain were inhabited by the Gomerians or Celtes. Italy was divided into a number of petty fates, arifing partly from Gaulifh and partly from Grecian colonies ; among which the Romans liad already become formidable. They were governed by their king Sertius Tallius; had increafed their city by the demolition of Alba Longa, and the removal of its inhabitants to Rome ; and had enlarged their domiaions by feveral cities taken from their neighbours. Greece was allo divided into a number of fmall flates, among which the Athenians and Spartans, being the mont femarkable, were rivals to each other. The former had, about 599 B. C. received án excellent legiflation from Solon, and were enriching themfelves by navigation and commerce : the latter were become formidable by the martial infirutions of Lycurgus; and having conguered Mefina, andadded its territory to their own, were juftly efteemed the moft powerful people in Greece. The other ftates of moft confidetation were Corinth, Thebes, Argos, and Arcadia, In Alia great
revolutions had taken place. The ancient kirgdom of Affyria was deftroyed by the Medes and Babylonians, its capital city Nineveh utterly ruined, and the greateft part of its inhabitants carried to Babylon. Nay, the very materials with which it wastuilt were carried off, to adorn and give ftrength to that fately metropolis, which was then undoubtedly the firt city in the world. Nebuchadnezzar, a wife and valiant prince, now fat oft the throne of Lubylon. By him the kingiom of Judze was totally overthrown in 587 B . C. Three years before this he had talien and razed the city of Tyre, and over-run all thre kingdom of Egypt. He is even faid by Jufephus to have conquered Spain, and reigned there nine years, after which he abandoned it, to the Carthaginians; but this feems by no means probable. The extent of the Babylonian empire is not certainly known : but from what is recorded of it we may conclude, that it was not at all inferior even in. this refpect to any that ever exifted; as the foripture tells us it was fuperior in wedth to any of the fucceeding ones. We know that it comprehended Phoenicia, Paleftine, Syria, Babylonia, Media, and Perfia, and rot improbably India alfo; and from a confideration of this valt extent of territory, and the riches with which every one of thefe conntries abounded, we mar. form Conie idea of the wealth and power of this moniarch. When we confider alfo, that the whole ftrength of this mighty empire was employed in beau-. titying the metropolis, we cannot look upon the wonders of that city as related by Herodotus to be at all incredible: See Babylon; and Ahchitecture, $n^{\ell}$ ig. As to what paffed in the republic of Cartiage about thistinne, we are quite in the dark; there being a chafm. in ifs hiftory for no lefs than 300 years.
4. The fourth general period of hiftory, namely, Fourth pem from the end of the fabulous times to the conqueft of riod. HiBabylon by Cyras, is very fhort, inchading no nore fory of thethan 3 y years. This fudden revointion was occafioned Babyloniaas: by the mifcondnet of Evil-merodarh, Nebuchadinez- empise. zar's fon, even in his father's life-time. For having, in a great hunting-match on occafion of his marriage, entered the country of the Niedes, and fome of his troops coming up at the fame time to rellieve the garrifons in thofe places, he jpined them to thofe already with him, and withour the leaft provocation began to plunder and lay wafte the neighbouring country. This prodiced an immediate revolt, which quirckly extended: over all Media and Prerfia. The Medes, headed by. Aftyages and his fon Cyaxares, drove back Evil-merodach ahd his party with great flagetrer ; nor doth it appear that they were afterwards reduced even by Nebuchadnezzar bimfelf. The new empire continued daily to gather ftrengith; and at laft Cyrus, Aftyages's: grandfon, a prince of grear pridence and valour, being máde géncralifimo of the Median and Perifan forces, took Babylon itfelfin the year 538 B . C. as related under the article Babyion.

During this period the Homatis increafed in power of the under the wife adminiftration of their king Servius Romans; Tullius, who, thoogh a pacific prince, rendered his Greeks, people more formidable by a peace of 20 years than Lydians, his predeceffors had done by all their viciories. Thand PerG preceno fians. Greeks, even at this early period, began to interfere with the Perfians, on account of the lonians or Grecian eotonies in Afa Minor. Thefe had been fub-

Civil dued by Croefus king of Lydia abour the year 562, Hintory. the time of Nebuchadnezzar's death. Whether the Lydians had been fubjued by the Babylonidh monarein or not, is not now to be afcertained; though it is very probable that they were either in fuijecion to hin, or greatly awed by his power, as before his death nothing confiderable was undertaken by them. It is indeed probable, that during the indiaity of Nebnchadnczzar, fpoken of by Daniel, the affairs of hiskingdom would fall into confuion; and many of thofe princes whom he formerly retained in fubjection wonld fet up for themfelves. Certain it is, however, that if the Babylonians did not regard Croefus as their fubject, they looked upon him to be a very faithful ally; infomuch that they celebrated an annual feaft in comme. moration of a viclory obtained by him over the Scythiars. After the death of Nebuchadnezzar, Croefus fubdued many nations in Afia Minor, and among the reft the lonians, as already relited. They were, however, greatly attached to his government; for though they paid him tribute, and were obliged to farnith him with fome forces in time of war, they were yet free from all kind of oppreffion. When Cyrus therefore was proceeding in his conquents of different parts of the Babylonith empire, before he proceeded to attack the capital, the Ionians refufed to fubmit to hin, though he offered them very advantageous terms. But foon after, Crœfus himfelf being defeated and taken prifoner, the Ionians fent ambaliadors to Cyrus, offering to fubmit on the terms which had formerly been propofed. Thefe terms were now refufed ; and the fotians being determined to refit, applied to the Spartans for aid. Though the Spartans at that tinc could not be prevailed upon to give their countrymen any. affifance, they fent ambaffadors to Cyrus with a threatening menfage ; to which be returned a contemptuous anfwer, and then forced the Ionians to fubmit at difcretine, five years before the tiking of Babylon. Thus commenced the hatred between the Greeks and Perfians; and thus we fee, that in the two firft great monarchies the feeds of their deftruction were fown eten before the menarchies themfines were eftablifhcd. For while Nebachadnezzar was railing the Babylonifh empire to its utmont height, his fon wasdeftroying what his father builr up; and at the very time when Cyrus was oftablihing the Perfian monarchy, by his ill-timed feverity to the Greeks he made that warlike people his enemies, whom his fucceffors were by no means able to refift, and who would probably have -vercome Cyrus himfelf, had they united in order to attack him. The tranfactions of Africa during this pesiod are almoft entirely unknown; though we cannot doubt that the Carthaginians enriched themfelves by means of their commerce, which enabled them afrat period. the Aliatic affairs coninued for fome time in a flate of Hitory tranquillity. The Jews obtained leave to return to of the Jews, their own country, rebuild their temple, and again Babyloni. ans, Egypmings, \&c, eftablifh their worflip, of all which an account is given in the facred writings, thongh undoubtedly they muft thave been in a ftate of dependence on the Perfians from that time forward. Camby fes the fucceflor of Cy fus adided Egypt to his empire, which had either not fubmitted to Cyras, or revoited foon after his death.

He intended alfo to have fuldued the Carthaginians ; but as the Pbœenicians refufed to fupply him with fhips to Coht againft their own countrymen, he was ouliged to lay this delign afide.

In 517 B. C. the Bubylonians finding themfelves gricvoully opprefled by their Perfianmalters, refolved to flake off the yoke, and fet up for themfelves. For this purpore, they took care to fore their city with all manner of proviions; and when Darias Hyftafees, then king of Perlia, advanced againft them, they took the moft barbarons method that can be imagined of preventing an unneceflary confumption of thofe pro. vifions, which they had fo carefully amaffed. Having collected all the women, old men, and children, into one place, they ftrangled them without diftinction, whether wives, fathers, mothers, brothers, or fifters; every one being allowed to fave only the wife he liked beft, and a maid fervant to do the work of the honfe. This cruel policy did not avail them: their city waztaken by treachery (for it was impoffible to take it by furce); after which the king canfed the walls of it to be beaten down from 200 to 50 cubits height, that their frength might no longer give encourage. ment to the inhabitants to revolt. Darius then turned his arms againft the Scythians; but finding that expedition turn out both tedious and unprofitable, he directed his courfe eaftward, and reduced all the country as far as the river Indus. In the mean time, the Ionians revolted; and being affitted by the Greeks, awar commenced between the two nations, which was not thoroaghly extinguifhed but by the deftraction of the Perfian empire, in $330 \mathrm{~B} . \mathrm{C}$. The Ionians, however, were for this the obliged to fubmit, after a war of fix years; and were treated with great feverity by the Perians. The conquef of Greece itfelf was then projected : but the expeditions for that purpofe ended. molt unfortunately for the Perfians; and encouraged the Greeks to make reprifals on then, in which they. fucceeded according to theirumoft wifhes ; and had it only been poffible for them to have agreed among themfelves, the downfal of the Perfian empire would have happened much fooner than it did. See Athens; Sparta, Macedon, and Persia?

In 459. B. C. the Egyplians made an attempt to recover their liberty, but were reduced after a war of fix years. In $4!3$ B. C. they revolted a fecond time: and being affifted by the Sidonians, drew upon the latrer that terrible deftruction foretold by the prophets; while they themfelves were fo thoroughly humbled, that they never after made any attesnpt to recover. their liberty.

The year 403 B. C. proved remerkable for the re. volt of Cyrus againf his brother Artaxerxes Mnemon; in which, through his own rafhnefs, he mifcarried, and loft his life at the battle of Cunaxa in the province of Babylon. Ten thoufand Greek mercenaries, who ferved in his army, made their way back into Greece, Xenothough furfounded on all fides by the enemy, and in the phon's rod heart of a hofile conntry. In this retreat they were treat. commanded by Xenophon, who has received the higheit praifes on account of his condact and military inill in bringing it to a hapyy conclufion. Two years after, the invafions of Agefilaus king of Sparta threatened the Perfianempire with total deftruction; from which however, it was relieved by his being recalledinorder
ath her gieat men, and no general was now to be

Civil to defend his own conntry again! the other Grecian Hinory. Itates; and after this the Perian affairs continued in 2 I a more profperous way till the time of Alexander.
Hiftory of During all this time, the volatile and giddy temper the Greeks. of the Grecks, together with their enthafiafic detire of romantic exploits, were preparing fetters for themfelves, which indeed feemed to be abfolutely neceffary to prevent them from deftroying one another. A zeal for liberty was what they all pretended; buten every occation it appeared, that thislove of liberty was only a defire of dominion. No ftate in Greece conld bear to fee another equal toitfelf; and bence their perpetual contefts for pre-eminence, which could not but weaken the whole body, and render them an eafy prey to an ambitious and politic prince, who was capable of taking advantage of thofe divilions. Being all equally imparient of reftraint, they never conld bear to fubmit to any regular government; and hence their determi. nations were nething but the decifions of a mere mob; of which they had afterwards almof conftantly reaion to repent. Hence alfo their bafe treatment of thole eninent inen whom they ought moft tolave honoured; as Miltiades, Ariftides, Themiftocles, Alcibiades, So. crates, Phocion, \&c. The various tranfactions between the Grecian ftates, though they make a very confiderable figure in particular hiftory, make nowe at all in a general iketch of the hiftory of the world. We Thall therefore only obferve, that in 404 B. C. the Athenian power was in a manner totally broken by the taking of their city by the Spartans. In 370, that of the Spartans received a fevere check from the Thebans at the battle of Leuctra; and eight years after was ftill further reduced by the battle of Mantinea. Epaminondas the great enemy of the Spartans was killed; but this only proved a more feeedy means of fubjugating all the fates to a foreign, and at that time defpicable, power. The Macedonians, a barbarous nation, lying to the north of the ftates of Greece, were rwo years after the death of Epaminondas reduced to the loweft ebb by the Illyrians, another nation of barbarians:in the neighbourhood. The king of Macedon being kitled in an engagement, Philip his brother departed from Thehes, where he had ftudied the art of war under Epaminondas, in order to take poffeflion of his kingdom. Being a man of great prudence and policy, he quickly fettled his own affairs; vanquithed the Illyrians; and, being no ftranger to the weakened fituation of Greece, began alnoft immediately to meditate the congueft of it. The parriculars of this enterprize are related under the article Macidon : here it is fufficient to take notice, that by firft attacking thofe he was fure he could overcome, by corrapting thofe whom he thought it dangerous to attack, by,fometimes pretending to affift one ftate and fometimes another, and. by impoling upon all as beft ferved his turn, he at halt put it out of the power of the Greeks to make any refiftance, at leaft fuch as could keep him from gaining his end. In 338 B. C. he procured himfelf to be etected general of the Amphictyons, or council of the Grecian ftates, under pretence of fertling fome troubles at that time in Greece ; but having once obtained liberty to enter that country with an army, he quickly convinced the ftates that they muft all fubmit to his will. He was oppofed by the Athenians and Thebans; but the inteltine wars of Greece had cut off
found : wable of oppoting Philip with fuccels.

The king of Macedon being now meter of all Greece, projected the conqueft of Alfa. To this he was encouraged $b_{y}$ the ill fuccels which hadattended the Perfians in thoir expcoitions againtt Greece, the fuccefies of the Greeks in their invations, and the retreat of the ten thoofand under Xenophon. All thefe events fhowed the weaknefs of the Perfians, cheir valt inferiority to the Greeks in military fkill, and how cafily their empire might be overthrown by a proper union among the fates.

Pbilip was preparing to enter upon his grand defign, Conqueftof when he was murdered by fome affaffins. His fon A- P'erfiaby lexander was poffeffed of every quality neceffary for Alexander. the execution of fo great a plan; and his impetuofity of temper made him execute it with a rapidity unheard of either before or fince. It muft be confeffed, indeed, that the Perfian cmpire was now ripe for deAruction, and could not in all probability have with. ftood an enemy much lefs powerful than Alexander. The Afiacics have in all ages been much inferior to the European nations in valour and military fkill. They were now funk in luxury and effeminacy; and what was worfe, they feem at this period to have been feized with that infatuation and diftraction of counfels which fcarce ever fails to be a forerunner of the deftruction of any nation. The Perfian minifters perfuaded their fovereign to teject the prudent advice that was given him, of diftreffing Alexander by laying wafte the country, and thus forcing him to return for want of provifions. Nay, they even prevented him from engaging the enemy in the moft proper manner, by dividing his forces ; and perfuaded him to put Charidemus the $A$ thenian to dcath, who had promifed, with 100,000 men, of whom one third weremercenaries, to drive the Greeks out of Alia. In fhort, Alexander met with only two checks in his Perfian expedition. The one was from the ciry of Tyre, which for feven months refifted his utmoft efforts; the other was from Memnon the Rhodian, who had undertaken to invade Macedonia. The firt of thefe obfacles Alexander at laft got over, and treated the governor and inhabitants with the utmoft cruelty. The other was favee felt; for Memnon died after reduciag fome of the Grecian iflands, and Darius had no other general capable of conducting the undertaking. The power of the Perfiam empire was totally broke by the victory gained over Darius at Arbela in 331 B. C. and next year a total end was put to it by the murder of the king by Beflus one of his fubjects.

The ambition of Alexander was not to be fatisfied with the poffefion of the kingdom of Perlia, or indced queft of on of any other on earth. Nothing defs than the total ther nafubjection of the world itfelffeemed fufficient to him; tiuns, and therefore he was now prompted to inwade every country of which he could enly learn the name, whether it had belonged to the Perfians or not. In confequence of this difpofition, he invaded and redaced Hyrcania, Bactria, Sogdia, and all that vaft tract of country now called Bukharia. Atlaft, having entered India, he reduced all the nat:ons to the river Hyphafis, one of the branches of the Indus: But when he would have proceeded farther, and extended his conquefts quite to the eaftern extremities of Afia, his

Civil Hiftory.
troops pofitively refufedto follow him farther, and he was conftrained to returi. In 323, this mighty conqueror died of a fever; wichout having time to feule the affirs of his vaft extendeu empire, or even to name his fucceffor.
While the Grecian empire thas fuddenly fprang up in the edft, the rival fates of Rome and Carthage were making confideraile advances in the weft. The Romans were edtablighing their empire on the moit folid toundations; to which their particular fituation naturally coutributed. Being origmally little better than a parcel of lawlefs banditti, they were defpifed and hated by the neighbouring flates. This foon produced wars; in which, at firft from accidental circumftances, and afterwards from their fuperior valour and conduct, the Romans proved almoft conflantly victorious. The jealounies which prevailed among the Itali $n$ fates, and their ignorance of their trueinterelt, prevented them from combining againft that afpiring nation, and crufhing it in its infancy, which they might eafily have done; while in the mean time the Romans, being kept in a ftate of continual warfare, became at laft fuch ex.pert foldiers, that no other ftate on earth could refift them. During the time of their kings they had made a very confiderable figure among the Italian nations; but after their expulion, and the commencement of the republic, their conquefts became much more rapid and extenfive. In $501 \mathrm{~B} . \mathrm{C}$. they fubdued the Sabines; eight years after, the Latins; and in 399 the city of Veii, the ftrongeft in Italy excepting Rome itfelf, was taken after a iege of ten years. Butin the midft of their fuccelfes a fudden irruption of the Gauls had almoft put an end to their power and nation at once. The city was burnt to the ground in 383 B.C. and the capitol on the point of being furprifed, when the Gauls, who were climbing up the walls in the night were accidentally difcovered and repulfed*. In a hhert time Rome was rebuilt with much greater fplendor
by the time that Alexander the Great died they were held in confiderable eftimation among foreign nations.

The Carthaginians in the mean time continued to enrich themfelves by conmerce; but, being lefs conenrich themlelves by connerce; blat, being leis con- of the Car-
veriant in military affair, were by no means equal to thaginians, the Romans in power, thougl they excelled them in and of Siwealth. A new flate, however, made its appearance cily. during this period, which may be faid to have taught the Carthaginians the art of war, and by bringiog them into the neighbourhood of the Romans, proved the firft fource of contention between thefe two pow. erful nations. This was the j hand of Sicily. At what time people were firf fettled on it, is not now to be afcertained. The firft inhabitants we read of were called Sicani, Siculi, Laftrigones, \&c. but of theferwe know little or nothing. In the fecond year of the I7th Olympiad, or 7io B. C. fome Greek colonies are faid to have arrived on the ifland, and in a flort time founded feveral cities, of which Syracule was the chief. The Syracufans at laft fubducd the original inhabitancs; though it doth not appear that the latter were ever well affected to their government, and therefore uere on all occafions ready to revolt. The firft confiderable prince, or, (as he is called by the Greeks) tyrant of Syracufe, was Gelon, who obtained the fovereignty about the year 483 B. C. At what time the Carthaginians firft carried their armsinto Sicily is not certainly known; only we are affured, that they poffeffed fome part of the illand as early as 505 B. C. For in the time of the firit confuls, the Romans and Carthaginians entered into a treaty chiefly in regard to matters of navigation and commerce; by which it was fipulated, that the Romans who flould touch at Sardinia, or that part of the ifland which belonged to Carthage fhould be received therein the fame manner as the Carthaginians themfelves. Whence it appears, that the dominion ofCarthage already extend. ed over Sardinia and part of Sicily: but in 28 years after, they had been totally driven out by Gelon; which probably was the firft exploit performed.by him. This appears from his fpeech to the Athenian and Spartan ambaffadors who defired his affiftance againft the forces of Xerxes king of Perfia. The Carthagi nians.made many attempts to regain their poffeffions in this illand, whichoccafioned long and bloody. wars between them and the Greeks, as related under the articles Carthage and Sicily. This illand alfoproved the fcene of much flaughter and bloodihed in the wars of the Grecks with one another*. Before the year *see AtBons 325 B.C. however, the Carthaginians had made them- and Sparta. felves mafters of a very confiderable part of the inland; from whence all the power of the Greeks could nat dillodge them. It is proper alfo to obferve, that af. ter the deftruction of Tyre by Alexander the Great, almoft all the commerce in the weftern part of the world fell to the fhare of the Carthaginians. W.bether they had at this time made any fettlement in Spain, is not known. It is certain, that they traded to that country for the fake of the filver, in which it was very rich; as they probably alfo did to Britain, for the tin with which it abounded.
6. The beginning of the fixth period prefentsus with sixth peria fate of the world entirely different from the fore- od. Hiftory going. We now behold all the eaftern part of the of the Maworld, from the confines of Italy to the river Indas, codonian
empire.

Civil Hifory.
25 than before, but now a general revolt and combination of the nations formerly fubdued took place. The Romans, however, fill got the better of their enemies; but, even at the time of the celebrated Camillus's death, which happened about 352 B. C. their territories farce extended fix or feven leagues from the capital. The republic from the beginning was agitated by thofe diffentions which at laft proved its xain. The people had been divided by Romulus into two clafles, namely Fatricians and Plebeians, anfwering to Britifh nobility and commonalty. Between thefe two bodies were perpetual jealoufies and contentions; Which retarded the progrefs of the Roman conquefts, and revived the hopes of the nations they had conquered. The tribunes of the people were perperually oppofing the confuls and military tribunes. The fenate had often recourfe to a dictator endowed with abfolute power; and then the valour and experience of the Roman troops made them victorious : but the return of domeftic feditions gave the fubjugated nations an opportunity of thaking off the yoke. This had the Romans continued for near 400 years, running the fame round of wars with the fame enemies, andireaping very little advantage from their conquefts, till at laft matters were compounded by chooling one of the confuls from among the plebeians; and from this time chiefly we may date the profperity of Rome, fo that

Civil Hiftory.
and beyord it, newly united in one valt empire, and at the fame time ready to fall to pieces for want of a proper head ; the weftern world filled with fierce and favage nations, whom the rival republics of Carthage and Rome were preparing to enflare as faft as they could. The firft remarkable events took place in the Macedonian empire:-Alexander, as already obferved, had not diltinctly named any fucceffor ; but he had left behind him a victorious, and, we may fay, invincible army, commanded by moft expert officers, all of them anbitious of fupreme authoriby. It is not to be fuppofed that peace could long be preferved in fuch a tituation. For a number of years, indeed, nothing was to be feen or heard of but the moft horrid laughters, and wick ednefs of every kind; until at laft the mother, wives, children, brothers, and ever fifters of Alexander were cut off; not one of the family of that great conqueror being leftalive. When matters were a little fettled, four new empires, each of them of no imall extent, had arifen out of the empire of Alexander. Caffander, the fon of Antipater, had Macedonia, and all Greece; Antigonus, Afia Minor; Seleucus had Babylon, and the ealtern provinces; and Ptolemy Lagus, Egypt, and the weftern ones. One of thefe empires, however, quickly fell; Antigonus being defeated and killed by Seleucus and Ly fimachus at the bartle of Ipfus, in 301 B . C. The greateft part of his dominions then fell to Seleucus; but feveral provinces took the opportunity of thefe confurions to flake off the Macedonian yoke altogether; and thus were formed the kingdoms of Pontus, Bithynia, Pergamus, Armenia, and Cappadocia. The two moft powerful and perinanent empires, however, were thofe of Syria, founded by Selencus, and Egypt by Ptolemy Lagus. The kings of Macedon, though they did not preferve the fame authority over the Grecian fates ThatAlexander, Antipater, and Caffander, had done, yet effectually prevented them from thofe outrages upon one another, for which they had formerly been fo remarkable. Indeed, it is fome what difficult to determine whether their cendition was better or worfe than before they were conquered by Philip; fince, though they were now prevented from deltroying one another, they were moft grievoully oppreffed by the Macedonian tyrants.

While the eaftern parts of the world were thus deluged with blood, and the fucceffors of Alexander were pulling to pieces the empire which he had eftablifhed; the Romans and Carthaginians proceeded in
their arms out of it ; and this pretence was foon found out. Being invited into Sicily to affift the Mamertines againf Hiero king of Syracufe and the Car. thaginians, they immediacely commenced a war with the latter, which continued with the utmoft fury for 23 years. The war ended greatly to the difadvantage of the Carthaginians, chiefly owing to the bad conduct of their generals; none of whom, Hamilcar Barcas alone excepted, feem to have been pofieffed of any degree of military k ill ; andthe ftate had fuffered too many misfortunes before lie entered upon the command, for him or any other to retrieve it at that time. The confequence of this war was the entire lofs of Sicily to the Carthaginians; and foon after, the Romans feized on the illand of Sardinia.

Hanilcar perceiving that there was now no alternative, but that in a fiort time either Carthage muft conquer Rome, or Rume vould conquer Carthage, bethought himfelf of a method by which his country might become equal to that haughty republic. This was by redacing all Spain, in which the Carthaginians had already confiderable poffeffions, and from the mines of which they drew great advantages. He had. therefore, no fooner finifhed the war with the mercenaries, which fucceeded that with the Romans, than he fot about the conqueft of Spain. This, however, he did not live to accomplift;, though he made great progrefs in it. His fon Addrubal continued the war with fuccefs; till at laf, the Romans, jealous of his progrefs, perfuaded him to enter into a treaty with them, by which he engaged himfelf to make the river Iberus the boundary of his conquefts. This treaty probably was never ratified by the fenate of Carthage; nor, though it had, would ir have been regarded by Hannibal, who fucceeded Ardrubal in the command, and had fworn perperual enmity with the Romans. The tranfactions of the fecond Punic war are perhaps the moft remarkable which the hiftory of the world can afford. Certain it is, that nothing can how more clearly the gight foundations upon which the greatef empires are built. We now fee the Romans, the nation moft remarkable for their military fkill in the whole warld, and who, for more than 500 years, had been conftantly victorious, unable to refift the efforts of one fingle man. At the fame time we fee this man, though evidently the firft general in the world, loft folely for want of a flight fupport. In former times, the republic of Carthage fupplied her generals in Sicily with hundreds of thoufands, though their enter. prizes were almoft conftantly unfuccefsful ; but now Hannibal, the conqueror of Italy, was obliged so abandon his defign, merely for want of 20 or 30,000 men. That degeneracy and infatuation, which never fails to overwhelm a falling nation, or raiher which is the caufe of its fall, had now infected the councils of Carthage, and the fupplies were denied. Neither was Carthage the only infatuated nation at this time. Hannibal, whofe prudence never forfook him either in profperity or adverfity, in the height of his good forme had concluded an alliance with Philip king of Macedon. Had that prince fent an army to the affiftance of the Carthag nians in Italy immediately after the battle of Canno, there can be no doubt but the Romans would have been forced to accept of that

Civil peace which they fo Katightily refufed $\dagger$; and indeed, Hiftory. this offer of peace, in the midft of fo much fuccefs, is

thage, $\mathrm{n}^{\prime \prime}$

125. an inftance of moderarion which perhaps does more honour to the Carthaginian general than all the military exploits he performed. Philip, however, could not be roufed from his indolence, nor fee that hisown ruin was connected with that of Carthage. The Romans had now made themfelves mafters of Sicily: afier which they recalled Marcellus, with his vittorious irmy, to be cmployed againft Hannibal; and the confequence at laft was, that the Carthaginian armies, unfupported in Italy, conid not conquer it, but wer e recalled into A frica, which the Rumans had invaded. The fouthern nations feem to have been as blind to their own intereft as the northern ones. They ought to have feen, that it was necefary for thom to meeferve Carthage from being defreyed ; but, infead of this, Mafinifla king of Numidia ein dyith the Romans, and by his means Hannibal was overcome at the - SeeZama. battle of Zama*, which finifhed the fecond Punic war, in 188 B. C.
Of Egypt The event of the fecond Punic war determined the fate of almoft all the other nations in the world. All this time, indeed, the empires of Egyp", Syris, and Greece, had been promotin- their own min by mutual wars and inteftine divifions. The Syrian empire was now governed by Antiochus the Great, who feems to have had littic right to fuch a title. His empire, though diminifhed by the defection of the Parthians, was fill very poverinl; and to him Hannibal applied, after he was obliged to leave his country, as related under Carthage, no 152. Antiochus, however, had ror fufficient judgment to fee the neceffity of following tiat great man's advice; nor would the Carchaginians be prevailed upon to contribute their affiftance againft the nation which was foon to deftroy them without any provocation. The pretence for war on the part of the Romans was, that Antiochus would not declare his Greek fubjects in Afia to be free and independent fates; a requifition which neither the Romans not any other nation had a right to make. The cvent of all was that Antiochis was every where defeated, and forced to conclude a peáce upon very difadvanta-

Of Greece. In Europe, matters went on in the fame wà ; the ftates of Greece; weary of the tyranny of the Macedonians, entered into a refolution of recovering their liberties. For this purpofe was framed the Achran
t. SeeGrecce League $\dagger$; but as they could not agree among themfelves, they at laft came to the imprudent determination of calling in the Romans to defend them againft Philip king of Macedon. This produced a war, in which the Romans were victorious. The Macedonians, however, were fill formidable; and; as the intention of the Romans to enflave the whole world could no longer be doubted, Perfens, the fucceffor of Philip, renewed the war. Through his own cowardice he lof a decifive engagement, and with it his kingdont, which

rixth, fabmitted to the Romaris in 167 B. C.
Macedon being thus conquered, the next ftep was utterly to exterminate the Carthaginians; whofe republic, notwithftanding the many difafters that had befallen it, was fill formidable. It is true, the Carthaginians were giving no offence; nay, they even Vox. VIII.
made the moft abject fubmiffions to the republic of Rome; but all was not fufficient. War was declared a third time againft that unfortunate fate; there was now no Hannibal to command their armies, and the city was utterly deftroyed 146 B . C. The fame year the Romans put an end to the liberties they had pretended to grant the cities of Greece, by the entire deftruction of Corinth. See that article.

After the death of Antiochus the Great, the af- H fairs of Syria and Egypt went on from bad to worfe Egory of fairs of Syria and Egypt went on from bad to worfe. Egypt, sp
The degenerate princes which filled the thrones of ria. and thofe empires, regarding only their own pleafures, Juden. either fpent their time in opprefling their fubjects, or in attempting to deprive each other of their dominions, by which means they became a more eafy prey to the Romans. So far indeed were they frome taking any means to fecure themfelves againft the overgrown power of that repblic, that the kings both of Syria and Egypt fometimes applied to the Romans as protectors. Their downfal, however, did not happen within the period of which we now treat. - The only other tranfaction which makes any conliderable figure in the Syrian empire is the opprefion of the Jews by Antiochus Epiphanes. After their return frem the Babylonifh captivity, they continued in fubjection to the Pcrfians till the time of Alexander. From that time they were fubject to the kings of Egypt or Syria, as the fortune of cither happened to prevail. Egypt being reduced to a low ebb by Antiochus Epiphanes, the Jews fell under his dominion; and being feverely treated by him, imprudently fhowed fome figns of joy on a report of his death. This brought him againft them with a powerful army; and in 170 B. C. he took Jerufalem by form, committing the moft horrid cruelties on the inhabitants, infomuch that they were obliged to hide themfelves in caverns and in holes of rocks io avaid his fury. Their religion was totally abolifhed, their temple profaned, an image of Jupiter Olympius fer up on the altar of burnt-offerings: which profanation is thought to be the abomination of defolation mentioned by the prophet Daniel. This revolution, however, waṣ of no long contituance. In 167 B . C. Mattatinias refored the true worthip in moft of the cities of Judea; and in 65 the temple was purificd, and the worfhip therereftored by Judas Maccabæus. This wasfollowed by a long feries of wars between the Syrians and Jews, in which the latter were almoft always victorious; and before thefe wars were finifhed, the deftruc. tion of Carthage happened, which purs an end to the fixth general period formerly mentioned.
7. The beginning of the feventh period prefents us Seventh with a view of the ruins of the Greek empire in the period, Gedeclining ftates of Syria and Egypt; both of them neral flate much circumferibed in bounds. The empire of Syria of the at firft comprenended all Afia to the river Indus, and worldbeyond it; but in 312 B . C. inolt of the Indian provinces were by Sclêncus ceded to one Sandrocottus, or Androcottuis, a native, who in return gave him 500 elephanis. Of the empire of Sandrocottus we know nothing farther than that he fubdued all the countries between the Indus and the Ganges; fo that from this time we may reckon the greatcit part of India independent on the Syro-Macedonian princes. In 250 B. C. however, the empire fuftained a much greater

Clivil
Hiftory.
lofs by the revolt of the Parthians and Bactrians from Antiochus Theus. The former could not be fubdued; and as they held in fubjection to them. the vaft tract -which now goes under the name of Perfia, we muft lookupon their defection as an irreparable lofs. Whether any part of their, country was afterwards recevered by the kings of Egypt or Syria, is not very certain; nor is is of confequence, fince we are affured that in the beginning of the feventh period, i. e. 146 B. C. the Greek empires of Syria and Egypt were reduced by the lofs of India, Perfia, Armenia, Pontus, Bithyniay Capadocia, Pergamus, \&c.: The general fate of the worldin i 46 B . C...therefore was as follows. In Afia were the empires of India, Parthia, and Syria, with the leffer fates of Armenia, Pontus, \&c. abovementioned; to which we maft.add that of Arabia, which during the fixth period had grown into fome confequence, and had maintaized its independency from the days of Ihmael the fon of Abraham. In Africa were the kingdoms of Egypt aud Ethiopia ; the Carthaginian territories, now fubject to the Romans; and the kingdoms of Numidia, Mauritania, and Getulia; ready to be fwallowed up by the fame ambitions and infatiable power, now that Carthage was deftroyed, which ferved as a barrier againft it. To the fouth lay fome unknown and barbarous nations, fecure by reafon of their fituation and infignificance, rather than their ftrength, or diftance from Rome. In Europe wefind none to oppofe the progrefs of the Roman arms, except the Gauls Ger mans, and fome Spanilh nations. Thefe were brave indeed ; but through want of military fkill, incapable of contending, with fuch mafters in the art of war as the Romans chen were.

The Spaniards had indeed beern fubdued by Scipio Africanus in the time of the fecond Punic war : but in 115 B. C. they revolted; and, under the conduct of one Viriathus, formerly a robber, held out for a long time againft all the armies the Romans could fend into Spain.: Him the Conful Cæpio caufed to be murdered abont $\mathrm{I} 3^{8} \mathrm{BC}$ C. becaufe he found it imporfible to reduce him by force. The city of Numantia defied the whole Roman power for fix years longer; till at laft, by dint of treachery, numbers, and perfeverance, it was not taken, but the inhabitants, reduced to extremity by famine, fet fire to their houfes and perifhed in the flames, or killed one another, fo that not orie remained to grace the triumph of the conqueror; and this for the prefént quieted the reft of the Spaniards. About the fame time Attalus king of Pergamus, left by will the Roman people heirs to all his goods; upon which they immediately feized on his kingdom.as part of thofe goods, and reduced it to a Roman province, under the name of $A$ fia Proper. Thus they continued to enlarge their dominions on every fide, without the leaf regard to juftice, to the means they employed, or to the milerics they brought upon the conquered people. In 122 B. C. The Balearic illands, now called Majorca, Minorca, and Ivica, were fubdued, and the inhabitants exterminated; and, foon after, feveral of the nations beyond the Alps were obliged to fubnit.

In Africa the crimes of Jugurtha foon gave this ambitious republic an opportunity of conquering the kingdoms of Numidia and Mauritania: and indeed
this is almoft the only war in which we find the Ro- Civil mans engaged where their pietenfions had the leaft Hiftory. colour of juftice; though in no cafe whatever could a nation fhow more degeneracy than the Romans did on this occafion. The particulars of this war are related under the articles Numidia and Rome. The event of it was the total reduction of the former about the year 105.B. C. but Mauritania and Gerulia preferved their liberty for fome time longer.

In the eaft, the empire of Syria continued daily to decline; by which means the Jews not only had an opportunity of recovering their liberty, bui even of becoming as powerful, or at leaft of extending their dominions as far, as in the days of David and Solomon. This declining empire was fill farther reduced by the civil diffenfions between the two brothers Antiochus Grypus and Antiochus Cyzicenus; during which the cities of Tyre, Sidon, Ptolemais, and Gaza, declared themfelves independent, and in other cilies tyrants ftartedup whorefufed allegiance to any foreign power. This happened about 100 B.C. ; and 17 years after, the whole was reduced by Tigranes king of Armenia. On his defeat by the Romans, the latter reduced Syria to a province of their empire. The kingdom of Armenia itfelf, with thofe of Pontus, Cappadocia, and Bithynia, foon fhared the fame fare ; Pontus the moft powerful of them all, being fubdued about 64 B. C. The kingdom of Judea alfo was reduced under the fame power much about this time. This fate owed the lofs of its liberty to the fame caufe that had ruined feveral others, namely, calling in the Romanss as arbitrators between two contending parties. The two fons of Alexander Jannæus (Hyrcanus and Ariftobulus) contended for, the kingdom. Ariftobulus, being defeated by the party of Hircanus, applied to the Romans. Pompey the Great, who acted as ultimate judge in this affair decided it. againft Ariftobulus, but at the fame time deprived. Hyrcanus of all power as a king; not allowing him: even to affume the regal title, or to extend his territory beyond the ancient borders of Judea. To fucli length did Pompey carry this laft article, that he obliged him to give up all thofe cities in Ceelofyria and Phœenicia which had been gained by his predeceffors, and added them to the newly acquired Roman province of Syria.

Thus the Romans became mafters of all the eaftern parts of the world from the Mediterrannean fea to the borders of Parthia. In the weft, however, the Gauls were ftill atliberty, and the Spanifh nations bore the Roman yoke with great impatience. The Gauls infefted the territories of the republic by their frequent incurfions, which werefometimes very terrible; and tho' feveral attempts had been made to fubdue them, they always proved infufficient till the time of Julius Cæfar. By him they were totally reduced, from the river Rhine to the Pyrenæan mountains and many of their nations almoft exterminated. He carried his arms alfo into Germany and the fouthern parts of Britain; but in neither of thefe parts did be make any permanent conquefts. The civil wars between him and Pompey gave him an opportunity of feizing on the kingdom of Mauritania and thofe parts of Numidia which had been allowed to retain their liberty. The kingdom of Egypt alone remained, and to this.

Sect. I.
Civil nothing belonged except the country properly fo callHiftory. ed. Cyrenaica was bequeathed by will to the Romans about $58 . \mathrm{B} . \mathrm{C}$. ; and abput the fame time the ifland of Cyprus was feized by them without any pretence, except a defire of poffefing the treafure of the king.The kingdom of Egypt continued for fome time longer at liberty; which in fome meafure muft be afcribed to the internal diffentions of the republic, but more efpecially to the amoirs of Pompey, Julius Cæfar, and Marc Antony, with the famous Cleopatra queen of Egypt. The battle of Actium, however'; determined the fate of Antony, Cleopatra, and Egypt itfelf; which laft was reduced to a Roman province about 9 B. C.
Origin and ' While the Romans thus employed all means to reprogrefs of duce the world to their obedience, they were mathe civil king one another feel the fame miferies at home which wars in they inflicted upon cther nations abroad. The firft civil diffentions took their rife at the fiege of Numan-
tia in Spain. We have already obferved, that this fmall city refifted the whole power of the Romans for fix years. Once they gave them a moft terrible and hameful defeat, wherein 30,000 Romans fled before 4000 Numantines. Twenty thoufand were killed in the battle, and the remaining ten thoufand fo thut up, that there was no poffibility of efcaping. In this extremity they were obliged to negociate with the enemy, and a peace was concluded upon the following terms: I. That the Numantines fhould fuffer the Romans toretire unmolefted; and, 2. That Numantia fhould maintain its independence, and be reckoned among the Roman allies.-The Roman fenate, with an injufice and ingratitude hardly to be matched, broke this treaty, and in return ordered the commander of their army to be delivered up to the Numantines: but they refufed to accept of him, unlefs. his army was délivered along with him ; upon which the war was renewed, and ended as already related. The fate of Numantia, however, was foon revenged. Tiberius Sempronius Gracchus, brother-in-law to Scipio Africanus the fecond, had been a chief promoter of the peace with the Numantines already mentioned, and of confequence had been in danger of being delivered up to them along with the commander in chief. This difgrace he never forgot; and, in order to revenge himfelf, undertook the caufe of the Plebeians againft the Parricians, by whom the former were greatly opprefled. He began with reviving an old law, which had enacted that no Roman citizen fhould poffefs more than 500 acres of land. The overplus he defigned to diftribute among thofe who had no lands, and to reimburfe the rich out of the public treafury. This law met with greatoppofition, bred many tumults, and at laft ended in the death of Gracchus and the perfecution of his friends, feveral handreds of whom were put to cruel deaths without any form of law.

The difturbances did not ceafe with the death of Gracchus. New contefts enfued on account of the Sempronian law, and the giving to the Italian allies the privilege of Roman citizens. This laft not only produced great commotions in the city but occafioned a general revolt of the ftates of Italy againft the republic of Rome. This rebellion was not quelled without the utmoft difficulty: and in the mean tine, the city was deluged with blood by the contending
factions of Sylla and Marius ; the fermer of whom fided with the patricians, and the latter with the plebeians. Thefe difturbances ended in the perpetual dictatorfhip of Sylla, about 80 B. C.

From tliis time we may date the lofs of the Roman liberty ; for though Sylla refigned his dictatorfhip two years after, the fucceeding contefts between Cæfar and Pompey proved equally fatal to the republic. Thefe contefts were decided by the - battle of Pharfalia, by which Cæfar became in effect mafter of the empire in 43 B. C. Without lofs of time he then crofed over into Africa; totally defeated the republican army in that continent ; and; by reducing the country of Mauritania to a Roman province, completed the Roman conquefts in thefe parts." His victory over the fons of Pompey at Munda $4 \circ$ B. C. fecured him from any further apprehenfions of a rival. Being therefore fole mafter of the Roman empire, and having all the power of it at his command, he projected the greateff fchemes; tending; according to fome, not lefs to the happinefs than to the glory of his country : when lie was affaffinated in the fenate-houfe, in the 56th year of his age, and 39 B. C.

Without inveftigating the political juftice of this action, or the motives of the perpetrators, it is impoffible not to regret the death of this great man, when we contemplate his virtues, and the defigns which lee is faid to have formed: (See Rome). Nor is it poffible to juftify, from ingratitude at leaft, even the moft virtuons of the confirators, when we confider the obligations under which they lay to him. And as to the meafure itfelf, even in the view of expediency, it feems to' be generally condemned. In fact, from the tranfactions which had long preceded, as well as thofe whichimmediately followed, the murder of $\mathbf{C}$ far, it is evident; that Rome was incapable of preferving its liberty any longer, and that the people had become unfit for being free. The efforts of Brutus and Caffius were therefore unfuccefsful, and ended in their own deftruction and that' of great numbers of their followersin the battle of Philippi. The defeat of the republicans was followed by numberlefs difturbances, murders, profcriptions, \&c. till at laft Octavianus, having cut offall who had the courage to oppofe him, ocavianue. and finally got the better of his rivals by the victory to the reat Actium, put an end to the republic in the year public. 27. B. C.

The deftruction of the Roman commonwealth proved advantageous to the few nations of the world who ftill retained their liberty. That outrageous defire of conqueft, which had fo long marked the Roman character, now in a great meafure ceafed ; becaufe there was now another way of fatisfying the defires of ambitious men, namely, by courting the favour of the emperor. After the fimal reduction of the Spaniards, therefore, and the conqueft of the countries of Mæfia, Pannonia, and fome others adjacent to the Roman territories, and which in a manner feemed naturally to belong to them, the empire enjoyed for fome time a profound peace.

The only remarkable tranfactions which took place during the remainder of the period of which we treat, were the conqueft of Britain by Claudius and AgricoIa, and the deftruction of Jerufalem by Vefpaian and Titus. The war with the Jews began A. D. 67 ; and
was

Civil was occafioned by their obftinately claiming the city Hittory. of Cæfarea, which the Romans inad added to the province of Syria. It ended in 72, with the moft terrible deftruction of their city and nation ; fince which time they have never been able to affemple as a diftint people. The fouthern parts of Britain. were totally fubdued by Agricola about ten years after.

In the 98 th year of the Chriftian era, Trajan was created emperor of Rome; and being a man of great yalgur and experience in war, carried the Roman con, quefts to theirntmoft extent. Having conquered the Dacians, a German natipn beyond the Danube, and who liad, of late been, very troublefome, he turned his arms eaftward; reduced all Mqfopotamia, Chaldæa, Afyria; and having taken Ctefiphon, the capital of the Parthian empire, appointed them a king, which the thought, wonld be a proper methad of keeping that warlike people infubjection. After this, he propofed to return to Italy, but died by the way; and with his reign the feventh general period above men-Ge- with a view of one valt empire, in which almoft all the neral tate nations of the world were fwallowed up. This empire of the world.

H I S T $\quad \mathbf{T}$ O
emperors who attempted to revive among them the ancient military dificipline which alone could enfure the victory over their enemies. Under Dioclefian, the diiorders were fo great, that though the government was held by two perfons, they found themfelves unable to bear the weight of it, and therefore took other two partners in the empire. Thus was the koman empire divided into four parts; which by:all hitorians is faid to have been productive of the greateft mifchiefs. As each of the four fovereigns would have as many officers both civil and military; and the fame number of forces that had been maintained by the ftate wher governed only by one emperor, the people were not able to pay the fums neceflary for fupporting them. Hence the taxes and impofts were increafed beyond neature, the inhabitants in feveral provinces, reduced to beggary, the land left untilled for want of hands, \&c. An end was put to thefe evils when the empire was again uniked under Confantine the Great; but in 330 a mortal blow was given to it by removing the imperial feat to Byzantium, now Conftantinople, and making it cqual to Rome. The introduction and eftablifhment of Chriftianiry, already corrupted with the grofleft fuperfitions, proved allo, mopt grievous detrinent to the cmpire. Inftead of that ferocious and obfinate valour in which the Romans had fo long been accuftomed to put their truft, they now inagined themfeves fecured by digns ofthe crofs, and other external fymbols of the Chriftian religion. Thefe they pled as a kind of magical incantations, which midonbtedly. proved at all times meftecual and hence alfo in fome meafure proceded the great revolution, which rook place in the next period,
9. The ninth general geriod Shows as the decline Ninth pe and miferable end of the weftern part of the Roman riod. De empire. We fee that mighty empire, which, formerly. fruction occupied almoft the whole world, now weakened by of the divifion, and furrounded by enemies. On the eaft, weftern the Pcrfians ; on the north, the Scythians, Sarmatians, Goths, and a nultitude of other barbarons nations; watched all occafions to break into it ; and mifcartied in their artempts, rarher through their own barbarity, than the ftrength of their enemies. The devafations comnitted by thofe barbarians when they made their incurfions are incredible, and the relation fhocking to human nature. Some authors feem much inclined to favour them; and even infinuate, that barbarity and ignorant ferocity were their chief if not their only faults: but from their hiftory it plainly appears, that not only barbarity and the moft hocking cruelty, but the higheft degrees of avarice, perfidy, and difregard to the moft folemn promifes, were to be numbered among their vices. It was ever a fufficient reafon for. them to make an attack, that they thought their ene. mies could not refint them. Their only reafon for making peace, or for keeping it, was becaufe their enemies were too: ftrong; and their only reafon for committing the moft horrid maffacres, rapes, and all manner of crimes, was becaufe they had gained a victory. The Romans, degenerate as they were, are yet to beeftecmed much better than thefe favages; and therefore we find not a fingle province of the empire that would fulbmit to the barbarians, while the Romans conid polibly defend them.

Some of the Roman emperorsindeed withfood this inundation of favages; but as the latter grew daily

## H I S T O R Y.

more numerous, and the Romans continued to weaken themfelves by their intefine divifions, they were at laft obliced to take large bodies of barbaripus into their pay, and teach them their military difcipline, in order to drive away their countrymen, or others who invaded the empire. This at lift proved its total deftratiun ; for, ill 476, the barbaritus who ferved in the Roman armies, and were dignifice with the trle of allies, demanded the third part of the lands of ltaly as a reward for their fervices; but meeting with a refufal, they revolted, and madethemfelves matiers of the whole country, and of Rome itfelf, which Irom that time ceafed to be the head of an cmpire of any confequence.

This period exhibits a moft unfavourable view of the weftern parts of the worid: The Romans, from the height of grandear, funk to the loweft havery, nay, in all probability, almoft externinated; the provinces they formerly goverued, inhabited by human beings fcarce a degree above the brutes: cvery art and feience loft ; and the favage conquerors even in dauger of ftarving for want of a fufficient knowledge of agricnlture, haviug now no means of fupplying themfelves by plunder and robbery as bee fore. britain had long been abandoned to the mercy of the Scots and PiQts; and in 450 the iahabitants had called in the Saxons to their affifance, whom they foon found worfe enemies than thofe againtt whom they had implored their aid. Spain was held by the Goths and Suevians; Africa (that is, Barbary and Bildulgerid), by the Vandals; the Burgundians, Goths, Franks, and Alans, had erected, feveral fmall ftates in Gaul; and Italy was fubjected to the Heruli under Odoacer, who had aaken upon him the title of kiug of Italy. In the eaft, indeed, matters wore an alpeet fomewhat more agreeable. The Roman empire continued to live in chat of Conftantinople, which was fill very extenfive. It conpreheaded all Alia Minor and Syria, as far as Perlia ; in Africa, the kingdom of Egypt; and Greece in Europe. The Perlians were powerful, and rivalled the emperors of Conftantimople; and beyond them lay the Indians, Chinefe, and other nations, who, unheard of by the inhatitants of the more weftern parts, enjoyed peace and liberty.

The Conftantinoplitan empire continned to decline by reafon of its continual wars with the Perfians, Bulgarians, and o her barbarous nations; to which alfo foperfition and relaxation of military difeipline largely contributed. The Perfian empire alfo declined trom the fame caufes, together with the intefine broils from which it was feldom free more than that of Conftanuimople. The hiflory of the eatern part of the world during this period, theretore, confints only of the wars between thefe two great empires, of which an aecunt is given noder the articles Consiantinople and Persia, and which were productive of no other confequence than that of weakening them both, and maing them a more eafy prey to thole enemies who were now as it were in embryo, but fhortly about to eref an empire almoft as exienfive as that of the Greeks or Romans.
Among the weftern nations, therevolutiors, as might natarally be expected from the character of the people, facceeded one another with rapidity. The Heruli un-
der Odoacer were driven out by the Goths nader Theodoric. The Goths were expelled by the Romans; and, while the two parties were contending, both were attacked by the Pranks, who carricd off au immenfe booty. The Romans were in their rurn expelled by the Goths: the Frauks again invaded Italy, and made themfelves mafters of the province of Venetia; latt at laft the fuperior fortune of the emperor of Conftantinople prevailed, and the Goths were finally fubdued in 553. Narfes, the conqueror of the Goths, governed laly as a province of the caftern empire till the year 568, when Longinus his fucceltor made confiderable alterations. The lalian provinces had ever fince the time of Conftautine the Great been governed by confulares, cai ruffores, and prafides; no alteration baving been either made by the Roman cmperors or the Gothic kings. But Longinus, being invefted with abfolate power by Juftinian, fupprelied thofe magifrates; and, inftead of them, placed in each city of note a governor, whom he diftinguifhed with the title of duk.. The city of Rome was not more honoured than any other : for Longinus, having abolifhed the very name of fenate and conffils, appointed a duke of Rome as well as of other citics. To himfelf he aflumed the itte of exarch; and, refiding at Ra. venna, his government was fyled the Exarchat: of Raoenna. But whice be was e!tablining this new empire, the greateft part of flaly was conquered by the Lombards.

In France a confiderable revolution alfo took place. In 487 , Clovis, the founder of the prefent French monarehy, polleffed himfelt of all the countries lying between the R hine and the Loire. By force or treachery, he conquered all the petty kingdoms which lad been crected in that country. His dominions had been divided, reunited, and divided again; and were on the point of being united a recond time, when the great impoftor Mahomet began to make tigurc, in the world.

In Spain, the Vifigoths erected a kingdom ten year's before the conqueft of Rome by the Heruli. This kingdom they had extended eaftward, abobt the fame time that Clovis was extending his conquefts to the weft: fo that the two kingdoms met at the rivertaire. The confequence of the approach of fueh barbarous conquerors towards cach other was an immediate war. Clovis proved victorious, and fubdued great part of the country of the Vifigoths, which put a final fop to their conquefts on that fide.

Another kingdom had been founded in the weftern parts of Spain by the Suevi, a conliderable time before the Romans were finally expelled from that country. In 409 this kingdum was enti ely fubrerted by Theoduric king of the Goths; and the Suevi were fo pent up in a fmall diftriet of Lulitania and Galicia, that it feemed impotible for them to recover themfelves. During the aliovementioned period, however, while the attention of the Goths was turned another, way, they had fond means again to erect themíelves inco an independent fite, and to become mafters of confiderably extended rerritories. But this f. $-\mathrm{ce} / \mathrm{s}$ proved of thort duration. In 584 the Gotins atiacked them ; totally deftroyed their cmpire a fecond ime; and thus became mafters of all Spain, execpt fone fuall part whica fill owned fubjection to the empe-
three rec times during this period. The Vandals had expelled the Romans, and cretted an independent king dom, which was at laft ovcrurned by the emperors of Contwininople; and from them the greatelt part of it was tahen by the Goths in 620 .
rors of ( ondantinople. Of this part, however, the Gons became malters alfo in the year 623; which concludes the gth general period.

Africa, purcrly fo called, had changed its mafters
so. At the commencenment of the tenth general period (which begins with the flight of Mahomec in the year 622 , from whence his followers date their era called the Hegira), we fee every thing prepared for the great revolution which was now to take place: the Roman empire in the weft annililated; the Perfian enpire and that of Conftantinople weakened by their mutual wars and intefine divifions; the Indians and other eaftern nations unaccuftomed to war, and ready to fall a prey to the firft invader; the fouthern parts of Europe in a diftracted and barbarous flate; while the inhabitants of Arabia, from their earlieft origin, accuftomed to war and plunder, and now unitted by the moft violent fuperfition and enthufiafticdefire of conqueft, were like a flood pent up, and ready to overwhelmethe reft of the world.-The northern nations of Europe and Afia, however fornidable in aftertines, were at prefent unknown and peaceable, at leaft with refpect to their fouthern neighbours; fo that there was in no quarter of the globe any power capable of oppofing the conquefs of the Arabs. With amazing celerity, therefore, they over-ran all Syria, Paleftine, Perfia, Bukharia, and India, extending their conquefts farther to the eaftward than ever Alexander had done. On the weft fide, their empire extended over Egypt, Barbary, and Spain, together with the inlands of Sicily, Satdinia, Majorca, Minorca, \&c. and many of the Archipelago iflands; nor were the coafts of Italy iffelf free from their incurfions; nay, they are ceven faid to have reached the diftant and barren country of Iceland. At laft this great empire, as well as others, began to decline. lits ruin was very fudden, and owing to its internal divifions. Mahomet had not taken care to eftablifh the apontefhip in his family, or to give any particular directions abour a fucceflor. The confquence of this was, that the caliphat, or ficceflion to the apoflefhip, was feized by many ufurpers in different parts of the empire; while the true caliphs, who refided at Bagdad, gradually loft all power, and were regarded only as a kind of high priefts. Of thefe divifions the Turks took advantage to eftablifl their authority in many provinces of the Mohammedan empire: but as they embraced the fame religion with the Arabs, and were filled with the fame enthufiaftic defire of conqueft, it is of little confeouence todiftinguifh between them ; as indeed ic fig$\frac{\text { nified little to the world in general whether the Turks }}{}$ or Saracens were the conquerors, fince both were cruel, barbarous, ignorant, and fuperfitions.
While the barbarians of the eafl werc thus grafping at the empire of the whole world, great difurbances happened among the no lefs barbarous nations of the weft. Supertition feems to have been the ruling motive in both cafes. The Saracens and Turks conquered for the glory of God, or of his apofte Mahomet and his fucceffors; the weftern nations profefied an e-
qual regard for the divine glory, but which was only to be perceived in the refpect they paid to the pope and cleggy. Ever ince the eftabilhment of Chrittianity by Conftantine, the biflops of Rome had be en gradually extending their power, and atcempting not only to render thenielves independent, but even to affume an authority over the emperors themifives. The defruction of the empire was fofar from wealhening their power, that it afforded them opportunities of greatly extending it, and becoming judges of the fovercigns of Italy themfelves, whofe barbarity and ignorance prompted them to fubmit to tbeir decifions. All this tine, however, they themfelves had been in fubjection to the emperors of Conflantitople; but on the decline of that empire, they found means to get themfelves exempted from this fubjection. The principal authority in the city of Rome was chen engroffed by the biftop; though of right is belonged to the duke appointed by the exarch of Ravenna. But tho they had now litule to fear from the eaftern erpperors, they were in great danger from the ambition of the Lomlards, whoaimed at the conqueft of all ltaly. This afpiring people the biflops of Ronue determined to check; and therefore, in 726, when Luipyrand king of the Lombards had taken Ravenna and expelled the exarch, the pope undertook to reftere him. For this purpofe he applicd to the Venetians, who ate now firft menioned in hiflory as a ftate of any confequence ; and by their neans the exarch was reliored. Some time before, a quarrel had happened between the pope (Gregory 11.) and Leo enperor of the eaft, about the worfhip of images. Leo, who it ieems, in the midft of fo much barbarifm, had fill prcferved fome fhare of common fenfe and reafon, reprobated the worthip of images in the ftrongent terms, and commanded then to be deftroyed throughout his dominions. The pope, whofe caufe was favoured by the mont abfurd fuperftitions, and by thefe only, refufed to obey the emperor's cominands. The exarch of Ravenna, as a fubject of the emperor, was ordered to force the pope to a compliance, and even to feize or af. falinate him in cale of a ref ffal. This excited the pious zeal of Luitprand to affif the pope, whom he had formerly deligned to fubduc: the exar. h was firft excommunicared, and then torn in pieces by thc enraged miluitude: the duke of Naples fhared the fame fate; and a vaft numberof the Iconoclafts, or Imagebreakers, as they were called, were flaughtered without mercy ; and to complete all, the fabjects of the exarchate, at the inftigation of the pope, renounced their allegiance to the emperor.

Leo was no fooner informed of this revolt than he ordered a powerful army to be raifed, in order to reduce the rebels, and take vengeance on the pope. Alarmed at thefe warlike preparations, Gregory looked round for fome power on which he might depend for protection. The Lombards were polifeffed of fufficient force, but they were too near and too dangerous neigh bours to be trafted ; the Venetians, though zealous Catholics, were as yet unable to withftand the force of the empire; $\mathrm{S}_{\mathrm{p}}$ in was over-run by the $\mathrm{Sa}_{\mathrm{a}}$ racens : the F'rench feemed, therefore, the only peo. ple to whom it was advifable to apply for aid ; ass they were able to oppofe the emperor, and were likewife enemies to his edict. Charrles Martel, who at that

Civil time governed France as mayo: of the palace, was Hiftory. therefore applied to; but before a treaty could be concluded, all the parties concenned were removed by death. Conftantine Copronymus, who fuccec ed Leo at Conftantinople, not only perifited in the oppofition to image-worfiip, begun by his predeceffor, but prohibited alfo the ithocation of faints. Zachary, who fucceeded Gregory 111. in the pontifieate, proved as zealous an adverfary as his predeceffors. Pepin, who fucceeded Charles Martel in the fovereigntyof France, proved as powerful a friend to the pope as his father had been. The people of Rome had nothing to fear from Conftantinople; and therefore drove out all the emperor's officers. The Lombards, awed by the power of France, for fome tine allowed the pope to govern in peace the dominions of the exarchate ; but in ${ }^{7} 752$, Aftolphus king of Lombardy not only reduced the greateft part of the pope's territories, but threatened the city of Rome itfelf. Upon this an application was made to Pepin, who obliged Aftolphus to reftore the places he had taken, and gave them to the Pope, or, as he faid, to St. Peter. The Greek emperor, to whom they of right belonged, remonftrated to no purpofe. The pope from that time became poffeffed of confiderable territories in Italy; which, from the manner of their donation, go under the name of St Peter's Patrimony. It was not, however, before the year 774 that the pope was fully fecured in thefe new dominions. This was accomplifhed when the kingdom of the Lombards was totally deftroyed by Charlemagne, who was thereupon crowned king of Italy. Soon after, this monarch made himfelf mafter of all the Low-Countries, Germany, and part of Hungary; and in the year 800, was folemnly crowned emperor of the weft by the pope.

Thus was the world once more fhared among three great empires. The empire of the Arabs or Saracens extended from the river Ganges to Spain; compre-: hending almoft allo of Afia and Africa which has ever been known to Europeans, the kingdoms of China and Japan excepted. The caftern Roman empire was reduced to Greece, Afia Minor, and the provinces adjoining to ltaly. The empire of the weft ander Charlemagne, comprehended France, Germany, and the greateft part of Italy. The Saxons, however, as yet poffeffed Britain unmolefted by external enemies, tho' the feven kingdoms erected by them were engaged in perpetual contefts. The Venetians alfo enjoyed a nominal liberty; though it is probable that their fituation would render them very much dependent on the great powers which furrounded them. Of all nations on earth, the Scots and Picts, and the remote ones of China and Japan feem to have enjoyed, from their fituation, the greateft hare of liberty; unlefs, perhaps, we except the Scandinavians, who under the names of Danes and Normans, were foon to infeft their fouthern neighbours. But of all the European potentates, the popes certainly exercifed the greateft au. thority; fince even Cliarlemagne himfelf fubmitted to accept the crown from their hands, and his fiucceffors made then the arbiters of their differences.

Matters, however, did not long continue in this ftate. The empire of Charlemagne was on the death of his fon Lewis divided among his three children. Endlefs difputes and wars enfued among them, till at
laft the fovereign power was feized by Hugh Capet in 987 . The Saxon heptarchy was diffolved in 827 , and the whole kingdom of England reduced under one head. The Danes and Nornans began to make depredations and infeft the neighbouring ftates. The former conquered the Englifh Saxons, and feized the government, but were in their turn expelled by the Normans in 1066. In Germany and Italy the greateft difturbances arofe from the contefts between the popes'and the emperors. To all this if we add the internal contefts which happened through the ambition of the powerful barons of every kingdom we can fcarce form an idea of times more calamitous than thofe of which we now treat. All Europe, nay, all the world, was one great field of battle ; for the empire of the Mahometans was not in a more fettled fate than that of the Europeans. Caliphs, fultans, emirs, \&c. waged continual war with each other in every quarter; new fovereignties every day fprong up, and were as quickly deftroyed. In fhort, through the ignorance and barbarity with which the whole world was overfpread, it feemed in a manner impofible that the human race could long continue to exift; when happily the crudades, by directing the attention of the Europeans to one particular object, made them in fome meafure fufpend their flaighters of one another.

Ir. The crufades originated from the fuperftition of Eleventh the two grand parties into which the world was at that period. time divided, namely, the Chriftians and Mahometans. The cruBoth looked upon the fmall territoryof Paleftine which ${ }^{\text {fades. }}$ they called the Holy Land, to be an invaluable acquifition, for which no fum of money could be an equivalent; and both took the mol unjuftifiable methods to accomplifitheir defires. The fuperftition of Omar the fecond caliph had prompted him to invade this country, 'part of the territories of the Greek emperor, who was doing him no hurt; and now when it had been fo long under the fubjection of the Mahometans, a fimilar fuperftition prompted the pope to fend an army for the recovery of it. The crufaders accordingly poured forth in multitudes, tike thofe with which the kings of Peifia formerly invaded Greece; and their fate was pretty fimilar. Their impetuous valour at firt, indeed, carried every thing before them: they recovered all Paleftine, Phenicia, and part of Syria, from the infidels; but their want of conduct foon loft what their valour had obtained, and very few of that vaft multitude which had left Europe ever returned to their native countries. A fecond, a third, and feveral other crufades, were preached, and were attended withalike fuccefs, in both refpects : vaft numbers took the crofs, and repaired to the Holy Land; which they polluted by the moft abominal maffacres and treacheries, and from which very few of them returned. In the third crufade Kichard I. of England was embarked, who feems to have been the beft general that ever went into the caft; bat even his valour and fkill were not fufficient to repair the faults of his companions; and he was obliged to return even after he had entirely defeated his antagonifts, and was within fight of Jerufalem.
But while the Chriftians and Mahometans were thus Conquefts ${ }_{47}$ fuperfitioully contending for a fmall territory in the of the Mzweftern parts of Afia, the nations in the more eafterly guts. parts were threatened with total extermination. Jen-
ghiz-

Civil Hiftory.

Civil ghiz Khan, the greatef as well as the mof bloody Hiftoty. conqueror that ever exifted, now makes his-appear-
ance. The rapidity of his conquefts feemed to emulate thofe of Alexander the Great; and the cruelties he committed were altogether unparalleled. It is worth obferving, that Jenghiz Khan and all his fol:lowers were neither Cliriftians nor Mahometans, but ftriet deifts. For a long time even the fovereign had not lieard of a temple, or any particular place on earth appropriated by the deity to himfelf, and treated the notion with ridicule when it was firf mentioned to him.

The Moguls, over whom Jenghiz Khan aflumed the fovereignty, were a people of Eaft Tartary, divided into a great number of petty governments as they are at this day, but who owned a fubjection to one foveteign, whom they called Vang-khan, or the Great Khan. Temajin, afterwards fengiz-Khan, was one of thefe petty princes; but unjuftiy deprived of the greateft part of his inheritance at the age of r 3 , which he could not recover till he arrived at that of 40 . This correfponds with the year 1201, when be totally reduced the rebels; and as a feccimen of his lenity caufed 70 of their chiefs to be tbrown into as many caldrons of boiling water. In 1202, he defeated and killed Vang-khan himfelf (known to the Europeans by the name of Prefer John of Afia); and pofferfing himfelf of his vaft dominions, became from thenceforward altogether irrefifible. In 1206, laving fill continued to enlarge his dominions, he was declared khan of the Moguls and Tartars; and took upon him the title of fenghiz Khan or The mof Great Khan of khans. This was followed by the reduction of the kingdom of Hya in China, Tangur, Kitay, Turkeftan, Karazm, (the kingdom of Gazna founded by Mahniud Gazni), Great Bukharia, Perfia, and part of India; and all thefc valt regions were reduced in 26 years. The devaftations and flanghters with which they were accompanied were unparalleled, no fewer than $14,470,000$ perfons been computed to have been maflacred by Jenghiz Khan during the laft 22 years of his reign. In the beginning of 1227 he died, thereby frecing the world from a moft bloody tyrant. His fucceffors completed the conqueft of China and Korea; but were foiled in their attempts on Cochin-china, Tong-king, and Japan. On the weftern fide the Tartar dominions were not mueh enlarged till the time of Hulaku, who conquering Media, Babylonia, Mefapotamia, Affyria, Syria, Georgia, Armenia, and almoft all Afia Minor; putting an end to the empire of the Saracens by the taking of Bagdad in 1258 .

The empirc of Jenghiz Khan had the fate of all others. Being far too extenfive to be governed by onc head, it fplit into a multitude of fmall kingdoms, as it had been before his time. All thefe princes, howcver, owned allegiance to the family of Jenghiz Khan till the time of 'Timur Bek, or Tamerlane. The Turks, in the mean time, arged forward by the inundation of Tartars who poured in from the eait, were forced upon the remains of the Greek empire; and at the time of Tamerlane abovementioned, they had almoft confined this once mighty empire within the walls of Conftantinople.
In the year I 335, the family of Jenghiz Khan becoming extinct in Perfia, a long civil war enfued; du-
ring which Timur Bek, one of the petty princes among whom the Tartar dominions were divided, found means to aggrandize himfelf in a manuer fimilar to what Jenghiz Khan had done about 150 years before. Jenghiz Khan, indeed, was the nodel whom he propored to inritate ; but it muft be allowed that Timior was more mercif!n than Jenghiz Khan, if indeed the word cin be applied to fuch inhuman tyrants. The plan on which Jenghiz Khan conducted his expeditions was that of total extermination. For fome time he utterly extirpated the inhabitants of thofe places which he conquered, defigning to people them anew with his Moguls; and in confequence of this refolution, he would employ his army in beheading roo,006 prifoners at once. Timur's cruelty, on the other hand, feldom went farther thant'the pounding of 3000 or 4000 people in large mortars, or building ihem among bricks and mortar into a wall. We muft obferve, however, that Timur was not a deift, but a Mahometan, and conquered exprefsly for the purpofe of fpreading the Mahometan religion; for the Moguls had now adopted all the fuperftitions and abfurdities of Mahomet. Thas was all the eaftern quarter of the world threatened anew with the moft dreadful devaftations, while the weftern nations were exhaufting themfelves in fruitlefs attempts to regain the Holy Land. The Turks were the only people who feem at this period to have been gathering ftreiggh, and by their perpetual encroachments threatened to fwallow up the weftern nations as the Tartars had done the eaftern ones.

In 1362,. Timur invaded Bukharia, which he reduced in five years. He proceeded in his conquefts, though not with the fame celerity as Jenghiz Khan, till the year 1387, when he had fubdued all Perfia, Armenia, Gcorgia, Karazm, and great part of Tartary. After this he procceded weftward, fubduing all the countries to the Euphrates; made himielf mafter of Bagdad ; and even entertd Ruflia, vi here he pillaged the city of Mofcow. From thence he turned his arms to the eaft, and totally fubdued India. In 1393, he invaded and reduced Syria; and having turned his arms againft the Turks, forced their fultan Bajazet to raife the fiege of Conftantinople. This brought on an engagement, in which Bajazet was entirely defeated and taken prifoner; which broke the power of the Turks to fuch a degree, that they were not for fome time able to recover themfelves. At laft this great conqueror died in the year 1405 , while on his way to conquer China, as Jenghiz Khan had done before him.

The death of Timur was followed almoft immedi- State of the ately by the diffolution of his empirc. Moft of the world nations he had conquered recovered their liberty. fince that The Turks lad now no further obftacle to their con. time. queft of Conftantinople. The weftern nations having exhaufted themfelves in the holy wars, as they were called, had lof that infatiable thirft after contqueft which for fo long time poffefied the minds of men. They had already made confiderable advances in civilization, and began to ftudy the arts of peace. Guipowder was invenied, and its application to the purpofes of war already known ; and though no invention threatened to be more deftructive, perhaps none was ever more beneficial to the human race. By the ufe

Civil
Hiftory.
of fire-arms, nations are pun more on a level with each other than formerly they wete; wat is redicedto a regular fyttem, which may be ftudied vith as much fuccefs as any other fcience. Conquefts are not now to be made with the fame eafe as formerly; and hence the laft ages of the world have been much more quiet and peacrable than the former ones. In 1453, the conquest of Conftantinople by the Turks fixed that wandering people to one place : and though no $x$ they poliefs very large regions both in Europe, Alia, and Africa, an effectual ftop hath long been put to their further progrefs.

About this time, alfo, learning began to revive in Europe, where it had becil long lott; and the invention of printing, which happened about the fame t'me, rendered it in a mannerimpolible for barbarifin ever to take place in fuch a degree as formerly. All nations of the world, indeed, feem now at once to have laid alide much of their former ferocity: and, though wars have by no means been uncommon, they have rot been carried on with fuch circumftances of fury and favage crueity as before. Inftead of attempting to enrich themfelves by plunder, and the fpoils of their neighbours, mankind in general have applied themfelves to commerce, the only true and durable fource of riches. This foon produced improvements in navigation ; and the fe improvements led to the difcovery ot many regions formerlyunknown. Athefame time, the European powers, being at ldit thoroughly fenfible that extenfive conquefts conld never be permanent, applied themfelves more to provide for the fecurity of thofe dominions which they already poffeffed than to attempt the conqueft of one another: and this produced the policy to which fo much attention was lately paid, namely, the priferving of the balance of Europes that is preventing any one of the nations from acGuiring fufficient itrength to overpower anether.

In the end of the 15 th century, the valt continent of America was difoovered ; and, almoft at the fame time, the paffage to the Eaft-Indies by the Cape of Good Hope. The difcovery of thefe rich comntries gave anew turn to the ambition of the Europeans. To cnrich themfelves, either by the gold and filver 1 roduced in thefe countries, or by traffic with the natives, now became the object. The Portuguefe had the advantage of being the firft difcoverers of the eafrern, and the Spaniards of the weftern comatries. The former did not neglect fo favourable an opportunity of enriching themfelves by commerce. Many fettlements were formed by them in the Eaft-India iflands, and on the cominent : but their avarice and perfidious behaviour towards the natives proved at laft the caule of their total expulfion The Spaniards enriched themfelves by the vait quantities of the precious metals imported from America, which were not obtained but by the moft horrad maffacres committed on the natives, and of which an account is given under the differentnames of the American countrics. Thefe porfetfons of the Spaniards and Portugucfe foon excited other European nations to make attempts to flare with them in their trealures, by planting colonies in diferent parts of America, and making fettlements in the Eaft Indies; and thus has the rage of war in fome meafure been transferred from Euro ${ }^{\circ}$ e to the fe diftant regions: and, ater various conters, the Britilh at laft
Vul Vill.
obtained a great fuperiority in the faft Indic, and in Amcrica previous to the late revolution.

In Europe the only confiderable revolutions which Itappened during this period, were, The total cxpulfion of the Moors and Saracens from Spain, by the taking of Grenada in I49I; the uniou of the kingdoms of Arragon and Caftile, by the marriage of Fcrdinand and liabella; and the revolt of the ftates of Holland from the Spaniards. After much conteition and bloodfled, thefe laft obtained their liberty, and were decletred a frce people in 1609: fince which time rhey have continued an independent and very confiderable nation of Europe.

In A fia nothing of importance hath happened fince the taking of Conftantinople by the Turks. That continent is now divided among the following nations. The moft northerly part, called Siberia, extending to the very extremity of the continent, is under the power of Rulfia. To the fouthward, from Afia Minor to China and Korca, are the Tartars, formidable indeed from their numbers, but, by reafon of their barbarity and want of anion, incapable of attempting: any thing. The Turks poffefs the weftern part of the continent called Afia Minor, to the river Euphrates. The Arabs are again confined within their own peninfula; which they poffers, as they bave ever doice, without owning fubjection to any foreign power. Tis the eaft of Turkey in Alia lies Perfia, now more collfincd in jts limits than before; and to the cattward of Perfia lies India, or the kingdom late of the Mogul, comprehending all the country from the Indus to the Ganges, and heyond that river. Stiil farther to the eaft lie the kingdoms of Siam, Pegn, Thibet, and Cochin-China, little known to the Europeans. 'The vaft-empire of China occupies the mont eafterly part of the continent; while that of Japan compreliends the illands which go by that name, ano which ar: fuppofed to lie at no great diftance from the weftern coafts of America.
In Africa the Turks poffefs Egypt, which they co:quered in 1517 , and have a nominal jurifdiction over the fates of Barbary. The interior parts are filled with barbarous and unknown nations, as they have always been, On the weitern coaits are many fettlements of the European nations, particularly the Britifh and Portuguefe; and the fouthern extremity is poffeffed by the Dutch. The eaftern coafts are almof totally unknown. The Afiaticand African illands are either poffeffed by the Europeans, or inhabited by favage nations.

The European nations at the beginning of the 17 th century were, Sweden, Mufcovy, Denmark, Poland, Britain, Germany, Holland, France, Spain, Portugal, Italy, and Turkey in Europe. Of thefe the Ruffians, though the moft barbarons, were by far the moft confiderable, both in regard to numbers and the extent of their empire ; but their fituation made them little feared by the others, who lay at a diftance from them. The kingdom of Poland, which was firft fet up in the year 1000 , proved a barrier becwixt Rufia and Germany ; and at the fame time the policy abovementioned, of keeping up the balance of power in Europe, rendered it probable that no one European nation, whatever wars it might be engaged in, would have been totally deftroyed, or cealed to exilt
rivi! Hilicry.

Ecclefia. as a diftinet lingdom. The late difmemberment of
tetcal.
Hiftory.

Poland, however, or its partition between the three powers, Kullia, Hungary, and Puifia, was a ftep very inconfiftent with the above political fyftem; and it is furprifing with what tamenefs it was acquiefced in by the other powers. Subfequent circumftances particularly the paffivenefs with which the ambitious defigns of Ruffia againft the Porte have been folong beheld, feem to indicate a total dercliction of that fcheme of equilibrinm, formerly fo wifely, though perhaps fometimes too anxioufly, attended to.

The revolution of the Britifh colonies in America, it was fuppofed by the enemies of Britain, would have given a tatal fhock to her ftrength and wonted fuperiority. The confequences, however, have been very different. Thofe colonies, it is trae, have bcen disjoined from the morher comiry, and have attained an independent rank among the nations. But Britain has had nocaufe to repine at the feparation. Divefted only of a fplendid encumbrance, an expenfive and invidious appanage, the has been left to enjoy the undivided benefits of her native vigour, and to difplay new energies, which promife her mild empire a long and profperous duration. On the other hand, the flame which was to have blazed only to her prejudice, has brought confufion on her chief foe; and the ambition and tyranny of that branch of the houfe of Bourbon which lias been long the peft of Europe, now lie humbled in the duft. The French, indeed, have thus become a nation of freemen as well as the Americans and the Britifh; who, by the way, were never otherwife, nor ever knew what oppreffion was except in inflicting it upon their African brethren, But neither is the French revolution an event which Britons, as lovers of liberty and friends to the rights of mankind, hould regret; or which, even in a polirical view, if duly conlidered, ought to excite either their jealoufy or apprehenfion. In fine, we feem to be advancing to a great era in the hiftory of humanaffairs. The emancipation of France, it is not to be doubted, will in time be followed by that of Spain, and other countries of Europe. The papal power, too, that fcourge of nations, is declining; and the period feens to be approaching when the Roman pontiff will be reduced to his original and fimple title of biJhop of Rome More liberal ideas both in politics and rcligion are every where gaining ground. The regulation, and perhaps in time the abolition, of the flave-trade, with the endeavours of the focieties for difcovering Africa, may lead to the civilization of fome parts of that immenfe continent and open new markets for manufactures. Finally, the Americans having eftablifhed a fettled government, have already become a great commercial people.

## SECT. II. Ecclefiaftical Hiftory.

50
Revolutions ist re ligion feldom happen.

THE hiftory of religion, among all the different nations that have exifted in the world, is a fubject no lefs important and interefting than that of civil hiftory. It is, however, lefs fertile of great events, affords an account of fewer revolutions, and is much more uniform than civil hiftory. The reafon of this isplain. Religion is converfant aboht things which cannot be feen; and which of confequence cannot fuddenly and Rrongly affect the fenfes of mankind, as
natural things are apt to do. The expectation of Ecclefia worldly riches can eafily induce one nation to altack another ; but it is not eafy to find any thing which will induce a nation to change is religion. The invilible nature of $1_{1}$ iritual things, the prejudice of habit and of eatly education, all fand in the way of changes of this hind. Hence the revolutions in religion have been but few, and the duration of amoft any religion of longer ftanding than the molt celebrated empires, the changes which have happened, in general have required a long time to bring them abont, and liftury fearce affords an inftance of the religion of any nation being effentially and fuddenly changed for a nother.

With regard to the origin of religion, we muft have recourfe to the Scriptures; and are as neceifarily conftrained to adopt the account there given, as we are to adopt that of the creation given in the fame book; namely, becaufe no other batio made its ap. pearance which feems in any degree rational, or confiftent with itfelf. - In what manner the true religion given tu Adam was fallified or corropted by his defcendants before the flood, doth not clearly appear from Scripture. Idolatry is not mentioned; neverthelefs we are affured that the inhabitants of the world were then exceedingly wicked: and as their wickednefs did not confift in worlhipping talfe gods, it may be concluded that they worlhipped none at all; i. e. that the crime of the antediluvians was deifm or atheifn.

After the Hood, idolatry quickly made its appearance: but. what gave riie to it is not certanly known. This fupertition indeed feems to be nataral to man, efpecially when placed in fuch a fituation that he hath lictle opportunity of inftraction, or of improving his rational faculties. This feems alfo probable from a caution given to the Jews, left, when they looked up to the fun, moon, and fars, and the reit of the hoft of heaven, they fhould be driven to wor fhip them. The origin of idolatry among the Syrians and Arubians, and alfo in Greece, is thercfore accounted for with great probability in the following manner by the author of The Ruins of Babeck. "in thofe uncomfortable defarts, where the day prefents nothing to the view but the uniform, tedious, and melancholy profpect of barren fands, the night difclofes a most diclightful and magnificent fectacle, and appears arrayed with charms of the moft attractive kind. For the moft part unclouded and ferene, it exhibits to the wondering eye the hoft of heaven in all their variety and glory. In the view of this ftupendons fcene, the tranfition from admiration to idolatry was too ealy to uninftructed minds; and a people whofe climate offered no beauties to contemplate but thofe of the firmament, would naturally look thither for the objects of their worfhip. The form of idolatry in Greece was different from that of the Syrians; which perhaps may be attributed to that fmiling and variegated fcene of mountains, valleys, rivers, woods, groves, and fountains, which the tranfported imagination, in the midit of its pleafing aftonifhment, fuppofed to be the feats of invifible deities."

A difficulty, howevever, arifes on this fuppofition; for if idolatry is naturally produced i:1 the mind of uninftructed and favage man from a view of tise creation, why hath not idolatry of fome hat or other

Ecclefia- taken place among all the different nations of the ftical world? This certainly hath not been the cafe; of Hifory. which the moft ftriking examples are the Perfians of old, and the Moguls in more modern times. Both theie nations wereftrict deifts: fo that we muft allow fome other caufes to concur in producing idolatry befides thefe already mentioned; and of thefe caufes an imperfect and obfcure notion of the true religion feems to be the moft probable.

Though idolatry, therefore, was formerly very prevalent, it neither extended over the whole earth, nor were the fuperfitions of the idolaters all of one kind. Every nation had its refpective gods, over which one more excellent than the reft was faid to prefide; yet in fincli a manner, that this fupreme dcity himfelf was controuled by the rigid empire of the fates, or by what philofophers called efernal necefity. The gods of the eaft were different from thofe of the Gauls, the Germans, and the other northern nations. The Grecian divinities differed widely from thofe of the Egyptians, "ho deified plants, animals, and a great varicty of the productions both of nature and art. Each people alfo had their own particular manner of worfhipping and appeafing their refpective deitics, entirely difterent from the facred rites of other countries. All this variety of religions, however, produced neither wars nor diffentions among the different nations; each nation fuffered its neighbours to follow their own method of worfhip, without difcovering any difpleafure on that account. There is nothing firprifing in this mutual toleration, when we confider, that they all looked upon the world as one great empire, dividedinto various provinces, over each of which a certain order of divinities prefided, for which reafon they imagined that none conld behold with contempt the gods of other uations, or force ftrangers to pay homage to theirs. - The Romans exercifed this toleration in the moft ample manner; for though they would not allow any change to be made in the religions that were publicly profeffed in the empire, nor any new form of worthip to be openly introduced, yet they granted to their citizens a full liberty of obferving in private the facred rites of other nations, and of honouring foreign deities as they thought proper.

The heathen deities were honoured with rites and facrifices of various kinds, according to their refpective natures and offices. Their rites were abfurd and ridiculous; while the priefts, appointed to prefide over this ftrange worfhip, abufed their anthority, by deceiving and impoling upon the people in the grofeit 53
State of religrion at the appearance of Chrift.

From the time of the flood to the coming of Chrift, idolatry prevailed among alnoft all the nations of the world, the Jews alone excepted; and even they were on all occations ready to rum into it, as is evident from their Hiftory in the Old Tetament. At the time of Chrift's appearalice, the religion of the Romans, as well as their empire, extended over a great part of the world. Some peonle there were among the heatheus who perccived the abfurdities of that fyftem, bur being deftitute of means, as well as of abilities, to effect a reformation, matters went on in their old way. Thongh there were at that time varions fects of philofophers, yet all of them proceeded upon falfe principles, and confequently could be of
no fervice to the advancement or reformation of religion. Nay, fome, among whom were the Epicareans and Academics, declared openly againt every kind of religion whatever.

Two religions at this time flourifhed in Palefine, viz. The Jewifh and Samaritan; between whofe respective followers reigned the moft violent hatred and contempt. The difference between them feems to have been chiefly about the place of worlhip; whic! the Jews would have to be in Jerufalem, and the Samaritans on mount Gerizzim. But though the jews were certainly right as to this point, they had gready corrupted their religion in other refpects. They expected a Saviour indecd, but they miftook his character ; imagining that he was to be a powerful and warlike prince, who fhould fet them free from the Roman yoke, which they bore with the utmof impatience. They alfoimagined that the whole of religion conlinted in obferving the rites of Mofes, and fome others which they had added to them, without the leaft it gard to what is commonly called morality or virtue ; as is evident from the many charges our Saviour brings againft the Pharifees, who had the greateft repuration for fanctity among the whole nation. To thefe corrupt and vicious principles they added feveral abfurd and fuperftitious notions concerning the divine narure, invifible powers, magic, \&e. which they had partly inbibed during the Babylonian captivity, and partly derived from their neighbours in Arabia, Syria, and Egypt. The principal fects among thein werethe Essenes or Effenians, Pharisees, and Sadducees. The Samaritans, according to the moft general opinion, had corrupted their religion ftill more than the Jews.

When the true religion was preached by the Saviour of mankind, it is not to be wondered at if he became on that account obnoxious to a people fo decply fank in corruption and ignorance as the Jews thea were. It is not here requifite to enter into the particulars of the doctrine advanced by hin, or of the oppofition he met with from the Jews; as a full account of thefe things, and likewife of the preaching of the golpel by the Apoftes, may be found in the New Teftament.-The rapidprogrefs of the Chriftian religion, under thefe faithful and infpired minifters, foon alarmed the Jews, and raifed variousperfecutions againft its followers. The Jews, indeed, feem at irft to havebeen every wherethe chief promoters of perfecution; for we find that they officioully went from place to place, wherever they heard of the increate of the gofpel, and by their calumniesand falfe fuggeftions endeavoured to excite the people againft the Apoftes. The Heathens, however, though at firft they fhowed no very violent fpirit of perfecation againft the Chriftians, foon canc to hate them as much as the Jews themfelves. Tacitus acquaints us with the caufes of this hatred, when fpeaking of the firf general perfecution under Nero. Thut inhuman emperor having, as was fuppofed, Cet fire to the city of Rome, to avoid the imputationof this wickednefs, transfersed it on the Chriitians. Our author intorms us that they were aireddy abborred on account of their many and enormous crimes. Tacitur's "Theauthor of thisname (Cbriftians)," fays he, "was the firf Christ, who in the reign of Tiberius, lias execu- perfecution ted under Pontius Pilate, procurator of judæa. The by Nero.

Ecclefiaftical Hiftury.
peftilent fuperfition uas for a while fuppreffed : hut it cevired again, and Spread, not only over Judæa, wherethis cuil was firft broached, but reached Rome, whither irom evesy quarter of the earth is conftantly flowing whaterer is hideous and abominable amongth n.th, and is there readily embraced and practifed. Firft, therefore, were apprehended fuch as openly avowed themfelves to be of that fect; then by them were difcovered an immenfe multitude; and all were convicted, not of the crime of burning Rome, but ol hatred and enmity to mankind. Their death and tortures were aggravated by cruel derifion and fport; for they were cither covered with the $\mathbb{1}$ kins of wild beafts and torn in pieces by devouring dogs, or faftened to croffes, or wrapped up in combittible garments, that, when the day-light failed, they might, like torches, ferve to difpel the darknefs of the night. Fence, towards the miferable fufferers, however guil: ty and deferving the moft 'xemplary punifhnent, conpathon arofe; feeing they were doomed to perifh, not with a view to the public grood, but to gratify the cruelty of one man."

That this account of Tacitus is downright mifreriefentation and calumny, muft be cuident to every one who reads it. It is imponifle that any perfon (all be convicted of hatred and enmity to mankind, without fpecifying a number of facts by which this hatred hewed itfelf. The burning of Rome would indeed have been a very plain indication of enmity to mandind; but of this Tacitus himfelf clears them, and mentions no other crime of which they wereguilty. It is probable, therefore, that the only reafon of this charge againft the Chriftians, was their abfolute refufal to have any thare in the Roman worthip, or to countenance the abfurd fuperftitions of Paganifm in any degree.
The perfecution under Nero was fucceeded by another under Domitian ; during which the Apoftle Join was banifhed to Parmos, where he faw the vifions, and wrote the book called his Revelations, which completes the canon of Scripture. This perfecution commenced in the 95th year of the Chriftian era; and John is fuppofed to have written his Revelation in the year af:er, or in the following one.

During the firft century, the Chriftian religion fpread over a great number of different countries; but as we have now no authentic records concerning the travels of the Apoftles, or the fuccefs which attended them in their miniftry, it was impoffible to determine how far the gofpel was carried during this period. We are, however, affured, that even during this early period many corruption's were creeping in, the progrefs of which was with difficulty prevented even by the apoftles themfelves. Some corrupted their profeffion by a mixture of Judaifm, others by-mixing it with the oriental philofophy; while others were already attempting to deprive their brethren of liberty, fetting themfelves up as eminent paftors, in oppofition even to the apoftles, as we learn from the epiftles of St Paul, and the thind epifte of St John. Hence arofe the fects of the Groftics, Cerinthians, Nicolaitans, Nazarenes, ribionites, \&ic. With which the church was troubled dring this centiry.

Conceming the ceremonies and method of worthip ufed by the Cfrinams of the firf century, it is impof.
ible to fay any thing with certainty. Neither is the Eicelefidchurch order, yovernment, and dif ipline, durng this fical period, afecrtained with any degrce of exactnctis. Earl of thofe parties, therefore, which exift at this day, contends with the greate at carinctintsto forthat particular mode of wor hip which they themfelves have adonted; and foute of the noft ligoted would williagly monopolize the word chus of in fuch amanaer as to exclude trom all hope of fatration every one who is not attached to their particular party, It doth not however appear that, excepting baptifn, the tord's fupper, and anointing the tick with oil, any exiernal cerenomies or fymbols rete properly of divine appointment. According to Lr follein, " there are feveral circumfances which incline us to thisk, that the friends and apoftes of our bleffed Lord cither rolerated throitgh neceifity, or appointed fir uife reafons, many other external rites in varions places. At the fame time, we are not to imagine, that they ever conterred upon any perfon a perpetual, indelible, pontific. 1 anthority, or that they enjoined the fame rites in all claurches. Welearn, on the contrary, from aurhentic records, that the Chriftian worlhip was from the beginning celebrated in a different manner in diferent places; and that, no doubt, by the orders, or at leaft with the approbation, of the apoftles and their difciples. In thofe early times, it was both wife and ncceffary to thew, in the eftablifhment of outward forms of worllip, fome indulgence to the ancient opinions, maniners, and laws, of the refpective nations to whom the gofpel was preached."

The fecond century commences with the thirdyear 56 of the emperor Trajan. The Chriftians were fill per- the fecond fecuted; but as the Roman emperors were for the moft cutury. part of this century princes of a mild and moderate rurn, they perfecuted lefs violently than formerly. Marcus Aurelins, notwithftanding the clemency and philofophy for which he is fo much celebrated, treated the Chriftians worfe than Trajan, Adrian, or even Severus himfelf did, who was noted for his cruelty. This refpite from rigorous perfecution proved a very favourable circumfance for the fpreading of the Chriftian religion ; yet it is by no means eafy to point out the partucular countries throngh which it was diffufed. We are, however, affured, that in the fecond century, Chrift was worthipped as God almoft through the whole eaft ; as alfo among the Gemmans, Spaniards, Celtes, and many other nations : but which of them received the gofpel in the firft century, and which in the fecond, is a queftion unanfwerable at this diftance of time. The writers of this century attribute the rapid progrefs of Chriftianity chiefly to the extraordinary gifts that were imparted to the firft Chriftians, and the niracles which were wrought at their command ; without fuppofing that any part of the fuccefs ought to be afcribed to the intervention of human means, or fecondary caufes. Many of the moderns, however, are fo far from being of this opinion, that they are willing either to deny the atthenticity of all miracles faid to have been wrought fince the days of the apoftes or to afcribe them to the power of the devil. To enter into the particulars of this controverfy is foreign to our prefent purpofe; for which reafon we muft refer to the writers of polemic divinity, who lave largely treated os his and other points of a timilar nature.

Ecclefia- The corruptions which had been introduced in the ftical firft century, and which were almolt coeval with ChriHiftory. fianity itfelf, continued to gain grand in the fecond.

57 Ceremonies, in themfeives futile and afelefs, but which
Ceremonies mut be confidered as higbly pernicions when joincd
muntiplied. to a religion incapable of any other ornanemt than the upright and virtuous conduct of its profeliors, were multiplied for no other purpofe than to pleate the tanorant multitudc. The immediate confequence of this was, that the attention of Chriftians was drawn alide fron the important duties of moralicy; and they were led to imarine, that a careful obfervance of the ceremonics might maine amends for the negle of moral daties. Tnis was the molt pernicious opinion that cond polfibly be entertainced; and was indecd the very ioundation of that enormous fyytom of ceclediatical poucr whin afterwards twok place, and held the
58 whole world in lavery and barbariom for mally ages. Myfteries Another mifchief was the introduction oimyjtiries, introduced. as hey were called, into the Chriftian religion; hat is, infinuating that fome parts of the worfipip in common ufe had a hidden efficacy and power far fuperior :o the plain and obvious meaning alfined to them by the vulgar: and by paying peculiar refpect to the fe myfteries, the pretended teachers of the religion of fefas accommodated their doctrines to the tafteof the ir larathen neighbours, whofe religion confifted in a heap of myfteries, of which nobody knew the meaning.
The teach- By thefe, and other means of a fmilar kint, the ers affume Chriftian pators greatly abridged the libery of their a power over the people. Hocks. Being mafters of the ceremonies and myiterics of the Chrifian religion, they had it in their power to make their followers wor thip and belicve whatever they thought proper ; and this they did not iail to make ufe of for their own advantage. They perfnaded the people, that the minifters of the Chriftian charch fucceeded to the character, rights, and privilcges of the Jewifh priefthood; and accordingly the bifhops contidered themfely es as invefted with a rank and character fimilar to thofe of the high-prieft among the Jews, while the prefbyters reprefented the priefts, and the deacons the Levites. This notion, which was firft introduced in the reign of Adrian, proved a fource of very con60 fiderable honour and profit to the clergy.
Form of
The form of ecclefiaftical government was in this church go century rendered permanent and uniform. One invernment. fpector or bilhop prefided over each Cliriftian affembly, to which office he was elected by the voices of the whole poople. To affift him in his office, he formed a council of prefbyters, which was not confined to any fated number. To the bifhops and prefbyters the minifters or deacons were fubject; and the latter were divided into a variety of claffes, as the different exigencies of the church required. During a great part of this century, the churches were independent of each other; nor were they joined together by afociation, confederacy, or any other bonds but thofe of charity. Each affembly was a little ftate governed by its own laws; which were either enacted, or at leaft approved of, by the fociety. Bit in procefs of time all the Chriftian churches of a province were formedinto one large ecclefiaftical body, which, like confederate fates, affembled at certain times, in order to deliberate about the common interefts of the whole. This inftiation had its of gin among the Greeks; but in a thort time
itluecame univerfal, and fimilar affemblies we e formed in all places where the gofpel had been plated. Thefe afemblies, which contifted of the depatics or commifioners from feveral churches, were called $f y$ nods by the Greciss, and comocius by the Latins; and the laws cuacted in thefe general mectings were called canous, i. e. rules.

Thefe councils, of which we find not the finallent trace before the middle of this century, changed the whole face of the church, and gaveit a new form; for by them the ancient privileges of the people were confiderably diminifhed, and the power and authorjey of the bifhops greatly angmented. The humility, inciced, and prudence, of theie pions prelates hondered them from alfuning all at once the power with which they were afterwards invefted. At their orft appearance in thefe general councils, they acknowledged that they were no more than the delegrates of hiteir refpective churches, and that they acted in the nume and by he appointment of their people. But they foon changed this humble tone; impercepribly extended the limits of their authority; turned their influcace into dominion, their comfels into laws; and at lengib openly aiteried, that Chrift had empowered them to prefcrive to his people authoritutive wies of faith and manners. Anuther effect of thefe conncils was the gradaal abolition of that perfect equality which regned among all bithops in the primitive times: for the order and decency of the le affemblies required, that fome one of the provincial bihops met in council fhould be inveited with a fuperior degrec of power and anthority; and hence the rights of metropolitans derive cheir origin. In the mean time the bounds of the church were enlarged; the cuftom of holding crancils was followed wherever the found of the gofel had reached; and the univerfal church had now the appearance of one vaft republic formed by a combination of a grear number of little fates. This occalioned the creation of a new order of ecclefiaftics, who were apponted in different parts of the world as heads of the charch, and whofe office it was to preferve the coniatence and union of that immenfe body, whofe members were fo widely dififerted throughoat the hations., Such was the nature and office of the Patriarchs; amons whom, at length, ambition, being arrived at its moft intolent period, formed a new dignity, invefting the bifhop of Rome with the title and authority of the prince of the Putriarchs.

During the fecond century, all the fects continued ${ }_{A c c} \mathbf{6 2}_{2}$ which had fprung up in the firft, with the addition of Account of feveral others; the moft remarkable of which were the tics, Afcetics. Thefe owed their rife to an error propagated by fome doctors of the church, who afferted that Clurift had eftablifhed a double rule of fanctity and virtue for two differenc orders of Chriftians. Of thefe rules, one was ordinary, the other extraordinary; the one of a lower dignity, the other more fublime: the firft for pertons in the active fcenes of life; the other for thofe who, in a facred retreat, afpired after the glory of a celcfitial ftate. In confequence of this fyitem, they divided into two parts all thofe moral dotrines and inftructions which they had received either by writing or tradition. One of thefe divifions they called precepts, and the other comnfels. They gave the name of precepts to thofe laws that ivere mive fally oblica-

frical Hitcoy.
general principle varioully modified, according to the dificrent difpotitions of mankind.

The Alcetic fect began firft in Egypt, from whence it paffed into syria and the neighbouring countries. At length it reached the European nations: and Fence that train of auftere and fuperfitious vows and rites which totally obfcured, or rather anminilated, Chriftianity; tae celibacy of the clergy, and many olher abfurdities of the like kind. The errors of the Afetics, however, did not ftop here: In compliance with the doctrines of fome Pagan Philofophers, they affirmed, that it was not only lawful, but even praifeworthy, to deceive, and to ufe the expedient of a he, in order to advance the caufe of piety and tiuth; and hence the pions frauds for which the church of Rome hath been fo notorious, and with which the hath been fo often and juttly reproached.

As Chriftians thus deviated more and more from the true practice of their religion, they became more zealous in the external profeffion of it. Anniverfary feftivals were cel-brated in commemoration of the death and refurrection of Chrift, and of the effufion of the Floly Ghoft on the Apoftles. Concerning the days on which thefe feftivals were to be kept, there a ofe violent contefts. The Afiatic churches in general feftivals. differed in this point from thofe of Europe ; and towards the conclation of the fecond century, Victor, bifhop of Rome took it in his head to force the eaftern churches to follow the rules laid down by the weftern ones. This they abfolutely refafed to comply with: upon which Victor cut them off from communion with the charch of Rome; though by means of the interceffion of fome prudent people, the difference was made up for the prefent.

During moft of the third century, the Chrifians 64 Third cen were allowed to enj y their religion, fuch as it was, turywithout moleftation. Thecmperors Maximinus and Decins, indeed, made them feel all the rigours of a feverc perfecution; but their reigns were thert, and from the death of becius to the time of Dioclefiain the church enjoyed tranquillity. Thus vaft multitudes were converted; but at the fame time the doetrine grew daily more corrupt, and the lives of profelfed Chriftians more wicked and fcandalous. New ceremonies were invented in greatnumbers, and an unaccountable paffion now prevailed for the oriental fuperftitions concerning demons; whence proceeded the whole train of exorcifm, fpells, and fears for the apparition of evil firits, which to this day are no where cradicated. Hence alfo the cuftom of avoiding all connections with thofe who we e not baptifed, or who lay under the penaity of excommunication, as perfons fuppofed to be under the dominion of fome evil fpirit. And hence the rigoar and feverity of that difcipline and penance impofed upon thofe who had incurred, by their immoralitics, the cenfure of the church. Several lterations were now made in the manner of celebrating the Lord's fupper. The prayers ufed on this accation were lengthened, and the folemnity and pomp with which it wasattended were confiderably increafed. Gold and filver veffels were ufed in the celehration; it was thonght effential to falvation, and for that reafon adminiftered even to infants.-Baptifm was celcbrated twice a year to fuch as, after a long courfe of trial and preparation, offered themfelves candidates.

The

Ecclefia- The remiffion of fins was thought to be its immediate fical confequence; while the bihop, by prayer and impoHiftory. fition of hands, was fuppofed to conter thole fancintyins gifts of the Holy Gliof that are necentiary to a life f righteouinels and virtue. An evil demon was fapposed natural!y to relide in every perfon who was the author and fource of all the corrupt difonitions and untighteous a ions of that perfon. The driving out of this demon was therefore an effenial requifite for baptifin ; and, in confequence of this opinion the baptized perfons returned home clothed in white garments, adorned with crowns, as facred emolems, the former of their inward purity and innocence, and the latter of their victory over fin and the world.Faftings began now to be held in more eftecm than formerly. A high degree of fanctity was attriutited to this practice, it was even looked upon as indifpenfably neceifary, from a notion biat the demons directed their force chiefly againft thofe who pampered themfelves with delicioms rares and were lefs troublefome to the lean and hungry wholived under the leverities of a rigorous abstinence.-- The dign of the crofs allo was fuppofed to adminilter a victorions power over all forts of trials and calamities; and was more efpecially conlidered as the fureft defence againit the finares and ftratagems of malignant firits; for which reafon, no Chriftian undertook any thing of moment, without arming himfelf, as he imagined, with the power of this trumphant fign. The herefies which troubled the church during this century, were the Gnosiics, ( whofe ductrines were new-modelled and improved by Mancs, from whom they were atterwards chietly called Mianichea:s), the Mieracites, Noetians, Sabeleans, and Novatians; for a particular account of which, fee thufe articles.
$\stackrel{65}{ } \quad \begin{gathered}6 \\ \text { Fourth cen- }\end{gathered}$ tury,

The fourilh ct-tury is remarkable for the eftablifle ment of Chriftianity by law in the Roman empire; which, however, did not take place till the year 324. In the beginning of this century, the empire was governed by four chiefs, viz. Lioclefian, Maximian Conftantius Chiorus, and Galerius, under whom the church enjoyed a perfeet roleration. Lioclefian, tho' much addicted to firperftition, had no ill-will ugainft the Chriftians; and Conftantius Chlorus, having abandoned polytheifm, treated them with contefeenfion and benevolence. This alarmed the Pagan priefts, whofe interefts were fo clofely connected with the continuance of the ancient fuperfitions; and who apprchended, not without reafon, that the Chriftian religion would at length prevail throughout the em-pire. To prevent the downfal of the pagan fuperftition therefore, they applied to Dioclefian aud GaleriusCæfar : by whom a moft bloody perfecution was commenced in the year 303, and continued till 3 II. An afylum, how ever, was opened for the Chriftians in the year 304. Galerius having dethroned Dioclefian and Maximian, declared himfelf emperor in the eaft; leaving all the weftern provinces to which grear numbers of Chriftians reforted to avoid the cruelty of the former to Confantius Chlorus. At length Galerius, being overtaken with an incurable and dreadful difeale, publiflied an edict ordering the perfecution to ceafe, and reftoring freedom to the Chriftians, whom he had moft inhumanely oppreffed for eight years. Galcrius died the fame year; and in a hort time af-
ter, when Conftantine the Great afcended the throne, the Chriftianswere freed from any farther uneafinefs by his abrogating all the penal laws againtt them; and afterwards illining edicts, by which no other religion than che Chriftian was tolerated throughout the empire.

This event, however, fo favourable to the outward peace of the church, was far from promoting its interllal harmony, or the reformation of its baders. The clergy, who had an this time been augmenting their Increafe of power at the expence of the liberty of the people, now its corrup let no bounds to their ambution. The bifhop of Rome tions, was the firft in rank, and diftinguithed by a fort of pre-eminency above the reft of the prelates. He furpaffed all his brethren in the magnificence and fpiendor of the church over which he prefided, in the riches of his revenues and polfeinons, in the number and variety of his minifter's, in his credit with the people, and in his fumptuous and fplendid manner of living. Hence it ha ppened, that when a new pontif was to be chofen by the preibyters and people, the city of Rome was gencrally agitated with dilienfions tumults, and cabals, wiich, often produced fatal confequences. The intrigues and difurbances which prevailed in that city in the year 366, when, upon the death of Liberius, another pontift was to be chofen in his place are a fufficieni prool of what we have advanced. Upon this occalion, one faction clected Damafus to that highdignity; while the opporite party chofe Urficinus, a deacon of the vacant church, to fuccced Liberins. This donble election gave rife to a dangerous fchifm, and to a fort of civil war within the city of Rome: which wás carried on with the atmoft barbarity and fury, and produced the moft cruel maffacres and defolations. inc inhuman content ended in the victory of Damafus; but whether his canle was more juft than that of Urficinus, is not fo tatily determined.
Notwilhftanding the pomp and fplendor which furrounded the Roman fee, it is ceatain that the bithops of Rome had not yet acquired that pre-eminence of
power and jurifdiction which they afterwards enjoyed. of Rome had not yet acquired that pre-eminence of
power and jurifdiction which they afterwardsenjoyed. in the ecclefiatical commonvealth, indeed, they were the moft eminent order of citizens; but ftill they were the mort eminent order of citizens; but ftill they were
citizens as well as their brethren, and fubject, like them, to the laws and edicts of the emperors. All religious caufes of extraordinary importance were examined and determined, either by judges appointed by the emperors, or councils affembled for that purpoie; while thofe of inferior moment were decided in
each diftrict by its refpective bifhop. The ecclefiatieach diftrict by its refpective bifhop. The ecclefiafticallaws were enacted either by the emperor or comicils. None of the bifhops acknowledged that they de-
rived their authority from the permiftion and appointcils. None of the bifhops acknowledged that they de-
rived their authority from the permiffion and appointment of the bifhop of Rome, or that they were created
bifhops by the favour of the apoftolic; fee. On the conment of the bifhop ofRome, or that they were created
bifhops by the favour of the apoftolic; fee. On the contrary, they all maintained that they were the amballadors and minifters of Jefirs Chrift, and that their au-
thority was derived from above. It muft, however, dors and minifters of Jefins Chrift, and that their au-
thority was derived from above. It muft, however, be obferved, that even in this century feveral of thofe Iteps were laid by which the bihops of Rome mounted afterwards to the fummit of ecclefiaftical power and defpotifm. This happened partly by the im rudence of the emperors, part:y by the dexterity of the Roman prelates themfelves, and partly by the inconfos-

 .

Ecclefia- Yate zeal and precipitate judgment of certain bifhops.
fical Hiftory. The improdence of the cmperor, and precipitation of the bifhops, were remarkably difcovered in the following event, which favoured extremely the ambition of the Roman pontiff. About the year 372 , Valentinian enacted a law, empowering the bilhop of Rome to examine and judge other bihops, that religions difputes might not be decided by any profane or fecular judges. The bithopsymembled in council at Rome in 378, not confidering the fatal confequences that must arife from this imprudent law both to themfelves and to the church, declared their approbation in the ftrongeft rerms, and recommended the execution of it in their addrefs tothe emperor Gratian. Some think, indeed, that this law empowered the Roman bifhop to judge only the bifhops within the limits of his jurifdiction; others, that his power was given only for a certain time, and for a particular purpofe. This laft notion feems the nof probable; but fill this privilege muft have beefr an excellent infrument in the hands of facerdrtal ambition.

By the removal of the feat of empire to Confantitrople, the emperor raifed up, in the bifhop of this new metropolis, a formidable opponent to the bilhop of Rome, and a bulwark which threatened a vigorous oppofition to his growing authority, For as the emperor, in order to render Conftantinople a fecond Rome, enriched it with all the rightsand privileges, honours and ornaments, of the ancient capital of the woild; fo its bimop, meafuring his own dignity and rank by the magnificence of the new city, and its emincace as the refidence of the emperor, affumed an equal degree of dignity with the bifhop of Rome, and claimed a fuperiority over the reft of the epifcopal order. Nor did the emperors difapprove of thefe high pretendions, fince they confidered their own dighty as connected in a certain meafure with that of the hiflop of their imperial city. Accordingly, in a council held at Conftantinople in the ycar 38 I , by the authority of Theodotins the Great, the bifhop of that city was, during the abfence of the bifhop of Alexandria, and againft the confent of the Roman prelate, placed by the third canon of that council in the firf rank after the bifhop of Rome, and confequently above thofe of Alexandria and Antioch. Nectarius was the firft biflop who enjoyed thefe new honours accumnlated upon the feeot Conftantinople. Hisfacceffor, the cele. brated John Chryfoftom, extended Aill farther the privileges of that fee, and fabjected to jts jurifdiction all Thrace, Afia, and Pontus; nor were the fucceed. ing bifhops of that imperial city deftitute of a fervent zeal to angment their privileges and extend their dominion. By this unexpected promation, the molt difagreeable effects were pioduced. The bifhops of Alexandria were not only filled with the moft inveterate hatred againft thofe of Conftantinopre, but a contention was excited betwetn the bilhops of Rome and Conftantinople; which, after being carried on for many ages, concluded at laft in the feparation of the Greek and Latin churches.
Form of church 'governament eftablifhed by Cosftantine.
which induced him to flit the adininiftration of the Ecclefiachurch to thefe changes in the civil conftitution, this ftical neceffarily introduced among the bihops new degrees Hiftory, of eminence and rank. The four bifhops, of Rome, Conftantiaople, Antioch, and Alexandria, were diftin. guined by a certain degree of pre-eminence over the reft. Thefe four prelates anfwered to the four prætorian prefects created by Conftantine ; and is is poffible, that even in this century they were diftinguifled by the Jewifh titie of patriaribs. After thefe followed the exarchs, who had the infpection of feveral provinces, and anfwered to the appointment of certain civil officers who bore the fame title. In a lower clafs were the metropolitans, who had only the government of one province; under whom were the archbi/bops, whofe infection was confined to certain diftricts. In this gradation the bifoops brought up the rear; but the fphere of their aathority was not in all placesequally extenfive; being in fome confiderably ample, and in others conlined within narrow limits. To hefe yarious ecclefiaftical orders we niight add that of the chorepifcops, orfaperintendents of the country-churches; but this laft order was in moit places frappreffed by the bifhops, with a defign to extend their own anthority, and enlarge the fphere of their power and jurif. diction. The adminiftration of the church itfelf was divided by Confantine into an externaland internalin. fpection. Thelatter, which was commitred to bifhops and councils, related to religious controverfies, the forms of divine worfhip, the offices of priefts, the vices of the ecclefiaftical orders, \&c. The external admeniftration of the church the emperor affumed to himfelf. This comprehended all thofe things which related to the ontward ftate and difoipline of the church; it likewife extended roall contefts that hould arife between the minifters of the church, fuperior as well as inferior, conccruing their pofieffions, their reputation, their rights and privileges, their offences againft the laws, \&c. but no controverlies that related to matters purely firitual were cognizable by this external in-fpection. It confequence of this artful divilion of the ecclefiaftical government, Conftantine and hisfucceffors called councils, prefided in them, appointed the judges of religions controverfies, terminated the differences which arofe between the bifhops and theepeople, fixed the limits of the ecclefiafticat provinces, took coguizance of the civil caufes that fubfifted between the minifters of the charch, and punimed the crimes committed againft the laws by the ordinary judges appointed forthat purpofe ; giving over all caufes purely ecclefiaftical to the bifhops and councils. But this famous divifion of the adminiftration of the church was never explained with fufficient accuracy ; fo that both in the fourth and fifth centuries, there are frequent inftances of the emperors determining matters purely ecelefiaftical, and likewife of bihops and councils determining matters which related merely to the external form and government of the church.

After the time of Confatine many additions we seat After ime of Conftatine many additions were Scandalous made by the emperors and others to the wealth and lives of the honours of the clergy; and thefe additions were fol- clergy. lowed by a proportionable increate of their vices and luxury, particularly among thofe wholived in great and opulent cirics. 'The bifhops, on the one hand, contended with each other in the mof fandalous manner con-

Ecciefia- cerainer the cxtent of their refpective jurifiliojons;
stical
Hiftory. while on che other, they trampled on the rights of the people, violated the privileges of the inf crior minifters, and initated in their conduet and in their manner of living the arrogance, voluptuoufnefs, and luxury of magitrates and princes. This pernicious example was foon followed by the feveral ecclefiallical orders. The preftyters, in many places, alfumed an equality with the bifhops in point of rank and authority. Many complaints are alfo made by the authors of this century about the vanity and effeminacy of the deacons. Thofe more particularly of the prefbyters and deacons whofilled the firft fations of thefe orders, carried their pretenlions to an extravagant length, and were offended at the notion of being placed on an equality with their culleagues. For this reafon they not only affumed the titles of arch-prefoyters and arch-deacons, but alfo claimed a degree of authority and power much fuperior to that which was vefted in the other members of their refpective orders.

In the fifth centary, the bifhops of Conftantinople having already reduced under theirjurildiction all the Afatic provinces, began to grafp at fill further accefof Rome and Conftantinople. fions of power. By the 28 th canon of the council held at Chalcedon in 45 I , it was refolved, that the fame rights and honours which had been conferred on the bilhop of Rome were due to the bifhop of Conftantinople, on account of the equal dignity and luftre of the two cities in which thefe prelates exercifed their authority. The fame council confirmed alfo, by a folemn act, the biffop of Conftantinople in the fpirirual government of thofe provinces over which he had ufurped the jurifdiction, Leo the Great, bifhop of Rome, oppofed with vehemence the pating of thefe laws; and his oppofition was feconded by that of feveral otherprelates. But their efforts were vain, as the emperors threw in their weight into the balance, and thus fupported the decifions of the Grecian bifhops. In confequence, then, of the decilions of this famous council, tha bifhop of Conftanti, ple began to contend obitinately for the fupremacy with the Roman pontiff, and to craft the bifhops of Antioch and Alexandria. About the fame time, Juvenal, bihop of Jerufalem, attempted to withdraw himfelf and his church from the jurifdiction of the $b$ : hop of Cæfarea, and afpired after a place amons the firft prelates of the Chriftian world. The high degree of veneration and efteem in which the church of Jerufalem was held among all other Chrifian focieties (on account of its rank among the apoftolical churches, and its title to the appellation of mither chiarch, as having fucceeded the firt Chriftian affembly formed by the apotles), was extremely favourable to the ambition of Juvenal, and rendered his project much more practicable than it wonld otherwife have been. Encouraged by this, and likewife by the rotection of Theodonus the younger, this afpiring prilate not only allumed the dignity of parriarch of all Pali ftue, a rank which rendered bim independentof all $f_{\text {Piritual aithority ; but all, invaded }}$ the right: of the bilhop of Antioch, and ufurped his jurifuicilion over the provinces of Phonicia and Aribia. Hence arofe a warm contef between Jovenal and Maximus bithof of Autioch; which the council of Chalcedon derided, by reftoring to the latter the provinces of Phonicia and Arabia, and confirming the former Vol. VIll.
in the fpiritual porfethon of all Paleftine and in the Exclefa. high rank which he had affamed in the church. fical
In 588, John, bihop of Contantinople, farnaned the Fafter, either by his own authority or that of the eniperor Mauritius, fummoned a council at Conftantinople to enquire into an accufation bronght againft Gregory, bifhop of Antioch; and upon this occation allumed the title of cectmenical or univerfal bi/hop. Thi; title had been formerly enjoyed by the bihops of Con. ftantinople without any offence; but now, Gregory the Great, at that time biliop of Rome, fufpectinis that John was aiming at the fupremacy over all the charches, oppofed his claim with the greateft vigoar. For this purpofe he applied by letters to the emperor, and others, whom he thought capable of affifting hin in his oppolition : but all his efforts were without effect; and the bifiops of Conftantinople were allowed to enjoy the difputed title, though not in the fenfe which had alarmed the Roman pontiff.

Gregory, however, adhered tenaciondy to his parpofe, rdifed new tumults and diffenfions among the clergy, and aimed at nothing lefs than an anlimited fupremacy over the Chrittian church. This ambitions defign fucceeded in the weft; while in the eaftern provinces, his arrogant pretenfions were farcely refpected by any but thofe who were at ennity with the bifhop of Conitantinople. How much the people were at this time dcluded by the Roman ponitfis,' appeas's from the expreffion of Ennodias, one of the thatterers of Symmachus (who was a prelate of but ambiguous fame), that the Roman pontiff was connituted judre in the place of God, which he filled as the vicegerent of the Moft High. On the other hand, it is certain, from a variety of the molt authentic records, that both the enperors and the nations in general were far from being difpofed to bear with patience the yoke of fervitude which the fee of Rome was arrogantly impoiing on the whole charch.

In the beginning of the feventh century, according origin to the mont learned hittorians, Boniface III. engaged Origin of Pho:as, emperor of Coftantinople, to take from the macy of bihop of that metropolis the title of ceiumenical or the pope. univerfal bifhop, and to confer it upon the Roman pontift; and thus was firft introduced the fitpremacy of the pope. The Roman pontiffs ufed all methods to maintain and enlarge this anthority and pre-eminence which they had acquired from one of the moft odious tyrants that ever difgraced the annals of hiftory.

In the eighth century, the power of the bifhop of Rome, and of the clergy in general, increafet prodigioufly. The chief caule of this, befides the fuperftition of the people, was the method at that time ufed by the European princes to fecure themfelves on their thrones. All thefe princes being then employed either in ufurpation or in felf-defence, and the whole continent being in the moft unfettled and barbarous condition, they endeavoured toattach warmly to their interefts thofe whom they confidered as their friends and clients. For this purpofe they difributed among them extenfive territories, cities, and fortreffes, with the various rights and privileges belonging to them ; refervingonly to themfelves the fuprenie dominion, and the military fervice of thefe powerful vatials. For this reaion it was by the Earopean princes reckoned a high iuftance of political pradence to diftribute among the

4 D bihops

Lesefa- bifhops and other Chrifian docors the fame fort of
Eical
Hiftory.
donations which had iormerly teell given to theilgenerals and clients. By means of the cleroy, they
hoped to check the feditious and turbulemi ipiilis of their vaffals; and to maintain them in their obesience by the influence and authority of their bifhops, whofe commands were highly refpected, and whofe fpiritual thanderbolts, rendered formidable by ignorance, Aruck terror into the boldeft and moft retolute hearts.

This prodigious acceflion to the opulence ald authority of the clergy in the weft, began at their head, viz. the Roman pontiff; from whence it furead gra-dually anong the inferior facerdotal orders. The barbarous nations who had received the gofpel, looked up. on the bilhup of Rome as the fucceffor of their chief druid or high prieft: and as this tremendous druid had enjoyed under the darknefs of Paganirn, a kind of boundiefs anthority; fo thefe barbarous nations thought proper to confer upon the chief bihop the fame authority which had belonged to the chief druid. The pope received thefe auguft privileges with great pleafiare; and leat, upon any change of affairs, attempts fhould be made to deprive him of them, he firengthened his titte to thefe extraordinary honours by a variety of palfages drawn from ancient hiftory, and, what is ftill more aftonifhing, byarguments of a religious nature. This fwelled the Roman druid to an enormous fize; and gave to the fee of Rome that high pre-eminence and defpotic authority in civil and political matters, that were unknown to former ages. Hence among other unhappy circumftances, arofe that monftrous and pernicious opinion, that fuch perfons as werc excluded from the communion of the church by the pontiff himfelf, or any of the bilhops, jorfeited thereby, not only their civil rights and advantages as citizens, but even the common claims and privileges of humanity. This horrid opinion, which was a fatal fource of wars, maffacres and rebellions, withont number, and which contributed more than any thing elfe to confirm and augment the papal authority, was borrowed by the clergy from the Pagan fuperfitions.-Though excommunication, from the time of Conftantine the Great, was in every part of the Chriftian world attended with many difagreeable effects; yet its higheft terrors were confined to Europe, where its arpect was truly formidable and biteous. It acquired alfo, in the eighth century, new acceffions of terror; fo that from that period the excommunication practifed in Europe differed entirely from that which was in ufe in other parts of Chriftendom. Ex. communicated perfons were indeed confidered in all places as objects of hatred both to God and man : but they were not, on that account, robbed of the privileges of citizens, nor of the rights of hamanity; mach lefs were thofe kings and princes, whom an infolent bifhop had thought proper to exclude from the communion of the church, fappofed to forfeit on that account their crowns or their tertitories. But from this century it was quite otherwife in Earope. Excommunication received that infernal power which diffolved all conncetions; fo that thofe whom the bithops, or their chief, exclited from church commanion, were degraded to a level with the beafts. The origin of this unmatural ant! horrid power was as follows. On the convertion of the barbarous mations to Chrintian-
ity, thefe ignorant profelytes confounted the excommunication in ufe among (hriftidus wirh that which had been dractifed in the times of Paganitm, and which was attended with all the dreduful effects abovencutionel. The Roman poutifis, on the other hand, were too artful not to entourdge tinis error; and therefore employed all forts of means to guin crecii to an opinion fo well calculated to gratify their ambition, and to aggrandize in geatral the epifcopal order.

The annals of the French nation furnigh us with the $\mathrm{He}_{\mathrm{b}}^{73}$ following inftance of the enormous power which was comes a at this tine vefted in the Roman pontiff. Pepin, who temporal was mayor of the palace to Childeric III. King of prince. France, and who in the exercife of that high office was polfeffed in reality of the royal power and authority, afpired to the titles and honours of majefty alfo, and formed a fcheme of dethroning his fovercign. For this purpofe he affembled the ftates in 75:; and though they were devoted to the interefts of this ambirions ufurper, they gave it as their opinion that the bithop of Rome was previonlly to be conh.lted whether the execution of fuch a fcheme was lawful or not. In confequence of this, ambaffadors were ient by Pepin to Zachary, the reigning pontiff, with the following queftion, "Whether the divine law did not permir a valiant and warlike people to dethrone a pufillanimons and indolent prince who was incapable of difcharging any of the functions of royalty; and to fubnt ate in his placeone more worthy to rule, and who had already rendered moft important fervices to the ftate ?" The fituation of Zachary, who ftood much in need of the fuccours of Pepin againft the Greeks and Lombards, rendered his anfwer fuch as the ufurper defired : and when this favourable decilion of the Ro. man oracle was publifhed in France, the unhappy Childeric was ftripped of his royalty without the leaft oppofition; and Pepin, without the finalleft refilance, ftepped into the throne of his mafter and his fovereign. This decifion was folemnly confirmed by Ste: phen II. the fucceffor of Zachary; who undertook a journey into France in the year 754 in order to folicit affiftance againft the Lombards. The pontiff at the fame time diffolved the obligation of the oath of fidelity and allegiance which Pepin had fworn to Childeric, and violated by his ufarpation in the year 751; and to render his tille to the crown as facred as poffible, Stephen anointed and crowned him, with his wife and two fons, for the fecond time. This complaifance of the pope was rewarded with the exarchate of Ravenna and all its dependencies, as we have already related. See Civil Hiftury, $n^{\circ} 44$. fupra; and Hiftory of Italy.

Inthe fucceeding centuries, the Roman pontiffs con- His power tinued toincreafe their power by every kind of artifice fill increaand fraud which can difhonour the heart of man; and, fes. by continually taking advantage of the civil diffentions which prevailed throughout Italy, France, and Germany, their intluence in civil affirs arofe to an enormous height. The increafe of their authority in reli. gions matters were not lefs rapid. The wifent and moft impartial among the Roman Catholic writers acknowledge, that from the time of Louis the Meek the ancient rales of ecclefiantical government were gradualy changed in Europe by the counfels and inftigation of

Ecclefa- the char lof Rome, and new havs $f$ batituted in their
nical place. The European pri. cis futworedomuctves to be
Hillory. divefted of the fupreme antbority in a dinus metcers, which they had de ivel from Cherlemagne; the power of the bihops was grearly diminillica, and coen the anthoriy of both provincin and gencraicouncils began to decliat. The popes, elcuated with then overgrown proferity, and become arrogant beyond memme by the daily accemons that were made to the ir andority, werc eagerly bent upon eftablining the maxim, liat the $b: h o p$ of Rome was conflituted and appointed by Jefus Chrift fupreme leginator and judge of lie church univerfal; and that therefore the bilhops derived all their authority from him. This opiaion, which they inculcated with the atmolt zeal and ardour, wasopenfed in vain by fuch as were acquainted with the antient ecclefiafical confintions, and the goverament of the church in the earlicr ages. In order to gain credit to this new ecclefinatical code, and to fupport the pretinfions of the popes to fupremacy, it was neceffary to produce the authority of ancient decis, in order to ftop the mouths of fuch as were difpofed to fet bounds to their ufurpations. The bifhops of Rone were aware oi this; and as thofe means were looked upon as the mof law. ful that tended beft to the accomplifhmeit of theit purpofes, they employed fome of their mof ingenious and zealous partifans in forging conventions, acts of councils, epiftles, and fuch-like records, by whic: it might appear, that in the firft ages of the charch the Roman pontifts were cloathed with the fame firitual majefty and fupreme athority which they now affumed. There were not, however, wanting among the bidhops fome men of prudence and fagacity, who faw through thefe impious fraads, and perceived the chains that were forging both for them and the church. The Freich bilhops diftinguilhed themflyes eminently in this refpect: but their oppofition was foon quathed; and as all Europe was funk in the groffef ignorance and darknefs, nome remained who were capable of detecting thefe odious impoftures, or difpofed to fupport the expiring liberty of the church.

This may ferve as a general fpecimen of the cbaracter and behaviour of the pretended vicegerents of Jefus Chrif to the rath century. In the inth comery; indeed, their power feems to have ifen to its ntmoth height. They now received the pompons titles of Mafters of the world, and Popes, i. e univerfal fathers. They prefided every where in the councils by their legates, affumed the authority of fupreme arbiters in all controverficsthat arofe oncerning religion or churchdifcipline, and maintained the pretended rights of the church againt the encroachments and ufurpations of kings and pinces. Their authority, however, was confined $w$ ithin certain limits: for, on the one hand, it was refteained by fovereign princes, that it might not arrogantly aim at civil dominion; and, on the other, it was oppofed by the bifhops themfelves, that it might nor arife to a fpiritual defpotifm, and utterly de troy the privilegesand liberty of fynods and councils. F!om the time of Leo IX. the popes employed every method which the moft artful ambition could lingert to 'remove tinfe limits, and to render their dominion both defpotic and univerial. They not only afpired to the charater of fuprome leginators in the church, to an unlimitedjuriddiction over all fyno is and councils whe-
ther general or provincial, to the fule diltiture : of Eclefia ill ecclediiftical honones and bencfices, as dirnity authorifed and puonted for that furpofic: but they carnical Hifory. ried their inmert $\quad$ "tenfons fo far, as to give themfelves out for lade... the univerie, arbitero of the fate of kurdo us ant infres, and fupreme rulas over the Jings and princes of the earth. Hence we fin? in Tances of their givino away kingdoms, and lootag fuhjest from thei allegiance to their fovereirchs; amon; which the hifory of John king of Englaisi is mot remarkable. $\therefore$ a laft they plainly afemed the whol: earth their properly; 's well where Chriftianity was preened as where it was not; and therefore, on the difonvery of Anciica and the Eafl-Indies, the pope, by virtue of this firitu $\mathrm{I}_{\mathrm{r}}$ ropery, granted the Portuguefearigh to a! the conotries lyiag ealtward, and to the $S_{j}$ fiardis all thofe lying to the nefward, of Cape rion in Africa which they were able to conquer by fore of arms; and that mothing might be wanting to compicte their chara fer, they pretended to be Ioras of the fature world alfo, and to have a power of reAlainag even the divine junice itfelf, and remiting that funthment which the Deity hath denounced agailf the worke s of iniquity.

All this time the power of laperftition reigned trinmpiant over the remains of Chriftianity which had cfeaped the cor: ptions of the firlt four centuries. In the fifth centary began the invocation of the happy fouls of deparce 1 iuts. Their flifance was in of faints,
 treated by m a.iy frevent pravers. while none ftood up gatory, \&c. to oppofe $t$ is prepofterous kind of wormip. The introduced. images of thofe who during their lives hadacquired the reputation of ulcommon fanctity, were now honoured with a particulur wormip in feveral places; and many imagined that this drew into the images the propitons prefence of the faints or celeftial bein, s which they were fuppof do'reprefent. A fingular and irrefifible effic ey was atributed to the brites of martyrs, and to the figure of the crofs, in defeating all the attempts of Satan, removing all forts of calamities, and in healing not only the difeafes of the body. but alfo thofe of the mind. The famous Pagan doctrine roncerning the pitriffation of deparisd fouls by neans of a certain kind of fire; i. e. purgatory, was alfo confimed and explained more fully than it bad formerly been; and every one knows of how much confequence this abfurd doctrine hath been to the wialth and power of the Romilh clergy.

In the fixth century, Gregory the Great advanced an opinion, That all the words of the facred writings were images of invifible and 1 , iritual things; for which reafon he loaded the churches with a multitude of ceremonies the moft infignificaut and futile that can be imagined; and hence arofe a new and molt difficult fcience, namely, the explication of the fe ceremonies, and the inveftigation of the caufes and circumftances whence they derived their origin. A new method was contrived of adminiftering the Lord's fupper, with a magnificentaffemblag of pompousceremonies. This was called the canon of the ma/s. Baptifm, except in cafes of neceffity, was adminilered only on the great feftivals. An incredible number of remples were rece- Introduc ted in honour of the faints. The plases fet ap it fry tion of the public worfhip were alfo very numerous: but now they were conflered as the means of purchafine the pro-

tion: Atill increafes.
barbarous multitude were perfuaded, that thefe departed fpirits defended and guarded againft evils and calamities of every kind, the provinces, lands, cities, and villages in which they were honoured with temples. The number of thefe temples were almoft equalled by that of the feftivals, which feem to have been invented in order to bring the Chriftian religion as near the model of Paganifm as poffible.

In the feventh century, religion feemed to be altogether buriedunderaheap of fuperftitious ceremonies; the worlhip of the true God and Saviour of the world was exchanged for the wormip of bones, bits of wood (fid to be of the crofs), and the images of faints. The cternal fate of mifery threatened in Scripture to the wicked was exchanged for the temporary punifhment of purgatory; and the expreffions of faith in Chrift by an upright and virimous condact, the augmentation of the riches of the clergy by donations to the church, and the obfervance of a heap of idle ceremonies. New feftivals were ftill added ; one in particular was intlicuted in honour of the true crof's on which our Saviour faffered: and churches were declared to be fanctuaries to all fuch as fled to them, whatever their crimes might have been.

Supertition, it would feem, had now attained its higheft pitch; nor is it eafy to conceive a degree of ignorance and degeneracy beyond what we have already mentioned. If any thing can poflibly be imagined more contrary to true religion, it is an opinion which prevailed in the eighth century, namely, That Chriftians might appeafe an offended Deity by voluntary acts of mortification, or by gifts and oblations lavifhed on the church; and that people onght to place their confidence in the works and merits of the faints. The piety in this and fome fucceeding ages confifted in building and embellifhing churches and chapels; in endowing monafteries and bafilics; hanting after the relics of faints and martyrs, and treating them with an abfurd and exceflive veneration; in procuring the inucreffion of the faints by rich oblations, or faperTitous rites; in worfhipping images; in pilgrimages to thofe places which were efteemed holy, particalarly to Palefine, \&c. The genuine religion of Jefus was now utterly anknown both to clergy and people, if we except a few of its general doctrines contained in the creed. In this century alfo, the faperfitious cuftom of folitary malfes had its origin. Thefe were celebrated by the prieft alone in behalf of fonls detained in yurgatory, as well as upon fome other occafions. They were prohibited by the laws of the church, but proved a fource of immenfe wealth to the clergy. Under Charlemague they were condemned by a fynod aflembled at Meniz, as criminal effects of avarice and florh. A new fuperftition, however, fill frung upin the tenth century. It was imagined, from Rev. xx. 1. that Antichrift was to make hisappearance on the earth, and that foon after the world would be deftroyed. An univerfal panicenfued; vaft numbers of people, abandoning all their connections in fociety, and hivilig over to the churches and monafteries all their worlily effecte, repaired to Palefine, where they imgened that Cirift would defcend from heaven to jadue the world. Others devoted themelves by a folemsand volantary cath to the ferpioc of the charches
convents, and prienthood, whofe llaves they became, in the moft rigorous fente of that word, performing didy their heavy taths, and all this from a notion that the fupreme jadge would diminth the feverity of their fentence, and louk upon them with a more favourable and propitious eye, on account of their having made themfelves the ilaves of his minifters. When theeclipfe of the fun or moon happened to be vifible, the cities were deferted, and their miferable inhabicants fled for refuge to bollow caverns, and hid themfelves anong the cragey rocks, and under the bending fummits of fteep nountains. The opulent attempted to bribe the faints and the Letity himfle by rich donaions conferred apon the facerdotal tribe, who were looked apon as the immediate vicegerents of heaven. In many places, temples, palaces, and noble edifices buth public and private, were fuffered to decay, nay, were deliberately pulled down, from a notion that they were no longer of any ure, as the final diffolution of all things was at hand. In a word, no language is fufficient to exprefs the confution and defpair that tormented the minds of miferable mortals upon this occafion. The general delufion was indeed oppofed and combated by the difcenning few, who endeavoured to difpel there terrors, and efface the notion from which they arofe in the minds of the people. But their attempts were ineffectual; nor could the dreadful apprehenfions of the fuperfitious multitude be removed before the end of the centary, and this terror became one of the accidental caules of the Croisabes.

That nothing might now be wanting to complete that antichriftian fyftem of religion which had overfpread all Europe, it was io the inth century determined that divine worthip fould be celebrated in the Latin tongue, though now unknown throughout the whole continent. During the whole of this century, alfo, Chriftians were employed in the rebuiiding and ornamenting their charches, which they had dchroyed through the fuperftitious fear already taken norice of.

In much the fanie way with what is above related, or worfe, if pofible, matters went on till the time of the reformation. The clergy were immerfed in crimes of the deepeft dye; and the laity, imagining themfelves able to purchafe pardon of their fins for money, followed the examples of their paftors without remorfe. The abfird principle formerly mentianed, namely, that religion confilts in acts of aufterity, and an unknown mental correfpondence, with God, produced the moft extravagant and ridiculous behaviour in the devotees and reputed faints. They not only lived anong the wild beafts; but alfo after the manner of thefe favage animals: they ran naked through the lonely defarts with a furious afpect, and all the agit:tions of madnefs and frenzy; they prolonged their wretched life by grafs and wild herbs, avoided the fight and conver fation of men, remaining almoft motionlefs in certain places for feveral years expofed to the rigour and inclemency of the feafons, and towards the conchafion of their lives flout themfelves up in narrow and miferable huts; and all this was conlidered as tue piety, the only acceptable method of worlhipping the Deity and attaining a fhare in his favour. - Bat of all the inftances of faperititious frenzy which difgraced the times we now fpeak of, none was held in higher veneration, of excied more the wonder of the muli.

Extravagant behaviour of the reputed faints.

Sect. II.

Eccelefia- tude, than that of a certain order of neen who were called Stiites by the Greeks, and Sancti Colnamares, or Pillar Saints, by the Latins. Thefe were perfons of a molt ingutar and extravagant curn of mind, who flood motionlefs on the tops of pillars exprefsly raifed for this exercife of their patience, and remaincd there for feveral years amidft the admiration and applanfe of the ftupid populace. The inventor of this trange difcipline was one Simeon a Syrian, who began his follies by changing the agretable employnent of a thepherd for the autterities of a monkith life. He began his devotion on the top of a pillar tix cubits high ; but as he increafed in fanctity, he alle increafed the height of his pillar, till, towards the conclution ot his life, he had got $a_{j}$ on the top of a pillar 40 cubits in height. Many of the inhabitants of Syria and Pa lettine, feduced by a falfe an bition and an utter igno. rance of true rligion, foliowed the example of 1 his fanatic, though not with the fane degree of aullerity. This fupertiniges practice began in the fifth century, and continued in the eaft for 600 years. The Latins, however, had too much wifdom and pradence to imitate the Syrians and Orientals in this whimfical foperflition: and when a certain fanatic, or impoftor, named $W_{u}$ ffilaicts, erected one of thefe pillars in the country of Treves, and propofed to live on it after the manner of Simeon, the neighbouring bilhops ordered it to be pulled down.

The practices of auftere worlhip and difcipline in other refpects, however, gained ground throughout all parts of Chriftendom. Monks of various kinds were to be found in every conatry in prodigious numbers. But though their difcipline was at firft exceedingly fevere, ic became gradually relaxed, and the monks gave into all the prevailing vices of the times. Other orders facceeded, who pretended to ftill greater degrecs of fanftity, and to reform the abules of the preceding ones; but thefe in their turn became corrupted and fell into the fame vices they had blamed in others. The mof violent animodities, difputes, and hatred, alfo reigned among the different orders of monks; and, indeed, between the clergy of all ranks and degrees, whether we confider them as claffed in different bodies, or as individuals of the fame body. To enter into a detail of their wranglings and difputes, the methods which each of them took to aggrandife themfelves at the expence of their neighbours, and to keep the reft of minkind in fubjection, would require many volumes. We fall only obferve, therefore, that even the external profeffion of the auftere and abford piety which rook place in the fourth and fifth centuries, continued gradually to decline. Some there were, indeed, whoboldly oppofed the torrent of fuperftition and wickednefs which threatened to overflow the whole warld: but their oppofition proved fruitlefs, and all of thefe towards the era of the reformation had been eitherinlenced or deftroyed: fo that, at that time, the pope and clergy reigned over mankind wirhout contronl; had made themfelves mafters of almoft all the wealth in every country of Earope, and may traly be faid to have been the only fovereigns; the reft of the human race, even kings and princes, being only their valfals and flaves.

While the Popifl fuperfition reigned thas violent3y in the weft, the abfict doctrines of Mahamet over-
fpread adl the eaft. The rife of this impontor is rela- Ecclefiated under the article Arabia. His fucceliors conquered in order to eftablifh the religion of their apontle; and chus the very name of Chrittianicy was extinguifhed in many places where it had formerly flourinhed. The conquitts of the Tartars having intermingled them with the Mahometans, they greedily embraced the fuperftiions of that religion, which thas almoft entirety overfpread the whole continents of Afia and Africa; and, by the conqueft of Con!tantinople by the Turks in 1453, was likewife eftablifhed throughout a confiderible part of Europe.

About the beginning of the r6th century, the Ro. State of ree man pontiffs lived in the utmof tranquillity; nor had ligion in they, according to the appearance of chings at that the begintime, any reafon to fear an oppolition to their antho- ning of the rity in any refpee fince the commotions which had ${ }^{16 \text { th }}$ cenbeen raifed by the Waldenfes, Albigenfes, \&c. were funce that now entirely fuppreffed. We maft not, however, time. conclude, from this apparent tranquility and fecurity of the pontiffs and their adherents, that their meafures were univerfally applauded. Not only privatc perfons, but affoche neft powerful princes and fovereign ftates, exclaimed loudly againt the tyranay of the popes, and the unbridled licentioufnefs of the clergy of all denominations. They demanded, therefore, a reformation of the church in its head and members, and a general council to accomplifi that neceflary purpofe. But thefe complaints and demands were not carried to fuch a length as to produce any good effect; fince they camefrom perfons who never entertained the leat doubt about the fupreme authority of the pope fin religious matters, and who of confequence, infead of attempting themfelves to bring abont that reformation which was fordently defired, remained entirely inactive, or looked for redrefs to the court of Rome, or to a general council. But while the fo much delired reformation feemed to be at fuch a great diftance, it faddenly arofe from a quarter whence it was not at all expected. A lingle perfon, Martin Lather, a monk of the order of St Augultine, ventured to oppofe himfelf to the whole torrent of papal power and defpotifm. This bold attempt was firft made public on the 30 oth of September 1517; and, notwithftanding all the efforts of the popeand his adherents, the doctrines of Luther continued daily to gain ground. Others, encouraged by his fuccefs, lent their affifance in the work of reformation; which at laft produced new churches, founded upon principles quite different from that of Rome, and which ftill continue. But for a particular account of the tranfactions of the firf reformers, the oppofition they met with, and the final fettlement of the reformed churches in different nations in Europe, fee the articles Luther and Keformation.

The fate of religion in other parts of the world feems as yet to be but little altered. Afia and Africa are funk in the grofeft fuperftitions either of the Mahommedan or Pagan kinds. The fouthern continent of America, belonging to the Spaniards, continnes immerfed in the moft abford fuperftitions of Popery, The northern continent, being monty peopled with colonies from Great Britain, profeifes the retormed religion. At the fame time it miaft be owned, that fome kind of reformation baih taken place even in popary and Mahomatedanim themfelyes. The popes have no

Compon- longerthat athority over fates and princes, ven thene tion of mult bigotied to pupery, which tory formerly hid. Hibery. Neither are the lives eition of the che 2 or laty fo corrupt as tincy wert before. The incredic of learuing in all parts of the world inds contrinted to "aufe mon open their eyes to tac light of rafon , and this hath beenattended with a piourisud dareale of duper. fution. Even in Mahommedan conatres, that furious enthufiam which formerly enbudened the inhabitans to face the greatef dangers, hath now almoft vanined; fo that the crecit of fiahomet bimfelf feems to have funk much in the eftimation of his followers. This is to be underftood even of the molt ignorant and bigted multitude; and the fenibble part of the Turks are faid to incline much to wards deifri. With reg.idto thofe nations which ftill profers Paganifm, the inter. courfe of Europeans with them is fo fmall, that it is impoffible to fay any thing concerning, them. As none of them are in a thate of civilization, however, it may be conjectured, that their religion is of the fame unpolifhed calt with their manners; aud that it confifts of a heap of barbarous fupernitions which have been handed down among them from time inmemorial, and which they continue to obferve without knowing why or wherefore.

## Sect. III. Of the Gompofition of Hiffory.

Cicero has given us the whole art of compoling hifory, in a very fhort and comprehenfive manner. We thall firft tranfcribe what he fays, and then con-

82 Cicere's rules.

De Orat.
Lib. ii, c.
15 . fider the feveral parts of it in their proper order. "No one is ignorant (fays he), that the firit law in writing hiftory is, Not to dare to fay any thing that is faife; and the next, not to be afraid to fpeak the truth : that on the one hand there be no fufpicion of affection, nor of prejudice on the other. Thefe foundations are what all are acquainted aith. But the fuperfactare confifts partly in things, and partly in the fyle or language. The former require an order of times, and defcriptions of places. And becaufe in great and memorable events, we are delirous to know firft their cautes, then the actions themfelves, and lafly their confequences; the hiforian fhould take notice of the fiprings or motives that occalioned them; and, in mentioning the facts themfelves, fhould not only relate what was done or faid, but likewife in what manner ; and, in treating upon their confequences, thow if they were the effects of chance, wifdom, or imprudence. Nor thould he only recite the actions of great and eminent perfons, but likewife defrribe their characters. The layle ought to be Huent, fmooth, and even, free from that harhnefs and poignancy which is ufual at the bar." Thus far Cicero. An hiftory written in this mantier, and furnilhed with all the fe properties, mult needs be very entertaining, as well as inftructive. And perhaps few have come nearer this flan than Tacitus : thongh his fubject is attended with this unhappy circumftance, or at leaft unpleafant one, that it affords us examples rather of what we ought to avoid than what to imitate. But it is the bufinefs of the hiftorian, as well as of the philofopher, to reprefent both virtues and vices in their proper colours; the latter doing it by precep:s, and the former by examples. Their manner is different; but the end and defign of both is, or hould
be, the fanc: And theterare hiftory has not impro- Componiperty becn faid by iome to be moral philofophy ex- tion of emplifed in the lives and aetions of mankind.

We that reduce thefe feveral'things mentioned by Cicero to three heads, Matter, Order, and Style; and treat upon each of them feparately. But as Truth is the batus and foundation of all hittory, it will be necellary to confider that in the firft place.

## Art. I. Of Truth in Hiftory.

83
Truth is, as it were, the very life and foul of of hiltoric hiftory, by which it is diftinguifled from fable or ro- truth. mance. An hiftorian therefore ourgt net only to be a man of probity, but void of all palfion or bias. He muft have the fteadiuefs of a philofopher, joned with the vivacity of a poet or orator. Without the former, he will be infendibly fwayed by fome paflien to give a falke colouring to the actions or charaters be defcribes, as tavour or dilike to parties or perfons affect his miad... Whereas he ought to be ef ro party, nor to have either friend or foe while writing ; but to preferve himkif in a ftate of the greateit indifferency to all, th it he nay judge of things as they really are in their own nature, and not as connected with this or that perfon or party. And with this firm and fedate temper, a lively imagination is requifite; without which his defcriptions will be flat and cold, nor will he be able to convey to his readers a juft and adequate idea of great and generons actions. Nor is the affitsance of a good judgment lufs neceffary than any of the former qualinies, to direct him what is proper to be faid and what io be omited, and to treat cuery thing in a manner fuitable to its importance. And fince thefe are the qualifications neceflary for an hiftorian, it may perhaps feem the lefs itrange that we have fo few good hiftories.

Buthifuricaltrath confifts of two patrs; one is, Not to fay any thing we know to be falie : Though it is not fufficient to excule an hiftorian in relatingaffifehood that he did not know it was fo when he wrote it, unlefs he firf ufed all the means in his power to inform himfelf of the truth; for then, undenbtedly, an invincible error is as unpardonable in hiftory as in morality. Bur the generality of writersiathis kind contemt themelves with taking their accounts from hearfays, or tranforibing them from others; without duly weighing the evidence on which they are founded, or giving themfelves the trouble of a ftrict inquiry, Fesw will afe the diligence neceffary to inform themfelves of the certainty of what they undertake to relate. And as the want of this greatly abates the pleafure of reading fach writers, while perfons read with diffidence; fo nothing more recommends an hiftorian than fuch indultry Thus we are informed of Thacydides, that when he wrote his hiftory of the Peloponnefian war, he did not fatisfy hint felf with the beft accouncs he could get from his conntrymen the Athenians, fearingthey might be partial in their.own caufe; but fpared no expence to inform himfelf hov the fame facts were related by their enemies the Lactdemonians ;-that, by comparing the relations of buth parties, he might better jud.e of the truth. And Polybias took greater pains than he, in order to write his hiftory of the Roman affints for he travelled into Africa, Spain, Gaul, and other parts of the world,

Compofi- that by viewing the feveral feenes of tion:, and in-
tion of forming himich from the 1 habitants, wioght come
HiAlory
at a greater certainty of the facts, and repreluat them
in a jutfer li»ht. But as an hiltoriat onghi not to aticut what he knows to be falle; fo he therl.. likenife we cautivus in relating thinge which are dorbeful, and acquai it his reaters with the eviserce he goes upon in fuch facts, from whence they may te ande twadge how far it is proper to credit them. So Heroiotus tells as what things he faw himelt in his travels, and what we heard from the intormation of the Egypina prietts and others with whom he converfid. And Curtius, in the life of Alexander, fpeaking of the affairs of India, ingenuonily contelles, that he wrote more than he fully belicved. "Fur (fays he) I neither dare to affirm politivcly what I doubt of, nor can I think it proper to omit what I have been told." By fuch a conduct the author fecures his credit, whether the things prove really true or falfe; and gives room for farther inquiry, without impaling on his readers.

The other branch of hifturical truth is, Not to omit any thing that is true, and neceflary to fet the matier treated of in a clear and full light. In the actions of paft ages or diftant countries, wherein the writer has no perfonal concern, he can have no great inducement to break in upon this rule. But where intereft or party is engaged, it requires no finall candour, as well as firmnefs of mind, conftantly to adbere to it. Affection to fome, averfion to others, fear of difobliging friends or thofe in power, will often interpofe and try his integrity. Befides, an omifion is lefs obvious to cenfure, than a falfe affertion: for the one may be eatily afcribed to ignorance or forgetfulnefs ; whereas the orther will, if difcovered, be commonly looked upon as defign. He therefore, who in fuch circumfances, from a generous love to truth, is fuperior to all motives to berray or flifle it, juftly deferves the character of a brave as well as honeft man. What Polybius fays upon this head is very well worth remarking : " A good man ought to love his friends and his conntry, and to have a like difpofition with them, both towards their friends and enemies. But when he takes upon him the character of an hiftorian, they mutt all be forgot. He muft often fpeak well of his enemies, and commend them when their actions deferve it; and fometimes blame, and even upbraid his greateft friends, when their conduct makes it neceffary. Nor mult he forbear fometimes to reprove, and at other times to commend, the fame perfons; fince all are liable to miftake in their management, and there are fearce any perfons who are always in the wrong. Therefore, in hiftory, all perfonal coniderations fonould be laid alide, and regard had only to their actions."

Whita different view of mankind and their actions fhould we have were thefe rules obferved by all hiftorians? Integrity is undoubtedly the principal qualification of an hifiorian; when we caa depend upon this, other imperfections are more eafly paffed over. Suetonius is faid to have written the lives of the firft twelve Roman emperprs with the fame freedom wherewith they themfelves lived. What better character can be given of a writer? The fame ingenious temper appears in the two Greciun hiforians above mentioned, Thacydides and Pulybias: The former of whom, thongh banifed by his countrymen the Athe-
nians, yct expucfes no marks of refentment in his Compofihito y, cither againt them in gencr..l, or even agathe the chief aumors of it, winen he has occation io mention them; and the lather docs not forbear centuring what he honyht blameable in his neareft relations and friends. Bht it is ofien no eaty matser to know whether an hi.wian fperks trathur not, and $\dot{k}$ epstip tothe feveral characters here mentioned; tho' it feems reafonable, apon the common principles of juftice due to all mankind, to credit him where no marks of partiality or prejudice appear in his writings. Sumetimes, indeed, a judgment miy in a good micafure be formied of the veracity of an author from lis manner of expreling himfelf. A certaill candour and franknefs, that is always uniform and confittent with i:telf, runs through their writings who have nothing in view but truth, which may be juftly.efteemed as a very good evidence of their fincericy. Whereas thofe who have partial defigis to anfwer are commonly more clofe and covert; and if at other times they affume an air ot opennefs and freedom, yet this is not contant and even, but foon followed again with the appearance of fome bias and referve: wr it is very difficult to act a part long together without lying open to a difcovery. And therefore, though craft and defignis exceedingly various, and, Proteus-iike, affumes very different fhapes, there are certain characters by which it may often be perceived and detected. Thus, where things are uncertain by reafon of their being reported various ways, it is partiality in an hiftorian to give into the moft unfavourable account, where others are as well known and equaily credible. Again, it is a proof of the fame bad cemper, when the facts themfelves are certain and evident, bar the defign and motives of thofe concerned in them are unknown and obfcure, to affign fome ill principle, fuch as avarice, ambition, malice, intereft, or any other vicious habit, as the caufe of them. This conduct is not only unjuft to the perfons whofe actions they relate; but hurtful to mankind in general, by endeavouring to deftroy the principal motive to virtue, which fprings from example. Others, whonfect to be more covert, content themfelves with fufpicions and fly infinuations; and then endeavour to come off, by intimating their unwillinguefs to believe them, tho' they would have their readers do fo. And to mention no more, there are others, who, when they have loaded perfons with unjuit calumnies and reflections, will allow then fome fight commendations, to make what they have faid before look more credible, and themfelves lefs partial. But the honeft and fuithful hiftorian contemns all fuch low and mean arts; he confiders things as they are in themfelves, and relates them as he finds them, without prejadice or affection.

## Art. II. The Subject or Argument of Hiftory.

The fubjeft in general is facts, together with fuch subject of things as are either connected with them, or may at hiftory, leaft be requifite to fet them in a juft and proper light. But althongh the principal defign of hifory be to acquaint us with facts, yet all facts do not merit the regard of an hiftorian; but fuch only as may be thonsht of ufe and fervice for the conduct of human life. Nor is it allowable for him, like the poet, to form the plan
tion of Hiftory.

Compon- is to revert thinas as he finds chem, wihhont any co-
tion of lansing or difguic to make thom more pleafig and Hiftory. palatabe to his reader, which would be to convert his
hiftory into a novel. Indees, fome hiftories afford more pleafure andentertamment than orhers, from the nature of the chings of which they confift ; and it may be eftemed the haplinefs of an hiftorian to meet wih fuch a finbject, but it is not his fault if it be otherwife. Thus Herodotus begins his hiftory with howing, that the barbarians gave the firft occation to the wars between them and the Greeks; and ends it. with an account of the puniliment which, after fome ages, they fuffered from the Greeks on that account. Such a rehation mult not only be very agreeable to his countrymen the Grecians, for whofe fake it was written ; but likewife very inftuctive, by informing them of the juftice of Providence in punifhing public injuriesin this world, whercin focieties, as fuch, are only capable of punifhment. And therefore thofe examples night be of ufe to caution them againf the like pratices. Orf the contrary, Thucydides begins his hiftory with the unhappy ftate of his countrymen the Atbenians; and in the courfe of it plainly intimates, that they were the caufe of the calamitous war between thent and the Lacedemonians. Whereas, had he been more inclined to pleare and gratify his countrymen than to write the truth, he might have fet things in fuch a light as to have made their enemies appear the aggreffors. But he fcorned to court applauie at the expence of truth and juftice, and has fet a noble example of integrity to all future hiftorians. But as all actions do not nerit a place in hittory, it requires no fmall judgement in an hiftorian to folect fuch only as are proper. Cicero obferves very jufly, that hiftory ss is converfant in great and memorable actions." For this reaion, an hiftorian fhould al ways keep pofterity in view; and relate nothing which may not, upon fome account or other, be worth the notice of after-ages. To defcend to trivial and minute matters, fuch as frequently occur in the common affairs of life, is below the dignity of hiftory. Such writers ought rather to be deemed journalifts than hiftorians, who have no view or expectation that their works flhoold farvive them. But the fkilful hiftorian is fired with a more noble ambition. His defign is to acquaint fucceeding ages with what remarkable occurrences happened in the world before them; to do juftice to the internory of great and virtuons men; and at the fame time to perperate his own. Pliny the younger has forte fine reflections upon this head, in a letter to a friend. "You advife me (fays he) to wrate an hiftory; and not yot only, for many others have done the fame, and I ant my felf inclinced to it. Not that I believe my felf qualified for it, which would be rafi to think till I have tried it; but becanfe I efieemit a gentrous adion not to fuffer thofe to be forgotten, whofe memory ought to be eternized; and to perpetuate the names of others, together with one's own. For there is nothing I ani fo defirous or ambitious of, as to be remembered hereafter; which is a thing worthy of a man, efpecially of one who, confcious of no gailr, has nothing to fear from pofterity. Thercfore I am thinking day and night by what means, as Virgil Cays,

Thir would fuffive me; forit is above my win to add wioh tin,

## But oh!

Compori-
tion of
Hiftory.
However, this is enongh, and what hitory alune feems Lib.w. op. 8. to promife." This was Pliny's opinion with regard to the ufe and advantage of hiftory; the fabjects of which are generally natters of wcightiand importance. And therefore, when a prasent hiftorian thinks it convenient to take notice of things in themfelves lefs confiderable, he either does it with brevity, or for fome apparent reafun, or accounts for it by fome juit apology. So Dion Caffius, when he has mentioned fome things of lefs moment in the life of Commodus (as indeed that emperor's life was clicfly filled np with cruelty and folly), makes this excufe for himfelf: "I would not have it thought that I defcend below the gravily of hiftury in writing thefe things : For, as they were the actions of an emperor, and I was prefent and faw them all, and both heard and converfed with him, I did not think it proper to omit them." He feems to think thofe actions, when performed by an emperor, might be worth recording, which, if done by a perfor of inferior rank, would fearce have deferved notice. Nor does he aypear to have judged amifs, if we confider what an influence the conduct and belaviour of princes, even in the common circumftances of life, have upon all beneath them; which may fometinies render them not unworthy the regard of an hiftorian, as examples either for initation or caution.

But although facts in general are the prôper fubject of hiftory, yet they may be differently coinfidered with regard to the extent of them, as they relate either to particular perfons or communities of men. And from this confideration hiftory has been cillin- nifferent guifhed juto three forts, viz. biagraph;', farticillar and kinds of general.biffory. The lives of fingle perlons is called hiftory. biograpty. By particular hifforg is meant that of particular fates, whether for a fhorter or longer fpace of time. And general hifiory contains an account of foveral flates exitting togetiner in the fame period of tine.
I. The fulbjeets of biography are the lives either of public or private perfons; fur many uffeful obfervations in the conduct of hunizn life may be made from juft accoumts of thofe who bave been eminent and beneficith to the world in tidher hation. Nay, the lives of vicious perfors are not without their ufe, as warnings to others, by obferving the fatal confequences which fooner or later generally follow fuch practices. But, for thufe who expofed their lives, or otherwife employed their time and labour, for the fervice of their fellow-creatures, it' feems but a juft debe that their memories fhould be perpetuated after them, and pofterity acquainted with their benefactors. The expectation of this was no finall incentive to virtue in the Pagan world. And perhaps cvery one, upon dne reflection, will be convinced how nataralthis paffion is to mankind in general. And it was for this feafon, probabty, that Virgil places not only his heroes, but alfo the inventors of ufeful arts and fciences, and other perfons of diftinguified merit, in the Elyfian Ficlds, where he thus defcribes then:

Here patriots live, who. for their country's good. In fighting fields were prodigal of blood :

1'riets

Priets of uri, leming'd lives here make abode, And poets worthy thair infpir:ng god; And fearching wits of more mechanic parts, Who grac'd their age with new invented arts; Thore who to worth their bounty did extend, And thofe who knew that bounty to commend: The hads of thefe with holy fillets bound, And all their temples were with garland's crown'd. IENEID, l. vi, v. 66.
In the lives of public perfons, their public characters are principally, but not folely, to be regarded. The world is inquilitive to know the conduct of princes aud other great men, as well in private as in public. And both, as has been faid, may be of fervice, confidering the influence of their examples. But to be orer-inquifitive in fearching into the weakneffes and infirmities of the greatelt and beft of men, is, to fay no inore of it, but a acedlefs curiofity. In the writers of this kind, Plutarch is juftly allowed to excel.

But it has been a matter of difpute among the learned, whether any one ought to write his own hiltory. It may be pleaded in favour of this, that no one can be fo much mafter of the fubject as the perfon himfelf : and befides, there are many inftances, both ancient and modern, to juftify fuch a conduct. But on the other hand it mult be owned, chat there are many iateonvenienees that attend it ; fome of which are mentioned by Ciccro. "If (fays he) there is any thing commendable, perfons are obliged to fpeak of themfelves with greater modefty, and to omit what is blameable in others. Befides, what is faid is not fo foon credited, and has lefs aythority; and after all, many will not ftick to cenfure it." And Pliny fays very weil to the fame parpofe, "Thofe who proclaim their owli virtuts, are thought not fo much to proclaim them becaufe they did them, as to have done them that they might proclain them. So that which would have appeared great if told by another, is loft when related by the party himfelf. For when men cannot deny the fact, they reflect upon the vanity of its author. Wherefore, if yon do things not worth mentioning, the ations themfelves are blamed; and if the things you do are commendable, you are blamed for mentioning them." Thefe reflections will be generally allowed to be very juit; and yet confidering how natural it is for men tolove themfelves, and to be inclined in their own favour, it feems to be a very difficult talk for any one to write an im. partial hiftory of his own ations. There is fcarce any treatife of this kind that is more celebrated than Cæfar's Commentaries. And yet Suetonius tells us, that "Afinius Pollio (wholived at that time) thought they were neither written with duc care nor integrity: that Cæfar was often too credulous in his accounts of what was done by other perfons; and mifreprefented his own actions, either defignedly, or through forgetfulnefs: and therefore he fuppofes he would baverevifed and corrected them." However, at fome times it may donbtlefs be jultifiable for a perfon to be his own hiftorian. Plutarch mentions two cafes wherein it is allowable for a man to commend himfelf, and be the publifher of fis own merits. Thefe are, when the doing of it may be of confiderable advantage either to himfelf or others. It is indeed lefs invidious for other perfons to undertake the province. And Vol. VIII.
efpecially for a perfon to talk or wrice of his own vir- $C$ thes, at a tipe when vice and a fencral corrapion of manners prevails, let what he fays be cver fo true, it will be apf at leaft to be takcu as a reflention upon others. "A Anciently (fays Tacitas), many wrote, their own lives, rather as a teftimony of their conduct, than from pride." Upon which he makes this judicious remark: "That the more virtue abounds, the fooner the report of it is credited." But the ancient writers had a way of taking off the reader's attention from themfelves in recording their own actions, and fo rendered what they faid lefs invidious; and that was, by feeaking of themfelves in the third perfon, and not in the firft. Thus Cæfar never fays, " $I$ did," or, " $I$ faid, this or that;" bat always, "Cafar did, or Caid, fo and fo." Why the moderns have not more chofen to follow them in this, we know not, fince it feems lefs exceptionable.
2. In a continued hiftory of particular Aates, fome account may be given of their original, and founders; the nature of their foil, and fituation; what advantages they have for their fupport or improvement, either within themfelves, by foreign traffic, or conquefts; with the form of their government. Then notice hould be taken of the methods by which they increafed in wealth or power, till they gradually advanced to their higheft pitch of grandeur; whether by their virtue, the goodnefs of their condliturion, trade, induftry, wars, or whatever caafe. After this the reafons of their declenfions flould be fhewn ; what were the vices that principally occafoned it (for that is generally the cafe); whether avarice, ambition, luxury, difcord, cruelty, or feveral of thefe in conjunction. And laftly, where that has been their unhapiy fate, how they received their final ruin and fubverfion. Mof of there things Livy had in view when he wrote his hiftory of the Roman ftate, as he acquaints his readers in the preface. "The accounts (fays he) of what happened either before or while the city was building, conffing rather of poetical fables than any certain records of facts, I hall neither affert nor confute them. Let antiquity be ollowed to make the origin of their cities more venerable, by uaiting things human and divine. But if any nation may be fuffered to fetch their origion from the gods, fuch is the military glory of the Romans, that when they reprefent Mars as the father of their founder, other nations may as eafily acquiefce in this as they do in their government. But I lay no great ftrefs upon thefe things, and others of the like nature, whatever may be thought of them. What I am defirous every one flould carefully attend to, are our lives and maneers : by what men, and what arts, civil and military, the empire was both acquired and enlarged : then let him obferve, how our manners gradually declined with our difcipline; afterwards grew worfe and worfe; and at length fo far degenerated, that at prefent we canneither bear with our vices nor fuffer them to be remedied. This is the chief benefit and advantage to be reaped from hifory, to fetch inftraction from eminent examples of both kinds; in order to imitate the one, which will be of ufe both to yourfelf and your councry, and avoid the other, which are equally bafe in their rife and event." Thus far Livy. And 4 E Hew
how well he has executed this defign muft be acknowledged by all who will be at the pains to perufe his work.
3. But as a particular hiftory confifts of a number of facts relating to the fame ftate, fuitably connected and laid together in a proper feries; fo a general hiftory is made up of feveral particular hiftories, whofe feparate tranfactions within the fame period of tine, or part of it, fhould be fo difinctly related as to caufe no confufion. 'Such was the hiftory of Diodorus Siculus, which contained an account of moft of the eminent ftates and kingdoms in the world, though far the greateft part of it is now unhappily lof Of the fame nature is the hiftory of Herodotus, though not fo extenfive; to whom we are efpecially indebted for the Perfian affairs. And to this kind may likewife be referred Juftin's hiftory, though it be only the epitome of a larger work written by another hand. The rules proper for conducting fuch hiftories are much the fame as thofe abovementioned concerning particular hiftories; excepting what relates to the order, of which we fhall have occafion to fpeak hereafter.

But the hiffories both of particular flates and thofe which are more general frequently contain only the affairs of fome fhort period of time. Thus the hiftory of the Peloponnefian war, written by Thucydides, comprifes only what was done in the firft twenty years of that war, which lafted feven years longer -than his account reaches; though indced the reaton of that might be, becaufe Thucydides died before the war was finifled, otherwife he would very probably have continued his hiftory to the conclufion of it. But the hiftory of the war between the Romans and king Jugurtha of Africa, given us by Salluft, as alfo Cæfar's hiftories of the Gallic and civil wars, are all confined with in a much lefs number of years than that of Thucydides. Nay, fometimes one fingle tranfaction is thought fufficient to furnifh out a hiftory. Such was the confpiracy of Catiline to fubvert the Roman ftate, written likewife by Salluft. As to more general hifories, Xenophon's hiftory of Greece may be efteemed as fuch; which in order to time fucceeds that of Thucydides, and contains the affairs of fortyeight years. And Polybius called his a general hiftory; which, though it principally contained the Roman affairs, yer took in the moft remarkable tranfactions of feveral other fates, for the fpace of fifty-three years : though it has met with the fame hard fate as * that of Diodorus Siculus, fo that only the fird five looks out of forty, of which it confifted at firft, now remain entire. And to mention no more, the celebrated hiftory of Thuanus is another inftance of this fort, in which the principal tranfactions of Europe for about 60 years, chiefly in the 16 th century, are defcribed with that judgment and fidelity, and in a manner fo accurate and beautiful, that he has been thought farcely inferior to any of the ancient hiftorians. Now, in fuch hiftories as thefe, to go farther back than is neceffary to fet the fubject in a juft light, feems as improper as it is unneceffary.
The general fubject or argument of hiftory, in its feveral branches, may be redaced to thefe four heads; narration, reflections, fpeeches, and digrefions.
actions, with fuch things as are neceffarily connected Compoiwith them ; namely, perfons, time, place, defign, and event.

As to actions themfelves, it is the bufinefs of the hiftorian to acquaint his readers with the manner in which they were performed; what meafures were concerted on all fides, and how they were conducted, whether with vigilance, courage, prudence, and caution, or the contrary, according to the natare of the action; as likewife, if any unforefeen accidents fell out, by whieh the defigued meafures were either promoted or broken. All actions may be referred to two forts, military and civil. And as war arifes from injuftice and injuries received on one fide or the other, it is fit the reader fhould be informed who were the aggreflors. For though war is never to be defired, yet it is fometimes neceffary. In the defeription of batules, regard fhould be had equally to both parties; the number of forces, conduct of the generals, in what manner they engaged, what turns and chances happened in the engagement, cither from accidents, courage, or ftratagem, and how it iffued. The like circumftances fhould all be obferved in fieges and other actions. But the mof agreeable fcene of hiftory arifes from a fate of peace. Here the writer acquaints us with the conflitution of fates, the nature of their laws, the manners and cuftoms of the inhabitants, the advantages of concord and unanimity, with the difadvantages of contention and difcord; the invention of arts and fciences, in what manner they were improved and cultivated, and by whom; with many other things, both pleafant and profitable in the conduct of life.
As to perfons, the characters of all thefe fhould be defcribed who at any confiderable part in an hiftory. This excites the curiofity of the reader, and makes him more attentive to what is faid of them ; as every one is more inquifitive to hear what relates to others in proportion to his knowledge of them. And it will likewife be of ufe to obferve, how their actions agree with their characters, and what were the effects of their different qualifications and abilities.
The circumftances of time and place are carefully to be regarded by an hiftorian, without which his accounts of facts will be frequently very lame and imperfect. And therefore chronology and geography feem not improperly to have been called the two eyes of biftory. Befides, they very much affift the memory: for it is much eafier to remember any thing faid to be done at fuch a time, and in fuch a place, than if only related in general ; may, the remembrance of thefe often recalls thofe things to mind which otherwife had been obliterated. By time is meant not only the year of any particular era or period; but likewife the feafon, as fummer or winter; and the age of particular perfons. For it is oftentimes from hence that we are principally enabled to make a juft eftimate of facts. Thus Cicero commends Pompey for undertaking and finifhing the Piratic war at a feafon of the year when other generals would not have thought it fafe to venture out at fea. This double danger, as $P_{r o}$ Leg. $^{\text {. }}$ well from the weather as the enemy, confidering the Man, c. 12 , neceffity of the cafe, heightens the glory of the action; fince to have done the fame thing in fammer would not have been an equal proof of the courage

Compofi- and intrepidity of the general. And there is nothing tion of more furpriling in the conquents of Alexander than Hiftory. that he fhould fubdue fo large a part of the world by the time he was little more than 30 years old; an age at which few other generals have been much diftinguifhed. Had we not known this, a confiderable part of his character had been loft.

The like advantages arife from the other circumfances of place. And therefore in marches, battles, and other military actions, the hiftorian fhould take notice of the nature of the country, the pafles, rivers, diftances of places, fituation of the armies, and ftrength of the towns either by nature or art ; from which the reader may the better form a judgment of the difficulties and greatnefs of any enterprife. Cæfar is generally very particular in thefe things, and feems to have thought it highly requifite in order to give his readers a juft idea of his actions. The defcriptions of countries, cities, and rivers, are likewife both afeful and pleafant ; and help us to judge of the probability of what is related concerning the temper and genius of the inhabitants, their arts, traffic, wealth, power, or whatever elfe is remarkable among them.

Butan accurate hiftorian goes yet further, and confiders the cainfes of actions, and what were the defigns and views of thofe perfons who were principally concerned in them. Soime, as Polybius has well obferved, are apt to confound the beginning of actions with their fprings and caufes, which ought to be carefully feparated. For the canfes are often very remote, and to be looked for at a confiderable diftance from the actionsthemfelves. Thus, as he tells us, fome have reprefented Hannibal's befieging Saguntun in Spain, and paffing the Ebro, contrary to a former agreement between the Romans and Carthaginians, as caufes of the fecond Punic war. But thefe were only the beginnings of it. The true caufes were the jealoufies and fears of the Carthaginians from the growing power of the Romans; and Hannjbal's inveterate harred tothem, with which he had been impreffed from his infancy. For his father, whom he fucceeded in the command of the Carthaginian army, had obliged him, when but nine yearsold, to take a moft folemn oath upon an altar never to be reconciled to the Romans: and therefore he was no fooner at the head of the army, than he took the firft opportunity to break with them. Again, the true fprings and caufes of actions are to be diftinguifhed from fuch as are only feigned and pretended. For generally the wor fe defigns men have in view, the more folicitous they are to cover them with fpecious pretences. It is the hiftorian's bufinefs, therefore, to lay open and expofe to view thefe arts of politicians. So, as the fame judicious hiftorian remarks, we dre not to imagine Alcxander's carrying over his army into Afia to have been the canfe of the war between him and the Perfians. That had its being long before. The Girecians had formerly two armies in Afia, one under Xenophon and the other commanded by Agefilaus. Now the Afntics did not venture to oppofe or moleft either of thefe armies in their march. This made king Philip, Alexander's father, who was an ambitious prince, and afpired after univerfal monarchy, think it might be a practicable thing to make a conqueft of Afia. Accordingly, he kept it in his view, and made preparations for it; but did not live to execute it. That was
left for his fon. Bat as king Philip could not have done this without firf bringing the other ftates of Greece intoit, his pretence to them was only to avenge the injuries they had all fuffered from the Perfians; though the real defign was an univerfal government, both over them and the Perfians, as appeared afterwards by the event. But in order to our being well alfured of a perfon's real defigns, and to make the accounts of them more credible, it is proper we fhould be acquainted with his difpofition, manners, way of life, virtues, or vices; that by comparing his actions with thefe, we may fee how far they agree and fuit each other. For this reafon Salluft is fo particular in his defcription of Catiline, and Livy of Hannibal ; by which it appears credible, that the one was capable of entering into fach a confpiracy againft his country, and the other of performing fuch great things as are related concerning him. But as the caufes of actions lie in the dark, and unknown, a prudent hiftorian will not trouble himfelf or his readers with vain and triting conjectures unlefs fomething very probable offers itfelf.

Laftly, an hiftorian fhould relate the iffe and event of the actions he defcribes. This is undoubtedly the moft ufeful part of hiftory; fince the greateft advantage arifing from it is to teach us experience from what has happened in the world before us. When we learn from the examples of orhers the happy effects of wifdom, prudence, integrity, and other virtues, it naturally excites us to an imitation of them, and to purfue the fame meafures in our own conduct. And, on the contrary, by perceiving the unbappy confequences which have followed from violence, deceit, rafhnefs, or the like vices, we are deterred from fuch practices. But fince the wifeft and moft prudent meafures do not always meet with the defired fuccefs, and many crofs accidents may happen to fruftrate the beft concerted defigns; when we meet with inftances of this nature, it prepares us for the like events, and keeps us from too great a confidence in our own fchemes. However, as this is not commonly the cafe, but in the ordinary courfe of human affairs like caufes ufually produce like effects; the numerous examples of the happy confequences of virtue and wifdom recorded in hiftory are fufficient to determine us in the choice of our meafures, and to encourage us to hope for an anfwerable fuccefs, though we cannot be certain we fhall in no infance meet with a difappointment. And therefore Polybius very jufty obferves, that " he who takes from hifory the caufes, manner, and end of actions, and omits to take notice whether the event was anfwerable to the means made ufe of, leaves nothing in it but a bare amufement, without any benefit or inftruction." Thefe, then, are the feveral things neceffary to be attended to in hiftorical narrations; but the proper difpolition of them muft be lefr to the $\mathbb{K}$ kill and prudence of the writer.
II. $R$, flections made by the writers. Some have cond mined thefe, as having a tendency to bias the reader; who fhould be left to draw fuch conclufions frem the accounts of facts as he fees proper. But fince all readers are not capable of doing this for themfelves, what difadvantage is it for the author to faggeft to them fuch obfervations as may affift them to make the beft ufe of what they read ? And if the philofopher is
allowed

Compoin-
tion of
Hiftory.
allowed to draw firchinferences from his precepts as be thinks juft and proper, why has not the hiftorian an equal right to make reflections upon the facts he relates? The reader is equally at liberty to jucge for himfelf in both cafes, without danger of being prejudiced. And therefore we find, that the beit hiltorians have allowed themfelves this liberty. It would be eafy to prove this by a large number of inftances, bat one or two here may fuffice. When Salluft has given a very diftinct account of the defigns of Catiline, and of the whole fcheme of the confpiracy, he concludes it with this reflection: "All that time the empire of the Romans feems to me to have been in a very unhappy flate. For when they had extended their conquelts through the whole world from eaft to weft, and tnjoyed both peace and plenty, which mankind efteem their greatelt happinefs; fome perfons were obftinately bent apon their own ruin, and that of their country. For notwith-
Bell. Catil.
c. 37 .

Zib. xxiii. e. 18. one ing two decrees were pubithed by the fenate, no one out of fo great a mulifude was prevailed with, by the rewards that werc offered, either to difeover the confpiracy or to leave the army of Cataline. So defperate a difeafe, and as it were infection, had feized the minds of moft people!" And as it is a very handfome obfervation that Livy makes upon the ill-conduot of Hannibal in quartering his army in Capua after the battie of Cannæ; by which menns they lof their martial vigour through luxury and eafe. "Thofe (fays he) who are fkilled in military affairs reckon this a greater fault in the general, than his not marching his army immediately to Rome after his vietory at cannex ; for fuch a delay might have feemed only to defer the victory, bat this ill ftep deprived him of thre power to gain it." The modefy of the hittorian in this paffage is worth remarking, in that he does not reprefent this as his own private opinion, and by that means undertake to cenfure the conduct of fo great a general as Hannibal was, bat as the fenfe of thofe who were akilled in fuch affairs. However, an hiftorian fhould be brief in fuch remarks; and confider, that allhough he does not exceed his province by applauding virtue, expreffing a joft indignationagainft vice, and interpofing his judgment upon chie natare and confequences of the facts he relates; yet there unght to be a difference between his reflections and the encomiums or declamations of an orator.
Offpeches III. Speeches inferted by hiforians. Thefe are of two forts, oblique and direct. The former are fuch as the hiftotian recites in his own perfon, and not in that of the fpeaker. Of this kind is that of Hannibal in Juftin; by which he endeavours to perfuade king Antioclius to carry the feat of the war againft the Romans into Italy. It runs thus: "Having defired liberty to fpeak (he faid), none of the prefent connfels and defigns pleafed him ; nor did he approve of Greece for the feat of the war, which might be mana'ged in Italy to greater advantage : becaufe it was impoffible to conquer the Romans but by their own arms, or to fubdue Italy but by its own forces ; fince both the inature of thofe men, and of that war, was different fromall others. In ether wars, it was of great inportance to gain an advantage of place or time, to raVage the counitries and plunder the rowns; but though you gain fome advantage over the Romans, or defeat
them, you muft fill fight with them when beaten. Wherefore, fhouldany one cugage with them in Italy, it was poffible for him to conquer them by their own power, Arength, and arms, as he himfelf had done; but fhould he attempt it out of Italy, the fource of their power, he would be as much deceived, as if he endeavoured to alter the courfe of a tiver, not at the fountain-head, but where its freams were largeft and deepett. This wis his judgnent in private, and what he had offered as his advice, and now repeated in the prefence of his friends; tiat all might know in what manner a war ought to be carried on againt the Romans, who were invincible abroad, but mighi be conquered at home. For they might fooner be driven out of their city than their empire, and from Italy than their provinces; having been taken by the Gails, and almoft fubdned by himrelf. That he was never defeated till he withdrew out of thair country; but upan his return to Carthage, the fortune of the war was changed with the place." He feems to intimate by this fpeech, that the Ronans were like fome fierce and impetuous animals, which are no othervife to be fubdued than by woonding them in fome vital part. In fyceches relared after this manncr, we are not neceffarily to fuppofe the hiftorian gives us the very words in which they were at firft delivered, but only the fenfe. Butin direct fpeeches, the perfon himfelf is introduced as addrefling his audience; and therefore the words as well as the fenfe are to be fuited to his character. Such is the fpeech of Enmenes, one of Alexander's captainsand fucceffors, made to his foldiers when they had traiteroufly bound him in chains in order to deliver him up to his enemy Antigonus, as we have it in the frme writer. "You fee, foldiers (fays he), the habits and ornaments of your general, whicia have not been put upon me by nine enemies; that would afford me fome comfort: it is by you, that of a conqueror I am become conquered, and of a generala captive; though you have fworn to be faithful to me four times within the fpace of a year. Hat 1 omit that, lince reflections do not become perfons in calamity. One thing I intreat, that, if Ant:gonus mult have thy life, you woald let me die among you. For it no way concerns hin how or where 1 fuffer, and I flatil efoape an ignominious death. If you grant me this, 1 free you from your oath, with which you have been To ofters engaged to me. Or, if fhame reftrains yon from offering violence to me at my requeft, give me a fword, and fuffer your general to do that for you without the obligation of an eath which you have fworn Lib. xiv. to do for your general."
But this likewife is a matter in which critics have been divided in their fentiments; whether any, or what kind, of fpeeches ought to be allowed in biftory. Some have thonght all fpeeches fhould be excluded : and the reafon given for that opinion is this ; that it breaks the thread of the difcourfe, and interrupts the reader, when he is defirous to come to the end of an action, and know huw it iffued. This is true, indeed, when fpeeches are either very long or too frequent; but otherwife they are not nnly entertaining, bat likewife inftractive. For it is of fervice to know the fpringsand reafons of actions ; and thefe are frequently opened and explained in the fpeeches of thofe by whom they were performed. Ochers therefore have not been againf

Compuftion of Hittory.

Compofi- againft all feeches in general, but only direct ones.
tion of And this was the opinion of Trogus Pompeius, a., JaHifory, ftin infornas us, though he did not think fit to follow him in that opinion, when he abridged him, as we have feen already by the Speech of king Lumenes. The reafon offered againft direct fpeeches is, becaufe they are not true; and truth is the foundation of all hiftory, from which it never ought to depart. Such fpeeches, therefore, are fid to weaken the credic of the writer; fince he who will tell us that another perfon fpoke fuch things which he does not know that he ever did fpeak, and in fuch language as he could not ure, may take the fame liberty ia reprefenting his adions. Thus, for example, when Livy gives us the fpeeches of Romulus, the Sabine women, Bratus, and ochers, in the firft ages of the Roman ftate, both the things themfelves are imaginary, and the language wholly difagreeable to the times in which thofe perfons lived. Accordingly we find, that when feveral hiftorians relate fome particular fpeech of the fame perfon, they widsly differ both in the fubject. matter and expreflions. So the fpeech of Veturia, by which the diffuaded her fon Coriolanus from befieging Rome, when he came againft it with an army

2is. in,

Ant. Rom.
lib. viii.
c. 46,

InGoriolano: of Volficians to avenge the injuries he had seceived, is very differently related by Livy, Diony fius of Halicarnaffus, and Plutarch. Such fictitious fpeeches therefore are jadged more fir for poers, who are allowed a greater liberty to indulge their fancy than hiftorians. And if any direct fpeeches are to be inferted, they fhould be fuch only as were really fpoken by the perfons to whom they are afcribed, where any fuch have
See Voff, beea preferved. Thefe have been the fentiments of

## Ars. Hijf.

s. 20. fome critics both ancient and modern. However, there is fearce an ancient hiftorian now extant, either Greek or Latin, who has not fome fpeeches, more or lefs, in his works; and thofe not only oblique, but alfo direct. They feem to have thought it a necefary ornament to their writings: and even where the true fpeeches might be come at, have chofen rather to give them in their own words; in order, probably, to preferve an equality in the nyie. Since therefore the beft and mof faithful hiftorians have generally taken this liberty, we are to diftinguifh between their accounts of facts and their fpeeches: In the former, where nothing appears to the contrary, we are to fappofe they adhere to truth, according to the beft information they could get; but in the latter, that their view is only to acquaint us with the caufes and fprings of actions, which they ciofe to do in the form of fyeeches, as a method moft ornamental to the work, and entertaining to the reader; though the beft hiftorians are cautions of infering fpeeches, but where they are very proper, and upon fome folemn and weighty occafions. Thucydides is faid to have been the firft who brought complete and finifhed fpeeches into hiftory, thofe of Herodotas being bur. Thort and imperfect. Anel though Diony fus of Halicarnaffus, in his cenfure upon Thucydides, fcems then to have difliked that part of his conduct; yet he afterwards thought fit to imitate it in his Actiquities of Rome, where we find many: not only oblique, but alfo direct fpeeches.

What has been faid of fpeeches, may likewife be underthood of letters, which we fometimes meet with in hiftories; as that of Alexander to Darius in $\mathbf{Q}_{\mathbf{L}}$

Curtius, thofe of Tiberius and Drufus in Tacitas, and Compolimany others. Some lctters are wholly fictitious; and tion of in others perhaps the hiftorian reprefeutsthi fubfance Hiftory. of what was realy faid, but gives it his own drefs. I.ib. iv. Thus we find that flort letter of Lentalus to Catiline e. r. at the time of his confpiracy differently related by Ci - Ann, lib. in cero and Salluft The reafon of which feems to be 73.iii. 56 , this: That as Cicero recited it publicly to the people 59. of Rome in his third oration againft Catiline, it is reafonable to imagine he did it in the vary words of the letter, which he had by him; whereas Silint, as an hiforian might think it fufficient to give the fenfe of it in his own words.
IV. Digreflous. Thefe, if rightly managed, afford the reader both delight and profir. Like fpeeches, they fhould neither be too long nor frequent; leit they interrupt the courfe of the hiftory, and divert the reader from the main defign of the work. But now and then to introduce a beautiful defcription, or fone remarkable incident, which may give light to the fubjest, is fo far from an interruption, that it is rather a relief to the reader, and excites him to go on with greater pleafure and attention. See further on this head, Oratory, n 37.

## Art. III. Of Order.

Since moft hiftories confift of an introduction and of crider the body of the work, in each of which fomeorder is requifite, we fhall fpeak to them feparately.

1. The defign of the introduction is the fame here as in orations. For the hiftorian propofes three things by his introduction, whicir may bie called its parts; to give his reader fome general view of the fubject, to engage his attention, and to poffefs him with a candid opinion of himfelf and his performance. Some have thought this laft unneceffry for an hiftorian. But if we confider how differently mankind are apt to judge of the fame perfons and actions, it feems as requifite for an hiltorian to be well efteemed as an orator. And therefore we find tome of the bef hiftorians have not omitted this part. . Livy's introdaction has been very much applauded by the learned, as a mafter-piece in its kind. It begins with an account of his defign. "Whether (fayshe) it may anfwer any valuable end for me to write the hiftory of the Roman affairs from the beginning of the city, I neither am certain, nor if I was would I venture to declare it." Soon after, he endeavours to prepare the reader's attention, by reprefenting the grandeur and afefulnefs of the fubject in the following words: "Either I am prejndiced in" favour of my fubject, or there never was any fate greater, more virtuous, and fruitful of good examples, or in which avarice and lux̧ury had a later admittance, or poverty and thriftinel's were cither more highly or: longer efteemed, they always coveting lefs thelefs they enjoyed." And then he prefently proceeds to ingratiate himfelf with his readers, and gain their favourable opinion: "Although my name is obfcure in fo great a number of writers, yet it is a comfort that they clond it by their fame and character. But I hall gain this advantage by my labour, that I flall be diverted for a time from the profiect of thofe evils which the age has feen for fo many years; while miy mind is wholly intent upon former times, free from all that care which:gives the writer an uneafmefs, though it cannot

Compofi- bias him againf the trith." In this paffage we fee tion of Hiftory. from two very powerful motives, modefty and a ftrict

In a general hifory, the order of time cannot always be preferved; though, where the actions of different communities have refpect to one as the principal, they fhould all, as far as poflible, be referred to the tranfactions of that fate. But even here the feveral affairs of thofe different fates ought to be related feparately, which will neceffarily occafion the anticipating fome things, and poftponing others, fo that they cannot all fland in the order of time in which they were performed. However, Velleius Patercalus fays very juftly with regard to this fubject, "That every entire action, placed together in one view, is mach better apprehended than if divided by different times." In this cafe, therefore, for better preferving the chronology, it is ufual with hiftorians, when they have finifhed any particular narrative, in paffing to the next, to exprefs the time by fome fhort and plain tranfition ; and fometimes to apologife for themfelves, by affigning the reafons of their conduct. So Polybius, whofe hiftory is of this kind, fays concerning himfelf: "As in writing the actions of each year, in the order of time, I endeavour to reprefent the affairs of the fame nation together in one fummary view, it is plain that inconvenience mutt of courfe attend this way of writing." Curtius profeffes only to write the actions of Alexander king of Macedon; but his hiflory contains in it the principal affairs of the greateft ftates in the world during that period. Now although, in the courfe of thofe tranfactions, the war between Archelans governor of Macedonia, and Agis king of Sparta, happened before the battle of Alexander at Arbela; yet the hiftorian not only relates that battle firft, but carries on the account of Alexander's affairs in Afia to the death of Darius without interruption: for which he gives this reafon: "If I fhould relate the affairs of Alexander, which happened in the mean time, either in Greece, or Illyrium and Thrace, each in their proper order and time, I muft interrupt the affairs of Afia; which it is much better to reprefent together in one continued feries as they fell out, to the flight and death of Darius." Such anachronifms, therefore, are nothing more than what neceffarily arife fometimes from the nature of the fubject: As every thing, the more complexit is, and containing under it a great number of parts, is more difficult to be digefted in a regular order. But in an hiftory compofed of feveral ftates, whofe affairs are independent of oue another, the actions of each nation muft neceffarily be feparated, in order to reprefent them in a jaft view, and prevent confufion. This is the method which Herodotus has taken, as likewife Diodorus Siculus and Juftin. Now both the pleafure and benefit which fuch hiftories afford, arife from obferving the conduct of each fate feparately in the courfe of their affairs, and then comparing one with the other. And as the order of time muft frequently be interrupted, it is not unufual to continue the chronology at proper diftances in relating the affairs of each nation; which preferves an unity in the whole, and connects it in one confiftent body.

The divifion of hiftories into books was defigned only for the better diftinction of the fubject and eafe of the reader. And the dividing thefe books again into chapters, is rather a practice of later editors (founded, as they have thought, on the fame rea-
fons),

Compofition of Hiftery.
$\underbrace{-}$ gard to truth. It inay farce feem necellary to ob ferve, that thofe introductions are efteemed the bef which are moft natural ; that is, fuch as are taken from the fubject matter of the hiftory itfelf, and clofe1 y connected with it. Such are thofe of Herodotas, Thucydides, Livy, Tacitus, and others. And therefore Salluft is greatly blamed by Quintilian on the account of his introdutions, which are fo general, that they mig't fuit other hiftories as well as thofe to whicl they are prefixed. Introductions fhould likewife be proportioned to the length of the work. We meet with fome fewhifories, in which the writersin. mediately enter upon their fubject, without any introduction; as Xcnophon in his Expedition of the younger - yrus, and Cxfar in his Commentaries of the Gallic and Civil Wiars. But the latter does not profefs to write a juft hiftory; and therefore left himfelf more at liberty, as well in this refpect as in fome others.
2. But order is principally to be regarded in the body of the work. And this may be managed two ways; cither by attending to the time in a chronolo. gical feries, or the different nature and circumftances of the things contained in the hiftory. However, as thefe two methods do not equally fuit all fubjects, we fhall a litule confider to what kind of hiftories each of them feems more properly adapted. All hiftory then, as we have obferved already, may be reduced to three forts; biography, the biftory of particular flates, and the general biffory of fereral fates exifting at the fame time.

In biography, or the lives of particular perfons, moft writers follow the order of time ; though fome reduce them to certain general heads, as their virutues and vices, or their pablic and private character. Plutarch and Cornelius Nepos have taken the former method, and Suetonius the latter.

As to the hiftory of particular fates, the order of time is generally beft, as being moft natural and eafy. And therefore it has ufually been obferved by the beft hiftorians, as Thucydides, Livy, and others. Tacitus, indeed, wrote two diftinct works; one of which he called Annals, and the other Hiftories. And as in both he has kept to the order of time, critics have been at a lofs to affign any other reafon for thefe different titles, unlefs that in the former work te confines him. felf more clofely to the facts themfelves, and does not treat fo largely upon the caufes, manner, or event of them, as he has done in the latter. And even in the circumfances of facts, there is a certain order proper to be obferved, for rendering the account more plain and intelligible. Thus, for inftance, in the difcription of a battle or ficge, the time flould firft be known, then the chief perfon or perfons who conducted it, then the number of forces, and oher requifites, afterwards the nature of the place, then the action itfelf, and lafly the event. But fometimes it is neceffary to add the time in which feveral of the other circumftances happened, efpecially in actions of any confiderable length. Where the order of thefe circumftances is confufed, it perplexes the account, and renders it both lefs entertaining to the reader, and more difficult to remember.

Compofi- fons), than countenanced by the example of ancient tion of writers.

## Hiftory.

## Art. IV. Of Style.

of ftyle.

De Clar.
Orat. 6, 75

Gcll. Lib.
xi. .. 8.

An hiftorical ftyle is faid to be of a middle nature, between that of a poet and an orator, clifering trom buth not only in the ornamental parts, but likcuvife in the common idioms and forms of expretion.

Cicero obferves, that " nothing is more agreeable in hiftory than brevity of exprefion, joined with purity and perficuity." Purity indeed is not peculiar to hiftory, but yet it is abfolutcly necelisy ; for no one will ever think him fit to write an hiltory who is not mafter of the language in which he writes: and therefore when Albinus had written an hiftory of the Roman affairs in Greek, and apologized for any llips or improprieties that might be found in the language upon the account of his being a Roman, Cato called him a trifler, for choofing to do that which, after he had done it, he was obliged to afk pardon for doing. Nor is perfpicuity lefs requifte in an hiftorical ftyle. The nature of the fubject plainly directs to this. For as hiftory confift principally in narration, clearnefs and perfpicuity is nowhere more neceffary than in a relation of facts. But thefe two properties are to be accompanied with brevity, fince nothing is more difagreeable than a long and tedious narrative. And in this refpect an hiftorical fyle differs both from that of poetry and oratory. For the poet frequently heightens and enlarges his defcriptions of facts, by dwelling upon every circumftance, placing it in different views, and embellifhing it with the fineft ornaments of wit and language, to render his images more agreeable; and the orator often does the like, with a defign to frike the paffions. But fuch colouring is not the bufinefs of an hiftorian, who aims at nothing more than a juft and faithful reprefentation of what he relates, in a way beft fuited to its nature, and in fuch language as is moft proper to fet it in a plain and eafy light.

Again, Cicero, treating of an hiftorical ftyle, fays : " lt ought to be fluent, fmooth, and even, free from that harthnefs and poignancy which is ufual at the bar." The properties here mentioned diftinguilh this Ayle from that of judicial difcourfes, in which the orator often finds it neceffary to vary his manner of fpeaking, in order to anfwer different views, either of purfuing an argument, preffing an adverfary, addreffing a judge, or recommending the merits of his caufe. This occafions an inequality in his fyle, while he fpeaks fometimes directly, at other times by way of queftion, and inter:mixes fhort and concife expreffions with round and flowing periods. But the hiftorian has no neceflity for fach variations in his flyle. It is his province to efpoufe no party, to have neither friend nor foe, but to appear wholly difinterefted and indifferent to all; and therefore his language fhould be fmooth and equal in his relations of perfons and their actions.

But further: Diony fius makes " decency a principal virtue in an hiforian ;" which he explains by faying, that "he ought to preferve the characters of the perfons and dignity of the actions of which he treats." And to do this it feems neceflary that an hiftorical syle fhould be animated with a good degree of life
and vigour; without which neither the characters of C cminent perfons, nor their remarkabre actions, which make up the main butinefs of hiftory, can be ciuly reprefonted: for even things in the:n?elves great and excellent, if related in a cold and lifelefemane of of ten do not affect us in a degrec fuitable to the cir dio. nity and importance. And this fecus panticularly necedfary in feeches, in order to reprefent what évery one fays, accolding to lis differcut country, age, temper, and ftation of life, in the fame manner we may fuppofe he either really did, or would have fuohen himfelf on that occafion. Befides, there are fonc ficenes of action which require very patheric and moviag language to reprefent them agrecably to their nature. And in defcriptions, the mot beautiful tropes and lively figures are often neceliary to fet the ideas of things in a proper light. Fron whence it appears, that painting and jmagery makes up no finall part of the hiforian's province, though his colours are not fo ftrong and glitering as thote either of the poet or orator. He ought therefore to be well acquainted with the maners of men and the nature of the paffions, fince he is often obliged is defcribe both; in the former of which Herodotus excels, and Thucydides in the latter, as Dionyfius bas obferved.

Now from thefe feveral properties laid down by ancient writers, as requilite for an hiftorical flyle, it feems upon the whole to agree beft with the middle character. And this will further appear, by what they fay relating to the ornamental parts of ftyle; namely, compotition and dignity. As to the former of thefe, which refpects the ftructare of fentences, and the feveral parts of them, Demetrius remarks, that "An hiftorical period ought neither to rife very high, nor fink very low, but to preferve a mediam." This fimplicity (he fays) "becomes the gravity and credit of hittory; and diftinguilhes it from oratory on the one hand, and dialogue on the other." His meaning is, that hiftorical periods fhould neither be fo full and fonorous as is frequent in oratory; nor yet fo hor and flat, as in dialogue : the former of which, as he fays, require a ftrong voice to pronounce them; and the latter have fcarce the appearance of periods. So that, according to this judicious writer, the periods beft fuited for hiftory are thofe which, being of a moderate length, will admit of a juft rife and cadency, and may be pronounced with eafe. And Dionythes tells us, that " Hiftory fhould flow fmooth and even, every where confiftent with itfelf, without roughnefs or chafms in the found." This relates to the harmony of periods, which arifes from fuch a pofition of the words, as renders the found pleafant and agreeable, and, as he thinks, ought to be attended to in hiftory. And as to dignity, which. refpects the ufe of tropes and figures, the fame author fays, that "Hifory fhould be embellifhed with tuch figures as are neither. velement nor carry in them the appearance of ant." This is agreeable to what Cicero obferves, in comparing Xenophon and Califthenes, two Greek hiftorians. "Xenophon the Socratic (fays be) was the firft philofopher, and after him Calinthenes, the fcholar of Ariftotle, who wrote an hiftory: the latter almoft like a rhetorician ; but the ftyle of the former is more moderate, and has not the force of an orator, Dc Orat. lefs vehement perhaps, but in my opinion more fweet hib. ii.

Conrorin tion of Hiftory.
and pleafant." The afference between thefe two visters, with regard to their ftyle, condined chiefly in the choice of their figares; which in Xenophon were more gentle and moderate, and therefore in the judgereent of Cicers more agreeable to hiftory. Now thefe feveral propertics relating to the ornaments of language, as whlas thofe before mentioned, which by ancient writers have been thought requifite for hiftory, are all fuited to the middle fyle, as we have elfewhere fhoun at large. See Oratory, no 99-I2if.

Bat notwithltanding this general account of the feveral properties which confitute an hiftorical fyle, it admits of confiderable varieties from the different narure and dirnity of the fubject. The lives of particular perfons do not require that ftrength and majefty of expreffion, nor all thote ornaments of language, as an hiftory of the Roman empire. And accordingly we find the ftyle of Nepos and Suetonius very different from that of Livy. The former is fmooth and
caly, farce rifing above the low character ; but the Compofilatter often approaches near to the fublime. And tion of other hiftorians again have kept a medium between theif. Upon the whole, therefore, we may conclude, that the middle ftyle is the proper character for hiStory ; though hiftorians may fometimes link into the low character, and at other times rife to the grandeur and magnificence of the fublime, from the different nature of their fulject, or fome particular parts of it. For that is to be eiteemed the proper character of any writing which in the general beft fuits it. And this diftinction may help us in fome meafure to reconcile the fentiments of writers upon this head, who feem to attiibute different characters to an hiftorical nyle, or at leaft to judge where the truth lies; fince a variety of fyle is not enly requifite in different fabjests, but likewife in different parts of the fame work.

H I T
History of Nature, or Natural Hiftory. See $N_{A^{-}}$ тonal Hiftory.

HISTRIO, in the ancient drama, fignified an actor or comedian ; but more efpecially a pantomime, who exhibited his part by geftures and dancing, Livy informs us, that the hiftriones were brought to Rome from Erruria, in the year of the city 391, (Dec. 1 . lib. 7.)

## HISTRIX. See Hystrix.

HITCHING, a large and populous town of Hartfordfhire in England, fituated near a large wood called Hitchwood. The manor was the ancient demefne of the kings of England, as it contimues at this day; and it has been the dower of feveral of their queens. The town is reckoned the fecond in the county for number of ftreets, houfes, and inhabitants. It was formerly famous for the ftaple commodities of the kingdom, and divers merchants of the ftaple of Calais refided here, fince which that trade is loft. The inhabitants now make large quantities of malt; and the market is one of the greareft in England for wheat. W. Long. o. 20. N. Lat. 51.55.

HITHE, a town of Kent in England, 70 miles from London. It is one of the cinque ports; and had formerly five parifies, but by the choaking up of its harbour and other accidents is now reduced to one. In the reign of Henry IV. numbers of its inhabitants were cut off by a peftilence, 200 of their houfes confumed by fire, and five of their hips funk at fea, with the lofs of 100 men ; fo that the people were going to abandun the town, had not the king by his charter generoufly releafed to them, for five turns next following, their fervice of five flips of 100 men and five horfe, which they were to have furnifined out and kept at their own charge in the king's wars for 15 days. It was firft incorporated by the name of barons of the town and pori of Hith; but the government was afterwards changed. It was incorporated by Queen Elizabeth with the name of the mayor, jurats, and common. alty of the town and port of Hith, who with the frecmen elect the members of parliament. The mayor is chofen yearly on Candlemas day. Here is a market on

HOA
Saturdays, and fairs in July and December. From hence to Canterbury is a paved Roman military-way, called Stoney. Street; and at a little diftance from hence are the remains of the walls of a caftle, which incladed roacres. There is a remarkable pile of dry bones in the town, 28 feet long, 6 broad, and 8 high; they are kept in a vault under the church in as good order as books in a library, confinting of feveral thoufand heads, arms, legs, thigh-bones, \&c. fome very gigantic, and appear by an infcription to be the remains of the Danes and Britons killed in a battle near this place, before the Norman conqueft. From hence to Boulogne is reclsoned the fhorteft cut to France. E. Long. I. 7. N. Lat. 5 I. 6.

HITTITES, the defcendants of Heth. See Heth. HIVE, in country affairs, a convenient receptacle for bees. See Apis and Bee.

HIVITES, a people defcended from Canaan. They dwelt at firft in the country which was afterwards poffeffed by the Caphtorims, or Philiftines. There were Hivites likewife at Shechem and Gibeon, and confequently in the centre of the promifed land; for the inhabitants of Shechem and the Gibeonites were Hivites, (Jolhua xi. 19. Genefis xxxiv. 2.) Laftly, there were fome beyond Jordan, at the foot of mount Hermon (Jothua xi. 3.). Bochart is of opinion, that Cadmus, who carried a colony of Phœenicians into Greece, was an Hivite. His name Cadmus, comes from the Hebrew Kedem, "the eaft," becaufe he was of the eaftern part of the land of Canaan. The riame of his wife Hermione, comes from mount Hermon, at the foot whereof the Hivites had their dwelling. The metamorphofis of Cadmus's companions into ferpents is grounded on the fignification of the name Hivites, which in Phœnician fignifies "ferpents."

HOACHE, in nataral hiftory, a kind of earth approaching to the nature of chalk, but harder, and feeling like foap; whence fome think that it is either the fame with the foap rock of Cornwall, or very like it. The Chinefe diffolve it in water till the liquor is of the confiftence of cream, and then varnill their China-ware with it.

## H O A

Hoadley.
HO.iDLEY (Ecnjamin), fucceffively bifhop of Bengor, Hereford, Saibibury, and Winchefter, was born in $\mathbf{5} 675$. His firf preferment in the church was - the rectory of St Peter le Poor, and the lecturefinp of St Mildred's in t'me Ponltry. In the year a 706, he publifhed fome rocmarks on the late bifhop. Attcrbury's fermon at the funeril of Ivir Bennet, in which Dr Atterbury hed, in the opinion of Mr Hoadley, laid down fome dangerous propolitions. Two years after, Mr Hoadley acain entered the lifts againf this formidablc antagonift, and in his excoptions againft a fermon publifhed by Dr Atterbury, intitled "The Power of Charity to cover $\smile i n$,'" he attacked the doctor with his ufual ftrength of reafoning and difpationate inquiry. In 1709 , another difpute arofe between thefe twolearned combatants, concerning the ductrine of non-refiftance, occationed by a perfornance of Mr Hoadley's, intitled "The Meafures of Obedience;" fome pofitions in which, Dr Atrerbury endeavoured to confute in his clegant Latin fermon, preached that year before the London clergy. In this debate Mr Hoadley fignalized himfelf in fo eminent a degree, that the honourable houfe of commons gave him a particular mark of their regard, by reptefenting, in an addrefs to the queen, the fignal fervices he had done to the caufe of civil and religious liberty.The principles, however, which he efpoufed being repugnant to the general temper of thofe times, drew on lim the virulence of a party; yet it was at this period (ifio, when, as he himfelf expreffed it, fury feemed to be let loofe upon him) that the late Mrs Howland prefented him to the rectory of Streatham in Sur ry, unaked, unapplied to, and without his either having feen her or been feen by her. Soon after the acceffion of King George I. Mr Hoadley was confecrated to the fee of Bangor; and, 1717, having broached fome opinions concerning the nature of Chrift's king. dom, \&c. he again became the object of popular clamour. At this juncture he was diftinguifhed by another particular mark of the royal regard, by means of which the convocation was fucceffively prorogued, and it was not permitted to fit, nor do any bufinefs, till that refentment was entirely fubfided. In i 72 I he was tranflated to Hereford; and from thence, in 1723, to Salifbury. In 1734, he was tranlated to Winchefter (on the demife of Dr Willis), and publifhed his Plain Account of the Sacrament: a performance which ferved as a butt for his adverfaries to fhoot at, yet impartially owns it to be clear, rational, and manly, wrote with great candour and judgment, and fuited to the capacity of every ferious and confiderate inquirer after truth.-His latter days were embittered by a moft vile inftance of fraud and ingratitude. The bifhop took a French prieft, who pretended to abjure his religion, under his protection, with no other recommendation than that of his neceffities"; in return for which ast of humanity, the prieft found an opportunity of getting the bifhop's name written by his own hand, and, caufing anote of fome thoufand pounds to be placed before it, offered it in payment. But the bifhop denyingit to be his, it was brought before a court of jultice, and was there found to be a grofs impofition. The ungrateful villain had now recorrfe to a pamphlet, in which he charged the billop with being a drunkard; andalleged that he had the note of him when be was

Voi. Vill.
in liquor. To this calumny the binop nade a full and nervous anfwer ; in which he exp fed the man's falfehood, and fotemnly averred that he was never drunk in his whole life. The world with becoming ardour embraced his defence, and he had the happinels to find himfelf perfectly acquitted even of any fufpicion of fuch a charge. As a wricer, he poffefled uncommon abilities. His fermons (publiflod in I 754 and 1 755) areefteemed inferior to few writings in the Englifh language, for plainnefs and perficuity, energy and frength of reafoning, and a free and mafterly manner. In private life, he was naturally facetious, eaty, and complying ; fond of company, yet would frequcatly leave it for the purpofes of ftudy or devotion. IIc was every where happy; and particularly in his own family, where he took all opportunities of infructing by his iatuence and example. He dicd in 1761, aged 83. Befides the works already mentioned, he wrote, 1 . Terms of Acceptance, 8vo. 2. Reafon+ ablenefs of Conformity. 3. On the Sacrament. Fis tracts aud pamphlets are extremely numerous.; and the reader may fee a complete catalogue of them in his life inferted in the fupplement to the Biographia Britannica.

Hoadley (Benjamin, M. D.), fon of the former was born in 1706; and ftudied at Bennet college Cambridge, under the tuition of Dr Herring afterwards archbilhop of Canterbury., He took his degree in phyfic; and particularly applying himfclf to mathematical and philofophical fladies, was, when very young, admitted a member of the royal fociety. He was made regifter of Hereford while his father filled that fee, and was carly appointed phyfician to his majefty's houfehold, but died at hishoufe in Chelfea in 1757. He wrote, i. Three Letters on the organs of refpiration, 4to. 2. The Sufpicious Hufband, a camedy. 3. Obfervations on a feries of electrical experiments; and, 4, Oratio anniverfaria, in Theatro Col. Med. Londin, ex Harvei infituto babita die OClob. I 742.

HOAI-ngan-fou, a city of China, in the province of Hiang-nan. According to Grofier, it is fituated in a marh, and is enclofed by a triple wall. As the ground on which it ftands is lower than the bed of the canal, the inhabitants live in continual dread of an inundation. The fuburbs extend to the diftance of a league on each fide of the canal, and form at their extremity a kind of port on the river Hoang-ho. This place is very populous, and every thing in it announces an active and. brifk trade. One of thofe great mandarins who have the infpection of the canals and navigation, and who are alfo obliged to fupply the courr with neceffary provifions, refides here. This city has eleven other under its jurifdiction; two of which are of the fecond, and nime of the third clafs.

HOAR-hound, in botany. See Marubrum.
HOARSENESS, in medicine, a diminution of the voice, commonly attended with a preternatural afperity and roughnefs thereof. The parts affected are the afpera arteria and larynx: For its caufes and care, fee (the Index fubjoined to) Medicine.

HOBAL, in mythology, an idol of the ançient Arabs, the worfhip of which at Mecca was dentroyed by Nahomet.

HOBBES (Thomas), a famous writer, born at Malmfiry in 1588 , was the fon of a clergyman. He 4 F
com-

## H O B

Hebles. eompleted his ftudies at Oxford, and was afterwards governor to the eldeft fon of William Cavendih earl of Devonghire. He travelled through France and Italy with that young nobleman, and at length applied himfelf entirely to the ftudy of polite literature. He tranflated Thucydides into Englifh; and publifhed his tranflations in 1628 , in order to fhow his countrymen, from the Athenian hiftory, the diforders and confufions of a democratical government. In 1626 his patron the earl of Devonlliire died ; and in 1628 his fon died alfo; which lofs affected Mr Hobbes to fuch a degree, that he very willingly accepted an offer made him of going abroad a fecond time with the fon of Sir Gervare Clifton; whom he accordingly accompanied into France, and faid there fome time. But while he continued there, he was folicited to return to England, and to refume his concern for the hopes of that family to whom he had attached himfelf fo early, and to which he owed fo many and fo great obligations. In 1631, the countefs dowager of Devonfhire defired to put the young earl under his care, who was then about the age of 13 . This was very fuitable to Mr Hobbes's inclinations, who difcharged that truft with great fidelity and diligence. In 1643 , he republifhed his tran@ation of Thucydides, and prefixed to it a dedication to that young nobleman, in which he gives a large character of his father, and reprefents in the frongefterms the obligations he was under to that illuftrious family: The fame year he accompanied his noble pupil to Paris, where he applied his vacant hours to the ftudy of natural philofophy, and more efpecially to the perfect underfanding of mechanifm, and the caufes of animal motion. He had frequent converfations upon thefe fubjects with father Martin Merfenne; a man defervedly famous, and who kept up a correfpondence with almof all the learned in Europe. From Paris he attended his pupilinto Italy, where at Pifa he became known to that great aftrosomer Galileo Galilei, who communicated to him his netions very freely; and after having feen all that was remarkable in that country, be returned with the earl of Devonfhire into England. After wards, forefeeing the civil wars, he went to feek a retreat at Paris; where by the good offices of his friend father Merfenne, he became known to the famous Renatus des Cartes, and afterwards held a correfpondence with him upon feveral mathematical fubjects, as appears from the letters of Mr Hobbes publifhed in the works of Des Cartes. But when this philofopher printed afterwards his Meditations, wherein he attempred to eftablifh points of the higheft confequence from innate ideas, Mr Hobbes took the liberty of diffenting from him; as did alfo the Erench king's mathemarical profeffor, the illuttrious Peter Gaffendi, with whom Mr Hobbes contracted a very clofefriendfhip, which was not interrupted till the death of the former. In 1642 , Mr Hobbes printed a few copies of his famous book De Cive, which, in proportion as is became known, raifed him many adverfaries, who charged him with inftilling principles which had a dangerous tendency. Among many illuftrious perfons who, upon flipwreck of the royal caufe, retired to France for fafety, was Sir Charles Cavendifh, brother to the duke of Newcaftle : and this gentleman, being fkilled in every branch of the malhematics, proved a
conftant friend and patron to Mr Hobbes; who, by Hobbes. embarking in 1645 in a controverfy about fquaring the circle, was grown fo famous for it, that in 1647 he was recominended to inftruct Charles prince of Wales, afterwards king Charles II. in that kind of learning. His care in the difcharge of this office gained him the, efteem of that prince in a very high degree : and tho ${ }^{\text { }}$ he afterwards withdrew his public favour from MrHobbes on account of his writings, yet he always retained a fenfe of the fervices he had dune him; flowed him various marks of his favour after he was reftored to his dominions; and, as fome fay, had his picture hanging in his clofet. This year alfo was printed in Holland, by the care of M. Sorbiere, a fecond and more complete edition of his book De Give; to which are prefixed two Latin letters to the editor, the one by Mr Gaffendi, the other by father Merfenne, in commendation of it ; and in 1650 was publifhed at London a fmall treatife of Mr Hobbes's, intitled Human Nature ; and another, De corpore politico, or "Of the elements of the law."

All this time Mr Hobbes had been digefting with great care and pains hisreligious, political, and moral principles, into a complete fyftem, which he called the Leviathan, and which was printed in Englifi at London in 1650 and 165 I . After the publication of his Leviathan he returned to England, and paffed the fummer commonly at his patron the earl of Devonflire's feat in Derbyhire, and fome of his winters in town, where he hadfor his intimate friends fome of the greareft men of the age. In 1660, upon the reftoration, he quitted the country, and came up to London, where he obtained from the king affurance of protection, and had an annual penfion of L. 100 fettled upon him out of the privy purfe. Yet this did not render him entirely fafe: for, in 1666, his Leviathan and his treatife De Cive were cenfured by parliament; which alarmed him very much, as did alfo the bringing in of a bill into the houfe of commons to punifh atheifm and profanenefs. When this form was a little blown over, he began to think of procuring a beautiful edition of his pieces that were in Latin; but finding this impracticable in England, he caufed it to be undertaken ahroad, where they were publifhed in quarto in 1668 , from the prefs of John Bleau. In r669, he was vifited by Cofno de Medicis, then prince, afterwards duke of Tufcany, who gave him ample marks of his efteem and refpect; and having received his picture, and a complete collection of his writings caufed them to be repofited, the former among his curiofities, the latter in his noble library at Florence. The like vifits hereceived from foreign ambalfadors and other ftrangers of diftinction; who were curious to fee a perfon whofe fingular opinions and numerous writings had made fo much noife all over Europe. In 1672, he wrote his own life in Latin verfe, when, as he obferves, he had completed his 84 th year : and, in 1674 , he publifhed in Englihverfe four books of Homer's Odyfley; which was fo well received, that it encouraged him to undertake the whole Iliad and Odyffey, which he likewife performed and publifhed in 1675. About this time he took his leave of London, and went to fpend the remaiader of his days in Derby hire, where, however, he did not remain inactive, not withfanding his advanced

Hobues. vanced age ; but publifhed from time to time feveral pieces, to be found in the collection of his works. He died in 1679, aged 92

As to his character and manners, they are thus defcribed by Dr White Kennet, in his Memoirs of the Cavendifh family. "The earl of Devonghire (fays he) for his whole life entertained Mr Hobbes in his family, as his old tutor, rather than as his friend or confident. He let him live under his roof in eafe and plenty, and in his own way, without making ufe of him in any public, or fo much as domeftic affairs. He would often exprefs an abhorrence of fome of his principles in policy and religion; and both he and hislady would frequently put off the mention of his name, and fay, 'He was a humorift, and nobody could account for him.' There is a tradition in the fimily, of the manners and cuftoms of Mr Hobbes, fomewhat obicrvable. His profeffed rule of health was to dedicate the morning to his exercife, and the afternoon to his ftudies. And therefore, at his firft rifing, he walked out, and climbed any hill within his reach; or if the weather was not dry, he fatigued himfelf within doors by fome exercife or other, to be in a fweat : recommending that practice upon this opinion, that an old man had more moifture than heat, and therefore by fuch motion heat was to be acquired and moifture expelled. After this, he took a comfortable breakfaft; and then went round the lodgings to wait upon the earl, the countefs, and the children, and any confiderable ftrangers, paying fome fhort addreffes to all of them. .He kept thefe rounds till about 12 o'clock, when he had alitle dinner provided for him, which he eat always by himfelf withont ceremony. Soon after dinner he retired to his ftudy, and had his candle with 10 or 12 pipes of tobaccolaid by him ; then fhuttiing his door, he fell to fmoking, thinking, and writing, for feveral hours. He retained a friend or two at court, and efpecially the lord Arliigton, to protect him if occafion fhould require. He uled to fay, that it was lawful to make ufe of ill inftruments to do ourfelves good: ' If I werecaft (fays he) into a deep pit, and the devil fhould put down his cloven foot, I would take hold of it to be drawn out by it.' After the reforation, hewatched all opportunities to ingratiate himfelf with the king and his prime minifters : and looked upon his penfion to be more valuable, as an earneft of favour and protection, than upon any other account. His future courfe of life was to be free from danger. He could not endure to be left in an empty houfe. Whenever the earl removed, he would go atong with him, even to his laft ftage, from Chatfworth to Hardwick. When he was in a very weak condition, he dared not to be left behind, but made his way upon a feather-bed in a coach, tho igh he furvived the journey but a few days. He could not bear any difcourfe of death, and feemed to caft off all thoughts of it: he delighted to reckon upon longer life. The winter before he died, he made a warm coat, which he faid mult laft lim three years, and then he would have fuch another. In his laft ficknefs his frequent queftions were, Whether his difeafe was curable ? and when intimations were given, that he might have eafe, but no remedy, he ufed this expreffion, "I fhould be glad to find a hole to creep out of the world at;' which are reported to have been his laft fendible words; and his lying fome
days following in a filent fupefaction, did feem owing Höbbes to his mind more than to his body."

The reverend Mr Granger obferves, that Hobbes's Hobgoblin. style is incomparably better than that of any other writer in the reign of Charles I. and was for its uncommon ftrength and purity farcely equalled in the fucceeding reign. "He has in tranllation (fays he) done Thucydides as much jurtice as he has done injury to Homer; but he looked upon himfelf as born for much greater things than treading in the fteps of his predeceffors. He was for friking out new paths in fcience, government, and religion ; and for removing the land-marks of former ages. His ethics have . ftrong tendency to corrupt our morals, and his politics to deftroy-that liberty which is the birthright of every human creature. He is commonly reprefented as a fceptic in religion, and a dogmatift in philofophy ; but he was a dogmatift in both. The main principles of his Leviathan are as little founded in moral or evangelical truths, as the rules he has lad down for fquaring the circle are in mathematical demonftration. His book on human nature is efteemed the beft of his works."

HOBBIMA (Minderhout), an eminent landfcape painter, was born about the year 16 rr at Antwerp; but the mafter from whom he received his inftruction is not known. He ftudied entirely after nature, fketching every fcene that afforded him pleafure, and his choice was exceedingly picturefque. His grounds are alwaysagreeably broken, and he was particularly fond of defcribing flopes diverfified with fhrubs, plants, or trees, which conducted the eye to fome building, ruin, grove, or piece of water, and frequently to a delicate remote diftance, every object perfpectively contributing to delade our obfervation to that point. The figures which he himfelf defigned are but indifferent; which was a defect imputable to Claude Lorraine and Gafpar Pouflin as wefl as to Hobbima; but the latter, confcious of his inability in that refpect, admitted but fewf figures into his defigns, and thofe he ufially placed fomewhat removed from the immediate view at a prudent diftance from the front line. However, moft of his pictures were fupplied with figures by Oftade, Teniers, and other very famous mafters, which muft always give them a great addicional value. They are now exceedingly fcarce, and indaftrioully fought for.

HOBBY, the name of a hawk called by fome authors fubbuteo. See Falco.

It is a hawk of the lure, and not of the fift; and is very like the faker, only much lefs. It makes excellent fport with net and fpaniels; for when the birds fee the hobby, they dare not commit themfelves to the wing, but lie clofe to the ground, and fo are ta* ken in nets.

Hobby is alfo a name formerly given to ftrong active horfes of a middling fize: they are reported to have been originally natives of Ireland, and were much liked and ufed. Nags anfwer the fame defcription as to fize, qualities, and employments.

HOBGOBLIN is a name vulgarly applied to fairies or apparitions. Skinner calls the word rabgoblins, and derives it from Robin Goodfellow, Hob being the nick name of Robin: but Wallis and Junins, with greater probability, derive it from hopgoblins, empufa,

Hoblers becanfe they are fuppofed to hop without moving both Il their feet.
Hody. HOBLERS, or Hobilers, Hobelarii, in ancient cuftoms, were men who, by their tenure, were obliged to maintain a light horfe or hobby, for the certifying any invafion towards the fea-fide. -The name was alfo ufed for certain Irifh knights, who ufed to ferve as light horfemen upon hobbies.

HOB-NAIL, a nail with a thick ftrong head, ufed in fhoeing a hobby or little horfe.

HOB-NOB, or Hab-map, a cant word formed from hap ne hap, and denoting an event which happens at random or by mere chance.

HOBOO, a name given by the people of Otaheite, and in the neighbouring iflands of the South Sea, to their fuperfine cloth. It is the thimeft and moft finifhed preparation of the aontd.

HOBSHEE-corfrees, a kind of Abyffinian flaves very frequent in the empire of Hindoftan. They come moftly from a province fubject to the Negus of Ethiopia, called Innariah, to the fouth of his other dominions, and bordering upon Negroland in Africa; from whence they are felected, and a great traffic made of them cver all Mogoliftan and Perfia; but it is chiefly from the ports of Arabia and the Red Sea that they are brought. Nothing can be imagined more fmooth or glofly, and perfectly black, than their fkin; in which they far furpals the negroes on the coalt of Guinea; and, generally fpeaking, have not any thing of their thick lips, though otherwife as woolly haired as they. They are highly valued for their courage, fidelity, and fhrewdnefs; in which they fo far excel, as often to rife to polts of great honour, and are made governors of places under the title Siddees.

HOBSON's-choIce, a vulgar proverbial expreffron, applied to that kind of choic̣e in which there is no alternative. It is faid to be derived from the name of a carrier at Cambridge, who let out hackney horfes, and obliged each cuftomer to take in his turn that horfe which ftood next the fable door.

HOCUS-POCUS, a cant expreffion with which the exhibitors oflegerdemain ricks generally preface their feats. They are thought to be derived from that arch legerdemain trick of the Romifh priefts converting the farramental bread into Deity ; in which wonderful metamorphofis the words hoc eft corpus made a confpicuotis part of the ceremony, and which words may be confidered as the probable root of our modern bocius-iocus.

HOD, a fort of tray for carrying mortar, in ufe among bricklayers.

HODEGOS, a term purcly Greek, ofngos, fignifying guide. The word ic chiefly ufed as the title of a book compofed by Anaftafius the Sinate, towards the clofe of the fifth century; being a method of difputing againft the heretics, particularly the Acephali.

Mr Toland has alfo publifhed a differtation under the fame title. Its fubject is the pillar of fire, \&c. which went before the the ifraelites as a guide in the defart.
HODGE-PODGE. See Hotch-porch.
HODMAN, a cant term formerly ufed for a young fcholar admitted from Weftininfter-fchool to be ftudent in Chrift-churc lı in Oxford.

HODY (Humphry), a learned Englifl divine, was born in 1659. At 2 I years of age, he publighed his ce-
lebrated Differtation againft Ariftæus'shiftory of the 70 interpreters; which was received with great applaufe by all the learned, Traic Voffius excepted, who could not bear to have his opinions oppofed by fuch a youth. Twenty years after, he treated the fubject morefully in his De Bibizorum textibus originalibus, verflonibus Gracis \& Latina vulgata, libri IV. In 1689, he wrote the Prologomena to John Melala's Chronicle, printed at Oxford ; and the year after was made chaplajn to Dr Stillingfleet bifhop of Worcefter. The deprivation of the nonjuring bifhops engaged him in a controverfy with Mr Dodwell; which recommended him to archbifhop Tillotfon, to whom, and his fucceffor Dr Tennifon, lie was domeftic chaplain. In 1698 he was made regius profeifor of the Greek tongue at Oxford, and archdeacon of Oxford in $\mathbf{r} 704$. On occafion of the controverfy about the convocation, he, in I 701 , publifhed A hiftory of the Englifh councils and convocations, and of the clergy's fitting in parliament, \&c. He died in 1706, leaving in MS. An account of thofe learned Grecians who retired to Italy on the taking of Conftantinople, \&c. which was publifhed in 1742 by Dr Jebb.

HOE, or How, a liufbandman's tool, made like a cooper's adz, to cut up weeds in gardens, fields, \&c. This inftrument is of great ufe, and ought to bemuch more employed than it is in hacking and clearing the feveral corners and patches of land in fpare times of the year, which would be no fmall advantage to it.
Horfe-Hoe, a large kind of hoe drawn by horfes, and ufed to ftir the intervals in the new hufbandry, and clear the corn from weeds. See Agriculture.

HOEING, in the new huibandry, is the breakingor dividing the foil by tillage while the corn or other plants are growing thereon. It differs from common tillage (which is always performed before the corn or plants are fown or planted) in the time of performing it ; and it is much more beneficial to the crops than any other tillage. This fort of tillage is performed various ways, and by means of different inftruments, and is defcribed under the article Agricuiture.
HOEI-TCHEOU, the moft fouthern city of the province of Kiang-nan in China, and one of the richeft of the empire. The people are economical and temperate, but they are active and enterprifing in trade: they boaft of their tea, varnifh, and engravings, which are indeed the moft efteemed in China. It has dependent upon it fix cities of the third clafs; the mountains which furround this canton contain gold, filver, and copper mines.
HOEMATOPUS, in ornithology; a genus of birds, of the order of grallæ. It has a long compreffed bill, with the end cuncated; the noftrils are linear, and the feet have only thrce toes. There is but one fpecies, the oftralegus, fea-pie, or oyftercatcher. They are very common on moft of our coafts ; feeding on marine iníects, oyfters, limpets, \&c. Their bills, which are compreffed fideways, and end obtufely, are very fit inftruments to infinuate between the limpet and the rock to which thefe fhells adhere; which they do with great dexterity to get at the fiff. On the coalt of France, where the tides recede fo far as to leave the beds of oyfters bare, thefe birds feed on them, forcing the fhells open with their bills. They keep in fummer-time in pairs, laying their eggs.

## Hoc

.

Hoffman, on the bare ground: they lay four of a whitifl-brown Hog. hue, thinly footted and itriped with black; and when any one approaches their young, they make a lond and Chrill noife. In winter they alfemble in valt flocks, and are very wild. The head, neck, fcapulars, and coverts of the wings of this bird, are of a fine black; in fome the neck is marked with white; the wings duky, with a broad tranfverfe band of white; the bill three incheslong, and of a rich orange colour.

HOFFMAN, the name of feveral eminent phyficians; of whom Maurice Hoffman, and John Maurice Hoffman his fon practifed at Altorf. Mdurice died in r698. leaving behind him many works; and was fueceeded by his fonJohn Maurice, who wrote as well as his father, and died in 1727, highly efteented by the faculty.-Frederic Hoffman, probably of the fame family, was born at Magdeburg in 1660. The principal known circumftances of his life are, his journey into Holland and England, where he became intimately acquainted with Paul Herman and Robert Boyle; never taking any fees, being fupported by his annual ftipend; his curing the emperor Charles VI. and Fred eric I. king of Pruffia of inveterate difeafes: to which may be added, his accurate knowledge of the nature and virtues of mineral waters. He furvived his 8oth year; and his works, which are in great efteem, were printed in fix volumes folio at Geneva, in 1740 .

HOFFMANISTS, in ecclefiaftical hiftory, denote thofe who efpoufed the fentiments of Daniel Hoffmann, profeffor of the univerfity of Helmftadt, who, from the year $159^{8}$, maintained, that philofophy was a mortal enemy to religion; and that what was true in philofophy was falle in theology. Thefe abfurd and pernicious tenets occafioned a warm and extenfive controverfy; at length Hoffmann was compelled by Julius duke of Brunfwick to retract his invectives againft philofophy, and to acknowledge, in the noft open manner, the harmony and union of found philofophy with true and genuine theology.

HOG, in zoology. See Sus.
Hog, on beard of a fhip, is a fort of flat fcrubbing broom formed by inclofing a number of fhort twigs of birch or fuch wood berween two pieces of plank faftened together, and cutting off the ends of the twigs, and 'ferving to fcrape the filth from a fhip's bottom under water, particularly in the act of boottopping. For this purpofe they fit to this broom a long ftaff with two ropes; one of which is ufed to thrun the hog under the fhip's bottom, and the other to guide and pull it up again clofe to the planks. This bufinefs is commonly performed in the fhip's boat, which is confined as clofe as polfible to the veffel's fide during the operation, and fhifted from one part of the fide to another till the whole is completed.

Hog's Ding is by Mortimer reckoned one of the richeft manures we are acquainted with, and the next in value to hleep's dung; and is found to be equal in virtue to twice the quantity of any other dung except this. The ancients feem to have been difpleafed with it on account of its breeding weeds; but this is only accufing it of being too rich, for any dung will do this when laid too thick. It is an excellent manure for pafture-grounds, and excels all other kindsof dung
for trees. The farmers who ufe this dung for their Hog. lands, generally tahe care to fave it, by well-paving llogarth. the ftyes; and increafe the quantity by throwing in bean-italks, ftubble, and many other thi: igs of a like nature : and, by good management of this kiad, many farmers have procured 50 or 60 loads of excellent manure a-year out of a fmall ftye. The very beft way of ufing thus dung is by mixing it with horfe-dung; and for this reafoll it is beft to have the gye near the ftable, that the two cicanfings may be mized in one heap, and afed together.

They have in many parts of Staffordhire a poor, light, thallow land, on which they fow a kind of white pea: the land is neither able to bear this nor any thing elfe to adyantage for their reaping; but, when the peas are ripe, they turn in as many hogs as the quantity of peafe will fatten, fuffering them to live at large, and io remain there day and hight: in confequence of this, the lands will produce grood crops of hay for feveral years afterwards; or, if too poor for that, it will at worft raife grals enough to make it good pafture-ground.

Hog's Lard. See Axungia.
HOGARTH (William), a muly great and original genius, is faid by Dr Burn to lave been the defcendant of a family originally from Kirkby Thore, in Weftmoreland. His father, who had been a fchoolmafter in the fame county, went early to London, where he was employed as a corrector of the prefs; and appears to have been a man of fome learning, a dictionary in Latin and Englifh, which he compofed for the ufe of fchools, being ftill exifting in MS. He married in London ; and kept a Cchool in Ship-Court, in the OldBailey. Our hero was born in 1697 or 1698 , in the parifh of St Martin Ladgate. The outfet of his life, however, was unpromifing. "He was bound," fays Mr Walpole, to a mean engraver of arms upon plate." Hogarth probably chofe this occupation, as it required fome fkill in drawing ; to which his genius was particularly turned, and which he contrived affiduoully to cultivate. His mafter, it fince appears, was Mr Ellis Gamble, a filverfmith of eminence, who refidedin Cran-bourn-ftreet, Leicefter-fields. In this profeffion it is not unufual to bind apprentices to the fingle branch of engraving arms and cyphers on every fpecies of metal; and in that parcicular department of the bufinefs young Hogarth was placed; " but, before his time was ex"s pired, he felt the impulfe of genius, and that it di"rected him to painting." Duriat his apprenticefhip, he fet out one Sunday, with tivo or three companions, on an excurfion to Highgate. The weather being hot, they went into a public houfe, where they had not been long before a quarrel arofe between fome perfonsin the fame room. One of the difputants fruck the other on the head with a quart pot, and cut him very much. The blood running down the man's face, together with the agony of the wound, which had diftorted his features into a molt hideons grin, prefented Hogarth, who howed himfelf thus carly, "t apprifed of the mode Nature had intended he fhould purfue," with too laughable a fubject to be overlooked. He drew out his pencil, and produced on the fpot one of the moft ludicrous figures that was ever feen. What rendered this piece the more valuable was, that it ex-
hibited

## H O G

more were difcoverable. While Hogarch was painting the " Rake's progrefs," he had a fummer refidence at Ifleworth ; and never failed to queftion the company who came to fee thefe pictures, if they knew for whom one or another figure was defigned. When they guefled wrong, he fet them right.
The Duke of Leeds has an original fcene in the "' Beggar's Opera," Painted by Hogarth. It is that in which Lucy and Polly are on their knees, before their refpective fathers, to intercede for the life of the hero of the piece. All the figures are either known or fuppofed to be portraits. If we are not mifinformed, the late Sir Thomas Robinfon (perhaps better known by the name of Long Sir Thomas) is ftanding in one, of the fide boxes. Macheath, unlike his fprucereprefentative on the prefent ftage, is a flouching bully; and Polly appears happily difencumbered of fuch a hoop as the daughter of Peachum within our younger memories has worn. Mr Walpole has a picture of a fcenc in the fame piece, where Macheath is going to execution. In this alfo the likeneffes of Walker and Mifs Fenton, afterwards dutchefs of Bolton (the firft and original Macheath and Polly) are preferved. In the year 1726, when the affair of Mary Tofts, the rabbit breeder of Godalming, engaged the public attention, a few of the principal furgeons fubfribed their guinea a plece to Hogarth, fot an engraving from a ludicrous 1ketch he had made on that very popular fubject. This plate, amongft other portraits, contains that of the St Andre; then anatomift to the royal houfehold, and in high credit as a fargeon. In 1727, Hogarth agreed with Morris, an upholfter. er, to furnifh him with a defign on canvas, reprefenting the element of earth, as a pattern for tapeftry. The work not being performed to the fatistaction of Morris, he refufed to pay for it; and our artift, by a fuit at law, recovered the money.

Inr 7 730, Mr Hogarth married the only daught er of Sir James Thornhill, by whom he had no child. This union, indeed, was a ftolen one, and confequentJy without the approbation of Sir James, who confidering the youth of his daughter, then barely 18 , and the flender finances of her hufband, as yet an obfcure artift, was not eafily reconciled to the match. Soon after this period, however, he began his " Harlot's Progrefs' (the coffin in the laft place is infcribed Scpt. 2. I731) ; and was advifed by lady Thornhili to have fome of the fcenes in it placed in the way of his father-in-law. Accordingly, one morning early, Mrs Hogarth undertook to convey feveral of them into his dining-room. When he arofe, he inquired from whence they came; and being told by whom they were introduced, he cried out, "Very well; the man who can furnifh reprefentations like thefe can alfo maintain a wife without a portion." He defigned this remark as an excufe for keeping his purfe-ftrings clofe; but foon after, became both reconciled and generous to the young people. An allegorical cieling by Sir James Thornhill is at the loufe of the late Mr Huggins, at Headly Park, Hants. The fubject of it is the ftory of Zephyrus and Flora; and the figure of a fatyr and fome others were painted by Hogarth.

In 1732, Hogarth ventured to attack Mr Pope, in a plate-called "The Man of Tafte;" containing a

## HO G

## 607 ]

## H. O

Hogarth. view of the Gate of Burlington-houfe, with Pope whitewafhing it and befpattering the duke of Chandos's coach. This plate was intended as a fatire on the tranflator of Homer, Mr Kent the architect, and the earl of Burlington. It was formuate for Hogarth that he efcaped the lafh of the former. Either Hogarth's obfcurity at that time was his protection, or the bard was too prudent to exafperate a painter who had already given fuch proof of his abilities for fatire.

Soon after his marriage, Hogarth had fummer lodgings at South Lambeth; and being intimate with Mr Tyers, contributed to the improvement of the Spring Gardens at Vauxhall, by the hint of embellifhing them with paintings, fome of which were the fuggeftions of his own truly comic pencil. For his affiftance, Mr Tyres gratefully prefented him with a gold ricker of admifion for himfelf and his friends,

In I733, his genius became conifpicuoufly known. The third fcene of his'6 Harlot's Progrefs,' introduced him to the notice of the great. At a board of treafury which was held a day or two after the appearance of that print, a copy of it was hhown by one of the lords, as containing among other excellencies, a ftriking likenefs of Sir John Gonfon. It gave univerfal fatisfaction: from the treafury each lord repaired to the print-fhop for a copy of it, and Hogarth rofe completely into fame.

The ingenious Abbé Du Bos has often complained that no hiftory painter of his time went through a feries of actions, and thus, like an hiftorian, painted the fincceflive fortune of an hero from the cradle to the grave. What Du Bos wifhed to tee done, Hogarth performed. He lanches out his young adventurer a fimple girl upon the town, and conducts her through all the viciffitudes of wretchednefs to a premature death. This was painting to the underfanding and to the heart: none had ever before made the pencil fubfervient to the purpofes of morality and inftruction : a book like this is fitred to every foil and every obferver; and he that runs mayread. Nor was the fuccefs of Hogarth confined to his perfons. One of his excellencies confifted in what may be termed the furniture of his pieces; for as, in fublime and liftorical reprefentations, the fewer trivial circumftances are permitted to divide the fpectator's attention from the principal figures, the greater is their force; fo, in fcenes copied from familiar life a proper variery of little domeftic images contributes to throw a degree of verifimilitude on the whole. ,, The Rake's leveeroom," fays Mr Walpole, "the nobleman's dining room, the apartments of the hufband and wife in Marriage á la Mode, the alderman's parlour, the bedchamber, and many others, are the hiftory of the manners of the age."

In 1745 , Hogarth fold about 20 of his capital pictures by auction; and in the fame year acquired additional reputation by the fix prints of "Marriage á la Mode," which may be regarded as the ground-work of a novel called " The marriage Act," by Dr Shebbear, and" of The Clandeftine Marriage."

Soon after the peace of Aix la Chapelle, he went over to France, and was taken into cuftody at Calais while he was drawing the gate of that town ; a circumftance which he has recorded in his pieture, intitled "O the Roaft Beef of Old England !" pub-
lifhed March 26. 1746. He was actually carried be- Hogarth. fore the governor as a fpy, and after a very ftrict examination commited a prifoner to Granfire, his landlord, on his promifing that Hogarth fhould not go out of his houfe till he was to embark for England.

In 1753 , he appeared to the world in the character of an anthor, and publifhed a quarto volume, intitled " The Analyfis of Beauty, written with a view of fixing the fluctuating ideas of tafte." In this performance he fhows, by a variety of examples, that a curve is the line of beauty, and that round fwelling figures are moft pleafing to the cye; and the truth of his opinion has been countenanced by fubfequent writers on the fubject. In this work, the leading idea of which was hieroglyphically thrownout in a frontifpiece to his works in 1745 , he acknowledges himfelf indebted to his friends for affiftande, and particularly to one gentleman for his corrections and amendments of at leaft a third part of the wording. This friend was Dr Benjamin Hoadley, the phyfician, who carried on the work to about the third part, Chap. IX. and then, through indifpofition, declined the friendly office with regret. Mr Hogarth applied to his neighbour Mr Ralph; but it was impoffible for two fuch perfons to agree, both alike vain and pofirive. He proceeded no farther than about a fheet, and they then parted friends, and feem to have continued fuch. The kind office of finifhing the work, and fuperintending the publication, was laftly taken up by Dr Morell, who went through the remainder of the book. The preface was in like mannner corrected by the Rev. Mr Townley. The family of Hogarth rejoiced when the laft Sheet of the "Analyfis" was printed off; as the frequent difputes he had with his coadjators, in tlie progrefs of the work, did not muel harmonize his difpofition. The work was tranflated into German' by Mr Mylins, when in England, under the author's infpection; and the tranflation was printed in London, price five dollars. A new and correct edition was in 1754 propofed for publication at Berlin, by Ch . Fr. Vok, with an explanation of Mr Hogarth's fatirical prints, tranlated from. the French; and an Italian tranflation was publifhed at Leghorn in 1761.

Hogarth had one failing in common with moft people whoattain wealth and eminence without the aid of liberal education.-He affected to defpife every kind of knowledge which he did not poffefs. Having eftablifhed his fame with little or no obligation to literature, he either conceived it to be needlefs, or decried it becaufe it lay out of his reach. His fentiments, in fhort, refembled thofe of Jack Cade, who pronounced fentence on the clerk of Chatham becaufe he could write and read. Till, in evil hour, this cclebrated artift commenced author, and was obliged to employ the friends already mentioned to correct his "Analyfis of Beauty," be did not feem to have difcovered that even fpelling was a neceffary qualification; and yet he had ventured to ridicule the late Mr Rich's deficiency as to this particular, in a note which lies before the Rake whofe play is refufed while he remains in confinement for debt. Previoús to the time of which we are now fpeaking, one of our artift's common topics of declamation was the ufeleffnefs of books to a man of his profeffion. In "Beer-ftreet," among other volumes. configned by him to the paftry-cook, we find Turn.

Hogarth bull " on Ancient Painting;" a treatife which Hogarth hould have been able to underftand before he ventured to condemn. Garrick himfelf, however, was not more ductile to fiattery. A word in praife of "Sigifmunda," his favourite work, mjght have commanded a proof print, or forced an original ketch out of our artift's hands. The following authenticated Atory of our artift will alfo ferve to fhow how much more eafy it is to detect ill-placed or hyperbolical adulation refpecting others than when applied to ourfelves. Hogarth being at dinner with the great Chefelden and fome other company, was told that Mr John Freke, furgeon of St Bartholomew's-hofpital, a few evenings before, at Dick's Coffee-houfe, had afforced that Greene was as eminent in compofition as Handel. "That fellow Freke," replied Hogarth, " 6 is always fhooting his bolt abfurdly one way or another! Handel is a giant in mufic; Greene only a light Florimel kind of a compofer."-"Aye," fays our artift's informant; " but at the fame time Mr Freke declared you were as good a portrait-painter as Van-dyck."-"'There he was in the right,"adds Hogarth'; "' and fo by G-I am, give me my time, and let me choofe my fubject!'"

A fpecimen of Hogarth's propenfity to merriment; on the mof trivial occafions, is obfervable in one of his cards requefting the company of Dr . Arnold King to dine with him at the Mitre. Within a circle, to which a knife and fork are the fupporters, the written part is contained. In the centre is drawn a pye, with a mitre on the top of it; and the invitation of our artift concludes with the following fport on the Greek letters-to Eta Beta $P_{2}$. The reft of the infcription is not very accurately fpelt. A quibble by Hogarth is furely as refpectable as a conundrum by Swift.

In one of the carly exhibitions at Spring-Gardens, a very pleafing fmall picture by Hogarth made its firft appearance. It was painted for the Earl of Charlemont, in whofe collection it remains, and was intitled "؛ Picquet, or Virtue in Danger ;'" and fhows us a young lady who during a tête-à-tete had juft loft all her money to a handfome officer of her own age. He is reprefented in the act of returning her a handful of bank bills, with the hope of exchanging them for a fofter acquilition and more delicate plunder. On the chimney-piece awatch cafe and a figure of Time over it, with this motto-NUNC. Hogarth, has caught his heroine during this noment of hefitation, this ftruggle with herfelf, and has marked her feelings with uncommon fuccefs.

In the " Mifer's feafts." Mr Hogarth thought proper to pillory Sir Ifaac Shard, a gentleman proverbially avaricious. Hearing this, the fon of Sir Ifaac, the late Ifac Pacatus Shard, Efq; a young man of fpirit, juft returned from his travels, called at the painter's to fee the picture; and among the reft, aiking the Cicerone "whether that odd figure was intended for any particular perfon;" on his replying "t that it was thought to be very like one Sir Ifaac Shard," he immediately drew his fword and flafled the canvas. Hogarth appeared inftantly in great wrath: to whom Mr Shard calmly jutified what he had done, faying " that this was a very unwarrantable licence; that he was the injured party's fon, and that he was ready to defend any fuit at law; which however, was never indituted.

About 1757 , his brother-in-law, Mr Thornhill, H ogarth refigned the place of king's ferjeant-painter in favour of Mr Hogarch.

The laftremarkable circumftance of his life was his conteft with Mr Churchill. It is faid that botlo met at Weftminfter-liall; Hogarth to take by his eye a ridiculous likenels of the poet, and Churchil to furnifl a defcription of the painter. But Fogarth's print of the poet was not much efteemed, and'the poet's letter to him was but little admired. Some pretend, indeed, to fay that it broke the painter²s heart; but this we can from good authority fay is not true. Indeed the report falls of itfelf; for we may as well fay, that Hogarth's pencil was as efficacious as the poet's pen, fince neitherlong furvived the contelt.

It may be truly obferved of Hogarth, that all his powers of delighting were reftrained to his pencil. Having rarely been admitted into polite circles, none of his flarp corners had been rubbed off, fo that he continued to the laft a grofs uncultivated man. The flighteft contradiction tranfported him into rage. To fome confidence in himfelf he was certainly irititled: for, as a comic painter, he could have claimed no honour that would not moft readily have been allowed him ; but he was at once unprincipled and variable in his political conduct and attachments. He is alfo faid to have beheld the rifing eminence and popularity of Sir Johua Reynolds with a degree of envy; and, if we are not mifinformed, frequently fpoke with a fperity both of him and his performances. Jufice, however, obliges us to add, that 'our artift was liberal, Lofpitable, and the moft punctual of paymafters; fo that, in fpite of the enoluments his works had procuced to him, he left but an inconfiderable fortune to his widow. His plates indeed are fuch refources to her as may not fpeedily be exhaufted. Some of his domeftics had lived many years in his fervice; a circumftance that always reflects credit on a mafter. Of moft of thefe he painted ftrong likeneffes on a canvas ftill in Mrs Fogarth's poffeffion:

Of Hogarth's leffer plates many were deftroyed. When he wanted a piece of copper on a fudden, he would take any from which he had already worked off fuch a number of impreffions, as he fuppofed he fhould fell. He then fent it to be effaced, beat out, or otherwife altered to his prefent purpofe. The plates which remained in his poffeffion were fecured to Mrs Hogarth by his will dated Aug. 12. 1764, chargeable with an annuity of L. 80 to his fifter Anne, who furvived him. When, on the death of his other fifter, the left off the butinefs in which the was engaged, he kindly took her home, and generoully fupported her, making her at the fame time, ufeful in the difpofal of his prints. Want of tendernefs and liberality to his relations was not among the failings of Hogarth.

The following character of Hogarth as an artift, is given by Mr Gilpin in his Effay on Prints. "The works of this mafter abound in true humour and fatire, which is generally well direced: they are admirable moral lelfons, and a fund of entertaimment fuited to every tafte; a circumfance which fhews them to be juft copies of nature. We may conlider them too as valuable repolitories of the manners, cuftoms, and dreffes of the prefent age. What a fund of entertainment would a collection of this kind afford, drawn from every period of the hiftory of Britain ?- How

HO G
Progarth. far the works of Hogarth will bear a critical examination, may be the fubjest of a litule more enquiry.
"In defign, Hoyarth was feldom at a.lofs. His invention was fertile, and his judgment accurate. An improper incident is rarely introduced, a proper one rarely omitted. No one could tell a flory better, or make it in all its circumfances more intelligible. His genius, however, it muft be owned, was fuited only to low or familiar fubjects; it never foared above commion life : to fubjects naturally fublime, or which from antiquity or other accidents borrowed dignity, he could not rife. In compo fition we fee little in him to admire. In many of his prints the deficiency is fogreat as plainly to imply a want of all principle; which makes us ready to believe, that when we do meet with a beautiful group, it is the effect of chance. In one of his minor works, the Idle Prentice, we feldom fee a croud more beautifully mainaged than in the laft print. If the Sheriff's office:s had not been placed in a line, and had been brought a little lower in the pieture, fo as to have formed a py ramid with the cart, the compofition had been unexceptionable; and yet the firft print of this work is fuch a ftriking inftance of difagreeable compofition, that it is amazing how an artift who had any idea of beautiful forms could fuffer fo unmafterly a performance to leave his hands. Of the diftribution of light Hogarth had as little knowledge as of compofition. In fome of his pieces we fee a good effect, as in the Execution juft mentioned ; in which, if the figures at the right and left corners had been kept down a little, the light, would have been beautifuliy diftributed on the fore-ground, and a fine fecondary light fpread over part of the croud. But at the fame time there is fo obvious a deficiency in point of effect in moft of his prints, that it is very evident he had no principles. Neither was Hogarth a mafter in drawing. Of the mufcles and anatomy of the head and hands he had perfect knowledge; but his trunks are often badly moulded, and his limbs ill fet on : yet his figures, upon the whole, are infpired with fo much life and meaning, that the eye is kept in good-humour in fpite of its inclination to find fanlt. The author of the Analyfis of Beauty, it might be fuppofed, would have given us more inftances of grace than we find in the works of Hogarth ; which hows ftrongly that theory and practice are not always united. Many opporunities his.fubjects naturally afford of introducing graceful attitudes, and yet we have very few examples of them. With inftances of pičurefque grace his works abound. Of his expreffion, in which the force of his geniuslay, we cannot fpeak in terms too high. In every mode of it he was truly excellent. The paffions he thoroughly underftood, and all the effects which they produce in every part of the haman frame. He had the happy art alfo of conveying his ideas with the fame precifion with which he conceived them. He was excellent too in expreffing any humorous eddity which we often fee ftamped upon the human face. All his heads are caft in the very mould of nature. Hence that endlefs variety which is difplayed thro' his works; and hence it is that the differencearifes between his heads and the affected caricaturas of thofe mafters who have fometimes a mufedthemfelveswith fatching togetheran affemblage of features from their own ideas. Such are Spaniolet's; which, though admirably executed, appear plainly to

## 609 H O G

have no archetypes in nature. Itogarth's, on the other Hogftead hand, are collections of natural curiofitics. The $O x j$ ordheads, the Phyfician's-umhs, and come of this cher fic- Hokeday. ces, are exprefsly of this humorous kind. They are truly comic, though ill-natured effulions of mirth; more entertaining than Spaniolet's, as they are pure nature ; but lefs innocent, as they contain ill-directed ridiculc.-But the fpecies of expreflom in which this mafter permaps moft excels, is that happyart of catching: thofe peculiarities of art and gefture which the ridiculous part of every profeffon contrad, and which for that reafon become characteriftic of the whole. His counfellors, his undertakers, his lawyers, his ufurcrs, are all confpicuous at light. In a word, almoft every profeffion may fee in his works that particular fecies of affectation which they hould moft endeavour to avoid. The execution of this mafter is well fuited to his fubjects and manner of treating them. He etches with great firit, and never gives one unuecelary Atroke,"

HOGSHEAD, in commerce, a meafure of capa. city containing 63 gallons.

HOGUE, a town and cape on the north-weft point of Normandy in France ; near which Admiral Rook burint the French admiral's fhip called the Rifing Sun, and 12 more large men of war, the day after the victory obtained by Admiral Ruffell near Cherburg in May 1692. W. Long. 2. o. N. Lat. 49. 50.

HOIST, in fea-language, denotes the perpendicular height of a flag or enfign, as oppofed. to the fly, which fignifies its breadth from the Itaff to the outer cdge.

HOISTING fignifies the operation of drawing up any body by the affiftance of one or more tackles. Hoifting is never applied to the act of pulling up any body by the help of a fingle block, except in the exercife of extending the fails by drawing them upwards along the mafts or ftays, to which it is invariably applied.

HOKE-day, Hock-Day, or Hock-Tuefday, in ancient cultoms (dies Martis, qucm quindenampafchavocant), the fecond Tuefday after Eafter week; a folemn feftival celebrated for many ages in England in memory of the great flaughter of the Danes in the time of king Ethelred, they having been in that reign almoft all de* ftroyed in one day in different parts of the kingdom, and that principally by women. This is ftill kept up in fome counties; and the women bear the principal fway in it, ftopping all paffengers withropes and chains, and exacting fome fmall matter from them to make merry with. This day was very remarkable in former times, infomuch as to be ufed on the fame footing with Michaelmas for a general terno or time of account. We find leafes without date referving fo much rent payable ad duos anniterminos, fcil. ad le hoke-day, b ad feftum fancti Michaelis. In the accounts of Magdalen-college, Oxford, there is yearly an allowance promulieribus hockantibus of fome manors of theirs in Hamplaire; where the men hock the women on Mondays, and the women hock them on Tueddays. The meaning of it is, that on that day the women in merriment fopped the way with ropes, and pulled paffengers to them, defiring fomething to be laid out for pious ufes.

Hoke-Day Money, or Hoke-Tue day Money, a tribute anciently paid the landlord, for giving his tenants and
bondmen

Ho...in, bordmen leave to celebrate hock-day, or hoke-day, in Hobsin. memory of the expulfion of the domincering Danes.

HO-KIEN-sOU, a city of China, and one of the principal in the province of Pe tcheli. It has two citits of the fecond, and fifteen of the third, clafs in its difirict, but is remarkable for nothing but the neatnefs of iis ftreets.

HOLBEIN (Hans), a celebrated painter, born at Bail in $S w i z$ rland in 1498 , learned the rudiments of his art from his father, who was a painter; but foon fowed his fiperior genias. In the town-houfe of Batil he painted our baviour's Paffion; and in the fill-market of the fame city Death's Dance, and a Dance of Yeafants, which were extremely admired ; and Erafmus was fo pleafed with them, that he defired him to draw his picture, and was ever after his friend. He ftaid fome years longer ac Bafil, till his neceffities, occafioned by his own extravagance and an increafing family, made him comply with Erafmus's perfuadions to go to England. In his journey he faid fome days ai Strafburg, where it is faid he applied to a very great painer fur work, who took him in, and ordered him to give a fpecimen of his fkill. On which Holbein finifhed a piece with great care, and painted a fly on the moft eminent part of it ; after which he privately withdrew in the ablence of his mafter, and purfued his journey, without faying any thing to any body. When the painter returned home, he was aftonifhed at the beauty and elegance of the drawing; and efpecially at the fly, which he at firft took for a real one, and endeavoured to remove it with his hand. He now fent all over the city for his journeyman; but after many inquiries, difcovered that he had been thus deceived by the famous Holbein.-Holbein having in a manner begged his way to England, prefented a letter of recommendation from Erafmus to Sir Thomas More, and allo Chowed him Erafmus's picture. Sir Thomas, who was then lord-chaucellor, received him with all the joy imaginable, and kept him in his houfe between two and three years; in which time he drew Sir Thomas's picture, and thofe of many of his relations and friends. Holbein one day happening to mention a nobleman who had fome years before invited him to England, Sir Thomas was very folicitous to know who it was. Holbein faid that he had forgot his title, but remem. bered his face fo well, that he believed he could draw his likenefs; which he did fo perfectly, that the nobleman it is faid was immediately known by it. The chancellor having now adorned his apartments with the productions of this great painter, refolved to introduce him to Henry VIII. For this purpofe, he invited that prince to an entertainment; having, before he came; hung up all Holbein's pieces in the great hall, in the beft order, and placed in the beft light. The king, on his firft entrance into this room, was fo charmed with the fight, that he afked whether fuch an artift was now alive, and to be had for money? Upon this, Sir Thomas prefented Holbein to his majefty; whoimmediately took him into his fervice, and brought himinto great efteem with the nobility and gentry, by which means he drew a vaft number of portraits. But while he was here, there happened an affair which might have proved fatal to him, had he not been protected by the king. On the report of this painter's character $y_{2}$ lord of the firf quality came to fee him
when he was drawing a figure after the life. Holbcin fent to defire his lurdhip to defer the bonour of his vilit to another day; which the noblcman taking for an affront, broke open the door, and very rudely went up fairs. Holbein hearing a noife, came out of his chamber ; and meeting the lurd at his door, fell into a violent pafion, and pufhed him backwards from the top of the flairs to the bottom. However, immediately reflecting on what he had done, he efcaped from the tumult he had raifed, and made the beft of his way to the king. The nobleman, much hurt, though not fo much as he pretended, was there fonn after bim; and upon opening his grievance, the king ordered Holbein to akk his pardon. But this only irsitated the nobleman the more, who would not be fatisfied with lefs than his life; upon which the king fternly replied, "My lord, you have not now to do with Holbein, but with me: whatever punifhment you may contrive by way of revenge againft him, fhall certainly be inflicted on yourfelf. Remember, pray, my lord, that I can whenever 1 pleafe make feven lords of feven ploughmen, but I cannot make one Holbein of even feven lords." Holbein died of the plague at his lodgeings at Whitehall in 1554 . "G It is amazing (fays De Piles), that a man born in Switzerland, and who had never been in Italy, fhould have fo good a gufto, and fo fine a genius for painting." He painted alike in every manner ; in frefco, in water-colours, in oil, and in miniature. His genius was fufficiently hown in the hiftorical fyle, by two celebrated compofitions which se painted in the hall of the Stillyard company. He was alfo eminent for a rich vein of invention, which he fhowed in a multitude of defigns which he drew for engravers, ftatuaries, jewellers, \&c. and he had this fingularity, that he painted with his left hand.

HOLCUS, IndiAn millet or corn : A genus of the monœcia order, belonging to the polygamia clafs of plants; and in the natural method ranking under the 4th order, Graminua. The calyx of the hermaphrodite is an uniflorous or biflorous glume; the coralla is a glume with an awn; there are three ftamina, two gyles, and one feed. The male calyx is a bivalved glume ; there is no corolla, but three ftamina.

Species. Of this genus there are I 3 fpecies, two of which are natives of Britain. The moft remarkable of thefe is the latanus, or creeping foft grafs of Hadfon; for the defcription and properties of which fee AgriculTURE, no 59. The noft remarkable of the foreign f'pecies is the forghum, or Guinea-corn. The falks are large, compatt, and full eight feet high. In Senegal the fields are entirely covered with it. Thenegroes, who call it guiarnot, cover the ears when ripe with its own leaves to thelter it from the fparrows, which are very mifchievous in that conntry. The grain made into bread, or otherwife ufed, is efteemed very wholefome. With this the gaves in the Weft Indies are generally fed, each being allowed from a pint to a quart every day. The juice of the falks is fo agreeably lufcious, that, if prepared as the fugarcanes, they would afford an excellent fugar. The negroes on the coaft of Guinea make of two kinds of millet a thick.grained pap called coufcous, whlch is common food.

HOLD, the whole interior cavity or belly of a hip, or all that part of her infide which is comprehendea

## HOL $\quad[6 \mathrm{It}] \quad \mathrm{HOL}$

Holder
hended between the floor and lower-deck through. out ber whole length. - This capacious apartment ufinally contains the ballaft, provifions, and ftores of a hip of war, and the principal part of the cargo in a merchatman. The difpofition of thefe articles with regard to each other naturally falls under confideration in the article Stowage : it fuffices in this place to fay, that the places where the ballat, water, provifions, and liquors are fowed, are known by the general name of the bold. The feveral ftore-rooms are fepirated from each other by butk-boads, and are denominated according to the articles which they contain, the fail-room, the bread-room, the fifh-room, the fpi-rit-room, \&c.

HOLDER (William), a learned and philofophical Englifhman, was born in Notinghamfhire, edu. cated in Pcmbroke-hall Cambridge, and in 1642 became rector of llechingdon of Oxford. In 1660 he proceeded D. D. was afterwards canon of Fly, fellow of the Royal Society, canon of St Paul's, fab-dean of the royal chapel, and fub-almoner to his majefty. He was a very accomplined perfon, and withala great virtuofo: and he wonderfully diftinguilhed himfelf, by makirg a young gentleman of diftinction who was born deaf and dumb to fpeak. This gentleman's name was Alexander Popham, fon of colonel Edward Popham, who was fome time an admiral in the fervice of the long parliament. The cure was performed by him in his honfe at Blechingdon in 1659 ; but Popham lofing what he had been taught by Holder after he was called home to his friends, was fent to DrWallis, who brought him to his fpeech again. Holder publifhed a book, intitled " the Elements of Speech; an effay of inquiry into the natural Production of Letters: with an appendix concerning perfons that are deaf and dumb, r669," 8vo. In the appendix he relates how foon, and by what methods, he brought Popham to fpeak. In 1678 , he publifhed in 4 to " a Supplement to the Philofophical Tranfactions of July 1670, with fome reflections on Dr W allis's letter there inferted." This was written to claim the glory of having taught Popham to fpeak, which Wallis in the faid letter had claimed to himfelf; upon which the Doctor foon after publifined " a Defence of the Royal Society, and the Philofophical Tranfactions, particularly thofe of July 1670, in anfwer to the Cavils of Dr Willian Holder, $1678, "$ fto. Holder was ikilled in the theory and practice of mufic, and wrove "a Treatife of the natural Grounds and Principles of Harmeny, 1694," 8 vo. He wrote alfo ' 6 a Difcourfe concerning Time, with Application of the natural Day, lunar Month, and folar year, \&c. 1694," 8vo. He died at Amen Corner in London, January 24. 1696-7, and was buried in St Paul's.

HOLDERNESS, a peninfula in the Eaft-Riding ef Yorkfhire, having the German fea on the eaft, and the Humber on the fouth. It had the title of an carldom, now extinct.

HOLDSWORTH (Edward), a very polite and elegant fcholar, was born about 1688; and trained at Winchefter fchool. He was thence elected demy of Magdalen college,Oxford, in July i 705; took the degree of M. A. in April 1711 : become a college-tutor, and had many pupils. In 1715 , when he was to be chofen
into a fellowhip, he reficraed his demy hip and left the Foleraces college, becaffe unvilling to fwear allegiance to the new government. The remainder of his life was fpent in travcling with young noblemen and gentlemen as Holiners. tutor: in 574 t and 1744 he was at Rome in this capacity. He died of a liver at Lord Digby's loonfe at Colefhill in Warwikihire, Decemler 30.1747. He was the author of the "Mufcipula," a poen, efteemed a mafter-piece in irs kind, and of which there is a good Englifl tranflation by Dr John Hoadly, in vol. 5. of Dodfley's Mifcellanics. He was the author alfo of a differtation, intituled "Pharfalia, and Philippi ; or the two Philippi in V'irgil's Gcorgics attempted to be explained and reconciled to Hiftory, 174 I ," 4 to ; and of "Remarks and Differtations on Virgil; with fome other cl ffical Obfervations, publithed with feveral notes and addational remarks by Mr Spence, 1768 ," 4to. Mr Spence fpeaks of hiti in Polymetis, as one who undertood Virgil in a more mafterly manaer than any perfon he ever knew.

HOLERACEX, (from bolus, "pot herbs)"; the name of the 12 th order in Linnæus's fragments of a natural method, confifting of plants which are ufed for the table, and enter into the economy of domeftic affilirs. See Botany, p. 459.

HOLIBUT, in ichthyology. See Pleuronectes.
HOLIDAY (Dr Barten), a learned divine and poet, was the fon of a taylor in Oxford, and born there about the year 1593 . He ftudied at Chriftchurch college, and in 1615 took orders. He was before admired for his fkill iu poctry and oratory ; and now diftinguihinghimfelf by his eloquence ans popu. larity as a preacher, he had two benefices conferredon him in the diocefe of Oxford. In 1618, he went as chaplain to Sir Francis Stewart, when he accompanied Count Gondamore to Spain. Afterwards he became chaplain to the king, and before the year 1626 was promoted to the archdeaconry of Oxford. In 1642 he was made doctor of divinityat Oxford; near which place he heltered himfelf during the time of the rebellion; but after the reftoration returned to his archdeaconry, where he died in 166 r . His works are, r. Twenty fermons, publifhed at different times. 2. Pbilofophice polito barbaree fpecimen, 4to. 3. Survey of the world, a poem in ten books, octavo. 4. A tranflation of the Satires of Juvenal and Perfius: 5. Technogamia, or the marriage of the arts, 2 comedy.

HOLINESS, or SANCTITY; a quality which confitutes or denominates a perfon or thing holy; i. e. pure, or exempt from fin. The word is alfo ufed in refpect of perfons and things that are facred, i. e. fet apart to the fervice of God, and the ufes of religion.

Holiness, is alfo a title or quality atrributed to the pope ; as that of majefly is to kings. Even kings, when writing to the pope, addrefs him under the venerable appellation of Your Holinefs, or Holy Father; in Latin, Sanctiffime or Beatiffime Pater. Anciently the fame title was given to all bilhops. The Greek emperors alfo were addreffed under the title of Holinefs, in regard of their being anointed with holy oil at their coronation. De Cange adds, that fome of the kings of England have had the lame attribute: 4 G 2
and

## $\mathrm{HOOL} \quad[612] \quad \mathrm{HOL}$

Holiofled that the orientals have frequently refufed it to the II Holland. pope.
HOLINSHED (Raphael), an Englifh hiftorian famous for the Chronicles under his nanie, was defcended from a family that lived at Bofely in Chefhire; but neither the time of his birth, and farcely any circumfances of his life, are known. However, he appears to have been a man of conliderable learning, and to have had a genius particularly adapted for hiftory. His Chronicles of England, Scetland, and Ireland, were firft publifhed at London in 570 , in 2 vols folio; and then in 1587 , in 3 vols. In this fecond edition feveral hects in the 2 d and 3 d vols were caftrated for containing fome paffages difagrecable to queen Elizaberh and her minifters; but the caftrations have fince been printed apart. Holinhed was not the fole compiler of this work, being affifted in it by feveral other hands. The time of his death is unknown; but from his will, which is prefixed to Hearne's edition of Cambden's Annals, it appears to have happened between 1578 and 1582:

HOLLAND (Philemond), M. D. commonly called the Tranflator general of his age, was educated in the univerlity of Cambridge. He was for many years a fchoolmafter at Coventry, where he alfo practifed plyfic. He trannated Livy, Pliny's Natural Hiftory Plutarch's Morals, Suetonius, Ammianus Marcellinus, Xenophon's Cyropædia, and Cambden's Britannia, into Englih ; and the geographical part of Speed's Theatre of Great Britain into Latin. The Britannia, to which he made many ufeful additions, was the moft valuable of his works. It is furprifing, that a man of two profeffions could find time to tranflate fo much; bat it appears from the date of the Cyropædia, that he continued to tranflate till he was 80 years of agre. He died in 1636, aged 85. He made the following epigram upon writing a large folio with a fingle pen.

With one fole pen I wrote this book, Made of a grey goofe quill ;
A pen it was when it 1 took, And a pen I leave it till.
Honland, the largeft of the Seven United Provinces, divided into South and North Holland, the latter of which is allo called Weft Friegland, is bound. ed on the weft by the German ocean, or north fea; to the eaft by the Zuyder-fee, the province of Utrechr, and part of Gelderland: to the fouth by Dutch Brabant and Zealand; and to the north by the Zuyderfee. Its greateft extent from north to fouth, including the illand of Texel, is about 90 Englifh miles; but from eaft to weft its extent varies from 40 to 25 . To defend it againft the fea, dykes have been erected at an immenfe expence, and innumerable canals cut to drain it, as being naturally very low and marlhy. Some parts of the province are very fruitful in corn ; bat the greater parts confint in rich paftures, wherein are kept large herds of kine, which fupply them with incredible quantities of butter and cheefe. Of the latter, that of Edam, in North Holland, is highly efteemed. The many rivers and canals that interfect the provinceare of great advantage to its commerce, but contribute to render the air foggy and unwholefome. There is a communication bywater betwixt almoft every town and
village. Towards the middle allo of the province are Holland, great numbers of turf-pits. It is fo populous, that New-Holthe numberof the inhabitants is computed ar $1,200.000$. land. In point of cleanlinefs no country furpaffes, and few come up to it, efpecially in North Holland, and that even in the villages. From the counts of Hulland chis province devolved, in 1436, to the dukes of Burgundy, and from them to the houle of Auftria, along with the other provinces. The fates of Holland and Weft Friefland are compofed of the nobility and depuies of the towns; of thelatter there are 18 that fend deputies to the affembly of the fates, which is heid at the Hague. The grand penfionary is a perfon of great dignity and weight in this affembly, and his office requires extraordinary abilities. There are alfo two councils compofed of ceputies, one for South, and another for North Holland, who have the cognizance of the revenue and military affairs. The whole province fends one deputy from among the nobleffe to the fates general, whotakes precedence of all others, together with three or four more. There are two fupreme courts of judicature for Holland and Zealand ; viz. the great council of Holland and Zealand, and the hof or court of Holland. To thefe appeals lie from the towns; but the caufes of noblemen come before them in the firftinftance. With refpect to the ecclefiaftical government, there is a fynod held annually both in South and North Holland, of which the former contains eleven claffes and the latter fix ; and the minifters of both together amount to 33 I . In the whole province are 37 towns; 8 boroughs, and 400 villages. -For the hiftory, fee United Provinces.
Holland, one of the divifions of Lincolnhire in England. It fo mpch refembles the province of that mane upon the continent, in moft refpects, being low and marilhy, with the fea on one fide, and canals running through it, that it mult either have had its name from thence, or on the fame account. On the eaft it has what the ancient geographers call Effuarium $M a$ taris, now the Wafhes, which are overflowed at high water, and part of Cambridgefhire on the fouth. The lower part of it is full of bogs and marhes, and has huge banks to defend it againft the fea and land foods. The ground is fo foft, that horfes are worked unflod; and it produces plenty of grafs, but little corn.The whole tract feems to have been gained from the fea; and is divided into Upper and Lower, the latter of which was unpalfable; but fince the fens have been drained, the lands are grown more folid, and the inhabitants fow cole-feed upon them to their great profit. Though there are no ftones to be found in or upon the ground, yet moft of the churches are of fone. They have no frefh water but from the cloids, which is prefervedin pits; but if thefe arc deep, it foonturns brackith; and if they are fhallow, they foon become dry.

New Holland, the largeft illand in the world, reaching from 10 to 44 deg. S. Lat, and between 110 and 154 of Long. eaft from Loncon. It received its namefrom having been chiefly extlored by Dutch navigators. The land firf difccvered in thofe parts was called Eendraght (Concord) Land, from the name of the hlip on board which the difcovery was made, in 1616; 24 deg. and 25 deg . fouth. In 1618, another part of this coaft, nearly in 15 deg. fouth, was difcovered

H O L
New-Hol- difcovered by Zeachen, who gave it the name of Arnland. beim and Diemen; though a different part from what afterwards received the name of Diemen's Land from Tafman, which is the fouthern extremity, in latitude 43 deg. In 1619, Jan Van Edels gave his name to a fouthern part of New-Holland. Another part, fituated between 30 and 33 deg . received the name of Leuwen. Peter Van Nuitz gave his name, in 1627 , to a coaft which communicates to Leuwen's Land towards the weftward; and a part of the weftern coaft, near the tropic of Capricorn, bore the name of De Wits. In 1628, Peter Carpenter, a Dutchman, difcovered the great gulph of Carpentaria, between 10 and 20 deg . fouth. In 1687 , Dampier, an Englifhman, failed from Timor, and coafted the weftern parts of New-Holland. In 1699 , he left England, with a defign to explore this country, as the Dutch fuppreffed whatever difcoveries had been made by them. He failed along the weftern coalt of it, from 28 to 15 deg. He faw the land of Endraught and of De Wit. He then returned to Timor: from whence he went out again; examined theifles of Papua; coafted New Guinea; difcovered the paffage that bears his name; called a great illand which forms this paffage or ftrait on the eaft fide, New-Britain; and failed back to Timor along New-Guinea. This is the fame Dampier who, between 1683 and 1691 , failed round the world by changing his hlips. Notwithftanding the attempts of all thefe navigators, however, the eaftern part of this vaft tract was totally unknown till Captain Cook made his late voyages; and by fully exploring that part of the coaft, gave his country an undoubted title to the poffeffion of it; which accordingly has fince been taken poffeffion of under the name of New South Wales.

Some have difputed whether the title of ifland can be properly applied to a country of fuch valt extent, or whether it ought not rather to be denominated a continent; while others have replied, that though the

## 613] H O L

word ifland, and others, fimilar to it, do indeed fignify New-Hala tract of land furrounded by fea, yet in the ufual acceptation it means only a land of moderate extent furrounded in this manner. Were it otherwife, we might call the whole world an illand, as it is every where furrounded by the fea; and in fact, Dionylius Perigetes applies this term to it, with the addition of the word immenfe, to diftinguifh it from other iflantis. The bett rule, according to Mr Stockdale, for determining when a country ought to lofe the name of ifand and begin to be called a contivent, is when it begins to lofe the advantages of an infular fituation. The firft and principal of thefe, is the being capable of an union under one government, and thence deriving a fecurity from all external attacks excepting thofe by fea; but in countries of great extent, this is not only difficult, but impoffible. If we confider, therefore, New-Holland as extending abour a thoufand miles every way, we fiall find that its claim to be called a continent is undoubted; its length from eaft to weft being about 2400 Englifl miles, and 2300 from north to fouth.

This coaft was firft explored by Captain Cook in the year 1770 ; but his ftay was too hort to examine the nature of the country with the accuracy which he would otherwife have done had he continued longer in it. In general, it was found rather barren than otherwife. Many brooks and fprings were found along the eaftern coaft, bat no river of any confequence. They found only two kinds of trees ufeful as timber, the pine, and another which produces a fort of gum. They found three kinds of palm-trees; butfew efculent plants, though there are abundance of fuch as might gratify the curiofity of the botanift. A great variety of birds were met with, which have fince been particalarly defcribed; but the number of quadrupeds bears. but a very finall proportion to that of the other animals. The moft remarkable infects feen at this time were the green ants (A), who build their nefts upon trees in a very fingular manner.
$\qquad$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(A) Thefe little animals form their habitations, by bending down the leaves of trees, and gluing the ends of them together fo as to form a purfe. Though thefeleaves are as broad as a man's hand, they perform this feat by main ftrength, thoufands of them being employed in holding down the leaves, while multitudes of others. apply the glutinous matter. Captain Cook's people afcertained themfelves that this was the cafe, by fometimes difturbing them at their work; in which cafe the leaf always fprung up with an elafticity which they could not have fuppofed that fuch minute infects were capable of overcoming. For this curiofity, however, they finarted prety feverely ; for thoufands of thefe little enemies inftanily threw themfelves upon the aggreffors, and revenged themfelves by their bites or ftings for the interruption they liad met with. Thefe were little lefs painful at firf than the fing of a bee; but the pain did not laft above a minute. Another fpecies of ants burrow themfelves in the root of a plant which grows'on the bark of trees like the milletoe, and which is conmonly as big as a large turnip. When this is cut, it appears interfected with innumerable winding paffages all filled with thefe animals; notwithftanding which, the vegetation of the plant faffers noinjury. Thefe do not give pain by their ftings, but produce an intolerable itching by crawling about on the fikin. They are about the fize of the fmall red ant in Britain. Another fort, which do not moleft in any manner, refemble the white ants (fee Termes) of the Eaft-Indies. They conftruet nefts three or four times as big as a man's head on the branches of trees; the ourfides being compofed of fome vegetable matter along with a glutinous fubftance. On breaking the outer cruftsof thefe bives, imnumerable cells appear fwarming with inhabitauts, in a great varie:y of wiading directions, all communicating with each other, and with feveral other neffs upon the fame tree. They have alfo another houfe built on the ground, generally at the root of a tree; formed like an irregular fided cone; fonetimes more than fix feet high, and nearly as much in diameter. The outfide of thefe is of well-tempered clay about two inches thick, and within are the cells, which have no opening outward. One of thefe is their fummer and the other their winter dwelling, communicating with each other by a large avenue leading to the ground, and by a fubterrancons paffage. The ground fructures are proaf againf wet, which thofe on the brauches are not.

New-Hot- This country has now become an object of more land. 3
Settlement of a Britif colony in New-Hol. land. confequence than formerly, by reafon of the eftablinment of a Britifh colony in is; where the criminals condemned to be tranfported are fent to pals their time of iervitude. Before this plan was refolved on by government, another had bees difcuffed, viz. that of employing thefe criminals in workhoufes; and Judge 3lackitone, with Mr Eden and Mr Howard, had con- fidered of the beft method of putting it in execution : but though this plan had been approved by parliament as early as 1779 , fome difficulties always occured, which prevented its going forward ; and at length, on the 6 th of December 1786 , orders were iffued by his majefty in council for making a fettlement on NewHolland, eftablifhing a court of judicature in the colony, and other regulations neceffary on the occafion. The whole received the complete fanction of the legiflature in the beginning of the year 1787 . The fquadron appointed for putting the defign in execution began to affemble at the Mother Bank, the place of rendezvous, in the ifle of Wight, on the $16 t h$ of March 1787 . It confifted of the Sirius frigate Captain John Hunter, the Supply armed tender Lieutenant H. L. Ball; three fore-fhips, the Golden-grove, Fifhburn, and Borrowdale, for carrying provilions and ftores for two years; and lafly, fix tranfports, the Scarborough and Lady Penrhyn from Portimouth, the Friend fhip and Charlotte from Plymouth, and the Prince of W ales and Alexander from Woolwich. Thefe were to carry the conviets, with a detachment of marines in each proportioned to the nature of the fervice; the largeft where refiftance was moft expected, viz. in thofe which carried the greateft number of male convicts. On the arrival of Governor Phillip at the ftation, he hoifted his flag on board the Sirius as commodore of the fquadron; and the embarkation being completed, he gave the fignal to weigh anchor on the 13 th of May at day-break. The inumber of convicts was 778 , of whom 558 were men. They touched at the illand of Teneriffe on the 3 d of June, without meeting with any bad accident. Here they ftaid a week, in o:der to procure fuch refrefliments as were neceffary for preventing the diforders mofly to be dreaded in fuch a long and perilous voyage. In this they fucceeded to their wifh; and were about to depart on the gth of June, when it was difcovered that one of the conviets had made his efcape, having found means to cut away a boat and make off with it. He offered himfelf as a failor aboard a Dutch veffel at that time in the harbour, but was refufed; on which he attempted to conceal himfelf in a cove. In this he would probably have fucceeded, had it not been for the boat which he could not conceal; fo that he was foon difcovered and brought ba $k$ to the fhip, where, however, he obtained his pardon from the governor.

On the roth of June the flect fet fail from Santa Craz in the ifland of Temeriffe, and on the 18 th came in fight of the Cape Verd iflands, where they feered for St Jago; but the want of a favourable wind and other circumftances prevented their geting in; fo that as Governor Phillip did not chufe to wafte time, they did not tonch land till they came to Rio Janeiro on the coaft of Brafil. It may feem furprifing, that a voyage to the caltward, which of itfelf may be accounted of fufficient length, fhould thus be wilfully made fo much
longer, by falling twice acrofs the Atlantic. The New-Hotcalms; however, fo frequent on the coalt of Africa, land. feem of themfelves to be a fufficientinducement for navigators to preferve a wefterly courfe; and even the inands at which it is fo neceflary to touch, are not fir diftant from the American coaft. The returning tracks of Captain Cook's three voyages are all within a little fpace of the 45 th degree of weft longitude, which is even 10 degrees farther weft than Cape St Roque; and that courfe appears to have been taken voluntarily, without any extraordinary inducement.

During the time of their flay at Santa Cruz the weather had been very moderate; the barometer about 30 inches; and the thermometer never above 72; as they approached the Cape Verd iflands it rofe to 82 , and did not exceed $82^{\circ} 51^{\prime}$ all the way from thence to Rio Janciro. Here they met with a very favourable reception, contrary to that which Captain Cook experienced on a fimilar occafion. Provifions were fo cheap, that though the allowance of meat was fixed by the gavernor at 20 ounces per day, the men were victualled completely at $3 \frac{3}{4}$ each, including rice, vegetables, and every other neceffary. Wine was not at this time to be had except at an advanced price; but rum was laid in, and fuch feeds and plants procured as were thought moft likely to flourifh in New South Wales; particularly coffee, indigo, cotton, and the cochineal fig. An hundred facks of caffada were likewife purchafed as a fubftitute for bread, if it flould happen to be fcarce. By the kindnefs of the viceroy allo, fome deficiencies in the military ftores were made up from the royal arfenal, and every affiftance given which the place could afford. They arrived here on the 5 th of Auguft 1787 , and fet fail on the 4th of September, receiving as the laft compliment from the governor a falute of 21 guns.

From Rio Janeiro the fleet had a fine run to Table Bay, in the fouthern extremity of Africa, which they accomplifhed in 39 days; were they took in the re. frefhments meant to fupply them during the remainder of the voyage. Here they arrived on the 13 th of October; and having fupplied themfelves with a great number of live fock, they fet fail on the 12 th of November, but were long impeded by contrary winds from the foutheaft. On the 25 th they were only 8oleagues diftant from the Cape, when Governor Phillip left the Sirius and went on board the Supply tender ; in hopes, by leaving the convoy, to gain fufficient time for examining the country round Botany Bay, that the moft proper fituation for the new colony might be chofen before the tranfports fhould arrive. They now met with favourable winds, blowing generally in very ftrong gales from the northweft, weft, and fouthweft. The wind fhifted only once to the eaft, but did not continue in that direction above a few hours. On the 3 d of Ja- They ar* nuary 1788 the Supply came within fight of New Sonth rive at Wales; but the winds then became variable, and a cur- New-Holrent, which at times fet very ftrongly to the fouthward, land. impeded her courfe fo much, that it was not till the 18th of the month that fhe arrived at Botany Bay.

Governor Phillip no fooner landed than he had an Interviev opportunity of converfing with the natives, who were with the affembled on fhore. As it was the intention of this natives: gentleman to conciliate if poffible their friendfhip, he ufed every method at this firft interview to infpire them with a favourable idea of the Europeans. For this pur-

New-Hol- pofe he prefented them with beads and other trifling land.

## 6

Inconveni-
ence of Bonoy quaintances in a friendly manner, next fet about an exa any Bay mination of the country about Botany Bay, which had or a fettlewent, ornaments, which they feemed pleafed to wear, though Captain Cook found them very indifferent about any kind of finery he could furnith them with. They feemed, according to the account of that celebrated navigator, to be fo attached to their own ornaments, that they made no account of any thing elfe. They received indeed fuch things as were given them, but made no offer to return any thing in exchange; nor could they be made to comprehend that any thing of the kind was wanted. Many of the prefents which they had received were found afterwards thrown away in the woods.
Governor Phillip having parted with his new acbeen ftrongly recommended by Captain Cook as the moft eligible place for a fetrlement. He found, how- ever, that the bay it felf was very inconvenient for fhipping; being expofed to the eafterly winds, and fo flallow that hifps even of a moderate burden could not get far enough within land to be fheltered from the fury of the ocean. Neither did the land about any part of this bay appear an eligible fituation for a colony; being in fome places entirely fwampy, in others quite deftitate of water. Point Sutherland feemed to afford the fituation moft free from objections, but the flips could not approach it; and even here the ground feemed to be univerfally damp and fpungy: fothat, on the whole, finding no place within the compafs of the bay proper for the new fettlement, they found themfelves obliged to renove fomewhere elfe.

The reft of the fleet arrived in two days after the Supply; and that no time might be loft, Governor Phillip ordered the ground about Point Sutherland to be cleared, and preparations to be made for landing, while he went wiih feveral officers in three boats to examine Port Jackfon, which was only three leagues diftant. Here they had the fatisfaction to find one of the fineft harbours in the world, where ro00 fail of the line might ride in perfect fafety. On examining the different coves, one was preferred which had a fine run of fpring water, and where hips could anchor fo clofe to the fiore, that at a very fmall expence quays might be conftructed for loading and unloading the largeft veffels. This was named by the governor Sydney Cove, in honour of Lord Sydney, and the country around it deftined for the place of fettlement. It is about half a mile long, and a quarter of a mile broad at the entrance. Onthe governor's return to Botany Bay, the reports made $\cdot$ hinn concerning the adjacent country were fo exceedingly unfarourable, that orders were immediately given for the removal of the fleet to A fettle- Port Jackton. On the morning of the 25 th, therefore, ment form. the governor failed from Botany Bay, and was foon foled at Port lowed by the whole tleet. In the mean time, they Jack\{on. were furpriled by the appea:ance of two other Earo8 $V_{\text {fifited }}$ by twotion 24 h . Thefe were found to be two French whorench hips, named the Aftrolabe and Boulfole, which had Whips. left Frduce on a voyage of difcovery under the command of M. la Peyroufe, in the year 1735 . They had touched at the inand of Santa Catharina on the coaft of Brafil, and from thence gone by the extremity of South America into tho Pacific Ocean, where they had
run along by the coafts of Chili and California; after New-Kolwhich they had vifited Eafter Inand, Noolka Sound, land. Conk's river, Kamtfcharka, Manilla, the Ines des Navigateurs, Sandwich, and the Friendly lles. They had alfo attempted to land on Norfolk Ifland, but found it impoffible on account of the furf. During the whole voyage none were loft by ficknefs; but two boats crews had unfortunately perifhed in a furf on the northweft coalt of America; and at Mafuna, one of the Ifles des Navigateurs, M. L'Angle, captain of the Altrolabe, with 12 of his people, officers and men, were murdered by the favages. This was the more furprifing, as there had been an uninterrupted friend fhip with them from the time the French touched at the illand, till that unfortunate moment M. L'Angle had gone afhore with two long boats for the purpofe of filling fome water-cafks. His party amounted to 40 men ; and the natives, from whom the French had already received abundance of refrefhments, did not fhow any figns of an hoftile difpofition : But from whatever motive their refentment was excited, the men had no fooner begun to get out the boats, than the favages made a moft furious and un expected affault with fones. In this enconnter M. L'Angle himfelf, with the people abovementioned, fella facrifice to the treachery of thefebarbarians. The remainder of the party efcaped with. great difficulty; the fhips having at that time paffed a point of land which intercepted their view of the affray.

The conviets and others deftined to remain in New South Wales being landed, no time was loft in beginning to clear ground for an encampment, ftore-houles, \&c. The work, however, went on but howly, partly owing to the natural difficulties they had to encounter, and partly owing to the habitual indolence of the cosvicts, which indeed was naturally to be expected confidering their former way of life. Neverthelefs, by the end of thefirft week of February, the plan of anencampment was formed, and places were marked out for different purpofes, fo that the colony already began to affume fome appearance of order and regularity. The materials and frame-work of a flight temporary habitation for the governor had been brought out from England ready formed, which were landed and pur together with as much expedition as circumftances would allow. Hofpital tents were alfo erected; and the ficknefs which foon took place howed the propricty of fo doing. In the paffage from the Cape there had been but little ficknefs, and few of the convicts had died; but a little time after they landed a dyfentery began to prevail, which proved fatal in feveral inftances, and the fcurvy began to rage with great violence, fo that the hof pital-tents were foon filled with paicents. The diforder proved the more virulent as frefly provitions could bur rarely be obtained; nor were efculent vegetables often obtained in fuch plenty as could produce any material alleviation of the complaint : the only remedy for the dyfentery was foind to be a kind of red gum, produced in plenty by the trees growing upon this coaft. Tle yeflow gum has the fame properties, though in an inferior degree.

In the beginning of February, a mof violent form of thunder and lightning deftroyed five of the fheep. which had a fhed erected for them undera tree, which proved a prelude to other misfortunes among the cattle. The encampment, however, was carricd on with great alacrity;

New-Flol-alacrity; the foundation of the ftore-houfes were laid, land. and every thing begañ to wear a promiling appearance.

Regular
form of government eftablifhed.

10 Nerfolk Illand fettled. folk Ifind - iny. It was folk Ifand. ry to make examples of fome of the convicts at Port Jackfon. Towards the end of February it was found neceffary to convene a criminal court, in which fix of the convicts received fentence of death. One who was the head of the gang was executed the fame day; was the head of the gang was executed the fame day;
one of the reft was pardoned; the other four were reprieved, and afterwards exiled to a fmall inland withreprieved, and afterwards exiled to a fmall inland with-
in the bay, where they were kept on bread and water. They had frequently robbed both the ftores and other
convicts. The fellow who was executed, and two They had frequently robbed both the ftores and other
conviets. The fellow who was executed, and two others, had been detected in ftealing the very day on which they received a week's provifion; and at the fame time that their allowance was the fame as that or the huts for the officers as foon as could be wifhed. On the 54th of February a fmall party was fent out to fettle on Norfolk Illand, who have fince eftablifhed a colony there which promifes to be of confiderable uti. lity $\dagger$. It was foon found, however, abfolutely neceffaof the foldiers, firituons liquors only excepted.

In the beginning of March the governor went out with a fmall party to examine Broken Bay, lying about eight miles to the northward of Port Jackfon. This On the 7th of the month a regular form of guvernment was eftablifhed in the colony, with all the folemnity which could poffibly be given : the governor made a proper fpeech to the convicts, reminding them of the fituation in which they ftood; and that now, if they continued their former practices, it was impoffible they could hope for mercy if detected; neither could they expect to efcape detection in fo fmall a fociety. Offenders, therefore, he faid, would certainly be punifhcd with the utmoft rigour; though fuch as behaved themfelves in a proper manner, might always depend upon encouragement. He particularly noticed the illegal intercourfe betwixt the fexes, as a practice which encouraged profligacy in every refpect: for which reafon he recommended marriage : and this exhortation feemed not to be altogether in vain, as 14 marriages were celebrated that very week in comfequence.

Heavy rains took place during the remainder of this month, which howed the neceffity of going on with the work as foon as poffible. The want of carpenters, however, prevented this from being done fo expeditioully as could have been wilhed. Only 16 of thefe could be hired from all the fhips; and no more than 12 of the convicts were of this profeffion, of whom feveral were fick ; fo that the party were by far too few for the work they had to perform. An hundred conviets were added as labourers; but with every effort it was found impoffible to complete either the barracks was found very extenfive, with many openings. One of the latter ended in feveral fmall branches, and a large lagoon, which they could not at that time examine. Moft of the land about the upper part of this branch was low and full of fwamps, with great numbers of pelicans, and other aquatic birds. Among the reft they met with an uncommon bird called at that time the Hooded Gull, but afterwards found to be the fpecies named by Mr Latham the Cafpian Terr.

From this northweft branch they proceeded acrofs the bay to the fouthweft branch, which is alfo very extenfive, with a fecond opening to the weftward capable of affording Ghelter to almolt any number of
fhips, with depth of water for veffels of almolt any New-HoI. burden. The land was found much higher here than land. at Port Jackfon, more rocky, and equally covered with timber. Large trees were feen growing even on the fummits of the mountains, which appeared totally inacceffible to the human fpecies. Round the headland which forms the fouthern entrance into the bay is a third branch, which governor Philip thought the fineft piece of water he had ever feen ; which for that reafon he honoured with the name of Pit-water. This branch, as well as the former, is fufficient to contain all the navy of Great Britain; but the latter has a bar at the entrance of only 18 feet at low water. Within are from 7 to 15 fathoms. The land here is more level than on the fouthweft branch, and fome fituations are proper for cultivation. The governor determined to have returned by land, in order to explore the country betwixt Port Jackfon and Broken Bay; but the continual rains prevented him.

On the roth of March the French Bhips departed, Death of la little intercourfe having paffed between them and the Receveur. Englifh during the time of their flay. While the former remained in Botany Bay, Father la Receveur, who had come out in the Aftrolabe as a naturalift, died of the wounds he had received in the battle with the inhabitants of Mafurra. A kind of monument was erected to his memory, with the following infeription: Hic jacet Le Receveur
E. F. F. minimis Galliæ facerdos,

Phyficus in circumnavigatione Mundi

## Duce De La Peyrouse,

 Ob. 17 h , Feb. 1788.This monument, however, was foon after deftroy ${ }^{*}$ ed by the natives; on which Governor Philip caufed the infcription to be engraved on copper and nailed to a neighbouring tree. M. de la Peyroule had paid a fimilar tribute to the memory of Captain Clerke at Kamtfchatka.

On the 15 th of Aprii, the governor, attended by Excurfio feveral officers and a frall party of marines, fet out on into the an expedition into the interior parts of the country. interior Their firf landing was at the head of a fmall cove part of the named Shell-cove, near the entrance of the harbour on country. the north fide. Preceeding in this direction, theyarrived with great labour at a large lake furrounded on all fides with bog and marfhy ground to a confiderable extent, and in which they trequently plunged up to the waift. Here they obferved that bird fo rare in other parts of the world, viz. a black fwan. On being fired at, it rofe, and thowed that its wings were edged with white, the bill being tinged red. They fpent three days in a very laborious manner in paffing the narlhes and fwamps which lie in the neighbourhood of the harbour: and here they had an opportunity of obferving, that all the fmall freams which defcend into Port Jackfon proceed from fwamps, occafioned by the ftagnation of the waterin the low grounds as it rifes from the fprings. On leaving thefe low grounds, they found them fucceeded by a rocky and barren country ; the hills covered with varions flowering thrubs, though frequently inacceffible by reafon of various natural obftacles. At about 15 miles diftance from the fea, the governor had a fine view of the internal parts of the country, which were mountainous.

New-Hol- To the molt northerly chain of thefe he give the name land. of Carmathe, and to the mort fontherly that of Lanfdown Hills; 'and to one which lay between thefe he gave the nameof Ћichmond Hill. It was conjectured, that a large river muft rife from thefe mountains; but there was now a necefity for returning. On the 22d, however, another expedition was undertaken. Governor Phillip with his party landed near the head of the harbour. Here they found a good country; but in a fhort time arrived at a clofe thizket through which they found it impofible to make their way, fo that they were obliged to return. Next day, by keeping clofe to the banks of a fmall creek, they made a inift to pafs that obftacle, and continued their courfe for three days to the weftward. The country was now extremely fine, either entirely level or rifing in fmall hills, the foil excellent, but fony in a few places. The trees grew at the diftance of from 20 to 40 feet from each other, in general totally deftitute of underwood, which was contined to the barren and ftony fpots. On the 5 th day they faw for the frift time in thisfecond expedition Carmarthen and Lanfdownhills; but the conntry all round was fo beautifnl, that Governor Phillip gave it the name of Belle vue. They were ftill apparently 30 miles from the mountains which they had intended to reach; bat not having been able to carry more than fix days provifions along with them, they found it neceffary to return ; and even with this fmall fock the officers as well as men were obliged to carry heavy loads. During all this time they had not proceeded farther in a direct line than 30 miles, fo great were the obftructions they had met with from deep ravines, \&c. Their return, however, was effected with much greater eafe, having cleared a track, and marked trees all the way as they went along to direct them in their journey back. The country explored at this time appeared fo fine, that Governor Phillip determined to form a fettlement there as foon as a - fufficient number could be fpared from thofe works which were inmediately neceffary. On his return he had fhe mortification to find, that five ewes and a lamb had been killed very near the camp, and in the middle of the day. This mifchief was fuppofed to have been done by fome dogs belonging to the natives.

All this time the fcurvy had continaed to rage with great violence; fo that by the beginning of May near 200 people were incapable of work. For this reafon and on account of the great difficulty of clearing the ground, no more than eight or ten acres of wheat and barley had been fown, befides what private individuals had fown for themfelves; and it was cven feared that this fimall crop wouldfuffer from the edepredations of ants and field-mice. To procure as much relief as poffible therefore in the prefent exigence, the Supply was fent in the beginning of May to Lord Howes Ihandin hopes of procuring fome turtle and other provifions; but unfortnnatcly the veffel returned without any turtle, having met with fqually weather, and being obliged to cut away her beet bower anchor. The natives now began by the to thow an hoftile difpofition which they had not sives,
fame purpofe had been carried off in his fight by the New- 1 lol natives, after being wounded in the head. A hirt land. and hat were afterwards found in fome of the hals of the natives, but no intelligence of the man could be gained. This was followed by other misfurtunes of the fame nature. On the 3oth of the month, two men who had been employed in cutting rufhes for thatch at fome diftance from the camp were found dead. Ont of them had four fpears in his body, one of which had pierced quite through it ; but the other had no marks of violence upon him. In this cafe, however, it was proved, that thofe who fuffered had been the aggreffors; as they had been feen with one of the canoes of the natives which they had taken from one of the fifhing places. All poflible inquiry was made after the natives who had been guilty of the murder, but to no purpofe. In the courfe of this inquiry, it was found that one of the natives had been murdered, and feveral wounded, previous to the attack upon the rufh-cuters. The governor promifed liberty to any convict who fhould difcover the aggrefors; but no information was procured, though it is probable that it may prevent accidents of that kind for the future. About this time the two bulls and four cows belonging to government and to the governor, having been left for fome time by the man who had the charge of them, ftrayed into the woods and could not be recovered, thongh they were afterwards traced to fome diftance.

The 4th of June being his majefty's birth day, was celebrated with as much feftivity as circumftances would allow ; and on this occation it was firt made public that the governor had given the name of Cumberland County to this part of the territory. The appointed boundaries were Carmarthen and Landown hills on the weft, the northern parts of Broken Bay on the north, and the fouthern parts of Botany Bay on the fouth; thus iacluding thefe three principal bays, with Sidncy Cove nearly in the centre.
The misfortunes which attended thofe convicts who A convie frayed to too great a diftance from the fettlement, executed. were not fufficient te prevent fome of thent from rambling into the woods, in hopes of fabfafing themfelves there and regaining their liberty. One of thefe, who had been guilty of a robbery, fled into the woods on the 5 th of June, but was obliged to return half-ftarved on the 24 rh . He had found it impoffible to fubfitt in the woods, and had met with very little relief from the natives. One of them gave him a filh, but made figns for him to go away. According to his account, they themfelves were in a very miferable fituation; and he pretended to have feen four of them apparently dying of hunger, who made figns to him for fomething to eat. He pretended alfo to have fallen in with a purty who would have burnt him, and that he made his efoape from them with difficulty. He faid alfo, that he had feen the remains of a human body lying on a.fire; and endeavonred to inculcate the idea of thefe favages eating human flefh when other provifions were farce. This poor wretch was tried and executed for the theft he had committed before his departure, along with another criminal.

By tinis time the colony was fo far advanced, that Regular the plan of a regular town had been marked out. The plan of a principal freet, when finifled, is to be 200 feet wide, town laid. terminated by the governor's houfe, the main guard,

New-Hol- and criminal court. The plans of other freets are land. likewife marked out; and it is the governor's intention, that when houfes are built here, the grants of land fhall be made with fuch clanfes as will prevent the building of more than one houfe on one allotment, which is to confift of 60 feet in front and 150 in depth. Thus a kind of uniformity will be preferved in the building, narrow freets prevented, and many inconveniences avoided, which a rapid increafe of inhabitants might otherwife occafion. It has likewife been an object of the governor's attention to place the public buildings in fuch fituations as will be eligible at all times, and particularly to give the forehonfes and hofpital fufficient fpace for future enlargement, fhould it be found neceffary. The firft huts erected in this place were compored only of the foft wood of the cabbage palm, in order to give immediate fhelter, and which had the further inconvenience of being ufed quite green. The huts of the convids were conitructed only of upright pofts wattled with flight twigs, and plaftered up with clay. Buildings of ftone might eafily have been raifed, had there been any means of procuring lime for mortar. There were three kinds of ftone met with about Sidney Cove, one equal in goodnefs to Portland ftone, an indifferent kind of fand ftone or fire-ftone, and a fort which feems to contain iron; but neither chalk nor any fpecies of limefone have yet been difcovered. Lime was indeed procured from oyfter-fhells collected in the neighbouring coves to conftruct a fmall houfe for the governor ; but it cannot be expected that a fufficient quantity can thus be procured for many or very extenfive buildings. Guod clay for bricks has been found near Sydney Cove, and very good bricks have been made of it ; the wood alfo, notwithftanding the many reports to the contrary, is found abundantly fit for various purpofes after being thoroughly feafoned. Such fpecimens as have been fent to England were fine-grained and free of knots, but heavy.

On the point of land that forms the weft fide of the Cove a fmall oblervatory has been erected, the longitude of which has been afcertained to be $159^{\circ} 19^{\prime} 30^{\prime \prime}$ eaft from Greenwich, and the latirude $32^{\circ} 52^{\prime} 30^{\prime \prime}$ fouth. Inftead of thatch they now make ufe of fhingles made from a certain tree, which has the appearance of a fir,
but produces wood like Englifh oak.

With regard to the ftate of this colony there have been various and difcordant accounts. Some of thefe have reprefented the country in fuch a light, that it would feem impofible to fubfift on it ; and it has been faid, that the people who have had the misfortune to go there already were in the utmoft danger of ftarving Lefore any affiftance could be fent from Britain. Thefe reports, however, appear not to be well-founded. Difficulties mut undoubtedly be felt at the firf fettlement of every uninhabited country; and we are not to expeet that a colony, moft of whom are wretches exiled for their crimes from their own country, can thrive in an extraordinary manner for fome time. Is appears, indeed, that fo far from the tranfportation to this place having had any good effect in reforming them, the governor has been obliged to execute the ntmoft rigour of the law by hanging feveral of them. A good number of others have unaccountably difappeared, and are fuppofed to have been murdered by
the natives, or perined with hunger in the woods; fo New-Holthat, unlefs the numbers be recruited by more refpec. table inhabitants, it is not likely that much can be expected from the Port Jackfon fettlement for a long time to come. Of this, however, there feems to be little doubt ; the general fpirit of emigration which prevails through moft, indeed we may fay all the conntries of Europe, will undoubtedly foon fupply a fufficient number ; and even fome of the Americans, notwithftanding the extent and fertility of their own country, and the liberty they enjoy in it, are faid to be willing to exchange thefe bleffings for the precarious hopes of what may be obtained in New-Holland among Britifh convicts and flaves. This rambling difpofition may perhaps be accounted for from an obfervation which has been made, viz. that "it may admit of a doubt whether many of the accommodations of a civilized life be not more than counterbelanced by the artificial wants to which they gave birth. That thefe accommodations do not give a fatisfaction equivalent to the trouble with which they are procured, is certain; and it is no wonder, then, to find numbers of people in every country who are willing to exchange them for independent eafe and tranquillity, which belong, comparatively fpeaking, to few individuals in thofe countries which are called civilized."

With regard to the geography of this extenfive country, which may perhaps be reckoned a fifth general divifion of the world, Captains Cook and Furneaux fo fully explored its coafts, that fucceeding navigators have added nothing to their labours. The only part which ftill remains unknown is that between the latitudes of $37^{\circ} 5^{\prime}$ and $39^{\circ}$ fouth; and as none of the fleet which lately failed from Britain could be fuppofed to undertake any voyage of difcovery, it is unknown whether a ftrait interfects the continent in this place or not. Captain Tench, however, informs us, on the authority of a naval friend, " that when the fleet was off this part of the coaft, a ftrong fet-off hore was plainly felt."

A vaft chain of lofty mountains run nearly in a north and fouth direction farther than the eye can trace, about 60 miles inland. The general face of the country is pleafing, diverfified with gentle rifings and fmall winding valleys, covered for the moft part with large fpreading trees, affording a fuccefinon of leaves in all feafons. A variety of flowering fhrnbs, almoft all entirely new to an European, and of exquifite fragrance, abound in thofe places which are free from trees; and among thefe, a tall fhrub, bearing an elegant flower, which fmells like Englifh may, is peculiarly delightfal, and perfumes the air to a great diftance. There are but few trees; and, as Captain Tench and others relate, of fo bad a grain, that they can farcely be ufed for any purpofe : This, however, Mr Stockdale afcribes to their being ufed in an unfeafoned fate, as has been already mentioned. In return for thefe as has been already mentioned. In return for thefe Red and
bad qualities, however, the trees yield vaft quantities yellow of the gum already mentioned as a cure for the dyfen- gums. tery. It is of an acrid quality, and therefore requires to be given along with opiates. The tree which yields it is of very confiderable tize, and grows to a great height before it puts out any branches. The gum itfelf is ufually compared to fanguis draconis, but differs from it in being perfectly foluble in water, which

New-Hol- which the fanguis draconis is not. It may be extracted from the wood by tapping, or taken out of the veins when dry. The leaves are narrow, and not unlike thofe of a willow; the wood fine grained and heavy, but warps to fuch a degree, when not properly feafoned, as foon to become entirely ufelefs.

The yellow gum is properly a refin, being entirely infoluble in water. It greatly refembles gamboge, but has not the property of ftaining. It is produced by a low fmall plant with long grafly leaves; but the fructification fhoots out in a furprifing manner from the centre of the leaves on a fingle ftraight ftem to the height of 12 or 14 feet. This ftem is frong and light, and is ufed by the natives for making their fpears. The refin is generally dug up from the foil under the tree, not collected from it, and may perhaps be the fame which Tafman calls gum lac of the ground. It has been tried liy Dr Blanc phyfician to St Thomas's hofpital, who found it very efficacions in the cure of old fluxes, and thatin many and obftinate cafes. Many of the New Holland plants have been already importedinto Britain, and are now fourifhing in perfection at the nurfery gardens of Mr Lee of Hammerfmith.

The foil immediately aroundSidney Cove is fandy, with here and there a ftratum of clay; but hitherto the produce has not been remarkable. The principal difficutly hitherto experienced in clearing the ground arifes from the fize of the trees, which is faid to be fo enormous, that 12 men have been employed for five days in grubbing up one. Captain Cook fpeaks of fome fine meadows abour Botany Bay, but none of thefe have been feen by the prefent fettlers, and Governor Phillip fuppofes then to have been fwamps feen at a diftance. Grafs grows in almoft every place, but in the fwamps with the greateft vigour and luxuriancy, though not of the finedt quality. It is found to agree better with cows and horfes than heep. A few wild fruits are fometimes procured; among which is a kind of fmall purple apple mentioned by Captain Cook; and a fruit which has the appearance of a grape, but tafting like a green goofeberry, and exceffively four.
From the firft difcovery of this continent, the extreme fcarcity of freh water has been mentioned by every navigator. None have been fortunate enough to enter the mouth of any navigable river fuch as might be expected in a coancry of fucli extent. The fettlers about Port Jackfon found enough for common purpofes of life ; but Captain Tench informs us, that when he left the country, towards the end of 1788 , there has been no difcovery of a Aream large enough to turn a mill. Since that time, however, Governor Phillip has been more fuccefsfinl, as

Rivers dif date Feb. I3. I790: In this letter he relates, that covered by foon after the fhips failed in November i 788 , he again Governor Phillip. made an excurfion to Botany Bay, where he flayed five days; but the refearches he made there tended only to confirm him in the opinion he already enterained that the country round it was by no means an cligible fituation for a colony. After having vifired Broken Bay feveral timees with boats, a river was found, which has fince been traced, and all thofe branches explored which afforded any depth of water. This river has
obtained the name of Hawkefbury, is from 300 to 800 New-Heifeet wide, and feems navigable for the largeftnerchant hips as far up as Richmond hill, at which it becomes very fhallow, and divides into two branches : on which account the governor calls Richmond Hill the head of the river. As after very heavy rains, however, the water fometimes rifes 30 feet above its level, it would not be fafe for fhips to go up fo far ; but 15 or 20 miles below it they would lie in frem water, and be perfectly fafe.

The country about Broken Bay is at firf high and rocky, but as we proceed up the river it becomes more level, the banks being covered with timber, and the foil a light rich mould, fuppofed to be very capable of cultivation. The other branches of this river are fhallow, but probably run many miles up into the country. Great numbers of black fwans and wild ducks were feen on thefe rivers, and the natives had feveral decoys for catching quails.

Richmond hill, near which a fall prevented the boats from proceeding farther up, is the moft foutherly of a large range of hills which run to the northward, and probably join the mountains nearly parallel to the coalt from 50 to 60 miles inland. The foil of this hill is good, and it lies well for cultivation. There is a very extenfive profpeet from the top, the whole country around feeming a level covered with timber. There is a flat of fix or feven miles between Richmond hill and a break in the mountains which feparates Lanfown and Carmarthen hills; in which flar the governor fuppofes that the Hawkefbury continues its courfe; though the river could not be feen on account of the timber with which the ground is every where covered where the foil is good. Six miles to the fouthward of Port Jackfon is a fmall river; and 20 to the weftward is one more confiderable, which probably empties itfelf into the Hawkefbury. As far as this river was at that time explored, the breadth was computed at from 300 to 400 fect. It was named the Nepaan, and, like the Hawkefbury, fometimes rifes 30 feet above its level. A party who croffed the river attempted to reach the mounains, but found it impofible, probably for want of provifions. After the firft day's journcy they met with fuch a fucceffion of deep ravines, the fides of which were frequently fo inacceffible, that in five days they could not proceed farther than 15 miles. At the time they turned back, they fuppofed themfelves to be 12 miles from the foot of the mountains. With regard to the ftate of the colony, it appears from this letter to be as flourifhing as could in any reafonable manner be expected. Another has been formed at a place called Rofehill, at the head of the harbour of Sydney Cove. At this place is a creek, which at half flood has water for large boats to go three miles up; and one mile higher, the water is frefh and the foil good. Some ground having been cleared and cultivated, the governor in the above letter wirites, that 27 acres were fown with corn, and that in December the crop was got in : That the corn was exceedingly good; about 200 buthels of wheat and 60 of barley, with a fmall quantity of flax, Indian corn, and oats; all which is preferved for feed: That if fettlers are fent out, and the convicts divided amongft them, this fettlement will very flortly maintain itfelf; but withont which this country cannot be cultivated to any advantage. "At
prefent

## H O L

New-Hol- prefeat (continues the governor) I have only one perland. fon, who has about 100 convicts under his direction, $\because$ ho is employed in cultivating the ground for the pub. lic benefit, and he has returned the quantity of corn abovementioned into the public fore : the officers have not raifed fufficient to fupport the little fock they have : fome ground I have had in cultivation will return about 40 bufhels of whear into ftore : fo that the produce of the labour of the convicts employed in cultivation has been very fhort of what might have been expected, and which I take the liberty of pointing out to your lordhip in this place; to how as fully as poffible the ftate of this colony, and the neceflity of the convicts being employed by thofe who have an intereft in their labour." "The country for 20 miles to the weftward is very capable of cultivation; though the labour of cutting down the trees is very great. At Sidney Cove the ftores had been infefted by a fwarm of rats which deftroyed no lefs than $12,000 \mathrm{lb}$. weight of flour and rice:The gardens alfo had fuffered very confiderably; for that, liaving met with fuch a confiderable lofs of provifion, and a fufficient fupply not being procured from the Cape, governor Phillip thought proper to fend a further detachment to Norfolk Illand, where the, fertility of the foil afforded great hopes of their being able in a flort time to fubfift themfelves inde. 22 pendent of any affiftance from the fores.
22. With regard to the civil eftablifment in this colony,
Govern. ment of the governorPhillip's jurifdiction extends from $43^{\circ} 49^{\prime}$ to colony, $\quad 10037^{\prime}$ fouth, being the northern and fouthern extremities of the continent. It commences again in $135^{\circ} \mathrm{E}$. Long. from Greenwich ; and proceeding in an eafterly direction, includes all the illands within the abovementioned latitudes in the Pacific ocean; by which partition it is fuppofed that every fource of litigation will be cut off, as all thefe are indifputably the difcovery of the Britifh navigators.

The powers of the governor are abrolutely unlimi, ted, no mention being made of a conncil to affift him in any thing; and as no ftated time is appointed for affembling the courts fimilar to the affizes and gael deliveries in England, the duration of impriforment is altogether in his hands. He is likewife invefted with a posver of fummoning general courts martial; but the infertion in the marine mutiny act, of a fmalfer number of officers than 13 being able to compofe fuch a tribunal, has been negleeted; fo that a military court, fhould detachments be made from head quarters, or ficknefs prevail, may not always be found practic:ble to be obtained, unlefs the number of offeers in the fetlement at prefent be increafed. The governor is allowed to grant pardons in all cafes, treafon and wilful murder excepted; and even in thefe he has authority-to flay the execution of the law until the king's pleafure fhall be fignified. In cafe of the governor's death, the lieutenant-governor takes his place ; and on his deceafe, the authority is lodged in the hands of the fenior officer.

It was not long after the convicts were landed that there appeared a ueceffity for affembling a criminal court: and it was accordingly convened by warrant from the governor. The members were the judgeadvocate, who preficed, three n.val, and three marine officers. The number of members is limited by act of parliament to feven: who are exprefsly ordered to be
officers either of his majefty's fea or land forces. The New-Holcourt being met, completely arrayed and armed as at a military tribunal, the judge advocate proceeds to adminifter the ufaal oaths aken by jarymen in England to each member; one of whom afterwards fwears him in a like manner. This ceremony being over, the crime is laid to the prifoner's charge, and the queftion "guilty or not guilty" pat to him. No law officer being appointed on the part of the crown, the party at whofe fuit he is tried is left to profecute the prifoner entirely by himfelf. All the witnefies are examined on oath; and the decifion muft be given according to the laws of England, or "as nearly as may be, allowing for the circumftances and fituation of the fettlement," by a majority of votes, beginning with the youngeft member, and ending wirh the prefident of the court. No verdiet, however, can be given in cafes of a capitai nature, unlefs at leaft five of the feven members concur therein. The evidence on both fides being firifhed, and the prifoner's defence heard, the court is cleared, and, on the judgment being fettled, is thrown open again, and fentence pronounced. During the time of fitting, the place in which it is affembled, is directed to be furrounded by a guard under arms, and admiffion granted to every one who chufes to enter it. Of late, however, fays captain Tench, our colonifts are fuppofed to be in fuch a train of fubordination; as to make the prefence of fo large a military force unneceffary; and two centinels in addition to the provoft martial are confidered as fufficient.

The firf trials which came before this court were Trials of thofe of three convicts, one of whom was convicted convicts, of having ftruck a marine with a cooper's adze, and \&a behaving otherwife in a moft fcandalous and riotous manner for this he was condemned to receive 150 lafhes, being a fmaller punifiment than a foldier would have fuffered in a fimilarcafe. A fecond, for having committed a petty theft, was fent to a fmall barren illand, and kept there on bread and water only for a week. The third was fentenced to receive 50 lathes; but being recommended by the court to the governor, had his fentence remitted. The fame lenity, however, could not be obferved in all cafes. One fellow, who had been condemned to be hanged, was pardoned while the rope was about his neck, on condition that he wouldbecome the common executioner ever after. Heaccepted the horrid office, but not without a paufe. Some examples of feverity were undoubtedly neceffary, and among thefe it is impoffible to avoid feeling fome regret for the fate of one who fuffered death for ftealing a piece of foap of eight-pence value: but by- the laft letter of governor Phillip, we are informed that the convicts in general are now behaving much better; more fo indeed than ever he expected. The laft fatement was of one woman who had fuffered for a robbery; five children had died, and 28 been born. The whole amount of the deaths 77 , of the births 87 .

The number of convicts already fent to New South Wales amounts to 2000 and upwards-above 1800 are fince embarked for that fettlement. The annnal expence of the civil and military eftablinments at that place is nearly L. 10,000 .

Befides the criminal court, there is an inferior one compofed of the judge advocate, and one or more

## H O L

New-Hyl- juftices of the peace, for the trial of fmall mifdeland. meauors. This court is likevife empowered to decide all law fuits; and its verdict is final, except where the fum exceeds L. 300 , in which cafe an appeal can be made to England from its decree. In cafe of neceffity, an admiralty court, of which the lientenant governor is judge, may alfo be fummoned for the trial of offences committed on the high feas.

The quadrupeds on the continent of New-Holland hitherto difcovered are principally of the Opoffum kind, of which the moft remarkable is the Kangaroo. There is alfoa fpecies of dogs very different from thofe known in Europe. They are extremely fierce, and never can be brought to the fame degree of familiarity with thofe we are acquainted with. Some of them have been brought to England, but fill retain their wual ferocity. There are a great many beantiful birds of various kinds; among, which the principal are the black fwans already mentioned, and the oftrich or caflowary; which laft arrives frequently at he height of feven feet or more. Several kinds of ferpents, large fpiders, and fcolopendras, have alfo been met with. There are likewife many curions fifhes; though the finay tribe feem not to be fo plentiful on the coaft as to give any confiderable affiftance in the way of provifions for the colony. Some very large fharks have been feen in Port Jackfon, and two fmaller fpecies, one named the Port Jackfon flark, the other Watt's Thark. The latter, notwith fandingits diminutive fize, the mouth fcarce exceeding an inch in breadth, is exceffively voracious. One of them having been taken and flung down upon the deck, lay there quiet for two hours; after which Mr Watts's dog happening to pafs by, the fifh fprung upon it with all the ferocity imaginalle, and feized it by the leg in fuch a manner that the animal could not difengage himfelf without affiftance.

The climate of this continent appears not to be difagreeable, notwithftanding the violent complaints which fome have made about it. The hear has never been exceflive in funmer, nor is the cold intolerable in winter. Storms of thunder and lightning are frequent; but thefe are common to all warm countries; and it has been fuppofed (though upon what foundation does not well appear) that were the country cleared of wood, and inhabited, thefe would in a great meafure ceafe. A fhock of an carthquake has likewife been felt; but thefe natural calamities arc incideut to fome of the fineft countries in the world. It is not known whether there are any volcanoes or not.
Account of . The inhabitants of New Holland are by all accounts the inhabi- reprefented as the mof miferable and favage race ofmor-
tants, tants, entirely naked; and though pleafed at firft with fome ornaments which were given them, they foon threw them away as ufelefs. It does not appear, however, that they are infenfible of the benefits of clothing, or of fome of the conveniences which their new neighbours are in poffeffion of. Some of them, whom the colonifts partly clothed, feemed to be pleafed with the comfortable warmth they derived from it; and they all exprcfs a great defire for the iron tools which they fee their neighbours make ufe of. Their colour, in the opinion of captain Cook, is rather a deep chocolate than a full black; but the filth with which their fkins
are covered, prevents the true colour of them from ap- New-Holpearing. At fome of their interviews with the colonifts, feveral droll inftanceshappenedoftheirmiftaling the negroes among the colonifts for their own countrymen. Notwithftanding theil difregard for European finery, they are fond of adorning, or rather deforming, their bodies with fcars; fo that fome of them cut the moft hideons figures that can be imagined. Thefcars themfelves have an uncominon appearance. Sometimes the flefh is raifed feveral inches from the fkin, and appears as if filled with wind; and all thefe feent to be reckoned marks of honour among them. Some of them perforate the cartilage of the nofe and thruft a large bone through it, an hideous kind of ornament humoronfly called by the failors their fprit-fail yard. Their hair is generally fo much clotted with the red gam already mentioned, that they refemble a mop. They alfo paint thenfelves with various colours like moft other favages: they will alio fometimes ornament themfelves with beads and hells, but make no ufe of the beautiful feathers procurable from the birds of the country. Moft of the men want one of the fore-teeth in the upper jaw ; a circumfance mentioned by Dampier and other navigators; and this alfo appears to be a badge of honour among them. It is very common among the women to cut off the two lower joints of the litule finger; which, confidering the clamfinefs of the amputating inftruments they joffefs, muft certainly be a very painfol operation. This was at firft fuppoted to be peculiar to the married women, or thafe who had borne children, but fome of the olden wo. men were found without this diftinction, while it was. obferved in others who were very young.

The New Hollanders appearextremely deficient in the ufeful arts. Of the cultivarion of the ground they lave no notion; nor can they even be prevailed upon to eat bread or dreffed meat. Hence they depend entirely for fulfiftence on the fruits and roots they can gather, with the fint they catch. Governor Phillip alfomentions their frequent fetting fire to the grafs, in order to drive out the opofiams and other animals from their retreats; and we have already taken notice of their uling decoys for quails. As all thefe refources, however, mutt be at beft precarions, it is no wonder that theyarefrequently diftreffed for provifions. Thus, in the fummer-time they would eat neither the fhark nor fting-ray; butin winter any thing was acceptalle. A young whale being driven ahore, was quickly cut in pieces and carried off. They broiled it only long enough to forch the outfide; and in this raw fate incy eat all their fifh. They lroil alfo the fern root and another whofe fecies is unknown. Among the fruits ufed by them is a kind of wild fig; and they eat alfo. the kernels of a fruit refembling the pine apple. The principal part of their fabliftence, however', is fifi; and when thefe happened to be fcarce, they were wont to wateh the opportunity when the colonifts hauled the feine, and often feized the whole, though a part had formerly been offered or given them. They fometimes. frike the fifh from the canoes with their fpears, fometimes catch them with hooks, and aifo make ufe of nets, contrary to the affertion of Dr Hakefworth, who fays that none of thefe are to be met with among then. Their nets are generally made of the fibres of the flax plan , with very little preparation, and are ftrong.

## H O L [ 622 ] H O L

New-Hol- ftrong and heavy; the lines of which they are comland. pofed twifted like whip-cord. Some of them, how-
ever, appear to be made of the fur of an animal, and others of cotton. The methes of their nets are made of very large loops artificially inferted into each other, but without any knots. Their hooks are made of the infide of a thell very much refembling mother of pearl. The canoes in which they fill are nothing more than large pieces of bark tied up at both ends with vines; and confidering the flight texture of thefe veffels, we cannor but adnire the dexterity with which they are managed, and the boldnels with which they venture in them out to fea. They generally carry fire along with them in thefe canoes, to drefs their fifh when caught. When filhing with the hook, if the fifh appears too flrong to be drawn ahore by the line, the canoe is paddled to the fhore ; and while one man gently draws the fill along, another ftands ready to ftrike it with a fpear, in which he generally fucceeds. There is no good reafon for fuppofing them to be cannibals, and they never eat animal fubfances but raw or next to it. Some of their vegetables are poifonous when raw, but deprived of this property when boiled. A conviet anhappily experienced this by eating them in an unprepared ftate; in confequence of which he died in 24 hours. The dilike of the New Hollanders to the European provilions has already been mentioned: if bread be given them, they chew and fpit it out again, feldom choofing to fwallow it. They like falt beef and pork rather better; but they could never be brought to tafte fpirits a fecond time.

The huts of thefe favages are formed in the moft rude and barbarous manner that can be imagined. They confift only of pieces of bark laid together in the form of an oven, open at one end, and very low, though long enough for a man to lie at full length. There is reafon, however, to believe, that they depend lefs on them for fhelter than on the caverns with which rhe rocks abound. They go invariably naked, as has already been obferved; though we muft not imagine that the cuftom of going naked inures them fo to the climate as to make them infenfible to theinjuries of the weather. The colonifts had repeated opportunities of obferving this, by feeing them hivering with cold in the winter time, or huddfing together in heaps in their huts or in caverns, till a fire could be kindled to warre them. It is probable, however, notwithflanding their extreme barbarity, that forke knowledge of the arts will foon be introduced among them, as fome have been feen attentively confidering the utenfils and conveniencies of the Europeans, with a view, feemingly of making fimilar improvements of their own. It has alfo been obferved, that in fome things they poffefs a very great power of imitation. They can imitate the fongs and language of the Earopeans almoft inftantancoully, much better than the latter can imitate theirs by long practice. Their talent for imitation is alfodifcernible in their fculptures reprefenting men and other animals every where met with on the rocks; which, though rude, are very furprifing for people who have not the knowledge even of conftructing habitations in the leaft comfortable for themfelves, or even clothes to preferve them from the cold.

In their perfons, the New Hollanders are attive, vi-
gorous, and fout, though generally lean. Dampier New-Holafferts that they have a dimnefs of fight ; though later navigators have determined this to be a miftake, afcribing to them on the contrary, a quick and piercing fight. Their fenfe of fmelling is allo very acute. One of them having touched a piece of pork, held out his finger for his companion to fmell with ftrong marks of difguft. The only kind of food they eagerly accept of is fifh. Their behaviour with regard to the women has been hitherto unaccountable to the colonifts. Few of them, comparatively fpeaking, have been feen; and thefe have fometimes kept back with the moft jealous fenfibility ; fometimes offered with the greateft familiarity. Such of the females as have been feen, have foft and pleafing voices; and notwithtanding their barbarifin and exceffive rudenefs, feem not to be entirely defitute of modefty.
