Here the jet is supposing to be within 100 or 150 yards of the reservoir; but if the conduit-pipe much exceeds this length, it must be of a larger diameter than what is here assigned: thus, for jets from \( \frac{1}{2} \) of an inch, to those of an inch, and from reservoirs from 40 to 50 feet height, if the distance be from 150 yards to \( \frac{1}{2} \) of a mile, the diameter of the pipe should be of 6 inches; from \( \frac{1}{2} \) of a mile to 2 miles it must be of 7 inches; and from 2 miles to 5, it must be 8 inches diameter for the same jets. If it be required to keep any number of jets playing, whose adjunctages are given in diameter by one common conduit-pipe, we must find the diameter of an adjunctage equal to all the given ones: thus, if there be four adjunctages of \( \frac{1}{2} \) of an inch each, then the square of \( \frac{1}{2} \) is \( \frac{1}{4} \), which multiplied by the number of adjunctages 4, makes \( \frac{1}{4} \), the square root of which is \( \frac{1}{2} = \frac{1}{2} \) = the diameter of the adjunctage, equal to all the four small ones. A pipe of conduit of 10 inches diameter will supply all the jets, as being a little more than six times as great as the diameter of the one large adjunctage now found. After this manner the dimensions of a conduit-pipe may be found for any number of adjunctages.

A fountain that shall spout the water in various directions is made as follows: supposè the vertical tube in which the water rises, to be AB (ibid. n° 2.) in this fit several other tubes, some horizontal, others oblique, some inclining, others recumbent, L, O, P, A, N, &c., then as all water retains the direction of the aperture through which it is spouted, that if the tube A is divided into small parts, let it play forth in all directions through the little apertures, to a distance proportional to the height of the fall of the water.

A ball, A, if its weight be not too heavy, being laid in the bottom of the cup or basin B (ibid. n° 4.) will be taken up in the stream, and sputtered at a considerable height, as A; alternately vibrating, or playing up and down, provided the tube BC, through which the water rises, be exactly perpendicular to the horizon.

The ball may be made of a thin plate of brass, or any other light metal; but as its figure of a ball contributes nothing to its reciprocal rise and fall, any other body, not too heavy, may be substituted in place thereof. As it is necessary that the body sputtered by the jet should keep the same precise perpendicular on its descent and rise, since otherwise it would miss the stream, such a fountain should be played in a place free from wind.

A fountain may be made to spout water in manner of a shower, by fitting a spherical
F O U

[1322]

F O U

rical or lenticular head AB (ib. n° 5.) made of a plate of metal, and perforated at top with a great number of little holes; for the water, rising with a certain velocity towards AB, will there be divided in innumerable little threads, and afterwards be broke and dispersed into small drops.

A fountain may be made to spread the water in form of a cloth, by folding the pipe about the surface of the water in the middle cavity at CE. Now since the surface CE is always falling, and the water DY is always rising, the height of the jet must continually decrease, till it is shorter by the height of the depth of the cavity CE, which is emptying, added to the depth of the cavity DY, which is always filling, and when the jet is fallen so low, it immediately gives over.

The way to prepare this fountain for playing, is as follows: first, pour in water at W, till you have filled the cavity DXY; then turn the fountain over, and the water will run from the cavity DXY into the cavity CE, which you will know to be full when the water runs out at B, held down; let the fountain up again, and pour in about a pint of water into the basin ABW, and so soon as it has filled the pipe WX, the fountain will play, and continue so long as there is any water in CE. You may then pour back the water left in the basin ABW, into any vessel, and invert the fountain; which being set upright again, will be set a playing by putting back the water poured out into ABW.

A fountain, which, when it has done spouting, may be turned up like an hour-glass, is made as follows: provide two vessels, AFH and BDG (ib. n° 9.) of a capacity proportional to the time the fountain is required to play without turning up, and placed so much the greater distance from each other as the water is required to spout the higher: the water contained in the cavity AFH, runs down the curve-pipe CDE, and spouts up through the jet E, by the pressure of the column of water CD; but unless the pipe GF, was open at G, to let the air run up to F, and press at the top of the surface of the water in the cavity A, the water would not run down and spout out at B; there is such another pipe as GK, belonging to the cavity B, through which
which the water of the jet is received into
the basin, supplies the cavity B, whilst
the fountain stands on the end B; but
when the fountain is inverted, it sup-
plies B with air, to let the water de-
scend in the direction GHI, I becom-
ing the spouting-pipe. Wherefore, by
turning the machine upside down,
the water spouts up through the cock
at G, and the vessel AHC, will be
the referorv. Hence, if the vessels
APH and DKB contain just as
much water as will be spouted up in an
hour's time, we shall have a spouting
clepsydra, which may be graduated or
divided into quarters, minutes, &c. See
the article CLEPSYDRA.

The fountain (plate CVI. n° 1.) is upon
the same principle, and of the same
kind with n° 8. plate CV. but having
double the number of pipes and concealed
cavities, it plays as high again. N° 2.
must be examined, to see its cavities and
pipes, where the basin is A, and the
four cavities B, C, D, and E, from which
the water from the pipe FG, spouts out
to double the height of the fountain;
the air at E, which, drives it, being
doubly condensed. The water going down
the pipe i (suppose it three feet long)
condenses the air that goes up into the
cavity C, through the pipe 2, so as to
make it $\frac{3}{4}$ stronger than the common
air; then the water which falling in the
pipe 3, from C to D, is capable by the
height of its fall, to condense the air at
E, so as to make it $\frac{5}{6}$ stronger, being
pushed at C by air already condensed in-
to $\frac{3}{4}$ lesser space, causes the air at E
to be condensed twice as much; that is,
to be $\frac{7}{8}$ stronger than the common air, so
that it will make the water at G spout
out with twice the force, and go to twice
the height that it would do, if the foun-
tain had been of the make of n° 8. pl.
CV. The way to prepare this fountain for
playing, is to turn it upside down, and
taking out the plugs g, h, to fill the
two cavities C and E, and having flut
the holes again, let the fountain upright,
and pour some water into the basin A,
and the jet will play out at G.

Another way of making artificial foun-
tains, is by the rarefaction of the air,
in the manner following: AB and CD
(quiet. n° 3.) are two pipes fixed to a
braifs-head C, to screw into a glafs-velvel
E, which having a little water in it, is
inverted, till the pipes are screwed on;
than reverting it suddenly, so as to put A
the lower end of the spouting-pipe AB,
into a jar of water A; and the lower end
of the descending pipe CD, into a rece-
ving vessel D, the water will spout
up from the jar A, into the tall glafs
velvel E, from which it will go down at
the orifice C, through the descending
pipe CD, into the vessel D, till the wa-
ter is out of A (making a fountain in
E) and has emptied itself into D.

The reason of the play in this fountain is
this: the pipe CD being 2 feet 9 inches
long, lets down a column of water which
rarifies the air $\frac{1}{4}$ part in the vessel E,
where it presses against the water spouting
at B, with $\frac{1}{2}$ less force than the
water is pushed up the hole A, by the
pressure of the common air on the water
in the vessel A; so that the water spouts
up into E (when the air is rarified $\frac{1}{4}$)
with the difference of the pressure of
the atmosphere, and the aforesaid rarified
air; that is, of $\frac{3}{3}$ to $\frac{7}{8}$. This would
raise the water 2 feet 9 inches: but the
length of the pipe A, 9 inches, being
deducted, the jet will only rise 2 feet.
This may be called a syphon-fountain,
where AB is the driving leg, and CD
the effuating leg.

A fountain that begins to play upon the
lighting of candles, and ceases when they
go out, may be contrived as follows:
provide two cylindrical vessels AB and
CD (ibid. n° 4.) connect them by tubes
open at both ends KL, FB, &c. so that
the air may descend out of the higher into
the lower; and these tubes folder candle
licks, H, &c. and to the hollow cover
of the lower vessel CF, fit a little tube
or jet FE, furnished with a cock G,
and reaching almost to the bottom of the
velvel. In G let there be an aperture
furnished with a screw, whereby water
can be poured into CD. Then upon
lighting the candles H, &c. the air in
the contiguous tubes becoming rarified
thereby, the water will begin to spout
through EF.

There are many other artificial fountains
made upon these principles; but what
are explained may be sufficient, when we
have added to it the description of one
invented by Dr. Delaguliers to play by
the spring of the air, increas'd by the
heat of the sun, which also serves for a
dial at the same time.

GNS (ibid. n° 5.) is a hollow globe
of thin copper, of 18 inches in diameter,
FOURCHETTE, or FER DE FOUCHE. See the article FER.

FOURTH, in music, one of the harmonical intervals, called concords. See the articles CONCORD and INTERVAL.

It is called fourth, as containing four sounds or terms between its extremes, and three intervals; or as being the fourth in order of the natural or diatonic scale, from the fundamental. The antients called it diatessaron, and speak of it as the principal concord, on whose divisions all the rest depend; but the moderns, so far from allowing it such perfections, find it one of the most imperfect, and even dispute whether it ought to be received among the number of concords at all.

It consists in the mixture of two sounds, in the ratio of 4:3; that is, of two sounds produced by two cords, whose lengths, &c. are in that proportion.

Diminished Fourth. See Diminished.

Superior Fourth, a discord consisting of two tones major and one minor, called also tritone: it is composed of the ratios 27:20, and 4:5. See Discord.

FOURTH-RATE. See the article RATE.

FOWEY, a borough-town of Cornwall, which sends two members to parliament: well long. 5°; and north lat. 50° 26'.

FOW, among zoologists, denotes the larger sorts of birds, whether domestic or wild: such are geese, pheasants, partridges, turkey, ducks, &c. See the articles GEESE, PHEASANT, &c.

Tame fowl make a necessary part of the flock of a country farm. See the article POULTRY.

Fowls are again distinguished into two kinds, viz. land and water-fowl; these last being so called, from their living much in and about water: also into those which are accounted game, and those which are not. See the article GAME.

FOWLING, the art of catching birds by means of nets, bird-lime, decoys, and other devices. See the articles NET, BIRD-LIME, &c.

Fowling is also used for the pursuing and taking birds with hawks, more properly called falconry. See FALCONRY.

FOWLING-Piece, a light gun for shooting birds. That piece is always reckoned belt which has the longest barrel, from 5½ to 6 feet, with a moderate bore: the every fowler should have them of different sizes, suitable to the game he designs to kill. The barrel should be well polished and smooth within, and the bore of an equal bigness from one end to the other;
FOX, or ST. FOY, a town of Guienne, in France, thirty-two miles east of Bourdeaux; it is situated under the meridian of London, in 44° 50', north lat.

FOYLING OF LAND, the fame with following it. See the article FALLING.

FOYLING, among sportsmen, denotes the footsteps of a flag on grass or leaves.

FOYNA, in zoology, a name sometimes given to the martain. See MARTIN.

FRACHES, in glaie-making, flat iron-pans, wherein the new-made vessels are put, to be removed gradually from the fire. See the article GLASS.

FRACTION, in arithmetic and algebra, is a part or parts of something considered as an unit or integer.

Fractions are distinguished into vulgar or common, and sexagesimal and decimal. See the articles SEXAGESIMAL and DECIMAL.

Vulgar fractions, called also simply fractions, consist of two parts or quantities, one wrote over the other, with a line between them. The quantity placed above the line is called the numerator of the fraction; and the quantity placed under the line, the denominator. See the articles NUMERATOR and DENOMINATOR.

Thus, \( \frac{2}{3} \) expresses the quotient of 2 divided by 3; and 2 is the numerator, and 3 the denominator. If the numerator of a fraction is equal to its denominator, then the fraction is equal to unity; Thus \( \frac{4}{4} = 1 \), and \( \frac{a}{b} \) or \( \frac{b}{a} \) are likewise equal to unity. If the numerator is greater than the denominator, then the fraction is greater than unit. In both these cases, the fraction is called improper. But if the numerator is less than the denominator, then the fraction is less than unit, and is called proper. Thus \( \frac{5}{3} \) is an improper fraction, but \( \frac{3}{4} \) and \( \frac{1}{2} \) are proper fractions. A mixt quantity is that whereof one part is an integer, and the other a fraction; as \( 3 \frac{5}{2} \), \( 2 \frac{1}{2} \), and \( \frac{2}{a} \).

See the articles CHARACTER and NOTATION.

Problem I. To reduce a mixt quantity to an improper fraction, multiply the part that is an integer by the denominator of the fractional part, and, to the product, add the numerator; then place the former denominator under this sum, and you will have the improper fraction required.
Thus, $2\frac{3}{4}$, reduced to an improper fractional, gives $\frac{11}{4}$; for $2 \times 5 = 10$, and $10 + 3 = 13$, which, divided by the former denominator, gives $\frac{11}{4}$. In the same manner, $4 \frac{1}{4}$, gives $\frac{17}{4}$; and $a + \frac{a^2}{b}$, gives $\frac{ab + a^2}{b}$; and $a - x + \frac{a^2 - ax}{x}$, gives $\frac{a^2 - x^2}{x}$.

Problem II. To reduce an improper fraction to a mixed quantity, divide the numerator of the fraction by the denominator, and the quotient shall give the integral part; and the remainder, set over the denominator, shall be the fractional part. Thus, $3 \frac{2}{5} = 2 \frac{2}{5}$; $\frac{ab + a^2}{b} = \frac{a + \frac{a^2}{b}}{b + x} = \frac{a + \frac{a^2}{b}}{b + x}$, and $\frac{a + \frac{a^2}{b}}{b + x} = \frac{x + \frac{x^2}{a + x}}{a - x} = \frac{a + \frac{a^2}{b}}{b + x}$.

Problem III. To reduce fractions of different denominators to fractions of equal value, that shall have the same denominator; multiply each numerator, taken separately, into all the denominators but its own, and the product shall give the new numerators: then multiply all the denominators into one another, and the product shall give the common denominator. Thus, $\frac{3}{5}$, $\frac{2}{3}$, and $\frac{2}{5}$ are respectively equal to $\frac{3b}{5b}$, $\frac{2a}{3a}$, and $\frac{2a}{5b}$; and $\frac{a}{b}$, $\frac{b}{c}$, and $\frac{c}{d}$ are respectively equal to $\frac{abc}{bcd}$, $\frac{bbd}{bdc}$, and $\frac{ccb}{bdc}$.

Problem IV. To add and subtract fractions, first reduce them to a common denominator (by Probl. III.) then add or subtract the numerators, and the sum or difference set over the common denominator, will be the sum or difference required. Thus, $\frac{5}{12} + \frac{3}{4} = \frac{9}{12} - \frac{17}{12}$. In the same manner, $\frac{a}{b} + \frac{c}{d} = \frac{ad + cb + bd}{bd}$; and $\frac{a}{b} - \frac{c}{d} = \frac{ad - cb}{bd}$; and $\frac{a}{b} \cdot \frac{c}{d} = \frac{a \cdot x}{2} \cdot \frac{x - 2}{3} = 6$. See Subtraction.

Problem V. To multiply fractions; let their numerators be multiplied into one another, to obtain a new numerator, and the denominators into one another, to obtain a new denominator; and the numerator and denominator so found will be the product required. Thus, $\frac{3}{5} \times \frac{2}{3} = \frac{6}{15}$, and $\frac{3}{2} \times \frac{2}{3} = \frac{1}{3}$.

In the same manner, $\frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd}$; and $\frac{a}{b} + \frac{a}{b} = \frac{a^2}{b^2}$.

If a mixed quantity is to be multiplied, first reduce it to the form of a fraction (by Probl. I.) and if an integer is to be multiplied by a fraction, you may reduce it to the form of a fraction, by placing the unit under it. Thus, $5\frac{2}{5} \times \frac{3}{2} = \frac{13}{5} \times \frac{3}{2} = \frac{43}{10}$, (by Probl. II.) Also $9 \times \frac{2}{5} = \frac{9}{1} \times \frac{2}{5} = \frac{18}{10} = 1\frac{1}{5}$; and, in the same manner, $b + \frac{bx}{a} = \frac{b + bx}{a} \times \frac{b}{a}$.

Problem VI. To divide fractions; first multiply the numerator of the dividend by the denominator of the divisor, and the product will be the numerator of the quotient; then multiply the denominator of the dividend by the numerator of the divisor, and their product will give the denominator of the quotient. Thus, $\frac{5 \times \frac{2}{3}}{\frac{2}{3}} = \frac{10}{9} \times \frac{4}{3}$, $\frac{c}{d} = \frac{\frac{a}{d}}{\frac{b}{c}} = \frac{\frac{a}{d}}{\frac{b}{c}} = \frac{a + b}{a - b} \cdot \frac{a^2 - 2ab + b^2}{a - b} = \frac{a^2 + ab}{a^2 - ab}$.

These last four problems are easily demonstrated from the definition of a fraction. 1. It is obvious, that the two fractions $\frac{a}{b}$, $\frac{c}{d}$, are respectively equal to $\frac{ad}{bd}$, $\frac{bc}{bd}$, and $\frac{cd}{bd}$.

2. Fractions reduced to the same denominator are added by adding their numerators and subscripting the common denominator.

Thus, $\frac{a}{b} + \frac{c}{b} = \frac{a + c}{b} + \frac{c}{b}$; for call $a = m$, and $\frac{c}{b} = n$, and it will be $a = mb$, and $c = nb$; and $mb + nb = a + c$, and $m + n = \frac{a + c}{b}$; that is, $\frac{a}{b} + \frac{c}{b}$. After the same manner, $\frac{a}{b} - \frac{c}{b} = \frac{m - n}{b} = \frac{a - c}{b}$.

3. Again,
The ground of this operation is discovered; only the remainders of the quantities are always to be ranged according to their room, and you shall have a fraction, equivalent to the given fraction, expressed in the lowest terms. Thus, \( \frac{3}{7} \) is reduced to \( \frac{3}{7} \), by dividing the numerator and denominator by the greatest common measure \( 3 \). In the same manner \( \frac{25}{30} = \frac{5}{6} \) for \( 2\frac{5}{6} \).

In algebraical terms, the operation is thus:

\[
\frac{25bc}{75abc} = \frac{3}{2} = \frac{3a}{2} \cdot \frac{5}{75} \cdot \frac{b}{c}
\]

by rejecting the divisor (as being nothing) rejecting the letters \( b\) of the dividend (as being common to numerator and denominator) and dividing the coefficients 75 and 125 by their greatest common measure 25; the result of which is \( \frac{3a}{5} \). In the same manner, \( \frac{156a^2 + 75x}{156ab + 50x} = \frac{a^2 - b^2}{a + b} \)

When unit is the greatest common measure of the numbers and quantities, then the fraction is already in its lowest terms.

Thus, \( \frac{3a}{5} \) cannot be reduced lower. It ought also to be remarked, that numbers whose greatest common measure is unit, are said to be prime to each other.

If it is required to reduce a given fraction to a fraction equal to it, that shall have a given denominator; you must multiply the numerator by the given denominator, and divide the product by the former denominator; and this quotient, let over the given denominator, will be the fraction required. Thus, if it

\[
\frac{8 \times 5}{2 + 7}
\]

and the remainder (if there is any) must also measure the dividend; because the dividend is equal to the sum of the divisor multiplied into the quotient, and of the remainder added together. Thus, in the last example, \( a - b \) measures the divisor \( a^2 - b^2 \), and the remainder

\[
-2ab + b^2
\]

it must therefore likewise measure their sum \( a^2 - 2ab + b^2 \). You must observe, in this operation, to make that the dividend which has the highest powers of the letter, according to which the quantities are ranged.

Problem VIII. To reduce any fraction to its lowest terms; find the greatest common measure of the numerator and denominator; divide them by that common measure, and place the quotients in their room, and you shall have a fraction, equivalent to the given fraction, expressed in the lowest terms. Thus, \( \frac{3}{7} \) is reduced to \( \frac{3}{7} \), by dividing the numerator and denominator by the greatest common measure \( 3 \). In the same manner \( \frac{25}{30} = \frac{5}{6} \) for \( 2\frac{5}{6} \).
were required to reduce \( \frac{2}{3} \) to an equal
fraction, whose denominator shall be 6; find the quotient of \( 2 \times 6 = 3 = 4 \); then
will \( \frac{3}{4} \) be the fraction required. In the
same manner, \( \frac{a}{b} \) is reduced to an equal
fraction, which has the denominator \( c \),
\( \text{viz. } \frac{ac + b}{c} \); for rejecting \( c \) out of both
numerator and denominator, there re-

quires to reduce vulgar fraction to equal decimal ones, see the article

DECIMAL.

It is observable, that when the left figure of the denominator of the fraction hap-
pens to be 1, 3, 7, or 9, then the de-

minal parts can never be precisely equal to the given fraction; yet by continuing the
division, you may approximate to its va-

tue as near as you please. Thus \( \frac{3}{7} = 0.42857142857142 \)

&c. as far as you please; and,
in the same manner, \( \frac{3}{7} = 0.42857142857142 \)

&c. Hence it may be farther observed, that these imperfect quotients return
again, and circulate without end: in the
first example, the circulation begins im-
mediately; but, in the second, it does not
begin again till the operation is con-
tinued to the seventh place; when the
first six figures are repeated over again,
constituting what is called the repeneld
of a decimal fraction. See the articles

REPETEND and SERIES.

These repetitions sometimes also happen,
when other figures, besides those above-
mentioned, are the denominator of the fraction. Thus \( \frac{1}{7} = 0.142857142857142 \)

ad infinitum.

FRACTION, in surgery, a rupture of a
bone, or a solution of continuity in a
bone, when it is crushed or broken by

some external cause.

Fractures generally happen when any part of the body, where a bone is situ-
ated, receives a violent shock, either by a
fall, or a blow with a piece of timber, &c. or by the shot of a gun. There are in-
fances where this accident has hap-
pened from an internal disorder, to wit, from the scurvy, a caries, or the venereal dis-
ease, which have rendered the substance
of a bone so brittle, that it has been frac-
tured without any apparent external acci-
dent. See Caries, Scurvy, &c.

Fractures are distinguished into several
classes. First, every fracture is either

simple, that is, when no other parts be-
sides the bone are injured, or compound,
as where there is a wound, a dislocation,
hemorrhage, inflammation, fever, caries,
or contusion of the bone; or where the
bone appears to be fractured in several
places at the same time. Other differ-
ces arise with regard to the situation of
the fracture; sometimes it happens in the

cranium, ribs, vertebrae, sometimes in
the upper or lower limbs; sometimes in
the middle of the bone, and sometimes
in either of the extremities. Again,
some fractures are transverse, others ob-
lique. In which case it frequently hap-
pens that the points of the bones wound
the neighbouring parts, pushing quite
through the muscular flesh, and common
integuments; or at least pricking them
grievously, and bringing on pain, in-
flammation, tumour, and spasm. Vi-

olent contusions also may be clasped under
the head of fractures; for the bones in
this case are frequently broke into splin-
ters, by the falling of any heavy body
upon the part, or by any violent pressure.
To fractures of the bones, we may also
very properly add fissures. See the articles

Fissure, Contusion, &c.

Fractures of bones are discoverable, 1.
By the eye, when the injured part is ap-

parently shorter than the found; or when
the patient cannot make use of it. 2. By
the touch, when a preternatural inequal-
ity of the bone may be perceived; or
that it bends in a part where nature did
not intend it should. 3. By the ear,
when upon moving the limb, the cru-

shing of the broken bones may be heard.
4. We may strongly suspect a fracture of the part, when it has received a vio-

lent blow. And, 5. It is observable that
the parts are more subject to this injury
in winter than in summer. Lastly, 6. Some-
times, particularly in fractures that are
made in a transverse direction, the broken
parts of the bone will immediately, of
themselves, recover their natural situa-
tion, and leave little room to suspect the dis-
order.

Great variety of mischiefs attend a frac-
tured bone, which differ, 1. With re-

gard to the injured part, and the nature
and disposition of the neighbouring parts.
2. With regard to the manner in which
fractures are made; for oblique fractures,
and those whole splinters and points
wound and vellicate the neighbouring
parts, are much more painful and dan-
gerous than transverse fractures. 3. We

may
may judge of the mischief that is likely to attend a fracture, from the number of pieces into which the bone is broken. And, 4. By observing whether the fracture happened at the middle of the bone, or at its extremities. The principal inconveniences that attend a fracture are these: the patient loses the use of the limb; the lower part of the limb will be contracted by the muscles, which will make it appear dislocated and deformed; the laceration of the periosteum and the vessels of the medulla being in great danger of fistula and caries. When the nerves are pricked and irritated by splinters, the patient suffers great pain, convulsions, inflammations, and fever; and if any vessels suffer preffure, the common consequences of a contusion ensue. Sometimes, whilst the bone is uniting, the broken parts are supplied in too plentiful a manner with juices, and the callus is formed irregularly, which occasions a deformity of the limb. See Callus.

In the care of fractures, the surgeon's principal care should be to unite the broken bone, to which three things are necessary. 1. That the bone be restored to its natural situation, which is done by extending and replacing it. 2. That after the bone has recovered its natural situation, it be kept there, by giving it rest, and applying proper bandages. Lastly, proper remedies must be used, in order to prevent or remedy the disorders that usually attend this accident. See the articles Inflammation, Fever, &c.

When the fractured bones maintain their natural situation, you are under no necessity of extending or replacing the limb, but of applying a proper bandage; but when the fractured parts recede from each other, some degree of extension is necessary. See the article Extension of fractured limbs.

Sometimes you will be troubled with splinters of the bone in your way, which render the reduction of the bone very difficult. If the splinters are free, and have no connexion with the bone, you must remove them carefully. When they adhere to the principal parts, you should endeavour to replace them with the greatest exactness; and where they cannot be reduced or re-united with the bone, they may be removed by a strong pointed forceps. If they are concealed under the skin, you must endeavour to reduce them to their natural situation: if this cannot be done, make an incision through the skin, and take them out. See the article Incision.

The bones being properly replaced, the next thing to be done is to secure them in their situation, that they may unite to the best advantage.

To this end two things are chiefly required. 1. To bind it up properly. And, 2. To lay the limb in a convenient posture. The apparatus for securing the situation of the limb is composed of bandages, bolsters, and splints. See the articles Bandage, Bolster, and Splint.

In fractures of the lower arm, after you have applied your bandage and dressings, you may suspend it in a scarf or fling, which is to hang from the neck: in fractures of the leg, you may rest the limb upon pillows, or in boxes, placing cushions or pillows under it; these machines are to be fastened to the limb with tapes, that it may remain fixed and immovable.

Fraqnum, in anatomy, a term applied to some membranous ligaments of the body. As,

Fraqnum Linguae, the ligament under the tongue, which sometimes ties it down too close to the bottom of the mouth; and then requires to be incised or divided, in order to give this organ its proper and free motion. This disorder generally arises in infants soon after their birth, so that they cannot move and exert their tongues in the action of sucking; though it is sometimes also observed in adults. For the operation of cutting the frenum, see the article Tongue-tied.

Each of the lips has also its peculiar frenum; the upper one under the nose; the under one near the roots of the dentes inciōres: these are of the utmost service to us in speaking, and eating and drinking.

Fraqnum Penis, a ligament of the penis, that ties the prepuce to the lower part of the glans of the penis. See Penis.

There is also a small frenum of the clitoris, by which it is connected to the offa pubis. See the article Clitoris.

Fragaria, a town of Arragon, in Spain, situated under the meridian of London: north lat. 41° 16'.

Fragaria, the Strawberry, in botany, a genus of the icifandria-penta-gynia class of plants, the corolla of which consists of five roundish, patent petals, inserted in the cup: there is no pericarpium; the common receptacle of the seed is of a roundish, oval figure, plane at the base, pulpose, large, fult, and deciduous; the seeds
FRAIL, FRAIGHT, or FRAME, in joinery, a kind of FRAME is also a machine used in divers arts; as, FRAME, among printers, is the stand which supports the cales. See the article Case. FRAME, among founders, a kind of ledge inclosing a board, which, being filled with wetted sand, serves as a mould to cast their works in. See Foundery. FRAME is more particularly used for a fort of loom, whereon artificers stretch their linens, silks, fluffs, &c. to be embroidered, quilted, or the like. FRAME, among painters, a kind of square, consisting of four long slips of wood joined together, whose intermediate space is divided by threads into several little squares like a net; and hence sometimes called reticula. It serves to reduce figures from great to small; or, on the contrary, to augment their size from small to great. FRAMING of a house, among carpenters, denotes all the timber-work therein; namely, the carcase, flooring, partitioning, roofing, ceiling, beams, ashlarings, &c. all together. See Flooring, &c. FRAMPOLE-FENCES, a privilege enjoyed by the tenants of the manor of Writtel in Essex, whereby they are intitled to the wood growing upon the fence, and as many poles as they can reach from the top of the ditch with an axe's helve, towards the repair of their fences. FRANC, or FRANK. See Frank. FRANCA, in botany, the same with Frankena. See the article Frankenia.

FRANCE, a large kingdom of Europe, situated between 4° west and 7° east long. and between 43° and 51° north lat. being bounded by the English channel and the auffrian Netherlands, on the north; by Germany, Switzerland, Savoy, and Piedmont, in Italy, on the east; by the Mediterranean sea, and the Pyrenean mountains, which separate it from Spain, on the south; and by the bay of Biscay, on the west. This kingdom was formerly divided into twelve provinces, but at present it is divided into twenty-five general governments, over every one of which is an officer, called an intendant, appointed by the king, who has a power of controlling the governor, and all other officers of justice; and presides over the receivers-general of his generality.

FRANCeORT, a city of Germany, situated on the confines of Helle and Franiaconia, on both sides of the river Maine: east longitude 7° 30' north lat. 50° 10'.

FRANCeORT on the Oder, a city of Germany in the circle of upper Saxony, and marquisate of Brandenburg, situated in east long. 15°, north lat. 52° 22'.

FRANCE-COMTE, the same with the county of Burgundy. See Burgundy.

FRANCE-COMTE, a province of France bounded by Lorraine on the north; by Allace and Switzerland, on the east; by La Breis and Bugey, on the south; and by the dukedom of Burgundy, on the west.

FRANCHISE, in a general sense, a privilege or exemption from ordinary jurisdiction; as that for a corporation to hold pleas among themselves to such a value, or the like. FRANCHISE is sometimes used for an immunity, from tribute, in which sense it is either personal or real; that is, belonging to a person immediately, or else by means of this or that place of which he is chief, or a member. A Franchise may be vested either in bodies
bodies politic, or corporations; in borough towns, or in any single person. There are franchises of different kinds, as the principality of Wales, counties palatine, counties, hundreds, parts of the sea, &c. Besides which there is a franchise of having a leet, manor, or lordship; as also of fairs and markets, felon's goods; as also the goods of fugitives and outlaws; deodands, treasure-trove, waifs, edleys, wrecks, &c. Franchises and liberties, being usually held by charter, are all said to be derived from the crown, but some lie in prescription without the help of any charter.

Franchise royal, seems to be that where the king's writ does not run; but Bracton says, that a franchise royal, is where the king grants to one and his heirs an exemption of toll, &c. Franchise is also used for an asylum or sanctuary, where people are secure of their persons. See Asylum.

Franchise of quarters, a certain place or district at Rome, wherein are the houses of the embassadors of the princes of Europe; and such as retire cannot be arrested or seized by the sheriffs or sheriffs, nor prosecuted at law. Several of the popes published their bulls and ordinances against the abuse made of this privilege, which refused so considerable a part of the city, by the enlargement of these places, from their authority, and rendered them a retreat for the most abandoned persons. At last Innocent XI. expressly refused to receive any more embassadors, but such as would make a formal renunciation of the franchise of quarters.

Francigenæ, in our old law-books, an appellation given to foreigners in general.

Franciscan monks, friars minor, or grey friars, religious of the order of St. Francis, founded by him in the year 1229. See the article Friar. The rule of the franciscans, as established by St. Francis himself, is briefly this: they are to live in common, to observe chastity, and to pay obedience to the pope and their superiors. Before they can be admitted into the order, they are obliged to fell all they have, and give it to the poor: they are to perform a year's noviciate, and when admitted, never to quit the order upon any account. They are to fall from the feast of All-saints, to the Nativity. This order has produced four popes, forty-two cardinals, and an infinite number of patriarchs. The franciscans had sixty-three monasteries in England, one of which was in the parish of St. Nicholas in London.

Francolini, a town of Italy, situated on the river Po, about nine miles northeast of Ferrara.

Franconia, a circle of the german empire, lying between Bohemia on the east, and the electorate of Mentz on the west. Its capital is Nuremberg; and from this country the Franks, who conquered and gave name to the kingdom of France, are said to have come.

Frangipane, a kind of exquisite perfume given to the leather of which gloves, &c. are made. There is likewise a perfumed liquor of the same name, as also a ros folis.

Frangula, black alder, a distinct genus of plants according to Tournefort, but ranked by Linnewus among the rhamnuses. See Rhamnus.

Frangulæ species, in botany, the name by which Dillenius calls the mauroecia of Linnewus. See Mauroecia.

Frank, or Franc, meaning literally free from charges and impositions, or exempt from public taxes, has various significations in our antient customs.

Frank almoign, signifies a tenure by spiritual service, where lands or tenements are held by an ecclesiastical corporation, sole or aggregate, to them and their successors, of some lord and his heirs, in free and perpetual alms. This is an antient tenure chiefly to be met with in grants to religious houses, colleges, &c. No person can have lands in frank almoign, unless it is by prescription, or on a grant made before the statutes of mortmain; so that the tenure may not be created at this day. Nevertheless the king is not restrained by the statutes, nor a subject licensed or permitted with him to make such a grant; and if an ecclesiastical person holds lands at a certain rent, &c. the lord may confirm his elate to hold to him and his successors in frank almoign.

Frank chace, is defined to be a liberty of free chace, whereby persons that have lands within the compass of the same, are prohibited to cut down any wood, &c. out of the view of the forester.

Frank fee, signifies the same as holding lands and tenements in fee simple; that is, to any person and his heirs, and not by such service as is required by antient demesne,
FRANK DEMESNE, but is pleaded at common law. See the article Fee.

Frank ferm, antiently signifies lands changed in the nature of the fee by feoffment, &c. out of the knight's service for other certain yearly services.

Frank fold, is where the lord has the liberty of folding his tenants sheep within in his manor. See the article Faldage.

Frank-incense, in natural history, &c. See the article Incense.

Frank language, or Lingua Franca, a kind of jargon spoken on the Mediterranean, and particularly throughout the coasts and parts of the Levant, composed of Italian, Spanish, French, vulgar Greek, and other languages.

Frank law, a word applied to the free and common law of the land, or the benefit a person has by it.

He that for any offence losteth this frank law, incurs these inconveniences, viz.

He may not be permitted to serve on juries, nor used as an evidence to the truth; and if he has any thing to do in the king's court, he must not approach it in person, but appoint his attorney; his lands, goods, and chattels shall be seized into the king's hands; and his lands be exchequered; his trees rooted up, and his body committed to custody.

Frank-marriage, is where a person, seized in fee of lands or tenements, has given them to another with his daughter, sister, or some woman otherwise of kin to him, in free marriage, by virtue of which the husband and wife have an estate in special tail, and shall hold the land of the donor, discharged of all services, except fealty, to the fifth degree.

Frank pledge, in our law, signifies a pledge or surety for the behaviour of freemen.

According to the antient custom of England, for the preservation of the public peace, every free-born man, at the age of fourteen, except religious persons, clerks, knights, and their eldest sons, was obliged to give security for his truth and behaviour towards the king and his subjects, or else be imprisoned. Accordingly, a certain number of neighbours became interchangeably bound for each other, to see each person of their pledge forthcoming at all times, or to answer for the offence of any one gone away; so that whenever any person offended, it was presently inquired in what pledge he was; and there the perons bound either produced the offender in thirty-one days, or made satisfaction for his offence.

Frank service. See the article Service.

Frank tenement, is said to be a possession of freehold lands or tenements. See Freehold and Tenement.

Frank, or Franc, an antient coin, either of gold or silver, struck and current in France. The value of the gold-frank was somewhat more than that of the gold crown; the silver-frank was a third of the gold one: this coin is long out of use, though the term is still retained as the name of a money of account; in which sense it is equivalent to the livre, or twenty sols.

Frankendal, a city of Germany, in the palatinate of the Rhine, situated on the west side of the river Rhine, in east long. 8° 15', north lat. 49° 3'.

Frankenia, see heath, or sea-chickweed, a genus of the decandria-monogynia class of plants, the flower of which consists of five petals, with a plain limb: the fruit is an oval, unilocular capsule, covered by the cup, and containing a great many ovated very small seeds.

Frankenstein, a town of Germany, in the palatinate of the Rhine, and duchy of Zuebruggen, situated twelve miles north-west of Landau.

Franker, a town of the United-provinces, in the province of west Friesland, nine miles west of Lewarden.

Frankincense, olibanum, in the materia medica. See Olibanum.

Franks, Frankis, or Franquis, an appellation given by the Turks, and other nations of Asia, to all the people of the western parts of Europe, to which they give the name of Frankifan.

Frankstat, or Fraustat, a town of Sileia, situated twenty-five miles north-east of Glogaw, subject to Prussia.

Frascati, or Frescati, a town of Italy, in the campania of Rome, thirteen miles east of that city, near which place is the tusculum of Cicero, called Grotto Ferrate.

Fratercula, in zoology, the name by which Gefner calls the arctic duck. See the article Duck.

Fraternity, in the roman catholic countries, signifies a society for the improvement of devotion. Of these there are several sorts; as, 1. The fraternity of the rofarv, founded by St. Dominic: it is divided into two branches, called the common rofarv, and the perpetual
petual rotary; the former of whom are obliged to confess and communicate every first Sunday in the month, and the latter to repeat the rotary continually. See the article ROSARY.

2. The fraternity of the scapulary, whom the blessed virgin, according to the fabbatin bull of pope John XXII. has promised to deliver out of hell the first Sunday after their death. See SCAPULARY.

3. The fraternity of St. Francis's girdle, are clothed with a fack of a grey colour, which they tie with a cord; and, in proceedings, walk bare-footed, carrying in their hands a wooden crook.

4. That of St. Alfin's leathern girdle, comprehends a great many devotees. Italy, Spain, and Portugal, are the countries where one sees the greatest number of these fraternities, some of which assume the name of arch-fraternities. Pope Clement VII. instituted the arch-fraternity of charity, which distributes bread every Sunday among the poor, and gives portions to forty poor girls on the feast of St. Jerom their patron.

The fraternity of death, buries such dead as are abandoned by their relations, and causes masses to be celebrated for them. The fraternity of St. Mary of the suffrage employ their prayers to relieve souls out of purgatory. The fraternity of mercy, at Lisbon, confines of persons of the great quality, the king himself being a member of it; the design of its institution is to procure a great number of masses to the faithful, but chiefly to its own members.

What has been said, may suffice to shew the nature of these fraternities; by entering into which, most of the devotees believe they are much nearer of salvation than they could otherwise be.

FRATERNITY, in a civil sense, a company or guild of certain artificers or traders. See the articles COMPANY and GILD.

FRATRICELLI, LITTLE BROTHERS, in church history, a sect of heretics who appeared in Italy about the year 1258, and afterwards spread all over Europe. They wore the habit of the francican order, and pretended that ecclesiastics ought to have no possessions of their own.

FRATRIAGE, fratriagium, the partition among brothers or coheirs, coming to the same inheritance or succession. Fratriage more particularly signifies a younger brother's inheritance; or whatever the younger sons possess of the father's estate, which, in our ancient law, they are said to enjoy ratione fratriagiæ; and were to do homage for the same to the elder brother, he being bound to do homage to the superior lord for the whole.

FRATRES ARVALES. See ARVALES.

FRATRES CONJURATI, in our ancient law-books, &c. signify sworn brothers, or those who took an oath to defend the king against his enemies.

FRATRICIDE, the crime of murdering one's brother. See PARRICIDE.

FRAUD, in law, signifies deceit in grants, or conveyances of lands, &c. or in bargains and sales of goods, &c. to the damage of another person.

A fraudulent conveyance of lands or goods to deceive creditors, as to creditors is void in law. And a fraudulent conveyance in order to defraud purchasers, is also to such purchasers void; and the persons justifying or putting off such grants as good, shall forfeit a year's value of the lands, and the full value of the goods and chattels, and likewise shall be imprisoned.

However, when conveyances are fraudulently made, they are not void to all persons, but only to those that afterwards come to the land as purchasers on good consideration. A general gift made of all the goods of a person, may be reasonably suspected to be by fraud, even though a true debt is owing to the party to whom made; and it is void against other creditors of the donor. Here the several marks of fraud in a gift or grant of goods, are as follow, viz. 1. If it be general, without any exception of some things of necessity. 2. If the donor continues to possess and use the goods. 3. If the deed be made in secret. 4. If there be a truft between the parties; or, 5. If made whilst the action is depending.

Where a person is party to a fraud, all that follows thereupon will be intended to be done by him, though fraud shall not be presumed or adjudged to be so, until found by jury.

By the statute of frauds, 29 Car. II. agreements for the sale of lands, leaves, &c. are required to be in writing. See 3 & 4 Will. and Mary, c. 14.

FRAUS LEGIS, is where the process of the law is used with a felonious purpose; and a person is turned out of possession of his house, by virtue of a writ of habere facias possessionem, on a false affidavit procured of the service of a declaration in ejectment.
ejecution and judgment had thereon in fraudem legis.

FRAXINELLA, in botany, the same with dictamus. See DICTAMNUS.

FRAXINUS, the ash, in botany, a genus of trees, belonging to the *polymnia-dosiereti* class, in some species of which there is no corolla; in others there is a small one, formed of four slender and acute petals: the fruit is single, of a compressed lanceolate figure, and is what we commonly call the alen-key, several clusters of which are affixed to the same common pedicle.

The wood of this tree is in great use among several artificers, as wheel-wrights, cart-wrights, carpenters, turners, &c. also for making ploughs, harrows, axle-trees, oars, balls, &c. It is said to be as lathing for building as oak, and often preferred before it: though the timber of the trunk greatly excels that of a bough. Some ash is also so curiously veined, that the cabinet-makers equal it to ebony, and call it green ebony; so that the woodmen, who light upon such trees, may have for it what they will. The season for felling this tree, is from November to February; for if cut down too early, or too late, it is liable to the worm. The ash is hurtful to corn-lands, and therefore should be planted either in sixes or fevens, in three feet distance.

FRAY, among seamen. A deer is said to fray its head, when it rubs it against a tree, to caufe the pills of the new horns to come off. See the article HEAD.

FREAM, a name given by farmers to plowed lands worn out of heart, and laid fallow till it recover. See FALLOWING.

FREAM, among sportsmen, denotes the noise of a boar in rutting time.

FRECKLES, *lentigines*, spots of a yellowish colour, of the bigness of a lentule-seed, scattered over the face, neck, and hands. Freckles are either natural, or proceeding accidentally from the jaundice, or the action of the sun upon the part. Heat, or a sudden change of the weather, will often cause the skin to appear of a darker colour than natural, and thereby produce what is called tan, sunburn, and morphew, which seem to differ only in degree; and usually disappear in winter. See the article TAN, &c.

Persons of a fine complexion, and such whose hair is red, are the most subject to freckles, especially in those parts which they expose to the air.

To remove freckles, put juice of lemons in a glass-vial, and mixing it with sugar and borax, finely powdered, let it digest eight days, and then use it. Homberg propoals bullish's gall, mixed with alum, and, after the alum has precipitated, exposed three or four months to the sun in a close vial, as one of the best remedies known for the removing of freckles.

FREDENBERG, a town of Germany, in the circle of Westphalia, fifty miles west of Caffel.

FREDERICA, a town of Georgia, in North America, situated in west long. 81° 30', north lat. 31°, on the island of St. Simons, in the mouth of the river Alatamaha.

FREDERICKSBURG, a caftle and palace of the king of Denmark, situated in the isle of Zeland, twenty miles north-west of Copenhagen, built upon piles in the middle of a lake.

FREDERICKSBURG, a fort upon the gold coast of Guinea, near cape Three-points, subject to the Danes. It lies in west long. 2°, north lat. 5°.

FREDERICKSBURG, a strong town of Norway, in the province of Agerhuys, situated on the frontiers of Sweden, thirty miles north of Frederickstat.

FREDERICKSODE, a town of Jutland, in the province of Reypen, situated on the little belt in the Baltic-sea, twenty miles west of Odenfee.

FREDERICKSBURG, a town of Slefwick, or south Jutland, situated on the river Eyder, near the german ocean, thirty-one miles west of Slefwick.

FREDERICKSBURG, a town of Norway, in the principality of Agerhuys, situated on a bay of the sea, called the Schaggerrack, near the frontiers of Sweden; east long. 11° 24', north lat. 59°.

FREE, in a general sense, is used in opposition to whatever is constrained or necessitated. When applied to things endowed with understanding, it more peculiarly relates to the liberty of the will. See the article FREEDOM.

FREE, among seamen. The pump is said to free the ship, when it throws out more water than leaks into her. To free the boat, is haling or lading out the water therein.

FREE-BENCH, signifies that estate in copyhold which the wife, being elop’d a virgin, has after the decease of her husband for her dower, according to the custom of the manor. In regard to this free-bench, different manors
Manors have different customs, and in
the manor of east and west Enbourne in
the county of Berks, and in other parts
of England, there is a custom, that when
a copyhold tenant dies, the widow shall
have her free-bench in all the deceased
husband’s lands, *dum sola & castra fuerit,*
whilst she lives single and chaste; but if
she is found to be guilty of incontinency,
the shall forfeit her estate. Nevertheless,
upon her coming into the court of the
manor riding backwards on a black ram,
with his tail in her hand, rehearsing a
certain form of words, the steward is
bound by custom to restore her to her
free-bench.

**Free-Bond**, ground claimed in some places
beyond or without the fence, and said to
contain two foot and an half.

**Free-Chapel**, is properly a chapel
of the king’s foundation, and by him
exempted from the ordinary’s visitation
or jurisdiction.

**Free**, or **Imperial Cities**, in Germany,
are those not subject to any particular
prince, but governed, like republics, by
their own magistrates. See City.

**Free-Fair**. See the article Fair.

**Free-Fee**. See the article Fee.

**Free-Hold**, signifies lands or tenements
which a person holds in fee-simple, fee-
tail, or for term of life.

Freehold is distinguished into freehold
in deed, and freehold in law: the first of
which signifies the real possession of lands,
&c. in fee, or for life; the other is the
right that a person has to such lands or
tenements before his entry.

**Free-Hold** is also extended to such offices
as a man holds in fee, or during life.
See the article Fee.

A freehold, by the common law, cannot
commence in futuro, but it must take
effect presently, either in possession,
reversion, or remainder; and where a per-
sion pleads liberum tenementum, or free-
hold, generally the law intends he has
an estate in fee, and not barely for life.
Whatever is part of the freehold, goes
to the heir; and things fixed thereto,
may not be taken as a detriment for rent,
or in execution, &c. No person shall
distrust freeholders to answer for their
freehold, or any thing concerning the
same, without the king’s writ. By the
ancient laws of Scotland, freeholders are
called milites, or knights.

**Free-Masonry**. See the article Mason.

**Free-Part**. See the article Part.

**Free-State**, a republic governed by mag-
gistrates elected by the free suffrages of
the inhabitants.

**Free-Stone**, a whitish stone dug up in
many parts of England, that works like
alabaster, but is more hard and durable;
being of excellent use in building, &c.
It is a kind of the grit-stone, but finer
sanded, and a smoother stone, and is
called free, from its being of such a con-
stitution as to cut freely in any direction:
such is the Portland-stone, and the free-
stone of Kent.

**Free-Stool**. See Friar-Stool.

**Free-Thinker**. See the article Deist.

**Free-Warren**, the power of granting
fencing, and said to
free.

**Freedom**, in general, the state or qua-
lity of being free. See Free.

**Freedom of a corporation**, the right of en-
joying all the privileges and immunities
belonging to it. See Corporation.

The freedom of cities, and other corpo-
rations, is regularly obtained by serving
an apprenticeship; but it is also purchas-
ed with money, and sometimes conferred
by way of compliment.

**Freedom of the will**, that power or fa-
culty of the mind, whereby it is capable
of acting or not acting, choosing or re-
jecting, whatever it judges proper. Of
this every man must be sensible, who
finds in himself a power to begin or for-
bear, continue or end several actions,
barely by a thought or preference of the
mind. The actual exercise of this pow-
er, is that which we call volition or wil-
ing; and the agent, capable of acting
in this manner, is denominated free, and
the actions he performs, voluntary.

Whereas, on the other hand, wherever
any performance or forbearance are not
equally in a man’s power; wherever do-
ing or not doing will not equally follow
upon the preference of his mind, there
he is not free, though perhaps the
action may be voluntary. To illustrate this,
suppose a man to be carried whilst fast
asleep into a room where is a person he
grows to fee, and be there locked fast in,
beyond his power to get out; he awakes,
and is glad to see himself in so describ-
able company, which he stays willingly in;
that is, prefers his staying to going away.
In this case, his stay is voluntary; and yet
being locked fast in, he is not at liberty
to stay, he has not freedom to be gone.
So that liberty does not consist in the pre-
ence...
FRE [1336] FRE

ference of the mind, but in the power of
conforming to that preference.

**Freedom of Contrariety**, among moralists,
that of choosing either of two opposites,
as virtue or vice, good or evil; concerning
which the received doctrine is, that
mankind have a freedom of contradic-
tion, but not of contrariety; that is,
they may abstain from the pursuit of
virtue and good, but are incapable of hav-
ing them, or of preferring their opposites.
See the article **Contradiction**.

**Freedom of Conscience. See Toleration.**

**Freeze, or Frieeze, in architecture.**
See the article **Frieze**.

**Freeze, or Frieze, in commerce, a coarse
kind of woollen stuff, or cloth, for win-
ter-wear; so called, as being frozen or
napped on one side.**

Irish frieze pays, on importation, a duty
of $\frac{1}{2}$ d. for every yard; and draws
back, on being exported, 4½ d. per
yard.

**Freezing, in philosophy, the same with
congelation. See Congelation and Frost.**

Philosophers are by no means agreed as
to the cause of this phenomenon. The
cartesians account for it by the recess or
going out of the ethereal matter from the
pores of the water. The corpusculari-
s, on the other hand, attribute it to the
ingress of frigorigific particles, as they call
them; and Hobbes asserts, that these par-
ticles are nothing else but common air,
which entangling itself with the particles
of water, prevents their motion. Others
will have a kind of nitrous fælir to be the
cause of congelation, by infiltrating itself
between the particles of water, and fixing
them together, like nails. And, indeed,
it seems probable that cold and freezing
do arise from some substance of a fæline
nature floating in the air; since all fælies,
and particularly nitrous ones, when mixed
with ice and snow, greatly increas
their cold, and even bulk.

Boehmave observes, that it is extremely
difficult to exhibit to the eye the precise
degree of cold wherein ice begins to form;
since heat and cold, once given to a body,
adhore long to it before they quit it.
When the air, therefore, is in such a
state as keeps Fahrenheit's thermometer
at 32 degrees, water will not freeze; be-
cause water being 800 times denser than
air, retains the warmth considerably
longer than air. If any person, there-
fore, is curious to know in what degree
of cold water begins to freeze, let him
first suspend a thermometer in a free open
air on all sides; and then wetting a thin
linen cloth with clear water, and hang-
ing it likewise in the open air, it will
grow stiff upon the first access of the
freezing cold, and thereby shew when
water is beginning to turn to ice. See the
article **Thermometer**.

By means of freezing, wine, vinegar,
and malt-liquors may be reduced to a
fourth part of their quantity, without
any considerable loss of their essential
parts; since only the aqueous parts freeze,
leaving the vinous parts concentrated or
brought into less compacts, and capable of
being transported with less expense, and
keeping for several years.

**Freezing Mixture.** Mr. Boyle shews
in his history of cold, that not only all
kinds of fælies, but likewise spirits, sugar,
and faccharum saturni, mixed with snow,
are capable of freezing mephit fluids; and
the same effect was also produced by the
mixture of oil of vitriol, or spirit of nitre,
with snow.

**Freezing Rain,** that which falls in form
of ice, or which freezes as soon as it reaches
the ground.

**Frieze Land, or Frieseland.** See the
article **Frieseland.**

**Fright, or Freight,** in navigation
and commerce, the hire of a ship, or a
part thereof, for the conveyance and car-
riage of goods from one port or place to
another; or the sum agreed on between
the owner and the merchant, for the hire
and use of a vessel.

The freight of a vessel is usually agreed
on either at the rate of so much for the
voyage, or by the month, or per ton.
Whereover a ship freighted by the voyage,
or by the month, is cast away, plundered
by pirates, or taken by the enemy, the
freight becomes lost; but if the merchant,
or any other who hires the ship, agrees
by the tun, or after such a rate for every
piece of the commodities on board, and
that part of the goods are saved, it is
there held that the ship ought to have
her freight, according to the rate of the
goods saved. The lading of a ship, in
law construction, is bound for the freight;
and where goods are put aboard, and the
ship has broke ground, a merchant may
not afterwards unlade them: for if he
then changes his mind, and resolves not
to venture, by the marine law, freight is
due. Likewise, if the freighter of a ship
lade
FRE [ 1337 ]

Jade on board any prohibited goods, or unlawful merchandize, whereby the vessel is detained or impeded in her voyage, he shall answer the freight agreed: but where a master freights out his ship, and afterwards takes in goods secretly and unknown to the first laders, he forfeits such freight. In case any ship is freighted out and in, no freight will be due till the voyage is performed; and here if a vessel be lost in coming home, the freight outwards and inwards are both lost.

If a whole vessel be hired, and the merchant or person who hires it do not give it full load or burden, the master of the vessel cannot, without his consent, take in any other goods without accounting to him for freight. Though the merchant do not load the quantity of goods agreed on in the charter-party, yet: he shall pay the whole freight; and if he load more, he shall pay for the excess. See the article Charter-party.

The master may set ahoire such goods as he finds in his vessel, which were not notified to him; or take them at a higher rate than was agreed on for the rest. If a ship be stopped or detained in its course, either through the merchant's or the master's fault, the delinquent shall be accountable to the other. If the master be obliged to refit his vessel during the voyage, the merchant shall wait, or else pay the whole freight: if the vessel could not be refitted, the master is obliged to hire another immediately, otherwise only to be paid his freight in proportion to the part of the voyage he performed: tho' in case the merchant prove that the vessel, at the time it fell fail, was not capable of the voyage, the master must lose his freight, and account for damages to the merchant. Freight shall be paid for merchandizes which the master was obliged to sell for victuals, refitting, or other necessary occasions, paying for the goods at the rate the rent were sold at where they were landed. In case of a prohibition of commerce with the country whither the vessel is bound, so that it is obliged to be brought back again, the master shall only be paid freight for going. And if a ship be stopped or detained in its voyage by an embargo, by order of the prince, there shall neither be any freight paid for the time of detention, in case it be hired per month, nor shall the freight be increased, if hired by the voyage: but the pay and victuals of the sailors, during the detention, shall be deemed average. See the article Average.

Freight is also used for the burden or lading of a ship, or the cargo of goods, &c. which the has on board.

Freight also signifies a duty of fifty sols per ton paid to the crown of France by the masters of foreign vessels going in or out of the several ports of the kingdom. It is to be observed, that all vessels not built in France, are accounted foreign, though belonging to the king's subjects; and, as such, are liable to the payment of this impost, unless otherwise exempted, or that two thirds of the crew are French.

The Dutch and the hans towns are exempted from the duty of freight.

French, in general, something belonging to France: thus we say, the French language, French customs, policy, &c.

The French language is made up of Latin, Greek, Teutonic, and the language spoken by the old Gauls. It is natural, and easily pronounced, and therefore used by most nations of Europe in converting with foreigners. There are very few compound words in French, which is acknowledged to be to its disadvantage. It has also a few diminutives: but as to purity, easiness, and flexibility, it yields to none.

French bread.

French coins.

French crown.

French weight, &c.

French number, or French, in anatomy. See the article French.

Frenchy, or Phrenzy, in medicine. See the article Phrenzy.

Fresco, a method of painting in relief on walls, so as to endure the weather. It is performed with water-colours on fresh plaster; or on a wall laid with mortar not yet dry. This sort of painting has a great advantage by its incorporating with the mortar, and drying along with it, becomes very durable. The composi should be made of sulphur stones mixt with well-burnt flint, or lime, and water: but the saltiness of the lime must be washed out, by pouring water frequently on it. But this should not be done in moist weather.

To prevent the plaster from peeling, strike into the joints of the wall stumps of horse-nails six inches distant from each other. First plaster the walls pretty thick; then let it dry for some time, the design and colours being first ready prepared. This painting is chiefly performed
formed on walls and vaults newly platered with lime and sand; and the plater is only to be put on in proportion as the painting proceeds.

Plaster the wall second time, about the thickness of half a crown, only so much as you intend to work upon; and while it is wet, work the colours therein, which will incorporate with the plaster so as never to wash out.

The painting must be worked with a free hand, and your colours made high enough at first, as there can be no alteration made after the first painting.

In this work scarce anything else is used but earths, which still retain their colour, defending it from the burning and falt of the lime. The colours are white, made of lime flacked some time, and what marble dust, red and yellow oker, violet red, verditer, lapis lazuli, smalt, black spanish brown, spanish white, &c. all which are ground and worked up with water.

The brushes and pencils for this work must be long and soft, or else they will rake and raze the painting; the colours must be full and flowing from the brush, and the design or cartoon must be perfect in the paper-copy.

The antients painted on stucco; and we may remark in Vitruvius what infinite care they took in making the incrustations or platering of their buildings, to render them beautiful and lafting; tho' the modern painters find a plater made of lime and sand preferable thereto.

FRESH, in general, something that is new, pure, and good; or, that has little or no fault in it.

FRESH DISSEISIN, in law, such a disesein as a man may defect of himself, and by his own power, without the assistance of the king or the law; as where it is of short continuance, viz. not above fifteen days. See the article DISSEISIN.

FRESH FINE, a fine that was levied within a year past. See the article FINE.

FRESH FORCE, signifies a force newly done; as where a person is dispossessed of any lands or tenements within a city or borough, or deforced of lands after the decease of his ancestor, to whom he is heir; the person having right may within forty days after the force committed, or title to him accrued, bring his affise or bill of fresh force, and recover the lands. See the article FORCE.

FRESH HAWSE, among seamen. See the article HAWSE.

FRESH SHOT, in the sea-language, signifies the falling down of any great river into the sea, by means whereof the sea hath fresh water a good way from the mouth of the river. As this is more or less, they call it a great or small fresh shot.

FRESH SPELL, in the sea-phrase, a fresh gang to relieve the rowers in the long-boat.

FRESH SUIT, in law, is such a close and active prosecution of an offender, as never ceases from the time of the offence committed or discovered, till he is apprehended.

The benefit and effect of this pursuit of a felon is, that the party pursuing shall have his goods again, which otherwise would be forfeited to the king. A person may be said to make a fresh suit tho' he does not take the thief presently, but some time after the robbery is committed, provided he has used his utmost endeavours to take him; and though the criminal was taken by another person not interested in any thing carried away, yet the party robbed shall be deemed to have made a fresh suit.

FRESH WATER. See the article WATER.

FRET, or FRETTE, in architecture, a kind of knot or ornament, consisting of two liffes or small fillets variously interlaced or interwoven, and running at parallel distances equal to their breadth. See plate CVI. n° 7.

Every return and intersection of these frets must be at right angles, otherwise they lose all their beauty, and become perfectly gothic. Sometimes the fret confines but of a single fillet, which, if well disposed, may be made to fill its space exceedingly well. Frets were very much used by the antients, especially on even flat members, or parts of a building, as the faces of the corona, and eyes of corniches; under the roofs, fofts, &c. and on the plinths of bases, &c. See the article CORONA, EVE, &c.

FRET, in heraldry, a bearing composed of six bars, crosseted, and variously interlaced, as represented in plate CVII. fig. 2.

Some call it the true-lover's knot.

FRET, in music, signifies a kind of stop on some instruments, particularly bas-viol and lutens. Frets confint of strings tied round the neck of the instrument, at certain distances, within which such and such notes are to be found.

FRET-WORK, that adorned with frets. It is sometimes used to fill up and enrich flat empty spaces; but is mostly prac-
titled in roofs, which are fretted over with plaster-work. The Italians also use fretworks in the mantling of chimneys, with great figures: a cheap piece of magnificence, and as durable almost within doors, as harder matters in the weather.

FRETTY, in heraldry, an appellation given to bearings made up of six, eight, or more bars laid across each other, in the manner of frets. See FRET.

FREYSTAT, a town of Silecia, in Germany, east long. 17° 55', north lat. 50°.

FRIABLE, among naturalists, an appellation given to bodies that are easily crumbled to pieces: such are the free-flone, pumice-flone, &c. FRIAR, or FRIER, from the French frere, a brother, a term common to monks of all orders, founded on this, that there is a kind of fraternity, or brotherhood, between the several religious persons of the same convent or monastery.

Friars are generally distinguished into these four principal branches, viz. 1. Minors, grey friars, or franciscans. 2. Augustines. 3. Dominicans, or black friars. 4. White friars, or carmelites.

From these four the rest of the orders descend. See the articles Franciscans, Augustines, &c.

FRIAR, in its more peculiar and proper sense, is restricted to such monks as are not priests, for those in orders are generally dignified with the title of father. See Monk and Father.

FRIAR OBSERVANT, is a branch of the franciscan friars; thus called, because they are not combined together in any cloister, convent, or corporation, as the conventuals are; but have bound themselves only to observe the rules of their order more strictly than the conventuals do, from whom they separated, out of a singularity of zeal, living in certain places of their own choosing.

FRIAR'S COUL, in botany, a name given to several species of arum. See the article Arum.

FRIBURG, the capital of a canton in Switzerland, situated eighteen miles south-west of Bern: east long. 6° 55', north lat. 46° 50'.

FRIBURGH, a city of Swabia, in Germany, twenty-eight miles south of Strafburg.

FRIBURGH, or FRIDBURGH, in our old cutdms, the same with frank pledge. See the article Frank.

FRICASSE, in cookery, a dish hastily dressed in a frying-pan, with butter, oil, or the like. Thus we say, a fricassee of pullets, tripe, eggs, &c.

FRICENTO, a town and bishop's see of Italy, forty-three miles east of the city of Naples.

FRICTION, in mechanics, the rubbing of the parts of engines and machines against each other, by which means a great part of their effect is destroyed. It is hardly possible to lay down general rules concerning the quantity of friction; since it depends upon a multitude of circumstances, as the structure, firmness, elasticity, &c. of the bodies rubbing against each other. Some authors make friction, upon an horizontal plane, equal to one third of the weight to be moved; while others have found it to be considerably less.

Be this as it will, the doctrine of friction, as ascertained by the latest experiments, may be summed up in the following manner. 1. When one body inflicts on another upon a horizontal plane, it presses it with its whole weight; which being equally re-acted on, and consequently the whole effect of its gravity destroyed by the plane, it will be absolutely free to move in any horizontal direction by any least power applied thereto, provided both the touching surfaces be perfectly smooth. 2. But since we find no such thing as perfect smoothness in the surfaces of bodies, but an evident roughness or unevenness of the parts in their surface, arising from their porosity and peculiar texture, it is easy to understand that when two such surfaces come together, the prominent parts of one will, in some measure, fall into the concave parts of the other; and, therefore, when an horizontal motion is attempted in one, the fixed prominent parts of the other will give more or less resistance to the moving surface, by holding and detaining its parts; and this is what we call friction. 3. Now since any body will require a force proportional to its weight to draw it over a given obstacle, it follows that the friction arising to the moving body will always be in proportion to its weight only, and not the quantity of the surface, by which it bears upon the resisting plane or surface. Thus if a piece of wood four inches wide, and one thick, be laid upon another fixed piece of the same wood, it will require the same weight to draw it along, whether it be laid on its broad or narrow side. 4. For tho' there be four times the number of touching particles on the
the broad side (ceteris paribus) yet each particle is prefined with but \( \frac{1}{4} \) of the weight that those are on the narrow side; and since four times the number, multiplied by \( \frac{1}{4} \) of the weight, is equal to \( \frac{1}{4} \) of the number multiplied by four times the weight, it is plain the resistance is equal in both cases, and so requires the same force to overcome it. 5. The reason why friction is proportional to the weight of the moving body, is, because the power applied to move the body, must raise it over the prominent parts of the surface on which it is drawn; and this motion of the body, as it is not upright, so it will not require a power equal to its whole weight; but being in the nature of the motion on an inclined plane, it will require only a part of its own weight, which will vary with the various degrees of smoothness and asperity. 6. It is found by experiment, that a body will be drawn along by nearly one third of its weight; and if the surfaces be hard and well polished, by less than a third part; whereas, if the parts be soft or rugged, it will require a much greater weight. Thus also the cylinder of wood A B, (plate CVII. fig. 3. n° 3.) if very smooth, and laid on two well polished supports, C, D, (having been first oiled or greased) and then charged with the weight of two pounds in the two equal balls, G, H, it will require an additional weight \( x \), equal to about a third part of the two pounds, to give motion to, or overcome the friction of the said cylinder. 7. Now this additional weight, as it causes a greater weight of the cylinder, will like wise encrease the friction, and therefore require the addition of another weight \( y \), equal to the third part of its own weight: for the same reason, the weight \( y \) will require another \( z \), a third part less; and so on, \( a d \ infinitum \). Hence, supposing the friction to be precisely a third of the weight, the first weight with all the additional ones, \( v c z. 2, 3, 4, 5, 6 \), &c. will be a series of numbers in geometrical progression, decreasing. Now the sum of all these terms, except the first, is found, by a well known theorem in arithmetic, to be equal to one pound. So that if the weight of the cylinder be inconvenient, the readiest way to overcome the friction, would be to double the power \( G \), or \( H \), at once. 8. But tho' we may, at a medium, allow a third part of the weight with which any simple machine is charg ed, for the friction arising from thence; yet this is very precarious, and seldom is the case: for if A B C D (ibid. n° 2.) be a piece of brass of six ounces, and E F G H be also a plate of brass, and both the surfaces well ground and polished, the weight \( P \) of near two ounces will be required to draw along the body A C alone; but if A C be loaded with 6, 8, or 16 lb., then a fifth part of the weight will be sufficient to draw it along the plane. On the other hand, if the plane be covered with a linien or woollen cloth, then a third, or half part, and sometimes more, will be requisite to draw it along on the plane. 9. Yet notwithstanding the difficulty and uncertainty attending the estimation of the quantity of friction, it is still a most useful and necessary enquiry, how, and by what means the friction of any machine may be diminished. In order to this, we must consider friction mechanically, or as a force acting against a power applied to overcome it. Thus suppose A B (ibid. n° 3.) an upright stem or shaft, turning freely in the socket B fixed in the table or plane I K L M; and A C, D E, two arms fixed in the said shaft, the latter of which, D E, has three pins going into a socket in the middle of heavy weights, \( F, G, \) or \( H \), in such a manner, that when a power applied at C moves the lever A C, it causes the lever D E to protrude or thrust along the weights at \( F, G, \) or \( H \), in a circular manner upon the table. 10. Now since we suppose the weight, all the while it is in motion, is freely and wholly supported by the plane, it follows that all the resistance it can give to the power applied to C, is only what arises from its friction on the plane. What this friction is, will be found by applying the weight at \( G \), so that B G be equal to A C; for then the power applied to C, acting in a tangent to the circle C R S, that shall just move the weight \( G \), will be equal to its friction. But if the weight be applied at \( F \), because B F is greater than A C, the same power at \( C \), as before, will not move it, by reason its force is here increased by having a greater velocity than the power; as, on the other hand, if placed at \( H \), a less power at \( C \) shall move it, because of its having there less velocity than the power, as is evident from the properties of the lever. 11. Hence, we understand, that though the weight of a machine remains the same; yet the friction may be diminished, by contriving that the parts, on which it moves and rubs,
Jinder, the friction of the two small pins or gudgeons $E,F$, the friction on these gudgeons is still farther diminished by causing them to move on the circumference of a wheel: thus, let $F$ be the gudgeon of the cylinder, revolving on the wheel $CDE$ (ibid. n° 4.) the velocity of the wheel's circumference will be the same with that of the gudgeon; but the velocity of the wheel's axis $AB$ (which is now to be considered as the rubbing part) is less than that of the wheel, in proportion as its diameter is less than that of the wheel: for example, if the friction of the cylinder moving on its surface, be $\frac{1}{3}$ part of the weight, and the gudgeon be to the cylinder as $1:10$, they will reduce the friction to $\frac{1}{10}$ part; and if, again, the axis of the wheel be to the wheel as $1:10$, the wheel will reduce the friction to $\frac{1}{10}$ part; and if the axis of this wheel be laid on the perimeter of another wheel, the friction will be reduced to a still less part of the weight; so that you may proceed in this manner to diminish the friction ad infinitum; and wheels applied in this manner, are called friction-wheels. 13. Besides what has been already said, somewhat farther is necessary to diminish the friction of wheel-carriages. It was before observed, that friction arose chiefly by lifting the body over the prominent parts of the plane on which it is moved; now if we can contrive to move the body along without lifting or sustaining its weight, we shall move it without much friction; and this may be done by laying the body on any moveable circular subject, as rollers, wheels, &c. thus let $A B$ (ibid. n° 5.) be the section of an heavy body, laid on a roller $E F$, upon the plane $C D$, and drawn by the power $P$; it is evident, when $A B$ moves, the asperities of its surface will lay hold on those of the roller, and move it likewise; and it is as evident, that when the body $A B$ is drawn against the prominent parts of the roller, they immediately give way, and make no resistance: thus the perpendicular diameter $a b$ yields into the situation $e f$, and $c a$ succeeds in its place. By this circular motion of the roller, its prominent parts below do only defend and move upon or over, and are not drawn against the fixed prominent parts of the plane, and so receive no resistance from them. Hence the body $A B$ is conveyed along, without being lifted up, in the same manner as a wheel is moved by a pinion, without any considerable resistance. And this is the true foundation of the doctrine of wheel-carriages. See the article Wheel-carriages.

Friction, in medicine, the rubbing a dis-eased part, either with or without unguents, oils, &c. Dr. Cheyne greatly recommends friction with a flesh brush, to persons of weak nerves and sedentary lives; by which means a full and free perspiration would be promoted, and obstructions removed, to the great relief of many valetudinarians.

FRIDBURG, an imperial city of Bavaria, in Germany: east longitude 11°, and north lat. 48° 30'.

FRIDBURG is also the name of two other towns in Germany, both situated in the circle of upper Saxony, the one nine miles south-west of Dresden, and the other thirty miles west of Leipzig.

FRIDLAND, a town of Bohemia, on the confines of Lusatia: east longitude 15° 5', and north lat. 50° 55'.

FRIDLINGEN, a town of Swabia, in Germany: east long. 7° 30', and north lat. 47° 35'.

FRIDSTOL, mentioned in our antient writers, among the immunities granted to churches, signifies a seat, chair, or place of peace and security, where criminals might find safety and protection: of these there were many in England, but the most famous was at Beverley, and that in St. Peter's church at York, granted by charter of king Henry I.

FRIDSBURG, an imperial city of Germany, sixteen miles north of Francfort on the Main.

FRIENDLESS MAN, an old saxon term for an outlaw.

FRIER, or PRIAR. See PRIAR.

FRIESLAND, one of the most northern provinces of the united Netherlands, bounded by the German ocean on the north, by Groningen and Oversyffel on the east, by the Zuider-sea and Oversyffel on the south, and by the same ocean on the west: its chief town is Lewarden.

East-Friesland, a province of Westphalia, in Germany, being the north-west part of Germany, bordering on Groningen.
As to the height of the frieze, it is in general much the same as that of the architrave. The height of the tufcan frieze, according to Vitruvius, who makes it flat and plain, is 30 minutes; but Palladio, who makes it convex and swelling, gives it only 26; Scamozzi makes it plain, but raises the height to 42 minutes. Vitruvius and Vignola, who make the doric frieze flat, only covered with triglyphs give it the height of 30 or 40 minutes; but Palladio and Scamozzi make it 45.

The ionic frieze, according to Vitruvius, who makes it flat, only covered with acanthus-leaves, &c., is 30 minutes in height; Vignola makes it 45, and flat like Vitruvius; Palladio, who makes it convex and swelling, calls the height 27; and Scamozzi 28. The height of the corin-thean frieze, according to Vitruvius, who enriches it with acanthus-leaves, human figures, &c., is 37 minutes; but Vignola makes it 45; Palladio, 28; and Scamozzi 31½.

Latly, the compositive frieze, which, in Vitruvius, is set with cartouche, and carved between them, is, according to that writer, 52½ minutes high; but Vignola, who makes it like Vitruvius, gives it but 45 minutes; Palladio, who makes it swelling, has but 30; Scamozzi, 32.

From the variety of their ornaments, friezes obtain various denominations. Convex or Pulvinated Friezes, such whose profile is a curve, the belt proportion of which is when drawn on the base of an equilateral triangle.
To this genus belong the gold-finch, chaff-finch, green-finch, yellow-hammer, canary-bird, linnet, sparrow, &c. See the articles GOLD-FINCH, &c.

FRINGILLAGO, a name given by some authors to the parus or titmoufe. See the article TITMOUSE.

FRINGILLARIUS ACCIPITER, the name by which authors call the sparrow-hawk. See the article HAWK.

FRIWALT, or FRIDLAND, a town of Brandenburg, thirty miles north-east of Berlin, situated on the west side of the river Oder.

FRIO, a cape or promontory of Brazil: west lon. 44°, and south lat. 23° 30'.

FRIPPERY, a french term sometimes used in our language to signify the trade or traffic of old second-hand clothes and goods. The word is also used for the place where such fort of commerce is carried on, and even for the commodities themselves. The company of frippiers, or fripperers, at Paris, are a regular corporation, of an antient standing, and make a considerable figure in that city.

FRISACH, a town of Bavaria, fifty miles south-east of Saltzburg: east lon. 14° 15', and north lat. 47° 20'.

FRISELAND, or FRISELAND. See the article FRISELAND.

FRISONE, in ornithology, the same with the cocothraustes, or loxia. See the article LOXIA.

FRIST, in the mercantile style, signifies selling goods upon credit, or trust.

FRIT, in the glas-manufactory, the matter or ingredients whereof glas is to be made, when they have been calcined or baked in a furnace; or it is the calcined matter to be run into glas. See the article GLASS.

There are three kinds of frit; the first, that made for crytal; the second, or ordinary frit, is that made for the common white or cryfalkine metal; and the third, that made for green glas. The frit for crytal is made as follows: take 200 lb of tarbo, powdered fine, and sifted; of the falt of pol verine 130 lb; mix them well together, and put them in the calcar, a fort of oven, or reverberatory furnace, which should be first well heated: here let them remain, baking, frying, and calcining, for five hours, during which the workman keeps mixing them with a rake, to make them incorporate. The second, or ordinary frit, is made of bare ashes of polverine, without extracting the falt from them.

The third, for green glas, is made of common ashes, without any preparation.

It may be observed, that glas might be made by immediately melting the materials, without this calcining and making them into frit; but the operation would be much more tedious.

FRITH, in its most usual acceptation, signifies an arm of the sea: such are the firth of Forth or of Edinburgh, the firth of Clyde, Murray firth, &c.

FRITH, among lawyers, signifies a lawn or plain between two woods.

FRITH-GILD, a term antiently used for what is now called a guild-hall, or a company of fuch corporation: and frithman was one free of fuch company. See GUILDHALL and COMPANY.

FRITH is also used to signify peace.

Hence

FRITH-SOKE, or FRITH-SOKEN, a term formerly used to signify a surety of defence.

FRITILLARY, fritillaria, in botany, a genus of the hexandria monogynia clafs of plants, the corolla of which is composed of fix campanulated, oblong, and parallel petals, with a broad bafe; the fruit is an oblong, obtuse, trilobate capsule, formed of three valves, and containing three cells; the seeds are numerous, plan, semiobvolute externally, and placed in a double row.

Thick FRITILLARY, fritillaria crassa, in botany, the same with the asclepias. See the article ASCLEPIAS.

FRJULI, a province of Italy, subject to Venice, and bounded by Carnithia in Germany on the north, by Carniola on the east, by the gulf of Venice on the south, and by the Belunefe and Feltrin on the west.

FRIZE, or FRIEZE, in architecture. See the article FRIEZE.

FRIZE, or FREEZE, in commerce. See the article FREEZE.

FRIZING of cloth, a term, in the woollen manufactory, applied to the forming of the nap of a cloth, or stuff, into a number of little hard burrs or prominences, covering almost the whole ground therof. See the article FREEZE.

Some cloths are only frized on the backside, as black cloths; others on the right side, as coloured and mixed cloths, ra- teens, bays, freezes, &c.

Frizing may be performed two ways; one with the hand, that is, by means of two workmen, who conduct a kind of plank
plank that serves for a frizing instrument.

The other way is by a mill, worked either by water, or a horse, or sometimes by men. This latter is esteemed the better way of frizing, by reason the motion being uniform and regular, the little knobs of the frizing are formed more equally and regularly. The structure of this useful machine is as follows.

The three principal parts are the frizer or crisper, the frizing-table, and the drawer, or beam. The two first are two equal planks or boards, each about ten feet long, and fifteen inches broad, differing only in this, that the frizing-table is lined or covered with a kind of coarse woollen stuff, of a rough fluffy nap; and the frizer is incrusted with a kind of cement composed of glue, gum arabic, and a yellow sand, with a little aqua vitae or urine. The beam, or drawer, thus called because it draws the stuff from between the frizer and the frizing-table, is a wooden roller, befat all over with little, fine, short points, or ends of wire, like those of cards used in carding of wool.

The disposition and use of the machine is thus: the table stands immovable, and bears or sustains the cloth to be frized, which is laid with that side uppermost on which the nap is to be raised: over the table is placed the frizer, at such a distance from it as to give room for the stuff to be passed between them, so that the frizer, having a very slow semicircular motion, meeting the long hairs or naps of the cloth, twists and rolls them into little knobs or burrs, while, at the same time, the drawer, which is continually turning, draws away the stuff from under the frizer, and winds it over its own points.

All that the workman has to do while the machine is a going, is to stretch the stuff on the table, as fast as the drawer takes it off; and from time to time to take off the stuff from the points of the drawer.

The design of having the frizing-table lined with stuff of a short, stiff, fluffy nap, is that it may detain the cloth between the table and the frizer long enough for the grain to be formed, that the drawer may not take it away too readily, which must otherwise be the case, as it is not held by any thing at the other end. It were unnecessary to say any thing particular of the manner of frizing stuffs with the hand, it being the aim of the workmen to imitate, as near as they can, with their wooden instrument, the flow, equable, and circular motion of the machine: it needs only be added, that their frizer is but about two feet long and one breadth; and that, to form the nap more easily, they moisten the surface of the stuff lightly, with water mingled with whites of eggs or honey.

FROBSHEIR'S STRAITS, in west Greenland, lie a little to the northward of cape Farewell: west lon. 48°, and north lat. 67°.

FRODSHAM, a market-town of Cheshire, fourteen miles north-east of Chester.

FROG, rana, in zoology, a genus of amphibious animals, the body of which is broad and short, without a tail, and furnished with four legs.

Besides the common frog, there are a great many other species, the most singular of which is that called the bull-frog, a native of the northern parts of America, with four divided toes on the fore-feet, and five webbed ones on the hinder. This, when the limbs are extended, measures near two feet; the trunk of its body being about eight inches long, and four or five in breadth: it is very voracious, and frequently swallows young ducks, and other water-fowl, before they have strength to shift for themselves. Its croaking is so loud as to resemble the roaring of a bull heard at a distance, whence its name of bull-frog. There is also another very extraordinary species of frog, called the tree-frog, from its living on trees and plants of various kinds: also the green-frog, from its colours; its body is about an inch and a half long. Frog, among farriers, the name with frith. See the article Frush.

FROG-FISH, the rana piastrina of authors. See the article Rana.

FROME, a market-town of Somersetshire, nine miles south of Bath.

FRONDES, among botanists, denote leaves consisting of several other leaves, and forming the whole of the plant; as is the case of the fern-kind, in which, the fructification being on the back of the leaves, the single leaf makes the whole plant, and is called frondis, not folium.

FRONT of a battalion, among military men, is the first rank, or file-leaders. It is likewise called the face or head of a battalion. In like manner
Front of a squadron, is the first rank of troopers.

Front of a camp, the foremost row of tents in the first line, which are the quarter-masters tents in the horfe, and serjeants in the foot.

Front of an army consists of a certain number of squadrons and battalions.

Front of a place, or the Tenaille, in fortification, all that is contained between the flanked angles of the two neighbouring bastions, viz. the two faces, two flanks, and the curtain.

Front, in architecture, the principal face or side of a building, or that which is presented to the chief aspect or view.

Front, in perspective, a projection or representation of the face or forepart of an object, or of that part directly opposite to the eye, which is more usually called the orthography. See Orthography.

Line of the Front. See the article Line.

Front scale. See the article Scale.

Frontal, in architecture, a little fronton, or pediment, sometimes placed over a little door, or window.

Frontal, or Frontlet, or Brow-band, is also used in speaking of the Jewish ceremonies.

This frontal consists of four several pieces of vellum, on each whereof is written some text of scripture: they are all laid on a piece of calfs leather, with thongs to tie it by.

The Jews apply the leather with the vellum on their foreheads in the synagogue, and tie it round the head with the thongs.

Frontale os. See Frontis os.

Frontale, in medicine, a name for any external medicine, or topic, applied to the forehead: more particularly it means a refrigerating and hypnotic remedy, prepared of cold cephalics, bruised and tied up in a linen bag, four or five fingers-breadth. It is sometimes used in the same sense with anacolemma. See the article Anacolemma.

Frontal muscles; in anatomy, two of the four muscles of the cutis of the cranium. See the article Skull.

The frontal muscles are very thin: they are situated under the skin of the forehead, and have both their extremities movable, excepting only for a few fibres, which arise from the inferior edge of the os frontis. They are extended on each side under the eye-lids, near the larger canthus of the eye, beyond the middle of the orbit, towards the lesser canthus; and extended somewhat obliquely outwards over the os frontis: after this, they expand their tendons over the upper part of the cranium, and seem to be joined with the aponeuroses of the occipitales, which are fixed. By this means they are able to move the skin of the forehead and eye-brows. The antagonists to these are the orbiculares palpebrarum, on which they are affixed. See Orbiculares Palpebrarum.

Frontal sinus. See Sinus.

Frontated, a term used by botanists relating to the leaf of a flower, which grows broader and broader, perhaps terminating in a right line: and is used in opposition to culpidated, that is, when the leaves of the flower end in a point.

Fronteira, a town of Portugal, in the province of Alentejo: well lon. 8° 6', and north lat. 38° 50'.

Frontier, the border, confine, or extremity of a kingdom or province, which the enemies find in front, when they would enter the same: thus we say, a frontier town, a frontier province, &c. Frontiers were antiently called marches.

Frontis os, in anatomy, called also os coronale, the bone of the forehead. See the article Face.

This is a bone of the cranium, of an irregular form, double in infants, but in adults usually single: sometimes however, it is divided into two parts down to the nape. It is situated in the anterior part of the skull, and forms that part of the face which is called the forehead, from whence it has its name. Its figure is symmetrical, resembling a large shell, almost round. See the article Skull.

The os frontis is articulated, by future, to seven other bones; the offa parietalia, os ethmoides, os sphenoides, os malarum, os parietalia, and the offa lachrymalia, offa naso, maxillaria, and the offa malarum. See the articles Suture, Ossa Parietalia, &c.

The os frontis contains the anterior lobes of the brain, and a portion of the longitudinal sinuses; and forms the forehead, the upper parts of the orbits, and a portion of the temples. See Brain.

In the internal surface of the os frontis there is a fovea, or furrow, and an eminence, to which the longitudinal sinuses of the dura mater adheres: on its external surface are situated the frontal and temporal muscles, and the cartilaginous annule of the musculus trochlearis of the eye. See Musculus Trochlearis, &c.

Frontigniac,
FRONTIGNIAC, a town of Languedoc, in France, situated sixteen miles south-east of Montpellier, and remarkable for producing excellent wine.

FRONTIGNIAC is also the name of a fort, situated on the river St. Lawrence, in north America; west longit. 77°, and north lat. 43° 26'.

FRONTISPICE, in architecture, the portrait or principal face of a building. See the article BUILDING.

FRONTISPICE is also used to signify an ornament fronting the title-page of a book, which, in some measure, should express the subject treated of.

FRONTLET, or FRONTAL. See the article FRONTAL.

FRONTON, in architecture, the same with pediment. See PEDIMENT.

FROST, in physiology, such an excessively cold state of the air, as converts watery fluids into ice. See the articles FREEZING and ICE.

In very cold snowy weather, not only water, but urine, beer, ale, milk, vinegar, and even wine, are either wholly or in part, converted into ice, though the latent but slowly. As to the freezing of expressed oils, a very intense cold may deprive them of their fluidity, so as to be capable of being cut into portions of any figure; but whether they are convertible into real ice, is not yet determined. In Russia oil freezes much harder than with us, but does not even there become perfect ice. Common wine-reek water, and the like weak spirits, are said to be converted into an imperfect ice in Muscovy; and the strong spirits into a substance like that of oil. When brandy freezes, a liquid part, much stronger than common brandy, retires to the center of the vessel.

Even solid bodies are liable to be affected by frost: timber is often apparently frozen, and rendered exceedingly difficult to saw. Marle, chalk, and other less solid terrestrial concretions, will be shattered by strong and durable frosts. Metals are contracted by frost: thus, an iron-tube twelve feet long, upon being exposed to the air in a frosty night, lost two lines of its length. On the contrary, it swells or dilates fluids near one tenth of their bulk. Mr. Boyle made several experiments with metallic vessels, exceeding thick and strong; which being filled with water, clove flopped, and exposed to the cold, burst by the expansion of the frozen fluid within them. Trees are frequently burnt up with frost, as with the most excessive heat; and in very strong frosts, walnut-trees, ashes, and even oaks, are sometimes miserably split and cleft, so as to be seen through, and this with a terrible noise like the explosion of fire-arms.

Frost naturally proceeds from the upper parts of bodies downwards; but how deep it will reach in earth or water, is not easily known, because this depth may vary with the degree of coldness in the air, by a longer or shorter duration of the frost, the texture of the earth, the nature of the juices wherewith it is impregnated, the constitution of its more internal parts as to heat and cold, the nature of its effluvia, &c. Mr. Boyle, in order to ascertain this depth, after four nights of hard frost, dug in an orchard, where the ground was level and bare, and found the frost had scarce reached 3½ inches; and in a garden nearer the house, only 2 inches below the surface. Nine or ten successive frosty nights froze the bare ground in the garden 6½ inches deep; and in the orchard, where a wall sheltered it from the south sun, to the depth of 8½ inches. He also dug in an orchard, near a wall, about a week afterwards, and found the frost to have penetrated to the depth of 14 inches. In a garden at Moscow, the frost in a hard season, only penetrates to 2 feet; and the utmost effect that compact James mentions the cold to have had upon the ground of Charleton-island, was to freeze it to 10 feet deep: whence may appear the different degrees of cold of that island and Russia. And as to the freezing of water at the above-mentioned island, the captain tells us, it does not naturally congeal above the depth of 6 feet, the rest being by accident. Water also, exposed to the cold air in large vessels, always freezes first at the upper surface, the ice gradually increasing and thickening downwards; for which reason frogs retire in frosty weather to the bottom of ditches: and it is said, that shoals of fish retire in winter to those depths of the sea and rivers; where they are not to be found in summer. Water, like the earth, seems not disposed to receive any very intense degree of cold at a considerable depth or distance from the air; the vast masses of ice found in the northern seas being only many flakes and fragments, which sliding under each other, are, by the congelation of the intercepted water, cemented together.

In
In cold countries, the frost proves often fatal to mankind; not only producing cancers, but even death itself. Those who die of it have their hands and feet first feized, till they grow past feeling it; after which the rest of their bodies is so invaded, that they are taken with a drowsiness, which if indulged, they awake no more, but die infinitely. But there is another way whereby it proves mortal, viz. by freezing the abdomen and visera, which on dissection are found to be mortified and black. See the article Cold.

Sharp frosts of long continuance, are very prejudicial to fish in shallow flowing waters; for if the water be deep, or there be either a current or deep, in the place, the ponds, therefore, should be made large and deep, at least one part of them ought to be considerably deep, to serve as a place of refuge in case of extreme cold. The symptom of mortality in a pond, is the appearance of the fish; for nothing but the pangs of death can make them move from the bottom in frosty weather. The only effectual method to save fish in this case, is to set great tubs or faths full of water in some out-houses, not far from the fire; then making holes in the ice, the fish will gather about them, as if they came up for fresh air; and are to be taken out and put into the tubs, where they may be kept till the frosts breaks, taking care to refresh the water every twelve hours. Sometimes fish that have been dead to all appearance, and others frozen and enveloped in ice, have been preserved by putting them into water brought to medium summer heat; for in six or seven hours the ice will be dissolved, and the fish appear as brisk and well as ever; after which they are to be put into waters, where the frost cannot injure them.

Hoar-Frost, pruina, a cold moist vapour, that is drawn up a little way into the air, and in the night falls again on the earth, where it is congealed into icy crystals of various figures. Hoar-frost, therefore, is nothing but dew, turned into ice by the coldness of the air. See Dew.

Froth, a white, light sub stance, formed on the surface of fluids, by vehement agitation, consisting of little spherules, or globules.

Froth-spit, or Cuckow-spit, a name given to a white froth, or fpume, very common in the spring, and first months of the summer, on the leaves of certain plants, particularly on those of the common white field lychnis, or catch-fly, thence called by some spitting poppy. All writers on vegetables have taken notice of this froth, the few have under- stood the cause or origin of it till of late; being formed by a little leaping animal, called by some the flea grails-hopper; by applying its anus close to the leaf, and discharging thereon a small drop of a white viscous fluid, which containing some air in it, is soon elevated into a small bubble; before this is well formed, it deposits such another drop, and so on, till it is every way overwhelmed with a quantity of these bubbles, which form the white froth which we see.

Froth, or Foam, in the manège, a moist white matter, that arises from the mouth of a horse. A horse that, by champing on his bridle, throws out a great deal of froth, is judged to be a horse of mettle and health, and to have a cold fresh mouth.

Frower, an edged tool used in cleaving wood into laths.

Frozen. See the articles Frost, Freezing, Ice, &c.

Frozen-zone. See the article Zone.

Fructiferous, signifies properly any thing that produces fruit; but, in a more large and figurative sense, it is used by some, particularly lord Bacon, for such experiments in natural philosophy, as prove advantageous to the experimenter in point of gain or profit.

Fructification, among botanists, in a more lax sense, includes the flower and fruit, with their several coverings. See the articles Flower and Fruit.

Strictly speaking, however, the term fructification signifies only the male and female organs of generation, called the stamina and pistil. See Stamina, Pistil, and Generation.

Fructists, fructificiæ, in botany, that sort of authors who have attempted the establishing the classes and distinctions of plants upon the fruit, feed, or receptacle of these in plants. Of this lift are Cæsalpinus, Morison, Ray, Herman, and Boerhaave.

Frugivorous birds, are such as feed on fruits, either wholly or in part. The frugivorous birds, according to Mr. Willughby, are a species of terrestial birds, some of which have crooked bills and claws, yet are of gentler nature, and not rapacious.

Fruit,
FRUIT, in general, includes whatever the earth produces for the nourishment and support of man, and other animals, as herbs, grain, hay, corn, &c. See the article HERBS, GRAIN, &c.

FRUIT, more properly, signifies the production of a tree, or plant, for the propagation or multiplication of its kind, in which sense the word takes in all kinds of seeds, with their furniture. But botanists, usually understand by it that part of a plant wherein the seeds are contained. See PLANT and SEED.

FRUIT also implies an assemblage of seeds in a head; as in a ranunculus, &c. and all kinds of seeds, or grains, whether inclosed in a cover, capsule, or pod; and whether bony, fleshy, fkinny, membranous, or the like.

The fruit in all plants, is the product, or result, of the flower; or that for the propagation and nutrition of which the flower was intended.

The structure and parts of different fruit differ in some things, but in all the species, the essential parts of the fruit appear to be only continuations or expansions of those which are seen in the other parts of the tree; and the same fibres are continued to them from the root. An apple, cut in two transversely, will be found principally composed of four parts. 1. A skin, or rind, which is only a continuation and expansion of the outer bark of the tree. 2. A parenchyma, or pulp, which is an expansion and intumescence of the bea, or inner bark of the tree. 3. The fibres, or ramifications of the woody part of the tree. 4. The core, which is the produce of the pith of the wood, indurated, or strengthened by twigs of the woody fibres intermixed with it. This serves to furnish a proper lodging for the seeds, and filtrates the juices of the parenchyma, or pulp, and conveys them to the seeds.

Of the fibres there are generally reckoned fifteen branches, of which, ten penetrate the parenchyma, and incline to the basis of the flower; the other five ascend more particularly from the pedicle, or stalk, and meet with the former at the base of the flower; and to these branches the capsule, or coats of the kernel, are fastened. These branches, being first extended through the parenchyma to the flower, furnish the necessary matter for the vegetation of it, but as the fruit increases, it intercepts the aliment, and by this means the flower is starved, and falls off.

In a pear, there are five parts to be distinguished; the skin, parenchyma, ramifications, stone and acetarium; the first three parts are common to the apple: the stone, observed chiefly in choke-pears, is a congeries of stony corpuscles, which are dispersed throughout the whole parenchyma, but in the greatest plenty, and amassed closest together about the center of the acetarium. This seems formed of the stony or calculous part of the nutritious juice.

The acetarium is a substance of a tart, acid taste, and of a globular figure, inclosed in an assemblage of several of the stony parts before-mentioned.

In plums, cherries, &c. there are four parts, viz. a coat, parenchyma, ramifications, and stone. The outer part, or shell of the stone, forms the calculous part of the nutritious juice of the plant; and the inner part, or kernel, of the pith of the tree, derived thither by feminal branches, which penetrate the base of the stone. The cortex consists of a shell, cortex, and medulla; the shell consists of a coat and parenchyma, derived from the bark and wood of the tree. The cortex consists of an inner and outer part, the first of which is a duplication of the inner trunk of the shell; the second is a softer substance, derived from the same source as the parenchyma of the shell. But authors are not agreed whether the medulla, or pulp of the kernel, doth arise from the pith of the tree, or from the cortical part thereof.

Berries, grapes, &c. contain, besides three general parts, viz. coat, parenchyma, and ramifications, grains of a stony nature, which are the seeds.

Use of FRUITS. Fruits are serviceable in guarding, preferring, and feeding the inclosed seed; in filtrating the coarser, more earthy and strong parts of the nutritious juice of the plant, and retaining it to themselves, sending none but the most pure, elaborated and spirituous parts to the seed, for the support and growth of the tender delicate embryo, or plantule, therein contained.

The use of fruits, with us, might be rendered much more extensive than it is. Many fruits, which do hurt when eaten raw, would make wines equal in flavour to many of those now obtained at great prices from abroad; and lands which
will not bear corn, yet would bear trees and shrubs, producing such fruits. Cherries, properly managed, make an excellent wine, and that in very large quantities, and plums also make a very agreeable kind; but that it has an astringency, which must be taken off by mixing a little sugar with it, when in the giats, not before it is drawn off. A coerni plum, a little larger than a damson, is the best kind for this wine, being a sort of plum that grows wild in our hedges. The wine made from it is of a very considerable strength, and affords a pleasant brandy, by distillation, in considerable quantities. Our common garden currants, afford a very agreeable wine; and our gooseberries are not second to any thing. See the articles BRANDY, WINE, &c.

The various ues of different fruits in the materia medica, &c. may be seen in the course of this work, each under its proper head.

Preparation of Fruit. In the Philosophical Transactions, No 237, we have a receipt for preserving fruit and flowers for a whole year, which is as follows. Take salt petre, one pound; bole armoniac, two pounds; common clean sand three pounds; mix them together; and, in dry weather, take fruit or flowers of any sort, not fully ripe, each with its stalk, and put them singly into an open glass, till it be full; cover it close with oil cloth; and in a dry cellar, put each of these glasses four fingers-deep under ground, so that quite round above, as well as below, there may remain two fingers-thick of the mixture. To preserve quinces, apples, &c. lord Bacon directs us to plunge them in honey; but as that may give them an over luscious taste, to dip them in syrup of wine, boiled to a due height. The conservation of fruit, continues that author, should be tried in vessels filled with fine sand, or powder of chalk; or in flower, the duff of oakwood, &c. Fruits intended for long keeping, he says, should be gathered before they are full ripe, and in a fair day, towards noon, the wind not blowing south, and the moon being under the horizon, and in her declere.

First Fruits. See First Fruits.

Fruit-Trees. With regard to fruit-trees it may be observed, 1. That the cutting and pruning them, when young, prevent their bearing, though it contributes to the richness and flavour of the fruit, as well as to the beauty of the tree. 2. That kernel fruit come later to bear than stone fruit-trees; the time required by the first before they come to any fit age for bearing, being one with another five years; but when they do begin, they bear in greater plenty than stone-fruit. 3. That stone fruit, figs, and grapes, commonly bear considerably in three or four years; and bear full crops the fifth and sixth years; and hold it for many years, if well ordered. 4. That fruit trees in the same neighbourhood will ripen a fortnight sooner in some grounds than in others of a different temperature. 5. That in the same country hot or cold summers set considerably forwards, or put backwards the same fruit. 6. That the fruit on wall-trees generally ripen before those on standards, and those on standards before those on dwarfs. 7. That the fruit of all wall trees planted in the south and east quarters, commonly ripen about the same time, only those in the south rather earlier than those in the east; those in the west are later by eight or ten days, and those in the north, by fifteen or twenty. For the planting, pruning, grafting, &c. of fruit-trees. See the articles Planting, Transplanting, Pruning, Grafting, Orchard, Garden, Nursery, &c.

FRUITERY, a place for the keeping of fruit, a fruit-house, or fruit-loft. A fruitery should be inaccesable to any thing of moisture, and should be as much as possible fo, even to frost. FRUITFULNESS, the quality of bearing plenty of fruit. See Fruit.

FRUMENTACEOUS, a term applied, by botanists, to all such plants as have a conformity with wheat, in respect of their fruits, leaves, ears, or the like.

FRUMENTARI, a kind of soldiers, or archers, under the western empire. The first time we read of these officers is in the time of the emperor Adrian, who made use of them to inform himself of whatever passed. They did not make any particular corps distinct from the rest of the forces, but there was a certain number of them in each legion. It is supposed that their old at first a number of young persons disposed, by Augustus, throughout the provinces, particularly on all the grand roads, to acquaint the emperor, with all expedition, of every thing that happened.
FRUMENTUM SARACENICUM, FRUMENT ARION, FRUMENTUM FRUMGYLD, in old law books, FRUSH, FRUMSTOL; from their being also a furnace furnished by the people themselves, where they still retained their antient name. As their principal office was the giving intelligence, they were often joined with the curio, with whom they agreed in this part of their office. See CURIOUS.

Their name of frumentarii is derived from their being also a sort of purveyors to the armies, cities, &c. collecting all the corn from the several provinces to furnish the common-wealth.

FRUMENTATION, in roman antiquity, a larges of corn bestowed on the people. This practice of giving corn to the people was very antient among the Romans; and frequently used to sooth the turbulent humour of the populace. At first the number of those to whom this larges was given, was indeterminate, till Augustus fixed it at two hundred thousand.

FRUMENTUM SARACENICUM, in botany, the same with the fagopyrum. See the article FAGOPYRUM.

FRUMENTUM INDICUM, the same with maiz, or indian corn. See MAIZ.

FRUMENTY, or FURMETY, a kind of pottage, made up of wheat, milk, sugar, spice, &c.

FRUMGYLD, in old law books, signifies the first payment made to the kindred of a perion slain, by way of recompence for his murder.

FRUMSTOL, a term antiently used for a mansebon-houte.

FRUSH, or FROG, among farriers, a sort of tender horn which adheres in the middle of a horse's sole; and, at some distance from the toe, divides into two branches, running towards the heel in the form of a fork.

The frush is a part of a horse's foot, the top of which only should be pared, and that every time the foot is pared, otherwise it is apt to corrupt.

FRUSUM, in mathematics, a part of a solid body separated from the rest.

The frustum of a cone is the part that remains when the top is cut off by a plane parallel to the base; and is otherwise called a truncated cone; for finding the surface and solidity of which, see the article CONE.

The frustum of a pyramid is also what remains after the top is cut off by a plane parallel to its base, the mensuration of which will be found under the article PYRAMID.

The frustum of a globe or sphere is any part thereof cut off by a plane, the solid contents of which may be found by this rule. To three times the square of the semidiameter of the base, add the square of its height; then multiplying that sum by the height, and this product multiplied by .5236 gives the solidity of the frustum. See the article SPHERE.

A frustum or portion of any solid, generated by the revolution of any conic section upon its axis, and terminated by any two parallel planes, may be thus compared to a cylinder of the same altitude, and whose base is equal to the middle section of the frustum made by a parallel plane. 1. The difference between such frustum and cylinder is always the same in different parts of the same or of similar solids; when the inclination of the planes to the axis, and the altitude of the frustum are given. 2. In the parabolic conoid, this difference vanishes; the frustum being always equal to a cylinder of the same height, upon the section of the conoid that bisects the altitude of the frustum, and is parallel to its bases. 3. In the sphere, the frustum is always less than the cylinder, by one fourth part of a right-angled cone of the same height with the frustum; or, by one half of a sphere, of a diameter equal to that height; and this difference is always the same in all spheres whatever, when the altitude of the frustum is given. 4. In the cone, the frustum always exceeds the cylinder, by one fourth part of the content of a similar cone, that has the same height with the frustum. See Mac Laurin's Fluxions, p. 24. where he likewise compares the frustums of the hyperbolic conoid and spherical with a cylinder. See also GAUGING.

FRUTEX, among botanists, denotes a shrub. See the article SHRUB.

FRUTEX AETHIOPIUS and AFRICANUS, a name given to several species of pine. See the article PINE.

FRUTICOSE STALKS, among botanists, those with a hard woody substans. See the article STALK.

FRY, in zoology, signifies the spawn, or rather young, of fish. See FISH.

FRYTH, or FRITH, in old law books. See the article FRITH.

FUAGE, in old writers, a tax of 12d. for every fire, levied in the time of Edw. 7th.
FUCA, or FUCA, in ichthyology, a genus of fishes, called by Artedi physic.
See the article Physic.

FUCHSIA, in botany, a genus of plants, the characters of which are not perfectly ascertained. The flower consists of a single petal, the tube is elevated; the limb is divided into eight segments, and plane; the segments are acuminate, and alternately lower; the fruit is a roundish berry, marked with four furrows, and containing four cells: the seeds are numerous, oval, and placed in a double series.

FUCUS, in botany, a genus of submarine plants, belonging to the cryptogamia class of Linnaeus.
The fucus consists of a tough matter, formed into a kind of leaves, which are flat and variously divaricated; and which have some appearance of fructification, in punctuated tubercles, covering oblong vehicles, supposed by Linnaeus to be male flowers; and smooth, roundish vehicles, hollow and interwoven with filaments, which appear to him to be female flowers.

There are a great many species of fucus with broader or narrower leaves, and other peculiarities; one of which, the broad-leaved, serrated fucus, grows to the height of six, eight, or more inches.

FUDDER, or FODDER, among miners.
See the article Fodder.

FUEL, whatever is proper to burn or make a fire; as, 1. Wood, which should be so felled that cattle may have the browing of it; for in winter they will not only eat the tender twigs, but even the very fops. The underwood is usually felled for fuel; but if the head or top be used for firing, it is best to begin three or four feet above the timber, if considerable. 2. Fossil and bituminous earths, as turfs and peats. 3. Sulphureous fossils of a firmer texture, as the common coals, scotch coals, cannel-coal, &c.

It is provided by statute, that wood-fuel shall not be felled under the assay, viz. a faggot bound is to be three feet in length, and have the bond twenty-four inches round, besides the knot. Billets also are to be of a certain length, on certain penalties. See the article Billet.

The fuel, in chemical operations, must be chosen suitable to the intention. The natural fire, in flimmer, suffices for insulations. A spirit-lamp may be made to give a moderate, or a considerably strong heat, according to the number of wicks employed. The lighter fuels, such as straw, leaves, twigs, &c. come next in order, after spirit of wine; then oils, wax, rosin, pitch, and, lastly, solid wood, coals, and turf; all which may have their proper furnaces, so as to be burnt in the requisite quantity, and with requisite fierceness or flowness. To excite the greatest degree of heat, the rule is to use the denfett fuel in large quantities, which must be blown incessantly with bellows all round the fire wherein the matter to be acted on is lodged.

FUENTE DUENA, a town of New-Castile, in Spain, 35 miles south-east of Madrid.

FUGA vacui in the ancient schools of philosophy, a suppos'd aversion in nature to a vacuum. See Vacuum.

FUGALIA, in roman antiquity, a feast suppos'd by some to be the same with the regaligium, held on the 24th of February, in memory of the expulsion of the kings, and the abolishing of the monarchial government. Others again, distinguish the fugalia from the regilugus. And others think, that the fugalia was the same with the popilugus; or the feast of fugia, the goddess of joy, occasioned by the rout of an enemy, which was the reason the people abandoned themselves to riot and debauchery. See Regilugus and Popilugus.

FUGAM FECIT, in law, is when it is found by inquisition that a person fled for felony, &c.

If flight and felony be found on an indictment for felony, or before the coroner, where the murder is committed, the offender shall forfeit all his goods, and the issues of his lands, till he is acquitted or pardoned: and upon finding before justices of oyer, &c. that the offender fled, though he be acquitted on his trial, he forfeits his goods.

FUTITIVE, a person obliged to fly his country, or remove from a place where he had some abode, or establishment, on account of his crimes, debts, or other occasions.

FUTITIVE'S GOODS, the proper goods of the person that flies on a felony committed by him, which, after the flight, is lawfully found to belong to the king, or lord of the manor.

FUGITIVES OVER SEA, persons that go over sea without the king's licence, who, unless they are merchants, or eminent persons, forfeit all their goods.
FUGUE, in music, is when different parts of a musical composition follow each other; each repeating what the first had performed.

There are three kinds of fugues; the simple, double, and counter.

Single, or Simple Fugue, is some point consisting of four, five, or more notes, begun by one simple part, and seconded by a second, third, fourth, fifth, &c. if the composition consist of so many; repeating the same, or such like, notes; (i.e. in the same proportion) so that the several parts follow, or come in one after another, in the same manner; the leading part still flying before those that follow.

Fugue Double, or Fuga Doppia, is when two or more different points move together in a fugue, and are alternately mixed and interchanged by the several parts. See the article Part.

Counter Fugue. See the article Counter.

FULCRUM, in mechanics, the prop or support, by which a lever is sustained. See the article Lever.

FULL, a town and abbey of Germany, the abbots of which is a priory of the empire: east long. 9° 35', north lat. 50° 24'.

FULICA, the coot, in ornithology, a genus of birds, of the order of the gallinæ, with a naked or bald forehead, and divided or cloven feet: add to this, that all the toes are longer than in whole-footed birds, and have semi-circular membranes affixed to their joints.

Of this bird, authors mention several species, all distinguished by their cloven toes, and a feathery excrescence bare of feathers, and reaching from the bill almost to the crown of the head.

FULIGINOUS, whatever proceeds from a thick, footy smoke, such as litharge and lamp-black.

FULIGNO, a city of Italy, in the pope's territories, ten miles north of Spoletto.

FULIGO, in natural history, a species of pumicer-fone. See PUMICE.

FULIGULA, in ornithology, the name by which authors call the tufted duck, with a hanging cret, a black body, and white belly, and a white spot on the wings. It is about the lice of the common duck.

FULL-MOON, plenilunium, that phasis of the moon when, in her opposition to the sun, the whole of her disc is illuminated; in which time eclipses of the moon can only happen. See the articles Moon and Eclipse.

FULLER, a workman employed in the woolen manufactories, to mill, or scour, cloths, ferges, and other stuffs, in order to render them more thick, compact, and durable. See the article Cloth.

Fullers, in conformity to the regulations of the manufacturers in France, are obliged to mark their stuffs with a particular lead after fulling. They are forbid, by the same regulations, to draw out, or tenter-tretch, their manufactories, that they may be made greater in length, and narrower in breadth, &c.

FULLER'S EARTH, terra jullonica, in natural history, a soft, greyish, brown, dense, and heavy marble: when dry, it is of a greyish, ash-coloured brown, in all degrees from very pale to almost black, and it has generally something of a greenish cast: it is very hard and firm, of a compact texture, of a rough and somewhat dusty surface, that adheres slightly to the tongue: it is very soft to the touch, not flaming the hands, nor breaking easily between the fingers: it has a little harshness between the teeth, and melts freely in the mouth: thrown into water, it makes no effulution, or hissing, but swells gradually in bulk, and falls into a fine soft powder. It makes no effervescence with aqua fortis.

It is of great use in scouring cloths, stuffs, &c. imbibing all the grease and oil used in preparing, dressing, &c. of the wool, for which reason it is made a contraband commodity, and is not to be exported under the penalty of 15. for every pound weight. See Fulling.

FULLER'S WEED, in botany, a name sometimes given to the diplocacus, or teasel. See the article DIPSACUS.

FULLERY, a place where cloths, &c. are fullled. See the next article.

FULLING, the art or act of scouring and prelting cloths, stuffs, rockings, &c. to cleanse, thicken, and render them more firm and strong, which is done by means of a water-mill.

For the description of this mill, see plate CVIII. fig. 1. in which, 1. is the track of the wheel, that turns on the outside; 2. a front view of the wheel; 3. the arbour with its leavers, which as they pass, raise the heads of the wooden mallets, and let them fall alternately: 4. the trough, which in the plate is hid behind the timber work, and is only expressed by dots that shew its position: each trough has at least two, and sometimes three mallets; 5. the head of the mallet,
mallet, with three or four notches, which
hinder the fluff from sticking under the
hammer; 6. the arm or handle; 7. the
end of the mallet fastened by a pin. 8.
In the troughs are laid the cloths, fluffs, &c. intended to be full'd; then
letting the current of water fall on the
wheel, the mallets are successively let fall
upon them, when by their weight and
velocity they stamp and press the fluffs
very strongly, which by this means be-
come thickened and condened.
In this operation, fuller's earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller's earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller's earth.

In the troughs
wheel, the mallets
upon them, when by
the fluffs

dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.

In this operation, fuller’s earth is used
with some proportion of soap; but soap
alone would do much better, was it not
dearer than fuller’s earth.

Fulling of stockings, caps, &c. is per-
formed either with the hands or
alone would do much better, was it not
dearer than fuller’s earth.
FUNCTION, the act of fulfilling the duties of any employment.

Function, being also applied to the actions of the body, is by physicians divided into vital, animal, and natural. The vital functions are those necessary to life, and without which, the individual cannot subsist; as the motion of the heart, lungs, &c. The natural functions are such as it cannot subsist any considerable time without them, as the digestion of the aliment, and its conversion into blood. Under animal functions are included the senses of touching, tasting, &c. memory, judgment, and voluntary motion, without any, or all of which an animal may live, but not very comfortably.

The animal functions perform the motion of the body by the action of the muscles, and this action consists chiefly in the shortening the flabby fibres, which is called contraction, the principal agents of which, are the arteries and nerves distributed in the flabby fibres. See the articles ARTERY and NERVE.

In short, all parts of the body have their own functions, or actions peculiar to themselves. Life consists in the exercise of these functions, and health in the free and ready exercise of them.

FUNCTION, in algebra, denotes any compound quantity; and when one of the component quantities is variable, it is said to be a variable function. See the article QUANTITY.

Functions are formed either by addition, subtraction, multiplication, division, involution, or evolution; as also by the resolution of equations. But besides these, which are called algebraical functions, there are others called transcendental, arising from the management of exponents, logarithms, &c.

For a farther account of functions, the reader may consult Bernoulli, Oper. T. 3. also Euler's Analyt. Infinitor.

FUND, in anatomy, signifies the bottom of any cavity in the body; thus, the fund of the eye is that part poffessed by the choroides and retina; the fund of the uterus, the fund of the bladder, &c. signify also the bottom of these parts. See the articles EYE and UTERUS.

FUND, in commerce, signifies the stocks of the great trading and monied companies. See the article STOCKS.

FUNDS is also a term adopted by those who speak of the public revenue of nations, to signify the several taxes that have been laid upon merchandizes either by way of
FUNDAMENT, FUNDAMENTAL NOTE, FUNDI-BAY, FUNDAMENTO, FUN

of duties of custom, or excise, or in any other manner, to supply the exigencies of the state, and to pay interest for what funds it may have occasion to borrow. Thus we say, such a duty, or such a tax, is a good fund to answer such a purpose.

The funds or taxes of this kingdom, are either temporary or perpetual: temporarily ones, are such as are either imposed for a certain number of years, or annually, as the land and malt-taxes: the perpetual funds, are such on which money has been borrowed for the public service, and which are appropriated for the secure and certain payment of the interest of such money, till the discharge of the principal to borrowed. See the articles DUTY, CUSTOM, TAX, &c.

FUNDAMENT, in anatomy, the same with anus. See the article ANUS.

FUNDAMENTAL, in general, something that serves as a base or foundation to another.

FUNDAMENTAL NOTE, in music, the principal note in a song, or composition, to which all the rest are in some measure adapted, and by which they are iawed: it is otherwise called the key to the song. See the articles KEY and CLEF.

FUNDAMENTO, in the Italian music, every part that plays or sings the bass; but more especially the thorough bass, as being the foundation of all harmony.

FUNDI-BAY, that situated between New England and New Scotland, in which there is said to be an excellent fishery.

FUNDULUS, in ichthyology, a fish otherwise called cobitis. See COBITIS.

FUNDULUS is also used by Charlton for the gudgeon. See the article GUDGEON.

FUNEN, the second island for magnitude belonging to the king of Denmark, situated at the entrance of the Baltic sea, and separated from Jutland by the strait called the lesser Belt, and from the island of Zealand by the strait called the great Belt. Its chief town is Odense.

FUNERAL RITES, ceremonies accompanying the interment or burial of any person. See the article BURIAL.

These rites differed among the antients according to the different genius and religion of each country. The Egyptians, among the rest of their funeral rites, embalmed their dead. See EMBALMING.

Among the antient Greeks it was usual sometimes, before the interment, to put a piece of money into the mouth of the deceased, which was thought to be Cha-

ron's fare for waiving the departed soul over the infernal river. This ceremony was not used in those countries which were supposed to be situated in the neighbourhood of the infernal regions, and to lead thither by a ready and direct road. The corpse was likewise furnished with a cake, composed of flour, honey, &c. which was designed to appease the fury of Cerberus, the door keeper of hell, and to procure the ghost a safe and quiet entrance.

During the time the corpse continued in the house, there flood before the door a vessel of water, the design of which was, that those concerned about the body, might purify themselves by washing; it being the opinion of the Greeks, as well as of the Jews, that pollution was contracted by touching a dead body.

The ceremonies by which they expressed their sorrow for the death of their friends, were various; but it seems to have been a constant rule to recede as much as possible in habit and behaviour from their ordinary customs. For this reason they abstained from banquets and entertainments; they divulged themselves of all ornaments; they tore, cut off, or shaved their hair, which they cast into the funeral pile, to be consumed with the body of their deceased friend. Sometimes they threw themselves on the ground, and rolled in the dust, or covered their head with ashes; they beat their breasts, and even tore their flesh with their nails, upon the loss of a person they much lamented. When persons of rank, such as public magistrates, or great generals, died, the whole city put on a face of mourning: all public meetings were intermitted; the schools, baths, shops, temples, and all places of concourse, were shut up. See the article MOURNING.

Interring or laying the dead in the ground, seems to have been the most antient practice among the Greeks; the burning came afterwards to be generally used among them. It was customary to throw into the funeral pile those garments the deceased habitually wore. The pile was lighted by one of the dead person's nearest relations or friends, who made prayers and vows to the gods to assist the flames, that the body might quickly be reduced to ashes; and during the time the pile was burning, the dead person's friends stood by it, pouring libations of wine, and calling upon the deceased. See the article BURNING.

When
When Numa reformed the religion of Rome, he ordered that the pontiffs should have the care of the funeral ceremonies; which, in most respects, were like those of the Greeks already described.

The funeral rites among the Hebrews, were solemn and magnificent: when any person was dead, his relations and friends rent their clothes; which custom is but faintly imitated by the modern Jews, who only cut off a bit of their garment in token of affliction. It was usual to bend the dead person's thumb into the hand, and fasten it in that posture with a string; because the thumb then having the figure of the name of God, they thought the devil would not dare to approach it. When they came to the burying place, they made a speech to the dead in the following terms: "Blessed be God, who has formed thee, fed thee, maintained thee, and taken away thy life. O dead! he knows your numbers, and shall one day restore your life." Then they spoke the elogium, or funeral oration, of the deceased; after which they paid a prayer, called the righteousfins of judgment; then turning the face of the deceased towards heaven, they called out, "Go in peace." The ancient christians testified their abhorrence of the pagan custom of burning the dead; and always deposited the body entire in the ground: and it was usual to bellow the honour of embalming upon the martyrs, at least, if not upon others. They prepared the body for burial, by washing it with water, and dressing it in a funeral attire. The exportation, or carrying forth of the body, was performed by near relations, or persons of such dignity as the circumstances of the deceased required. Psalmody, or singing of psalms, was the great ceremony used in all funeral processions among the ancient christians.

In the roman church, when a person is dead, they wash the body, and put a crucifix in its hand. At its feet stands a vessel full of holy-water, and a sprinkler, that they who come in may sprinkle both themselves and the deceased. In the mean time some priest stands by the corpse, and prays for the deceased till it is laid in the earth. In the funeral procession, the exorcist walks first, carrying the holy water; next the cross-bearer, afterwards the reli of the clergy, and last of all the officiating priest. They all sing the motet-
very antient, of cutting the throats of a
number of captives before the pile, as
vicitims to appease the manes of the de-
ceased. Caesar relates, that the Gauls
had this custom.
The funeral games were abolished by the
emperor Claudius.

**Funeral Honours. See Honour.**

**Funeral Oration.** A discourse pronounced
in praise of a person deceased, at the
ceremony of his funeral.

This custom is very antient, both among
the Greeks and Romans. Before the
company departed from the sepulchre,
they were often entertained with a pane-
gyric upon the dead person, always pro-
nounced by a near relation, or one of the
public magistrates.

**fungus,** in natural history, a kind of
sooty corn, of a conic figure, tho' some-
times flattened and striated longitudinally.

See the article **Coral.**

**fungus,** in surgery, denotes any spongy
exence. See Excrecence.

In wounds made by a sharp instrument
where there is no indisposition of body,
the cure is generally performed without
any interruption; but from the fungus;
and here dry lint alone is generally the
best remedy through the whole course of
dressing; see Ulcer and Wound.

If ulcers produce a spongy lax flesh,
sprouting very high above the surface, it
will be necessary to destroy it by some of
the escharotics, or the knife. This fun-
gus frequently approaches to a cance-
rous complexion, and when it rises upon
some glands, sometimes, actually dege-
nerates into a cancer, as has happened
in buboes of the groin. When excre-
ces have arisen in veneral ulcers, es-
charotics are to be preferred, and pulvis
angelicus, which is a composition of pre-
cipitate, powder and burnt alum, as it
eats deeper, is preferable to precipitate
alone. When the excrescence is cance-
rours, and does not arise from a large can-
cer, but only from the skin itself, the ac-
tual cautery is usually recommended;
tho' it is a more secure method to cut away
quite underneath, and afterwards to dress
with easy applications; but the cafes
where either of these methods are prac-
ticable, very rarely occur.

A fungus in the joints, is a tumour in
the articulations of the limbs, without
heat or pain, and so soft, that it easily
yields to the pressure of the finger; but
upon its removal, expands itself imme-
diately, without retaining any marks.

This may be distinguished from the
dropsy of the joint, if it be observed that
the latter is a distention of the entire
joint, and the other arises rather on one
side.

The most proper method of cure, is to
rub the part afflicted several times a-day
with warm cloths, and then to foment it
with the following decoction:—take of
litharge, half a pound; armenian bole,
an ounce; mallow and myrrh, each half
an ounce; wine vinegar, a pint; boil
these together for a quarter of an hour.
Use this decoction warm. See the article
Fomentation.

If none of these medicines answer the
purpose, an incision must be made into
the tumified joint, towards the lower and
most commodious part, pressing the tu-
mour hard with your fingers, and retain-
ing it with a bandage placed above it, to
prevent its giving way. When the mem-
ber is reduced to its pristine form, it may
be healed by vulnerary balms; but to
prevent the serum from collecting again,
purging and sudorific medicines should
be given, and the wound be kept open
with tents for some time. See Wound.

**fungus,** in botany, an order of vegetables,
extremely different from all others, and
belonging to the cryptogamia class of
Linnaeus.

The fungi have, indeed, so little of the
common and general appearance of ve-
getables, that many have denied them to
be such, and contended for their being
only excrementitious matter, protruded
from decaying vegetables of other kinds.
But notwithstanding the fungi have ne-
ither the colour or texture of other plants,
nor leaves nor flowers like them; yet
they must be allowed to belong to the
vegetable kingdom, as having absolute
and perfect seeds, consisting usually of
single antherae, which produce plants like
those from which they are collected.
The fungi are extremely different in
figure, and in their manner and place of
growth; some growing on the ground,
some on living trees, and many on de-
cayed wood; and that horizontally or
erect. Some are of only a few days du-
cration, others remain for years, and some
there are which grow under the surface of
the earth in no particular direction.

To the order of fungi belong a great
many genera, as agaric, boletus, phal-
lus, lycoperdon, &c. See Agaric, &c.

**Funiculus Umbilicalis,** in anatomy.

See Poetus and Navel-string.
FUNNEL of a chimney, the shaft or small-er part of the waft, where it is gathered into its least dimensions.

Palladio directs, that the funnels of chimneys be carried through the roof four or five feet at leaft, that they may carry the smoke clear from the house into the air. See the article CHIMNEY.

He also advises, that chamber-chimneys be not made narrower than ten or eleven inches, nor broader than fifteen; for if too narrow, the smoke will not be able to make its way; and, if too wide, the wind will drive it back into the room. See the article FUNNEL-FASHIONED, or FUNNEL-SHAPED-FLOWERS, in botany. See the article INFUNDIBULIFORM.

FUNNEL, or FUR, in commerce. See FURR.

FURBISHER, a perfon who furnishes, polishes, or cleans arms, as guns, fwords, pilots, &c. which is chiefly performed with emery. See the article EMERY.

FURCA and FOSA, in our old customs, the power of gallows and pit, or a jurifdiction of punishing felons, viz. the men by hanging, and the women by drowning.

FURCA, in antiquity, a piece of timber resembling a fork, used by the Romans as an instrument of punishment. The punishment of the furca was of three kinds: the first only ignominious, when a master, for small offences, forced his servant to carry a furca on his shoulders about the city. The second was penal, when the party was led about the circus, or other place, with the furca about his neck, and whipped all the way. The third was capital, when the malefactor, having his head fastened to the furca, was whipped to death.

FURCAM ET FLAGELLM, the meanest of all servile tenures, the bondman being at the lord's disposal for life and limb. See the article CROSS.

FURCHE', in heraldry, a cross forked at the ends. See the article CROSS.

FURFUR, BRAN. See the article BRAN. From their resemblance to bran, those excrementitious particles which are evacuated with the urine, are also called furfures; and for the same reason this name is also given to the scabies or scurf of the head.

FURIES, Eumenides, dire, certain goddeffes whose office it was to punish the guilty after death. These were three in number; Alceft, Megera, and Tiphonos, who were described with snakes instead of hair, and eyes like lightning, carrying iron-chains and whips in one hand, and in the other flaming torches; the latter to discover, and the former to punish the guilty; and they were supposed to be constantly hovering over such perfons as had been guilty of any enor-mous crime.

Mythologists suppose, that Tiphonos punished the crimes which sprang from hatred or anger; Megera, those from envy; and Alceft, those from an in-fatiable pursuit after riches and pleasure. They were worshipped at Caphna in Arcadia, and at Carmia in Peloponnesus. They had a temple at Athens, near the Areopagus, and their priests were chosen from amongst the judges of that court. At Telphusia, a city in Arcadia, a black eae was sacrificed to them.

FURLONG, in the sea-language, signifies the wrapping up and binding any fail clofe to the yard; which is done by hauling upon the clew-lines, bunt-lines, &c. which wraps the fail clofe together, and being bound fast to the yard, the fail is furled.

FURLING-LINES, on ship-board, small lines made fast to the top-sail, top-gal-lant-sail, and the mizen-yard-arms, to furf up the sails by.

FURLONG, a long measure, equal to 1/2 of a mile, or forty poles. See the articles MEASURE, MILE, and POLE.

It is also used, in some law-books, for the eighth part of an acre. See the article ACRE.

FURLOUGH, in the military language, a licence granted by an officer to a soldier, to be absent for some time from his duty.

FURNACE, an utensil, or vessel, proper to contain fire; or to raise and maintain a vehement fire in, whether of coal or wood. See the article FIRE.

There are divers kinds of furnaces, of various forms, and for various purposes. A chemical furnace is a structure of brick, iron, or stone, capable of containing, restraining, and applying fire to vessels, wherein the chemical subjects are to receive the action of fire. Hence a furnace requires, 1. A fireplace, wherein the fire is to be raised, kept up, and determined; and as artificial fire must be fed by fuel, a chimney becomes necessary to discharge the smoke; an ash-pit, to admit the air; and a door, where the fuel is to be thrown in. 2. In erecting a furnace, care must be taken to build it so as to preserve the strength of the fire, or not to waste it in vain; and this
this by directing it where it is particularly required. 3. A proper place must also be contrived, in which the vessels containing the subjects may receive the requisite degree of heat, for the requisite time to finish the operation.

In the building of furnaces, regard must be had, 1. To the quantity of fire which the fire-place ought to receive, contain, and support. 2. To the matter of the fuel to be used for the purpose. 3. To the degree of heat required in every operation; since in the same fire-place the same quantity of the same fuel may produce different degrees of heat. Whence, 4. The air loses itself; or acts but little upon the subject, where its force ought to be collected.

The first or most simple chemical furnace, according to Boerhaave, is constructed as follows. Make a hollow box, with a square base, of sound, dry oak, nine inches wide, and fourteen high. Into this fix a square piece of wainscot, one inch thick, and five inches from the base, fo as to divide the furnace into two parts; the lower whereof, being five inches high, serves for the fire-place; and the upper, eight inches high, is to receive the retort for distillation. This piece of wainscot, serving as a partition, must have a round hole in the middle, five inches over, where the round bottom of the vessel is to rest. Besides this large hole in the partition, there must be four other round holes made in it, each an inch in diameter, that the heat of the fire may rise freely from the fire-place into the second story. On one side of the fire-place there must be a door going upon hinges, and equal in dimensions to the whole side, or nine inches broad, and five high, fo as to open easily, and shut close. The whole internal fire surface of this fire-place must be lined with plated iron or copper, to defend the wood from the fire. The door is to have four round holes made in it, each of them an inch in diameter, to admit the external air; and these holes are to be fitted with four cylindrical stoppers, to regulate the fire, by admitting and excluding the air. This door must be made of seasoned wood, and made to shut extremely close. In the upper part of the furnace, the side above the door must have a square hole cut in the middle, to the top of it, four inches and a half over; the inner edge of which is to be cut away on its three sides to half the thickness of the board, or to the breadth of half an inch. And to the internal floping surface about this hole, a plate of wood must be so fitted as to make a joint; this being of use to shut the side of the furnace close, when we design to distil, digest, or exhale in a cucurbit, phial, or evaporating glaß: whereas the plate of wood being taken away, fits the furnace for distillation by the retort. There must also be another similar plate of wood with a hole in the middle, two inches and a half over, so as to let the neck of the retort pass through it, when fitted into the square hole, instead of the former. A pair of folding-doors should also be made to serve as the flat top, or cover to the furnace; the middle part of which doors must be cut into a round hole of five inches diameter, to let out the neck of the cucurbit, or bolt head, used in digestion. In the last place, there must be a round flat piece of wood, fix inches in diameter, to cover this upper orifice, when the furnace is used for distilling by the retort. See a view of this furnace in plate CVIII. fig. 2. n° 1.

In order to work this furnace, we must be provided with a square flat-bottomed earthen pan, (ibid. A) standing upon three feet, about half an inch high; the height of the pan being from the bottom of the furnace to its upper rim three inches and an half; at the bottom of this pan a little sifted ashes must be lightly sprinkled, a quarter of an inch thick; then an ignited coal of dutch turf, first burnt till it yields no longer smoke, is to be laid upon this bed of ashes, and covered by sifting more of the same ashes lightly upon it, whereby an equable, moderate heat may be kept up for near twenty-four hours.

This furnace works without yielding any smoke or disagreeable smell, and affords so gentle and equable a heat, that in the opinion of Boerhaave, eggs may be hatched by it: tho' it may be raised high enough to make water boil, or higher; and of course will commodiously perform all kinds of digestions and distillations of aqueous and spirituous liquors.
If a furnace be required capable of giving a stronger heat, so as to distill in sand, the best contrivance, according to Boerhaave, is the following; for making portable furnaces, these being the most commodious, on account of leaving the chimneys of the laboratory free. Let a hollow cylinder, CGHD, (ibid. n° 2.) be made of thin iron-plate, seventeen inches in diameter, and nineteen inches high; the lower end to be supported on the inside with a tort, or bolt-head, and being portable, that the upper surface thereof, being made like the two ends of the outside, may be fitted for distilling by the cucurbit, retort, or bolt-head, and being portable, it will serve many other operations.

The third furnace; which no laboratory can be without, is a bainneum marmi, made like the two former, excepting that the distance from the surface of the grate to the bottom of the cylindrical copper-vessel, is only eight inches. See the article BALNEUM.

A fourth furnace is also required in a laboratory, to raise a strong fire for the melting of bodies not easily fused; the best furnace for which purpose, is made thus. Let a stone-arch, abed, (ibid. n° 3.) be built three feet high, as a basis whereon to raise this furnace; then make an ash-hole, edf, five inches high; and over that fix a grate, efih, consisting of iron bars, near an inch thick, and set at about an inch distance from each other. Let the bottom of the grate, and the ash-hole, be of a circular figure, twelve inches in diameter, a b, c d, e f, b i; and build up the cylinder fix inches above the grate; then raise upon it a parabolic cone, k m n l, with an axis of eight inches, and its lower ordinate of fix. Over this parabolic cone, build a cylindrical chimney of three inches diameter, and two feet high. In the front of the fire-place, two inches above the grate, make a door five inches wide, and fix high, and arch it a-top with the arch of a circle, twelve inches in diameter. At the height of an inch above the arch of the door, make a conical hole in the furnace, two inches wide on the outside, that the operator may look downwards into the fire when any thing is melting, and let a stopper be exactly fitted to this opening. The furnace, a u y 4 , b x 3 , must be built with good brick and terras, and...
and have its sides five inches thick, the internal surface thereof being laid smooth with cement.

A fifth furnace, ABCD, (ibid. n° 5,) for distilling mineral acids, as those of sea-felt, nitre, alun, vitriol, &c. is directed by Boerhaave to be built in the following manner. Upon the pavement of the laboratory, under the chimney, build up a parallelopiped, twenty inches broad in front, AB, and twenty-eight inches long, BG. Let the cavity be twelve inches wide in front, and twenty-two inches long, which gives the thickness of the wall. Let the parallelopiped be raised eleven inches high. Make a door-way, HKLI, in the middle of the front, rising eleven inches from the ground, and four inches wide, leaving an indenture on the front to receive an iron door; and let it close occasionally. This part of the apparatus regards the ash-hole and air-vent of the furnace. Instead of a grate, here use prismatic iron-bars, an inch wide, and fourteen inches long, placing them an inch asunder, parallel with the breadth of the ash-hole.

Now describe an ellipse in the upper cavity upon this parallelopiped, with the foci twenty-two inches asunder, and the transverse diameter twelve inches; whence the breadth of the fire-place will be at both ends about ten inches. Next let there be a cavity formed, of this elliptical figure, four inches and a half deep, on the inside; and complete the external part of it in a parallelopipedic-form. In the front-wall, immediately over the ash-hole, make a door-way, POMN, seven inches wide, and nine inches high; and let the bottom edge of this door-way slope an inch and a half downwards, and let the lower line of the door be three inches above the upper line of the ash-hole. In the other side there must be an arched opening, RSQ, with its lower limit rising ten inches above the grate, being twenty inches long, and twelve inches high; and the elliptical arch with its foci, twenty inches asunder, and its transverse diameter twenty-four. This opening is for the distilling vessels to be put in and taken out. On the internal side, opposite to this opening, at the height of nine inches above the grate, a ledge of about an inch and a half must be left to support the vessels employed in the distillation; and in the middle of the upper part of this wall, there must be a square hole, three inches wide, and two inches high, for the chimney. The upper elliptical arch must next be made, whose vertex is to rise twenty-one inches above the grate, the axis of the ellipse twenty-two inches, and the transverse diameter ten. Let such an arch therefore be struck by revolving such an ellipse about its axis, reaching sixteen inches from the grate.

When this furnace is used for distillation, two alembics are to be placed horizontally, and parallel to each other, so that their bottoms may rest upon the ledge in the opposite wall, whilst their mouths lie parallel to the opening they are put in at; which opening is now to be perfectly closed up with brick and mortar, leaving the necks of the vessels trickling out, whereunto earthen pipes being applied, and their other ends fixed to receivers, the operation may be thus begun. See ALEMBIC and DISTILLATION.

For other chemical furnaces, see the article LABORATORY.

Furnace is also applied to that used in the melting of iron, which authors frequently confound with iron-forges, tho' there is a considerable difference between them. See the article FORGE.

This furnace is a brick-structure, much in the shape of an egg set on end, where-in the iron-ore, after it has been burnt in a kiln, is put, intermixed with cinders and charcoal, and the whole melted till it trickle down into the receiver underneath. See the article FLUX.

Swedenborg has laid down, from his own experience, certain rules for the construction of metallurgic furnaces, by which they will always be made more advantageous to the proprietor, ceteris paribus, than any other kind. These rules are, that the chimney be always placed as nearly as may be behind the center of the furnace; that the smaller the depth of the fire-place, provided it be sufficient to hold the coals, the better; that all furnaces must be the better the wider they are forwards; and the higher they are, so as not to lose the benefit of reverberation.

Bellowes-Furnace, is one of the two kinds of furnaces used in coinage for the fusion of metals, confisting of a fiat hearth at bottom, into which the air may be admitted by a hole, as in the chemical furnaces. On a level with the hearth is a second aperture, which gives passage to the
the pipe of the bellows, from whence the furnace is denominated; about a foot over this is a moveable grate; and over this is the place where the crucible is set, which is square, and made of the same earth with the crucible, of breadth sufficient to bear a range of coals around the crucible. To melt metal in this furnace, they lay a little plate of forged iron over the grate, and on this they set the crucible, which is likewise covered with an iron or earthen lid; then they fill the furnace with charcoal, and when it is well lighted, and the crucible sufficiently hot, they stop the vent-hole; lastly, throwing on fresh coals, they stop the furnace with an iron lid; thus continuing to work the bellows, andupply fresh fuel, till the metal is in fusion.

Domestic Furnace. See Oven.

Founder's Furnace. See the article Foundery.

Glass-blower's Furnace. See the article Glass.

Glas-painter's Furnace is made of brick, nearly square, and about 2½ feet each way. It is cut horizontally in the middle, by a grate, which sustains the pan or shovel the glass is baked in. This furnace has two apertures, one below the grate, to put the fuel in at; the other above it, through which the workman spies how the action of the colours goes on.

Hatter's Furnaces are of three kinds: a little one under the mould, whereon they form their hats; a larger in the flouring-room, under a little copper, full of lees; and a very large one under the great copper, wherein they dye their hats.

Plumber's Furnace is also of three kinds. In the first they melt the lead whereof the sheets are to be cast, being only a large copper, or receptacle like a copper, made of freestone, and coated well round with potter's clay, having a little iron-pan at bottom. In the second they melt the lead to be cast in moulds for pipes, &c. which are not to be foldered. The third is the tinning furnace, being a square frame of wood, or sometimes a mals of stone-work, with a brick-hearth whereon is made a charcoal fire, which serves them for the applying of thin tin leaves on their works.

Wind-Furnace, the second furnace used in the fusion of metals for coinage. At bottom it has a hearth made hollow, in manner of a copel, with a vent-hole in the fore part thereof; over the vent-hole is a grate, sealed in the massive of the furnace; over the grate is the place for the crucible, which is usually of forged iron. The fire being lighted, the crucible is put in, with a cover over it, and a capital or cover of earth or iron, is laid likewise over the furnace; and at the top of this capital is a hole, five or six inches in diameter. This is called a wind-furnace, by reason the air entering through the vent-hole at bottom, which is always open, serves the same purpose as the bellows in the other furnaces. Gold is generally melted in the bellows-furnace, as requiring an intenser heat before it fuses; but silver and copper are commonly melted in the wind-furnace.

Furnace, or Fornace. See the article Furnace.

Furnes, a town of Flanders, ten miles east of Dunkirk: east long. 2° 25', and north lat. 51° 10'.

Furniture of Dials, certain additional points and lines, such as the ecliptic, circles of declination, azimuths, Italian hours, points of the compass, &c. drawn on dial-plates. See the article Dial.

Furo, in zoology, a name given to the viverra, or ferret. See Ferret.

Furor Uterinus, a disorder peculiar to women, proceeding from an inordinate desire of coition, sometimes attended with melancholy, and sometimes with a maniacal delirium. The patient delights in talking obscenely, and in soliciting men to satisfy their desires both by words and gestures. It is occasioned by an inflammation of the pudenda, or of the parts in which the venereal stimulus refides, which are chiefly the clitoris and vagina; or in the too great abundance and acrimony of the fluids of those parts; or both these causes may exist together.

In the delirium maniacum, the patient is entirely flameless; but in the melancholicum more relieved, and her folly is confined to fewer objects. If it continues a month or two, the fault of the brain becomes obstinate, for it degenerates into real madness.

The indications of cure are to diminish the heat and sensibility of the affected parts, to cool, sweeten, and dilute the blood, and so render it balsamic; or to pursue both intentions at once. The first
first indication is answered by frequent and copious bleedings: the must likewise be purged with jalap, scammony, or diatridium. Emetics are also good; and emollient oysters should be given; to which add a drachm and a half of sal prunella, or a little vinegar, morning and night. To abate the acrimony, the patient may drink mineral waters, or emulsions with chicken-broth, and seeds of papaw, alb. lin, cannabis, &c. and sweetened. In the summer, quay with half a drachm of sal prunell, for each dose. After which she should be kept to a milk diet only. 

In a delirium melancholicum, lawful coition may be admitted. 

FURR, in commerce, signifies the skin of several wild beasts, dressed in alum with the hair on, and used as a part of dress by princes, magnates, and others. The kinds most in use are those of the ermine, sable, cafsor, hare, coney, &c. See the articles ERmine, SABLE, &c. Furs are charged with various duties. 

Badger-skins, pay each 5s. 7d. and draw back 4s. 3d. 

whereof 5s. 17d. is drawn back on exportation. Bear-skins, if black or red, pay each 4s. 9d. and draw back 4s. 7d. but if white, each skin pays 9s. 6d. and draw back 8s. 7d. 

Beaver-skins pay each 7s. 18d. and draw back 4s. 3d. Cate-skins, the hundred, 100 containing five score, pay 9s. 6d. and draw back 8s. 7d. 

Ermines, the timber, containing forty skins, pay 9s. 6d. and draw back 8s. 7d. 

Fox-skins, the ordinary kind, pay only 3s. 8d. each, and draws back 3s. 8d. but each black fox-skin pays 2l. 7s. 10d. and draw back 2l. 3s. 1d. 

Leopard-skins, the piece, pay 5s. 8d. and draw back 5s. 4d. 

Matrons, the timber, containing forty skins, pay 2l. 7s. 10d. and draw back 2l. 3s. 1d. 

Mole-skins, the dozen, pay 1s. 4d. and draw back 1s. 2d. 

Otter-skins, the piece, pay 100 2s. 6½d. and draw back 1s. 93d. 

FURS, in heraldry, a bearing which represents the skins of certain beasts, used as well in the doublings of the mantles belonging to the coat-armour, as in the coat-armours themselves. See the articles ERmine, ERMINois, &c. 

FURR, among carpenters, a piece nailed upon a rafter, to strengthen it when decayed, or to make it straight when it has sunk in the middle. 

FURRING, among carpenters, is the regular fashioning out any part. When the main piece of the material is scanty, either by defects, wains, or want of thickness; then a piece of the fur is put behind it to make good its thickness, which is called a fur. 

FURSTENBURG, a town and castle of Germany, the capital of a county of the same name, thirty miles north-west of Constance: east lon. 8° 30', and north lat. 47° 50'. 

FURSTENFIELD, a town of Austria and duchy of Styria, thirty-six miles east of Graz: east lon. 16° 46', and north lat. 47° 26'. 

FURUNCLE, or BOIL, in surgery, a small rising tumour, with inflammation, redness, and great pain, arising in the adipose membrane, under the skin. 

As there is no part of the body free from being the subject of furuncles, so the whole is sometimes so miserably infected with them, that the patient can hardly tell how to sit himself, or on what part to lie. Not only adults, but also the younger, even new-born infants, are obnoxious to this dreadful disorder, which occasions in them most fatiguing clamour and
and restlessness. Though there is little danger in this disease in adults; yet, in tender infants, it occasions convulsions, and even death itself.

The principal cause of furuncles is a too glutinous and inflamed state of the blood; and, consequently, the greater the inflammation, the worse and more numerous will be the furuncles.

With regard to the cure, it seems to consist chiefly in restoring the flagrating blood to its former circulation and free motion.

When the furuncles are very numerous, or return again, it is proper to use internal purging medicines, and such as attenuate and cleanse the blood. In adults, bleeding is proper, both by the lancet and scarification with cupping; and, at the same time, a strict regimen of diet should be used, drinking frequently and plentifully of a decoction of the woods, and such like attenuators of the blood. The patient should also entirely abstain from drinking fermented and spirituous liquors, particularly wine and its spirit; and from the too frequent use of tobacco. When the disorder is recent, external medicines only will frequently suffice for the whole cure. For this purpose a mixture of honey, acidulated with spirit of vitriol till it has acquired a considerable sharpness, is proper to anoint the furuncles. Of no less virtue is the frequent touching them with mere spirit of vitriol or sulphur. Diffusent plasters are also found very serviceable, as those of simple diacmention, de melito, de sperma ceti, vel dilaconis.

But if these medicines prove insufficient to diffuse the tumour, it is to be brought to suppuration, by applying a plaster made of honey and flour, or of diacmention with the gums; and where these are insufficient, to make use of the maturating cataplasms recommended under the article PILEGMON.

When the furuncle is known to be ripe, by its softness and yellow head, recourse is to be directly had to the scalpel; and having made an opening, the corrupted matter contained therein is to be discharged; after this, a plaster of diacmention must be applied, and the ulcer daily cleansed of its matter, till it is healed. Pustules and pimples arising in the face, are to be treated like furuncles; and, in both cases, the drinking of whey, and the mineral waters, is accounted good for cleansing the blood.

When sucking infants are afflicted with furuncles, it is proper to give the mother, or nurse, some purging medicine, and to order a strict regimen and diet. At the same time the infant should take some gentle laxative medicine, with absorbent powders, to allay the acrimony of its juices. Heifer.

FURUNCULUS, in zoology, a name given to the ferret. See FERRET.

FURZE, or FURZE-BUSH, in botany. See the article ULEX.

In many countries, where there are dry banks, or dry land or gravel, that nothing else will grow on, furze makes an extremely good fence; and is propagated either by sets or seeds, especially the latter. It will make a good hedge in three years, if well weeded and carefully kept from cattle, especially sheep; and if clipped, it will thrive extremely, and be very thick; but if let grow at large, it will prove the better shelter, and yield excellent fuel. It proves also an admirable covert for wild-fowl.

Sometimes, indeed, furze over-runs the pastures, or arable-lands; in which case it is to be grubbed up, or it may be destroyed by only marling the lands.

Furze-faggots are used for burning ships, when in the dock to be cleaned, or under repair.

FUSA, in the Italian music, the fame with our quaver. See the article QUAVER.

FUSANUS, in botany, a shrub otherwise called euonymus. See EUONYMUS.

FUSAROLE, in architecture, a moulding or ornament placed immediately under the echnis, in the doric, ionic, and composite capitals.

It is a round member, carved in the manner of a collar, or chaplet, with oval beads; and should always answer exactly under the eye of the volute, in the Ionic capital.

FUSEE, in clock-work, is that conical part drawn by the spring, and about which the chain or string is wound; for the use of which, see the articles CLOCK and WATCH.

FUSEE, or FIRELOCK. See the article MUSQUET.

FUSEE of a bomb. See BOMB.

FUSIBILITY, in natural philosophy, that quality of bodies, which renders them fusible. See the article FUSION.

FUSIBLE COLUMN. See COLUMN.

FUSIL, in heraldry, a bearing of a rhomboidal figure, longer than the lozenge, and
and having its upper and lower angles more acute and sharp than the other two in the middle. It is called in Latin fusus, a spindle, from its shape. See plate CVIII. fig. 3.

FUSILIERS, or FUSILEERS, in the military art, are foot-soldiers, armed with fusils, or firelocks. See FUSEE.

FUSILY, or FUSILE', in heraldry, signifies a field, or ordinary, entirely covered over with, or divided into fusils. See the article FUSIL.

FUSION, the melting of metals, minerals, &c. by means of fire.

Different metals run in different manners from their ores: thus, lead, though extremely fusible in the metal, runs with difficulty from the ore, so as to require a considerable violence of fire. This stubbornness not belonging to the metal, must be attributed to the fliny, splinterous, or other mineral matter with which the ore is mixed; which matter seems to require a degree of heat capable of vitriifying the lead, before the metal will run: but then the lead thus vitriified, recovers a metallic form again, by coming in contact with the coals. See LEAD.

Tin runs from its ore with greater ease than lead, and is therefore smelted in much less furnaces; but copper requires an intense heat, or a blast furnace; and iron the greatest heat that can be given in a furnace: and both iron and copper absolutely require immediate contact with the fuel employed. Hence it appears that each metal must have its determinate degree of heat, to run it with advantage from the ore or stone.

In order, likewise, to obtain the metal from the ore to the best advantage, the scoria or flag must be necessarily made to run thin and fluid; otherwise it entangles or invicates the metal, and will not let it separate fully. And hence we frequently observe in the affaying of copper-ores, small grains of metal interposed here and there, among the scoria, that require to be separated by stamping and washing the whole mass; which labour might have been prevented, by using a proper degree of heat capable of procuring a thin fusion and a suitable flux, so as to have made all the metals fall to the bottom of the crucible; which it constantly does, when the operation is well performed. See FLUX.

It seems principally owing to a defect in the knowledge of fusion, that so many recemements or flags of metals, antiently thrown as useless from the furnace, have been of late wrought to considerable profit by more skilful workmen: at least it seems more rational to attribute the success to this cause, than to a supposed growth of metals in such flags; or to believe that lead has grown rich in silver by lying exposed to the open air, while perhaps it is rather owing to the unskillfulness of the former workmen, who were unable to separate all the silver contained in the lead.

All moisture, and too sudden cooling, prove prejudicial to the more ignoble metals after fusion; and sometimes dangerous to the operator: for a little water falling upon melted iron or copper, makes them expand with prodigious violence, and discharge themselves abroad with a force like that of a cannon: and even sudden cooling will often occasion the surface of the metal to crack, and suffer the more internal part, not yet set or fixed, to issue out to a considerable distance; whence either the loss of the metal or mischief may ensue.

To prevent these ill effects, after copellation it is usual for the operator to throw a quantity of water, all at once, upon the lump of silver, as it lies in the teat, at the moment when it begins to grow rigid; for the water, by its coldness, suddenly makes to thicken a cover upon the surface of the silver, that the hotter parts in the inside cannot break through the upper. Shaw's Chem. Left.

FUST, the fame with the shaft of a column. See the articles COLUMN and SHAFT.

FUSTIAN, in commerce, a kind of cotton fluff, which seems as it were whaled on one tide.

Right fustians should be altogether made of cotton-yarn, both woof and warp; but a great many are made, of which the warp is flax, or even hemp.

There are fustians made of several kinds, wide, narrow, fine, coarse; with flag or nap, and without it.

The duties on fustians imported, are so high as to amount in a manner to a prohibition: for instance, Dutch and Italian fustians, the piece, containing two half pieces of fifteen yards the half piece, pay 11. 10s. 9d. draw back 11. 7s. Holmes and Bevernex fustians, the bale, containing forty-five half pieces, pay 15l. 8s. draw back 13l. 10. Naples M fustians.
in grammar, the seventh letter and fifth cononant of our alphabet; but in the greek, and all the oriental languages, it occupies the third place. It is one of the mutes, and cannot be founded without the assistance of some vowel. In English it has a hard and soft sound; hard, as in the words game, gun, &c. and soft, as in the words g推理, giant, &c. at the end of words, gh is pronounced like ff, as in the words rough, tough, &c. The letter g is also used in many words where the sound is not perceived, as in sign, reign, &c. As a numeral, G was antiently used to denote 400; and with a dash over it, thus 400,000. In music it is the character or mark of the treble clef; and from its being placed at the head, or marking the first sound in Guido's scale, the whole scale took the name gamut. See the articles Clef and Gamut. As an abbreviation, G stands for Gaius, Gallius, gens, gens, &c. G. G. for gemina, gelat, gelatin, &c. G. C. for genio civitatis, or Caucas. G. L. for Gaius libertus, or genio loci. G.V.S. for genio urbis facrum. G. B. for genio bono. And G. T. for genio tutelari. GABARA, or GABBARA, in antiquity, the dead bodies which the Egyptians embalmed, and kept in their houses, especially those of such of their friends as died with the reputation of great piety and holiness, or as martyrs. See the articles Embalming and Mummy. GABEL, a word met with in old records, signifying a tax, rent, custom, or service, paid to the king, or other lord. GABEL, or GAVEL, among builders. See the article Gavel. GABEL, according to the French duties or customs, a tax upon salt, which makes the second article in the king's revenue, and amounts to about one fourth part of the whole revenue of the kingdom. GABIN, a town of Poland, forty-six miles north-west of Warsaw: east lon. 20°, and north lat. 52° 35'. GABIONS, in fortification, baskets made of ozier-twigs, of a cylindrical form, six feet high, and four wide; which being filled with earth, serve as a shelter from the enemies fire. They are commonly used on batteries, to screen the engineers, &c. in order to which, one is placed on either side of each gun, room being only left for the muzzle to appear through. They also serve as a parapet on lines, lodgements, &c. when the ground is too hard to dig into. There are a smaller fort, used on parapets in trenches, &c. to cover the mufquateers.
G A G [ 1367 ]

GAGE, in joinery, an instrument marked G, in Plate of Joinery, in which the piece of wood b, is movable upon the staff c, so as to be set nearer or farther from the tooth a, at pleasure. Its use is to draw a line parallel to the straight side of any board, for gaging tenons, and marking stuff to an equal thickness.

GAGE, among letter-founders, a piece of box, or other hard wood, variously notched; the use of which is to adjust the dimensions, flopes, & c. of the different sorts of letters. See Foundery and Letter.

There are several kinds of these gages, as the flat-gage, represented in plate CIX. fig. 1. n° 3, and the face-gage and italic-gage, &c. ibid. n° 5.

Sliding-Gage, a tool used by mathematical instrument makers, for measuring and setting off distances. It is also used in letter-cutting, and making of moulds. See plate CIX. fig. 1. n° 4. where aa is the beam, b the tooth, cc the sliding socket, and ddd the shoulder of the socket.

Sea-Gage, an instrument invented by Dr. Hales and Dr. Desaguliers, for finding the depth of the sea, the description whereof is this. AB (plate CIX. fig. 1. n° 1.) is the gage-bottle, in which is cemented the gage-tube Ff, in the brass-cap at G. The upper end of the tube F, is hermetically sealed, and the open lower end f, is immersed in mercury, marked C, on which floats a small thickness or surface of treacle. On the top of the bottle is screwed a tube of brass H G, pierced with several holes, to admit the water into the bottle A B. The body K, is a weight, hanging by its shank L, in a socket N, with a notch on one side at m, in which is fixed the catch l of the spring S, and passing through the hole L, in the shank of the weight K, prevents its falling out, when once hung on. On the top, in the upper part of the brass-tube at H, is fixed a large empty ball, or full-blown bladder I, which must not be so large, but that the weight K may be able to sink the whole under water.

The instrument, thus constructed, is used in the following manner. The weight K being hung on, the gage is let fall into deep water, and sinks to the bottom; the socket N, is somewhat longer than the shank L, and therefore, after the weight K comes to the bottom, the gage will continue to descend, till the lower S M S part

GABLE, or GAVEL, among builders. See the article Gavel.

GABLES, or GAULS, among miners, a small punch of GAGE, GADFLY, or BREEZEFLY, names given GAGE, by Gadus, in old law-books, land MORTGAGE.

GAGATES, GADWAL, in ornithology, a species of GADUS, Mort-GAGE. See Mortgage.

GAGE, in the sea-language. When one ship is to windward of another, she is said to have the weather-gage of her. They likewise call the number of feet that a vessel sinks in the water, the ship's gage: this they find by driving a nail into a pike near the end, and putting it down beside the rudder till the nail catch hold under it; then as many feet as the pike is under water, is the ship's gage.

GAGLE, or GAVEL, among builders. See the article Gavel.

GABLOCK.S, GAD, among miners, a small punch of GAGE, GADFLY, or BREEZEFLY, names given GAGE, by Gadus, in old law-books, land MORTGAGE.

GAGATES, GADWAL, in ornithology, a species of GADUS, Mort-GAGE. See Mortgage.

GAGE, in the sea-language. When one ship is to windward of another, she is said to have the weather-gage of her. They likewise call the number of feet that a vessel sinks in the water, the ship's gage: this they find by driving a nail into a pike near the end, and putting it down beside the rudder till the nail catch hold under it; then as many feet as the pike is under water, is the ship's gage.
part of the socket strikes against the weight; this gives liberty to the catch to fly out of the hole L, and let go the weight K; when this is done, the ball or bladder L, instantly buoy up the gage to the top of the water. While the gage is under water, the water having free access to the treacle and mercury in the bottle, will by its preasure force it up into the tube F', and the height to which it has been forced by the greatest preasure, viz. that at the bottom, will be shewn by the mark in the tube which the treacle leaves behind it, and which is the only use of the treacle. This shews into what space the whole air in the tube F' is comprized; and consequently the height or depth of the water, which by its weight produced that comprission, which is the thing required.

If the gage-tube F', be of glass, a scale might be drawn on it with the point of a diamond, shewing by inspection, what height the water stands above the bottom. But the length of 10 inches is not sufficient for fathoming depths at sea, since that, when all the air in such a length of tube is comprized into half an inch, the depth of water is not more than 6.34 feet, which is not half a quarter of a mile.

If to remedy this, we make use of a tube 50 inches long, which for strength may be a musquet-barrel, and suppose the air comprized into an hundredth part of half an inch; then by laying as 1:999: 460:39600 inches, or 3300 feet; even this is but little more than half a mile, or 2640 feet. But since it is reasonable to suppose the cavities of the sea bear some proportion to the mountainous parts of the land, some of which are more than three miles above the earth's surface; therefore, to explore such great depths, the Dr. contrived a new form for his gage, or rather for the gage-tube in it, as follows: BCDF (ibid. n° 2.) is a hollow metallic globe communicating on the top with a long tube AB, whose capacity is a ninth part of that globe. On the lower part at D, it has also a short tube DE, to stand in the mercury and treacle. The air contained in the compound gage-tube is comprized by the water, as before; but the degree of compression, or height to which the treacle has been forced, cannot here be seen thro' the tube; therefore, to answer that end, a slender rod of metal or wood, with a knob on the top of the tube AB, will receive the mark of the treacle, and shew it, when taken out.

If the tube AB be 50 inches long, and of such a bore that every inch in length should be a cubic inch of air, and the contents of the globe and tube together 500 cubic inches; then, when the air is comprized within an hundredth part of the whole, it is evident the treacle will not approach nearer than 5 inches of the top of the tube, which will agree to the depth of 3300 feet of water as above. Twice this depth will comprize the air into half that space nearly, viz. 2.5 inches, which correspond to 6600 which is a mile and a quarter. Again, half that space, or 1.25 inch, will shew double the former depth, viz. 13200 feet, or 2.5 miles, which is probably very nearly the greatest depth of the sea.

Bucket-sea-GAGE, an instrument contrived by Dr. Hales, to find the different degrees of coolness and saltiness of the sea, at different depths; consisting of a common household pail or bucket, with two heads to it. These heads have each a round hole in the middle, near four inches diameter, and covered with valves opening upwards; and that they might both open and shut together, there is a small iron rod fixed to the upper part of the lower valve, and at the other end to the under part of the upper valve; so that as the bucket descends with its sinking weight into the sea, both the valves open by the force of the water, which by that means has a free passage through the bucket. But when the bucket is drawn up, then both the valves shut by the force of the water at the upper part of the bucket; so that the bucket is brought up full of the lowest sea-water to which it had descended.

When the bucket is drawn up, the mercurial thermometer, fixed in it, is examined; but great care must be taken to observe the degree at which the mercury stands, before the lower part of the thermometer is taken out of the water in the bucket, else it would be altered by the different temperature of the air.

In order to keep the bucket in a right position, there are four cords fixed to it, reaching about four feet below it, to which the sinking weight is fixed.

Water-GAGE, or HYDROMETER. See the article HYDROMETER.

GAGES for grinding OPTIC GLOFFES. See the article GRINDING.
The larger galangal is brought to us in pieces of two inches or a little more in length, and of near an inch in thickness: its surface is less unequal and tuberose than the smaller sort, but is far from being smooth; on the outside it is of a brown colour, with a very faint cast of red, and within it is of a paler colour, and has a much less acid and pungent taste than the smaller kind. It is to be chosen in the largest, soundest, and heaviest pieces.

The roots of both the galangals, but particularly of the lesser, abound with a vitriolic, oily, aromatic salt; the lesser is esteemed an excellent vomit: it has the credit of being a great cephalic, carthie, and uterine, but is more particularly recommended in vertigos. The greater galangal possessesthe fame virtues, but in a less degree. See the article KEMPFEARIA.

GALLANT, or GALLANT. See the article GALLANT.

GALANTHUS, the snow-drop, in botany, a genus of the hexandria-monogynia class of plants, the flower of which consists of three oblong and obtuse petals; the fruit is a globose-oval capsule, obtusely trigonal, and containing a great number of roundish seeds. The galanthus is the name of the two authors, with a large snow-white flower.

The larger galangal is brought to us in pieces of two inches or a little more in length, and of near an inch in thickness: its surface is less unequal and tuberose than the smaller sort, but is far from being smooth; on the outside it is of a brown colour, with a very faint cast of red, and within it is of a paler colour, and has a much less acid and pungent taste than the smaller kind. GALENIC, or GALENICAL, in pharmacy, a manner of treating diseases founded on the principles of Galen.

The distinction of galenic and chemical, was occasioned by a division of the practitioners of medicine into two sects, which happened on the introduction of chemistry into medicine; then the chemists, arrogating to themselves every kind of merit and ability, stirred up an opposition to their pretenfions, founded on the invariable adherence of the other party to the antient practice. And though this division into the two sects of galenists and chemists has long ceased, yet the distinction of medicines, which resulted from it, is still retained.

Galenical medicines are those which are formed by the easier preparations of herbs, roots, &c. by infufion, decoction, &c. and by combining and multiplying ingredients; while those of chemistry draw their more intimate and remote virtues by means of fire and elaborate preparations, as calcination, digestion, fermentation, &c.

The late improvements in philosophy, which have retrieved the reputation of galenical pharmacy, have also greatly reformed it. It is now become all mechanical and corporeal; and instead of qualities and degrees, every thing is now reduced to mechanical affections; to the figures, bulks, gravities, &c. of the component particles, and to the great principle of attraction.

GALENISTs, in church-history, a branch of anabaptists, who are said to have adopted several arian opinions concerning the divinity of our Saviour. See the articles ARIANS and ANABAPTISTS.

GALEOB Dolon, in botany, a name given by Dillenius, to the Leonurus. See the article LEONURUS.

GALEOLA, hemp-leaved dead-nettle, in botany, a genus of the dynasia-glycospermia class of plants, the flower of which is monopetalous, with the upper lip crenated and arched, and the lower one trifid; the seeds are four in number, and contained in the cup. Both the leaves and seeds of this plant are used in medicine, and said to be diuretic and antifeptic.

GALERITA, in ichthyology, a species of blennius. See the article BLENNIIUS.

The galerita is distinguished from the other species of blennius, by a transverse cutaneous creft on the head.

GALEUS,
GALS, in ichthyology, a name by which several species of sharks are called. See the article SHARK.

GALEXIA, a name used for some of the lamprey. See the article LAMPREY.

GALICIA, the most north-west province of Spain, bounded by the ocean on the north-west, by the provinces of Alturas and Leon on the east, and by Portugal on the south.

GALILEA, or GUADALAJARA, a province of Mexico, bounded by new Mexico on the north, by the gulf of Mexico on the east, by Mexico proper on the south, and by the Pacific ocean and gulf of California on the west.

GALILEE, or GALILEE, once a province of Judea, now of Turky in Asia, was bounded by mount Lebanon on the north, by the river Jordan and the sea of Galilee on the east, by the river Chifon on the south, and by the Mediterranean on the west. It was the scene of many of our Saviour's miracles.

GALILEANS, a sect of the Jews. Their founder was one Judas, a native of Galilee, from which place they derived their name. Their chief, esteeming it an indignity for the Jews to pay tribute to strangers, raised up his countrymen against the edict of the emperor Augustus, which had ordered a taxation or enrollment of all the subjects of the Roman empire. They pretended that God alone should be owned as master and lord; and in other respects were of the opinion of the pharisees: but, as they judged it unlawful to pray for infidel princes, they separated themselves from the rest of the Jews, and performed their sacrifices apart.

GALILEUM, or GALLIUM, in botany. See the article GALLIUM.

GALL, in the animal economy, the same with bile. See BILE and BILIOUS.

GALL-BLADDER, called vesicula, and cystis fellea, is usually of the shape of a pear, and of the size of a small hen's egg. It is situated in the concave side of the liver, and lies upon the colon, part of which it tinges with its own colour. It is composed of four membranes: or coats: the common coat; a vesicular one; a muscular one, consisting of straight, oblique, and transverse fibres; and a nervous one, of a wrinkled or reticulated surface within, and furnished with an unctuous liquor.

The use of the gall-bladder is to collect the bile, first secreted in the liver, and mixing it with its own peculiar produce, to perfect it farther, to retain it together a certain time, and then to expel it.

GALL, in natural history, denotes any protuberance or tumour produced by the puncture of insects on plants and trees of different kinds. These galls are of various forms and sizes, and no less different with regard to their internal structure. Some have only one cavity, and others a number of small cells communicating with each other. Some of them are as hard as the wood of the tree they grow on, whilst others are soft and spongy; the first being termed gall-nuts, and the latter berry-galls, or apple-galls.

The general history of galls is this: an insect of the fly-kind is incited by nature to take care for the safety of her young, by lodging her eggs in a woody substance, where they will be defended from all injuries: the for this purpose wounds the branches of a tree; and the lacera ted vessels, discharging their contents, soon form tumours about the holes thus made. The hole in each of these tumours, through which the fly has made its way, may for the most part be found: and when it is not, the maggot-inhabitant or its remains are sure to be found within, on breaking the gall. However, it is to be observed, that in those galls which contain several cells, there may be insects found in some of them, though there be a hole by which the inhabitant of another cell has escaped.

Oak-galls put, in a very small quantity, into a solution of vitriol in water, though but a very weak one, give it a purple or violet colour; which, as it grows stronger, becomes black; and on this property depends the art of making our writing-ink, as also a great deal of those of dying and dressing leather, and other manufactures.

In medicine, galls are found to be very astringent, and good, under proper management, in diarrhoeas, dysenteries, and haemorrhages of all kinds; they have also a very eminent virtue as a febrifuge. Half a dram, or more, of the powder of Aleppo-galls may be given for a dose, and will often cure an intermittent fever. They are also used externally by way of fomentation in procidentiae of the anus; and a decoction of them has been injected in the faecal albus, with very great success.

St. GALL.
GALL, in geography, a town of Switzerland, five miles west of the lake of Constance; forming a republic of itself, but without any territory. Its legislative power is lodged in two councils. It is said to contain 10,000 inhabitants, all employed in the linen-manufacture.

GALLANT, or GALANT, a French term adopted into our language, and signifying polite, civil, and well bred, with a disposition to please, particularly the ladies. It also signifies brave or courageous.

GALLÉON, or GALLION, in naval affairs. See the article GALLION.

GALLERY, in architecture, a covered place in a house, much longer than broad, and usually in the wings of a building; its use being chiefly to walk in.

GALLERY, in fortification, a covered walk across the ditch of a town, made of strong beams, covered over head with planks, and loaded with earth: sometimes it is covered with raw hides to defend it from the artificial fires of the besieged. Its sides should be mufquet-proof. It ought to be eight foot high, and ten or twelve wide, and the covering to rise with a ridge, that what is thrown upon it by the besiegers with a design to burn it, may roll off. See plate CIX.

Galleries are chiefly used to secure and facilitate the miners approach to the face of the bastion, over the mont, which is already supposed to be filled up with faggots and bavins, and the artillery of the opposite flank dismounted.

GALLERY of a mine, is a narrow passage, or branch of a mine carried on under-ground to a work designed to be blown up.

Both the besiegers and the besieged also carry on galleries in search of each other's mines, and these sometimes meet and destroy each other.

GALLERY, in a ship, that beautiful frame, which is made in the form of a balcony, at the stern of a ship without board; into which there is a paffage out of the admiral's or captain's cabin, and is for the ornament of the ship.

GALLERY, in gardening, a kind of covered walk, in a garden, formed into porticoes or arches, with horn-beams, lime-trees, or the like.

Each pillar of the porticoes or arches ought to be four feet distant from the other, and the gallery twelve feet high, and ten feet wide, that there may be room for two or three persons to walk in a-breadth.

In forming these galleries, it is to be observed, that when the horn-beams are grown to the height of three feet, and the distance of the pillars well regulated; the next thing to be done is, to form the frontispiece: to perform which, the horn-beam must be run up a trellace made for that purpose, which forms the arch, and as it grows up, those bows which obstruct the others, must be cut with the sheers, and in time they will grow strong, and may be kept in form by the sheers.

GALLEY, in naval affairs, a low-built vessel, using both sails and oars, and commonly carrying only a main-mast and-fore-mast, which may be struck or lowered at pleasure. Such vessels are much used in the Mediterranean, especially by the king of France. See SHIP.

Condemnation to the GALLEYS, the punishment of being compelled to serve on board these vessels, imposed on certain criminals in France; and that either for life, or for a limited number of years, according to the nature of their crimes.

GALLEY, or GALLY, in printing. See the article GALLY.

GALLI, in antiquity, the priests of the goddess Cybele, who were eunuchs, and took their name from Gallus, a river in Phrygia.

When a youth was to be initiated into this order, the custom was to throw off his cloaths, to run crying aloud in the midst of the troop, and then drawing a sword to castrate himself; after this, he ran about the streets, carrying in his hands the marks of his mutilation, which he was to throw into a house, and in that house to put on a woman's dress.

GALLIAMBIC VERSE, Galliambus, in ancient poetry, a verse consisting of six feet, viz. an anapest, or a spondee; an iambus, or an anapest, or a tribrach; an iambus; a daecyll; a daecyll; an anapest. The word galliambus is a compound of iambus and gallus, a bird of Cybele. These priests carried about the image of that goddess, in order to get alms, and as a part of their employment was singing verses all over the country, they, by this means, rendered poetry very deliciable.

GALLIARD, a gay, sprightly, whimsical kind of dance, formerly much used, consisting of very different motions and actions, sometimes running smoothly along
GALL [1373]

along, then capering, sometimes along the room, and sometimes across.
This dance was brought from Rome; from whence it was also called romanefque.

GALLIARDA, the name of a tune that belongs to a dance called galliard.
It is commonly in triple time, of a brisk and lively humour, and something like a jig.

GALLICAN, any thing belonging to France: thus the term gallican church denotes the church of France, or the assembly of the clergy of that kingdom. See the article CHURCH.

GALLICAN BREVARY, the breviary used by the church of Agregentum in Sicily: probably so called from its being introduced by St. Gerlan, who was made bishop of Agregentum after the Saracens were driven out of Sicily by earl Roger; and by the other French bishops, brought thither by Norman princes.

GALLICISM, a mode of speech peculiar to the French language, and contrary to the rules of grammar in other languages.

GALLIAE, in ornithology, an order of birds, the beak of which is concic, and somewhat incurvated, and the upper chap imbricated.

Under this order are comprehended the ostrich, peacock, pheasant, wood-cock, turkey, the common dunghill cock, partridge, &c. See the articles Ostrich, Peacock, &c.

GALLINA GUINEENSIS, the guinea-hen. See the article GUINEA-HEN.

GALLINA PISCIS, a name given to the gurnard. See the article GURNARD.

GALLINACEOUS, an appellation given to the birds of the order of the galline. See the article GALLINE.

GALLINAGINIS CAPUT, in anatomy.

See Caput Gallinaginis.

GALLINAGO, in ornithology, a bird called in English the snipe. See Snipe.

GALLING, or EXCORIATION, in medicine. See the article EXCORIATION.

GALLING of a horse's back, a disorder occasioned by heat, and the chafing or pinching of the saddle.
In order to prevent it, some take a hind's skin well garnished with hair, and fit it neatly under the pannel of the saddle, so that the hairy side may be next the horse.

When a horse's back is galled upon a journey, take out a little of the stuffing of the pannel over the swelling, and few a piece of soft white leather on the inside of the pannel; anoint the part with salt butter, and every evening wipe it clean, rubbing it till it grow soft, anointing it again with butter, or for want of that, with grease; wash the swelling, or hurt, every evening with cold water and soap, and tie it with salt, which should be left on till the horse be saddled in the morning.

GALLINULA, in ornithology, a bird, otherwise called tringa. See Tringa.

GALLION, or GALLEON, in naval affairs, a sort of ships employed in the commerce of the West-Indies. The Spaniards send annually two fleets; the one for Mexico, which they call the flota, and the other for Peru, which they call the galleons. See the article FLOTA.

By a general regulation made in Spain, it has been established, that there should be twelve men of war, and five tenders, annually fitted out for the armada of galleons; eight ships of fix hundred tons burden each, and three tenders, one of an hundred tons, for the island Margarita, and two of eighty each, to follow the armada; for the New Spain fleet, two ships of fix hundred tons each, and two tenders of eighty each; and for the Honduras fleet, two ships of five hundred tons each: and, in case no fleet happened to fail any year, three galleons and a tender should be sent to New Spain for the plate.

They are appointed to sail from Cadiz, in January, that they may arrive at Port-Bello about the middle of April. Where the fair being over, they may take aboard the plate, and be at Havannah with it about the middle of June, where they are joined by the flota, that they may return to Spain with the greater safety.

GALLIOT, a small gally designed only for chace, carrying only one mast, and two or three patteringes; it can both sail and row, and has sixteen or twenty oars. All the seamen on board are soldiers, and each has a musket by him on quitting his oar.

GALLIPAGO-ISLANDS, are situated in the Pacific Ocean on both sides the equator, between 85° and 90°, west long, and about four hundred miles west of Peru.

GALLIPOLI, a port-town of European Turk, situated at the entrance of the Propontis, or Sea of Marmora, about 100 miles south west of Constan tinople; east long. 28°, and north lat. 40° 45'.
GALLIPOLI is also a port town of the kingdom of Naples, situated on the gulf of Otranto, about twenty-three miles west of that city: east long. 19°, and north lat. 40° 25'.

GALLIUM, LADIES-EDDISTRAS, in botany, a genus of the tetrandria-magnesia class of plants, the flower of which is a quadrifid single petal, without any tube, and placed flatwise: the fruit consists of two globose bodies, growing close together, but not adhering, and containing each a single kidney-shaped seed. It is said to be an excellent affirgent.

GALLO, an island in the pacific ocean near the coast of Peru, about 200 miles west of Popayan: west long. 30°, and north lat. 2° 15'.

GALLO, also a town of Italy, ten miles south of Ancona.

GALLO, or PUNTO GALLO, a sea-port of Ceylon, subject to the Dutch: east long. 78°, and north lat. 6°.

GALLON, a measure of capacity both for dry and liquid things, containing four quarts; but these quarts, and consequently the gallon itself, are different, according to the quality of the thing measured: for instance, the wine gallon contains 231 cubic inches, and holds eight pounds avoirdupois, of pure water: the beer and ale gallon contain 281 solid inches, and holds ten pounds three ounces and a quarter avoirdupois, of water: and the gallon for corn, meal, &c. 272 1/4 cubic inches, and holds nine pounds thirteen ounces of pure water.

GALLOON, in commerce, a narrow thick kind of ferret, or lace, used for edge or border cloaths, sometimes made of wool, and at others of gold or silver.

GALLOP, in the manege, a motion of a horse that runs at full speed, in which making a kind of leap forewards, he lifts both his fore-legs almost at the same time; when these are in the air, just upon the point of touching the ground, he lifts both his hind-legs almost at once.

A horse in galloping forwards, may lead with which fore-leg he pleases, tho' horses do it most commonly with their right fore-leg; but with whatever fore-leg they lead, the hind-leg of the same side must follow it, otherwise their legs are said to be dizzunited. To remedy this disorder, the rider must lay the horse a little upon the hand, and give him the spur on the contrary side to that in which he is dizzunited.

In a circle, a horse is always to lead with the fore-leg, within the turn; otherwise he is said to gallop false; but here too, the hind-leg of the same side must follow.

GALLOPADE, in the manege, also termed the fine gallopade, the short gallop, the listening gallop, and the gallop of the school, is a hand-gallop, in which a horse galloping upon one or two treads, is well united, well knit together, and well coupled. Hence it is said, that a horse makes a gallopade, and works with one haunch, that is, instead of going upon one tread, whether right-out, or in a circle, he has one haunch kept in subjection, let the turn or change of the hand be what it will; so that the inner haunch, which looks to the center of the ground, is more narrowed, and comes nearer to the center than the shoulder; and thus the horse does not go altogether to that side, and his way of working is a little more than one tread, and somewhat less than two.

GALLOPAVO, in zoology, the same with pavo, or the peacock. See the article Peacock.

GALLOWAY, a province of Scotland, which gives the title of earl to a branch of the noble family of Stuart.

It is divided into two districts: the western, called Upper Galloway, being the same with Wigtownshire; and the eastern, or stewartry of Kirkcudbright, called Lower Galloway.

GALLOWAY, also the capital of a county of the same name, in the province of Connaught, in Ireland: west long. 9° 12', and north lat. 53° 12'.

It has a good port, and is advantageously situated for a foreign trade.

New-GALLOWAY, a borough-town of Scotland, in the county of Wigtoun, with which, and some other boroughs, it clashes.

GALLOWS, an instrument of punishment, on which persons convicted of felony, &c. are executed by hanging. It is formed of two pieces of timber fixed in the earth, with a beam fastened to each on the top; or with three pieces of timber fixed in the earth, with three pieces on the top, forming a triangle.

Gallows of a plough, a part of the plough-head, so called by farmers, from its resemblance to the common gallows, as consisting...
GALS, in natural history. See GALL.
Harnef-GALLS, among farriers. See the article HARNESS.

GALLUS, the Cock, in ornithology, a well-known domestic fowl, the head of which is ornamented with a longitudinal fleshy creft, or comb: the wattles are two, and placed longitudinally on the throat. This, in its natural state, is a very robust and beautiful bird, variegated with a great number of elegant colours. See plate CX. fig. 1, where no 1 represents the common dunghill-cock, and no 2. the hen.

GALLUS MARINUS, a name very improperly used by fome authors for two different kinds of fih, the faber and orbis. See the articles FABER and ORBIS.

GALLY, in printing, a frame into which the compositor empties the lines out of his composing-flick, and in which he ties up the page when it is completed. The gally is formed of an oblong square board, with a ledge on three sides, and a groove to admit a false bottom, called a gally-flize.

GALLY, in the fea-language, is a place in the cook-room, where the grates are set up, and in which fires are made for roasting or boiling the viétuals.

GALLY-WORM, in zoology, the English name of the juflus of authors. See the article JULUS.

GAMBEZON, or GAMBA, in antiquity, a kind of soft quilted waistcoat, worn under the coat of mail to prevent its hurting the body. It was made of wool or cotton, quilted between two fluffs, and was also called counterpoint.

GAMBA, a great river of Africa, which, running from east to west falls into the Atlantic ocean in 14° north lat. and 15° west long. It is said to be navigable for floops 600 miles. About ten leagues up this river is James's Island, a fettlement belonging to Great Britain: it is very small, being less than a mile in circumference, but is defended by a fort.

GAMBOGE, is a concreted vegetable juice, the produce of two trees, both called by the Indians caracapulli, and is partly of a gummy, and partly of a reftinous nature. It is brought to us either in form of orbicular masses, or of cylindrical rolls of various fizes; and is of a dense, compact, and firm texture, and of a beautiful yellow. It is chiefly brought to us from Cambaja, in the East-Indies, called also Cambodja, and Cambogia; and from thence it has obtained its names of cambadium, cambogium, and cambogium.

It is a very rough and strong purge; it operates both by vomit and ftool, and both ways with much violence, almost in the infant in which it is swallowed; but yet without gripping. It requires caution and judgment in administrating it; but those who know how to give it properly, find it an excellent remedy in dropsies, cachexies, jaundice, asthma, catarrhs, and in the worst cutaneous eruptions.

Its dose is from two or three grains to fix, eight, or ten: four grains generally operate briskly without vomiting, and eight or ten grains usually vomit briskly, and afterwards purge downwards.

It is at present much more esteemed by painters in water-colours, than by physicians. Hill's Mat. Med.

GAME, ladi, in general, signifies any diversion, or sport, that is performed with regularity, and restrained to certain rules. See the article GAMING.

Games are usually distinguished into those of exercise and address, and those of hazard. To the fift belong chefs, tennis, billiards, wrestling, &c. and to the latter those performed with cards or dice, as back-gammon, ombre, picquet, whiff, &c. See the articles CHESS, BACK-GAMMON, &c.

GAMES, ladi, in antiquity, were public diversions, exhibited on solemn occasions. Such, among the Greeks, were the Olympic, pythian, ithmian, nemean, &c. games; and, among the Romans, the apollinarian, circenian, capitoline, &c. games. See the articles OLYMPIC, PYTHIAN, &c.

It was alfo customary, among the Greeks, for perfons of quality to institute games, with all kinds of exerci ces, as running, wrestling, boxing, &c. at the funerals of their friends, to do them honour, and render their death more remarkable. This practice is frequently mentioned by antient writers, as Miltiades's funeral in Herodotus, Brasidas's in Thucydides, Timoleon's in Plutarch, with many more. Nor was this custom peculiar to later ages, fince we find the description of Patroclus's funeral games takes up the greatest part of one of Homer's iliads; and even prior to this, Odipus's funeral...
GAME, in law, signifies birds or prey, among the Romans, there were three forts of games, viz. sacred, honorary, and ludicrous. The first were instituted immediately in honour of some deity or hero; of which kind were those already mentioned, together with the augufulles, florales, palatini, &c. The second class were those exhibited by private persons, at their own expense, in order to please the people, and ingratiate themselves with them, to make way for their own preferment: such were the combats of gladiators, the scenic games, and other amphitheatrical sports. The ludicrous games were much of the same nature with the games of exercise and hazard among us: such were the ludus troj anus, tellere, tali, trochoe, &c. See the article Trojan Game, &c.

By a decree of the Roman senate, it was enacted, that the public games should be consecrated, and united with the worship of the gods as a part thereof; whence appears, that feasts, sacrifices, and games, made up the greatest part, or rather the whole, of the external worship offered by the Romans to their deities. Others distinguish the Roman games into 1. The equellrian, or curule games, which were the same with the circenian. 2. The gymnic games, wherein were exhibited gladiatorial, and other shows of the like nature: these were sacred to Mars and Minerva. 3. The theatrical entertainments, consisting of tragedies, comedies, balls, &c. these were sacred to Apollo, Bacchus, Minerva, Venus, &c.

GAME, in law, signifies birds or prey, taken or killed by fowling, or hunting. There are several statutes for punishing offences committed by persons not qualified by law, to take or destroy the game. The antient laws ordain, that no person shall take pheasants or partridges, with engines in another's ground, without his licence, on forfeiture of 10l. and persons killing any pheasant, partridge, pigeon, duck, hare, or other game, forfeit 20s. for every fowl, hare, &c. 11 Hen. VII. c. 17. Contables having a justice of peace's warrant, may search the houses of suspected persons for game; and in case any be there found, and they do not give a good account how they came by it, such persons shall forfeit for each hare or pheasant, partridge, &c. not under 5s. nor exceeding 20s. Likewise by another statute, if any

higler, chapman, carrier, inn-keeper, or victualler, shall have in his custody any hares, pheasants, partridges, heath-game, &c. he forfeits for every hare and fowl, 5l. unless the same be sent by a person qualified to kill game. The selling or offering game to sale is made liable to the like penalty; and in that case, if any hare, &c. be found in a shop, &c. it is deemed exposing it to sale. Persons not qualified, keeping dogs, nets, or engines to kill game, on their conviction before a justice of peace, shall also pay 5l. or be sent to the house of correction for three months, 4 and 5 W. and M. c. 23. 5 Ann. c. 14. 9 Ann. The penalties for destroying game, are recoverable by action, as well as before justices of peace, by 8 Geo. I. c. 19. If a person hunts any game on the land of another, such other cannot justify the killing of his dogs. Where one in hunting starts a hare upon his own land, and then follows and kills such hare in another person's ground, it is lawful, and the game is his own; but where a man starts a hare on another's land, and kills it there, he is subject to an action of trespass.

GAME-COCK, a fighting cock, or one kept for sport; in the choice of which, four things are chiefly to be regarded, viz. shape, colour, courage, and sharp heel.

1. As to shape, a game-cock must not be chosen either too large, or too small: the first being generally unwieldy, and unactive; the other weak and tedious in fighting. The middle-sized cock is therefore most proper for this purpose, as being strong, nimble, and easily matched; his head ought to be small, with a quick large eye, and a strong beak, which should be crooked, and in colour suitable to the plume of his feathers; the beam of his leg should be strong, and of the colour of his plume; his spurs should be rough, large, and sharp, a little bending, and pointing inward. 2. The best colour for a game-cock is either that of a grey, yellow, or red: the pyed pile may pass indifferently; but the white and dun are rarely known to be good for any thing. If his neck be invested with a scarlet complexion, it is a sign of his being strong, lusty, and courageous: whereas a pale and wan complexion denotes him faint and unhealthy. 3. His courage may be known by his proud, upright standing, and flately
GAME-HEN, should be of a black, brown, speckled grey, grizzle, or yellow colour; being baited on the crown denotes courage and resolution; and having the addition of weapons, conduces very much to her excellency. Her body should be big and well poked behind, for the eye of his adversary; and, lastly, see that there be no feathers on the crown of his head, for his opponent to take hold of; and moisten his head all over with your spittle.

GAME-HEN, should be of a black, brown, speckled grey, grizzle, or yellow colour; being baited on the crown denotes courage and resolution; and having the addition of weapons, conduces very much to her excellency. Her body should be big and well poked behind, for the production of large eggs. A general remark is, that a right hen of the game, from a dung-hill cock, will bring forth very good chickens: but the best game cock from a dunghill hen, will never get a bird fit for the game. See the articles BREEDING, HATCHING, and CHICKEN.

GAME-KEEPERS, are those who have the care of keeping and preferring the game, and are appointed to that office by lords of manors, &c. who not being under the degree of esquire, may, by a writing under their hands and seals, authorize one or more game-keepers, who may seize guns, dogs or nets used by unqualified persons for destroying the game. Game-keepers are also to be persons either qualified by law to kill the game, or to be truly and properly the servants of the lords or ladies of manors appointing them; and no game-keeper can qualify any person to such end, or to keep dogs, &c. 5 Ann. c. 14. 9 Ann. c. 25. 3 Geo. I. c. 11. The persons qualified to keep guns, dogs, &c. are those who have a free warren, or 100 l. a year by inheritance, or for life, or a lease for ninety-nine years of 100 l. per annum, also the eldest sons of esquires, &c. 22 and 23 Car. II. c. 25.

A lord of a manor may appoint a game-keeper within his manor and royalty to kill hares, pheasants, partridges, &c. for his own use, the name of whom is to be entered with the clerk of the peace of the county; and if any other game-keeper, or one legally authorized, under colour of his authority, kills game, and afterwards tells it, without the consent of the person that impowers him, he is on conviction to suffer corporal punishment.

GAME-LION, in antient chronology, was the eight month of the Athenian year, containing twenty-nine days, and answering to the latter part of our January, and beginning of February. It was thus called, as being, in the opinion of the Athenians, the most proper season of the year for marriage.

GAME-METRIA, or GEMATRIA. See the article GEMATRIA.

GAMEING, the art of playing or practicing any game, particularly those of hazard, as cards, dice, tables, &c. Gaming has, at all times, been looked on as a thing of pernicious consequence to the commonwealth; and is, therefore, severely prohibited by law. The statute 33 Hen. VIII. gives judic Peace, and head officers in corporations, a power to enter all houses suspected of unlawful games; and to arrest the game-flers, till they give security not to play for the future. Persons keeping any unlawful gaming-house, are fined 40l. and the gameflers 6s. 8d. a time. If any persons by fraud, deceit, or unlawful device, in playing either at cards or dice, tables, bowls, cock-fighting, horse-races, foot-races, &c. or bearing a share in the stakes, or betting, shall win any money or valuable thing of another, he shall forfeit
forfeit treble the value thereof; likewise if any person shall play at any of the said games upon tick, and not for ready money, and lose the sum of one hundred pounds on credit, at any one meeting, if the money be not paid down, his security taken for it shall be void, and the winner becomes liable to a forfeiture of treble value of such money won. 16 Car. II. c. 7. But brought be the same: persons all notes, bills, bonds, mortgages, or other securities given for money won at gaming, are declared void; but also where lands are granted, they shall go to the next person intitled, after the decease of the person so incumbering the same: persons losing by gaming at one time one hundred pounds may recover the money lost, from the winner, by an action of debt brought within three months; and on the loser's not prosecuting, any other person may lawfully do it, and recover treble the value, with costs. 9 Ann. c. 14. Those who cheat at cards, dice, &c. besides their forfeitures, have inflicted on them such infamous and corporeal punishment, as in cafes of perjury; and beating or challenging any other person to fight, on account of money won by gaming, shall forfeit all their goods, and be imprisoned two years: and where persons play that have no visible estate, and do not make it appear that the principal part of their maintenance is got by other means than gaming, they may be bound to their good behaviour by two justices of the peace, &c. Stat. ibid. See 2 Geo. II. c. 28. The ace of hearts, pharaoh, basset, and hazard, are judged to be lotteries by Bunburys. See 2 ibid. The chances are judged to be lotteries by Bunburys. See 2 ibid. All the sales of houses, goods, plate, &c. in such a way, are void, and the things forfeited to any who will sue for the same. 12 Geo. II. c. 28.

**Laws of Gaming.** These are founded on the doctrine of chances. See the article Chance.

Mr. de Moivre, in a treatise de Menfura Sortis, has computed the variety of chances in several cafes that occur in gaming, the laws of which may be understood by what follows.

Suppose $p$ the number of cases in which an event may happen, and $q$ the number of cases wherein it may not happen, both sides have the degree of probability, which is to each other as $p$ to $q$.

If two gamblers, A and B, engage on this footing, that, if the cases $p$ happen, A shall win; but, if $q$ happen, B shall win, and the stake be $a$; the chance of $A$ will be $\frac{p^a}{p+q}$ and that of $B$, $\frac{q^a}{p+q}$. Consequently, if they fell the expectancies, they should have that for them respectively.

If A and B play with a single die, on this condition, that, if A throw two or more aces at eight throws, he shall win; otherwise B shall win; what is the ratio of their chances? Since there is but one cafe wherein an ace may turn up, and five wherein it may not, let $a=1$, and $b=5$. And, again, since there are eight throws of the die, let $n=8$; and you will have $a+b^n-b^n=na^n=1$, to $b^n=1$: that is, the chance of A will be to that of B, as $63991$ to $1015625$, or nearly as $2$ to $3$.

A and B are engaged at single quites, and, after playing some time, A wants 4 of being up, and B 6; but B is so much the better gamester, that his chance against A upon a single throw would be as 3 to 2; what is the ratio of their chances? Since A wants 4, and B 6, the game will be ended at nine throws; therefore, raise $a+b$ to the ninth power, and it will be $a^9+g a^8 b+36 a^7 b^2+84 a^6 b^3+126 a^5 b^4+126 a^4 b^5$, to $84 a^3 b^6+36 a^2 b^7+6 a b^8$; call $a_3$, and $b_2$, and you will have the ratio of chances in numbers, viz. $1759077$ to $194048$.

A and B play at single quites, and A is the best gamester, so that he can give B 3 in 5, what is the ratio of their chances at a single throw? Suppose the chances as $z$ to 1, and raise $z+1$ to its cube, which will be $z^3+3 z^2+3 z+1$. Now since A could give B 2 out of 3, A might undertake to win three throws running; and, consequently, the chances in this case will be as $z^3$ to $3 z^2+3 z+1$. Hence $z^3=3 z^2+3 z+1$; or, $z^2=-3 z^2+3 z+1$. And, therefore, $z=\sqrt{\frac{1}{2}-1}$. The chances, therefore, are $\frac{1}{\sqrt{2}-1}$, and $z$, respectively.

Again, suppose I have two wagers depending, in the first of which I have 3 to 2 the bet of the lay, and in the second 7 to 4, what is the probability I win both wagers?

1. The probability of winning the first is $\frac{3}{5}$, that
that is the number of chances I have to win, divided by the number of all the chances: the probability of winning the second is $\frac{2}{13}$: therefore, multiplying these two fractions together, the product will be $\frac{2}{39}$, which is the probability of winning both wagers. Now, this fraction being subtracted from 1, the remainder is $\frac{37}{39}$, which is the probability I do not win both wagers: therefore the odds against me are 34 to 21.

2. If I would know what the probability is of winning the first, and losing the second, I argue thus: the probability of winning the first is $\frac{5}{12}$; the probability of losing the second is $\frac{7}{12}$; therefore multiplying $\frac{5}{12}$ by $\frac{7}{12}$, the product $\frac{35}{144}$ will be the probability of my winning the first, and losing the second; which being subtracted from 1, there will remain $\frac{109}{144}$, which is the probability I do not win the first, and at the same time lose the second.

3. If I would know what the probability is of winning the second, and at the same time losing the first, I say thus: the probability of winning the second is $\frac{1}{3}$; the probability of losing the first is $\frac{2}{3}$; therefore, multiplying these two fractions together, the product $\frac{2}{9}$ is the probability I win the second, and also lose the first.

4. If I would know what the probability is of losing both wagers, I say, the probability of losing the first is $\frac{7}{12}$, and the probability of losing the second $\frac{2}{3}$; therefore, the probability of losing them both is $\frac{14}{36}$; which being subtracted from 1, there remains $\frac{22}{36}$; therefore, the odds of losing both wagers is 7 to 4.

This way of reasoning is applicable to the happening or failing of any events that may fall under consideration. Thus if I would know what the probability is of missing an ace four times together with a die, this I consider as the failing of four different events. Now the probability of missing the first is $\frac{3}{4}$, the second is also $\frac{3}{4}$, the third $\frac{3}{4}$, and the fourth $\frac{3}{4}$; therefore the probability of missing it four times together is $\frac{3}{4} \times \frac{3}{4} \times \frac{3}{4} \times \frac{3}{4} = \frac{81}{256}$; which being subtracted from 1, there will remain $\frac{175}{256}$ for the probability of throwing it once or oftener in four times: therefore the odds of throwing an ace in four times, is 67 to 64.

But if the flinging of an ace was undertaken in three times, the probability of missing it three times would be $\frac{3}{4} \times \frac{3}{4} \times \frac{3}{4} = \frac{27}{64}$; which being subtracted from 1, there will remain $\frac{37}{64}$ for the probability of throwing it once or oftener in three times: therefore the odds against throwing it in three times are 37 to 27.

Again, suppose we would know the probability of throwing an ace once in four times, and no more: since the probability of throwing it the first time is $\frac{1}{4}$, and of missing it the other three times is $\frac{3}{4} \times \frac{3}{4} \times \frac{3}{4} = \frac{27}{64}$; but because it is possible to hit it every throw as well as the first, it follows, that the probability of throwing it once in four throws, and missing the other three, is $\frac{4 \times 125}{1024} = \frac{500}{1296}$; which being subtracted from 1, there will remain $\frac{796}{1296}$ for the probability of throwing it once, and no more, in four times. Therefore, if one undertake to throw an ace once, and no more, in four times, he has 500 to 796 the worth of the lay, or 5 to 8 very near.

Suppose two events are such, that one of them has twice as many chances to come up as the other, what is the probability that the event, which has the greater number of chances to come up, does not happen twice before the other happens once, which is the case of flinging 7 with two dice before 4 once? Since the number of chances are as 2 to 1, the probability of the first happening before the second is $\frac{2}{3}$, but the probability of its happening twice before it, is but $\frac{4}{9}$ or $\frac{5}{9}$; therefore it is 5 to 4; even does not come up twice before four once.

But, if it were demanded, what must be the proportion of the facilities of the coming up of two events, to make that which has the most chances come up twice, before the other comes up once? The answer is 12 to 5 very nearly: whence it follows, that the probability of throwing the first before the second is $\frac{12}{17}$, and the probability of throwing it twice is $\frac{3}{17} \times \frac{12}{17}$ or $\frac{36}{289}$; therefore, the probability of not doing it is $\frac{253}{289}$: therefore the odds against it are as 145 to 144, which comes very near an equality.

Suppose there is a heap of thirteen cards of one colour, and another heap of thirteen cards of another colour, what is the
Thus if \( a + b \) play on condition, that if either two or more of the events in question happen, \( A \) shall win; but in case one only happen, or none, \( B \) shall win; the probability of \( A \)'s winning will be
\[
\frac{b^3}{a+b^3},
\] but if \( A \) and \( B \) play on condition, that if either two or more of the events in question happen, \( A \) shall win; but in case one only happen, or none, \( B \) shall win; the probability of \( A \)'s winning will be
\[
\frac{a+b}{a+b^3}.
\]

The only two terms in which \( a \) does not occur, are the two last, viz., \( nab^{n-1} \) and \( b^n \).

**GAMMA AUREUM**, in zoology, a species of the phaleas, or moths, with dextrose wings. See **PHALENA**.

**GAMMATUS**, in ichthyology, a species of the cancer, or crab-fish. See the article **CANCER**.

**GAMMER-LAMB**, or **GIMMER-LAMB**. See the article **GIMMER**.

**GAMMONING**, among seamen, denotes several turns of rope taken round the bow-sprit, and reeved through holes in knees of the head, for the greater security of the bow-sprit. Blanckley.

**GAMMUT**, **GAM**, **GAMMA**, **GAMMUT**, in music, a scale wherein we learn to sound the musical notes, \( at, re, mi, fa, sol, la, \) in their several orders and dispositions. See **NOTE** and **SCALE**.

The invention of this scale is owing to Guido Aretnus. Theodotus, 2d ed., p. 5, 7, it is not so properly an invention as an improvement on the diagram, or scale of the Grecians. See the article **DIAGRAM**.

The gammut is also called the harmonic hand, by reason that Guido made use of the figure of the hand to demonstrate the progression of his sounds.

Guido, finding the diagram of the antients of toos small an extent, added five more chords or notes to it; one below the proslamanomenos of the antients, and four above the note hyperboleon. The first he called hypo-proslamanomenos, and denoted it by the letter \( G \), or the greek \( G \), gamma; which note being at the head of the scale, occasioned the whole scale to be called by the name of gam, or gammut. This scale is divided into three series or columns, the first called durum, the second natural, and the third molle, as represented by the following scheme. See **PROSLAMANOMENOS**, **NETE**, **DURUM**, **NATURAL**, and **MOLLE**.

...
The use of this scale is to make the passages and transitions from B moll to B durum, by means of tones and semitones. The series of B natural standing between the other two, communicates with both, so that to name the chord of the scale by these syllables, if we would have the semitones in their natural places, viz. b, c, and e, f, then we apply ut to g; and after la we go into the series of B natural, at fa; and after the la of this, we return to the former at mi; and so on. And we may begin at ut in c, and pass into the first series at mi, and then back to the other at fa, by which means the one transition is a semitone, viz. la, fa, and the other a tone, la, mi. To follow the order of B moll, we may begin with ut in c or f, and make each semitone after the same manner. See the articles Tone and Semitone.

Hence came the barbarous names of gammut, are, B mi, &c. but what perplexed work is here with so many different syllables applied to each chord, and all to mark the places of the semitones, which the simple letters a, b, c, &c. do as well, and with more ease. Several alterations have been made in the gammut. M. le Murs particularly added a seventh syllable, viz. fi; and the English usually throw out that and ut, and make the other serve for all, as will be shown under the article Solfaing.

Gammut, or Gamm, is also the first or gravel note in the modern scale of music, the reason whereof is shown under the preceding article.

Gander, in ornithology, the male of the goose-kind; one of which, it is said, will serve five geese. See Goose.

Gang, in the sea-language, the same with crew. See the article Crew.

The company wherewith a ship's boat is manned,
manned, is called the cockswain's crew, or gang. See the article Cockswain.

Gang-way is the several passages or ways from one part of the ship to the other; and whatever is laid in any of those passages, is said to lie in the gang-way.

Gang-fish, a species of Coregonus, with the upper jaw longest and flat, and with fourteen rays in the back fin. See the article Coregonus.

Ganges, a large river of the hither India, rises in the mountains which separate India from Tartary; and, running from the north-west to the south-east near 1500 miles through the Mogul's dominions, discharges itself by several channels into the bay of Bengal.

This river is worshiped like a god by the superstitious Indians, many thousands of whom annually undertake pilgrimages to it, and carry their dying friends to expire on its banks, and as soon as they die, heap them into the middle of it.

Ganglial, or Couler, a town of Golconda, in the hither India: east long. 46°, north lat. 41°.

Ganglion, or Ganglion, in surgery, a hard tubercle, generally movable, in the external or internal part of the carpus; upon the tendons or ligaments in that part, usually without any pain to the patient. Though ganglions so nearly resemble an encysted tumour, that Celsus makes them one and the same; yet their difference may appear, if it were only from their different seats; ganglions being confined to the tendons and ligaments of the hands and feet, whereas encysted tumours are not restrained to any part of the body. See the article Encysted.

With regard to the causes of ganglions, they seem generally to proceed from an infpiffation of the vifcid juices, which are let out, and lodged betwixt the fibres and membranes, when the tendons and ligaments of those parts have been injured by a fall, blow, strain, contusion, or the like, in which case they gradually increase more or less, as long as the fibres yield; the juices find vent so as to advance to the size of a filbert, walnut, or even a pigeon's egg: some are oblong, round, or oval, with an equal or uneven surface: some of them which are recent, may be easily dispersed; and others, which have been of long standing, hardly yield to any remedies but the knife.

The infpiffated matter of a recent ganglion, may often be happily dispersed by barely rubbing the tumour well every morning with the falling saliva, and binding a plate of lead on it afterwards for several weeks successively. Many attribute a greater discutient virtue to the lead, when it has first had some mercury rubbed on it. Forehead, and others, advise the use of a platter of ammoniac and mercury, and often to rub them with oil of fapo. Others write, that a cure may be readily performed, if the patient lays his hand upon a table, and strikes on the tumour with his fist: but care should be taken not to injure the bones, tendons, or other parts of the hand in striking the tumour; and the same care must be taken if there is a necessity of having recourse to cautics or incision, in order to remove them. See Cautic and Incision.

Gangrene, a very great and dangerous degree of inflammation, wherein the parts affected begin to corrupt, and put on a state of putrefaction. A gangrene is distinguished from a sfacelus, in as much as this latter is not an incipient but an absolute and perfect corruption, or death of the parts, already made. See the article Sphacelus.

A gangrene may be discovered generally from the following signs: namely, the inflammation, with its symptoms, which have all along been very violent, do generally undergo a sudden change, as if they were going off. The parts which were before swelled and tinct, do now grow soft and flaccid, and upon pressing with the finger on the skin and fat, its impreffion remains behind, as in an oedema; at length the cuticula separates from the cutis, often rising up in blisters, like those on burns, filled with a reddish, yellowish, and black humour; and the tinct of the limb is in some degree diminished. See the article Oedema.

The causes of a gangrene, as well as a sfacelus, are either external or internal. Among the internal causes are reckoned an erysipelas, and all other inflammations which rise spontaneously, and can by no means be dispersed, nor brought to suppuration. Inflammations of this kind usually proceed from the blood's being too acrimonious, or corrupted by the bile, or in a scorbutus; or when the circulation of the blood is too quick, or too slow, by
by reason of old age, or any other weaknesses; or, lastly, when the patient uses a perverse course of life with respect to diet, and passions of the mind, especially anger, grief, and fear, during the time of the inflammation. By external causes are intended injuries of the air, cold water, and the application of topical remedies externally to the inflamed parts; which are either cooling, astringent, fat, oily, or the like; together with all great external hurts or accidents, which frequently happen to the body through falls, blows, &c. as in wounds, fractures, lacerations, &c. See Wound, Fracture, and Luxation.

A gangrene is for the generality never without danger, because it easily changes into a phæcælus, or intire mortification, which never admits of cure but by taking off the dead parts. But a gangrene which is slight, incipient, and not spread far, but only affects the skin and fat, is not very difficult to cure; especially when it happens in a young and stout patient, in a mild and temperate reason, and does little or no injury to the muscles and nerves: but the larger, more violent, and confirmed is the gangrene, and the faster it spreads, the more difficult it is generally to effect a cure, especially in an old or weak patient; or in an ill habit of body, from a dropisy, phthisis, or scorbутus: the weather also being too hot, or very cold, or the parts affected being near the thorax, or abdomen, may make the case more dangerous. Nor can this case be neglected without the utmost danger of life, or its suddenly turning into a phæcælus.

Therefore the gangrene must be treated so, that it may not terminate in a phæcælus. For which end, first of all, in plethoric and strong habits, the patient must be bled largely, and the operation repeated at discretion; but in weak habits, it should be omitted. The remainder of the treatment, according to Heister, will consist chiefly in observing the following directions. 1. To be careful in the beginning to prevent all violent external causes of inflammations, too strict a bandage in wounds and fractures, all foreign bodies which are stuck in the part, as thorns, splinters, &c. improper medicines externally applied, as ointments, oils, and plasters, with cooling and astringent things; all which should be removed as soon as possible. 2. The next observation respects chiefly the keeping up the patient's strength, especially in weak and old people. This may be best effected by ordering a diet which not only affords good juices, but is also well accommodated to the age, constitution, and other circumstances of the patient. In weak and old people, the most suitable diet will be soups, strengthening broths, &c. With respect to medicines, the most proper are the corroborants, usually termed cordials, as the spirits, essences, powders, and electuaries of that tribe; especially made up or mixed with confected alkermes. It will be proper also, in this case, frequently to apply a sponge to the nœs or carpal arteries, which has been dipped in hungary water; also to bind it to the temples. For patients who are of a more warm, fanguine, and bilious habit, foops and ptifans mixed with acid juice of citrons or lemons, will be very proper strengtheners; at the same time, not neglecting other medicines, which are proper to be used in fevers: but the peruvian bark is by many celebrated in this disorder beyond any other internal medicine. 3. The chief and last obligation concerning the treatment of a gangrene, is chiefly to discharge the stagnating and corrupted blood from the parts affected as soon as possible, to prevent the neighbouring parts from being affected thereby.

The principal means to effect this are,

1. To make use of proper internal, strengthening medicines. 2. To make certain indications on the part affected, by numerous incisions lengthways, and of a sufficient depth, in order to discharge the stagnating and corrupted blood, and to make way for the ingress of the virtues of the diuretic medicines which are applied externally. Lastily, 3. Diuretient, stimulating, and balmatic fomentations and cataplasmes which resist putrefaction, are to be carefully applied to the disordered part. See Fomentation and Cataplasm.

The fomentation is to be applied hot, several times in a day, to the parts affected, by means of linen or woollen cloths; and to give a lasting warmth, we may apply a hot tile wrapped up in a thick cloth, or a hot bag of sand.

GANNET, in ornithology, a bird of the larus or gull-kind, frequent on the western coasts of England.

It is equal in size to the common duck. The upper part of the body is of a deep rusty irregulous colour, much like
that of the common buzzard; and the breast and belly are also brown, but paler. It is an extremely singular species, its whole aspect, in some degree, approaching to that of some of the larger birds of prey. See plate CX. fig. 2.

GANTLET, or GAUNTLET, a large kind of glove, made of iron, and the fingers covered with small plates. It was formerly worn by cavaliers, when armed at all points.

GANTLET, in surgery, a kind of bandage for the hand. See BANDAGE. It consists of a swathe or four or five yards long, with which they wrap up the hand, and all the fingers, one after another.

GAOL, a prison, or place of legal confinement. Every county has two gaols, one for debtors, which may be wherever the sheriff pleases; the other for the peace and matters of the crown, which is the county gaol.

If a gaol be out of repair, or insufficient, &c. Justices of peace, in their quarter sessions, may contract with workmen for the rebuilding or repairing it; and by their warrant order the sum agreed on for that purpose, to be levied on the several hundreds and other divisions in the county by a just rate, 11 & 12 Will. III. c. 19. See the article PRISON.

GAOL-DELIVERY, is where a commission or patent is granted by the king in the nature of a letter, to certain persons, who are thereby appointed his justices, or to two or three of them, authorising them to deliver his gaol, at such a place, of the prisoners contained therein; and for that end it commands them to meet at such place, at the time they themselves shall appoint, when the sheriff of the county is commanded to bring all the prisoners in the gaol before them, &c. 4 Inst. 168.

The justices of gaol-delivery are impowered by the common law to proceed upon indictments of felony, trespass, &c. and to order execution or reprieve; they may likewise discharge such prisoners, as on their trials are acquitted, and those against whom, on proclamation made, no evidence has appeared: they have authority to try offenders for treason, and to punish many particular offences by statute. 2 Hawk. 24. 2 Hale's hist. Placit. Cor. 35.

GAOLER, the keeper of a gaol or prison. Sheriffs are to make such gaolers for whom they will be answerable: but if there be any default in the gaoler, an action lies against him for an escape, &c. yet the sheriff is most usually charged. 2 Inst. 592. Where a gaoler kills a prisoner by hard usage, it is felony. 3 Inst. 52.

No fee shall be taken by gaolers, but what is allowed by law, and settled by the judges, who may determine petitions against their extortions, &c. 2 Geo. II. c. 22.

GAP, a city and bishop's see of Dauphine, in France, eighteen miles west of Embrun: east longitude 5° 46', north lat. 44° 32'.

GARAGAY, a rapacious bird of Mexico, about the size of our kite.

GARBE, in heraldry, a sheaf of any kind of grain, borne in several coats of arms, and said to represent summer, as a bunch of grapes does autumn.

GARBLER of spices, an ancient officer in the city of London, who is authorized to enter into shops, ware-houses, &c. there to view and search drugs, spices, &c. and see that they be garbled or cleansed from the dros and dust wherewith they are mixed.

GARBLING of bow-flavus, the forting them, or separating the good from the bad.

GARBOARD-STRAKE, the plank next the keel of a ship, one edge of which is run into the rabbit made in the upper edge of the keel on each side. Blanckley's Nav. Expol.

GARISLA, or GUARD. See GUARD.

GARCINA, in botany, a genus of the genus sarcandra-monogynia class of plants, called magottans by Garcia, from whom Linnaeus has given it the name of garcina. The flower consists of four roundish, paten petals; and the fruit is a large unilocular, coriaceous berry, containing eight hairy and fleshy seeds, convex on one side, and angular on the other.

GARD, or GUARD. See GUARD.

GARDIA, a town of the Venetians, in Italy, subject to Venice: east long. 11°, north lat. 48° 5'.

GARDAN, or GUARDANT, in heraldry, denotes any beast full faced, and looking right forward. See plate CX. fig. 2. which represents a lion gardant.

GARDELEBen, a town of Brandenburg, in Germany: east long. 11° 45', north lat. 52° 40'.

GARDEN, a plot of ground, cultivated and properly ornamented with a variety of plants, flowers, fruit, &c. Gardens are usually distinguished into flower-garden, fruit-garden, and kitchen-garden; the first of which, being de-
igned for pleasure and ornament, is to be placed in the most conspicuous part, that is, next to the back front of the house; and the two latter, being designed for use, should be placed elsewhere. But tho’ the fruit and kitchen-gardens are here mentioned as two distinct gardens, yet they are now usually in one; and that with good reason, since they both require a good soil and exposure, and equally require to be placed out of the view of the house. See Kitchen-Garden.

In the choice of a place proper for a garden, the most essential points to be considered are the situation, the soil, the exposure, water and prospect.

As to the situation, it ought to be such a one as is wholesome, and in a place neither too high nor too low; for if a garden be too high, it will be exposed to the winds, which are very prejudicial to trees; and if it be too low, the dampness, the vermin, and the venomous creatures that breed in ponds and marshy places, add much to their insalubrity.

The most happy situation is on the side of a hill, especially if the slope be easy, and in a manner imperceptible; if a good deal of level ground be near the house; and if it abound with springs of water; for, being sheltered from the fury of the winds, and the violent heat of the sun, a temperate air will be there enjoyed; and the water that descends from the top of the hill, either from springs or rain, will not only supply fountains, canals, and cascades for ornament, but when it has performed its office, will water the adjacent valleys; and, if it be not sufferèd to stagnate, will render them fertile and wholesome. Indeed if the declivity of the hill be too steep, and the water be too abundant, a garden on the side of it may frequently suffer, by having trees torn up by torrents and floods; and by the tumbling down of the earth above, the walls may be demolished, and the walks spoiled. It cannot, however, be denied, that the situation on a plain or flat, has several advantages which the higher situation has not: for floods and rain commit no damage; there is a continued prospect of champaigns, intersected by rivers, ponds and brooks, meadows and hills covered with woods or buildings; besides, the level surface is less tissuede to walk on, and less chargeable, than that on the side of an hill, since terrace walks and steps are not there necessary; but the greatest disadvantage of flat gardens, is the want of those extensive prospects which rising grounds afford.

A good earth, or soil, is next to be considered; for it is scarce possible to make a fine garden in a bad soil; there are indeed ways to meliorate ground, but they are very expensive; and sometimes when the expense has been bestowed of laying good earth three feet deep over the whole surface, a whole garden has been ruined, when the roots of the trees have come to reach the natural bottom.

To judge of the quality of the soil, observe whether there be any heath, thistles, or such-like weeds growing spontaneously in it; for they are certain signs that the ground is poor. Or if there be large trees growing thereabouts, observe whether they grow crooked, ill-shaped, and grubby, and whether they are of a faded green, and full of moss, or infected with vermin; if this be the case, the place is to be rejected; but, on the contrary, if it be covered with good grass fit for pasture, you may then be encouraged to try the depth of the soil. To know this, dig holes in several places, six feet wide, and four feet deep; and if you find three feet of good earth, it will do very well; but less than two, will not be sufficient. The quality of good ground is neither to be flaky, nor too hard to work; neither too dry, too moist, nor too sandy and light; nor too strong and clayey, which is the worst of all for gardens.

The next requisite is water, the want of which is one of the greatest inconveniences that can attend a garden, and will bring a certain mortality upon whatever is planted in it, especially in the greater droughts that often happen in a hot and dry situation in summer; besides its usefulness in fine gardens for making fountains, canals, cascades, &c. which are the greatest ornaments of a garden.

The last thing to be considered, is the prospect of a fine country; and tho’ this is not absolutely necessary as water, yet it is one of the most agreeable beauties of a fine garden: besides, if a garden be planted in a low place that has no kind of prospect, it will not only be disagreeable, but unwholesome.

In the laying out and planting of gardens the beauties of nature should always be studied; for the nearer a garden approaches to nature, the longer it will please. The area of a handsome garden,
VY:hen should be observed in the disposition of the garden, whereby the trees and objects, but not evergreen, of at least three steps from the house to the garden; this will render the house more dry and wholesome, and the prospect on entering the garden more extensive. The first thing that should present itself to view, should be an open lawn of grass, which ought to be considerably broader than the front of the building; and if the depth be one half more than the width, it will have a better effect: if on the sides of the lawn there are trees planted irregularly, by way of open groves; the regularity of the lawn will be broken, and the whole rendered more like nature. For the convenience of walking in damp weather, this lawn should be surrounded with a gravel walk, on the outside of which should be borders three or four feet wide, for flowers, and from the back of these, the prospect will be agreeably terminated by a slope of ever-green shrubs, which, however, should never be suffered to exclude agreeable prospects, or the view of handsome buildings. These walks may lead through the different plantations, gently winding about in an easy natural manner, which will be more agreeable than either tho' long straight walks, too frequently seen in gardens, or those serpentine windings, that are twisted about into so many short turns, as to render it difficult to walk in them; and as no garden can be pleasing where there is a want of shade and shelter, these walks should lead as soon as possible into plantations, where persons may walk in private, and be sheltered from the wind. Where the borders of the gardens are fenced with walls or pales, they should be concealed with plantations of flowering-shrubs intermixed with lawns, and other evergreens, which will have a good effect, and at the same time conceal the fences, which are disagreeable, when left naked and exposed to the sight. Groves are the most agreeable parts of a garden, so that there cannot be too many of them; only that they must not be too near the house, nor be suffered to block up agreeable prospects. To accompany parterres, groves opened in compartments, quin- cunxes, and arbour-work with fountains, &c. are very agreeable. Some groves of ever-greens should be planted in proper places, and some squares of trees of this kind may also be planted among the other wood. See Quincunx, &c.

Narrow rivulets, if they have a constant stream, and are judiciously led about a garden, have a better effect than many of the large stagnating ponds or canals, so frequently made in large gardens. When wildresses are intended, they should not be cut into stars and other ridiculous figures, nor formed into mazes or labyrinths, which in a great design appear trifling. Buildings, statues, and vases, appear very beautiful; but they should never be placed too near each other: magnificent fountains are also very ornamental; but they ought never to be introduced, except there be water to keep them constantly running. The same may also be observed of cascades and other falls of water. See the articles Cascades, Fountains, &c.

In short, the several parts of a garden should be diversified; but in places where the eye takes in the whole at once, the two sides should be always the same. In the business of designing, the aim should be always at what is natural, great and noble. The general disposition of a garden, and of its parts, ought to be accommodated to the different situations of the ground, to humour its inequalities, to proportion the number and forts of trees and shrubs to each part, and to shut out from the view of the garden no objects that may become ornamental. And before a garden is planned out, it ought ever to be considered, what it will be when the trees have had twenty years growth. Miller's Gard. Dict.

GARDENING, a branch of agriculture, containing the cultivation of gardens. See the preceding article.

The art of gardening affords a variety of delights. It teaches how to dispose fruit-trees, flowers, and herbs to the best advantage, whether for profit or pleasure; and shews how to prepare the soil for fostering the different kinds of seeds, as well as how to treat the plants when grown up. It is a pleasure to behold a person employed, amongst the plants of a spacious garden, in reforming, by proper methods, a growth of natural wildings; to see him cultivate mutual alliances between his plants, by grafting or inoculation, whereby the bad are melliorated, and the good rendered still more perfect. By this means, a plant taken from the wilds of a forest, softens its savage nature, and will sometimes divest itself of its
GARDENING a hawk, in falconry, the putting her on a turf of grafs to cheer her.

GARDIAN, or GUARDIAN. See the article Guardian.

GARDS, or GUARDS. See Guards.

GARDUS, in ichthyology, a fish more usually called sargus. See Sargus.

GARGANEY, in ornithology, a bird of the anas or duck-kind, about the size of the common teal, which in many particulars it greatly resembles. It is distinguished by a green spot in the wings, and a white line over the eyes. See the article Anas.

GARGARISM, in medicine, is sometimes taken, in a large dose, for every affection of the mouth; but, strictly speaking, it signifies a liquid medicine, appropriated to affections of the mouth, gums, fauces, larynx, and sometimes of the head, received into the mouth, and there used by way of collution, without deglutition.

Gargarizations, according to Celsus, are made for the sake of alleviation, repulsion, or evacuation. The first intention is answered by milk and cream of ptifan, or bran; repulsion is effected by water wherein lentils, rotes, brambles, quinces or dates have been bottled; and evacuant gargarisms are mustard and pepper.

GARIDELLA, fennel-leaved Migel-la, in botany, a genus of the decandria-trigynia class of plants. It has no flower petals; but there are five long, equal, and bilabiate nectaria: the fruit consists of three oblong, compressed, acuminate capsules, formed of two valves, and containing numerous small seeds.

GARLAND, a part of chaplet made of flowers, feathers, and sometimes precious stones, worn on the head, in manner of a crown.

GARLAND also denotes ornaments of flowers, fruits, and leaves, intermixed, antiently much used at the gates of temples, where feasts and solemn rejoicings were held; or at any other place where marks of public joy or gaiety were required, as at triumphal arches, turnaments, &c.

The flowers and greens whereof garlands were composed, were various. The antients made no public entertainment but upon the festivals of the gods; and then the garlands, hymns and songs, were that part of the entertainment the gods were supposed to delight in, according to Athenæus. And in latter ages of antiquity, upon the public festival of any god, they used that particular herb or flower supposed to be sacred to that deity: but, at other times, all such herbs were made use of as the feation would best admit of, or as they thought were most conducive to pleasure, health, or refreshment. Garlands were not confined to the head only, but other parts of the body, particularly the breast, were adorned with them.

GARNET, granatus, in natural history, a very beautiful gem, of a red colour, with an admixture of bluish. When pure and free from blemishes, it is little inferior, in appearance, to the oriental ruby, the only one of a middle degree of hardness between the sapphire and common crystal. It is found of various sizes, from that of a pin's head to an inch in diameter. Among our lapidaries and jewellers, genuine garnets are known by different names, according to their different degrees of colour. 1. The garnet, simply so called, is the finest and most valuable kind, being of a very deep blood-red, with a faint admixture of blue. 2. The rock-ruby, a name very improperly given to the garnet, when it is of a very strong but not deep red, and has a fairer cast of the blue: this is a very beautiful gem. 3. The forane or foreign garnet; that of a yet brighter red, approaching to the colour of native cinnabar, with a faint blue tinge. 4. The asmandine, a garnet only a little paler than that called the rock-ruby.

Garnets are very properly distinguished into the oriental and occidental kinds, as being found in Europe as well as the East-Indies. The oriental ones are principally brought from Calicut, Cananor, and Cambay; and the european ones common in Italy, Hungary, and Bohemia. Some authors have supposed the deeper-coloured garnet to be the same with the carbuncle of the antients, from which it really differs; since, on receiving the fun's
counterfeit garnet, or garnet-paste, a preparation of glass, the colour of which emulates that of the genuine garnet. See the article glass-making.

This paste is made three different ways. 1. By mixing two ounces of prepared crystal with six of common red-lead, and adding sixteen grains of manganese, and three grains of zaffre. 2. By adding two and a half ounces of minium to two of crystal, and then mixing with them fifteen grains of manganese, and four grains of zaffre. 3. By mixing five ounces of minium with two ounces of prepared crystal, and adding fifty-two grains of manganese, and four grains of zaffre. This last makes by far the most elegant garnet-paste.

garnet, in a ship, is a tackle having a pendant, coming down from the main-mast, with a block well seized to the main-stay, just over the hatch-way, to which a guy is fixed, to keep it steady; and at the other end is a long tackle-block, in which the fall is reeved, that so by it any goods or casks may be hauled and hoisted into or out of the ship.

When this garnet is not used, it is fastened along the stay.

clew-garnet, in a ship. See clew.

garnish, in law-books, signifies to warn; in which sense, to garnish the heir, is mentioned in East 27 Eliz. c. 3. See the article garnishment.

garnishee, is used for the third person or party in whose hands money is attached within the liberties of the city of London, in the sheriff's court there; and he is so called, because he has had garnishment or warning not to pay the money, but to appear and answer to the plaintiff creditor's suit.

garnishment, is a warning given to a person for his appearance, for the better furnishing of the caufe and court; as where a person is sued for detaining charters or other writings delivered him by the plaintiff, and another person, upon some certain conditions; and therefore he prays that the other person may be warned to plead with the plaintiff, whether the conditions are or are not performed; which is the praying of garnishment; and interpreted to be either a warning of that other, or a furnishing the court with parties sufficient to determine the caufe.

Garonne, a large river of France, which taking its rise in the Pyrenean mountains, runs north-west by the city of Tholou, divides the provinces of Guienne and Gascony, and visiting the city of Bordeaux, falls into the bay of Biscay, about sixty miles below that city. It has also a communication with the Mediterranean, by means of the royal canal of Lewis XIV.

The tide flows up this river twenty miles above Bordeaux.

garosmus, in botany, a name by which flaming orach is sometimes called.

garrison, in the art of war, a body of forces, disposed in a fortrees, to defend it against the enemy, or to keep the inhabitants in subjection; or even to be disembarked during the winter season: hence, garrison and winter-quarters are sometimes used indifferently, for the same thing; and sometimes they denote different things. In the latter case, a garrison is a place wherein forces are maintained to secure it; and where they keep regular guard, as a frontier town, a citadel, castle, tower, &c. The garrison should always be stronger than the townsmen.

Winter-quarters signify a place where a number of forces are laid up in the winter season, without keeping the regular guard. See winter-quarters.

garrison-town, a strong place in which troops are quartered, and do duty, for the security thereof, keeping strong guards at each port, and a main guard in the market-place.

garrison, in geography, a town of Ireland, in the county of Fermanagh, and province of Ulster; west long. 30° 54', and north lat. 54° 16':

garrulus, in ornithology, a bird called in the English the roller. See roller.

garstang, a market-town of Lancahir, ten miles north of Preston.

garter, a ligature for tying up the stocking; but particularly used for the badge of a noble order of knights, hence denominated the order of the garter, a military order of knighthood, the most noble and antient of any lay-order in the world, instituted by King Edward III. This order consists of twenty-six knights-companions, generally princes and peers, whereof the king of England is the sovereign, or chief. They are a college or corporation, having a great and little feal.

Their
Fig. 1. Order of the Garter

Fig. 2. GORE. Fig. 3. GIRONNE. Fig. 4. GARDANT.

Fig. 5. GAUGING ROD.
Their officers are a prelate, chancellor, regifter, king at arms; and usher of the black rod. They have also a dean with twelve canons, and petty canons, vergers, and twenty-six pensioners, or poor knights. The prelate is the head. This office is vested in the bishop of Winchester, and has ever been so. Next to the prelate is the chancellor, which office is vested in the bishop of Salisbury, who keeps the seals, &c. The next is the regifter, who by his oath is to enter upon the registry, the scrutinies, elections, penalties, and other acts of the order, with all fidelity. The fourth officer is garter, and king at arms, being two different offices united in one person. Garter carries the rod and scepter at the feast of St. George, the protector of this order, when the sovereign is present. He notifies the elections of new knights, attends the solemnity of their installations, carries the garter to the foreign princes, &c. He is the principal officer within the college of arms, and chief of the heralds. See King at arms.

All these officers, except the prelate, have fees and pensions. The college of the order is seated in the castle of Windsor, with the chapel of St. George, and the chapter-house, erected by the founder for that purpose. The habit and ensign of the order are a garter, mantle, cap, George, and collar. The four first were anciently the knights companions by the founder; and the George and collar, by Henry VIII. The garter (see plate CXL. fig. 1. no. 1.) challenges preeminence over all the other parts of the dress, by reason that from it the noble order is denominated; that it is the first part of the habit preferred to foreign princes, and absent knights, who, and all other knights elect, are therewith first adorned; and it is of so great honour and grandeur, that by the bare investiture with this noble ensign, the knights are esteemed companions of the greatest military order in the world. It is worn on the left leg between the knee and calf, and is enamelled with this motto, HONI SOIT QUI MAL Y PENSE; i.e. "shame to him that thinks evil thereof." The meaning of which is, that king Edward, having laid claim to the kingdom of France, retorted shame and defiance upon him that should dare to think amiss of the just enterprise he had undertaken, for recovering his lawful right to that crown, and that the bravery of those knights whom he had elected into this order, was such as would enable him to maintain the quarrel against those that thought ill of it.

The mantle (ibid. no. 2.) is the chief of those vestments made use of upon all solemn occasions. The colour of the mantle is by the statutes appointed to be blue. The length of the train of the mantle only distinguishes the sovereign from the knights companions. To the collar of the mantle is fixed a pair of long frings, antiently wove with blue silk only, but now twifted round, and made of Venice gold and silk, of the colour of the robe, with knobs, or buttons, and taffels at the end. The left shoulder of the mantle has from the institution been adorned with a large garter, with the device HONI SOIT, &c., within this is the cross of the order, which was ordained to be worn at all times by king Charles I. At length the star was introduced, being a fort of cross irradiated with beams of silver. (ibid. no. 3.)

The collar (ibid. no. 4.) is appointed to be composed of pieces of gold in fashion of garters, the ground enamelled blue, and the motto gold. See Collar. The manner of electing a knight companion into this most noble order, and the ceremonies of investiture, are as follow. "When the sovereign designs to elect a companion of the garter, the chancellor belonging to this order draws up the letters, which passing both under the sovereign's sign manual and signet of the order, are sent to the person by garter principal king at arms, and are in this manner, or to the same effect, "We, with the companions of our most noble order of the garter, assembled in chapter, holden this present day at our castle at Windsor, considering the virtuous fidelity you have shewn, and the honourable exploits you have done in our service, by vindicating and maintaining our right, &c., have elected and chosen you one of the companions of our order. Therefore, we require you to make your speedy repair unto us, to receive the ensigns, thereof, and be ready for your installation upon the—day of this present month, &c." The garter, which is of blue velvet bordered with fine gold wire, having commonly the letters of the motto of the same, is, at the time of election, buckled.
buckled upon the left leg, by two of the senior companions, who receive it from the soveraign, to whom it was presented upon a velvet cushion by garter king at arms, with the usual reverence, whilst the chancellor reads the following admonition, enjoined by the statutes. "To the honour of God omnipotent, "and in memorial of the bleffed martyr "St. George, tye about thy leg, for "thy renown, this noble garter; wear "it as the symbol of the most illustrious "order, never to be forgotten, or laid "aside; that thereby thou mayft be "admonihed to be courageous, and "having undertaken a just war in "which thou shalt be engaged, thou "mayft stand firm, valiantly fight, and "successively conquer."

The princely garter being thus buckled on, and the words of its significations pronounced, the knight elect is brought before the soveraign, who puts about his neck, kneeling, a sky-coloured ribbon, (ibid. n° 5.) whereunto is appendant, wrought in gold within the garter, the image of St. George on horseback, with his sword drawn, encountering with the dragon. In the mean time, the chancellor reads the following admonition: "Wear this ribbon about thy neck, "adorned with the image of the bleffed "martyr and folder of Christ, St. "George, by whose imitation provoked, "thou mayft overpass both proflerosous "and adverfe adventures, that having "folutely vanquished thy enemies both "of body and fould, thou mayeft not "only receive the praffe of this transient "combat, but be crowned with the "palm of eternal victory."

Then the knight elefted kiffe the soveraign's hand, thanks his majeftry for the great honour done him, rises up, and salutes all the companions severally, who return their congratulations. N° 2.

Ibid. exhibits a view of a knight of the garter in the habit of this order. Since the institution of this order, there have been eight emperors, and twenty-eight kings, besides numerous soveraign princes enrolled as companions thereof. Its origin is somewhat differently related: the common account is, that it was erected in honour of a garter of the countess of Salisbury, which she dropped dancing with king Edward, and which that prince picked up; but our bel antiquaries think it was instituted on account of the victory over the French at Crefly, where the king ordered his garter to be displayed as a signal of the battle.

GARTH, signifies a little close, or back-side, in the north of England; also a wear. See the article WEAR.

GARTHMAN, a term formerly used for a fisher-man.

GARUM, among phycians, denotes the brine, or pickle, wherein anchovies, herrings, &c. are preferred. See the article PICKLE.

GARYOPHYLLUS, or CARYOPHYL- LUS, in botany, &c. See the article CAR YOPHYLLUS.

GAS, among chemists, a term made use of by Helmont, to signify, in general, a spirit incapable of coagulation, such as proceeds from fermented wine. In particular, it has various significations; thus, gas vitale, is the spirit of our life, the light and the ballam, which preserves from corruption. The gas pingue sulphurum is what is suddenly mortal, being lethiferous exhalations arising principally in caves and mines. Gas sulphur, the gas or spirit of sulphur, is made by burning sulphur under a glass bell fett over a vessel of water, till the water is sufficiently impregnated with the sulphur. The gas sylvestre is that invincible and incoercible spirit which arises from vegetable juices under fermentation. Helmont makes several other distinctions of gas; as the gas ventofum, which is mere air; the gas fuccinum, which is sublimae de flatibus; the gas sulfurum, and the gas fructuum, which are mere elementary water.

GASE-HOUND, or GAZE-HOUND. See the article GAZE-HOUND.

GASCOIN, or GASCOIGN, denotes the hinder thigh of a horse, which begins at the stifte, and reaches to the ply or bending of the ham.

GASCONY, the most south-west province of France, bounded by Guienne, on the north; by Languedoc, on the east; by the Pyrenees, which separate it from Spain, on the south; and by the bay of Bidcau on the west. The inhabitants of this province are remarkable for vaunting and pretending to improbabilities; whence the like pretence, in others, is called a gafconade.

GASKOIN, or GASCIN. See GASCOIN.

GASSENHOVEN, or GUTZENHOVEN, a town of the Austrian Netherlands, fifteen miles east of Louvain: east long. 58°, and north lat. 50° 55'.

GAS-
GASTALDUS, or CASTALDUS, an officer antiently entertained in the courts of divers princes. The gaftaldus was what in Italy and Spain, is now called major domo, or the master or steward of an household. The gaftaldus was a comes or count, which shews his office to have been very considerable.

In the laws of Italy we sometimes met with a gaftaldus in the sense of a carrier, and sometimes as an ecclesiastical officer.

GASTROSTÉUS, in ichthyology, a genus of acanthopterygious fishes, distinguished by having only three small bones in the branchiostege membrane, and the belly almost entirely covered with oblong bony laminae.

To this genus belong the common stickle-back, the leffer stickle-back, and the great stickle-back. See the article STICKLE-BACK.

GAST-HOUND, or GAZE-HOUND. See the article GAZE-HOUND.

GASTRO-EPIPOIC VÉIN, a vein that opens into the vena portae. See VEIN.

GASTRIC, in general, something belonging to the stomach. See STOMACH.

GASTRIC JUICE, gastricus fucus, among physicians, a thin, pellicid, spumous, and salutifh liquor, which continually dissects from the glands of the stomach, for the dilution of the food. See FOOD.

GASTRIC VESSELS, in anatomy, the arteries and veins of the stomach. See the articles ARTERY and VEIN.

GASTRILÓQUUS, the fame with ventriloquus. See VENTRILÓQUUS.

GASTROCÉNIUS, in anatomy, the name of two thick, pretty broad, and oblong muscles, which form a great part of what is called the calf of the leg. They are situated laterally with respect to each other, under the poples.

GASTROCÉNIUS is also the name of one of the extensor-muscles of the foot.

GASTROMANCY, γεστρομανία, a method of divination by water, practised by the antient Greeks in the following manner. They filled certain round glasses with fair water, about which they placed lighted torches: then invoked a dæmon, praying in a low, murmuring voice, and propoised the question to be solved. A chaste and unpolluted boy, or a woman big with child, was appointed to obferve with great care and exactness, all the alteration in the glasses; at the fame time deiring, befeching, and commaning an answer; which, at length, the dæmon used to return by images in the glasses; which, by reflexion from the water, represented what should come to pass.

GASTRÓGRAPHY, γαστρογραφία, in surgery, the operation of sawing up wounds of the abdomen. See ABDOMÉN.

There are two cafes in which this operation is absolutely necessary; the first is, where the wound is so large, that there is no possibility of retaining the intestines by any other method; for as the intestines are continually pushed forward in the act of inspiration, by the action of the diaphragm and the abdomen, the falling down of the intestines in this case is unavoidable, and therefore the operation is necessary. The other is in large transverse wounds of the abdomen, where the muscles are divided, but the peritoneum is not concerned.

In wounds of the abdomen the chief inquiry is, whether the omentum or intestines are let out. If none of these have burst through the wound, the lips of the wound must be kept as close together as possible with the hands, and the patient kept with his head lying downwards, till the wound is sufficiently secured from letting out the contents of the abdomen. But when the intestines are already fallen out, they must be returned with the greatest expedition, lest they should receive any injuries from the external air. It is first to be examined, however, whether they have received any wound, or not; and whether they preserve their natural warmth and colour: for where they are cold, livid, dry, or wounded, they are not to be returned suddenly, but fomented with warm milk and water, or wrapped up for some time in the caul of some animal newly killed, till they have in some degree recovered their natural heat and colour.

You will easily perceive, that there is some hurt in the intestines, though the wound does not immediately appear, if there is a more than ordinary flaccidity in them; in which case, the rest of the intestines must be pulled gently forward till you find the wound. See the article INTESTINES.

If nothing of this sort is the case, but the intestines are in their natural state and condition, they must be instantly returned in the following manner. The patient being placed in a supine posture, and laid on that side that is opposite to
the wound, the intestines must be returned by the aperture of the wound, with the two fore fingers; taking care never to take off one finger, till the other is on the gut. The patient is all the while to hold his breath, and the lips of the wound must be then brought together. If the intestines have been forced through a small wound, and are afterwards so distended with wind, that they cannot easily be returned, it is necessary to pull the intestine gently forward, that more of it may come out, and the wind take up the abdomen. The wound, when all this is done, must be anointed with some vulnerary balm, and covered with pledgets of lint, a sticking plaster, and bolsters, securing all with the scapulary bandage.

GASTROTOMY, γαστροτόμος, in surgery, the cutting open the abdomen and uterus, as in the cesarian section. See the article CESARIAN.

GATE, in architecture, a large door, leading, or giving entrance into a city, town, castle, palace, or other considerable building: or a place giving passage to persons, horses, coaches, or waggons, &c. As to their proportion, the principal gates for entrance through which coaches and waggons are to pass, ought never to be less than seven feet in breadth, nor more than twelve, which last dimension is fit only for large buildings. The height of a gate is to be \( \frac{1}{2} \) of the breadth, and somewhat more; but as for common gates in inns, under which waggons go loaded with hay, straw, &c., the height of them may be twice their breadth.

Paled Gates, such as are set up in fences for shutting up the pastures into fields, and other inclosures. These are of two sorts, either of fawed or cleft timber.

Opening of the Gates in astrology. See the article OPENING.

GATE, in the manege, the going or pace of a horse.

GATE of the sea, or SEA-GATE, in the sea-language. When two ships are aboard one another, by means of a wave or billow, it is usual to say they are aboard one another in a sea-gate.

GATE, in geography, a chain of mountains that run through the middle of the hither Peninsula of India, from south to north.

GATHER, in the sea-language, is said of a ship that gets the wind of another.
GATTON, a borough town of Surry, sixteen miles south of London, which sends two members to parliament.

GAVALI, a name by which bellium is sometimes called. See BELLIIUM.

GAVEL, or GABLE, among builders. See the article GABLE.

GAVERLET, in law, an antient and special cessa vit used in Kent, where the custom of gavel-kind continues, by which the tenant, if he withdraws his rent and services due to the lord, forfeits his lands and tenements.

In respect to this gavelet the lord was to seek by award of his court from three weeks to three weeks, to find some dissent upon the lands, until the fourth court; and if in that time he could find no dissent upon the premises whereby he might have justice of his tenant; then, at the fourth court, it was awarded, that the lord should take the lands, &c. into his hands, in the name of a dissent, and keep it a year and a day without manuring, in which space of time, if the tenant did not come and pay his arrearages, and make the lord amends, then the lord was to go to the next county-court with his witnesses of his own court, and pronounce there the process; after which, by the award of his court, he became intitléd to enter and manure those lands or tenements as his own. And if the tenant wanted to re-enjoy his lands, &c. as he did before, he was then obliged to make agreement with the lord for the same.

GAVERLET, in London, is a writ used in the huffings, given to lords of rents in the city of London.

GAVELKIND, a tenure or custom belonging to lands in the county of Kent, by which the lands of the father are, at his death, equally divided among all his sons; or the land of a deceased brother, in case he leaves no issue, among all the brethren. This is by some called antient fescage-tenure: the custom came from our Saxon ancestors, among whom the inheritance of lands did not descend to the eldest, but to all the sons alike; and the reason why it was retained in Kent is, because the kentish men were not conquered by the Normans in the time of William I.

The particular customs attending this tenure are, that the heir, at the age of fifteen, may give or sell his lands in gavelkind; and tho' the father is attainted of treason and felony, and suffers death, the son shall inherit. A wife shall be endowed of a moiety of the gavelkind-lands, of which her husband died seised, during her widowhood. Likewise a husband may be tenant by curtesy of half his wife's lands, without having any issue by her; but if he marries again, not having issue, he forfeits his tenancy.

GAVELMAN, a tenant liable to pay tribute.

GAVELMED, the duty of mowing grass, required by the lord of his customary tenants.

GAVELCESTER, the same with Tolcester. See the article Tolcester.

GAVEREN, or Waveren, a town of the Austrian Netherlands, situated on the east-bank of the river Scheld: east long. 3° 35', north lat. 52°.

GAUGE, or GAGE. See GAGE.

GAUGE-LINE, on the gauging-rod. See the article GAUGING.

GAUGE-POINT, of a solid measure, the diameter of a circle, whose area is equal to the solid content of the same measure. Thus, the solidity of a wine-gallon being 231 cubic inches, if you conceive a circle to contain so many inches, the diameter of it will be 17. 15; and that will be the gauge-point of wine-measure.

And an ale-gallon, containing 282 cubic inches, by the same rule, the gauge-point for ale-measure will be found to be 19.15. After the same manner, may the gauge-point of any foreign measure be obtained; and from hence may be drawn this consequence, that when the diameter of a cylinder, in inches, is equal to the gauge-point of any measure, given likewise in inches, every inch in length thereof will contain an integer of the same measure, e. gr. in a cylinder whose diameter is 17.15 inches, every inch in height contains one entire gallon in wine measure; and in another, whose diameter is 18.95 inches, every inch in length contains one ale-gallon.

GAUGER, a king's officer, who is appointed to examine all tuns, pipes, hogheads, and barrels of wine, beer, ale, oil, honey, &c. and give them a mark of allowance, before they are sold in any place within the extent of his office.

There are divers statutes that mention this officer and his office; as by 27 Ed. III. c. 8. all wines, &c. imported are to be gauged by the king's gaugers, or their deputies, otherwise they shall be forfeited, or their value; and on default
of the gauger, that he be not ready to do his office when required, or that he de-
frauds in doing his office to the damage of the buyer or seller, he shall pay the
party griev'd his treble damage, lose his office, be punished by imprisonment, and
eranom'd at the king's will; and in
case less be found in the tun or pipe than
ought to be, the value of as much as
shall lack, shall be deducted in the pay-
ment.
Every gauger shall truly, within the li-
mits of his office, gauge all tuns, butts,
pipes, tierces, puncheons, tertiars, hog-
heads, barrels, and rundlets; and mark
on the head of every vessel the contents,
upon pain to forfeit to the party to whose
use the wine, &c. shall be sold, four times
the value of that which the vessel marked
shall lack of his content: the same for-
feiture shall be recovered by an original
writ, &c. and every person selling the
wine, &c. in the vessel marked, shall al-
low of the price, the value of the lack of
gauge, or default of filling, upon pain
of forfeiture to the buyer, double the
value, to be recovered with costs as be-
fore. No brewer shall put to sale any
beer or ale in vessels brought from beyond
the sea, within the city of London, or
suburbs of the same, or within two miles
from the coopers of London.

The art of gauging is that branch of the
mathematics called stereometry, or the
measuring of solids; because the capaci-
ties of all sorts of vessels used for liquors,
as cubical, parallelopipedal, cylindrical,
spheroidal, conical, &c. are computed
as though they were really solid bodies,
and reduced thereby to some known cu-
bic measure, as gallons, quarts, pints,
&c. The principal vessels that come
under its operation are pipes, barrels,
rundlets, and other casks; also backs,
coolers, vats, &c.
The solid content of cubical, parallelo-
pipedal, and prismatical vessels is easily
found in cubic inches, or the like, by
multiplying the area of the base by the
perpendicular height. And for cylintri-
cal vessels, the same is found by multi-
plying the area of the base by the perpen-
dicular altitude as before.

Casks of the usual form of hogheads,
kilderkins, &c. may be considered as se-
gments of a spheroid cut off by two planes,
perpendicular to the axis; which brings
them to Oughtred's theorem for mea-
suring ale and wine-casks, which is thus:
add twice the area of the circle at the
bung, to the area of the circle of the head;
multiply the sum by one third of the
length of the cask, the product is the con-
tent of the vessel in cubic inches.

But for accuracy, Dr. Wallis, Mr. Ca-
well, and others, think that most of our
casks had better be considered as frustums
of parabolic spindles, which are less than
the frustums of spheroids of the same
base and height, and give the capacity of
vessels nearer the truth than either Ought-
red's method, which supposes them spher-
oids; or than that of multiplying the
circles of the bung and head, into half
the length of the cask, which supposes
them parabolic conoids; or than that of
Clavius, &c. who takes them for two
truncated cones, which is farthest off of
all.

The common rule for all wine or ale-
casks, is to take the diameters at the
bung and at the head, by which you may
find the area of the circle there; then
taking two thirds of the area of the circle
at the bung, and one third of the area of
the circle at the head, and adding them
together into one sum; this sum multi-
plied by the internal length of the cask,
gives the content in solid inches; which
are converted into gallons by dividing by
28 x 2 for ale, and 33 for wine-gallons.

But gauging, as now practis'd, is chiefly
done by means of instruments called
gauging-rods or rulers, which do the busi-
ness as once, and answers the question
without so much calculation, which is no
inconsiderable addition both to the ease
and dispatch of the work, though it is
not so much to be depended on.

The methods of gauging which are most-
ly us'd, is by the four-foot gauging-
rod and Everard's sliding ruler: the de-
scription and uses of both are as follows:

The four-foot GAUGING-ROD (plate CXI.
fig. 5.) is usually made of box, and con-
stitutes of four rules, each a foot long, and
about three eighths of an inch square,
joined together by three bras-joints; by
which means the rod is rendered four feet
long.
GAU

When the four rules are opened, and but one foot when all are folded together.

On the first face of this rod, marked 4, are placed two diagonal lines, one for beer and the other for wine; by means of which the content of any common vessel in beer or wine-gallons, may be readily found, by putting the braided end of the gauging-rod into the bung-hole of the cask, with the diagonal lines upwards, and thrust this braided end to the meeting of the head and staves; then with chalk make a mark at the middle of the bung-hole of the vessel, and also on the diagonal lines of the rod, right against or over one another, when the braided end is thrust home to the head and staves; then turn the gauging-rod to the other end of the vessel, and thrust the braided end home to the end as before. Lastly, see if the mark made on the gauging-rod, come even with the mark made on the bung-hole, when the rod was thrust to the other end; which if it be, the mark made on the diagonal lines, will, on the same lines, shew the whole content of the cask in beer or wine-gallons. If the mark made on the bung-hole be not right against that made on the rod, when you put it the other way, then right against the mark made on the bung-hole, make another on the diagonal lines; and the division on the diagonal line, between the two chalks, will shew the whole content of the vessel in beer or wine-gallons.

Thus, e. g. if the diagonal line of a vessel be 28 1/2 inches, its content in beer-gallons will be nearly 51, and in wine-gallons 62.

If a vessel be open, as a half barrel, tun, or copper, and the measure from the middle on one side to the head and staves be 38 inches, the diagonal line gives 122 beer-gallons; half of which, viz. 61, is the content of the half tub.

If you have a large vessel, as a tun or copper, and the diagonal line taken by a long rule be 70 inches; then every inch at the beginning-end of the diagonal line call 10 inches; thus 10 inches become 100 inches; and every tenth of a gallon call 100 gallons; and every whole gallon call 1000 gallons.

On the second face, 5, are a line of inches and the gauge-line, which is a line expressing the areas of circles (whose diameters are the correspondent inches) in ale-gallons: at the beginning is wrote Ale-area. Thus, to find the content of any cylindrical vessel in ale-gallons: seek the diameter of the vessel in inches, and just against it, on the gauge-line, is the quantity of ale-gallons contained at one inch deep; this multiplied by the length of the cylinder, will give its contents in ale-gallons.

On the third face, 6, are three scales of lines; the first, at the end of which is written Hoghead, is for finding how many gallons there are in a hoghead, when it is not full, lying with its axis parallel to the horizon. The second line, at the end of which is written B. L. is for the same purpose. The third is to find how much liquor is wanting to fill up a butt, when it is standing; at the end of it is wrote B. S. signifying butt standing.

Half way the fourth face of the gauging-rod, 7, there are three scales of lines, to find the wants in a firkin, kilderkin, and barrel, lying with their areas parallel to the horizon. They are distinguished by the letters F. K. B. signifying a firkin, kilderkin, and barrel.

The use of the lines on the two last faces is very easy; you have only to put it downright into the bung-hole to the opposite staves, if the vessel, you want to know the quantity of ale-gallons contained therein, be lying: and then where the surface of the liquor cuts any one of the lines appropriated to that vessel, will be the number required.

Everard's sliding-rule is principally used in gauging, being ordinarily made of box, a foot long, an inch broad, and 1 1/2 inch thick, with two small scales to slide in it, which may be drawn out, one towards the left hand, and the other towards the right hand, till the whole be 3 feet long. See plate CXII.

The principal lines on the instrument are those commonly known by the name of Gunter's line, or Line of numbers, which are here distinguished one from another by certain letters, set at the end of the lines, towards the right hand; thus the lines D are each of them one single line of numbers, beginning at the end of the rule towards the left hand, and from hence continued to the other end. The lines A, B, and C, are called double numbers, each being two lines or radiuses of numbers; the line E is called triple numbers; the line F is called the single line of numbers; the line G is called the single line; and all to the same point. On the lower part of the slide there is an account of the distance covered by the instrument.
which is marked M B. to signify that the number it is set against, 2150.42, is the cubic inches in a malt-bushel. The other two are marked with A. to signify that the numbers they are set against, 283, are the cubic inches in an ale-gallon. Close to the figure 7, in the first radius on the same line, is a dot marked f. set exactly over .707, denoting .707 to be the side of a square inscribed in a circle, whose diameter is unity. Close to 9 is another dot, marked f e. set over .886, which is the side of a square, equal to the area of a circle, whose diameter is unity. Another dot nigh W, is set over 231, the cubic inches in a wine-gallon; and another near C, is set over 3.141592, the circumference of a circle, whose diameter is unity. The line marked M D. signifies malt-depth, is no more than a line of numbers in a reverse order, the number x being set directly against M. B. on the first radius, and is of exceeding great use in calling up of malt-gauges.

On the line D. there are four center-pins, the first, marked W G. is the gauge-point of a wine-gallon, i.e., the diameter of a cylinder whose height is 1 inch, and content 231 cubic inches, or a wine-gallon, which is 17.15 inches. The second center-pin, marked A G. stands at the gauge-point for an ale-gallon, which is 18.95 inches. The third, M S. stands at 46.3, the side of a square, whose content is equal to the inches of a solid bushel. The fourth, M R. is the gauge-point for a malt-bushel, which is 52.32 inches. The two lines of segments are each numbered from 1, 2, &c. to 100: the first is for finding the weight of a cask taken as the middle frustum of a spheroid, lying with its axis parallel to the horizon: and the second for finding the weight of a cask standing.

Again, on one of the narrow sides, noted e, are, 1°, a line of inches, numbered 1, 2, 3, &c. to 12, each subdivided into 10 equal parts. 1°. A line, by which, with that of inches, we find a mean diameter for a cask, in the figure of a middle frustum of a spheroid. 3°. A line for finding the mean diameter of a cask in the figure of the middle frustum of a parabolic spindle, which gaugers call the second variety of casks. 4°. One for the third variety, which is of a cask in the figure of two parabolic conoids abutting on a common base.

On the other narrow face, marked f, are, 1°. A foot, divided into 100 equal parts, marked F M. 2°. A line of inches, noted 1 M. 3°. A line F C. for finding the mean diameter of the fourth variety of casks, which is the middle frustum of two cones, abutting on a common base.

On the backside of the sliding-piece is a line of inches from 13 to 36, when the two pieces are put endwise: and against that, the correspondent gallons, or hundred parts, that any small or like open vessel, from 13 to 36 inches diameter, will contain at one inch deep.

The use of the sliding-rule in some parts of arithmetic.

Problem I. Having two numbers given, to find a third geometrically proportional unto them; and to three, a fourth; and to four, a fifth, &c.

Find one of the numbers given, upon the line B, and set it against the other given number, on the line A; then find the same number on B (which was last counted) upon A; and against this third upon B, is the fourth on A. In like manner, against the fourth on B, you have the fifth on A, &c.

Example. Let it be required to find a third proportional to these two numbers, 2 and 4, which may bear the same proportion to 4, that 4 does to 2?

Draw out the sliding-rod, till 2 upon B stand against 4 upon A; then against 4 upon B, is 8 (the third proportional) upon A; and against this third (viz. 8) upon B, is 16 upon A, which is the fourth proportional, &c. Contrariwise, if it were required to find a third proportional to the same numbers, 2 and 4, which may bear the same proportion to 2, that 2 bears to 4? Set 4 in the second radius upon A, to 2 upon B; then against 2 upon A (towards the left hand) is 1, the third proportional; and against 1 upon A, is .5, the fourth upon B: also against this fourth upon A, is .25, the fifth proportional on B, &c.

Problem II. One number being given to be multiplied by another, to find the product. In multiplication, either of whole numbers, mixed or decimal fractions, the proportion is,

As 1: the multiplicator: the multiplier: the product.

Example. Let it be required to multiply 6 by 4. The proportion then is as 1 : 4 :: 6 : 24. Therefore set 1 upon the line B, to 4 upon the line A; then against 6 upon B, is 24, the product sought, upon A.
Everard's Sliding Rule.
Problem III. One number being given to be divided by another, to find the quotient. In division, both of whole numbers and mixed, the proportion is, as the divisor is to 1, so is the dividend to the quotient.

Example. Let it be required to divide 24 by 4, the proportion is, as 4:11: 24:6. Therefore set 4 upon B, to 1 upon A; and then against 24 upon B, is 6 upon A, which is the quotient sought.

Problem IV. Three numbers being given, to find a fourth in direct proportion.

Rule. Set the first number upon B, to the second upon A, and then against the third number upon B, is the fourth number sought upon A.

Example. If 8 quarters of malt will make 20 barrels of small beer, how many barrels of such beer will 22 quarters make?

Set 8 upon B, to 20 upon A; and then against 22 upon B, is 55 upon A; and so many barrels will 22 quarters make.

Problem V. To three numbers given, to find a fourth in an inverted proportion.

Rule. Set the third number upon A, to the first (being of the same denomination) upon B; and then against the second number upon A, you have the fourth upon B.

Example. If 8 men do any piece of work in 9 days, in how many days can 12 men do the same work?

Set 8 upon A, to 9 upon B; then against 9 upon A, is 6 upon B, which is the answer. For 12 men may do the same work in 6 days, which 8 men will do in 9 days.

Problem VI. Between two numbers given to find a mean geometrical proportional.

Rule. Set one of the numbers given upon C, to the same number upon D; and then against the other given upon C, is the geometrical mean sought upon D.

Example. Let the numbers given be 50 and 72, to find a geometrical mean, &c.

Set 50 upon C, to 50 upon D; and then against 72 upon C, is 60 upon D; so 60 is the geometrical mean between 50 and 72. Or thus, set 72 upon C, to 72 upon D; and then against 50 upon C, is 60 upon D, the mean as before.

To find the square or cube roots of any number, let the lines C and D for the first, and D and E for the second, be applied to one another, so that 10 at the end of D be even with 10 at the end of C; and 10 at the end of D be even with 10 at the end of E; the lines in this case are like a table, shewing the square or cube roots of any number by inspection; for against any number upon C, you have the square root thereof upon D; and against any number upon E, you have the cube root thereof upon D: & c contra.

The use of the rule in measuring superficies: and first of a circle.

Problem I. The diameter or circumference of a circle, either being given, to find the other. The circumference of that circle whose diameter is unity, is 3.1415926536; but for practice, the four first figures are sufficient; therefore, as 3.1415: the diameter of any circle to its circumference. By the rule thus, set 1 upon the line A, against 3.1415 on B; then against any diameter on the line A, you have the circumference on B: & c contra.

\[
\begin{align*}
20 & \quad \text{you have the} \\
30 & \quad \text{circumferences} \\
40 & \quad \text{the number} \\
50 & \quad \text{divisible}
\end{align*}
\]

Or contrariwise against 20 you have 6.366 of those circumferences 30, 9.549 40, 12.732 50, 15.915

Problem II. The diameter of any circle being given, to find the area (or any part thereof) in inches, or in ales or wine-gallons. I. For the whole area in inches. The area of a circle is equal to the product, or rectangle, of half the diameter into half the circumference; that is, if half the diameter be multiplied by half the circumference, the product will be the area: thus, when the diameter is 1, the circumference is 3.1415, the half of which is 1.5707, which multiplied by half the diameter \( \pi \) the product will be the area of that circle, whose diameter is 1, viz. \( \pi \).

The areas of all circles are in proportion one to another, as the squares of their diameters: therefore, as the square of the diameter of any circle is to the area of that circle, so is the square of the diameter of any other circle to the area thereof. Now as the square of 1 is but 1, it must be as \( \pi \) 1.785398: square of the diameter of any circle to the area thereof. So \( \pi \) 1.785398 is a fixed multiplicant; and if an unit with cyphers be divided by \( \pi \), the quotient will be 1.7324, a fixed divisor: and by either of these numbers may the area of any circle be found, either by multiplication or division. For if the squares of any diameter be multiplied or divided by these numbers.
numbers, the product or quotient will be the area in inches, feet, or yards, according as the diameter was measured in inches, feet, &c.

But with more expedition by the rule. Set 1 upon the line D, to .785398 upon C. The rule being thus set, the lines are like a table of circles, areas to all diameters; for against any diameter upon the line D, you have the area thereof upon C. Thus if the diameter is 20, the area is 314.1593; if it is 25, the area is 490.87 inches. And on the contrary if the area is 300, the diameter is 19.543; if 400, the diameter is 22.46 inches.

The area in inches divided by 282, the cubic inches in an ale-gallon, or by 231 for wine-gallons, gives the area for either respectively; or you may use any other divisor, according to the measure you want. But without knowing the inches contained in any area, the area in gallons may be found thus: divide .785398 by 282, the quotient will be .0027851 ale-gallons; or by 231, for wine-gallons, and it gives .0033995. These numbers are the areas of circles in ale and wine-gallons, whose diameters are 1; and are fixed multipliers for finding the area of all circles in either of these measures; for if the square of the diameter of any circle be multiplied by either of these numbers, the product is the area in ale or wine-gallons respectively.

If you would effect this by division, the several divisors are thus found: multiply the divisor for finding the area in inches, viz. 1.27324, by 282, or 231, the products 359.05 for ale-gallons, and 294.11 for wine-gallons, are the divisors sought. And the square of the diameter of any circle divided by one of these, gives the respective area.

But the area of any circle may be more readily found by the help of fixed numbers, called gauge-points; and these numbers are the diameters of those circles whose content, at 1 inch deep, is equal to the respective gallon to which they belong. They are the square roots of the divisions last mentioned, that for A.G. being .895, for W. G. 17.15, on the rule: thus, set .895 (the gauge-point for ale-gallons) upon D, to 1 upon C; then against any diameter upon D, you have the area upon C. The like for wine-gallons, by the proper gauge-point. Note, when the area of any circle is sought in ale-gallons, if the diameter be more than 18.95 and less than 100, set the gauge-point upon D, to 1 at the beginning of C. Or when the diameter is less than the gauge-point, or more than 100, then set the gauge-point to 1, in the middle upon C. Lastly, to find any part of the area, let the gauge-point to $\frac{1}{2}$, or $\frac{1}{4}$, or any other part of 1, then against the diameter you have the like part of the area.

From what has been said, it will not be difficult to use the rule in gauging the areas of all right-lined figures; and when the area is found, the solidity is easily obtained. Thus, for example, the diameter, depth, and content of any cylindrical tun, any two being given, to find the third. In this problem are three questions, all resolved at once setting the rule: 1. By the depth and content to find the diameter. Example. Suppose the depth 40 inches, and the content 1800 ale-gallons, what is the diameter?

Set 40, the depth, upon C, to the gauge-point upon D; then against 1800, the content, upon C, is 127.1 inches, the diameter sought.

2. By the diameter and content, to find the depth, without moving the rule: say As 127.1, the diameter, is to 1800, the content, so is the gauge-point upon D, to 40, the depth.

3. By the depth and diameter, to find the content, the rule standing as before: say As the gauge-point is to 40, the depth, so is the diameter, upon D, to 1800, the content, upon C.

Note, as a circle is the base of a cylinder, so a triangle, quadrangle, or any other plane superficies, may represent the base of a prism: for if there be planes erected perpendicularly upon the lines which encompass any such superficies, they will generate a solid, which may be called a prism, and the content of any such solid is found by multiplying the area of the base by the altitude, or distance from one base to another.

The use of the rule in gauging malt. The duty upon malt is charged upon the bushel, and so proportionally for greater or lesser quantities. The bushel here intended is the Winchester-bushel, which contains 2150.42 solid inches, but 2150 will be near enough for practice.

If the area in inches, of any plane figure, be divided by 2150, the quotient shews the bushels and parts of a bushel, which such a figure or vessel contains:
one inch deep. Example. There is a

cilcmen or vat, whose base is a rec-
tangular parallelogram, the length is 72 inches, and the breadth 48 inches, what is the
area, at 1 inch deep? Ans. 1,667,
that is, 1 bushel and .607 thousand parts of
a bushel. For 72 multiplied by 48,
is 3,456; and this divided by 2,150, gives
1,667. But the area of any figure may
be more readily found by the lines A and
B, upon the rule: thus, as 2,150 upon
A, is to one of the sides upon B; so is
the other side upon A, to the area upon
B: so in the example above, set 2,150
upon A, to 72 upon B; then against
48 upon A, is 1,607 upon B. Or set
2,150 upon A, to 48 upon B; then against
72 upon A, is 1,607 upon B.

The area thus found, being multiplied
by the mean depth in inches, gives the
content of such a cilcmen at that depth
and so for any quantity of malt upon
the floor; but care must be taken in
finding the mean depth of any quantity
of malt, either in the cilcmen or upon
the floor, by reason of the unevenness
of the surface of the malt; and of
the bottom of the cilcmen or floor upon
which it was laid; in order to which,
take the depth in 6, 8, or 10 places;
and all these depths together, and
divide the sum by the number of places
in which the depths were taken, the quo-
tient will be the mean depth required.

Barley is sometimes steeped in round
vessels, and the area of a circle in bu-
shels is thus found: take the diameter
in inches; and let the square thereof be
multiplied by .003653, or divided by
2737.47, the product or quotient will be
the area sought.

Example. Suppose the diameter of any
vessel be 60 inches, this squared is 3600,
and this multiplied by .003653, or di-
vided by 2737.47, gives 132, the area
required.

But for any round vessel, the rule gives
the area in bushels by inspection, by help
of a certain number called the gauge-
point, which in this case is 52.32 (being
the diameter of a circle, whose area is
2150, the 6d. lid inches in a bushel). Thus
in the example above, the diameter was
60 inches, therefore set the gauge-point
(viz. 52.32) upon D, to 1 upon C; then
against 60 upon D, is 1.315, the
area upon C. And the rule being thus
set against any diameter upon D, you
have the area upon C.

But a cilcmen, couch, or floor-gauge may
be more speedily and expeditiously call
up by the line M D, signifying malt
depth. On this line always find the
depth of the cilcmen, couch, or floor;
thcn lay, as the depth upon the line M D,
is to the length or breadth upon B, so is
the length or breadth upon A, to the
content in malt-bushels upon B. Ex-
ample. Admit a floor whose length is
160, breadth 132, and depth 8.1 inches,
what is the content in malt-bushels?

Operation by the rule.

Set the depth 8.1 on M D, to the length
160 on the line B; then against the
breadth 132 upon A, you have 79.5
upon B, the content in malt-bushels.

Thus,

\[
\begin{align*}
M & : D & : B & : A & : B \\
8.1 & : 160 & : 132 & : 79.5
\end{align*}
\]

Or thus:

\[
\begin{align*}
M & : D & : B & : A & : B \\
8.1 & : 132 & : 160 & : 79.5
\end{align*}
\]

GAULE, in botany, the same with myrica.

See the article MYRICA.

GAUNT-BELLIED, in the manage, is
said of a horse whose belly shrinks up to-
wards his flanks.

GAUNTLET, or GANTLET. See the
article GANTLET.

GAVOTTIA, or GAVOTTE, is a kind of
dance, the air of which has two brisk and
lively strains in common time, each of
which strains are played twice over.
the first has usually four or eight bars,
and the second contains eight, twelve, or
more. The first begins with a minim,
or two crotchets, or notes of equal va-
"lue, and the hand rising; and ends with
the fall of the hand upon the dominant
or median of the mode, but never upon
the final, unless it be a rondéau: and the
last begins with the rise of the hand, and
ends with the fall upon the final of the
mode. See RONDEAU, DOMINANT, &c.

Tempi di GAVOTTA is when only the time
or movement of a gavotte is imitated,
without any regard to the measure, or
number of bars or strains.

Little airs are often found in sonatas, which
have this phrase to regulate their motions.

GAURS, in matters of religion, an antient
feet of the magicians in Peru. They
have a suburb at Ifpahan, which is call-
ed Gaurabad, or the town of the gaurs,
where they are employed only in the mean-
left and vilest drudgery: but they chiefly
abound in kerman, the barrenest pro-

8 Q.2 vince
(vience in all Peria, where the mahometans suffer them to live with some freedom, and in the full exercize of their religion. Some years ago many of them fled into India, where their posterity remain to this day. They are a poor harmless sort of people, zealous in their superstition, rigorous in their morals, and exact in their dealings: they profess the worship of one God alone, the belief of a resurrection, and a future judgment, and utterly detest all idolatry, though the mahometans believe them to be the most guilty of it. It is true, they perform their worship before fire, for which they have an extraordinary veneration, as believing it to be the most perfect emblem of the deity. They have the same veneration for Zoroafter that the Jews have for Mozes, esteeming him a prophet sent from God.

GAWSE, or GAWZE, in commerce, a very light, thin, open kind of stuff, made of silk, and sometimes of thread; there are also figured gawzes, and some with gold or silver flowers on a silk ground.

GAZER, or GAZER, in zoology, the name of several species of goat: as, 1. The african gazella, called alio antelope and dorcas lybica, the horns of which are cylindric and half way arched. 2. The indian gazella, or antelope, with very long, cylindric, and straight horns, annulated at the base. 3. Another species of african gazella, with cylindric, arched, and perfectly annulated horns. This last is a small, but very beautiful species, and greatly resembles the common deer in shape: the horns, which arise from the middle of the forehead, are of a beautiful black colour, and annulated all the way from the base to the very tips. See a figure of it in plate CXIII. fig. 1.

GAZETTE, a news-paper, or printed account of the transactions of all the countries in the known world, in a loose sheet or half sheet. This name is with us con-

fined to that paper of news published by authority.

The word is derived from gazetta, a venetian coin, which was the usual price of the first news-paper printed there, and which was afterwards given to the paper itself.

GAZON, in fortification, pieces of fresh earth, covered with grass, and cut in form of a wedge, about a foot long and half a foot thick, to line the outsides of works made of earth, as ramparts, parapets, &c. The first bed of 'gazons is fixed with pegs of wood; the second bed should be so laid as to bind the former, by being placed over its joints; and so continued till the works are finished. Between these beds it is usual to sow all sorts of binding herbs, in order to strengthen the rampart.

GEAR, or About your GeaR, in the fes-

GELD, in our old customs, a faxon word signifying money, or tribute: also a com-

pensation for some crime committed. See the article GELD.

Hence wergeld, in our antient laws, was ufed for the value of a man slain; and orfgeld, of a beast. See ORFGELD.

Foot-GELD. See the article Foot-GELD.

Horn-GELD. See the article HORN-GELD.

Wood-GELD. See WOOD-GELD.

GELDABLE LANDS, &c. See Taxable.

GELDERLAND, comprehending Zut-

phen, is a province of the united Ne-

therlands, bounded by the Zuider-see and

Overijssel on the north, by Westphalia on

the
GELDING, the operation of castrating any animal, particularly horses.

This operation consists in cutting out the testicles; in performing which, three things are to be observed: first, regard is to be had to their age; next, to the season of the year; and, lastly, to the state of the moon. For the first, if the operation is to be performed on a colt; he may be gelded at nine or at fifteen days old, if the testicles be come down, in regard the sooner he is geld the better it will be for his growth, shape, and courage; though a horse may be gelded at any age, if proper care be taken in the cure. As for the second, the best time is about April or May, or else about the latter end of September. And for the third, the wane of the moon is the best.

The manner of gelding is as follows: the beast being castrated down on some soft place, the operator takes the stones between his forefoot and his great finger, and slitting the cod, presses the stones forth; then taking a pair of nippers, made very smooth, either of steel, box, or brasil-wood, he clapsthe strings of the stones between them, very near to where the stones are set on, and presses them so hard, that there may be no flux of the blood; then, with a thin, drawing cauteryizing iron, made red-hot, sears away the stone.

This done, he takes a hard plaster made of rosin, wax, and washed turpentine, well dissolved together, and melts it on the head of the strings: that being done, he sears them, and melts more of the salve, till such time as he has laid a good thickness of it upon the strings. This being done to one stone, the nippers are loosed, and the like is done to the other; and the two slits of the cod are then filled with white oil, and the outside of the cod is anointed with hogs-grease; and thus they let him rise, and keep him in a warm stable, without tying him up.

If he swells much in his cods or sheath, they chase him up and down; and make him trot an hour in a day, and he soon recovers.

The manner of gelding a hog is as follows: the operator, after having made two crost slits, or incisions, on the midit of the stones, presses them out, and anoints the fore with tar. But another more general method, yet somewhat more dangerous, if not well done, is first to cut the stone on the top, and after having drawn that one forth, the operator puts in his fingers at the same slit, and, with a lancet, cuts the skin between the two stones, and by that slit presses out the other stone. Then having cleaned out the blood, he anoints the part with fresh grease: and thus there is but one incision made in the cod. Boar-pigs ought to be geld about six months old; yet they are commonly gelded about three weeks or a month old.

GELDING of a lamb may be performed from the age of three days to three weeks or more, in the following manner: one is to hold the lamb between his legs, or in his lap, and turn him on his back, holding his fore-feet upright together (but if any black spots are seen in his flank, he must not be cut at all), then the cutter, holding the tip of the cod in his left hand, cuts the lap of it an inch quite away; which done, he, with the foremost fingers and thumbs of both hands, should softly slip down the cod over the stones, to the belly, and with his teeth, holding the left stone in his mouth, he draws it softly out the length of the string; after which he is to draw out the other stone in the same manner; then he spits in the cod, and anoints the lamb’s flanks with fresh grease, and so lets him go, and keeps flittering him up and down for two or three hours.

GELDRES, a city of Gelderland, situated twenty-three miles south of Nimoguen: east longit. 6° 8’, and north lat. 51° 35’.

This city, with the territory about it, was yielded to the king of Prussia, by the treaty of Utrecht.

GELENHAUSEN, an imperial city of Germany, governed by its own magistrates; it is situated nine miles north of Hanau; east longit. 3° 56’, and north lat. 50° 15’.

GEOLOGY, a kind of divination drawn from laughter; or a method of knowing the qualities and character of a person, acquired from the consideration of his laughter.

GEM, gemma, in natural history, a common name for all precious stones, of which there are two classes, the pellucid and semipellucid.
The bodies composing the class of pel- lucid gems are bright, elegant, and beauti- ful foils, naturally and effentially compound, ever found in small detached masses, extremely hard, pellicid, and of great luster; composed of a very firm and pure matter, without any admixture of earthy substance, giving fire with steel, not fermenting with acid menstruums, and very difficultly calcinable in the fire. Of this class there are two genera, the chrostafima, and the chroastaces. See CHROASTIMA and CHROASTACES.

The bodies composing the class of semi- pellicid gems, are stones naturally and effentially compound, not inflammable nor soluble in water, found in detached masses, and composed of crystalline matter, debaied by earth: however, they are but slightly debaied, and are of great beauty and brightness, of a moderate degree of transparency, and are usually found in small masses.

Of this class there are two orders: the first of which consists of the semipellucid gems, of but two variegations, and frequently of one plain, simple colour; tho' sometimes veined: this order contains four genera, viz. the fardons, the chalcedonies, the hydrophans, and the prussian. See the articles SARD, CHALCEDANY, HYDROPHAN, and PRUSSIAN.

The second order of semipellucid gems, consisting of those remarkable for their veins, zones, and variegations, contains also four genera, viz. the achatæ, the onychæs, the fardonyches, and the cameo. See the articles ACHATÆ, ONYCHÆS, SARDONYCHÆS, and CAMEÆ.

Many authors, not only among the antients but the moderns, are full of the virtues and medicinal properties of precious stones; but their reputation, in this respect, is now not a little fallen. Yet as the fragments of such stones are still preserved by the physicians in some of the most celebrated compositions, as there are certain chemical preparations made of them, as several perons of the greatest candour and experience have related many considerable effects of certain gems, on their own particular observations, and, lastly, as it is no way improbable that some of the softer stones may have some considerable operations on the human body, it might be imprudent indiscriminately to exclude from them any medicinal virtue at all. When much the greater part of their traditioary qualities are set aside as 'fabulous, there will remain some on as real and well warranted a footing, as many of our other medicines.

On such considerations the excellent Mr. Boyle was induced to give us that extraordinary piece of the origin and virtues of gems, the purport whereof is to shew, that such stones were originally in a fluid state, or are made up of such substances as were formerly fluid; and that many of their general virtues are probably derived from the mixture of metallic and other mineral substances, usually incorporated with them; while the great variety and the particular efficacy of their virtues, arise from some happy concurrent substancess of that composition, e. g. the peculiar nature of the impregnating liquor, the proportion wherein it is mixed with the petrefcent juice, and the like.

To support this hypothesis of the virtues of gems, he shews, that several of them are not simple concretions of any petrefcent liquors, but consist also of other adventitious parts, which he argues from the separability of such substances in some stones, the specific gravity in others, and the different tints and colours to be met with in gems of the same species. There may, therefore, be in some gems numbers of adventitious corpuscles; and there is reason to think, that some of these corpuscles may be endued with several properties and medicinal virtues.

The effects of what is objected to them is this: the mineral substances they contain are so closely locked up, that they can communicate nothing to the body, and so can have no medicinal operation; being unconquerable by so small a heat, as that of the stomach, and other parts of the body.

This objection might be plausible enough to prevent the ascribing any medicinal virtues to them, a priori, but can conclude nothing against what is warranted by so many facts and observations, especially when there are several particulars that obviate this objection. For a vigorous loadstone, though frequently harder than many gems, is known to emit copious effuvia; and there are many which have been found to have a manifest and inconvenient operation on the body, by being worn in the pocket, or long held in the hand.

"The hydrostatical balance, says Mr. Boyle, is of prime use in discovering genuine
GEM

...genuine gems from counterfeits, which... but too often pass for true, to the prejudice of physicians and their patients, and the loss of lapidaries: for as there are, perhaps, no qualities of bodies more essential than their ponderosity, so there is scarce any where in impurities and more difficulty to make a notable alteration without being discovered... See the article HYDROSTATICAL BALANCE.

Imitation or counterfeiting of Gems in glass.
The art of imitating gems in glass, is too considerable to be passed without notice; some of the leading compositions therein, we shall briefly mention upon the authority of Neri. See GLASS.

These gems are made of pastes, and are no way inferior to the native stones, when carefully made and well polished, in brightness or transparency, but want their hardnes. See the article PASTE.
The general rules to be observed in making the pastes, are these. 1. That all the vessels in which they are made be firmly luted, and the lute left to dry before they are put into the fire. 2. That such vessels be chosen for the work, as will bear the fire well. 3. That the powders be prepared on a porphyry-flone, not in a metal mortar, which would communicate a tinge to them. 4. That the just proportion in the quantity of the several ingredients be nicely observed. 5. That the materials be all well mixed, and if not sufficiently baked the first time, to be committed to the fire again, without breaking the pot: for if this be not observed, they will be full of blisters and air-blisters. 6. That a small vacuity be always left at the top of the pot, to give room to the swelling of the ingredients.

To make paste of extreme hardnes, and capable of all the colours of the gems, with great lustre and beauty. Take of prepared crystal, ten pounds; salt of polverine, six pounds; sulphur of lead, two pounds; mix all these well together into a fine powder; make the whole with common water into a hard paste; and make this paste into small cakes of about three ounces weight each, with a hole made in their middle; dry them in the fun, and afterwards calcine them in the straights part of a potter's furnace. After this, powder them, and levigate them to a perfect finenes on a porphyr, and set this powder in pots in a glass-furnace to purify for three days; then cast the whole into water, and afterwards return it into the furnace, where let it stand fifteen days, in which time all foulness and blisters will disappear; and the paste will greatly resemble the natural jewels.

To give this the colour of the emerald, add to it brae thrice calcined; for a sea-green, braes simply calcined to a redness; for a sapphire, add zaffer, with manganee; and for a topaz, manganee and tartr. All the gems are thus imitated in this by the same way of working as the making of coloured glases; and this is so hard, that they very much approach the natural gems.

The colour of all the counterfeit gems made of the several pastes, may be made deeper or lighter, according to the work for which the stones are designed; and it is a necessany general rule, that small stones for rings, &c. require a deeper colour, and large ones, a paler: besides the colours made from manganee, verdigrase, and zaffer, which are the ingredients commonly used, there are other very fine ones which care and skill may prepare. Very fine red may be made from gold, and one not much inferior to that from iron: a very fine green from brass or copper: a sky-colour from silver, and a much finer one, from the granates of Bohemia.

GEMARA, in Jewish antiquity, a collection of decisions and determinations on the law, wrote after the Misna was completed.

It was called gemara, or perfection, because it was considered as fo perfect an explication of the law, that after it no farther additions could be made, or anything more desired. It is otherwise called the talmud. See TALMUD.

GEMATRIA, or GEMATRIE, in Jewish antiquity. See the article CABBALA.

GEMBOURS, a town of the Austrian Netherlands, in the province of Brabant, situated on the river Orne, ten miles north-west of Namur: east long. 4° 30', and north lat. 50° 36'.

GEMELLES, in heraldry. See the article BAR-GEHEL.

GEMELLUS, in anatomy, the name of two muscles, both of which are small, flat and narrow, and situated almost transversely one above the other, between the tuberosity of the ilium and the great trochanter, immediately below the pyriformis, and parted by the tendon of the obturator internus.

The superior and smallest gemellus is fixed.
fixed to the lower part of the spine of the ilium, to the superior part of the small iliac notch, and is continued under the acetabulum where it is bent downwards. The inferior and largest gemellus, is fixed to the superior and back part of the tuberosity of the ilium, and bending upwards towards the other fine, together it forms a sort of irregular semicircle.

GEMMINATED COLUMN. See the article COLUMN.

GEMINI, the twins, in astronomy, one of the twelve signs of the zodiac, the third in order, beginning with aries. See the articles SIGN and ZODIAC.

This constellation, according to different authors, contains from 24 to 89 stars. It is represented by the figure of two twin-children, looking each other affectionately in the face, and supposed to be Castor and Pollux.

GEMMA, gem, in natural history. See the article GEM.

Sal GEMMAE, is the purest and finest fossil falt, and an extremely bright and beautiful fossil. It is considerably hard and firm, and at least as pellucid as rock crystal; but is frequently coloured throughout with a milky-white, which takes off greatly from its lustre; and as crystal is liable to be tinged with red, green and yellow, so as to resemble rubies, sapphires, emeralds, and topazes, so this salt is sometimes tinged with these several colours; but rarely preserves the transparency of crystal under the same circumstances. See the article SALT.

GEMONIÆ SCALÆ, in roman antiquity, a place for executing criminals, not unlike Tyburn with us. It was situated on the Aventine mount, or tenth region of the city; and was, according to some, a place raised on several steps, from whence they precipitated the criminals. But others will have it to have been a kind of dungeon, to which they defended by steps.

GEMOTE, a term used in old laws-books for a court. See the article MOTE.

GEMUND, a town of Germany, in the circle of Welfphalia, and dukedom of Juliers, situated on the river Roer: east long. 6° 15', and north lat. 50° 34'.

GEMUND, a town of Germany, in the circle of Swabia, and county of Reichberg, situated on the river Reims: east long. 9° 40', and north lat. 48° 45'.

GEMUND, a town of Germany, in the circle of Franconia, situated on the river Maine: east long. 9° 45', and north lat. 50° 8'.

GENA, the cheek, in anatomy, that part of the face between the nose and the ears. See the article FACE, &c.

GENE QUADRATUS. See QUADRATUS.

GENAP, a town of Brabant, situated on the river Dyle, fourteen miles south-east of Brussels.

GENDARMES, or GENS D'ARMES, in the french armies, a denomination given to a select body of horse, on account of their succeeding the antient gendarmes, who were thus called from their being completely clothed in armour. The king's body guards, the light horse of the royal house, and the musqueteers, are at present reputed to belong to the gendarmerie.

The grand gendarmes are a troop composed of about 250 gentlemen, who guard the king's person. The king himself is their captain, and one of the prime peers their captain-lieutenant, who has under him two lieutenants, three ensigns, three guidons, and other officers. There are besides theft, gendarmes of the queen, the dauphin, &c.

GENDER, gemus, among grammarians, a division of nouns, or names, to distinguish the two sexes. See NOUN and SEX.

This was the original intention of gender; but, afterwards, other words which had no proper relation, either to the one sex or the other, had genders assigned them, rather out of caprice than reason; which is at length established by custom. Hence genders vary according to the languages, or even according to the words introduced from one language into another. Thus arbor, in latin, is feminine; but arbore, in french, is masculine: and dem, in latin, is masculine; but dente, in french, is feminine. Nay, a gender has sometimes changed in the same language, according to time and occasion. Thus abhors, according to Priscian, was antiently masculine, but afterwards became feminine; and navire, was antiently feminine in french, but is now masculine. In english we have no genders; indeed we express the difference of sex by different words; as boar, sow; boy, girl, &c. We have also twenty-four feminines distinguished from the males by varying the termination of the female into efs; as actor, actres; prince, princes; heir, heires, &c. and we have a few words in which the feminine is distinguished from the masculines by the termination ix, as executor.
GENEA LOGICA ARBOR, or GENEALOGY, an appellation given to GENEALOGY, a town in the dutchy of Cleeve, miniltratrix, minine. The greek and latin have fides, the neuter, common, and doubtful gender. This last indeed is not common, for it properly belongs only to the names of some animals, which are pro­miscuously joined both to masculine and feminine adjectives, to express their male or female, as bos, canis, fus, &c. They have also the epicene gender, which is not a different one, but serves promiscuously for either; including both the kinds under one single gender and termination: thus vulpes, a fox, tho' it signifies either the male or female, is really of the feminine gender, in latin. And fo catastoda, watchmen or centinels, are really feminine, tho' they signify men. This is common to all languages that have them. The latin and greek, in the neuter gender, do not regard them, having no relation to the male or female sex, but what fancy gives them, and the termination of certain words.

The oriental languages frequently ne­glect the use of genders; and the perian language has none at all, which is no dis­advantage; the distinction of genders being entirely ufeless.

GENEALOGY, γενεαλογία, an enumeration of a series of ancestors; or a summary account of the relations and alliances of a perfon or family, both in the direct and collateral line.

GENEP, a town in the dutchy of Cleeve, in Germany, situated on the Nierfe and Maefe, ten miles weft of Cleeve: east long. 5° 20', and north lat. 51° 40'.

GENERAL, an appellation given to what­ever belongs to a whole genus. See GENUS. Thus we lay, general geography, diet, council, averment, issue, &c. See the articles GEOGRAPHY, DIET, &c.

GENERAL OFFICERS, in the army. See the article Officer.
a plurality. But they signify a genus, kind, or sort of things. See the articles Abstraction and Genus.

General of an army, in the art of war, he who commands in chief. See Army.

A general ought to be a man of great courage and conduct; to have great experience, and to be of good quality. His conduct appears in establishing his magazines in convenient places; in examining the country, that he may not engage his troops too far, while he is ignorant of the means of bringing them off; in subsisting them; and in knowing how to take the most advantageous posts, either for fighting or shunning a battle. His experience inspires his army with confidence, and an assurance of victory; and his quality, by creating respect, augments his authority. By his liberality he gets intelligence of the strength and designs of the enemy; and by this means is enabled to take the most successful measures. A general ought likewise to be fond of glory, to have an aversion to flattery, to render himself beloved, and to keep a strict discipline.

The office of a general is to regulate the march and encampment of the army; in the day of battle to choose out the most advantageous ground; to make the disposition of the army; to post the artillery; and where there is occasion, to send his orders by his aids de camp. At a siege, he is to cause the place to be invested; to order the approaches and attacks; to visit the works, and to send out detachments to secure his convoys.

General of horse, and General of foot, are posts next under the general of the army, and these have upon all occasions an absolute authority over all the horse and foot in the army. General of the artillery, or Master General of the ordnance. See ordnance.

General is also used for a particular march, or beat of drum; being the first which gives notice, commonly in the morning early, for the infantry to be in readiness to march.

General is also used for the chief of an order of monks; or of all the houses and congregations, established under the same rule. Thus we say, the general of the Franciscans, Cistercians, &c.

Generating Line, or Figure, in geometry, is that which by its motion produces any other plane or solid figure. Thus, a right line moved any way parallel to itself, generates a parallelo-

gram; round a point in the same plane, with one end fastened in that point, it generates a circle. One entire revolution of a circle, in the same plane, generates the cycloid; and the revolution of a semi-circle round its diameter, generates a sphere, &c. See the articles Cycloid, Sphere, &c.

Generation, generation, in physiology, the act of procreating and producing a thing which before was not; or, according to the schoolmen, it is the total change or conversion of one body into a new one, which retains no marks of its former state. Thus, we say, fire is generated, when we perceive it to be where before there was only wood, or other fuel; in the same manner, a chick is said to be generated, when we perceive it where before there was only an egg; or, the egg is changed into the form of a chick.

In generation, there is not properly any production of new parts; but only a new modification, or manner of existence, of the old ones.

When almighty God, says Dr. Blair, created the world, he so ordered and disposed of the matters mundi, that every thing produced from it should continue so long as the world should stand. Not that the same individual species should always remain; for they were in process of time to perish, decay, and return to the earth from whence they came; but that every like should produce its like, every species produce its own kind, to prevent a final destruction of the species, or the necessity of a new creation. For which end he laid down certain regulations, by which each species was to be propagated, preferred, and supported, till, in order and course of time, they were to be removed hence; for without that, thofe very beings, which were created at first, must have continued to a final dilution of all things; which almighty God of his infinite wisdom, did not think fit. But that he might still the more manifest his omnipotence, he fet all the engines of his providence to work, by which one effect was to produce another, by means of certain laws or rules, laid down for the propagation, maintenance, and support of all created beings. This his divine providence is called nature, and those regulations are called the laws or rules of nature, by which it ever operates in its ordinary course; and whatever recedes from that,
**GENERATION of animals.** According to Aristotle, the males contain the principle, and the females the matter of generation: for though both were furnished indeed, with a seminal liquor, yet the semen of the males alone was prolific. The moderns, on the other hand, as well those who contend for the sytem of generation from eggs, as they who adopt that of the animalcules in the male-feed, pretend that females have no such seminal liquor at all, and that what was commonly taken for it was some other animal fluid.

There are great and many difficulties which attend the most plausible account of the first formation of the parts of an animal, and the beginning of motion in its fluids: for though both reason and experience convince us, that all the parts of an animal did exist before generation; yet how this matter comes to assume so very different a form, as that of an embryo, is by no means agreed on.

Harvey is of opinion, that all females are furnished with eggs, and that the embryos, or young animals, are formed in the same manner as a chick in the egg of any bird. Generation, according to this celebrated physician, is effected wholly by means of the uterus, or womb; which conceives the fetus by a kind of contagion communicated to it by the male-feed, much in the same way as the load-lone communicates magnetism to iron. This contagion, he thinks, acts not only on the uterus, but is communicated to the whole body of the female, which is altogether prolific; though the uterus, he acknowledges, is the only part that is capable of conceiving the fetus, just as the brain is alone capable of forming ideas and notions. Agreeably to this doctrine of Harvey, Steno, and other anatomists, have pretended to discover certain eggs in the ovaries or testicles of women; which Mr. Buffon denies to be the case, affirming, that there are no such eggs to be found in the testicles or ovaries of women.

We cannot enter into a detail of the reasonings for and against the system of generation from eggs, and shall therefore only obviate, that its advocates pretend to have discovered eggs in all the females on which they made observations, that the largest of those found in women did not exceed the bigness of a pea; that they are extremely small in young girls under fourteen, but that age and commerce with men makes them grow larger; that there are more than twenty such eggs in each ovary or testicle; that they are fcedculated in the ovary by the spirituous and volatile part of the male-feed; that they afterwards are detached and fall into the uterus through the fallopian tubes; that here the foetus is formed of the internal fibritance of the egg, and the placenta of the exterior part. See the article FOETUS.

Leenenshoek is the author of another system of generation, from animalcules in the male feed. He tells us, he discovered many thousands of these in a drop less than a grain of sand. They are found in the semen of all males whatever, but not in that of females; and are so small, that 3,000,000,000 of them are not equal to a grain of sand, whole diameter is but the hundredth part of an inch. When any of these animalcules gets into an egg, fit to receive it, and this falls into the womb through the fallopian tubes, the humours which distil through the vessels of the womb, penetrating the coats of the egg, swell and dilate it, as the sap of the earth does feed thrown into it. The placenta begins to appear like a little cloud, upon one side of the external coat of the egg; and, at the same time, the spine of the embryo-animalcule is grown so big, as to become visible; and a little afterwards, the cerebrum and cerebellum appear like two bladders; and the eyes stand next goggling out of the head; then the beating of the heart or punishment, is plainly to be seen; and the extremities discover themselves last of all.

These animalcules are of different figures, some like tadpoles, and others like eels. In the semen of a man, and in that of a dog, there have been discovered two different kinds of them, the one supposed to be males, and the other females. Some even pretend to have seen animalcules di'engage themselves from the membranes that surround them; and that they then appeared perfectly like men, with legs, arms, &c. like those of the human body.

All the advocates for the system of generation from animalcules strongly oppose that from eggs. They contend, that these animalcules cannot be looked upon as being preternaturally miraculous, or monstrous.
upon as the inhabitants of the semen, since they were of greater extent than the liquor itself, and not to mention that no such animals are found in any other liquors of the body; and since females have nothing similar to these animals, they think it manifest that the prolific principle resides in males. When they are asked, to what purpose serves such an immense profusion of human animalcules, they answer, that it is agreeable to the ordinary course of nature, both in the animal and vegetable part of the creation. They likewise strengthen their system, by allowing the many examples we have of similar transformations in the insect-class of animals, which, from caterpillars and small worms, become winged animals of the butterfly, or fly-kinds.

By this system, says Mr. Buffon, the first woman cannot be said to have contained the whole race of mankind, as being all, according to it, the true pofterity of the first man, and in their animalcule-state contained only in him. On this principle, he proceeds to invalidate the system of generation from animalcules: for supposing the size of a man to be 1, then will that of one of the spermatic animalcules be \( \frac{1}{x} \); and as a man is to an animalcule of the first generation in the same ratio, that this animalcule is to an animalcule of the second generation, it follows that this last will be expressed by the fraction \( \frac{1}{x^2} \). In this manner he computes the size of the animalcules of several generations, all supposed to be living animals, notwithstanding that their minuteness exceeds the power of imagination to conceive; and then tells us, that the system of generation from eggs is liable to the same objections, whereof the detail may be seen in his Hist. Natur. tom. 2. p. 157, & seq.

As to Buffon's own system, he thinks that every part, both of animals and vegetables, contains an infinite number of organic molecules; that these molecules assume successively different forms, and are put into different motions, according to the circumstances they are in; but that they are much more numerous in the female liquors of both sexes, and the seeds of plants, than in other parts; that these organic molecules make the matter of nutrition; that this matter is always active, and tends to organization, forming itself into different shapes, according to the moulds it meets with. When the quantity of this organic matter is but small, as in man, and most large animals, generation only takes place at the age of maturity, and even then the number of animals produced is but small. The cafe is just the reverse in animals, which abound with this matter, as in fishes, and most birds.

With respect to the generation of mankind, the same author thinks it a certain fact, that the male-feed is received into the womb of the woman; and that, for this purpose, it is highly probable the internal orifice opens during the act of coition. The female-feed also makes its way into the womb, where being mixed with that of the male, they both together contribute to the formation of the foetus; which is either male or female, according as the seed of the man or woman abounds more with organic molecules; and the infant resembles either the father of mother, according to the different combinations of these molecules. Both these seminal liquors he thinks equally active in the formation of the foetus, and that they fix and counterbalance each other; the molecules of each parent being thereby determined to form similar parts to those of the individual that furnished them, as the head, trunk, arms, legs, &c. He thinks the molecules proceeding from the genital parts fix themselves first; and that the other molecules arrange themselves successively round these, in the same order which they before occupied in the parent. When a great quantity of the seminal liquors of both sexes is received into the womb, there are formed different spheres of attraction, in different parts of these liquors; the consequence of which is, that several foetuses are formed at the same time. See VEGETATION.

Nearly a-kin to Mr. Buffon's system is that of Mr. Maupertuis, which he has explained in his Venus Physique. He observes, that all the variety, obervable among mankind, may have been accidental at first; but being once established in the constitution of the parents, they become natural to their pofterity. To illustrate this, he gives an instance of a fossiligntary family at Berlin, who had six fingers, or six toes, and frequently both; and that this peculiarity was transmitted equally by the father and mother,
but was lost by alliances with those who had but the usual number of fingers or toes.

He farther observes, that most animals, excepting mankind, have flattened teatons for procreation, and that the females go with young some a longer; others a shorter time. Mares go from eleven to twelve months; cows and hinds go nine months, as do all women; foxes and wolves, five months; and hares go only seven weeks; cats nine weeks; and rabbits but thirty-one days. Molt birds are hatched in twenty-one days; the canary birds, and some others, are hatched in thirteen or fourteen days. It appears, therefore, that there is an endless variety in the time and manner of the generation of animals.

Those who desire a more full account of these sytems of generation may consult Harvey, Leewenhoek, Buffon, &c.

Parts of Generation. The parts of generation, in men, are the testicles, vasa deferentia, vesicule feminales, and penis. See the article Testicle, &c.

Those, in women, are the pudendum or vulva, the clitoris, nymphae, vagina, uterus or womb, ovaries, and fallopian tubes. See the articles Pudendum, Clitoris, &c.

Generation of Fishes. The opinion of most naturalists, that the female fishes first deposit their spawn, and that the males afterwards eject the semen upon it, is denied by Linnaeus; who thinks it impossible, that the eggs of any animal should be impregnated out of its body. He thinks it much more probable, that the males always eject their semen some time before the females deposit their spawn; and that by swallowing this semen, the spawn is impregnated in the body of the fish. Nay, he tells us, that he himself saw three or four females, in the spawning time, gather about the male, and greedily swallow the semen he ejected. This he observed in some species of the eel, sarch, and especially the cyprinus; but he recommends farther enquiry to be made on this subject.

Generation of Insects, no less than that of birds, is now certainly known to be from eggs; which the female deposits in places, where, at a proper season, they are hatched into animals like their parents; or into maggots, or worms, which, after several transformations, at last appear in the form of their parents.

See Insect, Transformation, &c.

Extraordinary Generation. Such is that of polypes, from cuttings or pieces of another polype. See Polype.

Generation of Plants. The impregnation of the female palm-tree by the male, has been known in the most antient times. Herodotus, the father of history, tells us, that the Greeks called some of these trees male, the fruit of which they bound to the other kind, which bears dates; that the small flies, wherewith the male abounded, might affift in ripening the fruit of the female-tree. The remote age in which Herodotus wrote, sufficiently apologizes for his believing, that what was really brought about by the farina fecundans of the male-flower, was to be attributed to the insects frequently found therein, and which perhaps frequently carry this farina from the male to the female. The process of impregnation, according to Theophrastus, was this: while the male plant was in flower, they cut off a branch of these flowers, and scattered the dust and down therein upon the flowers of the female plant; by which means the female did not cast her fruit, but preferred them to maturity. This has been lately verified at Berlin, where a female palm-tree bore fruit for many years; but the fruit never ripened, and when planted, did not vegetate, merely because there was no male palm in the place: for having procured a branch of male flowers from Leipzig, twenty German miles from Berlin, they suspended it over the female flowers of their tree; and the experiment succeeded so well, that the female tree produced more than an hundred perfectly ripe fruit; and the experiment being repeated, it bore above two thousand ripe fruit, which being planted produced young trees.

It is in the flowers of vegetables only, that the parts subservent to generation are produced; and these flowers are either male, female, or hermaphrodite. Male-flowers are those possessed of the organs of generation, analogous to the male parts of animals: such are the stamina and apices, called by Linnaeus, filaments and antherae. The female flowers are only endowed with parts like thofe, which perform the office of generation in females; and these are the pistil and its appurtenances, which Linnaeus divides into three parts, the germens, style, and stigma. The hermaphrodite flower, which constitutes the great bulk of
of the vegetable creation, is possessed of all these parts in itself, and is therefore capable of propagating its species without any foreign assistance; which, by many incontestable experiments, it has been found neither the male nor female flower simply is able to do. The impregnation of hermaphrodite flowers, may be performed within their own calyx; but, before a separate female flower can be so, the farina fescundans of the male flower must necessarily be conveyed to it thro' the circumambient air; which is the reason, why the quantity of the produce of such plants is much more precarious, than that of plants which have hermaphrodite flowers: for if, during the flowering of these separate male and female plants, the weather proves either very wet or stormy, their produce of fruit will be very inconsiderable, from the spoiling or hasty dissipation of the male farina. Thus, independent of frosts, the fruit of the nut and fibertree will be most numerous in those years, in which the months of January, and February are the leaf stormy and wet, because at that time their flowers are produced. For the same reasons, a stormy or wet May destroys the chefnuts; and the same weather, in July, prodigiously lessens the crop of maize, or indian corn, as its spikes of male-flowers stand lofty, and at a considerable distance from the female.

Some of the more skilful modern gardeners put in practice, with regard to melons and cucumbers, the very method mentioned by Theophrastus two thousand years ago, in regard to the palm-tree. As thefe plants, early in the season, are in this climate confined to frames and glasses, the air in which they grow is more stagnant than the open air; whereby the distribution of the farina fescundans, so necessary towards the production of the fruit for the propagation of the species, is much hindered. To obviate the inconvenience thence arising, they collect the male-flowers when fully blown; and presenting them to the female ones by a stroke of the finger, they scatter the farina fescundans therein, which prevents the falling of the fruit before it is ripe.

By far the greater part of plants produce hermaphrodite flowers; but some there are which have separate male and female-flowers growing from the same root, as maize, nettles, box, elm, birch, oak, beech, hazel, hornbeam, plane-tree, pine, fir, cypres, cedar, melons, cucumbers, gourds, and several others; in many of these, the male and female flowers stand at a considerable distance. There are other plants which produce those necessary organs upon different roots, as the palm-tree, hops, the willow-tree, milletoe, spinac, hemp, poplar, french and dog's mercury, the yew-tree, juniper, and several others. Among these, the valisneria of Linnaeus, as to the manner in which its male-flower impregnates the female, is one of the most singular prodigies in nature. It grows in rivulets, ditches, and ponds, in many parts of Europe. The male plant, which is continually covered with water, has a short flalk, upon the top of which its flowers are produced. As this top never reaches the surface of the water, the flowers are thrown off from it, and come unopened to the surface of the water; where, as soon as they arrive, by the action of the air, they expand themselves, and swim round the female flowers, which are blown at the same time. These last have a long spiral foot-flalk, by which they attain the surface of the water, and remaining there in flower a few days, are impregnated by the male-flowers detached from the flalk at the bottom.

It is observably, that the operations of nature are carried on most usually by certain general laws, from which however the sometimes deviates. Thus almost all plants have either hermaphrodite flowers, or male and female flowers, growing from the same root, or male and female flowers from different roots; but there are a few of another class, which from the same root furnish either male and hermaphrodite flowers, or female and hermaphrodite ones: of this kind are the mulberry-tree, the mufa or plantain-tree, white hellebore, pellitory, arrach, the ash-tree, and a few others. Watson, in Phil. Trans. Vol. 47, p. 169—183.

Some object to this theory of the generation of plants, from having observed some plants, which were termed female, growing singly; and though at a very great distance from any male plants of the same kind, producing perfect fruits, which grew when sown. Mr. Miller tells us, he himself was staggered in his opinion, on having observed a female plant of white briony, which grew singly
In a garden, where there were no other plants of the same kind; which, nevertheless, for several years, produced berries, which grew and flourished perfectly well. This put him upon examining the plant more carefully than he had done before, when a great many male-flowers were found intermixed with the female ones; and he adds, that he has frequently observed the same in many other plants, which are generally male and female in distinct plants, yet have sometimes both sexes on the same plant.

From what has been said, it appears very plain, that the embryo of the female flower must be impregnated by the farina fecundans, or male dust, in order to render the fruit perfect; but how, or in what manner, it is performed, is what we can only guess at; since, in the generation of animals, our naturalists differ widely, as has been thrown above, in their opinions concerning the particular method how it is performed. If, says the reverend Dr. Hales, I may be allowed to indulge conjecture, I would propose it to the consideration of naturalists, whether, from the manifest proof we have that sulphur attracts air, a hint may not be taken to enquire whether this may not be the primary use of the farina fecundans, to attract and unite with itself, elastic or other refined active particles. That this farina abounds with sulphur, and that a very refined dust, is probable from the subtile oil which chemists obtain from the chieves of saffron: and if this be the use of it, was it possible that it could be more aptly placed than on the tender points of the stamina, where it might easily, with the least breath of wind, be dispersed in the air; thereby surrounding the plant, as it were, with an atmosphere of sublimed sulphureous pounce? These unifying with particles of air, may, perhaps, be inspired at several parts of the plant, and especially at the pistil, and be thence conveyed to the capillum feminales. And if to these united sulphureous and aerial particles, we suppose some particles of light to be joined (for Sir Isaac Newton has found that sulphur attracts light strongly); then the result of these three by far the most active principles in nature will be a punctum falliens, to invigorate the feminal plant: and thus we are at last conducted, by the regular analysis of vegetable nature, to the first enlivening principle of their minutest origin.

So much for the generation of plants, and the discovery of their different sexes, upon which Linnaeus has founded his system of botany, at present so much and so well received. Whoever, therefore, would consider, more minutely, the structure of flowers, and the almost infinite variety of the number and disposition of their parts, may consult Linnaeus's Philo-Semitism, lately published, where this subject is treated in a very copious and instructive manner. But besides this regular and natural generation, many plants may be propagated, by planting cuttings or slips of them in the earth. See CUTTINGS.

GENERATION of STONES. See the article LITHOGENESIA.

GENERAL NAMES, among philosophers, the same with general terms. See the article GENERAL TERMS, supra.

GENEROSA, among lawyers, the addition for a gentlewoman, who may quaff any writ wherein she is termed spinster. See the article SPINSTER.

GENESIS, among mathematicians, signifies the formation or production of some figure or quantity. See the article GENERATING, supra.

GENESIS, among divines, a canonical book of the Old Testament, and the first of the pentateuch, or five books of Moses. The Hebrews call it Berechith, or, In the beginning, these being the first words in the book. The Greeks gave it the name of Genesis, from its beginning with the history of the creation of the world. It includes the history of two thousand three hundred and sixty-nine years, and besides the history of the creation, contains an account of the original innocence and fall of man; the propagation of mankind; the rise of religion; the general defection and corruption of the world; the deluge; the restoration of the world; the division and peopling of the earth; and the history of the first patriarchs down to Joseph, at whose death it ends.

It was easy for Moses to be satisfied of the truth of what he delivers in this book, because it came down to his time through a very few hands. For, from Adam to Noah, there was one man (Methuselah) who lived to see them both; in like manner, from Noah to Abraham, Shem conversed with them both; as Isaac also did with Abraham and Joseph, from whom the
these things might easily be conveyed to Moises by Amram, who was cotemporary with Joseph. Moises is supposed to have written this book, during his retirement in the land of Midian, before he conducted the Israelites out of Egypt.

GENET, GENNET, or JENNET, in the manage, denotes a small sized, well proportioned Spanish horse.

To ride a la genette, is to ride after the Spanish fashion, so short, that the spurs bear upon the horse's flank.

GENET is also the name of a kind of cat, bred in Spain, somewhat bigger than a weasel, of a grey or black colour, but the fur of the black is the most valuable.

GENETHLIACTI, in astrology, men who erect horoscopes, or pretend to predict what will happen to persons, from the stars which presided at their birth.

Nothing can be more absurd than this pretended science, and yet there have been times when princes themselves were greatly infatuated with these sort of people. The assurance with which these cunning fellows predicted future events made them always find dupes, and even after they were expelled from Rome by a decree of the Senate, they met with such protection from the credulity of the people, that they still continued un molested in the city.

GENETHLIACTUM, or GENETHLIACT POEM, verses made on the birth of any prince, or other illustrious person, in which the poet, by a kind of prediction, promises him great advantages, great prosperity, and glorious victories.

The same name is also given to verses of this kind, made on the birth of any person whatsoever.

GENEVA, a city near the confines of France and Switzerland, on the river Rhone, about sixty miles north-west of Lyons: east long. 6°, north lat. 46° 20'. Geneva is a fortified town, about two miles in circumference, situated at the west end of a lake sixty miles long, and twelve broad, called the lake of Geneva. It is a republic, governed by a council of 200, and a senate of twenty-five members; and is said to contain 30,000 inhabitants.

GENEVA, or GEN, among distillers, an ordinary malt-spirit, distilled a second time, with the addition of some juniper berries. See the article JUNIPER.

Originally, the berries were added to the malt in the grinding; so that the spirit thus obtained was flavoured with the berries from first, and exceeded all that could be made by any other method. At present, they leave out the berries entirely, and give their spirits a flavour by distilling them with a proper quantity of oil of turpentine; which, though it nearly resembles the flavour of juniper berries, has none of their valuable virtues.

GENEVIEVE, or St. GENEVIEVE'S DAY, a festival observed at Paris on the third of January, in honour of St. Genevieve, patroness of the city.

NUNS of St. GENEVIEVE. See the article MIRAMIONES.

GENIAL, an epithet given by the pagans to certain gods who were supposed to preside over generation.

The genial gods, says Peutius, were earth, air, fire and water. The twelve signs, together with the sun and moon, were sometimes also ranked in the number.

GENICULI, among botanists, the knots or joints in the stalks of plants; whence they are denominated geniculate plants.

GENIOGLOSSI, in anatomy, two muscles which lie immediately under the geniohyoides. They arise from the fore-part of the lower jaw internally, and inclining themselves, are inserted in the root of the tongue. When the act of the tongue forward, and thrust it out of the mouth.

GENIOHYOIDÆUS, in anatomy, is a muscle which arises in the middle of the chin, above the mylohyoides, and near the sphenocyndrotes of the jaw: its termination is in the back of the os hyoides. See the articles MYLOHYOIDES, SYNCHONDROSIS, &c.

GENIPA, in botany, a genus of the geniculata-monogynia class of plants, the flower of which consists of a single, rotated petal; its tube is very short, and of a funnel-like shape; and the limb large, and divided into five deep segments. The fruit is a fleshy berry, of an oval figure, small at each end, and containing two cells, in which are a number of depressed angulated seeds. See Plate CX. fig. 4.

GENIS, a town of Savoy, situated on the river Guier, twelve miles west of Chambery.

GENISTA, GREEN-WEEED, or Dyer's-weed, a genus of the didelphial-decandria class of plants, with papilionaceous flowers; and the fruit a roundish turgid,
turgid, and unilocular pod, containing a single kidney-like seed.

**GENISTA** spartium, a plant called by Linnaeus ulex. See the article ULEX.

**GENISTELLA**, in botany, the fame with the genista. See the article GENISTA.

**GENITAL**, an appellation given to whatever belongs to the parts of generation. See the article GENERATION.

**GENITALIUS, or GENITARIES, in anatomy, a name sometimes given to the testes, or testicles of man, on account of the relation of this case to natural indowments.** See the article INDIGETES.

**GENITARIES, or GENITARIES, in anatomy, a name sometimes given to the testes, or testicles of man, on account of their office in generation.** See the article TESTICLE.

**GENITES, genitus, among the Hebrews, those descended from Abraham, without any mixture of foreign blood.**

The Greeks distinguished by the name of genites such of the Jews as were issued from parents, who, during the baby-lonish captivity, had not allied with any gentile family.

**GENITIVE, in grammar, the second case of the declension of nouns.** The relation of one thing considered as belonging in some manner to another, has occasioned a peculiar termination of nouns, called the genitive case: But in the vulgar tongues, they make use of a sign to express the relation of this case. In English they prefix the particle of; in French de, or du, &c. Though in strictness there are no cases in either of these languages; inasmuch as they do not express the different relations of things by different terminations, but by additional prepositions, which is otherwise in the Latin, &c. See the article CASE.

In the Hebrew tongue, the genitive case is marked in a very different manner from that of the Greek and Latin; for whereas in those languages the noun governed is varied, in the Hebrew the noun governing undergoes the alteration. See the article HEBREW LANGUAGE.

**GENITURA, in botany, a name used by some for anethum, or dill.**

**GENIUS, a good or evil spirit, or daemon, whom the ancients supposed to inhabit the souls of men, to direct his birth, accompany him, and be his guard.** See the article DÆMON.

The rank and office of the genii were inferior to those of the lares; for the latter were the tutelar gods of a family, whereas the genii had the care of government only of single persons, or places.

Apuleius following the sentiment of Plato, gives the following account of the genii.

They are spirits who never were engaged in matter, nor were ever joined to bodies. Of these genii Plato is of opinion that every man has his own, who watches over him, and is a witness not only of his actions, but of his very thoughts; and that, when the person dies, the genius conducts the soul of which he had the charge, to judgment, and affirms at the trial: if the accused person fulfifies, the genius convicts him; if he speaks the truth, he confirms it; and it is upon his evidence that sentence is pronounced.

The ancients not only ascribed a genius to particular persons, but to places likewise. They allowed a genius to provinces and towns, to forests, trees, fountains, and to the sciences. Each person sacrificed once a year to his genius, and scattered flowers, and sprinkled wine to him: sometimes they offered leaven or salted dough, or a pig two months old. It was commonly thought that each person had two genii attending him. Flattery introduced the custom of swearing by the genius of the emperors, among the Romans, in the decline of that empire. Socrates's genius is famous in antiquity. The Mahometans pretend that the genii inhabited the world many thousand years before Adam, under the reigns of several princes, who all bore the name of Solomon; but falling at length into a general corruption, Êbbi was sent to drive them to a remote part of the earth, there to be confined; that some of that generation, still remaining, they were by Talmurath, one of the ancient kings of Persia, who waged war against them, forced to retreat to the famous mountains of Kaf. See the article ANGEL.

**GENIUS, in matters of literature, &c. a natural talent or disposition to do one thing more than another; or the aptitude a man has received from nature to perform well and easily that which others can do but indifferently, and with a great deal of pains.**

To know the bent of nature is the most important concern. Men come into the world with a genius determined not only to a certain art, but to certain parts of that art, in which only they are capable of success. If they quit their sphere, they fall even below mediocrity in their profession. Art and industry add much to natural endowments, but cannot supply S S them
them where they are wanting. Every thing depends on genius. A painter often pleases without observing rules, whilst another displeases though he observes them; because he has not the happiness of being born with a genius for painting.

A man born with a genius for commanding an army, and capable of becoming a great general by the help of experience, is one whose organical conformation is such, that his valour is no obstruction to his presence of mind, and his presence of mind makes no abatement of his valour. Such a disposition of mind cannot be acquired by art: it can be possessed only by a person who has brought it with him into the world. What has been said of these two arts, may be equally applied to all other professions. The administration of great concerns, the art of putting people to those employments for which they are naturally formed, the study of physic, and even gaming itself, all require a genius. Nature has thought fit to make a distribution of her talents among men, in order to render them necessary to one another: the wants of men being the very first link of society; she has therefore pitched upon particular persons to give them an aptitude to perform rightly some things which she has rendered impossible to others; and the latter have a greater facility granted them for other things, which facility has been refused to the former. Nature, indeed, has made an unequal distribution of her blessings among her children; yet she has disinherited none; and a man divested of all kinds of abilities, is as great a phenomenon as an universal genius.

From the diversity of genius, the difference of inclination arises in man, whom nature has had the precaution of leading to the employments for which she designs them, with more or less impetuosity in proportion to the greater or lesser number of obstacles they have to surmount, in order to render themselves capable of answering this vocation. Thus the inclinations of men are so very different, because they follow the same mover, that is, the impulse of their genius. This, as with the painter, is what renders one poet pleasing, even when he trepasses against rules; while others are disagreeable, notwithstanding their strict regularity.

The genius of these arts, according to the abbe du Bos, consists in a happy arrangement of the organs of the brain; in a just conformation of each of these organs; as also in the quality of the blood, which dips its ferment, during exercise, so as to furnish a plenty of spirits to the springs employed in the functions of the imagination. Here he supposes that the composer’s blood is heated; for that painters and poets cannot invent in cool blood; nay, that it is evident they must be wrapt into a kind of enthusiasm when they produce their ideas. Aristotle mentions a poet who never wrote so well as when his poetic fury hurried him into a kind of frenzy. The admirable pictures we have in Taffo of Armida and Clorinda, were drawn at the expense of a disposition he had to real madness, into which he fell before he died. Do you imagine, says Cicero, that Pacuvius wrote in cold blood? No, it was impossible. He must have been inspired with a kind of fury, to be able to write such admirable verses.

GENNET, or GENET. See Genet.

GENOA, a city and archbishop’s see of Italy, and capital of the republic of the same name, is built on a strand near the sea, and rises gradually to the top of a hill; the houses, which are lofty and well built, rising like the feats of a theatre, afford a fine prospect at sea. The harbour is large and deep, and the principal street, from one end to the other, resembles a double row of palaces: east long. 9° 30’, and north lat. 44° 30’. This city, which is fortified by a double wall, is six miles round, and contains thirty parish churches, twenty colleges, and as many convents and religious houses. The legislative authority is lodged in the great senate, consisting of the signiory and four hundred noblemen and principal citizens, elected annually out of the freemen. The signiory consists of the doge and twelve other members, who hold their places two years. Four parts in five of the senate must agree to the enacting of laws. The doge is obliged to reside in the palace the two years he is in office; and after they are expired, he retires to his own house, where his administration is either approved or condemned; and if the latter, he is proceeded against as a criminal. The territories of the republic lie in the form of a crescent, along the coast of the Mediter-
Mediterranean, extending 150 miles; but the country no where reaches above twenty miles from the sea, and in some places not ten.

GÉNIE, in matters of religion, a pa-

pafegments, variolls in figure: the petal, tubulated and imperforated at the base; and at the edge, divided into five

fragments of the crimson, of the blue, or of the yellow, which is of a middle size, free from the small fibres, and well dried; tho' if it be scorched, it is to be rejected.

The root of this plant is large, remark-

able, and of a firm texture. It is brought to us from Germany, where it is in many places cultivated as liquorice, and of a growth of thirty-two, whereof two are priefts; the other twenty, freemen, and have owed obedience in the performance of divine service. It is in many places cultivated as liquorice, and of a growth of thirty-two, whereof two are priefts; the other twenty, freemen, and have owed obedience in the performance of divine service.

GÉNIE, gentilis, in the roman law and history, a name which sometimes ex-

presses what the Romans otherwise called barbarians, whether they were allies of Rome or not: but this word was used in a more particular fense for all strangers and foreigners not subject to the roman empire, in contradilntion to provincialis, or an inhabitant of a province of the empire.

The word is used in this fense in the Greek, but was not introduced into this or the Latin tongue, till after Christianity was eftablilshed; it being taken from scripture.

GENUflexion, Gentlemen

There are likewise three vergers, so called from the silver-rods they carry in their hands; being a serjeant, a yeoman, and groom of the vestry; the first attends the dean and sub-dean, and finds surplices and other necessaries for the chapel; the second has the whole care of the chapel, keeps the pewes, and seats the nobility and gentry; the groom has his attendance within the chapel-door, and looks after it.

Gentlemen Pensioners. See the article Pensioner.

Genuflexion, among ecclesiastical writers, the posture of kneeling, was a very antient custom in acts of devotion; though the Ruffians are said to esteem it indecent, and even the difsenters, among us, prefer that of standing.

Genus, among metaphysicians and logicians, denotes a number of beings, which agree in certain general properties, common to them all; so that a genus is nothing else but an abstract idea, expressed by some general name or term. See the articles Abstraction and General Terms.

It is plain, therefore, that by a genus we do not barely signify one particular thing, nor yet a plurality of things; but a fort or kind of things, all agreeing in certain general properties.

Thus animal is said to be a genus in respect of man and brute, in regard man and brute agree in the common nature and character of animal: so a right lined figure of four sides, is a genus in respect of a parallelogram, and a trapezium; and so likewise is substance, in respect of substance extended, which is body; and thinking substance, which is mind.

The method by which the mind advances to form genera is, according to Mr. Locke, as follows. Obeying several things that differ from the mind's idea of man, for instance, and therefore cannot be comprehended under that name, to agree with man in some certain qualities by retaining only those qualities, and uniting them into one idea, it gets another more general idea, to which giving a name, it makes a new genus, or a term of a more comprehensive extension.

Thus by leaving out the shape, and other properties signified by the word man, and retaining only a body with life, sens, and spontaneous motion, we form the idea signified by the name animal. By the fame way the mind proceeds to body, substance; and at last to being, thing, and such universal terms as stand for any ideas whatever.

This shews the reason why, in defining things, we make use of the genus, namely, to save the labour of enumerating the several simple ideas which the next term stands for: from whence it appears, that genus is no more than an abstract idea comprehending a greater or less number of species, or more particular classes. See the article Species.

Genus and species themselves are the workmanship of human understanding; tho' it is not denied that nature, in making things alike, lays the foundation of this genus, is no more than a distinct idea comprehending a greater or less number of species, or more particular classes. See the article Essence.

In the series of notions rising one above another in the degree of universality, that division which comprehends under it several genera, is called in the schools the higher genus, which denomination continues until we arrive at the last advance of the understanding; when being come to the most general of all ideas that admits not of a superior, it is distinguished by the name of the genus generalissimum. In like manner the several genera comprehended under a higher genus, are in respect of it considered as species; and as these last too have species under them, the inferior divisions are, for distinction's sake, termed lower species. Thus the progression continues, and when we come to the lowest sub-division of all, comprehending only individuals, we call this the species specialissima. All that lie between this and the highest distribution of things are the intermediate genera and species, which are termed each in their turn genus generalius, or species specialior, according as we consider them in the attending or defending scale of our ideas; or, to speak in the language of logicians, according to their acent or decent in linea predicamentali.

Genus is also used for a character or manner applicable to every thing of a certain nature or condition: in which sense it serves to make capital divisions in divers sciences.
GENUS, in music, by the antients called genus melodiae, is a certain manner of dividing and sub-dividing the principles of melody; that is, the consonant and dissonant intervals, into their concious parts.

The moderns considering the octave as the most perfect of intervals, and that wherein all the concords differently: was the diapente. But the antients went differently: the diatessaron, or fourth, was the least interval which they admitted as concord; and therefore they sought first how that might be most conveniently divided: from whence they constituted the diapente and diapason.

The diatessaron being thus, as it were, the root and foundation of the scale, what they called the genera, or kinds, arose from its various divisions; and hence they defined the genus modulandi the manner of dividing the tetrachord, and disposing its four bounds as to succession.

The genera of music were three, the enharmonic, chromatic, and diatonic: the two first were variously subdivided, and even the last, tho' that is commonly reckoned to be without any species; yet different authors have proposed different divisions under that name, without giving any particular names to the species, as was done to the other two.

For the characters, &c. of these several genera, see the articles ENHARMONIC, CHROMATIC, and DIATOMIC.

GENUS, in rhetoric. Authors distinguish the art of rhetoric, as also orations or discourses produced thereby, into three genera, or kinds, demonstrative, deliberative, and judiciary.

To the demonstrative kind belong panegyrics, genethliacons, epithalamiums, funeral harangues, &c. See the articles PANEGYRIC, &c.

To the deliberative kind belong perorations, diffusions, commendations, &c. See the articles RHETORIC, ORATION, &c.

GENUS, in algebra. The antient algebraeists divided that art into two genera or kinds, viz. the logistic and specious. See LOGISTIC and SPECIOUS.
With respect to the vegetable kingdom, all plants and trees are reduced to genera from the consideration of the number, situation, figure, and proportion of the parts of fruitification. See the article Fructification.

In the same manner, the genera of fossils are established upon the figure, hardnefs, confluence, inflammability, and other obvious properties of the substances that compose the mineral kingdom. See the article Fossils.

Geocentric, in astronomy, is applied to a planet or its orbit, to denote it concentric with the earth, or as having the earth for its center, or the same center with the earth. See the articles Earth and Planet.

Geocentric latitude of a planet, is its distance from the ecliptic as it is seen from the earth, which, even though the planet be in the same point of her orbit, is not constantly the same, but alters according to the position of the earth in respect to the planet. For let BAT (plate CXIII. fig. 2.) be the orbit of the earth, P N the orbit of the planet, which suppose to be at P; from which let fall on the plane of the ecliptic the perpendicular P E. In whatever part of her orbit the earth is, this line P E will always subtend the angle which measures the geocentric latitude of the planet. Suppose, therefore, the earth at T, and Venus in P, where she comes nearest to the earth, in which position Venus is seen in her inferior conjunction with the sun, and her geocentric latitude is measured by the angle P T E. But if Venus should be in the same situation, P, and the earth were at J, and from thence Venus were observed in her superior conjunction with the sun, where she is at her greatest distance from us, her geocentric latitude would be answerable to P E T, which is much less than the angle P T E, because the distance P T is greater than P T.

What we have here said of the latitude of Venus, is likewise true of that of mercury, and upon the same account. See Heliocentric and Latitude.

Geocentric place of a planet, the place wherein it appears to us from the earth, supposing the eye there fixed; or it is a point in the ecliptic to which a planet seen from the earth is referred.

Geodæsia, the same with surveying.

See the article Surveying.

Geographical mile, the same with the sea-mile; being one minute, or the sixtieth part of a degree of a great circle on the earth's surface.

Geography, the doctrine or knowledge of the terrestrial globe; or the science that teaches and explains the properties of the earth, and the parts thereof which depend upon quantity. Geography, as defined by Varenius, is that part of mixt mathematics, which explains the state of the earth, and of its parts depending on quantity, viz. its figure, place, magnitude, and motion, with the celestial appearances, &c. In consequence of this definition, that author divides geography into general and special, or universal and particular.

By universal geography, is understood that part of the science which considers the whole earth in general, and explains its properties without regard to particular countries. This division is distinguished into three parts, absolute, relative, and comparative. The absolute part respects the body of the earth itself, its parts and peculiar properties, as its figure, magnitude, and motion; its lands, seas, and rivers, &c. The relative part accounts for the appearances and accidents that happen to it from celestial causes; and, lastly, the comparative contains an explanation of those properties which arise from comparing different parts of the earth together.

Special or particular geography, is that division of the science which describes the constitution and situation of each single country by itself; and is twofold, viz. chorographical, which describes countries of a considerable extent; or topographical, which gives a view of some place, or small tract of the earth. See the articles Chorographical and Topographical.

Hence the object or subject of geography is the earth, especially its superficies and exterior parts.

The properties of geography, according to the same writer, are of three kinds, viz. celestial, terrestrial, and human. The celestial properties are such as affect us by reason of the apparent motion of the sun and stars. These are eight in number. 1. The elevation of the pole, or the distance of a place from the equator. 2. The obliquity of the diurnal motion of the stars above the horizon of the place. 3. The time of the longest and shortest day. 4. The climate and zone. 5. Heat, cold, and the feaons of the year; with rain, snow, wind, and other
other meteors. 6. The rising, appearance and continuance of the stars above the horizon. 7. The stars that pass through the zenith of a place. 8. The celerity of the motion with which, according to the copernican hypothesis, every place constantly revolves. See the articles ELEVATION, POLE, &c.

The terrestrial properties are those observed in the face of each country, and are ten in number. 1. The limits and bounds of each country. 2. Its figure. 3. Its magnitude. 4. Its mountains. 5. Its waters, viz. springs, rivers, lakes, and bays. 6. Its woods and deserts. 7. The fruitfulness and barrenness of the country, with its various kinds of fruits. 8. The minerals and fossils. 9. The living creatures there. 10. The longitude and latitude of the place.

The third kind of observations to be made in every country is called human, because they chiefly regard the inhabitants of the place, and there are also ten in number. 1. Their stature, shape, colour, and the length of their lives; their origin, meat, and drink. 2. Their arts, and the profits which arise from them, with the merchandise and wares they barter one with another. 3. Their virtues and vices, learning, capacities, and schools. 4. Their ceremonies at births, marriages, and funerals. 5. The language which the inhabitants use. 6. Their political government. 7. Their religion and church government. 8. Their cities and famous places. 9. Their remarkable histories. 10. Their famous men, artificers, and inventions of the natives.

These are the three kinds of occurrences to be explained in special geography.

In universal geography, the absolute division of the earth, and the constitution of its parts, are examined; and the celestial phenomena in general are to be applied to their respective countries in special geography.

The principles of geography, or those from which arguments are drawn for proving of propositions in that science, are, according to Varenius, of three sorts. 1. Geometrical, arithmetical, and trigonometrical propositions. 2. Astronomical precepts and theorems. 3. Experience, being that upon which the greatest part of geography, and chiefly the special, is founded.

In proving geographical propositions, we are to observe that several properties, and chiefly the celestial, are affirmed by proper demonstrations; but in special geography, excepting the celestial, almost every thing is explained without demonstration; being either grounded on experience and observation, or on the testimony of our sages: nor can they be proved by any other means. There are also several propositions proved, or rather exposed to view, by the terrestrial globe, or by geographical maps. See the articles GLOBE and MAP.

Other propositions cannot be so well proved, yet are received as apparent truths. Thus, tho' we suppose all places on the globe, and in maps, to be laid down in the same order as they are really on the earth; nevertheless, in these matters, we rather follow the descriptions that are given by geographical writers.

The manner in which we have treated the several geographical articles that occur throughout this work, may be seen under each head, and our division of the science may be seen in the introduction.

Geography is very antient, at least the special part thereof; for the ancients scarce went beyond the description of countries. It was a constant custom among the Romans, after they had conquered and subdued any province, to have a map or printed representation thereof, carried in triumph, and exposed to the view of the spectatours. Historians relate, that the Roman senate, about an hundred years before Christ sent geographers into divers parts to make an accurate survey and menturation of the whole globe, but they scarce ever saw the twentieth part of it.

Before them, Neco, king of Egypt, ordered the Phenicians to make a survey of the whole coast of Africa, which they accomplished in three years. Darius procured the Ethiopic-sea, and the mouth of the Indus, to be surveyed; and Pliny relates, that Alexander, in his expedition into Asia, took two geographers to measure and describe the roads; and that from their itineraries, the writers of the following ages took many particulars. Indeed this may be observed, that whereas most other arts and sciences are fullerers by war, geography and fortification alone have been improved thereby. Geography, however, must have been exceedingly defective, as a great part of the globe was then unknown, particularly all America, the northern parts of Europe and Asia, with the Terra Australis,
GEOMETRY, or Geometrical Plane, was ignorant of the earth's being capable to be spheroidal, and of the torrid zone's being habitable, &c.

The honour of reducing geography to art and syllable, was conferred for Ptolemy, who, by adding mathematical advantages to the historical method in which it had been treated of before, has described the world in a much more intelligible manner: he has delineated it under more certain rules, and by fixing the bounds of places from longitude and latitude, hath discovered others of places; and though these figures, upon the immersions and emersions of Jupiter's satellites, yet they have not altogether proved effectual. See the article Longitude.

The principal writers upon geography, among the antients, are Ptolemy, Pliny, and Strabo: among the moderns, Joannes de Sacrobofo, Cluverius, Heylen, Ricciolus, Weigelins, de Chales, and, above all, Varenius, with Jurin's additions; to which may be added Leibnicht, Sturmius, Morden, Gordon, Salmon, &c.

GEOMANCY, γεωμανία, according to Polydore Virgil, a species of divination performed by means of chalks made in the ground. Though others think it consisted in making a number of small dots on paper, at random; and from the various figures which those make, forming a judgment of futurity. See the article Geomancy.

GEOMETRICAL, in general, an appellation given to whatever belongs to, or is strictly connected with geometry. See the article Geometry.

GEOMETRICAL construction of equations. See the article Construction.

GEOMETRICAL curve. See Curve.

GEOMETRICAL Locus, or Place. See the article Locus.

GEOMETRICAL Place. See Place.

GEOMETRICAL Plane, in perspective. See the article Plane.

GEOMETRICAL PROGRESSION and PROPORTION. See Progression and Proportion.

GEOMETRICAL solution of a problem, is when it is solved according to the rules of geometry, and by such lines as are truly geometrical, and agreeable to the nature of the problem. See Problem.

GEOMETRY, γεωμετρία, originally signified no more than the art of measuring the earth, or any distances or dimensions within it; but at present, it denotes the science of magnitude in general; comprehending the doctrine and relations of whatever is susceptible of augmentation or diminution, considered in that light.

Hence, to geometry may be referred the considerations not only of lines, surfaces, and solids; but also of time, velocity, number, weight, &c.

Plato thought the word geometry an improper name for this science, and accordingly substituted in its place the more extensive one of mensuration; and, after him, others gave it the title of pantometry, as demonstrating not only the quantities of all manner of magnitudes, but also their qualities, ratios, positions, transformations, relations, &c. And Proclus calls it the knowledge of magnitudes and figures, and their limitations; also of their motions, and affections of every kind.

Origin and progress of Geometry. This science had its rise among the Egyptians, who were in a manner compelled to invent it, to remedy the confusion which generally happened in their lands, from the inundations of the river Nile, which carried away all boundaries, and effected all the limits of their possessions. Thus this invention, which at first consisted only in measuring the lands, that every person might have what belonged to him, was called geometry, or the art of measuring land; and it is probable, that the draughts and schemes, which they were annually compelled to make, helped them to discover many excellent properties of these figures; which speculations continued to be gradually improved, and are so to this day.

From Egypt geometry passed into Greece, where it continued to receive new improvements in the hands of Thales, Pythagoras, Archimedes, Euclid, &c. The elements of geometry, written by this last in fifteen books, are a most convincing proof to what perfection this science was carried among the antients. However, it must be acknowledged, that it fell short of modern geometry, the bounds of which, what by the invention of fluxions, and the discovery of the almost
almost infinite orders of curves, are greatly enlarged. See the articles Curve and Fluxion.

We may distinguish the progress of geometry into three ages: the first of which was in its meridian glory at the time when Euclid's Elements appeared; the second, beginning with Archimedes, reaches to the time of Des Cartes, who, by applying algebra to the elements of geometry, gave a new turn to this science, which has been carried to its utmost perfection by Sir Isaac Newton and Mr. Leibnitz.

Division of Geometry. This science is usually distinguished into elementary, and higher or sublime geometry.

The first, or elementary geometry, treats of the properties of right lines, and of the circle, together with the figures and solids formed by them. The doctrine of lines comes first, then that of surfaces, and lastly that of solids.

The higher geometry comprehends the doctrine of the conic sections, and numerous orders of curves. See the article Conic Sections and Curve.

Geometry is again divided into speculative and practical; the former treating of the properties of lines and figures, as Euclid's Elements, Apollonius's Conic Sections, &c. and the latter shewing how to apply these speculations to the use of mensuration, navigation, surveying, taking heights and distances, gauging, gunnery, &c. See the articles Mensuration, Navigation, &c.

We have an excellent treatise on this subject by Dr. Gregory, with additions by Mr. Maclaurin: it is divided into three parts; the first of which teaches the mensuration of lines and angles. In the second, surfaces are treated of; and these not only such as are plain, but likewise curve-surfaces, as those of a cylinder, cone, and sphere. The third part treats of solid figures and their mensuration, as sphere, cylinder, cone, &c. See the articles Sphere, Cylinder, &c.

Usefulness of Geometry. The usefulness of this science extends to almost every art and science. It is by the help of it that astronomers turn their observations to advantage, regulate the duration of times, seasons, years, cycles, and epochs; and measure the distance, motions, and magnitudes of the heavenly bodies. It is by it that geographers determine the figure and magnitude of the whole earth; and delineate the extent and bearings of kingdoms, provinces, harbours, &c. It is from this science too, that architects derive their just measures, in the construction of public edifices as well as of private houses. See the articles Astronomy, Geography, and Architecture.

It is by the assistance of geometry that engineers conduct all their works, take the situation and plans of towns, the distances of places, and the measure of such things as are only accessible to the sight. It is not only an introduction to fortification, but highly necessary to most mechanics, especially carpenters, joiners, mathematical-instrument-makers, and all who profess designing. See Carpentry, Joinery, Ship-building, Engraving, Designing, &c.

On geometry likewise depends, the theory of music, optics, perspective, drawing, mechanics, hydraulics, pneumatics, &c. See Music, Optics, Perspective, Drawing, Mechanics, &c.

Geoponic, something relating to agriculture. See Agriculture.

George, or Knights of St. George, has been the denomination of several military orders, whereof that of the garter is one of the most illustrious. See Garter.

There is also one of these orders still subsisting at Genoa.

Religious of the order of St. George, form several congregations in Italy and other places.

St. George del Mina, the capital of the Dutch settlements, on the Gold-coasts of Guinea, situated seven or eight miles west of Cape-coast-castle, the capital of the British settlements there: west lon. 5°, and north lat. 5°.

Fort St. George, a town and fort on the coast of Comandar, in the hither India; east lon. 80°, and north lat. 15°.

The town is divided into the White and Black-town. The fort, and White-town, which adjoins to it, are inhabited only by British; the whole circumference, which is not above half a mile, being surmounted by a stone wall. The outward or Black-town, called Madras, has been lately encompassed by a stone wall and battlements, and is about a mile and a half in circumference; the whole being almost environed by a river and the sea.

St. George's, the largest of the Bermudas or Summer-islands.

Cros of St. George, a red one in a field argent, which makes part of the British standard. See Cross and Garter.

Georgia, in Asia, a province bounded by Circassia and Daghestan on the north,
by the Caspian sea on the east, by Armenia or Turcomania on the south, and by Mingrelia on the west.

**GEORGIA**, in America, one of the British plantations, taken out of South-Carolina, from which it is separated by the river Savannah on the north, and bounded by the Atlantic ocean on the east, by the river of St. John, which divides it from Spanish Florida, on the south and west.

**GEORGIAN MONKS and NUNS**, religious of Georgia, in Asia, who follow the rule of St. Basil. See the article BASIL.

**GEORGIC**, a poetical composition upon the subject of husbandry, containing rules therein, put into a pleasing dress, and set off with all the beauties and embellishments of poetry.

The style proper to a georgic must be worked up with a great deal of thought and vigour, that the words may be lively, and every thing the poet describes may immediately rise up to the reader's view. Hesiod and Virgil are the two greatest masters in this kind of poetry. In Virgil's Georgics are contained the most useful rules for husbandry in all its branches. Virgil has infinitely exceeded Hesiod in this fort of writing: he began his Georgics at the perìslation of 

**Rapin's book**

The moderns have produced nothing in Agrigentum of the antients, about fifty years. See Cyder, by Mr. Philips, who, if he had enjoyed the advantage of Virgil's language, would have been second to Virgil in a much nearer degree.

**GERANITES**, in natural history, an appellation given to fuch of the semipellicullid gems, as are marked with a spot resembling a crane's eye.

**GERANUM, CRANE'S BILL**, in botany, a genus of the *monadelphus-decandra* class of plants, the flower of which consists of five large, patent, oval, and vertically cordated petals; the fruit is a capsule, of the form of a crane's bill.

Geranium stands recommended by authors, as one of the greatest vulnuries and astringents of the vegetable world, particularly for stopping hemorrhages, excess of the menis. &c.

**GERARDIA**, in botany, a genus of the *adynamia-angivferment* class of plants, the corolla of which consists of a single tinge petal; the tube is roundish, and longer than the cup; the upper lip is erect, obtuse, plain, and emarginated; the lower lip is reflexed, and divided into three segments: the fruct is an oval capsule, containing two cells, and consisting of two valves; the seeds are oval and fingle.

This plant is much recommended in gouty disorders.

**GRAW**, a town of Germany, nine miles north-west of darmfit.

**GERBERA**, in botany, a genus of the *fyngefia-polygamy* class of plants, the general corolla of which is radiated, with very numerous hermaphrodite corollae on the disc, which are monopetalous, erect, and divided into three segments at the limb; the stifia are five very short filaments; the seeds are fingle, oblong, crowned with flender down, and contained in the cup.

**GERFALCON**, or **GYRFALCON**, among sportmen, a hawk of great force. See the article HAWK.

The gerfalcon is the largest of the falcon-kind, with head and eyes like those of the haggar. She is strong armed, having long ftrichers and fingles; and being of a fierce and hardy nature, is extremely difficult to be reclaimed; but when once the is overcome, she proves an excellent hawk, and will scarce refuse to fly at any thing. See FALCONRY.

**GERGENTUM**, a town of Sicily, the Agrigentum of the antients, about fifty-five miles south-east of Palermo: east lon. 13° 30', and north lat. 37° 20'.

**GERMAINS, or St. GERMAINS**, a town and royal palace of France, fourteen miles north-west of Paris.

St. Germain is also a borough of Cornwall, eight miles west of Plymouth. It sends two members to parliament.

**GERM**, among gardeners, the same with bud. See the article BUD.

**GERMAN, in genealogy**, denotes entire or whole: thus, a brother-german is one both by the father's and mother's side; and cousins-german are the children of brothers or sisters.

**GERMAN, o; GERMANIC, also denotes any thing belonging to Germany; as the german empire, german flute, &c.**

**GERMANGER, in botany, the english name of the *teucrum* of Linnaeus. See the article TEUCRIUM.**

**Water-GERMANGER**, a plant called by botanists scordium. See SCORDIUM.

**GERMANY**, an extensive empire of Europe, situated between 5° and 19° east longitude,
G E R

[1423]

longitude, and between 43° and 45° north latitude; bounded by Denmark and the Baltic sea on the north, by Poland and Hungary on the east, by Switzerland and the Alps on the south, and by France, Holland, &c. on the west.

It is divided into ten circles, three of which lie on the north, viz. Upper and Lower Saxony, and Westphalia; three on the south, viz. Austria, Bavaria, and Swabia; three about the middle, viz. Frania, and the Upper and Lower Rhine; the tenth, which consisted of the dutchy of Burgundy and the seventeen provinces of the Netherlands, have long been detached from the empire. See Saxony, Westphalia, &c.

There are in Germany upwards of three hundred sovereign princes and states, most of them arbitrary in their respective territories.

G E R M E N, or GERM, the same with bud.

See the article Bud.

G E R M E R S H E I M, a town of Germany, subjected to France, about ten miles east of Landau: east lon. 8° 15', and north lat. 49° 12'.

G E R M E N A T I O N, the first sprouting of the seeds of plants. See Vegetation.

G E R O N T E S, in grecian antiquity, a sort of magistrates of ancient Sparta, anfwer ing to the areopagites at Athens.

G E R T R U D E B U R N G, a fortified town of the united Netherlands, in the province of Holland, nine miles north of Breda; subjected to the prince of Orange.

G E R U N D, in grammar, a verbal noun of the neuter gender, partaking of the nature of a participle, decidable only in the singular number, through all the cases except the vocative; as, nom. amandum, gen. amandi, dat. amando, accus. amandam, abl. amando.

Grammarians are very much embarrassed to settle the proper nature and character of gerunds. It is certain they are no verbs, nor distinct modes of verbs, in regard they do not mark any judgment or affirmation of the mind, which is the essence of a verb; besides their having cafes, which verbs have not. Some, therefore, will have them to be adjectives passive, whose substantive is the infinitive of the verb: on this footing they are denominated verbal nouns, or names formed of verbs, and retaining the ordinary regimen thereof. See the article Noun.

The gerunds are derived from active, neuter, and deponent verbs; and, for the most part, they follow their signification; as, docendum, from docere; currendo, from currere; loquendum, from loquor.

G E S N E R I A, in botany, a genus of plants, of the didynamia class, the flower of which is monopetalous, tubular, and divided into five segments at the limb; the fruit is a roundish capsule, containing a very great number of extremely small seeds.

G E S S E R I T, or Quam diu fe bene gessit. See the article Quam diu.

G E S S E S, or JESSES, the furniture belonging to a hawk. See JESSES.

G E S T A T I O N, among physicians, the same with pregnancy. See the article Pregnacy.

G E S T I C U L A T I O N, in rhetoric, signifies the affected action of an orator, which is deemed a great fault. See Action.

G E S T R I C I A, a province of Sweden, bounded by Helilngia on the north, by the Bothnic gulf on the east, by Upland on the south, and by Dalecarlia on the west.

G E S T U E T F A M A, an antient writ, where a person's good behaviour was impeach ed, now out of use.

G E S T U R E, in rhetoric, consists chiefly in the proper action of the hands and face. It is a kind of natural language, that supplies the use of speech in persons born dumb. See the article Action.

G E T H Y L L I S, in botany, a genus of the decandria-monogynia class of plants, the corolla of which consists of a single petal; the tube is filiform and very long; the limb is plane, divided into six equal segments, of a lanceolated figure, and but about a third part the length of the tube; the fruit is an oblong, ventricose, Triangular capsule, with three cells; the seeds are numerous.

G E V A U D A N, a territory of Languedoc, adjoining to the Cevennes.

G E V E R, or St. Goar, a town of Germany, fifteen miles south of Coblenz.

G E V I I M, avent, in botany, a genus of the decandria-pentagynia class of plants, the corolla of which consists of five roundish petals, with narrow unges of the length of the cup, and inserted into it; there is no pericarpium; the common receptacle of the seeds is oblong, hairy, and placed on the cup, which is, at that time, reflex: the seeds are numerous, compressed, hilpid, and each furnished with a long gniculated style.

G E V I I M, is also used for saxifrage, saxifraga. See the article Saxifraga.

G E X, a town of France, seven miles north-west of Geneva.

8 T 2

G H E M A R A,
GIANG, in chronology, a cycle of twelve years; in use among the Turks and Cathays. See the article CYCLE.

Each year of the giagh bears the name of some animal: the first, that of a mouse; the second, that of a bullock; the third, that of a lynx or leopard; the fourth, of a horse; the fifth, of a crocodile; the sixth, of a serpent; the seventh, of a horse; the eighth, of a sheep; the ninth, of a monkey; the tenth, of a hen; the eleventh, of a dog; and the twelfth, of a hog.

They also divide the day into twelve parts, which they call giaghs, and distinguish them by the name of some animals. Each giagh contains two of our hours, and is divided into eight kehs, as many as there are quarters in our hour.

GIALLOLINO, in natural history, a heavy, friable, fine, yellow ochre, called naples-yellow, and much used among painters, who esteem it a very fine colour. See the article OCHRE.

GIANT, πέλας, a person of enormous bulk, or stature.

The reality of giants, and of nations of giants, is much controverted among the learned. Dr. Derham observes, that though we read of giants before Noah's flood, yet there is great reason to think the size of a man was always the same from the creation: for as to the nephilim, or giants, in Gen. vi. the antients vary about them; some taking them for great philosophi, and monsters of impiety, rapine, tyranny, and all wickedness, as well as of monstrous stature. And as to those Numb. xiii. represented as men of gigantic size, it is probable the fears of the spies might have added thereto: however this be, it is plain that in both these places giants are spoke of as rarities and wonders of the age, not of the common stature; and such instances we have had in all ages.

GIANT'S BONES, in natural history, a name erroneously given to certain fosse bones, vulgarly supposed to have been the bones of giants; but, in reality, are those of the elephant or whale-kind.

GIANT'S CAUSEWAY, a vast collection of a black kind of marble, called basaltes, in the county of Antrim, in Ireland. See the article BASALTES.

GIAROLA, in ornithology, a species of lark, with a remarkably long heel.

GIAROLA, a species of shipe, with a white tail. See the article SNipe.

GIBBOUS, or GIBELLINS, a famous faction in Italy, opposite to another, called the guelphs.

These two factions ravaged and laid waste Italy for a long series of years, so that the history of that country, for the space of two centuries, is no more than a detail of their mutual violence and slaughter. The gibelins foid for the emperor against the pope: but concerning their origin and the reason of their names, we have but a very obscure account. According to the generality of authors, they rose about the year 1240, upon the emperor Frederic Ill's being excommunicated by pope Gregory IX. Other writers maintain, that the two factions arose ten years before, though still under the same pope and emperor. But the most probable opinion is that of Maimbourg, who says, that the two factions of guephs and gibelins arose from a quarrel between two antient and illustrious houses on the confines of Germany, that of the Hems of Gibelinge, and that of the Guephs of Adorf.

GIBET, a kind of gallows, whereon criminals are executed, or hung in chains. See the article GALLOWS.

GIBLETS, gigerie, the offals of poultry, particularly of a goose and duck, including the head and neck, heart, liver, pinions, and legs; which the art of cookery has busied itself about, by inventing ragouts, pies, soups, &c. made of them.

GIBRALTAR,
GIBRALTAR, a port-town of Andalusia, in Spain, subject to Great Britain: west lon. 6°, and north lat. 36°.

It stands at the foot of mount Calpe, one of Hercules's Pillars, about sixteen miles north of Ceuta, in Africa, from which it is divided by the Straights, to which it gives name. It is built on a rock, in a peninsula, and can only be approached on the land-side by a very narrow passage between the mountain and the sea: cross this passage the Spaniards have drawn a line, and fortified it, to prevent the garrison's having any communication with the country.

The Straights of Gibraltar are about twenty-four miles long, and fifteen broad.

GIESEN, a town of Germany, thirty miles north of Frankfort.

GIFT, in law, a conveyance, by which either lands or goods are passed: it is of larger extent than a grant, being applied to things moveable and immovable.

A gift may be by deed, by word, or in law: thus, all a person's goods and chattels, except in some special cases, may be given without deed; though such a gift is liable to suspicion. When such a gift is made in satisfaction of a debt, it should be done before witnesses of credit; that the goods and chattels be, at the same time, appraised to the full value; and that the gift be expressly made in full satisfaction of the debt.

As to gifts in law, where a man is married, all the goods and chattels of his wife belong to the husband; also, if a person be made executor of a will, by gift in law, all the testator's goods are his, after paying the testator's debts.

And as to deed of gift, all things that lie in livery, as meilifages, lands, woods, &c. may be given or granted in fee for life, or years, at first; and be alligned over forever, afterwards. Such a deed may be made upon condition; and, if it be of goods and chattels, the delivery of a fixpence is a good fein in the whole.

GIGG, or GIGG. See the article GIGG.

GIGANTIC, something of a monstrous size, like that of giants. See GIANT.

GERIZE, the fame with giblets. See the article GIBLETS.

GIG, or JIGG, in music, denotes a brisk and lively air; or an airy kind of dance, to a sprightly measure.

GIGOT-BRANCH, in the manege. See the article BRANCH.

GILAN, a province of Persia, bounded by the Caspian sea on the north. Its capital is a city of the same name: east longit. 48°, and north lat. 37°.

GILBERTINES, a religious order founded in England by St. Gilbert, in the reign of Henry I. The nuns followed the rule of St. Benedict, and the monks that of St. Augustin. There were many monasteries of this order in different parts of England.

GILD, or GUILD. See GUILD.

GILDING, the art of spreading or covering a thing with gold, either in leaf or liquid. See the article GOLD.

We have this advantage over the antients, in the manner of using and applying the gold, that the secret of painting in oil, lately discovered, furnishes us with means of gilding works, capable of enduring all the violence of time and weather, which theirs could not.

There are several methods of gilding in use among us, as gilding in water, gilding in oil, gilding by fire, &c. of each of which in order.

The method of water-gilding. Water-gilding requires more preparation than oil-gilding, and is chiefly on wooden works, and those made of stucco; and these too must be sheltered from the weather. A size is used for this way of gilding made of threads, &c. of parchment or gloves boiled in water to the confidence of a jelly. If the thing to be gilt be wood, it is first washed with this size, boiling hot, and then set to dry; and afterwards with white paint mixed up with the same size. Some use Spanish white for this purpose, and others plaster of Paris, well beaten and sifted. This size paint must be laid on with a stiff brush; which is to be repeated, seldom or oftener according to the nature of the work, as ten or twelve times in flat or smooth works, but seven or eight will be sufficient in pieces of sculpture. In the former case they are applied by drawing the brush over the work, in the latter by dabbing it. When the whole is dry, they moisten it with fair water, and rub it over with several pieces of coarse linen, if it be on the flat; if not, they beat or switch it with several slips of the same linen, tied to a little stick, to make it follow and enter all the cavities and depressures thereof.

Having thus finished the white, the next thing to be done, is to colour it with yellow ochre: but if it be a piece of sculpture in relievo, they first touch it up, and prepare the several parts, which may have
have happened to have been disfigured, by the small iron instruments, as gouges, chisels, &c. The ochre used for this purpose must be well ground and sifted, and mixed up with the size before-mentioned. This colour is to be laid on hot; and in works of sculpture, supplies the place of gold, which sometimes cannot be carried into all the depressions and cavities of the foliages and other ornaments. A lay is also applied over this yellow, which serves for the ground on which the gold is to be laid: this lay is usually composed of armenian bole, blood-flone, black-lead, and a little fat; to which some add soap, and oil of olives; others, burnt-bread, bitre, antimony, glas of tin, butter, and sugar-candy. These ingredients being all ground down together with hot size, three lays of this composition is applied upon the yellow, the one after the other has been dried; being cautious not to put any into the cavity of the work to hide the yellow.

The brushe, used for this purpose, must be a soft one; and when the matter is become very dry, they go over it again with a stronger brush, to rub it down, and take off the small grains that stick out, in order to facilitate the burnishing of the gold.

To be prepared for gilding, you must have three sorts of pencils; one to wet, another to touch up and amend, and a third to flatten; also a gilding cushion, for spreading the leaves of gold on when taken out of the book; a knife to cut them, and a squirrel's tail fitted with a handle; or else a piece of fine soft stuff on a stick, to take them up directly and apply them. You are first to begin with wetting your pencils; by which the last lay laid on with water is moistened, that it may the better receive and retain the gold. Then you are to lay the leaves of gold on the cushion, and if whole, you must take up with the squirrel's tail, but if in pieces, with the other instrument, or the knife whereby they are cut, and lay and spread them gently on the parts of the work you had moistened before. If the leaves, as they frequently do, happen to crack or break in laying on, these breaches must be made up with small bits of leaf, taken up upon the repairing pencil, and the whole work is to be smoothed either with the same pencil, or another something larger; the gold being pressed into the dents, into which it could not be so easily carried by the squirrel's tail.

The work having been thus far gilded, must be set to dry, in order to be burnished or flattened. See Burning and Flattening.

The last operation is the applying the vermeil in all the little lines and cavities; and to stop and mend very little faults with shell-gold. The composition called vermeil is made of gum gutta, vermillion, and a little of some ruddy-brown, ground together with venetian varnish and oil of turpentine. Some gilders, instead of this, make shift with fine laccia, or dragon's blood, with gum-water. Sometimes instead of burnishing the gold, they burnish the ground or composition laid on the last before it, and only afterwards wash the part over with the size. This method is chiefly practised for the hands, face, and other rudities in relief: which, by this means, do not appear so very brilliant as the parts burnished, though much more so than the parts perfectly flat.

To gild a piece of work, and yet preserve white grounds, they apply a lay of Spanish white, mixed with a weak quick-glue on all the parts of the ground, whereon the yellow or the last lay might run.

The method of Gilding in Oil. This operation requires much less apparatus than that before-mentioned. The basins or matter whereon the gold is laid, in this method, is the remains of colours found settled to the bottom of the pots in which painters wash their pencils. This matter, which is very viscid or sticky, is first ground, and then passed through a linen-cloth, and thus laid on the matter to be gilt, after it is washed once or twice over with size; and if it be wood, with some white paint. When this is almost dry, but yet is still unfeetuchous enough to catch and retain the gold, the leaf-gold is laid on, either whole, if the work be large, or cut to pieces, if smaller: the leaves of gold are taken up and laid on with a piece of fine, soft, well-carded cotton; or sometimes by a pallet for the purpose, or sometimes with the knife with which the leaves were cut, according to the parts of the work that are to be gilded, or the breadth of the gold that is to be laid on. As the gold is laid on, they pass over it a coarse stiff pencil or brush, to make it stick and as it were incorporate with the ground; and after this they mend any cracks that may have happened in it, either with the same pencil or one that is smaller.
GILDING

This kind of gilding is chiefly used for domes and roofs of churches, courts, banquetting-houses, &c. and for figures of plaster of Paris, lead, &c.

The method of gilding with liquid gold.

This is performed by gold reduced to a calx and amalgamated with mercury, in the proportion of about an ounce of mercury to a dram of gold. To perform this, they heat a crucible red-hot, and then put the gold and mercury into it, stirring them gently about till the gold be found melted, and incorporated into a mass with the mercury. When this is done, they cast them into water, to wash and purify them; and out of that into other waters, where the amalgama, which is almost as liquid as if there were nothing but quicksilver in it, may be preferred a long time for use.

Before they proceed to lay this amalgamated gold on the metal, they first render the metal rough, by washing it over with aqua fortis, or aqua licaunda; and afterwards rinse the metal in fair water, and scour it a little with fine sand, and then it is ready for the gold.

They next cover over the metal with the mixture of gold and mercury, taking it up with a slip of copper, or a brush made of brais-wire, spreading it as even as possible, to do which they wet the brush from time to time in fair water. Then they set the metal to the fire, upon a grate, or in a sort of cage, under which the amalga, which is almost as liquid as if there were nothing but quicksilver in it, may be preferred a long time for use.

Then the work is rubbed over with the wire-brush, dipt in beer or vinegar, which leaves it in a condition to be brought to a colour, which is the last part of the process, and which the gilders keep to themselves as a mighty secret.

The method of gilding by fire on metal.

To prepare the metal, they scratch it well, or rake it; then polish it with a poliisher; and afterwards let it to the fire to blue, i.e. to heat, till it appear of a blue colour. When this has been done, they clap on the first leaf of lead gold, rubbing it lightly down with a poliisher; and expose it thus to a gentle fire. They usually give it but three such lays, or four at the most, each lay confiniting of a single leaf for common works, and of two for extraordinary ones: after each lay, it is set a fresh to the fire; and after the last lay, the gold is in condition to be burnedish.

To gild paper. Grind bole-armoniac with rain-water, and give one laying of it; when it is dry, take glair of eggs, and add to it a little sugar-candy and gum-water, which lay over the former, and upon this, when it is dry enough, lay leaf-silver, or leaf-gold.

To gild the leaves of books. Take bole-armoniac, eight penny-weight; sugar-candy, two penny-weight: mix and grind them with glair of eggs: then on a bound book (while it is in the press, after it hath been fineared with glair of eggs, and is dried) smear the said composition, let it dry, then rub it well and polish it; then with fair water wet the edges of the book, and suddenly lay on the gold, press it down lightly with cotton, let it dry, and then polish it with a tooth.

GILDING OF CHINA OR PORCELAIN. See the article PORCELAIN.

GILL, a measure of capacity, containing a quarter of a pint. See PINT AND MEASURE.

GILL is also a name for ground-ivy, which, being infused in ale, makes what is known by the name of gill-ale; a sort of medicated ale, said to be abserverve and vulnerary.

GILLÀ VITRIOLI, a name sometimes given to the emetic salt of vitriol. See the article VITRIOL.

GILLINGEN, a town of Swabia, eleven miles south of HAILBRON.

GILLS, branchis, in ichthyology. See the article BRANCHÆ.

GILOLO, a large island of the Pacific ocean, lying between 1° south latitude and 2° north latitude, and between 125° and 128° east longitude.

GILOLO is also the name of the capital of the above island, situated in 40° north latitude.

GILT-HEAD, aurata, in ichthyology, the sharp-backed sparus, with a crooked gold-coloured line between the eyes. It is a very beautiful fish, the ground-colour of whole body is an olive-brown, but elegantly variegated with a number of different colours. See SPARUS.

GILT-VARNISH. See VARNISH.

GIN, or GENEVA, among distillers. See the article GENEVA.

GIN, in mechanics, a machine for driving piles, fitted with a windlass and winches at each end, where eight or nine men heave, and round which a rope is reeved, that
that goes over the wheel at the top; one end of this rope is seized to an iron-monkey, that hooks to a beetle of different weights, according to the piles they are to drive, being from eight to thirteen hundred weight; and when hove up to a crofs-piece, near the wheel, it unhooks the monkey, and lets the beetle fall on the cross-piece, for its being hooked again to the beetle. See the article ENGINE.

GINGEN, an imperial city of Germany, twenty miles east of Ulm; east lon. 10°, and north lat. 48° 36'.

GINGER, zinziber, in botany. See the article ZINZIBER.

The root of this plant is too well known to need any description: it will be sufficient to observe, that it is of the tuberous kind, knotty, crooked, and irregular, and diversificated into many branches; of a pale yellowish colour when broken, and, like the contrayerva, of a fibrous structure. This root is of a very hot, acrid, and pungent kind, knotty, crooked, and irregular, and of a very agreeable smell.

Ginger is too cheap to be sophisticated, and too well known to need any directions about the choice of it; it may only be observed that the hardelt and firmitest pieces are the best. The Indians are particularly fond of ginger; they eat both the young shoots of the leaves, and the roots themselves, cut small, in their salads and broths; and they make an excellent sweet-meat of them, preferring them with sugar. Ginger is an excellent carminative and stomachic; it afflicts digestion, expels flatulences, and takes off colic pains, often almost instantaneously. It is also highly esteemed by some as a cephalic, and is particularly said to strengthen the memory. It is often used as a corrective to purging medicines, and has the credit of being a great provocative to venery, especially in the preserved state. It may be given in powders, from two or three to ten, twelve, or fifteen grains; but it is seldom given in such large doses, on account of its acrimony. It is used in decoctions from one dram to two or three, to the quart. It is an ingredient in the venice-treacle, mithridate, and diaicordium, and in many other of the compositions of the tisps; and is very frequently used in carminative and stomachic powders, in extemporaneous prescription.

Method of preserving Ginger. Wash the ginger, and lay it to steep for ten or twelve days, in white-wine and water, stirring them every day; then to a pound of roots allow two quarts of white-wine, and about a pint of lemon-juice; boil these together for about a quarter of an hour; then add two pounds and a half of fine sugar, and boil it to a syrup, scumming it as it rifes; then let it by in a glazed pot till the next day, and afterwards boil it again in the syrup, for half an hour; then let it by till the next day, when boiling it again, let it cool; repeating this till the ginger is clear: after which put it into glasses, and cover them with paper.

This is a fine sweet-meal for the winter-season.

GINGER-BREAD, a richer kind of bread, the flavour and taste whereof are heightened and improved with spices, and particularly with ginger, whence the name.

The preparation of ginger-bread is as follows: grate two penny white loaves into two pounds of almonds well blanched and pounded; then add two ounces of ginger, finely scraped, liquorice, and anise in powder, of each half an ounce; add to these five or six spoonfuls of rosemery-water; and knead all into a paste, with a pound of sugar, mould it, and roll it thin, then print it, and dry it in a stove. Others make it of treacle, citron, lemon, and orange-peel, with candied ginger, coriander, and caraway-seeds, mixed up with as much flour as will make it into a paste.

GINGER-WINE is made as follows: take three gallons of water, an ounce of rance-ginger, and three pounds of sugar; boil them for an hour, and then put into it three lemons, and a little good yeast; clofe up the vessel, and let it stand five days: if it has so worked as to be clear in that time, it may be bottled: if not, let it stand longer, until it has worked sufficiently; and in ten days after it may be drank.

GINGIDIIUM, in botany, the name by which some call two different plants, a species of fennel and of thapsia. See the articles FENNEL and THAPSIA.

GINGIVE, the gums, in anatomy, a hard fort of flesh, inveting the alveoli, or sockets of the teeth. The gums consist of the common membrane of the mouth, and the periodontum of the jaws, to which they adhere very closely and firmly. They are furnished with
with a vast number of blood-veiels, whence their florid red colour; and they serve for the covering of the jaws, and the keeping the teeth fast in their sockets.

GINGLYMUS, γιγλυμος, one of the three subdivisions of that kind of articulation called diarthrosis. See the articles ARTICULATION and DIARTHROSI.S. The ginglymus is that juncture of the bones wherein they mutually receive and are received by one another, as is the case of the articulation of the humerus and cubitus. See HUMERUS, &c. The ginglymus is again subdivided chiefly into three kinds; the first is when the same bone at the same extremity receives, and is reciprocally received by another bone, after the manner of an hinge, as that of the cubitus and humerus: the second is when a bone receives another at one of its extremes, and is received into another, as the vertebrae do: the third is that where a bone is received into another after the manner of a wheel, or the axis of the wheel in a box, such as that of the second vertebra of the neck in the first.

GINSENG, in botany. See the article PANAX.

The root of the ginseng is of an oblong figure, never growing to any great size, being generally about four or five inches long, and its thickness that of one's little finger. It is of a firm texture, its surface is furrowed and wrinkled in different places. It is of a brownish colour on the outside, and somewhat yellowish within; and is so pure and fine, that it seems transparent. The top of the root, when it is lent entire to us, is found composed of knots, or tubera, placed over one another in an irregular manner; these are formed of the bottoms of the decayed stalks of the several preceding years. When the root is fair and entire, it is easy to know by these how old it is; but very old roots not being so much in repute, the people who gather ginseng have often the precaution to cut off some, or even all these knobs, before they dry the root.

Ginseng is of a very agreeable and aromatic smell, tho' not very strong; its taste is acrid and aromatic, and has somewhat bitter in it. It is to be chosen and firm, moderately heavy, not too tough, and of a good smell. Before it be bought, it will be prudent to cut every root th'o', for the Chinese, of whom we have it, frequently find a way to introduce pieces of lead into it, to increase the weight.

The roots of the ginseng and ninzin are so much alike in their shape, colour, and virtues, that they are frequently mistaken for one another, and by the generality of authors understood to be the same, notwithstanding that they belong to two very different plants, and of two different genera. See the article NINZIN.

The Chinese and Tartars collect the root of this plant with infinite pains, at two seasons of the year, spring and autumn. They are forbid to touch them with any iron instrument, so that they can only clean them with wooden knives. They wash them in a decoction of millet-feed, and afterwards hang them over the fumes of the same liquor, which they boil in considerable quantities for that purpose, in a cloe vessel, in the upper part of which the root is suspended, over the surface of the liquor: after this they dry it for use, thus it becomes transparent. The small fibres which are taken off, they boil in water, and make an extract of them, which they use in the same intention with the root.

The Chinese value the ginseng so highly, that it sells with them for three times its weight in silver. They, as well as the Asiatics in general, think the ginseng almost an universal medicine: they have recourse to it in all diseases, as the last remedy, and readily give themselves over when it will not cure them; but the virtues most generally ascribed to it, are those of a restorative, a provoking, and a cordial. It is famous in the east for giving strength to those who have disabled themselves by the too free use of women: there they also recommend it greatly in the small-pox, fevers of all kinds, disorders of the stomac'h and bowels, and tell us that diarrhoas and dysenteries are cured by it: but they caution people not to give it in too large doses to persons of a florid constitution, on whatever occasion it may be necessary to them. The European physicians esteem it a good medicine in convulsions, vertigo, and all nervous complaints, and recommend it as one of the best restoratives known.

Its dose is from ten grains to twenty, in powder; and from one dram to two to the pint, in infusions.

GIOVENAZZO, a bishop's see in the kingdom of Naples, twelve miles west of Bari.

8 U
GIRACE, a city and port-town of Calabria, about thirty-six miles north-east of Reggio.

GIRANDOLE, a kind of branched candlestick. See the article CANDLESTICK.

GIRDERS, in architecture, some of the largest pieces of timber in a floor. Their ends are usually fastened into summers and breast-summers, and joists are framed in at one end to the girders. The size of girders and summers, upon the rebuilding of London, were ordained by act of parliament, to be in length from ten to twenty-six feet, in breadth from eleven to seventeen inches, and in depth from eight to fourteen inches. It was also ordained by the same statute, that no girdle or summer should be less than ten inches in the wall, and that their ends should be laid in loam; as also that they be of good heartly oak, as free from knots as may be, because that will be the least subject to breaking, and may with more safety be relied on in this crooks and transverse work.

GIRDING-GIRT, in the sea-language. A ship is girt, or hath a girding-girt, when her cable being so tight, or strained, upon the turning of the tide, she cannot get over it, but lies across the tide. GIRDLE, cingulum, or zona, a belt or band of leather, or other matter, tied about the reins, to keep that part more firm and tight.

The Romans always wore a girdle, to put up the tunica, when they had occasion to do any thing: this custom was so general, that such as went without girdles, and let their gowns hang loose, were reputed idle diletante persons.

It was antiently the custom among us, for bankrupts and other insolvent debtors to put off and surrender their girdle in open court; the reason whereof was, that our ancestors used to carry all their necessary utensils, as purse, keys, &c. tied to the girdle: whence the girdle became a symbol of the estate.

Virgin-GIRDLE. It was the custom among the Greeks and Romans, for the bride-groom to untie his bride's virgin-girdle, before he took her to his embraces. See the article BRIDEGROOM. This girdle was made of sheeps-wool; it was tied in the herculean knot, and in bed the husband untied it, as a happy presage of his having as many children as Hercules, who at his death left seventy behind him. The poets attribute to Venus a particular kind of girdle, capable of inspiring the passion of love. See the article CAESUS.

Quicksilver-GIRDLE, singulum fapiens, in medicine, a sort of belt or girdle, invented by Rulandus, made with woollen-cloth sufficiently impregnated with quicksilver, killed with hog's lard. This is fewed up in a linen-cloth, which is applied to the skin, about the hypochondria, in disorders of the itch, phthiriasis, ulcers, and in cases where there is no absolute necessity for exciting a salivation. The patient's body must be kept warm, and defended from the cold of the external air, otherwise the belt, which is of itself highly safe, becomes very dangerous, as the access of the external cold during its use, according to Etmüller, endangers a salivation, petechial fever, or other disorders. Bartholome informs us, that this girdle proves mortal, when applied to patients who are either too young, weakened by diseases, or of a cacoethic habit of body.

Christians of the GIRDLE, the christians of Aisa, particularly those of Syria and Mepopotamia, who to this day wear a large leathern girdle, being enjoined thereto by Motavakkel, tenth caliph of the family of the Absafides, in the year 856, as a badge of their profession.

Order of the GIRDLE. See CORDELIER.

GIRDLE, in architecture. See CINCTURE.

GIRGE, a city of upper Egypt, on the west side of the Nile: east lon. 32°, and north lat. 26°.

GIRGILIM, in the materia medica, the same with the sefamum.

GIRKIN, a term used by gardeners for a small kind of cucumber. See CUCUMBER.

GIRLE, among sportsmen, denotes the roebuck in its second year.

GIRONNE, a large city and bishop's see of Spain, in the province of Catalonia, forty-five miles north-east of Barcelona: east lon. 29° 35', and north lat. 42°.

GIRONNE, or GIRONNY, in heraldry, a coat of arms divided into girons, or triangular figures, meeting in the center of the field, and alternately colour and metal. See plate CXI. fig. 3.

GIRT, in the menzuration of timber, denotes the circumference of a tree. See the article TIMBER.

GIRT, among builders, a term sometimes used for fillet. See the articles FILLET.

GIRTHS of a saddle, the strong canvas-straps, which, being buckled under a horse's belly, serve to fix the saddle. See the article SADDLE.

GISBORN,
GISBORN, a market-town of Yorkshire, fifty miles west of York.
GISBOROUGH, another market-town of Yorkshire, thirty-seven miles north of York.
GISCARA, in botany, the name of a Brazilian species of palm-tree.
GISON, or GISON, in Jewish antiquity, signifies, according to Josephus, a little wall, about breast high, made round the temple of Jerusalem, and round the altar of burnt sacrifices, to keep the people at a distance. This author, in his books of antiquities, makes the gison three cubits high, but one in his history of the Jewish war.
GISORS, a city of Normandy, in France, twenty-eight miles north-east of Rouen: east long. 1° 25', north lat. 50° 10'.
GITHAGO, a name used by some for a species of lychnis. See LYCHNIS.
GIVEN, among mathematicians and philosophers, the same with data.
GIUSTANDIL, a town of European Servia: east lat. 24°, north lat. 43°.
GIULA, a city of Hungary, subject to the house of Austria: east long. 21° 35', north lat. 46° 38'.
GLABELLA, in anatomy, the name by which some call the space between the eye-brows, as being smooth and void of hair.
GLACIS, in building, an easy, insensible slope, or declivity. The declent of the glacis is less steep than that of the talus. In gardening, a descent sometimes begins in talus, and ends in glacis. See the article TALUS. The glacis of the cornice, is an easy imperceptible slope in the cymatum, to promote the descent and draining off the rain-water.
GLACIS, in fortification, that mass of earth which serves as a parapet to the covered way, sloping easily towards the campaign, or field. The glacis, otherwise called esplanade, is about six feet high, and loses itself by an insensible diminution in the space of ten fathoms. See ESPLANADE.
GLADDON, or GLADWIN, a plant called by botanists iris. See the article IRIS.
GLADE, in botany. See the article GLAD.
GLADE, in gardening and agriculture, an opening and light passage made through a wood, by lopping off the branches of trees along that way.
GLADIATORS, in antiquity, persons who fought generally in the arena at Rome, for the entertainment of the people. The gladiators were usually slaves, and fought out of necessity; though sometimes freemen made profession thereof, like our prize-fighters, for a livelihood. The Romans borrowed this cruel diversion from the Assyrians; and we find that the very priests had their ludi pontificales, and ludi fecundales. As from the earliest ages of antiquity we read that it was customary to sacrifice prisoners of war to the men of the great men that fell in the engagement, in process of time, they came to sacrifice slaves at the funerals of all persons of condition; but as it would have appeared barbarous to cut their throats like beasts, they were appointed to fight with each other, and to do their best to save their own lives by killing their adversary. See the article BUSTURIAI.
Hence arose the matters of arms called lanistæ, and men learned to fight. These lanistæ bought slaves to train up to this cruel trade, whom they afterwards sold to such as had occasion to exhibit fawns. Junius Brutus, who expelled the kings, was the first that honoured the funeral of his father with these inhuman diversions at the sepulchre of the deceased; but afterwards they were removed to the circus and amphitheatres; and other persons, besides slaves, would hire themselves to this infamous office.
They were all first sworn that they would fight till death, and if they failed, they were put to death, either by fire, swords, clubs, whips, &c. It was usual with the people, or emperor, to grant them life when they shewed no signs of fear. Augustus decreed, that it should always be granted them.
From slaves and freed men, the wanton sport spread to persons of rank, as we find in Nero's time. And Domitian exhibited combats of women in the night-time; we also read, that dwarfs encountered with one another. Constantine the great first prohibited these combats in the east, but the practice was not entirely abolished in the west before Theodosius king of the Ostrogoths, in the year 500.
When any person designed to entertain the people with a show of gladiators, he
fet up bills in the public places, giving an account of the time, the number and names of the combatants, and the circumstances whereby they were to be distinguished; each having his several badge, which generally was a peacock's feather; they also gave notice what time the show would last; and sometimes gave representations of these things in painting, as is practised among us, by those who have any thing to show at fairs, &c. Upon the day appointed for the show, in the first place the gladiators were brought out all together, and obliged to take a circuit round the arena in a very solemn and pompous manner. After this, they proceeded, pari am componere, to match them by pairs, in which great care was taken to make the matches equal. The first sort of weapons they made use of were javelins, or wooden files, called rudis, and the second were effective weapons, as swords, poniards, &c. The first were called arma luforia, or exercitioria; the second, decretoria, as being given by decree or sentence of the praetor, or of him who at whole expense the spectacle was exhibited.

They began to fence or skirmish with the first, which was to be the prelude to the battle, and from these, when well warmed, they advanced to the second, with which they fought naked. The first part of the engagement was called ventilare, praeludere; and the second diminicare ad certum, or verfis armis pag-nare.

When any received a remarkable wound, either his adversary or the people used to cry out, babet, or hoc babet. If the vanquished surrendered his arms, it was not in the victor's power to grant him life: it was the people during the time of the republic, and the prince or people during the time of the empire, that were alone empowered to grant this boon. The two signs of favour and dislike given by the people, were premere paliicem, and avertere pullicem, the former of which M. Dacier takes to be a clenching of the fingers of both hands between one another, and in holding the two thumbs upright close together, was a sign of the people's admiration of the courage shewn by both combats; and at the same time for the conqueror to spare his antagonist's life: but the contrary motion, or bending back of the thumbs, signified the dissatisfaction of the spectators, and authored the victor to kill the other combatant downright for a coward. The emperor faved whom he liked, if he was present at the solemnity, in the same manner.

After the engagement, several marks of favour were conferred on the victor, particularly a branch of palm-tree; and oftentimes a sum of money, perhaps gathered up among the spectators: but the most common rewards were the pileus and the rudis; the former being given only to such gladiators as were slaves, for a token of obtaining their freedom; but the rudis seems to have been bestowed both on slaves and freemen, with this difference, that it procured the former no more than a discharge from any further performance in public, upon which they commonly turned lanifia; but the rudis, when given to such persons as, being free, had hired themselves out for these shows, restored them to a full enjoyment of their liberty. See the articles Pileus, Rudis, and Lanista.

There were divers kinds of gladiators distinguished by the weapons, manner, time of fighting, &c. Such were the andabata, catervarii, confummati, cubicularii, dimachiae, sicae, &c.

GLADIOLE, gladiolus, in botany, a genus of the triandria-monoecia class of plants, the flower of which consists of six petals that unite at their bases: the fruit is an oblong, triocular capsule, containing a great many triangular seeds.

The root of gladiole, or the common corn-flag, is accounted deficient, and good in malignant and pestilential fevers.

GLADIUS, a sword; whence jus gladii, or right of the sword, is used in our ancient latin authors, and in our norman laws, for supreme jurisdiction: and it is probably from hence that, at the creation of an earl, he is gladio succinens, to denote his having a jurisdiction over the county.

GLADIUS-PISCIS, a fish more usually called xiphius. See the article Xiphias.

GLAMA, a species of peruvian camel, with the back even, and the breed gibbose. See the article Camel.

GLAMORGANSHIRE, a county of south Wales, bounded by Brecknockshire on the north, and by the Bristol channel on the south. Its capital is Landaff.

GLAND, in anatomy, a small body, formed by the interweaving of vessels of every kind, covered with a membrane, usually provided with an excretory duct, and defined to separate some particular fluid from
Many of the anatomical writers of the very first clas, and among these some who have written professedly of the glands, and have made it their peculiar business to examine nicely into their nature, and explain their structure, have yet, from mere difficulty of ascertaining adequate ideas of the term, evaded giving a definition or general description of the glands; and in consequence of this, numberless errors, and an almost inextricable confusion, has crept into the study of this important part of the human structure.

Other authors, who have had more boldness, if not greater abilities than those who have avoided meddling with definitions of these parts, have ventured to establish what they call glands: but these differ so much from one another in what and use it cannot.

Many of the anatomical writers of the received and allowed by all writers who have avoided meddling with defining any thing of its use. There are therefore other characters by which a gland may be known, though by its office and use it cannot.

Other writers, of the number of whom is the great Malpighi, in definitions of particular bodies, having found vessels in the brain, liver, kidneys, and other parts of the body, thence declared them to be glandulous in their structure: but in these cases, the bodies described were all morbid ones; and as the same vessels are not found in healthful ones, nor indeed any thing analogous to them, it is a sufficient proof that they are not natural parts of their structure; and besides, vessels and glands are different. See Vesicle and Vascular.

It is evident that the antients called certain parts of the human body glands, and that for no other reason but because they found them composed of a peculiar kind of fleshy substance, of a peculiar habit, or external appearance, without paying any the least regard either to their internal structure, their spherical figure, (by which character some define them) or their use.

If it be asked, says Heister, what this particular habit in the glands is? or how we are to know it? the answer is, that the peculiar complication and arrangement of the vessels, from which there arises a form obviously distinguishable at sight from the muscles, the fat, the bones, the membranes, the vessels, and in fine from every other part of the human fabric, which gives a sufficiently certain, determinate and striking notice of it.

The differences of the glands among themselves, as established by many authors, are very numerous: it will not be necessary
to run into the whole disquisition; we shall only select a few which are more generally established than the rest, and of more immediate and real use. We shall first divide them into two general kinds, the simple, called also conglobate glands, and the conglomerate. See the articles Conglobate and Conglomerate.

The glands differ also greatly in regard to their constitution: some of them are considerably hard and firm, and others extremely soft and tender: of the latter kind in particular are the glands situated in the articulations of the bones of the several parts of the body.

They differ also very considerably in colour. Some of them are of a pale, whitish, red, or fleshly colour; others of a strong, deep red; others yellowish, or brownish, and some evidently blackish.

Their differences in figure are as considerable also as those in colour: some of them are round, others oval, others oblong, and many others of figures as different as well can be from any one of these regular ones: the pancreas, the thyroides, and the thymus, are instances of this: some of them have obtained their names from their peculiar figure: of this number are the glandula pinealis, the miliares, and others. See the articles Pancreas, Thyroides, Thymus, &c.

The uses of the Glands are also as different as their colours or figures: some of them are salival, mucofe, and lymphatic; others are mucilaginous, sebaceous, and waxy; others lachrymal, pituitary, &c. and from these their several contents or secretions, they are termed lachrymal, &c. See the articles Salival, Lymphatic, Mucilaginous, &c.

The situation of the Glands is another article in which they differ, and from which many of them have their several names; such are the parotides, maxillares, linguales, thyroide, palatine, labial, jugulare, cervical, axillary, inguinal, lumbar, intestinal, mesenteric, renal, &c. See the articles Parotides, Maxillares, Cervicales, &c.

And, finally, the size of the glands is a thing in which they differ most obviously and essentially.

Of the Glands in particular. The particular glands of the body, or such as are truly and properly of this denomination, are, according to Heister, as follow; and first of the glands of the head.

In the sinuses of the dura mater, and out of them, at the sides, there are found a number of small glands described by Pacchionius; and there are sometimes others visible in the fosse of the os frontis, and about the divisions of the vessels, between the dura mater and the arachnoides. These glands seem defined for the secreting of a fluid to moisten the dura mater. Other glands of the brain are the pineal gland, and the pituitary gland. See the articles Pineal, Pituitary, Dura Mater, and Brain.

In the exterior part of the head, that is, out of the cavity of the skull, we have the parotids, the maxillary glands, the sublinguals, the linguals, the labials, the palatine, and the buccinals, which are distributed here and there about the membrane of the mouth; and are each described in their places. In the orbit also there is the lachrymal glands; under the eyes are the sebaceous or sebaceous glands, the tonils in the fauces, the mucous glands in the pituitary membrane of the nostrils, and the ceruminous glands of the ears, each of which are described under their several heads. See the articles Eye and Ear.

The principal gland of the neck is the thyroides, besides which there are also found in the neck a great number of liefer ones, distributed here and there among the muscles and fat. Their figure, their number, and their situations, vary in different subjects; but in general those in the anterior part of the neck are called jugulares; and those in the hinder part, occipitales and cervicales. The use of these is hitherto uncertain; it is generally supposed that they are of service to the lymphatic vessels, but what sort of use they can be of to them, does not so easily appear. See the articles Thyroides, Jugulares, Occipitales, Cervicales, and Neck.

Ruyfch and Morgagni have also described and figured glands in the epiglottis; and Morgagni has described others in the other parts of the larynx, particularly about the arytenoide cartilages, as also in the trachea: but these are often so small, that they are scarce discoverable in dissection.

The oesophagus, especially towards its upper part, has a great number of glands; and it is common to find a little aperture or orifice in the center of each, which has much the appearance of an excretory duct.

In the thorax we meet with the gland thymus;
thymus; as also with the glandulae bronchiales; these last are very observable glands, situated externally in the larger divisions of the trachea and bronchia. They are of a blackish colour; and their use, like that of many others of the glands of this part of the body, is yet very little known. It had been long supposed that they served to secrete a liquid which they discharged into the bronchia, for the lubricating and moistening these parts; but Vercellonius will have it, that they secrete a fluid whose use is to be assistent in the digestion of our food, and that they discharge it into the oesophagus through certain extremely minute ducts. See the articles THORAX, THYMUS, BRONCHIA, &c. About the fifth vertebra of the back, there is sometimes found in the thorax a remarkable gland adhering to the posterior part of the oesophagus: this is usually called glandula doralis. It is, in different subjects, of various sizes. It is often of the size of a kidney-bean; sometimes of that of an almond, and sometimes considerably larger; in others, it is much less than the smaller, and sometimes it is wholly wanting; or at least so extremely minute and inconsiderable, that the best dissectors are not able to find it. Sometimes also two glands are found in this part in the place of one. Vercellonius is of opinion, that this gland is also placed there for the secretion of a fluid serving to assist the digestion of our food in the stomach: but Fontanous, and some others, suppose, that these glands discharge a fluid of a mucous nature into the cavity of the oesophagus: several authors affirm, that in dogs these glands are found tumid, and inhabited by a number of oblong and slender red worms. See DORSUM, VERTEBRA, and OESOPHAGUS.

In the abdomen there are very considerable numbers of glands: the largest of them is the pancreas; after this in size come the glandulae renales, or capsula atrabilaria; after these the mesenteric, and the interinnals of Brunner and Peyer in the intestines. See ABDOMEN, &c.

The glands of the stomach are very easily distinguishable in dogs and hogs; but in human subjects, its difficult to find them: many anatomists have doubted them. Morgagni, however, discovered them to fairly in human subjects, that there is no doubt left about them.

About the vertebra of the loins, near where the receptaculum chyli is situated, and about the os sacrum, and the divisions of the iliac vessels, are many glands of various sizes and figures: they are commonly called lumbarae, sacrae, and iliacae, and they have numerous lymphatics entering into them, and discharging their contents into the receptaculum chyli. The lambar glands have been sometimes found swelled to the bigness of a man's fist.

In the concave part of the liver, about the ingress of the vena portae and the neck of the gall-bladder; as also about the spleen, near the ingress of the vessels, there are frequently found conglobate glands, of about the bigness of a kidney-bean: these are called by authors hepatic glands, cystic glands, and by other names formed from the names of the parts they are near; and they seem to serve the lymphatic vessels. See LIVER.

About the left orifice of the stomach, there sometimes also is found, according to Vercellonius, a gland which he says is equal to a kidney-bean in size; he also says that it has ducts opening into the cavity of the stomach. In hogs this gland is very conspicuous, but in human subjects it is not so.

Many authors have told us, that in the omentum, in every part where the fat lies, there are a number of glands whose office it is to secrete it. Dilatation thews us a few about that part where it is joined to the pylorus; and as to the rest, it is not necessary that there should be glands, because there is fat: for that may be, and is, indeed, in great abundance secreted immediately from the arteries.

In the gall-bladders of oxen there are often found a number of small glands of a yellow colour, not unlike the cerninuous glands in the auditory passage. In human subjects the same kind of glands are also sometimes found. The bladder and the ureters have also sometimes a number of small glands, but they are very indeterminate in number and size, and are not always indeed found in the same place, especially about the ureters. Those about the bladder are usually situated towards the neck of it, and are sometimes tolerably conspicuous.

In the parts of generation of man there occur, 1. The glandula Cowperi. 2. The glandula Littri. And, 3. The odontogrous glands of Tylo. See PENIS.
GLA

As to the latter ones, those of which are situat ed in the interior part of the prepuce, are much more obvious than those about the corona penis, where it is very difficult to distinguish them from the nervous papillæ of the same part.

1. We meet with the prostrate. 2. The glands of the vesicula seminalis; but these are rarely seen. 3. Those which Morgagni discovered in the nymphae: these have a very near alliance with the glandulae odoriferae of the penis in men. 4. Authors tell us of glands in the female as well as the male urethra: but the disector will find only little foramina and ducts in the place of them. 5. About the extremity of the urethra, however, in the vagina, there are sometimes found evident glands, situated beneath them: these, as well as the glands of the nymphae, are often very turgid in the time of parturition. 6. The vesicles sometimes met with near the internal orifice of the uterus, and taken by some for a new ovary, are not properly glands, tho' some people have been very positive that they were such; having nothing of the habit and peculiar appearance of glands, and being in truth only vesicles. 7. Some have also maintained that there are glands in the uterus, by which the menstrual discharges are secreted; but this notion arises only from the false hypothesis, that there are no glands, there can be no secretion. See the articles VAGINA and UTERUS. Among the glands which belong to the articulations, and the extremities, we are to mention first the axillary ones. 2. The inguinal glands; these last being situated on each side in the groin near the crural vessels, are in various diseased apt to grow tumid, and inflamed. Abscesses are often formed in them; but their use in the body is not easily understood. 3. The glands, called from their discoverer glandula haverriana, in the articulations: they are also called from the matter they secrete glandula mucosa. These are the softest of all the glands in the body; they secrete a mucous soft fluid, which serves to lubricate the joints, and render their motions easy; and to prevent their growing dry, and cohering together.

About the scapula, the flexure of the elbow, the hand, the knee, and the foot, there are also found here and there some small glands; as also in some places between and among the muscles: but as their number and situation, as well as their size and figure, are very uncertain and variable, it is not necessary to recount them here.

We are, however, yet to speak of the cutaneous glands. Verheyen tells us, that Steno had discovered, that there is a gland situated under every distinct pore of the skin, from whence there arises a vessel for the conveyance of the matter of sweat, which terminates at the surface of the cutis: and hence Verheyen, though he does not say that he had ever seen any of these glands himself, ventures to give them a place among the parts he describes; and calls them subcutaneous glands. The pores of the skin are so extremely numerous, that if, according to these authors, there were a gland belonging to every one of them, the glands must be almost infinite in number. But in dissection, when the cutis has been carefully cleared from the fat that is under it, it is certain no such glands are seen, either in the separated fat, or on the lower surface of the cutis: there are indeed always found little portions of the fat here and there infinuating themselves into the little foroæ, or holes in the cutis; but pieces of fat will be distinguished from glands, with very little difficulty by an expert anatomist. From this, and from innumerable searches after these glands, it appears, that there are indeed no such glands as those called subcutaneous. See the article CUTIS.

GLANDERS, in the manege, a disease in horses, confisting of a thick, slimy, corrupt humour, running from the nostrils, of a different colour, according to the different degrees of malignity, or as the infection has been of a shorter or longer continuance; being white, yellow, green, black, or bloody. Authors ascribe this disease to various causes: some to infection; others, to a disorder of the lungs; others, to the spleen; some to the liver; and others, to the brain. After it has been of so long a standing, as that the matter is become of a blackish colour, which is usually in its
its last stage, they suppose it to come from the spine; and hence they call it the mourning of the chine.

Kernels and knots are usually found under the caudui in this disorder; and as these grow bigger and more inflamed, so the glands increase more.

For the cure of the glands, Mortimer gives the following receipt.

Take a pint of children's chamber-lye, two ounces of oil of turpentine; half a pint of white wine vinegar; four ounces of sugar of bismuth; half a handful of rue: boil this composition till it comes to a pint, and give it to the horse fasting; and let him fast after it six hours from meat, and twelve from water.

GLANDIVES, a city and bishop's see of Provence, in France, situated on the river Var, twenty-six miles north-west of Nice; east long. 6° 40', north lat. 44°.

GLANDULAR, or GLANDULOUS, among anatomists. See GLANDULOUS.

GLANDULE, GLANDULA, a term used by anatomists to express a small gland. See the article GLAND.

GLANDULOUS, something abounding with, or partaking of the nature of glands. See the article GLAND.

GLANDULOUS BODY, glanduloform corpus, a name by which some call the prostate. See the article PROSTATE.

GLANDULOUS ROOTS, among gardeners, &c. denote such tuberose ones as are connected together by small fibres. See the article ROOT.

GLANIS, gans, a fish called in English, the sheat-fish; it is a species of silurus with four cirri on the lower jaw. See SILURUS.

GLANS, acorn, in natural history. See ACORN.

GLANS, in anatomy, the anterior extremity of the penis, called by other different names, as the head of the penis, the nut of the penis, and the balant of the penis. See the article PENIS.

The glans is composed of the epidermis and the corpus cavernosum, which is continuous with the urethra. See the articles EPIDERMIS AND CORPUS, &c.

Its surface is very smooth and polished, and is very sensitive to the touch, which is owing to a multitude of nervous papillae distributed all over it; and are most obvious when the penis is erected. In the front of it is the urethra, and immediately under is inserted the frenum or frenulum of the penis. The posterior extremity of the glans, with its neck behind, is distinguished by the name of the corona. See the article CORONA.

GLANS is also used to denote the tip or extremity of the clitoris, from its resemblance both in form and use to that of the penis. The principal difference consists in this, that it is not perforated as is the glans of the penis. This glans is also covered with a prepuvium formed of the inner membrane of the labia. See the article CLITORIS.

GLANS is also taken for thornous, or strumulous tumors.

It also signifies a suppository, or pledge.

GLANUS, or GLANIS. See GLANIS.

GLAREA, in natural history, a kind of impalpable sand. See the article SAND.

GLARIS, the capital of one of the cantons of Switzerland, of the same name; the inhabitants of which are both protestant and popish; it is situated thirty-five miles south-east of Zurich, in east long. 9°, and north lat. 47°.

GLASGOW, a large city in Scotland, in the shire of Lanarkshire, or Clyde-dale, situated on the river Clyde, twenty miles north-west of Lanerk, and forty miles west of Edinburgh, in 45° 8', west long., and 55° 5', north lat.

This is one of the most elegant towns in Scotland. It has an university, and a good foreign trade.

GLASS, vitrum, a transparent, brittle, facetious body, produced by the action of fire upon a first salt and sand, or stone, that readily melts.

The chemists hold, that there is no body but may be vitrified, or converted into glass, being the last effect of fire, as all its force is hot sufficient to carry the change of any natural body beyond its vitrification.

Antiquity and history of GLASS. When, or by whom, the art of making glass was first found out is uncertain; some will have it invented before the flood; but without any proof. Nero traces the antiquity of this art as far back as the time of Job; but Dr. Merret will have it as ancient as either pottery, or the making of bricks; because that a kiln, of bricks can scarce be burnt, or a batch of pottery be made, but some of the bricks and the ware will be at least superficially turned to glass; so that it must have been known at the building of Babel, and as long before as the making of bricks was used; it must have been known, consequently, among the Egyptians, when the Irideles were employed by them in making bricks.
Of this kind, no doubt, was that sofif glafs mentioned by Ferrant. Imperat. to be found under-ground in places where great fires had been. The Egyptians indeed boast, that this art was taught them by the great Hermes. Aristophanes, Aristotle, Alexander Aphrodisius, Lucretius, and John the divine, put us out of all doubt that glafs was in use in their days.

Pliny relates, that it was first discovered accidentally in Syria, at the mouth of the river Belus, by certain merchants driven thither by a form at sea, who, being obliged to continue there, and dress their victuals, by making a fire on the ground, where there was great plenty of the herb kali; that plant burning to ashes, its fats mixed and incorporated with sand, or ftones fit to vitrify, and produced glafs: that this accident being known, the people of Sidon, in that neighbourhood, assayed the work, improved the hint, and brought it into use; and that this art has been improving ever since.

Venice, for many years, excelled all Europe in the fineness of its glasses, but of late the French and English have excelled the Venetians, so that we are no longer supplied with this commodity from abroad.

Nature and characters of Glafs. Naturallists are divided in what clasfs of bodies to rank glafs: some making it a concrete juice; others a fton; others again rank it among semi-metals; but Dr. Merret oberves, that these are all natural productions, whereas glafs is a factitious compound, produced by fire, and never found in the earth, but only the fand and fton that form it; that metals are formed by nature into certain species; and that fire only produces them, by its faculty of separating heterogeneous, and uniting homogeneous bodies: whereas it produces glafs, by uniting heterogeneous matter, viz. falt and fand, of both which it evidently confifts; 100 lb. weight of fand yielding above 150 lb. of glafs.

The fame learned doctor gives us a precise and accurate enumeration of the several characters, or properties of glafs, whereby it is distinguished from all other bodies, viz. 1. That it is an artificial concrete of falt and fand, or ftones. 2. Fusible by strong fire. 3. When fus'd, tenacious and coherent. 4. It does not waftle nor contract in the fire. 5. When melted, it cleaves to iron. 6. When it is red hot, it is durable, and may be fashioned into any form; but not malleable; and capable of being blown into hollow nefs, which no mineral is. 7. Frangible when thin, without annealing. 8. Friable, when cold. 9. Diaphanous, whether hot or cold. 10. Flexible and elastic. 11. Difsoluble by cold and moisture. 12. Only capable of being graven or cut with a diamond, or other hard ftone, and emery. 13. Receives any dye or colour both externally and internally. 14. Not disoluble by aqua fortis, aqua regia, or mercury. 15. Neither acid juices nor any other matter extract either colour, taffe, or any other quality from it. 16. Admits of polishing. 17. Neither loses weight nor substance by the longest and most frequent ufe. 18. Gives fufion to other metals, and softens them. 19. The moft pliable thing in the world, and that which best retains the fashion given it. 20. Not capable of being calcined. 21. An open glafs being filled with water in the fummer-time, will gather drops of water on the outside, juft so far as the water on the inside reaches; and a perfon's breath blown on it will manifestly moisten it. 22. Little glafs balls filled with water, mercury, and other liquor, and thrown into the fire; as also drops of green glafs being broken, will fly afunder with a great noise. 23. Neither wine, beer, nor any other liquor, will make it muffy, or change its colour, or ruft it. 24. It may be cemented, as ftones and metals. 25. A drinking-glafs, partly filled with water, and rubbed on the brim with a wet finger, yields fufion and blaufe notes, higher or lower as the glafs is more or less full, and will make the liquor frike and leap.

Materials for making of Glafs. The materials whereof glafs is made, we have already mentioned to be falt and fand, or ftones. The falt here ufed, is procured from a fort of ahes, brought from the Levant, called polverine, or rochetta; which ahes are those of a fort of water-plant, called kali, cut down in fummer, dried in the fun, and burnt in heaps, either on the ground, or on iron-grates; the ahes falling into a pit, grow into a hard mafs, or fton, fit for use. See Kali and Polverine.

To extract the falt, thefe ahes, or polverine, are powdered and sifted, then put into boiling water, and there kept till one third of the water be confumed; the whole
whole being stirred up, from time to time, that the ashes may incorporate with the fluid, and all its faults be extracted; then the vessel is filled up with new water, and boiled over again, till one half be consumed; what remains is a sort of lee, strongly impregnated with salt. This lee, boiled over again in fresh coppers, thickens in about twenty-four hours, and shoots its salt; which is to be laded out, as it shoots, into earthen pans, and thence into wooden fats to drain and dry. This done, it is grossly pounded, and thus put in a sort of oven, called calcar, to dry. It may be added, that there are other plants, besides kali, which yield a salt fit for glass: such are the algas or sea-weed, the common way-thistle, bramble, hops, wormwood, woof, tobacco, fern, and the whole leguminous tribe, as pease, beans, &c. See the articles Ashes, Salt, Extraction, Algae, &c.

The sand or stone, called by the artists Tarsa, is the second ingredient in glass, and that which gives it the body and firmness. These stones, Agricola observes, must be such as will fuse; and of these such as are white and transparent are best; so that crystal challenges the precedence of all others. See the articles Crystal and Tarsa.

At Venice they chiefly use a sort of pebble, found in the river Tefino, resembling white marble, and called cucoglo. Indeed Ant. Neri assures us, that all stones which will strike fire with steel, are fit to vitrify: but Dr. Merret fews, that there are some exceptions from this rule. Flint is admirable; and when calcined, powdered, and seared, make a pure white crystalline metal: but the expense of preparing them makes the makers of our glass-houses sparing of their use. Where proper stones cannot be so conveniently had, sand is used; which should be white, and small, and well washed, before it be applied: such is usually found in the mouths and sides of rivers. Our glass-houses are furnished with a fine sand for crystal, from Maidstone, the same with that used for sand-boxes, and in scouring; and with a coarser for green glass from Woolwich. For crystal glass, to 200 lb. of tarsa, pounded fine, they put 150 lb. of salt of polverine; mix them together, and put them into the calcar, a sort of reverberatory furnace, being first well heated. Here they remain baking, frying, and calcining; for five hours, during which the workman keeps mixing them with a rake, to make them incorporate: when taken out, the mixture is called frit, or boltito. See the articles Frit and Boltito.

It may be further observed, that glass might be made by immediately melting the materials without thus calcining, and making them frit: but the operation would be much more tedious.

A glass much harder than any prepared in the common way may be made by means of borax, in the following manner. Take four ounces of borax, and an ounce of fine white sand, reduced to powder, and melt them together in a large close crucible set in a wind furnace, keeping a strong fire for half an hour: then take out the crucible, and when cold, break it; and there will be found at the bottom a hard, pure glass, capable of cutting common glass almost like a diamond. This experiment duly varied, says Dr. Shaw, may lead to some considerable improvements in the art of glass, enamels, and artificial gems. It shews us an expeditious method of making glass without the use of fixed salts, which has generally been thought an essential ingredient in glass, and which is the ingredient that gives common glass its lustre; and it is not yet known, whether calcined crystal, or other substances, being added to this salt, instead of sand, it might not make a glass approaching to the nature of a diamond. See the article Gem.

Kinds of Glass. Of these materials we have many sorts of glasses made, which may principally be distinguished according to their beauty; as the crystal flint glass, the crystal white glass, the green glass, and the bottle glass. Again these sorts are distinguished by their several uses; as plate or coach-glasses, looking-glasses, optic-glasses, &c. which are made of the first sort. The second sort includes crown-glasses, toys, phials, drinking-glasses, &c. The third sort is well known by its colour, and the second by its form.

Balas coloured Glass is made thus: put into a pot crystal frit, thrice washed in water; tinge this with manganese prepared into a clear purple: to this add alumine cauimum sifted fine in small quantities, and at several times; this will make the glass grow yellowish, and a little reddish, but not blackish, and always diffipates the manganese. The last time you add manganese, give no more of the alumine cauimum, unless the colour
be too full. Thus will the glass be exactly of the colour of the balas-ruby.

Red Glass. A blood-red glass may be made in the following manner: put six pounds of glass of lead, and ten pounds of common glass into a pot glazed with white glass: when the whole is boiled and refined, add, by small quantities, and at small distances of time, copper calcined to a redness, as much as, on repeated proofs, is found sufficient: then add tartar in powder by small quantities at a time, till the glass is become as red as blood; and continue adding one or other of the ingredients till the colour is quite perfect.

Yellow Glass. It is a necessary remark in glass-making, that the crystal-glass made with salt that has an admixture of tartar will never receive the true gold yellow, though it will all other colours: for yellow glass, therefore, a salt must be prepared from polverine, or pot-ashes alone, to make the glass.

Furnaces for the making Glass. In this manufacture, there are three sorts of furnaces, one called calcar, is for the frit; the second is for working the glass, the third serves to anneal the glass, and is called the leer. See Furnace.

The calcar A, (plate CXXII. fig. 3.) resembles an oven ten feet long, seven broad, and two deep: the fuel, which in England is sea coal, is put into a trench on one side of the furnace; and the flame reverberating from the roof upon the frit, calcines it. The glass-furnace, or working-furnace B, is round, of three yards diameter, and two high; or thus proportioned. It is divided into three parts, each of which is vaulted. The lower part C is properly called the crown, and is made in that form. Its use is to keep a brisk fire of coal and wood, which is never put out. The mouth of it is called the bocca. There are several holes in the arch of this crown, through which the flame passes into the second vault, or partition, and reverberates into the pots filled with the ingredients above-mentioned. Round the inuses are eight or more pots placed, and piling pots on them. The number of pots is always double that of the bocce D, or mouths, or of the number of workmen, that each may have one pot refined to work out of, and another for metal to refine in, while he works out of the other. Through the working holes the metal is taken out of the pots, and the pots are put into the furnace, and these holes are stopped with moveable covers made of lute and brick, to screen the workmen’s eyes from the scorching flames. On each side of the bocca, or mouth, is a bozzarella, or little hole, out of which coloured glass, or finer metal, is taken from the piling pot. Above this oven, there is the third oven or leer, about five or six yards long, where the vessels, or glafs, is annealled, or cooled: this part consists of a tower, besides the leer F, into which the flame ascends from the furnace. The tower has two mouths, through which the glasses are put in with a fork, and let on the floor or bottom: but they are drawn out on iron pans, called fraches, through the leer, to cool by degrees; so that they are quite cold by the time they reach the mouth of the leer, which enters the farolet, or room where the glasses are to be flowered. But the green glass furnace is square; and at each angle it has an arch for annealing, or cooling the glasses. The metal is wrought on two opposite sides, and on the other two they have their colours, into which are made ‘linnet holes,’ for the fire to come from the furnace to bake the frit, and to discharge the smoke. Fires are made in the arches to anneal the work, so that the whole process is done in one furnace. These furnaces must not be of brick, but of hard sandy stones. In France, they build the outside of brick, and the inner part to bear the fire is made of a sort of fuller’s earth, or tobacco-pipe clay, of which earth they also make their melting-pots.

Mr. Blancourt observes, that the worst and roughest work in this art, is the changing the pots, when they are worn out, or cracked. In this case the great working hole must be uncovered; the faulty pot must be taken out with iron hooks and forks, and a new one must be speedily put in its place, thro’ the flames, by the hands only. For this work, the man guards himself with a garment made of fkins, in the shape of a pantaloons, that covers him all but his eyes, and is made as wet as possible: the eyes are defended with a proper fort of glafs.

Instruments for making of Glass. The instruments made use of in this work, may be reduced to these that follow. A blowing pipe, made of iron, about two feet and a half long, with a wooden handle. An iron rod to take up the glass,
GLASS

Working or blowing round GLASS. The tools thus provided, the workman dips his blowing pipe into the melting-pot, and by turning it about, the metal sticks to the iron more firmly than turpentine. This he repeats four times, at each time rolling the end of his instrument, with the hot metal thereon, on a piece of iron G, over which is a vessel of water which helps to cool, and so to condensate, and to dispose that matter to bind more firmly with what is to be taken next out of the melting-pot. But after he has dipt a fourth time, and the workman perceives there is metal enough on the pipe, he clasps his mouth immediately to the other end of it H, and blows gently through the iron tube, till the metal lengthens like a bladder about a foot. Then he rolls it on a marble stone I, a little while, to polish it, and blows a second time, by which he brings it to the shape of a globe of about eighteen or twenty inches diameter. Every time he blows into the pipe, he removes it quickly to his cheek, otherwise he would be in danger, by often blowing, of drawing the flame into his mouth; and this globe may be flattened by returning it to the fire, and brought into any form by flamf-irons, which are always ready. When the glass is thus blown, it is cut off at the collet, or neck, which is the narrow part that fruck to the iron. The method of performing this, is as follows: the pipe is rested on an iron bar, close by the collet: then a drop of cold water being laid on the collet, it will crack about a quarter of an inch, which with a slight blow, or cut of the shears K, will immediately separate the collet.

After this is done, the operator dips the iron rod into the melting-pot, by which he extracts as much metal as serves to attract the glass he has made, to which he now fixes this rod at the bottom of his work, opposite to the opening made by the breaking of the collet. In this position, the glass is carried to the great bocca, or mouth of the oven, to be heated and scalded, by which means it is again put into such a soft state, that by the help of an iron instrument, it can be pierced, opened, and widened without breaking. But the vessel is not finished, till it is returned to the great bocca; where it being again heated thoroughly, and turned quickly about with a circular motion, it will open to any size, by the means of the heat and motion. And by this means we come to learn the cause why the edge of all bowls and glasses, &c. are thicker than the other parts of the same glasses, because in the turning it about in the heat, the edge thickens; and the glass being as it were doubled in that part, the circumference appears like a selvage.

If there remains any superfluities, they are cut off with the shears L; for till the glass is cool, it remains in a soft, flexible state. It is therefore taken from the bocca, and carried to an earthen bench, covered with brands, which are coals extinguished, keeping it turning; because that motion prevents any settling, and preserves an evenness in the face of the glass, where, as it cools, it comes to its consistence; being first cleared from the iron rod by a flight stroke by the hand of the workman.

If the vessel conceived in the workman’s mind, and whose body is already made, requires a foot, or a handle, or any other member or decoration, he makes them separate; and now affays to join them with the help of hot metal, which he takes out of the pots with his iron rod; but the glass is not brought to its true hardnes, till it has passed the leer, or annealing oven, described before.

Working, or blowing, of window or table GLASS. The method of working round glass, or vessels of any sort, is in every particular applicable to the working of window or table-glasses, till the blowing iron has been dipt the fourth time. But then instead of rounding it, the workman blows, and so manages the metal upon the iron-plate, that it extends two or three feet in the form of a cylinder. This
This cylinder is put again to the fire, and blown a second time, and is thus repeated till it is extended to the dimensions required, the side to which the pipe is fixed diminishing gradually till it ends in a pyramidal form; so that to bring both ends nearly to the same diameter, while the glafs is thus flexible, he adds a little hot metal to the end opposite the pipe, and draws it out with a pair of iron pincers, and immediately cuts off the same end with the help of a little cold water, as before.

The cylinder being now open at one end is carried back to the bocca, and there, by the help of cold water, it is cut about eight or ten inches from the iron pipe, or rod; and the whole length at another place, by which also it is cut off from the iron rod. Then it is heated gradually on an earthen table, by which it opens in length, while the workman, with an iron tool, alternately lowers and raises the two halves of the cylinder, which at last will open like a sheet of paper, and fall into the same flat form in which it serves for use; in which it is preferred by heating it over again, cooling it on a table of copper, and hardening it twenty-four hours in the annealing furnace, to which it is carried upon forks. In this furnace, an hundred tables of glafs may lie at a time, without injury to each other, by separating them into tens, with an iron shiver between, which diminishes the weight by dividing it, and keeps the tables flat and even.

This was the method formerly made use of for blowing plate-glafs, looking-glafes, &c. but the workmen, by this method, could never exceed fifty inches in length, and a proportional breadth, because what were larger were always found to warp, which prevented them from reflecting the objects regularly, and wanted substance to bear the necessary grinding. These imperfections have been remedied by an invention of the Sieur Abraham Thevart, in France, about the year 1688, of casting or running large flat plates of glafs in the following manner.

_Casting, or running of large looking GLASS plates._ The furnace G, (plate CXIV.) is of a very large dimension, environed with several ovens, or annealing furnaces, called carquaffes, besides others for making of frit, and calcining old pieces of glafs. This furnace, before it is fit to run glafs, costs 3500l. It holds above three years, and even in that time it must be refitted every six months. It takes six months to rebuild it; and three months to refit it. The melting-pots are as big as large hogheads, and contain about 2000 weight of metal. If one of them burfts in the furnace, the los of the matter and time amounts to 250l. The heat of this furnace is so intense, that a bar of iron laid at the mouth thereof becomes red hot in less than half a minute. The materials in these pots are the fame as described before; and A is the man breaking the frit for that purpose. When the furnace is red hot, these materials are put in at three different times, because that helps the fusion; and in twenty-four hours they are vitrified, refined, fettled, and fit for casting. H is the bocca, or mouth of the furnace, K is the cifer that conveys the liquid glafs it receives out of the melting-pots in the furnace to the casting table. These cifer are filled in the furnace, and remain therein six hours after they are filled; and then are hooked out by the means of a large iron chain, guided by a pully marked I, and placed upon a carriage with four wheels marked L, by two men P, P. This carriage has no middle piece; so that when it has brought the cifer to the casting table M, they flip off the bottom of the cifer, and out rushes a torrent of flaming matter O, upon the table: this matter is confined to certain dimensions by the iron rulers N, N, N, which are moveable, retain the fluid matter, and determine the width of the glafs; while a man R, with the roller Q resting on the edge of the iron rulers, reduces it as it cools to an equal thickness, which is done in the space of a minute. This table is supported on a wooden frame, with trusses for the convenience of moving to the annealing furnace; into which, after it was formed, and the new plate is shoved, where it will harden in about ten days. After this, the glafs needs only be ground, polished, and foliated for use. The measuring furnaces, or Annealing furnaces, are three persons to watch, and move the mouth of the furnace out of the fire, according to the proper time; and the firemen move the mouth of the furnace from theAnnealing furnace, into which, strewed the substance and ruled, which forms the annealing furnace. This takes three hours, according to the size and thickness of the glafs. The glafs is made transparent by fire, but it receives its lustre by the skill and labour of the grinder and polifer, the former of whom takes it rough out of the hands of the maker. In order to grind plate-glafs, they lay it horizontally upon a flat stone-table, (pl. CXV.) made of a very fine grained freestone; and for its greater security they
After it down with lime, or stucco: for otherwise the force of the workmen, or the motion of the wheel, with which they grind it, would move it about. This stone-table is supported by a strong frame, A, made of wood, with a ledge quite round its edges, rising about two inches higher than the glass. Upon this glass to be ground, is laid another rough glass not above half so big, and so looked as to slide upon it; but cemented to a wooden plank, to guard it from the injury it must otherwise receive from the scraping of the wheel, to which this plank is fastened; and from the weights laid upon it, to promote the grinding, or frituring, of the glasses. The whole is covered with a wheel, B, made of hard light wood, about six inches in diameter; by pulling of which backwards and forwards alternately, and sometimes turning it round, the workmen who always stand opposite to each other, produce a constant attrition between the two glasses, and bring them to what degree of smoothness they please, by first pouring in water and course sand: After that a finer sort of sand as the work advanced, till at last they must pour in the powder of sandal. As the upper or incumbent glass polishes, and grows smoother, it must be taken away, and another from time to time put in its place.

This engine is called a mill by the artificers, and is used only in the largest size glasses; for in the grinding of the leffer glasses, they are content to work without a wheel, and to have only four wooden handles fastened to the four corners of the stone which loads the upper plank, by which they work it about.

When the grinder has done his part, who finds it very difficult to bring the glasses to an exact plainness, it is turned over to the care of the polisher, who with the fine powder of tripoli-stone, or emery, brings it to a perfect evenness and lustre. The instrument made use of in this branch, is a board, C, furnished with a felt, and a small roller, which the workman moves by means of a double handle at both ends. The artist in working this roller, is asifted with a wooden hoop, or ipring, to the end of which it is fixed: for the ipring, by constantly bringing the roller back to the same points, facilitates the action of the workman's arm.

Grinding and polishing of optic Glasses. See Grinding and Polishing.
well together with water. For purple, take minium, one pound; brown stone, one pound; white flint, five pounds; divide them into three parts, and add to them as much sal nitre as one of these parts; calcine, melt, and grind it as you did the green. For red, take jet, four ounces; litharge of silver, two ounces; red chalk, one ounce; powder them fine; and mix them. For white, take jet two parts; white flint, ground on a glas very fine, one part; mix them. For yellow, take Spanish brown, ten parts; lead silver, one part; antimony, half a part; put all into a crucible, and calcine them well.

In the windows of ancient churches, &c. there are to be seen the most beautiful and vivid colours imaginable, which far exceed any of those used by the moderns, not so much because the secret of making those colours is entirely lost, as that the moderns will not go to the charge of them, nor be at the necessary pains, by reason that this sort of painting is not now so much in esteem as formerly. Those beautiful works which were made in the glasses-houses were of two kinds. In some, the colour was diffused through the whole substance of the glass. In others, which were the more common, the colour was only on one side, scarce penetrating within the substance above one third of a line; though this was more or less according to the nature of the colour; the yellow being always found to enter the deepest. These last, though not so strong and beautiful as the former, were of more advantage to the workmen, by reason that on the same glass, tho' already coloured, they could use other kind of colours where there was occasion to embroider draperies, enrich them with foliages, or represent other ornaments of gold, silver, &c.

In order to this, they made use of emery, grinding or wearing down the surface of the glass, till such time as they were got through the colour to the clear glass. This done, they applied the proper colours on the other side of the glass. By this means, the new colours were hindered from running and mixing with the former, when they exposed the glasses to the fire, as will appear hereafter. When indeed the ornaments were to appear white, the glass was only bared of its colour with emery, without tinging the place with any colour at all; and this was the manner by which they wrought their lights, and heightenings, on all kinds of colour.

The first thing to be done, in order to paint, or stain glasses, in the modern way, is to design, and even colour the whole subject on paper. Then they choose such pieces of glass as are clear, even, and smooth, and proper to receive the several parts, and proceed to distribute the design itself, or papers it is drawn on, into pieces suitable to those of the glass; always taking care that the glasses may join in the contours of the figures, and the folds of the draperies; that the carnations, and other finer parts, may not be impaired by the lead with which the pieces are to be joined together. The distribution being made, they mark all the glasses as well as papers, that they may be known again: which done, applying every part of the design upon the glasses intended for it, they copy, or transfer, the design upon this glass with the black colour diluted in gum water, by tracing and following all the lines and strokes as they appear through the glasses with the point of a pencil.

When these strokes are well dried, which will happen in about two days, the work being only in black and white, they give a slight wash over with urine, gum arabic, and a little black; and repeat it several times, according as the shades are desired to be heightened, with this precaution, never to apply a new wash till the former is sufficiently dried. This done, the lights and risings are given by rubbing off the colour in the respective places with a wooden point, or the handle of the pencil.

As to the other colours above-mentioned, they are used with gum-water, much as in painting in miniature; taking care to apply them lightly for fear of effacing the out-lines of the design; or even, for the greater security, to apply them on the other side, especially yellow, which is very pernicious to the other colours, by blending therewith. And here too, as in pieces of black and white, particular regard must always be had not to lay colour on colour, or lay on a new lay, till such time as the former are well dried.

It may be added, that the yellow is the only colour that penetrates through the glass, and incorporates therewith by the fire; the rest, and particularly the blue, which is very difficult to use, remaining on the surface, or at least entering very little.
When the painting of all the pieces is finished, they are carried to the furnace, or oven, to anneal, or bake the colours. The furnace here used is small, built of brick, from eighteen to thirty inches square; at six inches from the bottom is an aperture to put in the fuel, and maintain the fire. Over this aperture is a grate, made of three square bars of iron, which traverse the furnace, and divide it into two parts. Two inches above this partition, is another little aperture, through which they take out pieces to examine how the cohesion goes forward. On the grate is placed a square earthen pan, six or seven inches deep; and five or six inches left every way than the perimeter of the furnace. On the one side hereof is a little aperture, through which to make trials, placed directly opposite to that of the furnaces intended for the fame end. In this pan are the pieces of glass to be placed, in the following manner. First, the bottom of the pan is covered with three strata, or layers, of quick lime pulverized; those strata being separated by two others of old broken glass, the design whereof is to secure the painted glass from the too intense heat of the fire. This done, the glases are laid horizontally on the last or uppermost layer of lime. The first row of glases they cover over with a layer of the same powder, an inch deep; and over this, they lay another range of glases, and thus alternately till the pan is quite full; taking care that the whole heap always end with a layer of the lime-powder. The pan being thus prepared, they cover up the furnace with tiles, on a square table of earthen ware, closely luted all round; only leaving five little apertures, one at each corner, and another in the middle, to serve as chimneys. Things thus disposed, there remains nothing but to give the fire to the work. The fire for the first two hours must be very moderate, and must be increased in proportion as the cohesion advances, for the space of ten or twelve hours; in which time it is usually completed. At last the fire, which at first was charcoal, is to be of dry wood, so that the flame covers the whole pan, and even issues out at the chimneys. During the last hours, they make effays, from time to time, by taking out pieces laid for the purpose through the little aperture of the furnace, and pan, to see whether the yellow be perfect, and the other colours in good order. When the annealing is thought sufficient, they proceed with great haste to extinguish the fire, which otherwise would soon burn the colours, and break the glases.

Glass of lead, a glas made with the addition of a large quantity of lead; of great use in the art of making counterfeit gems. See the article Gem. The method of making it is this. Put a large quantity of lead into a potter's kiln; and keep it in a state of fusion, with a moderate fire, till it is calcined to a very grey, loose powder; then spread it on the kiln, and give it a greater heat, continually stirring it, to keep it from gathering into lumps: continue this several hours, till the powder become of a fair yellow; then take it out, and sift it fine; this is called calcined lead. Take of this calcined lead fifteen pounds, and crystalline or other frit, twelve pounds; mix these as well as possible together; put them into a pot, and set them in the furnace for ten hours; then call the whole, which will now be perfectly melted, into water; separate the loose lead from it; and return the metal into the pot; and after standing in fusion twelve hours more, it will be fit to work. This glass is capable of all the colours of the gems in great perfection.

Glass porcelain, the name given by many to a modern invention of imitating the china-ware with glass. See Porcelain. The method of making it, as given by Mr. Reamur, who was the first that carried the attempt to any degree of perfection, is as follows. The glases vessels to be converted into porcelain, are to be put into large vessels, such as the common fine earthen dishes are baked in; or, into sufficiently large crucibles: the vessels are to be filled with a mixture of fine white sand, and of fine gypsum; or plaster-stone, burnt into what is called plaster of paris; and all the interfaces are to be filled up with the same powder, so that the glases vessels may no where touch either one another, or the sides of the vessels they are baked in. The vessel is to be then covered down, and jured, and the fire does the rest of the work: for this is only to be put into a common potter's furnace, and when it has stood there the usual time of baking the other vessels, it is to be taken out, and the whole contents will be found no longer glas, but converted into...
GLASS of chalcedony, a mixture of several ingredients with the common mixture of glass, which will make it represent the semi-opake gems, the jaspers, agates, chalcedonies, &c. See Gem.

Glass of antimony may be deprived of its emetic quality by digesting it with pure spirit of vinegar till the menstruum be highly tinged. See Antimony.

Mr. Boyle says, that if you abstract this liquor, and digest good rectified spirit of wine on the remaining powder, an excellent tincture against several diseases may be obtained. See Tincture.

Duties on Glass. Balm-glasses, on importation, pay per gros, 2s. 5½ d.; and draw back on exportation, 2s. 3½ d.

Burning-glasses, on importation, pay, per dozen, 99½ d., and draw back on exportation, 11 1/3 d. Perspective-glasses, the piece not exceeding three feet in length, pay 8s. 1 10½ d. on importation; and draw back 7s. 4½ d. on exportation. Perspective-glasses exceeding three feet in length, pay 16s. 2 10½ d. on importation; and draw back 14s. 9 d. on exportation. Small perspective-glasses the dozen, pay on importation 8s. 17½ d. and draw back on exportation, 7s. 4½ d. Vials the hundred, pay on importation, 4s. 11 6½ d. and draw back on exportation, 4s. 7 6½ d. Water-glasses the dozen pay on importation, 3s. 11 9½ d. and draw back on exportation, 3s. 8 5½ d. Broken glasses the 112 lb. pays on importation, 1s. 11 1/3 d. and draw back on exportation, 11 6½ d. Coarse drinking-glasses, the dozen pay on importation 11 9½ d. and draw back on exportation, 11 1/3 d. Flanders-drinking glasses per hundred, pay on importation, 8s. 9½ d. and draw back on exportation, 7s. 8 1/3 d.

French drinking-glasses per hundred, pay on importation, 10s. 8 1/3 d. and draw back on exportation, 6s. 5½ d. Venice drinking-glasses the dozen pay on importation, 5s. 11 9½ d. and draw back on exportation, 5s. 6 1/3 d. Flanders coarie hour-glasses, the gros pay on importation, 19s. 11 8 3/4 d. and draw back on exportation, 18s. 6 7/8 d. Flanders fine hour-glasses pay per dozen, on importation, 6s. 7 1/8 d. and draw back on exportation, 5s. 11 9½ d. Looking glasses of crystal, small, 8 1/2 d. pay per dozen on importation, 9s. 11 23/50 d. and draw back on exportation, 9s. 3 37/50 d. Middle fort, the dozen pay on importation, 19s. 11 23/50 d. and draw back on exportation, 18s. 6 7/8 d. Looking-glasses of crystal, the dozen no. 11. 12. pay on importation, 14½ 19s. 9 7/10 d. and draw back on exportation, 13½ 18s. 5 5/10 d.

GLASTONBURY, a market-town of Somersetshire, five miles south of Wells.

GLASTONBURY-THORN, in botany, a species of meupilus, or medlar.

GLATZ, the capital of a county of the same name in Bohemia, 100 miles east of Prague: east long. 16° 8', north lat. 50° 23'.

GLAUBER'S SALT, a cathartic or purging salt, thus made. Take of the cake that remains after the distillation of Glauber's spirit of sea-salt; dissolve it in hot water, and filter the solution through paper. Then reduce the salt into crystall. It is given in doses, from half an ounce to an ounce. See Salt.

Glauber's salt, called by some fal mirabil, is nearly allied to Ephom salt. See Ephom.

GLAUCEDO, among physicia.s, the same with glaucus. See Glaucosa.

GLAUCION, in ornithology, a very elegant fresh-water fowl, of the anas or duck-kind, nearly of the size of the common wild duck: its eyes are bright and very piercing in their aspect, and the iris of a fine gold-yellow. See Anas.

GLAUCIDIIUM, in zoology, the same with glaucus. See the article GLAUCUS.

GLAUCIS
GLAUCIS species, in botany, a name by which botanists call two distinct plants, the isandra and peplis. See the articles ISNARIA and PEPLIS.

GLAUCIUM, in botany, the same with chelidonium, or celandine. See the article CHELIDONIUM.

GLAUCOIDES, a name used by some for two distinct plants, the glauon and peplis.

GLAUCOMA, in medicine, the change of the crystalline humour of the eye into an azure-colour, proceeding from its dryness and condensation, as some affirm; but Heifter rather thinks, it arises from an opacity of the vitreous humour, which becomes of a whitish-green colour: for in a suffusion, an opake body is placed behind the pupil, or is next to the uveal part. Sennertus says, it may be known from a very remarkable whitenefs appearing in the eye, and lying deep behind the pupil; which makes every thing appear as if seen through a smock or cloud. It is said to be incurable when inveterate; but that the medicines prescribed for a gutta pererna, are best also in this cafe. See the article GUTTA SERENA.

GLAUCUS, in ichthyology, the name of two distinct fishes, the one a species of scoller, with the second ray of the hinder-back-fin longest; and the other a species of squalus, with a triangular cavity in the hinder part of the back, but without any foramina before the eyes. This last is the blue shark.

GLAUX, in botany, a genus of the pen-tandria-monogynia class of plants, the flower of which consists of a single, campanulate, erect, and permanent petal, divided into five roundish segments; the fruit is a large, globose, but acuminated and unilocular capsule, formed of five valves, and containing five roundish seeds.

GLAUX is also the name by which some call the astragalus, or milk-vetch. See the article ASTRAGALUS.

GLAZIER, an artificer who works in glass. See the article GLASS.

The principal part of a glazier's business consists in fitting panes and plates of glass to the fashes and window-frames of houses, pictures, &c. and in cleaning the same.

GLAZING, the polishing or crusting over earthen-ware, by running melted lead or litharge over it. The common ware is glazed with a composition of 50 lb. clean sand, 70 lb. lead-ashes, 30 lb. wood-ashes, and 12 lb. salt, all melted into a cake. With this mixture they glaze it over, and then set it in an earthen glazing pan; taking care that the vessels do not touch one another. As several colours are used for this purpose, we shall give the following receipts, from Smith's Laboratory. 1. For a black, take lead-ashes, 18 parts; iron filings, 3; copper-ashes, 3; and zaffer, 2: this, when melted, will make a brown black; and if you would have it blacker, put some more zaffer to it. 2. For blue, take lead-ashes, 1 lb. clear sand or pebble, 2 lb. salt, 2 lb. white calcined tartar, 1 lb. Venice or other glafs, 16 lb. and zaffer, half a pound: mix them well together: and after melting quench them in water, and then melt them again; which operation is to be repeated several times; and if you would have it fine and good, it will be proper to put the mixture into a glafs furnace for a day or two. 3. A brown glazing may be given with a mixture of lead-glafs, 12 parts, and common glafs and manganese, of each one part. 4. A citron-yellow may be made of 6 parts of red-lead, 7 parts of fine red brick-duft, and 2 parts of antimony, all melted together. 5. A flesh-colour, with 12 parts of lead-ashes, and of white glafs. 6. For a green-colour, take 8 parts of litharge, 8 parts of Venice gläs, 4 parts of brass dust, and melt them together for use; or melt together 2 parts yellow-gläs, with as much copper-duft. 7. For a gold-yellow, take of antimony, red-lead, and sand, an equal quantity, and melt them into a cake. 8. For a fine purple-brown, take lead-ashes, 15 parts; clear sand, 18; manganese, 1; white gläs, 15 measures; and 1 of zaffer. 9. For a fine red, take antimony, 2 lb. litharge, 3 lb. rust of iron calcined, 1 lb. and grind them to a fine powder. 10. For a fine white glazing, take 2 lb. of lead, 1 lb. of tin, and calcine them to ashes; of which take 2 parts; of calcined flint or pebble, 1 part; of salt, 1 part; and mixing them well together, melt them into a cake. At Rotterdam, they make a fine shining white glazing, by melting together 2 lb. clean tin-ashes, 10 lb. lead-ashes, 2 lb. fine Venice-gläs, and 1 1/2 lb. tartar. 11. A yellow glazing is made of 4 ounces of red-lead, and 2 ounces of antimony, melted together. 12. For a fine yellow, take red-lead, 3 pints; antimony and tin, of each 2 lb. then melting them into a cake, grind it fine; and repeating this several
GLEAD, or GLADE, in ornithology, a name used in fame parts of the kingdom for the milvis, or kite. See Milvis.

GLEAM, among falconders, is said of a hawk, when the calls or throws up filth from her gorge.

GLEBE, in law, the land belonging to a parish or vicar, wherein is contained some mineral ore. See the article Ore.

GLEE, in the law, the land belonging to a parish church, besides the tithes.

When a parson or vicar has caused any glebe-lands to be manured and fertile, or any bone, which receives another fit for the milvus, or kite. Heiffer, for an injection, recommends lime-water, with a little sugar of lead, or lime-water, with a little camphorated spirit of wine. Turner, when there is any suspicion of a remaining virulence, adds calomel to the lime-water.

GLENE, γλέννα, in anatomy, a shallow cavity of any bone, which receives another bone in articulation. It also signifies the cavity or socket of the eye.

GLENOIDES, the name of two cavities, or small depressions, in the inferior part of the first vertebra of the neck.

GLESUM, a name antiently given to amber. See the article Amber.

GLIS, in zoology, a name given by some to the common rat, as also to the reel and dor-mouse. See Mus and Rat.

The flesh of the reel-mouse is recommended for a bulimy; and its fat, rubbed on the feet, is said to procure sleep.

GLISCHROMICHES, in natural history, the name by which Dr. Hill calls the tougher and more viscid loams. See the article Loam.

Of this genus there are several species.

1. The greyish-white glischromiches, of a dense and compact texture: this raises a great effervescence with aquafortis, and makes a very valuable brick; but requires so much working, that it is seldom used alone. 2. The pale-yellow glischromiches: this raises no effervescence with aquafortis, but makes a fine red brick. 3. The yellowish-brown glischromiches, which raises no effervescence with aquafortis, and makes a very good brick, but is seldom used alone. 4. The reddish-brown glischromiches. It raises no effervescence with aquafortis, and tho' used in brick making, makes but a soft and coarce kind.

GLISSA, a fish of the tunny-kind, of a very delicate taste. See Thynnus.

GLISTER, in surgery, the same with clyster. See the article Clyster.

GLOBE, in geometry, the same with sphere. See the article Sphere.

GLOBE, in practical mathematics, an artificial spherical body, on the convex surface of which are represented the countries, seas, &c. of our earth; or the face of the heavens, the circles of the sphere, &c.
&c. That with the parts of the earth delineated upon its surface, is called the terrestrial globe; and that with the constellations, &c. the celestial globe. These globes are placed in frames, with other appurtenances, as represented in plate CXVI. fig. 1. and 2. Their principal use, besides serving as maps to distinguish the outward parts of the earth, and the situation of the fixed stars, is to illustrate and explain the phenomena arising from the diurnal motion of the earth. See the article Diurnal.

Construction and description of the Globes. The globes commonly used are made of pasteboard, or paper, fitted to a spherical mold. After this covering is formed to the artificer's mind, it is divided, by incision, along the middle, and taken off the mold in the form of two caps, or halves, which being firmly sewed together, are afterwards pasted over with a composition made of whiting and glue, till the globe become perfectly spherical and smooth. This done, a map of the earth, or of the heavens, is projected in several gores, which being pasted on, the whole is coloured and varnished. Thus finished, the globe is hung in a brazen meridian, moveable within a wooden horizon, and fitted with a horary circle, quadrant of altitude, &c.

There are ten principal circles represented upon globes, viz.: six greater and four lesser ones. The greater circles are the horizon, meridian, equinoctial, as it is called on the celestial, and equator on the terrestrial globe, the ecliptic drawn along the middle of the zodiac, and the two colures. See the articles Horizon, Meridian, &c.

The lesser circles, of principal use, are the two tropics and two polar circles. See Circle, Tropic, and Polar.

Of these circles some are fixed, and always obtain the same position; others moveable, according to the position of the observer. The fixed circles are the equator and ecliptic, with their parallels and secondaries; which are usually delineated upon the surface of the globes. The moveable circles are the horizon, with its parallels and secondaries.

The horizon is that great and broad wooden circle surrounding the globe, and dividing it into two equal parts, called the upper and lower hemispheres. It has two notches, to let the brazen meridian flip up and down, according to the different heights of the pole. On the flat side of this circle are described the twelve signs, the months of the year, the points of the compass, &c. The brazen meridian is an annulus or ring of brafs, divided into degrees, as represented in the figure. It divides the globe into two equal parts, called the eastern and western hemispheres. The quadrant of altitude is a thin pliable plate of brafs, answering exactly to a quadrant of the meridian. It is divided into 90°, and has a notch, nut and screw, to fix to the brazen meridian in the zenith of any place; where it turns round a pivot, and supplies the room of vertical circles. The hour-circle is a flat ring of brafs, divided into twenty-four equal parts, or hour-distances; and on the pole of the globe is fixed an index, that turns round with the globe, and points out the hours upon the hour-circle. Lastly, there is generally added a compafs and needle upon the pediment of the frame.

The surface of the celestial globe may be esteemed a just representation of the concave expanse of the heavens, notwithstanding its convexity; for it is easy to conceive the eye placed in the center of the globe, and viewing the stars on its surface; supposing it made of glass, as some globes are: also that if holes were made in the center of each star, the eye in the center of the globe, properly placed, would view thro' each of the holes the very stars in the heavens represented by them.

As it would be impossible to have any distinct notion of the stars, in respect of their number, order, and distances, without arranging them in certain forms, called constellations, this the first observers of the heavens took care to do; and these, like kingdoms and countries upon the terrestrial globe, serve to distinguish the different parts of the superficies of the celestial globe. See Constellation.

The stars, therefore, are all disposed in constellations under the forms of various animals, whose names and figures are represented on the celestial globe; which were first invented by the ancient astronomers and poets, and are still retained for the better distinction of these luminaries.

Problems on the celestial Globe. 1. To rectify the globe. CAife or elevate the pole to the latitude of the place; screw the quadrant of altitude in the zenith; let the
the index of the hour-circle to the upper XII; and place the globe north and south by the compass and needle; then is it a just representation of the heavens from the given day at noon. 2. To find the sun's place in the ecliptic. Find the day of the month in the calendar on the horizon, and right against it is the degree of the ecliptic which the fun is in for that day. 3. To find the sun's declination. Rectify the globe, bring the sun's place in the ecliptic to the meridian, and that degree which it cuts in the meridian is the declination required. 4. To find the sun's right ascension. Bring the sun's place to the meridian, and the degree of the equinoctial cut by the meridian, is the right ascension required. 5. To find the sun's amplitude. Bring the sun's place to the horizon, and the arch of the horizon intercepted between it and the east or west point, is the amplitude, north or south. 6. To find the sun's altitude for any given day and hour. Bring the sun's place to the meridian; set the hour-index to the upper XII; then turn the globe till the index points to the given hour; where let it stand; then screwing the quadrant of altitude in the zenith, lay it over the sun's place, and the arch contained between it and the horizon, will give the degrees of altitude required. 7. To find the sun's azimuth for any hour of the day. Every thing being done as in the last problem, the arch of the horizon contained between the north point, and that where the quadrant of altitude cuts it, is the azimuth east or west, as required. 8. To find the time when the sun rises or sets. Find the sun's place for the given day; bring it to the meridian, and let the hour-hand to XII; then turn the globe till the sun's place touches the east part of the horizon, the index will shew the hour of its rising; after that, turn the globe to the west part of the horizon, and the index will shew the time of its setting for the given day. 9. To find the length of any given day or night. This is easily known, by taking the number of hours between the rising and setting of the sun for the length of the day; and the residue, to 24, for the length of the night. 10. To find the hour of the day, knowing the sun's altitude given. Bring the sun's place to the meridian, and let the hour-hand to XII; then turn the globe in such a manner, that the sun's place may move along by the quadrant of altitude (fixed in the zenith) till it touches the degree of the given altitude; where stop it, and the index will shew on the horary circle the hour required. 11. To find the place of the moon, or any planet, for any given day. Take Parker's or Weaver's ephemeris, and against the given day of the month you will find the degree and minute of the sign which the moon or planet sets at noon, under the title of geocentric motions. The degree thus found being marked in the ecliptic on the globe by a small notch, or otherwise, you may then proceed to find the declination, right ascension, latitude, longitude, altitude, azimuth, rising, setting, &c., in the same manner as has been shewn for the sun. 12. To explain the phenomena of the harvest moon. In order to this we need only consider, that when the sun is in the beginning of aries, the full moon on that day must be in the beginning of libra; and since when the sun sets, or moon rises, on that day, those equinoctial points will be in the horizon, and the ecliptic will then be left of all inclined thereto, the part or arch which the moon describes in one day, viz. 13°, will take up about an hour and a quarter ascending above the horizon; and, therefore, so long will be the time after sun-set, the next night, before the moon will rise. But at the opposite time of the year, when the sun is in the autumnal, and the full moon in the vernal equinox, the ecliptic will, when the sun is setting, have the greatest inclination to the horizon; and therefore, 13° will in this case soon ascend, viz. in about a quarter of an hour; and so long after sun-set will the moon rise the next day after the full; whence, at this time of the year, there is much more moon-light than in the spring; and hence this autumnal full moon came to be called the harvest moon, the hunter's or shepherd's moon; all which will be clearly shewn on the globe. 13. To represent the face of the starry firmament for any given hour of the night. Rectify the globe, and turn it about, till the index points to the given hour; then will all the upper hemisphere of the globe represent the visible half of the heavens, and all the stars on the globe will be in such situations as exactly correspond to those in the heavens; which may therefore be easily found, as will be shewn in the sixteenth problem. 14. To find the hour when any known star will rise, or come upon the meridian. Rectify the globe,
globe, and set the index to XII; then turn the globe till the star comes to the horizon or meridian, and the index will show the hour required. 15. To find at what time of the year any given star will be on the meridian at XII at night. Bring the star to the meridian, and observe what degree of the ecliptic is on the north meridian under the horizon; then find in the calendar on the horizon the day of the year against that degree, and it will be the day required. 16. To find any particular star. First find its altitude in the heavens by a quadrant, and the point of the compass it bears on; then, the globe being rectified, and the index turned to the given hour, if the quadrant of altitude be fixed on the zenith, and laid towards the point of the compass on which the star was observed, the star required will be found at the same degree of altitude on the said quadrant, as it was by observation in the heavens.

Problems on the terrestrial Globe. 1. To find the latitude of any place. Bring the given place to the brazen meridian, and observe what degree it is under, for that is the latitude required. 2. To rectify the globe for any given place. Raise the pole so many degrees above the horizon, as are equal to the latitude of the place; then, finding the sun's place, bring it to the meridian; and proceed, as directed in problem 1, on the celestial globe. 3. To find the longitude of a given place. Bring the place to the brazen meridian, and observe the degree of the equator under the same, for that expresses the longitude required. 4. To find any place by the latitude and longitude given. Bring the given degree of longitude to the meridian, and under the given degree of latitude you will see the place required. 5. To find all those places which have the same latitude, or longitude, with those of any given place. Bring the given place to the meridian, then all those places which lie under the meridian have the same longitude: again, turn the globe round on its axis; then all those places, which pass under the same degree of the meridian with any given place, have the same latitude with it. 6. To find all those places where it is noon at any given hour of the day, in any place. Bring the given place to the meridian; set the index to the given hour; then turn the globe, till the said index points to the upper XII; and observe what places lie under the brazen meridian, for to them it is noon at that time. 7. When it is noon at any one place, to find what hour it is at any other given place. Bring the first given place to the meridian, and set the index to the upper XII; then turn the globe till the other given place comes to the meridian, and the index will point to the hour required. 8. For any given hour of the day in the place where you are, to find the hour of the day in any other place. Bring the place where you are to the meridian; set the index to the given hour, then turn the globe about, and when the other place comes to the meridian, the index will show the hour of the day there, as required. 9. To find the distance between any two places on the globe in English miles. Bring one place to the meridian, over which fix the quadrant of altitude; and then laying it over the other place, count the number of degrees thereon contained between them; which number multiply by 69 1/4, (the number of miles in one degree) and the product is the number of English miles required. 10. To find how any one place bears from another. Bring one place to the brazen meridian, and lay the quadrant of altitude over the other; and it will show on the horizon the point of the compass on which the latter bears from the former. 11. To find those places to which the sun is vertical in the torrid zone, for any given day. Find the sun's place in the ecliptic for the given time, and bring it to the meridian, and observe what degree thereof it cuts; then turn the globe about, and all those places which pass under that degree of the meridian, are those required. 12. To find what day of the year a sun will be vertical to any given place in the torrid zone. Bring the given place to the meridian, and mark the degree exactly over it; then turn the globe round, and observe the two points of the ecliptic which pass under that degree of the meridian; lastly, see on the wooden horizon on what days of the year the sun is in those points of the ecliptic; for those are the days required. 13. To find those places in the north frigid zone, where the sun begins to shine conflently without setting, on any given day between the 21st of March and the 21st of June. Find the sun's place in the ecliptic for the given day; bring it to the general meridian, and observe the degrees of declination; then all those places which are the same number of degrees distant from the pole, are the places required to
14. To find on what day the sun begins to rise constantly without setting on any given place in the north frigid zone, and how long. Rectify the globe to the latitude of the place; and, turning it about, observe what point of the ecliptic between aries and cancer, and also between cancer and libra, coincides with the north point of the horizon; then find, by the calendar on the horizon, what days the sun will enter those degrees of the ecliptic, and they will satisfy the problem. 15. To find the place over which the sun is vertical, on any given day and hour. Find the sun's place, and bring it to the meridian, and mark the degree of declination for the given hour; then find those places which have the sun in the meridian at that moment; and among them, that which passes under the degree of declination, is the place desired. 16. To find, for any given day and hour, those places wherein the sun is then rising and setting, or on the meridian; also those places which are enlightened, and those which are not. Find the place to which the sun is vertical at the given time, and bring the same to the meridian, and elevate the pole to the latitude of the place; then all those places which are in the western semicircle of the horizon have the sun rising, and those in the eastern semicircle see it setting; and those under the meridian, it is noon. Lastly, all places above the horizon are enlightened, and all below it are in darkness or night.

17. The day and hour of a solar or lunar eclipse being given, to find all those places in which the same will be visible. Find the place to which the sun is vertical at the given instant, and elevate the globe to the latitude of the place; then in most of those places above the horizon will the sun be visible during his eclipse; and all those places below the horizon, will see the moon pass through the shadow of the earth in her eclipse.

18. The length of a degree being given, to find the number of miles in a great circle of the earth, and hence the diameter of the earth. Admit that one degree contains $\frac{1}{60}$ of the equator, and multiply 360 (the number of degrees in a great circle) by $\frac{1}{60}$, and the product will be 2160, the miles which measure the circumference of the earth. If this number be divided by 3.1416, the quotient will be 703.57, miles, for the diameter of the earth. 19. The diameter of the earth being known, to find the surface in square miles, and its solidity in cubic miles. Admit the diameter be 7964 miles; then multiply the square of the diameter by 3.1416, and the product will be 1242000; very near, which are the square miles in the surface of the earth. Again, multiply the cube of the diameter by 0.5236, and the product 264,567,89170 will be the number of the cubic miles in the whole globe of the earth. 20. To express the velocity of the diurnal motion of the earth. Since a place in the equator describes a circle of 21,600 miles in twenty-four hours, it is evident that the velocity with which it moves is at the rate of 1042$\frac{1}{2}$ in one hour, or $17\frac{3}{40}$ miles per minute. The velocity in any parallel of latitude, decreases in the proportion of the co-sine of the latitude to the radius. Thus for the latitude of London, 51° 30', say, As radius 10,000,000 To the co-sine of lat, 51° 30' = 9.794149 So is the velocity in the equator, $17\frac{3}{40}$ $\begin{equation} 2.232046 \end{equation}$ To the velocity of the city of London, 10° 9' $\begin{equation} 2.03215 \end{equation}$ That is, the city of London moves about the axis of the earth at the rate of 1042$\frac{1}{2}$ miles every minute of time. But this is far short of the velocity of the annual motion about the sun; for that is at the rate of 60,000 miles per hour, or about 1000 miles each minute, supposing the diameter of the annual orbit to be 82 millions of miles.

Patent-Globes, those with Mr. Neale's improvements, for which he obtained his majesty's letters-patent. The terrestrial globe, with the improvements of this ingenious artist, is represented in plate CXVII. fig. 1, the earth being suppos'd in that part of its orbit where the north pole A is at its nearest approach to the sun S, which accordingly by the index or ray SR, points to the tropic of cancer; b is a moveable circle, which, set to the latitude of a given place, will cause the semicircle c to point out the zenith of the said place; d represents the ecliptic, e the equator, and f a screw by which the annual motion may be separated from the diurnal; g is a semicircle which always moves at 90° distance from the moon, and thereby becomes the lunar horizon for the northern hemisphere; h is an inclined plane on which the rim of the moon PO moves, thereby causing the moon itself to show its several latitudes, nodes, &c. and by this plane
plane moving the contrary way, in a little more than 19° of the annual revolutions of the globe, is shewn the retrograde motion of the nodes.

This globe is mounted with the horizon a fixed vertically, and placed so as to move upon its own axis A H, whereby it represents the diurnal motion of the earth. Hence if the globe be turned round its own axis, by means of the winch at top, the ray from the sun will, in this situation, describe the tropic of cancer; the whole arctic circle will be taken into the enlightened hemisphere, and that of the antarctic circle will be involved in darkness. Let us now suppose the globe turned thirty times about by the winch, the north pole will then be removed to C, and the index advanced to virgin; the days and nights will be equal all the parallels of latitude, and cause an equal distribution of day and night world over; for both the sun's and moon's circles are, now, through all the signs of the ecliptic. If the rotation of the globe be continued, the observer will see the north pole descend just as many degrees below the horizon, as the pointer has advanced south of the equator; and when it is arrived at the tropic of capricorn, all that part of the globe within the arctic circle will be involved in continual darkness, whilst that within the antarctic circle enjoys uninterrupted day.

The difference of time between the rising or setting of the fun and moon. The celestial globe (ibid. fig. 3.) is mounted not quite so differently from the common globes, as the terrestrial one; its horizon being as usual, and the globe moveable to the latitude of any country; only instead of those upright pillars to support the horizon, as in common ones, here semicircles are fixed on the pedestal, and from the pole of the equator a motion is conveyed to the pole of the ecliptic; where two arms or indices are placed, on which are fixed the artificial sun and moon. These, as the globe is turned about its axis by the winch W, keep their exact motions over the fame, by means of the wheel-work at Q, in like manner as those luminaries do in the heavens; so that being once set right by an ephemeris, they will remain so, and thereby shew the rising and setting of these luminaries, with the length of the day and night, together with the true cause of all the vicissitudes of the seasons; and how, notwithstanding their apparent motion from east to west, they really move from west to east; the moon, in a very little more than twenty-nine days and a half; and the sun, in a year. See EARTH, SUN, and MOON.

Problems peculiar to the patent-globes.

1. To rectify these globes. This, on the celestial globe, is performed in the same manner as on the common globes. But the terrestrial globe admits of no such rectification; for instead of raising or lowering the pole of the globe itself, according to the latitude of the place, we must here rectify a moveable brass-horizon, so as that the given place shall be in the zenith of the said horizon. 2. To rectify the sun or moon, according to these globes. Having found the sun's place in the ecliptic, in the common way, turn the fun about by its item till it is directly opposite to the fame sign and degree of the ecliptic upon the globe. The fame
may also be done with respect to the moon, having first found her place by an ephemeris for that day. 3. To show on these globes the cause of an eclipse of the sun or moon. This is self-evident on either globe, by turning them by the winch till the two luminaries come in conjunction with, or opposition to each other, provided they happen to be in or near the nodes. 4. To explain the reason why they happen no oftener. This will appear no less evident, by setting the moon to any considerable latitude, and turning the globe till she comes in conjunction with the sun; for then from the pointer from the sun will be seen to pass either above or below her, according as she is in north or south latitude; so that there can be no eclipse of the sun, when the moon is not in or near her nodes. 5. To exhibit a natural representation of the retrograde motion of the moon's nodes. This is done by only turning the globe with the winch, and observing that the place where the moon crosses the ecliptic, in its motion round the earth, is every time in different places; which are found to be retrograde, or contrary to the order of the signs; that is, they move backward through all the signs from east to west.

GLOBULAR, in general, an appellation given to things of a roundish figure, like that of a globe.

GLOBULAR CHART, a name given to the representation of the surface, or of some part of the surface of the terrestrial globe upon a plane, wherein the parallels of latitude are circles nearly concentric, the meridians curves bending towards the poles, and the rhumb-lines are also curves. See the article CHART.

GLOBULARIA, in botany, a genus of plants of the tetrandria-monogynia class, the proper flower of which is formed of a single petal, tubular at the base, and divided into five segments at the limb; the universal corolla is nearly equal; there is no pericarpium, but the proper perianthium closes at its top, and contains the seed, which is single, and of an oval figure.

Of this genus there are several species, among which that called by some the alpynum of Montpellier, is a violent cathartic and emetic, and is sometimes given in droppings with thebes; but it ought to be tried with great caution; its bark contains its principal virtues.

GLOBULE, a diminutive of globe, frequently used by physicians in speaking of the red spherical particles of the blood. See the article BLOOD.
GLOCESTER, the capital of Gloucester-shire, ninety miles west of London; west lon. 2° 16', and north lat. 51° 30'. It is a bishop's see, and lends two members to parliament.

GLOGAW, a city of Silesia, situated on the river Oder, forty five miles north-west of Breslaw; east lon. 16° 8', and north lat. 51° 40'.

GLORIA, among ecclesiastical writers. See DOXOLOGY.

GLOSS, a genus of Silesia, fifty miles south of Breslaw.

GLOSS, in matters of literature; denotes an exposition or explication of the text of any author, whether in the same language, or any other; in which it differs little from commentary. See the article COMMENTARY.

GLOSS, among artificers, the lustre or brightness set upon cloth, silk, and the like. See the articles CLOTH, SILK, &c.

GLOSSARY, glossarium, a sort of dictionary, explaining the obscure and antiquated terms in some old author; such are Du Cange's Latin and Greek glossaries, Spelman's Glossary, and Kennet's Glossary at the end of his Parochial Antiquities.

GLOSSOCOMON, or the GLOUCESTER, or GLOCESTER. See the article GLOCESTER.

GLOVE, a covering for the hand and wrist. Gloves, with respect to commerce, are distinguished into leathern-gloves, silk-gloves, thread-gloves, cotton-gloves, worsted-gloves, &c. Leathern gloves are made of chamois, kid, lamb, doe, elk, buff, &c.

Foreign gloves, on their importation, pay the following duties, viz. gloves of Canada, Milan, or Venice, unwrought, the dozen pair, pay 4s. 9d. draw back 4s. 3½d. Thence of Canada, Milan, or Venice, wrought with gold or silver, the dozen pair, pay 19s. 1½d. draw back 11s. 18d. French gloves, the gross, pay 1l. 13s. 10½d. draw back 1l. 8½d. French, wrought with gold or silver, the dozen pair, pay 21s. 1½d. draw back 1l. 14s. 1½d. Spanish gloves, plain, the dozen pair, pay 3s. 7½d. draw back 3s. 8½d. Silk-gloves knit, the dozen pair, pay 11s. 5½d. draw back 1ns. 10½d. Thence of Vandon, the dozen...
GLY

The best glue is that which is oldest; and the surest way to try its goodness, is to lay a piece to steep three or four days, and if it swell considerably without melting, and when taken out resumes its former driness, it is excellent.

A glue that will hold against fire or water, may be made thus: mix a handful of quick-liquef with four ounces of linseed oil; boil them to a good thickness, then spread it on tin-plates in the shade, and it will become exceeding hard, but may be easily dissolved over a fire, as glue, and will effect the business to admiration.

Method of preparing and using Glue. Set a quart of water on the fire, then put in about half a pound of good glue, and boil them gently together till the glue be entirely dissolved and of a due consistence. When glue is to be used, it must be made thoroughly hot; after which, with a brush dipped in it, comse the faces of the joints as quick as possible; then clapping them together, slide or rub them lengthwise one upon another, two or three times, to settle them close; and so let them stand till they are dry and firm.

Fish-Glue, a name sometimes given to ichthyocolla. See Ichthyocolla.

Glume, gluma, among botanists, a kind of cup, consisting of two or three membranous valves, which are often pellucid at their edges. This sort of cup belongs to the grallae.

Gluteus, in anatomy, the name of three muscles, which form the buttocks, and from their size are called maximus, medius, and minimus. They all arise in the external surface of the ilium, ilchiun, and os sacrum: the termination of the first, or greatest, is about four fingers-breadth from the great trochanter, and the terminations of the two others are in this trochanter.

Glutinative Medicines, the same with agglutinants. See Agglutinants.

Glucine, scarlet-pea, in botany, a genus of the Anadelphe-decandria class of plants, with a papilionaceous flower, and an oblong bilocular pod, containing a number of kidney-shaped seeds, of a scarlet colour, spotted with black.

Glucyconian verse, in ancient poetry, consists of three feet, whereas the first is a spondee, the second a choriambus, and the last a pyrrichius; or the first may be a spondee, and the other two dactyls. Thus, Mens re-glum bona pos; sed.
or, Mens re-glum bona posidet.

Glycyrrhiza,
GLYCYPHYLLA, LIQUORICE, in botany, a genus of the diadelphion-decandria class of plants, with a papilionaceous flower, consisting of four petals; the fruit is an oblong, compressed, and unilocular pod, containing a few kidney-shaped seeds.

For the description and medicinal virtues of liquorice, see the article LIQUORICE.

GLYPH, in sculpture and architecture, denotes any canal or cavity, used as an ornament.

GLYSTER, or CLYSTER, among physicians. See the article CLYSTER.

GNELINA, in botany, a genus of the didynamia-angiosperma class of plants, the flower of which is campanulate, and also divided into four segments; the fruit is a globose unilocular berry, surrounding a bilocular nut or kernel.

GNAPHALIUM, CUDWEED, in botany, a genus of the fougenea-polygonia-superflua class of plants, with numerous hermaphroditic flowers on its disk, and a few female ones on the verge; there is no pericarpium; the seeds, which are oblong, single, and crowned with down, being contained in the cup. Cudweed is esteemed drying and astringent, and recommended in dyenteries, hemorrhages, and all kinds of fluxes; but the modern pharmacy makes little use of it.

GNAPHALIUM is also used for fi- lago. See the article FIALGO.

GNAPHALOIDES, the name of a plant called by Linnaeus micropus. See the article MICROPUS.

GNAT, in zoology, an insect of the fly-kind, called by authors culex. See the article CULEX.

There are several species of gnats, distinguished partly by their size, and partly by the different colours with which they are variegated, as black, brown, grey, yellow, &c. They belong to the order of two-winged flies.

GNETBEA, the capital city of great Poland, situated one hundred and ten miles west of Warsaw; east lon. 18°, and north lat. 53°.

It is the see of an archbishop, who is always primate of Poland. See the article POLAND.

GNIDIA, in botany, a genus of the ostan- dria-monica class of plants, the flower of which consists of four petals,375 inserted into the cup; there is no perica-pium; the seed is single, and retained in the bottom of the cup.

GNOME is often used in a synonymous sense with apothegm. See APOTHEGm.

GNOMES, gnomi, certain invisible people, who, according to the cabalists, inhabit the inner parts of the earth. They are supposed small in stature, and the guardians of quarries, mines, &c. See the article CABBALISTS.

GNOMON, in dialling, the style, pin, or cock of a dial; which, by its shadow, shows the hour of the day. The gnomon of every dial represents the axis of the world. See DIAL and DIALLING.

GNOMON, in geometry. If, in a parallelogram ABCD (pl.CXIX.fig.1.no1.) the diameter AC be drawn; also two lines EF, HI, parallel to the sides of the parallelogram, and cutting the diameter in one and the same point G, so that the parallelogram is, by these parallels, divided into four parallelograms, then are the two parallelograms DO, BG, through which the diameter does not pass, called complements; those through which the diameters pass, EH, FI, are called the parallelograms about the diameter; and a gnomon consists of the two complements, and either of the parallelograms about the diameter, viz. GD + HE + EI, or GD + IF + GB.

GNOMON, in astronomy, a style erected perpendicular to the horizon, in order to find the altitude of the sun. Thus, in the right-angled triangle ABC ibid. n° 2. are given, AB the length of the style, BC the length of its shadow, and the right angle A B C. Hence, making CB the radius, we have this analogy for finding the angle A C B, the sun's altitude, viz. BC:AB::radius: tangent of the angle C. By means of a gnomon, the sun's meridian altitude, and consequently the latitude of the place, may be found more exactly than with the smaller quadrants. See the article QUADRANT.

By the same instrument, the height of any object GH may be found; for as DF (ibid. n° 3.) the distance of the observer's eye from the gnomon, is to DE, the height of the style; so is FH, the distance of the observer's eye from the object, to GH, its height.

GNOMON of a globe, the index of the hour-circle. See the article GLOBE.

GNOMATIC, something belonging to a gnomon. See the preceding article.

GNOMATIC COLUMN. See COLUMN.

GNOMATIC PROJECTION. See the article PROJECTION.
GNOMONICS, gnomonica, the art of dialling, or of drawing sun and moon dials, on any given plane. See the articles Dial and Dialling.

GNOSTICS, in church-history, Christian heretics so called, it being a name which almost all the ancient heretics affected to take, to express that new knowledge and extraordinary light, to which they made pretensions; the word gnostic signifying a learned, or enlightened person.

St. Epiphanius ascribes the origin of the gnostics to Simon Magus, and says that they acknowledged two principles, a good and a bad. They supposed there were eight different heavens, each of which was governed by its particular prince: the prince of the seventh heaven, whom they named Sabaoth, created the heavens and the earth, the fix heavens below him, and a great number of angels. In the eighth heaven they placed their Barbelo, or Barbaros, whom they sometimes called the Father, and sometimes the mother of the universe. All the gnostics distinguished the creator of the universe from God, who made himself known to men by his Son, whom they acknowledged to be the Christ. They denied that the Word was made flesh; and asserted that Jesus Christ was not born of the virgin Mary, that he had a body only in appearance, and that he did not suffer in reality. They neither believed a resurrection, nor a judgment to come; but imagined that those who had not been instructed in their maxims, would return into the world, and pass into the bodies of hogs and other of the like animals. They had several apocryphal books, as the Gospel of St. Philip, the Revelations of Adam, the Gospel of Periotion, &c.

GO is sometimes used in a special signification, in our law; as to go without day, is to be dismissed the court.

Go, in ichthyology, a name sometimes given to the sea gudgeon.

GOA, a city and sea-port of the hither India, situated in an island of the river Mandou, and subject to the Portuguese; east lon. 73° 20', and north lat. 15° 50'.

GOAD, a pointed stick, or rod, armed with a sharp iron-pin at the end, to prick oxen or other cattle forwards.

GOAL, or GAOL. See GAOL.

GOARING, or GOREING, in the seanlanguage. See Goring.

GOAT, capra, in zoology, a quadruped of the order of the palla. See the article CAPRA.

The common goat with carinated and arcuate horns, is nearly of the size of the sheep, only that the wool of the latter makes it appear larger. The fur of the goat is of a pale dun, and the hairs rigid and waved, but not curled as in the sheep. It is a native of most parts of Europe. The buck goat has under his jaws two wattles or tufts like a beard. The female also resembles the male, and is valued if the have large teats, a great udder, and no horns, or at least very small ones. These animals require almost nothing to keep them. Their milk is esteemed the greatest nourisher of all liquids, women's milk excepted, and very comfortable to the stomach. The young kids also are very good for the table, and may be managed in all respects like lambs.

GOAT'S BEARD, tragopogon, in botany. See the article TRAGOPOGON.

GOAT'S EYE, aegias, among ancient physicians. See the article AEGIAS.

GOAT-FISH, capriicus, in ichthyology. See the article CAPRICEUS.

GOAT'S RUE, galega, in botany. See the article GALEGA.

GOAT'S STONES, a name by which some call orchis. See the article ORCHIS.

GOAT-SUCKER, caprinulcirus, in ornithology, a species of hippuris. See the article HIRUNDO.

GOAT'S THORN, the same with tragacanth.

GOBELINS, a celebrated manufactory for tapestry, established by Mr. Colbert, at Paris, in 1667. See TAPESTRY.

GOBIO, a species of cyprinus, with the upper jaw longe; and two ciri at the mouth.

GOMBONARIA, a species of gobius. See the next article.

GOBIUS, in ichthyology, a genus of acanthopterygious fishes, with five small bones in the membrane of the gills, and the belly-fins of which grow together into a tunnel-shape. To this genus belongs: 1. The sea-gudgeon, or variegated gobius with fourteen rays in the hinder back-fin; it grows to eight inches in length, and is tolerably thick in proportion: it is very beautifully variegated with brown, white, yellow, green, blue, and black. See pl. CXIII. fig. 1. n° 1. 2. The paganelius, or gobius with a yellow transverse line on the top of the first back-fin; it grows to about fix inches in length, and is tolerably thick in proportion (ibid. n° 2.) 3. The zozo, or gobius with the ventral fin
from the motions of bodies, nor do they undergo any resistance from his omnipresence.

It is confessed, that god exists necessarily; and by the same necessity he exists always and everywhere. Hence also he must be perfectly similar; all eye, all ear, all brain, all arm, all perception, intelligence, and action; but after a manner not at all corporeal, not at all like men; after a manner altogether unknown to us. He is definite of all body, and bodily shape, and therefore cannot be seen, heard, or touched; nor ought to be worshiped under the representation of any thing corporeal. We know him only by his properties, or attributes, by the most wise and excellent structure of things, and by final causes: but we adore and worship him only on account of his dominion; for God, setting aside dominion, providence, and final causes, is nothing else but fate and nature.

The plain argument, says Mr. Maclaurin, for the existence of the deity, obvious to all, and carrying irresistible conviction with it, is from the evident contrivance and fitness of things for one another, which we meet with throughout all parts of the universe. There is no need of nice or subtle reasonings in this matter; a manifest contrivance immediately suggests a contriver. It strikes us like a sensation; and artful reasonings against it may puzzle us, but it is without shaking our belief. No person, for example, that knows the principles of optics and the structure of the eye, can believe that it was formed without skill in that science; or that the ear was formed without the knowledge of sounds; or that the male and female in animals were not formed for each other, and for continuing the species. All our accounts of nature are full of instances of this kind. The admirable and beautiful structure of things for final causes, excite our idea of the contriver: the unity of design shews him to be one. The great motions in the system, performed with the same facility as the least, shews his almighty power, which gave motion to the earth and the celestial bodies with equal ease; to the minutest particles. The subtlety of the motions and actions in the internal parts of bodies, shews that his influence penetrates, the smallest recesses of things, and that he is equally active and present everywhere. The simplicity of the laws that prevail in the world, the excellent
disposition of things, in order to obtain the best ends, and the beauty which adorns the works of nature, far superior to any thing in art, fuggeth his connuniate wisdom. The usefulness of the whole scheme, so well contrived for the intelligent beings that enjoy it, with the internal disposition, and moral structure of those beings themselves, shew his unbounded goodness. These are the arguments which are sufficiently open to the views and capacities of the unlearned; while, at the same time they acquire new strength and lufter from the discoveries of the learned. The deity's acting and interposing in the universe, shew that he governs, as well as formed it; and the depth of his counsels, even in conduing the material universe, of which a great part surpasses our knowledge, keep up an inward veneration and awe of this great being, and dispose us to receive what may be otherwise revealed to us, concerning him. It has been justly observed that some of the laws of nature now known to us, must have escaped us, if we had wanted the sense of seeing. It may be in his power to bestow upon us other senses, of which we have at present no idea; without which it may be impossible for us to know all his works, or to have more adequate ideas of himself. In our present state, we know enough to be satisfied of our dependency upon him, and of the duty we owe to him, the lord and disposer of all things. He is not the object of sense; his essence, and indeed that of all other substances, is beyond the reach of all our discoveries: but his attributes clearly appear in his admirable works. We know, that the highest conceptions we are able to form of them, are still beneath his real perfections; but his power and dominion over us, and our duty towards him, are manifest.

Though God has given us no innate ideas of himself, says Mr. Locke, yet having furnished us with those faculties our minds are endowed with, he hath not left himself without a witness; since we have sense, perception, and reason, and cannot want a clear proof of him, as long as we carry ourselves about us. To shew, therefore, that we are capable of knowing, that is, being certain that there is a God; and how we may come by this certainty, I think we need go no farther than ourselves, and that undoubted knowledge we have of our own existence. I think it is beyond question, that man has a clear perception of his own being; he knows certainly that he exists, and that he is something. In the next place, man knows, by an intuitive certainty, that bare nothing can no more produce any real being, than it can be equal to two right angles. If, therefore, we know there is some real being, it is an evident demonstration, that from eternity there has been something: since what was not from eternity, had a beginning; and what had a beginning, must be produced by something else. Next it is evident, that what has its being from another, must also have all that which is in and belongs to its being from another too: all the powers it has, must be owing to, and received from the same source. This eternal source then of all being, must be also the source and original of all power; and so this eternal being must be the most powerful.

Again, man finds in himself perception and knowledge: we are certain then that there is not only some being, but some knowing intelligent being in the world. There was a time then, when there was no knowing being, or else there has been a knowing being from eternity. If it be said, there was a time when that eternal being had no knowledge; I reply, that then it is impossible there should have ever been any knowledge: it being as impossible that things wholly void of knowledge, and operating blindly, and without any perception, should produce a knowing being, as it is impossible that a triangle should make itself three angles bigger than two right ones. Thus, from the consideration of ourselves, and what we infallibly find in our own constitutions, our reason leads us to the knowledge of this certain and evident truth, that there is an eternal, most powerful, and knowing being, which whether any one will call God, it matters not. The thing is evident; and from this idea, duly considered, will easily be deduced all those other attributes we ought to ascribe to this eternal being.

From what has been said, it is plain to me, that we have a more certain knowledge of the existence of a God, than of any thing our senses have not immediately discovered to us. Nay, I presume I may say, that we more certainly know that there is a God, than that there is any thing else without us. When I say, we know, I mean, there is such a knowledge within our reach, which we cannot misl, if
we will but apply our minds to that, as we do to several other inquiries. It being then unavoidable for all rational creatures to conclude, that something has existed from eternity, let us next see what kind of thing that must be. There are but two sorts of beings in the world, that man knows or conceives; such as are purely material, without sense or perception; and sensible perceiving beings, such as we find ourselves to be. These two sorts we shall call cogitative and incogitative beings; which, to our present purpose, are better than material and immaterial.

If then there must be something eternal, it is very obvious to reason, that it must necessarily be a cogitative being; because it is as impossible to conceive that bare incogitative matter should ever produce a thinking intelligent being, as that nothing of itself should produce matter. Let us suppose any parcel of matter eternal, we shall find it in itself unable to produce any thing. Let us suppose its parts firmly at rest together; if there were no other being in the world, must it not eternally remain so, a dead inactive lump? is it possible to conceive that it can add motion to itself, or produce any thing? Matter then, by its own strength, cannot produce in itself so much as motion. The motion it has, must also be from eternity, or else added to matter by some other being, more powerful than matter. But let us suppose motion eternal too; but yet matter, incogitative matter, and motion could never produce thought. Knowledge will still be as far beyond the power of nothing to produce. Divide matter into as minute parts as you will, vary its figure and motion as much as you please, it will operate no otherwise upon other bodies, of proportional bulk, than it did before this division. The minute particles of matter, knock, repel, and reflect one another, just as the greater do, and that is all they can do; so that if we suppose nothing eternal, matter can never begin to be; if we suppose bare matter without motion eternal, motion can never begin to be; if we suppose only matter and motion eternal, thought can never begin to be; for it is impossible to conceive, that matter, either with or without motion, could have originally in and from itself, sense, perception, and knowledge, as is evident from hence, that then sense, perception, and knowledge must be a property eternally inseparable from matter, and every particle of it. Since, therefore, whatever is the first eternal being, must necessarily be cogitative; and whatever is first of all things, must necessarily contain in it, and actually have at least all the perfections that can ever after exist; it necessarily follows, that the first eternal being cannot be matter. If, therefore, it be evident, that something must necessarily exist from eternity, it is also as evident, that that something must be a cogitative being. For it is as impossible that incogitative matter should produce a cogitative being, as that nothing, or the negation of all being, should produce a positive being, or matter.

This discovery of the necessary existence of an eternal mind, sufficiently leads us to the knowledge of God: for it will hence follow, that all other knowing beings that have a beginning, must depend on him, and have no other ways of knowledge or extent of power, than what he gives them; and therefore if he made those, he made also the less excellent pieces of this univerfe, all inanimate bodies, whereby his omnipresence, power, and providence will be established; and from thence all his other attributes necessarily follow.

With respect to Christians, it need only be just mentioned, that they were very early divided in opinion, as to the nature and essence of the supreme Being; a great part worshipping three persons in the unity of the godhead, whilst others absolutely rejected a trinity of persons, and asserted the unity of the divine nature, both as to person and substance. See the articles ARIAN and TRINITARIAN.

With respect to the theology of the pagans, it is thought by most learned men, that they acknowledged but one God; and that the many different divinities worshipped by them, were but attributes and actions of one and the same God. This may probably be true of the wiser heathens; and indeed there are many strong and beautiful passages in pagan authors, to prove that these acknowledged but one God. Thus Pythagoras taught the unity of God, and defined him to be a mind penetrating and diffusing itself through all the parts of the universe, from which all animals receive life: and Plato called God the being which is; and whenever he mentions the deity, it is always in the singular number.

It is a celebrated division of the heathen gods into diu majorum gentium, and diu minorum.
Another division was taken from their place of residence; thus there were celestial, terrestrial, infernal, marine, and sylvan gods. They were also divided into animal and natural gods: the animal gods were mortals, who had been raised to divinity by ignorance and superstition (see Apollo, &c.); and the natural gods, the parts of nature, such as the stars, the elements, mountains, rivers, &c. There were also deities, who were supposed to preside over particular persons: some had the care of women in child-birth; others, the care of children and young persons; and others were the deities of marriage. Each action, virtue, and profession had also its particular god: the shepherds had their Pan; the gardeners, their Flora; the learned, their Mercury and Minerva; and the poets, their Apollo and the Muses. See the articles Genius, Lares, Penates, &c.

Godalmington, a market-town of Surry, thirty miles south-west of London.

God-Wote, an ecclesiastical fine imposed for offences against God.

Goddes, a heathen deity of the female sex.

The ancients had almost as many goddesses, as gods; such were Juno, the goddess of air; Diana, the goddess of woods, &c. and under this character were represented the virtues, graces, and principal advantages of life; Truth, Justice, Piety, Liberty, Fortune, Victory, &c.

It was the peculiar privilege of the goddesses to be represented naked on medals; for it was supposed that the imagination must be awed and restrained by the consideration of the divine character.

God-Fathers, and God-Mothers, persons who at the baptism of infants, answer for their future conduct, and solemnly promise that they will renounce the devil and all his works, and follow a life of piety and virtue, and by this means lay themselves under an indissoluble obligation to instruct them, and watch over their conduct.

This custom is of great antiquity in the christian church, and was probably instituted to prevent children being brought up in idolatry, in case their parents died before they arrived at years of discretion.

The number of god-fathers and god-mothers is reduced to two, in the church of Rome; and three, in the church of England; but formerly they had as many as they pleased.

Goes, a port town of Zeland, in Holland, ten miles east of Middleburgh.

Godget, a name sometimes given to the sea gudgeon. See the article Gobius.

Gogmagog-Hills lie three miles south-east of Cambridge; remarkable for the intrenchments called up on them.

Goiio, a city of Italy, ten miles north-west of Mantua.

Golconda, the capital of a province of the same name, in the lusher India: east lon. 77°, and north lat. 16°.

Gold, aurum, a yellow metal, the heaviest, purest, most ductile, and shining, and on these accounts the most valuable of all metals. See the article Metal.

Gold is the most frequently found native of all the metals; and is indeed very rarely found in a state of ore, that is, divided into its metallic form, by its particles being penetrated by, and intimately mixed with sulphur; and in the few instances in which it is found thus, it never constitutes a peculiar ore, but is found intermixed among the ores of other metals; and most frequently among those of silver, or those of which, though some other be the predominant metal, yet there is a large quantity of silver among it, in which the gold lies in its state of ore. See the article Ore.

Native gold, though free from the penetrating sulphurs which reduce metals to ores, is yet very seldom found pure, but has almost constantly an admixture of silver with it, and very frequently of copper: when it has copper in it, it is easily discovered, if in any considerable quantity, by its hardness: the silver is not so easily detected in it. Native gold is sometimes found in pure masses of considerable size, many having been found of more than a pound weight: these masses are met with in the gold-mines, and are called aurum obryzum, or obryzum, but they are very rare: such, however, have been sometimes found in the german mines. See the article Mine.

Its more common appearance, in its more loose state, is in form of what is called gold-dust: this is native gold in smaller masses, usually indeed very small, mixed among the sands of rivers. This is found in many parts of the world, but the greatest quantity of it is from Guinea: some of it is to be met with in the beds of some of the rivers in Scotland. Native gold, in a middle state as to size between these two
two kinds, is also found in the cliffs or perpendicular fissures of the solid strata in the mountains of Chili. These fissures are filled up partly with reddish marle, partly with native gold immered in a debaied crystalline stone, of a bluish hue; and partly with loose native gold, which is usually found in flat pieces, from the size of a pea to that of a horse bean: the quantity however, so far as has been yet discovered, is not great.

There, and common appearance; for it is generally criminately in several kinds; parts of the world where there is gold, fume hundred and fifty fathoms: lie at bedded in peculiar in those places, but it is met with indifferently in several kinds; some soft, some harder, and even in earths. The richest masses are usually of a whitish, and somewhat bright, but often tinged in part also with black, and large quantity of a white earth: this is which this stone, the gold lies in a very beautiful form, and a great variety of figures; some parcels of it are variously diversicated, or in form of small branched figures, but these are very rare. Others are variously interwoven in narrower, or broader veins; and others in small flat spangles, intermixed with specks of black: the stone in which this is lodged will very readily give fire with steel, and will not at all ferment with aqua fortis.

Besides this, however, there are many other stones in the mines of Peru, which hold considerable quantities of gold, visible in large or smaller specks; and these are of all colours, but usually white or reddish: the gold in these is usually in small spangles, but there is no certainty either in the size of the masses of pure native gold in this, or any other state; that of the coasts of Guinea, usually called gold-dust, and commonly finer than the smaller bands, yet sometimes affords pieces of three or four ounces weight; and the lumps of autum obryzum, as it is called, have been found between twenty and thirty pound weight: these things, however, are not common.

Properties of Gold. The chemists tell us, that gold is composed of two substances; the one an extremely pure and simple matter, of the nature of mercury, and the other, which they say, fixes or destroys the fluidity of this, an equally pure and simple substance, extremely subtle, and of the nature of sulphur. We are not, says Dr. Hill, to take all this upon the credit of those who affirm it; for by all the trials that have been made, gold seems the most simple of all substances. It is the heaviest of all known bodies; and it is the most difficult of all the metals. See the articles GRAVITY and DUCTILITY.

It is wholly incapable of ruff, and is not sonorous when struck upon. It requires a strong fire to melt it, remaining unaltered in the degree of heat that fuses tin or lead, but running with a less vehement one than is necessary to the fusing of iron, or copper. It does not retain its colour, till the time of its melting, but becomes ignited and white, before it runs, and when in fusion it appears of a pale, bluish, green colour on the surface. It amalgamates the most readily of all the metals with quicksilver. When in a state of fusion, it very easily, and very intimately blends itself with silver, and when mixt with that metal, will also run into a mafs with iron. Either silver or gold may indeed be mixed singly with this metal, by fusion, but it is much more easily done with regard to gold, when before blended with silver. It much more easily mixes with copper, and the other metals; and very readily with some of the semimetals, as with the regulus of antimony: common fire carried to its utmost vehemence, has no further effect on gold than the fusing it. It will remain ever so long in its fiercest heat, and come out at last unaltered, and with its whole weight. Exposed to the focus of the strongest burning-glases, it sparkles and flies off in small masses, which if recovered on paper, and examined afterwards, are found to be pure unaltered gold; but if the heat be managed very nicely, and the same gold again and again exposed to it, it is affirmed that a part of the gold will at length go off in fumes, and the remainder will be found to be a substance of a deep blue, with some admixture of purple; and approaching to the nature
G O L [1464] G O L

of vitriol, rather than of gold, of which it wants the malleability, and the specific gravity.

The proper solvent of gold is aqua regia: this menitrurum owes its power upon this metal to the fact it contains; that being almost the only fact which has the quality of acting upon gold. The effect of this menitrurum affords us one test for this metal; if we require another, we may have recourse to a fusion with antimony, for if pure gold and antimony be blended together, the antimony upon keeping up the fire to a great height will be driven off in fumes, and will leave the gold, if pure, unaltered in weight; whereas, if it contained any mixture of another metal, the antimony would have taken it away with it, not excepting even silver itself. See the articles AQUA REGIA and ANTIMONY.

If a quantity of salt of tartar, or any other fixed alkali, be thrown into a solution of gold, the metal is precipitated in form of a powder, which has an explosive power greater than that of gun-powder, or the pulvis fulminans of the chemists. This powder, from its property, is called aurum fulminans. See the article AURUM.

Gold is greatly the most divisible of all bodies. If melted with a hundred thousand times its weight of silver, it will perfectly and equally blend itself with that metal; any grain of the melted mass being cut off, will be found on assaying, to contain its due and proportionate quantity of the gold in it; and a single drop of a solution of gold in aqua regia, will communicate a metallic taste to a pint of spirit of wine, if mixed with it. It is to be observed, that aqua regia, tho' the general and common solvent of gold, is not the only one. Hunkel long since discovered, that it might be disdiluted by the fumes arising from a mixture of oil of tartar, and oil of vitriol; and a menitrurum in the common liquid form, may be produced from these which will have the same power. Mercury also is a true solvent of this metal by amalgamation; and the hepar sulphuris, or liver of sulphur, on being fused with it, takes it up so perfectly, that it will be carried into a lac sulphuris, either in the solution or precipitation. See AMALGAMATION.

The chemical character to express gold is a circle with a point in the center thus, ☞. They intend this as a symbol of perfection and simplicity; the circle being the most uniform of all figures; and comprehending the greatest space under the smallest superficies. See the article CHARACTER.

Numberless have been the attempts to convert other metals into gold; but as nothing is so hard to communicate by art as gravity, they are hitherto, and are likely always to be without success. See the article PHILOSOPHER'S STONE.

The degradation of gold seems as highly difficult as the making it: some industrious people have gone so far towards this, as to bring gold to a state in which no reducing fluxes they were acquainted with, could restore it again; but this is no proof that others might not have been invented that would have done it. The vapour of phosphorus, indeed, in a manner calcines gold into a sort of unmalleable matter of the appearance of a calx; and the same thing may be done by a long and gentle calcination of gold, that has been amalgamated with mercury: but people are able to reduce gold in this state, produced by either means, into pure malleable gold again.

Method of imitating GOLD. Dr. Shaw thinks the following method of Mr. Homberg, for treating copper with quicksilver, preferable in imitating gold for the making watches, buckles, cane-heads, snuff-boxes, &c. to any other.

If an amalgam be boiled in river-water for two hours; and then the quicksilver be distilled off, and cohabated once; then the remaining copper, being now fused, will be of a beautiful gold colour, and more ductile than copper, so as to become well fitted for watch-work, gilding, and the finer machines and utensils. See the article AMALGAM.

For the methods of separating and refining GOLD, see the articles ASSAYING, COPPELLING, CEMENTATION, DEPART, REFINING, ORE, and WASHING.

GOLD, in medicine. The virtues of gold in medicine, however highly extolled by some writers, seem altogether imaginary. The Greeks never paid much respect to it in this way. Geoffroy tells us, that they never used it in medicine at all; but he seems mistaken, for Dioscorides prescribes the filings of this metal to those who had swallowed mercury. It first got footing as a medicinum among the Arabs, and we find them prescribing it to be beat into thin leaves as an ingredient
in many of their compositions. They
tell us, that it is a cordial, and that it
has great virtues against palpitations of
the heart, nervous complaints, and me-
lancholy. The chemists go farther, and
talk of aurum potabile as an universal
medicine: but there seems no great credit
to be given to any thing that has been
said upon this head; and the present
practice allows its use as an ornament
only, to medicines, not as a medicine
itself: the only preparation of it that
has been received on the footing of a
medicine by rational people, is the aurum
fulminans, and that has been of late
proved to be a very mischievous one.
For this, and the other preparations of
gold, see the article Aurum.

Gold-wire, a cylindrical ingot of silver,
superficially gilt, or covered with gold
at the fire, and afterwards drawn suc-
cessively through a great number of little,
round holes, of a wire-drawing iron,
each less than the other, till it be some-
times no bigger than a hair of the head.
See the article Wire.

It may be observed, that before the wire
be reduced to this excessive thinness, it
is drawn through above an hundred and
forty different holes, and that each time
they draw it, it is rubbed after, with
new wax, both to facilitate its pas-
sage, and to prevent the silver's appear-
ing through it.

Gold-wire flattened, is the former wire
flatted between two rollers of polished
steel, to fit it to be spun on a plack, or to
be used flat, as it is without spinning,
in certain stuffs, laces, embroideries, &c.
See the article Stuff, &c.

Gold-thread, or Spun Gold, is a
flatted gold, wrapped or laid over a thread
of silk, by twisting it with a wheel and
iron bobs.

Manner of forming Gold-wire, and Gold
Thread, both round and flat. First, an
ingot of silver, of twenty-four pounds,
is forged into a cylinder, of about an
inch in diameter: then it is drawn thro'
eight or ten holes, of a large, coarse
wire-drawing iron, both to finish the
roundness and to reduce it to about three-
fourths of its former diameter. This
done, they file it very carefully all over
to take off any filth remaining on the
forge; then they cut it in the middle;
and thus make two equal ingots thereof,
each about twenty-six inches long, which
they draw through several new holes, to
take off any inequalities the file may
have left, and to render it as smooth and
equable as possible.

The ingot thus far prepared, they heat
it in a charcoal fire; then taking some
gold leaves, each about four inches square,
and weighing twelve grains, they join
four, eight, twelve, or sixteen of these
as the wire is intended to be more or
less gilt; and when they are so joined,
as only to form a single leaf, they rub
the ingots reeking hot with a burnisher.
These leaves being thus prepared, they
apply over the whole surface of the in-
got, to the number of six, over each
other, burnishing or rubbing them well
down with the blood-stone, to close and
smoothe them. When gilt, the ingots
are laid anew in a coal fire; and when
railed to a certain degree of heat, they
go over them a second time with the
blood-stone, both to folder the gold
more perfectly, and to finish the polish-
ing. The gilding finisht, it remains to
draw the ingot into wire.

In order to this, they pass it through
twenty holes of a moderate drawing
iron, by which it is brought to the thick-
ness of the tag of a lace: from this time
the ingot loses its name, and commences
gold wire. Twenty holes more of a
leffer iron leaves it small enough for the
least iron; the finest holes, of which last
scarce exceeding the hair of the head,
finish the work.

To dispose the wire to be spun on silk,
they pass it between two rollers of a
little mill: these rollers are of nicely
polished steel, and about three inches in
diameter. They are set very close to
each other, and turned by means of a
handle fastened to one of them, which
gives motion to the other. The gold
wire in passing between the two, is ren-
dered quite flat, but without losing any
thing of its gilding, and is rendered so
exceedingly thin and flexible, that it is
easily spun on silk thread, by means of a
hand wheel, and so wound on a spool or
bobin.

Gold-leaf, or Beaten Gold, is gold
beaten with a hammer into exceeding
thin leaves, so that it is computed, that
an ounce may be beaten into sixteen
hundred leaves, each three inches square,
in which state it takes up more than
159002 times its former surface. See the
article Ductility.

This gold, they beat on a block of black
marble, about a foot square, and usually
raised three feet high: they make use of
three
three sorts of hammers, formed like mallets, of polished iron: the first, which weighs three or four pounds, serve to chase, or drive: the second, of eleven or twelve pounds, to close; and the third, which weighs fourteen or fifteen pounds, to stretch and finish. They also make use of four moulds of different sizes, viz. two of vellum, the smallest whereof consists of forty or fifty leaves, and the larger of two hundred: the other two, consisting each of five hundred leaves, are made of bullocks guts well scoured, and prepared. See Mould.

Method of preparing and beating Gold. They first melt a quantity of pure gold, and form it into an ingot: this they reduce, by forging, into a plate about the thicknes of a sheet of paper; which done, they cut the plate into little pieces about an inch square, and lay them in the first or smallest mould to begin to stretch them: after they have been hammered here a while with the smallest hammer, they cut each of them into four, and put them into the second mould, to be extended further. Upon taking them hence, they cut them again into four, and put them into the third mould, out of which they are taken, divided into four, as before, and laid in the last, or finishing mould, where they are beaten to the degree of thinness required.

The leaves thus finished, they take them out of the mould, and dispose them into little paper books, prepared with a little red hole for the gold to stick to; each book ordinarily contains twenty-five gold leaves. There are two sizes of these books; twenty-five leaves of the smallest only weigh five or six grains, and the same number of the largest, nine or ten grains. It must be observed, that gold is beaten more or less, according to the kind or quality of the work it is intended for; that for the gold wire-drawers to gild their ingots withal, is left much thicker than that for gilding the frames of pictures, &c. withal. See Gilding.

Gold-finch, in ornithology, the English name of a species of fringilla, with the wings variegated with black, yellow, and white. See the article Fringilla. The common gold-finch is a very elegantly coloured bird, somewhat smaller than the common sparrow. But besides this, there are several other species, as the Greenland gold-finch, with a black spotted head, about the size of the common linnet; and the greenish yellow gold-finch, nearly of the size represented in plate CXVIII. fig. 1. This last is a most elegant bird; the fore-part of its head, and the upper part of the throat being covered with fine scarlet-coloured feathers, the top of the head ash-coloured, and the upper part of the body a yellowish green.

Gold-coin. See the article Coin. Washing of Gold-ore. See the article Washing of Ore.

Gold-size. See the article Size. Gold-smith, or as some choose to express it, Silver-smith, an artist who makes vessels, utensils, and ornaments in gold and silver.

The goldsmith's work is either performed in the mould, or beat out with the hammer, or other engine. All works that have raised figures, are cast in a mould, and afterwards polished and finished: plates, or dishes, of silver or gold, are beat out from thin flat plates; and tankards, and other vessels of that kind, are formed of plates foldered together, and their mouldings are beat, not cast. The busines of the goldsmiths formerly required much more labour than it does at present; for they were obliged to hammer the metal from the ingot to the thinnest they wanted; but there are now invented flatting-mills, which reduce metals to the thinnest that is required, at a very small expence. The goldsmith is to make his own moulds, and for that reason ought to be a good designer, and have a taste in sculpture: he also ought to know enough of metallurgy, to be able to alloy mixed metals, and to mix the alloy.

The goldsmiths in London employ several hands under them for the various articles of their trade: such are the jeweller, the snuff-box, and toy-maker, the silver turner, the gilder, the burnisher, the chaser, the refiner, and the gold-beater. See the article Jeweller, &c. Goldsmiths are superior tradesmen: their wares must be alloyed by the warden of the company of this name in London, and marked; and gold is to be of a certain touch. No goldsmith may take above one shilling the ounce of gold, besides what he lays for the fashioning, more than the buyer may be allowed for it at the king's exchange; and here any false metal shall be seized and forfeited to the king. The cities of York, Exeter, Bristol,
Bristol, &c. are places appointed for the affaying wrought-plate of goldsmiths; also a duty is granted on silver-plate of fix-pente an ounce, &c. Plate made by goldsmiths, shall be of a particular fineness, on pain of forfeiting 10l. and if any parcel of plate sent to the affayers is discovered to be of a coarser alloy than the respective standards, it may be broke, and defaced; and the fees for affaying are particularly limited.

Burnished Gold, that smoothed or polished with a burnisher. See the articles Burnisher, and Burning.

Mosaic Gold, that applied in pannels, on proper ground, distributed into squares, lozenges, and other compartments, part whereof is shadowed to heighten, or raise the rest. See the article Mosaic.

Shell-Gold, that used by the illuminers, and wherewithal we write gold letters. It is made of the pareings of leaf-gold, and even of the leaves themselves, reduced into an impalpable powder, by grinding on a marble with honey. After leaving it to infuse some time in aqua fortis, they put it in shells, where it sticks. To use it they dilute it with gum-water, or soap-water.

Pure Gold, that purged by fire of all its impurities, and all alloy. See Alloy. The moderns frequently call it gold of twenty-four carats, but in reality there is no such thing as gold so very pure, and there is always wanting at least a quarter of a carat. Gold of twenty-two carats, has one part of silver, and another of copper; that of twenty-three carats has half a part; i.e., half a twenty-fourth of each. See Caract.

Standard value of Gold coin. See Coin. Gold, in heraldry, is one of the metals, more usually called by the French name or. See the articles Metal and Or.

Laws relating to Gold manufactures. Gold and silver beaten, wrought in papers, for the printers, are prohibited to be imported by Richard III. Gold and silver thread, lace, fringe, or other works made thereof, are prohibited to be imported by the 10th of Anne. Upon oath, that the goods were actually made after the first of July, 1712, of plate, wire, spun upon silk, and security given that they shall not be relanded in Great-Britain, &c. the exporter of gold lace, thread, and fringe, to have the following allowance, viz., gold-lace, thread, or fringe, the pound weight averdupois, 6s. 8d.

GOLDEN, something that has a relation to gold, or confists of gold, is valuable, or the like; as,

GOLDEN-BULL. See the article Bull.

GOLDEN-CALF, in Jewish antiquity, a figure which the Israelites cast in gold, and set up in the wilderness for worshipping during Moses’s absence in the mount, and which that legislator, at his return, burnt, ground to powder, and mixed with the water the people were to drink of; as in Exod. xxxii.

GOLDEN-FLEECE, in the ancient mythology, the skin, or fleece, of the ram upon which Phryxus and Helle are supposed to have swam over the sea to Colchis; which being sacrificed to Jupiter, its fleece was hung upon a tree in the grove of Mars, guarded by two brazen-hoofed bulls, and a monstrous dragon that never slept; but was at last taken and carried by Jason, and the Argonauts.

Order of the Golden-Fleece. See the article Fleece.

GOLDEN-NUMBER, in chronology, a number shewing what year of the moon’s cycle any given year is. See Cycle. From what has been said under cycle of the moon, it appears that the golden number will not shew the true change of the moon for more than three hundred and twelve years, without being varied. It is to be observed, that the golden number is not so well adapted to the Gregorian as to the Julian calendar; the epact being more certain in the new style, to find which, the golden number is of use. See the article Epact. The rule for finding the golden number is already given under Cycle of the moon, or lunar Cycle, of which rule take this example for the year 1754.

\]

GOLDEN-ROSE. The pope annually consecrates a golden rose on the fourth Sunday in Lent, which is sent to princes, or to some church, as a mark of his peculiar affection.

GOLDEN-RULE, in arithmetic, is also called the rule of three, and the rule of proportion. See Proportion, and Rule of Three.

GOLDINGEN, a city of Poland, in the duchy of Courland, sixty miles west of
of Mittau: east long. 22°, and north lat. 57°.

GOLNAW, a city of Brandenburg-Pomerania, fifteen miles north-east of Stettin: east long. 15°, north lat. 53° 40'.

GOLPS, in heraldry, are roundels of a purple tinture, called by the French tinctures, adding their peculiar colours.

GOLBERGEN, goltbergenfis terra, a species of bole. See BOLE.

GOMBRON, GOMGOLARA, GOMERA, GOMORRO•ISLANDS, GOMATUS, GONGER, GOMPHOSIS, GONDOLA-SHELL, GONARCHA, GONFANON, GONDOLA-SHELL, GONAGRA, - coal:

GOVERIA, Perlia, opposite to the island of Ormus: east long. 55° 30', north lat. 27° 30'.

GOMERA, one of the Canary-Islands, subject to Spain, and situated west of Teneriff: west long. 18°, north lat. 28°.

GOMORRO•ISLANDS, situated between 10° and 15° south lat. on the eastern coast of Africa.

GOMPHIUS, γυμφωνος, in anatomy, a species of articulation, wherein one bone is set in the other, like a nail or peg; as the teeth within the jaws. See the article ARTICULATION.

GOMPHRENA, the purple everlasting flower, in botany, a genus of the pentandria-digynia class of plants, the flower of which is divided into five parts, and erect: the petals are fuculated and permanent: the fruit is a thin, roundish crust, with one cell, in which are contained a single, large, roundish seed, with an oblique end. It is a native of both East and West-Indies; and the flower is usually of a beautiful purple colour.

GONAGRA, among physicians, signifies the gout in the knee. See GOUT.

GONARCHA, in antiquity, a dial delineated on several surfaces, or planes, some horizontal, others erect, oblique, &c. See the article DIAL.

GONDOLA, in naval architecture, a flat kind of boat, very long and narrow, chiefly used on the canals at Venice.

GONDOLA-SHELL, in natural history, a species of dolium, with an extremely wide mouth. See DOLIUM.

GONFANON, or GONFALON, a kind of banner, carried in the processions of the principal churches at Rome.

GONGER, in ichthyology, the same with conger. See the article CONGER.

GONGOLARA, in botany, the same with the arica marina, or sea-heath. See the article FUCUS.
ternal and internal kind. The former of these intentions is answered by such laxatives as operate in a double manner, such as the pilulae balsamicæ of Becher, which are not only purgative, but highly corrodorating. To answer the other intention, the following powder must be used. Take of cuttle-bone, one ounce; of red coral, amber, the species of hyacinth, and the bark of cafarilla, each two drams; make into a powder, one dram of which is to be taken every morning and evening in a decoction of barley, prepared with some almonds. At the same time the following epithem may be applied to the region of the pubes and perineum, especially during the nighttime. Take of herbs, baum, mint, and balsam; of the leaves of red rotes, and balsam, each one handful; of pomgranate-bark, cloves, nutmegs, cardamoms, and maflich, each half an ounce: mix together, and put into a small bag to be boiled in red French wine. These measures are to be seconded by an accurate regimen, being chiefly such as is prescribed below for the virulent gonorrhoea. In the cure of a malignant gonorrhoea, regard is to be had to the constitution of the patient: when he is hot, and of a delicate constitution, he ought, especially in the beginning of the distemper, to abstain from hot substances, purgatives, sudorifics, diuretics, &c. The following preparation may be frequently exhibited in this disorder. Take of mint, three handfuls; of venice turpentine, one ounce; of peruvian balam, half an ounce: distil with three pints of rhenish wine. The dose is from one to two ounces; and the following may be used as a succedaneum. Take of rose-water, and rectified spirit of wine, each half a pint; and of the balsam of life, fifty drops. Mix all together.

A virulent gonorrhoea, or clap, being the second species of this disorder, proceeds from impure coition with an infected person.

This distemper begins, and makes its progress, in the following manner. The patient, sooner or later, according as the person with whom he has had conversation, was more or less infected, and according to his constitution, by which he may be more or less disposed to receive the infection, is first seized with an unusual pain in the genitals; and a kind of sensation like a rotation of his testicles. Afterwards, if the prepuce constantly covers his glands, there appears an eruption, or pustule, which, by its size, colour and figure, resembles a spot of the measles. Presently after appears a weeping matter like semen, which daily changes colour, and becomes more purulent, and more yellow, till, at length, if the disorder be highly virulent, it assumes a greenish hue, or appears like a thin fomaceous matter, mixed with blood.

The pustule at length becomes an ulcer, called a shanker. See Shanker.

Those whose glans is uncovered, seldom have such a pustule, and are less liable to imbibe the infection. The running brings on a heat, or fainting in making water, which is most violent, when it is over, for then it seems to burn the whole duct of the urethra.

Another symptom is the cordeæ, or contraction of the frenum, by which the penis is bent downwards. There is likewise, when the penis is erected, great pain, as if compressed transversely with a strong hand. This chiefly happens in the night, when the patient is warm in bed: sometimes the urethra being eaten, and excoriated with long running of acrimonious pus, nature breeds a soft spongy flesh, to supply the defect, which daily increasing, forms caruncles, or carinolities so far as to plug up the urinary passage, and stop up the urine. However, the little adjoining ulcers continue to pour forth a kind of an ichor. It also happens, through some violent motion, or the ill timed use of astringents, that the fancies, which should be carried off by the gonorrhoea, is translated to the scrotum, and causes one or both of the testicles to swell, and inflame with intolerable pain: the running at the same time decreasing, while the scalding of the urine is as great as ever.

To these symptoms may be added the phimosis, and the paraphimosis. There are also sometimes watery bladders, called crystallines, and at length buboes of the glands in the groin. See Phimosis, Paraphimosis, Bubo, and Pox.

Women are not so subject to such a variety of symptoms as men: their chief complaint being a difficulty of urine, and a running; however, they are liable to shankers and venereal warts, as well within as on the outward parts of the labia pudendi; as also to buboes in the groin: as for the contraction of the sphincter...
sphincter vaginae, purging as it were the external orifice, this is not a phimosis, though by some improperly so called.

This disorder proceeding from an infection of a malignant gonorrhoea, or the luces venerae, is first conveyed to the genitals, and afterwards thro' the pores to the lymph, or feminal liquor; the due crisis and natural mixture of which it destroys, by inducing partly a caustic and corrodion, and partly a putrid exulceration of the genitals. For at first the glans only is infected whilst in coition, the poison infuluating itself into the pores; after which, it soon proceeds to the glands of the urethra, then to the proftate, and afterwards to the vescicæ feminales. The regimen, during the time of the cure, according to Boerhaave, requires the patient to abstain from all oily food; and he must also avoid every thing, which by its acrimonious quality stimulates to venery; such as spices, bulbous roots, flesh, eggs, fish, and fermented liquors: for as the infiltation of the penis retards the cure, it is of the utmost confluence to be avoided; as are also every thing else that inflames the fancy, or provokes to venery, as amorous dalliance with women, &c. Water and whey are the best drinks; and seeds and summer fruits the best aliment. All possible care must be taken that cold never reach the penis, and that it be kept always moist, lest the pores contracting repel the flux of matter. An emollient and somewhat antifeptic cataplasm will be beneficial. In the cure, Sydenham's method of purging the patient till the symptoms were abated is now justly laid aside. Turner's last method, which he made use of himself, is as follows: Take two drachms of quicksilver; one drachm of gum guaiacum; and beat them together with a little spirit of lemon, till the globules of the mercury disappear: afterwards add half a drachm of the pills of colocynth with aloes: beat it into a mafs; of which make up twenty-four pills. Two of these pills containing half a scruple of the mercury, may be taken night and morning; or according to the operation; one only for a week or ten days, unless the patient complains of his gums, or a sore mouth; for then the mercury must be left out.

If the cordee does not remit, a scruple of fal prunella may be taken, with as much fine sugar between whiles, in a draught of the following apozem: Take of mercury water two pounds; of the solution of gum arabic, and syrup of marshmallows, of each one ounce; make it into an apozem, or decoction. The mercury water is common river-water, in two quarts of which four ounces of quicksilver have been boiled to a quart. The patient may drink of the apozem through the whole course.

And now, as there is occasion, the pills are continued for a week, or ten days more, but at night only; and in the morning is given the quantity of a nutmeg of the following elecuary: Take virgin-honey, an ounce and a half; balm of capivi, fix drachms; powder of the root of jalap, and sal prunella, of each one drachm, which make into an elecuary. The patient must drink a draught of the apozem as well after the elecuary as after the pill. See the article ELECUARY.

There is no danger of the running being fopt while his body is kept open by these means; but when the quantity grows less, and the colour whiter, and feels more tenacious, the pill is laid aside, and the elecuary kept to some days longer, night and morning. If it purges too much, the jalap is left out, and the rhubarb substituted instead thereof. When it proves tedious, boiled turpentine is given by way of farther agglutinating, and drying the gleet. See the article GLEET.

When the cordee and dyfury are very stubborn, or the running more virulent than ordinary, the genitals are to be smeared every night quite up to the groin, with the weaker blue ointment, and the pill without the quicksilver is given early in the morning in a large dose; or a draught of the infusion of senna. This method will succeed in three weeks, or a month's time, if the patient is governable.

In the place of mercurials given internally, Abruc directs the use of crude quicksilver, as in the common unction to be rubbed up the parts, as about the body of the penis, especially under the urethra, to the perineum, and to the pubes and testicles, by which the mercury, infuluating itself through the pores into the lymphatic vessels,
instantly conveyed into the glandules and subdues the poison lodged therein, taking away all the symptoms without any disturbance to the prime vice, the stomach and guts.

If there is no discharge from the penis of any virulent matter, it is called the gonorrhoea fcca, or dry clap; the symptoms of which are a dysury, or difficulty of making water, and after, from the increafe of the inflammation and tumefaction, an ischury, or total suppression of urine. See the articles Dysury, and Ischury.

In the cure of the dry clap, Aftruc advises plentiful bleeding in the beginning, to take off the tension, and to abate the inflammation; as also emollient decotions of mallows, linseed, &c. in milk, to foment the parts: but perhaps it might be better to make a pullice of these ingredients, after Boerhaave’s method, to lay to the parts affected; or, which is best of all, to use them one after the other. Aftruc advises also lenient clysters, cooling emulsions, and pifans, with sal prunella and anedynes, between whiles. During the continuance of the inflammation, no mercurials must be used, and if the symptoms increase, threatening an absces in the perineum, it is to be forwarded as much as possible, by suppuration, as well as the matter discharged. The symptoms of this difeafe being all separately treated of under their feveral heads, for the cure and method of treating each, see the articles Tumour, Bubo, Caruncle, Gleet, Shanker, Phimosis, Paraphimosis, Crystal-line, Porri, Condylomata, Cris-tae, &c.

When the gonorrhoea has continued a long while, or long enough for the poisonous matter to make its way into the blood; or by astringents given unseasonably it cannot make its exit; then the patient is infected with the pox. See the article Pox.

The third species of this disorder requires the very fame treatment with the simple and virulent; but here the least time must not be lost; the affected part must be kept in a conflant state of laxity, by the most emollient applications; and the contagious matter with all possible expedition be drawn out: for the whole cure depends upon the total discharge of the infectious matter, together with the pus, which it has introduced; and if this task is not performed, a pox is greatly to be apprehended. Wherefore, if this difeafe continues but for a little time, recourse must be had to all the severities of a faliuation. For though salivating does not at all cure either of the two former kinds of gonorrhoea, this species of the difeafe, having its seat in the glandulas cowperiame of the urethra, so that the pus discharges itself by their excretory duct into the urinary duct, is much more susceptible of the power of mercury.

GONALGIA, a term of much the fame import with gonagra. See GONAGRA.

GOOD, in general, whatever is apt to cause or increafe pleasure, or diminish pain in us; or, which amounts to the fame, whatever is able to procure, or preferve to us the poiffesion of agreeable fenfations, and remove thofe of an oppofite nature.

By pleafure and pain, fays Mr. Locke, I would be understood to mean of body or mind, as they are commonly diftinguished; though, in truth, they are only different conftituions of the mind, fometimes occafioned by a diforder in the body, and fometimes by thoughts of the mind. Pleafure and pain, and their caufes good and evil, are the hinges upon which our passions turn; fo that by reflecting on the various modifications of tempers of mind, and the intestine fenfations which pleafure and pain, good and evil, produce in us, we may thence form to ourselves the ideas of our passions. See Passion, Happiness, &c.

Metaphysical Good, the fame with perfection. See Perfection.

Moral Good, denotes the right conduct of the feveral fenes and paifions, or their juft proportion and accommodation to their repective objects and relations.

The fame principle, or law of our natures, which determines us to pursue any one end, or fpecies of good, prompts us to pursue every other end, or fpecies of good of which we are fusceptible, or to which our Maker has given us an original propenlion. But amidst the great multiplicity of ends or goods, which form the various ingredients of our happiness, we perceive an evident gradation, or subdivision; and in the accommodation of our actions thereto, confifts their moral goodnes. Thus, the goods of the body, or of the external fenes, seem to hold the loweft rank in this gradation or scale of goods. These we have in common with brutes; and when,
when, at any time, they come in competition with goods of a higher order, the unanimous verdict of mankind gives the preference to these last. Next to sensual goods come those arising from social connections, as fame, fortune, power, civil authority, and the like, which are chiefly valuable, as being the means of procuring natural or moral good, but principally the latter. Goods of the understanding are still superior, as taste, knowledge, memory, judgment, &c. And the highest are the moral goods of the mind, directly and ultimately regarding ourselves, as command of the appetites and passions, prudence, fortitude, benevolence, &c. These are the principal ingredients of our happiness.

Moral good is of so singular and sublime a nature, that when the mind is in pursuit of it, though it should prove unsuccessful in its aims, it can reft in the conduct without repining, or being rejected at the ill success: nay, the pleasure attending the confcioufnefs of upright aims, and generous efforts, absorbs the disappointment, and makes inferior ends disappear, as of no amount in the great aggregate or surplusage that remains. See the article HAPPINESS.

GOOD BEARING, in law, denotes much the fame with good behaviour.

GOOD BEHAVIOUR, in law, an exact carriage and behaviour to the king and his people. A justice of peace may, at the request of another, or where he himself sees cause, demand surety for the good behaviour; and to that end the justice may issue out his warrant against any persons whatsoever, under the degree of nobility; but when it is a nobleman, complaint is to be made in the court of chancery, or king's bench, where such nobleman may be bound to keep the peace. Infants and femecourts, who ought to find surety by their friends, may be bound over to their good behaviour; as also lunatics, that have sometimes lucid intervals, and all others who break the peace, or being suspected to do it, by affrays, assaults, battery, wounding, fighting, quarrelling, threatening, &c. A pardon may be likewise bound to his good behaviour for a scandalous way of living, keeping bawdy-houses, gaming-houses, &c. and to pay common drunkards, whoremongers, common whores, cheats, libellers, &c. He who demands surety for the peace, on any violence offered, must take an oath before the justice, that he goes in fear of his life, or some bodily harm, &c. and that it is not out of malice, but from a regard to his own safety.

GOODS, bona, in law, the fame with chattels. See the article CHATTELS.

GOODS, among distillers, a term for spirits of any kind. See the article SPIRITS.

GOODS, among distillers, a term for spirits of any kind. See the article SPIRITS.

GOOD HOPE, or Cape of Good Hope, the most southern promontory of Africa, where the Dutch have built a good town and fort: east long. 16° and south lat. 34° 15'.

GOODLE, in law-books, signifies a breach in a sea bank, or wall.

GOOSE, anfer, in ornithology, a well-known bird of the anas-kind, with the back of a greyish brown colour, the belly and edges of the wing-feathers white. Geese are fowls of great profit, both for food, for their feathers, and for their grease. For the gathering of their feathers, some authors advise their being pulled twice a year, viz. in March and August; yet this is certainly an unprofitable as well as a cruel practice; for the goose on being incapable of flight, easily falls a prey to the fox, and other ravenous creatures, and by uncoasting her, you occasion her getting cold, which suddenly kills her: "Tis therefore, most advisable to flay till moulting time, or till you kill her, and then all her feathers may be made ufe of atpleasure.

GOOSE-BERRY, grofularia, or ribes, in botany. See the article RIBES.

The belt way of rafing these useful bushes is by cuttings, observing always to take the handloameft shoots, and that from branches that bear moft fruit. These are to be planted in February. See the article CUTTINGS.

There are a great many sorts of gooseberry, among which the white holland kind is the fairest, and beft bearer of all others; the berries being large, transparent, and well tafted. The englith yellow goose-berry is known every where, and fittest for culinary ufe, while green. The hedge-hog goose-berry is large, well-tafted, and extremely hairy. There is also a fort of green goose-berry, that is a very pleasant fruit.
Goose-berries taken in season, produce a delicious wine, very proper for summer re-pafts. Also, if thoroughly pressed, with an addition of water, and well fermented, they yield in distillation the best brandy of any of our fruits, and little inferior to French brandy.

Goose-dung, in agriculture. See the article Dung.

Goose-neck, in a ship, a piece of iron fixed on the end of the tiller, to which the laniard of the whip-staff, or the wheel rope comes, for steering the ship.

Goose-wing, in the sea-language. When a ship fails before, or with, a quarter-wind on a fresh gale, to make the more halfe, they launch out a boom, and fail on the lee-side; and a fail so fitted, is called a goose-wing.

GOR, the capital of a province of the same name, in the East-Indies, subject to the Mogul: east long. 85°, north lat. 31° 15'.

Gorce, in law-books, denotes a kind of wear. See the article Wear.

Gor-cock, a bird, otherwise called a moor-cock. See Moor-cock.

Gorcum, a city of the United Provinces, in the province of Holland, on the river Waal, twenty-two miles east of Rotterdam: east long. 4° 50', north lat. 51° 50'.

Gordian knot, in antiquity, a knot made in the leathers or harness of the chariot of Gordius, king of Phrygia, so that it was no finding there where it began or ended. The inhabitants had a tradition, that the oracle had declared, that he who untied it, should be master of Asia. Alexander having undertaken it, was unable to accomplish it, when fearing left his not untying it should be deemed an ill augury, and prove a check in the way of his conquests, he cut it at once, with his sword, and thus either accomplished or eluded the oracle.

Gore, in heraldry, one of the abatements, which, according to Guillim, denotes a coward. It is a figure consisting of two arch lines drawn one from the sinister chief, and the other from the sinister base, both meeting in an acute angle in the middle of the fess point. See plate CXI. fig. 4.

Gore, in law, signifies a narrow slip of ground.

Goreing, in the sea-language, sloping. A fail is cut goreing, when it is cut sloping by degrees, and is broader at the clew than at the earing, as all top-sails and top-gallant sails are.

Gorel, the title of the prince of Georgia, in Asia. See Georgia.

Gorge, gula, in architecture, the narrowest part of the tuscun and doric capitals, lying between the astragal, above the shaft of the pillar and the annulets. See Tuscan and Doric.

It is also used for a concave moulding, larger, but not so deep as a scotia, which serves for compartments, &c. See the article Compartment.

Gorge, in fortification, the entrance of the platform of any work. In all the out-works, the gorge is the interval between the wings on the side of the great ditch, as the gorge of a ravelin, half-moon, &c. These, it is to be observed, are all defective of parapets; because, if there were any, the besiegers, having taken possession of the work, might use it to defend themselves from the shot of the place; which is the reason, that they are only fortified with pailisa, does, to prevent a surprise. The gorge of a bastion is nothing else but the prolongation of the curvities from their angle with the flanks, to the center of the bastion where they meet. When the bastion is flat, the gorge is a right line, which terminates the distance between the two flanks. See the articles Bastion and Fortification.

Gorged, in heraldry, the bearing of a crown, coronet, or the like, about the neck of a lion, a swan, &c. and in that case it is said, the lion or cygnet is gorged with a ducal coronet, &c.

Gorged is also used when the gorge, or neck of a peacock, swan, or the like bird, is of a different colour or metal, from the rest.

Gorged, among farriers, &c. signifies the same as swell'd; in which sense they say, the legs of a horse are gorged; the pattern joint is gorged; you must walk him out to diggorse his shoulder.

Gorgerin, in architecture, the same with gorge. See the article Gorge.

Gorgona, the name of two islands, one in the pacific ocean on the coast of Peru: west long. 79°, north lat. 3°; the other in the Mediterranean, twenty-five miles west of Leghorn.

Gorgonium, in botany, a name sometime given to eryngium. See the article Eryngium.

Gorgons, in antiquity, a warlike female nation of Liby, in Africa, who had
GOS [1474] GOT

had frequent quarrels with another nation of the same sex, called Amazons.

GORITIA, or GoRITZ, a town of Carniola, in Austria, near the confines of the territories of Venice: east long. 14°, north lat. 46° 20'.

GORLITZ, a city of Upper Saxony, in Germany, fifty miles east of Dresden: east long. 15° 6', north lat. 51° 12'.

GOSHAWK, the English name of the yellow-legged falcon, with a brown back, and a white variegated breast. See the article FALCON.

It is a large and very beautiful bird, which preys upon the pheasant, mallard, wild goolfe, hare, and coney, and will even venture to seize on a kid or goat. She ought to be kept with great care, as being very choice and dainty.

GOSLAR, an imperial city of Lower Saxony, in Germany, thirty miles south of Brunswick: east long. 10° 30', north lat. 52°.

GOSPEL, the history of the life, actions, death, resurrection, ascension and doctrine of Jesus Christ.

The word is saxon, and of the same import with the Latin term evangelium, or the Greek euangelion, which signifies glad tidings, or good news; the history of our blessed favour being the best news ever published to mankind.

This history is contained in the writings of St. Matthew, St. Mark, St. Luke, and St. John; who from thence are called evangelists. The chriofian church never acknowledged any more than thefe four gospels as canonical; notwithstanding which, several apocryphal gospels are handed down to us, and others are entirely lost.

The antient fathers endeavoured to find out divers mysteries in there being but four genuine canonical gospels. St. Jerom, in particular, says, that as there are four parts of the world, and four principal winds, it was also proper there should be four gospels in the church, as four columns to support it, and four breathings of life to render it immortal. They thought they found the figure of the four evangelists in the beginning of the prophecy of Ezekiel, and in the ninth chapter of the Revelations, where mention is made of four living creatures, the first having the face of a man; the second of a lion; the third of an ox; and the fourth of an eagle; and for this reason the evangelists are usually painted with these symbols.

GOSSYPIUM, COTTON, in botany, a genus of the monadelphus-polyandria class of plants, the flower of which consists of five plane and patent petals, growing together at their bases, and vertically cordated: the fruit is a roundish capsule, containing four cells, with a great number of oval seeds, surrounded with a fine downy matter. See COTTON.

GOSTAVIN, or GOSTIVIN, a town of great Poland: east long. 20°, north lat. 52° 45'.

GOTHA, the capital of the dutchy of Saxe-Gotha, in Upper Saxony: east long. 10° 36', north lat. 51°. It is subject to the duke of Saxe-Gotha, brother of her royal highness the princes dowager of Wales.

GOTHIC, in general, whatever has any relation to the Goths: thus, we say gothic costumes, gothic architecture, &c. See the article ARCHITECTURE.

Gothic architecture is far removed from the manner and proportions of the antique; having its ornaments wild and chimerical, and its profiles incorrect. However, it is frequently found very strong, and appears very rich and pompous, as may be seen in several of our english cathedrals. This manner of building was, originally, very heavy and coarse; but is since run into the opposite extreme, being slender, rich, and delicate to a fault. In the gothic architecture, we fee high vaults raised on slender pillars; and every thing crowded with windows, roses, croffes, figures, &c.

Gothic character, or letter. See the article LETTER.

Gothic column. See COLUMN.

GOTHLAND, the most southern province of Sweden, being a peninsula surrounded on three sides by the Baltic Sea. It is subdivided into east and west Gothland, Smaland, Halland, Bleken and Schonen.

Gothland, is also an island of the Baltic, situated between the province of Gothland and Livonia.

GOTTENBURG, a port-town of Sweden, situated without the Sound, on the coast of the Schaggerack Sea, near the entrance of the Baltic.

GOTTINGEN, a city of Germany, in the circle of Lower Saxony, and dukedom of Brunswick: east long. 5° 45'; north lat. 51° 32'.

GOTTORP,
GOVERNMENT, in general, is the pol-

city of a state, or an orderly power con-
stituted for the public good.

Civil government was instituted for the

preservation and advancement of men's
civil interests, and for the better security
of their lives, liberties, and properties.
The use and necessity of government is
such, that there never was an age or
country without some sort of civil au-
thority: but as men are seldom unanimous
in the means of attaining their ends, so
their difference in opinion in relation to
government, has produced a variety of
forms of it. To enumerate them, would be
to recapitulate the history of the whole
earth. But they may, in general, be re-
duced to one of these heads: either the
civil authority is delegated to one or
more, or else it is still referred to the
whole body of the people; whence aris-

es the known distinction of government in
to monarchy, aristocracy, and democ-

Mr. Hooker thinks, that the first govern-
ment was arbitrary, andadministered
by a single person; till it was found by
experience, that to live by one man's
will, was the cause of all men's misery:
and this, he concludes, was the original
of inventing laws. The Roman, and
most of the grecian states, were built up
on the republican plan; but when the
Goths, and other northern nations, de-
stroyed the roman empire, and extended
their conquests into far distant countries,
they established, wherever they came, a
mixed form of government. The pre-

ervation of this constitution depending
upon the balance between the king, no-
bility, and people, the legislative power
was lodged in their three states, called
by different names in different countries;
in the north, diets; in Spain, cortes; in
France, estates; and in Britain, parli-

ments, in the making and repealing all
laws, it has the main advantage of an
aristocracy, and a democracy, and yet is
free from the disadvantages and evils of
either of them. This mixed form of
government is, however, now driven al-
most out of Europe, in some parts of
which we can hardly find the shadow of
liberty left, and in many, there is no
more than the name of it remaining.
France, Spain, Portugal, Denmark, and
part of Germany, were all, an age or
two ago, limited monarchies, governed
by princes, well advised by parliaments
or cortes, and not by the absolute will
of one man. But now all their valuable
rights and liberties are swallowed up
by the arbitrary power of their princes;
whilst we in Great Britain have still hap-
pily preferred this noble and antient go-
thic constitution, which all our neigh-
bours once enjoyed. There is such a
due balance of property, power and do-
m-inion in our constitution, that, like the
antient government of Sparta, it may be
called an empire of laws, and not of
men; being the most excellent plan of
limited monarchy in the world.

Governments are commonly divided into
two classes, arbitrary and free govern-
ments; but there are many different sorts
each. Thus the governments of
France and Spain are generally called
arbitrary; tho' they differ as much from
the governments of Turky and other
eastern empires, where absolute dopo-
ticin prevails, as they do from the go-
vernment of England, and other euro-
pean nations, where liberty is said to
flourish in its fullest perfection.

Government is also a post or office which
gives a perfon the power or right to
govern or rule over a place, a city, or pro-
vince, either supreme or by deputation.

Government is also used for the city,
country, or place to which the power of
governing is extended. In France there
are thirty-eight governments of provin-
ces independent of each other; and be-
fides thes there are twelve grand govern-
ments, which are those of the ille of
France, Burgundy, Normandy, Guienne,
Britany, Champaign, Languedoc, Pic-
cardy, Dauphiny, Provence, Lyonnais, and
Orleanois: but thefe last are only so
many classes of governors or govern-
ments, contrived for the better and easier
regulating the feats, &c. of the many
governors, bailiffs, provosts, &c. who
are obliged to affit at the general estates.
GOVERNMENT, in grammar, a part of construction usually called regimen. See Construction and Regimen.

GOVERNOLO, a town of Italy, ten miles south-east of Mantua.

GOGGE, an instrument or tool used by divers artificers; being a sort of round hollow chiffer, for cutting holes, channels, grooves, &c. either in wood or stone. See the article JOINERY.

GOURD, cucurbita, in botany. See the article CUCURBITA.

Gourd-feeds are of the number of the four greater cold feeds. They are esteemed cooling and diuretic, and are used in emulsions, and some compositions of the shops. They are good in fevers, and in all disorders arising from an acrimony of the blood or humours. Emulsions of these, and the other cold feeds, are ano-

GOURD, in medicine, as defined by Boerhaave, a very painful disease, whose seat is in the joints and ligaments of the feet, and whose principal times of invasion are the spring and autumn. This disease, according to the foremen-
tioned author, seldom invades any patient till he is upwards of thirty; and men are more subject to it than women; as also all persons of acute parts that follow their studies too close, especially in the night-time, with an intense application of mind. Likewise those who live high, and indulge their appetites; drinking plentifully of rich generous wines; or who use acids too freely, or white eager wines; or who have been addicted too early to venereal pleasures; or whose bodies are large, gross, and full. Those are liable to it whole sweaty feet are too suddenly chilled; or who suffer their feet to sweat in wet shoes and stockings. Hence hunting and riding in the cold are pernicious. It may likewise be received by contagion, and is hereditary, descending from father to son.

In treating of this disease we shall, from the authority of Sydenham, first give an account of what that writer calls the regular gout, and afterwards of what he calls the irregular: by the latter is meant a gout which, by the preposterous use of improper medicines, has been turned out of its natural course; or, by reason of the patient's weakness, cannot attain to its proper and genuine symptoms.

The regular gout makes its onset in the following manner. It usually seizes the patient in the latter end of January, or beginning of February, all of a sudden, without any previous notice, unless the patient has been troubled with crudities of the stomach, and indigestion for some weeks before: the body likewise, in many, seems to have been puffed up with wind, with a kind of heaviness, which daily increases, till at length the fit comes thundering on; a few days before which there is a torpor, and, as it were, a de-

Now there is a tenderness of the legs, and a sense of wind down the muscles of the thigh, with a kind of spasmodic affection of them. Likewise the day before the fit, the appetite is more voracious, but not natural.

Though the patient seems to go to bed in good health, yet commonly about two in the morning, he is alarmed by a pain which most frequently affects the great toe, sometimes the heel, the ankle, or the calf of the leg, which pain resembles that of dislocated bones: there is likewise a sensation, as if water, almost cold, was poured on the membranes of the part affected. Soon after a shivering and shaking supervene, with a feverish disorder. The pain, which at first was tolerable, becomes more violent, as the shaking decreases, and grows more intense every hour till night; and then it is at the height, settling itself about the little bones of the tarus and metatarus, whose ligaments it affects. Now there seems to be a violent extension of the ligaments; or there is a sensation of their being lacerated: sometimes they seem to be pressed or squeezed together. At this time the parts affected become so exceeding sensible, that they cannot bear the weight of the sheet, nor the shaking of the room by a person walking about, unless he threads very softly. This always happens at the accession of the fit. About twenty-four hours after this, the patient perceives the part to be swelled, and the pain much abated.

The next day, or perhaps two or three days
days afterwards, if the gouty matter is copious, the part affected is a little in pain. In a few days, the other foot begins to be affected in the same manner; and if the pain has ceased in the first, the weakness which it left behind soon vanishes: the same tragedy is now acted over again. Sometimes when the gouty matter is in great plenty, it attacks both feet at once, but it generally seize one after the other.

After both feet have been tormented, the fits which follow are out of rule, both as to the time of invasion and the duration; only the pain grows more intense at night, and remits in the morning. From a series of the small fits arises what is called a fit of the gout, which is longer or shorter, according to the patient's age. This happens to the more vigorous, and whom the gout seldom visits, in fourteen days; to persons advanced in years, who have often felt its rage, two months: but those who are debilitated with age, or the long stay of the disease, it does not leave till a year, which being pretty far advanced, drives the suffers out of rule, both as to the time and proportion of the fit will be either accelerated or retarded: for if the time was very severe, the next will not come on in less time than a solar revolution.

Such is the regular gout and its genuine symptoms: but when it is disturbed by incongruous medicines, and the patient is worn out by the long continuance of the disease, it becomes irregular, and the sub stance of the body is as it were changed into a fomes of the disease, and nature becomes unequal to the task of conquering the disease thus changed in the accustomed manner.

The feet were at first the seat of the disease, but now it attacks the hands, wrists, elbows, knees, and other parts of the body: sometimes it doth distorts the fingers, as to make them resemble a bunch of parsnips; and at length thinny concretions appear about the ligaments of the joints, which breaking through the skin, resemble chalk, or crab's eyes. Sometimes the gouty matter invades the elbows, and creates a whitish swelling of the size of an egg, which soon assumes a red colour, and becomes inflamed: sometimes it affects the thigh in such a manner, as if a great weight was hung thereon; and yet without any remarkable pain: from thence it descends to the knee, which it attacks more roughly, hindering all motion.

Now the gout afflicts the patient all the year, except for two or three months in summer; and the particular fit which did not last above a day or two, continues ten or fifteen days: the patient is disturbed with sickness as well as pain; his limbs begin to be contracted and unfit for motion; and if he attempts any exercise beyond his strength, the fomes of the disease will attack the viscera in a more dangerous manner.

The curative intention, according to Wintringham, requires, first, that the prime vis be let free from a load of indigested crudities, and the viscera be restored to their prifine vigour; secondly, that the fluid stagnating in, and filling up the smaller vessels, may be expelled the body, and a free passage through the contracted vessels be restored.

The first intention may be answered by vomits and gentle cathartics repeated as occasion requires; by bitter, aromatics, antiscorbutic medicines; by alkaline fixed salts, taken in small quantities for a long time; by aliments and drinks that are nourishing, light, easy of digestion, quickly assimilated, and taken in due quantity; by powerful exercise often repeated, and long continued; and especially by riding in a dry, serene, pure air; by frictions; by motion of the affected parts; by going to sleep at early hours.

The second intention may be answered partly by the preceding, as well as by procuring gentle sweats; by bathing in natural and artificial baths; by sweating in a bagno; or by the use of volatile salts, and copious drinking of attenuating liquors, actually hot, in the morning while in bed, in order to procure a sweat; as also by mercurial purges, taking a large quantity of demulents after them; by frictions of the whole body, especially the parts affected, with hot, dry, linnen-cloths, till a redness appear; by cold baths; and the like.

To abate the excessive pain in the part affected, Boerhaave says, that if there be an
an absolute necessity, opiates may be

an absolute necessity, opiates may be

given internally, and the patient may
drink plentifully of hot whey, or any
other liquor of the like nature. Exter-
nally emollients and anodynes may be
used, laid on pretty hot; or the part
affected may be beat with nettles; or
it may be anointed with terebinthi-
nated balm of sulphur; or tow may be
burnt thereon.

Sydenham says, that tho' there is nothing
of any moment to be done in the fit; yet
that it will be proper to abstain from
milk for some days, and to live on water-
groel, or chick-like diet, but no longer
than the stomach is averse to flesh, for
fear of bringing on a

weakness only remain, nothing can be
with exercise; but if the symptom will

sume, or seafoned with spices: two or
of meat only; he

is almost gone, and the swelling and
of canary

with a little wine; of
or water with a little wine; of
or seafoned with spices: two or
of the patient. This being water, provided the head is not attacked,
then boil them till a
third part of the liquor is exhaled, and
as soon as it is taken off the fire, infuse
therein half an ounce of anisefeed for two
hours. Lastly, strain it off and let it rest
till it become clear, and put it up into
bottles for use.

Regard must likewise be had to the symp-
toms, which in the fit endanger the pa-
tient's life. The most common is a
weak and languid stomach, attended
with ficknesses and gripes, as if from wind.
In this case nothing is better than a glass
of canary drank now and then, together
with exercise; but if the symptom will
not yield to this, give twenty drops of the
beaue tincture in spirituous alexiterial
water, provided the head is not attacked,
and let the patient compose himself to
rest. If the symptom will not yield to
this, sweating is prescribed, as also in a
diarrhoea, when laudanum fails: but if
there is a translation of the gouty matter
to the lobes of the lungs, and the pain
has left the joints, this symptom is to be
treated as a peripneumony. See the
article PERIPNEUMONY.

If the nephritic pains should come upon
the gout, let the patient omit all other
medicines, and drink a large quantity of
poffet-drink, in which the leaves and
roots of marshmallows and marsh-mallows
have been boiled. Then let a clyster be
given, and afterwards a dose of laudanum.
When the gout has seized on the head,
Dr. Cheyne orders it to be treated as any
other violent head-ach, or an inflamma-
tion of the brain and its membranes. In
young and strong constitutions, mercur-
ial and antimonial vomits will do won-
ders; likewise gentle stomach-purges are
to be poured down continually, that is
two or three spoonfuls every third hour,
till the effect is obtained. See the articles
HEAD-ACH and VOMIT.

Pitcairn afferts, that the gout may be
cured in the same manner as the lues
venera, by a salivation, and a decoction of
the woods; and Cheyne allows, that a
full and free salivation will cure the gout
for several years, but then it hatters the con-
stitution too much, that the future fits be-

small, and use the following decoction
only. Take of the root of farfiparilla,
six ounces; faffafrafs wood, china root,
and the shavings of hartthorn, each two
ounces; liquorice root, an ounce; boil
them together in two gallons of spring-
water for half an hour. Afterwards
infuse them upon hot ashes, close covered
for twelve hours; then boil them till a
third part of the liquor is exhaled, and
as soon as it is taken off the fire, infuse
therein half an ounce of anisefeed for two
hours. Lastly, strain it off and let it rest
till it become clear, and put it up into
bottles for use.

GOUTY-LAND, GOUT-WORT, trials, has found very efficacious in the cure of the gout, of which a iufficient testimony. Cheyne likewise observes, that a dram of powdered sulphur, or flower of brimstone, taken regularly in a spoonful of milk, has prevented the fit for many years. It moves the body gently once or twice a day. Mulfgrave, to bring the gout back from the navel parts to the joints, had a great opinion of the alcohol martis. See the article ALCOHOL.

If this does not excite a pain in the joints in four or five days, recourse must be had to externals; such as the cephalic plaster, ceratnm viride, or hat-cafe; or the parts in four or five days, recourse must be had to externals; such as the cephalic plaster, ceratnm viride, or hat-cafe; or the parts

De Sault, supposing the gout depends on the want of perspiration, propo(es warm baths, exerciC~

in the summer, and a milk diet, as prefervatives

as possible, clean linen and other cloaths, moderate eating, abftinence from

and then endeavours to procure a general sweat. When the pain is very violent, he blunts it by applying a cloth dipt in liquid laudanum, and exhorts the patient to use exercife after this. Cheyne says, that mercurial vomits are not only proper for the gout in the stomach, but that they are absolutely neceffary, as well as the mercurial purges, when the gout becomes fixed to and permanent in a part, as also when it is dispersed all over the habit like a rheuma-tism; that the active medicines must first render the humours liquid, which gum guaiac, with diaphorical testimony, will afterwards carry off.

GOUT-WORT, in botany, a term sometimes used for angelica. See ANGELICA.

GOUTY-LAND, among farmers, denotes a moorish, cold and black foil, abounding with springs.

In Staffordshire this sort of land is ordered much in the same manner as heathy land, only that it is usually burnt deeper. It bears little but oats, white oats upon the goury, and black oats upon the black cold land.

The turf of these grounds burnt, and carried upon rye or barley-lands, is esteemed a better improvement than dung. See the article HEALTHY LAND.

GOWN, toga, a well known garment, worn by divines, lawyers, &c. who are therefore called gown-men, or gentlemen of the gown.

The citizens of antient Rome all wore gowns, toga; and at the appellation given them, gens togata. See the articles TOGA, PRÆTEXTA, &c.

GRABATII, in church-hitory, a name antiently given to persons who deferred receiving of baptism, till on their death-bed.

GRABOW, or Grubow, a town of Lower Saxony, and duchy of Mecklen-burg, east longitude 11° 36', north lat. 53° 32'.

GRACE, gratia, among divines, signifies any unmerited gift which God bestows on mankind.

Divines distinguish grace into habitual and actual: the first resides fatally in us, is fixed in the soul, and remains till it is expunged by some grievous willful fin. This is also called justifying grace, as it makes us appear innocent and righteous in the sight of God; and fastifying grace, as it makes us holy and devoted to God. Actual grace is that which God gives us for the special performance of some particular good thing, as to convert us, to enable us to resist a particular temptation, &c.

Grace is also divided into natural and supernatural: the natural including the gifts of being, life, of rational facultie~, an immortal soul, &c. and the supernat-ural, is considered as a gift conferred on intelligent beings in order to their sal-vation.

GRACE, in geography, a city of Provence, in France, fifteen miles south-west of Nice: eait long. 6° 50', north lat. 43° 40'.

Act of GRACE, an act of parliament for a general and free pardon, and for setting at liberty insolvent debtors.

Days of GRACE, in commerce. See DAY.

GRACE is also a title of dignity given to dukes, archbishops, and in Germany, to barons and other inferior princes.

GRACE of God, or By the GRACE of God, a formula used by sovereign princes, to express their independence. Thus in speaking of his Britannic majesty, the formula runs thus: "George, by the grace of God, king of Great Britain, &c."

9 C 2

GRACES,
Graces, gratia, among canonists, the name with provisions. See Provision.

Graces, in heathen mythology, three goddesses, whose names were Aglia, Thalia, and Euphrosyne; that is, shining, flourishing, and gay; or according to some authors, Pallas, Euphrosyne, and Aegiale. Some make them the daughters of Jupiter, and Eurynome, or Eunomia, the daughter of Oceanus; but the most common opinion is, that they were the daughters of Bacchus and Venus.

They are sometimes represented dressed, but more frequently naked, to shew, perhaps, that whatever is truly graceful, is so in itself, without the aid of exterior ornaments. They presided over mutual kindness and acknowledgment; bestowed liberality, eloquence, and wisdom, together with a good grace, gaiety of disposition, and easiness of manners.

Gracilis, in anatomy, a muscle of the leg, so called from its slenderness: it arises from the synchondrosi of the os pubis.

Graculus, the Jackdaw, in ornithology, a species of corvus. See the articles Corvus and Jackdaw.

Graculus Palmipes, a species of pelican, from the lateral or horizontal branches.

Gradation, in architecture, a flight of steps, particularly in ascending from the cloister to the choir in churches.

It also denotes an artful disposition of several parts, as it were by steps and degrees, after the manner of an amphitheatre; so that those placed before, are rather serviceable than the contrary, to those behind.

Gradation, in logic, a form of reasoning, otherwise called sorites. See the article Sorites.

Gradation, in painting, a gradual and insensible change of colour, by the diminution of the tints and shades.

Gradation, in rhetoric, the same with climax. See the article Climax.

Gradus, a city of Sclavonia, situated on the river Save, twenty-five miles west of Sisak: east long. 18°, north lat. 45° 37'.

Gradus in the Italian music, the same with degree. See the articles Degree and Monjoint.

Gradus, in geography, an island of the Atlantic sea, thirty-five miles north-east of Venice.

Gradual, gradual, in ecclesiastical writers, a book containing prayers to be used after the epistle. The canonists still give the name gradual to a verse sung after the epistle.

Gradual Psalms. See Psalms.

Graduate, a person who has taken a degree in the university. See Degree.

Graduation, in mathematics, the act of graduating or dividing any thing into degrees, or equal parts.

Gradus, a degree. See Degree.

Graffer, a term met with in law-books, signifying a notary or scrivener.

Graffium, a term also found in law-books, for a register or chartulary of deeds and other evidences.

Graft, or Graff, in gardening, a cion or shoot of a tree inserted into another, so as to make it yield fruit of the same nature with that of the tree from whence the graft was taken.

In the choice of grafts, the following directions should be carefully observed: 1, That they are shoots of the former year. 2, That they are taken from healthy fruitful trees. And, 3, That you prefer those grafts which are taken from the lateral or horizontal branches, to those taken from the perpendicular shoots. These grafts should be cut off from the trees before the buds begin to swell, which is generally three weeks or a month before the season for grafting; therefore, when they are cut off, they should be laid in the ground with the cut downwards, burying them half their length, and covering their tops with dry litter, to prevent their drying; if a small joint of the former year's wood be cut off with the cion, it will preserve it the better; and when it is grafted, this may be cut off; for the grafts must be cut to a proper length before they are inserted into the flocks; but till then, the shoots should remain their full length, as they were taken from the tree, which will preserve them better from trucking. If these grafts are to be carried to a considerable distance, it will be proper to put their cut ends into a lump of clay, and to wrap them up in moss, which will preserve them fresh for a month or longer: but these should be cut off earlier from the trees, than those which are to be grafted near the place where the trees are growing. For the choice of stocks for grafting, see the article Stock.

Grafting, or Engrafting, is the taking a shoot from one tree, and inserting it.
ing it into another; in such a manner, as that both may unite and become one tree. See Graft, supra.

The use of grafting is to propagate any curious sorts of fruit, so as to be certain of the kinds; which cannot be done by any other method: for as all the good fruit have been actually obtained from seeds, the seeds of thefe, when fown, will, many of them, degenerate, and pro-
duce fuch fruit as are not worth cultivating: but when shoots are taken from fuch trees as produc good fruit, there will never alter from their kind, whatever be the flock or tree on which they are grafted; for tho' the grafts receive their nourifhment from the flocks, yet they are never altered by them, but continue to produce the fame kind of fruit as the tree from which they were taken.

General directions for Grafting. All fuch trees as are of the fame genus, i.e. which agree in their flour and fruit, will take upon each other; for infeance, all nut-bearing trees may be safely graffed on each other; as also the plum-bearing trees, under which head I reckon not only the ferveral sorts of plums, but also the almond, peach, neftarine, apriccot, &c. which agree effayuly in their general characters by which they are dif-
tinguished from all other trees: but many of these are very fubjeft to emit large quantities of gum from fuch parts of the trees as are deeply cut and wound-
ed, which, in the tender trees of this kind, viz. peaches and nectarines, being more common and hurtful, it is found to be the fureft method to bud or inoculate them. See Innocation.

All fuch trees as bear cones will do well upon each other, tho' they may differ in one being ever-green, and the other shedding its leaves in winter; as is ob-
ervable in the cedar of Libanus, and the larch-tree, which are found to fucceed upon each other very well: but thefe must be grafted by approach; for they abound with a great quantity of rosin, which is apt to evaporate from the graft, if separated from the tree before it be joined with the flock, whereby they are often destroyed; as also the laurel on the cherry, or the cherry on the laurel. All the nut-bearing trees will also take upon each other, and tho' which have a ten-
der soft wood, will do well if grafted in the common way; but tho' of a more firm contexture, and that are low grow-
ers, fould be grafted by approach.

By ftrictly observing this rule we fhall seldom mifcarry, provided the operation be rightly performed and at a proper feafon, unlefs the weather should prove very bad. It is by this method that many kinds of exotic trees are not only propagated, but also rendered hardy enough to endure the cold of our climate in the open air; for being grafted upon 
flocks of the fame sort that are hardy, the grafts are rendered more capable of enduring the cold; as has been experienced in moft of our valuable fruits now in England, which were formerly transplanted hither from more southerly climates.

Methods of Grafting. We fhall now give the methods of grafting, only ftrictly observing, that before the operation is begun, the following tools and materials ought to be provided, viz.: a small hand-
faw, to cut off the heads of large flocks; a good strong knife with a thick back, to make clefts in the flocks; a fharp pen-
knife to cut the grafts; a grafting chifel, and a small mallet; baits string or woolen yarn; and a quantity of 
clay, which fould be prepared a month before it is ufed, in the following manner: get fome ftrong, fat loam; then take fome new flone-horde dung, and break it in amongit the loam; if you cut a little straw or hay very fmall, and mix amongit it, the loam will hold together the better; and if there be a quantity of falt added, it will pre-
vent the clay from dividing in dry weather; this compound fhould be well flir-
red together, and water put to it in the manner of making mortar; after which it fhould be moistened aforehand, and flirred every other day; but it ought to be re-
membered, that it fhould not be exposed to the frofts, or to drying winds. Of late 
years, fome have made ufe of another compofition for grafting, which they have found to anfwer the intention of keeping out the air, better than the clay 
juft prefcribed. This is compofed of turpentine, bees-wax, and rolin, melted together, which when of a proper con-
fidence, may be put on the flock round the graft, in the fame manner as the clay is ufly applied; and tho' it be not above a quarter of an inch thick, yet it will keep out the air more eflecutively than the clay; and as cold will harden
it, there is no danger of its being hurt by frost, which is very apt to caule the
clay to cleave and sometimes fall off; and when the heat of summer comes on,
this mixture will melt and fall off without any trouble; but you must be care-
ful not to apply it too hot, lest you injure the graft.
There are several ways of grafting, the principal of which are the following.

**Grafting in the rind.** Also called crown-grafting, and shoulder-grafting, is only
proper for large trees, where either the head or the large branches are cut off
horizontally, and two or four cions put in, according to the size of the branch or
stem: in doing of this the cions are cut flat on one side, with a shoulder to rest
upon the crown of the stock; then the rind of the stock must be raised up, to
admit the cion to enter about two inches between the wood and the bark of the
stock, so as the shoulder of the cion may meet, and closely join the crown of the
stock; and after the number of cions are inserted, the whole crown of the
stock should be well clayed over, leaving two eyes of the cions uncovered. This
method of grafting was formerly much more in practice than it is at present: its
discontinuance was occasioned by the ill success which it has been attended,
from the cions being frequently blown out by strong winds, after they had
made large floots; which has sometimes happened after they had had five or six
years growth; so that whenever this method is practised, there should be stakes
fastened to support the cions, till they have almost covered the stock. This
method of grafting is generally performed about the latter end of March, or the
beginning of April.

**Cleft-grafting,** also termed stock or slit-grafting, is practised upon stocks or trees
of a smaller size, from an inch to two inches or more in diameter, and may be
used with success where the rind of the stock is not too thick. This method of
grafting is to be performed in the months of February and March; and in doing
it, the head of the stock or branch must be cut off with a slope, and a slit made
the contrary way in the top of the slope, deep enough to receive the cion, which
should be cut sloping like a wedge, so as to fit the slit made in the stock, being
careful to leave that side of the wedge which is to be placed outward, much
thicker than the other; and in putting the cion into the slit of the stock, great
care must be taken to join the rind of the cion to that of the stock; for if these do
not unite, the grafts will not succeed; when this method of grafting is used to
stocks which are not strong, it will be proper to make a ligature of bals to pre-
vent the slit of the stock from opening; then the whole should be clayed over, to
prevent the air from penetrating the slit, so as to destroy the grafts; only leaving
two eyes of the cions above the slit for floating.

**Whip-grafting,** also called tongue-graft-
ing, is most commonly practised of any
by the nurserymen near London, espe-
cially for small stocks, because the cions
much sooner cover the stocks in this me-
thod than in any other. This is per-
formed by cutting off the heads of the
stocks sloping; there must then be a
notch made in the slope toward the up-
per part downwards, a little more than
half an inch deep, to receive the cion,
which must be cut with a slope upward,
and a part left in this slope like a tongue;
which tongue must be inserted into the
slit made in the slope of the stock, so as
that the two rinds of both cion and stock
may be equal and join together exactly;
then there should be a ligature of bals to
fasten the cion, so as that it may not be
easily displaced; and afterwards clay it
over, as in the former methods.

**Root-grafting,** consists in grafting a
fruitful branch upon a root. The man-
ner of performing it, is to take a
graft of the tree you design to pro-
gate, and a small piece of the root of
another tree of the same kind, or very
near it, or pieces of roots cut from such
tree as you transplant, and whip-graft
them, binding them well together. This
tree may be planted where you would
have it stand, for the piece of root will
draw sap and feed the graft, as the stock
does in the other methods.

**Grafting by approach.** See INARCHING.

**Esutcheon Grafting.** See the article IN-
OCULATION.

**GRAILES,** a market-town of Essex, sit-
uated on the river Thames, seventeen
miles east of London.

**GRAIL,** the same with gradual. See the
article GRADUAL.

**GRAIN,** all sorts of corn, as wheat, barley,
oats, rye, &c. See the articles CORN,
WHEAT, &c.

**GRAIN**
GRAIN is also the name of a small weight, the twentieth part of a scruple in apothecaries weight, and the twenty-fourth of a penny-weight troy. See the article WEIGHT.
A grain-weight of gold-bullion is worth two-pence, and that of silver but half a farthing.
GRAIN also denotes the component particles of stones and metals, the veins of wood, &c. Hence crof-grained, or against the grain, is contrary to the fibres of wood, &c.
GRANING-BOARD, among curriers, the of a penny-weight troy.
A grain-weight of gold-bullion is worth farthing. -

Grammar is usually divided into four parts, orthography, etymology, syntax, and proedy. See ORTHOGRAPHY, &c. Many are of opinion, that grammar is an art or science antecedent to languages; which, according to them, ought to be accommodated to the original principles. But just the reverse of this is true. Languages were by no means made for grammar, but that for them. It serves to teach languages to those who are ignorant of them; and, therefore, should be accommodated to the private language in each particular. In a philosophical view, indeed, there are some circumstances indifferently essential to them all; but this natural agreement is so much altered by the different customs of various languages, as to be for the most part utterly unknown. A just and exact method of grammar, therefore, can be only that, which supposing a language introduced by custom, without attempting any alteration in it, furnishes certain observations called rules, to which the methods of speaking used in this language, may be reduced; and this collection of rules is what is called grammar.

Grammar, says lord Bacon, is of two kinds; the one having relation to speaking, the other to writing; for, as Aristotle well observed, words are the fifts or marks of thoughts, and letters of words. See the articles LANGUAGE, LETTER, WORD, &c.
According to the same noble author, grammar holds the place of a conductor, in respect of the other sciences; and tho' the office be not noble, it is extremely necessary; especially as the sciences, in our times, are chiefly derived from the learned languages. It is of less use in maternal languages, than in learning the foreign ones; but is most of all serviceable in the dead ones, or such as are only preserved in books.

Philosophical Grammar, one proposed by lord Bacon, not upon any analogy which words bear to each other, but such as should diligently examine the analogy or relation betwixt words and things. He disapproves of too curious an enquiry about the impolition and original etymology of names. This he thinks an elegant, and as it were a waxen subject, that may be handomely wrought and twisted, but is attended with little truth and advantage. But, says he, it would be a noble kind of grammar, if any one, well verified in languages, both the learned and vulgar, should treat of their various properties; shewing wherein each of them excelled, and fell short; for thus languages might be enriched by mutual commerce; and one beautiful image of speech, or one grand model of language, for justly expressing the sense of mankind, formed, like the Venus of Apelles, from the excellencies of several. And thus, at the same time, we should have some considerable marks of the genius and manners of people and nations, from their respective languages. See farther remarks on this subject in Bacon's Doctrine of Delivery, Sect. 7.

Grammar is also used for a book containing the rules of this art, methodically digested; of which there are multitudes indeed, but few good ones.

Grammar is likewise used in a synonymous sense with elements, as a geographical grammar, &c.

GRAMMARIAN, one that is skilled in, or teaches grammar.
Antiently the name grammarian was a title of honour, literature, and erudition; being given to persons accounted learned in any art or faculty whatever. But it
GRAMPOUND, GRANADA, a town of the Austrian Netherlands, in the province of Flanders, situated on the river Dender: east lon. 3° 50', and north lat. 50° 55'.

GRAMMONT, a town of Lower Hungary, situated on the river Denderveld, thirty-eight miles south-west of Launceston: west lon. 5° 25', and north lat. 45° 20'.

It sends two members to parliament.

GRAMBUS, in ichthyology, the English name of a fish of the dolphin-kind, with the snout turning upwards, and broad serrated teeth. See Delphinus.

GRAN, a city of lower Hungary, situated on the Danube: east lon. 18° 40', north lat. 48°.

GRANA REGIA and TIGLIA, in the materia medica, names by which the purging grains or seeds of ricinus are called. They are violent and dangerous purgatives, prescribed in the Indies in rheumatisms and dropsies; but whist safer and equally efficacious medicines may be had, there is no necessity to have recourse to these.

GRANADA, a province of Spain, bounded by Andalusia on the north, by Murcia and the Mediterranean on the east, by the same sea on the south, and by Andalusia on the west.

GRANADA, the capital city of the province of Granada, in Spain, situated two hundred miles south of Madrid: west lon. 3° 40', and north lat. 37° 15'.

GRANADA, a province of terra firma, in south America, bounded on the north by the provinces of Carthagena and St. Martha, on the east by Venezuela, by Popoyan on the south, and by Darien on the west.

GRANADA, a city of Mexico, in north America, situated on the side of the lake Nicaragua: west lon. 89°, and north lat. 11° 8'.

GRANADA is also the most southerly of the Caribbee-iflands, situated one hundred and fifty miles south-west of Barbadoes: west lon. 61° 36', and north lat. 12° 15'.

GRANADIER, a soldier armed with a sword, a firelock, a bayonet, and a pouch full of hand-granadoes. They wear high caps, are generally the tallest and briskest fellows, and are always the first upon all attacks.

Every battalion of foot has generally a company of granadiers belonging to it, or else four or five granadiers belong to each company of the battalion; which, on occasion, are drawn out, and form a company of themselves. These always take the right of the battalion.

Horse-granadiers, called by the French grenadiers volants, or flying-granadiers, are such as are mounted on horsecar, and fight on foot: their exercise is the same with the other granadiers.

GRANADILLA, PASSION-FLOWER, a plant called by Linnaeus Passiflora. See the article Passiflora.

GRANADILLOS, some of the Caribbee-Iflands, situated between the island of St. Vincent and Granada; but so inconsiderable that no nation has thought them worth pooffessing.

GRANADO, a hollow ball or shell, of iron or other metal, about two inches thick, six inches in diameter, and half a inch in diameter; which being filled with fine powder, is set on fire by means of a small fusee fastened to the touch-hole, made of the same composition as that of a bomb: as soon as the fire enters the shell, it burfts into many pieces, much to the damage of all that stand near. See the article Bomb.

Thuanus observes, that the first time granadoes were ufed, was at the siege of Wachteudonck, a town near Gueldres: and that the inventor was an inhabitant of Venlo, who, in making an experiment thereof, occasioned two thirds of that city to be burnt, the fire being kindled by the fall of a granado.

GRANARY, a building to lay or store corn in, especially that designed to be kept a considerable time.

Sir Henry Wotton advises to make it look towards the north, as much as may be, because that quarter is the coolest and most temperate. Mr. Worldige observes that the best granaries are built of brick, with quarters of timber wrought in the inside, to which the boards may be nailed, with which the inside of the granary must be lined so close to the bricks, that
there may not be any room left for vermin to shelter themselves. There may be many stories one above another, which should be near the one to the other; because the shallower the corn lies, it is the better, and more easily turned.

Some have two granaries, one above the other, and fill the upper with wheat, or other corn; the upper one having a smaller hole in the floor, by which the corn falls down into the lower one, like the sand in an hour-glass; which, when it is all come down into the lower granary, is carried up again into the upper one; and by this means, is kept continually in motion, which is a good preservative for the corn. A large granary, full of square wooden pipes, may likewise serve to keep corn from heating.

In Kent, when corn is first brought into granaries, they lay it about half a foot thick, turn it twice a week, and once in that time screen it, for the first two months; after which they lay it a foot thick for two months more, turning it once or twice a week, and screening it proportionally according as the weather is moist or dry. After five or six months more, they lay it two feet thick, and turn it once a fortnight, screening it once a month, as occasion requires. After a year, they lay it two feet and a half, or three feet thick, and turn it once in three weeks or a month, screening it proportionally. When it has lain two years or more, they turn it once in two months, and screen it once a quarter. And in this manner they proceed, turning and screening it at greater or smaller intervals, according as they find it in brightness, hardnefs, and dryness; for the oftener the grain is turned, the better it proves. For this purpose, an empty space, about a yard wide, is left on all sides of the room, and another at six feet distance through the whole area, into which empty spaces they turn the corn, as often as necessary. See the article Corn.

Before the corn is brought into granaries it ought to be well cleaned from impurities, and thoroughly dried; for it is observable, that such corn succeds best.

In many parts of Africa, they preserve corn in deep pits, made in dry sandy ground, or even the solid rock; on the floor of these they lay a bed of straw, then a stratum of corn; after that another bed of straw, and then another of corn; and in this manner they proceed till the whole is filled up, taking care to place a layer of straw between the corn and the sides of the pit.

GRANATE, or GARNET, granatus, in natural history. See Garnet.

GRAND, a term borrowed from the French, of the same import with great.

GRAND ASSIZE, in law, a writ to determine the right of property in a real action.

GRAND CAPE. See Cape Magnum.

GRAND DAYS, are those days in the several terms, which are solemnly kept in the inns of court and chancery, viz. candlemas-day, ascension-day, St. John the Baptist, and All Saints-day.

GRAND DISTRESS, a writ that lies in two cases, either when a tenant or defendant is attacked, and does not appear; or where he has appeared, if he afterwards makes default, in which case this process lies instead of a petit cape; and thereby all the goods and chattels of the defendant may be distrained within the county. See the article Distress.

GRAND JURY, is the jury who find bills of indictment before justices of peace and gaol-delivery, or of oyer and terminer, &c. against any offenders that may be tried for the fact.

GRANDE, a branch of the river Niger, in Africa, which discharges itself into the Atlantic ocean, in 15° west lon. and 11° north lat.

GRANDE, is also a river of Brasil, in the province of Del Rey, in south America, which discharges itself into the Atlantic ocean, in 51° west lon. and 32° south lat.

GRANDE, a denomination given to a nobleman of Spain or Portugal.

The grandees are suffered to be covered before the king, who treats them like princes, flying them Illustrious, in his letters; and in speaking to them, or of them, they are styled Eminences.

GRANDESTZ, or GRADENTZ, a city of Poland, forty-two miles south of Dantzick: east longit. 19°, and north lat. 53° 30'.

GRANDPRE, a town of Champaign, in France, thirty miles east of Rheims: east lon. 4° 6', and north lat. 49° 18'.

GRANGE, a house or farm, not only furnished with necessary places for all manner of husbandry, as stables for horses, stalls for cattle, &c. but where there are granaries and barns for corn, hay-lofts, &c. And by the grant of a grange, such places will pass, without being particularly mentioned.

GRANICUS, a little river near the Hellespont, in the lefier Allá, where Alexander
GRANITE, granite, in natural history, a distinct genus of stones, composed of separate and very large concretions rudely compacted together, of great hardness, giving fire with heat, not fermenting with acids, and slowly and imperfectly calcinable in a great fire.

Of this genus there are three species:
1. The hard white granite, with black spots, commonly called moon stone: this is a very valuable kind, consisting of a beautiful congeries of very variously contructed and differently coloured particles; not diffused among, or running into one another, but each pure and distinct, though firmly adhering to whichever of the others it comes in contact with, and forming a very firm mass: it is much used in London for the steps of public buildings, and on other occasions where great strength and hardness are required.
2. The hard red granite, variegated with black and white, and common in Egypt and Arabia. 3. The pale whitish granite, variegated with black and yellow. This is sometimes found in Arabia, but more frequently in loose nodules, and is used for paving the streets.

GRANULOUS, an appellation given to animals which feed on corn or seeds. These are principally of the bird-kind.

GRANT, in law, a conveyance in writing of such things as cannot pass or be conveyed by word only; such are rents, revenfions, services, advowions in gross, tithes, &c.

The person making such a conveyance is called the grantor, and he to whom the grant is made, the grantee.

A grant has usually the words give and grant, &c., which in a deed of what lies in grant, will amount either to a gift, grant, feufooth, or release, &c., and accordingly may be pleaded; though to every good grant it is requisite that there be a grantor, or person able to give; a grantee, capable of the thing granted; something granted; as grantable; that it be done in the manner the law requires; and that there be an agreement to, and an acceptance of the grant by him to whom made, &c.

When persons non sana memoria make grants, they may be good as to themselves, though voidable by their heirs, &c., and notwithstanding infants and

"GRANITE", GRANULATED, something that has undergone granulation. See the next article.

GRANULATION, according to Cramer, is the reducing metals to small particles, in order to promote their fusion and mixture with other bodies. This is more coarsely done in the wet way, by means of running them into water through a new brome, or rolling them about in a hollow cylinder contrived on purpose: but the nicer and finer is the dry method, by means of a wooden box chalked within. Lead is very nicely granulated this way, and is to be done in the following manner.
GRA [1487] GRA

Put a quantity of lead into an iron-ladle, and melt it slowly over a gentle fire; so soon as it is perfectly liquid, pour it into a round wooden box, with a wooden cover nicely fitted to it; and let both that and the cavity of the box be well rubbed over with chalk; shut the box immediately when the melted lead is in, and shake it violently, so that the metal within may be agitated forcibly against all parts of the box. Continue this agitation till the metal is cold, and on opening the box, you may find the greatest part of it finely granulated, or committed into very small porous grains. Let the chalk that adheres to these grains be rubbed off, and then sift them, to make them of an equal size.

Lead, tin, and brass are the most proper metals for this process; since those, when ready to melt, are always extremely brittle, somewhat like wetted sand. This sort of granulation, therefore, cannot be obtained from such metals as are the more tenacious the nearer they come to fuson, as gold, silver, &c. for which reason those can only be granulated the other and coarser way, by means of water.

GRANULOSE roots, those composed of small knobs, like grains of corn.

GRANUM, in the materia medica. See the article GRANA, supra.

GRAPE, the fruit of the vine, vitis. See the article VINE.

Those kind of grapes which are thin-skinned; grow fooner ripe than others, and will thrive in a temperate climate, where the others will not. If it happen that grapes are struck with hail at the time that they are large and near ripening, they never become ripe at all, but harden, and so remain. See WINE.

The best sort of grapes are the white and sweet grapes with a tender skin, and without stones. It is said, that this fruit, when ripe, is of an hot and moist nature, very fattening, refreshing an inflamed liver, provoking urine, and good for the stomach; yet being windy, they disturb the entrails, so that they are best eaten before meals, or else with pomegranates, and other sharp fruit: but if for a few days they are hung up, they will lose their windines, and become better. See the article ARUM.

The juice of the agrestes, or unripe wild grapes, is the opomachium of the ancients; as their oleum opomachium was the expressed oil from the unripe olives. See the article ARRESTEN.

They used to expose the grapes to the sun for some days, and then press out their juice into large vats: and in the time of Dioscorides, they used to let it stand open in them, exposed to the sun, till most of the humidity was exhaled, and the remainder insipidified into a rob, a form much used among the ancients. This is reckoned a cooler, but has no place in our present pharmacy.

GRAPHOMETER, a mathematical instrument, otherwise called a semi-circle, the use of which is to observe any angle, whose vertex is at the center of the instrument in any plane (though it is most commonly horizontal, or nearly so) and to find how many degrees it contains.

The graphometer is a graduated semi-circle ABC, made of wood, brass, or the like, and so fixed on a fulcrum GH, by means of a brass-ball and socket, that it easily turns about, and retains any situation. It has two lights fixed on its diameter AC, and at the center there is commonly a magnetic needle and compass in a box. There is likewise a moveable ruler, or index ED, with two lights P, P; which turns round the center, and retains any situation given it. See plates CXIX. fig. 2. n° 1. and 2.

To measure by this instrument any angle ACB (ibid. n° 3.) in any plane, and comprehended between the right lines AC and BC, drawn from two points A and B, to the place of station C. Let the graphometer be placed at C, supported by its fulcrum; and let the immovable fights on the diameter of the instrument DE, be directed towards the point A; and likewise while the instrument remains immovable, let the fights of the ruler FG, which is movable about the center C, be directed to the point B. Now it is evident, that the moveable ruler cuts off an arch DH, which is the measure of the angle ACB, sought. Moreover, by the same method, the inclination of DE, or of FG, may be observed with the meridian line, which is pointed out by the magnetic needle included in the box, and movable about the center of the instrument.

GRAPHTOLITHUS, in natural history, a name given by Linnaeus to a kind of stone, resembling a geographical map, found in Scandinavia.

GRAPNELS, a sort of anchors with four floops, serving for boats to ride by.

There is also a kind called fire and chain-grapnels, made with four barbed claws instead of anchors.
before the seed is sown, the surface of the ground should be made level and fine, other wise the seed will be buried unequally. The quantity of grass-seed for an acre of land is usually three bushels, if the seed be clean; otherwise a much greater quantity must be allowed: when the seed is sown it must be gently harrowed in, and the ground rolled with a wooden roller, which will make the surface even, and prevent the seeds being blown in patches. If, when the grass comes up, there should be any bare spots where the seed has not grown, they may be sown again, and the ground rolled, which will fix the seeds, and the first kind ly flowers will bring up the grass.

If any thistles, ragwort, or such other troublesome weeds in the following spring come up among the grass, they should be carefully cut up with a spade before they grow too large; and this should be repeated two or three times in the summer, which will effectually destroy them.

As to grass-plates and green walks, they are made, for the most part, not by sowing grass-seed, but by laying turf's; and indeed the turf's from a fine common or down, are much preferable to sown grass: but if walks or plates are to be made by sowing, the best way is to procure the seed from those pastures where the grass is naturally fine and clear, or else the trouble of keeping it from pityry or benty grass will be very great, and it will scarce ever look handilome.

In order to sow grass-walks, the ground must be first dug; and when it has been first dressed and laid even, it must be very carefully raked over, and all the clods and stones taken off, and then covered over an inch thick with good mould. This being done, the seed is to be sown pretty thick, that it may come up close and short; it must then be raked over again, to cover the seed, that if the weather should happen to be windi, it may not be blown away. It ought also to be observed, that where grass is sown in gardens, either for lawns or walks, there should always be a good quantity of the white trefoil or dutch clover sown with it; for this will make a fine turf much sooner than any other sown grass, and will continue a better verdure than any other of the grass-tribe.

In order to keep grass-plates or walks handilome, and in good order, you may sow in autumn fresh seed over any places that

---

GRASS, gramen, in botany, &c. a name given to several distinct plants, as the agrostis or couch-grass, the briza or quacking-grass, &c. Under the term grass are also comprehended all manner of herbaceous plants serving for the food of cattle, as clover, rye-grass, &c.

The best season for sowing grass-seed is the latter end of August and the beginning of September, that the grass may be well rooted before the frost sets in, which is apt to turn the plants out of the ground when not well rooted. This seed should be sown in moist weather, or when there is a prospect of showers; but where this cannot be performed in autumn, the seeds may be sown in spring, about the latter end of March, if the season proves favourable.

Some people mix clover and rye-grass seeds together, allowing ten pounds of clover and one bushel of rye-grass to an acre; but this is only to be done where the land is designed to remain but three or four years in pasture, because neither of these kinds are of long duration; so that where the land is designed to be laid down for many years, it will be proper to sow with the grass-seeds some white trefoil, or Dutch clover, which is an abiding plant, and spreads close to the surface of the ground, sending forth roots at every grass will be very great, and it will scarce ever look handilome.

The land on which grass-seed is intended to be sown, should be well plowed, and cleared from the roots of noxious weeds, such as couch-grass, fern, rufhes, heath, gorse, broom, reet-harrow, &c. which if left in the ground, will soon get the better of the grass, and over-run the land. Therefore, where any of these weeds abound, it will be a good method to plow up the surface in April, and let it lie some time to dry; then lay it in small heaps, and burn it; the ashes so produced will be a good manure for it. But where couch-grass, fern, or reet-harrow grow thick, and their roots run far underground, the land should be plowed two or three times pretty deep in dry weather, and the roots carefully harrowed off after each plowing, which is the most certain method of destroying them.
GRATIOLATIA, a Cape or promontory of the province of Honduras, in Mexico; west lon. 84°, north lat. 14° 30'.

GRATIOLAS A DIOS, a Cape or promontory of the province of Honduras, in Mexico; west lon. 84°, north lat. 14° 30'.
G R A [ 1 4 9 0 ]  

left, should be preferred. Again, some
screen the gravel too fine, but this is an
error; for if it be cast into a round heap,
and the great stones only are raked off,
it will be the better. There are many
kinds of gravel which do not bind, and
by this means cause a continual trouble of
rolling, to little or no purpose; as for
such, if the gravel be loose or sandy, you
should take one load of strong loam and
two of gravel, and so cast them well to-
gether.

The month of March is the properest
time for laying gravel; for it is not prud-
ent to do it sooner, or to lay walks in
any of the winter-months before that
time. In making these walks, great re-
gard must be had to the level of the
ground, as to lay the walks with easy
defects toward the low parts of the
ground, that the wet may be easily drain-
ed off; but when the ground is level, it
will be proper to have link-stones laid by
the sides of the walk, and at convenient
distances, to let off the wet; and when
the ground is naturally dry, the drains
from the link-stones may be contrived so
as to convey the water into seepools,
from which the water will soak away
in a short time: but in wet lands there
should be under ground drains, to con-
vey the water off, either into ponds,
ditches, or the nearest place proper to re-
eceive it.

Some are apt to lay gravel walks too
round; but this is an error, because they
are not so good to walk upon; and be-
sides, it makes them look narrow; one
inch is enough in a crown of five feet;
and it will be sufficient, if a walk be ten
feet wide, that it lies two inches higher
in the middle than it does on each side:
if fifteen feet, three inches; if twenty
feet, four inches; and so in propor-
tion.

For the depth of gravel-walks, six or
eight inches may do well enough; and
a foot in thickness will be sufficient for
any; but then there should always be a
depth of rubbish laid under the gravel,
especially if the ground be wet.

Some turn up gravel walks into ridges in
December, in order to kill the weeds:
but this is very wrong, since it never an-
swers the end, and therefore if constant-
ly rolling them after rain and frost will
not effectually kill the weeds and moss,
you should turn the walks in March, and
lay them down at the same time.

In order to destroy worms that spoil
the beauty of gravel or gravel-walks, some
recommend the watering them by water
made very bitter by walnut-tree leaves
being steeped in it; but if in the first
haying of the walks there be a good bed
of time-rubbish laid in the bottom, it will
be the most effectual method to keep out
the worms, for they do not care to har-
bour near lime.

G R A V E L, in medicine, a terrible distemper
arising from a gritty matter concreting in-
to small stones in the bladder. See the
article STONE.

G R A V E L I N, a port-town of the French
Netherlands, twelve miles south-west of
Dunkirk.

G R A V E L L I N G, a misfortune that hap-
pens to a horse by travelling, occasioned
by gravel-stones getting between the hoof
and the shoe, which settling at the quick,
there felter and fret. It is cured by
taking off the shoe, picking out all the
gravel, and afterwards washing and
cleaning the part affected; which done.
Sheep's tallow and bay felt melted toge-
ther, are to be poured hot upon it, and
the shoe set on again; and at two or three
dressings it will be healed.

G R A V E L L Y L A N D, or soil, that abound-
ing with gravel and sand, which easily
admits of heat and moisture; and the more
fomy they are, the more barren they
prove.

The best produce of these lands in corn,
is rye, white-oats, bran-turneps, &c.
The natural produce in weeds is quick-
grass, foar, broom, furze, brakes, heath,
&c. The best manure is marl, or any
sort of clay that will disolve with the
frost, cow-dung, chalk, mud, and half-
rotten straw from dunghills.

G R A V E N E C, a town of Swabia, in Ger-
many, thirty miles west of Ulm.

G R A V E R, in the art of engraving, a tool
by which all the lines, scratches, and
flades are cut in copper, &c.
Gravers are of three sorts, round-pointed,
square-pointed, and lozenge. The round
are the best for scratching withal; the
square-pointed are for cutting the largest
strokes; and the lozenge-pointed ones
for the most fine and delicate strokes:
but a graver of a middle form, between
the square and lozenge-pointed, will make
the strokes or hatches appear with more
life and vigour.

The manner of making the gravers is as
follows: provide some crofs-bow steel, and
procure it to be beaten out into small
rods, and hardened, and then, with a
good
G R A V I T A T I O N.

[ 1491 ]

Good file, shape them as you please. This being done, heat them red-hot, and then immediately dip them in soap, which will render them very hard. In doing this observe, that if you turn your hand never so little away in dipping them into the soap, the graver will be crooked. If the graver prove too hard, lay the end of it upon red-hot charcoal, till it begin to grow yellowish, and afterwards dip it in tallow (or, as some say, in water) and it will toughen it. Then having sharpened the graver upon an oil-stone, strike the point of it into a piece of hard boxwood, to take off the roughness about the points, which was caused by whetting it upon the stone. In the last place, touch the edge of the graver with a file; if it cuts, it is too soft, and will not work; but if it will not touch it, it is fit for the work. If the point of the graver breaks, it is a sign that it is tempered too hard; but it will frequently, after a little use by whetting, come to be well conditioned.

GRAVESEND, a port town of Kent, situated on the southern shore of the river Thames, twenty miles east of London.

GRAVINA, a city and bishop's see of the kingdom of Naples, twenty-seven miles south-west of Barri: east lon. 17°, and north lat. 41°.

GRAVING, or ENGRAVING. See the article Engraving.

Graving, in the sea-language, is bringing a ship 'a-ground, and then burning off with furze, reed, or broom, all the filth and foulness that sticks to her bottom without-board, in order to pay her a new.

GRAVITATION, in physiology, a species of attraction, or the tendency of one body towards another, in consequence of its gravity. See Attraction and Gravity.

Causes of Gravity. This indeed is so difficult to be accounted for, that Sir Isaac Newton himself is cautious how he does it. At the close of his Principia he tells us, that he has not hitherto affirmed the cause of gravity, which is a power, however, that proceeds from a cause reaching even to the centers of the sun and planets, without losing its virtue, and that acts, not according to the particles of the surface, like a mechanical cause, but according to the quantity of solid matter in bodies; its action being every way extended to immense distances, and always decreasing in a duplicate proportion of them. The gravity of bodies towards the sun, he further says, is composed of their gravity towards all its particles; and in going from the sun, decreases exactly in a duplicate proportion of the distance to the orbit of Saturn; and even the farthest aphelia of the comets, if those aphelia are at rest. But the reason of these properties of gravity, I could never hitherto, says Sir Isaac, deduce from phenomena; and am unwilling to frame hypotheses about them: for whatever is not deduced from phenomena, ought to be called an hypothesis; and no sort of hypotheses are allowable in experimental philosophy, where propositions are deduced from phenomena, and made general by induction. Thus the impenetrability, the mobility, the momentum of bodies, the laws of motion and gravity, were discovered; and it is enough that gravity has a real existence, and acts according to such laws as we have delivered, and that it suffices to produce all the motions of the celestial bodies, and of our sex. See the articles Planet, Moon, &c.

Laws of Gravitation are as follows: 1. It is common to all bodies, and mutual between them. 2. It is proportional to the quantity of matter in bodies. 3. It is exerted every way from the center of the attracting body in right-lined directions. 4. It decreases as the squares of the distances increase: thus, if a body at A (plate CXIX. fig. 3.) on the earth's surface, distant one semidiameter from the center C, weighs 36.00 pounds, it will, at the distance of 2, 3, 4, 5, 6, semidiameters, weigh 9.00, 4.00, 2.25, 1.45, 1.00 pounds, which numbers decrease as the squares of the distances increase. The truth of this proposition is not to be had from experiments; the utmost distance we convey bodies to, from the surface of the earth, bearing no proportion to their distance from its center, but is sufficiently clear from the motions observed by the heavenly bodies. See the articles Central Forces, Copernican System, &c. Hence we learn, that all bodies have gravity, or are heavy, and that there is no such thing as absolute levity in nature; and by the second law, the gravitation of all bodies is proportional to the quantity of matter they contain: and hence, since bodies of equal bulk are found to have unequal quantities of matter, it evidently follows, that a vacuum, or solid void of matter, must necessarily exist, and
and that an absolute plenum is a doctrine unphilosophical, and equally false and absurd. See Vacuum and Density.

Also from the third law it follows, that all bodies depending freely by their gravity, tend towards the earth in right lines perpendicular to its surface, and with equal velocities, abating for the resistance of the air; as is evident from the second law above. See the article Descent.

Again, since the gravitation is always as the quantity of matter, and inversely as the square of the distance, it follows that were the internal parts of the earth a perfect void, or hollow concavity, a body placed any where therein, would be absolutely light, or void of gravity: but supposing the earth a solid body throughout, the gravitation from the surface to the center will decrease with the distance, or it will be directly proportional to the distance from the center.

Gravitation being found by many experiments and observations to affect all the matter of bodies equally, we have hence more reason, says Mr. Maclaurin, to conclude its universality, since it appears to be a power that acts not only at the surfaces of bodies, and on such bodies as are removed at a distance from them, but to penetrate into their substanccs, and into that of all other bodies, even to their centers, to affect their internal parts with the same force as the external, to be obstructed in its action by no intervening body or obstacle, and to admit of no kind of variation in the same matter, but from its different distances only from that to which it gravitates.

This action of gravity on bodies arises from its action on their parts, and is the aggregate of their actions; so the gravitation of bodies must arise from the gravity of all their particles towards each other. The weight of a body towards the earth, arises from the gravity of the parts of that body; the gravity of a mountain towards the earth, arises from the gravitation of all the parts of the mountain towards it; the gravitation of the northern hemisphere towards the southern, arises from the gravitation of all its parts towards it; and if we suppose the earth divided into two unequal segments, the gravitation of the greater towards the lefTer, arises from the gravitation of all the parts of the greater towards the lesser.

In the same manner the gravity of the whole earth, one particle being excepted, toward that particle must arise from the quantity of gravitation of all the other particles of the earth towards that particle. Every particle, therefore, of the earth gravitates towards every other particle: and for the same reason every particle in the solar system gravitates towards every other particle in it.

Center of Gravitation. See Center.

Line of Gravitation. See Line.

Plane of Gravitation. See Plane.

Gravity, in physiology, the natural tendency of bodies towards a center. See the article Gravitation.

From the two following observations we not only learn that gravity is universal and inseparable from all matter; but that it is an active principle, and the most general for conserving and recruiting motion.

Gravity, says Dr. Delagiviers, may be looked upon as a property of matter, which, though not essential, is yet universal, and in one sense inseparable from it; that is, all parcels of matter, however modified, or all bodies, have a gravitation or attraction towards one another, as well in respect of the heavenly as of the terrestrial bodies. The tendency of heavy bodies towards the center of the earth, being owing to the same cause that makes the sun and planets tend towards one another.

The vis inertiae, says Sir Isaac Newton, is a passive principle by which most bodies persist in their motion or rest, receive motion in proportion to the force impressing it, and resist as much as they are resisted. By this principle alone there never could have been any motion in the world; some other principle was necessary for putting bodies into motion; for, from the various compositions of two motions, it is certain that there is not always the same quantity of motion in the world. But by reason of the tenacity of fluids, the attrition of their parts, and the weakness of elasticity in solids, motion is much more apt to be lost than got, and is always upon the decay. There is therefore a necessity of conserving and recruiting it, by active principles; and such is the cause of gravity, by which the planets and comets keep their motion in their orbs, and bodies acquire great motion in falling, &c.

The same philosopher observes, that bodies immered in fluids have two kinds of gravity, the one absolute, and the other relative.

Absolute gravity is the whole force with which a body tends downwards; for the laws
Laws of which, see Acceleration, Descent, and Gravitation.

Relative Gravity is the excess of gravity whereby a body tends downwards more than the fluid which surrounds it.

By the former kind of these gravities, says the last mentioned philosopher, the parts of fluids and of all bodies gravitate in their proper places, and by their joint weights compose the weight of the whole. For every whole has weight, as is evident in vessels filled with liquids; and the weight of the whole being equal to the weight of all the parts, must of necessity be composed of them. But bodies, by the latter kind of gravity, do not gravitate in their own places; that is, do not—when compared with one another, pregravitate; but mutually hindering each others endeavours to descend, they remain in their places as if they had no weight. Bodies in the air, which do not pregravitate, are thought by the vulgar to be heavy, so far as the air does not support them; so that the weight of bodies among the vulgar is only the excess of their real weight above that of the air. And therefore they call those things light which, being less heavy than the air, and yielding to its greater gravity, mount upwards. But these bodies are only comparatively light, not really so: for they will descend in vacuo. Thus bodies, which by reason of their greater or less gravity descend or ascend in water, are but comparatively and apparently heavy or light, and their comparative and apparent levity is the excess or defect whereby their real gravity either exceeds or falls short of the gravity of water. But whatever bodies neither descend by pregravitating, nor ascend by yielding to one that pregravitates, though they still by their real weights increase the weight of the whole, yet comparatively, and in a popular sense, they do not weigh in water. Hence, Specific Gravity, called also relative, comparative, and apparent gravity, is that by which one body is laid to be heavier or lighter than another of a different kind: thus lead is laid to be specifically heavier than cork, because supposing an equal bulk of each, the one would be heavier than the other.

From hence it follows, that a body specifically heavier than another, is also more dense; that is, contains a greater quantity of matter under the same bulk, because bodies, weigh in proportion to the quantity of matter they contain.

If a solid be immersed in a fluid of the same specific gravity with itself, it will remain suspended therein in whatever part of the fluid it is put; but if the body is specifically heavier than the fluid, it will subside to the bottom. On the contrary, if the body is specifically lighter than the fluid, it will rise to the top.

A body being laid on the surface of a fluid specifically heavier than itself sinks in it, till the immersed part takes up the quantity of fluid, whose weight is equal to that of the whole body; and a body suspended in a fluid specifically lighter than itself, loses a part of its weight equal to that of a quantity of the fluid of the same bulk. See the article Fluid.

For the method of finding the various comparative or specific gravities of fluids and solid bodies to the last degree of accuracy, see the articles Hydrostatical Ballance, and Hydrometer.

We shall here subjoin a table of the specific gravities of metals, minerals, ores, stones, fossils, animal substances, vegetable substances, miscellaneous substances, and fluids, considering rain-water as 1,000.

A Table of Specific Gravities.

1. Of Metals.

Since all bodies are subject to expand with heat, and be condensed with cold, it will follow, that the specific gravities of bodies cannot be precisely the same in summer and winter. This was first observed in experiments by M. Homberg, and after him, by M. Eifenschmid, who found the absolute weight of a cubic inch of several sorts of bodies in summer and winter, as in the table below.

GRAVITY, in music, an affection of sound, whereby it is denominated deep or low. See the article SOUN

Gravity stands in opposition to acute

ness, or that affection of sound whereby it is denominated acute or shrill. See the article ACUTE.

The relation of gravity and acuteness is the principal thing concerned in music; the distinction and determinateness of which relation gives the sound the deno

mination of harmonic and musical.

The degrees of gravity, &c. depend on the nature of the sonorous body itself, and the particular figure and quantity thereof. Though in some cases on the part of the body where it is struck.

Thus, e.g. the sounds of two bells of different metals, of the same shape and dimensions, being struck in the same place, will differ; and two bells of the same metal will differ in sound, if they differ in shape and magnitude, or be struck in different places: so in chords, all other things being equal, if they differ in tension, matter, or dimension, they will always differ in gravity. Thus again, the sound of a piece of gold is much graver than that of a piece of silver of the same shape and dimensions; and in this case the tones are, ceteris paribus, proportional to the specific gra

vities: so a solid sphere of brass, two feet diameter, will sound graver than another of one foot diameter; and here the sounds are proportional to the quantities of the matter, or absolute weights.

But it must be observed, that acuteness and gravity, as also loudness and lowness, are but relative things. We commonly call a found acute, or loud, in respect of another which is grave or low in respect of the former: so that the same sound may be acute and grave, as also loud and low, in different compara

tions.

The degrees of acuteness and gravity make the different tones of a voice or sound: so we may say one sound is in tune with another, when they are in the same degree of gravity.

The immediate cause or means of this diversity lies deep. The modern musicians fix it on the different velocities of the vibrations of the sonorous bodies. If two or more sounds are compared in relation of gravity, they are either equal or unequal in the degrees of tune: such as are equal are called unions, and the unequal constitute what we call an in-

terval in music. See the articles UNISON, and INTERVAL.

GRAVY, in cookery, the juice of dressed meat, whether roasted, fried or boiled. Gravy is obtained from beef, mutton, veal, poultry, and even fish. The gravy of partridges, pullets, and other fowls, may be gotten by pressing them when about half roasted. The gravy of veal, beef, mutton, &c. is thus obtained: cut them in pieces, and putting them into an earthen pot, stop it close by pasting the cover that no steam may get out; then let it on a gentle fire, for two hours, and the gravy will be made.

A fish gravy for soup may be made of tench or eels, cleaned, and put into a kettle with water, salt, a bunch of sweet herbs, and an onion struck with cloves: let them boil for an hour and half; and straining off the liquor, throw clean linen cloth, and to it the peelings of mushrooms, or mushrooms themselves cut small: boil these together, and strain the liquor into a few-pan, upon fried flour, and a little lemon-juice. This may serve for a foundation to all fish-sous, and will keep good for some time.

GRAY, or GREY, in the manage, &c. See the article GREY.

GRAY, in zoology, an animal known among authors, by the name meles. See the article MELES.

GRAY, in ornithology, a species of duck, called also gadwal. See the articles DUCK and GADWAL.

GRAY, in geography, a city of Franche Comté, in France, twenty two miles north-west of Belfort: east long. 5° 32', north lat. 47° 36'.

GRAYLING, in ichthyology, a species of coregonus, with the upper jaw longest, and with twenty-three bones in the back

fin. See the article COREGONUS.

GREASE, a swelling and gourdines of the leg of a horse.

If the horse be full of flesh, the cure is to be begun by evacuation, such as bleeding, purging, &c. and keeping his heels as clean as possible, by washing them with warm water and soap; for nothing promotes the greate more than negligence and naifiness. In general, turning out in the day-time, moderate exercise, a large and convenient stall, with good dressing, are the best remedies; but if the greate be got to a great height, and there is a nauseous discharge, after cutting off the hair, and washing the heels with soap and water, bathe them with the follow-
following wound-water, pretty warm, twice a day, for three days. Take rock alum, and white vitriol, of each two ounces; powder them together, and burn them in a clean fire-shovel, till they become a white calx: then take powdered camphire, one ounce; bole armeniac in powder, two ounces; river or rain-water, two quarts. Make the water hot, and stir the other things into it. When you use it, it should be shaken up, and a little of it warmed in a pot, and the sores washed with a piece of sponge or rag.

**Grease, Moltèn**, a distemper incident to horses, in which the fat is melted by over hard riding or labour. It may be known by the horse's panting at the breast and girt-ling-place, and heaving at the flank, which will be easily seen the night you bring him in, or the next morning.

For the cure, bleed him in the neck vein, to a good proportion; give him dried bran, and if he empties himself, a re-ning.

**Grease**, with hunters, the fat of a boar, or hare; but the former has commonly the word bevy added to it, and is called bevy-greafe.

**Great**, a term of comparison applied to things of extraordinary quantity or quality; thus, we say, a great city, a great genius, &c.

**Great Circles** of the sphere. See the article Circle.

**Great-circle sailing**, the manner of conducting a ship in, or rather pretty near the arch of a great circle, that paffes thro' the zenith of the two places, viz. from whence she came, and to which she is bound. See the article Sailing.

**Great Men**, in law books, signify the lords of parliament, or other person of note and distinction.

**Great Seal.** See the article Seal.

**Greek**, in a legal sense, is used for satisfaction.

**Greece**, the present Rumelia, and the ancient Hellas, is situated between 20° and 26° east long. and between 36° and 41° north lat. It reaches from the Adriatic Sea, eaffward, to the Archipelago, and is generally a healthy and fruitful country.

**Greek, or Grecean**, any thing belonging to ancient Greece.

The greek language, as preferred in the writings of the celebrated authors of antiquity, as Homer, Hefiod, Demofthenes, Aristotle, Plato, Xenophon, &c. has a great variety of terms and expreffions, suitable to the genius and occasions of a polite and learned people, who had a taste for arts and sciences. In it, proper names are signifcant; which is the reafon that the modern languages borrow so many terms from it. When any new invention, instrument, machine, or the like, is discovered, recourse is generally had to the greek for a name to it; the facility wherewith words are there compounded, affording such as will be expressive of its use: such are barometer, hygrometer, microscope, telescope, thermometer, &c. But of all sciences, medicine most abounds with such terms, as diaphoretic, diagnostic, diathecæ, hemorrhage, hydrophobia, phthisis, atrophy, &c. Besides the copiousness and signifcance of the Greek, wherein it excels most, if not all, other languages, it has also three numbers, viz. a singular, dual, and plural; also abundance of tenses in its verbs, which makes a variety in discourse, prevents a certain drinfe that always accompanies too great an uniformity, and renders that language peculiarly proper for all kinds of verse. The use of the participles of the aorist and preterit, together with the compound words already mentioned, give it a peculiar force and brevity without taking any thing from its perplexity.

It is no easy matter to affign the precise difference between the modern and ancient Greek; which consists in the terminations of the nouns, pronouns, verbs, &c. not unlike what obtains between some of the dialects of the Italian or Spanifh. There are also in the modern Greek many new words, not to be met with in the antient. We may therefore distinguish three ages of the greek tongue, the firft of which ends at the time when Constantinople became the capital of the roman empire; the second lafted from that period to the taking of Constantinople by the Turks; and the third, from that time to this.

**Greek Bible.** See the article Bible.

**Greek Church.** See Church.

**Greek monks and nuns**, of whatever order, confider St. Bafil as their founder and common father, and esteem it the highest crime to deviate in the leaff from his constitutions. There are several beautiful convents with churches, in which the monks perform divine service day
day and night. Some of the monks are mendicites, or live together, wear the same habit, eat at the same table, and pursue the same exercises and employments: These are of two sorts; the one of the grand and angelical habit, being such as profess to live more righteously than the rest; the other of the lesser habit, who do not pretend to lead such sanctified lives. Other monks again are anachorets. See the article Anachoret.

**GREEN**, one of the original colours, excited by the rays of light. See Colour. Artificial greens, however, are rarely simple colours, but produced by the mixture of yellow and blue: thus, two powders, one blue and the other yellow, appear perfectly green when mixed; tho’ if viewed with a microscope, the mixture will be seen chequered yellow and blue. See Yellow and Blue.

The dyers make divers shades, or degrees, of green; all which are first dyed in blue, and then taken down with wood, verdigrease, &c. and afterwards greened with the weed, there being no one ingredient that will dye green alone. See the article Dyeing.

**GREEN**, among painters. Gamboge will give five or six sorts of green with verdigrease. But the yellow, which some prefer before all others, is made of french berries; which is either deeper or fainter, according as the liquor is more or less stained by them. In like manner, a yellow, drawn from the roots of the barberry or mulberry, will answer the same purpose, being mixed with transparent verdigrease. As to verdigrease itself, it produces a fine bluish green, flows readily in the pencil, and may even serve as an ink to write with; but is subject to decay. Mountain-green is used for a gravis-colour. Verditer is a light green, seldom used but to colour landscapes that seem afar off. Sap-green is dark and dirty, and therefore never used but to shadow other greens in the darker places. Copper-green is an excellent transparent and shining gravis-green, if thickened in the sun-shine, or over a gentle fire. It is the most used of any green in waffhing of prints or maps.

**GREEN-CLOTH**, a board, or court of justice, held in the compting-house of the king’s household, composed of the lord steward, and officers under him, who sit daily. To this court is committed the charge and oversight of the king’s household in matters of justice and govern-

ment, with a power to correct all offenders, and to maintain the peace of the verge, or jurisdiction of the court royal; which is every way about two hundred yards from the last gate of the palace where his majesty resides.

It takes its name, board of green-cloth, from a green cloth spread over the board where they sit.

Without a warrant first obtained from this court, none of the king’s servants can be arrested for debt.

Clerks of the **GREEN-CLOTH**, are two officers of the board of green-cloth who appoint the diet of the king and his household, and keep all records, ledgers and papers relating thereto; make up bills, parcels and debentures for salaries, and provisions and necessaries for the officers of the pantry, buttery, cellar, &c. They also wait upon foreign princes when entertained by his majesty.

**GREEN-FINCH**, in ornithology, the English name of the greenish fringilla, with the wings and tail variegated with yellow. See the article Fringilla.

This bird is very frequent with us, and is a little larger than the chaffinch. See Plate CXVIII. fig. 1.

There is also a very beautiful green-finch brought from Surinam, with a red-head, and a roundish yellow spot near the joint of the wing. See ibid. fig. 2. where it is figured nearly of the bigness of life.

**GREEN-HOUSE**, or conservatory, a house in a garden contrived for sheltering and preserving the most tender and curious exotic plants, which, in our climate, will not bear to be exposed to the open air during the winter season. These are generally large and beautiful structures, equally ornamental and useful. See plate CXX.

The length of these houses, says Mr. Miller, must be proportioned to the number of plants they are to contain; but their depth should never be greater than their height in the clear; which in small or middling houses may be sixteen or eighteen feet, and in large ones from twenty to twenty-four. The windows in front should extend from about one foot and a half above the pavement, to within the same distance of the ceiling, which will admit of a cornice round the building, over the heads of the windows. In a small green-house, the fashes should not be less than four or five feet broad, and in a large one, they ought not to exceed
Fig. 1. The Green Gold-Finch.

Fig. 2. The Red-Headed Green-Finch.

Fig. 3. Glycyrrhiza Liquorice.
exceed seven and a half, the shutters of which ought to fall back close to the piers on the inside, that when open, they may not prevent any of the rays of light from reaching the plants. The piers between these windows, which support the building, should be as narrow as possible, for which reason they should either be of stone or of well-burnt brick. If they are of stone, they ought not to exceed two feet and a half in front, and should be sloped off backward to about eighteen inches broad, by which means the rays of the sun will not be obstructed by the corners of the piers; which they would be, if they were square: but if they are built with brick, it will be proper to make them nearly three feet in front, or if they were square: but if they are built with brick, it will be proper to make them nearly three feet in front, as well as to leave the space between them not be more than two bricks and a half in thickness.

Over the green-house there may be rooms for drying and preserving seeds, roots, &c. and behind it, there may be erected a house for tools and other purposes; which will prevent the frost from entering that way; so that the wall between them need not be more than two bricks and a half in thickness.

The floor of the green-house, which should be laid either with marble, common stone, or broad tiles, must be raised two feet above the surface of the ground on which the house is placed; or if the situation be moist, at least three feet; and if the whole be arched with low brick arches under the floor, it will be of great service in preventing the damps rising in winter. Under the floor, about three feet from the front, it will be advisable to make a flue of about ten inches in width, and two feet deep, to be carried the whole length of the house, which may be returned along the back part, and the smoke be carried up into funnels adjoining to the tool-house. The fire-place may be contrived at one end of the house; and the door at which the fuel is put in, as also the ash-grate, may be contrived to enter into the tool-house, and the fuel being laid in the same place, the whole will be out of sight. Fires, however, must be very sparingly used in this place: not one winter in three or four will require them to be lighted, since this ought never to be done but when the frost cannot well be kept out any other way, and when this is the case, this expedient may save a whole house of plants. Indeed the coldest weather cannot make it necessary for the green-house to be shut up close for a long time together, which would be attended with very ill consequences; for as it frequently happens, that in continued frosts, we have an hour or two of sun-shine in the middle of the day, it will be of great service to the plants if they are allowed to enjoy its rays through the glases; but the window-shutters should be closed again as soon as it is clouded. The inside of the house should either be whitewashed, or painted white; for this colour reflects the rays of light in a greater quantity than any other.

In this green-house, there should be truffles, upon which rows of planks should be fixed, in order to hold the pots or tubs of plants, the foremost of which should be placed four feet from the window, and the rows behind should rise gradually from the first, in such a manner, that the heads of the second row be entirely advanced above the first, the items only being hid by it: and at the backside, there should be allowed at least a space of five feet, for the convenience of watering the plants, and admitting a current of air around them: care should also be taken not to place the plants too close to each other, nor ever to place euphorbiurns, sedums, torch-thistles, and other tender succulent plants, amongst oranges, myrtles, and other evergreens.

To avoid the inconvenience of placing plants of very different natures in the same house, it will be very proper to have two wings added to the main green-house, which, if placed in the manner of the annexed plan, will greatly add to the beauty of the building, and also collect a greater share of heat. In this plan the green-house is supposed exactly to front the south, one of the wings to face the south-east, and the other the south-west: so that from the time of the sun's first appearance upon any part of the building, until it goes off at night, it will be constantly reflected from one part to the other, and the cold winds will be also kept off from the front of the main green-house. In the area may be placed many of the tender exotic plants, that will bear to be exposed in the summer season: and in the spring, before the weather will permit the plants to be set out, the beds and borders of this area may be full of anemones, ranunculuses, tulips, &c.
In the annexed plate A, is the ground plan of the green-house; B B the ground plan of the two stoves. C C C the sheds behind the green-house and stoves. D D the passage of communication between the green-house and stoves, where the stairs are placed which lead to the rooms over the green-house. E E the section of the flames in the back of the stoves, and F is the upright of the green-house and stoves.

In the center of this area may be contrived a small balcony for water, which will be very convenient for watering the plants; and the two wings of the building should be so contrived as to maintain plants of different degrees of hardiness, which should be effected by the situation and extent of the fire-place, and the manner of conducting the flames. These wings being, in the draught annexed, allowed sixty feet in length, may be divided in the middle by partitions of glass, with glass-doors, and to each of these there should be a fire-place, with flames carried up against the back-wall. The glassed houses should be made to slide and take off, so that they may be drawn down more or less in warm weather, to admit air to the plants; and the upright glass in front may be so contrived, that every other may open as doors upon hinges, and the alternate glasses may be divided into two, the upper part of each to be drawn down like sashes, to let in the air.

If there are not flames running behind the whole length of these wings, the walls should not be less than two bricks thick, and the back part having sloping roofs covered with tiles or flates, should be lined with reeds, &c. under the covering, in order to keep out the cold.

Greenland, or West Greenland, extends from the meridian of London to 50° west long. and from 60° to 80° north lat.

The Danes have some colonies here, and pretend to the property of the whole. However, the Dutch make very free with the fisheries on this coast, notwithstanding the representations, and even menaces of the Danes on that head.

East Greenland, or Groenland. See the article Greenland.

Greenland Fishery. See the article Fishery.

Greenwich, a town of Kent, situated on the southern shore of the Thames, five miles east of London; remark-
GRENADIER and GRENOCK. See GRENOBLE, a city of France, capital of GREVE, GRESHAM-COLLEGE. See COLLEGE.

GREWIA, in botany, a genus of the GYMNANDRIA-POLYANDRIA class of plants, the corolla whereof consists of five petals, of the form of the cup, but less, and emarginated at the base: the fruit is a quadrangular berry, containing four cells: the seeds are few, and of a globose figure. The seeds are large, and contain as much as one-half of the plant. The distribution is a term denoting a young wild hare. See HOUND.

GREY, or GRAY, a mixed colour partaking of the two extremes, black and white. See COLOUR.

To dye a silver GREY. Take water a sufficient quantity; of galls bruised small, two ounces; tartar bruised, three ounces; boil them, and enter twenty yards of stuff. Take water a sufficient quantity; tartar bruised small, four ounces; white tartar bruised small, four ounces; make them boil, then enter twenty yards of stuff, and handle it; boil it a quarter of an hour, and cool it; if you would have it darker, put in more copperas.

To dye a dark GREY. For every pound of woolen ware, use a quarter of a pound of copperas, and a quarter of a pound of brown wood, or walnut-tree wood. To finish it, take two ounces of brown wood, and half an ounce of copperas.

To dye stuff, &c. a lavender GREY. Heat a proper quantity of clean rain-water in a kettle, and for every pound of stuff, take an ounce of blue lac, beaten small; and half an ounce of pounded galls, and the same quantity of vitriol: boil them together, and put in the stuffs; and boil them for half an hour. This dye is proper for stuff and coarse stuffs, but not for the better sort.

To dye silk a good GREY. This you may do as in the tawney dye, and after you have wrung out, rinsed, and beaten it, if it be browned, it becomes a good grey. In the manage, they have several sorts of greys, as the branded-grey, which is speckled black dispersed here and there; they have also the dapple-grey, the silver-grey, the iron-grey, &c.

GREY-FLY, an insect called by authors oestrum. See the article OESTRUM.

GREY-HOUND. See the article HOUND.

GRICE, a term denoting a young wild boar. See the article BOAR and HOG.

GRIFFON, in heraldry, an imaginary animal, feigned by the ancients to be half eagle and half lion; by this form they intended to give an idea of strength and swiftness joined together, with an extraordinary vigilance in guarding the things intrusted to its care. Thus the heathen naturalists persuaded the ignorant, that gold mines were guarded by these creatures with incredible watchfulness and resolution.

GRIG, a name given to the lesser amoeba dyre, or fand-clis. See AMMODYTE.

GRILLADE, in cookery, meat broiled on a gridiron.

GRIMBERG, a town of the austrian Netherlands, in the province of Brabant, five miles north of Brussel: east long. 4° 15', north lat. 50° 55'.

GRIMPERG, a city of Germany, in the circle of the lower Rhine, and earldom of Triers: east long. 6° 35', north lat. 49° 40'.

GRIMSBY, a borough and port-town of Lincolnshire, situated at the mouth of the Humber: east long. 4°, north lat. 53° 34'. It sends two members to parliament.

GRINDERS,
GRINDERS, dentes molares, in anatomy, &c. See TEETH and MOLARES.

GRINDING, trituratio, the reducing hard substances to fine powders, either by the mörter, or by way of levigation upon a marble.

Grinding has a great share in some instances of raising or depressing the efficacy of what comes under its management: for in grinding, all those bodies whose efficacy conflicts in the peculiar shape and points of their component particles, the more and the finer they are broken, the less will they operate. Thus may calomei be Rendered much gentler, and made capable of being given in much larger quantities, only by long rubbing in a glass mortar; for the continual trituration has the same effect upon it, as repeated sublimation, which is only breaking the same specula more and more, until it become almost plain mercury. But in refrinous substances, particularly purgative ones, as jalap, scammony, &c., the finer the powder they are reduced to, the greater is likely to be their efficacy; for as the latter which the stomach and bowels have of them is in proportion to their contacts, therefore the more the quantity is divided, the farther will it diffuse itself, and vellicate the fibres; that is, it will work the more.

Grinding is also the rubbing or the wearing off the irregular or otherwise redundant parts of the surface of a body, and reducing it to the defined figure, whether that be flat, concave, or the like.

Method of Grinding optic glaftes. Mr. Huygens directs, in general, to make the breadth of the concave tool, plate, dish, or form, in which an object-glass must be ground, almost three times the breadth of the glass. Though in another place he speaks of grinding a glass whose focal distance was 200 feet, and breadth 3½ inches, in a plate only fifteen inches broad. But for eye-glaftes, and others of lesser spheres, the tools must be broader in proportion to the breadth of these glaftes, to afford room enough for the motion of the hand in polishing.

Mr. Huygens made his tools of copper, or of cast brass, which, for fear they should change their figure by bending, can hardly be cast too thick; however, he found by experience, that a tool fourteen inches broad, and half an inch thick, was strong enough for the forming glaftes to a sphere of thirty-fix feet diameter; when the tool was strongly cemented upon a cylindrical stone an inch thick, with hard cement made of pitch and ashes.

In order to make moulds for casting such tools as are pretty much concave, he directs, that wooden patterns should be turned in a lathe, a little thicker and broader than the tools themselves; but for tools that belong to spheres above twenty or thirty feet diameter, he says it is sufficient to make use of flat boards turned circular to the breadth and thickness required. When the plates are cast, they must be turned in a lathe exactly to the concavity required; and for this purpose it is requisite to make a couple of brass-gages in the manner following, according to the directions of Mr. Molyneux.

Take a wooden pole, a little longer than the radius of the spherical surface of the glass to be formed; and through the ends of it strike two small steel points, at a distance from each other equal to the radius of the sphere intended; and by one of the points hang up the pole against a wall, so that this upper point may have a circular motion in a hole or socket made of brass or iron, fixed firmly to the wall. Then take two equal plates of brass or copper, well hammered and smoothed, whose length is somewhat more than the breadth of the tool of cast brass, whose thickness may be about a tenth or a twelfth of an inch, and whose breadth may be two or three inches. Then having fastened these plates flat against the wall in a horizontal position, with the moveable point in the pole, strike a true arch upon each of them. Then file away the brass on one side exactly to the arch struck, so as to make one of the brass edges convex, and the other concave; and to make the arches correspond more exactly, fix one of the plates flat upon a table, and grind the other against it with emery. These are the gages to be made use of in turning the brass tools exactly to the sphere required.

But if the radius of the sphere be very great, Mr. Huygens directs the gages to be made as follows. Imagine the line A E, (plate CXIX. fig. 4. n° 1.) drawn upon the brass plate to be the tangent of the required arch A F B, whose radius, for example, is 36 feet, and diameter 72.

From A let off the parts A E, E E, &c. severally equal to an inch, and let them be continued a little beyond half the breadth...
breadth of the tool required: then as 72 feet, or 804 inches is to 1 inch, so let 1 inch be to a fourth number: this will be the number of decimal parts of an inch in the first line E, reckoning from A. Multiply this fourth number successively by 4, 9, 16, 25, &c. the squares of 2, 3, 4, 5, &c. and the several products will be the number of parts contained in the 2d, 3d, 4th, 5th, E, F respectively. But because these numbers of parts are too small to be taken from a scale by a pair of compasses, subtract them severally from one inch, represented by the lines E, G, and the remainders being taken from a scale of an inch divided into decimal parts, and transferred by the compasses from G to F, will determine the points F, P, &c. of the arch required. And the fame being done on the other side of the line A, the brass plates must be filed away exactly to the points of this arch, and polished as before.

Mr. Huygenses would have his plates or tools first formed in a turning lathe, and then ground together with emery; that is to say, the concave and convex tool of the fame sphere together: but the tools of very large spheres, he would have ground at first quite plane, by a stone-cutter; and then ground hollow with a round flat stone and emery, to the desired gage.

The tools thus ground must be polished by an incrustation of pitch and emery, and perfected with blue hone. See the article Polishing.

The glasses being planed to an equal thickness, and polished a little by a glass grinder, and rounded by a grindstone, take away the plate with several feveal cavities, and with some fitted emery, made into a cement, fix on a smaller round piece of brass, or rather steel, truly flat, and turned, about the bigness of a goose-quill, and about the depth of 1/10 of an inch; and at the very bottom of this triangular hole, a little round hole must be punched somewhat deeper, with a very small steel punch. A small steel point, of about an inch long, must be truly shaped and fitted to this triangular hole, and at the very apex to the small round deep impression. Nevertheless it must not be fitted so exactly, but that it may have the liberty to move a little to and fro; the apex always continuing to press upon the surface of the round hole below. This steel triangular point must be fixed to the end of a pole; to the other end of which another round iron point must be fixed, of about five or six inches long, to play freely up and down in a round hole in a piece of brass let into a board fixed against the ceiling for that purpose, perpendicularly over the bench and over the center of the tool, which must be strongly and truly fixed horizontally thereon, as represented in plate CXIX. fig. 4. n°2.

Having these things prepared, with some pots of emery of various finenesses, take of your roughest fort a small half pugil, wetting the fame, and daubing it pretty equably on the tool; then lay on your glass, and fix up your pole, and continue to grind for a quarter of an hour; not prelling upon the pole, but barely carrying the glass round thereby: then take a little quantity of some finer emery, and work another quarter of an hour there- with: then take the like quantity of still finer emery, and work for the same time: last of all take a less quantity of some of the very finest you have, which will be sufficient for a glass of five inches diameter, and work therewith for an hour and a half: taking away by little and little some of the emery with a wet sponge. Do not keep it too wet nor too dry, but about the confidence of paper: for much depends on this. If it be too dry, your emery will stick, clog, and incorporate, and cut little or none at all, besides it will scratch and cut your glass irregularly; and if it is too wet, and too much diluted, it will, from the irregular separation of its parts, cut in some places more than others, as in the other cafe.

But Mr. Huyges tells us, that this method of using various sorts of fresh emery is not good; finding by experience, that the surfaces of large glasses are often scratched. And therefore he says, that it is best to take a large quantity of the first and second emery, and so work with the fame from the first to the laft, taking away, by little and little, every half hour, or quarter of an hour, more and more of the emery with a wet sponge, by which means he could bring the glass extremely smooth and fine, so as to see pretty distinctly a candle or the fash-windows well defined through it, which is a mark when it is ground enough to receive a polish.

When you first begin to grind, and the emery...
emery begins to be smooth, the glass will stick a little to the tool, and run stiff; then fresh emery is to be added. The method hitherto described of grinding with emery, is what is recommended by Mr. Huygens. Le Pere Cherubin prescribes another material, which is the grit of a hard grind-stone, well beaten into a fine powder, and sifted pretty fine: and here in England the same thing was used to be performed by Mr. Cox with common clean white sand, taking away its earthy matter from the wind, or by and between its parts, which is Gripe of a ship, is also a sea-term.

GRIPE, in medicine, a fort of colic, or painful discharge of the belly. See the article COLIC.

GRIPE, or GRIP, in husbandry, a small ditch cut across a meadow, or plowed land, in order to drain it.

GRIPE, in the sea-language, is a piece of timber fayed against the lower piece of the stern, from the fore-mast end of the keel, joining with the knee of the head: its use is to defend the lower part of the stern from any injury: but it is often made larger, to make the ship keep a good wind.

Gripe of a ship, is also the compass or sharpness of the stern under water, chiefly towards the bottom of it. Gripe is also a sea-term, for a ship's turning her head more to the wind than she should: this is caused either by over-loading her a-head, the weight of which presses her down, so that she will not readily fall off from the wind; or by staying or letting her masts too much aft: which is always a fault in short ships that draw much water, since it causes them to be continually running into the wind: though in floating ships, if the masts be not stayed very far aft, they will never keep a good wind.

GRIPSWALD, a town of Germany, in the circle of Upper Saxony, and province of swedish Pomerania, situated on a bay of the Baltic sea: east long. 13° 40', north lat. 54° 15'.

GRISLAGINE, in ichthyology, a species of cyprinus, with whitish fins, and eleven 1879 in that beside the anus.

GRISLEA, in botany, a genus of the aclandria-monogynia class of plants, the flower of which consists of four extremely minute petals, of an oval figure, arising from the denticulations of the cup, and scarce larger than they. It is an american tree, sufficiently distinguished by its flower alone.

GRIONS, allies of Switzerland; their country is almost of a circular form, about sixty miles over every way, and is bounded on the north by Tyrol and part of Switzerland; on the east, by Tyrol and Trent; on the south, by Italy; and by the Swiss cantons on the west.

GRIST, in country-affairs, denotes corn ground; or ready for grinding. See the articles CORN and MILL.

GRITH, a faxon word signifying peace; from whence grithbreche is used in law-books for the breach of the peace.

GROANING, or HOOTING, among sportsmen, the cry or noise of a buck in rutting time.

Groat, an English money of account, equal to four-pence.

GROATS, in country-affairs, oats after the hulls are off, or great oat-meal.

GROCERS, antiently were such persons as engrossed all merchandise that was vendible; but now they are incorporated, and make one of the companies of the city of London, which deals in sugar, foreign fruits, spices, &c.

GRODNO, a great city of Poland, in the province of Lithuania: east long. 24°, north lat. 51° 40'.

GROENDALE, a town of Brabant, six miles south-east of Brussels.

GROENLAND, or SPITZBERGEN, a cold miserable country without inhabitants, and with very few animals or vegetables, situated between 10° and 30° east long: and between 77° and 82° north lat.

GROGRAM, a kind of stuff, made of silk and mohair. Turk'y programs pay on importation 8 as d. the yard; and draw 100 back, on being exported, 7 3 4 as. Lisle programs, if narrow, pay 116. 6 4 as. d. each piece, not exceeding 15 yards, and draw back 165. 1 4 as. d. if broad they pay 175. 3 6 as. d. and draw back 155. 2 7 as. d. each piece, not exceeding 15 yards.

GROIN, PUBES, in anatomy. See the article PUBES.

GROLL, a town of Guilderland, twenty-one miles east of Zutphen.

GROMETS.
GROMETS, in the sea-language, small rings formerly fastened with staples to the yards, to make fast the gaskets, but now never used.

GRONINGEN, the capital of a province of the same name, which makes one of the seven united provinces: east long. 6° 40', north lat. 53° 20'.

GRONOVIA, in botany, a genus of the pentandria-monogynia class of plants, the flower of which consists of five extremely small petals, of a roundish figure: the fruit is a roundish, coloured capsule, with only one cell, in which is contained a single, large, and roundish seed.

GROOM, a name particularly applied to several superior officers belonging to the king's household, as groom of the chamber, groom of the stile. See the articles STOLE and WARDROBE.

GROOM-PORIER, an officer of the king's household, who provides chairs, tables, and firing for the king's lodging, and also furnishes cards, dice, &c. and decides the disputes which arise at play.

GROOM is more particularly used for a servant appointed to attend on horses in the stable. It is his business to feed and water them, to curry and rub them down, and to keep a watchful eye over them, that they may have no inward or outward disorder; without his discovering it, and using his endeavours to remove it.

GROOVE, among miners, is the shaft or pit sunk into the earth, sometimes in the vein, and sometimes not.

GROOVE, among joiners, the channel made by their plough in the edge of a moulding, fillet, or rail, to put their pannels in, in wainscotting.

GROOVE also denotes a gardener's tool for transplanting plants.

GROSS, in law-books, signifies absolute or independent on another: thus, an ad-vowson in gross, is one distinct and separate from the manor.

GROSS also denotes the quantity of twelve dozen, of things sold by tale.

GROSS-BEAR, in ornithology, the English name of a bird called by authors lokia. See the article LOXIA.

GROSS-WEIGHT, the whole weight of merchandizes, with their dust and drofs; as also the bag or chest wherein they are contained. An allowance is usually made out of the gross-weight for tare and tret. See the article TARE.

GROSSE-BOIS, in our old law-books, signifies wood of such a growth as to be accounted timber. See TIMBER.

GROSSETTA, a city of Tuscany, in Italy, fifty-five miles south of Florence: east long. 12°, north lat. 45° 40'.

GROSSULARIA, the gooseberry and currant-bushes, the same with the ribes of Linneus. See the articles RIBES, GOOSEBERRY, &c.

GROTESQUE, or GROTESK, in sculpture and painting, something whimsical, extravagant, and monstrosous; consisting either of things that are merely imaginary, and have no existence in nature; or of things so distorted, as to raise sur-prize and ridicule.

Grotelque work is the same with what is sometimes called antique. The name is said to have taken its rise from the figures of this kind much used in adorning the grottos which in antient times were the tombs of eminent persons or families; such as that of Ovid, whose grotto was discovered near Rome about eighty years ago.

GROTESQUES, or GROTESKS, are particularly used to signify those fanciful ornaments of animals interpersed among foliages, fruit, &c. as those painted by Raphael Urban in the Vatican, and those carved by Michael Angelo, in the ciling of the portico of the capitol. These kind of compartments are called by Vitruvius, harpagnituli.

GROTKA, a city of Silefia, and capital of a dutchy of the same name, thirty miles south of Breslaw: east long. 17°, north lat. 50° 40'.

GROTKA is also a town of Servia, in European Turkey, twenty miles south east of Belgrade: east long. 21°, north lat. 45°.

GROVETO, in the natural history of the earth, a large deep cavern or den in a mountain or rock.

Of these we find several remarkable ones in different parts of the world. The most celebrated one of our own country, is that called Oakley-hole, on the south side of Mendip-hills. Its length is about two hundred yards, and its height various; being in some places very low, and in others eight fathoms. There is another at Puzzoli, about four leagues from Naples, called the dog's grotto; because a dog thrown into it is immediately killed, by a destructive vapour equally fatal to all animals within its reach. The milky grotto, crypta lutea, about a mile from the antient village of Bethlehem, is said to have been thus called from the holy virgin's letting fall some drops of her milk in it; on which account
account the earth of this cavern has been supposed to possess the virtue of restoring women's milk.

Grotto is also used for a small artificial edifice made in a garden, in imitation of a natural grotto.

The outsides of these grottos are usually adorned with rustic architecture, and their inside with shell-work, coral, &c. and also furnished with various fountains, and other ornaments.

The following is recommended as a good cement for grotto-work. Take two parts of white rosin, melt it clear, add to it four parts of bees-wax; when melted together, add some flower of the flone you design to cement, two or three parts, or so much as will give the cement the colour of the flone; to this add one part of the flower of sulphur: first incorporate all together over a gentle fire, and afterwards knead it with your hands in warm water. With this fallen the flones, shells, &c. after they are well dried, and warmed before the fire.

Grove, in gardening, a small wood impervious to the rays of the sun.

Groses are not only great ornaments to gardens, but are also the greatest relief against the violent heats of the sun, affording shade to walk under in the hottest parts of the day, when the other parts of the garden are useless; so that every garden is defective which has no shade. See the article Garden.

Groses are of two sorts, viz., either open or close. Open groses are such as have large shady trees which stand at such distances, as that their branches approach so near to each other, as to prevent the rays of the sun from penetrating through them.

Most of the groses that have been planted either in England or in the celebrated gardens of France, are only a few regular lines of trees; many of which are avenues to the habitation, or lead to some building or other object: but these do not appear so grand, as those that have been made in woods, where the trees have grown at irregular distances; where they have large spreading heads, and are left so far abunder, as to permit the grass to grow under them, they then afford the greatest pleasure; for nothing is more noble than fine spreading trees, with large limbs, growing through grass, especially if the grass is well kept, and has a good verdure; besides, most of those planted groses have a gravel walk, made in a straight line between them, which greatly offends the sight of persons who have a true taste: therefore whenever a gravel-walk is absolutely necessary to be carried through these groses, it will be much better to twit it about, according as the trees naturally stand, than to attempt regularity: but dry walks under large trees, are not so useful as in open places; because after rain, the dropping of the trees will, for a considerable time, render the walks useless.

In planting groses, it is much the best way to dispose the trees irregularly, which will give them a more magnificent and noble appearance, and also form a shade sooner than when the trees are planted in lines.

When, in planting a garden, full grown trees are found upon the spot, they should, if possible, remain inviolate; for it will be better to put up with many inconveniences, than to destroy what will require an age to retrieve; so that nothing but offending the habitation, by being so near as to occasion great damp, should tempt us to cut them down.

Close groses have frequently large trees standing in them; but the ground under these are filled with shrubs or underwood; so that the walks which are in them are private, and screened from winds; by which means they are rendered agreeable for walking, at such times when the air is either too hot or too cold for walking in the more exposed parts of the garden. These are often contrived so as to bound the open groses, and frequently to hide the walls or other inclineries of the garden; and when they are properly laid out, with dry walks winding through them, and on the sides of these sweet-smelling shrubs and flowers irregularly planted, they have a charming effect: for here a person may walk in private, sheltered from the inclemency of cold or violent winds, and enjoy the sweets of the vegetable kingdom; therefore, when it can be admitted, if they are continued round the whole inclineries of the garden, there will be a much greater extent of walk; and these shrubs will appear the best boundary, where there are not fine prospects to be gained.

GROUND, in agriculture, is much the same with earth or soil. See the articles Earth and Soil.
GROUND, in painting, the surface upon which the figures and other objects are represented.

The ground is properly understood of such parts of the piece, as have nothing painted on them, but retain the original colours upon which the other colours are applied to make the representations.

A building is said to serve as a ground to a figure, when the figure is painted on the building.

The ground behind a picture in miniature, is commonly blue or crimson, imitating a curtain of fatin or velvet; if it be to be blue, it should be laid on as follows: wash rice till it is very pure and clear, and temper a quantity in a well bound with gum. Then with a small pencil lay on the same colour about the Pourflile, that is, the ambient superficies of the picture; having done this, take a large pencil, and wash over the whole ground you design to cover with a blue, somewhat thin and watery, and then with a pretty large pencil, full of colour and flowing, lay over with a thick and substantial colour what you had before only washer over; in the doing of this you must be very quick, keeping the colour you have laid on moist, and not suffering any part to dry till you have covered the whole.

If you would have your ground a crimson like fatin, then trace out where and in what places you will have those strong and hard lights and reflections to fall, which are seen in fatin or velvet, with indians lake; there lay your lights with a lake that is thin and watery, and while it is yet wet, lay the deepening and hard strong shadows with a stronger and darker colour of lake thick ground, close by the other lights. The best way for imitation, is to have a piece of fatten before you to imitate.

GROUND, in etching, denotes a gumous composition smeared over the surface of the metal to be etched, to prevent the aquafortis from eating, except in such places where this ground is cut through with the point of a needle. See the article Etching.

GROUND of a field, the same with field. See the article Field.

GROUND-ANGLING, fishing under water without a float, only with a plumb of lead or a bullet, which is better, because it will roll on the ground; this method of fishing is most proper in cold weather, when the fish swim very low.

The bullet is to be placed about nine inches from the baited hook. A person in fishing in this manner, ought not to strike as soon as he feels the fish bite, but slack his line, that the fish may the better swallow the bait and hook. As for the tackle, it should be fine and slender; for strong and thick lines only serve to fright the fish.

The morning and evening are the chief seasons for the ground-line in fishing for trout; but if the day prove cloudy, or the water muddy, you may fish at ground all day.

GROUND-PLUMBING, is to find out the depth of the water in fishing; which is done by a matchet-bullet with an hole through it, tied to a strong twist and hung on the hook.

GROUND-IVY, hedera terrerfis, in botany. See the article GLECHOMA.

Ground-ivy is attenuant and diflovent, and famous both internally and externally as a vulnerary. It is much used with us in an infusion in form of tea, for disorders of the breast and lungs, and is sometimes an ingredient in pectoral decoctions. A conserve made of the plant when in flower, retains its virtues in an agreeable form, but is seldom kept in the shops. It is esteemed a specific in eruptions and ulcerations of the viscera, and particularly of the kidneys and lungs. It is also recommended in consumptions, bruises from falls, head-achs, and other the like disorders.

GROUND-PINE, in botany, a plant called by authors chamepitys, or teucrium. See the article TEUCRIUM.

Stinking Ground-Pine, in botany. See the article POLYCNEMUM.

GROUND-TACKLE, is a ship's anchors, cables, &c. and, in general, whatever is necessary to make her ride safe at anchor.

GROUND-TIMBERS, are those timbers in the ship which lie on her keel, and are fastened to it with bolts thro' the keelson. They are so called from the ship's resting upon them when she is aground.

GROUND-TOWS, are what comes from the hemp when dreed at the hatchel for the spinners, and out of which hambourgh or cabin-lines, marin, and white ocham are made.

GROUND-WORK, in a building, the same with foundation. See Foundation.
GROUNDAGE, a custom or tribute paid for the ground on which a ship stands in port.

GROUNDING, is bringing a ship on ground to be cleaned, trimmed, or to have a leak stopped.

GROUNDING, in ichthyology, the smooth, spotted cobitis, with the body of a cylindrical figure, and otherwise called the loach. See COBITIS.

GROUNDSEL, erigeron, in botany, &c. See the article ERIGERON.

GROUP, in painting and sculpture, is an assemblage of two or more figures of men, beasts, fruits, or the like, which have some apparent relation to each other. It is necessary in a good piece of painting, that all the figures be divided into groups: this has somewhat in it of the nature of symphony or concert of voices; for as in the one the voices must sustain each other, in order to fill the ear with an agreeable harmony from the whole; so in groups, if the parts or figures be not well disposed, something will be found disagreeable.

There are two kinds of groups, or two manners of considering them, with respect to the design, and to the clair-obscure. The shift of these is common both to works of painting and sculpture; but the latter is peculiar to painting.

Groups, with respect to the design, are combinations of several figures, which bear a relation to each other, either upon account of the action, or of their proximity, or of the effect they produce. These we conceive as representing so many different subjects, or at least so many distinct parts or members of one great subject. Thus, in architecture, we say a group of columns, when we speak of three or four columns standing together on the same pedestal.

Groups, with respect to the clair-obscure, are assemblages of figures, where the lights and shadows are diffused in such a manner, that they strike the eye together, and naturally lead it to consider them in one view.

GROUP, in music, one of the kinds of diminutions of long notes, which, in working, form a sort of group, knot, or knot. It usually consists of four or more crotchets, quavers, &c. tied together at the discretion of the composer.

GROUPADE, or CROUPADE, in the manage. See the article CROUPADE.

GROUPED COLUMN. See COLUMN.

GROUSE, or GROWSE, a species of the tetrao, is a valuable bird of the size of a well-grown fowl; the head is large; the eyes bright and piercing; the ears are patulous, the beak is three quarters of an inch long, and of a pale colour, somewhat hooked, and pointed at the extremity: it has a scarlet protuberance over the eyes, which is very bright and beautiful; its wings are variegated, and its tail forked. The male, excepting the little variegations of white in his wings, is totally black, and there is a fine changeable tinge of a deep blue on his neck; but the female is brown and mottled, and in colour resembles the woodcock.

This a native of England, but is not very frequent; it lives on large mountainous heaths.

GROWAN, among the miners of Cornwall, a coarse gritty stone, of a greyish colour, which they are often obliged to dig through, before they can reach the ore.

GROWTH, the increase of a thing, or its advancing towards maturity.

GROWTH-HALF-PENNY, a rate paid in some places for the tithes of every fat beast, or other unfruitful cattle.

GROYNE, or CORUNA, a port of Spain. See the article CORUNA.

GRUARI, in law-books, in general, signifies the principal officers of a forest.

GRUB, in zoology, the English name of the hexapode worms, produced from the eggs of beetles, and which at length are transformed into winged insects of the same species with their parents. See the article SCARABÆUS.

GRUBS, in medicine, certain unctuous pimples arising in different parts of the face, but chiefly in the side of the nose. The cure of these ought only to be attempted by evacuations and cleansers of the blood.

GRUBBING, in agriculture, the digging or pulling up the stubs and roots of trees.

When the roots are large, this is a very troublesome and laborious task; but Mr. Mortimer has shewn how it may be accomplished so as to save great expense by a very simple and easy method. He proposes a strong iron-hook to be made, about two feet four inches long, with a large iron-ring fastened to the upper part of it. See plate CXXI. fig. 2. This hook must be put into a hole on the side of the root, to which it must be fastened, and a lever being put into the ring, two or three
three men, by means of this lever, may
wring out the root, and twist the fap-
roots afunder. Stubs of trees may also
be taken up with the same hook, in which
work it will save a great deal of labour,
though not so much as in the other, be-
cause the stubs must be first cleft with
wedges before the hook can enter the sides
of them, to wrench them out by pieces.

**GRUBBING a cock**, with cock-fighters, a
term used for cutting off the feathers un-
der his wings.

This is a thing not allowed by cockpit-
law, nor is any one permitted to cut off
the feathers in any handling place.

**GRUBENHAGEN**, a town and castle of
Lower Saxony and duchy of Brunswick,
remarkable for its mines of silver, copper,
iron, and lead: east lon. 9° 36', and north lat. 51° 45'.

**GRUINALIS**, in botany, the same with
geranium. See the article GERANIUM.

**GRUMOSE roots**, among herbalists,
such as are knotty, and faltened to one
head, like those of celandine and anemo-
nies. See the article Root.

**GRUNDULUS**, the groundling. See
the article Groundling.

**GRUS**, the crane, in ichthyology, a bird
of the ardea or heron-kind. See the ar-
ticle Ardea.

The common crane, or ardea with the
top of the head papillofe, is a large,
flately, and beautiful bird, with a very
long neck. The indian crane, with the
whole upper part of the head papillofe, is
smaller than the european or common
kind, but otherwise very like it. See the
article Crane.

**GRUS**, in antiquity, a kind of dance which
the young Athenians performed every
year at Delphos, about the altar of Apol-
lo, on the day of Delia. The leaps and figures of this dance, which
were intricate and running one into an-
other, were designed to express the turn-
ings and windings of the labyrinth in
which Theseus killed the minotaur.

**GRY**, a measure containing one tenth of a
line. See the article Line.

**GRYGALLUS**, in ornithology, a name
given to the urogallus, or tetrao. See
the article Tetrao.

**GRULLO-TALPA**, the mole-cricket,
aspecies of grylus, with the anterior feet
palmed. See the next article.

This is the largest of all the european
winged insects, being two inches and a
half in length, and three quarters of an
inch in diameter. Its colour is a dusky-
brown, and there grow from the extre-
mitv of the tail, on each side, two hairy
bodies resembling in some degree the tail
of a mole. See plate CXXI. fig. 4.

**GRYLLUS**, in zoology, the name of the
cock and locust-kind, which, together
with the grasshoppers, make only one
genus of insects, the characters of which
are these: the antennae are fettaceous; the
exterior wings are membranaceous, nar-
row, and have much of the appearance of
the wings of some of the fly-kind; the
thorax is comprefled and angulated; and
the legs are formed for leaping. See the
articles Locust and Gryllo-talpa.

**GRYLLUS**, in ichthyology, a name given
to two distinct fishes, the conger-cel
and ophidon. See the articles Conger and
Ophidon.

**GRYPHITES**, in natural history, in eng-
lisb crow's stone, an oblong felli
dshell, very narrow at the head, and be-
coming gradually wider to the extremity,
where it ends in a circular limb; the
head or beak of this is very hooked or
bent inward.

They are frequently found in our gravel
or clay-pits, in many counties. There
are three or four distinct species of them;
some are extremely rounded and convex
on the back, others less so; and the
plates of which they are composed, are in
some smaller and thinner, in others thicker
and larger, in specimens of the same big-
ness. See plate CXXIV. fig. 2.

**GRYPHUS**, a kind of ænigma. See the article
Ænigma.

**GUADALAJARA**, a city of Mexico,
in north America, and the capital of
Guadalajara, or New Galicia: west lon.
108° 20', and north lat. 30° 45'.

**GUADALAVIAR**, a river of Spain, which
rises in the province of Arragon, and
runs south-east through the province of
Valencia, falling into the Mediterra-
nean a little below the city of Va-
lenca.

**GUADALAXARA**, a city of Spain, in
the province of New Castile, twenty-eight
miles north-west of Madrid: west long.
3° 50', and north lat. 40° 40'.

**GUADALUPE**, one of the largest of the
Caribbe-eilands, eighty miles north of
9 G  
Martinico,
GUA

Martinico, subject to France: west lon. 61°, and north lat. 16° 30'.

GUADARAMA, a town of New Castile, in Spain, twenty-three miles north-west of Madrid: west lon. 42° 45', and north lat. 46° 45'.

GUADIANA, a river of Spain, which rises in the middle of New Castile, and running through Extremadura, enters Portugal; where passing through the provinces of Alentejo and Algarva, it discharges itself into the Atlantic ocean.

GUADILBARBAR, a river of Africa, which rises in the mountains of Atlas, runs through the kingdom of Tunis, and falls into the Mediterranean sea near Bona.

GUADILQUIVIR, a river of Spain, which rises in the mountains of Segura, in New Castile, runs the whole length of Andalusia, and passing by Cordova and Seville, falls into the Atlantic ocean at St. Lucar.

GUADIX, a city of Spain, in the province of Granada: west long. 3°, and north lat. 37° 15'.

GUADUM, in botany, a name sometimes given to ffratis or wood. See ISATIS.

The fame term is also used for the genifella tinctoria, or dyer's weed.

GUAJAC, guajacum, in botany and medicine. See the article GUAJACUM.

GUAJACUM, in botany, the name by which Tournefort calls the pfdium of Linnæus. See the article PSIIDIUM.

GUAINUMBI, the humming-bird. See the article HUMMING-BIRD.

GALEOR, a city of the hither India, and the capital of the province of Gualeor, situated forty miles south of Agra: east lon. 79°, and north lat. 26°.

GUAM, the chief of the Ladrone islands, in the Pacific ocean: east lon. 140°, and north lat. 14°.

GUAN, or QUAN, an american bird, a little bigger than the common hen. In shape it somewhat resembles a turkey, to which Mr. Edwards takes it to be near of kin. The top of the head is covered with black feathers, which it can erect into a crest: the upper part of the body is of a dark colour, and the neck, breast, and belly are of the same colour, only spotted with white. See plate CX. fig. 3.

GUANABANUS, in botany, the name by which Plumieri calls the anona. See the article ANONA.

GUANIHANI, or ST. SALVADOR, now called Catt-island, one of the Bahamas islands in the Atlantic ocean, in north America: west lon. 76°, north lat. 24°.

GUANUCO, a town of Peru, in south America, one hundred and eighty miles north cast.
GUARD, in ichthyology, a name given to several species of baleines. See the article Balistes.

GUARANTY, or WARRANTY, in art."Artillery-Guard, GUARD, in matters of policy, the engagement of mediatorial or neutral states, whereby they plight their faith, that certain treaties shall be inviolably observed, or that they will make war against the aggressor.

GUARANTY, or WARRANTY, in law. See the article WARRANTY.

GUARD, in a general sense, signifies the defence or preservation of any thing; the act of observing what passes, in order to prevent surprize; or the care, precaution, and attention we make use of, to prevent any thing happening contrary to our intention or inclinations.

GUARD, in the military art, is a duty performed by a body of men, to secure an army or place from being surprized by an enemy.

In a garrison the guards are relieved every day, and it comes to every soldier's turn once in three days, so that they have two nights in bed, and one upon guard. To be upon guard, to mount the guard, is to stay at their posts till the forragers all come off the ground.

Advanced Guard, is a detachment from the army, to secure the artillery; their corps de garde is in the front, and their centres round the park. This is a forty-eight hours guard: and upon a march, they go in the front and rear of the artillery, and must be sure to leave nothing behind; if a gun or waggon break down, the captain is to leave a part of his guard to assist the gunners and matroffs in getting it up again.

Corps de Garde, are soldiers entrusted with the guard of a post, under the command of one or more officers.

Counter-Guard, in fortification. See the article Counter-Guard.

Forrage-Guard, a detachment sent out to secure the forragers, which are posted at all places, where either the enemy's party may come to disturb the forragers; or where they may be spread too near the enemy, so as to be in danger of being taken. They confit both of horse and foot, and must stay at their posts till the forragers all come off the ground.

Grand-Guard, three or four squadrons of horse, commanded by a field-officer, posted at about a mile and a half from the camp, on the right and left wings, towards the enemy, for the security of the camp.

Main-Guard, that from whence all the other guards are detached.

Thofe who are to mount the guard, meet at their respective captain's quarters, and go from thence to the parade; where, after the whole guard is drawn up, the small guards are detached for the posts and magazines; and then the subaltern officers throw lots for their guards, and are commanded by the captain of the main-guard.

Picquet-Guard, a good number of horse and foot always in readiness in cafe of an alarm: the horse are all the time saddled, and the riders booted. The foot draw up at the head of the battalion, at the beating of the tattoo; but afterwards return to their tents, where they hold themselves in readiness to march, upon any sudden alarm. This guard is to make resistance, in case of an attack, till the army can get ready.

Quarter-Guard, a small guard, commanded by a subaltern officer, posted by each battalion, about an hundred yards before the front of the regiment.

Rear-Guard, that part of the army which brings up the rear, which is generally the old grand-guards of the camp. The rear-guard of a party is six or eight horse, that march about four or five hundred places behind the party. The advanced-guard of a party on its going out, make the rear guard on its return.

Standard-Guard, a small guard, under a corporal, out of each regiment of horse, and placed on foot, in the front of each regiment.

Ven-Guard, that part of the army which marches in the front.
GUARD is more particularly understood of a soldier detached from a company or corps, to protect, detain, or secure any person, 

GUARDS are also troops kept to guard the king's person, called also royal-guards, life-guards, gardes du corps, &c. These are distinguished into horse, foot, grenadiers, and yeomen.

The English horse-guards are distinguished by troops, and the foot-guards by regiments.

Yeomen of the Guards. See Yeoman.

The French Guards are divided into those within, and those without the palace; the first consists of the gardes du corps, or body-guard, which consists of four companies of horse, the first of which companies was antiently Scotch, and still retains the name, though it now consists wholly of Frenchmen. The guards without, are the gens d'armes, light-horse, musqueteers, and two other regiments, the one of which is French and the other Swifs. See Gendarmes.

GUARD, in fencing, is a posture proper to defend the body from an enemy's sword.

There are four general guards of the sword; to form a perfect idea of which, we must suppose a circle drawn on a wall, and divided into four cardinal points, viz. top and bottom, right and left. When the point of the sword is directed to the bottom of the circle, with the hilt opposite to its top, the body inclining very forward, this is called the prime or first guard. The second guard, by many improperly called the tierce, is when the point is directed to the right or second point of the same circle, with the hilt of the sword turned to the left, and the body proportionably raised. The tierce, or third guard, is when the point of the sword is raised to the uppermost part of the same circle; in which case the body, the arm, and the sword, are in their natural position, and in the mean of the extremes of their motion. The quart, or fourth guard, is when the point of the sword is directed to the fourth point of the circle, defending to the right as far as one fourth of the tierce, with the outward part of the arm and the flat of the sword turned towards to the ground, and the body out of the line to the right, and the hilt of the sword towards the line to the left. There is also a quint, or fifth guard, which is only the return of the point of the sword to the right, after turning the circle to the point of the prime, from whence it had departed, with a different disposition of the body, arm, and sword. The common center of all those motions ought to be in the shoulder.

In all these kinds of guards, there are the high-advanced, high-retired, and high-intermediate guard, when disposed before the upper part of the body, either with the arm quite extended, quite withdrawn, or in a mean state. The mean-advanced guard, or simply mean guard, is when the sword is placed before the middle part of the body. The low-advanced, retired or intermediate guards, are those where the arm and sword are advanced, withdrawn, or between the two extremes, before the lower part of the body.

GUARDANT, or GARDANT, in heraldry. See the article GARDANT.

GUARDIAN, in law, a person who has the charge of any thing; but more commonly it signifies one who has the custody and education of such persons as have not sufficient discretion to take care of themselves and their own affairs, as children and idiots.

There are several sorts of these guardians at common law, viz. guardians by nature, who are the father and mother; guardians in socage, being the next of blood; and guardians by reason of nurture, which is when the father by will appoints a person to be the guardian of his child. The statute ordains, that a father, by deed in his life-time, or by his will, may dispose of the custody of his child, under twenty-one years of age and not married, during the child's minority, to any persons who are not popish recusants, as he shall think fit; which guardians may bring actions of trespass, &c. against any unlawful takers away of such child or children, and take possession of their lands, &c. If the father appoints no guardians to his child, the ordinary, or spiritual court have power to order one for the goods and personal estate only, until the infant is of the age of fourteen; but as to his lands, there shall be a guardian in socage, &c. This guardianship in socage continues till the minor is fourteen years of age, at which time he may choose his guardian before a judge, at his chambers, or in court; or chancery: likewise after the infant comes to that age, he may fix his guardian in socage, to account as bailiff.

The business of guardians is to take the profits of the minor's lands to his use, and vercing the circle to the point of the prime, from whence it had departed, with a different disposition of the body, arm, and sword. The common center of all those motions ought to be in the shoulder.

In all these kinds of guards, there are the high-advanced, high-retired, and high-intermediate guard, when disposed before the upper part of the body, either with the arm quite extended, quite withdrawn, or in a mean state. The mean-advanced guard, or simply mean guard, is when the sword is placed before the middle part of the body. The low-advanced, retired or intermediate guards, are those where the arm and sword are advanced, withdrawn, or between the two extremes, before the lower part of the body.

GUARDANT, or GARDANT, in heraldry. See the article GARDANT.

GUARDIAN, in law, a person who has the charge of any thing; but more commonly it signifies one who has the custody and education of such persons as have not sufficient discretion to take care of themselves and their own affairs, as children and idiots.

There are several sorts of these guardians at common law, viz. guardians by nature, who are the father and mother; guardians in socage, being the next of blood; and guardians by reason of nurture, which is when the father by will appoints a person to be the guardian of his child. The statute ordains, that a father, by deed in his life-time, or by his will, may dispose of the custody of his child, under twenty-one years of age and not married, during the child's minority, to any persons who are not popish recusants, as he shall think fit; which guardians may bring actions of trespass, &c. against any unlawful takers away of such child or children, and take possession of their lands, &c. If the father appoints no guardians to his child, the ordinary, or spiritual court have power to order one for the goods and personal estate only, until the infant is of the age of fourteen; but as to his lands, there shall be a guardian in socage, &c. This guardianship in socage continues till the minor is fourteen years of age, at which time he may choose his guardian before a judge, at his chambers, or in court; or chancery: likewise after the infant comes to that age, he may fix his guardian in socage, to account as bailiff.

The business of guardians is to take the profits of the minor's lands to his use, and
GUERITE, a small tower of wood or stone, generally placed on the point of a bastion, or on the angles of the floucher, to hold a centinel, who is to take care of the fos, and to watch, in order to prevent a surprize.

GUERNSEY, or GARNSEY, an island in the English channel, on the coast of Normandy, fifty-eight miles south of Portland, in Dorsetshire, and twenty-two miles of cape la Hogue, in Normandy; about ten miles long and as many broad, containing ten parishes. The natives, who speak French, are still governed by the Norman laws, but are subject to England.

GUIAQUIL, a city and port-town of Peru, situated near the Pacific Ocean: west lon. 80°, and south lat. 3°.

GUIARA, a port-town on the Caracoa-coast, in terra firma, in South America: west longitude 66°, and north latitude 10° 35'.

GUIDON, a sort of flag or standard, borne by the King's life-guards; being broad at one extreme, and almost pointed at the other, and fit or divided into two.

GUIDON also denotes the officer who bears the guidon. He is the same in the horseguards that the ensign is in the foot. The guidon of a troop of horse takes place next below a cornet.

GUIDONIA, in botany, the name given by Plumier to the family of Linnaeus.

GUIENNE, a province of France, bounded by the Orleansis on the north, by Gascogne, from which it is separated by the river Garonne, on the south, by Languedoc on the east, and by the bay of Biscay on the west.

GUILANDINA, BONDUC, in botany, a genus of the decandria-monogynia class of plants, the flower of which consists of five lanceolate and sessile petals; the fruit is a rhomboidal pod, containing only one cell, in which are included numerous offensive seeds, of a globoso-compressed figure. For the virtue of these seeds, see the article BONDUC.
GUILD, or GILD, a fraternity or company. As to the original of these guilds or companies, it was a law among the Saxons that every freeman of fourteen years of age, should find sureties to keep the peace, or be committed; upon which the neighbours entered into an association, and became bound for each other, either to produce him who committed any offence, or to make satisfaction to the injured party; in order to which they, upon occasion, made a pecuniary compensation according to the quality of the offence committed. These guilds are now companies, joined together with laws and orders made by themselves, by the licence of the prince.

GUILD, GILD, or GELD, is also used among our antient writers for a compensation, or mulct, for a fault committed.

GUILD-HALL, the chief hall of the city of London, for holding of courts, and for the meeting of the lord-mayor and commonalty, in order to make laws and ordinances for the welfare and regulation of the city.

GUILD-RENTS, are rents paid to the crown by any guild or fraternity: or those that formerly belonged to religious houses, and came to the crown at the general dissolution of monasteries.

GUILDFORD, or GULDFORD, a borough-town of Surry, situated on the river Wye, thirty miles south-west of London. It sends two members to parliament.

GUILLESTRE, a city of France, in the province of Dauphiny: east lon. 6° 20', and north lat. 44° 45'.

GUINEA, a large country of Africa, situated between 11° east and 15° west longitude, and between 4° and 10° north latitude. The British, Dutch, French, and other nations, have forts and factories on this coast.

GUINEA is also the name of a British gold-coin. See the article COIN.

GUINEA-PIG, in zoology, a quadruped of the mouse or rat-kind, with a variegated body, resembling, in some measure, a young pig, whence the name. It is considerably larger than the rat, but less than the rabbit. See plate CXXI. fig. 5.

GUINEA-WORM, dracunculus, in zoology and medicine. See DRACUNCULI.

GUIPUSCOA, the north-east division of the province of Biscay, in Spain, situated on the confines of Navarre in France.

GIRA, or GUARA GUAIMUM, in ornithology, the brasilian name of the green slipper, with a crested head and very long tail.

GUISE, a town of France, in the province of Picardy, situated on the river Oye; east lon. 3° 36', and north lat. 49° 55'.

GUITAR, or GUITARRA, a musical instrument of the string-kind, with five double rows of strings, of which those that are bass, are in the middle, unless it be for the burden, an octave lower than the fourth.

This instrument was first used in Spain, and by the Italians. It has the particular denomination of spagnuola given it; and is found in Italy and other countries, but more frequently in Spain.

GULA, in anatomy, the same with the oesophagus. See OESOPHAGUS.

GUL, or GOLA, in architecture, a wavy member, the contour of which resembles the letter S, which the Greeks call cy­matium, and our architects an ogee. See the article CYMATIUM and Ogee. This member is of two kinds, recta and inversa. The first and principal has its cavities or hollows above, and convexities below. This always makes the top of the corona of the cornice, jetting over the drip of the cornice, like a wave ready to fall. It is sometimes absolutely the entablature, as being the first or uppermost member of it.

The second, being also called gula inversa, as the first is called gula recta, is exactly the reverse of the former, the cavity or hollowness of it being at the bottom, so that with respect to the former it appears inverted. This is used in the architrave, and sometimes in the cornice along with the former, only separated by a reglet.

GULES, in heraldry, signifies the colour red, which is expressed in engraving by perpendicular lines falling from the top of the escutcheon to the bottom. See plate CXXI. fig. 6.

It is the first of all colours in armory, and was formerly prohibited to be worn by any person in his coat-armour, unless he were a prince, or had a permission from him. This colour is a symbol of charity, valour, generosity, and represents blood-colour, and true scarlet. The Romans, according to Spelman, painted the bodies of their gods, and generals that triumphed, with vermillion;
**Fig. 1.** Grapnels. Grubbing Hook

**Fig. 8.** Geranium Crane's Bill
GUM [1515]

The bodies truly belonging to this, are, by that author, reduced to so small a number as four; these are, 1. Gum arabic. 2. Gum seneca. 3. Gum tragacanth. 4. Manna.

GUM ARABIC. See Gum ArabiC.

GUM SENeca, or SENeca, as it is commonly written, is a gum extremely re­
sembling gum arabic. It was brought to us from the country through which the river Senega runs, in loofe or fingle drops, but there are much larger than those of the gum arabic usually are; sometimes it is of the bigness of an egg, and sometimes much larger: the surface is very rough, or wrinkled, and appears much less bright than the inner substance, where the maifes are broken. It has no fnem, and fcarce any taste. We are not ac­
nuainted with the tree which produces it. The virtues of it are the fame with the gum arabic, but it is rarely used in me­
dicine, unlefs as mixed with the gum arabic: the dyers and other artificers con­sume the great quantities of it that are annually imported here. The negroes di­
solve it in milk, and in that state make it a principal ingredient in many of their dishes; and often feed on it thus alone.

GUM TRAGACANTH. See the article Tragacanth.

GUM Manna. See the article Manna.

Other substances known by the name of gums, are as follow.

GUM ALoEs, a preparation of aloes, as it down in the London Dispen­
fatory. See the article Aloes.

It is made thus: Take of succotrione aloes, four ounces; of water, a quart: boil the aloes till it is di­
solved as much as may be; and let all by for a night: the resin will be precipitated to the bottom of the ves­
fel; the liquor, poured off or strained, being evaporated, will leave the gum.

The intention of this separation of the re­
fin, is to procure, in the gum, a medi­
cine less purgative, but more agreeable to
the stomach, than the crude aloes.

GUM AMMONIAC. See the article Gum AmmoniaC.

GUM ANIME. See Gum Anime.

GUM ELEMI. See the article Elemi.

GUM GUIAICUM. See Guaiacum.

GUM LACCA. See the article Lacca.

It may be observed in general, that gums and infipfated juices are the better, the freer they are from mixture and drofs; but that they are seldom fit for use before straining.
GUN, among gardeners, a kind of gangrenous incident to fruit-trees of the fione-kind, arising from a corruption of the sap, which, by its viscidity, not being able to make its way through the fibres of the tree, is, by the protrusion of other juice, made to extravasate and ouze out upon the bark. When the distemper surrounds the branch, it admits of no remedy, but when only on one part of a bough, it should be taken off to the quick, and some cow-dung clapped on the wound, covered over with a linen-cloth, and tied down. M. Quintus, directo to cut off the morbid branch two or three inches below the part affected.

GUM, gingivo, in anatomy. See the article GINGIVAE.

GUN, a fire-arm, or weapon of offence, which forcibly discharges a ball, shot, or other offensive matter, through a cylindrical barrel, by means of gun-powder. See the article GUN-POWDER.

Gun is a general name, under which are included divers or even mort species of fire-arms. They may be divided into great and small.

Great guns, called also by the general name cannons, make what we also call ordnance, or artillery; under which come the several sorts of cannons, as cannon-royal, demi-cannon, &c. Culverins, demi-culverins, fakers, minions, falcons, &c. See CANNON, CULVERIN, &c. as also ORDNANCE and ARTILLERY.

Small guns include musquets, musquetoons, carabines, blunderbusses, fowling-pieces, &c. See MUSQUET, &c. Pistols and mortars are almost the only sort of regular weapons, charged with gun-powder, that are excepted from the denomination of guns. See the articles PISTOL and MORTAR.

We have given the proportions and uses of these fire-arms, under their respective articles; but that their parts may be the more distinctly comprehended, there is delineated in the Plate of Gunnery (CXXII) fig. 1. a view of the outside of a piece of ordnance, with the names of its parts; fig. 2. ibid. shows the chafe or bore, and the thickness of the metal; fig. 4. is a cannon mounted on its carriage; and fig. 3. is a mortar mounted on its carriage. The advantage of large guns, or cannons, over those of a smaller bore, is generally acknowledged. Robins observes that this advantage arises from several circumstances, particularly in distant cannonading. The distance to which larger bullets fly with the same proportion of powder, exceeds the flight of the smaller ones, almost in proportion to their diameters; so that a thirty-two pound shot, for instance, being somewhat more than six inches in diameter, and a nine-pound shot but four inches, the thirty-two pound shot will fly near half as far again as that of nine pound, if both pieces are so elevated as to range to the farthest distance possible. Another and more important advantage of heavy bullets is, that with the same velocity they break holes in all solid bodies, in a greater proportion than their weight. Finally, large cannons, by carrying the weight of their bullet in grape or lead-shot, may annoy the enemy more effectually than could be done by ten times the number of small pieces. See the article GUNNERY.

The author here quoted, has proposed to change the fabric of all the pieces employed in the British navy, from the twenty-four pounders downwards, so that they may have the same or less weight, but a larger bore. He thinks the thirty-two pounders in present use would be proper models for this purpose. These being of fifty-two or fifty-three hundred weight, have something less than a hundred and two thirds. But that their parts may be more strained, will heat more, and recoil more than the smaller.

On this scheme our present twenty-four pounders will be eased of fix or eight hundred weight of useless metal; and some pieces of a less calibre, as nine and fix pounders, would be sometimes eased by fourteen hundred: hence much larger guns, of the same weight, might be borne. Thus, instead of fix, nine, twelve, and eighteen pounders, our ships might carry twelve, eighteen, and twenty-four pounders: guns would be kept cooler and quieter, and would be of more service, in many respects, if their usual charge of powder were diminished.
GUN

Gun is also a name given to an instrument used by miners in cleaving rocks with gun-powder. It is an iron cylinder of an inch and a half thick, and about six inches long; and having a flat side to receive the side of a wedge, and a hole drilled through it to communicate with the inside of the hole in the rock: this hole is made about eight inches deep, and in the bottom of it is put about two or three ounces of gun-powder: then this gun is driven forcibly in, so as to fill up the hole, and the wedge is driven in on its flat side to secure it.

The priming at the hole is then fired by a train, and the officer being so well stopped by this gun, the force of the powder is determined to the circumjacent parts of the rock, which it splits. See the article Mining.

Gun-room, in a ship, the apartment under the great cabin, where the master-gunner and his crew rendezvous, get ready their cartridges; &c. and do all things-belonging to their business.

Gunnelus, in ichthyology, a species of blennius; called also the butter-fish, with about ten black spots beside the back-fin.

Gunner, an officer appointed for the service of the cannon; or one skilled to fire the guns.

In the Tower of London, and other garrisons, as well as in the field, this officer carries a field staff, and a large powder horn in a string over his left shoulder: he marches by the guns, and when there is any apprehension of danger, his field staff is armed with match: his business is to lay the gun to pass, and to help to load and traverse her.

Gunner of a ship, or master-gunner, has the charge of all the ordnance of the ship carries, to see that they be serviceably mounted, and sufficiently supplied with spunges, ladles, and rammers; that in foul weather they be traversed within board, especially those of the lower tier, and that the parts be shut, and caulked up; and that at all times they may be well lashed, and made fast, lest any of them break loose, to the imminent danger of foundering the ship. In the time of an engagement, the gunner is to see that every piece be sufficiently manned; he is answerable to give an account of all his charge upon demand. He has a mate and quarter-gunners for his assistance.

Mate-Gunner, a patent-officer of the ordnance, who is appointed to teach all such as learn the art of gunnery, and to certify to the master-general the ability of any person recommended to be one of the king’s gunners. To every scholar he administers an oath, not to serve, without leave, any other prince or state; or teach any one the art of gunnery, but such as have taken the said oath.

Gunner’s Level. See the article Level.

Gunner’s Tackle. See Tackle.

Gunnery, is the art of determining the course and directing the motion of bodies shot from artillery, or other war-like engines.

The great importance of this art is the reason it is distinguished from the doctrine of projectiles in general: for it is no more than an application of those laws which all bodies observe when cast into the air, to such as are put in motion by the explosion of guns or other engines of that sort. And it is the same thing whether it is treated in the manner of projectiles in general, or of such only as belong to gunnery; for from the moment the force is impressed, all distinction with regard to the power which put the body first in motion is lost, and it can only be considered as a simple projectile. See the article Projectiles.

Prob. I. The impetus of a ball, and the horizontal distance of an object aimed at, with its perpendicular height or depression, if thrown on ascents or descents, being given, to determine the direction of that ball.

From the point of projection A (plate CXXII. fig. 5, 6, 7, 8) draw A m representing the horizontal distance, and B m the perpendicular height of the object aimed at: Bisect A m in H, and A H in f; on H and f erect H T, f F perpendicular to the horizon, and bisecting A B the oblique distance or inclined plane in D, and A D in F. On A raise the impetus A M at right angles with the horizon, and bisect it perpendicularly in c, with the line G G. Let the line A C be normal to the plane of projection A B, and cutting G G in C; from C as center, with the radius C A, describe the circle A G M cutting if possible the line F S in S, t points equally distant from G; lines drawn from A through S, t will be the tangents or directions required.

Continue A S, A t to T; t bisect D T, D t, in V; v; and draw lines from M to S, r; then the L A S F = L M A S = L A M S = L S A F; and for the same reason L A S F = L M A S = L A M S = 9 H L.
When the mark can be hit with two directions, the angles between the lines of projection are equal to that which the highest makes with the perpendicular \( \triangle \), or \( \angle \). The altitude is as the versed sine of double the angle of elevation, which is made equal to half the radius; or in this case a fourth part of the impetus is equal to a fourth part of the amplitude. From this and the preceding prop. there are two easy practical methods for finding the impetus of any piece of ordnance. The fourth part of the amplitude is a mean proportional between the impetus at the curve's principal vertex and its altitude. For \( \text{MN} : \text{Nz} : \text{Nz} : \text{NA} = \frac{rF}{2} : \frac{wD}{2} \).

The altitudes are as the versed sines of double the angles of elevation, the impetus remaining the same. For making half the impetus radius, \( \text{AN} \) the altitude is the versed sine of the angle \( \frac{1}{2} \text{AC} \), twice \( \frac{1}{2} \text{AF} \). And also, radius: tangent \( \text{L} \); elevation: \( \frac{1}{4} \) amplitude: altitude, that is, \( \text{R}: \text{tangent} \cdot \frac{1}{4} \text{AF} : \frac{1}{2} \text{AM} = \frac{D}{2} \).

proj. on ascents and descents, fig. 5, 6.

If the mark can be hit only with one direction \( \text{AG} \), the impetus in ascents will be equal to the sum of half the inclined plane and half the perpendicular height, and in descents it will be equal to their difference; but if the mark can be reached with two directions, the impetus will be greater than that sum or difference. For when \( \text{AG} \) is the line of direction, the \( \text{L} \) \( \text{GA} \) being \( \text{MAG} \) \( \text{G} \) \( \text{AG} \), and \( \text{gz} \) added to or subtracted from both makes \( \text{Gz} \); half the impetus equal to the sum or difference of \( \text{Ag} \); a fourth part of the inclined plane, and \( g \) \( \text{a} \) fourth part of the perpendicular height. In any other direction \( \text{FP} \) is greater than \( \text{Fo} \) \( \text{AF} \); and \( \text{Ff} \) added to or subtracted from both, makes \( \text{Ff} \) half the impetus greater than the sum or difference of \( \text{AF} \). a fourth part of the inclined plane, and \( \text{Ff} \) a fourth part of the perpendicular height. Whence if in ascents the impetus be equal to the sum of half the inclined plane and half the perpendicular height, or if in descents it be equal to their difference, the mark can be reached only with one direction; if the impetus is greater than that sum or difference, it may be hit with two directions;
resections; and if the impetus is less, the mark can be hit without none at all.

Prob. II. The angles of elevation, the horizontal distance, and perpendicular height being given, to find the impetus.

Fig. 56.

From these data you have the angle of obliquity, and length of the inclined plane; then as

\[
\frac{A}{S} = \frac{AM}{SM} = \frac{LAM}{LAM} = \frac{SAF}{SAM}, \quad \text{and} \quad \frac{AP}{AF} = \frac{SAM}{SAM} = \frac{SMAM}{SMAM},
\]

whence by the ratio of equality, \( A/F = \frac{SAF}{SAM} = \frac{SMAM}{SMAM} \), which gives this rule.

Add the log. of \( AF \) to twice the logarithmic line of the angle \( MAF \), from their sum substract the logarithmic lines of the angles \( AF \) and \( MAM \), and the remainder will give the logarithm of \( AM \) the impetus.

When the impetus and angles of elevation are given, and the length of the inclined plane is required, this is the rule.

Add the log. of \( AM \) to the log. of the sine of the angle \( MAF \), from their sum substract twice the log. of sine of \( FMA \), and the remainder will give the log. of \( AF \) the fourth part of the length of the inclined plane.

If the angle of elevation is \( A\) and its amplitude \( AB \) (fig. 3.) and any other angle of elevation \( A\) is given; to find the amplitude \( A\) for that other angle, the impetus \( AM \) and angle of obliquity \( DAH \) remaining the same.

Describe the circle \( AM \) take \( AF \) a fourth part of \( AB \), and \( AF \) a fourth part of \( A\). From the points \( P, F \), draw the lines \( PF \) and \( P\) parallel to \( AM \), and cutting the circle in the points \( P, F \); then

\[
AF = \frac{AM}{SAF} = \frac{SMAM}{SMAM} = \frac{PAM}{PAM} = \frac{SAF}{SAM} = \frac{SMAM}{SMAM},
\]

whence by the ration of equality,

\[
AF = \frac{AM}{SAF} = \frac{SMAM}{SMAM} = \frac{PAM}{PAM} = \frac{SAF}{SAM} = \frac{SMAM}{SMAM},
\]

which gives this Rule.

Add the log. of \( AF \) to the log. of the sine of the angle \( PAM \); from their sum substract the log. of the angle \( PAM \), and the remainder will give the log. of \( AF \), a fourth part of the amplitude required.

Prob. III. To find the force or velocity of a ball or projectile at any point of the curve, having the perpendicular height of that point, and the impetus at the point of projection given. From these two data find out the impetus at that point; then \( 2 \times 16 \) feet or inch is the velocity acquired by the descent of a body in a second of time; the square of which \( (4 \times 16 \text{ feet} \times 1 \text{ inch}) \) is to the square of the velocity required, as \( 16 \) feet \( \times 1 \) inch is to the impetus at the point given; wherefore multiplying that impetus by four times the square of \( 16 \) feet \( \times 1 \) inch, and dividing the product by \( 16 \) feet \( \times 1 \) inch, the quotient will be the square of the required velocity; whence this rule. Multiply the impetus by four times \( 16 \) feet \( \times 1 \) inch, or \( 64 \) feet \( \times 1 \) inch, and the square root of the product is the velocity.

Thus suppose the impetus at the point of projection to be \( 5000 \), and the perpendicular height of the other point \( 100 \); the impetus at that point will be \( 3750 \).

Then \( 3900 \) feet multiplied by \( 64 \frac{1}{2} \) feet gives \( 295799 \) feet, the square of which nearly, the space which a body would run through in one second, if it moved uniformly.

And to determine the impetus or height, from which a body must descend, to as at the end of the descent it may acquire a given velocity, this is the rule.

Divide the square of the given velocity (expressed in feet run through in a second) by \( 64 \frac{1}{2} \) feet, and the quotient will be the impetus.

1. The duration of a projection made perpendicularly upwards, is to that of a projection in any other direction whose impetus is the same, and its sine of the inclination of the plane to projection (which in horizontal projections is radius) is to the sine of the angle contained between the line of direction and that plane.

Draw out \( A \) (fig. 5.) till it meets \( B \) continued in \( E \), the body will reach the mark \( B \) in the same time it would have moved uniformly through the line \( AE \); but the time of its fall through \( MA \) the impetus, is to the time of its uniform motion thro’ \( A \), as twice the impetus is to \( AB \). And therefore the duration of the perpendicular projection, being double the time of its fall, will be to the time of its uniform motion through \( A \), as four times the impetus is to \( AE \) or as \( AE \) is to \( EB \); that is, as \( A \) is to \( D \); which is as the sine of the angle \( D \) or \( MAB \) its complement to a line of projection (in horizontal projection) to the sine of the angle \( F \) \( DA \).
Hence the time a projection will take to arrive at any point in the curve, may be found from the following data, viz. the impetus, the angle of direction, and the inclination of the plane of projection, which in this case is the angle the horizon makes with a line drawn from the point of projection to that point.

Hence also in horizontal cases, the durations of projections in different directions with the same impetus, are as the sines of the angles of elevation. But in ascents or descents their durations are as the sines of the angles which the lines of direction make with the inclined plane.

Thus, suppose the impetus of any projection were 4500 feet; then 16 feet 1 inch : 1" : 4500 feet : 275" the square of the time a body will take to fall perpendicularly thro' 4500 feet, the square root of which is 16' nearly, and that doubled gives 32" the duration of the projection made perpendicularly upwards.

Then to find the duration of a horizontal projection at any elevation, as 20°; say R: S, L 20°:: 32". Duration of a projection at that elevation with the impetus 4500. Or if with the same impetus a body at the direction of 35° was projected on a plane inclined to the horizon 17°, say as fine 73°: fine 18°:: 32" duration required.

The two following tables, at one view, give all the necessary cases as well for shooting at objects on the plane of the horizon, with proportions for their solutions, as for shooting on ascents and descents.

| TABLE |
GUN-POWDER, a composition of saltpetre, sulphur, and charcoal, mixed together, and usuallly granulated; which easily takes fire, and, when fired, rarifies, or expands, with great vehemence, by means of its elastic force.

It is to this powder we owe all the action and effect of guns, ordnance, &c., so that the modern military art, fortification, &c., in great measure depend thereon.

Method of making GUN-POWDER. Dr. Shaw's recipe for this purpose is as follows. Take four ounces of refined saltpetre, an ounce of brimstone, and six drams of small coal: reduce these to a fine powder, and continue beating them for some time in a stone mortar, with a wooden pestle, wetting the mixture between whiles with water, so as to form the whole into an uniform paste, which is reduced to grains, by passing it through a wire-ieve fit for the purpose; and in this form being carefully dried, it becomes the common gun-powder.

For greater quantities, mills are usuallly provided, by means of which more work may be performed in one day, than a man can do in a hundred. See MILL.

The nitre or saltpetre is refined thus: dissolve four pounds of rough nitre as it comes to us from the Indies, by boiling it in as much water as will commodiously suffice for that purpose; then let it stout for two or three days in a covered vessel of earth, with flicks laid across for the crystals to adhere to. These crystals being taken out, are drained and dried in the open air.

In order to reduce this salt to powder, they dissolve a large quantity of it in as small a proportion of water as possible; then keep it constantly stirring over the fire, till the water excludes, and a white, dry powder is left behind. See NITRE.

In order to purify the brimstone employed, they dissolve it with a very gentle heat; then scum and pass it through a double strainer. If the brimstone should happen to take fire in the melting, they have an iron cover that fits on close to the melting vessel, and damps the flame. The brimstone is judged to be sufficiently refined if it melts without yielding any fetid odour between two hot iron plates into a kind of red substance.

The coal for the making of gun-powder is either that of willow, or hazel, well charred in the usual manner, and reduced to powder. And thus the ingredients are prepared for making this commodity.
modesty: but as these ingredients require to be intimately mixed and as there would be danger of their firing if heat in a dry form, the method is to keep them continually moist, either with water, urine, or a solution of sal ammoniac: they continue thus dampened them together for twenty-four hours, after which the mass is fit for cooking and drying in the sun, or otherwise, so as sedulously to prevent its firing.

Rationale of Gun-Powder. The explosive force of gun-powder is now a thing commonly known, but the physical reason thereof may not perhaps be hitherto sufficiently understood. In order to explain it, Dr. Shaw proposes the following observations, 1. That salt-petre of itself is not inflammable, and though it melts in the fire, and grows red hot, yet does not explode, unless it comes in contact with the coals. 2. That brimstone easily melts at the fire, and easily catches flame. 3. That powdered charcoal readily takes fire, even from the sparks yielded by a flint and steel. 4. That if nitre be mixed with powdered charcoal, and brought in contact with the fire, it burns and flames. 5. That if sulphur be mixed with powdered charcoal, and applied to the fire, part of the sulphur burns slowly away, but not much of the charcoal; and, 6. That if a lighted coal be applied to a mixture of nitre and sulphur, the sulphur presently takes fire with some degree of explosion; leaving part of the nitre behind, as we fee in making the salt prunelle, and salt polychrestum.

These experiments duly considered, adds the doctor, may give us the chemical cause of the strange explosive force of gun-powder. For each grain of this powder consisting of a certain proportion of sulphur, nitre, and coal, the coal presently takes fire, upon contact of the smallest spark: at which time both the sulphur and the nitre immediately melt, and by means of the coal interposed between them, burst into flame; which, spreading from grain to grain, propagates the same effect almost instantaneously: whence the whole mass of powder comes to be fired; and as nitre contains both a large proportion of air and water, which are now violently rarified by the heat, a kind of fiery explosive blast is thus produced, wherein the nitre seems, by its aqueous and aerial parts, to act as bellows to the other inflammable bodies, sulphur and coal, to blow them into a flame, and carry off their whole sub stance in smoke and vapour.

Different kinds of Gun-Powder. The three ingredients of gunpowder are mixed in various proportions according as the powder is intended for musquets, great guns, or mortars; though these proportions seem not to be perfectly adjusted, or settled by competent experience.

Semenovitz for mortars, directs 100 lb of salt-petre, 25 lb of sulphur, and as many of charcoal; for great guns, 100 lb of salt-petre, 15 lb of sulphur, and 15 lb of charcoal; for musquets and pistols 100 lb of salt-petre, 8 lb of sulphur, and 10 lb of charcoal. Mithius extols the proportion of 1 lb of salt-petre to three ounces of charcoal, and two, or two and a quarter of sulphur; than which, he affirms, no gun-powder can possibly be stronger. He adds, that the usual practice of making the gunpowder weaker for mortars than guns, is without any foundation, and renders the expense needless much greater: for whereas to load a large mortar, 24 lb of common powder is required, and consequently to load it ten times 240 lb he thaws by calculation, that the same effect would be had by 150 lb of the strong powder. To increase the strength of powder, Dr. Shaw thinks it proper to make the grains considerably large, and to have it well sifted from the small dust. We fee that gun-powder, reduced to dust, has little explosive force; but when the grains are large, the flame of one grain has a ready passage to another, so that the whole parcel may thus take fire nearly at the same time, otherwise much force may be lost, or many of the grains go away as shot un-fired.

It should also seem that there are other ways of increasing the strength of powder, particularly by the mixture of salt of tartar; but perhaps, adds the last-mentioned author, it were improper to divulge any thing of this kind, as gunpowder seems already sufficiently destructive.

Method of trying and examining Gun-Powder. There are two general methods of examining gun-powder; one with regard to its purity, the other with regard to its strength. Its purity is known by laying two or three little heaps near each other upon white paper, and firing one of them; for if this takes fire readily
GUN

readily, and the smoke rises upright, without leaving any drost, or feculent matter behind, and without burning the paper, or firing the other heaps, it is esteemed a sign that the sulphur and nitre were well purified, that the coal was good, and that the three ingredients were thoroughly incorporated together: but if the other heaps also take fire at the same time, 'tis presumed that either common salt was mixed with the nitre, or that the coal was not well ground, or the whole mass not well beat, and mixed together; and if either the nitre or sulphur be not well purified, the paper will be black or spotted.

In order to try the strength of gunpowder, there are two kinds of instruments in use; but neither of them appear more exact than the common method of trying to what distance a certain weight of powder will throw a ball from a musquet.

There has been much talk of a white powder which, if it answered the character given it, might be a dangerous composition: for they pretend that this white powder will throw a ball as far as the black, yet without making a report; but none of the white powder we have seen, says Dr. Shaw, answers to this character; being, as we apprehend, commonly made either with touchwood or camphor, instead of coal.

Observations on the force of Gun-powder.

Gun-powder fired either in vacuo, or in air, produces by its explosion a permanent elastic fluid. For if a red-hot iron be included in a receiver, after being exhausted, and gun-powder be let fall on the iron, the powder will take fire, and the mercurial gage will suddenly descend upon the explosion; and though it immediately ascends again, yet it will never rise to the height it first stood at, but will continue depressed by a space proportioned to the quantity of gun-powder which was let fall on the iron.

The same production likewise takes place, when gun-powder is fired in the air: for if a small quantity of powder be placed in the upper part of a glass tube, and the lower part of the tube be immerged in water, and the water be made to rise to near the top, that only a small portion of air is left in that part where the gunpowder is placed; if in this situation the communication of the upper part of the tube with the external air be closed, and the powder be fired, which will easily be done by a burning-glass, the water will in this experiment descend upon the explosion as the quicksilver did in the last; and will always continue depressed below the place at which it stood before the explosion; and the quantity of this depression will be greater, if the quantity of powder be increased, or the diameter of the tube be diminished. From whence it is proved, that as well in air as in a vacuum, the explosion of fired powder produces a permanent elastic fluid. It also appears from experiment, that the elasticity or presiture of the fluid-produced by the firing of gun-powder, is, ceteris paribus, directly as its denity.

This follows from hence, that if in the same receiver a double quantity of powder be let fall, the mercury will subside twice as much as in the firing of a single quantity.

To determine the elasticity and quantity of this elastic fluid, produced from the explosion of a given quantity of gunpowder, Mr. Robins premised, that the elasticity of this fluid increases by heat, and diminishes by cold in the same manner as that of the air; and that the density of this fluid, and consequently its weight, is the same with the weight of an equal bulk of air having the same elasticity, and the same temperature. From these principles, and from his experiments, for a detail of which we must refer the reader to his New Principles of Gunnery, in Scholium, to prop. If, he concludes, that the fluid produced by the firing of gun-powder will be $\frac{3}{4}$ of the weight of the gun-powder, and the ratio of the respective bulk's of the powder, and the fluid produced from it, will be in round numbers 1 to 244.

Hence we are certain, that any quantity of powder fired in any confined space, which it adequately fills, exerts, at the instant of its explosion, against the sides of the vessel containing it, and the bodies it impels before it, a force at least 244 times greater than the elasticity of common air; or which is the same thing, than the presiture of the atmosphere; and this without considering the great addition which this force will receive from the violent degree of heat with which it is endued at that time, the quantity of which augmentation is the next head of Mr. Robins's enquiry. He determines that the elasticity of the air is augmented when heated to the extreme heat of red hot iron, in the proportion of 796 to 194$\frac{1}{3}$, and supposing that the flame of fired
Fired gun-powder is not less hot than red hot iron, and the elasticity of the air, and consequently of the fluid, generated by the explosion, being augmented by the extremity of this heat in the ratio of 79 to 194, it follows that if 244 be augmented in this ratio, the resulting number which is 999 will determine how many times the elasticity of the flame of fired powder exceeds the elasticity of common air, supposing it to be confined in the same space, which the powder filled before it was fired.

Hence then the absolute quantity of the pressure exerted by gun-powder, at the moment of its explosion may be affigned: for since the fluid then generated has an elasticity of 999, or in round numbers 1000 times greater than common air; and since common air by its elasticity exerts a pressure on any given surface equal to the weight of the incumbent atmosphere, with which it is in equilibrio, the pressure exerted by fired powder, before it has dilated itself, is 1000 times greater than the pressure of the atmosphere; and consequently the quantity of this force on a surface of an inch square, amounts to above fix tun weight, which force however diminishes as the fluid dilates itself. The variations of the density of the atmosphere does not in any way alter the action of powder by any experiment that can be made. But the moisture of the air has a very great influence on the force of it: for that quantity which in a dry seaon would communicate to a bullet a velocity of 1720 feet in one second, will not in damp weather communicate a velocity of more than 12 or 1300 feet in a second, or even less, if the powder be bad and negligently kept.

The velocity of expansion of the flame of gun-powder when fired in a piece of artillery, without either bullet, or any other body before it, is prodigious. By the experiments of Mr. Robins, it seems this velocity cannot be much less than 7000 feet in a second. This, however, must be understood of the most active part of the flame. For as was observed before, the elastic fluid in which the activity of gun-powder consists, is only 7 of the substance of the powder, the remaining 7 will in the explosion be mixed with the elastic part, and, will by its weight retard the activity of the explosion; and yet they will be so com-
GUN SHOT-WOUNDS, are attended with much worse consequences than wounds made by sharp instruments; for the parts are more shattered and torn, especially when the shot falls upon the joints, bones, or any considerable part.

In treating these wounds, the following rules must be observed;

1. To extract all foreign bodies, to stop the hemorrage, to promote suppuration, to encourage new flesh, and to make an even cicatrix. The extraction of foreign bodies should, if possible, be performed with the hand; or if that cannot be done, with the forceps or a hook. They are safest removed at first; for, after some delay, the tumour and inflammation of the parts, render it difficult and painful. Sometimes the orifice of the wound is so narrow, that it will be impossible to come at the body you have a desire to extract, without making a larger opening; which should be done on the most convenient side, always observing that no nerve, blood-vein, tendon, or ligament lies in the way. And as two balls are frequently concealed in the same wound, after the removal of one, the surgeon should diligently search for another, or for any other extraneous body that may be forced in with it, which might protract the cure of the wound. When an attempt is made to extract the ball, or any other extraneous body, the patient should be laid in the same situation he was in at the time of receiving the wound; for, by frequent changes of situation, the ball will easily bury itself and get out of your reach. Whenever a ball has penetrated so deep, that you can easily feel it with your finger on the side opposite to the wound, you should examine nicely whether it is safest to bring it back by the way it came in, or to make an opening upon it, and draw it out at the opposite side.

If the wound cannot safely be enlarged, nor the balls extracted without great pain and danger, they must be left in the wound, either till the pain is abated, or the passage rendered so easy by suppuration, that they work themselves out. On the other hand, extraneous bodies are instantly to be removed, where there is danger of bringing on convulsions, pain, and an inflammation, by being left behind. If a ball has passed into any of the cavities of the body, where the extraction of it cannot be attempted with safety, it is best to leave it where it has lodged, and to heal the wound; for there have been variety of instances, where persons have carried balls within them for many years, without suffering any inconvenience. Balls lodged in the bones, are to be extracted with restrained forces, observing the same rules and directions we have already laid down. When this cannot be done, they may be laid hold of with a fort of tepan necessary to extract balls that are lodged in bones, and that are covered with a large quantity of flesh, as in the thigh bone; but if the ball is strongly fixed in the bone, as to resist all these methods, it must be left there till the parts suppurate, and set it at liberty. Balls that are thrown into the joints are to be removed with all expedition, for delays are here extremely dangerous; but it is scarce possible to prevent violent pains, inflammations, and caries of the bones, which generally require amputation of the limb. In wounds from large guns, the joint or bone is frequently grievously shattered, or carried off; in this case, it is far better to take off the limb at once, than to spend a great deal of time in fruitless attempts to cure it; for the natural figure of the shattered joint can never be restored, and the branches of nerves that were sent to the bone, and the infection of the tendons and ligaments being torn from it in many places, cannot but bring on violent inflammations and a gangrene; but where the bones are not violently shattered and broken, the surgeon should be careful...
careful in time to remove the splinters, and all extraneous bodies, and to treat the wound according to the rules prescribed above: lastly, if any large artery is wounded, either in the arms or legs, which will appear by the loss of blood, the tourniquet should be applied, and the blood being stopped, you must endeavour to take up the vessel, by the affuance of the crooked needle; but if this cannot be done, or if the condition of the wound will allow no hopes of success from the future dressings, it will be proper to take off the limb a little above the wound.

The wound being cleared, and the blood stopped, the first intention is to use our utmost endeavours to prevent or allay the tumour and inflammation. The wound should be dreeled up, with lint dipped in spirits of wine warmed, covering it with compresses wet with the same liquor, or with camphorated spirit of wine, either alone, or diluted with aqua calcis. Having done this, the next intention is to forward the suppuration of the bruised and torn parts, and then to fill up the wound with new flesh, neatly cicatriz'd; for the method of doing which, see the articles Suppuration and Wound.

In gun-shot wounds, several grains of powder frequently penetrate the skin of the face, and occasion deformity, if they are not taken out; which may be done with a pin, or an instrument like an earpicker: but if they are got in too deep to be picked out in this manner, the skin must be laid open with a fine small lancet, in order to get at them with the instruments we have described. Great care should be taken not to break the grains in taking them out; for that will occasion very foul spots.

GUNSTBERG, a town of Germany, in the circle of Swabia, situated on the east side of the Danube: east long. 10° 15', north lat. 48° 15'.

GUNTER'S LINE, a logarithmic line, usually graduated upon scales, sectors, &c. See Scale and Sector.

It is also called the line of lines, and line of numbers; being only the logarithms graduated upon a ruler, which therefore serves to solve problems instrumentally in the same manner as logarithms do arithmetically. It is usually divided into an hundred parts, every tenth whereof is numbered, beginning with 1, and ending with 10; so that if the first great division, marked 1, stand for one tenth of any integer, the next division, marked 2, will stand for two tenths; 3, three tenths, and so on; and the intermediate divisions will, in like manner, represent 100th parts of the same integer. If each of the great divisions represent 10 integers, then will the lesser divisions stand for integers; and if the great divisions be supposed each 100, the sub-divisions will be each 10.

Use of Gunter's Line. 1. To find the product of two numbers. From 1 extend the compasses to the multiplier; and the same extent, applied the same way from the multiplicand, will reach to the product. Thus if the product of 4 and 8 be required, extend the compasses from 4 to 8, and that extent laid from 8 the same way, will reach to 32, their product.

2. To divide one number by another. The extent from the divisor to unity, will reach from the dividend to the quotient: thus to divide 36 by 4, extend the compasses from 4 to 1, and the same extent will reach from 36 to 9, the quotient sought.

3. To three given numbers, to find a fourth proportional. Suppose the numbers 6, 8, 9; extend the compasses from 6 to 8, and this extent, laid from 9 the same way, will reach to 12, the fourth proportional required.

4. To find a mean proportional between any two given numbers. Suppose 8 and 32: extend the compasses from 8 in the left-hand part of the line, to 32 in the right; then bisecting this distance, its half will reach from 8 forward, or from 32 backward, to 16, the mean proportional sought.

5. To extract the square root of any number. Suppose 25: bisect the distance between 1 on the scale and the point representing 25; then the half of this distance, set off from 1, will give the point representing the root 5. In the same manner the cube root, or that of any higher power, may be found by dividing the distance on the line, between 1 and the given number, into as many equal parts as the index of the power expresses; then one of those parts, set from 1, will find the point representing the root required.

Gunter's Quadrant, one made of wood, brass, &c. containing a kind of stereographic projection of the sphere, on the plane of the equinoctial; the eye being supposed placed in one of the poles. Besides the use of this quadrant in finding heights and distances, it serves also
GUT [1527]

GUTTER ANGLICANA, volatile English drops. See the article DROPS.

GUTTÆ, in architecture, are ornaments in the form of little cones, used in the plafond of the dorick cornice, or on the architrave underneath the triglyphs, representing a sort of drops or jets. They are usually fix in number. See the article DORIC.

GUTTA SERENA, a disease in which the patient, without any apparent fault in the eye, is entirely deprived of sight.

Its cause is ascribed to an obstruction of the optic nerve, which may proceed from a palsy in the nerve, from a suppression of usual hemorrhages, from ulcers healed too soon, or from an epilepsy.

Heister affirms, that it is to be cured by aromatics, carminatives, and astringents; chiefly eye-bright, veronica, hyssop, rosemary-flowers, sage, fennel and aniseeds, valerian-root, salafiras, cinnamon and wood-lace, either in infusion, or in powder. The juice of wood-lace newly expressed, and taken for some weeks, extinguishing the dofe, is of excellent use; as likewise mercurials, and sometimes a salivation. If it arises from a suppression of usual hemorrhages, they are to be restored; but if this cannot be done, artificial bleeding is to be substituted.

Coward recommends volatiles, antiscorbutics, chalybeats, mercurials, cephalics, and nerve medicines.

Externally, issues, fevers, and clysters, are said to be good, especially in the phlegmatic; but if the patient is phlegoric, cupping and bleeding, particularly cauteries, or issues on the coronal future, or in the neck, are proper; and the eyes may be washed with fennel, valerian, eye-bright, or rose-water: or an infusion of fennel-roots in wine, with bags of strengthening herbs and fennel-seeds, may be put upon them. Sneezing powders may likewise be proper, especially florentine orrice, or horie-chefsnuts. An old gutta serena, however, is generally incurable.

GUTTE, or GUTTY. See GUTTY.

GUTTERS, in architecture, a kind of canals in the roofs of houses, serving to receive and carry off the rain.

Gutters, with respect to their position, are of two kinds: such as come something near a parallelism with the horizon; and such as incline towards a vertical position to the horizon.

GUTTER-TILES, those intended for gutters. See the article TILE.
GYMNASIARCH, γυμνασιαρχής, in antiquity, the director of the gymnasion. He had two deputies under him; the one called sytarch, who presided over the athletes, and had the oversight of the wrestling; the other, gymnastes, who had the direction of all the other exercises.

GYMNASTICS, the art of performing the several bodily exercises, as wrestling, running, fencing, dancing, &c. See the article WRESTLING, &c.

GYMNIC, something belonging to the athletic exercises; for an account of which, see the articles PENTATHLON, OLYMPIC, ISTHMIAN, &c.

GYMNOPÆDIA, a dance used by the ancient Lacedaemonians, and performed during their sacrifices by young persons naked, who at the same time sung a song in honour of Apollo.

GYMNOPYRIS, in natural history, a name given by Dr. Hill to the pyritæ of a simple internal structure, and not covered with a crust.

Of these there are only two species. 1. A green variously shaped kind. 2. A botryoide kind. See PYRITE.

The first species is the most common of all the pyritæ, and appears under a great diversitv of shapes. It is very hard and heavy, very readily gives fire with steel, but will not at all ferment with aqua-fortis. The second species is very elegant and beautiful, and its ufal colour is a very agreeable pale green; but what most distinguishes it from all other pyrite is, that its surface is always beautifully elevated into tubercles of various sizes, resembling a cluster of grapes. See plate CXXIV. fig. 2.

GYMONOSOPHISTS, a sect of philosophers who clothed themselves no farther than modestly required. There was some of these fages in Africa; but the most celebrated clan of them was in India. The african gymnosophists dwelt upon a mountain in Ethiopia, near the Nile, without the accommodation either of
GYM [1529]

of house or cell. They did not form themselves into societies like those of India, but each had his private retirement, where he studied and performed his devotions by himself. If any person had killed another by chance, he applied to these ages for abolution, and submitted to whatever penances they enjoined. They observed an extraordinary frugality, and lived only upon the fruits of the earth. Lucan ascribes to these gymnosophists, several new discoveries in astronomy.

As to the Indian gymnosophists, they dwelt in the woods, where they lived upon the wild products of the earth, and never drank wine, nor married. Some of them practised physic, and travelled from one place to another: these were particularly famous for their remedies against barrenness. Some of them, likewise, pretended to practice magic, and to foretell future events.

In general, the gymnosophists were wise and learned men: their maxims and discourses, recorded by historians, do not in the least favour of a barbarous education, but are plainly the result of great sense, and deep thought. They kept up the dignity of their character to so high a degree, that it was never their custom to wait upon any body, not even upon princes themselves; for which reason Alexander, who would not condescend to visit them in person, sent some of his courtiers to them in order to satisfy his curiosity. Their way of educating their disciples, is very remarkable. Every day, at dinner, they examined them how they had spent the morning; and every one was obliged to shew, that he had discharged some good office, practised some virtue, or improved in some part of learning; if nothing of this appeared, he was sent back without his dinner. They held a transmigration of souls; and it is probable that Pythagoras borrowed his doctrine from them.

GYMNOSPERMIA, in botany, a series or sub-division of the didymia class of plants; comprehending all those with labiataed flowers, without any pericarpium or capsule surrounding their seeds, which are only lodged in the base of the cup; whence the name gymnospermia. See the article Didymia.

GYMNOTUS, in ichthology, a genus of malacoptygious fishes, without any back or belly-fins, and with only five bones in the membrane of the gills.

There is only one known species of this genus, the carapo of Marcgrave.

GYN/ECCEUM, among the antients, the apartment of the women, a separate room in the inner part of the house, where they employed themselves in spinning, weaving, and needle-work.

GYN/EOCRACY, γυναικερατία, denotes the government of women, or a state where women are capable of the supreme command. Such are Britain and Spain.

GYNANDRIA, in botany, the name of one of Linnaeus's classes of plants, the twentieth in order; comprehending all the plants whose stamens are placed either on the style or on the receptacle, elongated into the form of a style, and carrying on it both the pistil and stamens. See the article Botany.

Of the several genera of this class, some have two stamens to each flower; some, again, have three; and others, four, five, six, ten, or more. And hence they are naturally arranged into several distinct orders, under the appellations of gynandria-dianandra, gynandria-trianandra, &c.

GYNGLIMUS, or GINGLYMUS, in anatomy. See the article Ginglymus.

GYPSUM, or Plaster-stone, in natural history, a genus of fossils naturally and essentially simple, not inflammable nor soluble in water, and composed of small flat particles; which form bright, glossy, and in some degree transparent masses, not flexible or elastic, not giving fire with steel, nor fermenting with or being soluble in acid menstrua, and very easily calcining in the fire.

Of these gypsiums, some are harder, others softer; and are of several colours, as white, grey, red, green, &c. Sometimes distinct, and sometimes variously blended together.

The texture of all the gypsiums being ultimately the same, it may be sufficient to observe, that their origin is plainly from particles of a determinate nature and substance, and of a certain and invariable figure, an oblong, flat, and irregularly angular one. These we sometimes see, as indeed is most natural to them, disposed without order or regularity, into loose, complex, friable masses; at others, they are getting out of their native order, and emulating the structure of other classes of bodies, of which they are indeed properly the basis, and appearing somewhat in the figure of the fibres; and at other times, of the foliacous composite flakes of the selenite: the
GYPSUM, or GYPSUM, is a species which have these structures, are truly varying from the gypsums into those bodies they emulate; for the fibrarian are only a peculiar arrangement of these very particles, and the felonites only more broad flakes of the same, like those of the folaceous tales.

The gypsums are much used in plaster, for pluccoing rooms, and casting 'buffs and statues.

GYPSUM STRIATUM, striated plaster-stone,

the white, left glossy tricheria, with short thick filaments. See TRICHERIA.

GYRFALCON, or GERFALCON. See the article GERFALCON.

GYRE, or GIRLE, among sportsmen. See the article GIRLE.

GYSHORN, a town of Germany, in the duchy of Lunenburg, situated on the river Aller, forty-five miles north-east of Hanover; east long. 10° 45', north lat. 52° 50'.

H, or h, the eighth letter, and sixt phonant in our alphabet; tho' some grammarians will have it to be only an aspiration, or breathing. But nothing can be more ridiculous than to dispute its being a distant sound, and formed in a particular manner by the organs of speech, at least in our language: witness the words eat and beat, arm and harm, ear and hear, at and hat, &c. as pronounced with or without the h.

It is pronounced by a strong expiration of the breath between the lips, closing, as it were, by a gentle motion of the lower jaw to the upper, and the tongue nearly approaching the palate.

There seems to be no doubt, but that our h, which is the fame with that of the Romans, derived its figure from that of the hebrew ה. And, indeed, the Phenicians, most antient Greeks and Romans, used the fame figure with our H, which in the series of all these alphabets keeps its primitive place, being the eighth letter.

H, used as a numeral, denotes 200; and with a dash over it, ẹ, 200,000.

As an abbreviation, Ḥ was used by the ancients to denote homæ, hæres, hora, &c. Thus H. B. flood for hæres baronum; and H. S. corruptly for L. L. S. a letterce; and H. A. for Hadrianus.

HAAG, a town of Germany, and circle of Bavaria, thirty-two miles north-west of Munich.

HAAK, or HAKE, in ichthyology. See the article HAKE.

HABAT, the north-west province of the empire of Morocco, situated on the straits of Gibraltar.

HABBAKUK, or the prophecy of Habbakuk, a canonical book of the Old Testament.

There is no mention made in scripture, either of the time when this prophet lived, or of the parents from whom he was descended; but according to the authors of the lives of the prophets, he was of the tribe of Simeon, and a native of Bethzachar. As he forefaw the taking of Jerusalem by Nebuchadnezzar, he fled to Ofracin in Arabia, where he lived for some time; but after the Chaldeans had made themselves masters of Jerusalem, and were on their return home, he returned into Judea, where he employed himself in agriculture; but as he was carrying the reapers their dinner, he is said to have been transported by an angel to Babylon, with what he had provided for his people in the field; which he set before Daniel, who was shut up in the lion's den, and was transported back again to Judea, where he died, before the end of the captivity.

He is reported to have been the author of several prophecies which are not extant: but those that are indisputably his, are contained in three chapters. In these the prophet complains very pathetically of the disorders which he observed in the kingdom of Judea. God reveals to him, that he would shortly punish them in a very terrible manner by the arms of the Chaldeans. He foretells the conquests of Nebuchadnezzar, his metamorphosis, and death. He foretells, that the vail

defigns
HABEAS CORPORA, in law, a writ issued for bringing in a jury, or such of them as refuse to appear upon the venire facias, for the trial of a cause brought to issue. It commands the sheriff to have the jurors before the judges on such a day, &c. and is of the same nature in the common pleas, as the distingus juratores in the court of king's bench.

HABEAS CORPUS, in law, is a writ of two kinds, the one being the great writ of the english liberty, which lies where a person is indicted for any crime or trespasses before justices of the peace, or in a court of any franchise, and on being imprisoned, has offered sufficient bail, which has been refused, though the cause be bailable; in which case he may have this writ out of the king's bench, in order to remove himself thither, to anwerve the cause at the bar of that court. The practice in this case, is first to procure a certiorari out of the court of chancery, directed to all the justices for removing the indictment into the king's bench; and upon that to obtain this writ, directed to the sheriff, for causing the body of the party to be brought at a certain day.

The other kind of habeas corpus is used for bringing the body of a person into court, who is committed to any goal or prison, either in criminal or civil causes; which writ will remove the person and cause from one court and prison to another.

No habeas corpus, or other writ, to remove a cause from out of an inferior court, can be allowed, if the same be not delivered to the judge of the court, before the jury who are to try the cause have appeared, and before any of them are sworn, 43 Eliz. c. 5.

The habeas corpus act, 31 Car. II. c. 2, has ordained, that a person may have a habeas corpus from any judge, on complaint made and view of the warrant of commitment, (except such person is committed for treason or felony expressed in the warrant, or some other offence that is not bailable) which habeas corpus must be made returnable immediately; and on producing a certificate of the cause of commitment, the prisoner is to be discharged on bail given to appear in the court of king's bench the next term, or next assizes, &c. Persons committed for either treason or felony, expressly mentioned in the warrant, upon a motion made in open court, in the first week of the term, or day of sessions, &c. after commitment, are to be brought to trial; and if they are not indicted the next term or sessions after commitment, on a motion made the last day of that term, they shall be let out upon bail, except it appear on oath that the king's witnesses are not ready; and in case they are not indicted or tried the second term after commitment, they shall be discharged.

Judges denying a habeas corpus, shall forfeit 50l. and if an officer refuse to obey it, or to deliver a true copy of the commitment-warrant, he forfeits 100l. for the first offence.

HABEAS CORPUS AD PROSEQUENDUM, a writ for the removal of a person in order to prosecution and trial in the proper county.

HABEAS CORPUS AD FACIENDUM ET RECIPIENDUM, a writ issued out of the court of common-pleas, on behalf of defendants sued in inferior courts, to remove their cause into the said court.

HABEAS CORPUS AD RESPONDENDUM, a writ that lies where a person is imprisoned at another's suit in any prison except that of the king's bench; and a third person would
HABEAS CORPUS AD SATISFACIENDUM, a writ that lies against a person in the fleet-prison, &c. to charge him in execution. The delivery of this writ to the warden, is sufficient.

HABENDUM, in law, a term signifying to have and to hold.

A deed or conveyance has two principal parts; the premises and the habendum. The office of the first is to express the names of the granter, the grantee, and the things granted; that of the habendum, to shew what estate or interest the grantee is to have in what is granted. According to Lord Coke, the habendum is to limit the estate, so that the general implication, which by construction of law passes in the premises, is by the habendum controlled and qualified. Thus in a lease to two persons, to have and to hold to the one for life, alters the implication of the joint tenancy in the freehold, which would pass by the premises, were it not for the habendum.

HABERDASHER, in commerce, a seller of hats; or of small wares. The master and wardens of the company of haberdashers in London, calling to their assistance one of the company of cappers, and another of the hat-makers, and mayors, &c. of towns, may search the wares of all haters that wear hats with foreign wool, and have not been apprentices to the trade, or who dye them with any thing but copperas and galls, or wood and madder; in which case they are liable to penalties, by Stat. 8 Eliz. c. 7. and 3 Geo. II. c. 22.

HABERE FACIAS PROFESSIONEM, a writ that lies where one has recovered a term for years in an action of ejectment, in order to put him into possession again. The sheriff is obliged to execute this writ; and may raile the poiffe comitatus to affit him, in case he be opposed. He may also break open a house into which entrance is denied, to deliver possession to the person recovering by law. But an action of the cassette lies against him, if he deliver possession of more than is contained in the writ.

HABERE FACIAS SEIGINAM, a writ which lies where a person has recovered land in the king's court; directed to the sheriff, commanding him to give seisin of the land recovered.

This writ oftentimes issues out of the records of a fine, and requires the sheriff to give the cognizee, or his heirs, seisin of the land in which the fine is levied. There is likewise a writ called, habere faciam subscrim, ubi rex habitum annum, diem & valsum, that lies for the delivery of lands to the lord of the fee, after the king has had his year, day and walt; in the lands of one convicted of felony.

HABERE FACIAS VISUM, is a writ that lies in divers cafes, as in dower, for one's own life, &c. where it is necessary to take a view of the lands or tenements in question.

HABERGION, a small coat of mail, or only sleeves and gorget of mail, formed of little iron rings, or meshes linked into each other. See the article GORGET.

HABELEMENTS OF war, in our antient statutes, signify armour, harness, utensils, or other provisions for war, without which there is supposed no ability to maintain war.

HABIT, in philosophy, an aptitude or disposition either of mind or body, acquired by a frequent repetition of the same act. This habit is by some of the schoolmen termed habitud-qualifications, a qualitative habit, and defined a quality adventitious to a thing, fitting and disposing it either to act or suffer. Others again define habit an affection of the mind or body, persisting by long use and continuance. Hence habits may be distinguished into those of the mind and of the body; thus virtue is called an habit of the mind; strength, an habit of the body. All natural habits, whether of body or mind, are no other than the body and mind themselves considered as either acting or suffering; or they are modes of the body or mind wherein either perseverance, till effaced by some contrary mode. Custom, says Mr. Locke, settles habits of thinking in the understanding, as well as of determining in the will, and of motions in the body, all which seem to be but trains of motion in the animal spirit, which once set going, continue on in the same steps they have been used to, which by often treading are worn into a smooth path, and the motion in it becomes easy as well as natural. See ASSOCIATION.

The archbishop of Cambrey defines habits in general to be the certain imprefions left in the mind, by means whereof we find a greater ease, readiness, and
inclinace to do any thing; formerly
done, by having the idea ready at
hand to direct how it was done before.

Thus, for example, we form the habit
of sobriety, by having always before us
the inconveniences of excess; the re-
lections whereof being often repeated,
tender the exercise of that virtue contin-
ually more and more easy.

Malebranche gives a more mechanical
theory of habits. His principle, con-
imnently the notions of a flock
of animal spirits lodged in the brain,
ready to be sent at the motion of the will,
by means of the nerves which open:
or terminate in the brain, into the muscles
of the body.

Now an influx of spirits into a muscle
occasions a swelling, and of course a
shortening of the muscle, and consequent-
ly a motion of that part to which the
muscle is fastened. Further, the spirits
do not always find all the roads open
and free through which they are to pass:
whence that difficulty we perceive of
moving the fingers, with that quicknes-
necessary to play on a musical instrumen-
t, or of moving the muscles necessary to
pronounce the words of a foreign lan-
guage. But by degrees the spirits, by
their continual flux, smooth the way
so, that at length they meet with no re-
sistance at all. Now it is in this facility
the spirits find of passing, when directed
into the members of the body, that habits
confist.

HABIT, in medicine, denotes the settled
constitution of the body, or the habitue
of any thing else, as the structure or com-
oposition of a body, or the parts thereof.

Habit is also used for a dress or garb, or
the composition of garments, wherewith
a person is covered; in which sense we
say, the habit of an ecclesiastic, of a reli-
gious, &c. a military habit, &c.

The different habits and cloths that the
generality of the world wear, are, through
inadvertency and inattention, very fre-
quently the cause of very unhappy ma-
ladies. The antients have observed the
inconveniences of many parts of dress;
and daily observations confirm us the
many mischiefs the ladies suffer from the
stiff-whale-bone flays they wear, and the
diforders of the visera of the lower belly
to which these are subject who lace them-
selves too tightly; and this is not only
of dangerous consequence to themselves,
but frequently is the death of children
in breeding women. The tight binding
of the neck by the mens neck-cloths,
focks, or the too tight collars of their
shirts, &c. has been very frequently the
occasion of very terrible disorders of
the head, the eyes, and the breast; deaf-
ness, vertigoes, paintings, and bleedings
at the nofe, are the frequent consequences
of this practice. Mr. Winlow has
observed, that the different motions of
the bones of the foot, which are very
free in their natural state, as is very plain-
ly seen in young children, are usually
wholly lost to us as we grow up, by
means of the improper pressure of our
shoes. The high-heeled shoes the wo-
men wear, entirely changes the natural
conformation of the bones of the whole
foot.

HABITATION, or COHABITATION, in
law. See the article COHABITATION.

HABITUAL, something grown to a habit
by long use. See the article HABIT.

HABITUAL GRACE, among divines. See
the article GRACE.

HABITUDE, among schoolmen, the re-
spect or relation one thing bears to an-
other. See RELATION.

Some of the more precise schoolmen con-
sider habitue as a genus, and sub-divide
it into two species; where it is considered
as quietest, they call it respect; where
as moved, relation: to which some add
a third species, considered in respect of
figure, which they call mode. See the
article RELATION, &c.

HABITUDE is also used by philosophers
for what we commonly call habit, or a
certain disposition or habitue for the
performing or suffering certain things,
acquired by repeated acts of the same
kind.

HACHA, a town of Terra firma, in South
America, situated on the north sea, at the
mouth of the river Hacha, in west long.
72°, north lat. 1° 0'.

HACKNEY, a village on the north-east
side of London, with a handsome church,
three meeting-houses; and seventeen almsh-
houses.

HACKNEY-COACH. See COACH.

HADDINGTON, a parliament-town of
Scotland, about eighteen miles east of
Edinburgh.

HADDOCK, the English name of a well
known. fish of the gadus-kind, with a
bearded mouth, and three fins on the
Hæm [1534]

Hæm, its body is whitish; the upper jaw longish, and the tail a little forked. See the article GADUS.

Hade, among miners, signifies the steep descent of a shaft, or the like passage.

Hademar, a town of Germany, in the circle of the upper Rhine, and county of Nassau in the Weterau, situated in 5° 45' east long. and 50° 26' north lat.

Hadersleban, a town of Slewick, or south Jutland, situated near the sea called the little Belt, in east long. 10°, north lat. 55° 15'.

Hadley, a market-town of Suffolk, situated seventeen miles south-east of Bury.

Hadrumut, a city of Arabia Felix, the capital of the province of Hadramut, situated in east long. 50° 30'; north lat. 16°; three hundred and sixty miles north-east of Mocho.

Hæmacatus, in natural history, the variegated, blood-coloured agat of the antients. See the article AGAT.

Hæmagogos, among physicians, a compound medicine, consisting of phætid and aromatic simples, mixed with black hellebore; and prescribed in order to promote the menstrual and haemorrhoidal fluxes; as also to bring away the lochia. See the article MENSES, &c.

Hæmanthus, Guinea-orchis, in botany, a genus of the hexandria-monogynia class of plants, the flower of which consists of five equal and ovated petals; the fruit is a lanceolated, obtuse and unilocular, bivalve capsule, containing a few compressed, oblong seeds. See the article Campeche.

Hæmatites, blood-stone, in natural history, an extremely rich and fine iron-ore. See IRON.

It is very ponderous, and is either of a pale red, a deeper red, or a bluish colour; usually of a very glossy surface; and when broken, of a fine and regularly frithed texture: the slice converging toward the center of the body; and the mafles thereof naturally breaking into fragments of a broad base and pointed end; appearing foemcting pyramidally. The hæmatites is various in its degrees of purity and hardness, as well as in its figure: the finest and most pure is of a botryoide surface; the whole superficies rising into larger or smaller roundish tu-

Hæmatites, sometimes the hæmatites is of a coarse texture, and a laxer structure, in which state it is known to many by the name schitus.

The hæmatites, besides its value as an ore, has its uëse in medicine: the highest coloured and most like cinnabar that can be had, being esteemed astringent and defective. It is given in powder from ten grains to fifty and twenty for a dose, in haemorrhages; and is also used in different temperatures of the eyes.

Hæmatopus, the sea-pye, in ornithology, a distinct genus of birds of the order of the sceolopes, with a compered beak, terminating in a wedge-like point. The hæmatopus is of the bigness of the common magpie, and is so called from the colour of its legs, which are of a bright scarlet.

Hæmatosis, among physicians, the same with fanguinification. See the article SANGUINIFICATION.

Hæmatoxylum, Campeche-wood in botany, a genus of the detandria-monogynia class of plants, the flower of which consists of five equal and ovated petals; the fruit is a lanceolated, obtuse and unilocular, bivalve capsule, containing a few compressed, oblong seeds. See the article Campeche.

Hæmoptosis, Hæmoptysis, or Hæmoptoe, in medicine, a spitting of blood.

An hæmoptysis is either accidental or habitual, and is stopped by astringents, as bole-aromatic, dragon’s blood, and the lapis hæmatites, and best and most safely cured by the peruvian bark. In this disorder purging is to be avoided, but bleeding is convenient; diuretics and diaphoretics are of use, but opiates are excellent; in particular fevers hyosciarni is a noble specific, commended both by the antients and moderns, yet it is to be given with great precaution, in small quantities, and often repeated; for when given in too large a dose, it occasions a delirium: hederæ terrestris, or Gordiy, produces marvelous effects.

In a desperate accidental hæmoptysis, other things being tried in vain, (as in all other haemorrhages) the expectation of the physician is seldom frustrated, if he makes use of the following remedy. Take plantain water and red wine, of each half a pound; syrup of poppies, half an ounce; to these add a very small quantity of the oil of vitriol, and make the whole up into a julep.
Hæmorrhage, in medicine, a flux of blood from any part of the body. Hæmorrhages are divided by medical writers into natural and preternatural. Natural hæmorrhages comprehend bleeding at the nose, spitting of blood, the fluxes of the hæmorrhoids and menæs, the lochia from alfo comprehend under this term the ing of urine. Dents, as falls, blows, and wounds; as derive their origin from euyping, and the like. Hæmorrhages the artificial evacuations by bleeding, th~

Some hæmorrhages are such as derive their origin from external accidents, as falls, blows, and wounds: some alfo comprehend under this term the artificial evacuations by bleeding, cupping, and the like. Hæmorrhages differ much according to the age and state of the patient, and other accidents: hæmorrhages from the nose, are most frequent in young persons; those of the hæmorrhoids, in persons of a middle age, or later in life; the spitting of blood, to persons in a middle age; and voiding of blood by urine, usually to older people. Some hæmorrhages are periodical, and others vague or uncertain. The first observe fome stated periods of time for their return upon people: the laft are wholly uncertain in that particular. Some are alfo termed critical; there are fuch as happen in the crisis of fevers. There are usually violent pains about those parts whence natural hæmorrhages are to proceed; but these always go off as foon as the bleeding comes on in due quantity. Young persons of a healthy and florid constitution, are most subject to hæmorrhages: people of plethoric habits, are alfo much subject to them; and especially fuch whole blood is found and fluxile, not subject to any dyscracy; thośe who drink much wine, or eat high feasoned food; and chiefly thośe persons who are subject to violent passions, especially anger: hence it is that brutes are rarely afflicted with them. The principal causes therefore of hæmorrhages are a plethora, violent commotions of the body, hot foods and liquors, a heat of the season, a sudden cooling of the body after violent heat, and passion.

As to the prognoftics of hæmorrhages, it may in general be observed, that thośe proceeding from the lungs, vomiting, and voiding blood by urine, are all very dangerous. The others, when regulated, and in due proportion, are salutary, and often prevent diseases. But the common cuftom of stopping them by attingents, or otherwife, is often productive of magnotations, inflammations, and violent fevers.

Natural hæmorrhages are more particularly,

Hæmorrhage, or bleeding at the nose, is owing to the more plentiful appulse of blood to the nostrils, by a stronger motion of the heart, whereby the small arteries in the pituitary coat become turgid, and too much diftended, till at length they gape, and the blood gushes out. A bleeding at the nose may be promoted when persons of fedentary lives, that indulge their appetites, and to become plethoric, put their blood into extraordinary agitation, by any of the caufes already mentioned, or by volatile medicines, hot baths, or suddenly chilling their feet, &c. This hæmorrhage differs much as to the quantity: fome lose only a few drops, fome feveral ounces, and fome five or fix pounds. No hæmorrhage is more apt to return; which it does to fome in a few days, to others in a few hours. To the plethoric it is generally falutary; and there are many infances of a vertigo, feotomia, dull, heavy pains of the head, a phreny, and even an epilepsy, being carried off by it. On the contrary, from its suppression there have arisen vertigos, apoplexies, epilepties, convulsions, noise in the ears, hardnefs of hearing, and even a gutta serena.

But enormous and long continued bleedings at the nose, when they arife from spains of the internal parts, and are preceded with coldnefs of the extreme parts, and fainting fits, generally occasion death: it is alfo dangerous in spotted and malignant fevers, and in chronic difeafes. If the bleeding is very inordinate, it will be proper to ufe cooling emulions, gentle or stronger opiates, to moderate the spastic strictures, as occasion fhall require. Camphor mixed with nitre and calx of antimony, will be highly necessarv, if the matter of exanthemata or cutaneous eruptions is the caufe of the hæmorrhage, as is often the caufe. A revulsion may be made from the head by bleeding in the lower parts; then by temperate pediluvia, and putting the hands into warm water. After a revulsion by bleeding, there is nothing equal to nitre, to appeafe the organ of the blood; next to thefe are vegetable acids,
such as the juice of seville-oranges, berries, the water and juice of wood sorrel; but more especially the diluted spirit of vitriol, tincture of roes, &c.

Externally refrigerants may be mixed with diffcutients, and applied to the forehead, nose, and neck. In perfons of a bilious constitution, cold water alone drank-freely, has a good effect.

Hæmorrhage of the hemorrhoids, or of the piles. See Hæmorrhoids.

Hæmorrhage of the lochia, in lying-in women. See the articles Lochia and Delivery.

Hæmorrhage of the menes. See the article Menses.

Hæmorrhage of the lungs. See the articles Blood and Hæmoptosis.

Hæmorrhage of the urinary passages, a disorder commonly called pissing of blood, being an emission of blood, with or without urine, from the vesicls of the kidneys or bladder, which may be either enlarged, broken, or eroded; and is more or less dangerous, according to the different circumstances that attend it. If pure blood is voided suddenly, without interruption, and without pain, we conclude, says Hoffman, it proceeds from the kidneys. It likewise comes from the kidneys if the urine is coffee-coloured, or more florid, and generally precedes a fit of the gravel; it sometimes accompanies the passage of a stone through the ureter: but if the blood is of a dark colour, with or without purulent matter, emitted with heat and pain in the pubes, and in a small quantity, it certainly proceeds from the bladder. It may be occasioned by a stoppage of the hæmorrhoidal flux; from a violent motion of the body, especially riding; from a stone concealed in the kidney; from an erosion and ulcers of the bladder; from external violence; from gripping pains caused by violent purges; from sharp diuretics, especially cantharides.

All bloody urine has some degree of danger, but it is most so when mixed with purulent matter.

If the patient is plethoric, or it proceeds from a languid evacuation, bleeding is necessary, as also cooling nitrous draughts, and purified nitre mixed with abrasients, with whey for a vehicle, or barley-broth, or small-beer acidulated with drops of the spirit of vitriol. The body must be kept open with laxatives, as rhubarb, with currants; or with cream of tartar; also emollient Clysters. The relaxed vessels must be agglutinated with decoctions of vulnerary herbs, such as agrimony, ground-ivy, yarrow, golden-rod, and the roots of comfrey dulcified with virgin-honey, to which milk may be occasionally added.

If there is an ulcer in the kidneys or bladder, medicines must be given that heal the acrimony, such as syrup of marsh-mallows, also infusions of the vulnerary herbs above-mentioned, likewise of the barks of acacia, cherry-tree, and gum.

When grumpus blood plugs up the passage of the ureter into the bladder, or the sphincter of the bladder, and occasions a difficulty or stoppage of urine, warm water drank plentifully, and baths of the same, are useful: likewise warm water should be injected into the bladder with a syringe, that the sharp humour may be diluted, and the grumes dissolved; but if the urine should be quite stopped with a spasm, then give emulsions of the four cold feeds, with crabs-eyes; and calx of antimony. Externally apply a bladder filled with a decoction of emollient flowers in milk to the abdomen, and keep the body open with manna, or an emollient oyl clyster. Milk and whey are likewise excellent in these disorders, if a dram of bole armenic is taken in every draught.

It is an error of fatal consequence to give astringents in these disorders, which stop the flux too suddenly. For such preternatural hæmorrhages as derive their origin from external accidents, as falls, blows, and wounds, see the articles Contusion, Wound, Fissure, Contrapissure, &c.

For artificial hæmorrhages by bleeding, cupping, and the like, see the articles Phlebotomy, Cupping, &c.

For the critical hæmorrhages in fevers, &c. See the article Fever, &c.

Hæmorrhoidal, an appellation given by anatomists to the arteries and veins going to the intelectum rectum. The internal hæmorrhoidal artery is a branch of the inferior meenteric; and the external one, a branch of the iliac. The hæmorrhoidal veins are branches of the hypogalaries.

Hæmorrhoids, or Piles, in medicine, an hæmorrhage, or flux of blood from the hæmorrhoidal vessels. See Hæmorrhage, and Hæmorrhoidal.

When the hæmorrhoidal vessels only swell, and discharge no blood, but are exceeding
HÆM [1537] HÆM

Exceeding painful, this is termed the blind piles.

All copious fluxes of the blood from the anus, are not to be reckoned of the morbus kind. For the habit of body, strength, age, and temperament, of the patient are to be considered. That which is enormous and excessive to one person, may be moderate and salutary to another. That only is to be esteemed pernicious, which continues too long; and enfeebles the patient, whereby the digestion, nutrition, and other functions are hurt, and there is reason to fear the production of dangerous chronic diseases. An extensive hemorrhoidal flux is generally preceded by a heavy pressing pain of the back and loins; sometimes a numbness of the legs and thighs; a contraction of the external parts, with a slight thivering, and a subsidence of the vesels therein; a hard contracted pulse; a dryness of the mouth and fauces; the urine diminished in quantity, and most commonly pale; a fente of weight about the anus extending to the perineum; a weakness of the stomach; a flatulency in the lower belly; a frequent desire to make water, and to go to stool; with sometimes an exclusion of a white biliary mucus; the old and weak have a pro- cidentia ani.

In this case the blood is generally at first black, and very gumrous, and sometimes comes away in large clots from the varicous veins; afterwards it becomes red, and at last serous: sometimes it is piti- tuous, or like the white of an egg. There are infinaces of voiding a pint or a quart of blood daily. It often continues long, from twenty to thirty, or even forty days.

The external or blind piles seldom bleed, but turn to painful varices, which being opened, weep a little, but will not yield much blood. But the internal piles, which are the off-spring of the sphenic branch, and are extended to the inner subsitance of the rectum, and as far as the sphenicter of the anus, together with the small arteries derived from the lower meseraic, not only bleed plentifully, but when the flux is suppreffed create diseaues of the liver, sphen, pancreas, mefentery and intestines. The persons subject to this disease, are those of a loofe, fpongy texture, of a bulky size, who live high, and lead a sedentary life, or to whom it is hereditary: sharp purges, aloeticks, high seasoned food, free drinking of sweet wines, neglect of customary bleeding, anger, sadness, hard riding, and the like, will usher in this disorder.

This hemorrhage is dangerous, because it decays the strength, weakens the body, and produces a fene of weight in the thighs. The sleep is laborious, and the precordia oppressed, there is a rumbling in the belly, and a weak pulse. When it continues long, the ancles swell, and the countenance is ghastly. There is a straining of breathing; and last of all, it terminates in a cachexy, droopy, or a flow and hectic fever.

If the patient is plethoric, bleed, and let his drink be cold water of the chalybeate kind; or whey turned with orange juice, or juleps, made with tinclure of rofes, cooling waters, and syrup of rofes; likewise nitre, in powder, with absorbents; and to appeafe the spasm, opiates of the mildest kind.

If it continues long, and the blood begins to grow ferous, then give rhubarb with currants, and tamarinds, or which is much the fame, with cream of tartar. Then gentle diaphoretics may be com- pounded of burnt hartthorn, caix of antimony, wine vinegar, mixt with crabs-eyes, water of elder flowers, simple alexiteral water, and diacordium, or hot decoctions of yarrow, veronica, &c. may be taken in bed in order to sweat; also half a grain of camphor mixt with nitrous and bezordic powders. The camphor may feem an inconsiderable dose, yet its efficacy is very great in dis- orders of this kind.

In the blind piles there is a moft intense pain at the time of going to ftool, and the excrements are tinged with blood: sometimes tumours like warts lie hid under the sphincter, or appear on the verge of the anus. Sydenham orders to take away ten ounces of blood from the arm; then to disolve two drams of litharge, in four ounces of spring water, with which mix one fcrupel of thebaic extract. Dip a hot cloth in a little of this mixture, and apply it to the part; or if the tumour is within, inject a few fonpfuls of it with a fyringe; the patient must abtain from flesh, drink barley water, and take diacodium every night. Sometimes the veins in the blind piles are so much dilated with blood, as to he very painful, and raref tubercles as large as peafe, grapes, or eggs: they appear livid and black from the stagnation of a thick
thick blood, and when pressed with the fingers, feel like a bladder filled with liquor. Some are soft and indolent, others hard, inflamed, and painful, rendering the patient unable to walk, sit, or stand, and produce such a spasm in the anus, as not to admit a clyster: sometimes they bleed, or turn to troublesome itching ulcers, and occasion an abscess, or a fistula.

According to Heister, linnen dipt in warm spirit of wine, and emollients, are of infinite service. Leeches may be also applied to exhaust the blood; if they are not at hand, and the parts are inflamed, the lancet must be used; then dressings must be made with lint, with compresses, and the T bandage. The tubercles, which are full and large, may be removed by a ligature, unless inflamed. Sometimes they are high in the rectum, and then a speculum ani must be used, in which case they must be either scarified with a lancet, or divided with scissors, that the thick noxious blood may be discharged, and the pains relieved. HAGARD FALCON, the greenish legged falcon, with a livid back. It is a large species, equal to a full grown hen in size. See the article FALCON.

HAGIOGRAPHA, of holy writings, a name given to an particular division of the Old Testament, as containing hymns to God, and moral precepts for the conduct of life. The books distinguished by this term were the Psalms, Proverbs, Ecclesiastes, and the Song of Solomon.

HAGIOSIDERON, in the greek church, a name given to an instrument made of iron, used by the Greeks, under the dominion of the Turks, to supply the place of bells, the use of which is prohibited. It is a plate of iron about three inches broad, and sixteen long, fastened by the middle to a chain or cord, and hung at the church door; on this they strike with an iron-hammer, with a kind of measure or cadence that is not disagreeable. This is used to call the people to church; and it is also carried before the priest, in a procession of the sacrament to a sick person, when it is beat upon time to time, to advertise the people to adore it, just as the romish church do with a bell.

HAGUE, a town of the United Provinces, in the province of Holland, situated two miles
miles east of the sea, and fourteen north-west of Rotterdam. This is one of the finest towns in Europe; but tho' it enjoys all the privileges of a city of Holland, except that of sending representatives to the states, yet as it has no walls, it is only esteemed a village. Here every city of the United Provinces has a house for their respective deputies, and here the states of the province of Holland assemble, and all public affairs are transacted.

**HAIL, grandi**, in physiology, an aqueous concretion, in form of white or pellucid spherules, descending out of the atmosphere.

Hail is evidently no other than drops of rain congealed into ice. This happens when in their passage thro' the inferior air, they meet with nitrous particles, which are known to contribute greatly to freezing. Their magnitude is owing to a fresh accession of matter as they pass along. Hence we see the reason why hail is so frequent in summer, because at that time greater quantities of nitre are exhaled from the earth, and float up and down the air. See the articles **RAIN and FROST**.

**HAILBRON, a city of Germany, in the Circle of Swabia, and dutchy of Wirtemberg:** east long. 9° north lat. 49° 10'.

**HAINAN, or AYNAH, an island of an oval form, and about 300 miles in circumference, about fifty miles south of the continent of China, and subject to that emperor. It is situated between 107 and 110° of east long, and between 18 and 20° of north latitude.**

**HAINAULT. See HAYNAULT.**

**HAINBURG, a town of Germany, in the circle and archduchy of Austria, situated on the Danube, thirty-five miles east of Vienna: east long. 17° 8' north lat. 48° 28'.**

**HAINES, a river of the Austrian Netherlands, which runs from east to west thro' the province of Hainault, and falls into the Scheld at Conde.**

**HAIR, in physiology, slender, oblong, and flexible filaments, growing out of the pores of animals, and serving most of them as a covering. When these filaments, in human subjects, grow on the body, they are denominated pili; when on the head, capilli. These last are most proper for examination: that part of them, which is without the skin, appears cylindric to the naked eye; but, when examined by the help of glasses, it is found to be unequal and irregular, and often knotty. It is pellucid, but is not hollow; but the extremities of them are often split into several parts, so as to resemble a pencil. The part of the hair that is within the skin, is called the root of it; and, from its roundish figure, the bulb. This part is hollow and vafculous, in the manner of the bales of the young feathers on birds: this vafculous part is inclosed in a follicle, or case, and is most conveniently to be examined in the large hairs of a cat's whiskers, or in the beards of other animals. The origin of the hair is in the cutis, and in the fat that lies underneath it; and probably from nerves, as an acute pain is felt in pulling them off. The nutritious matter of the hair is probably the same with that of the other parts of the body; not merely excrementitious, as the old authors have supposed. It is a common assertion, that the hair grows after a person is dead; but unquestionable experiments prove this to be of the number of vulgar errors, not at all the more true for being universally received as truth.

The colour of the hair is very different in different people of the same country; but there are also general differences of it, peculiar, in a manner, to the climates. In the hottest countries it is very black; in the colder, it is yellowish, reddish, or brown; but in all places it grows grey or white with age; and in the labourers, in copper mines, and others, who are continually receiving the effluvia of that metal, it becomes greenish. The length of the hair is, in the individual, very different. It is always much longer on the head than elsewhere. In general, it is short and curled under the torrid zone, and gradually longer in the more temperate climates. Its conformity to the touch, also, varies greatly. In regard to the different climates and subjects. In general, it is harsher in the *Ethiopian* than in the European; and harder and dryer in adults than in infants, whose habit abounds more with humidities.

In regard to the parts of the body on which it grows: it is very harsh and hard under the arm-pits, and about the pudenda: on the head it is much softer; and on all the other parts of the body it is greatly softer than there, and very short.
As to the time of the origination of the hair, that of some parts of the body is of the same date with the parts it grows on; such is that of the head, the eyelashes, and eye-brows. That of others begins to grow only at a certain time; such is that of the beard, of the coat, or the infant. the coat is kept warm, as well as parts of it never grow after the birth of Hair, among others, is generally called the coat; and, with regard to horses, deserves particular consideration. The hair growing on the fetlock, serves as a defence to the prominent part of it, in travelling in stony ways, or in frosty weather; if the hair of a horse's neck, and the parts most uncovered, be close, smooth and fleck, it is an indication of his being in health and good case. In order to make the hair of an horse soft and fleck, he must be kept warm at heart, for the hair inward cold will cause the hair to flare; also, to sweat him often, for that will loosen, and raise the duff and filth that renders his coat foul; and when he is in the heat of a sweat, scrape off all the white foam, sweat and filth that is raised up, with an old sword blade; and also when he is blooded, if you rub him all over with his own blood, repeating it two or three days, and curry and dress him well, it will make his coat shine as if covered with a fine varnish. Hair falling from the main or tail, is caused either by his having taken some heat, which has engendered a dry mange; or from some furfeit which causes the evil humours to retort to those parts. To cure this, anoint the horse's mane and crest with black sap; make a strong lec of ash, and wash it all over with it. But if a canker should grow on a horse's tail, which will eat away both flesh and bone; then put some oil of vitriol to it, and it will consume it: and if you find that the vitriol corrodes too much, you need only to wet it with cold water, and it will put a stop to it. If you would take away hair from any part of a horse's body; boil half a pound of lime in a quart of water, till a fourth part is consumed, to which add an ounce of opomint; make this into a plaster, and lay it on.

**Hair's Breadth**, a measure of length, being the forty-eighth part of an inch. **Hake**, in ichthyology, the English name of the gadus, with two fins on the back,
HALABAS, HALBARD, HALBERSTAT, a city of Germany, in Saxony, the capital of the province of Halabas, situated at the confluence of the rivers Ganges and Jemma: east long. 8° 30' north lat. 26° 35'.

HALBARD, or HALBERT, in the art of war, a well-known weapon, carried by the horsemen and the terjeants. It is a sort of spear, the shaft of which is about five feet long, and made of ash, or other wood. Its head is armed with a steel point, edged on both sides, not unlike the point of a two-edged sword. But besides this sharp point, which is in a line with the shaft, there is a cross piece of steel, flat and pointed at both ends; but generally with a cutting edge at one extremity, and a bent sharp point at the other; so that it serves equally to cut down, or pull withal. It is also useful in determining the ground between the ranks, and in adjusting the files of a battalion.

HALBERSTAT, a city of Germany, in the circle of Upper Saxony, the capital of the duchy of the same name; subject to the king of Prussia, east long. 11° 6', north lat. 51° 55'.

HALBERT, among farriers, is a small piece of iron an inch broad, and three or four inches long, folded to the toe of a horse's shoe, to hinder a lame horse from treading on his toe. These halbert-shoes necessarily constrain a lame horse, when he goes at a moderate pace, to tread or rest on his heel, which lengthens and draws out the back finew, that was before in some measure shrunk.

HALCRIPTUM, a name given by Dr. Hill, to the salt suspended in a fluid form, and in very small quantities, in mineral waters, scarce discernible by the taste, and with much difficulty separable from them; but, by proper management, may be procured in form of a dry powder; which, being carefully prepared by solution and evaporation, affords extremely minute, oblong, quadrangular crystals. The halcriptum, thus obtained, has all the properties of the common alkaline salts. See the article ALKALI.

All the chalybeate waters afford it; but none in such large quantities as that of Puymont. See the article PARMONT.

HALCYON, in ornithology, a name given by the ancients to the lipida, or king-fisher. See the article KING-FISHER.
two equal parts, shall be the flanked angle of the half-moon; then the points, $b, b$, where the line of the countercarpe interfefts the line A.M., will determine the length of its faces, $A b, A b$. Those with flanks are constructed much in the same manner; only that $D b$, from four to ten toises, is cut off of each demigorge, and the flanks $D G, E P$, are raised perpendicular to the curtin:

HALT SEAL, that used in the court of chancery for sealing commissions to delegates, upon any appeal, in ecclesiastical or marine causes.

HALF-TANGENTS. See the articles TANGENT and SCALE.

HALF-TONGUE, medietas linguæ, among lawyers. See the article MEDIEFAS.

HALIÆTUS, in ornithology, a name used by some for the bald buzzard. It is of the size of a large cock, and its head is white, whence it has got the epithet bald, because at a distance it appears as if there were no feathers on it.

HALIOTIS, the ear-shell, a simple shell without any hinge, and formed all of one piece, of a depressed figure, very patent at the mouth, having an approach to the spiral form at the summit, and having several perforations on the lateral part of the disk. It has got the name ear-shell from its figure. See EAR and AURIS.

HALL, in architecture, a large room at the entrance of a fine house and palace. Vitruvius mentions three kinds of halls; the tetraestyle, with four columns, supporting the platfond, or ceiling; the corinthian, with columns all round let into the wall, and vaulted over; and the egyptian, which had a peristyle of infolated corinthian columns, bearing a second order with a ceiling.

The hall is properly the finest as well as first member of an apartment; and in the houses of ministers of state, magistrates, &c., is the place where they dispatch business, and give audience. In very magnificent buildings, where the hall is larger and loftier than ordinary, and placed in the middle of the house, it is called a faloon. See APARTMENT.

HALL, in old writers, is also used for a manfion-house; and to this day, in many parts of the kingdom, gentlemen's seats are called halls.

HALL is also a public building, or court of justice, as Westminster-hall, Guild-hall, a company's hall, &c.

In Westminster-hall are held the courts of King's bench, Common-pleas, Chancery, and exchequer. See the articles King's BENCH, COMMON-PLEAS, &c.

HALL, in geography, a town of Germany, in the circle of Auffria, and county of Tyrol, situated six miles north-east of Infruck; east long. 11° 28' north lat. 47° 15'.

HALL is also a town of the Austrian Netherlands, in the province of Brabant, seven miles south of Bruffels: east long. 4° 10', north lat. 50° 50'.

HALLIS is also a city of Germany, in the circle of Upper Saxon, the capital of a dutchy situated on the river Salz, subject to the king of Prufia: east long. 12° 5' north lat. 51° 35'.

HALL is also a town of Germany, in the circle of Swabia, twenty miles east of Hailbron; being an imperial city, or sovereign state: east long. 9° 45'; north lat. 49° 20'.

HALLAGE, a fee or toll paid for cloth brought to be sold in Blackwell-hall, London.

HALLAMAS, the same with all-fains. See the article ALL-SAINTS.

HALLATON, a market-town, ten miles south-east of Leicefter.

HALLAND, a subdivision of Gothland, in Sweden, at the entrance of the Baltic.

HALLEIN, a town of Bavaria, eight miles south of Saltzburg.

HALLELUJA, a word signifying, praise the Lord.

The singing halleluja was a sort of invitatory, or call to each other, to praise the Lord.

St. Austin says, that in some churches, it was sung only on Easter-day, and the fifty days of Pentecost; but that even in those churches where it was most in use, it was never used in the time of Lent. The fourth council of Toledo forbids the singing it, not only during Lent, but on all other days of fasting; and by the same council it is appointed to be sung after the reading of the gospel.

It was also sung at funerals, as St. Jerom informs us in his epitaph of Fabiola, where he speaks of the whole multitude singing psalms together, and making the golden roof of the church shake with echoing hallelujas.

HALLEN, a town of the austrian Netherlands, in the province of Brabant: east long. 4°, north lat. 50° 54'.

HALLEIN, a town of Germany, in the
Fig. 1. Half Moon.

Fig. 2. Halo.
archbishopric of Saltzburg: east long. 13° 6', north lat. 47° 36'.

HALLE, a town in the Netherlands, in the province of Brabant: east long. 5°, north lat. 50° 40'.

HALLERIA, in botany, a genus of the diodymania-engiofpermia class of plants, the flower of which is monopetalous and ringent, with a quadrifid limb: the fruit is a berry, containing two cells, with a solitary seed.

HALIFAX, a large market-town in the west riding of Yorkshire; thirty-four miles south-west of York: west long. 1° 40', north lat. 53° 45'.

HALMSTAT, a port-town of Gotland in Sweden, eighty miles south of Gotteneberg: east longitude 13° 5', north lat. 56° 45'.

HALO, in physiology, a meteor in the form of a luminous ring or circle, of various colours, appearing round the bodies of the sun, moon, or stars. See the articles COLOUR, SUN, &c.

Concerning the production of halos, Sir Isaac Newton intimates, that they are formed by the light which comes through the drops of rain, by two refractions, viz. at N and F (plate CXXV. fig. 2. n° 1.) without any reflection; but how this may be, is not easy to conceive. A rainbow, or deeply coloured ring, as will be shown under rainbow, might have been expected at the distance of about thirty-eight degrees from the sun; and also why it cannot happen. See RAINBOW.

For the same reason we should also not expect an halo to be formed by the same refracted rays, viz. on account of their not being refracted parallel to the eye, and consequently not entering it dense enough to render that part of the heaven more luminous than the rest; or to produce the lucid ring we call by this name. Again, Sir Isaac says, it ought to appear strongest at the distance of about twenty-six degrees from the sun, viz. when the angle IMG = 24°; and to decay gradually both ways. But though that philosopher did not undoubtedly affirm any thing without very great reason, yet this does not appear to us. For that the angle IMG may be twenty-six degrees, the angle of incidence B C N must be about forty-six; and then the angle of refraction C N F will be near thirty-three degrees: but why such an incidence and refraction should cause the rays to be refracted in greater plenty to the eye than any other, does not appear to me, says Martin, nor can I find it by any experiment. On the contrary, as the angle IMG increases with the angle of incidence, and consequently with the angle of refraction, it is evident that with respect to heterogeneous light, the greater the angle IMG is, the more will it be refracted and scattered; and consequently the farther the drops are situated from the sun, the less dense will be the light transmitted by refraction to the eye, which therefore ought to decrease, as the distance of the sun increases. See REFRACTION.

As Sir Isaac Newton has said but little, fo his expeditors Dr. S. Gravelsande and Dr. Pemberton have thought fit to be absolutely silent on this head. Mr. Huygens has advanced an hypothesis by which the phenomenon may be solved, if we grant him the following postulatum, viz.

That there are certain globules in the atmosphere, consisting of a coat or shell of transparent ice or water, containing an opaque nucleus or kernel within; and that these are made from particles of snow, which is in itself opaque, attracting the aqueous particles in the vapour by exhalation by which it is sustained, which gathering together, form the semiellipsoid shell of water, or are frozen into a crystalline shell of ice; and this, he thinks, is proved to be matter of fact by the halstones which fall to the earth: for these, says he, when broken, discover some snow at the center.

These things premised, he addresses himself to the solution, as follows. Let A B C D (ibid. n° 2.) represent such a globule with the opaque nucleus E F in the middle of it; and let us suppose the rays coming from G, H, to fall on the side A D. It is manifest they will be refracted inwards from the surface A D; from whence it follows that a great number of them must strike upon the kernel E F. Let G A, and H D, be the rays which, after refraction, touch the sides of the kernel E F, and let them be refracted again at B and C, emerging in the lines B K, and C K, crossed each other in the point K, whose distance from the globule is somewhat less than its semidiameter. Wherefore, if K and D K be produced towards M and L, it follows that no light coming from the sun through the globule, can proceed to the eye any where placed within the angle L K M, or rather in the cone which that represents; supposing that the obliquity of the incident rays H D and G A is such as shall make
H A L [1544] H A L

make the arch Q C, and Q B, the greatest possible; for then all the rays exterior to HD and GA, will be refracted nearer to Q, and after emergence cross each other in a point k, nearer the globeule than the former; and therefore cannot come at the eye placed within the said cone L K M. Suppose now the eye placed at N, (ibid. n° 3.) and let NR, N Q, be drawn parallel to L K, and M K; then it is plain none of the globeules, the same as A B C D, within the cone K N Q, can come to the eye at N. Thus the globeules at O and P have their refracted rays a k b and c k d, including the eye in the cone of obscurity. But other globeules which lie without the cone Q N R, as S and T, do not involve the eye N by their shadow-cones t k e, and f k m; and therefore some of those rays which are more refracted than k c, or k f, will fall upon the eye, and produce a luminous circular ring or corona, including a dark area with N, and whose light outwardly decreases as it is more remote from the center.

HALSFANG, or HEALSFANG, in old writers, the same with pillory. See the article PILLORY.

Sometimes it signifies a mulâ, paid to be exempted from that punishment.

HALSTEAD, a market-town of Essex, sixteen miles north of Chelmsford.

HALTER, in the manege, a headfall of hungarian leather, mounted with one and sometimes two straps, with a second throat-band, if the horse is apt to un-halter himself.

HALTER-CAST, among farriers, an excoriation of the pattern occasioned by a horse's endeavouring to scrub the itching part of his body near the head and neck, when one of his hinder feet entangling in the halter, he sometimes receives very dangerous hurts in the hollow of his pattern by his struggling to disengage himself.

For the cure of this, take linseed-oil and brandy, of each an equal quantity; make them together in a bottle till they are well mixed, and anoint the place morning and evening; having first clip away the hair; but take care to keep the foot very clean.

HALTERISTS, halterijfe, in antiquity, a sort of players at dicas, so called from the greek ἀκραυγαῖα; which is suppos'd to have been a leaden weight or ball, carried in each hand with a view to poise their bodies.

HALTING, among farriers, a limping or going lame, an irregularity in the motion of an horse, arising from a lameness in the shoulder, leg, or foot, which makes him spare the part, or use it timorously.

Halting happens sometimes before, and sometimes behind; if it be before, the ailment must necessarily be either in the shoulder, knee, flank, pattern, or foot. If it be in the shoulder, it must be towards the withers, or in the pitch of the shoulder; and it may be known by his drawing one of his legs after him, and not falling it so nimbly as the other. If he cast it more outward than the other, it is a sign of lameness, and that the grief lies in the shoulder; and if you turn him short, on either hand, you will find that he will either favour that leg, or trip in turning. His lameness may also be seen by his flanding in the stable, where he will hold the same leg more out than the other. If when you are upon his back, he complains more than he usually does, the grief certainly lies in the withers; so that on gripping him hard, you will perceive him to shrink, or perhaps offer to bite. If he treads thick and short before, then the grief is upon the pitch of the shoulder, close to the breast, which may be discoveryed by pressing the thumb hard against the place, on which he will shrink, and put back his leg, foot, and body. If the grief be in the elbow, it may be known by pinching him with the fore-fingers and the thumb, and then he will hold up his leg and offer to bite; but if the grief be in the knee, it may be discovered by the stiffness of his going; for he will not bend it so nimbly as he does the other. If it be in the flank or shin-bone, the fame may be seen or felt, it being a back finew, splinter, strain, or the like. If it be in the bend of the knee, it is a malander, which is also easily discovered. Further, when the pattern or joint is affected, it may be known by his not bending it so well as the other, and by its being very hot. If it be in the foot, it must be either in the coronet or sole: if in the coronet, it probably came by some strain or wrench: if in the hoof, by some over-reach or dis temper in or about the fruhs: if in the sole, from some prick, accloy, nail, &c.

HALTWESL, a market-town of Northumberland, thirty-two miles west of Newcastle: west long. 2°, north lat. 55°.

HALYMOTE, in old law-books, signifies a holy or ecclesiastical court. See the article COURT.
HALYWERCFOlk, in old writers, were persons who enjoyed land, by the pious service of repairing some church, or defending a sepulchre. This word also signified such persons in the diocese of Durham, as held their lands to defend the corps of St. Cuthbert, who from thence claimed the privilege of not being forced to go out of the bishopric.

HAM, in anatomy, the part behind the knee. See Knee and Leg.

HAM, in old writers, a saxon word used for a home or dwelling-place, for a borough and a village, and also for a little narrow slip of meadow.

HAM, in geography, a city of Germany, in the province of Weiphalia, and the capital of the county of Mark, subject to Prussia: east long. 7° 15', north lat. 51° 35'.

HAM, in cookery, the leg and thigh of a hog faasoned and dried.

To salt a ham in imitation of those of Weiphalia: let the ham be of young pork, trim it with salt for one day, that it may fetch out the blood; then wipe it dry, and rub it with the following mixture: take a pound of brown sugar, a quarter of a pound of salt petre, half a pint of bay-laft, and three pints of common salt,; then rub the leg of pork with that it may fetch out the blood; wipe it dry, and rub it with the follow­ ing mixture: common salt, iron, hot, supposed both to be born and to die. Frequently turning it, it will ripen, and be fit for the table. As for the trees on which their life depended, they were sure to be punished for it in an exemplary manner.

It was easy for the Gentiles to fall into the opinion of these sort of divinities; for as they entertained a kind of religious veneration for such trees as were very old, and of an uncommon size, it was an easy transition to the belief, that they were the abode and residence of some deity.

HAMAMELIS, in botany, a genus of the tetrandria-digynia class of plants, the corolla of which consists of four linear, equal, and very long petals: the fruit is a bivalve capsule, containing two cells: the seed is a single nucleus, of an oblong oval figure, and smooth surface.

HAMAXOBiens, hamaxobii, an antient people of europian Sarmatia, so called from their living together in chariots or waggons, for the conveniency of shifting the place of their abode at pleasure.

HAMBLING, or HAMELLING, in the forest law, is the ham-stringing of dogs, or cutting the great tendon called the ham-string.

HAMBURGH, a large city and well fortified port-town of Germany, in the circle of lower Saxony, and duchy of Holstein, situated on the north side of the river Elbe, partly on islands, and partly on the continent. It is an imperial city, or foreign state, governed by its own magistrates, and subject only to the general laws of the empire. Merchants from all parts of Europe resort to it, from whence their goods are sent into the heart of the empire: east long. 9° 40', north lat. 54°.

HAMBURGH-COMPANY of merchants. See the article COMPANY.

HAMCHEU, the capital of the province of Chekiam, in China, situated on the river Cienton, 160 miles south-east of Nanking: east long. 120°, north lat. 30°.

HAMELIN, a town of Germany, in the circle of lower Saxony, and duchy of Brunswick, subject to the elector of Hanover: east long. 9° 15', north lat. 52° 15'.

HAMELLING, or HAMBLING. See the article HAMBLING.

HAMIA, or AMIA, in ichthyology. See the article AMIA.

HAMILTON, a town of Scotland, in the county of Clydefdale, situated on the river Clyde, eleven miles south-east of Glasgow: west long. 3° 50', north lat. 55° 40'.

HAMLE, the name of the eleventh month of the ethiopian year, beginning on the 25th of June, old style.

HAMLET, HAMEL, or HAMPSHEL, is a small village, or part of a parish.

HAMMER, a well known tool used by mechanics, consisting of an iron head, fixed cross-wise upon a handle of wood. There are several sorts of hammers used by black-smiths; as, i. The hand-ham­ mer,
HAMMER, which is of such weight that it may be welded or governed with one hand at the anvil. 2. The up-hand fledge, used with both hands, and seldom lifted above the head. 3. The about-sledge, which is the biggest hammer of all, and held by both hands at the farthest end of the handle, and being swung at arms-length over the head, is made to fall upon the work with as heavy a blow as possible. There is also another hammer used by smiths, called a rivetting-hammer, which is the smallest of all, and is seldom used at the forge, unless upon small work. See Plate of Smithery.

Carpenters and joiners have likewise hammers accommodated to their several purposes. See Plate of Joinery.

HAMMER, malleus, in anatomy. See the articles EAR and MALLEUS.

HAMMER of a clock. See CLOCK.

COINING with the HAMMER. See the article COINING.

HAMMOCK, in a ship, a piece of canvas hung up fast by the four corners between decks, for seamen to sleep in.

Hammont, a town of Germany, in the circle of Westphalia, and bishopric of Liege, situated near the confines of Brabant: east long. 5° 32', north latitude 51° 20'.

HAMPER, or HANPER, in chancery. See the article HANPER.

Hampshire, an English county, bounded by Berkshire, on the north; by Surrey and Suffolk, on the east; by the English channel, on the south; and by Wilthire and Dorsetshire, on the west. It comprehends the isle of Wight. Its chief towns are Winchester, Southampton, and Portsmouth.

New Hampshire, a province of New England, in north America, bounded by Nova Scotia, on the north; by the Atlantic ocean, on the east; by the province of Massachusetts-bay, on the south; and by New York, on the west: subject to Great Britain.

Hampstead, a pleasant village in Middlesex, four miles north of London.

Hamsoken, in old law-books, signifies the liberty or privilege a man enjoys in his own house. It is also said to signify a franchise granted to lords of manors, by which they hold pleas, and take cognizance of the breach of that immunity. In Scotland it is used for the crime of him that violently, and contrary to the peace, assaults a person in his own house.

Hampton, a market-town of Gloucestertshire, twelve miles south of Gloucester: west long. 2° 15', north lat. 51° 38'.

Hampton, is also a port-town of New Hamphire, forty miles north of Boston: west long. 70°, north lat. 42° 3'.

Hampton-court, a town in Middlesex, situated on the north side of the Thames, twelve miles west of London, and two west of Kingston; in which is the finest palace belonging to the king of England.

Hanper, or HANPER, in chancery. See the article HANPER.

Hanau, the capital of a county of the name in Germany, is pleasantly situated on the river Kunts, thirteen miles east of Frankfort, and twelve north-west of Aschaffenburg: east long. 8° 45', north lat. 50° 12'.

HANCES, in a ship, are falls or descents of the fife rails, which are placed from the stern down to the gang-ways.

HAND, manus, in anatomy, the extreme part of the arm. See the article ARM.

The bones of the hand are those of the carpus, metacarpus, and fingers, with the os salesamoida. See CARPUS, &c.

The gibbous or convex part of the two first of these bones, constitutes the back of the hand; and the hollow part, the palm. Their bodies are placed distant from each other, and the interstices between them are filled up with the muscles called muculii interossei, serving to move the fingers.

As for the muscles of the hands, see the articles FINGER, WRIST, METACARPUS, &c.

The mechanism of the hand, is admirably contrived to answer the manifold uses and occasions wherein it is employed, being made up not only of nerves, muscles, &c. but a great number of little bones, all curiously jointed into each other; whence its extraordinary flexibility, which enables it to lay hold of adjacent bodies.

Luxation of the hand, in surgery. The hand is said to be luxated forwards, or downwards, when it recedes from the muscules that bend the fingers; the luxation is said to be backward, when it departs from the muscules which extend the fingers; and when the carpus makes a tumour near the thumb, and a cavity near the little finger, the luxation is said to be outward.

To reduce luxations of the hand, it must be sufficiently extended by two assistants; one
To make a horse right upon the hand, and free in the stay, he must be taught, by degrees, and by gentle methods, to know the hand; the horsemann must turn him, or change hands, stop him, or manage with dexterity the pressure of his mouth, so as to make him suffer cheerfully and freely the effect of the bit, without retifling or retting heavy upon the hand.

Hand-barrow, a wheel-barrow, which is of great use in fortification, for carrying earth from one place to another, and in a siege, for carrying bombs or cannon-balls along the trenches.

Hand-borrow, in law-books, a surety, or manual pledge, of an inferior rank; as head-borrow signifies a chief or superior.

Hand-breath, a measure of three inches.

Hand-cuffs, an instrument formed of two circular pieces of iron, each fixed on a hinge at the ends of a very short iron bar, which being locked over the wrists of a malefactor, prevents his using his hands.

Hand-habend, in law-books, a thief caught with the stolen goods about him.

Hand-hook, an instrument used by smiths to twist square iron.

Hand-screw, an instrument more usually called a jack. See the article Jack.

Hand-spikes, wooden levers used at sea to traverse the ordnance, or to turn the windlasses in weighing up the anchor, &c.

They are more commodious than iron crows, because their length allows a better poise.

Harmonical Hand, in music, a name given to the antient diagram. See Diagram.

The reason of this appellation was, that Guido Artine, upon inventing the notes ut, re, mi, fa, sol, la, disposed them on fingers, of the figure of a hand stretched out. See the article Note.

He thus changed the letters of the alphabet, which till that time used to express the notes, for these fix fillables, taken out of the first strophe of the hymn of St. John the baptist, composed by Paulus Diaconus.

Ut quant laxis re-sonare fibris
Mi-ra geforum fa-muli tuorum,
Sol-ve polluti la-bi rectum.

Santie Johannes.

Imposition of Hands, the ceremony of laying the hands on the head of a person to be ordained. See Ordination.

Hands, in heraldry, are borne in coat-armour dexter and sinister, that is, right and
HANDLING, among cock-fighters, signifies the measuring the girth of a cock's body, by the hands.

HANGINGS, the linings of rooms, whether made of paper, aras, or the like.

HANGWITE, or Hangwite, a fine imposed for hanging a felon or thief, without due course of law, or for suffering him to escape out of legal custody. Thus to be quit of hangwite, denotes a freedom from the penalty above-mentioned.

HANOVER, a city of Germany, in the circle of Lower Saxony, and dukedom of Brunswick, situated on the river Leine, thirty-six miles west of Brunswick: it is the capital of his Britannic Majesty's German dominions, situated in east long. 9° 45', north lat. 52° 32'.

HANPER, Hanaper, or Hamper, an office of the chancery, answering to the fiscus of the Romans.

HAPPINESS, among philosophers, consists in the enjoyment not only of the goods of the body, as health, strength, neatness, decency, &c., but also of the more refined goods of the mind, as knowledge, memory, taste, and especially the moral virtues, magnanimity, fortitude, benevolence, &c.

Human happiness, in the present state of things, consists of many separative and little rivulets, which must often be left dry in the perpetual flux and reflux of human affairs; yet the main stream, with which these lesser ones generally communicate, flows from within, from the heart of man; and, if this be found and clear, happiness will roll on through life with a strong and equal current. Many of the inferior goods that enter the account of happiness, as health, fame, fortune, and the like, are often even after our utmost care unattainable, or at least precarious; it is therefore of the utmost consequence to be prepared against the want or loss of them, by having our desires moderated, and our passions under due command. And, let it be remembered, that it is not only of great importance to our ease and security against ill, but one of the highest improvements of virtue, to contain what is thus unattainable and precarious, to contain those things the contempt of which is truly great and heroic, and to place our happiness chiefly in those virtuous exercises and affections which arise from a pure and well disposed mind, an happiness which no condition in life can exclude, no change of fortune interrupt or destroy. This will arm and fortify the mind against those pains, which result to the generality of mankind, from the contrary evils. Hence it is evident, 1. That the happiness of such a creature as man, can never be at a stand, or continue a fixed variable thing. His finite nature, let it rise ever so high, admits still higher degrees in improvements and perfection. And his progress in improvement, or virtue, always makes way for a progress in happiness, so that no possible point can be attained in any period of his existence in which he is perfectly happy; that is, so happy as to exclude higher degrees of happiness. All his perfection is only comparative. 2. It appears that many things must conspire to complete the happiness of so variable a creature as man, subject to so many wants, and susceptible of such different pleasures. As his capacities of pleasure cannot be all gratified at the same time, and must often interfere with each other in such a precarious and fleeting state as human life, or be frequently disappointed, perfect happiness, i.e., the undisturbed enjoyment of the several pleasures of which we are capable, is unattainable in our present state. 4. That state is molly to be fought after, in which the fewest competitions and disappointments can happen, which least of all impairs any sense of pleasure, and opens an unexhausted source of the most refined and lasting

[1549]

Harling-enjoyments. 5. That state which is attended with all those advantages, is a state or course of virtue. 6. Therefore, a state of virtue, in which the moral goods of the mind are attained, is the happiest state.

HAQUEBUS, the same with harquebuss. See the article HAQUEBUS.

HAQUENY, or HACKENY. See the article HACKEN Y.

HARANGUE, a speech made by an orator in public.

It is frequently used for a too pompous and prolix declamation.

HARBINGER, an officer of the king’s household, having four yeomen under him, who ride a day’s journey before the court, when it travels, to provide lodgings, &c.

HARBOUR, a town of Leicestershire, thirty miles south-east of Leicester: west long. 1°, north lat. 52° 26’.

HARBOUR, a place where ships may ride safe at anchor, chiefly used in speaking of those secured by a boom and chain, and furnished with a mole. See the articles BOOM, CHAIN, and MOLE.

By many acts of parliament, persons sailing and unlading ballast, rubbish, or the like, in any harbour or haven, forfeit 51.

HARBOURING, among sportsmen, is said of a hart that goes to rest: hence to unharbour a deer, is to dislodge him.

HARBURGH, a port-town of Germany, in the circle of Lower Saxony, and duchy of Luneburg, situated on the river Elbe, opposite to Hamburg: east long. 6° 30’, north lat. 53° 57’.

HARCOURT, a town of France, in the province of Normandy, twenty-three miles south-west of Rouen.

HARDENING, the giving a greater degree of hardnes to bodies than they had before. See the article HARDNESS.

There are several ways of hardening iron and steel, as by hammering them, quenching them, when hot, in cold water, cafe-hardening, &c.

To harden English and Swedish steel, being heated pretty hot, it is suddenly plunged in water; but Spanish and Venetian steel requires only a blood-red heat, before it is quenched in the water; sometimes the steel is rubbed with a woollen rag, dipt in a mixture of powdered indigo and fallad-oil, while it is heating, and afterwards let cool of itself.

Cafe-HARDENING is performed after the following manner: take cow-horn or hoof, dry it well in an oven; pound it to powder; put as much bay-leaf as of this powder into stale urine, or white-wine vinegar, and mix them well together; then cover the iron or steel with this mixture, and wrap it up in Ioam or plate-iron; so that the mixture may touch every part of the work; then put it into the fire, and blow the coals till the whole lump has a blood-red heat, but no higher, and then take it out and quench it.

HARDERWICK, a town of Guelderland, in the United Netherlands, twenty-three miles north-west of Zutphen: east long. 5° 36’, north lat. 52° 35’.

HARDINESS, in physiology, that quality in bodies whereby their parts cohesive firmly together, so as not to give way to any external impulse, nor yield inwards, without breaking.

In this sense hardiness coincides with what on other occasions we call firmness, in opposition to softness and fluidity. See SOFTNESS and FLUIDS.

From that species of attraction called cohesion, it is easy to account for the different degrees of hardnes in bodies: those whole constituent particles are flat or square, and so situated as to touch in many points, will be hard; those particles which are more round, and touch in fewer points, will constitute a softer body; those which are spherical, or nearly of that figure, will form a fluid. See the articles ATTRACTION and COHESION.

But nothing can conduce more to explain the nature of this doctrine, than the following passage of Sir Isaac Newton.

“The parts of all homogeneal bodies, says he, which fully touch one another, stick together very strongly. And for explaining how this may be, some have invented hooked atoms, which is begging the question; and others tell us, that bodies are glued together by rest, that is by an occult quality, or rather by nothing; and others, that they stick together by conspiring motions, that is; by relative rest among themselves. I had rather infer from their cohesion, that their particles attract one another by some force, which, in immediate contact, is exceeding strong; at small distances, performs many chemical operations, and reaches not far from the particles with any sensible effect. All bodies seem to be composed of hard particles; even the rays of light seem to be hard bodies; and therefore hardnes may be reckoned the property of all compounded matter.
HAR [1550]  

HARE, in zoology, an animal of the lepus-kind, distinguished by its abrupt tail, and black eyes. It greatly resembles the rabbit, but is larger, and somewhat longer, in proportion to its thickness; and its ears are remarkably long, being always in a position to receive the least sound, and moveable with surpising ease. See plate CXXVII. fig. 1.

The hare is a beast of venery, or of the forest, but particularly esteemed in the second year of her age. There are reckoned four sorts of them, from the place of their abode: some live in the mountains, some in the fields, some in marshes, and some wander about every where. The mountain-hares are the swiftest, the field-hares are not so nimble, and those of the marshes are the slowest; but the wandering hares are the most dangerous to follow, for they are cunning in the ways and mazes of the fields, and knowing the nearest ways, run up the hills and rocks, to the confusion of the dogs, and the disappointment of the hunters. See the article HUNTING.

HARE-LIP, labium leporinum, in surgery. See the article LIP.

HARE'S EARS, bupleurum, in botany. See the article BUPLEURUM.

HARE'Slettuce, a name sometimes given to the fonchus, or low-thistle.

HARE-STRONG, the same with peucedanum, or hog's fennel.

HARENGUS, the herring. See the article HERRING.

HARFLEUR, a port-town of France, in the province of Normandy, situated near the mouth of the Seyne, four miles west of Havre de Grace: east long. 15°, north lat. 40° 30'.

HARIOT, or HERIOT, in law, a due belonging to a lord at the death of his tenant, confiniting of the best beast, either horse, ox, or cow, which he had at the time of his death; and in some manors, the best goods, piece of plate, &c. are called hariots.

There is both hariot-service, and hariot-cumom: when a tenant holds by service to pay a hariot at his decease, which is expressly reserved in the deed of seofment, this is hariot-service; and where hariots have been customarily paid time out of mind, after the death of a tenant for life, this is termed hariot-cumom. For hariot-service, the lord may distrain any beast belonging to the tenant, that is on the land. For hariot-cumom, the lord is to seize and not distrain; but he may seize the

HARDS, or HURDS, the outward part of hemp or flax, separated from the fine. See the articles HEMP and FLAX.

HARDY-SHREW, in zoology. See the article SHREW.

HARDY-SHRUBS, among gardeners. See the article SHRUB.
the best beast that belonged to the tenant, tho' it be out of the manor, or in the king's highway, because he claims it as his proper goods by the death of his tenant. Nevertheless, where a woman marries and dies, the lord shall have no harriot-custum, because a feme-covert has no goods to pay as a harriot.

HARLE, in ornithology, the name by which the merganser is called in several parts of the kingdom. See MERGANSER.

HARLEBECK, a town of the austrif Netherlands, in the province of Flanders, situated on the river Lys six miles north-east of Courtray: east long. 5° 15', north lat. 50° 50'...

HARLEQUIN, a buffoon or merry-andrew; but is now used for a person of extraordinary agility, drest in party-coloured cloaths, the principal character in a pantomime entertainment. See the article PANTOMIME.

HARLESTON, a market-town of Norfolk, situated on the river Waveney, fourteen miles south of Norwich: east long. 1° 25', north lat. 52° 33'.

HARLINGEN, a port town of Friesland, situated on the German sea: east long. 5° 20', north lat. 53° 15'.

HARLOT, a whore, or one that prostitutes her body for hire. These are liable to be committed to prifon, and kept to hard labour. For the punishment of those who keep and entertain them, see the article BAWDY-HOUSE.

HARLOW, a market-town of Essex, situated fifteen miles west of Chelmsford: east long. 6°, north lat. 51° 45'.

HARMALA, in botany, a plant other-wise called pegamum. See PEGANUM.

HARMONIA, HARMONY, in music. See the article HARMONY.

HARMONIA, in anatomy, a species of articulation, being a kind of lymphsis intended for absolute refi. See the article ARTICULATION.

HARMONICA, HARMONICS, among musicians. See the article HARMONICS.

HARMONICAL, something belonging to harmony. See the article HARMONY.

HARMONICAL ARITHMETIC, that part of arithmetic which considers musical intervals, expressed by numbers, in order to our finding their mutual relations, compositions, and resolutions.

HARMONICAL COMPOSITION, in a general sense, includes both harmony and melody, i.e. of music or songs, both in a single part, and in several parts.

In its more proper and limited sense, harmonical composition is restrained to that of harmony; and may be defined the art of disposing and conceiving several single parts together, so as to make one agreeable whole. See HARMONY, COMPOSITION, and COUNTER-POINT.

HARMONICAL DIVISION, in music. See the article DIVISION.

HARMONICAL INTERVAL, in music, denotes the difference of two sounds, which is agreeable to the ear, whether consonance or succession; and are, therefore, the same with concord. See the articles CONCORD and INTERVAL.

HARMONICAL PROPORTION. See the article PROPORTION.

HARMONICAL SERIES, a series of many numbers in continual harmonical proportion. Thus if there are four or more numbers, of which every three immediate terms are harmonical, the whole will make an harmonical series: such is 30: 20: 15: 10. Or, if every four terms immediately next each other are harmonical, it is also a continual harmonical series, but of another species, as 3, 4, 6, 9, 18, 36, &c.

HARMONICAL SOUNDS, an appellation given, by Mr. Sauveur, to such sounds as always make a determinate number of vibrations, in the time that one of the fundamentals, to which they are referred, makes one vibration. Harmonical sounds are produced by the parts of chords, &c. which vibrate a certain number of times, while the whole chord vibrates once.

The relations of sounds had only been considered in the series of numbers, 1, 2, 3, 4, 5, &c. which produced the intervals called octave, fifth, fourth, third, &c. Mr. Sauveur first considered them in the natural series, 1, 2, 3, 4, 5, &c. and examined the relations of sounds arising therefrom. The result is, that the first interval, 1:2, is an octave; the second, 1:3, a twelfth; the third, 1:4, a fourteenth, or double octave; the fourth, 1: 5, a seventeenth; the fifth, 1: 6, a nineteenth, &c.

This new consideration of the relations of sounds, is more natural than the old one; and is, in effect, all the music that nature makes without the assistance of art. See the articles CHORD, VIBRATION, ORGAN, &c.

HARMONICS, harmonica, that part of music which considered the differences and proportions of sounds, with respect to acute
Acute and grave; in contradistinction to rythmica and metrica.

The harmonics is the only part of the antient music whereof we have any tolerable account. According to Mr. Malcolm, the doctrine of harmonics was reduced into seven parts, viz. of sounds, of intervals, of systems, of the genera, of the tones or modes, of mutation, and of the melopoeia. See the articles Sound, Interval, &c.

Harmony, &c., in music, the agreeable result, or union, of several musical sounds, heard at one and the same time; or the mixture of divers sounds, which together have an effect agreeable to the ear. See the article Sound.

As a continued succession of musical sounds produces melody, so does a continued combination of these produce harmony. See the article Melody.

Among the antients, however, as also sometimes among the moderns, harmony is used in the strict sense of consonance, and is equivalent to symphony; and concord and harmony do in reality signify the same thing, though custom has made a little difference between them. See the articles Symphonia, &c.

The antients, says Mr. Malcolm, seem to have been entirely unacquainted with harmony, the soul of modern music: in all their explications of the melopoeia, they say not a word of concert, or the harmony of parts. We have instances, indeed, continues that author, of their joining several voices or instruments in consonance; but then these voices and instruments are not so joined as that each had a distinct and proper melody, and so made a succession of various concords; but were either unisons or octaves in every note; and so all performed the same individual melody, and so constituted one song. See the article Synaulia.

When the parts differ not in the tension of the whole, but in the different relations of the successive notes, it is this that constitutes the modern art of harmony. See Music and Melopoeia.

To understand the nature, and determine the number and preference of harmonics, it is to be considered, that in every compound sound, where there are not more than three simple ones, there are three kinds of relations, viz. primary relation of every simple found to the fundamental or gravest, whereby they make different degrees of concord with it; the mutual relations of the acute-sounds each with the other, whereby they mix concord or discord into the compound; and the secondary relation of the whole, whereby all the terms unite their vibrations, and coincide more or less frequently.

Suppose four sounds A, B, C, D, where of A is the gravest, B the next, then C, and D the acutest. Here A is the fundamental, and the relations of B, C, and D are primary relations: so if B be a third greater above A, that primary relation is 4 to 3; and if C be a fifth to A, that primary relation is 2 to 3; and if D be an octave to A, that is 1 to 2.

For the mutual relations of the acute terms B, C, D, they are had by taking their primary relations to the fundamental, and subtracting each leffer from each greater: thus B to C is 5 to 6, a third leffer; B to D, 5 to 8, a sixth leffer, &c.

Lastly, to find the secondary relation of the whole, seek the least common dividend to all the leffer terms or numbers of the primary relations, i.e. the least number that will be divided by each of them exactly, this is the thing sought, and thens that all the simple-sounds coincide after so many vibrations of the fundamental as the number expresses.

So in the preceding example, the leffer terms of the three primary relations are 4, 2, 1, whose least common dividend is 4; consequently at every fourth vibration of the fundamental, the whole will coincide.

The proper ingredients of harmony are concords; and all discords, at least in the primary and mutual relations, are absolutely forbidden. It is true, discords are used in music, but not of themselves simply, but only to set off the concords by their contrast and opposition. Hence, any number of concords being proposed to stand in primary relations with a common fundamental, we discover whether or not they constitute perfect harmony, by finding their mutual relations: thus, suppose the following concords or primary relations, viz. the greater third, fifth, and octave given, their mutual relations are all concord, and therefore may stand in harmony; for the greater third and fifth are to one another as 5 to 6; a leffer third; the greater third and octave, as 5 to 8, a leffer fifth; and the fifth and octave, as 3 to 4, a fourth. But if fourths, fifths, and octaves be proposed, it is evident they cannot stand in harmony, by reason between the fourth and fifth there is a discord, viz. the ratio 8 to 9.

Again,
Again, supposing any number of sounds which are concord each to the next, from the lowest to the highest; to know if they can stand in harmony, we must find the primary and all the mutual relations, which must be all concord: thus the followingones cannot, viz. 4, 6, 9, by reason 4 to 6 is a discord.

The perfection of harmonies depends on all the three relations, it is not the best primary relation that makes the best harmony; for then a fourth and a fifth must be better than a fourth and a sixth, whereas the first two cannot stand together, because of the discord of the mutual relation. Nor does the best secondary relation carry it; for then would be a fourth and a fifth, a whole secondary relation, with one common fundamental, is 6, be better than a third and fifth, whose secondary relation is 10, but here also the preference is due to the better mutual relations. Indeed, the mutual relations depend on the primary, though not so that the best primary shall always produce the best mutual relations. However, the primary relations are of the most importance; and, together with the secondary, afford us the following rule for determining the preference of harmonies, viz. comparing two harmonies together that have an equal number of terms, that which has the best primary and secondary relations, is the most perfect. But in cases where the advantage lies in the primary relation of the one, and in the secondary of the other, we have no certain rule; the primary are certainly the most considerable, but how the advantage in these ought to be proportioned to the disadvantage of the other, or vice versa, we know not; so that a well-tuned ear must be the last resource in these cases.

Harmony is divided into simple and compound.

Simple Harmony is that in which there is no discord to the fundamental above an octave. The ingredients of simple harmony are the seven original simple concords, of which there can be but eighteen different combinations that are harmony, which are given in the following table from Mr. Malcolm.

</tbody>
</table>

These are all the possible combinations of the concords, that are harmony; for the octave is compounded of a fifth and a fourth, or a sixth and a third, which have the variety of greater and lesser: out of these are the first six harmonies composed. Then the fifth being composed of a greater and a lesser third, and the sixth of a fourth and a third; from these proceed the next six harmonies of the table: then an octave joined to each of these six, make the last six of the table.

The perfection of the first twelve is, according to the order of the table; of the first six each has an octave, and their preference is according to the perfection that other lesser concord joined to the octave. For the next six, the preference is given to the two combinations with the fifth, whereas that which has the third greater is the best. For the last six, they are not placed last, because the least perfect, but because they are the most complex; and are the mixtures of the other twelve with each other; in point of perfection, they are plainly preferable to the preceding six, as having the same ingredients with an octave more.

Compound Harmony is that which to the harmony of one octave, adds that of another. For the compound harmonies, their varieties are easily found out of the combinations of the simple harmonies of several octaves.

Harmony may also be divided into that of concords and that of discords. The first is that which we have hitherto considered, wherein nothing but concords are admitted: the second is that where-in discords are used, and mixed with concords. See the articles Concord and Discord.

Composition of Harmony. See the article Composition.
HARMONY is also sometimes used to denote
an agreement, suitableness, union; conformity, &c. thus, in music, we sometimes apply it to a single voice, when sonorous, clear, and soft; to a single instrument, when it yields a very agreeable found: in matters of literature, we use it for a certain agreement between the several parts of the discourse: in architecture, harmony denotes an agreeable relation between the parts of a building: in painting, they speak of an harmony both in the ordnance and composition, and in the colours of a picture; in the ordnance it signifies the union or connection between the figures, with respect to the subject of the piece; in the colours, it denotes the union or agreeable mixture of different colours. See Symmetry, Colouring, &c.

HARMONY of the spheres, or Celestial Harmony, a sort of music much talked of by many of the antient philosophers and fathers, supposed to be produced by the sweetly tuned motions of the stars and planets. This harmony they attributed to the various proportionate impressions of the heavenly globes upon one another, acting at proper intervals. It is impossible, according to them, that such prodigious large bodies, moving with so much rapidity, should be silent; on the contrary, the atmosphere continually impelled by them, must yield a set of sounds proportionate to the impression it receives; consequently as they do not all run the same circuit, nor with one and the same velocity, the different tones arising from the diversity of motions, directed by the hand of the Almighty, must form an admirable symphony, or concert.

They therefore supposed, that the moon, as being the lowest of the planets, corresponded to mi; mercury, to fa; venus, to sol; the sun, to la; mars, to si; jupiter, to do; saturn, to re; and the orb of the fixed stars, as being the highest of all, to mi, or the octave.

Pre-established Harmony, a celebrated system of M. Leibnitz, by means whereof he accounts for the union or communication between soul and body. The philosophers had universally held, that the soul and the body acted physically on each other. Des Cartes first shewed that the heterogeneity of their natures did not allow of such real union; and that they could only have an apparent one, whereof God is the mediator. Mr. Leibnitz, unsatisfied with either of these hypotheses, establishes a third: a soul or spirit, he observes, is to have a certain series of thoughts, desires, and wills; a body, which is only a machine, is to have a certain series of motions, to be determined by the combination of its mechanical disposition, with the impressions of external objects.

If now there be found a soul and a body so framed, that the whole series of wills of the soul, and the whole series of motions of the body, exactly correspond; and at the same time, for instance, when the soul desires to go to any place, the two feet move mechanically that way; this soul and body will have a relation to one another; not by any actual union between them, but by the constant and perpetual correspondence of the several actions of both. Now God puts together this soul and body, which had such a correspondence antecedent to their union. And the fame is to be understood of all the other souls and bodies, that have been or ever will be joined.

In effect the laws of motion in the body, succeeding in the order of efficient causes, do all agree and correspond with the ideas of the soul; so that the body is determined to act at the time when the soul wills. The same principle he extends further, and makes a pre-established harmony between the kingdoms of nature and grace, to account for the apparent communication between them, and makes physical and moral evil correspond. For a farther account of his manner of reasoning upon this doctrine, we refer the reader to his Elais de Theodicee.

HARMOSTES, in grecian antiquity, an appellation given to several magistrates among the Spartans, whose business was to look to the building of citadels, the reparation of forts and fortifications, and the like.

HARNESS, the furniture put upon a horse to draw in a coach, or other wheel-carriage.

HARNESS-GALLS, swellings or sores on the breasts of coach-horses, occasioned by the galling of the harness, especially in rainy weather.

To cure this, first shave off the hair about the fore very close, and rub the whole breast with a lather of water and black-soap; then wash that part of the breast which is usually covered with the petrel, with salt-water, puffering it to dry of itself. If the hardness of any part of the harness occasions the galling, take it away, or cover it with little bolters.
HARO, or HAROL, clamor de haro, in our old coffoms, an out cry after felons, the original of which came from the Normans. See the article HUE and CRY.

HARP, a musical instrument of the string-kind, of a triangular figure, held upright between the legs of the person who plays upon it.

There is some diversity in the structure of harps. That called the triple harp, has three rows of strings or chords, which in all make seventy-eight, or four octaves; the second row makes the half-turn, and the third is uninion with the first. There are two rows of pins on the right side, called buttons, that serve to keep the strings tight in their holes, which is fastened at the other end to three rows of pins on the upper side, called the keys. This instrument is struck with the fingers and thumbs of both hands: its music is like that of the spinet, all its strings going by semitones; whence some have called it the inverted spinet. There are among us two sorts of this instrument, viz. the Irish harp, which is strung with wire; and the Welch harp, strung with gut.

King David is usually painted with a harp in his hands; but we have no testimony in all antiquity, that the Hebrew harp was any thing like ours; on a Jewish medal of Simon Macchabeus, we see two sorts of musical instruments, but they are both of them different from our harp, having only three or four strings. The harp in use among the ancient Jews, is supposed to be more like a lute, or a guitar, than the instrument above described, which it is thought was invented either by the Cimbri, or the Anglo-Saxons.

Bell-Harp, a musical instrument of the string-kind, thus called from the common players upon it, swingeing it about as a bell on its biais.

It is about three feet long; its strings, which are of no determinate number, are of brass or steel-wire, fixed at one end, and stretched a-cross the sounding-board, by screws fixed at the other end. It takes in four octaves, according to the number of the strings, which are struck only with the thumbs, the right hand playing the treble, and the left the base; and in order to draw the sound the clearer, the thumbs are armed with a little wire-pin. This may perhaps be the lyra or cithara of the antients; but we find no mention of it under the name it now bears, which must be allowed to be modern.

Harpeggiato, or Harpeggio, in music, is to cause the several sounds of one accord to be heard distinctly one after the other, beginning with either at pleasure, but commonly with the lowest.

Harpies, harpyce, ùrpueas, among the antient poets, fabulous impure monitors, said to be the daughters of Neptune and Earth. Virgil mentions three of them, Aello, Ocypete, and Celeno; they are described to be owls with the face of a virgin, bear's ears, their bodies like vultures, and hands like their crooked talons. Virg. Æn. III.

Harpineer, or Harpioneer, the person who manages the harping-iron. See the next article.

Harping-Iron, or Harpoon, a large spear or javelin, made of forged iron, and five or six feet long; it is fastened to a line, and used in the whale-fishery. See the article Fishery.

Harpings, in a ship, properly denote her breadth at the bow. Some also give the same name to the ends of the boms that are fastened into the stern.

Harpischord, the most harmonious of all the musical instruments of the string-kind. It is played on after the manner of the organ, and is furnished with a set and sometimes with two sets of keys; the touching or striking of these keys, move a kind of little jacks, which also move a double row of chords or strings, of brass or iron, stretched over four bridges on the table of the instrument.

Harquebus, a piece of fire arms, of the length of a musquet, usually cocked with a wheel. It carried a ball that weighed one ounce seven eights.

There was also a larger sort, called the great harquebuss, used for the defence of strong places, which carried a ball of about three ounces and a half; but they are now but little used, except in some old castles, and by the French in some of their garrisons.

Harrrier, a kind of hound, endowed with an admirable gift of smelling, and very bold in the pursuit of his game.

There are several kinds of harriers; some being for the hare, the fox, the wolf, hart, weatel, badger, &c.

Harrow, in agriculture, an instrument used by husbandmen, to break the clods of earth, and to draw the ground over the seed when sown. It is a sort of wooden drag, made in form of a square, with large
HAR

HAR, a large iron-teeth, or tines, not unlike those of a herse. See HERSE.

HART, a stag, or male deer, in the sixth year. See STAG and CERVUS.

HART-ROYAL, one that has been hunted by the king or queen, and escaped with life; in which case proclamation is usually made, that none kill or offend him, as being a hart-royal proclaimed.

HART-HUNTING. See HUNTING.

HART'S HORN, cornua cervi, in pharmacy, the whole horns of the common male deer, as separated from the head, without farther preparation.

The chemical analysis of hart's horn is sufficiently known: it yields a water highly impregnated with a volatile salt, which is called spirit of hart's horn, with a fetid oil, and a volatile salt by the common distillation in a retort. The remainder in the bottom of the retort, after the distillation is finished, is black; but on being calcined in an open fire, it becomes white and friable, and is what is kept in the shops under the name of burnt hart's horn. Before these preparations, we use the thin shavings of the horns, which, on long boiling in water, become a jelly: this jelly is nutritious and strengthening; it is sometimes given in diarrhoeas; but a decoction of burnt hart's horn in water, is more frequently used for this purpose, and is what is called hart's horn drink.

The salt of hart's horn is a great fixator, and is given in fevers of many kinds with great success; the spirit has the fame and all the other virtues of volatile alcalis, and is used to bring people out of faintings by its pungency, on holding it under their nose, and at the same time pouring some drops of it in water down the person's throat.

HART'S HORN, in botany, a name given by some writers to coronopus. See the article CORONOPUS.

HART-WORT, loddylgium, in botany. See the article TORDYLLIUM.

Ethiopian HART-WORT, a plant more usually called peucedanum, or hog's fennel.

HARTFORD, the capital of Hartford-shire, situated twenty-one miles north of London: west lon. 4° 43', and north lat. 51° 5'.

HARTFORD is also a town of New-England, in the province of Connecticut, situated fifty miles west of Boston: west lon. 71° 16', and north lat. 42°.

HARTLAND, a market-town of Devon, situated near the Bristol-channel; it gives name to a cape, called Hartland-point, at the entrance of the Bristol-channel: west lon. 4° 45', and north lat. 51° 9'.

HARTLEPOOL, a port-town of the county of Durham, situated on the German ocean, fourteen miles south-east of Durham: west longit. 55', and north lat. 56° 40'.

HARVEST, the time or season that the corn is ripe, and fit to be reaped and taken into barns.

HARVEST-FLY, in zoology, a large four-winged fly, of the cicada-kind, very common in Italy, and erroneously supposed to be a grasshopper. See the article CICADA.

HARUSPEX, or ARUSPEX, in roman antiquity. See ARUSPICES.

HARWICH, a borough and port-town of Essex, sixty-two miles north-east of London: east lon. 1° 25', north lat. 52° 5'. It sends two members to parliament.

HASLÉ, or HAZLE. See HAZLE.

HASLEM, an island of Denmark, in the Categate-see, north of the island of Zealand.

HASLEMERE, a borough-town of Surrey, thirty-eight miles south-west of London, and ten miles south-west of Guildford. It sends two members to parliament.

HASSELT, a town of Westphalia, in Germany, fifteen miles north-west of Maasfichrt.

HASSIDEANS, or ASSIDEANS, an appellation given to those Jews who returned to Matriathias, to fight for the law of God, and the liberties of their country.

HASSOCK, a basin made of rushes, to kneel or rest the feet upon in churches.

HASTA, among medallists, a kind of javelin, not shod or headed with iron; or rather an ancient sort of spear, longer than ordinary, occasionally given to all the gods.

HASTATED LEAF, among botanists, one resembling the head of an halbert. See plate CXXVII. fig. 4.

HASTINGS, a borough-town of Sussex, situated on the coast of the English channel, fifty miles south-east of London: east lon. 56°; and north lat. 50° 50'.

HAT, a covering for the head, worn by the men in moss parts of Europe. Tho' most in esteem are made of the pure hair of the caftor or beaver; for they are also made of the hair or wool of divers other animals, and that by much the same process.
HAT [1557]

Method of making Hats. To make the beaver-hats, they tear off the long and short hair from the skin, with knives suitable to the occasion. After which they proportion the quantity of the several sorts of beaver-hair, by mixing one third of the dry calf, to two thirds of old-Hcoat, which is a term for a skin that has been worn some time by the Indians of America, who catch and fell them to the Europeans. The hair, so mixed, is carded and weighed out into parcels, according to the size and thickness of the hat intended. The stuff is now laid on the hurdle, with an instrument called a bow, resembling that of a violin, but larger; whose string being worked with a small bow-stick, and made to play on the furs, they fly, and mix themselves together, the duff and fluth at the same time passing through the chinks. Instead of a bow, some hat-makers use a searce of hair, through which they pass the stuff. Thus hats are formed of an oval figure, ending with an acute angle at the top; with what stuff remains they stuff a hardened leather upon it. This done, they are carried to the baion, upon which laying one of the hardened hats they sprinkle it over with water, and mould it; and the heat of the fire, with the water and preffing, imbody the stuff into a flight hairy sort of felt; after which, turning up the edges all round over the mould, they lay it by, and proceed with another, which being in like manner reduced to the same consistence and form, they are both joined together, so as to make them meet in an angle at top, making only one conical cap. The next process is to remove the hat to a trough, resembling a mill-hopper, which is a copper-kettle filled with water and grounds, kept hot for the purpose; and, after being dipped in the kettle, the hat is laid on the floating side, called the plank. Here they proceed to work it, by rolling and unrolling it again and again, one part after another, first with the hand, and afterwards with a small wooden roller, taking care to dip it from time to time, till at length, by thus fulling and thickening it four or five hours, it is brought to the dimensions intended. In this violent labour, the workmen usually guard their hands with thick leather, which they call gloves. The hat thus wrought into the form of a conical cap, is reduced into proper shape on a block of the size of the interceded crown, by tying it round with a string, called a commander; after which, with a bent iron, called a stamper, they gradually beat down the commander all round, till it has reached the bottom of the block, and what remains at the bottom below the string forms the brim. In this flation it is set to dry, and afterwards fingered, by holding it over the blaze of a fire, made of straw, or shavings; it is then rubbed with pumice-stone, to take off the coarser nap; then rubbed over with seal-skin, to lay the nap still finer; and lastly, carded with a fine card, to raise the fine cotton, with which the hat is to appear when finished: then fitting it to the block, they tie it, cut round the edges, and deliver it to the dyers. (See the article Dying.) The dye being completed, the hat is dried by being hung in the roof of a flowe heated with a charcoal-fire; and, when dry, it is stiffened with melted glue, or rather gum-fenega, which is smeared over the hat with a brush, and rubbed in with the hand. Then, having spread a cloth over the steaming baion, which is a little fire-place raised about three feet high, with an iron-plate laid over it, exactly covering the fire, the hat is laid upon the cloth, with the brim downwards, the cloth being first sprinkled with water, to raise a strong steam, to force in the stiffening. When it is moderately hot, the workman strikes gently on the brim, with the flat of his hand, to make the joinings incorporate and bind so as not to appear, turning it from time to time, and at last setting it on the crown. And when it has been sufficiently steamed and dried, it is put again on the block, brushed, ironed, well smoothed, and fitted for lining.

Hats make a considerable article in commerce: England supplies Spain, Portugal, Italy, and Germany, with extraordinary quantities of them; and as our manufacturers have the reputation of making the best hats in Europe, their importation is prohibited.

Hats are also made for women's wear, of chips, straw, or cane, by plaiting, and sewing the plats together; beginning with the center of the crown, and working round till the whole is finished. Hats for
HAT [1558]

The art of hatching chickens by means of ovens has long been practised in Egypt; but it is there only known to the inhabitants of a single village named Berme, and to those that live at a small distance from it. Towards the beginning of autumn they scatter themselves all over the country, where each person among them is ready to undertake the management of an oven, each of which is of a different size, but in general they are capable of containing from forty to fourfcore thousand eggs. The number of these ovens placed up and down the country is about three hundred and eighty-fix, and they usually keep them working for about six months: as therefore each brood takes up in an oven, as under a hen, only twenty-one days, it is easy in every one of them to hatch eight different broods of chickens. Every Bermean is under the obligation of delivering to the person who intrusts him with an oven, only two thirds of as many chickens as there have been eggs put under his care; and he is a gainer by this bargain, as more than two thirds of the eggs usually produce chickens.

In order to make a calculation of the number of chickens yearly so hatched in Egypt, it has been supposed that only two thirds of the eggs are hatched, and that each brood consists of at least thirty thousand chickens; and thus it would appear that the ovens of Egypt give yearly to at least ninety-two millions fix hundred and forty-thousand of these animals.

This useful and advantageous method of hatching eggs has been lately discovered in France, by the ingenious Mr. Racemur, who, by a number of experiments, has reduced the art to certain principles. He found by experience that the heat necessary for this purpose is nearly the same with that marked 32 on his thermometer, or that marked 96 on Fahrenheit's. This degree of heat is nearly that of the skin of the hen, and what is remarkable of the skin of all other domestic fowls, and probably of all other kinds of birds. The degree of heat which brings about the development of the cygnet, the gosling, and the turkey-pong, is the same as that which fits for hatching the canary-songster, and, in all probability, the smallest humming-bird: the difference is only in the time during which this heat ought to be communicated to the eggs of different birds: it will bring the canary bird to perfection in eleven or twelve days, while the turkey-
turkey-pout will require twenty-seven or twenty-eight.

After many experiments, Mr. Reaumur found that fowls heated by means of a baker's oven, succeeded better than those made hot by layers of dung; and the furnaces of glafs-houses and those of the smelters of metals, by means of pipes, to convey heat into a room, might, no doubt, be made to answer the same purpose. As to the form of the fowls, no great nicety is required: a chamber over an oven will do very well; nothing more will be necessary but to ascertain the degree of heat, which may be done by melting a lump of butter, of the size of a walnut, with half as much tallow, and putting it into a phial; this will serve to indicate the heat with sufficient exactness, for when it is too great, this mixture will become as liquid as oil, and when the heat is too small, it will remain fixed in a lump; but it will flow like a thick syrup, upon inclining the bottle, if the fowl be of a right temper: great attention therefore should be given to keep the heat always at this degree, by letting in fresh air, if it be too great, or shutting the fowl more close, if it be too small; and that all the eggs in the fowl may equally share the irregularities of the heat, it will be necessary to shift them from the sides to the center; thereby imitating the hens, who are frequently seen to make use of their bills, to push to the outer parts those eggs that were nearest to the middle of their nests, and to bring into the middle such as lay nearest the sides.

Mr. Reaumur has invented a sort of low boxes, without bottoms, and lined with furs. Those, which he calls artificial-parents, not only shelter the chickens from the injuries of the air, but afford a kindly warmth, so that they proficiently take the benefit of their shelter as readily as they would have done under the wings of a hen. After hatching, it will be necessary to keep the chickens, for some time, in a room artfully heated and furnished with these boxes; but afterwards they may be safely exposed to the air in the court-yard, in which it may not be amiss to place one of these artificial-parents to shelter them if there should be occasion for it.

As to the manner of feeding the young brood, they are generally a whole day after being hatched, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, after which they will begin to pick up insects and grubs for themselves. But to save the trouble of attending them, capons may be taught to watch them in the same manner as hens do. Mr. Reaumur assures us that he has seen above two hundred chickens at once, all led about and defended only by three or four such capons. Nay, cocks may be taught to perform the same office, which they, as well as the capons, will continue to do all their lives after.

Hatching, or Haching, in designing, &c. the making of lines with a pen, pencil, graver, or the like; and the interlacing or going across those lines with others drawn a contrary way, is called counter-hatching. The depths and shadows of draughts are usually formed by hatching.

Hatching is of singular use in heraldry, to distinguish the several colours of a shield, without being illumined: thus, gules or red is hatched by lines drawn from the top to the bottom; azure, by lines drawn across the shield; and of other colours. See the article Gules, Azure, &c.

Hatching also signifies the marshalling of several coats of arms in an escutcheon. See the article Marshalling.

Hatesbury, or Heytsbury. See the article Heytsbury.

Hatfield, a market-town of Hertfordshire, situated twenty miles north-west of London.

Hatfield-broad Oak, or King's Hatfield, a market-town of Essex, twelve miles from Chelmsford, and twenty-eight from London.

Hatherley, a market-town of Devonshire, twenty miles north-west of Exeter.

Hattem, a town of Gelderland, one of the United Provinces; east long. 6°, north lat. 52° 36'.

Hattcock, a shock of corn containing twelve sheaves: others make it only three sheaves laid together.

Hatuan, a town of upper Hungary, fifteen miles north-east of Buda: east lon. 19° 33', and north lat. 47° 48'.

Havana, a port-town of the island of Cuba, in America, situated at the entrance of the gulph of Mexico; sub-
HAVANT, a market-town of Hampshire, six miles north-east of Portsmouth.

HAVEL, a river of Brandenburg, in Germany, which receives the river Spree, near Berlin, and discharges itself into the Elbe, a little below Havelburg.

HAVELBURG, a town of Germany, in the circle of Upper Saxony, and marquisate of Brandenburg, subject to the king of Prussia: east long. 12° 44', and north lat. 55°.

HAVEN, a sea-port or harbour. See the article HARBOUR.

HAVEN, a term used by country-people for oats.

HAVENFORD-WEST, a borough-town of Pembroke-shire, in south Wales, situated twelve miles south-east of St. David's. It sends only one member to parliament.

HEVER, a market-town of Essex, twenty-four miles north of Chelmsford.

HAUGH, or HAW. See the article HAW.

HAUNCH, or HANCH, the hip, or that part of the body between the last ribs and the thigh. See the article HIP.

The haunches of a horse are too long, if, when standing in the stable, he limps with his hind legs farther back than he ought; and when the top or onset of his tail is not in a perpendicular line to the tip of his hocks, as it always does in horses whose haunches are of a just length. There are some horses, which, though they have too long haunches, yet commonly walk well: such are good to climb hills, but are not at all sure upon a descent, for they cannot ply their haunds, and never gallop slowly, but always nearly upon a full speed.

The art of riding the great-horse has not a more necessary lesson than that of putting a horse upon his haunches, which in other words is called coupling him well, or putting him well together, or compact. A horse that cannot bend or lower his haunches, throws himself too much upon his shouder, and lies heavy upon the bridle.

HAUNT, among sportsmen, the place to which game are accustomed to resort: among hunters, it is the walk of a deer, or the place of his ordinary pas sage.

All kinds of large fowl that divide the foot, have their haunts by the sides of shallow rivers, brooks, and plashes of water; they delight in boggy places and the sty parts of fens over-grown with rushes, reeds, and ledges, in half drown-

ed moors, and the hollow vales of downs and heaths, where there is shelter for them to lurk in obscurity. Where do not appear in flocks, but they are the best flight for hawks that can be imagined. The leffer fowl, which are web-footed, continually haunt drowned fens, the main stream of rivers where the current is swiftest, and all places where there is plenty of water, in which they may swim undefurbed by man or beast; the wild-goose and barnacle excepted, who like no water above their founding, and seek none but shallow places. These laft are inconceivably delighted with green winter corn, and may always be found where it is sown, especially if the ends of the lands have much water about them.

The smaller fowl frequent small brooks, rivers, ponds, drowned meadows, loughs or lakes, especially if stored with unfrequented islands well furnished with shrubs, rushes, reeds, &c.

HAVER, in geography, a French term signify ing haven. Hence, HAVRE DE GRACE is a port-town of France, in the province of Normandy, situated on the English channel, at the mouth of the river Seine: east longit. 10', and north lat. 49° 30'.

HAUTBOY, a musical instrument of the wind kind, shaped much like the flute, only that it spreads and widens towards the bottom, and is founded through a reed. The treble is two feet long; the tenor goes a fifth lower, when blown open; it has only eight holes; but the bass, which is five feet long, has eleven.

HAW, in botany, &c. A sort of berry, the fruit of several species of meipilus, hence denominated haw-thorns. See the article MESPILUS.

HAW, among farriers, an excrescence resembling a gristle, growing under the neither eye-lid and eye of a horse, which, if not timely removed, will put it quite out. It proceeds from gross, tough, and phlegmatic humours, which falling from the head, and there uniting together, grow to this inffrmity; the signs of which are the watering of the eye, and the involuntary opening of the under eye-lid.

Every farrier can cut it out; but ordinaire the horse must be held fait by the head, and a needle with a strong double thread run through the middle of his upper eye-lid, which must be held open by the thread's being tied to his head: a needle and thread should then be run through the haw, when cutting the skin round

HAU [1560]
round with a sharp pen-knife, the hawk may be plucked out. Then take the blood out of his eye, wash it with beer or ale, and put in a good deal of salt; afterwards wash it again, and stroking it down with your own hand, let him go.

Sheep are cured of this malady by dropping into the eye the juice of chamomile or cow-wheat.

HAW-FINCH, in ornithology, the English name of a bird, known among authors by the name cochothraulus.

HAWK, a synonymous term with falcon, though, by some, restrained to the lesser sort of falcons. See the articles FALCON and FALCONRY.

Others distinguishing hawks into the long-winged and short-winged kinds: of the first kind are the gentle-falcon, gerfalcon, lanner, faker, hobby, and that will make her mount the lure readily, and if with your hawk on your fist; then having loosed her hood, whistle softly, to provoke her to fly, unhood her, and let her fly with her head into the wind, for by that means she will be the better able to get upon the wing, and will naturally climb upwards, flying a circle. After she has flown three or four turns, then lure her with your voice, calling the lure about your head, having first tied a pullet to it; and if your falcon come in, and approach near you, cast out the lure into the wind, and if she stoop to it, reward her.

You will often find, that when she flies from the fist, she will take stand on the ground: this is a fault, which is very common with soar-falcons. To remedy this, fright her up with your wand; and when you have forced her to take a turn or two, take her down to the lure and feed her. But if this does not do, then you must have in readiness a duck head, so that she may see no way but backwards, and that will make her mount the higher. Hold this duck in your hand, by one of the wings near the body; then lure with the voice, to make the falcon turn her head, and when she is at a reasonable pitch, call your duck up just under her, when, if she strike, stoop, or true the duck, permit her to kill it, and reward her by giving her a reasonable gorge. After you have practised this two or three times, your hawk will leave the sfiand, and delighted to be on the wing, will be very obedient.

It is not convenient, for the first or second time, to shew your hawk large fowl; for it frequently happens, that they escape from the hawk, and she not recovering them, rakes after them: this gives the falconer trouble, and frequently occasions the loss of the hawk. But if she happens to puritine a fowl, and being unable to recover it, gives it over, and comes
Some hawks have a disdainful coyness, proceeding from their being high fed: such a hawk must not be rewarded, tho' she should kill; but you may give her leave to plume a little, and then taking a sheep's heart, or the leg of a pullet, when the hawk is busy in pluming, let either of them be conveyed into the body of the fowl, that it may favour of it; and when the hawk has eaten the heart, brains, and tongue of the fowl, take out what is inclosed, call her to your fit, and feed her with it: afterwards give her some of the feathers of the fowl's neck, to fcover her, and make her caft.

If your hawk be a flately high-flying one, she ought not to take more than one flight in a morning; and if she be made for the river, let her not fly more than twice: when she is at the highest, take her down with your lure; and when she has plumed and broken the fowl a little, feed her, by which means you will keep her a high-flyer, and fond of the lure.

HAWSER, in the sea-language, a large rope, or a kind of small cable, serving for various uses a-board a ship, as to fasten the main and fore shrouds, to warp a ship as she lies at anchor, and wind her up to it by a capstan, &c. The hawser of a man of war may serve for a cable to the sheat-anchor of a small ship.

HAWSES, in a ship, are two large holes under the bow, through which the cables run when the lies at anchor. Thus the hawse-pieces are the large pieces of timber in which these holes are made. Hawse-bags, are bags of canvas made tapering, and stuffed full of ocharm; which are generally allowed small ships, to prevent the sea from washing in at these holes: and hawse-plugs, are plugs to stop the hawses, to prevent the water from washing into the manger.

There are also some terms in the sea-language that have an immediate relation to the hawses. As a bodhawse, is when the holes are high above the water. Freye the hawse, or veer out more cable, is used when part of the cable that lies in the hawse is fretted or chafed, and it is ordered that more cable may be veered out, so that another part of it may rest in the hawse. Froze the hawse, that is, lay new pieces upon the cable in the hawses, to preserve it from fretting.

Burning in the hawse, is when the cables endure a violent fires. Clearing the hawses, is disentangling two cables that come thro' different hawses. To ride hawse-full, is when in fires of weather the ship falls with her head deep in the sea, so that the water runs in at the hawses.

HAY, any kind of gras, cut and dried, for the food of cattle.

The time of mowing gras for hay, must be regulated according to its growth and ripeness; nothing being more prejudicial to the crop than mowing it too soon, because the sap is not then fully come out of the root, and when made into hay, it shrinks away to nothing. It must not, however, be let stand too long, till it have filled its feeds. When the tops of the grass look brown, and begin to bend down, and the red honey-fuckle flowers begin to wither, you may conclude it ripe for mowing.

As soon as your grass is mown, if there is plenty of it, and it be thick in the swath, the hay-makers should follow the mowers, and spread the swaths (unless you fear wet,) which is called bedding of them. At night, make it into cocks; and next day, as soon as the dew is off the ground, spread it again, and turn it, that it may dry on the other side. In this manner it is to be spread, turned, and made into cocks at night, till fully dry; and in case the weather seems to threaten rain, it should be made into larger cocks, whereby it will be secured from wet, tho' let stand a day or two. Where thick-leaved weeds are among the gras, it will require more drying and turning than ordinary.

Mowing of land too often is a great prejudice to it, unless constantly renewed by land-floods or marke; so that where these conveniences cannot be had, the lands should be fed once in two or three years; feeding being as necessary for hay-ground, as following is for corn-grounds.

Saint-fode Hay, is of several sorts, which may be distinguished by the following terms.
The virgin. 2dly. The blossomed. 3dly. The full-grown. And, 4thly. The threshed hay. The first of these is beyond comparison the best. It must be cut before the blossoms generally appear; for when it stands till it is full blown, the most spirituous and nourishing parts of its juice are spent, the sap is much impoverished, and the faint-foin can never recover that richness it had in its virgin-state. But this fine hay cannot well be had of uncultivated faint-sain, because that may not be much above an handful high when it is in a condition to be cut; it would then make a very light crop, and would be a great while before it sprang up again: but the rich will have two or three tuns to an acre, and spring again immediately for a second crop; so that little or none in quantity would be lost by so great an improvement of its quality.

The second sort is that cut in the flower, which, tho' much inferior to the virgin-hay, far exceeds any other kind as yet commonly propagated in England; and if it be a full crop, it may amount to three tuns an acre. This is that faint-foin which is commonly made, and the larger it is, the more nourishing it is for horses.

The next sort of faint-foin is the full grown, cut when the blossoms are gone, or going off: this also is good hay, tho' it falls short by many degrees of the goodness of the other two sorts: but it makes a greater crop than either of them, because it grows to its full bulk, and shrinks little in drying.

The last sort is the threshed hay, which when not damaged by wet weather, has been found more nourishing to horses than coarle water-meadow hay; and, when it is cut small by an engine, is good for cattle, and much better than the chaff of corn. The best time to cut it, is when the greatest part of the seed is well filled; the first-blown ripe, and the last-blown beginning to be full.

The goodness of the hay depends greatly upon the manner of ordering it. The best hay in all England is made of faint-foin, without ever spreading it. This method, tho' it be longer before it be finished, costs less labour than the other. If faint-foin be laid up pretty green, it will take no damage, provided it be set in small round ricks, with a large balket drawn up in the middle of each, to have a vent hole through which the super-

fuous moisture of the hay may transpire. As soon as its heating is over, these ricks ought to be thatched; and all faint-foin ricks, that are made when the hay is full dried in the cocks, ought to be thatched immediately after the making them. That which is laid up moist dried, will come out of the rick of a green colour; but that which has been much heated in the rick, will be brown.

The feed affords the owner another opportunity of making a profit of his faint-foin; but this, if the hoeing husbandry were general, would not be vendible in great quantities for planting; because the ordinary crop of an acre, will produce feed enough to drill an hundred acres, which would not want planting for a long time. The other use then of this feed is for provender; and it has been affirmed by some, who have made trials of it, that three bushels of good faint-foin feed given to horses, will nourish them as much as four bushels of oats; and when well ordered, it is so sweet, that most fords of cattle are greedy of it.

Hay, in geography, a market-town in Brecknockshire, south Wales, thirteen miles north-east of Brecknock.

Hay-bote, in law, a liberty to take thorns, and other wood, to make and repair hedges, gates, fences, &c. by a tenant for life or years.

Hay-bote is also taken for wood for the making of rakes and forks, used in making hay.

Haylesham, a market-town of Sul
dex, situated ten miles east of Lewes.

Hay-market, a particular place in London, or its suburbs, where hay is sold, and where all carts of hay that stand to be sold there pay 3 d. per load towards paving the streets. The new hay sold in London, &c. between the first of June and the last of August, ought to weigh sixty pounds a truf; and old hay, the other part of the year, is to weigh fifty-six pounds, the seller being liable to forfeit 2s. 6d. for every truf under that weight.

Hayn, a town of Silesia, in the territory of Lignits, thirty-five miles north-west of BREUSS: east long. 16° 5', north lat. 51° 17'.

Haynan. See the article Hainan.

Haynaught, a province of the Netherlands, bounded by Brabant and Fland
ers, on the north; by Namur and Liege, on the east; by the Cambresis, Picardy, and Champaign, on the south; and by Artois,
Artois, and another part of Flanders, on the west; the north part is subject to the house of Austria, and the south part to France. Its capital is Mons.

HAYWARD, the person who keeps the common herd or cattle of a town. He is appointed by the lord's court, and his office is to see that the cattle neither break nor crop the hedges of inclosed grounds; he is also to look to the fields, and impound cattle that commit trespasses therein.

HAZARD, a game on dice, without tables, therein.

It is played with only two dice; and as is very properly called; makes a man, or undoes him.

It longing to the caster, and the former, or main, to the other gamblers. There can der five; so that five, and nine, nine, five to eight, hazard. Chances and nickes are from £x, eight to iliort, chance to five; and ther when the chance is the same with of the seen it not. Now nickes are ei­ames-ace and duce-ace, are out to all fares, or trey-duce, and twelve. Here

But to illustrate this game by a few ex­amples: suppo the main to be seven, and the caster throws five, which is his chance; he then throws again, and if five turn up, he wins all the money set him; but if seven is thrown, he must pay as much money as there is on the board: again, if seven be the main, and the caster throws eleven, or a nick, he sweeps away all the money on the table; but if he throws a chance, as in the first cafe, he must throw again: lastly, if seven be the main, and the caster throws ames-ace, duce-ace, or twelve, he is out; but if he throws from four to ten, he hath a chance; though they are accounted the worst chances on the dice, as seven is reputed the best and easiest main to be flung. Four and five are

bad throws (the former of which being called by the tribe of nickers, little dicky­fifer) as having only two chances, viz. trey-ace and two duces, or trey-duce and quarter-ace; whereas seven hath three chances, viz. cinque-duce, face­ace, and quarter-trey. Nine and ten are in the like condition with four and five; having only two chances. Six and eight have indeed the same number of chances with seven, viz. three; but ex­perienced gamblers nevertheless prefer the seven, by reason of the difficulty to throw the doublets, two quaters, or two treys. It is also the opinion of most, that at the first throw, the caster hath the worst of it.

On the whole, hazard is certainly one of the most bewitching and ruinous games played on the dice. Happy, therefore, the man who either never heard of it, or who has resolution enough to leave it off in time. See the articles Chance and Gaming.

HAZLE, coryliis, in botany. — See the article Corylus. Witch-Haze, a name sometimes given to the elm. See the article Elm.

HAZLE-EARTH, or HAZLEY-EARTH, in agriculture, a kind of red loam, which is said to be an excellent mixture with other sorts of earth; uniting what is too loose, cooling what is too hot, and gently entertaining the moisture.

The best manure for a hazley soil is marl, chalk, and sea-coal ashes. See Marl, Chalk, and Ashes.

HAZLE-HEN, a bird of the size of a mod­erately grown pullet; it is a species of tetroa, with a grey tail, spotted and facri­ficated with black, frequent in many parts of Europe. See the article Tetrao.

HEA, a province of the empire of Morocco, situated on the ocean, south-west of Morocco proper.

HEAD, caput, in anatomy, the uppermost part of the body of an animal. The head is the first of the five divisions into which anatomists distinguish the human body, consisting of the head, neck, thorax, abdomen, and extremities. See the article Neck, &c.

The first parts to be distinguished in the head, are the hairy part, or scalp; and the naked part, or the face; after which we are to attend to the division into the occiput and occipit, the fore and hinder part of the head; the temples, the crown, or vertex; the bucca, the cheeks, and the philtrum, or lacuna. See the articles Scalp, Face, &c.
The coverings of the head are, first, the hair; secondly, the skin; thirdly, the membrana cellulosa; and, fourthly, the muscles. See Hair, Cutis, &c.

Besides the external integuments of the head, there is an aponeurotic expansion which covers the head like a cap, and is spread round the neck, and on the shoulders, like a riding-hood; and for this reason Windlow gives it the name of coif, and calls the superior portion of it the aponeurotic cap.

The head contains in the cavity of the bones of the skull the chief organ, or primum mobile of the whole animal economy; the face is the seat of several other particular organs, which are greatly compounded. The proper containing other particular organs, which are greatly formed, are the pericranium, and the bones of the skull: the parts contained are the membranes of the brain, the brain itself, and the vessels. See Brain.

With regard to the bones of the head, it may be observed, that the head expresses that part of the skeleton which is placed upon the top vertebra of the neck, and in this view is divided into the cranium or skull, and maxillae. See the articles Skull and Maxillae.

The whole head of the skeleton is spheroidal, composed as it were of two ovals a little depressed on each side: one of them is superior, the extremities pointing forward and backward; the other is anterior, the extremity being turned upwards and downwards, in such a manner as that one extremity of each oval meets, and is lost in the other, at the place particularly known by the name of the forehead.

This complex figure being viewed sideways, represents a spheroidal triangle; and we ought farther to observe, that the oval of the skull is broader behind than before, and that of the face broader above than below.

For the arteries and veins of the head, see the articles Artery and Vein.

For the glands and muscles, see the articles Gland and Muscle.

Diseases of the Head, are often mistaken, even by physicians, for those of other parts. Some physicians tell us, that those who are subject to disorders of the head, ought not to take any food at night.

Head-ach, a most troublesome sensation in the nervous membranes of the head, produced by various causes, and attended with different symptoms, according to its different degrees, and the place where it is seated.

The most common seat of this disease is the pericranium. It may likewise be in the skin that covers the skull, and in the dura mater: this last but seldom happens, but when it does it is very dangerous. There may likewise be a very acute pain in the thin membrane that covers the sinuses of the os frontis.

If the head-ach be slight, and afflicts a particular part of the head, it is called cephalalgia; if the whole, cephalæa; if one side only, hemicrania; if there is a fixed pain on the top of the head which may be covered with the end of the thumb, it is called clavus hystericus.

The general cause of the head-ach, according to Hoffmann, is a hindrance of the free circulation of the blood through the vessels of the head.

When the blood rushes with impetuosity, and in too great plenty into the membranes, which may happen to the plethoric, to those whose usual bleeding at the nofe is suppressed, and to young persons, there is a pain in the whole head, which becomes hot, swells, aches, and looks red; the vessels swell, and there is a strong pulsation in those of the neck and temples. The nostrils are dry and parched; there is a burning heat, and drought in the fauces.

When the vessels of the head are filled with a mucous serum from a slippage of the running of the nofe, then there is a heavy obtuse pressing pain chiefly in the fore part of the head, in which there seems to be such a weight, that the patient can scarce hold it up: sometimes the skin is so swelled that it will pit; sometimes it happens from the scrous, sharp, caustic matter of the French disease, which infects the pericranium, and often causes a caries in the skull: sometimes it may proceed from matter of a saline, caustic nature, driven back from the external parts, as in the gout, itch, erysipelas of the head, gutta rosacea, the small-pox and measles, before the morbid matter is expelled to the outward skin, or, which is worse, when it is driven back. In these cases where a small quantity of caustic matter causes the pain, it rather proceeds from a violent irritation of the membranes than from their distention.

There is likewise a most violent, fixed, constant, and almost intolerable head-
which brings on a debility both of body and mind, hinders sleep, disturbs digestion, destroys the appetite, causes vertigo, dizziness of sight, blindness, a noise in the ears, convulsions, and the epilepsy; and by contact of the other nervous parts of the body, produces vomiting, costiveness, coldness of the external parts, and the countenance of a dying person.

Sometimes the head-ach is symptomatic, and attends upon continual and intermittent fevers, and especially the quartan, irregular flowing of the mensies, the hypochondriac passion, and the like. A hemiplegia generally proceeds from a fault in the stomatch from crudities or indigestion, and commonly appears when digestion is performed.

The curative indications are, 1. To divert the impetus of the blood and humours from the head, and to diffuse them by suitable remedies. 2. To relax the spastic fractures of the membranes, the cause of which is a sharp caustic matter, that the fluids may have a free circulation.

3. To correct the peccant matter, and evacuate it gently through the most convenient emunctories. 4. To prevent a return by strengthening the whole nervous system, by proper remedies, and especially by an accurate diet and regimen.

When the blood rushes to the head in too great quantity, bleeding is necessary, more particularly under the tongue, in the forehead, in the jugulars, or by leeches behind the ears. If the body abounds with too much blood, it will be best to bleed in the angle first, and the next day, or a day after, in a vein about the head. But first of all cleanse the body by an emollient dyder, or by giving an infusion of rhubarb and manna, with cream of tartar.

To restrain the organ of the blood, it will be proper to give a diaphoretic and aperient mixture, with diaphoretic antimony, purified nitre, burnt hart's horn, and diacodium, diluted with a sufficient quantity of suitable simple distilled waters. But if the head-ach proceeds from a copious vitiated serum flagging in the membranes, either within or without the skull, with a dull heavy continual pain, which will neither yield to bleeding nor gentle laxatives, then more powerful remedies are required to dissolve the thick glutinous humours, and to carry them off by stool.

Take of pure gum ammoniac, sagapenum, the best myrrh, roasted aloea, extract of black hellebore, resin of jalap, mercurius dulcis, and prepared cinnabar, each half a dram; of the extract of saffron, of the powder of caftor, and of the salt of amber, each fifteen grains. Make them into a mass; out of every scruple of which make twelve pills; fix of which may be taken at night, and the other six in the morning. On the day the pills are taken, let the patient take nothing but thin broths. After three days, they may be repeated again: when the vitiated serum has been sufficiently evacuated, then give strengthening remedies mixed with diuretics; at the same time the patient should use exercise to make him sweat, with strong frictions, and such aliment and liquors as tend to promote a diacree by urine. See Diuretic.

If this method fails of success, apply a blister made with an ounce of the emplastrum attrahens, and a dram of cantharides, adding a few grains of camphor. It may be of the size of a crown-piece, and applied to the nape of the neck; it should be often renewed, and continued for a long time. When the difeafe is evident to the sight and touch, from the serum flagging under the skin of the head, a blister may be laid all over the head, with great advantage. See the article Vesicatory.

When there is any intense pain remaining fixed in one place lying pretty deep in the membranes, the herb ranunculus used as a vesicatory, has a wonderful efficacy: the leaves must be bruised in a marble mortars, and the part, if hairy, shaved; then a flicking platter is to be laid on it, with a hole about the bigness of a silver-penny, and the leaves over that, just in the same manner as a caustic. See the article Caustic.

If it is caused by a suppression of a coryza, a snelling-bottle of volatile salts should be held frequently to the nose, or the patient may take herb snuff, with the addition of flowers of benjamin and powder of cloves. See Catarrh.

When the head-ach arises from a corrupted mass of blood and an impure serum, as in the scurvy, and lues venereum, a decoction of the woods, with crude antimony, may be serviceable; after evacuations with the pills recommended above, fasting a day now and then with labour and exercise, may be useful; as also a sudorific. See the articles Exercise and Sudorific.
HEA

A hemicrania, especially a periodical one, is generally owing to a foulness in the stomach, and præmie visæ, for which gentle emetics will be beneficial; as also purgatives, to drive the humours from the head; afterwards stomachics. If it proceeds from profuse evacuations of the menes or hæmorrhoids, those fluxes must be reduced within bounds. See the article FLUX, &c.

If the head-ach is so intolerable as to endanger the patient's life, or is attended with continual watching, fainting fits, a fever, an inflammation, or a delirium, recourse must be immediately had to opiates, with native cinnabar, or hæmorrhoids, then when it is fractured, because of the greater commotions of the brain, &c. and therefore concludes it necessary to perform the operation of the trepan oftener than is commonly practisèd.

Head is also used for the top or extremity of any thing; thus we say the head of a tree, the head of a bone, the head of a muscle, the head of a nail, &c.

Head, in architecture, an ornament of carved work, or sculpture, frequently serving as the key of an arch, or plat-band, on other occasions. These fott of heads usually represent some of the heathen divinities, virtues, seasons, ages, &c. with their attributes, as a thunderbolt for Jupiter, a diadem for Juno, a trident for Neptune, a crown of ears of corn for Ceres, a helmet for Mars, a caduceus for Mercury, &c.

The heads of beasts are also used in places suitable, as an horse's head for an equery; a deer's or boar's head, for a park or forest; a dog's head for a kennel; a bullock's or sheep's, for a shambles or market-houle. In the metopes, friezes and other parts of certain antique doric-temples, we see representations of bullocks, or rams-heads, as a symbol of the sacrifices offered there.

Head, in heraldry. The heads of men, beasts, or birds, are very frequent in armoury, and borne either full-faced, looking forward, or side-faced in profile, when only one half of the face appears, which differences ought to be mentioned in blazoning, to avoid mistakes; as a head, or heads fronting; or a head, or heads side-faced, or in profile: thus, Vert, a chevron guules, between three turks-heads couped side-faced proper, is borne by the name of Smith. And again, Or, acros gules, between four blackmoors heads, couped at the shoulders proper, is borne by the name Juxon. As the head is the principal part of the body, so it is of course the noblest bearing.

Among medallists, the different heads on antient coins, are distinguished by the different dresse thereof. See MEDAL.

In the imperial medals, where the head is quite bare, it is usually a sign the person was not an emperor, but one of the children of an emperor, the presumptive

HEA

Fissure, Fracture, Trepan, &c.

Mr. le Dran, in his observations on the wounds of the head, shews how much more dangerous the case is, when the cranium does not break by violent blows, &c. than when it is fractured, because of the greater commotions of the brain, &c. and therefore concludes it necessary to perform the operation of the trepan oftener than is commonly practisèd.
HEA [1568] HEA

heir of the empire. The heads which are covered, are either covered with a diadem, or a crown, or a simple cowl, or a veil, with some other foreign covering; whereof the diadem is the most antient. The heads of deities are distinguished by some special symbol thereof.

HEAD, among huntmen, is used for the horns of a deer, as a hart, buck, &c. See ANTLERS, ROYAL, CROCHES, &c.

HEAD, in the manage. Head of a horse imports the action of his neck, and the effect of the bridle, and the writh: this horse plants his head well, and obeys the hand; such a horse refuses to place his head; he shoots out his nose, and never reeds right on the hand, &c. For the properties of the head of a horse. See HORSE.

To give a horse head. See the articles PARTIR and ÉCHAPER.

HEAD in and likewise the hips. You must passage your horse-head and crouse in, i.e. work him side-ways upon two parallel lines, at step or trot, so that when the horse makes a volt, his shoulders mark a piste, or tread at the same time, that his haunches give the trast of another, and the horse plying or bending his neck, turns his head a little within the volt, and so looks upon the ground he is to go over.

HEAD, in the military art. Head of a work is the front of it next the enemy, and farthest from the place, as the front of a hornwork is the distance between the flanked angles of the demibastions; the head of a double tenaille is the fallant angle in the middle; and the two other sides which form the re-entering angles. See the article FRONT, &c.

HEAD, in painting, sculpture, &c. a representation of that part of the human body, whether in colours, draught, or cœraux: if taken from the life, or supposed to bear a just resemblance to the person, it is more properly called portrait. See the article PORTRAIT.

HEAD-BOROW, the person who is chief of the frank-pledge in boroughs, or who antiently had the government within his own pledge. See FRANK-PLEDGE.

HEAD-BOROWS, at this time, are a kind of constables. See CONSTABLE.

HEAD-FARCIN. See the article FARCIN.

HEAD-LAND, in husbandry, is taken to signify the upper part of land left for the turning of the plough. HEAD-LAND, in the sea-language. See LAND.

HEAD-LINES, in a ship, those ropes of all sails which are next to the yards, and by which the sails are made fast to the yard. See SAIL and YARD.

HEAD-PENCE, a certain sum antiently collected by the sheriff of Northumberland, of the inhabitants of that county, without any account to be given thereof to the king, which exaction was abolished by Hen. VI.

HEAD-SEA, is when a great wave or billow of the sea comes right a-head of the ship, as she is in her course.

HEAD-SAILS, in a ship, those which belong to the fore-mast, and boltspirt: for it is by these that the head of the ship is governed, and made to fall off and keep out of the wind; and these in quarter-winds are the chief drawing sails.

HEAD-SILVER, a fine paid to the lords of the tent. See the article COMMON-FINE.

HEAD-STALL, in the manage. See the article CAVESON.

HEAD-STALL, among musicians. See the article PHORBÉA.

HEAD-TIN, in metallurgy, a preparation of tin-ore toward the fitting it for working into metal. When the ore has been pounded and twice washed, that part of it which lies uppermost, or makes the surface of the mass in the tub, is called head-tin: this is separated from the rest, and after a little more washing becomes fit for the blowing-house.

HEAD of a ship, or other vessel, is the prow, or that part which goes foremost.

Moor’s HEAD is understood of a horse with a black head and feet; the body being usually of a roan colour. Among engineers a moor’s head is used for a kind of bomb or granado shot out of a cannon. Among chemists it is a cover, or capital, of an alembic; having a long neck to convey the vapours raised by the fire into a vessel, which serves as a refrigeratory. See ALEMBIC.

Dragon’s HEAD, in astronomy, &c. is the ascending node of the moon, or other planet. See the article NODE.

HEADS, a term used by builders for that kind of tile which they use to lay at the caves of a house; being the full breadth of a common tile, and but half a tile in length. See the article TILE.

HEADFORD, a town of Galway, in Ireland, twelve miles north of the city of Galway.

HEADON, or HEYDON. See HEYDON.

HEALFANG, or HALSFANG. See the article HALSFANG.

HEALING, is used, by surgeons, for the curing of wounds, ulcers, and other ills.
HEALTH, is a right disposition of the body, and of all its parts; consisting in a due temperature, a right conformation, just connection, and ready and free exercise of the several vital functions. Health admits of latitude, as not being the same in all subjects, who may yet be said to enjoy health.

That part of medicine, which shews the means of preserving health, is termed Hygiene. See the article HYGIENE.

The Greeks and Romans deified health, daughter of 

HEA

[1569] HEA

See the articles Wound, Ulcer, Tumour, &c.

HEALING, in architecture, the covering a roof with lead, tiles, slate, or the like.

HEAN, in beafts, is the fame with the succundies, or after-birth in women.

The medicines proper to expel it, are thyme, winter-favoury, and penny-royal, boiled in white wine and given inwardly; as also common hore-hound stewed in white wine. Dittany put up in form of a peffary, drives out a dead foal, and produces the fame effect; fo does parlley-feed, alexanders, hops, fennel, savin, and bay-berries.

HEAM, a town of Tonquin, in the farther India, situated on the river Domea, eighty miles north of the bay of Tonquin: east long. 107°, north lat. 22°.

HEARING, auditus, the fene whereby we perceive sounds. See Sound.

The organ of hearing is the ear, and particularly the auditory nerve and membrane. See the article Ear.

This membrane, in the various degrees of tension and relaxation, adapts itself to the several natures and states of noxious bodies; becoming tense for the reception of acute sounds, and relaxed for the admission of grave sounds. In short, it is rendered tense and relaxed in a thousand different degrees, according to the various degrees of acuteness or gravity in sounds.

Sound, then, is in effect nothing but a certain modulation of the air, which being collected by the external ear, passes thro’ the meatus auditorius, and beats upon the membrane of the tympanum, which moves the bones in the tympanum: these move the internal air, which finally communicates the motion to the auditory nerve, in the labyrinth and cochleae; and according as the vibrations are quick or slow, the sound is either acute or grave.

The curious structure of the labyrinth and cochlea, serves to make the weakest sounds audible; for the whole organ of hearing being included in a small space, the impression would have been made only on a very small part of it, had the auditory nerve run in a straight line; and the strength of the impression being, cæteris paribus, always as the number of parts upon which the impression is made, those sounds which are now low, could not have been heard at all. If, like the retina, the auditory nerve had been expanded into a large web, that had covered or lined some wide cavity, even in this case the impression of sounds had been much weaker than they are now: for this large cavity would have given room for the sounds to dilate, and all sounds grow weaker in proportion as they dilate: but in the present structure of the labyrinth and cochleae, both these inconveniences are prevented; the canals of which, by their winding, contain large portions of the auditory nerve; upon every point of which, the smallest sound being once impressed, becomes audible; the sounds are hindered from dilating, by their narrowness; and the impressions that are made upon the nerves, by the first dilatation, are ever the strongest. In like manner, the strength of the impression is increased in the narrow canals, by means of the elasticity of the sides of the bony-canal; which receiving the first and strongest impulses of the air, reverberate them the more strongly upon the auditory nerve.

It deserves observation, that though the air be the usual matter of sounds; so that if a bell be hung in vacuo, it will not be heard at all; yet most other bodies, properly disposed, will do its office, only some more faintly than others. Thus a sound may be heard through water, or even through earth, of which there are various instances.

As the sight is assist'd by spectacles, or other glasses, so the hearing is enlivened and rendered quick, by means of acoustic instruments; which are of various figures, but for the most part bear some resemblance to a trumpet, diverging and growing wider towards the external mouth,
mouth, marked BB, (plate CXXVII. fig. 3. n° 1) the slender part A being introduced into the ear. But besides this common kind, those represented ibid. n° 2 and 3, are highly commended; but especially the third one, which by reason of its smallness, and form, being wreathed up like a spiral shell, may be so concealed under one's hair or wig, as scarce to be observable; whilst the slender part A is introduced into the ear, and the cords BB tied round it. However, it is to be observed, that the simple kind almost in the shape of a horn, (ibid. n° 1.) and made either of brass, silver, &c. is the best instrument hitherto invented for affilting the hearing. 

Dulness of Hearing. See the articles DEAFNESS and EAR.

Some recommend the following medicate for dulness of hearing: Take essence of amber, a dram; caldor and oil of chamomile, of each half a scruple; and oil of amber, one drop; mix them all together, and three or four times a day put a piece of cotton, wetted in the mixture, into the ear.

The drinking of mineral waters every spring in a regular manner, is also recommended as a preventive from this disordered.

HEARSE, among sportsmen, a kind of the second year of her age. See HIND.

HEART, cor, in anatomy, a muscular body, included in the pericardium, and situated nearly in the middle of the breast, between the lobes of the lungs; being the primary organ of the circulation of the blood, and consequently of life. Its figure is nearly conic, the larger end being called its base, and the smaller end its apex. Its lower part is plane, and the upper part convex. Its situation is nearly transversely, or horizontal; so that its base is in the right, and its apex, with the greatest part of its bulk, is in the left side of the thorax; and consequently, it is there that the pulsation is felt.

The plane surface of the heart lies on the diaphragm; the convex one is turned upwards. The heart is connected, 1st, by the intervention of the pericardium with the mediastinum, and with a large part of the middle of the diaphragm; this is contrived by nature, to prevent its being displaced, inverted, or turned too rudely about, in consequence of the various motions of the body. 2. Its base is connected to its common vessels; but its apex is free, and is received into a kind of cavity in the left lobe of the lungs.

The length of the human heart is about six fingers breadth; its breadth at the base, is about five fingers; and its circumference about thirteen. It is, both externally and internally, surrounded with a smooth membrane. There is a quantity of fat about it, which covers its base and its apex, and serves for lubricating it, and for facilitating its motions. Its blood-vessels are of two kinds, common and proper; its common or peculiar vessels being the coronary arteries and veins.

The common vessels of the heart are two veins, called the vena cava, and the vena pulmonalis; and two arteries, the pulmonary one and aorta. The nerves of the heart are small, and arise from the par vagum and intercostals. The auricles are two. See VEIN, ARTERY, &c.

There are also two cavities in the heart, called its ventricles: of these the right is thinner and weaker in its circumference, but usually much more capacious than the left: it receives the blood from the vena cava, and the right auricle, and delivers it into the pulmonary artery, to be carried to the lungs. The left ventricle is much stronger and thicker in its sides; but it is narrower and smaller than the right: it receives the blood from the pulmonary vein, and the left auricle, and extrudes it very forcibly into the aorta. The right ventricle is in the anterior part of the thorax; the left in the hinder part; so that they might be called the anterior and posterior ventricles, much more properly than the right and left. See CIRCULATION.

There are in the sides of both the ventricles of the heart, and of both its auricles, several columnæ carnea, or lacertuli, with furrows between them, leeming so many small and distinct muscles; and from the concourse of the tendinous fibres of theiè in the heart, there are formed peculiar membranes situated at the orifices of the auricles of the heart; and there are also other columns of this kind, which run transversely from one side of the ventricles to the other: these serve partly to affist the contraction of the heart in its systole, and partly to prevent its too great dilatation in its diastole. See the article SYSTOLE AND DIASTOLE.

The valves of the heart are of three kinds. 1. The tricuspidales: these are three
Fig. 1. The HARE.

Fig. 2. HATCHET.

Fig. 3. HEARING.

Fig. 4. HASTATED LEAF.
three in number, and are situated at the
ingress of the vena cava in the right
ventricle. 2. The mitrals: these are
two, and are situated in the left ventricle
at the ingress of the pulmonary vein: 
these serve to hinder the ingress of the
blood from the heart into the veins again,
while they are constricted. 3. The fe-
miliar ones: these are three, and are
situated at the origin of the aorta and
pulmonary artery, and serve to prevent
the reflux of the blood from them into
the heart: these, for the sake of strength,
are furnished with a number of fleshy
fibres and spheroide corpuscles.

The orifices of the veins of Thebesius
and Verheyen, in the hollows of the heart,
are for conveying back the blood from the
substance of the heart to its cavities.
The fibres of the heart are of a molecu-
lar substance, and of a most amazing fa-
bric. They are of two kinds: 1. Straight
ones in the left ventricle; and, 2. Spiral
ones, common to both ventricles, and of
two orders. The exterior ones run to the
left, from the base of the heart: the
interior ones run to the right, and inter-
sect the others; and, when they act,
they closely confine the cavities of the
heart, and drive out the blood from them.

According to this fabric, the heart may
be resolved into two muscles, each of
which constitutes one of its ventricles.
The use of the heart, is for the circu-
lization of the blood. It receives the blood
from the veins, running from all parts of
the body; and propels it again, by its
own motion, to all those parts, through
the arteries. On this depend life itself,
the preservation of the frame, and the
movements and actions of all its parts. See
the article CIRCULATION of the Blood.

This motion of the heart is wonderful: it
continues to the utmost period of life,
day and night, without a single moment's
interruption or intermission; and is per-
formed more than an hundred thousand
times every day. Here is, indeed, some-
thething like what the mechanists want, un-
der the name of a perpetual motion; and
the stupendous wisdom of the creator is,
in nothing, expressed more gloriously.

But that the reader may have as distinct
an idea as possible of this primary organ of
life, we shall lay before him several views
of it. That exhibited in plate CXXVIII,
no. 1. represents the human heart seen
in its convex part, and in its natural
situation; where B marks the branches
of the coronary vein; C, the coronary
artery; D, the right auricle; E, branches
of veins going from the right auricle;
G, the trunk of the aorta; H, the trunk
of the pulmonary artery; I, the ascend-
ing trunk of the vena cava; K, the de-
scending trunk of the vena cava; L, L,
&c. branches of the aorta, rising up-
wards; M, one of the branches of the
pulmonary artery; N, N, &c. branches
of the pulmonary vein. No 2. ibid.
represents the heart opened, to shew the
structure and form of its ventricles;
where A expresses the muscular septum,
or partition, which divides the ventricles;
B, the right ventricle opening into the
right auricle, and into the trunk of the
pulmonary artery; C, the left ventricle,
opening into the left auricle, and into the
great trunk of the aorta. No 3 and
no. 4, ibid. represent the heart in dif-
terent positions; where A marks the
ascending trunk of the vena cava; B the
trunk of the aorta, C branches of the
pulmonary vein, D the descending trunk
of the vena cava, and E part of the right
auricle, cut away, to shew the different
arrangement of the internal fibres and
venous ducts.

Force of the Heart. Several ingenious
persons have, from time to time, attemp-
ted to make estimates of the force of the
blood in the heart and arteries; who
have as widely differed from each other,
as they have from the truth, for want of
a sufficient number of data to argue
from. This let the truly ingenious Dr.
Hales upon making proper experiments,
in order to ascertain the force of the
blood in the veins and arteries of several
animals. If, according to Dr. Keil's estima-
ete, the left ventricle of a man's heart throw out
in each systole an ounce, or 1. 618 cubic
inch of blood, and the area of the orifice
of the aorta be = 0.4187; then divid-
ing the former by this, the quotient 3.9
is the length of the cylinder of blood,
which is formed in passing thro' the aorta
in each systole of the ventricle; and in
the seventy-five pulses of a minute, a
cylinder of 292.5 inches in length will
pass: this is at the rate of 1440 feet in
an hour. But the systole of the heart
being performed in one third of this
time, the velocity of the blood in that
instant will be thrice as much, viz. at
the rate of 4386 feet in an hour, or 73
feet in a minute. And if the ventricle
throws out one ounce in a pulse; then
in the seventy-five pulses of a minute,
the quantity of blood will be equal to 4.41 lb 11 oz. and in thirty-four minutes a quantity equal to a middle-aged man, viz. 158 lb. will pass through the heart. But if, with Dr. Harvey, and Dr. Lower, we suppose two ounces of blood, that is, 3.276 cubic inches to be thrown out at each sphygm of the ventricle, then the velocity of the blood in entering the orifice of the aorta, will be double the former, viz. at the rate of 146 feet in a minute, and a quantity of blood equal to the weight of a man's body will pass in half the time, viz. 17 minutes. If we suppose, what is probable, that the blood would rise 7+1 feet high in a tube fixed to the carotid artery of a man, and that the inward area of the left ventricle of his heart, is equal to fifteen square inches; these multiplied into 7+1 feet give 1350 cubic inches of blood, which presses on that ventricle, when first it begins to contract, a weight equal to 51.5 pounds.

What the doctor thus calculates, from supposition, with regard to mankind, he actually experimented upon horses, dogs, fowls, &c. by fixing tubes, in orifices opened in their veins and arteries; by observing the several heights, to which the blood rose in these tubes, as they lay on the ground; and by measuring the capacities of the ventricles of the heart, and orifices of the arteries. And that the reader may the more readily compare the said estimates together, he has given a table of them, ranged in the following order.

<table>

Dr. Jurin likewise deduces the force of the heart from the laws of hydraulics, in the following manner. He supposes \( p \) to be the weight of the left ventricle, or a quantity of blood equal to the same weight; \( S \) the internal surface of the heart; \( l \) the mean length of the filaments of blood issuing from the heart; \( s \) the section of the aorta; \( q \) the quantity of blood contained in the left ventricle; \( t \) the time in which the blood would be expelled from the heart, taking away the resistance of the arteries, and of the blood going before; \( \omega \) the variable velocity with which the blood issuing from the heart would flow thro' the aorta, abstracting from the resistance; \( x \) the variable length of the aorta, described by the blood gushing from the heart; \( z \) the time in which the length \( x \) is described. Hence the mean variable velocity, of the blood contiguous to the ventricle, or the mean velocity of the ventricle itself, is \( \frac{\omega}{z} \); the motion of the ventricle is \( \frac{p}{S} \times \frac{\omega}{z} \); the motion of the issuing of the blood is \( \frac{\omega}{z} \times \left( l + x \right) \); the sum of these, or the power of the ventricle is \( \frac{\omega}{z} \times \frac{p}{S} + l + x \). But it is 
\[ \omega = \frac{x}{z}. \]
Whence by Newton's inverse method of fluxions, the power of the ventricle will be found \( \frac{sx}{z} \times \frac{p}{S} + \frac{z}{x} + l \).

Now, since \( z = t \), it will be \( sx = q \). Hence the power of the ventricle is \( \frac{q}{t} \times \frac{p}{S} + \frac{q}{t} + l \). In the same manner the power of the right ventricle will be found \( \frac{q}{t} \times \frac{p}{S} + \frac{q}{t} + \lambda \). Here the same things are signified by the greek letters in the right ventricle, as by the italic letters in the left. Hence the whole power of the heart is \( \frac{q}{t} \times \frac{p}{S} + \frac{q}{t} + \frac{q}{t} + \frac{q}{t} + l + \lambda \).

E. I.

If we suppose \( p = 8 \) ounces avoirdupois = 13.128 cubic inches; \( q = 4 = 6.564 \) cubic inches; \( S = 10 \) square inches; \( l = 3 \) inches; \( x = 1 \frac{1}{2} \); \( s = 2 \) ounces avoirdupois = 3.282 cubic inches; \( s = 0.4189 \) square inches; \( \frac{q}{t} = 0.383 \); \( t = 0.4 \). The power of the ventricles will be equal to the motion of the underwritten weights.

Of which weights the velocity will be such, as that a line of an inch long might be described by the distance in a second.

Weight, &c. of the Hearts of children, compared with those of grown persons.

Dr. Bryan Robinson has made several useful observations on this subject, which are as follow.

1. The weight of the heart with respect to the weight of the body, is greater in children than in grown persons, in proportion of 3 to 2. Hence the weight of the heart, with respect to the weight of the body, lessens continually from the birth, till the bodies come to their full growth.

2. The quantity of blood which flows through the heart or lungs in a given time, in proportion to the weight of the heart, or quantity of blood contained in the body, which quantity of blood is proportional to the weight of the heart, is greater in children than in grown bodies, in the proportion of 20 to 7; which is the proportion of their pulses in a minute. Hence, the quantity of blood that flows through the heart or lungs in a given time, in proportion to the whole quantity of blood contained in the body, lessens continually from the birth, till bodies arrive at their full growth.

3. The velocity of the blood with respect to its quantity, which quantity is as the weight of the heart, is much greater in children, than in grown persons, in the proportion of 80 to 7. Hence, the blood of children moves faster than the blood of grown people; yet for its quantity, it moves much quicker, and passes much oftner thro' the lungs. On which account the blood of children, notwithstanding the slowness of its motion, may by paffing oftner through the lungs, and thereby receiving more of the acid of the air, in proportion to its quantity, be more fluid, and of a brighter colour, than the blood of grown persons.

4. The quantity of blood that flows through the heart or lungs in a given time, in proportion to the weight of the body, is greater in children than in grown bodies, in the proportion of 39 to 7. Hence, though the velocity of the blood is less in children than in grown bodies, yet its motion with respect...
HEAT, in physiology, one of the secondary qualities of bodies, produced by fire, and opposed to cold. See Cold.

Under the article fire, we considered the sun as the principal source of heat upon the earth's surface, and the confines of the earth and atmosphere: without this, all the bodies upon our globe would doubtless grow rigid, lifeless, and fixed. It is this that first within them, as the idea of heat in our mind; and in the hot body, according to Locke, it is a particular idea or disposition of the soul.

Heat in us is properly a sensation, excited by the action of fire; or it is the effect of fire on our organs of feeling. See Fire. Hence it follows, that what we call heat is a particular idea or modification of our own mind, and not any thing existing in that form in the body that occasions it. Heat, says Mr. Locke, is no more in the fire that burns the finger, than pain is in the needle that pricks it. In effect, heat in the body that gives it, is only motion; and in the mind, only a particular idea or disposition of the soul.

Heat in the hot body, according to 's Gravefande, is an agitation of the parts of the body, made by means of the fire contained in it; by such an agitation a motion is produced in our bodies, which excites the idea of heat in our mind; so that heat in respect of us is nothing but that idea, and in the hot body nothing but motion. If such motion expel the fire in right lines, it gives us the idea of light; if in a various and irregular motion, only heat. See Light.

Heat, with respect to our sensations, or the effect produced on us by a hot body, is estimated by its relation to the organ of feeling; no object appearing to be hot, unless its heat exceed that of our body. Whence the same thing to different persons, or, at different times, to the same person, shall appear both hot and cold. The degree of heat is measured by the expansion of the air, or spirit in the thermometer. See Thermometer. Under the article fire, we considered, among the several other properties of heat, its quality of expanding and dilating bodies. It is found to expand metals considerably, as appears from an experiment of Mulchenbroek; the effects of which experiment are digested in a table, which having the degrees of expansion marked in equal parts to the 2nd part of an inch, we have given under the article Expansion.

The ingenious Mulchenbroek contrived a machine for measuring the least alteration of dimensions in metals by heat, the description of which is this: plate CXXVI. n° 1. represents the whole machine with all its parts together, as it is used. At one end of this is a brass machine, LE, ER, which for the better shewing its parts is delineated, (ibid. n° 2.) as seen from another side. D is a circular plate 2½ inches diameter, the circumference of which is divided into degrees; this plate stands upon four pillars EEE, which join it to the lower brass plate; and between the two plates, there is a perpendicular steel-arbor or axis F, which has on its lower part a pinion of six leaves or teeth, and on its upper end a wheel of sixty teeth, marked G: there is also another axis IH, supported by a cock H, which comes down from the upper plate; serving to turn the index IK, and having at its lower end a pinion of six leaves to take the teeth of the wheel G, by one turn of which wheel the index is carried round all the divisions: L is a rack, or straight piece of metal with teeth, which take the leaves of the pinion F, while it slides along under two small cocks PP; being pressed towards the pinion F by means of two screws, M, M; or drawn from it as there is occasion: there are twenty-five teeth in each inch of this piece; and as it moves forward and backward, the pinion F is carried round, and consequently the wheel G, which carries round the pinion H, together with the index IK. Let us suppose the rack to have run the length of an inch, then F and G will have turned round 4½ times; and consequently, the pinion H will have gone round 10 × 4½ = 41½ time, because H turns round ten times for G once; so that the index IK will have moved round
A Machine
for Measuring the Expansion
of Metals by
HEAT.
round $41\frac{2}{3}$ times, or 12500 degrees; therefore, when the index goes but from one degree to another, the rack $L$ moves but the 12500th part of an inch; and as the motion of the index over half a degree is very sensible, we may perceive when the rack has moved $\frac{1}{2500}$ part of an inch.

No. 3. ibid. represents a square bar of metal, upon which the experiment is made, 5 5/8 inches long, and $\frac{1}{4}$ of an inch thick. Its end $O$ has a small tail, that it may communicate no heat to the iron plate $A$, into which it is received at $B$ (ibid. n° 1.) and fixed by a screw $C$. Its other end $N$ has a hole in it, through which goes the screw $Q$, that makes it fast to the rack $L$.

The bar being thus fixed, cannot become longer without pushing forward the rack $L$, and thereby moving round the index $IK$, by means of the wheel and pinions $F$, $G$, $H$; so likewise when it grows shorter, they must move the contrary way.

Now in order to apply the heat of burning spirits, there is a box, $R$, made of brass (ibid. n° 4) 3 1/8 inches long, 1 7/8 inch wide, and $\frac{1}{8}$ inch deep; which is covered at top with a piece of stone, $S$, represented in n° 5, with the under-side uppermost, the use of which is, to prevent the spirits from taking fire. It has a long hole cut thru' the middle, into which is let a brass plate $T$ (ibid. n° 1.) with five small equidistant holes, to transmit so many wicks of fine cotton; which being lighted, one or more at a time, cause the bar to expand, and the degree whereof is shown by the index.

No. 6. represents the lower frame with Dr. Defaguliers's alterations, where $BN$ is the round rod of metal to be tried with the steel-plate made fast at $N$ by the pin $Q$. This plate, the natural situation of which is $NL$, is here kept straight in the position $NL$, by means of the spring $SL$; and is directed by the groves of the pulleys $PP$, so that its upper-side presses on the roller $H$. The dotted circles $mgg$, represents the wheel above on the axis of $H$; and $gig$, the watch-chain, carrying round the last roller $i$, an index $nix$, as in n° 1.

It has been justly observed by some of our modern philosophers, that actual or absolute heat, is to sensible or relative heat, the same as motion is to velocity: for absolute heat is nothing but the whole motion of all the parts of the ignited body; and sensible, or relative heat, respects only the comparative velocity of the parts. Thus, equal bulks of mercury and water set in a land-heat, where the heat of the fire may be uniformly communicated to both, will acquire in equal times equal degrees of absolute heat; but the relative heat of the water, or that which is sensible to the finger will be near 14 times as great as that of the mercury, because the water, having 14 times a less quantity of matter, will admit of velocity so much in proportion greater.

Again, if mercury and water have the same relative or sensible heat, that is, if both are heated in such a manner as to cause an equal ascent in the thermometer, then a quantity of mercury will heat 14 times as much water as the same quantity of water will do; or it will make the same quantity of cold water 14 times hotter than the same quantity of hot water can. All which is easy to be shown by experiment, and abundantly proves, that heat and fire are wholly owing to the velocity of the parts of the heated or ardent body: on which theory the various phenomena of heat, cold, fire, burning, &c. are rationally accounted for. For first, we are to consider, that cold and heat are only comparative terms, or that the same thing may either be too hot, or too cold, according to the relative idea or standard-degree. Thus ice or snow, is said to be cold with respect to the finger, but ice or snow is warm if compared to a freezing mixture, so that if (as we commonly do) we make the hand or any part of the body the standard of heat and cold, or the term of comparison, then it is evident, 1. If the parts of any body applied to the hand have the same velocity as the parts of the hand, such a body we naturally pronounce is neither hot nor cold. 2. If the particles of the body applied to the hand have a greater velocity than those of the hand, we pronounce it warm, if the excess be small; but hot, if it be great. 3. If the velocity of the parts of the body applied be less than that in the hand, the sensation then is what we call cold, which also may be in various degrees. 4. Hence it is plain there can be no such thing as absolute cold, but where the particles of matter are absolutely quiescent, or at rest. 5. Hence also, there can be no such thing as absolute heat, because no degree of velocity
HEA

[1576]

HEA

velocity can be assigned but a greater is still assignable, till we come to infinity; where we are quite lost, as having no idea of infinite velocity or heat.

From this theory of heat and cold, we may conclude, that there is no body in nature whose parts are not in motion, in some degree, since we have yet been able to discover no ultimate degree or limit of cold; and if any such thing were to be found in nature, it is likely, that it would be as impossible to bear or endure the teft, as any extreme degree of heat; both heat and cold naturally tending to destroy the animated part, or telf, in the extreme degrees; cold, by destroying the vital motion, and fixing the part rigid and inflexible; but heat, by putting the parts into too great an agitation, causing a greater velocity of the fluids and diffusion, and a force of tension in the solids, beyond what the natural state of the body can bear; and therefore it will inevitably destroy it.

Kinds, degrees, directions, &c. of Heat; in chemistry, &c. See the article Fire.

Heat, in geography. The earth being farther removed from the sun in summer than in winter, as was shown under the article EARTH, it may be asked, how it comes to pass, that since the sun is the fountain of heat as well as light, our winters are much colder than our summers. In answer to this, it is to be considered that the rays of the sun fall with much less obliquity upon the surface of the earth, on our side of the equator in the summer, than in the winter; and therefore they not only act more forcibly upon it, but a greater quantity of them fall upon a given place. For it is shown in mechanics, that a moving body, striking perpendicularly on another, acts on it with all its force, and that a body striking obliquely, acts with the less force, the more it deviates from the perpendicular. Now fire, moving in right lines, must observe the same mechanical law as other bodies; and consequently its action must be measured by the angle of incidence; and hence fire striking on any obstacle in a direction parallel thereto, has no sensible effect, by reason the ratio is almost infinite, i.e. nothing: hence the sun radiating on the earth in the morning scarce produces any warmth at all. Again, in the winter, besides that the sun is much lower in the heaven when at its meridian height, than in the summer, it's rays pass through a longer portion of the earth's atmosphere, by which great part are intercepted, and some by various refractions and reflections, turned another way. See the article ATMOSPHERE.

And lastly, in summer, the sun continues with us sixteen hours, and is absent but eight, whereas in winter it is with us but eight hours, and is absent sixteen, all which things conspire to make a considerable alteration with respect to heat and cold.

If this be so, why is not the weather hotter, when the sun is in the tropic of cancer, its rays then falling with the least obliquity, and passing the shortest way through the atmosphere, and the days being then at the longest, than it is about a month afterwards, when the sun is in the next sign? In answer to this, it is to be remembered that bodies are not always the hottest at that very instant the greatest degree of heat is applied to them: they require time to heat, as well as to cool; it is the length of time therefore that the heat is applied to them, as well as the degree of it, that determines the quantity of heat communicated to them. For the like reason we find it warmer about two o'clock in the afternoon, than at twelve, when the sun is in its meridian altitude, and its rays fall thickest and most forcibly upon the earth.

The diversity of the heat of climates and seasons arising chiefly from the different angles under which the sun's rays strike upon the surface of the earth, Dr. Halley gives a mathematical computation of the effect of the sun under the different seasons and climates, going upon the mechanical principle already laid down: whence the vertical ray which is of the greatest heat being put for radius, the force of the sun on the horizontal surface of the earth will be to that as the sine of the sun's altitude at any other time: but how strictly just this calculation may be, for reasons already assigned, and from the following considerations, we wholly leave to the sagacity of our readers to determine. Let it be considered, that the different degrees of heat and cold in different places depend in a very great measure upon the accidents of situation, with regard to mountains and vallies, and the soil. The first greatly helps to chill the air by the winds which come...
come over them, and which blow in eddies thro' the levels beyond; and mountains, sometimes turning a concave side to the sun, have the effects of a burning mirror upon the subj ect plain; and the like effects is sometimes had from the convex parts of clouds, either by refraction or reflection. As to soils, a finy, sandy, or chalky earth, it is known, reflect most of the sun's rays into the air again, and retains but few, by which means a considerable effe ct is produced. As to oils, a tony, or multiplied by the

Hence are deducible the following corollaries. 1. That the equinoctial heat, when the sun becomes vertical, is as twice the square of the radius, which may be propo sed as a standard to compare with in all other cases. 2. That under the equinoctial, the heat is as the sine of the sun's declination. 3. That in the frigid zones, where the sun sets not, the heat is as the circumference of a circle into the sine of the altitude at 6; and consequently that in the same latitude these aggre gates of warmth are as the sine of the sun's declination; and at the same declination of the sun, they are as the sines of the latitudes into the signs of the declination. 4. That the equinoctial day's heat is every where as the cosine of the latitude. 5. In all places where the sun sets, the difference between the summer and winter-heats, when the declinations are contrary, is equal to a circle into the sine of the altitude at 6 in the summer parallel; and consequently these differ ences are as the sine of the latitude into or multiplied by the sines of declination. 6. From the foregoing table, it appears that the tropical sun under the equinoctial, has of all others the least force. Under the pole, it is greater than any other day's heat whatever; being to that of the equinoctial as 5 to 4.

From the table and these corollaries, a general idea may be conceived of the sun of all the actions of the sun in the whole year; and thus that part of heat which ariseth simply from the presence of the sun, may be brought to a geometrical certainty. The heat of the sun for any small portion of time is always as a right-angled contained under the sine of the angle of incidence of the rays producing heat at that time.

Heat is usually divided by the school philosophers into actual and potential; the former of which is that hitherto treated of, and the latter that which we find in pepper, wine, and certain chemical preparations, as of oil of turpentine, brandy, quick-lime, &c.

The peripatetics account for the heat of quicklime from an antiperiHapal. The epicureans, and other corpulcarians, attribute even potential heat to atoms, or particles of fire detained and locked up in the pores of these bodies, and remaining at rest therein, which being excited to action again by the heat and moisture of the mouth, or by the effusion of cold water, or the like cause, then break their inclosures, and discover what they are.

In the memoirs of the French academy, for the year 1713, the reader may find this doctrine well illustrated by M. Lemery, the younger, in the instances of quick-lime, regulus of antimony, tin, &c. which account Mr. Boyle endeavours to set aside, and substitute a mechanical property, viz. a peculiar texture of parts in these cases in lieu of fire. See Boyle's Mechanical Origin of Heat and Cold.

Heat, in the animal economy, known by the several names of natural heat, vital heat, innate heat, and animal heat, is commonly supposed to be that generated by the attrition of the parts of the blood, occasioned by its circulatory motion, especially in the arteries.

To what organs, or operations, the heat of the human body, and other animal bodies, is owing, is hitherto extremely doubtful. The opinions that at present prevail
HEA

prevail are, 1. That the heat of animal bodies is owing to the attrition between the arteries and the blood. 2. That the lungs are the fountain of this heat. 3. That the attrition of the parts of the solids on one another produce it. 4. That it is owing to the mechanical attrition of the particles of our fluids. To which opinions Dr. Stevenson of Edinburgh, adds a 5. viz. That whole processes by which our aliment and juices are constantly undergoing some alteration.

The reasonings in favour of these several opinions may be seen at large, as laid down by the above-mentioned author in an essay on the cause of animal heat, in the Medical Essays, vol. vi. The chief arguments in favour of the first opinion, are, that if an artery is tied, or cut, the part to which it goes, turns cold; and on the ceasing of the pulsation of the arteries, cold and death follow. An increase of heat attends a brisk circulation, and a languid circulation is accompanied with a small heat. One who burns in a fever, or is hot with exercise, has a full and frequent pulse. In cold faintings, chlorosis, &c. the pulse is small and slow. To these they add, that the thermometer shews the arterial blood to be a little hotter than that of the veins.

This is accounted for from the conical figure of the arteries, from their fluxes and branches into exquisitely small capillaries; whence the resistance, and consequently the attrition must be great, from the number, strength, and elasticity of their coats; from the propelling power of the heart, and their strong resistance. From all these it is inferred, that the particles of blood perpetually getting new motions, directions, and rotations, are attenuated, condened, have their angles grinded off, and are made homogeneous; hence, it is said, follows the fluidity, red colour, and heat of the mass, which is here perfected. See the articles Artery, Heart, Circulation, and Blood.

The second opinion is, that the lungs are the fountain of heat in the human body. All that has been said for the blood's being heated in the arteries, is advanced to prove this hypothesis, with considerable additions, viz. that in the lungs the blood vessels every where attend, divide, and subdivide, along with the ramifications of the wind-pipe, and as these are perpetually changing their situation and form, becoming longer, or shorter, making more acute, or more obtuse angles, so must the concomitant blood-vessels every moment make new angles, and give the blood new directions; that at last it enters into an exquisitely fine net-work, spreads everywhere on the vaally thin air-veHicles, where these air-bladders are perpetually changing their angles, points of contact, their form, volume, interfaces, and so forth. From these and the elasticity of the air, and weight of the atmosphere, the blood is said to be churned, pressed backward and forward, broken and kneaded together, dissolved and condensed, made red and hot in respiration.

The third opinion is, that the cause of the animal heat is owing to the action of the solid parts upon one another. The reason in support of this opinion, is, that the heart and arteries move most; thence that it is natural to think, that the heat should be owing to this motion.

The fourth opinion is, the mechanical attrition of the particles of the fluids upon one another. Dr. Stevenson observes, that those who support this hypothesis, must not only suppose that mechanical attrition begets heat, but begets itself without diminution; that they must not only shew what sets this attrition going, but what maintains it because all mechanical force perpetually decreases in a resifting medium; in short, that they must shew the possibility of a perpetuum mobile, the impossibility of which they themselves demonstrate.

The fifth opinion is, what Dr. Stevenson calls the animal processes, or that processes by which our aliment and fluids are perpetually undergoing some alteration. This processes, according to that writer, may be one sui generis, somewhat of a middle nature between fermentation and putrefaction; and he thinks it comes so near to the latter, that he choos to call it by that name. In putrefaction, which is a most powerful dis solvent of bodies, the intestif action of their minute particles creates, collects, or some way or other is the cause or means of heat. The doctor thinks it probable that this processes is constantly carried on in all our juices, especially where there is blood; and this is chiefly in the veins, so that the blood is
both the fountain of heat and the first
spring of motion.
The late Dr. Mortimer, in the Philos. Trans. n° 476. gives it as his opinion, that the heat of animals is explicable from the phosplorous and air they contain. Phosphorus exists, at least in a dormant state, in animal fluids; and it is also known, that they all contain air; it is therefore only necessary to bring the phosphoral and aereal particles into contact, and heat must of consequence be generated.

HEATH, ERICa, in botany, a genus of the
o. frandria-monogynia class of plants, the flower of which consists of one erect and quadrifid petal; and its fruit is a quadriculocar capsule, containing a great number of very small seeds. The distilled water of heath-flowers is recommended for sore eyes, as also for the colic; and fomentations of them are said to be good in the gout and paralytic cases. Date.

BERRY-BEARING HEATH, a name given to emperium. See EMPETRUM.

MOUNTAIN HEATH, the name by which some call faxifrage. See SAXIFRAGE.

HEATHEN, a name sometimes given to the grouse. See the article GROUSE.

HEATH-MOSS, CORALLOIDES, in botany. See the article CORALLOIDES.

HEATHENS, in matters of religion, the same with pagans. See PAGANS.

HEAVING, in the sea-language, signifies throwing anything overboard. Also turning about the capstan, is called heaving at the capstan. Likewise, when a ship being at anchor, rises and falls by the force of the waves, she is said to heave and set.

HEAVEN, CAELUM, literally signifies the expanse of the firmament, surrounding our earth, and extended every way to an immense distance.

The Hebrews acknowledged three heavens: the first the aerial heaven, in which the birds fly, the winds blow, and the flowers are formed; the second, the firmament in which the stars are placed; the third, the heaven of heavens, the residence of the Almighty, and the abode of saints and angels.

Heaven is considered by chriftian divines and philosophers, as a place in some remote part of infinite space, in which the omnipresent Deity is said to afford a nearer and more immediate view of himself, and a more fenfible manifestation of his glory, than in the other parts of the universe.

This is often called the empyrean, from that splendor with which it is supposed to be invested; and of this place the inspired writers give us the most noble and magnificent descriptions.

The pagans considered heaven as the residence only of the celestial gods, into which no mortals were admitted after death, unless they were deified. As for the souls of good men, they were configned to the elysian fields. See the article ELYSIAN FIELDS.

CRYSTALLINE HEAVENS. See the article CRYSTALLINE.

HEAVINESS, in general, the same with weight or gravity. See GRAVITY and WEIGHT.

HEAVY, in the manege. A horse is said to rest heavy upon the hand, when, thro' the softness of his neck, the weakness of his back, and the weight of his fore-quarters, or through weariness, he throws himself upon the bridle, but without making any effort to escape the horsemans hand.

By stopping him, and making him frequently go back, you may make him light upon the hand; that is, if his heaviness proceeds from laziness and stiffness; but if it is occasioned by a defect in his back, there is no remedy for it.

HEBDOMARY, a solemnity of the ancient Greeks, in honour of Apollo, in which the Athenians sung hymns in honour of that god, and carried in their hands branches of laurel. The word signifies the seventh day, this solemnity being observed on the seventh day of every lunar month.

HEBENSTREITIA, in botany, a genus of the dicynodendron-aegiofermis class of plants, the flower of which is monoptalous, with a cylindraceous tube shorter than the calyx, and quadrifid at the limb; the fruit is an oblong capsule, containing two oblong seeds, convex and furrowed on one side, and plane on the other.

HEBRAISM, an idiom or manner of speaking peculiar to the hebrew language. See the next article.

HEBREW, or HEBREW LANGUAGE, that spoken by the ancient Jews, and wherein the Old Testament was wrote.

This appears to be the most antient of all the languages in the world, at least we know of none older; and some learned men are of opinion, that this is the language in which God spoke to Adam in Paradise,
Paradise, and in which the saints will speak in heaven.

The books of the Old Testament are the only pieces to be found, in all antiquity, written in pure Hebrew; and the language of many of these is extremely sublime: it appears perfectly regular, and particularly so in its conjugations; indeed, properly speaking it has but one conjugation, but this is varied in each seven or eight different ways, which has the effect of so many different conjugations, and affords a great variety of expressions to represent by a single word the different modifications of a verb, and many ideas which in the modern, and in many of the antient and learned languages, cannot be expressed without a periphrasis.

The primitive words, which are called roots, have seldom more than three letters or two syllables.

In this language there are twenty-two letters, only five of which are usually reckoned vowels, which are the same with ours, viz. a, e, i, o, u; but then each vowel is divided into two, a long and a short, the sound of the former being somewhat grave and long, and that of the latter short and acute: it must however be remarked, that the two last vowels have sounds that differ in other respects besides quantity, and a greater or less elevation. To these ten or twelve vowels may be added others called semi-vowels, which serve to connect the consonants, and to make the easier transitions from one to another. The number of accents in this language are, indeed, prodigious: of these there are near forty, the use of some of which, notwithstanding all the enquiries of the learned, are not yet perfectly known. We know, in general, that they serve to distinguish the sentences like the points called commas, semicolons, &c. in our language; to determine the quantity of the syllables, and to mark the tone with which they are to be spoke or sung. It is no wonder then, that there are more accents in the hebrew than in other languages, since they perform the office of three different things, which in other languages are called by different names.

HEBREWS, or Epistle to the Hebrews, a canonical book of the New Testament.

Though St. Paul did not prefix his name to this epistle, the concurrent testimony of the best authors, antient and modern, afford such evidence of his being the authotr of it, that the objections to the contrary are of little or no weight. His mentioning himself in it, as lately a prisoner in Italy, and his promise to visit the Hebrews, together with Timothy, who had been released from imprisonment, both denote the writer, and the time of his writing this epistle, that it was just after the deliverance of St. Paul from his first trial at Rome.

The Hebrews, to whom this epistle was wrote, were the believing Jews of Palestine, and its design was to convince them, and, by their means, all the Jewish converts, wherefoever dispersed, of the insufficiency and abolishment of the ceremonial and ritual law. In order to which he undertakes to shew, first, the superior excellency of Christ's priesthood above the levitical; thirdly, the mere figurative nature, and utter insufficiency of the legal ceremonies and sacrifices: and, fourthly, that to forfake the mosaical law, was not, as the Jews boldly affected, to apostatize from God, but was their indispenfable duty and obligation. These particulars are intermixed with proper inferences and exhortations, all tending to shew the jewih christians the unreasonableness, folly, and danger of relapsing into judaism.

HEBRIDES, islands on the west of Scotland, of which Sky, Mull, Ila, and Arran are some of the largest.

HECATOMB, among the antient pagans, was the sacrifice of an hundred bulls or oxen; or, in a less confined sense, an hundred animals of any sort. Pythagoras is said to have sacrificed an hecatomb to the muses, through joy and gratitude for his having discovered the demonstration of the XLVIIth proposition in the first book of Euclid, viz. that, "In a rectangled triangle, the square of the hypothenuse is equal to the squares of the other two sides."

Julius Capitolinus relates, that when an hecatomb was to be sacrificed, they erected for that purpose an hundred altars of turf, on each of which they sacrificed one animal. He adds, that when the emperors offered hecatombs, they sometimes consisted of an hundred lions, an hundred eagles, or the like.

HECATOMBÆON, in antient chronology, the first month of the athenian year, consisting of thirty days, and anwering to the latter part of our June.
HEB [1591]. HEC

with ours, viz. a, e, i, o, u, but then each vowel is divided into two, a long and a short, the sound of the former being somewhat grave and long, and that of the latter short and acute: it must however be remarked, that the two last vowels have sounds that differ in other respects besides quantity, and a greater or less elevation. To these ten or twelve vowels may be added others called semi-vowels, which serve to connect the consonants, and to make the easier transitions from one to another. The number of accents in this language are, indeed, prodigious: of these there are near forty, the use of some of which, notwithstanding all the enquiries of the learned, are not yet perfectly known. We know, in general, that they serve to distinguish the sentences like the points called commas, semicolons, &c. in our language; to determine the quantity of the syllables, and to mark the tone with which they are to be spoke or sung. It is no wonder then, that there are more accents in the hebrew than in other languages, since they perform the office of three different things, which in other languages are called by different names.

HEBREWS, or Epistle to the Hebrews, a canonical book of the New Testament. Though St. Paul did not prefix his name to this epistle, the concurrent testimony of the best authors, antient and modern, affords such evidence of his being the author of it, that the objections to the contrary are of little or no weight. His mentioning himself in it, as lately a prisoner in Italy, and his promise to visit the Hebrews, together with Timothy, who had been released from imprisonment, both denote the writer, and the time of his writing this epistle, that it was just after the deliverance of St. Paul from his first trial at Rome. The Hebrews, to whom this epistle was wrote, were the believing Jews of Palestine, and its design was to convince them, and, by their means, all the jewish converts, whatsoever dispersed, of the insufficiency and abolishment of the ceremonial and ritual law. In order to which he undertakes to shew, first, the superior excellency of Christ's person above that of Moes: secondly, the superiority of Christ's priesthood above the levitical: thirdly, the mere figurative nature, and utter insufficiency of the legal ceremonies and sacrifices: and, fourthly, that to forsake the molacal law, was not, as the Jews boldly asserted, to apostatize from God, but was their indi preamble duty and obligation. These particulars are intermixed with proper inferences and exhortations, all tending to shew the jewish christians the unreasonableness, folly, and danger of relapsing into judaism.

HEBRIDES, islands on the west of Scotland, of which Sky, Mull, Isla, and Arran are some of the largest.

HECATOMB, among the antient pagans, was the sacrifice of an hundred bulls or oxen; or, in a less confined sense, an hundred animals of any fort. Pythagoras is said to have sacrificed an hecatomb to the muses, through joy and gratitude for his having discovered the demonstracion of the XLVIIIth proposition in the first book of Euclid, viz. that, "In a right angled triangle, the square of the hypothenuse is equal to the squares of the other two sides:"

Julius Capitolinus relates, that when an hecatomb was to be sacrificed, they erected for that purpose an hundred altars of turf, on each of which they sacrificed one animal. He adds, that when the emperors offered hecatombs, they sometimes consisted of an hundred lions, an hundred eagles, or the like.

HECATOMBÆON, in antient chronology, the first month of the Athenian year, consisting of thirty days, and answering to the latter part of our June and beginning of July. It was so called on account of the many hecatombs sacrificed in it.

HECK, an engine to take fish in the river Ouse. A salmon heck is a grate for catching that sort of fish.

HECKLE. See the article HATCHEL.

HECKLING of hemp and flax. See the articles HEMP and FLAX.

HECTIC, or HECTIC FEVER, a kind of slow fever, occasioned by exculerations of the lungs, and the purulent matter mixing with the blood, and disturbing its natural motion. The symptoms are an unusual heat in the palms of the hands, a redness of the cheeks, especially after eating; also a weak, but quick pulse, a languid habit of body, and loss of strength.

It is of the utmost consequence, says Dr. Mead, to attempt the cure of this dreadful disease early; and as it arises from inflammations, it requires repeated bleedings. Dr. Pringle recommends the same practice, with the use of fetons and issues,
made in the side that is most affected. He observes, that he found nothing dimin
ish the hectic fits so much as small but repeated bleedings, especially when faine
draughts and a cooling diet are taken at the same time. In thirst, heat, and other
symptoms, the signs of a putrid state of the humours, the ptisan is to be acidulat
ed with the spirit of vitriol, and the aliment are to be chozen of the acificent
kind. A mixture of equal parts of barle
y-water and sweet milk, seasoned with
sugar and nutmeg, makes a proper and
an agreeable part of diet; and in cafe of
blebs, let the patient drink a decoction
of bran with raisins and liqueur. Colliquative sweats are most safely check
ed by lime-water, whereas the patient
may drink about a pint a day, softened
with a little new milk.
A milk-course, though much recommend
ed by physicians, as having the double
advantage of being food and phylie, ought
to be taken with caution; not be
cause some people have a natural
aversion to milk, but because in head-achs, acute
fevers, flatulencies, bilious loofnesses,
and bloody floods, it is found to be very
prejudicial. The preference is generally
given to affes-milk, as being most cooling and detergent; but when it can be con
veniently had, whey made of cows-milk,
or even of goats, may be substituted in
its room, especially if the goats have
been fed on fragrant herbs. In cafe the
milk does not agree with the stomach, as
frequently happens, it should be medi
cated in the following manner: take of
red roses dried, of bulaulines, pomegra
nate-rind, and cinnamon, each one dram;
and boil them in a pint of cows-milk:
when the decoction begins to boil, pour
a little cold water into it, to make it
subside. Repeat this procef several times,
and lafiy strain off the liquor, sweeten it
with sugar, and put it by for use.
Others recommend equal quantities of
milk and an infusion of male speedwell.
few-thistle, fage of Jerusalem, liverwort, colts-foot, ground-ivy, maiden-hair,
flowers of St. John’s wort, and rofe,
with a little fugar a few drops of oil of
tartar per deliquium: this muft be drank
pretty warm, and continued for six weeks.
But above all, fresh butter-milk is faid to
be the most efficacious specific.
Medicines that are gently corroborating
are also useful: fuch are the solution of
coral, or mother of pearl, in orange juice;
tortex eleutheri, or peruvian bark, made
into an elefluary with fyrup of lemons.
Hediger affirms he has cured many of thefe
fevers with the bark, in a few days. But
above all things, riding daily muft not
be forgot, as being the beft kind of exer
cise, and highly benefical in these dif
temper.
Hedlices attack children sometimes from
voracity, and at others from refrigeration
of the body; in which cafes the use of the
temperate baths of sweet water, continued
for fome time, is faid to be of great ser
vice; and to remove the obftructions of
the mofetific glands and veffels, the fre
quent but sparing use of the following
falt apertent mixture will be necessa
ry: take of falt of tartar, nitre, and ar
canum duplicatum, each two drams; fal
ammoniac, three drams: mix them all
together, and let a little of the mixture
be put into the child’s drink, according
to his age and strength.
HEDEA, IVY, in botany. See IVY.
HEDEA TERRESTRIS, GROUND-IVY, a
genus of plants called by Linnaeus gle
choma. See the articles GLECHOMA and
GROUND-IVY.
HEDGES, in agriculture, are either plant
ed to make fences round inclosures, or to
divide the feveral parts of a garden. When
they are defignèd as outward fenses, they
are planted either with haw thorn, crabs,
er black-thorn; but thofe hedges which
are planted in gardens, either to furround
wildnefs-quarters, or to feal the other
parts of a garden from flight, are planted
according to the fancy of the owner, fome
preferring ever-greens, in which cafe the
holly is beft; next the yew, then the laur
el, lauruffinus, phillyrea, &c. others prefer the beech, the hornbeam, and the
elm. See the article GARDEN.
Before planting, it is proper to consider
the nature of the land, and what fort of
plants will thrive beft in it; and alfo,
what is the foil from whence the plants
are to be taken. As for the fize, the fets
ought to be about the bignefs of one’s
little finger, and cut within about four
or five inches of the ground; they ought
to be fefh taken up, straight, smooth,
and well rooted. Thofe plants that are
raifed in the nurfery, are to be pre
ferred.
In planting outside hedges, the turf is to
be laid with the grass-side downwards, on
that fide of the ditch the bank is defignèd
to be made; and fome of the beft mould
should be laid upon it to bed the quick,
which is to be fet upon it a foot aunder.
When the first row of quick is set, it must be covered with mould, and when the bank is a foot high, you may lay another row of sets against the spaces of the former, and cover them as you did the others: the bank is then to be topped with the bottom of the ditch, and a dry or dead-hedge laid, to shade and defend the under-plantation. Stakes should then be driven into the loose earth, so low as to reach the firm ground: these are to be placed at about two feet and a half distance, and in order to render the hedge yet stronger, you may edder it, that is, bind the top of the stakes with small poles, and when the eddering is finished, drive the stakes anew.

The quick must be kept constantly weeded, and secured from being cropped by cattle; and in February it will be proper to cut it within an inch of the ground, which will cause it strike root afresh, and help it much in the growth.

When an hedge is about eight or nine years growth, it will be proper to plough it; for the method of doing which, see the article Plashing.

The crab is frequently planted for hedges; and if the plants are raised from the kernels of the small wild crabs, they are much to be preferred to those raised from the kernels of all sorts of apples without distinction; because the plants of the true small crab never shoot so strong as those of the apples, and may therefore be better kept within the proper compass of an hedge.

The black-thorn, or sloe, is frequently planted for hedges; and the best method of doing it, is to raise the plants from the stones of the fruit, which should be sown about the middle of January, if the weather will permit, in the place where the hedge is intended; but when they are kept long out of the ground, it will be proper to mix them with sand, and keep them in a cool place. The same fence will do for it when sown, as when it is planted.

The holly is sometimes planted for hedges; but where it is exposed, there will be great difficulty in preventing its being destroyed; otherwise, it is by far the most beautiful plant, and being an ever-green, will afford much better shelter for cattle in winter, than any other Fort of hedge. The best method of raising these hedges, is to sow the stones in the place where the hedge is intended, and where this can be conveniently done, the plants will make a much better progress than those that are transplanted; but these berries should be buried in the ground several months before they are sown. The way to do this, is to gather the berries about Christmas, when they are usually ripe, and put them into large flower-pots, mixing some sand with them; then dig holes in the ground into which the pots must be sunk, covering them over with earth, about ten inches thick. In this place they must remain till the following October, when they should be taken up, and sown in the place where the hedge is intended to be made: The ground should be well trenched, and cleared from the roots of all bad weeds, bushes, trees, &c. Then two drills should be made, at about a foot-distance from each other, and about two inches deep, into which the seeds should be scattered pretty close, left some should fail. When the plants grow up, they must be carefully weeded; and if they are desired to be kept very neat, they should be cut twice a year, that is in May and in August; but if they are only designed for fences, they need only be sheered in July. The fences for these hedges while young, should admit as much free air as possible: the best sort are those made with polls and rails, or with ropes drawn through holes made in the polls; and if the ropes are painted over with a composition of melted pitch, brown Spanish colour and oil, well mixed, they will last several years.

Hedges for ornament in gardens are sometimes planted with ever-greens, in which case the holly is preferable to any other. Next to this, most people prefer the yew; but the dead colour of its leaves renders those hedges less agreeable. The laurel is one of the most beautiful ever-greens, but the shoots are so luxuriant that it is difficult to keep it in any tolerable shape; and as the leaves are large, to prevent the disagreeable appearance given them by their being cut through with the sheers, it will be the best way to prune them with a knife, cutting the shoots just down to a leaf. The laurustinus is a very fine plant for this purpose; but the same objection may be made to this as to the laurel; this, therefore, ought only to be pruned with a knife in April, when the flowers are going off; but the new shoots of the same spring must by no means be shortened. The small-leaved and rough-leaved laurustinus are the best plants for this
this purpose. The true phillyrea is the
next best plant for hedges, which may be
led up to the height of ten or twelve feet,
and if they are kept narrow at the top,
that there may not be too much width
for the (now to lodge upon them, they
will be close and thick, and make a fine
appearance. The ilex or ever-green
oak, is also planted for hedges, and is a
fit plant for those designed to grow very
tall. The deciduous plants usually plant-
ed to form hedges in gardens are, the
hornbeam, which may be kept near with
less trouble than most other plants. The
beech, which has the fame good quali-
ties as the hornbeam; but the gradual
falling of its leaves in winter cause a con-
tinual litter. The small-leaved english
elm is a proper tree for tall hedges, but
these should not be planted closer than
eight or ten feet. The lime-tree has also
been recommended for the same purpose;
but after they have stood some years they
grow very thin at bottom, and their leaves
frequently turn of a black disagreeable
colour.
Many of the flowering shrubs have also
been planted in hedges, such as roses,
honeyfuckles, sweet-briar, &c. but these
are difficult to train; and if they are cut
to bring them within compass, their
flowers, which are their greatest beauty,
will be entirely destroyed.
HEDGE-HEG. See Hedge-Hog.
HEDGE-SPARROW, the brown motacilla,
white underneath, and with a grey spot
behind the eyes. See Motacilla.
This is of the bigness of the red-breast;
the head is large and rounded; the eyes
small, and their iris hazel; the beak is
flender; the ears are large and patulous.
HEDMORA, a city of Sweden, in the
province of Dalecarlia, situated on the
river Dalecarlia, fifty miles north-west of
Upfal: east long. 15° 55', and north lat.
60° 16'.
HEDYOTIS, in botany, a genus of the
tetrandria-monogynia class of plants, the
flower of which is monopetalous and in-
fundibuliform; and its fruit is a bilocu-
lar capsule, containing a great number of
seeds.
HEDYSARUM, the french honey-
suckle, in botany, a genus of the
diadelphia-decaandria class of plants, the
corolla of which is papilionaceous and
friated; the fruit of a bivalve articulated
pod, each joint of which is roundish,
compressed, and containing one kidney-
shaped-seed.
This plant is deobrfluent and vulnerary.

HEEL, in anatomy, the hind-part of the
foot. See Foot and CALCANEUM.
HEEL of a horse, the lower hinder part of
the foot, comprehended between the quar-
ters, and opposite to the toe.
The heel of a horse should be high and
large, and one side of it should not rise
higher than the other upon the pattern.
To recover the heels of a horse that is
hoof-bound, you should take out his sole,
and keep his heels very wide, by which
they will be restored in a month.
HEEL of a horseman. This being the part
that is armed by the spur, the word is
used for the spur itself; as, this horse un-
derstands the heels well.
To ride a horse from one heel to an-
oder, is make him go sideways, some-
times to one heel, and sometimes to an­other.
HEEL, in the sea-language. If a ship
leans on one side, whether she be a-
ground or a-float, then it is said she heels
a-starboard, or a-port; or that she heels
offwards, or to the shore; that is, in-
clines more to one side than to an­other.
HEEL of the mast, that part of the foot of
any mast, which is pared away planting
on the aftward side thereof, in order that
it may be trayed aftward on. The
heels of the top-masts are squares.
HEELER, or Bloody heel-cock, a fighting
cock that strikes or wounds much with
his spurs.
The maffers know such a cock even while
a chicken, by the striking of his two heels
together in his going.
HEGIRA, in chronology, a celebrated
epoca among mahometans. See the ar-
ticle EPOCHA.
The event which gave rife to this epoca
was the flight of Mahomet from Mecca,
with his new profeelytes, to avoid the per-
cution of the coraiichites; who, being
then moft powerful in the city, could not
bear that Mahomet should abolifh idola-
try, and efftablifh his new religion. This
flight happened in the fourteenth year af­ter
Mahomet had commenced prophet:
he retired to Medina, which he made the
place of his residence.
The mahometans have many fabulous
traditions concerning this flight of their
fyle prophet from Mecca to Medina:
Having taken a resolution, say they, to
leave the city, he went out one night,
being the first of the moon, accompanied
only by Abubeker, his father-in-law, and
paffed the night in a grotto, distant
an hour's journey from Mecca. As soon
as
Fig. 1. Heights & Distances.

Fig. 2. Heliocentric.

Fig. 3. Hexagon.
as his retreat was known in the city, the coraiichites, his declared enemies, went in pursuit of him, and arrived at the entrance of the grotto early the next morning: but that same night a large tree had grown up, at the mouth of the cave, in which the prophet was concealed; and what opening was left, was covered over with a spider's web; this being a plain indication, that nobody was in the cave, the coraiichites went away, and Mahomet escaped the pursuit of his enemies.

HEIDELBURG, a city of Germany, in the circle of the lower Rhine, the capital of the palatinate, situated on the river Neckar: east long. 8° 40', and north lat. 49° 20'.

HEIGHT, altitude, in geometry, is a perpendicular let fall from the vertex, or top, of any right-lined figure, upon the base or side subtending it. It is likewise the perpendicular height of any object above the horizon; and is found several ways, by two staffs, a plain mirrour, with the quadrant, theodolite, or some graduated instrument, &c. The measuring of heights or distances is of two kinds: when the place or object is accessible, as when you can approach to its bottom; or inaccessible, when it cannot be approached.

Prob. I. To measure an inaccessible height AB, by means of two staffs. See plate CXXIX. fig. i. n° 1.

Let there be placed perpendicularly in the ground, a longer staff DE, likewise a shorter one FG, so as the observer may see A, the top of the height to be measured, over the ends D, F, of the two staffs; let FH and DC, parallel to the horizon, meet DE and AB in H and C: then the triangles FHD, DCA, shall be equiangular; for the angles at D and B are right angles; and ACB, ECD, are equal, being the angles of incidence and reflection of the ray AC; wherefore the remaining angles at A and E, are also equal. Therefore it will be as CD is to DE; so is CB to BA.

Note 1. The observer will be more exact, if, at the point D, a staff be placed in the ground perpendicularly, over the top of which the observer may see a point of the glass exactly in a line betwixt him and the tower.

Note 2. In place of a mirrour may be used the surface of water, which naturally becomes parallel to the horizon.

Prob. III. To measure an accessible height by the geometrical quadrant, theodolite, &c.

Let the angle C (ibid. n° 4.) be found. Then in the triangle ABC, right-angled at B (BC being supposed the horizontal distance of the observer from the tower) having the angle C, and the side BC, the required height will be found by the first case of plain trigonometry. Thus, suppose the angle C, 37° 24', and the horizontal distance, BC 116, then the proportion will be as R: T. \[ \log. C B = 116 \]

Supposing the observation made on the top of the tower, and the height of the tower to be known, to find the distance of
HEI [ 1596 ]

of any object on the plane below; it is only the converse of the former case.
You may also, having the base and angles, easily find the hypothenuse AC, or how far it is from the top of the tower to the station, by the second case of right angled triangles; and it is useful in many cases.

Prob. IV. To measure an inaccessibl height by the geometrical quadrant, &c. at two stations.

Let the angle ACB be observed (ibid. n° 5.) then let the observer go from C, to the second station D, in the right line BCD; and after measuring this distance CD, take the angle ADC likewise with the quadrat. Then in the triangle ACD, which is formed by the two visual rays AD, AC, and the distance of the two stations D and C, there is given the angle ADC, with the angle ACD, because the angle ACB was given before; therefore the remaining angle CAD is given likewise. But the distance of the stations C and D is also given; therefore by the second case of oblique-angled trigonometry, the side AC will be found. Wherefore in the right-angled triangle ABC, all the angles and hypothenuse AC are given; consequently by the third case of plain trigonometry, the height sought, AB, may be found; as also the distance of the station C, from AB, the perpendicular within the hill or inaccessible height.

Example. Suppose the angle at C, 45° 30', and the angle at D 32° 12', and the distance CD, between the two stations, 113 feet; then the angle DAC will be 11° 18', and the angle CAB 46° 30'. Hence for CA, the proportion will be as S.LDAC: DC: : S.LD:CA.

The log. DC 112 — 2.04922
Sine L D 32° 12' — 0.72663

\[ \frac{S.LDAC}{11° 18'} = \frac{S.LD}{0.72663} \]

Added 11.77585

\[ S.LDAC = 11° 18' \]

\[ CA = 304.6 \]

Then for AB, the height of the object, it will be as R: S.LACB: : CA: AB.

As radius — 10,00000
is to the line of 45° 30' — 9.83781
so is CA 304.6 — 2.48371
to AB 209.7 — 2.32152

Lastly, for CB, the distance of the object from the nearest station, it will be as R: S.LCAB: : CA: BC.

As radius — 10,00000
is to the line of CAB 46° 30' — 9.86056
so is CA 304.6 — 2.48371
to BC 221 — 2.34427

If the height of the tower is wanted, the angle BCF (ibid. n° 6.) may be found with the quadrant, which being taken from the angle ACB already known, the angle ACF will remain; but the angle FAC was known before; therefore the remaining angle AFC will be known. But the side AC was supposed found by the last problem; therefore in the triangle ACF, all the angles, and one of the sides AC being known AF the height of the tower above the hill may be found by trigonometry.

Prob. V. To measure the distance of two places A and B, of which one, A, is accessible, by the theodolite, &c. ibid. n° 7.

Let there be erected at two points, A and C (sufficiently distant) visible signs; then let the two angles BAC, BCA, be taken by the theodolite. Let the distance of the stations A and C be measured with a chain. Then the third angle being known, and the side AC; therefore, by the second case of oblique trigonometry, the distance required AB, will be found.

Prob. VI. To measure, by the theodolite, &c, the distance of two places, neither of which is accessible. ibid. n° 8.

Let two stations C and D be chosen, from each of which the places may be seen whose distance is sought: let the angles ACD, BCD, and likewise the angles BDC, BDA, CDA, be measured by the theodolite, &c. the distance of the stations C and D be measured by a chain, or, if necessary, by the last problem. Now in the triangle ACD, there are given two angles ACD and ADC; therefore the third CAD is likewise given; moreover the side CD is given; therefore by the second case of oblique trigonometry, the side AD will be found. After the same manner, in the triangle BCD, from all the angles, and one side CD given, the side BD is found. Wherefore in the triangle ADB, from the given sides DA and DB, and the angle ADB contained by them, the side AB (the distance sought) is found to be the fourth case of oblique angled trigonometry. Note, That it is not necessary that the points A, B, C, and D be in one plane, and that any triangle is in one plane.

HEILA, a port-town of regal Prussia, in the kingdom of Poland, situated on the point of the peninsula in the Baltic-see, twelve miles north of Danzick, east long. 19°; north lat. 54° 30'.
HEINUSE, among hunters, a roe-buck of the fourth year.

HEIR, heres, in law, signifies the person who succeeds another by death to lands, tenements, and hereditaments, being an estate of inheritance, or an estate in fee; because nothing palles by right of inheritance but in fee.

Where there is a grandfather, father and son, if the father die before the grandfather, who afterwards dies, he shall go to the eldest grandson, and not to any other children of the grandfather. On the father's dying without issue, &c. the next eldest brother shall have the lands, &c. as heir; and for want of a brother, they descend to the father's sisters. A man has issue only a daughter, and dies leaving his wife with child of a son, who is afterwards born; here the son, after his birth, is heir; however, in the mean time, the daughter is to have the land. Yet there are some persons disqualified from being heirs, as a bastard, an alien, one attainted of treason or felony, &c. but idiots and lunatics, perons excommunicated, or that are out-laws in debt, and not to any.

The word heir is a collective term, and extend to all heirs, under which the heirs of heirs are comprehended; as where lands are given to a person and his heirs during the life of another, &c. stealing an heir's, and marrying her against her will, was declared felony by 3 Hen. VII.

HEIR-LOOME, is a word that comprehends in it divers pieces of furniture; as the first bed, and other things, which by the custom of some places have belonged to a house for several descents. These are never inventoried after the death of the owner as chattles, and therefore do not go to the executor or administrator, but to the heir along with the house, by custom, and not by common law.

Heir-loomes are not developeable by will, for custom vested them in the heir before a devise; yet a sale thereof in the person's lifetime might make it otherwise.

HELENAUG, in ornithology, a name given to the arctic duck of Clibus.

HELENA, or St. HELENA, an island in the Atlantic ocean, situated 1200 miles west of the coast of Africa, and 1800 east of the coast of South America: west long. 6° 15', south lat. 16°.

It is about twenty-one miles round, and consists of one steep rock, which looks like a caille in the middle of the sea, and which is covered with about a foot of vegetable earth, that produces corn, grapes, and almost all manner of fruits and vegetables; but the corn is generally eaten up by the rats, and the country is too hot to make wine. It has but one landing place, which is defended by a platform, and a fort in which the govern-
nor reduces. It is subject to the English East-India company, by whose assistance it was planted, after it was taken from the Dutch in the reign of King Charles II.

St. HELENA's DAY, a festival in the romish church on the 8th of August. This feast was the empress Helena, daughter of the emperor Constantine, who, it is said, discovered the cross of Christ after it had been long buried in the ground.

HELENA, in astronomy. See the article CASTOR.

HELENA, or HELENASTRUM, a genus of the Syngenia-Polygamy-Fruftanea class of plants, the compound flower of which is radiated, and consists of a multitude of hermaphrodite and female ones, the former on the disk, and the latter on the verge. The hermaphrodite flowers are tubular, and quinquedentated at the limb; whereas the female ones are linear, ligulated, and trifid at the point. The flamina are five slender and very short filaments; and the seed which is single, is contained in the cup.

HELENIUM, ELECAMPANE, &c. is ranked by LINNEUS among the star-worts. See the articles ASTER and ELECAMPANE.

HELEPOLIS, in the antient art of war, a machine for battering down the walls of a place besieged, the invention of which is ascribed to Demetrius, the Poliorcete. Diodorus Siculus says, that each side of the helepolis was 403 cubits broad, and 90 in height; that it had nine itages, and was carried on four strong solid wheels eight cubits in diameter; that it was armed with large battering rams, and had two roofs capable of supporting them; that in the lower itages there were different sorts of engines for casting stones; and in the middle they had large catapults for lancing arrows, and smaller in those above, with a number of expert men for working all these machines.

HELIACAL, in botany, a term applied to the rising or setting of the stars, or, more strictly speaking, to their emersion out of and immersion into the rays and superior splendor of the sun. A star is said to rise heliacally, when after having been in conjunction with the sun, and on that account invisible, it comes to be at such a distance from him, as to be seen in the morning before sunrise; the sun, by his apparent motion, receding from the star towards the east; on the contrary, the heliacal setting is when the sun approaches so near a star, as to hide it with his beams, which prevent the fainter light of the star from being perceived, so that the terms appari­tion and occultation would be more proper than rising and setting.

All the fixed stars in the zodiac, as also the superior planets, Mars, Jupiter, and Saturn, rise heliacally in the morning, a little before sun-rising, and a few days after they have set coelestially. Again, they set heliacally in the evening, a little before their achronyceal setting. But the moon, whose motion eastward is always quicker than the apparent motion of the sun, rises heliacally in the morning, after the new moon; and sets heliacally in the morning, when old and approaching to a conjunction with the sun.

The inferior planets, Venus and Mercury, which sometimes seem to go westward from the sun, and sometimes again have a quicker motion eastward, rise heliacally in the morning, when they are retrograde; but when direct in their motions, they rise heliacally in the evening. The heliacal rising or setting of the moon, happens when she is 17° distant from the sun, but for the other planets, 20° are required; and for the fixed stars, more or less according to their magnitude.

HELIAEA, cithara, in grecian antiquity, was the greatest and most frequented court in Athens for the trial of civil affairs. The judges who sat in it, were at least fifty, but the more usual number was either two or five hundred. When causes of great moment were to be tried, it was customary to call in the judges of the other courts: sometimes a thousand were called in, and then two courts were said to have been joined: sometimes fifteen hundred or two thousand were called in, and then three or four courts met together.

They had cognizance of civil affairs of the greatest weight and importance, and were not permitted to give judgment till they had taken a solemn oath to do it with impartiality, and to give sentence according to the lawes, &c.

HELIANTHUS, the great sun-flow­er, in botany, a genus of the Syngenia-Polygamy-Fruftanea class of plants, the compound flower of which is radiated, with a multitude of cylindraceous her­maphrodite flowers on the disk, and a few very long ligulated female ones; the flamina are five filaments; and the seeds are
are single, and contained in the cup. The flowers are yellow, and often more than a foot in diameter.

**HELIASTES**, in antiquity, one of the judges of the court of heliaca. See the article **HELIXEA**.

**HELICTERES**, the *screw-tree*, in botany, a genus of the gynandria-decandria class of plants, the flower of which consists of five oblong petals, equal in breadth; and the fruit is composed of five unilocular capsules, containing a great many kidney-shaped seeds, and twisted spirally about one another.

**HELIOCRAPOS**, in botany, a genus of the polyandria-digynia class of plants, the flower of which consists of four linear petals, considerably shorter and narrower than those of the cup; the fruit is a pedunculated, bilocular capsule, of a turbinated oval figure, containing single seeds of an oval shape.

**HELIOMETRICAL** latitude of a planet, the inclination of a line drawn between the center of the sun and the center of a planet, to the plane of the ecliptic, which may be thus determined.

If the circle FGH (plate CXXIX. fig. 2, n° 1.) represent the orbit of the earth round the sun, and the inner one, ANBW, be so placed as to incline to the plane of the other; (on which account it appears in the form of an ellipse) then when the planet is in the node n, it will appear in the ecliptic, and so have no latitude. But if it move to P, then, being seen from the sun, it will appear to decline from the ecliptic, or to have latitude; and the inclination of the line SP to the plane of the ecliptic, is called the planet’s heliocentric latitude; the measure of which is the angle PSp, supposing the line SP to be perpendicular to the plane of the ecliptic.

This heliocentric latitude will be continually increasing till the planet come to the point A, which they call the limit, or utmost extent of it; and then it will decrease again, till it reach the other node N, when it will have no latitude; after which it will increase again, till it come to B, or its utmost latitude; and, lastly, decrease again, till the planet come to be in n, whence it set out.

**HELIOMETRICAL place of a planet**, in astronomy, the place of the ecliptic wherein the planet would appear to a spectator placed at the center of the sun.

The ingenious Dr. Halley gives the following method to find the heliocentric places of a planet, and its distances from the sun, which supposes only that the periodical time of the planet is known. Let KLB (ibid. n° 2.) be the orbit of the earth, S the sun, P the planet, or rather the point in the plane of the ecliptic, in which the perpendicular let fall from the planet meets that plane. And first when the earth is in K, observe the geocentric longitude of the planet, and having the theory of the earth, we have the apparent longitude of the sun, and consequently, the angle PKS. The planet, after it has completed an entire revolution, returns again to the point P, at which time supposes the earth in L; and there again, let the planet be observed, and find the angle PLS, the planet’s elongation from the sun. Having the times of observations, we have the places of the earth in the ecliptic, or the points K and L; and, consequently, the angle LSK, and the sides LS and SK: wherefore we shall have the angles SKL and SLK, and the side LK. From the known angles SKP and SPL, take away the known angles SKL and SLK, and we shall have the angles PLK and PKL known; therefore in the triangle PLK, having all the three angles, and the side LK, we shall find the side PL; and in the triangle PLS, having the sides PL and LS, and the intercepted angle PLS, we shall have the angle LSP, which determines the heliocentric place, and its distance from the node according to the ecliptic, as also the side SP. But as the tangent of the geocentric latitude is to the tangent of the heliocentric, so is the currate distance of the planet from the sun, to its currate distance from the earth. But as the geocentric latitude may be found by observation, the heliocentric latitude will also be found; by which, and the currate distance of the planet from the sun, we can find the true distance.

**HELIOMETRES**, a phenomenon sometimes observed about sun-fishing; being a large luminous tail, or column of light, proceeding from the body of the sun, and dragging after it, not unlike the tail of a comet; whence the name.

**HELIOSCOPE**, in optics, a sort of telescope, peculiarly fitted for viewing the sun, without hurting the eyes. See the article **TELESCOPE**.

As the sun may be viewed through coloured glasses, without hurting the eyes.
If the object and eye-glasses of a telescope be made of coloured glasses, as red or green, such a telescope will become an helioscope.

But Mr. Huygens only used a plain glass, blacked at the flame of a candle on one side, and placed between the eye-glasses and the eye; which answers the design of an helioscope very well.

**HELIOSTATA,** in optics, an instrument invented by the late learned Dr. S. Graveland; who gave it this name, from its fixing, as it were, the rays of the sun in a horizontal direction across the dark chamber, all the while it is in use.

This instrument is an automaton, or piece of clock-work, whose parts are as follows. A A (plate CXXX.) is a frame in which a metal line peculiar S is suspended, moveable about its axis by means of two small screws a, a. This frame is fixed to the piece C, which being hollow, is moveable upon the cylindrical shaft P. This pillar is fixed on a triangular base or foot & perpendicular, by the three screws B, B, B. On the back part of the speculum is fixed a long cylindrical wire, or tail D, in a perpendicular position. By this it is connected to the second part of the helioscata, which is a common thirty-four hour clock, represented at H, the plane of which clock is set parallel to that of the equator in any given place. The clock is sustained on the column F G, in which it is moveable up and down by a thin lamina or plate that enters it as a cæsæ, and fixed by a proper height by two screws d, d, at the side. The whole is truly adjusted to a perpendicular situation by means of the three screws I, I, I, in the tripod L, L, M, and the plummet Q, whose capsis must answer to the point c beneath.

The axis of the wheel which moves the index N O, over the hour circle, is somewhat large, and perforated with a cylindrical cavity approaching a little to a conical figure; and receives the flank of the said index N O very close and tight, that by its motion the index may be carried round. In the extremity, O, of the index is a small cylindrical piece, with a cylindrical perforation to receive the tail t of the fork T, yet so as to admit a free motion therein. In each side of the fork are several holes exactly opposite to each other, in which go the screws y, r, upon which smooth cylindrical ends moves the tubular piece R.

When the machine is to be fixed for use, another part is made use of to adjust it; which is called the poitior, and is denoted by the letters V X Y Z.

The cylinder C is removed with a speculum from the foot P, and the brass column V X put on in its stead, and adheres more firmly to the pin s, that it may keep its position while the machine is constituted.

On the top of the column, about X as a center, moves the lever Y Z, so that it may be any how inclined to the horizon, and keep its position. The arm Y X may be of any length at pleasure; but the arm X Z is of a peculiar construction, and of a determinate length. To this arm, which extends no farther than y, is a sliding-piece Z x, sharp pointed at Z. By this arm the Z X is determined to a given length, the piece Z x being fixed by the screws x x. Upon this arm is drawn the short line w x, by which it may be lengthened in the whole, and is, of the whole length X Z, when shorter.

The reason is, this arm is always to increase and decrease in proportion to the sect of the sun's declination to the radius X Z, when shorter; but the radius is to the sect of 23° 30', the sun's greatest declination as 100,000 to 109,04411, or as 100 to 109. Now the reason of this construction of the arm X Z, is to find for any given day the distance of the center of the speculum S from the top of the style N, which must ever be equal to the sect of the sun's declination; for it must always be equal to the distance of the top of the said style, I, from the center of the cylinder R in the fork T, and that is always equal to the said sect of declination.

For since the style l N and the fork T are in a position parallel to each other, therefore the middle hole in the sides of the fork being (as they must be) of the same height above the end of the index O, as is the height of the style N I, it is evident that on an equinoctial day the sun's rays will pass directly through the perforation of the piece R, if it be put in a position parallel to the plane of the ecliptic, or that of the clock; and also that the top of the shadow of the said style will fall exactly on the said hole.

In this case the top of the style is at the least distance from the central point of R, and therefore may be represented by radius; while in any other position above or below, the distance will increase in proportion...
HELIOTROPE, in natural history, a hard bluish-green jasper, with red variegations. See the article JASPER.

HELL, in anatomy, the whole circuit or extent of the auricle outwards, in opposition to which the inner protuberance answering thereto, is called anthelix. See the article EAR.

HELIOTROPE, in botany, a genus of the pentandria-monogynia class of plants, the corolla of which consists of a single petal; the tube is of the length of the cup; the limb is plane, divided lightly into five segments, and obtuse; the smaller segments stand alternate, and are acute; the large are placed between; the mouth is closed by five prominent squamules, which bending toward one another, form a little star; there is no pericarpium; the calyx remains unaltered, and contains four oval acuminate sépals.
The mahometans believe the eternity of rewards and punishments in another life. Among Chiuffians, there are two controverted questions in regard to hell, the one concerns locality, the other the duration of its torments. The locality of hell, and the reality of its fire, began first to be controverted by Origen. That father interpreting the scripture account metaphorically, makes hell to consist not in external punishments, but in a consciousness of sense of guilt, and a remembrance of past pleasures. Among the moderns, Mr. Whiston advanced a new hypothesis. According to him the comets are so many hells appointed in their orbits alternately to carry the damned into the confines of the sun, there to be scorched by its violent heat, and then to return with them beyond the orbit of Saturn, to thence in these cold and distant regions. Another modern author not satisfied with any hypothesis hitherto advanced, assigns the sun to be the local hell. As to the second question, viz. the duration of hell torments, we have Origen again at the head of those who deny that they are eternal; it being that father's opinion, that not only men, but devils, after a due course of punishment suitable to their respective crimes, shall be pardoned and restored to heaven. The chief principle upon which Origen built his opinion, was the nature of punishment, which he took to be emendatory, applied only as physic for the recovery of the patient's health. The chief objection to the eternity of hell torments among modern writers, is the disproportion between temporary crimes and eternal punishments. Those who maintain the affirmative, ground their opinions on the scripture accounts, which represent the pains of hell under the figure of a worm which never dies, and a fire which is not quenched; as also upon the words, "They shall go away into everlasting punishment, but the righteous into life eternal."

**HELLEBORE, helleborus, in botany, a genus of the polyandria polygnia class of plants, with a roaceous flower, composed of five or more roundish and large petals; the fruit is composed of several bicarinated capsules, containing a great number of roundish seeds. See plate CXXXI. fig. 1. The root of this plant is the true black hellebore of the shops, which is a purge,
HELLENISM, in matters of language, a Hellenistic, or helmintholithus, in natural history, a name given by Linnaeus to petrified bodies resembling worms. Of these he reckons four genera. 1. Petrified lithophyta, found in the mountains of Sweden. 2. Petrified shells. 3. Petrified zoophytes. 4. Petrified reptiles. See lithophyta, shell, &c.

HELLEBORE, in pharmacy, the root of the broad leaved veratrum. See the article VERATRUM. White hellebore, given in powder or in drops, which is given in hysteric cases, and obstructions of the vixera.

HELLENISTIC, or Hellenistic language, that used by the grecian Jews who lived in Egypt and other parts where the greek tongue prevailed. In this language it is said the Septuagint was written, and also the books of the New Testament; and that it was thus denominated to shew that it was greek filled with hebratims and lyricisms.

HELLENODICÆ, in grecian antiquity, the directors of the olympic games. See the article OLYMPIC.

HELLESPONT the entrance of the straights which divide Asia from Europe, and pass from the Archipelago to Conchantinople. It is now called the Dardanells, and is about two miles wide.

HELM of a ship, is a piece of timber fastened into the rudder, which comes forward into the forecaste, or place where the person at the helm steers the ship, by holding the whipstaff in his hand, which is joined to the helm. They begin however to be left off, steering-wheels being used in their room.

HELMET, an antient defensive armour worn by horfmen both in war and in tournaments. It covered both the head and face, only leaving an aperture in the front secured by bars, which was called the visor.

It is still used in heraldry by way of crest over the shield or coat of arms, in order to express the different degrees of nobility, by the different manner in which it is borne. Thus a helmet in profile, is given to gentlemen and esquires: to a knight, the helmet flanding forward and the beaver a little open: the helmet in profile and open, with bars, belongs to all noblemen under the degree of a duke: and the helmet forward and open, with many bars, is assigned to kings, princes, and dukes.

There is generally but one helmet upon a shield; but sometimes there are two, and even three: if there be two, they ought to face each other; and if three, the middlemost should stand directly forward, and the other two on the sides facing towards it.

HELMINTHOLITHUS, in natural history, a name given by Linnaeus to petrified bodies resembling worms. Of these he reckons four genera. 1. Petrified lithophyta, found in the mountains of Sweden. 2. Petrified shells. 3. Petrified zoophytes. 4. Petrified reptiles. See LITHOPHYTA, SHELL, &c.
The freemen of Sparta were forbidden the exercise of any mean or mechanical employment, and therefore the whole care of supplying the city with necessaries, devolved upon the Helots: the ground was tilled, and all sorts of trade managed by them, whilst their masters, gentlemen like, spent their time in all sorts of manly exercises. Notwithstanding the great usefulness of the Helots, they were treated in the most barbarous manner, and often murdered without any show of justice. It was a thing common with the Spartans to force them to drink to excess, and then lead them in that condition into their public halls, that their children might see what a contemptible and beastly sight a drunken man is. They made them dance uncomely dances, and sing ridiculous songs; forbidding them expressly to use any that was serious and manly.

HELPS, in the manege. To teach a horse his lesson, there are seven helps or aids to be known: these are the voice, rod, bit or maffle, the calves of the legs, the stirrups, the spur, and the ground. The helps are occasionally turned into corrections.

HELSINGFORD, a port-town of Sweden, situated on the gulf of Finland, in 24° 6' east long. and 60° 8' north lat.

HELSINGIA, a province of Sweden, bounded by the Bothnic gulf on the east, and by Delcarlia on the west.

HELSINGIC CHARACTER, a peculiar kind of character, found inscribed on stones in the province of Helsingia: the runic and helsingic characters may be easily transformed into each other.

HELSTON, a borough of Cornwall, nine miles south-west of Falmouth: it sends two members to parliament.

HELVE, a term used among country people for the handle of a hatchet, pick-axe, mattock, or the like.

HELVETIC, something belonging to Helvetia, or Switzerland. See the article Switzerland.

HELVÖETSLEYS, a port-town of the United Netherlands, situated in the island of Voorn, in the province of Holland, five miles south of the Briel: it is one of the best harbours in Holland, and that to which the English packet always goes.

HELXINE, buck-wheat, in botany, a genus of the oéandria-trigynia class of plants, the corolla of which is permanent, and consists of a single petal, divided into five obute, cresto-patent segments: there is no pericarpium, the corolla performs the office of it, and surrounds the seed, which is single, triquetrous, and acute.

HEM, in the ovens for baking calamine, a partition which separates the hearth from the oven itself: it is open at top, to let the flame pass over to bake the calamine.

HEMERO-BAPTISTS, a sect among the Jews, so called because they washed themselves every day, making holiness to confit in these daily ablutions. They were Pharisees in everything, except that the lords, they denied a resurrection. Probably there were the sect who found fault with our Saviour's discipies for eating with unwashed hands. D'Herbelot tells us, that the disciples of St. John Baptist, who, in the first ages of the church, were called hemero-baptists, and the number of whom is considerable among the Jews, have since that time formed a sect, or rather religion apart, under the name of mendai jahia.

HEMEROBIUS, in zoology, a genus of insects of the neureptera order, the characters of which are these: the palate is prominent, and has on each side two tarsacula: the wings, being four in number, are reflex and timid. To this genus belong the golden-eye, a large beautiful fly, so called from the colour of its eyes; the formica-leo, and several other species.

HEMEROCALLIS, day-lily, in botany, a genus of the hexandria monogyenia class of plants, the corolla of which is of an infundibuliform figure: the tube is short; the limb is paten', and divided into six somewhat reflex segments: the fruit is an ovato-trilobous, trigonal capsule, formed of three valves, and containing three cells: the seeds are numerous and roundish.

HEMEROBROMI, in grecian antiquity, sentinels and guards appointed for the security and preservation of cities, and other places. They went out of the city every morning, as soon as the gates were opened, and kept patrolling all day about the place: sometimes also making excursions further into the country, to see that there were no enemies lying in wait to surprize them.

HEMEROBROMI were also a sort of couriers among the antients, who only travelled one day, and then delivered their packets or dispatches to a fresh man, who run his day, and so on to the end of the journey.
HEMICYCLE, in hemi, hemi, HEMICAL, in medicine, a HEMIOPE, HEMITOLIA, or HEMIPLEXIA, among physicians, a palsy of one half of the body. See the article Palsy.

HEMISPHERIA, LADY-COW, in zoology, a genus of beetles, with elevated and entire antennae; and whose thorax, with the exterior wings, which are margined, constitutes an hemispheric figure.

There are a great many species of lady-cows, the most common of which is that with reddish wings, and seven black spots on them; an insect too well known to need farther description. See the article COCCINELLA.

HEMISPHHERE, hemisphærium, in geometry, the half of a globe or sphere, when it is supposed to be cut through its center in the plane of one of its great circles. Thus the equator divides the terrestrial globe into the northern and southern hemispheres: in the same manner the meridian divides the globe into the easter and western hemispheres; and the horizon into two hemispheres, distinguished by the epithets upper and lower. See the articles SPHERE and GLOBE.

The center of gravity of an hemisphere, is \( \frac{2}{3} \) of the radius distant from the vertex.

HEMISPHEROIDAL, in geometry, an appellation given to whatever approaches to the figure of an hemisphere, but is not exactly so.

HEMISTICH, semistich, in poetry, denotes half a verse, or a verse not completed.

Of this there are frequent examples in Virgil's Æneid; but whether they were left unfinished by design or not, is disputed among the learned; such are, *Ferro accinclus vocat*, Æn. II. v. 614.

In reading common English verse, a short pause is required at the end of each hemithick, or half verse.

HEMITONE, in music, the same with a semitone, or half note. See TONE.

HEMITRITÆUS, among physicians, a kind of intermittent fever, being a semiterm. See FEVER and TERTIAN.

HEMLOCK, conium, in botany. See the article CONIUM.

Water HEMLOCK, cicuta. See Cicuta.

HEMP, cannabis, in botany. See the article CANNABIS.

Hemp is a useful plant, purchased at a
dear rate from foreigners, when it might be cultivated among ourselves, to the great benefit of the nation in general. It delights in warm, sandy, or somewhat gravelly soil; but it must be somewhat rich, and of a good depth. The best seed is that which is brightest, and retains its colour and substance in rubbing. Three bushels will sow an acre; but the richer the land is, the thicker it must be sown, and the poorer it is, the thinner. The time of sowing it, is from the latter end of March, to the end of April, according as the spring falls out; but the earlier it is sown the better. If it be a dry season, great care must be taken to preserve it from birds.

The first season for gathering it is about Lammas, when a good part of it will be ripe; that is, the light summer hemp which bears no seed, and is called simble-hemp. When it is ripe the stalks grow white, and the leaves fall downwards, turning yellow at the top; it must then be pulled up, dried, bound up in bundles as big as may be grasped in both hands, and laid by for use. Care must be taken not to break what is left standing, because it is to grow till near Michaelmas before it will be fit to gather: this is usually called karle-hemp. When it is gathered, lay it in the sun three or four days to dry, and then flack or houle it till the seed be threshed out.

An acre of hemp, in the best land, commonly yields about two or three quarters of seed, which, with the hemp unworked, is often worth from 5 to 8l. but if wrought, from 10 to 12l. but the simble-hemp is not worth above half as much as the other.

As to the method of preparing it, after the seeds are threshed out of the heads, the stalks are laid up in bundles and steeped in a standing water, the cleaner it is the better; they are fastened to poles, and left to soak about fifteen days; and when the substance of the stalk is almost rotten, the bundles are taken out and well dried. But flax, instead of being steeped in water, is usually exposed alternately to the moist air of the night, and the heat of the sun, by which means it receives a finer colour.

When hemp and flax are well penetrated and afterwards completely dried, they are bruised by handfuls on a block, with a kind of mallet; all the hull, which is the inward substance of the stem, flies off in flakes, by the force of the blows, and nothing remains in the hands of the beater but the thin bark in large threads, through the whole length of the stem. This parcel of threads is afterwards hung on a perpendicular board, and bruised with a wooden beetle, in order to shake out all the little straws that may happen to remain of the hull. All the grog's parts are now separated from the stem, and the threads of the bark receive their perfection from the comb or hatchel. The refuse of this combing, which consists of all the threads which are too thick, is called tow, for the use of which see the article Tow.

Hemp and flax are the materials of a variety of profitable manufactures; for besides linen, great quantities of ticken of all fineness, fail-cloth, incle, tape, ticking, girtwip, cordage, twine, nets, and many other things are made of them; and they furnish multitudes of other manufactures, which employ the poor, and bring, by their exports, profit to the nation. But as we are under the necessity of importing very large quantities of hemp from foreign countries, the production of this article among ourselves, and in our plantations, cannot be too plentifully cultivated, nor too highly encouraged.

For the laws relating to hemp and flax, see the article Flax.

HEMFSTEAD, a market-town of Hertfordshire, twenty-nine miles north-west of London.

HEN, gallina, in ornithology, though used in a general sense to dignify any female bird, is more particularly restrained to those of the order of gallinæ. See the article Gallinæ.

HEN BANE, a plant called by botanists Hyoscyamus. See Hyoscyamus.

HEN-HARRIER, in ornithology, the falco with a brown back, and a variegated, black, and brown tail. See the article Falco.

This is a considerably large species, and is equal to a well grown pullet in size: the head is small, and somewhat flattened at the top; the breast is large, and very robust; it is broad and thick at the back, very much hooked, and extremely sharp at the point; the base of it is covered with a thick yellow membrane, in which are situated the nostrils, and there are a kind of black hairs resembling whiskers.

HENDECAGON, in geometry, a figure that hath eleven sides, and as many angles.
HEP [1607] HEP

In fortification, hendecagon denotes a place defended by eleven battions.

HENEBON, a town of Brittany, in France, twenty-two miles north-west of Vanes.

HENLEY, a market-town of Oxfordshire, situated on the river Thames, twenty miles south-east of Oxford, and thirty-five miles west of London.

HENLEY is also a market-town of Warwickshire, seven miles south-west of Warwick.

HEN-MOULD, among farmers, denotes a black spungy soil fitter for grazing than for corn.

In some places, indeed, they give the name of hen-mould to a rich black earth mixed with whitish streaks, which is exceeding fertile.

HENNEBURG, a town of Germany, in the circle of Franconia, and the capital of the county of Henneburg: east long. 10° 27', and north lat. 50° 40'.

HENOTICON, in church-history, a decree or edit of the emperor Zeno, made at Constantinople, in the year 482, by which he pretended to reconcile all parties under one faith. It is generally agreed that Peter, patriarch of Alexander, and Acacius, patriarch of Constantinople, were the authors of this decree, and that their design was to compliment the emperor with a right of prescribing regulations in matters of faith. The emperor, by this decree, arrogated to himself the right of being head of the church. Pope Simplicius, however, in the year 483, condemned the henoticon, and cited Acacius, the chief promoter of it, to appear before him at Rome; but it was not entirely suppressed till the year 518.

HENDRICO, a county of the colony of Virginia, in North America.

HENRY, or CAPE-HENRY, the south cape of Virginia, at the entrance of Chesapeake-bay: well long. 74° 50', north lat. 37°.

HENTING, among farmers, a method of sowing immediately before the plough, by which it is pretended, a great deal of charge is saved. See SOWING.

HENTING-FURROWS, those turned from each other at the bottom, in ploughing ridges. See the article PLOUGHING.

HEPAR, the LIVER, in anatomy. See the article LIVER.

HEPAR SULPHURIS, LIVER OF SULPHUR, in pharmacy, according to Quincy, is thus made: take of flowers of sulphur, four ounces; salt of tartar in powder, an ounce and half; let them be well mixed together, and then melted in an earthen dish, and kept constantly stirring till the mass has acquired a red colour, care being taken that it does not catch fire.

HEPAR UTERINUM, in anatomy, the same with placenta. See PLACENTA.

HEPATIC, in medicine and anatomy, any thing belonging to the liver.

HEPATIC ALOE. See the article ALOE.

HEPATIC DUCT. See PORUS BILARIVS.

HEPATIC FLUX, a flux of the belly, of a very singular kind, and so rarely met with, that many authors have confounded the accounts of it with those of dysenteries and haemorrhoidal fluxes. The signs by which it is known are these: the patient voids by the anus a liquid matter resembling water in which raw flesh had been washed; this is attended with pains and a sense of weight and tension in the abdomen, and spastic motions about the loins, which sometimes extend themselves to the right side, toward the region of the liver. In some patients there is no intimation of any pain, or any particular symptom; and, in some, a tenesmus is constantly joined with this voiding of a bloody fluid.

The persons subject to this disease are men, and those chiefly between the age of eighteen and forty, for the most part; as also such as are of a languid-phlegmatic habit, and of a sedentary life.

The ancients supposed this to be owing to a debility of the liver, which was not able, in this case, properly to attract or retain the blood; but it seems rather to belong to the haemorrhoidal discharges, where, when pure and proper blood is not voided, this fluid comes in its place. This flux is not dangerous at the time; but when it is long continued, it will at length wear down the patient's strength, and bring on bad habits.

This disease, according to Junker, is to be treated in the same manner as the hemorrhoidal discharge, when obstructed; and attempering and abservergent medicines are to be given with gentle purges: rhubarb, in doses from a scruple to two or more, is to be given every day, for a long time: after this, nitre, tartarium vitriolatum, the alkaline salts of plants, as of worm-wood, with the absorbent powders, such as crab's eyes; and to these may be added decoctions of small quantity, and the like herbs.

HEPATIC VEIN. See BASILICA.

HEPATICA, LIVER-WORT, in botany,
HEPATITIS, in medicine, the name of an acute, continuous, and inflammatory fever, in which nature frequently and forcibly propels the humoras through the liver, seemingly with an intent to resolve and absterge the liver, seemingly with an intent to inflammation. The hepatitis is internal inflammation of the liver, which there (as some say) finally, by applying cold external medicines to the regions of the liver, or by cupping upon the part. Bleeding is very proper in the beginning of the disease; and after this, the bowels are to be kept gently open, not by stimulating purges, but by emollient cathartics. The mixtura simplex is a very valuable medicine given several times a day; and in the intermediate hour the following powder is to be given: take purified nitre, and tartarium vitriolatum, each two drams; crab's eyes, and the jaw of a pike reduced to powder andated with lemon juice, of each four scruples; diaphoretic antimony, a dram; the dose of this mixed powder is a scruple. In the mean time the region of the liver should be bathed externally with spirit of wine camphorated, impregnated with saffron. Above all things, rest, moderate warmth, and a placid regimen are to be observed.

HEPATOSCOPY, in antiquity, that branch of divination, which predicted future events by inspecting the entrails of animals, but especially the liver. See the article DIVINATION.

HEPATUS, in ichthyology, a species of labrus, with the lower jaw longer than the upper, a forked tail, and transverse black lines on each side.

HEPHAESTIA, in grecian antiquity, an athenian festival in honour of Vulcan, the chief ceremony of which was a race with torches. It was performed in this manner: the antagonists were three young men, one of whom, by lot, took a lighted torch in his hand, and began his course; if the torch was extinguished before he had finnished the race, he delivered it to the second; and he, in like manner, to the third: the victory was his, who first carried the torch lighted to the end of the race: and to this successive delivering of the torch, we find many allusions in ancient writers.

HEPES, in ichthyology, a fish other-wise called atherina. It is a long and slender fish, with a forked tail, and its back variegated with black spots.

HEPTACHORD, in the ancient poetry, signified verses that were sung or played on seven chords, that is, on seven different notes. In this sense it was applied to the lyre, when it had but seven strings. One of the intervals is also called an heptachord, as containing the same number of degrees between the extremes.

HEPTAGON, in geometry, a figure consisting of seven sides, and as many angles...
In fortification, a place is termed an heptagon, that has seven bastions for its defence.

HEPTAGONAL NUMBERS, in arithmetic, a fort of polygonal numbers, where in the difference of the terms of the corresponding arithmetical progression is 5. One of the properties of these numbers is, that if they be multiplied by 49, and 9 be added to the product, the sum will be a square number. See Number.

HEPTAMERIS, in music, the seventh part of a meris; being, according to M. Sauveur, the forty-third part of the octave. See Octave.

HEPTANDRIA, in botany, a class of plants, the seventh in order, comprehending the plants that have hermaphrodite flowers, and seven staminas in each. See Flower, Stamen, &c.

Of this class there are only two genera, the esculus and trientalis. See ESEULUS and TRIENTALIS.

HEPTANGULAR, in geometry, an appellation given to figures which have seven angles.

HEPTARCHY, a government of seven persons; also a state or country divided into seven kingdoms, and governed by seven independent princes; in which sense it is particularly applied to the government of South Britain, when divided amongst the Saxons.

HEPTATEUCH, the seven first books of the Old Testament, containing the pentateuch, or five books of Moses, and the books of Joshua and Judges.

HEPTHETHMIMERIS, in ancient poetry, a verse consisting of three feet and an half, or seven half feet. It likewise denotes a caesura after the third foot of a verse. See CæSURA.

HERACLEA, a port-town of Romania, in European Turkey, situated on the Propontis, sixty miles south-west of Constantinople; it was once a great city: east long. 28°, and north lat. 42°.

HERACLEA, an ancient festival celebrated in honour of Hercules by several states of Greece.

HERACLEONITES, a sect of christians, the followers of Haracleon, who refined upon the gnostic divinity, and maintained that the world was not the immediate production of the Son of God, but that he was only the occasional cause of its being created by the demiurgus. The heracleonites denied the authority of the prophecies of the Old Testament, maintaining that they were mere random

HERACLIUM, in botany, a genus of the pentandria-digynia class of plants, the general flower of which is disform and radiated; the single flowers of the disc consist of five equal petals; those of the radius consist of five unequal petals: the fruit is elliptic, compressed, and friated on each side in the middle, and contains two oval compressed seeds.

To this genus belongs the sphondylium, or cow's parsnip of authors.

HERACLIDEÆ, or return of the HERACLIDÆ into Peloponæus, in chronology, a famous epocha, that constitutes the beginning of profane history; all the time preceding that period being accounted fabulous.

This return happened in the year of the world 2862, an hundred years after they were expelled, and eighty after the destruction of Troy.

HERALD, an officer at arms, who is employed in blazoning coats of arms. See COAT.

HERALDS were formerly held in much greater esteem than they are at present, and were created and christened by the king, who pouring a gold cup of wine on their head, gave them the herald-name; but this is now done by the earl-marshall. They could not arrive at the dignity of herald without having been seven years pursuivant; nor could they quit the office of herald, but to be made king at arms. See POURSUIVANT.
HERALDRY, the art of armoury and HERB, in pharmacy, an appellation given to the stalks and leaves of plants, especially such as are flabby and fucculent, and die away every year; but is also frequently used to denote the leaves alone.

The three chief heralds are called kings at arms, the principal of which is Garter; the next is called Clarenceux, and the third Norroy; these two latter are called provincial heralds. See KING at arms. Besides these there are fix other inferior heralds, viz. York, Lancaster, Somerset, Richmond, Cheffer, and Windsor; to which, on the coming of king Geo. I. to the crown, a new herald was added, styled Hanover herald; and another, styled Glouceter king at arms.

The kings at arms, the heralds, and four pourfuivants are a college or corporation, erected by a charter granted by Richard III. by which they obtained several privileges, as to be free from subsidies, tolls, and all troublesome offices. See the article COLLEGE.

HERALDRY, the art of armoury and blazoning, which comprehends the knowledge of what relates to solemn cavalcades and ceremonies at coronations, investments, the creation of peers, nuptials, funerals, &c. and also whatever relates to the bearing of arms, assigning those that belong to all persons, regulating their right and precedencies in point of honour, and reenfranchising those who have not a just claim, from bearing coats of arms that do not belong to them. See BLAZONING, ARMS, SHIELD, &c.

HERAT, a city of Persia, in the province of Chorassan: east long. 61°, and north lat. 34° 30'.

HERB, in pharmacy, an appellation given to the stalks and leaves of plants, especially such as are flabby and fucculent, and die away every year; but is also frequently used to denote the leaves alone.

The term herb, therefore, denotes the stalks and leaves, in contradistinction to the flowers, seeds, and roots. See PLANT, FLOWER, FRUIT, ROOT, &c. Quincy gives the following directions for the gathering and preferring of herbs. They should be gathered just when beginning to flower, as being then in greatest perfection; and this must be done when there is no rain or dew upon them, otherwise they will be apt to turn black in drying. They ought to be dried in the shade, as too great heat exhales their moisture too fast, and destroys their beautiful verdure. The freher they are used the better, though some may be kept much longer than others. So long as the fresh colour they dry with continues, they may be trusted in medicine, but no longer. They are much better for decoction and distillation when dried than green, because their saline and volatile parts very difficultly mix with a menstruum, until their native phlegm be evaporated.

HERBS-TRUELOVE, herba paris, in botany, See the article PARIS.

HERBAGE, in law, signifies the pature provided by nature for the food of cattle; also the liberty to feed cattle in the forest, or in another person's ground.

HERBAL, in literary history, a book that treats of the classes, genera, species, and virtues of plants. See the articles PLANT and BOTANY.

HERBAL is sometimes also used for what is more usually called hortus fuscus. See the article HORTUS.

HERBALIST, the author of an herbal, or one who is skilled in plants.

HERBE, in the french academies, a reward, or some good fluff, given to a horse who has worked well in the manege.

HERBORG, a town in the circle of the Upper Rhine, and territory of Nassau; east long. 5° 15', and north lat. 50° 35'.

HERCINIAN FOREST, a forest which antiently extended the whole length of Germany and Bohemia, some remains of which are still in being, viz. the Black Forest, Odenwald near Heidelberg, Sisgewald in Wurtzburg and Bamberg, and Hartf Wald in Brunswic.

HERCOLE, a port-town of Tuscany, on the coast called Stato del Prefidii: east long. 12°, and north lat. 42° 25'.
HEREDITION, an appellation given to whatever belongs to a family by right of succession, from heir to heir. Some monarchies are hereditary, and others elective; and some hereditary monarchies descend only to the heirs male, as in France; but others, to the next of blood, as in Spain, England, &c. Thus the dominions of the emperor are distinguished into hereditary, which are those he derives from his ancestors by right of inheritance, and those he enjoys in quality of emperor by virtue of his election. Hereditary is also applied to offices and estates; thus the office of earl-marshall is hereditary in the family of Howard. Hereditary is also figuratively applied to good or ill qualities, supposed to be transmitted from father to son; thus we say, virtue and piety are hereditary virtues in such a family; and that in Italy the hatred of families is hereditary. And indeed the gown, the king's evil, madness, &c. may really be hereditary diseases.

HEREFORD, the principal city of Herefordshire, situated on the river Wye, twenty four miles north-west of Gloucester, and one hundred and twenty west of London: west long. 2° 42', and north lat. 52° 6'. It sends two members to parliament.

HEResy, the crime of obstinately persisting in opinions, that are contrary to the fundamentals of religion. There is no law that expressly determines this offence, it being impossible to set down all the particular errors that may be said to be heretical, and in relation to which so many disputes have arisen; in general, however, those opinions that were supposed to be condemned by the scriptures, or the four first general councils, have been accounted heresy. Here was antiently treason, and punished by burning the offender; but he forfeited neither lands nor goods, because the proceedings against him were pro fatale animae. At present, all punishments of death, and the old statutes which gave power to arrest or imprison persons for herey, are repealed; though, by the common law, an obstinate heretic, being excommunicated, may be still imprisoned, on the writ de excommunicato capiendo, till he makes satisfaction to the church. And persons denying the truth of the christian religion, or the divine authority of the scriptures, &c. are liable, for the second offence, to three years imprisonment, by 9 & 10 Will. III. cap. xxxii.

HERETIC, a general name for all such persons, under any religion, but especially the christian, as profess or teach religious opinions contrary to the established faith, or to what is made the standard of orthodoxy. The laws both of church and state were antiently very severe against those who were adjudged to be heretics: the principal of which were, first, the general note of infamy affixed to all heretics in common. Secondly, all commerce forbidden to be held with them. Thirdly, the depriving them of all offices of profit and dignity. Fourthly, the rendering them incapable of disposing of their estates by will, or of receiving estates from others. Fifthly, imposing on them pecuniary multas. Sixthly, proscribing and banishing them. Seventhly, inflicting corporal punishment on them, such as scourging, &c. before banishment. Besides their laws, which chiefly affected the persons of heretics, there were others which tended to the extirpation of herey, such as those which forbade heretical teachers to propagate their opinions in public or private: those which denied the children of heretical parents their patrimony and inheritance, unless they returned to the church; such as ordered the books of heretics to be burnt. There were many other penal laws against heretics, from the time of Constantine to Theodosius junior, and Valentinian III. But the few already mentioned may be sufficient to give an idea of the rigour with which the empire treated such persons, who held or taught opinions contrary to the faith of the catholic church; whose discipline towards heretics was no less severe than the civil laws: but since those early times, the most horrid deaths, and the most excruciating tortures, have been invented. For the laws of England in relation to heretics, see the preceding article.

HERISSON, in fortification, a beam armed with a great number of iron-spikes, with their points outwards, and supported by a pivot, on which it turns. These serve as a barrier to block up any passage, and are frequently placed before the gates, and more especially the wicket-doors of a town or fortres, to secure those passages, which must of necessity be often opened and shut.

HERK, a town of Germany, in the diocesepriick of Liege, situated on a river of
of the same name, near its confluence with the Demer: east long. 5° 20', and north lat. 51°.

HERLING, a market-town of Norfolk, twenty miles south-west of Norwich.

HERMAPHRODITE, among antiquarians, flatues of the god Mercury, made of marble, and sometimes of brass, without arms or feet, and set up by the Greeks and Romans in the cross-ways.

Antiquity likewise furnishes us with compound hermæ, or flatues of Mercury joined with some other deity, as Herm-Athena, or Mercury and Minerva; Herm-Hercules, or Mercury and Hercules; Herm-Eros, or Mercury and Cupid; and so of others.

HERMAPHRODITES, in antiquity, antient greek festivals, in honour of the god Hermes, or Mercury. One of these was celebrated by the Pheneatae, in Arcadia; a second by the Cyllenians, in Elis; and a third by the Tanagreans, where Mercury was represented with a ram upon his shoulder, because he was said, in a time of plague, to have walked thro' the city in that posture, and to have cured the sick; in memory of which, it was customary at this festival, for one of the most beautiful youths in the city, to walk round the walls, with a ram upon his shoulder.

A fourth festival of the same name was observed in Crete, when it was usual for the servants to sit down at the table while their masters waited; a custom which was also practised at the roman satura, a statue representing Mercury and Minerva both in one. See HERMÆ.

HERMÆ, or HERMÆ. See HERMÆ.

HERMETIC, or HERMETICAL, an appellation given to whatever belongs to chemistry, from Hermes Trimegists, who is supposed to have been its inventor.

HERMETICAL PHILOSOPHY, that which undertakes to solve the various phenomena of nature, from the chemical principles, falt, sulphur, and mercury.

HERMETICAL SEAL, among chemists, a method of stopping glass-vessels, used in chemical operations, so closely, that the most subtle spirit cannot escape through them.

It is commonly done by heating the neck of the vessel in a flame, till ready to melt, and then twisting it closely together with a pair of pincers. Or, vessels may be hermetically sealed, by stopping them with a glass plug, well luted; or, by covering the vessel with another ovum philosophicum.

HERM-HARPOCRATES, in antiquity, a compound flatue of Mercury and Harpocrates. See the article HERMÆ.

HERMIT, a devout person retired into solitude to be more at leisure for contemplation, and to difencumber himself from the affairs of the world.

An hermit is not reputed a religious, unless he has made the vows.

Paul the hermit is usually reckoned the first: though St. Jerom at the beginning of the life of that saint, says it is not known who was the first. Some go back to St. Anthony, some to John the Baptist, and others to Elias. However, several of the antient hermits, though they lived in deferts, had nevertheless numbers of religious accompanying them.

There are also several orders and congregations of religious distinguished by the title of hermits; as the hermits of St. Augustin, of St. John the Baptist, of St. Jerom, of St. Paul, of St. James de Montiio, of St. William, of St. Benedict of Montefabalo, &c.

HERM, in zoology, the long-tailed squilla, with a soft tail, and the right claw the largest. See the article SQUILLA.

This grows to two inches and a half in length; the legs are slender and long, and the anterior ones have claws on them like the common crabs.

HERMODYCMTLS, in pharmacy, a root supposed to be that of the plant colchicum. See the article COLCHICUM.
HERNIA, in medicine, a preternatural hernia;
HERNGRUNT, a town of Hungary, situated north of Buda, near the north lat. 48° 47'/.
HERNANDIA, in botany, a genus of plants, the characters of which are not perfectly ascertained; the corolla of the male as well as the female flower, is divided into five segments; there is no pericarpium, the cup is very large, inflated and roundish, and intire; the seed is oval, succulent, unilocular nut; the nucleus is globose.
HERNIA, in medicine, a preternatural tumour formed in the abdomen, particularly in the navel, inguinal, and scrotum, by a protrusion of the intestines or omentum, and usually known by the name of rupture.
These tumours differ first, according to their place or situation: those formed at the navel are called omphalocele, or exomphalus. See Exomphalus.
A hernia in the groin is called bubonoecele, and that of the scrotum, ophrooecele, &c. See the article Bubonocele and Oschocele, &c.
Hernias are also distinguished from the body or surface contained in, or forming, the tumour: when from a protrusion of the intestines, a hernia is termed enterocecle; when from the omentum, epipocele; if from flatus, pneumatoccele; and if from water, hydrdoccele, &c. See the articles Enteroceele, Epipocele, Pneumatoccele, Hydoccele, &c.
Hernias are also distinguished from circumstances less remarkable, as from the size, being either small, large, or enormous; from their confluence, being either hard, soft, fixed or moveable, capable of being returned into the abdomen, or not; which latter are called ad

...
in the kidneys, and bladder; in incising mucosities of the stomach and other parts, and bringing them away; in evacuating bile and water, and consequently curing the jaundice.

HERO, in the antient mythology, a great and illuftrious perfon, of a mortal nature, though supposed by the populace to partake of immortality; and, after his death, placed among the number of the gods.

Heroes were perpons partly of divine and partly of human extracction, being begot between a deity and a mortal, and coincides with what we otherwise call a demi god; such was Hercules, who was the fon of Jupiter by Alcmena: accordingly Lucian describes a hero to be a medium between a god and a man, or rather a composition of both.

HERO is also ued in a more extensive fene for a great, illuftrious, and extraordinary perfonage; particularly in refpect of valour, courage, intrepidity, and other military virtues.

F. Bouhours makes this diftingution between a hero and a great man, that the former is more daring, fierce, and enterprizing; and the latter more prudent, thoughtful and referved. In this fene we fay, Alexander was a hero, and Julius Cæfar a great man.

HERO of a poem, or romance, is the principal perfonage, or character therein. See the article CHARACTER.

The hero of the Iliad is Achilles; of the Odyssey, Ulysses; of the Aeneid, Aeneas; of Taffe's Jerufalem, Godfrey of Bulloign; of Milton's Paradise Lost, Adam; though Mr. Dryden will have the devil to be Milton's hero, in regard he gets the better of Adam, and drives him out of Paradife.

Many of the critics find fault with the hero of the Aeneid, for being too delicate, wanting the fire, firmness, and uncontrollable spirit, remarkable in the hero of the Iliad. Piety, tenderness, and submission to the gods, are virtues of the middle class of mankind; they do not strike enough for a hero who is to be the instrument of fuch notable exploits. In anfwering to this, F. Boffu obferves, that Aeneas's character was not to be formed on the model either of Achilles or Ulysses; nor to be of the fame kind with them, as the fable and defign of the Aeneid were very different from thofe of the Iliad and Odyssey. Virgil's defign was to persuade the Romans to receive a new form of government, and a new master; who must have all the qualities requisite for the founder of a state, and all the virtues which make a prince beloved.

Virgil was restrained in his choice; his hero was to be of the genius of Augustus. The characters of Homer's two heroes, as being directly contrary to his defign, he has thrown upon Turnus and Mezentius, who are the counter-parts to his hero. It is disputed whether it be neceffary, that the hero of an epic poem be a good and virtuous man. Boffu maintains the negative. Between a hero in morality, and a hero in poetry, the fame diftingution may be made as between moral and poetical goodnefs. Hence, as the manners of Achilles and Mezentius are poetically as good as thofe of Ulysses and Aeneas, fo these two cruel and unjuft men are as regular poetical heroes, as thofe two juft, wife, and good men. Whatever Ariftotle may fay in his book of morality, in his poetry he fpeaks another language. The hero of a poem, he obferves, must neither be good nor bad, but between both: he muft not be superior to the reft of mankind by his virtue and juftice, nor inferior to them by his crimes and wickednefs. In effect, reafon, the nature of the poem, which is a fable, the practice of Homer, and the rules of Ariftotle and Racce agree that it is so far from being neceffary, that a hero be a faultlefs man, that it is not neceffary he be an honeft man.

It is likewise difputed, whether, the catafrophe is neceffarily to leave the hero happy, or whether it be allowable to leave him unhappy.

The general practice of the heroic poets fland for the affirmative. In tragedy, according to Ariftotle unhappy catafpheres are preferable to happy ones, and always much better received among the antients. It is otherwife in the epopeia; but yet this does not exclude all unhappy conclusions. If the poet propofed his hero as a pattern of perfection for imitation, the misfortunes falling on him would fit very ill with the defign; but this was doubtlefs the farteft thing from the intentions of the great masters of the epopeia. The only reafon perhaps for this uniform practice of the poets is, that an epic poem containing an action of more extent than that of tragedy, the reader would not be fo well fatisfied if, after
Fig. 1. Hellebore.

Fig. 2. The Ash-coloured Heron.

Fig. 3. Hieracium.
HEROIC, something belonging to a hero, or heroine: thus,
HEROIC AGE, that age or period of the world wherein the heroes are supposed to have lived. The heroic age coincides with the fabulous age.
HEROIC POEM, that which describes some extraordinary enterprise; being the same with epic poem. See EPIC.
HEROIC VERSE, that wherein heroic poems are usually composed; or it is that proper for such poems. In the greek and latin, hexameter verses are usually denominated heroic verses, as being alone used by Homer, Virgil, &c. See the article HEXAMETER.
Alexandrine verses of twelve syllables were formerly called heroic verses; but later writers use verses of ten syllables.
HEROIN, a woman of an heroic spirit, or who makes the principal personage in an heroic poem. See HERO and POEM.
HERON, in ornithology, a bird of the ardea-kind, with a hanging crest.
The common heron is a tall bird, measuring more than four feet from the point of the beak to the tip of the toes. Its head is covered with short white feathers; only from the hinder parts, there hangs a crest of very long black feathers; the upper part of its body is of a dullish bluish grey; the under part white, and the thighs yellowish.
The ash-coloured heron from Hudson's Bay differs from the common heron, in being something bigger, of a browner ash-colour on its back, and in having no white feathers on its forehead. See plate CXXXI. fig. 2.
HERPES, in medicine, a bilious pimple, which breaking out in different manners upon the skin, accordingly receives different denominations.
If they appear single, as they frequently do in the face, the bane is inflamed, and the top pointed; and having discharged a drop of matter, the redness and pain go off, and they dry away. There is another sort more contusive and of greater malignity, when a cluster of pimpls rise in a ring, accompanied with smart, and sometimes with great itching; this species is termed serpigo, and vulgarly the tetter, or ring-worm. It seizes the face, hands, and other parts of the body, is of an obstinate nature, eating into the skin; and forsaking the place where it first appears, it spreads its taint into the adjacent parts. It neither forms matter, nor comes into digestion; but when rubbed, will sometimes emit a thin, sharp, watery, humour, and excites smart, heat, and itching.
Another kind of this disease appears in large clusters upon the neck, breasts, loins, hips, and thighs, attended with a slight fever and inflammation: the heads are white and matterly, which are succeeded by a small round leab, resembling millet-feed, whence its name of herpes miliaris; and is commonly called shingles. Another species, from its degree of virulence and corruption, is named herpes excedens, or herpes depascens. See the article ULCER.
The simple bilious pimple, which rises in the face, requires but little assifiance from medicine; for though it burns, smart, or itches a day or two, yet it naturally comes to a head, soon dies, and disappears.
The serpigo is sometimes very difficult to be exterminated, and after it appears dead, it will at certain feasons of the year, obstinately break out again.
The bleeding at first is by some condemned, yet repeated purging, especially with cholagogue medicines is universally approved: these not succeeding, recourse must be had to mercurials, especially if there be the least suspicion of any old venereal taint remaining in the blood. Having removed the cacochymy, the physician may proceed to topics. Ambrois Paré, after a general evacuation, prescribes the following. Take of powder of oak-galls, pomegranate-peel, balsamines, and armenian bole, each half an ounce; of rose-water, half an ounce; of the sharp est vinegar, half an ounce; of goose-grease, and oil of myrtles, each six drams; of turpentine, half an ounce: make up into an ointment for use. Barbet imputes the cause of the herpes rather to the lymph, than to the bile and flat phlegm, blamed by the antients. In the military eruptions, called shingles, great care must be taken that the bilious cacochymy is purged off before the use of topics: the internal prescription for this purpose is the same with that in the erysipelas. See the article ERYSPIELAS.
When the pimpls are all ripened, their heads may be cut off with a pair of 9 U 2 scissors,
HER [1616]

HERRISON, in ichthyology, a species of clupea, with the lower jaw longish, and without any black spots. It is from five to eight inches in length, and between one and two in breadth. However, its size is far from being certain; since it varies not only on account of age, but according to the seas and places where it is caught. The back is of a dusky bluish colour, and is more blue in spring than any other times; the sides and the belly are of a silvery white; the fin on the back stands near the middle, and is of a whitish colour, and has nineteen rays; the pectoral fins are whitish, flat low, and have each eighteen rays; the ventral fins are very small and white; the pinna ani is near the tail, and has eighteen rays; the tail is of a greyish colour, forked, and furnished with eighteen rays.

We have been design'dly particular in the description of this useful fish; the manner of killing and curing which is delivered under the article FISHERY.

Barrelling of HERRINGS. See the article HERRING.

HERRING-BUSK, in naval affairs. See the article Buss.

HERSE, in fortification, is a lattice or poulcellule, made in the form of a harrow, and stuck full of iron spikes.

It is usually hung by a rope, fastened to a moulinet, which is cut in cale of furpize, or when the first gate is broken with a petard, to the end that it may fall and fill up the passage of the gate, or other entrance of a fortress.

These heres are also often laid in the roads, with the points upwards, to incommode the march both of the horse and infantry.

HERSILLAN, in the art of war, is a strong plank or beam, about ten or twelve feet long, stuck full of spikes on both sides, and also used to incommode the march of the infantry or cavalry.

HERSTAL, a town of Germany, in the bishopric of Liege, situated three miles north of the city of Liege; east long. 5° 36' north lat. 56° 42'.

HERTFORD, or HARTFORD. See the article HARTFORD.

HERWERDEN, a town of Westphalia, subjed to the king of Prussia; and remarkable for its protestant-nunnery: east longitude 8° 15', and north latitude 52° 12'.

HESDEN, a town of Artois, near the confines of Picardy, when the fets after the sun. See VENUS.

HESPERIDES, in antiquity, the daughters of Hesperus, brother of Atlas, who kept a garden full of golden apples, guarded by a dragon: but Hercules having laid the dragon asleep, stole away the apples. Others say, that they kept sheep with golden fleeces that were taken away by Hercules.

Some think the hesperides were the daughters of a rich merchant of Miletus, who, on account of their beauty, were guarded by a man called Dragon; and that Hercules, by killing or bribing him, got them away.

HESPERIS was also a name antiently given to the Cape Verdi Islands. See the article Cape VERD.

HESPERIS, DAME'S VIOLET, in botany, a genus of the tetradyamia filicioua clais of plants, the corolla of which consists of four cruciform petals, of an oblong figure, of the length of the cup, a little reflex, and ending in small ungu's: the fruit is a long pod, plane, comprefied, striated, bilocular, bivalve, containing several oval, compressed seeds.

This plant is antifcorbutic, and diaphoretic, and very serviceable in the asthma, cough, and convulsions: the outward use of it is recommended against inflammations, cancers, a gangrene, phæceus, and contagious diseases.

HESSE-CASSEL, landgraviate, including Wetteravia, is a circle of the Upper Rhine, bounded by Westphalia and Brunswick on the north; by Franconia and Saxony on the east; by the river Maine on the south, and by another part of Westphalia, and the electorate of Mentz and Trier's on the west; it is subjedt to the king of Sweden.

HESSE-DARMSTADT, is bounded by the river Maine, which divides it from Heife-Caffel on the north; by the same river on the east; and by the Palatinate on the south and west.

HETEROCLITE, among grammarians, one of the three variations in irregular nouns,
nouns, and defined by Mr. Ruddiman, a noun that varies in declension; as hoc 'vatis, vocis; hoc vocis, vocorum.

Other grammarians take the word heteroelute in a larger sense, applying it to all irregular nouns. See ANOMALOUS.

The heteroclite nouns properly so called, or, according to the definition, are only three, vice. vatis, jugerum, and donus.

HETERODOX, in polemical theology, any thing contrary to the faith and doctrines of a true church.

HETERODROMUS VECTIS, in mechanics, a lever, wherein the fulcrum, or point of fulpension, is placed between the power and the weight. See LEVER.

In this kind of lever, the weight is elevated, or raised, by the descent of the power, and vice versa.

HETEROGENEITY, in physiology, that quality or property of bodies, which denominates a thing heterogeneous. See the next article.

The word is also used for the heterogeneous parts themselves. In which sense the heterogeneities of a body are the same thing with the impurities thereof.

Heterogeneity is a word of a very lax signification, and is brought by the chemists to serve almost for any thing they do not understand, so that the disagreement or inaptitude to mixture in any body is imputed to the heterogeneity of their parts.

HETEROGÉNEOUS, or HETEROGÉNEAL, something that consist of parts of diffimilar kinds, in opposition to homogeneous. See HOMOGENEOUS.

Heterogeneous, in mechanics, such bodies whose density is unequal in different parts of their bulk; or they are such whose gravities in different parts are not proportionable to the bulks thereof; whereas bodies equally dense or solid in every part, or whose gravity is proportionable to their bulk, are said to be homogeneous.

Heterogeneous light, is, by Sir Isaac Newton, said to be that which consists of rays of different degrees of refrangibility; thus the common light of the sun or clouds is heterogeneous; being a mixture of all sorts of rays.

Heterogeneous nouns, one of the three variations in irregular nouns; or such as are of one gender in the singular number, and of another in the plural, as hoc caelum, hi caeli. Heterogeneous, under which are comprehended, mixed nouns, are six-fold, 1. Those which are of the masculine gender in the singular number, and neuter in the plural, as hic tarsus, hie tartara. 2. Those which are masculine in the singular number, but masculine and neuter in the plural, as hic locus, hi loci, & hie loca. 3. Such as are feminine in the singular number, but neuter in the plural, hie caratha, & hie carastha. 4. Such nouns as are neuter in the singular number, but masculine in the plural, as hoc caelum, hi caeli. 5. Such as are neuter in the singular, but neuter and masculine in the plural, as hie rafrum, hi rafiri, & hie rafira; and, 6. Such as are neuter in the singular, but feminine in the plural number, as hoc epulam, he epula.

HETEROGENEOUS NUMBERS, mixed numbers consisting of integers and fractions. See INTEGER and FRACTION.

HETEROGENEOUS QUANTITIES, are those which are of such different kinds, as that one of them taken any number of times, never equals or exceeds the other.

HETEROGENEOUS SURDS, are such as have different radical signs, as $\sqrt{a}$, $\sqrt{b}$, $\sqrt{9}$, $\sqrt{18}$, &c. See SURD.

If the indices of the powers of the heterogeneous surds be divided by their greatest common divisor, and the quotients be set under the dividends; and those indices be multiplied crosswise by each others quotients; and before the products be set the common radical sign $\sqrt{}$, with its proper index; and if the powers of the given roots be involved alternately, according to the index of each others quotient, and the common radical sign be prefixed before those products, they will those two surds be reduced to others, having but one common radical sign. As to reduce

$\sqrt[2]{a}$ and $\sqrt[2]{b}$

$\sqrt[2]{a} \cdot \sqrt[2]{b}$

HETEROPYRAE, in natural history, a genus of fossils, of the class of the hide-rochita, composed of various crusts, surrounding a nucleus of a different substance from themselves, and often loose and rattling in them. See the article SIDEROCHITA.

Of this genus Dr. Hill reckons seven species. 1. The hard heteropyra, with brown and purplish crusts, and a whitish green nucleus, being a very beautiful fossil of a smooth equal texture, considerably compact and close, generally determinate and regular in shape and size,
in form of an oblong oval figure, and about an inch in length, and half an inch in diameter. 2. The rough purplish heteropyra, containing a large nucleus of a very light earth. 3. The mifhapen heteropyra, with ferrugineous, red, and dusky, yellow crusts, and a greenish, white nucleus. 4. The yellow, brown, and black-crusted heteropyra, with a whitish nucleus, being about four inches in length, and three in breadth, and two and a half in thickness, of an oblong form, a close compact texture, and very heavy. 5. The yellow, ferrugineous, and purplish-crusted heteropyra, with a pale yellow nucleus, from four to twelve inches in length, and about the third of its length in breadth, and nearly the same in thickness. 6. The coarse, yellow, and brown heteropyra, with a brownish yellow nucleus of an orbicular form, and between one and two inches in diameter. 7. The coarse heteropyra, with brown, black, and orangecoloured crusts, and a yellow nucleus, being of an oblong form, and about an inch and a half in length.

HETEROSCIUS, in geography, a term of relation denoting such inhabitants of the earth as have their shadows falling but one way, as those who live between the tropics and polar circles, whose shadows at noon, in north latitude, are always to the northward; and in south latitude, to the southward. Thus we who inhabit the northern temperate zone, are heterocii with regard to those who inhabit the southern temperate zone, and they are heterocii with respect to us. Hence it follows, that only the inhabitants of the two temperate zones are heterocii, though in reality there is always one part of the torrid zone whose inhabitants are heterocii with respect to those of the rest, and with regard to those of one of the temperate zones, except at the time of the solstices, and even at this time all of the torrid zone are heterocii with regard to those of one of the temperate zones; but as the people of the torrid zone have their shadows now on this, and then on that side, they are called amphihci. See A M P H I S C I U S.

HETEROUSIANS, a name composed of άτρέπος, other, and υοίς, substance, being given to a sect of Arians, who did not believe that the son of God was of a substance like to that of the father, which was the opinion of another branch of the Arians, who were from thence called hemo-

HEXACHORD, in antient music, a concord called by the moderns a sixth. Guido divides his scale by hexachords, and there are seven contained in it, three by B quadro, two by B natural, and two B mole; and it is for this reason that he divided his scale into six columns, in which he disposed the hexachords. See the article GAMUT. The hexachord is two-fold, greater and less. The greater hexachord is composed of two greater tones, and two less, and one greater semitone, which make five intervals. The less hexachord is of two greater tones, one lefser, and two greater semitones. See TONE, &c.

HEXACHORD, or HEXAHEDRON. See the article HEXAHEDRON.

HEXÆDROSTYLA, in natural history, a genus of fossils consisting of crystalliform columnar fpars, terminated at their summit by a pyramid, but adhering irregularly to some other body at their base. See the article SPAR. There are three species of this genus of fossils. 1. The slender hexahedryllum, with a long pyramid, being so pure and clear a spar, and so much of the ordinary figure of the hexagonal crystal, that there is no doubt but it has often been mistaken for crytal: its most frequent size is nearly two inches in length, and a third of an inch in thickness, the pyramid being about one fourth of that length. 2. The hexahedryllum, with a long irregular pyramid, being of a moderately equal, but somewhat coarse and impure texture, and subjacent to spots of various earths and minerals, and often so altered by them, as not to be known, but by its figure, which it ever keeps regularly to: it is naturally of a dulky white, but moderately transparent, considerably heavy, and very soft. 3. The hexahedryllum, with a very short pyramid, being usually of a very pure, clear, and
HEXAGON, in geometry, a figure of six sides and angles; and if these sides and angles be equal, it is called a regular hexagon. The side of every regular hexagon, inscribed in a circle, is equal in length to the radius of that circle. Hence, it is easy, by laying off the radius six times upon the circumference, to inscribe an hexagon in a circle.

To describe a regular hexagon on a given right line A B (plate CXXIX. fig. 3.) draw an equilateral triangle A C B, and the vertex C will be the center of a circle which will inscribe the hexagon required A B D E F G.

As is to 1.625, so is the square of the side of any regular hexagon to the area thereof, nearly.

HEXAGON, in fortification, is a place defended by six bastions.

HEXAHEDRON, in geometry, one of the five platonic bodies, or regular solids; being the same with a cube. See CUBE.

HEXAMETER, cænus hexametrum, in ancient poetry, a kind of verse consisting of six feet; the first four of which may be indifferently, either spondees or dactyls; the fifth is generally a dactyl, and the sixth always a spondee. Such is the following verse of Horace:

\[ \begin{array}{cccccc}
1 & 2 & 3 & 4 & 5 & 6 \\
\end{array} \]

The verse of Homer:

\[ \begin{array}{cccccc}
1 & 2 & 3 & 4 & 5 & 6 \\
\end{array} \]

HEXASTYLE, in architecture, a building with six columns in front.

HEXHAM, a market town of Northumberland, sixteen miles west of Newcastle.

HEYDON, a borough town in Yorkshire, thirty-seven miles south-east of York, and six miles west of Hull. It sends two members to parliament.

HEYLSHEM, a town of the Austrian Netherlands, in the province of Brabant, situated five miles south of Tirlemont; east long. 4° 55', north lat. 50° 53'.

HEYRS, in huckaberry, young timber-trees usually left for standards, in the falling of woods or copes.

HEYTSBURY a borough town of Wiltshire; fourteen miles north-west of Salisbury, sends two members to parliament.

HIÆNA, or HYÆNA, in zoology. See the article HYÆNA.

HIATICULA, the SEALARK, in ornithology, a species of Charadrius, with a black front, and a white line on it. See the article CHARADRIUS. It is a very pretty bird, about the size of the common lark, or a little larger. The upper
upper part of its body is grey, and the belly white.

HIATUS, properly signifies an opening, chasm, or gap; but it is particularly applied to those vortices, where one word ends with a vowel, and the following word begins with one, and thereby occasion the mouth to be more opened, and the sound to be very harsh.
The term hiatus is also used in speaking of manuscripts, to denote their defects, or the parts that have been lost or effaced.

HIBISCUS, in botany, a genus of the monadelphia polyandria class of plants, the corolla whereof consists of five petals, vertically cordated, having one prominence of the apex greater than the other, and coalescing at the base: the fruit is roundish, and contains five cells: the seeds are kidney-shaped.
The several species of this plant are in English called the chineze-rose, the abel-moch, the bladder alcea, and the gum-leaved-ketmia.
The seeds of the abel-moch were once kept in our shops, as a provocative and cordial; but they are now out of use.

HICUP, or Hiccough, in medicine, a spasmodic affection of the stomach and diaphragm, arising from any thing that irritates and velocitates their nervous coats.
When it proceeds from a flight error in diet, it will soon end spontaneously, or by drinking any thing which dilutes the acid matter; but it is sometimes of a more dangerous kind, and may proceed from a hurt of the stomach, poison, an inflammation of the stomach, intestines, diaphragm, bladder, or the rest of the viscera.
Sometimes, immediately before death, it may proceed from gangrenes of the outward parts. In acute fevers, and chiefly the malignant, it is often fatal.

When it happens in old or weak people from a plentiful meal, especially from hard and flatulent aliment, or from drinking cold liquors, a draught of generous wine, or a dram of any spirituous liquor, will generally take it away. Stomachic powders mixed with peruvian bark, and taken in generous wine, are also profitable.

When it proceeds from acid humours in the stomach, absorbent and alkaline medicines are good. If it proceeds from an acute fever, or an inflammation of the stomach, it is a dangerous disea: however, dulcified spirit of nitre, joined to an alexipharmic, and given often, is proper; or a dram of diazordium given in the evening, may perform a cure. If it proceeds from a gangrene or mortification, it is generally incurable; but peruvian bark, with medicines against internal inflammations, are most likely to succeed. If it is caused by poison, plenty of milk must be taken with oil.

Fuller declares, that he does not know a better medicine than the julep of musk; and Allen says, that this affords, one would almost think, supernatural affihance.

HICKWALL, or WITWALL, in ornithology, names used in several parts of the kingdom for the lefser black and white woodpecker, with the three lateral long feathers of the tail variegated at the top.
It is a small bird, hardly weighing more than an ounce. See the articles Picus and Woodpecker.

HIDAGE, in law-books, an extraordinary tax antiently paid to the king for every hide of land. Sometimes, indeed, it is used for being quit of this tax.

HIDE, the skin of beasts, but particularly applied to those of large cattle, as bullocks, cows, horses, &c. See the article Skin.

Hides are either raw or green, just as taken off the carcasse; salted or seasoned with salt, alum, and salt-petre, to prevent their spoiling; or curried and tanned.
See the article Currying, Tanning, &c.

Hides make a considerable article of commerce, being subject to the following duties and drawbacks, on importation, and when exported again. Buff-hides pay each 3 s. 6 d. and draw back 2 s. 3 d.
Cow- or horse-hides in the hair, pay each 7 d. and draw back 4 s.
 ditto tanned, pay each 2 s. 4 d., and besides pay for every pound weight 7 d. and draw back 6 s. 6 d.
Cow- and horse-hides in the hair, pay each 2 s. 3 d., and draw back 4 s.
 ditto tanned, pay each 2 s. 4 d., and besides pay for every pound weight 7 d. and draw back 6 s. 6 d.

Hides of Barbary and Muscovy pay each 7 s. 6 d. draw back 4 s. And besides if dressed in oil, for every pound weight 7 d. draw back 6 s. 6 d. And besides if tanned, the pound weight 3 2 s. 4 d. draw back 2 2 3 2.

Hides are either raw or green, just as taken off the carcasse; salted or seasoned with salt, alum, and salt-petre, to prevent their spoiling; or curried and tanned. See the article Currying, Tanning, &c.

Hides of Barbary and Muscovy pay each 7 s. 6 d. draw back 4 s. And besides if dressed in oil, for every pound weight 7 d. draw back 6 s. 6 d. And besides if tanned, the pound weight 3 2 s. 4 d. draw back 2 2 3 2.
HIDE [1621]

2s. 4d. India hides pay each 11\(\frac{66}{100}\)d. draw back 10\(\frac{73}{100}\)d. and besides if dressed in oil, for every pound weight 7d.

draw back 4\(\frac{6}{100}\)d. if tanned, for each pound 3\(\frac{50}{100}\)d. draw back 2\(\frac{33}{100}\)d. if tawed, for each hide 3s. 6d. draw back 4s. 2d. Hides of horses, mares and geldings, pay for every 20s. of their value upon oath 4s. 9\(\frac{3}{100}\)d. draw back 4s. 3\(\frac{23}{100}\)d. and besides for every hide, 2s. draw back 1s. 4d. Loin-hides pay each 1s. 10\(\frac{8}{100}\)d. draw back 1s. 9\(\frac{37}{100}\)d. and besides for every pound weight, 7d. draw back 6\(\frac{6}{100}\)d. Red or Muscovy hides tanned, coloured, or uncoloured, pay each 1s. 7\(\frac{12}{100}\)d. draw back 1s. 6\(\frac{25}{100}\)d. and besides for every pound weight, 3d. draw back 2d. All other hides, and pieces of hides, not above particularly charged, pay for every 20s. value upon oath, 4s. 4\(\frac{1}{100}\)d. draw back 4s. 3\(\frac{23}{100}\)d. and if tanned, for every pound weight, 3\(\frac{50}{100}\)d. draw back 2\(\frac{33}{100}\)d. if dressed in oil, for each pound 7d. draw back 6\(\frac{6}{100}\)d. and if tawed, each hide pays 3s. 6d. and draws back 2s. 4d. For the duty on brithit hides, tanned, &c. See the articles EXCISE, LEATHER, PARCHMENT, &c.

Hides and calves’kins, tanned in Great Britain, draw back, upon due exportation, two third parts of the duties originally paid for them; and besides a further allowance of one penny for every pound weight of skin so dressed, there is a draw-back of 1\(\frac{1}{2}\)d. for every pound weight manufactured into boots, shoes, gloves, &c.

HIDE OF LAND, was such a quantity of land as might be plowed with one plough within the compass of a year, or so much as would maintain a family; some call it sixty, some eighty, and some an hundred acres.

The distribution of this kingdom by hides of land is very antient, mention being made of it in the laws of king Ina. Henry I. had three hillings for every hide of land, in order to raise a dowry for his daughter: this tax was called hidage.

HIDE-BOUND, among farriers, a distemper in horses when the skin sticks so fast to the back and ribs, that the hand cannot separate the one from the other without great difficulty: his body is at the same time lean, his back-bones stand up, his guts are for the most part deficient in moisture, and his dung dry and more offensive than common.

If a horse become hide-bound by hard riding and ill keeping, he may be cured by good keeping. If it be the effect of a fever, or some other disease, if that be cured which is the cause, the effect will cease: but if he has no fever upon him, and he is hide-bound only from lowness of blood and spirits, give him boiled barley, white-water, or the like, and when his flesh is raised, harden it with good oats, beans, and moderate exercise.

HIDEL, in old law-books, denotes a sanctuary or place of protection.

HIDROTICS, in medicine, the fame with sudorifics. See SUDORIFIC.

HIERACIUM, HAWKWEEED, in botany, a genus of the syngenia-polygemiaqualis class of plants, the compound flower of which is imbricated and uniform, consisting of a great number of equal, hemaphrodite corollas, which are linear, truncated, and quinquedentate; the stamens are five very short capillary filaments: the seeds are foliary, obliquely quadragonal, and winged downwards. See plate CXXXI. fig. 3.

The leaves of this plant are esteemed cooling, and good in inflammations. They likewise strengthen the sight.

HIERACITES, hieracita, in church-history, Christian heretics in the third century, so called from their leader Hierax, a philosopher of Egypt; who taught that Melchisedec was the holy ghost, denied the resurrection, and condemned marriage: he likewise held, that no one could be saved who died before he arrived at years of discretion. The disciples of Hierax taught that the word, or son of God, was contained in the father, as a little vessel is contained in a great one; from whence they had the name metangimoniasts, from the greek word μεταγιμωνία - μηναδες, which signifies contained in a vessel.

HIERA PICRA, in pharmacy, a powder prepared in the following manner: take 9 X of
TINLURE

HIERARCHY, among divines, denotes simple series. This may be a French spirit. and then mix them.

Species of Hiera Picra, according to Quincy, is made thus: take of cinnamon, zedoary, asafetum, the lefter cardamom seeds, and fisson, of each fix drams; cochineal, a scruple; of the beef aloes, twelve ounces; and let them all be made into a powder together.

Tincture of Hiera Picra, is made thus: take of the species of hiera picra, one ounce; of white wine, one pound; digested and then strain off the fine liquor. It may be made in the same manner with a French spirit. This may be so managed as to become a good alterant. It is generally given over night from two to three ounces; and sometimes only one spoonful at night, and it produces excellent effects in a cachexy, chlorosis, and obstructions of the menses.

HIERARCHY, among divines, denotes the subordination of angels. See the article Angel. Some of the rabbins reckon four, others ten, orders or ranks of angels; and give them different names, according to their different degrees of power and knowledge. Dionyfius the areopagite, the jeoff Celert, and many others, have gone so far as to settle a kind of ceremonial or rule for the precedence of angels, as seraphim, cherubim, thrones, dominions, prinicipalities, &c.

HIERARCHY likewise denotes the subordination of the clergy, ecclesiastical polity, or the constitution and government of the Christian church, considered as a society. The nature of this polity will be best understood, by looking back to the constitution of the antient Christian church; which, as a society, consisted of several orders of men, viz. bishops, priests, and catechumens; that is, rulers, believers, and catechumens. Under the rulers are comprehended the whole body of the clergy, viz. bishops, priests, and deacons. See the articles Bishop, Priest, &c.

The believers were perfect Christians, and the catechumens imperfect. See the articles Christians and Catechumen. It has been pretended, says Broughton, that the bishops and presbyters were the same, which opinion has given rise to the presbyters. See Presbyterians. The bishops, presbyters, and deacons, therefore, according to him, constituted the three superior orders of the clergy; besides whom there were several inferior orders, as subdeacons, acolyths, exorcists, readers, door-keepers, singers, catechists, stewards, &c. See the article Acoluthi, &c. All these orders of the clergy, continues the same author, were appointed to their several offices in the church, by solemn forms of consecration or ordination, and had their respective privileges, immunities, and revenues: and by means of this gradation and subordination in the hierarchy, the worship and discipline of the primitive church were kept up.

How far the constitution of our own churches agrees with or has departed from the plan of the antient hierarchy, may be seen at one glance of the eye. We have the first general distinction of bishops, presbyters or priests, and deacons. Among the first, we retain only the distinction of archbishops, with the title likewise of primates and bishops; having no patriarchs or chorarchs; but as to the inferior orders of the clergy, as acolyths, &c. they are all unknown to the church of England.

The unity and order of the Christian church were secured by laws both ecclesiastical and civil. The ecclesiastical laws were, either rules and orders made by each bishop for the better regulation of his particular diocese; or laws made in provincial synods, for the government of all the dioceses of a province; or, lastly, laws respecting the whole Christian church made in general councils. See Synod. The civil laws of the church, were the edicts made from time to time by the emperors, either restraining the power of the church, granting it new privileges, or confirming the old; and the breach of these laws were severely punished both by the church and state.

Hieres, a town of Provence, in France, situated on the Mediterranean, eight miles east of Toulon; east long. 6° 5', north lat. 43° 5'.

Hieres is also the name of several islands situated in the Mediterranean, near the coast of France, opposite to the towns of Hieres and Toulon.

Hieroglyphics, in antiquity, mythical characters, or symbols, in use among the
the Egyptians, and that as well in their writings as inscriptions, being the figures of various animals, the parts of human bodies, and mechanical instruments.

But beside the hieroglyphics in common use among the people, the priests had certain mythical characters, in which they wrapped up and concealed their doctrines from the vulgar. It is said, that these something resembled the chimerical characters, and that they were the invention of Hermes. Sir John Marsham conjectures, that the use of these hieroglyphical figures of animals, introduced the strange worship paid them by that nation; for as these figures were made choice of, according to the respective qualities of each animal, to express the qualities and dignity of the persons represented by them, who were generally their gods, princes and great men, and being placed in their temples, as the images of their deities; hence they came to pay a superstitious veneration to the animals themselves.

The meaning of a few of these hieroglyphics, has been preferred by ancient writers. Thus we are told they represented the supreme deity by a serpent with the head of a hawk. The hawk itself was the hieroglyphic of Osiris; the river-horse, of Typhon; the dog, of Mercury; the cat, of the moon, or Diana; the beetle, of a courageous warrior; a new-born child, of the rising sun; and the like.

Hierogrammatists, i.e. holy regifterers, were an order of priests among the ancient Egyptians, who preferred over learning and religion. They had the care of the hieroglyphics, and were the expouders of religious doctrines and opinions. They were looked upon as a kind of prophets, and it is pretended that one of them predicted to an Egyptian king, that an Israelite, meaning Moses eminent for his qualifications and achievements, would slay and depose the Egyptian monarchy. They were thought to be skilful in amulets and charms, in astrology and augury: by this means they had a great sway in the Egyptian senate or council, and were always at court to assist the king with their advice. They were exempted from the public taxes, were esteemed of the highest quality, and bore a scepter like the king's: but after the conquest of Egypt by the Romans, they became very inconsiderable, and dwindled into mere fortune-tellers. They wore a linen-coat, and paper-shoes; they bathed twice a day and twice in the night in cold water, and in their religious worship used to beat and discipline themselves very severely.

Hieromancy, i.e. prophesy, in antiquity, that part of divination which predicted future events from observing the various things offered in sacrifice. See Divination and Sacrifice.

Hieromenia, in ancient chronology, a Christian month, commonly called Panemos; being the same with the Athenian boedromion.

Hieromonemon, the name of an officer in the Greek church, who presided over learning and religion. They were obliged to the strictest continency, in regard to the dignity of their ministration; for which reason they drank decotions of hemlock, to extinguish carnal desires.

The ceremonies of initiation, into the mysterious rites of Ceres, was performed by the hierophantes; whose names were held in such veneration, that the initiated were expressly forbidden to mention them in the presence of the profane.

Hierophylax, an officer in the Greek church, who was guardian or keeper of the holy utensils, vestments, &c. answering to our sacrilege or vestry-keeper.

Hieroscopy, the same with hieromancy. See Hieromancy.

High, altus, a term of relation, importing one thing being superior or above another: thus we say, a high mountain, the high court of parliament, high relief, &c. See the articles Mountain, Parliament, &c.
High, in music, is sometimes used in the same sense with loud, and sometimes in the same sense with acute.

High bearing cock, a term used in speaking of fighting cocks, for one that is larger than the cock he fights with.

High-water, the state of the tide when highest, or the time just before it begins to ebb. See the article Tides.

High-way, a free passage for the king's subjects, on which account it is called the king's high-way, tho' the freehold of the soil belong to the lord of the manor, or the owner of the land. Those ways that lead from one town to another, and such as are drift or cartways, and are for all travellers in great roads, or that communicate with them, are high-ways only; and as to their repairation, are under the care of surveyors.

By the 2 & 3 Phil. & Mar. c. 2, it is enacted, that constables and churchwardens of parishes, calling the parishioners together, shall yearly elect two honest persons to be surveyors of the high-ways, who are thereby authorized to order and direct the persons and carriages employed in amending them; and the persons so chosen, are to take upon them the execution of the office, on pain of forfeiting 20 s. The same statute has farther ordained, that certain days shall be appointed for working on the repairs of high-ways, on which every person having a plough-land, or keeping a draught or plough, is to send out one cart, provided with horses, tools, &c. and two able men attending; also clergymen, keeping a coach and horses, shall be obliged to send out a team, or shall forfeit 10 s. for every default therein: and every householder or cottager shall work on the said days, for the amendment of the high-ways, under the penalty of 1 s. 6 d. a day, leviable by distraint, &c. Where a high-way lies within a parish, the parish is bound to repair it, unless it appears that the same ought to be repaired by some person, either by reason of tenure or prescription. On oaths made, by the surveyors, of sums expended in repairing any high-way, justices of the peace may order them a rate not exceeding 6 d. in the pound; but money thus raised, shall not excuse working on the high-ways, where the statute work and labour has not been performed. 3 & 4. Wil. & Mar. If a high-way leading through a field is out of repair, travellers may justly going out of the track, tho' there be corn torn; and in case a high-way is not sufficient, any passenger may break down the inclosure, and go over the land adjoining, till a sufficient way be made. All manner of injuries to high-ways that render them less commodious to travellers, are deemed nuisances; such as laying logs of timber in them, erecting gates, or making hedges across them, permitting boughs of trees to hang over them, &c. Persons neglecting to scour their ditches, whereby the ways are dangerous, after thirty days notice given by the surveyors, are liable to the forfeiture of 2 s. 6 d. for every eight yards not scourèd; and not under 20 s. or exceeding 5 l. if they permit soil to lie in the high-ways. Geo. I. c. 52. Polls with inscriptions ought to be set up by surveyors, where two or more crofs roads meet, as a direction to travellers to the next market-towns, on the penalty of 10 s. 8 & 9 Wil. III. 7 Geo. II. c. 9.

High-way men, are robbers on the high-way, for the apprehending and taking of whom a reward of 40 l. is given by the statute of 4 & 5 Wil. & Mar.

Higham-Ferrers, a borough town in Northamptonshire, twelve miles north-east of Northampton; it sends two members to parliament.

Highness, a title given to princes. Before king James I. the kings of England had no other title but that of highness; which was also the case of the kings of Spain before Charles V. At prefent all the sons of crowned heads are titled royal highnesses, as the electors of Germany are electoral highnesses.

Highworth, or Highworth, a market town of Wilts, situated thirty miles north of Salisbury.

Hiis Testibus, a phrase antiently added in the end of a deed, written in the same hand with the deed; upon which the witnesses were called, the deed read, and their names entered. See the article Witness.

Hiis testibus in subject deeds, continued till, and in, the reign of Henry VIII.

Hilaria, an antient roman festival, observed on the eighth of the calends of April, or the twenty-fifth day of March, in honour of the goddess Cybele. It was so called from the various expressions of joy and mirth on this occasion. The statue of the goddess was carried in procession through the streets of the city. The day was spent in masquerades of all sorts, and every one was permitted to appear
appear in what disguise he pleased. The
day before the festival was spent in tears
and mourning; the reason of which was
probably this: Cybele represented the
earth which, at that time of the year,
begins to feel the kindly warmth of the
spring, and to pass from sorrow to joy, was an emblem of
the vicissitude of the feasons, which suc-
cceeded one another.

HILARODIA, in the antient music and
poetry, a sort of poets among the Greeks,
who went about singing little gay poems
or songs, somewhat graver than the ionic
pieces, accompanied with some instru-
ment. From the streets they were at
length introduced into the tragedy, as the
magaldi were into comedy. They ap-
peared drest in white, and were crown-
ed with gold. At first they wore shoes,
but afterwards they assumed the crepida;
being only a foal tied over with a /strap.

HILARODIA, a poem or composition in
verse, made or sung by a sort of
article.

HILARIO-TRAGEDIA, a dramatic per-
formance, partly tragic, and partly comic.
Scaliger holds the hilaro-tragedia, and
the hilarodia, or poem sung by the hila-
rodi, to be the same thing. Others ra-
ther take the hilaro-tragedia to have been
pretty nearly what we call a tragi-
comedy. Others again will have it to
have been a pure tragedy, only termi-
nating with a happy catastrophe, which
brings the hero out of the wretched into
the fortunate state. Suidas mentions one
Rhinthon, a comic poet of Tarentum, as
the inventor of this kind of poetry.

HILARY-TERM, among lawyers. See the
article Term.

HILDESHEIM, the capital of a
bishops-
cric, surrounded by the territories of
Brunswic, and subjcct to its own bishop:

east long. 100°, north lat. 52° 17'.

HILL, in the natural history of the earth.
See the article Mountain.

HILUM, among botanists, denotes the eye
of a bean. See Bean and Eye.

HIN, a hebrew measure of capacity for
things liquid, containing the sixth part
of an epha, or one gallon two pints, or
2.633 solid inches, english measure.

HIND, a female stag in the third year of
its age.

HIND-CAULF, a male-hart or hind in the
first year. She fawns in April or May.
See the article Hunting.
HIP

HINKLEY, a market-town, ten miles south of Leicester.

HIP, or HAW, in the materia medica, is reputed attenuant and diuretic. There is a very pleasant conserve of hips kept in the shops.

HIP, or HAUNCH, among farriers. See the article HAW.

HIP-SHOT, is laid of a horse that has sprained his haunches. See STRAIN.

HIPS in building, those pieces of timber placed at the corner of a roof. The hips are much longer than the rafters, by reason of their oblique position, and are planted not with a right or square angle, but a very oblique one, and consequently are not, or at least ought not, to be square at any angle, (as rafters are not at all) but level at every one of them; and, which is more, as rafters have but four planes, these commonly have five. They are generally by country workmen called corners; and some call them principal rafters, and others sleepers. The truth is, hips and sleepers are much the same, only sleepers lie in the valleys, (and join at the top with the hips) but those surfaces or planes which make the back of the hip, are under the sides of the sleeper.

The backs of a hip are those two superficies or planes on the outside of the hip, which lie parallel, both in respect of the length and breadth, with the superficies of the adjoining side and end of the roof.

HIP-GOUT, sciatica. See the articles GOUT and SCIATICA.

HIP-MOULD, is by some used for the back of the hip, but others understand it to mean the prototype or pattern, commonly made of a thin piece of wainfoot, by which the back and sides of the hip are set out.

HIP-ROOF, among carpenters, called also Italian roof, is a roof which has neither gable-head, thread-head, nor jerkenhead (by which is meant such heads as are both gable and hip at the same end;) for it is a gable or upright as high as the collar-beam, and then there are two short hips, which slant up with their tops to the tops of a pair of rafters, which country carpenters call fanglars. A hip-roof has rafters as long, and with the angles of the foot, &c. at the ends of buildings, as it has at the sides; and the feet of the rafters at the ends of such buildings as have hip-rooms, stand on the same plane, viz. parallel with the horizon, and at the same height from the foundation, with rafters on the sides of the roof.

HIPARCHUS'S PERIOD. See Period, HIPPEUS, in physiology, a kind of comet, so called from its resemblance to a horse. But the shape of this comet is not always alike, being sometimes oval, and sometimes imitating a rhomboid. Its train also is sometimes spread from the front, or fore part, and sometimes from the hind part. Hence this class of comets is distinguished into equinus barbatus, equinus quadrangularis, and equinus ellipticus. See the article COMET.

HIPPO, in zoology, a species of serpent, with 160 feuta on the abdomen, and 100 s quam on the tail. See COLUBER and SERPENT.

HIPPOBOCSA and HIPPOBOSECUS, in zoology, names given to the horse-fly, frequent about the bodies of horses, to whom it is very troublesome. HIPPOCAMBUS, the sea horse, in ichthyology, the square-bodied syngnathus, with no fin at the tail. It is five inches long, and where thickest, about an inch in diameter; the head is long, slender, and compressed, forming a kind of snout; the body is of a quadrangular figure, but the divisions are not equal, and in the thickest part it is hexangular or heptangular. See SYNGNATHUS. It is a very singular and rare fish; the tail of which usually curls up in the drying, and its head being bent down, gives it a rude resemblance to a horse; whence the name. See plate CXXXII. fig. 3.

HIPPOCASTANUM, HORSE-CHESTNUT, the name with the eulalia of Linnaeus. See the article ESULA.

HIPPOCENTAUR, in antiquity, a fabulous animal, half man half horse. What gave rise to the fable of hippocentaurs, was this. The Thessalians are said to have been the first inventors of the art of breaking horses; and being fast seen on horseback, they seemed to make but one body with the horses; whence the origin of the fable. HIPPOCRAS, an infusion of aromatic powders in wine, which is afterwards edulcorated with sugar and honey; being so called because that, when the infusion is finished, it is strained through Hippocrates's sleeve. It is prepared of various aromatics and other
Fig. 1. Hinges.

other ingredients, according to the different intentions to be answered.

HIPPOCRATEA, in botany, a genus of plants, whose characters are not justly ascertained; the calyx is a perianthium formed of a single leaf, patent, and lightly divided into five obtrorse segments, larger than the corolla; the corolla is monopetalous, oval, truncate at the top, and undivided at the edges; the fruit is a capsule of a depressed-plane figure, patent, femistrifid, with trifid segments; and contains three cells, each of them bivalve, and the valves carinato-compressed; the seeds are oblong, and have a membranaceous ala.

HIPPOCRATES'S SLEEVE, a big used to strain syrups and decoctions for clarification. See Clarification.

HIPPOCREPIS, COMMON HORSESHOE VETCH, in botany, a genus of the diadelphus-decandria class of plants: the corolla is papilionaceous; the vexillum cucurred, seated in the uginus the length and comprised; the fruit is a compressed plane pod, very long and reflex, and jointed; the seed is single in each joint, of an oblong and incurved figure.

HIPPODROME, in antiquity, the course where horse-races were performed.

HIPPODROMUS, in grecian antiquity, the boeotian name for the athenian month hecatombaion. See Hecatombaion.

HIPPOGLOSSUS, the TURBOT, in ichthyology, a species of pleuronectes, with the eyes on the right side, and the body smooth. It grows to a considerable size, and is one of the most esteemed fish at our tables. The dorsal-fin reaches from the head to the tail, and has an hundred and five rays; the pectoral fins have each sixteen rays, and the ventral ones fix. See the article Pleuronectes.

HIPPOMANE, in botany, a genus of plants whose characters are not properly ascertained; the male and female flowers are produced distinctly; the male flower has no corolla: the fruit is a large, globose berry, somewhat umbilicated, and containing only one cell: the seed is round and woody. The eating of this plant is said to make horses mad, whence its name ἵππομανῆς.

HIPPOMANES signifies the expressed juice of the tithymallus; as also a juice distilled from the genitals of a mare, in the time of her covering; some again take it for the secundines of a mare; and, lastly, it signifies a fleshy substance adhering to the forehead of a colt newly foaled, which some imagine to have a virtue of procuring love, and promoting the birth.

HIPPOMYRMEX, the HORSE-ANT, in zoology, a species of ant, much larger than the common ant. See Ant.

HIPPOPHEAE, the SWALLOW-THORN, or SEA BUCK-THORN, in botany, a genus of the dioecia-tetrandria class of plants, having no corolla; the calyx of the male flowers is divided into two parts, as is also the calyx of the female: the fruit is a globose, unilocular berry; the seed is single and roundish. Hippocrates prescribes the juice of this plant to evacuate white phlegm; and also as a cathartic in other disorders.

HIPPOPOTAMUS, the RIVER-HORSE, a genus of quadrupeds, of the order of the jumenta, the characters of which are these: the fore teeth of the upper jaw are four, and placed in pairs; those of the lower jaw are prominent, and the intermediate ones are protruded forward; the canine-teeth are single, and obliquely truncated; the teats are only two, and placed near the groin.

The hippopotamus is a native of Africa, passing a great part of its time under water, in the rivers of the Nile and Niger; but comes on shore to sleep and breed. It is a large unwieldy animal, as big as an ox. See plate CXXXII. fig. 2.

HIPPURIS, in botany, a genus of the monandria-monogynia class of plants, having no corolla: the cup is scarce distinguished; it consists of only two extremely small margins, standing opposite to one another on the head of the germen; there is no pericarpium; but after every flower there comes a seed, which is roundish and naked.

HIPPURUS, in ichthyology, the dolphin or coryphena with a forked tail. See the articles Dolphin and Coryphena.

HIRCANA, in geography, the provinces of Persia in Asia, which lie on the southern shore of the Caipian sea.

HIRCHFIELD, a city of Germany, in the circle of the upper Rhine, and langraviate of Helff Caffel, situated on the river Fulde, in east long. 9° 32', north lat. 50° 47'.

HIRCI, OF SANGUIS HIRCI. See the article Sanguis.

HIRCUS, in anatomy, a part of the auricle or outer ear, being that eminence next the temple. See Ear.

history: thus we fay, hisorical truth,
hisorical ftyle, hisorical narration of
facts, &c. See the article History.
HISTORIOGRAPHER, a professed his-
torian, or writer of history.
An historian of all authors spreads the
most ample theatre; he erefs the greatefl
tribunal on earth; for it is his office to
fit supreme judge of all that passes in
the world, to pronounce the definy of
the great ones of the earth, and fix their
character with pofterity; to do juftice
to virtue and worth, in beftowing eternity
upon great and good actions, and fixing
an everlafing mark of infamy on bad
ones; to infti?r all people and nations,
and direct the conduct of ages; he there-
fore ought to be endowered with many
great and uncommon qualifications. He
must be a perfon of conunfmate know-
ledge of men and things, of found judg-
ment, uncommon fagacity and penetra-
tion, experienced in matters of state and
war, of great integrity, firmness of mind,
freedom of fentiment, and matter of a
pure, clear, nervous, and exalted ftyle.
An historian whose province it is to speak
to kings and princes, to the great men
of all ages and countries, and to be the
common matter and infti?r of man-
kind, muft not only write with purity,
simplicity, and manly fene, but with
dignity and elegance: he muft refect all
that is vulgar and low in ftyle, make the
majesty and sublimity of his expreffion
comport with the dignity of his fubject;
muft by an exact choice and propriety
of words, a natural difpofition of phrafes,
and a prudent moderate ufe of figures,
give weight to his thoughts, force to his
language, and imprint a character of
greatness on all that he fays. He muft
at
at the same time represent things with an air of gravity and prudence, and not give a loose to the heat of imagination, or vivacity of wit; but discreetly suppress every thing that shall seem idle, languid, and unprofitable, and give every thing that just figure and proportion which is consistent with propriety and decorum. He must endeavour at a noble simplicity of thought, language, design, and ordinariness, and carefully avoid all profuences of false conceit, strained expression, and affected pompoufulness so inconsistent with the gravity, dignity, and noble character of history. In a word, he must write so as to be intelligible to the ignorant, and yet charm the wise; form and express such ideas as are great, and yet shall appear very common, and intermix no other ornament with his narration than what the modesty of truth can bear. He should be above the reach and power of hopes and fears, and all kinds of interest, that he may always dare to speak the truth, and write of all without prejudice; religiously observing never to abate the public faith, nor to advance any thing upon common fame, which is always uncertain, but upon undoubted memoirs and faithful relations of such persons as have had a hand in affairs. He must always be upon his guard against the biases and affections of those who supply him with matter, and must not credulously give his assent to the historians that went before him, without enquiring narrowly into their character, and what influence they may have been under when they wrote, in order to make a just estimate of their weight and credit. An historian, as to his matter, should choose subjects great in themselves, and such as are worthy of public fame and remembrance; and should make himself so far master of his matter, as to be able to cast it into what form he pleases, and to strike upon all his subjects the colours they are naturally disposed to bear, in order to make his lessons profitable to posterity, by regulating the heart and spirits of men, animating them to great and virtuous actions by illustrious examples, and cautioning them against vice, folly, cruelty, and injustice, by laying open the fatal consequences resulting from them. The course of his narration must proceed in the order of time in which the facts happened, in a pure, grave, uninterrupted series, such as may not improperly be compared to a great river flowing with composed majesty and stately smoothness; and when it falls in his way to introduce little occurrences, they must be so artfully interwoven with the great, in the thread of the narration, as to offer a reasonable entertainment and relief to the reader from the fatigue that too sedulous an attention to the great, requires. He must also observe great judgment in the ordinance and disposition of events and their circumstances, so as to interest the reader, and let him into all his thoughts and views, by making his persons act as their character and temper inclined them; discovering their manners, sentiments, designs, motives, and operations as they really stand in a necessary dependence upon each other, and with so natural a connection, as to show nothing out of its place. His transitions, in which confides the great art of narration, and one of its principal beauties, must be natural and easy, arising from the difference of subject rather than expression. He must make a wife and judicious choice of circumstances, such as are proper to enlarge and improve the ideas of things, and to strike that light and colour upon them which most easily attracts belief and engages the mind; and must for that purpose always observe a due mixture of great and little circumstances, neither of which must be carried beyond nature, or be so minute, low, or frivolous, as to debase his subject. He must not only recite the bare events and actions of men, but also lay open the motives and principles from which they took their rise, and upon which they proceeded to their final issues. He must lay open the hearts of the actors, let his reader into the most important secrets of their councils and designs, and oblige him with a sight of those secret springs, which moved them to enterprize, and of the causes of their success or miscarriage. He must be very sparing and cautious in the use of descriptions, which are to be introduced so far only as they serve to illustrate things that are essential to the main subject, and to enliven the narration; and even in that case, they must be succinct and elegant. The frequent use of harangues are disapproved of by many judicious persons; for these long formal harangues of generals to their soldiers, when in the presence of the enemy, and ready to enter upon action, which we find in many historians, are undoubtedly not only unnatural and impro

HIS [1629] HIS

9 Y
improbable, but contrary to the truth of history. Nevertheless, a short speech suited to the subject, made by a person of eminent character has its proper beauty and animates a narration. A judicious historian ought not to admit any portraits into his work but those of the greatest persons, and such as are principally interested, and have the chief hand in affairs; and these must be real, natural and truly resembling their originals; expressive of their genius, the qualities of the head and heart, rather than descriptive of the external form of his personages. When such are furnished with a masterly hand, with true judgment and success, they are not only great ornaments and embellishments in history, but of use to strip the hearts of men of their disguises, to lay open all their secret folds, and disclose the real springs of actions. It is a great fault in an historian to abound too much in reflections of his own; he therefore must not turn philosopher or moralist indifferently upon all occasions; for every man defires to be free in his judgment of the facts represented to him, and the consequences he is to draw from them, in which consilts the greatest pleasure of the reader. But if an author should throw in, or mingle reflections of his own with his story, they must be such as arise naturally from the subject, and contain a great and noble sense in a few words; they must not be too fine spun or fluided, nor have more brightness than solidity, but appear rather to be the reasoning of a wise flateman, than the affection of a declarer; nor must they be too frequent, or too loose and disjointed, but be enamelled in the body of the work. Digressions, if made with judgment, and not too wide and foreign from the subject, have also their proper grace and ornament in history; as they give an agreeable variety to the narration, and relieve the mind of the reader; but they must be introduced by the historian with an artful hand and great address; they must bear an alliance and connection with the purport of the history, and their length must be proportionably greater or less, as they are more nearly or remotely allied to the capital point of the story.

**History**, with regard to its subject, is divided into the history of nature and the history of actions. The history of nature (which is much the same with physiology) is a description of natural bodies, whether terrestrial, as animals, vegetables, fossils, fire, water, air, meteors, &c. or celestial, as the stars, planets, comets, &c. History of actions is a continued relation of a series of memorable events.

History with regard to its matter, is either natural, sacred, civil, ecclesiastic, literary, or personal. Natural history, is a description of the singularities of nature; its irregularities and prodigies; and the alterations it undergoes in the birth, progress, end, and use of things. Sacred history, is that which lays before us the mysteries and ceremonies of religion, visions or appearances of the deity, miracles and other supernatural things, whereof God alone is the author. Civil history, is that of people, monarchies, states, communities, cities, &c. Ecclesiastic history, is that which gives an account of the rise and establishment of the several religions and churches, of the rise and progress of the various opinions sects and heresies, &c. Literary history treats of arts and sciences, their original progress, and of the persons who have been most remarkable in discovering and promoting them. Personal history, is that which gives the life of one or more single persons, and is the same with what is called biography.

History with regard to its form, is either simple, figurate, or mixed. Simple history, is that which is delivered without art or ornament; being only a bare, and faithful recital of things, in the manner and order wherein they passed. Figurate history, is that which is further enriched with ornaments, by the wit and ingenuity of the historian; by laying open the characters of the principal persons, the secret springs and motives of the several events, &c. Mixed history, is that which besides the recital and ornaments of figurate history, calls in the proofs and authorities upon which the facts are founded; furnishing authentic memoirs, or original letters, manifestos, &c. to vouch the truth of what is advanced. See **Historiographer**.

**Credibility, foundation, and nature of History.** Some choose to define history, a true and well grounded account of
of past events; a definition equally applicable to all the kinds of it: for tho' in some of them, as the history of nature and literature, we meet with accounts of qualities and opinions; of works of nature and art; yet these have no other relation to history than as they are events, and are deduced from observations on past changes. And as to the grounds on which the credibility of an history is founded, they are derived partly from the events related, and partly from the evidence and character of such as relate them; whence arises an internal and external credibility.

The interior credibility consists not only in the possibility of the event reported, but likewise in its probability; which last consists in this, that the circumstances in which an event is reported to have happened be conformable or suitable thereto, or that there be some foundation for it in the connection of the circumstances, and that in parallel cases the same had frequently happened. Hence it is easy to conceive, that many events may appear improbable, nay incredible to some, through mere ignorance, or by separating them from their circumstances. This is the case with the frequent charges of incredibility brought against those numerous armies we read of in antient history, from confounding the regular armies of the moderns, with the tumultuous ones of the antients; which were a kind of militia composed of all or the greater part of the fighting men of a country.

Under the external grounds of credibility are comprehended the genuineness of the original testimony, and the capacity and integrity of those who relate it: the evidence alluded must not only be ascribed to its true authors, but those must appear to be persons so circumstanced and inclined as to relate the truth, so as to add to it nothing false, nor omit any thing of consequence to the event reported. The first of these, or the genuineness of the original testimony, affects not only books and tracts, but public records and monuments of past events, statues, inscriptions, columns, edifices, &c. And to detect the fraudulent practices of former times, in forging evidences of this kind, requires great knowledge in the history not only of human societies, but of the opinions, sciences, languages, and customs of different times. And hence appears the necessity of great penetration, and capacity in an historian; but above all, of great integrity and sincerity in relating the truth.

In trying the credibility of an event by the number of evidences brought in support of it, we ought to weigh: 1. How many historians, and other known sources, are really extant of any particular event. 2. The actual diversity of their testimonies. 3. Their agreement and contradiction; and whether they cannot be reconciled. 4. The exterior and interior credibility of the contradicting narrations.

From what has been said, we may draw the following inferences. 1. That there is a real and demonstrable certainty of events, which ought not to be doubted or contested: and, indeed, scepticism in historical matters most commonly, if not always, proceeds from ignorance of the real nature of that certainty and its criterion, or from a kind of inadmissibility of unwearied diligence, of farther helps, and deeper reflection in examining and proving, than the conveniency of many will allow. 2. That the demonstrability of a fact, the credibility of an historian who reports, and the evidences of his whole work, ought never to be confounded or mistaken for one and the same thing: for an historian may be well worth credit, tho' he be not infallible, and even though he has actually committed errors in some of his reports. 3. The demonstrability of events has different degrees and limits, as reaching only so far as the records preferred will permit: and hence appears the necessity of well distinguishing such events, the reality or falsity of which can be proved, from events that are at best uncertain and doubtful. 4. That the credibility of events may gain new strength is evident; since many facts cannot be known, till after the death of such as were either the actors or persons concerned in them; besides it frequently happens, that records and vouchers of transactions, long since past, are afterwards discovered, which till then were either unknown, or could not be confidently published by those who knew them, for want of such witnesses and proofs. 5. The credit of history can never decay by age, as some have erroneously affected; since facts, once established upon good evidence, must ever remain so, while the vouchers of such evidence are preserved.
served: may an account which formerly was uncertain, or even considered as improbable or false, may be vindicated and proved by late discoveries of historical writings and records.

Usefulness of History. That great advantage may be reaped from the study of history, will appear from the following considerations.

1. It proves an agreeable amusement, and relaxation: for though the mind is not wholly inactive in the study of history; yet, being a lighter and more entertaining employment, the faculties of the mind, when fatigued and almost exhausted with more intense employment, find actual repose, and are recruited and restored to vigour.

2. But beside the pleasure of studying history, it lays a foundation not only for general prudence, but for that particular kind, which the circumstances and situation of each man require. To become acquainted with the characters of men, the marks, sources, and effects of their passions and prejudices, the power and changes of their customs, and the like, is an essential and necessary step to prudence: and all this knowledge is considerably improved by history, which teaches us to make other men's experience our own, to profit by it, and to learn wisdom from their misfortunes.

3. History is of eminent use in promoting virtue, partly by a copious and pleasant instruction in a right and virtuous conduct in general, and partly by examples that inestimably lead us to the practice of several virtues in particular.

4. Every other science receives great benefit from history. Philosophy, and practical mathematics have recourse to history, or to nature, through the medium of history, for most of their objects; and in many parts of these sciences, the whole force of the demonstration is founded on experiments; which would make but an indifferent figure, if the assistance of other men's experiments by the means of history were excluded: and the same holds of divinity, law, medicine, &c.

Method of studying History. Persons who read history merely for amusement, or, having in view some particular branch of learning, attend only to certain branches of history, are not confined to that order and connection, which is absolutely requisite for obtaining a proper knowledge of history; the most regular, as well as successful way of studying which, is, to begin with an epitome of universal history, and afterwards apply to the history of particular nations and common-weals, for the study of particular histories presupposes, or, to speak more properly, is only extending the knowledge of particular parts of universal history. Unless this be our plan, we shall only fill the memory with some events, which may be done without applying to history, or pretending to the knowledge of it.

History, in painting, denotes a picture composed of divers figures, or persons, representing some transaction, either real or feigned. See Painting.

Histrion, in the ancient drama, signified an actor or comedian, but more especially a pantomime, who exhibited his part by gestures and dancing. See the article Drama.

Histrion, the Porcupine, in zoology. See the article Porcupine.

Histrion, the Porcupine-fish, in ichthyology, the rough spotted offraction, or globe-fish, befit with frequent small spires.

It grows to about twelve inches in length, and to eight or nine in diameter. It is brought to us dried from the eastern seas, and has been sometimes caught in the Mediterranean. See plate CXXXII. fig. 5.

Hitch, in the sea language, is to catch hold of any thing with a hook or rope, and by this means to hold it fast; thus when a boat is to be hoisted in, the sailors say, hitch the tackles into the ring-bolts of the boat; and when they are about to weigh anchor, hitch the fish-hook to the fluke of the anchor.

Hitchel, or Hatchel. See the article Hatchel.

Hitching, a market-town in Hartfordshire, fourteen miles north-west of Hartford, and thirty-two north-west of London.

Hithe, or Hythe, in our old writers, denotes a port, wharf, or small haven, to embark, or land wares at, as Queenhithe, &c.

Hithe is also one of the Cinque Ports in the county of Kent, situated on the English channel, six miles west of Dover.

Hive, apiary, in country affairs, a convenient receptacle for bees. See Bee. There are several sorts of hives used in different counties of England, as wick-hives, made of prunets; willow, or hard-hives, dashed with cow-dung tempered with dust; or hives made with straw.
Having windows, or out of curiosity cold,Tho. molt valuel fall warmest in’t, to making them straw and ever, nicely twisted and nailed together. Of these there should be kept several sizes, so as to suit a bigger or lesser swarm; and where you design to multiply your flock, make use of the small ones, and of the larger where you define a great deal of honey. See Hiving, and Honey.

Hiving of Bees, the placing a swarm of them in a hive, provided for that purpose. See the article Hive.

When a swarm of bees has left an old hive, and is placed in the form of a cluster hanging down from the branch of some tree or shrub, turn up the hive, and shaking the bough, make them fall into it, and then set the hive upon a cloth on the ground; or if the bough be small, you may cut it off, and laying it on the cloth, set the hive over it; but if the bees are fixed on a branch near the ground, lay the cloth under it, then shake them down and place the hive over them. If it happen that some bees will obstinately keep to the place where they at first fixed themselves, after having tried in vain to sweep them off gently with a brush, rub the branch with the juice of wormwood, rue, elder, or of such other plants as they hate the smell of, and if this does not succeed, linen rags must be burnt under them, the fumes of which will soon drive them off, and make them join their companions.

It sometimes happens, that the swarm is not placed so favourably as in the instances before-mentioned; they often hang themselves in long clusters, on the small branches of high trees, and in this case, many different expedients are to be used to have them, according to the circumstances of their position. The common method is for one man to climb the tree with a long staff in his hand, and another to mount a ladder placed against the tree, and to hold the hive under the swarm, while the other sweeps them into it with the staff; and when the bough on which they hang is so far from the body of the tree, that this is impracticable, tie the ladder, the hive is to be fixed to the end of a long pole, and by that means held under the swarm while they are swept into it. When all this is impracticable, by reason of the great height of the branch on which the swarm hangs, a large cloth is to be spread on some of the lower branches, and the whole swarm swept down in a cluster upon it; this is then to be drawn carefully to the ground, and another person is to be ready there to warm the hive over the greater part of the cluster, and the rest will soon creep into it, and join them. If they are slow in doing this, they are to be driven in by burning linen rags about the places where they fly; the disagreeable smell of which will send them towards the hive, where finding their companions not in command with it, they will naturally remain.

Sometimes the bees that go out in a swarm fix upon a hole in a wall, or a hollow in the trunk of a tree. This is a much better choice for them than the branch of a tree; but it is much worse for the person who is to have them, for they are very difficult to be got out. The common way is to attack these swarms in the middle of a cold night, to enlarge the opening from without, and placing the hive under it, to scoop the bees out with a ladle, and put them into the hive. It sometimes happens, that the swarms part, and light in fight of one another; in which case, if the lesser part are disturbed, they will fly to the greater; but if they are not in sight of each other, hive them both in two several hives, and shaking the bees out of one hive on the cloth on which the other hive stands, place that hive over them, and they will all take to it.

If your swarm happens after the middle of June, and are small, put two or three of them together, even whether they arise the same day, or several days after; for by thus uniting them, they will labour the more carefully, gather more of honey, and stoutly defend themselves against all enemies. As to the manner of uniting them in one hive, it is thus performed: having spread a cloth on the ground, near the floor on which this united swarm is to stand, let a pair of reeds, or two supports for the hive; then in the evening when it grows dark, knock down the hive out of which you intend to remove your bees upon the left; then lift up the hive a little, and clapping it between your hands to shake out the bees that stick in it, lay it down sideways by those insects,
and let the flock or swarm to which you would add them, upon the reefs over them; upon which they will immediately ascend from the cloth underneath into the hive, and if any remains in the other hive, they will halter after their companions. When you have gotten them all in, place the hive on the floor, which should be done either that night, or early the next morning. Some reckon it better to place the hive in which the swarm is newly put, with a view to its being drove into another, with the skirts uppermost, and to set the other upon it, binding them about the skirts with a towel, and in this manner to let them stand till the morning, by which time all the bees will have ascended, so that you may then set the receiver on a stool. Thus three or four swarms may be put together. But they ought to be united the same evening after they have swarmed; because after having made combs, they are the more unwilling to part from them.

In these several methods of hiving bees, people ought to defend themselves as carefully as possible against their stings; the most convenient way of doing which, is to have a piece of gauze, or coarse muslin, large enough to come over the person's hat, and to reach down to the collar of his coat behind, and to his breast before, which being kept at a little distance from his face by his hat, he may see what he does without the least danger: he ought also to secure his hands by wearing a good pair of gloves; and woolen ones are the best for this purpose.

HOACHE, in natural history, a kind of earth approaching to the nature of chalk, but harder, and feeling like soap; whence some think that it is either the same with our soap-rock of Cornwall, or very like it. The Chinese dissolve it in water, till the liquor is of the consistence of cream, and then varnish their china-ware with it.

HOACTLI, in zoology, the name of an American bird described by Nieremberg: it is of the size of a common hen, the legs and neck are long; its head is black, and is ornamented with a beautiful crest of the same colour; its whole body is of a fine white, but its tail is grey, as are also the upper sides of its wings; the wings have a greenish cast, and the back sometimes has many black feathers; its feet are not webbed, its legs are of a pale whitish colour; it has a circle of white, beginning at the eyes, and going round the head; it is common on the lakes of Mexico, and builds among reeds and fedge. It bites very desperately.

HOAR-FROST. See Frost.

HOAR-HOUND, or Horehound, Marrubium, in botany. See Marrubium.

HOARSENESS, raucedo, in medicine, a diminution of the voice, sometimes attended with a preternatural afinity, or roughness thereof.

The part here affected, is the aspera arteria, and its larynx, which last chiefly forms the voice. See the articles Aspera arteria, and Larynx.

The proximate cause is too great an effusion of thin lymph upon the part. It is a catarrhal affection from a too sharp salt, or acid lymph. Etmuller, in a very obfinate hoarfenefs, prescribes spermaceti as an approved remedy; as also, decoct, raporum, and rob. paffulorum. In an inveterate hoarfitnes, where a vi·cid mucus, or thick lymph is the cause, dissolving and expeterating medicines are convenient; and above all, fyrup de erufimo, oxymel fiihitio, and balf. sulph. Bleeding is to be avoided, for it prolongs the diftemper.

Sometimes worms in the intestines are the causes of hoarfenes.

HOBBY, the name of a hawk, called by authors Chalcius.

It is a hawk of the lure, and not of the fift; and is very like the faker, only much lefs. It makes excellent fport with net and fpaniels; for when the birds fee the hobby, they dare not commit themselves to the wing, but lie close to the ground, and fo are taken in the nets.

HOCHSTET, a town of Swabia in Germany, situated twenty-five miles north-east of Ulm.

HOD, an instrument used to carry bricks and mortar in, up ladders, &c. to build or repair houses, &c. with.

HODMAN, an appellation given to a young student admitted into Chrift's College in Oxford, from Westminster-School.

HODNET, a market town of Shropshire, ten miles north-east of Shrewbury.

HODSDON, a market-town of Hertfordshire, seventeen miles due north of London.

HOE, in country affairs, a tool made like a cooper's adz, to cut upwards in gardens, fields, &c. This tool is commonly called the hand-hoe; for other forts of hoes fee the next article.

This instrument is of great use, and should be more employed in hacking and clearing the several corners, cracks and patches.
patches of land, in spare times of the year, which would be of no small advantage thereby.

**Prong Hoe.** See the article **Prong.**

**Hoeing,** according to Tull, is the breaking and dividing the soil by tillage, whilst the corn, and other plants are growing thereon. It differs from common tillage (which is always performed before the corn or plants are sown or planted) in the time of performing it; and it is much more beneficial to plants are grown or planted) in the time when crops than any other tillage. This sort of tillage is performed various ways, and by means of different instruments. See **Plough.**

Land, which before tilling would have yielded little, tho' the more it is tilled before sowing, the greater plenty of crop it yields, yet if tilled only before the sowing will always have some weeds, and they will partake of the advantage of the tillage as well as the corn. This is one reason for an after tillage, such as that by hoeing. But there is another consideration that yet more requires it, this is, that as soon as the ploughman has done his business by plowing and harrowing the land after sowing, the soil of its own accord begins to undo it all again by tending towards its original texture and specific gravity, the altering of which was the only business of all the former tillage. The breaking the particles of the earth, and making in it new pores for the air, for the other does not pass and decay which must happen on transplanting, and which it recovers only by degrees.

One great benefit of hoeing, is, that it keeps plants moist in dry weather, the advantage of which to their growth is easily seen. This good office it performs on a double account; first as they are better nourished by hoeing, they require less moisture, and consequently carry off less; for these plants, which receive the greatest increase, having most terrestrial nourishment, carry off the least water in proportion to their augment, as is proved by Dr. Woodward's experiments. Secondly, the hoe, particularly the horse-hoe, for the other does not go deep enough, procures moisture for the roots from the dew that falls most in dry weather, and these dews seem to be the most enriching of all moisture, as it contains in it a fine black earth, which will subside from it in standing, and which seems fine enough to be the proper pabulum or food for plants. For a comparative view of the profits arising from the common and horse-hoeing husbandry. See **Husbandry.**

**Hog,** *Sus,* in zoology, a genus of quadrupeds, of the order of the Jumenta, the characters of which are these: the upper fore-teeth are four in number, and are convergent; those of the lower jaw are eight, and are patulous: the canine teeth of the upper jaw are two, and very short; those of the under jaw are single, and exerted: the crown of the head is carinated, and the hoof is divided. See the article **Swine.**

Besides the common hog, there are several other species, as, 1. The American hog, with the back bristly behind, and with
a naked tail. 2. The musk-hog, with
a cyst, or gland on the back, in which is
secreted a perfumed fluid; its tail is
naked. 3. The babyrumia, with two
teeth growing on the forehead.

Hog's dung is, by Mortimer, reckoned
one of the richest manures we are ac-
quainted with, and the next in value to
that of sheep's dung, and is found to be
equal in virtue to twice the quantity of
any other dung, except this. The an-
tients seem to have been dipherated with
it, on account of its breeding weeds, but
this is only accusing it of being too rich,
for any dung will do this when laid too
thick. It is an excellent manure for
pasture-grounds, and excells all other
kinds of dung for trees. The farmers
who use this dung for their lands, ge-
gerally take care to save it, by well pav-
ing the flyes, and encreas the quantity
by throwing in bean-flakes, flubble, and
many other things of a like nature; and
by good management of this kind many
farmers have procured fifty or sixty loads
of excellent manure a year, out of a small
fly. The very best way of using this
dung, is to mix it with horse-dung; and
for this reason it is best to have the flye
near the stable, that the two clearings may
be mixed in one heap, and used together.
They have in many parts of Staffordshire
a poor, light, shallow land, on which they
sow a kind of white-pea: the land is nei-
ther able to bear this, nor any thing else,
to advantage for their reaping; but when the peas are ripe, they turn in as many
hogs as the quantity of peas will fatten,
suffering them to live at large, and re-
main there day and night; in confe-
quence of this the land will produce good
crops of hay for several years afterwards;
or if too poor for that, it will, at whore
table grace enough to make it a good pa-
sure-ground.

Hog, Erinaceus, in zoology, a genus
of quadrupeds, the lateral fore-teeth of
which are shorter than the others; the
nostrils are ciliated; and the body, in-
stead of hairs, is clothed, in the manner of
that of the porcupine, with spines.

Of this genus there are two species.
1. The Erinaceus, with larger ears;
or the common hedge-hog, being a little
animal, considerably thick in proportion
to its length, and which, when it draws
itself together at the approach of danger,
appears of an oval figure. The length
of this creature is about seven inches; its
head small and oblong, broad towards
the upper-part, and growing smaller to-
wards the nose; the mouth is formed ve-
ry much like that of the badger; the eyes
are small, black, and protuberant; the
ears are short and broad; the neck is
short; the back broad and prominent; the
legs short and robust; the feet formed
like those of the dog; there are five toes
on each, and one is shorter than the reft,
in manner of a thumb. The other species
is the white erinaceous, with very small
ears, being larger than the common
hedge-hog, but very like it in form.

Musk-Hog, Tajaucu, in zoology. See the
article TAJACU.

Hog-steer, among sportsmen, denotes a
wild boar three years old.

Hog's fennel, a plant called by botanists
peucedanum.

Hog's plum, a plant otherwise called spo-
dias. See the article SPONDIAS.

Hog's weed, a plant called by Linnaeus
boerhasvina.

Hogenhine, in our antient saxon laws,
signifies one that came as a guelot to an
inn, and continued there the third night,
from which time he was accounted of
that family; so that if he offended against
the king's peace, his holt was to be an-
swerable for him.

Hog's-head, in commerce, a measure of
capacity, containing sixty-three gal-
lons.

Hogue, a town and cape on the north-
west point of Normandy in France, near
which admiral Rook burnt the french
admiral's ship called the Rising-fun,
with twelve more large men of war:
west longitude 2°, and north latitude
49° co'.

Hohio, a river of North America, which
rising in the Apalachian mountains, near
the confines of Carolina and Virginia,
runs south-west, and falls into the river
Mississippi.

Horse, or Hoyse, a term used by fea-
men, for haul ing up any thing into the
ship, or the getting up a top-mall, yard,
or the like.

Hoitallotl, in zoology, the name of an american bird, described by Nie-
remberg, and called by him aenis longa.
It is very remarkable for the swiftness of
its running, and is of a very long fhape,
having also a long tail: its beak is also
very long, black above, and grey under-
neath: its tail is green, and has all the
splendor and beauty of the peacock's:
its whole body is of a whitish yellow, and, near the tail, of a blackish yellow; but the shoulders are black, with white spots. It does not fly high, nor very well, but runs so swiftly as is scarce to be conceived. It is but an ill tasted bird.

HOKE-DAY, the Tuesday after Easter-week; which was the day on which the English conquered and expelled the Danes: this was therefore kept as a day of rejoicing, and a duty, calledROKE-tuesday-money, was paid to the landlord, for giving his tenants and bondmen leave to celebrate it.

HOLCUS, INDIAN MILLET, in botany, a genus of the polygamia-monoecia class of plants, the corolla of which is a glume, furnished with a triple arista or awn; the stamens are three, the styles two, and the seed single.

HOLD, that part of a ship which lies between the keelson and the lower-deck; in which, divided by bulk heads, are the steward's room, powder-room, bread-room, and the boatwain's and carpenter's store-rooms. In a merchantman, all the goods and lading in general, are flowed in the hold.

HOLD-FAST, a large piece of iron, in the shape of the letter S, fixed into a wall, to strengthen it. Also a tool used by joiners, carvers, &c. which goes through their benches, to hold fast such work as cannot be finished by its being held in the hand.

HOLDE, in old law books, signifies the bailiff of a city or town: and according to some writers, it also signifies a general.

HOLDERNESS, a peninsula in the east riding of Yorkshire, which has the German ocean on the east, and the river Humber on the south.

HOLIBUT, a name sometimes given to the turbot. See the article TURBOT.

HOLLAND, one of the United Provinces: it is about one hundred miles long, from north to south, and scarce thirty miles broad; but enjoys the greatest trade of any province in the world, and in point of strength and riches is equal to the other six united provinces. It is situated one hundred miles east of England, and is bounded on the north and west by the German sea, on the east by the Zundersea, and on the south by the provinces of Zealand and Utrecht.

HOLLAND is also the name of the south-east division of Lincolnshire.

HOLLAND, in commerce, a fine and close kind of linen, so called from its being first manufactured in Holland. See the article LINEN.

HOLLOW, in architecture, a concave moulding, about a quarter of a circle, called by some a cæmentum, and by others, an abacus.

HOLLOW-SQUARE, in the military art, a body of foot drawn up, with an empty space in the middle for colours, drums, and baggage.

HOLLOW-TOWER, according to Harris, is a rounding made of the remainder of two brières, to join the curtin to the orillon, where the small shot are played, that they may not be so much exposed to the view of the enemy.

HOLLY, Eryngium, in botany, is ranked by Linnaeus among the lices. See the article ILEX.

Holly-hedges make an excellent fence; but are liable to perish in severe winters. See the article HEDGE.

The timber of holly is the whitest of all hard wood, and therefore used by inlayers. It is also used by millwrights, turners, &c.

Knee-HOLLY, a name given to butcher's broom.

Sea HOLLY, a plant more usually called Eryngium. See the article ERYNGIUM.

HOLM signifies an island in a river: also a hill or cliff.

HOLM is also a port and market-town of Cumberland, situated on Solway-firth, twenty miles west of Carlisle.

HOLOCAUST, a burnt offering, or sacrifice, wholly consumed by fire; of this kind was the daily sacrifice in the jewih church. This was done by way of acknowledgment, that the person offering and all that belonged to him, were the effects of the divine bounty. The heathens, who also offered holocausts, probably considered them in the same light: and the disposing of sacrifices this way was the general custom, till Prometheus introduced the custom of burning only a part, and retaining the remainder for his own table.

HOLOGRAPH, among civilians, a will wholly wrote by the hand of the testator.

HOLOMETER, a mathematical instrument that serves universally for taking all measures, both on the earth and in the heavens.

HOLOSTEUM, in botany, a genus of the pentandria-trigynia class of plants, the corolla whereof is composed of five plane, patent, tridented petals, broadest towards
towards the ends; the fruit is a cylin-
drico-conic cap'tule; the receptacle is free,
oblate, triquetrous, and has very short
hairs; the seeds are numerous and tri-
quetrous. There is a species of this ge-
nus, in which the flamina are only four
instead of five.

HOLSOM, in the sea-language, is said of
a ship that will ride well, without rolling
or labouring.

HOLSTEIN, a dutchy of Germany, in
the circle of Lower Saxony, one hun-
dred miles long, and fifty broad. It is
bounded by Stettin or South Jutland on
the north, by the Baltic sea and the
duchy of Sax-Lauenburg on the east,
by the river Elbe on the south, and by
the German sea on the west.

HOLY-GHOST, one of the persons of the
holy Trinity. See GOD and TRINITY.

Order of the HOLY-GHOST, the principal
military order in France, instituted by
Henry III. in 1569. It consists of an
hundred knights, who are to make proof
of their nobility for three deceas
The king is the grand-maister, or sovereign,
and as such, takes an oath on his coro-
nation day, to maintain the dignity of
the order.

The knights wear a golden-croix, hung
about their necks by a blue silk ribbend,
or collar. But before they receive the
order of the Holy Ghost, that of St. Mi-
chael is conferred as a neceffary degree;
and for this reason their arms are sur-
rounded with a double collar.

HOLY-THURSDAY, the fame with adven-
tion-day. See ASCENSION.

HOLY-DAYS, the fame with festivals. See
the article FEAST.

HOLY-ROOD DAY, a festival otherwise
called the exaltation of the croix. See
the article CROSS.

HOLY-HEAD, a cape and town in the isle of
Anglesea, situated in the irish channel:
west longitude 4° 45', and north latitude
53° 26'.

HOLY-ISLAND, an ifland in the German
sea, five miles south of Berwick upon
Tweed: west long. 1° 42', and north
lat. 55° 45'.

HOLY-WELL, a town of North Wales, in
Flintshire, ten miles eait of St. Asaph.

HOLINESS denotes purity, or a person
free from sin.

HOLINESS is also a title given to the pope,
by those of his communion.

HOMAGE, in law, is the submission,
loyalty, and service which a tenant pro-
mised to his lord, when he was first ad-
mitted to the land which he held of the
lord in fee: also that owing to a king, or
to any superior.

In the antient grants of lands and tenen-
ments in fee, the lord not only obliged
his tenants to perform certain services,
but likewise took a submifion, with pro-
mife or oath that they should be true to
him as their lord and benefactor.

The lord of the fee of lands, for which
homage is due, takes it of every tenant
as he comes to the land; but none can
either do, or receive homage, except such
persons as have estates in fee simple or
tail, in their own right, or the right of
another.

HOMAGE ANCESTREAL, is where a per-
son and his ancesfors, time out of mind,
held land of the lord and his ancesfors by
homage. Such lord was to acquit his
tenant against all other lords above him,
and from all other service.

HOMAGE-JURY, a jury in a court-baron,
confitting of tenants that do homage to
the lord of the fee.

This jury makes enquiry into, and pre-
sentments of defaults and deaths of
Tenants, and of admissions and surrenders
into the lord's court.

HOMAGER, a person bound to do ho-
mage to another.

HOMAGIO RESPECTUANDO, a writ, by
which the escheator was commanded to
deliver lands to the heir of the king's te-
nant, notwithstanding his homage was
not done.

HOMAGIUM REDDERE has been used
to signify, to renounce homage; as where
the tenant or vaifal made a solemn decla-
ration of disowning his lord, for which
there was a form prescribed by the feuda-
tory laws.

HOMBERG, a town of Germany, in the
circle of the Upper Rhine, and landgra-
vinate of Hesse, situated ten miles north of
Francfort: eait long. 8° 24', north lat.
50° 20'.

HOMBERG is also a town of Germany, in
the palatinate of the Rhine, and dukedom
of Deuxponts: eait long. 7° 6', and north
lat. 49° 20'.

HOMER, OMER, CORUS, or CHOMER,
in jewish antiquities, a meaure con-
taining ten baths, or seventy-five gallons,
and five pints, as a meaure for things
liquid; and thirty-two pecks and one
pint, as a meaure for things dry. The
homer was most commonly a meaure for
things dry, and the greatest that was us-
ed among the Jews: it contained, ac-
cording
HOMICIDE, the slaying or killing of a person. This is divided into two sorts, voluntary and casual; voluntary, is that which is done with deliberation, and a full purpose to kill; and, when done out of malice prep恩ended, is murder; casual homicide, is where the death of a person happens by chance, or without any intention to kill; which is man slaughter, or chance-medley.

HOMILE, in ecclesiastical writers, a sermon, or discourse, upon some point of religion, delivered in a plain manner, so as to be easily understood by the common people.

At the time of the reformation there were several of these homilies made and printed, and ordered to be read in such churches as were not provided with a sufficiently learned minister, in order to prevent unlearned doctrine being taught in remote country places.

In the primitive church, homily rather meant a conference or conversation by way of question and answer, which made part of the office of a bishop, till the 5th century, when the learned priests were allowed to preach, catechize, &c. in the same manner as the bishops used to do. These are still extant several fine homilies, composed by the ancient fathers, particularly St. Chrysostom and St. Gregory.

HOMINE ELIGENDO, &c. in law, is writ directed to a corporation, for the election of a new person to keep one part of the seal, appointed for flatuates-merchant, when a former party is dead.

HOMINE REPLEGIANDO, in law, is an ancient writ that lies for bailing a person out of prison, where any one is confined without commandment of the king or his judges; or for any cause that is repelivable. This writ is directed to the sheriff, commanding him to replevy the prisoner.

In case a person takes away secretly, or keeps in his custody any person against his will, on oath made thereof, and a petition to the lord-chancellor, he will grant a writ of replegiar facias, upon which the sheriff returns an elongatus, and then there issues a capias in writernam, to take the party so offending.

HOMINE CAPTIO IN WITHERNAM, in law, is a writ for apprehending a person who has taken any other man or woman, and conveyed him or her out of the county, so that they cannot be reapplied by law.

HOMOCENTRIC, the same with concentric. See the article Concentric.

HOMOCHRONA, in natural history, a genus of fossils, consisting of stones composed of a crystalline matter, considerably debased by earth, and this of various kinds in the different species; but ever of one kind only in the same stone, which is thence always of one plain and simple colour, and never subject to veins or other variegations.

Of this genus authors reckon five species. 1. The white homochron, from half an inch in diameter, to seven or eight inches. 2. The red homochron, from one inch or less in diameter, to two or three. 3. The yellow homochron of various sizes, from one inch or less in diameter, to fix or seven. 4. The bluish homochron, whose general size is two inches in diameter. And 5. The greenish homochron, from half an inch to two inches in diameter.

All these species are of anอบicular form in a compact and close texture, and freely give fire with fuel.

HOMODROMUS VECTIS, that kind of lever, in which the weight is in the middle, between the power and the fulcrum; or the power in the middle between the weight and the fulcrum.

HOMOGENEAL, or HOMOGENEAL, an appellation given to things, the parts of which are similar of the same nature and properties.

HOMOGENEOUS LIGHT, that whose rays are all of one colour and degree of refractionability, without any mixture of others. See the article Colour.

HOMOGENEOUS SURDS, those which have the same radical character, or signs, as \( \sqrt{a} \), and \( \sqrt{b} \). See the article Surd.

HOMOGENEUM COMPARATIONIS, in algebra, is used by Vieta, for the absolute number in quadratic, cubic, &c. equations; which number always suffices one side of the equation, and is the product of the roots multiplied into one another. See the article Equation.

HOMOLOGOUS, in geometry, an appellation given to the corresponding sides and angles of similar figures, as being proportional to each other.

Thus, in two similar triangles \( \triangle ABC \), \( \triangle DEF \), (plate CXXXIII, fig. 1.) the sides
\[ z = \frac{9}{2} \]
\[ z = \frac{5}{2} \]
A B and D E, B C and E F, and A C and D F are homologous. And these triangles are to each other as the squares of their homologous sides. See the article Triangle.

Homologous Things, in logic, those which agree in name, but are of different natures.

Homonymous, an appellation given to words which have two different significations, being the same with equivocal terms.

Homsoken, a privilege enjoyed by every person, in his own house or home, which ought not to be invaded. See the article Hamsoken.

Honan, a province of China, bounded by those of Xi-ni and Pekin, on the north, by Xantong and Nankin on the east, by Buchuen on the south, and by Xi-ni on the west, lying between 33° and 37° north latitude. Its capital is Caifum.

Honduras, a province of Mexico, in North America; which, including the country of the Mosquito-Indians, is situated between 85° and 94° west long, and between 12° and 16° north latitude.

Hone, a fine kind of whetstone, used for setting razors, pen knives, and the like. See the article Cos.

Hones pay, on importation, a duty of 9 s. 6 d. per hundred, and draw back 2 s. 7 ½ d.

Honey, mel, is, in general, a thick, viscous, and more or less fluid substance, of a whitish or yellowish colour, sweet to the taste, soluble in water, becoming viscid in fermentation, inflammable, liquifiable by a gentle heat, and of a fragrant smell.

There are three distinctions of honey, according to its purity, fluidity, and the manner in which it has been procured from the honey-combs. The first and finest kind is virgin-honey; or the first produce of a swarm, obtained from the combs without profiting; these being only set to drain, in order to its running out. The second kind is that known by the name of white-honey, being thicker than the former, and often indeed almost solid; it is procured by professing the combs, but without the assurance of best. The third and worst kind is the common yellow honey, obtained from the combs first heated over the fire, and then proffered. Honey is prepared in the beehives, or honey-glands of plants, situated in their flowers; the only office of the bees is to collect the small quantities lodged there, and to amass them in stores capable of furnishing themselves with food, and us with a supply sufficient for our purposes. The bee that is out in search of honey, no sooner sees a flower that it likes, than it settles on it, and seizing on these glands, it sucks from them all the sweet juice they contain, which is either absolute honey, or very easily changed into such. The honey thus taken into the body of the bee, and deposited again into the cells of the honey-comb, is defined not only for the food of the young offspring, while unable to go out and help themselves, but for the sustenance of the bees themselves in bad weather, or when there is no food for them abroad.

Notwithstanding, however, that honey is known to be originally lodged in the flowers of plants, and might seem to be always ready in sufficient quantities for the bee; yet it is necessary that several circumstances concur, in order to its being fine and perfect in its kind. Among these are, a warm and serene state of the air, during the time in which the bees are most of all employed in making it, and a good state of health in the bee, as also its being made at a time when many fragrant plants are in flower, and in a place where such grow not too far off.

Honey taken out of the new combs early in the summer, is vastly preferable to that taken from the same hive in autumn. The reason of this is, that the bees, during the time of their making the former, have been in a more healthy and vigorous state, and that there have been fragrant flowers in greater number and perfection at that season, than later in summer.

Honey is an excellent peptoral, and is deterrent, aperient, and diuretic. It should always be clarified, by melting it over the fire, either alone, or with the whites of eggs, taking off the scum, before it is used in medicine. The chemists pretend to have made an acid spirit from it, which is a solvent for gold; but we have only their assurance of it, no body else having ever seen such a liquor.

Honey, imported, pays 7 s. 8 ½ d. the barrel, and draws back 6 s. 9 d. Or each ton, imported, pays 21 s. 6 s. 2 ½ d. and draws back 2 l. 6 s. 6 d.

Honey-comb, a waxen structure, full of cells, framed by the bees, to deposit their honey and eggs in. See Bee and Wax. The construction of the honey-comb seems one of the most surprising parts of the
the works of insects, and the materials of which it is composed, which, though evidently collected from the flowers of plants, yet do not, that we know of, exist in them in that form, has given great cause of speculation to the curious. The regular structure of the comb is also equally wonderful. When the several cells in it are examined, it should seem that the nicest rules of geometry had been consulted for its composition, and all the advantages that could be wished, or desired, in a thing of that kind, are evidently found in it. Each cell consists of six plane sides, which are all trapeziums, but equal to each other; the bottom of the cell is contrived with three rhombuses HKDI, DEFI, and FGHI (plate CXXXIII. fig. 2. n° 1.) so disposed as to constitute a solid angle at I, under the three equal angles DIH, DIF, and HIP, each of which is double the maximum angle of $54^\circ 44' = D I K = D K I$. Hence it comes to pass, that a less quantity of surface is sufficient to contain a given quantity of honey, than if the bottom had been flat, in the proportion of 4659 to 5550, as has been found by calculation; that is, nearly a fifth of the whole, so far as the figure in the end of the cells extends, in each; which fifth part of wax and labour saved, amounts to a vast deal in the whole comb. And if these admirable insects knew their advantage, they could not more nicely observe the rules of modern geometry. Hence we may observe, that though the rules of discovering the maxima and minima of quantities by fluxions, is a part of knowledge which the mathematicians have but lately acquired, and which they esteem the sublimity of human science, yet this very thing was imparted to these insects at the creation.

The method of making two sorts of cells in each comb, is also admirably contrived to save the expence of wax, since had they been made single, every comb must have had its peculiar base, and every set of cells their bottom of wax, whereas one bottom now serves for two cells; and there is but one plate of wax in the center of a double comb.

This structure occasions a very great sparing of the wax, or matter of the comb; but besides this there is another great advantage resulting from this structure, which is, that the angles arising from the aforementioned combination of the bases, greatly strengthen the whole work.
HONOUR, HONFLEUR, a port-town
HONITON, a borough.
HONFALIZE, wherever
which the gla's of the bees can give a view of the creatures regularly employed at their work; for the moment one sees a bee at work in building, that moment we see one either fly off, or else another get before her, so as to hinder the view: however, it is plain that the bee uses her teeth, in modelling and fashioning the wax.

HONEY-COMB, in gunnery, is a flaw in the metal of a piece of ordnance, when it is ill cast and spongy.

HONFALIZE, or the HOFATISE, a town of the auffrian Netherlands, in the province of Luxemburg: east long. 5° 45', and north lat. 50° 13'.

HONFLEUR, a port-town of France, in the province of Normandy, situated on the south side of the river Seine, near the English channel: east long. 1° 15', and north lat. 49° 24'.

HONITON, a borough-town of Devonshire, twelve miles east of Exeter.

It sends two members to parliament.

HONOUR, a testimony of esteem or submission, expressed by words, actions, and an exterior behaviour by which we make known the veneration and respect we entertain for any one, on account of his dignity or merit. The word honour is also used in general for the esteem due to virtue, glory, and reputation. It is also used for virtue and probity themselves, and for an exactness in performing whatever we have promised; and in this last sense we use the term, a man of honour. But honour is more particularly applied to two different kinds of virtue, bravery in men, and chastity in women.

Virtue and Honour were deified among the antient Greeks and Romans, and had a joint temple consecrated to them at Rome; but afterwards each of them had separate temples, which were so placed, that no one could enter the temple of Honour, without passing through that of Virtue; by which the Romans were continually put in mind, that virtue is the only direct path to true glory. Plutarch tells us, that the Romans, contrary to their usual custom, sacrificed to Honour uncovered; perhaps to denote, that wherever honour is, it wants no covering, but flows itself openly to the world.

HONOUR, is also used for a signory or lordship, on which inferior lordships and manors depend; for as a manor consists of several lands, tenements, services, and customs, so an honour contains several manors, knights-fees, &c.

HONOURS of the church, are the rights and privileges belonging to the patron, &c. as a seat and sepulchre in the chancel, the being first served with the consecrated bread and wine, &c.

HONOURS of the city, are the public offices and employments thereof: thus he who has been confable, Overseer of the poor, and churchwarden of his parish, common-council-man, alderman, and lastly mayor, has passed all the honours of the city. See the article CITY.

HONOUR-COURTS, are courts held within the honours or seignories.

Funeral-HONOURS are the ceremonies performed at the interment of the great, as hangings, hearles, funeral harangues, &c. See the article FUNERAL.

Maids of Honour, are six young ladies in the household of the queen, and princess royal; the salary of those of a queen are 300l. per annum each, and those of the princess dowager of Wales, 200l.

HONOUR-POINT, in heraldry, is that next above the center of the escutcheon, dividing the upper part into two equal portions. See the article POINT.

HONOURS and ruff, a well-known game at cards, wherein all the ducies are kept in the pack; by which means, as four play (two being of a side), twelve is dealt to each person, and there remain four for the flock, whereof the uppermost is turned up for trump; he that hath the ace of that suit, ruffs, that is, he takes in those four cards, and lays out four others in their place. The honours are the ace, king, queen, and knave; and he that hath three of these honours in his own hand, his partner not having the fourth, sets up eight by cards, that is two tricks; if he hath all four, then sixteen or four tricks; and here observe, that it is all one, if the two partners make three or four honours between them, as if one had them. If the honours are equally divided among the players, they then lay, honours are split. If either side are at eight greats, any of the partners has the benefit of calling can you? provided he has two honours in his hand; and if his partner answers one, the game is up, which is nine in all: if he has more than two, he flies them directly, which answers the fame...
HOOF, [1631] HOOF

fame purpose. However, if a trick be played before any of the gamellers call, they lose the benefit of can you, for that deal.

As to the value of the cards, the ace is the highest, then the king, queen, knave, ten, nine, &c. in order: but the least trump will win the highest card of any other suit.

In playing, vigilance and judgment do a great deal; for though you have but low cards, yet by playing them suitable to those in your partner's hand, so that he may either trump them, or play the best of that suit on the board, you may contribute much to gain the game. For this purpose, you ought to have a special eye to what cards are played out, by which means you will know what to play, if you lead, or trump securely and advantageously.

HONOURARY, something done or conferred upon any one, to do him honour. See the article Honour.

Honourary is sometimes understood of a person who bears or poise loyal some post or title, only for the name's fake, without doing any thing of the functions belonging to it, or receiving any advantage from it: thus we say, honourary councillors, honourary fellow, &c.

Honourary is also used for a lawyer's fee; or a salary given to public professors in any art or science.

HONOURARY SERVICES, in law, such services as relate to the tenure of grand serjeantry, and usually annexed to honours.

HONOURARY TUTOR, a person of quality, appointed to have an eye over the administration of the affairs of a minor, while the onetary tutors have the real management of them.

HOOD, in falconry, a piece of leather, with which the head of a hawk, falcon, &c. is covered.

After a hawk is seel'd, she should be fitted with a large easy hood, which is to be taken off and put on very often, watching her two nights, and handling her frequently about the head: when you perceive that she has no aversion to the hood, unseal her in an evening by candlelight, continuing to handle, hood, and unhood her as before, till at last she takes no offence, but will patiently endure handling; after unsealing, anoint with your finger and spittle, the place where the feeling-thread was drawn through; then hood her, and hold her on your fist all night; as soon as she is well reclain-
ed, let her sit upon a perch, but every night keep her three or four hours on the fist; stroking, hooping, and unhooing her. This may also be done in the daytime, as soon as she has learned to feed eagerly, and without fear.

HOOF, ungula, the horny substance that covers the feet of divers animals, as oxen, horses, sheep, &c. See HORN.

A horse's hoof should be of a round, not longish figure; and its substance solid, tough, high, smooth, without any circles, somewhat shining, and of a dark colour, for that which is white is commonly brittle; in short, it ought to be of the colour of the hoof of a deer, and the whole foot round, but a little larger below than above, upright, and somewhat hollow on the inside, and so disposed that he may tread more on the toe than the heel.

The hoof of a horse is either perfect or imperfect: an imperfect hoof is one that wants any of the above qualities; and, 1. May be broad and spreading out at the fides and quarters; such a horse has, for the most part, narrow heels, and will soon be flat-hoofed; he will neither carry a shoe long, nor travel far. 2. Others are rugged or brittle-hoofed, which is a sign that it is too hot and dry. Some are long, which causes the horse to tread all upon his heels, and by that means to breed wind-galls. 4. There are some crooked hoofs, broad on the outsides and narrow within, by which means the horse is splay-footed. 5. Others have, flat hoofs, and not hollow within, which give rise to the inconveniences above specified in the first sort of imperfect hoofs: but if it be too hollow, it will dry too fast, and make him hoof-bound. 6. When the frinh is broad, the heels will be weak and soft, and the horse will never tread boldly on the ground. 7. Some have narrow heels; these are the tenderest of all, and the horse will grow hoof-bound.

Bony Hoof, is a round bony swelling, growing on the very top of a horse's hoof, which is always caufed by some blow or bruise.

The method of cure is, first to digest the swelling, either with rotten litter, or hay boiled in stale urine, or with a plaster of stale wine-lees and wheat-flour boiled together, in order to ripen it, and bring it to suppuration, or to dissolve the tumour, if it come to a head, lance it in the lowest part of the lothnes, with a thin hot iron,
to let out the matter; then tent it with turpentine, deer’s tют, and wax, equal quantities of which should be boiled together; and laying a plaster of the same false over it, to keep in the tent till it be thoroughly well.

Hoof-break, this disorder is a shrinking of the hoof at the top and at the heel, which makes the skin flare above the hoof, and grow over it. This disorder may happen to a horse, either by keeping him too dry in the stable, by straight shoeing, or by some unnatural heat after foundering.

Hoof-britle, an infirmity in horses, proceeding either naturally, from the fire or dam; or accidentally, from a surfeit falling down into the feet; or from the horse’s being formerly foundered.

For the cure, take unwrought wax, turpentine, sheep’s tют, and hog’s greafe, of each four ounces; saddl-oil, a quarter of a pint; and of dog’s greafe, half a pound; boil them all together, and, with this mixture, anoint the hoof well for two or three days, especially at the fetting on of the hair, and stop them with cow-dung and dog’s greafe, melted together.

Hoof-swelled, a disorder that sometimes happens by a prick, or a young horse’s being over-ridden, or too hard wrought, and which, if not speedily removed, will beget a wet spavin.

For the cure, take the strongest aqua fortis you can get, and first file or draw away the old hoof somewhat near, with a file or drawing-iron, then touch what is left of the hoof, three or four dressings or more, with the aqua fortis; and anoint the foot with an ointment made of one pound of hog’s greafe; patch-greafe, three quarters of a pound; venice-turpentine, five ounces; new wax, three ounces; and saddl-oil, three ounces; all melted together over the fire: and by anointing the coffin of the foot quite up to the top, you will cause a new hoof to grow upon it.

Hoof-loosened, a dividing of the horn or coffin of the hoof from the flesh, at the setting on of the coronet. This disorder cannot be properly cured without the assistance of the farrier.

Hoogstätten, a town of the auffrian Netherlands in the province of Brabant, twenty miles north-east of Antwerp: east lon. 4° 45’, north lat. 51° 35’. Hook, a piece of iron or brafs-wire bent and turned up at one end.

Hooks are a necessary sort of utensils, and being used for various purposes, are of several sorts: thus, boat-hooks (see pl. CXXXV. fig. 1. n° 1.) are for letting off boats; can-hooks (ibid. n° 2.) are for hoisting casks into a ship: cant-hooks (n° 3.) are for turning or canting large masts, having at one end a ring for a hand-spike to go through, and at the other a claw; laying-hooks (n° 4.) used by rope-makers, when laying of cordage; rave-hooks (n° 5.) used by caulkers for picking the old oakam out of the seams of ships; sheer-hooks (n° 6.) let into or put on the main and fore yard-arms of fire-ships, in order to fasten into an enemy’s shrouds, sails, or rigging.

Besides these there are draught-hooks, placed both behind and before the cheeks of a gun-carriage; fish-hooks of several sizes, used for catching fish; and a large fort in the same form, and called by the same name, used in ships for taking hold of the flank of the anchor, when it is to be hove up to the bow; gamming-hooks, used when gammoning the bowspit; port-hooks, drove into the fides of a ship, to hang the ports upon; puttock-hooks, for the plates to hook upon; tackle-hooks, spliced into the straps of blocks, or ends of rope; pot-hooks, to hang kettles or pots over the fire; spinnin-hooks, used by rope-makers to hang their threads on, as they spin them; armour-hooks to lay arms upon, as guns, halberts, half-pikes, &c. chimney hooks, to set the tongs, fire-shovel, &c. against; caiement-hooks, curtain-hooks, hooks for doors, gates, &c. double line-hooks, single line-hooks; tenter-hooks, &c.

Hook-pins, are bolts made with a shoul­der at one end; and used by carpenters in framing: these are drove through the mortises and tenants of the work, prepared for building or wathing, ibid. n° 7.

Hooker, in naval architecture, a vessel much used by the dutch, built like a pink, but rigged and masted like a hoy. Hookers will lie nearer a wind than vessels with cross-falls can do. They are from fifty to two hundred tons burden, and with a few hands will fail to the East-indies.

Hop, lupulus, humulus, in botany, a genus of the dioecia-pentandria class of plants, neither the male nor female flower of which has any corolla; the cup of the male flower is composed of five leaves; that
Hop

March and April, but the most experienced people prefer the month of October, because they will then strike firm roots, and be strong and vigorous again in spring. The largest plants are to be chosen; and it is best to procure them from some rich ground, where the hills have been laid high; they should be about eight or ten inches long, and have three or four joints or buds a-piece; the holes for planting them are to be dug eight or ten inches deep, and about a foot over, and in each of these holes four plants are to be set, one in each corner: they may be covered an inch deep over the top, if planted in October; but in spring, when they have shot from the joints, then they must not be buried: after this, the ground must be carefully kept clear of weeds.

Dressing of Hops. This is preparing the ground in winter and spring for the making a good summer-crop. In doing this, the hills upon which the plants stand must be all pulled down, and undermined on every side, till the spade comes near the principal root; then shake off or remove with the hand the loose mould from the upper or looffe roots, that you may see where the new roots grow out of the old sets. The old sets are to be carefully preserved, but the other roots may be cut away. Whatever time the hills are pulled down, the roots must not be cut till March. When the young hops are dressed for the first time, all the roots are to be cut away that grew the year before, and the sets are to be cut off within one inch of the same; and every year after, they must be cut as close as may be to the old roots; but to a weak hop, some of the shoots are to be left at the dressing. Those roots of the plant which grow downwards, are never to be injured, but only those which run horizontally are to be cut. The old roots and the young ones may be easily distinguished, in that the old ones are always red, and the young white. If there are by accident any wild hops got among the rest, the places where they grow are to be marked with sticks, or otherwise, at the time of their being gathered; and after this, at the time of dressing the ground, that whole hill is to be destroyed, and a new one made with new plants in the room of it. When the roots are cut and dressed, the rich compost is to be put to them; and the hills must not be made too high at first, lest they hinder the young shoots.

Gathering
Gathering and drying of Hops. Hops blow in the latter end of July, in the beginning of August they bell, and they are sometimes ripe at the beginning of September, sometimes later. When they begin to change colour, are easily pulled to pieces, and their seeds look brown within them, they are ripe, and they are then to be gathered as quick as possible, for the leaf blast of wind will hurt them at this time.

The manner of gathering hops, is to take down four hills standing together in the midst of the garden, and to cut the roots even with the ground, then lay the ground level, and when it is swept clean, it makes a floor, on which the hops may be laid and picked. The hop-plants are first unwound from the poles, and then the people sit round and pick off the hops into baskets.

Care should be taken to dry the hops as fast as they are picked, for in lying undried they are apt to heat and change colour very quickly. If the quantity picked be so large that the kiln, in which they are to be dried, is over flocked, they must be spread thin upon a floor, and they will keep two or three days in that manner, without any harm. Indeed, where the quantity is but small, there is no need to have recourse to the kiln at all, for they will dry much better than any other way, by being laid thin upon a floor, and often turned. The drying of hops is the most material part of their manufacture; for if they be ill dried, they lose all their agreeable flavour; and great caution should be used, that they be all equally dried.

Bagging of Hops a term used by the farmers, who cultivate hops, for the last thing they have to do with them, in order to bring them to market; that is, the putting them up in large bags of coarse cloth, for carriage. When the hops have been picked and dried in the field, or tin-floor, they are so brittle that they would break to pieces and be spoiled if they were immediately to be put up; they are therefore to lie together three weeks, or thereabouts, that they may become tough: if they are covered from the air by blankets in the heap, they may be bagged much sooner than if left open.

The manner of bagging them is this: a hole is made in an upper-floor, so large that a man may easily go up and down it; then a hoop is fitted to the mouth of the bag, and so firmly sewed on, that it cannot be torn off; the bag is then let down through the hole, and the hoop remaining above, stops it from being pulled quite through, being larger than the hole. A few hops are to be first thrown into the bag, and a person below is to take up a parcel of these in each corner of the bag, tying it with a packthread, this makes a sort of taffel, by which the bags are afterwards the easier managed and turned about. When this is done, one man must go down into the bag, and, while another casts in the hops, he must tread them down equally every way with his feet; when the bag is in this manner filled, it is to be ripped from the hoop, and sewed up, leaving two taffels at the corners, as at the bottom. A bag of hops thus prepared, may be kept for several years in a dry place.

The tops of this plant, being of a cooling quality, are eaten, when boiled, as an emollient. A decoction of hop-flowers is also accounted an antidote against poison, and cures the itch, as well as the flux and ague, and is esteemed excellent in choleric and pestilential fevers. The heads and tendrils are good in the feury and most cutaneous diseases. Juleps and apozems are also prepared with hops for hypochondriacal and hysterical affections, and to promote the menses; but the chief use of this plant consists in preserving beer and other malt-liquors (in which the flower of this plant is a principal ingredient) from turning sour, and rendering it wholesome and grateful to the taste, &c.

Hops, the hundred weight, pay, on importation, £ l. 4s. 6d. and on exportation draw back £ l. 9s. 4½d. but if exported to Ireland, there is no drawback.

HOPE, or Cape of Good-Hope. See the article Good-Hope.

HOPPLITES, in antiquity, an appellation given to Ich of the candidates at the Olympic games, as ran races in armour.

HOPPER, a kind of basket, wherein the feed-corn is carried at the time of sowing. See the article SOWING.

It is also used for the wooden trough, in which the corn is filled, into which the corn is put to be ground. See the article MILL.

HORARY, something relating to an hour. Hence

HORARY, or Hour-circle of a globe, is a small brazen circle, fixed upon the brazen meridian, divided into twenty-four hours,
HOURS, having an index moveable round the axis of the globe, which, upon turning the globe fifteen degrees, will show what places have the sun an hour before or after us: for instance, if the index of the hour-circle be set at the upper XII. when the globe is rectified for London, and the globe turned 15 degrees from east to west, the index will point at the hour of I. which shews that all places under that meridian, and particularly Naples, have the sun an hour sooner than London has it: on the contrary, let the index be set at the upper XII. again, and the globe be turned 15 degrees from west to east, the index will point at XI. because all places under that meridian, particularly the Madeira-islands, have the sun an hour after London has it. For the several problems performable on the globes, by means of the horary circle, see the article GLOBE.

HORARY CIRCLES, or LINES, in dialling, are the circles or circles which mark the hours on sun-dials. See DIAL.

HORARY MOTION of the earth, the arch it describes in the space of an hour, which is nearly 15 degrees, though not accurately so, as the earth moves with different velocities, according to its greater or lesser distance from the sun. See EARTH.

HORD, in geography, is used for a company of wandering people, which have no settled habitation, but throll about, dwelling in waggons, or under tents, to be ready to shift as soon as the herbage, fruit, and the present province is eaten bare: such are several tribes of the Tatars, particularly those who inhabit beyond the Wolga, in the kingdom of Astracan and Bulgaria.

A hord consists of fifty or sixty tents, ranged in a circle, leaving an open place in the middle. The inhabitants of each hord usually form a military company or troop, the eldest whereof is commonly the captain, and depends on the general or prince of the whole nation.

HORDEOLUM, or CRITHE, in medicine, a tubercle in the upper part of the eye-lid near the eye-brows, like a grain of barley, whence it takes its name; but it is commonly called a flye. For the cure of an hordeolum, Allen orders it to be covered over with white wax, or anointed with hen's grease, or fasting spittle; or to rub it with the body of a fly, the head being thrown away; or with the blood of a dove or partridge. If all these prove ineffectual, it must be extirpated by cutting, or consumed by a liquid caustic; after which, let the plaster of the abbot de Grace be applied.

HORDEUM, BARLEY, in botany, a genus of the triandra-trigonia class of plants, the corolla whereof consists of two valves; the inferior valve is angular, of an ovato-acuminated figure, bellied, and longer than the cup, and terminates in a very long arista; the anterior valve is lanceolated, plane and smaller; the corolla serves as a pericarpium, surrounding the seed, and not letting it out; the seed is oblong, ventricose, pointed at each end, and marked with a longitudinal furrow.

For the culture and great use of this plant, see the article BARLEY.

For the bounty on the exportation of barley, see CORN.

HORDICALIA, or HORDICIDIA, in antiquity, a religious feast held among the Romans, wherein they sacrificed cattle big with young. This feast fell on April 15, on which day they sacrificed thirty cows with calf, to the goddes Tellus, or the Earth: part of them were sacrificed in the temple of Jupiter. The calves taken out of their bellies were burnt to ashes at first by the pontifices, afterwards by the eldest of the veal virgins.

HOREHOUND, marubium, in botany. See the article MARUBIUM.

Stinking HOREHOUND, ballotta, in botany. See the article BALLOTTA.

Baical-HOREHOUND. See the article MARUBIATRUM.

Baja-HOREHOUND, a name given by some to flachys. See the article STACHYS.

Water-HOREHOUND, lycopus, in botany. See the article LYCOPUS.

HORIZON, in astronomy and geography, that great circle which divides the heavens and the earth into two equal parts, or hemispheres, distinguishing the upper from the lower. See SPHERE.

The horizon is either sensible or rational. The sensible horizon is that circle, which, being discovered by our senses, limits our prospect. See the article CIRCLE.

When we are on terra firma, this circle commonly seems rugged and irregular, occasioned by the unevenness of the ground; but at sea, there are no such irregularities. The semi-diameter of this circle, varies according to the height of the eye of the observer. If a man fix feet high, and stand upon a large plain, or the surface of the sea, he could not see above three miles round.
HORIZONT

The rational, or true horizon, is a great circle of the apparent celestial sphere, dividing it into two equal hemispheres, and serving as the limits of elevation or depression of celestial objects. This horizon being parallel to the sensible horizon, is distant from it by the semi-diameter of the earth, through whose center it passes: for the astronomers reduce the appearances of the heavens to a spherical surface, which is not concentrical to the eye, but to the earth.

It divides the heaven and earth into two parts, the one light, and the other dark, which are greater or leffer, according to the condition of the place, &c. It determines the rising and setting of the sun, moon, or stars, in any particular latitude; for when any of these appear just at the eastern part of the horizon, we say, it rises; and when it does so at the western part, we say, it sets. And from hence also the altitude of the sun or stars is accounted, which is their height above the horizon.

This circle is divided by astronomers into four quadrants, or cardinal points. See the article COMPASS.

The poles of this horizon are the zenith and nadir: and the innumerable circles drawn through those poles to the horizon, are called the vertical circles, or azimuths. See the articles ZENITH, NADIR, and AZIMUTH.

These two horizons produced to the fixed stars, will appear to coincide into one, since the earth, compared to the sphere in which the fixed stars appear, is but a point; therefore the two circles, which are but a point distant from each other, may be well considered as coinciding into one.

HORIZON of a globe. See the article GLOBE.

HORIZONTAL, something relating to the horizon; or that is taken in, or on a level with the horizon: thus we say, an horizontal plane, &c.

HORIZONTAL DIAL, that drawn on a plane parallel to the horizon, having its stytle elevated according to the altitude of the pole, in the place it is designed for. See the article DIAL.

HORIZONTAL DISTANCE. See the article DISTANCE.

HORIZONTAL LINE, in perspective, a right line drawn through the principal point parallel to the horizon; or it is the intersection of the horizontal and perspective planes. See the article PERSPECTIVE.

HORIZONTAL PARALLAX. See the article PARALLAX.

HORIZONTAL PLANE, that which is parallel to the horizon of the place, or nothing inclined thereto. The busines of levelling is to find whether two points be in the horizontal plane, or how much the deviation is.

HORIZONTAL PLANE, in perspective, a plane parallel to the horizon passing thro' the eye, and cutting the perspective plane at right angles.

HORIZONTAL PROJECTION. See the article PROJECTION and MAP.

HORIZONTAL RANGE, or LEVEL RANGE, of a piece of ordnance, is the line a ball describes, when directed parallel to the horizon, or horizontal line.

The horizontal ranges are the shortest: some pieces of cannon will make them fix hundred paces, and some but one hundred and fifty; and the ball with the range of fix hundred paces, will go from nine to thirteen feet in the earth. See the article GUNNERY.

HORIZONTAL REFRACTION. See the article REFRACTION.

HORIZONTAL SHELTERS, among gardeners, are defences disposed parallel to the horizon, for tender plants, blossoms, and fruits, in the spring, to defend them against blasts, and pinching nights.

Horizontal shelters, says Miller, have by some persons been greatly recommended to preserve fruit-trees, but with how little reason, or upon what slight experiments, every one that has ever made use of them will easily judge, especially those which are contrived by placing tiles in the walls, at certain distances; nothing being more obvious than that vegetables, when prevented from receiving the advantages of dews, rains, &c. the kind benefits of heaven, grow weak, languid, and at last entirely decay: and from numbers of experiments, which have been lately made, we find that trees imbibe great quantities of nourishment through the pores of their leaves and branches, whereby they are rendered vigorous and healthy, even in such situations, and upon such soils, where one would think it impossible they should receive much nourishment from the earth: to deprive them of this advantage, therefore, is no less than destroying them.

The only sort of shelter Mr. Miller approves of, for fruit-trees, is that made with two leaves of flit-deal, joined over each other, and a net; these being fixed
HORMINUM, in botany, a genus of the didynamia-gymnospermia class of plants, reckoned by some a species of baum; the flower of which is monotalous and ringent; the upper lip is hollow, and feminifid; the seeds are in number, and contained in the cup. See plate CXXXIX, fig. 2.

An infusion or decoction of clary, is esteemed good in the flour albus, colic, flatulencies of all kinds, and hysterical complaints.

This plant is also said to be an antispasmodic, good against epilepsies, and in great esteem as a provocativ to venery. It has also been commended as a vulnerary, and its juice is an ingredient in some ointments and plasters.

HORN is also used as a species of sago. See the article SAGE.

HORN, corne, in physiology, a hard substance growing on the heads of divers animals, particularly the cloven-footed quadrupeds; and serving them both as weapons of offence and defence.

The casting of the horns of deer is a singular phenomenon, the true reason of which seems to be a fillopage of the circulation; so that being deprived of the nourishing juice, they fall off much in the same manner as the leaves of trees do in autumn. About ten days after the horns are cast, the new ones begin to appear; these at first are soft and hairy, but they afterwards grow hard, and the creature rubs off the hair.

Horns make an article of commerce. Those of oxen or cows, imported, pay a duty of 15. 7½d. per hundred, and draw back on exportation, 15. 5½d. Those of harts or farts, pay on importation 56. 9½d. per hundred, and draw back 58. 1½d.

HORN is also a musical instrument of the wind-kind, chiefly used in hunting, to animate the hunters and the dogs, and to call the latter together.

The French horn is bent into a circle, and goes two or three times round, growing gradually bigger and wider towards the end, which in some horns is nine or ten inches over.

HORN, in architecture, sometimes denotes a volute. See the article VOLUTE.

To give a frode with the HORN, among farriers, is to bleed a horse in the roof of the mouth with the tip of a flag's horn.

HORN OF PLANTS. See CORNUCOPIA.

Horns of insects, the slender oblong bodies projected from the heads of those animals, and otherwise called antennæ, or feelers.

The horns of insects are extremely various; some being forked, others plumèd or feathered, cylindrical, tapering, articulated, &c.

As to the use of these parts, some have imagined they served to wipe and defend the eyes; others, that they served as feelers, left the creature should run against any thing that might hurt it; and others there are, who think that the organs of finelling.

HORN-BEAM, Carpinus, in botany. See the article CARPINS.

HORN-COOT, a name sometimes given to the great horn owl. See BUBO.

HORN-FISH, a species of acus, otherwise called gar-fish. See the article ACUS.

HORN-WORK, in fortification, an out-work composed of two demi-bastions, joined by a curtin. See plate CXXXIII, fig. 4. Its construction is very simple. From C the angle of the half-moon, they lay off eighty-eight fathoms to D; and on the center C, with the radius CD, describe the arch FDG, on which laying off DF DG each equal sixty fathoms, and drawing FG, this will be the exterior side of a polygon, whereon the two demi-bastions may be described in the usual way. The parapet of the horn-work is the same with that of the half-moon, and its moat is ⅓ of the great moat. Its curtin is usually defended by an half-moon, whose moat is ⅔ of that of the great half-moon, before the curtin of the place.

According to Vauban, none of the out-works is equal in strength to the horn-work, if placed before the bastion, and not as usual before the curtin.

HORN-GELD, a tax paid for feeding of horned beasts in the forest. See FORREST.

HORNET, Crawford, in zoology, a species of apis with a black thorax, and double black spots on the segments of the body, See the article APIS.
HORSE-FLY, a two-winged fly, so called from its resemblance to the hornet.

HORSEY, a market-town of the east riding of Yorkshire, thirty-five miles east of York.

HOROGRAPHY, the same with dialling. See the article DIALLING.

HOROLOGY, a general name for instruments to measure the hours, as a watch, clock, dial, &c. See the articles WATCH, CLOCK, &c.

HOROPTER, in optics, a right line AB (plate CXXXIII. fig. 2.) drawn through the point C, where the two optic axes, HC and IC, meet, parallel to the line HI which joins the centers of the two eyes, H and I.

It is called horopter, as limiting the bounds of distinct vision. See VISION.

HOROSCOPE, in astrology, is the degree of the ascendant, or the star that rises above the horizon at a certain moment, which is observed in order to predict some future event, as the success of a design, the fortune of a person who was at that instant born, &c.

The same name is also given to a scheme or figure containing the twelve houses, in which are marked the situation of the heavens and stars, in order to form predictions. See HOUSE.

Lunar Horoscope, the point from whence the moon proceeds when the sun is in the ascending point of the east.

HORSE, equus, in zoology, a well known quadruped, the characters of which are these: the fore-teeth are fixed in number, the upper ones incurvated, and the inferior prominent: the canine teeth are not exerted, and are on each side separated by a space from the teeth: the hoof is divided, and the teats are two, and placed in the groin.

The horse is one of the noblest quadrupeds we are acquainted with. In strength and natural fierceness, he is inferior to few, and yet easily tamed. The head is long, and large; the eyes large, and prominent; the ears erect, and beautiful; the neck is long and thick, and elegantly decorated with a mane; the body is rounded, and beautifully turned; the legs are strong, without being bulky; and the tail is long, and hairy all the way; the hairs being like the mane, only longer, thicker, and more beautiful.

Foreign horses or mares on their being landed in this kingdom, pay a duty of 1l. 18s. 6d. and on their exportation, a draw-back is allowed of 1l. 13s. 9d. But British horses, mares, and geldings, on their exportation, pay only 5s. each.

Hunting-Horse, ought to have a large, lean and long head, open ears, small, and standing upright; a forehead long, broad, and rising in the middle, like that of a hare; his eyes should be full, large, and bright; his nostrils wide and red within; his mouth large, deep in the wiskers, and hairy; his throat or wind-pipe large, loose, and straight when he is reined in with the bridle; his head should be set on his neck in such a manner, that a space may be felt between his neck and his chow; his crest should be firm, thin, and well raised; his neck long and straight, yet not loose and pliant; his breast strong and broad; his chest deep; his chine short; his body large; his ribs round like a barrel, his belly being hid within them; his fillies large; his buttocks rather oval than broad; his cumbrels upright, and not bending; his legs clean; flat and straight; his joints short, well knit, and upright, especially bentixt the patterns and the hoof, and with but little hair on his fetlocks; his hoofs black, strong, and hollow, and rather long and narrow, than big and flat; and his mane and tail long, and rather thin than thick.

As to marks or colours, some do not scruple to affirm, that wherever a horse is met with that has no white about him, especially in his forehead, tho' he be otherwise of the belt reputed colours, as bay, black, forrel, he is of a dogged disposition, especially if he has a small pink eye, a narrow face, and a nose bending like a hawk's bill.

Horse-Racing, a diversion more used in England than in all the world beside. Horses for this use should be as light as possible, large, long, and well shaped, nervous, of great mettle, and good wind, with small legs, and neat small shaped feet.

The rider ought to place himself on the horse with his knees firm, and his stirrups just at such a length, that when his feet are thrust home in them, he can raise himself a little in his saddle; for without that allowance, his legs will not be firm when he comes to run; the counterpoise of his body must be forward, to facilitate the horse's running, and his elbows close to his body; he must not sway to this side or that, but must take great care of his feet and hand; he should also take care not to hold himself by the bridle.
bridle, and not to twitch it back upon any occasion.

A plate being to be run for, every man that rides must be the just weight both at staring and at the end of the same heat: for if any one wants weight at coming in, he loses the heat, even tho' he came in first horse. Half an hour is allowed between every heat to rub down the horses, and at the warning of the drum and trumpet, the jockeys are to mount. If the same horse wins too heats running, or two heats out of three, he wins the plate; but if three heats are won by three different horses, a fourth is run, when he that wins two of the heats gains the plate. In these races, where there are more heats than one, it is sometimes a piece of policy in a rider to lose a heat, and for the sake of the horse to lie behind all the way, as much as he can, provided he brings him in within the distance-post: but when there is only a single heat to be run, he must puls for all at that one time.

Horse-races are to be begun and ended the same day, and no plate, except the king's plates, is to be run, when he that wins two of the heats wins the plate; but the rider mount and alight several times, cherishing him between each time; and thus he is to be managed till he will go on, or stand still at pleasure. This being done, the long rein may be laid aside, and the band about the neck, which are always used on this occasion, and nothing will be necessary but the trenches and caveon, with the martingal. A groom must lead the way before; or another horse going only fright forwards, and making him stand still when desired. In this manner, by sometimes following, and sometimes going before another horse on the trot, the creature will by degrees be brought to know that it is his business to be quiet and governable.

HORSE-SHOES, plates of iron used for the defence of horses' feet. There are of several sorts.

1. That called the planch-fhoe, or pan-culet. This shoe is exceeding good for a weak foot, as it keeps it from stones and gravel, and will last longer than any shoe: but it is said to make a good foot and bad leg, because it causes the foot to grow beyond the measure of the leg.

2. Shoes with calkins. These are intended to keep the horse from sliding; but however they do him more harm than good, because they prevent his treading even on the ground, by which means he is in danger of straining his foot, especially in stony places. Some indeed do not think a horse well shod, unless all his shoes be made with calkins, either single or double; the double ones are however les hurtful; for he will tread eviewer with them than with those that are single: but then they must neither be too long nor sharp-pointed, but rather short and flat.

3. Shoes with rings. These were invented to make a horse lift his feet high, and were designed for horses that have tender hoofs: but what was intended for a remedy,
a remedy, is highly prejudicial; for by adding either calkins, or the rings to his shoes, his heels are made weaker than they were before.

4. Shoes with swelling welts, or borders round them. These being higher than the heads of the nails, save them from wearing; and, if made of well-tempered iron, are both the best and most lasting shoes.

5. Some in passing mountains, where smiths are not easy to be met with, carry shoes about them, with vices to fasten them to the horse's hoofs, without the help of hammer or nail: but tho' this sort of shoe may save the horse's feet from stones, yet they pinch his hoof, and perhaps do him more injury than the stones themselves would do. On such occasions it is better to make use of the following shoe.

6. The joint-shoe is made of two pieces, with a flat rivet-nail joining them together at the toe, so that it may be made both wide or narrow, to serve any foot.

7. The patten-shoe: this is used for a horse that is burnt in the hip, stifles or shoulder; as it causes him to bear upon that leg the grief is on, and consequently makes him use it the better.

8. The panton or pantable shoe, which opens the heels, and helps hoof-binding. To which may be added the half panton-shoe, and the shoe proper for flat feet.

HORSE-SHOE, in fortification, is a small work sometimes of a round and sometimes of an oval figure, inclosed with a parapet, sometimes raised in the moat or ditch, or in low grounds, and sometimes to cover a gate, or to serve as a lodgment for soldiers.

HORSE-SHOE-HEAD, a disease in infants, in which the futures of the skull lie too open.

This is commonly a sign of a weak constitution, and a short life. The nurses usually embrocate the parts affected with brandy or rum, to which some add the white of an egg, or palm-oil.

HORSE, in a military sense, the name with cavalry. See the article CAVALRY.

The light horse, in an army, are all the regiments of horse, except the guards.

HORSE, in a ship, is a rope made fast to each yard arm, and on which the men stand to foul the sails. It is also a wooden frame with a rowel fixed in it, made use of by the riggers to would ship-masts.

HORSHAM, a market-town and borough of Sussex, situated twenty miles north-west of Lewes, in west long. 22°, north lat. 51° 10'. It sends two members to parliament.

HORSHAM-STONE, a greyish kind of slate, formerly used to cover houses, so called because brought from Horsham.

HORTAGILERS, in the grand seignior's court, upholsterers, or tapistry-hangers. The grand seignior has constantly four hundred hortagilers in his retinue when he is in the camp; these go always a day's journey before him, to fix upon a proper place for his tent, which they prepare first; and afterwards those of the officers, according to their rank.

HORTICULTURE, the fame with gardening. See GARDEN and GARDENING.

HOR TULANUS, in ornithology, a bird otherwise called emberiza flava, or the yellow-hammer. See EMBERIZA and YELLOW-HAMMER.

HORTUS SICCUS, a DRY-GARDEN, an appellation given to a collection of specimens of plants, carefully dried and preserved.

The value of such a collection is very evident, since a thousand minutiae may be preferred in the well-dried specimens of plants, which the most accurate engraver would have omitted. We shall, therefore, give two methods of drying and preserving an hortus fuccus; the first by Sir Robert Southwell, in Phil. Trans. n° 217, and the other by Dr. Hill, in his review of the works of the royal society, with the doctor's objections to Sir Robert's method.

According to the former gentleman, the plants are to be laid flat between papers, and then put between two smooth plates of iron, screwed together at the corners, and in this condition committed to a baker's oven for two hours. When taken out, they are to be rubbed over with a mixture of equal parts of aquafortis and brandy; and, after this, to be fastened down on paper, with a solution of the quantity of a walnut of gun tragacanth dissolved in a pint of water.

To this the doctor objects, that the heat of an oven is much too uncertain to be employed in so nice an operation; and that the space of time, ordered for the continuing the plants in it, is of no information, unless the degree of heat, and even the different nature of the plant, as to its more or less succulency, and the firmness or tenderness of its fibres, be attended
tended to. There are scarce any two plants perfectly alike in those particulars; and consequently the heat, and duration of heat, that is sufficient for one plant in a parcel, would destroy another. But besides this, he objects farther, that the acid destroys the colour of many plants, never recovers that of others loth in the drying, and frequently, after the plant is fixed down, rots both the paper it is drying, and frequently, after the plant follows: take of a specimen flower, and with it one of its bottom leaves, if it have any; bruise the leaves, if it be too rigid; sift it, if too thick; spread out the leaves and flowers on paper; cover the whole with more paper, and lay a weight over all. At the end of eighteen hours take out the plants, now perfectly flattened; lay them on a bed of dry common sand; sift over them more dry sand, to the depth of two inches, and thus let them lie about three weeks: the less succulent dry much sooner, but they take no harm afterwards. If the floor of a garret be covered, in spring, with sand two inches deep, leaving space for walking to the several parts, it will receive the collection of a whole summer, the covering of sand being sifted over every parcel, as laid in. They need no farther care, from the time of laying them, till they are taken up to be stuck on paper. The cement used by the doctor is thus prepared: early in the spring, put two ounces of camphor into three quarts of water in a large bottle; shake it from time to time; and when the first collected plants are ready for the softening down, put into a pint of the water, poured off into an earthen vessel that will bear the fire, two ounces of common glue, such as is used by the carpenters, and the same quantity of ichthyocola beat to shreds; let them stand six and thirty hours, then gently boil the whole a few moments, and strain it off through a coarse cloth. This is to be warmed over a gentle heat, when it is to be used, and the back of the plants smeared over thereby with a painter’s brush: after this lay them on paper, and gently presses them for a few minutes; then expose them to the air a little, and finally lay them under a small weight between quires of paper to be perfectly dried.

It is scarce to be conceived, how strongly the water becomes impregnated with the camphor by this simple process: a part of it, indeed, flies off in the making of the cement and the using of it; but enough remains with the plant to prevent the breeding of insects in it. He farther observes, that plants may be dried very well without sand, by only putting them frequently into fresh quires of paper, or a few, by only pressing them between the leaves of a book; but the sand method prefers the colour best, and is done with least trouble.

Another method, much better than that of the oven, is the flattening and drying the plant, by passing a common smoothing-iron for linens, over the pages between which it is laid: but for nice things, the most perfect of all methods is that by a common sand-heat, such as is used for chemical purposes. The cold sand is to be spread smooth on this occasion, the plant laid on it carefully flattened, and a thick bed of sand sifted over: the fire is then to be made, and the whole process carefully watched, till by a very gentle heat the plant be perfectly dried. The colour of the tenderest herb may be preferred in this manner; and flowers that can be preferred no way else may be managed perfectly well thus.

HOSANNA, a hebrew word, signifying save now, or save we beseech thee; from the frequent use of which, during the feast of tabernacles, the whole solemnity got the appellation of hoanna rabba.

HOSEA, in commerce. See STOCKING.

HOSEA, a canonical book of the Old Testament, so called from the prophet of that name, its author, who was the son of Beri, and the first of the leffer prophets. He lived in the kingdom of Samaria, and delivered his prophecies under the reign of Jeroboam II. and his successors, kings of Israel, and under the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. His principal design is to publish the gross idolatries of the people of Israel and Judah, to denounce the divine vengeance against them, and to fortell the captivity in Assyria.

HOSPITAL, a place or building properly endowed, or otherwise supported by charitable contributions, for the reception and support of the poor, aged, infirm, sick, or helpless. A charitable foundation laid thus for the sustenance and relief of the poor, is to continue for ever. Any person seized of an estate in fee, may, by deed inrolled in chancery, erect and found an hospital,
Royal Hospital for disabled soldiers, commonly called Chelsea-hospital. This hospital was founded by king Charles II. carried on by king James II. and finished by king William and queen Mary. The building is very spacious and magnificent; the number of ordinary pensioners is about 500, besides the officers and servants of the house: the out and extraordinary pensioners are very numerous; and thine upon occasion do duty in the several garrisons, from whence draughts are made for the army, &c. The pensioners are all provided with cloaths, diet, walking, lodging, firing, and have one day’s pay in every week for spending-money. The qualifications required to be admitted of this body, are, that the candidate bring a certificate from his superior officer that he has been maid and disabled in the service of the crown; or that he has served the crown twenty years, which must be made appear by the muster-rolls. To defray the charges of this hospital, there is a considerable sum paid yearly out of the poundage of the army; besides one day’s pay of each officer and common soldier every year, which in time of war amounts to a very considerable sum. For the administration of this hospital, there is a governor, lieutenant-governor, major, treasurer, &c.

Greenwich-Hospital, a retreat for seamen, who, by age, wounds, or other accidents, are disabled from service; and for the widows and children of such as are slain in the service. This in point of magnificence and spaciousness, greatly excels even Chelsea-hospital. A good part of it was built in King Charles II’s time. It was much promoted by king William, and finished under queen Anne, king George I. and II. The number of pensioners entertained in this hospital, are about 1200; and to each hundred are allowed five nurses, being the widows of seamen. The pensioners are all cloathed in blue, and are allowed stockings, shoes, linnen, and twelve-pence a week for other necessaries: the victualling is according to the allowance of Chelsea-hospital, viz. four men to a mefs, each mefs to contain four pounds of flesh, a gallon of beer, &c. There are 100 boys, the sons of disabled seamen, who are maintained with the money arising by shewing the hospital and painting in the hall. This hospital is administered by a governor, lieutenant-governor, &c.

Chrift’s Hospital, by Newgate-street, formerly a convent of grey friars, being dissolved by king Henry VIII. was converted by his son Edward VI. into a hospital for poor children, called the blue-coat hospital, from the blue clothing of the children, whose number amounts to about 500; the greatest part maintained in the house, and the others at nurse, at the charge of the foundation. The boys are yearly put to trades, and the girls to some honest service or trade. Here the boys have a grammar-school, from which the most improved scholars are yearly sent to the university: there is here also a stately writing school, and a mathematical school, founded by king Charles II. where forty youths are taught several parts of the practical mathematics, particularly navigation, to fit them for a prentices to masters of ships. The officers of this hospital are a president, treasurers, governors, &c.

St. Bartholomew’s Hospital, at a small distance from Christ’s hospital, did formerly belong to the same grey friars, but alter the dissolution of the monasteries, king Henry VIII. left 500 marks a year to it for the relief of poor people: but it was much more largely endowed for the use of sick and lame persons only, by Edward VI. There are two other hospitals at the charge of this; one in King’s-land, and the other, called the Lock, in Southwark, for the venereal disease only. It is computed that these three hospitals relieve five thousand poor sick and lame persons annually, fix or seven hundred of which are in-patients at St. Bartholomew. This hospital is a large, sumptuous, new building of stone, erected with proper offices in the nature of a quad-
quadrangle. It is provided with able physicians and surgeons, &c. For the direction of it there is a precent, treasurer, &c.

Bethlehem, or Bedlam Hospital, a flatly hospital in Moorfields, for the cure and maintenance of poor lunatics, or distracted persons. This hospital, for elegance of structure and spacious conveniences, is not to be equaled in Europe. It stands also in a good open air.

St. Thomas's Hospital, in Southwark, is upon the same scheme and nature with St. Bartholomew. It is a noble extensive charity, was founded by King Edward VI. and rebuilt in 1701.

Guy's Hospital, near St. Thomas's, was founded at the sole cost of Thomas Guy, bookbeller of London, in 1722, who left 200,000 to build, furnish, and endow it. It was designed chiefly for incurables.

Sutton's Hospital. See Chartreuse.

Bridewell Hospital. See Bridewell.

At Hoxton there is another hospital, founded by alderman Ask, for twenty poor old men of the haberdasher's company, and twenty poor boys to be there educated.

There are also two very beneficial charities or hospitals, one at Hyde-park-corner, and the other in Petty-france, Westminster, after the manner of those in London, and both very well attended.

In 1739, a long wished-for charity was established by charter for taking in and educating poor deserted young infants. The governors and guardians have purchased of the earl of Salisbury fifty acres of land in Lamb's conduit-fields, on which they have erected a large building for this charitable purpose, called the founding hospital.

About the year 1741, an infirmary or hospital in Goodman's fields was begun by charitable donations, for the relief of disabled poor seamen in the merchant service; and now they are near finishing a large flately building for this charitable undertaking near White-chapel-mount.

For several other charities of a like nature, tho' less considerable, in and about London, see the article Workhouse.

Camp-Hospitals, are either general or regimental. The general hospitals are of two kinds, viz. the flying hospital, attending the camp at some convenient distance, and the stationary hospital, which is fixed at one place. In the choice of both Dr. Pringle thinks it better to have them in towns than villages, as the former will afford larger wards, besides more of other conveniences. These wards should be as airy as possible. Regimental hospitals are of the greatest importance, and therefore should be supplied with blankets and medicines from the public stores, with an allowance also for nurses and other necessaries. Barns, stables, granaries, and other out-houses, but above all churches, make the best hospitals from the beginning of June to October.

Hospital-fever, a name given to the malignant catarhal fever, as being frequent in hospitals. See the article Malignant Fever.

This sort of fever, according to Dr. Pringle, may be owing to a great many concurring causes, but the principal are foul and putrid air, occasioned by filth and impurity of any kind. Hence it is no wonder that it prevails in marshy countries, after hot seasons, and in populous cities, especially if low and ill aired, unprovided with common stores; or where the streets are narrow and foul, and the houses dirty; water scarce; and when jails and hospitals are crowded, and not ventillated, and kept clean; when in sickly times the burials are within the towns, and the bodies not laid deep; when slaughter-houses are also within the walls, or when dead animals or offals are left to rot in kennels, or on dunghills; when drains are not provided to carry off any large quantity of stagnating and corrupted water in the neighbourhood; when flesh meat makes the greatest part of the diet, without a proper mixture of bread, greens, wine, or other fermented liquors; from the use of old mushy grain, or what has been damaged by a wet season; or, lastly, when the fibres are relaxed by immoderate warm bathing.

When the disease comes on slowly, the symptoms are small interchanges of heats and colds, trembling of the hands, incontinence; or, when it advances fast, the above symptoms are in a higher degree; and besides these, the patient is afflicted with a great latitude, a nausæa, pains in the back, a constant pain and confusion in the head, a dejection of spirits, &c. The method of cure varies according to the state of the disease, which may be distinguished into three periods; the first continuing as long as the
the person is able to go about; the second beginning with his confinement; and the third, when the pulse sinks, and the florid comes on.

In the first as well as the other period, the cure is principally to be aimed at by removing the patient out of the foul air. When this cannot be done, the ward or room should be purified by making a succession of air by means of fires, or letting it in by doors and windows, or diffusing the fumes of vinegar. The next thing to be done is to promote a diaphoresis, which in this period should only be attempted by mild sudorifics, as the spiritus mindereri.

When the fever is confirmed, contravera powders, with nitre, camphor, the common pitan acidulated, and such medicines as are good in inflammatory cases, are used. But opiates are dangerous both in this and the third stage, in which the pulse sinks, and florid is greater, a delirium impends, and the petechiae often appear. When this is observed to be the cafe, the nitre and diaphoretic medicines are to make room for a decoction of snake-root, to which a small quantity of strong water may be added. It may also be given in substance from two to four scruples a day, with sensible good effects. Towards the decline of the fever, an equal quantity of peruvian bark may be joined with the root. Wine is also an excellent cordial at this period, and may be given either made into whey, or added to the panado; being the only food proper for the patient. It may be taken from half a pint to a quart a day, according to the strength of the patient. Perhaps there is no rule of more importance than to give a strict charge to the attendants of the sick never to let the patient, when low, remain above two or three hours without taking something cordial and nourishing. If there be danger of a phrenitis coming on, it will be proper to call in the assistance of epiphatics. Sinapisms too may be useful when the pulse is very much florid. If a diarrhea comes on in the decline of the fever, it is to be moderated by adding a few drops of the tinctura thebaica, to the full quantity of the alexipharmic decoction; or by giving a spoonful or two of an astringent mixture. In proportion, however, to the putrid nature of the stools, astringents are to be used with the greatest caution. When the fever is over, there are few but complain of a vertigo and want of rest; a continuation of the deafness and other nervous symptoms, are frequently the consequence of great lowness, in which case the pilula Mathēl are to be given at night, with analptics, and medicines of the strengthening kind.

HOSPITALERS, an order of religious knights, now known by the title of knights of Malta. See MALTA.

HOSPITIUM, a term used in old writers either for an inn or a monastery, built for the reception of strangers and travellers. See INN and MONASTERY.

HOSPODAR, a title borne by the princes of Walachia and Moldavia, who receive the investiture of their principalities from the grand signior. He gives them a velt and standard: they are under his protection, and obliged to serve him, and he even sometimes deposits them; but in other respects they are absolute sovereigns within their own dominions.

HOST, hoffes, denotes either a person who entertains another, or the person so entertained; but it is now generally used in the first of these senses.

HOST, or HOAST, hoffia, in the church of Rome, a name given to the elements used in the eucharist, or rather to the consecrated wafer; which they pretend to offer up every day, a new host or sacrifice, for the sins of mankind. They pay adoration to the host, upon a halfe presumption, that the elements are no longer bread and wine, but transubstantiated into the real body and blood of Christ. See TRANSUBSTANTIATION.

HOSTAGE, a person given up to an enemy as a security for the performance of the articles of a treaty.

When two enemies enter into a treaty or capitulation, it is common for them mutually to give hostages as a security for their reciprocally performing the engagements they have entered into. An hostage becomes either an accseral or principal, according to the state of things. Thus, for example, he is an accsesal, when a prince promises fidelity to another prince, and gives either his son, or some great lord, as a security for his performing his promise without any further stipulation: for then these hostages are only an additional engagement of the prince; and if he violate his word, they are not in any manner responsible for it. An hostage becomes a principal, when it is
HOT [1645] HOT

furnished that he shall be answerable for the event of things. For example, if a city promises to surrender within a certain time, in case it is not succoured, and for the security of this article gives hostages, if the hostages are of the same nature as bail given to a creditor to secure a debt; so that if the succour arrives within the time, the promise becoming void, the hostages are discharged; and cannot be detained, just as the bail is discharged, if the original debtor pays the creditor; but if the succour do not arrive, and the city is guilty of a breach of faith, by refusing to surrender, then the hostages become principal, and may be punished for the breach of faith; just as a bail becomes the principal debtor, on the other debtor's becoming insolvent.

An hostage given for another person is free, in case that other person dies. According to the law of nations, hostages ought not to be put to death, unless they themselves have been guilty of some particular crime.

HOSTEL, or HOTEL. See HOTEL.

HOSTIA, HOST. See the article Host.

HOSTILITY, denotes a state of war or enmity between two nations.

During a truce, all acts of hostility are to cease on both sides.

HOT, a relative term, importing the contrary of cold. See HEAT and COLD.

HOT-BATH. See the article BATH.

HOT-BEDS, in gardening, beds made with fresh horse-dung, or tanner's bark, and covered with glafces to defend them from cold winds.

By the skilful management of hot-beds, we may imitate the temperature of warmer climates; by which means, the seeds of plants brought from any of the countries within the torrid zone, may be made to flourish even under the poles.

The hot-beds commonly used in kitchen-gardens, are made with new horse-dung mixed with the litter of a stable, and a few sea-coal-ashes, which are of service in continuing the heat of the dung. This should remain six or seven days in a heap, and being then turned over, and the parts mixed well together, it should be again cast into a heap, where it may continue five or six days longer, by which time it will have acquired a due heat.

These hot-beds are made in the following manner: in some sheltered part of the garden, dig out a trench of a length, and width proportionable to the frames you intend it for; and if the ground be dry, about a foot or a foot and a half deep; but if it be wet, not above six inches: then wheel the dung into the opening, observing to stir every part of it with a fork, and to lay it exactly even and smooth on every part of the bed, laying the bottom part of the heap, which is commonly free from litter, upon the surface of the bed: and if it be designed for a bed to plant out cucumbers to remain for good, you must make a hole in the middle of the place designed for each light about ten inches over, and fix deep, which should be filled with good fresh earth, thrusting in a stick to shew the places where the holes are; then cover the bed all over with the earth that was taken out of the trench, about four inches thick, and put on the frame, letting it remain till the earth be warm, which commonly happens in three or four days after the bed is made, and then the plants may be placed in it. But if your hot-bed be designed for other plants, there need be no holes made in the dung; but after having smoothed the surface with a spade, you should cover the dung about three or four inches thick with good earth, putting on the frames and glafces, as before. In making these beds, care must be taken to settle the dung close with a fork; and if it be pretty full of long litter, it should be trod down equally on every part. During the first week or ten days after the bed is made, you should cover the glafces but slightly in the night, and in the day time carefully raise them, to let out the steam; but as the heat abates, the covering should be increas'd, and as the bed grows cold, new hot dung should be added round the sides of it.

The hot-bed made with tanner's bark, is, however, much preferable to that described above, especially for all tender exotic plants and fruits, which require an even degree of warmth to be continued for several months, which cannot be effected with horse-dung. The manner of making them is as follows: dig a trench about three feet deep, if the ground be dry; but if wet, it must not be above a foot deep at most, and must be raised two feet above the ground. The length must be proportioned to the frames intended to cover it, but it should never be less than ten or twelve feet, and the width not less than six. The trench should be bricked up round the sides to the above-mentioned height of three feet, and filled in the spring with fresh tanner's bark that
that has been lately drawn out of their
wats, and has lain in a round heap, for
the moisture to drain out of it, only three
or four days: as it is put in gently beat
it down equally, with a dung-fork; but
it must not be trodden, which would pre-
vent its heating, by letting it too close;
then put on the frame, covering it with
glares, and in about ten days or a fort-
night, it will begin to heat; at which
time plunge your pots of plants or seeds
into it, observing not to tread down the
bark in doing it. These beds will con-
tinue three or four months in a good
temper of heat; and if you fill up the
bark pretty deep, and mix a load or two
of fresh bark with the old when you find
the warmth decline, you will preserve
good heat two or three months longer.
Many lay some hot horrid dung in the
bottom of the trench under the bark;
but this ought never to be practiced un-
til the heat is wanted sooner than the
bark would heat of itself, and even then
there ought only to be a small quantity
of dung at the bottom.

The frames which cover these beds
should be proportioned to the several
plants they are designed to contain; if
they are to cover the bananas or pine-
apple, the back part should be three feet
high, and the lower part fifteen inches:
if the bed be intended for taller plants,
the frame must be made of a depth pro-
portional to them; but if it be for low-
ing of seeds, the frame need not be above
fourteen inches high at the back, and
seven in the front; by which means, the
heat will be much greater.

Hot-house, in salt-making, the place
where they dry the salt, when taken out
of the boiling-pan: it is situated near
the furnace, which, by means of funnels
or tubes, conveys the heat into it.

Hotch-pot, in law, is used for mix-
ing of lands given in marriage with other
lands in fee which fall by descent; as
where a man possessed of thirty acres of
land has issue only two daughters, and
after his having given with one of them
ten acres in marriage, he dies possessed
of the other twenty: here the is, thus married, in order to gain her share
of the rest of the land, must put her part
given in marriage in hotch-pot; that is,
he must refuse to take the sole profits of
her lands, and case it to be mingled
with the other, so that an equal division
may be made of the whole between her
and her sister; by which means, instead
of only her ten acres, she has fifteen.

HOTTENTOT-COUNTRY, the most sou-
thern promontory of Africa, compre-
hending the cape of Good Hope, and the
reelf of the Dutch settlements, situated be-
tween 35° and 33° of east long, and be-
tween 23° and 35° of south lat. Though
mountainous, it is a most fruitful country.
The hottentot-nations who inhabit the
southern promontory, are sixteen in num-
ber; and as the natives are extremely
useful to the Dutch, they suffer them
to be governed by their own laws and cus-
toms: They are black, and in their flat
houses, thick lips, and hair, resemble the
megreis. It is remarkable, that all the
women have a callous flap or skin which
hangs over the pudenda.

HOTTONIA, WATER-VIOLET, in ho-
tany, a genus of the Plantaginaceae mono-
gynous clas of plants, the flower of which
consists of a single petal, the tube where-
of is equal in length to the cup, and its
limb plain, and divided into five ovado-
oblong, emarginated-limbs; the fruit is
a globose acuminate capsule, placed
on the cup, and having only one cell, in
which is contained a great number of
round seeds.

HOTT'S, or Hutts, are the pomees and
round balls of leather, stuffed, and tied to
the lips of fighting-cocks, to keep them
from hurting one another in sparring.

Houden, a market-town in the east riding
of York, fourteen miles south-east of
York.

Hough and Houghing, in agriculture.
See Hoe and Hoeing.

Hough, in the manage, is that joint of
the hinder quarter which joins the thigh
to the leg.

Hovingham, a market-town of the
east riding of Yorkshire, seventeen miles
north-east of York.

Houlsworth, a market-town of
Devonshire, thirty-eight miles north-west
of Exeter.

Hound, a hunting dog, of which there
are several sorts, as the grey-hound,
grey-hound, &c.

The grey-hound is valued for his swift-
ness, strength, and sagacity in pursuing the
game. Those of the best foot have a
long body, a sharp head, sparkling eyes, a long mouth, and sharp teeth; little ears with thin gristles, a straight,
straight, and strong breast; his legs long,
and his belly small; with broad shoul-
}
ders, round ribs, fleshy buttocks, but not fat, and a long tail.
The best time to try and train grey-hounds to the game, is at twelve-months old; they should be kept in a slip while abroad, till they can see their course, and a young dog should not be run till the game has been a considerable time on foot, left being over greedy of the prey, he strain his limbs. The huntman is to lead them on his left hand, if he be on foot, and on the right if on horseback. For the method of entering greyhounds, see the article 'ENTRANCE OF hounds.'

The greyhound ought to be for the method of entering greyhounds, the jul: advantage, game; but forget not to give the hare all times a
If you design your grey-hound for a wager, give him the liver and lights; then taking the chase; and on being fret on by the
The general food of a grey-hound ought to be chippings, crusts of bread, soft bones and gristles; the chippings should be scalded in beef, mutton, veal, or venison broth; and when it is pretty cool, made to float in good milk, and if this be given him morning and evening, it will keep him in a 'good state of body. But if he be poor, sickly and weak, take a sheep's head with the wool, break it to pieces, and boil it till it is very tender, and thickening the broth with oatmeal, feed your dog with the meat and broth morning and evening. If you design your grey-hound for a wager, give him the following diet-bread. Take half a peck of wheat-flour, and the fame quantity of oatmeal, and having scattered in it an indifferent quantity of liquorice and aniseeds, knead it up with the whites of eggs, and bake it in small leaves, then loaf it in beef or other broths, and having walked and aired him, half an hour after fun-rise, and half an hour after fun-set, give him some of it to eat.

Blood-Hound, is a dog remarkable for the 'keenness of his scent; he differs from the foetch fluck-hound, only in the large-

HORUS, bora, in chronology, an aliquot part of a natural day, usually a 24th, sometimes a 12th.

But the word hour has not always been of the fame signification; for in antient times an hour did indefinitely express a short space of time. It is thought too that antiently the four seasons of the year, wherein the fun finisqeth its annual course, had the name of hours, because Horus instituted a certain year, consisting of three months, and for this reason the antients called spring, summer, autumn, and winter, hours, and the year itself hours: of which some footsteps appear in this, that the Greeks called their annals Hari; and the writers of them, horographi. However it be, the division of the day into hours is very antient, tho' the most antient hour is that of the twelfth part of the day.

An hour, with us, is a measure or quantity of time, equal to a 24th part of the natural day, or nycththemeron; or it is the duration of the 24th part of the earth's diurnal rotation. Fifteen degrees of the equator answer to an hour; tho' not precisely, yet near enough for common use.
The hour is divided into sixty minutes; the minute into sixty seconds; the second into sixty thirds, &c.

To find the hour of the day, the latitude of the place, the sun's declination, and his altitude must be given. Thus, Suppose the latitude is $51^\circ 32'$, the sun's declination $18^\circ$ north, and his altitude $40^\circ$, to find the hour of the day.

The geometrical solution of this problem is performed stereographically on the plane of the meridian the oblique angled spherical triangle which is made by the complement of the latitude; the complement of the sun's altitude, and the sun's distance from the elevated pole. Thus, with the chord of $60^\circ$ (plate CXXXIV. fig. 1.) draw the primitive circle ZONH; quarter it; also draw the axis P C P thro' the poles, and the equinoctial ZECO, likewise the parallel of declination D d equal $18^\circ$; then draw parallel to the horizon HO, the almucantar or parallel of the sun's altitude $=40^\circ$ to cut the parallel of the sun's declination in O the place of the sun at that time. Then through O draw two great circles, one through Z and N the poles of the horizon, and the other thro' P and P the poles of the equinoctial, as Z ON, and P OP; which form the oblique angled spherical triangle P Z O containing sides \[
\text{Side} \begin{cases} 
ZP & \text{Co. lat. } 38^\circ 28' \\
\text{CO} & \text{Co. decl. } 72^\circ 00' \\
ZP & \text{Co. alt. } 50^\circ 00' \\
\text{Sum is}, & 160^\circ 28' \\
\text{Half is}, & 80^\circ 14' \\
\text{Co. alt. } & 50^\circ 00' \\
\text{Remainder} & 30^\circ 14'
\end{cases}
\]

This subtended from $180^\circ 00'$ leaves $47^\circ 20'$ equal to 3 hours 9 minutes nearly, or to 31 minutes after eight in the morning, or 31 minutes before four in the afternoon. But by spherical trigonometry, having three sides given; that is ZP $38^\circ 28'$ the complement of the latitude, ZO $50^\circ 00'$ the complement of the sun's altitude, and P O $72^\circ 00'$ the sun's distance from the elevated pole (which is the declination added to $90^\circ$, when the latitude and declination are of a contrary name; but if of one name, it is the complement of the declination); and the angle Z P O the hour of the day is found by case 11. of spherical trigonometry, as follows. First add the complement of the latitude, complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Secondly, From half that sum subtact the complement of the sun's altitude, noting the half sum, and the remainder. Then the complement arithmetical of the sides of the complement of the latitude, and the sun's distance from the pole, and the sides of the said half sum and remainder, added together; the line of half this sum, doubled, and subtact from 180 degrees, gives the hour from noon.

Which doubled gives $132^\circ 40'$ from the north, in north latitude; and from the south, in south latitude. If the hour of the night is required, the height of some star must be taken. And it is found by adding to, or subtacting the right ascension of that star from that of the sun.

There are divers kinds of hours, used by chronologers, astronomers, dialists, &c. Sometimes hours are divided into equal and unequal. Equal hours are the 24th part of a day and night precisely, that is, the time wherein fifteen degrees of the equator mount above the horizon. These are also called equinoctial hours, because they are measured on the equinoctial
HOU [1649] HOU

nociell; and astronomical, because used by astronomers. They are also differently denominated, according to the manner of accounting them in different countries. Astronomical hours are equal hours, reckoned from noon, or mid-day, in a continued series of twenty-four. Babylonish hours are equal hours reckoned in the same manner from sun-rise. The Italian hours, are also equal hours reckoned in the same manner too, from sun setting. European hours are also equal hours, reckoned from midnight; twelve from thence to noon, and twelve more from noon to midnight. Jewish, or planetary, or antient hours, are the twelfth part of the artificial day and night, each being divided into twelve equal parts. Hence, as it is only in the time of the equinoxes that the artificial day is equal to the night, it is then only that the hours of the day are equal to those of the night: At other times they will be always either increasing or decreasing. And they will be the more or less unequal according to the obliquity of the sphere.

HOUSE, domus, a habitation, or place built with conveniences for dwelling in; thus, we say a town-house, country-house, &c.

A country-house is the villa of the antient Romans, the quinta of the Spaniards and Portuguese, the closerie and caffeine of the French, and the vagna of the Italians.

It ought always to have wood and water near it; these being the principal beauties of a rural seat. The trees make a far better defence than hills, as they yield a cooling, and healthy air, shade during the heat of summer, and very much break the severities of the winter-day.

It should not be situated too low, on account of the moisture of the air; and on the other hand, those built on places exposed to the winds are expensive to keep in repair. In houses not above two stories high, and upon a good foundation, the length of two bricks, or eighteen inches, for the heading course will be sufficient for the ground-work of any common structure; and six or seven courses above the earth, to a water-table, where the thickness of the walls are abated, or taken in, on either side the thickness of a brick, viz. two inches and a quarter. But for large and high houses of three, four, or five stories, with garrets, their walls ought to be three heading courses of bricks, or twenty-eight inches at least, from the foundation to the first water-table; and at every story a water-table, or taking in, on the inside, for the summers, girders, and joists to rest upon, laid into the middle, or one quarter of the wall at least, for the better bond. But as for the partition wall, a brick and half will be sufficiently thick; and for the upper stories, a brick length, or nine inch brick wall will suffice.

As to the regulations concerning the houses in London, we have taken notice of them under the article Building.

Town-House, a public hall, where the magistrates of a town, or borough, hold their meetings for the due administration of their polity.

Work-House, a place built at the charge of a county, town, or parish, where indigent, vagrant, and idle people, as also strumpets, gamesters, and other rogues, are set to work, and furnished with clothing, diet, &c. Such are the London work-houses, Bridewell, and that of the parish of St. Margaret, Westminster. The justices, at their sessions, are required to appoint governors, or masters of such houses, whose office is to set the persons committed to their charge to work, and to give them moderate correction by whipping, &c. if refractory; and to render a true account every quarter, sessions, of persons committed into their custody.

House-Bote, in law, an allowance of timber out of the lord's woods, for the repairs of an house: this is otherwise called eftovers.

House is also used for a noble family, or race of illustrious persons, descended from the same stock.

House, in astrology, denotes the twelfth part of the heavens.

The division of the heavens into houses, is founded upon the pretended influence of the stars, when meeting in them, on all sublunary bodies. These influences are supposed to be good or bad, and to each of these houses particular virtues are aligned, on which astrologers prepare and form a judgment of their horoscopes. The horizon and meridian are two circles of the celestial houses, which divide the heavens into four equal parts, each containing three houses; fix of which are above the horizon, and fix below
below it; and six of these are called eastern, and six western houses.

A scheme or figure of the heavens is composed of twelve triangles, also called houses, in which is marked the stars, signs and planets so included in each of these circles. Every planet has likewise two particular houses, in which it is pretended, that they exert their influence in the strongest manner; but the fun and moon have each of them only one, the house of the former being Leo, and that of the latter Cancer.

The houses in astrology have also names given them according to their qualities; the first is the house of life; this is the ascendant, which extends five degrees above the horizon, and the rest below it: the second is the house of riches: the third the house of brothers: the fourth, in the lowest part of the heavens, is the house of relations, and the angle of the earth: the fifth, the house of children: the sixth, the house of health: the seventh, the house of marriage, and the angle of the west: the eighth, the house of death: the ninth, the house of piety: the tenth the house of offices: the eleventh, the house of friends: and the twelfth, the house of enemies.

House-breaking, or ROBING, is the breaking into and robbing a house in the day-time, the same crime being termed burglary, when done by night; both are felony, without benefit of clergy.

House of Lords. See Parliament.

House of Commons. See Parliament.

Green-House. See the article Green.

Hat-House. See the article Hat.

House-Painter. See Painter.

House-Leech, sedum, in botany. See the article Sedum.

HOUSEHOLD, the whole of a family considered collectively, including the mistresses, children, and servants. But the household of a sovereign prince includes only the officers and domestics belonging to his palace.

The principal officers of his majesty's household are, the lord steward, lord chamberlain of the household, the groom of the robe, the master of the great wardrobe, and the master of the horse.

The civil government of the king's house is under the care of the lord steward of the king's household, who, as he is the chief officer, all his commands are observed and obeyed. His authority extends over all the other officers and servants, except those of his majesty's chapel, chamber, and stables, and he is the judge of all crimes committed either within the court or the verge. See the articles Lord Steward and Verge.

Under him are the treasurer of the household, the comptroller, cofferer, the master of the household, the clerks of the green-cloth, and the officers and servants belonging to the accounting-house, the marshalla, the verge, the king's kitchen, the household kitchen, the acastery, bake-house, pantry; buttery, cellar, pastry, &c. Next to the lord steward is the lord chamberlain of the household, who has under him the vice chamberlain, the treasurer, and comptroller of the chamber; forty-eight gentlemen of the privy chamber, twelve of whom wait quarterly, and two of them lie every night in the privy-chamber; the gentleman usher, the grooms of the great chamber, the pages of the presence-chamber; the maec-bearers, cup-bearers, carvers, musicians, &c. See Lord Chamberlain of the Household.

The groom of the robe has under him the eleven other lords of the bed-chamber, who wait weekly in the bed-chamber, and by turns lie there a nights on a pallat-bed; and also the grooms of the bed chamber, the pages of the bed-chamber and back stairs, &c. See Groom of the Stole.

The master or keeper of the great wardrobe has under him, a deputy, comptroller, clerk of the robes, brusher, &c. and a number of tradesmen and artisans, who are all sworn servants to the king.

The master of the horse has under his command the equerries, pages, footmen, grooms, coachmen, farriers, fadlers, and all the other officers and tradesmen employed in his majesty's stables.

Next to the civil lift of the king's court, is the military, consisting of the band of gentlemen pensioners, the yeomen of the guard, and the troops of the household: of which, the two first guard the king above stairs.

When the king dines in public, he is waited upon at table by his majesty's cup-bearers, carvers, and gentlemen faders; the musicians playing all the time. The dinner is brought up by the yeomen of the guard, and the gentlemen faders set the dishes in order. The carvers cut for the king, and the cup-bearers serve him the drink with one knee on the ground, after he has first tasted it in the cover.

HOUSING, among bricklayers, a term used...
Housing, or Housing, in the方言, is either boot or shoe-housing: the former is a piece of stuff made fast to the hinder part of the faddle, and covers the crupipe of the horse, either for ornament, or to cover the horse's-kennels, or to preserve the rider's cloaths from being daubed with the sweat, &c. of the horse.

The housing, for such as ride with shoes, is commonly a piece of scarlet cloth embroidered with gold fringe, and put round the saddle to as to cover the crupipe, and descend to the lower part of the belly, to save the gentleman's silk stockings when he mounts in his shoes.

Houstonia, in botany, a genus of the genus tetrandria-mongynia class of plants, the corolla of which consists of a single petal, of a funnel-shape, with a patent limb divided into four roundish segments; the fruit is a roundish, didymous, bivalve capsule, with two cells, each containing a single seed.

How, or Hob. See the article Hoe.

Howker, or Hooker. See Hooker.

Howl, among ship-carpenters, is said of a ship whose futtocks are feasted and bolted into the ground timbers, and the plank laid on them to the orlop.

Hoy, in naval architecture, a small vessel, fitted only with one mast. See Ship.

Hoye, a town of Westphalia, capital of a county of the same name, and subject to the elector of Hanover's exalt long. 9°, north lat. 53° 5'.

Hoyse, or Hoise, in the sea-language. See the article Hoise.

Hoizing of dogs, the name with expediating. See the article Expeditate.

Hubert, or St. Hubert, a town of the dutchy of Luxembourg, thirty miles south-east of Namur.

Huckster, a person who sells provisions, or small wares, by retail.

Hudson's bay, a large mediterranean sea of north America, situated between 51° and 63° of north lat. and of unequal breadth from 110 to 35 leagues.

Hudson's streights, giving entrance into Hudson's Bay, lie between 65° and 75° of west long.

Hudson's river, rises near the lake Champlain, in Canada, and falls into the Atlantic, a little below the city of New-York.

Hudson's bay company. See the article Company.

Hue and cry, in law, the pursuit of a person who has committed felony on the highway.

If the party robbed, or any in the company of a person either robbed or murdered, go to the constable of the next town, and require him to call and cry, and to pursue the offender; describing him, and giving an account as near as he can, of the course he took; and the constable is immediately to call upon the parli for aid in seeking after the felon, and if he cannot be found within the bounds of that parish, then he is to give the next constable warning, and he the next, till the offender be apprehended, or at least pursued to the sea-side. If persons are not ready at the summons of the sheriff, and cry of the county to engage in the pursuit, they may be fined, and in case the inhabitants of any hundred, after hue and cry is made, neglect to pursue the same, they shall be liable to pay one half of the damages recoverable against the hundred in which the robbery was committed.

In making the hue and cry, diligent search is to be made in all suspected places; and not only parish-officers, but all private persons that purge the hue and cry may arrest the bodies of such persons, as in their pursuit they shall find any ways suspicious, and carry them before a justice of the peace of the county where taken, and in that case, the arresting a person, tho' he should not be guilty, is lawful. 2 Edw. I. If the offender is not taken within forty days after the robbery is committed, the party robbed may make oath before a justice of the peace of the county where the robbery was committed, of the time and place of the robbery, and of what money he was robbed, and that he did not know any of the robbers; and afterwards, within twenty days such person may bring his action against the hundred, which must be fiued out within a year after the robbery. 27 Eliz. By a late statute, notice of the robbery is to be entered in the Gazette, describing the robber and robbery, &c., and proceeds against the hundred, is not to be served on any inhabitant, except the high constable; who is to appear thereeto, and to deler the action, &c. 3 Geo. II. c. 16.

Huegley, a large town in the East Indies, situated on an island in the most westerly branch.
branch of the river Ganges, in the province of Bengal: east long. 87° north lat. 23°.

HUER, or CONDER, in the herring fishery. See CONDER and FISHERY.

HÜETTE, a city of Spain, in the province of New Castile, sixty-seven miles east of Madrid: west long. 2° 45', north lat. 40° 35'.

HUGONIA, in botany, a genus of the decandra-pentagynia class of plants, the corolla of which consists of five large, roundish, and patent petals: the fruit is a globule berry, containing only one hard and triturated seed. The hugonia, a shrub of eight or ten feet high, is a native of the East-Indies.

HUGUÉNOTS, a name given by way of contempt to the Calvinists of France. The name had its rise in the year 1560; but authors are not agreed as to its origin. The most plausible opinion, however, is that of Palquier, who observes, that at Tours, the place where they were first thus denominated, the people had a notion, that an apparition or hobgoblin, called king Hugon, frolicked about the streets in the night-time; from whence as those of the reformed religion met together in the night to pray, &c. they called them huguenots, that is, the disciples of king Hugon.

HUISSIER, a serjeant, usher, or beadle. See SERJEANT, USHER, &c.

HULKS, large vessels used in setting the masts of ships. See SHIP.

HULL, in the seat language, is the main body of a ship, without either masts, yards, sails, or rigging. Thus to strike a hull in a storm is to take in her sails, and to laft the helm on the lee-side of the ship; and to hull, or lie a hull, is said of a ship whose sails are thus taken in, and helm laid-off a lee.

HULL, in geography, a strong sea-port town in the east riding of Yorkshire, situated on the river Hull, near the mouth of the Humber, thirty-two miles south-east of York. It is a place of good trade, and has a yard for building men of war and other vessels.

HULLOCK of a sail, is a small part of a sail, let loose in a great storm; it is chiefly used in the mizen to keep the ship's head to the sea, when all the rest of the sail is made up, except a little at the mizen-yard-arm.

HULPEN, a town of the Austrian Netherlands, in the province of Brabant, situated nine miles south-east of Brügges: east long. 4° 22', north lat. 50° 42'.

HULST, the capital of the county of Woes, in Dutch Flanders, situated fifteen miles north-east of Ghent: east long. 3° 50', north lat. 51° 20'.

HUMAN, in general, is an appellation given to whatever relates to mankind: thus we say, the human soul, human body, human laws, &c. See the articles SOUL, BODY, &c.

In order to form a just idea of the human body, says Dr. Mead, it ought to be considered as an hydraulic machine contrived with the most exquisite art, in which there are numberless tubes, properly adjusted and disposed, for the conveyance of fluids of different kinds, as the blood, animal spirits, lymph, &c. See the articles BLOOD, SPIRITS, &c.

The solids likewise make a very necessary part of the human body; some, as the bones, serving as supports and levers to regulate its motions; others, as the intestines and blood-vessels, serving to prepare and convey nourishment to its various parts; and, finally, others, as the muscles, acting under the direction of the mind like so many ropes and pulleys. See the articles BONE, INTESTINES, VEIN, ARTERY, MUSCLE, &c.

As therefore health consists in regular motions of the fluids, together with a proper state of the solids, it is next to a miracle that so complicated a machine should hold out to extreme old age: for a body, such as ours, cannot possibly retain life for ever; which is not difficult to account for, because the membranous fibres of the blood-vessels, which were made elastic in order to drive their included juices forward, become gradually wither'd, and at length rigid; whence they are rendered incapable of executing their offices, and the secretions of the several parts are diminished by degrees: and that this is the cæle, appears from defections of the bodies of very old people; the insides of their arteries being sometimes found ossified here and there, whereby they had almost entirely lost their springiness; and the offices of the natural ducts, are often observed to be quite cartilaginous.

HUMANITY, the peculiar nature of man, whereby he is distinguished from all other beings. See the article MAN.

HUMANITIES, in the plural, signify grammar, rhetoric, and poetry, known by the name of littera humaniores; for teaching
HUM [1653]  HUM

ing of which, there are professors in the universities of Scotland, called humanists. See Grammar, Rhetorical, &c.

HUMBER, a river formed by the Trent, the Ouse, and several other streams united. It divides Yorkshire from Lincolnshire, and falls into the German Sea at Hol- denthe.

HUMBLE-BEE, the English name of several species of apis, distinguished by their colours, black, tawney, reddish, &c. See the article Avis.

HUMECTATION, in pharmacy, the moistening, or preparing medicines by steeping them in water; either to soften and relax their solid parts, or to prevent the evaporation of their more subtle contents.

HUMERUS, in anatomy, the upper part of the arm, between the scapula and elbow.

The os humeri or brachii, as it is called, is articulated at one end with the scapula, and at the other to the ulna and radius. See the articles Arm, Brachium, &c.

As to the motion of the os humeri, it is evidently the most free and extensive of that of any bone in the human body; being furnished with several flexor and extensor muscles. See Flexor and Extensor.

Luxation of the Humerus. This bone, from the length and laxity of its ligaments, the largeness of its motion, and the shallowness of the cavity in the scapula into which it is articulated, is very subject to be luxated.

As soon as this is discovered to be the case, the patient should be seated on the floor, or on a low stool, while two assistants stretch his arm; which being sufficiently extended, the surgeon ought to elevate the head of the humerus by means of a napkin, hung about his neck, and put under the arm-pit; and at the same time move it backward and forward, as he shall see occasion, till it is happily reduced into its place. See plate CXXXIV, fig. 2.

However, it often happens, that this force is incapable of extending the arm sufficiently; so that it becomes necessary to have recourse to machines, as the ambe of Hippocrates; which consists of a pillar or fulcrum A A (pl. CXXXV. fig. 3, n° 1) and the moveable lever B C, which is bound to the arm in the manner represented in the figure by the ligatures E E E. When this is done, the end of the lever B is carefully and gradually pressed downward, by which means the other end C is moved upward; and thus the luxated arm is both extended, and replaced at the same time.

This instrument having received many improvements since the days of Hippocrates, we shall here give the description of a portable one, invented by Mr. Freke. It consists of two boxes, A, A, (plate CXXXV. fig. 3, n° 2,) joined together by a hinge, F, in the middle; wherein are contained, when folded together, every thing necessary for reducing a dislocated shoulder.

The length of this instrument, when shut up, is one foot eight inches, its breadth nine inches, and its thickness three inches and a quarter. When it is opened, it is kept so by two hooks fixed on the backside of it; and, when one end of it stands on the ground, the other stands high enough to become a fulcrum, or support of the lever B B, which is fixed on a roller b, by a large wood-screw, which turning sideways, as well as with the roller, it obtains a circumlocutory motion, so that it will serve to reduce a luxation, either backward, forward, or downward. The roller on which the lever is fixed, is just the diameter of the depth of one of the boxes, into which are driven two iron pins, the ends of which are received by the two sides of the box, which are an inch thick. The lever is two feet four inches long, and is cut off and joined again by two hinges C, to fold up so as to be contained in the boxes. On the backside of it is a hook, to keep it straight. One other end of it is to hang over the roller about an inch and a half, which is to be excavated and covered with buff leather, for the more easy reception of the head of the os humeri. Two iron cheeks D are screwed on each side of the lever, to receive them an iron roller, which has two holes thro' it, to receive two cords coming from a brace E, fixed on the lower head of the os humeri; for if it be applied on the muscular part of the arm, it never fails slipping down to the joint, before you can extend the limb. The iron roller has a square end, on which is fixed a wheel G, within the cheek notched round, which works as a ratchet, on a spring-ketch underneath the lever, by which it is stopped, as you wind it with a winch; and may at pleasure be let loose, as there shall be occasion for it, by discharging the ketch.

The
The brace E, compared with common bandages, is of more consequence than can easily be imagined by inexperienced persons. It consists of a large piece of buff leather, big enough to embrace the arm, sewed on two pieces of strong iron curved plates, riveted together, one of them having an eye at each end to fasten two cords in; the other is bent at the ends into two hooks, which are to receive the cords, after they have crossed over the arm above.

In order to keep the patient steady in his chair from coming forward, or letting the scapula rise up on depressing the lever, after the limb is extended by the winch, there must be fixed over the shoulder a girth, H, H, with two hooks at the ends of it, long enough to reach to the ground on the other side, where it must be hooked into a ring I, screwed into the floor for that purpose.

We ought not to omit observing here, that there are several other contrivances invented both by ancient and modern surgeons for reducing a luxation of the humerus; some of which the reader will find described in Heister's Surgery, P. I. B. iii. e. 7.

HUMIDITY, that quality in bodies whereby they are capable of wetting other bodies. This differs very much from fluidity, and is to be merely a relative thing, depending upon the congruity of the component particles of the liquor to the pores of such particular bodies, as it is capable of adhering to, penetrating a little into, or wetting. Thus, for instance, quicksilver is not a moist thing with regard to our hands or clothes, but may be called so in reference to gold, tin, or lead, to whose surfaces it will perfectly adhere, and render them soft and moist. Even water itself, which almost wets every thing, and is the great standard of moisture and humidity, is not capable of wetting every thing, for it stands or runs easily off in globular drops from the leaves of cabbages, and many other plants, and will not wet the feathers of ducks, swans, and other water-fowls. Add that the texture alone may cause the fluid to be humid, as is plain in that neither quicksilver, lead, or bismuth alone, will stick upon glass; yet being mixed together, they will form a mait that will do so, as appears from such a composition being frequently used in foliating looking-glasses.

HUMIDUM RADICALE, or radical moisture, among physicians, seems to amount to no more than the purest and most delicate part of the nutritious matter in a condition to be assimilated.

By too much heat, as in fevers, hecticas, &c. this humidity is too hastily exhausted and spent.

HUMILIS MUSCULUS, one of the depressor-muscles of the eye. See EYE.

HUMMING-BIRD; trochilus, in ornithology, a genus of birds, of the order of the paliferes, remarkable for being the smallest of all known birds. Their beak is of a subulated figure, but fine as a thread; it is longer than the head, and not perfectly straight; add to this, that they have a fine tube or pipe, which they can extend beyond the point of the beak.

Of this singular genus, there are several elegant species. 1. The leaf species of all the humming birds is figured (plate CXXXVI. fig. 1.) of its natural bigness and shape: the upper part of its body is of a dirty brown, and the under part of a dirty white. 2. The little brown one, variegated with dark spots, is likewise figured (ibid. fig. 2.) as big as life. 3. The crested humming-bird, represented (ibid. fig. 3.) as big as the life, is a very elegant species: the top of the head, from the bill to the hinder part which ends in a crest, is first green, and, towards the hinder part, dark blue; both of a fine lustre: the upper part of its body is a dark green, intermixed with gold-colour: the quill-feathers are of a purple-colour, and the tail is of a bluish black.

4. The long-tailed, black-cap humming-bird; likewise engraved (ibid. fig. 4.) of its natural bigness, has an extremely long tail made up of only two feathers; which being of a very loose texture, are easily ruffled with the least breath of air: this is one of the largest species.

There are a great many other species of humming-birds, a description and figures of which may be seen in Edwards's History of Birds.

HUMORISTS, gli humorigi, a celebrated academy of learned men at Rome, first established by Paul Mancini. The device of this academy is a cloud; which being raised on vapours from the salt water of the sea, returns again fresh, with this hemitich from Lucretius, Radit asmine dulci.

HUMOROSI, the name of another academy at Cortona in Italy, which must
not be confounded with that of the humorists. 

HUMOUR, humor, in a general sense, denotes much the same with liquid or fluid. See the article Fluid. The antients seem to have called the nutritious juices the radical humour; and to have constituted as a cause of diseases, a disproportion between the innate heat and radical moisture or humour. They also made four humours in the blood. See the article Blood. 

HUMOURS of the eye, are the crystalline, vitreous, and aqueous; for a description of which, see the articles Eye, Crystalline, &c. 

HUMOUR is also used for the peculiar temper of a person, arising from the constitution and prevalence of this or that humour. See the articles Constitution and Temperament. 

We frequently impute to an unlucky or crook accident, says the Abbé du Bos, those chagrin whose origin is entirely in the intemperance of our humours, or in some disposition of the air, which opposes our machine. 

HUMOUR, in dramatic poetry, is esteemed a subordinate species of what is more usually called manners. See Manners. Every passion wears two different faces; one serious and solemn, fit only for tragedy; and the other merry and ridiculous, called humour, and proper for comedy. The English poets have excelled those of all other nations in this particular; and, indeed, ours is the only language that has a name for it. 

To be always witty only becomes a few characters; so that it is necessary to call in the affinities of humour, to prevent the other dramatic persons from going into the common style and manner; hence humour may be looked on as the true spirit and wit of comedy. See Wit. 

HUMULUS, the hop, in botany. See the article Hop. 

HUMUS, in natural history, the name by which Linnaeus calls earth. See Earth. 

HUNDRED, hundredum, or centuria, a part or division of a county, which was antiently so called from its containing an hundred families, or from its furnishing an hundred able men for the king's wars. After king Alfred's dividing this kingdom into counties, and giving the government of each county to a sheriff, these counties were divided into hundreds, of which the constable was the chief officer. The grants of hundreds were at first made by the king to particular persons; but they are not now held by grant or prescription; their jurisdiction being devolved to the county-court; a few of them only excepted, that have been by privilege annexed to the crown, or granted to some great subjects, and still remain in the nature of a franchise. 

HUNGARICUS MORBUS, a disease so called from its being first observed in the imperial army, in 1556. It is thought to have been a compound fever, partaking of the nature both of the bilious and hospital fevers. See Bilious and Hospital-Fever. 

HUNGARY, a kingdom bounded by the Carpathian mountains, which divide it from Poland, on the north; by Transylvania and Walachia on the east; by the river Drave, which separates it from Schavonia, on the south; and by Austria and Moravia on the west. It is one continued plain of 300 miles long, and is situated between 16° and 33° of east lon. and between 45° and 49° of north lat. It is now subject to the Emperor queen. 

HUNGARY-WATER, a distilled water, so denominated from a queen of Hungary; for whose use it was first prepared. Quincy gives the following directions for making it. Take of fresh gathered flowers of rosemary, two pounds; rectified spirits of wine, two quarts; put them together, and distil them immediately in balseo. 

Or, Take of fresh tops of rosemary, one pound and a half; proof spirit, one gallon; and distil in balseo till five pints are obtained. 

HUNGER, an uneasy sensation, which creates an appetite or desire of food. See the article Food. 

Hunger is by some attributed to a sharp acrimonious humour, which velicates the coats of the stomatch; others, who deny the existence of any such liquor, attribute it to the attrition or rubbing of the coats of the stomatch; and others, again, account for it from the avidity of the blood. 

HUNGERFORD, a market-town of Berkshire, situated on the river Kennet, twenty-four miles west of Reading. 

HUNGRY EVIL, among farriers, an extra-ordinary desire in horses to eat, which sometimes proceeds from catching cold, or from travelling long in frost and snow, or that barren places. For the cure, give him great slices of bread,
broad, toasted and steeped in sack, to comfort his stomach; or give him wheat-flour in wine or milk, a quart at a time. But there is nothing better than to feed him moderately several times a day with good beef-bread well baked, or with oats well dried and fitted.

HUNNINGHEN, a town of Germany, in the langraviate of Alsace, situated on the Rhine, three miles north of Basel: east long. 7° 35', north lat. 47° 37'.

HUNNOBY, a market-town in the east riding of Yorkshire, situated thirty-four miles north-east of York.

HUNTER, a name given to a hunting-horse. See the article Horse.

HUNTING, the exercise or diversion of purifying four-footed beasts of game. See the article Game.

Four-footed beasts are hunted in the fields, woods, and thickets, and that both with guns and grey-hounds.

Birds, on the contrary, are either shot in the air, or taken with nets and other devices, which exercise is called fowling; or they are pursued and taken by birds of prey, which is called hawkling. See the articles Fowling and Hawking.

The purifying of four-footed beasts, as badgers, deer, does, roebucks, foxes, hares, &c., properly termed hunting, is a noble exercise, serving not only to recreate the mind, but to strengthen the limbs, whet the stomach, and cheer up the spirits. However, all sorts of weather are not proper for hunting; high winds and rain being great obstacles to it. In the spring season, this diversion should be taken in the night-time with nets; in the summer, the morning is the most proper time for it; and in the winter, it should only be followed from nine in the morning till two in the afternoon. The general rule is, that you place yourself under the wind, where you design to wait for game.

Hunting is practised in a different manner, and with different apparatus, according to the nature of the beasts which are hunted, a description of whom may be found under their respective articles.

With regard to the seasons, that for hart and buck-hunting begins a fortnight after midsummer, and lasts till holy-rood-day; that for the hind and doe, begins on holy-rood-day, and lasts till candlemas; that for fox-hunting begins at Christmas, and holds till lady-day; that for roe-hunting begins at Michaelmas, and ends at Christmas; hare-hunting commences at Michaelmas, and lasts till the end of February; and where the wolf and boar are hunted, the season for each begins at Christmas, the first ending at lady-day, and the latter at the purification.

When the sportmen have provided themselves with nets, spears, and a hunting-horn, to call the dogs together; and likewise with instruments for digging the ground, the following directions will be of use to them in the pursuit of each sort of game.

Badger-Hunting. In doing this, you must seek the earths and burrows where he lies, and in a clear moonshine-night go and fill all the burrows, except one or two, and therein place some latches, fastened with drawing strings, which may shut him in as soon as he hairneth the bag. Some use no more than to set a hoop in the mouth of the sack, and so put it into the hole; and as soon as the badger is in the sack and hairneth it, the sack flippeth off the hoop and follows him into the earth, so he lies tumbling therein till he is taken. These latches or bags being thus set, cast off the hounds, beating about all the woods, coppices, hedges and tufts, round about, for the compass of a mile or two, and what badgers are abroad, being alarmed by the hounds, will soon betake themselves to their burrows; and observe that he who is placed to watch the latches, must stand close and upon a clear wind; otherwise the badger will discover him, and will immediately fly some other way into his burrow. But if the hounds can encounter him before he can take his sanctuary, he will then stand at a bay like a boar, and make good sport, grievously biting and clawing the dogs, for the manner of their fighting is lying on their backs, using both teeth and nails; and by blowing up their flins defend themselves against all bites of the dogs, and blows of the men upon their noses as aforesaid. And for the better preservation of your dogs, it is good to put broad collars about their necks made of greyskins.

When the badger perceiveth the terriers to begin to yearn him in his burrow, he will fill the hole betwixt him and the terriers, and if they still continue baying, he will remove his couch into another chamber, or part of the burrow, and so from one to another, barricading the way before them, as they retreat,
HUN [1657] HUN

retreat, until they can go no further. If you intend to dig the badger out of his burrow, you must be provided with the same tools as for digging out a fox; and besides, you should have a pail of water to refresh the terriers, when they come out of the earth to take breath and cool themselves. It will also be necessary to put collars of bells about the necks of your terriers, which making a noise may cause the badger to bolt out. The tools used for digging out of the badger being troublesome to be carried on men’s backs, may be brought in a cart. In digging, you must consider the situation of the ground, by which you may judge, where the chief angles are; for else, instead of advancing the work, you will hinder it. In this order you may besiege them in their holds, or castles, and may break their platforms, parapets, cafes-mates, and work to them with mines and countermines, until you have overcome them.

Having taken a live and lusty badger, if you would make sport, carry him home in a sack, and turn him out in your court-yard, or some other enclosed place, and there let him be hunted and worried to death by your hounds.

There are the following profits and advantages which accrue by killing this animal. Their flesh, blood, and grease, tho’ they are not good food, yet are very useful for physicians and apothecaries for oils, ointments, salves, and powders for shortness of breath, the cough of the lungs, for the stone, sprained fluxes, col-taches, &c. and the skin being well dried, is very warm and good for ancient people, who are troubled with paralytic distempers.

Buck-Hunting. Here the same hounds and methods are used, as in running the flag; and, indeed, he that can hunt a hart or flag well, will not hunt a buck ill.

In order to facilitate the chase, the gamekeeper commonly selects a fat buck out of the herd, which he shoots in order to main him, and then he is run down by the hounds.

As to the method of hunting the buck; the company generally go out very early for the benefit of the morning, sometimes they have a deer ready lodged, if not, the coverts are drawn till one is rowed; or sometimes in a park a deer is pitched upon, and forced from the herd, then more hounds are laid on to run the chase; if you come to be at a fault, the old staunch hounds are only to be relied upon till you recover him again; if he be funk and the hounds thrust him up, it is called an imprime, and the company all found a recceat; when he is run down, every one strives to get in to prevent his being torn by the hounds, fallow-deer seldom or never standing at bay.

He that first gets in, cries hoo-up, to give notice that he is down and blows a death. When the company are all come in they punch him and reward the hounds; and generally the chief person of quality amongst them takes say, that is, cuts his belly open, to see how fat he is. When this is done, every one has a chop at his neck, and the head being cut off is shewed to the hounds to encourage them to run only at male deer, which they fee by the horns, and to teach them to bite only at the head: then the company all standing in a ring, one blows a single death, which being done all blow a double recceat, and so conclude the chase with a general hallo of hoo-up, and depart the field to their several homes, or to the place of meeting; and the huntman, or some other, hath the deer cast cross the buttocks of his horse, and so carries him home.

Fox-Hunting makes a very pleasant exercise, and is either above or below ground.

1. Above ground. To hunt a fox with hounds, you must draw about groves, thickets, and bulhes near villages. When you find one, it will be necessary to flop up his earth the night before you design to hunt, and that about midnight, at which time he is gone out to prey: this may be done, by laying two white sticks across in his way, which he will imagine to be some gin or trap laid for him; or else, they may be flopped up with black-thorns and earth mixed together.

At first, only cast off your sure finders, and as the drag mends, add more as you dare trust them. The hound first cast off should be old and staunch, and when you hear such a hound call on merrily, you may cast off some others to him; and when they run it on the full cry, cast off the rest; thus you shall complete your pastime. The words of comfort are the same which are used in other chaces. The hounds should be left to kill the fox themselves, and to worry and tear him as much as they please: some hounds will eat him with eagerness.

When
When he is dead, hang him at the end of a pike-flaft, and halloo in all your hounds to bay him; but reward them with nothing belonging to the fox, for it is not good, neither will the hounds in common eat it.

2. Under ground. If in case a fox does so far escape as to earth, countrymen must be got together with shovels, spades, mattocks, pickaxes, &c. to dig him out, if they think the earth not too great. They make their earths as near as they can in ground that is hard to dig, as in clay, stony ground, or amongst the roots of trees; and their earths have commonly but one hole; and that is straight a long way in before you come at their couch. Sometimes craftily they take possession of a badger's old burrow, which hath a variety of chambers, holes, and angles.

Now to facilitate this way of hunting the fox: the huntman must be provided with one or two terriers to put into the earth after him, that is to fix him into an angle; for the earth often consists of many angles: the use of the terrier is to know where he lies, for as soon as he finds him he continues baying or barking, so that which way the noise is heard that way dig to him. Your terriers must be garnished with bells hung in collars, to make the fox bolt the sooner; besides the collars will be some small defence to the terriers.

The instruments to dig withal are these: a sharp pointed spade, which serves to begin the trench, where the ground is hardest, and broader tools will not so well enter; the round hollowed spade, which is useful to dig among roots, having very sharp edges; the broad flat spade to dig withal, when the trench has been pretty well opened, and the ground softer; mattocks and pickaxes to dig in hard ground, where a spade will do but little service; the coal-rake to clean the hole, and to keep it from slapping up; clamps, wherewith you may take either fox or badger out alive to make sport with afterwards. And it would be very convenient to have a pail of water to refresh your terriers with, after they are come out of the earth to take breath.

After this manner you may besiege a fox, &c. in their strongest holes and cellars, and may break their cellmates, platforms, parapets, and work to them with mines and countermines till you have obtained what you desired. But for the managing these dogs, see Terriers.

Hare-Hunting. As, of all chases, the hare makes the greatest pastime; so it gives no small pleasure to see the craft of this small animal for her self-preservation. If it be rainy, the hare usually takes to the high-ways; and if she come to the side of a young grove, or spring, she seldom enters, but sprints down till the hounds have over-shot her; and then she will return the very way she came, for fear of the wet and dew that hangs on the boughs. In this case, the huntman ought to stay an hundred paces before he comes to the wood-side, by which means he will perceive whether the hare as aforesaid, if she do, he must halloo in his hounds, and call them back, and that presently, that the hounds may not think it the counter she came first. The next thing that is to be observed, is the place where the hare fits, and upon what wind she makes her form, either upon the north or south wind; she will not willingly run into the wind, but run upon a side, or down the wind; but if she form in the water, it is a sign she is foul and meafl'd: if you hunt such a one, have a special regard all the day to the brook-sides, for there, and near plashes, she will make all her crossings, doublings, &c.

Some hares have been so crafty, that as soon as they have heard the sound of a horn, they would instantly start out of their form, tho' it was at the distance of a quarter of a mile, and go and swim in some pool, and rest upon some rush bed in the midst of it; and would not stir from thence till they have heard the horn again, and then have started out again, swimming to land, and have stood up before the hounds four hours, before they could kill them, swimming and using all subtilties and crossings in the water. Nay, such is the natural craft and subtility of a hare, that sometimes, after she has been hunted three hours, she will start a fresh hare, and squat in the same form. Others having been hunted a considerable time, will creep under the door of a sheep-coat, and there hide themselves among the sheep; or when they have been hard hunted, will run in among a flock of sheep, and will by no means be gotten out from among them, till the hounds are coupled up and the sheep driven into their pens. Some
of them (and that seems somewhat strange) will take the ground like a coney, and that is called, going to the vault. Some hares will go up one side of the hedge, and come down the other, the thickness of the hedge being the only distance between the courses. A hare that has been forely hunted, has got upon a quickset hedge, and ran a good way upon the top thereof, and then leapt off upon the ground. And they will frequently betake themselves to furze-bushes, and will leap from one to the other, whereby the hounds are frequently in default.

Having found where a hare hath relieved in some pasture or corn-field, you must then consider the season of the year, and what weather it is; for if it be in the spring-time or summer, a hare will not then set in bushes, because they are frequently infested with pismires, snakes, and adders; but will set in cornfields, and open places. In the winter-time, they set near towns and villages, in tufts of thorns and brambles, especially when the wind is northerly or southerly. According to the season and nature of the place where the hare is accustomed to fit, there beat with your hounds, and start her; which is much better sport than trailing of her from her relief to her layer.

After the hare has been started, and is on foot, then step in where you saw her pair, and halloo in your hounds, until they have all undertaken it, and go on with it in full cry; then recheat to them with your horn, following fair and softly at first, making not too much noise either with horn or voice; for at the first, hounds are apt to overshoot the chase thro' too much heat. But when they have run the space of an hour, and you see the hounds are well in with it, and flick well upon it, then you may come in nearer with the hounds, because by that time their heat will be cooled, and they will hunt more soberly. But, above all things, mark the first doubling, which must be your direction for the whole day; for all the doublings that she shall make afterwards will be like the former, and according to the policies that you shall see her use, and the place where you hunt, you must make your compasses great or little, long or short, to help the defaults, always seeking the moistest and most commodious places for the hounds to scent in.'
he can the more easily hear the voice of his pursuers, whether they be far from him, or near to him. But at last being again discovered by the hunters and fragrant scent of the dogs, he flies into the herds of cattle, as cows, sheep, &c. leaping on a cow or ox, laying the fore parts of his body thereon, that so touching the earth only with his hinder feet, he may leave a very small or no scent at all behind, for the hounds to discern. But their usual manner is, when they see themselves hard beaf, and every way intercepted, to make force at their enemy with their horns, who first comes upon him, unless they be prevented by spear or sword. When the beast is slain, the huntsman with his horn windeth the fall of the beast, and then the whole company comes up, blowing their horns in triumph for such a conquest; among whom, the skilfullest opens the beast, rewards the hounds with what properly belongs to them, for their future encouragement; for which purpose the huntsmen dip bread in the skin and blood of the beast, to give to the hounds.

It is very dangerous to go in to a hart at bay, of which there two sorts, one on land and the other in water. Now if the hart be in a deep water, where you cannot well come at him, then couple up your dogs; for should they continue long in the water, it would endanger their furbating or foundering. In this case, get a boat, and swim to him, with dagger drawn, or else with rope that has a noole, and throw it over his horns; for if the water be so deep that the hart swims, there is no danger in approaching him; otherwise you must be very cautious.

As to a land-bay, if a hart be burnished, then you must consider the place; for if it be in a plain and open place, where there is no wood nor covert, it is dangerous and difficult to come in to him; but if he be on a hedge-side, or in a thicket, then, while the hart is staring on the hounds, you may come softly and covertly behind him, and cut his throat. If you miss your aim, and the hart turn head upon you, then take refuge at some tree; and when the hart is at bay, couple up your hounds; and when you see the hart turn head to fly, gallop in roundly to him, and kill him with your sword.

*Directions at the death of a Hart or Buck.*

The first ceremony, when the huntsman comes in to the death of a deer, is to cry, *wure haunch,* that the hounds may not break in to the deer; which being done, the next is the cutting his throat, and there bleeding the youngest hounds, that they may the better love a deer, and learn to leap at his throat: then the mort having been blown, and all the company come in, the best person, who hath not taken fay before, is to take up the knife that the keeper or huntsman is to lay across the belly of the deer, some holding by the fore-legs, and the keeper or huntsman drawing down the pizzle, the person who takes fay, is to draw the edge of the knife leisurely along the middle of the belly, beginning near the brisket, and drawing a little upon it, enough in the length and depth to discover how fat the deer is; then he is to break up the deer, first flits the skin from the cutting of the throat downwards, making the arbor, that so the ordure may not break forth, and then he pounces him, rewarding the hounds with it.

In the next place, he is to present the same person, who took fay, with a drawn hanger, to cut off the head of the deer. Which being done, and the hounds rewarded, the concluding ceremony is, if it be a flag, to blow a tripole mort; and if a buck, a double one; and then all who have horns, blow a recheat in concert, and immediately a general whoop, whoop.

*Otter-Hunting* is performed with dogs, and also with a sort of instruments, called otter-spear; with which when they find themselves wounded, they make to land, and fight with the dogs, and that most furiously, as if they were fensible that cold water would annoy their green wounds.

There is indeed craft to be used in hunting them; but they may be caught in snares under water, and by river-sides; but great care must be taken, for they bite sorely and venomously; and if they happen to remain long in the snares, they will not fail to get themselves free by their teeth.

In hunting them, one man must be on one side of the river, and another on the other, both beating the banks with dogs; and the beast not being able to endure the water long, you will soon discover if there be an otter or not in that quarter; for he must come out to make his sprains, and in the night sometimes to feed on grass and herbs.

If any of the hounds finds out an otter, then view the moist grounds and moist places,
places, to find out which way he bent his head; if you cannot discover this by the marks, you may partly perceive it by the spraints; and then follow the hounds, and lodge him as a hart or deer. But if you do not find him quickly, you may imagine he is gone to couch somewhere farther off from the river; for sometimes they will go to feed a considerable way from the place of their rest, choosing rather to go up the river than down it. The persons that go a hunting otters, must carry their spears, and if they miss, must carry their spears, to watch his vents, that being the chief advantage; and if they perceive him swimming under water, they must endeavour to strike him with their spears, and if they miss, must pursue him with the hounds, which, if they be good and perfectly entered, will go chanting and trailing along by the river side, and will beat every root of a tree, and other bed, and tuft of bull rushes; nay, they will sometimes take water, and bait the beast, like a spaniel, by which means he will hardly escape.

Roe-buck HUNTING is performed divers ways, and very easily in the woods. When chased, they usually run against the wind, because the coolness of the air refreshes them in their course; therefore the huntsmen place their dogs with the wind: they usually, when hunted, first take a large ring, and afterwards hunt the hounds. They are also often taken by counterfeiting their voice, which a skilful huntsman knows how to do by means of a leaf in his mouth. When they are hunted, they turn much and often, and come back upon the dogs directly; and when they can no longer endure, they take foil, as the hart does, and will hang by a bough in such a manner; that nothing of them shall appear above the water but their snout, and they will suffer the dogs to come juft upon them before they will fir.

The venison of a roe-buck is never out of season, being never fat, and therefore they are hunted at any time; only that some favour ought to be shown the doe, while she is big with fawn, and afterwards till her fawn is able to shift for himself; but someroe does have been killed with five fawns in their bellies. He is not called, by the skilful in the art of hunting, a great roe-buck, but a fair roe-buck; the herd of them is called a bevy: and if he hath not bevy-grease upon his tail, when he is broken up, he is more fit to be dog’s meat than man’s meat. The hounds must be rewarded with the bowels, the blood, and feet flit aluder, and boiled all together; this is more properly called a doie, than a reward.

HUNTING-MATCH. The first thing that is to be considered by one who designs to match his horse for his own advantage, and his horse’s credit, is not to flatter himself with the opinion of his horse, by fancying that he is a swift, when he is but a slow galopper; and that he is a whole-running-horse (that is, that he will run four miles without a frob at the height of his speed) when he is not able to run two or three. Very probably some gentlemen are led into this error, by their being mistaken in the speed of their hounds, who, for want of trying them against other dogs that have been really fleet, have supposed their own to be so, when, in reality, they are but of a middling speed: and because their horse, when trained, was able to follow them all day, and upon any hour, to command them upon deep as well as light earths, have therefore made a false conclusion, that their horse is as swift as the best; but upon trial against a horse that has been rightly trained after hounds that were truly fleet, have bought their experience perhaps full dear. Therefore it is advisable for all lovers of hunting to procure two or three couple of tried hounds, and once or twice a week to follow after them a train-scens, and when he is able to top them on all sorts of earth, and to endure heats and colds stoutly, then he may better rely on his speed and toughnes.

That horse which is able to perform a hare-chase of five or six miles briskly and courageously, till his body be as it were bathed in sweat; and then, after the hare has been killed, in a nipping frosty morning, can endure to stand till the sweat be frozen on his back, so that he can endure to be pierced with the cold as well as the heat; and then even in that extremity of cold, to ride another chase as briskly and with as much courage as he did the former; that horse which can thus endure heats and colds, is most valued by sportsmen. Therefore, in order to make a judgment of the goodnes of a horse, observe him after the death of the first hare, if the chace has been any thing brisk; if when he is cold, he shrinks up his body, and draws his legs up together, it is an infallible sign of want of vigour and courage: the like may be done by the slackening of his girths after the first chase,
and from the dullness of his teeth, and the dullness of his countenance, all which are true tokens of faintness, and being tired; and such a horse is not to be relied on, in case of a wager.

Here it will not be improper to take notice of the way of making matches in former times, and the modern way of deciding wagers. The old way of trial was, by running so many train-scents after hounds, as was agreed upon between the parties concerned, and a bell-course, this being found not so uncertain, but more durable than hare-hunting; and the advantage consisted in having the trains led on earth most suitable to the qualifications of the horses. But now others choose to hunt the hare till such an hour, and then to run this wild-goose-chace, a method of racing that takes its name from the manner of the flight of wild-geese, which is generally one after another; so the two horses after running of twelve score yards, had liberty, which horse sooner could get the leading, to ride what ground he pleased, the hindmost horse being bound to follow him, within a certain distance agreed on by articles, or else to be whipped up by the triers or judges which rode by; and whichever horse could distance the other, won the match.

But this chace was found by experience to be inhuman, and so destructive to good horses, especially when two good horses were matched; for neither being able to distance the other, till both were ready to sink under their riders through weakness, oftentimes the match was fain to be drawn, and left undecided, though both the horses were quite spoiled.

This brought up the custom of train-scents, which afterwards was changed to three heats, and a straight course; and that the lovers of horses might be encouraged to keep good ones, plates have been erected in many places in England. The fewer of these before you come to the course, if your horse be fiery and mettled, the better; and the shorter the distance, the better. Also, above all things, be sure to make your bargain to have the leading of the first train, and then make choice of such grounds where your horse may left slow his speed, and the fleetest dogs you can procure; give your hounds as much law before you as your triers will allow, and then, making a loofe, try to win the match with a wind; but if you fail in this attempt, then bear your horse, and save him for the course; but if your horse be slow, but well-winded, and a true spurred nag, then the more train-scents you run before you come to the straight course, the better. But here you ought to observe to gain the leading of the first train; which, in this case you must lead upon such deep earths, that it may not end near any light ground: for this is the rule received among horsemen, that the next train is to begin where the last ends, and the last train is to be ended at the starting-place of the course; therefore remember to end your last on deep earths, as well as the first.

HUNTINGDON, the capital of Huntingdonshire, situated on the river Ouse, fifty-six miles north of London: west lon. 5° 15', and north lat. 52° 23'. It sends two members to parliament.

HUQUAM, a province of China, bounded by Honan on the north, and by Quam and Canton on the south; lying between 25° and 30° of north latitude.

HURA, the sand-box-tree, in botany, a genus of the monoecia monadelphie class of plants, the male flowers of which are arranged in an imbricated amentum; the anther is feefole, and adheres to the amentum; the female flower has neither calyx nor corolla; its style is funnel-shaped, and the fruit is a capsule consisting of twelve cells, in each of which is contained a single seed.

HURDLES, in fortification, twigs of willows or osiers interwoven close together, sustained by long stakes, and usually laden with earth.

Hurdles, called also clays, are made in the figure of a long square; the length being five or six feet, and the breadth three, or three and a half; the closer they are woven, the better. They serve to render batteries firm, or to consolidate the passage over muddy ditches; or to cover traverses and lodgments, for the defence of the workmen, against the fire-works, or the rônes, that may be thrown against them.

HURLERS, in husbandry, certain frames, made either of split timber, or of hazel rods, wattled together, to serve for gates in inclosures, or to make sheepfolds, &c.

HURDS, or HORDS, of flax, or hemp, the smaller parts separated in the dressing, from the or fine stuff.

HURLE-BONE, in a horse, a bone near the middle of the buttock, very apt to go out of its socket with a hurt or strain.
HURLERS, a number of large stones set in a square figure, near St. Clare, in Cornwall, so called from an odd opinion held by the common people, that they are so many men petrified, or changed into stones, for profaning the sabbath-day, by hurling the ball, an exercize for which the people of that county have been always famous. The hurlers are oblong, rude, and unhewed. Some suppose them to have been trophies erected in memory of some battle; others take them for boundaries, to distinguish lands; and others hold them to be sepulchral monuments.

HURON, a vast lake of north America, situated between 84° and 89° west long. and between 43° and 46° north lat. from whence the country contiguous to it is called the country of the Hurons, whose language is spoken over a great extent in the southern parts of north America. See the article ALGONQUIN.

HURRERS, a name formerly given to the cappers and hat-makers of London.

HURRICANE, a furious storm of wind, owing to a contrariety of winds. See the article WIND and WHIRLWIND.

Hurricanes are frequent in the West-Indies, where they make terrible ravages, by rooting up trees, destroying houses and shipping, and tho' like.

The natives, it is said, can foretell hurricanes by the following prognostics: 1. All hurricanes happen either on the day of the full, change, or quarter of the moon. 2. From the unusual redness of the fun, the great illnesses and at the same time turbulence of the skies, dwelling of the sea, and the like, happening at the change of the moon, they conclude there will be a hurricane next full-moon; and if the same signs be observed on the full-moon, they may expect one next new-moon.

As to the cause of hurricanes, they undoubtedly arise from the violent struggle of two opposite winds. Now as the wind betwixt the tropics is generally easterly, and upon the sea's going back from the northern tropic, the western winds pour down with violence upon those parts, the opposition of these contrary winds cannot fail to produce an hurricane.

Hurricanes shift not through all the points of the compass, but begin always with a north wind, veer to the east, and then cease; and their shifting between these two points is so sudden and violent, that it is impossible for any ship to veer with it; whence it happens that the sails are carried away, yards and all, and sometimes the masts themselves wreathed round like an offer.

HUSBAND, maritus, a man joined or contracted with a woman in marriage.

By marriage the husband has power over his wife's person; but if he threatens to kill her, &c. she may make him find surety of the peace: he has likewise power over the wife's estate; and if she have fee, he gains a freehold in her right. He also gains her chattels real, as terms for years, &c. and all personal chattels in the possession of the wife, are the husband's; but where the wife is out of possession, or the chattels are debts, or things in action, in case they are not recovered by him and his wife, the husband shall not be entitled to have them. A husband cannot alien the lands of his wife, only by fine wherein she joins; or make leaves of her estate, but where she is made a party, and the rent referred to husband and wife, and the heirs of the wife, &c. nor shall his wife's own acts, as to her estate, bind even herself without a fine levied, when she is examined by writ, if she does it freely, &c. The husband shall be tenant by the courtesy of his wife's land, after her death, where issue is born between them; and the wife shall have dower in her husband's lands, after his decease; also her necessary apparel, &c. and if she survives the husband, she shall have her terms for years, or chattels real, again, where the husband has not altered the property: yet in a husband's life-time the wife is disabled to make any contract without his consent, unless it is for necessaries according to his degree and estate; and notwithstanding she may use the goods of her husband, she may not dispose of, or pawn them; though, if she take them away, it is not felony in her. As a husband is not obliged by his wife's contract, without notice and assent; so he is not bound by the receipt of his wife, for his money. Although a wife be very lewd, if she lives with her husband, he is chargeable for all necessaries for her; and so he is in case he runs away from her, or turns her away. It is otherwise if she goes away from the husband; then, as soon as such separation is notorious, whoever gives her credit, does it at his peril, and her husband is not liable, unless he takes her again; though here, if the husband receives her, or comes after her, and lies

HUN [1663] HUS
with her but one night, that may make him chargeable for her debts.

HUSBANDRY, denotes much the same with agriculture. See AGRICULTURE. As there is no subject of more general advantage than the cultivation of lands, we have given the operations and improvements thereof, under a great variety of articles, as Plowing, Fallowing, Inclosures, Drain, Hedge, Ditch, Sowing, Weeding, Hoeing, Corn, Pasture, Hay, &c.

The New Method of Horse-hoeing Husbandry, written by the ingenious Jethro Tull, has now been published some years, so that a pretty good judgment may be formed of the performance. See the article Hoeing.

Every man, who has considered the principles upon which this method of culture is founded, may discern how far his theory is consistent with nature; though, it is probable, few have as yet made sufficient experiments, to be fully informed of its worth. How it has happened, that what proposes such advantages, has been so long neglected in this country, may be matter of surprize to those who are unacquainted with the characters of the men on whom its practice depends; but to those who know them thoroughly, it can be none: for it is certain that very few of them can be prevailed on to alter their usual methods, though their continuing therein, renders them unable to maintain their families and pay their debts: but what is still more to be lamented, those who are averse to improvements, diftrust others also from thinking of them. But as the methods commonly used, together with the mean price of grain, have every where reduced the farmers so low that they pay their rents very ill, and in many places throw up their farms, the curse of these evils is certainly an object worthy of the public attention: for it the proprietors must be reduced to cultivate their own lands, which cannot be done by the hands of these obdurate and indolent people, it is easy to discern on which side his balance of profit and loss will turn. This consideration, together with many others which might be urged, hath induced us to recommend this tracts to the serious attention of all who with well to their country; in hopes that some may be prevailed on, from a regard either to the public good or their own interest, to give the method propounded a fair and impartial trial; for could it be introduced into several parts of Great Britain, by men of generous and benevolent principles, their example might, in time, establish the practice, and bring it into general use; which is scarce to be expected, by any other means.

It is therefore to such only as are qualified to judge of a theory, from the principles on which it is founded, that we ourselves the honour to address them, to give this essay an attentive reading, and to try the experiments with proper care.

As a motive to this, it is to be observed, that, though the method of culture propounded by Mr. Tull, has made little progress in England, it is not likely to meet with the same neglect abroad, especially in France, where a translation of his book was undertaken, at one and the same time, by three different persons; but afterwards two of them put their papers into the hands of the third, M. Du Hamel du Monceau, of the Royal Academy of Sciences at Paris, and of the Royal Society of London, who has published a book, intitled, A Treatise on Tillage, on the principles of Mr. Tull. The ingenious author has, indeed, in some measure altered the method observed by Mr. Tull, in his book; yet has very exactly given his principles and rules; but as he had only seen the first edition of the Horse-hoeing Husbandry, so he is very defective in his descriptions of the ploughs and drills, which is that was very imperfect, and was afterwards amended by Mr. Tull, in his additions to that essay. One of the principal reasons for taking notice of this book, is to shew the comparison this author has made between the old method and the new. By his calculation, the profits arising from the new are considerably more than double those of the old. For, according to him, the profits of twenty acres of land, for ten years, amount, at 10 = d. per livre.

liv. 1. s. d

By the old method to 3000, or 131 5 0
By the new method to 7650, or 314 13 9

Which makes a prodigious difference in favour of the latter. As this computation was made by one who cannot be supposed to have any prejudice in favour of Mr. Tull’s scheme, it will naturally find more credit with the public, than any comparison made by Mr. Tull himself, or by those who approve his practice.

There have appeared no objections against Mr. Tull’s principles or practice, that
may not be equally urged against every fort of improvement: one of the principal is, its being impracticable in common fields, without the concurrence of every one who occupies land in the same field. But does not this equally affect the old husbandry? for every such person is obliged to keep the turns of plowing, following, &c. with the other occupiers; so that if any of them were inclined to improve their lands, by sowing græs-feed, or any other method of culture, they are under the same difficulties as if they would be, were they to practice Mr. Tull's method.

Others object, that the introducing this fort of husbandry is unnecessary, since the improvements made by græs-feeds are so very considerable; besides, the returns made by the fold and dairy being much quicker than by grain, they engage the farmer to mix ploughing and grazing together. But this can have no weight; for it is well known, that in the farms where the greatest improvements have been made by græs-feeds, the dressing required for the arable land often runs away with most of the profit of the whole farm, especially when the price of grain is low. If this be the situation of the most improved farms, what must be the case of those which chiefly consist of arable land, where most of the dressing must be purchased at a great price, and often fetched from a considerable distance. This, together with the great expense in servants and horses, unavoidable in arable farms, shew the advantages the grazier has over the ploughing farmer. It is therefore much to be wished, that the practice of mixing the two forts of husbandry, were more generally used in every part of the kingdom; and here we apprehend Mr. Tull's method of culture would be the surest way to improve both. For though Mr. Tull chiefly confined the practice of his method to the production of grain, yet it may be extended to every vegetable which is the object of culture in the fields, gardens, and woods; and perhaps may be applied to other crops to equal if not to greater advantage than to corn. In the vineyard it hath been long practis'd with success; and it may be used in the hop-ground with no less advantage. For the culture of beans, pease, woad, madder, and other large-growing vegetables, and for lucern, fainfoin, and the larger græses, we conceive it the most profitable method, since in all these crops, one sixth part of the seed now commonly sown, will be sufficient for the same quantity of land, and yet the crop will be much greater. It may also be used with equal advantage in our colonies in America in the culture of sugar-canes, indigo, cotton, and rice.

It has been objected that it is practicable only on such lands as are soft and light, and not at all on stiff or stony ground: but the hoe-plough has been long used in vineyards, where the soil is stronger and abounds with stones full as much as any part of this country; though the use of this plough is attended with some difficulties upon such land, for wheat, or plants of low growth, whose roots may be in danger of being turned out of the ground, or their tops buried by the clods or stones; yet none of the larger growing plants are subject to these inconveniences. Besides, the stronger the soil is, the more benefit it will receive from this method of culture, if the land be thereby more pulverized; which will certainly be the consequence, where the method laid down by Mr. Tull is duly observed.

But as most instruments, in their first use, are attended with some difficulty, the hoe-plough has been complained of as cumbersome and unwieldy both to the horse and ploughman. But it is proper here to observe, that the swing-plough, commonly used in the land about London, will do the business of the hoe-plough in all ground that is not very strong or very stony; and that where it is so, the foot-plough, made proportionably strong, will completely answer all purposes; but then, when these are used to hoe corn, the board on the left hand of the plough, anfwering the mould-board, must be taken off, otherwise, so much earth will run to the left side, as to injure the crop when it is low.

The drills are excellent instruments, yet we imagine them capable of farther improvements. Parallel grooves, at about an inch asunder, round the inside of the hopper, would shew the man who follows the drill, whether or no both boxes vent the seed equally. By an hitch from the plank to the harrow, the latter may be lifted to a proper height, so as not to be in the way when the ploughman turns at the head-land. Two light handles on the plank, like those of the common plough, would enable the person who follows the drill, to keep it from falling off the middle of the ridge: it may be useful al-
so in wet weather, to double the drill; by which means two ridges may be sown at the same time, the horse going between them: for the planks of two drills, each plank having one of the shafts fixed to it, may be joined end to end by two flat bars of iron, one on each side, well secured by iron-pins and screws; and by corresponding holes in the planks and bars, the distance between the drills may be altered, according to the different spaces between the ridges.

We shall now annex a computation of the expence and profit both of the old and new methods of culture and the new, experimentally tried by a gentleman of veracity, in a country where the soil was light and chalky, that is, of the same nature with that from whence Mr. Tull drew his observations. In the new husbandry, every article is put at its full value, and the crop of each year is four bushels short of the other; though, in several years experience, it has equalled, and generally exceeded, those of the neighbourhood in the old way.

An Estimate of the Expence and Profit of Ten Acres of Land, in Twenty Years.

I. In the Old Way.

The first year for wheat costs 33l. 5s. *viz.*

HUS [1667]  

So that the profit on ten acres of land, in twenty years, in the new way, exceeds that in the old way by 135l. s. 8d. an ample encouragement to practice a scheme, by which so great an advantage will arise from so small a quantity of land in the compass of a twenty-one years lease. It ought also to be observed, that Mr. Tull's husbandry requires no manure at all, though we have here, to prevent objections, allowed the charge of it for the first year; and moreover, that though the crop of wheat from the drilling plough is here put only at so small a quantity of land in the compass, in the old way by 135l. s. 8d., to encourage to the practice of it, requires no manure at all, though we have charge of it for the drilling plough is here put only at so small a quantity of land in the compass, in the old way by 135l. s. 8d., to encourage to the practice of it.

They are very resolute partisans, and better in an invasion or hasty expedition, than in a set battle.

HUSITES, the disciples of John Huf, a Bohemian, and curate of the chapel of Bethlehem at Prague; who, about the year 1414, embraced and defended the opinion of Wickliff of England, for which he was cited before the council of Conftance, and, refusing to renounce his suppopfed errors, he was condemned to be burnt alive, which sentence was accordingly executed upon him at Conftance.

It is evident in what the pretended hereby of John Huf's and Jerom of Prague, who suffered with him, confifted, from the answer they made to the council, when they were admonished to conform to the sentiments of the church: they were lovers, they said, of the holy gospel, and true disciples of Christ; that the church of Rome, and all other churches of the world, were widely departed from the apostolical tradition; that the clergy ran after pleasures and riches, lorded it over the people, affected the highest seats at entertainments, bred horses and dogs, and the revenues of the church, which belonged to the poor members of Christ, were confumed in vanity and wantonness; and that the priests were ignorant of the commandments of God, or if they did know them, paid but little regard to them. The followers of Huf's were also called calixtins, taberites, and bohemian brethren.

HUSTINGS, a court held in Guildhall before the lord-mayor and aldermen of London, and reckoned the supreme court of the city. Here deeds may be inrolled, recoveries sued out, and replevins and writs of error determined. In this court also is the election of aldermen, of the four members of parliament for the city, &c.

This court is very antient, as appears by the laws of Edward the confelor.

Some other cities have likewise had a court bearing the same name, as Winchett, York, &c.

HUSUM, a port-town of Slefwic or south Jutland, situated on the German sea; subject to the duke of Holstein Gottorp; east long. 8° 30', north lat. 54° 40'.

HUT, a small cottage; also a soldier's lodge, otherwise called a cafern. See the article CASERN.

HUTHERFIELD, a market-town in the west riding of Yorkshire: west long. 1° 34', north lat. 55° 37'.

HUXING
HYA [1668]

HUXING of a pike, a method of catching that fish, performed in the following manner: a person takes thirty or forty as large bladders as he can get, blows them up, and ties them close together; then at the mouth of each he ties a line, which is longer or shorter according to the depth of the water; and at the end of the line is fastened a baited hook: they are then put into a pond with the advantage of the wind, that they may gently move up and down the water. When a matter-pike has swallowed the hook, and is almost spent, he is taken out of the water.

HUYN, a strong town in the bishopric of Liege, situated on the Maes, sixteen miles north-east of Namur: east long. $5^\circ 15'$, north lat. $50^\circ 35'$.

HYACINTH, hyacinthus, in botany, a genus of the hexandria-monogynia class of plants, the flower of which consists of a single companioned petal, divided into six reflex segments at the limb: the fruit is a roundish capsule, lightly ridged with three corners, and divided into three cells, each of which usually contains two roundish seeds.

There is a great variety of these beautiful flowers, all of which are propagated by seeds, or offsets from the old bulbs.

HYACINTH, in natural history, a genus of pellucid gems, whose colour is red with an admixture of yellow.

The hyacinth, though striking to the eye than any other red gems, is not without its beauty in the finest specimens. It is found of various sizes, from that of a pin's head to the third of an inch in diameter. Like common crystal, it is sometimes found columnar, and sometimes in a pebble-form; and is always hardest and brightest in the larger mafles.

Its colour is a dull or deadish red, with an admixture of yellow in it; and this mixed colour is found in all the variety of tints, that a prevalence of the red or of the yellow in different degrees is capable of giving it.

Our jewelers allow all those gems to be hyacinths or jacinths, that are of a due hardness with this mixed colour; and as they are of very different beauty and value in their several degrees and mixture of colours, they divide them into four kinds; three of which they call hyacinths, but the fourth, very improperly, a ruby. When the stone is in its most perfect state, and of a pure and bright flame-colour, neither the red nor the yellow prevailing, in this state they call it hyacintha la belle. 2. When it has an over proportion of the red, and that of a dunkest colour than the fine high red in the former, and the yellow that appears in a faint degree in it, is not a fine, bright, and clear, but a dusky brownish-yellow, then they call it the affron hyacinth. 3. Such stones as are of a dead whitish-yellow, with a very small proportion of red in them, they call amber-hyacinths. And, 4. When the stone is of a fine deep red, blended with a dusky and very deep yellow, they call it a rubacelle. But the over-proportion of a strong red in this gem has made people refer it to the class of rubies, its evident mixture of yellow, shews that it truly belongs to the hyacinths.

The hyacinth la belle is found both in the East and West Indies. The oriental are the harder, but the american are often equal to them in colour. The rubacelle is found only in the East Indies, and is generally brought over among the rubies, but it is of little value: the other varieties are found in Silefia and Bohemia.

Our druggists usually keep under the names of hyacinths, small garnets, some of them of the smooth pebble-kind, somewhat resembling the native rubies, and others angular. They have the former from Poland, the latter principally from Bohemia: but neither of them are true hyacinths. They have sometimes, the rarest, the third kind, or amber-hyacinths; and if any sorts were to be laid on the virtues of this stone, they are the only kind that can lay any claim to it. They have also a very small and bad kind of the amber-hyacinth, whiter than those received among the jewelers, which are found in the beds of rivers in Bohemia; these, they would persuade us, are true oriental hyacinths, but beside our knowing that the same are found in Bohemia, the want of hardness in the very finest of them, is an evident proof of the contrary. The antients have attributed great virtues to this gem; and later writers have even made it the basis of a cordial and astringent confection, which takes its name from it. It is generally said to be cordial, reforative, and moderately astringent; and some have added that it is hypnotic. But the refutation of bringing the most costly things into medicines, rather than any rational opinion of
of their virtues, seems to have given the original hint of introducing the gems into it; and if there were nothing else against it, one would be cautious of their getting into use, were it only from the uncertainty of what apothecaries meet with under their names at the druggists.

HYACINTHIA, an antient grecian festival, observed at Amycle in Lacoenia, in the month Heatonbeon, in memory of the beautiful young Hyacinthus, son of Amyclos king of Sparta. It continued three days, during the first of which they shewed all imaginable signs of grief for the death of Hyacinthus: upon the second and third day, various spectacles were exhibited, and hymns sung in honour of Apollo: they likewise offered multitudes of victims, and gave rich entertainment to their friends.

HYADES, in astronomy, seven stars in the bull's head, famous among the poets for the bringing of rain.

The principal of them is in the left eye, called by the Arabs Aldebaran. See the articles Taurus and Aldebaran.

HYDATIDES, in medicine, little transparent vesicles or bladders, full of water, sometimes found solitary, and sometimes in clusters, upon the liver, and various other parts, especially in hydroptic constitutions.

But in a particular sense, the hydatis is a disease of the eye-lids, called also aquula. St. Yves informs us, that there sometimes comes on the edge of the cartilages of the eye-lids, or on the conjunctiva, an elevation like the bladders which appear on the skin after burns. They are as big as a pea, or a lentil; are filled with a very clear liquor, and have the name of hydatides from the lymph which they contain. Sometimes a serosity is extravasated between the conjunctiva and the membrane which covers it: it separates these membranes, and in the movement of the eye, a fort of wrinkle appears, which shews that a serosity stagnates between these membranes, and produces the swelling. This disease is not at all dangerous; it is a little troublesome when it seizes only part of the conjunctiva. The surest remedy is to prick it dexterously with the point of a lancet, and to lay it open according to the longitudinal direction of the tumour, without any other application.

HYDATOIDES, the name with the aqueous humour of the eye. See Eye.

HYDATOSCOPIA, called also hydro-mancy, a kind of divination or method of foretelling future events by means of water. See Hydromancy.

HYDE, or HIDE. See the article Hide.

HYDNUM, in botany, a genus of fungi, called by some erinaceus: it is an horizontal fungus, echinized, or beset with sharp-pointed fibres on its under part. See the article Fungus.

HYDRA, in astronomy, a southern constellation imagined to represent a water-serpent.

The number of stars in this constellation in Ptolemy's catalogue is 25, and in the Britannic catalogue, 68.

HYDROGOGUES, ϊδρογόγοι, among physicians, remedies which evacuate a large quantity of water in dropsties. See the article Droysey.

Quincy observes, that the strongest cathartics chiefly answer to the character of hydragogues, in that they so forcibly shaking and venticating the bowels, and their appendages, they squeeze out water enough to make the fowls appear little elfe.

The principal hydragogues, in the common opinion, are the juices of elder, of the root of iris, of folkanella, mechoacan, jalap, &c. In the general, all sudorifics, aperitive, and diuretic medicines are truly hydragogues.

HYDRANGÆA, in botany, a genus of the decandria-digynia class of plants; the corolla whereof consists of five equal, roundish petals, greater than the cup: the fruit is a roundish didymous capsule: the two permanent stiles make two beaks to it, and is rendered angular by many ribs: it is coronated by the cup, and divided into two cells by a transverse membrane: the seeds are numerous, angular, acuminated, and very small.

HYDARGYRUM, a name given to mercury or quicksilver. See the article Mercury.

HYDRAULICS, the science of the motion of fluids, and the construction of all kinds of instruments and machines relating thereto.

The laws of the motion of fluids, and the caulces of their decent or rise below or above the common surface or level of the source or foundation, have been already delivered under the article fluid; and the art of conducting fluids into pipes, canals, drains, &c. as also the art of raising them, with the several machines
HYDRELÆUM, in pharmacy, a mixture of common oil with water, which, taken internally, is emetic; but applied externally, is anodyne, and promotes suppuration.

HYDRENEROCELE, in surgery, a species of hernia, wherein the intestines descend into the scrotum, together with a quantity of water. See HERNIA.

HYDROCANISTERIUM, an engine which spouts water in great quantities, and to considerable heights, in order to extinguish accidental fires in houses. See the article ENGINE.

HYDROCELE, in surgery, denotes any hernia arising from water, but is particularly used for such a one of the scrotum which sometimes grows to the size of one's head, without pain, but exceeding troublesome to the patient.

Tho' authors, says Sharp, mention several kinds of this disease, there are but two; the first is when the water is contained in the tunica vaginalis; the second, when it is contained in the cellular membrane of the scrotum. This last is always complicated with an anaarca, a kind of dropsey which confils in the extravasation of the water which lodges in the cells of the membrana adiopofa. The hydrocele in this case is easily known, for the skin is thinning and soft, yielding easily to a flight impression, which will remain pitted some time. The penis is also sometimes prodigiously swelled by the liquor which infinuates into the cellular membrane. There are none of these symptoms in the dropsey of the tunica vaginalis.

In the dropsey of the cellular membrane of the scrotum, some recommend the puncture with a trocar; others, to make small apertures here and there with the point of a lancet; others, to put a small skene of silk through the skin with a needle, and to let it remain as a feton till all the water is drained off. But the two first methods yield very little relief, and the last may be more likely to induce a gangrene. Nor is there occasion for any operation at all, because the cellular membrane of the scrotum, is nothing but a continuation of the membrana adiopofa, and therefore evacuations made in the skin of the final of the legs, will effectually empty the scrotum; yet sometimes there fails to greater a quantity into the scrotum, that the distention is very painful, threatening a mortification: likewise the prepuce is very often so excessively dilated and twisted, that it hinders the patient from making water. In these cases, there should be an incision made on each side of the scrotum, three inches in length, quite through the skin into the cells which contain the water, and likewise two or three half an inch long in any part of the penis with a lancet or knife. The dropsey of the tunica vaginalis, is caused by an excessive accumulation of a serosity which is naturally separated in the internal surface of that tunic, in a small quantity, to moisten and lubricate the tefticle.

This disorder is not often the effect of any accident. It never diminishes when once begun, but generally continues to encrease, but in some persons not so quick as others. It is tenfe and smooth, and ceases before or when it arrives at the rings of the abdominal vessels. When the tefticle is encreased in size, the tumour is rounder, and, if not attended with an enlargement of the spermatic vessels, the cord may be easily distinguished between the tumour and the abdomen.

As to the cure, the author above-mentioned has found little success from inward medicines or outward applications, and therefore thinks it most advisable to wait till the tumour becomes troublesome, and then to tap it with a lancet. If the orifice of the skin slips away from that of the tunic, and prevents the escape of the water, you may introduce a probe, and by that means secure the exact situation of the wound. When the tunica vaginalis is very tenfe, the tefticle itself cannot be easily distinguished; but there will be no danger of wounding it, if the inferior part of the scrotum is opened with a lancet not too long. During the evacu-
HYDROCERATOPHYLLUM, precluded enneanderia clafs and trianigynia. HYDROGRAPHY, HYDROCOTYLE, MARSH-PENNY.

HYDROCHARIS, with an admixture of black: the body evacuation, the fcrotum must be regularly preceded; and after the operation, a little piece of dry lint and sticking-platter are sufficient. This is called a palliative cure, but it now and then proves an absolute one. It is dangerous to attempt a radical cure by making a large wound, either by incision or caustic, and therefore that method should be discarded.

HYDROCEPHALUS, in surgery, a preternatural dilatation of the head, to an uncommon size, by a stagnation and extravasation of the lymph, which, when collected within side of the bones of the cranium, the hydrocephalus is then termed internal; as it is external, when retainedbetwixt the common integuments and the cranium. The first kind of the disorder is seldom to be met with but in infants; and if it is advanced to any great degree, is a dangerous café, and generally incurable. If the disorder is in its first stage, and but beginning to shew itself, it will be most advisable, according to Heister, to try what may be done by medicines, such as gentle and repeated purges, to draw the humours downwards, with corrosifying medicines, internally; while externally there is applied a large compress dippt in lime-water and spirit of lavender, or hungary water, which compress must be retained by a proper bandage. See the article BANDAGE.

The external hydrocephalus is distinguished by the softness of the head and skin externally; but in the internal hydrocephalus, the head feels as hard as ural, and yet it is much more dilated and enlarged. Though the external hydrocephalus is not without danger, yet it may be much more easily cured than the internal, but with the greater difficulty, as it is of a longer standing. According to the same author, the cure must be attempted as well by internal as external remedies at the same time; such as cathartics, diaphoretics, diuretics, attenuating and strengthening medicines for internal use: and externally may be applied a compress dipped in the fomentation before-mentioned for the internal hydrocephalus. In this case the repeated chewing of tobacco in the mouth, to discharge the froth and saliva from the head by spitting, is advisable: some tincture the head with fumes of burning spirit of wine highly rectified, but if all these means prove unsuccessful, recourse must then be had to chirurgical helps, among which you ought first to try a blister applied behind the ears on the occiput and neck, and if this does not altogether answer the intention, you may add incision and cupping upon the same parts. See CUPPING.

HYDROCERATOPHYLLUM, in botany, a plant otherwise called ceratophyllum. See CERATOPHYLLUM.

HYDROCHARIS, the LITTLE WATER-LILLY, in botany, a genus of the dicaea peltandria clafs of plants, the male flower of which has a Ipatha, and is composed of three large, plain, and roundish petals; the female flower is like the male one, only without any Ipatha: the fruit is a coriaceous and roundish capsule, consisting of fix cells, in which are contained a great number of very small and roundish seeds.

HYDROCORAX, the WATER-RAVEN, in ornithology, a species of besceros, with a small head and bluish back.

This bird is about the bigness of the common raven, and is a native of Tartary and China; from whence its beak is often brought over to us as a curiosity, on account of its size, as being seven inches in length, and in the largest part, about the middle of the gibbosity, near three inches in diameter.

There is also another species, about the bigness of our common crow, the head of which is of a deep greenish cast, but with an admixture of black: the body too is of a greenish colore.

HYDROCOTYLE, MARSH-PENNY-WORT, in botany, a genus of the pen-tandria-digynus clafs of plants, the universal corolla of which is uniform in figure, though not in situation; and the single corollae are formed of five oval-acute, patent petals: the fruit is orbicular, ereth, and composed of two compressed and semi-orbicular seeds.

This plant is common with us in damp places, and is full of sedentary: that feed on it; whence it is sometimes called white-rot. See the article Rot.

HYDROGRAPHY, ὑδρογραφία, the art of measuring and describing the sea, rivers, lakes, and canals.

With regard to the sea, it gives an account of its tides, counter-tides, foundings, bays, gulphs, creeks, &c. as also of the rocks, shelves, sands, shallows, promontories, harbours, the distance and bearing of one port from another, with every thing that is remarkable, whether out at sea, or on the coast.
HYDROMANCY, a method of divination by water, practised by the ancients in this manner. They filled a cup or bowl of water; then fastening a ring to a piece of thread tied to their finger, held it over the water, and repeated a certain form of words, defining to be satisfied with regard to their enquiry; and if the question was answered in the affirmative, the ring would strike the sides of the bowl of its own accord.

Another kind of hydromancy was to look upon the water in which the figure of several demons used to appear. This expedient Numa is said to have made use of, to settle the ceremonies of religion.

This way of divination is said to have been used first by the Persians, and afterwards approved by Pythagoras.

HYDROMEL, among physicians, water impregnated with honey, either before or after fermentation.

Vinous hydromel, commonly called mead, is said to be good for the gravel. See the article MEAD.

HYDROMETER, an instrument to measure the gravity, density, velocity, force, &c. of water and other fluids. See the articles WATER and FLUID.

The hydrometer is one of the most useful instruments of the philosophic kind; for the hydrostatical balance be the most general instrument for finding the specific gravities of all sorts of bodies; yet the hydrometer is best fitted to find those of fluids in particular, both as to cæle and expedition.

This instrument should be made of copper, since ivory imbibes spirituous liquors, and thereby alters its gravity; and glass is apt to break. The most simple kind, used for finding the strength of spirits, consists of a copper-ball B (plate CXXXVII. fig. 1. n° 1.) with a brass-wire, AB, \( \frac{1}{3} \) of an inch thick, folded into it. The upper part of this wire being filed flat on one side, is marked proof at m, because it sinks exactly to this mark in proof-spirits. There are other two marks at A and B, to shew whether the liquor be \( \frac{1}{50} \) above or below proof, according as the hydrometer sinks to A or emerges to B, when a brass-weight as C or K has been screwed on at the bottom c. There are also weights to be screwed on, for shewing the specific gravities of fluids quite to common water. The round part of the wire above the ball, may be marked fo as to represent river-water when it sinks to RW,
HYD [1673] HYD

thing; and diminish the solidity, by which the instrument is rendered more exact.
In order to adapt this instrument to all sorts of uses, there ought to be two different items to screw on and off in a small hole at a. One item should be such a nice thin slip of brass, or rather of steel, like a watch-spring set straight, as we have just mentioned, on one side of which ought to be the several marks or divisions, to which it will sink in various sorts of waters, as rain-water, river-water, spring-water, sea-water, salt-spring-water, &c. And on the other side you mark the division to which it sinks in various lighter fluids, as hot bath-water, Bristol water, Lincoln water, Chelsea-water, port wine, mountain, madeira, and various other sorts of wine. But in this case the weight A on the top must be a little less than before, when it was used for the heavier waters.

But, in case of trying the strength of spirituous liquors, a common cylindrical item will do best, because of its strength and steadiness; and this ought to be fo contrived that, when immerged in what is called proof-spirit, the surface of the spirit may be upon the middle point 20, which is easily done by duly adjusting the small weight A on the top, and making the item of such a length that, when immerged in water, it may just cover the ball, and rise to a; but, when immerged in pure spirit, it may arise to the top at A; then by dividing the upper and lower parts at 20, A 20, into ten equal parts each, when the instrument is immerged in any sort of spirituous liquor, it will immediately shew how much it is above or below proof.

This proof-spirit consists of half water and half alcohol, or pure spirit, that is, such as when poured upon gunpowder, and set on fire, will burn all away, and permit the powder to take fire, which it will, and blast as in the open air. But if the spirit be not so highly rectified, there will remain some phlegm or water, which will make the powder wet, and unfit to take fire. This proof-spirit of any kind, weighs seven pounds twelve ounces per gallon.

The common method of making the spirits in a vessel, and by raising a crown of bubbles, to judge by the manner of their rising or breaking away whether the spirit be proof or near it, is very precarious, and capable of great fallacy. There is no way so easy, quick, certain, and philosophical, as this by the areometer, which will demonstrate infallibly the difference of bulks, and consequently specific gravities, in equal weights of spirits, to the 30, 40, or 50 thousandth part of the whole, which is a degree of accuracy, beyond which nothing can be desired.

HYDROPHACE, in botany, a name sometimes given to the lemma of Linneus. See the article LEMNA.

HYDROMETRY, ὑδρομετρία, a term sometimes, tho' rarely, used to denote the measurement of fluids, their gravity, velocity, &c. and consequently comprehending both hydraulics and hydrostatics.

HYDROMPHALUS, in medicine and surgery, a tumour in the navel, arising from a collection of water.

The hydromphalus is distinguished from other tumours of the navel by its being very soft, and yet not tractable and obedient to the touch, so as to diminish or enlarge by compressing it. See the article EXOMPHALUS.

When viewed, placed between the eye and the light, the hydromphalus is found transparent. It is to be diffus'd by emollient and resolutive medicines. It is also cured by a puncture made in the middle of the navel.

HYDROMYSTES, a name antiently given to certain officers in the greek church, whose business was to make holy-water, and sprinkle it on the people. See the article HOLY-WATER.

HYDROPARASTATÆ, a seat of heretics, the followers of Tatian.

This seat were called also encratizæ, apo-tastizæ, faccophorizæ, feverianæ, and aquarizæ.

The hydroparastatæ were a branch of the manicheæ, whose distinguishing tenet was that water should be used in the eucharist instead of wine.

HYDROPHANÆ, in natural history, a genus of jemi-pellucid gems, composed of crystal and earth; the latter ingredient being in large proportion, and mixed imperfectly, as in the chalcedony; and giving a general cloudiness or mistiness to the stone, but of so imperfect and irregular an admixture, as not to be capable of so good a polish as the chalcedony; and appearing of a dusky and foul surface, till thrown into water, in which they become lucid, and in some degree transparent,
Hydophobicia, in medicine, an aversion or dread of water; a terrible symptom of the rabies canina.

This disease generally proceeds from the bite of a mad dog, and almost always arises from the infection communicated by the bite of a mad animal; yet it has been observed to arise spontaneously in some animals affected with acute diseases; and we have an instance in the medical effays by Dr. Innes at Edinburgh, of a young man that had this symptom attending an inflammation of the stomach. Almost all kinds of animals may be afflicted with this disorder, and may infect other animals, and even men, as dogs, cats, wolves, foxes, horses, asses, mules, horned cattle, hogs, monkeys, and cocks; but it most frequently attacks dogs, wolves, and foxes, without any previous contagion.

A hot climate; excessive heats and sudden colds; a long, hot, and dry season; feeding much upon putrid, flinking, verminous flesh; want of water; worms generated in the kidneys, guts, brains, or nostrils, are the preceding causes of madness in these animals. When they are going to run mad, they appear dejected, thin company, and hide themselves; they will not bark, but seem to mutter or murmur, and are averse to food and water; they will fly upon strangers, but retain some regard for their master: their ears and tails hang down, and they walk along as if they were sleepy. This is the first degree of the disease; and though the bite is then bad, it is not at the worst. Afterwards, they begin to pant, hang out their tongues, froth at the mouth, and gape; sometimes they seem dull and half asleep; sometimes they will run, but not directly forward, and soon cease to know their masters; their eyes are dejected, look watry and dully; their tongues are of a lead-colour; they fall away suddenly, and grow raging mad. A bite at this time is incurable, and the nearer they are to death, with the more dreadful symptoms it is attended.

There is scarce any poison infectious so many ways as this, for it takes effect through the cloaths, without fetching blood; by the breath of the animal drawn into the lungs; by a touch of the froth, if recent; by handling the wound, or instrument which was the death of the animal; or by handling things which have been infected by any of the former means. Again, there is scarce any poison which produces such terrible effects, and causes such a wonderful change in the person infected. When it begins to work, it is most violent and quick; and yet, as it is said, will lie dormant for twenty years together before it exerts itself. This diversity depends upon the heat of the season, the degree of the disease in the infected animal, and the temperature of the person bit; for the bilious are sooner affected with it, the phlegmatic and hydropic the least: likewise something may be attributed to the way of living, diet, and medicines.

A healthy man infected with this contagion, according to Boerhaave, finds the effects of it discover themselves in the following order: there is a pain in the place where he was bit or received the contagion, and then wandering pains in the other parts, chiefly those that are near it; a languid, heaviness, littleness of the whole body; unquiet troubled sleep, and terrible dreams, with convulsions and subulatus of the tendons; continual inquietude, sighs, faintness, love of solitude; thus ends the first degree of the disease. Afterwards all the symptoms encrease with a prodigious slumber and oppression about the precordia; a difficult breathing, respiration, horror, a shaking and trembling at the sight of any liquid, pellucid things; loss of appetite; an incredible anxiety; trembling and terrible convulsions, almost forcing the patient into a rage when any liquid is touched with the lips or tongue; then a vomiting of dark, bilious, viscid matter, or porraceous bile; an increased heat; a fever, continual watching, a priapism, a confused series of wild and extravagant thoughts: here the second degree of the disease may be said to terminate. Now all the symptoms grow worse and worse: the tongue hangs out, and is rough; the voice is hoarse: strange horrors, startings and wild looks at the sight of water; a frothing at the mouth; a voluntary inclination to spit at the by-flanders; also to bite them; the patient foams at the mouth,
mouth, gnashes with the teeth, and would do mischief if not forcibly held. His pulse and breathing fail; there is a cold sweat; the highest fury: yet during all this time, which is wonderful, the patient continues in his senses, and is afraid of doing harm. On the fourth day from the first degree of the disease, the patient falls into convulsions with great difficulty of breathing; and then dies.

The prevention and cure of this disease, except in a few instances, are very doubtful and uncertain. The preventive cure, according to Boerhaave, consists in making deep scarifications, as soon as possible, after the bite, in the part affected and those adjacent to it, that they may make a considerable discharge of blood; and then applying large cupping-glasses thereon; or it may be burnt pretty deep with an actual cautery. Then it should be made to suppurate by some corrosive application proper for that purpose; and during all that time, it should continually be fomented with a pickle made with vinegar and salt: this should be continued for six months at least; the garments he had on at the time of the bite should be cautiously laid aside, or destroyed. He should likewise, with all convenient speed, be dip in a river, or the sea, making him believe that he is going to be drowned: this is to be often repeated; for the effect consists in terrifying the mind, and not in the salt water, as is commonly supposèd: then he should be often and strongly purged with rhubarb, agaric, and the juice of elder-bark. He should be put into a sweat every morning fasting, with a mixture of aromatic vinegar, tea-salt, and hot water: his feet and hands should also be daily fomented in a warm bath, and he should wash his head, mouth, and face. Let him often drink cold water, and throw it up again, by vomiting; and let his drink be acidulated. His aliment should be most light and laxative, and often taken in such a quantity as to vomit it up again. He should likewise abstain from things that are too spicy, from wine, from heating things, from violent exercises, and from commotions of the mind.

The cure should be attempted when the disease is in the first degree; and, in the beginning of the second, by treating it as highly inflammatory; by letting blood from a large orifice even to a deliquium; by giving clysters soon after with nitrous or moderately salt water; thus: take barley water, ten ounces; nitre, two drams; elder vinegar and honey of roses, each an ounce; make a clyster. Or take rue-water, ten ounces; tea-salt, two drams; vinegar impregnated with marigold-flowers, six drams; common honey, an ounce; make a clyster.

These may be repeated boldly, and with less caution than in other cases. After this let the patient be blindfolded, and thrown into a pond of cold water; or let cold water be thrown upon him, till the dread of it almost ceases: then let a large quantity be forced down his throat; let this be his treatment daily, and at night let sleep be procured.

Hoffman's sentiments on this head are greatly different from those of Boerhaave.

The antients, says he, were of opinion, that all poisons were of a cold nature, because they observed that a more free effusion of blood to the external parts was restrained by ipaime, for which reason they prescribed heating things, and particularly generous wines, as an universal antidote: thecele Celsus seems to have followed; and informs us, that the practice of old was to put the patient into a bath, and to make him sweat as long as his strength would permit, at the same time keeping the wound open, that the virus might be discharged from it; and then to give him plenty of good generous wine: this being done for two or three days, they judged him out of danger. This practice of the antients, Hoffman thinks most effectual, and condemns immersion in cold water, &c. as Boerhaave does the practice of administering acid, drying, and heating medicines.

This may give some light into the nature of the pulvis antilyllis published by Dr. Mead, and received into the dispensatory of the college, wherein pepper is one of the ingredients. Take of the powder of aly-coloured liverwort, four drams; and of the powder of black pepper, two drams: this powder mixt together, is to be taken in warm milk in the morning fasting for four mornings together. After this the doctor orders the patient to be put into a cold bath, pond or river, for thirty days successively, early in the morning, and before breakfast: he is to remain in it with his head above water, no longer than a minute.

Dr. Sault, from his own experience, recommends another method of cure by mercurial frictions upon the cicatrices, and
HYD [1676]

and the parts adjoining, for three dayssuccessively, and then every other day: besides this, he orders the patient to take a dram and a half of Palmarius's powder. Dr. James is of opinion, that a vomit or two of mercurius emeticus flavus would be proper, the dole of which is from two to eight grains; not omitting the cinnamonarum powder, nor going into the cold bath in the morning for a month.

HYDROPHORIA, in grecian antiquity, a solemnity held at Athens and Ægina, in memory of those that perished in the deluge.

HYDROPHYLLUM, in botany, a genus of the pentandria-monoeygia class of plants, the corolla whereof consists of a single campanulated, petal, divided into five erect, obtuse, and emarginated segments; the fruit is a globose capsule, formed of two valves, and containing only one cell, with a single, roundish, and large seed. See plate CXXXVII. fig. 3.

HYDROPIC, a dropical patient; or a person swelled and bloated with the abundance of water. See DROPSY.

HYDROPOTÆ, in medicine, a person who drinks nothing but water.

It has long been controverted among physicians, whether or no the hydropotæ live longer than other persons.

HYDROPS, in medicine, the same with dropy. See the article DROPSY.

HYDROSCOPE, an instrument antiently used for the measuring of time.

The hydroscope was a kind of water-clock, consisting of a cylindrical tube, conical at bottom: the cylinder was graduated, or marked out with divisions, to which the top of the water becoming successively contiguous, as it trickled out at the vertex of the cone, pointed out the hour.

HYDROSTATICAL BALANCE, a kind of balance contrived for the easy and exact finding the specific gravities of bodies, both liquid and solid.

This instrument is of considerable use in estimating the degree of purity of bodies of all kinds; the quality and richness of metals, ores, minerals, &c. The proportion in any mixture, adulteration, or the like: of all which the specific weight is the only adequate measure. The doctrine of the hydrostatical balance is founded on this theorem of Archimedes, that a body heavier than water, weighs less in water than in air, by the weight of as much water as is equal to it in bulk.

We have a new hydrostatical balance, the parts of which are as follow: A B (plate CXXXVIII. n° 1.) is the foot on which it stands; C D is a pillar supporting a moveable brass plate E F, fastened thereto by the screw in the knob c. In the end of this plate is fixed an upright piece I K, supporting another plate G H; which slides backwards and forwards thereon, and is moveable every way about it. In the end of this plate, at H, is fixed (by a nut beneath) a wire L M, tapped with a fine thread from one end to the other; upon this moves the swan-neck flip of brass N O, to which a very exact balance is hung at the point N; to one of whose scales P is appended the heavy body R, by a fine horse-hair or piece of silk S: the weight of the said body R in the air, is expressed by the weight put into the scale Q to make an equilibrium therewith, which being destroyed by immersing the solid in the fluid TV, contained in the glass WV, is again restored by weights put into the scale P. So that the weights in the scale Q compared with those in the scale P, shew at once the specific gravity of the solid R to that of the fluid TV.

The specific gravity of fluids is readily determined by weighing one and the same solid body in them severally; for since we suppose the balance in equilibrium with the body suspended in the air, the equilibrium will be destroyed when the solid is immersed in the fluid, and must be then restored by weights put into that scale to which the body is appended. These weights will severally express the gravities of an equal bulk of the respective fluids; and consequently they may be thus compared with each other, or all of them with the gravity of common water, as usual, and disposed in a proper table; making water 1.000. See Table of Specific Gravities.

In the same manner, if divers solids are first weighed in air, and then afterwards immersed in the same fluid, as water, for instance, the equilibrium will be destroyed; which will be restored, as before, by putting in so much weight as is equal to the weight of the same bulk of water: the gravity, therefore, of every solid is thus compared with water, and consequently with each other.

But in this, and many other cases, it is required to be very exact in weighing bodies, even beyond what is attainable by the nicest mechanism of this instrument.
Fig. 1. HYDROSTATIC BALANCES

A / 2

The improved

HYDROSTATIC

BALANCE

Fig. 2. HYPERICUM, S'John's Wort.
ment. We shall therefore give the reader an account of an improvement of the common balance in this respect; and it is the more pertinent in this place, as this instrument serves equally for exactness in common as in hydrostatical matters.

The figure of the machine represents the balance in its hydrostatical use, *ibid.* n° 2. We shall first describe the machine, then shew the new contriv'd artifice for exactness; and, lastly, give an instance of its universal use. YCG is the stand or pillar fixed in the table. From the top at A hangs, by two silk strings, the horizontal piece or bar BB; from which is suspended, by a ring at i, the fine beam of a balance b, which is kept from descending too low on either side by the gentle springing piece txyz, fixed on the supporter M. The harness is annulated at o, to shew distinctly the perpendicular position of the examen, by the small pointed index fixed above it.

The strings by which the balance is suspended passing over two pulleys, one on each side the piece at A, go down to the bottom on the other side, and are hung over the hook at w; which hook, by means of a screw P, is moveable about 1/8 inches backwards and forwards, and therefore the balance may be raised or depressed so much. But if a greater elevation or depression be required, the sliding piece S, which carries the screw P, is readily moved to any part of the square brass-rod V K, and fixed by means of a screw.

The motion of the balance being thus provided for, the rest of the apparatus is as follows: HH is a small table fixed upon a piece D, under the scales d and e, and is moveable up and down in a long slit in the pillar above C, and fastened at any part with a screw behind. At the point in the middle of the bottom of each scale is hung by a fine hook a brass-wire a d, a c. These pass through two holes m, m in the table; and to the wire a d is suspended a curious cylindrical wire r s, perforated at each end for that purpose. This wire r s is covered with paper graduated by equal divisions, and is about five inches long.

In the corner of the table at E, is fixed a brass-tube in which a round wire b l is so adapted as to move neither too hard nor too freely by its flat head I. Upon the lower part of this moves another tube Q, which has friction enough to cause it to remain in any position required; to

this is fixed an index T, moving horizontally when the wire b l is turned about, and therefore may be easily set to the graduated wire r s.

To the lower end of the wire r s hangs a weight L, and to that a wire p n with a small brass ball g, about 1/8 of an inch in diameter. On the other side, to the wire a c, hangs a large glass bubble R by a horse-hair. Let us at present suppose the weight L taken away, and the wire p n suspend from S; and on the other side let the bubble R be taken away, and the weight P suspended in its room at e. This weight F we suppose to be such as will keep in equilibrio with the several parts appended to the other scale, at the same time that the middle point of the wire p n is in the surface of the water in the vessel N. The wire p n is to be of such a size, that the length of one inch shall weigh four grains. Hence it is evident, since brass is eight times heavier than water, that for every inch the wire sinks in the water, it will become half a grain lighter, and half a grain heavier for every inch it rises out of the water: consequently, by sinking two inches below the middle point, or raising two inches above it, the wire will become one grain lighter or heavier. And therefore, if when the middle point is at the surface of the water in equilibrio, the index T be set to the middle point a of the graduated wire r s, and the distance on each side ar and as contain a hundred equal parts; then, when in weighing bodies the weight is defied to the hundredth part of a grain, it may be easily had by proceeding in the following manner.

Let the body to be weighed be placed in the scale d, and put the weight X in the scale e; and let this be so determined, that one grain more shall be too much, and one grain less too little. Then the balance being gently moved up or down by the screw P, till the equilibrio be nicely shewn at o; and then if the index T be at the middle point a of the wire r s, it shews that the weights put into the scale e, are just equal to the weight of the body. By this method we find the absolute weight of the body; the relative weight is found by weighing it hydrometrical in water, as follows.

Instead of putting the body into the scale e, as before, let it be appended with the weight F at the hook e, by a horse hair as at R, suspending the vessel of water O to E.
were away; then the equilibrium being made, the index T standing between a and r, at the 36th division, shews the weight of the body put in 109.5. 36 grains. As it thus hangs, let it be immersed in the water of the vessel O, and it will become lighter by much; the scale e will descend till the beam of the balance rests on the supporter z. Then suppose 100 grains put into the scale d restores the equilibrium precisely, so that the index T stands at the 36th division above a; it is plain the weight of an equal bulk of water would, in this case, be exactly 100 grains.

After a like manner may this balance be applied to find the specific gravities of fluids, which will not be difficult from what has been said.

Bradford's new Hydrostatical instrument, a new invention for discovering coin, and discovering its defect either of weight or purity.

It consists of a thin, flat, brass-ruler, about half a foot long; on each side of which are two graduated lines, those on the upper side being marked A and W (plate CXXXIX. fig. 1. n°1,) and those on the under side B and W, ibid. n° 2. There is also a small chain and pincers wherein to fix any piece of money intended to be weighed and proved; together with two pair of center-pins, marked A and B, ibid. n° 2 and 3, whereas the former pair A are to be used for proving all pieces of gold not exceeding the value of 36 s. and the other pair marked B, for all pieces from 36 s. to 72 s. or 3 l. 12 s.

Lastly, there is a sliding-piece or index C, (ibid. n° 3.) by the motion of which backwards and forwards upon the ruler, the value of any piece supplemented in the pincers is found upon the graduated lines already mentioned; whereas those marked A and B are called statical lines, as being calculated for weighing the piece in air; and those marked W, W, are hydrostatical lines, as serving to point out the alloy or adulteration of the piece weighed. A whole division on each line, is equal to the weight or value of 1 s. in gold; a half division to 6 d. and a quarter division to 3 d.

To prove a guinea: first suspend it in the pincers, and then placing the inside of the sliding-piece C to z on the line A, on the upper side of the ruler, which must move freely on the center-pins marked A; and if the guinea and sliding-piece exactly balance each other, the guinea is full weight: if not, move the slider backward or forward, till they equiponderate, and the division cut by the inside of the slider is the true weight; for instance, suppose it rests at 20 1/2, then does the guinea weigh only 20 s. 6 d.

In the next place, to prove the alloy of this piece, let the slider be brought to the division 20 1/2 upon the hydrostatical line marked W; for whatever division is cut by the slider, in weighing on the statical line, it must be placed at the same on the hydrostatical line adjoining. Then let the piece, together with the pincers, and the brass-link whereon it is suspended, be immersed in water, (ibid. n° 3.) as far as the notch in the said link; and if the instrument acts in equilibrium, or the piece sink deeper in the water, the guinea is standard-gold; but if the slider must be moved farther backward before it will equiponderate, the guinea is adulterated. If alloyed with silver, allow 2 s. for every penny it wants in the hydrostatical weight; and then, if the number of pence the piece is deficient in weight hydrostatically, when doubled, exceed the number of fillings it weighs statically, you may conclude it is adulterated with some base metal than silver.

However, a more speedy method of discovering whether a piece of gold be adulterated or not, without moving the slider more than once, is this: when you have weighed a piece statically, bring the slider to the division on the hydrostatical line expressing its weight; andimmering the piece and pincers as before, so that the surface of the water may be exactly at the notch or mark on the long link, if the instrument doth not then equiponderate, gently lower your hand that holds the fluid till the instrument comes to an equilibrium; at which time, if the guinea be a counterfeit, great part of the pincers will appear above water; and if a 36 s. piece be tried, not only the pincers, but a small part of the coin will appear above the surface, if the piece be counterfeit. This last method is sufficiently near the truth for common practice.

If you should have occasion to weigh and prove a very small piece of gold, as 2 s. 9 d. or 4 s. 6 d. the method is to put the said piece in the pincers with some other piece that has been proved before; by which means, the weight and alloy of the small piece may be easily discovered, as above. And if the piece be above

expression of the gold to that of the

See HYDROSTATIC BALANCE. But how great the ulefulnes and im¬

portance of hydrotastic knowledge is to phy¬

icians, chemifs, apothecaries, jewellers,

goldsmiths, &c. will appear by reading

Mr. Boyle's excellent Medicina Hydro¬

statica, in which book the skilful author

proposes the following ues to be made

of hydrostatic knowledge, viz.

1. To explore the nature and difference of

sofils, by finding their specific gravities.

For fince the moft pure and homogene¬

of kinds of foines are in gravity to

water as about 2½ to 1, and tin, the

lightef metals, is to water in gravity as about 7 to 1, if a flony

substance be found to have a greater proportion of

gravity than that of 2½ to 1, it muft be

probable that it has in ifte adventi¬

tious matter of a metalline nature ; or is

at leat commixed with fome mineral

body more heavy than pure flone, and

may therefore very probably be uefully

applied to fome medicinal purpofes. As

infances of this kind, he mentions the

lapis hematites, lapis lazuli, and lapis

calaminars, all which have their ues in

physic.

2. He proposes this method as very cer¬
tain to determine whether a body, sup¬
pofed to be a flone of the mineral kind,

be fo indeed. Thus con. which, fays

he, fome take to be a plant, and others

a lithodendron, but moft reckon it among

precious foines, is in gravity to water as

2,68 to 1, which favours the laft opin¬

ion: thus a calcatus humanus and a

bezoar were found as 1.7 and 1.5 to 1 ;

and therefore too light, to be of the fame

species with the common flone.

3. A third ufe which he proposes is to
discover the rellenblance or diference be¬
tween bodies of the fame denomination,

and thereby to collect and aifter their

several
several degrees of goodness respectively. Whence he argues the necessity of this fort of knowledge to physicians, chemists, apothecaries, druggists, to the goldsmith, the merchant, the miner, &c.

4. A fourth use is to discern genuine stones from counterfeit ones, which may be of great help to jewellers; here he gives instances of factitious coral, and factitious gems, and a bezar, which he found out that way not to be genuine, tho' a great price was set on the latter.

5. Hence mercury is said to have a different gravity, being sometimes 13 ½, and sometimes above 14 times heavier than water; and hence a notable difference may arise in weather glasses at the same time, and in the same place, to a whole inch, from the different gravity of the mercury in the one and in the other; therefore, those who publish registers of the weather, ought to find out and declare to the world the specific gravity of the quicksilver they use in their barometers.

6. These he enumerates over and above what we have taken notice of a mechanical and geometrical nature, and to let us know the high value he had for this science, he expresses himself thus: "As little skill as I have in hydrostatics, I would not be debarred from the use of them for a considerable sum of money; it having already done me acceptable service, and on far more occasions than I myself at first expected, especially in the examen of metals, and mineral bodies, and of several mineral productions," with much to the fame purport.

HYDROTICS, among physicians, signify medicines more usually called sudorifics. See the article Sudorifics.

HYGIENE, from ωγιν, health, that part of medicine which prescribes rules for the preservation of health; which depends, in a great measure, on the prudent use of the non-natural air, diet, exercise, &c. of the mind, retention and excretions. See Air, Diet, Exercise, &c.

HYGROMETER, a machine, or instrument whereby to measure the degrees of dryness, or moisture of the air, or rather of the atmosphere. See the articles Air, and Atmosphere.

There are divers sorts of hygrometers; for whatever body either swells or shrinks, by dryness or moisture, is capable of being formed into an hygrometer. Such are woods of most kinds, particularly ash, deal, poplar, &c. Such also is cat-gut, the beard of a wild oat, &c. Stretch an hempen cord or lute-firing, as A B (plate CXL. n° 1.) along a wall, bringing it over a pulley, B; and to the other end D, fix a weight E; into which fit an index G. On the same wall fit a plate of metal H, divided into any number of equal parts, and the hygrometer is compleat. For it is known from experience that moisture sensibly shortens the length of cords or fiddle-firings; and that as the moisture evaporates, they return to their former length. The weight, therefore, in the present case, upon an increase of the moisture of the air, will ascend; and upon a diminution of the same, it will descend.

Hence, as the index G will show the spaces of ascent and descent; and those spaces are equal to the increments and decrements of the length of cord, or gut, A B D; the instrument will discover whether the air be more or less humid now, than it was at another given time. But if a more delicate and accurate hygrometer be required, strain a whip-cord or fiddle-firing, over several pulleys B, C, D, E, F, and G. (ibid. n° 2.) and proceed as in the former example. Nor does it matter whether the several parts of the cord A B, BC, CD, &c. be parallel to the horizon as expressed in the figure or perpendicular to the same.

The advantage of this above the former hygrometer, is, that we have a greater length of cord in the same compass; and consequently greater contraction or dilataction.

Another method of construction, which is more simple, is thus. Fasten a hempen cord or fiddle-firing, A B (ibid. n° 3.) to an iron-hook; and let the other end, B, descend upon the middle of a horizontal board, or table, E F; near B, hang a leaden weight or ball of a pound, C, and fix an index C G. Lastly, from the center B describe a circle, which divide into any number of equal parts. Or, instead of the table or board, draw two concentric circles on the ball K from L (n° 4.) and divide them into any number of equal parts, and fix an index N, to any proper support N. So that it may almost touch the divisions of the ball. Here the cord or gut twining or untwining will shew the change of moisture, &c. by the successive application of the index to the divisions of the circle.

Or thus: provide two wooden frames, A B
HYG [1681]

AB and CD, (n°. 5') with grooves there-in; and between these grooves fit two thin leaves of ah, A E F C, and G B D H, so as they may easily slide either way. At the extremes of the frames A, B, C, D, confine the leaves with nails, leaving between them the space E G H F, about an inch wide. On I faften a flip of brails dented, IK; and in L a little dented wheel, upon whole axis, on the other side of the machine an index is to be put. Laftly, from the center of the axis, on the fame side, draw a circle, and divide it into any number of equal parts. Now, it is found from experience, that when wood readily imbibes the moisture of the air, and swells therewith; and as happen in the alhen wood readily imbibes the moisture it into any number of equal parts. Wind's blowing, or the heat or drought, that the temper or feafon, fuch place in it a fponge, or other body. And, again, as the moisture the wind's altering of the wind, and the heat or cold at that time. 5. The wind's being in the north, north-eaft, and eaft, winter and summer, for the moft part at that time the deal shrinks, in the night also as well as in the day, but not fo much; which is a sign of drying weather, and sometimes of froft or cold in winter, heat or fcorching in summer, in a clear day. But on the contrary, the south wind's blowing, or the west and south-west, the deal always relaxes that day, or at leaft is at a flay, provided this happen in the day-time; for then if in the night, not fo much; and fo this will do some considerable time before rain. 6. By a conftant obfervation of this instrument, you may be able to guess at the wind's situation without a weather-cock, provided you have by you a common and a sealed thermometer. 7. Also you may know the time of the year: for in the spring it moves quicker, and more in winter; in summer it is more shrunk than in the spring; in autumn less in motion than in summer. It is to be obferved, that all the hygrometers above defcribed become by degrees lefs and lefs accurate, and at length undergo no sensible alteration at all from the humidity of the air. The following is much more lafting. Take a nice balance (ibid. n°. 6.) and place in it a fponge, or other body, which easily imbibes moisture; and let it be in equilibrio, with a weight hung at the other end of the beam. Now if the air become moist, the fponge becoming heavier, will preponderate; if dry, the fponge will be raised up. This balance may be contrived two ways; by either having the pin in the middle of the beam, with a fender tongue a foot and a half long, pointing to the divisions on an arched plate fitted to it; or, the other extremity of the beam may be made fo long as to decribe a large arch on a board placed for the purpofe, as is repreffented in the figure. To prepare the fponge, it may be neceffary to wafh it in water; and when dry again, in water or vinegar, wherefal armoniac, or falt of tartar, has been difolved, and let it dry again, then it is fit to be used.

In the laft mentioned hygrometer, Mr. Gould, in the Philosophical Transactions, instead
HYM [1682] HYO

instead of a sponge, recommends, oil of vitriol, which is found to grow sensibly lighter or heavier, in proportion to the lesser or greater quantity of moisture it imbibes from the air; so that being falsified in the mosteke weather, it afterwards retains or loses its acquired weight, as the air proves more or less moist. The alteration in this liquor is so great, that in the space of fifty-seven days, it has been known to change its weight from three drachms to nine; and has shifted an index or tongue of a balance thirty degrees. A single grain, after its full increase, has varied its equilibrium so sensibly, that the tongue of a balance, only an inch and a half long, has descried an arch one third of an inch in compass, (which arch would have been almost three inches if the tongue had been one foot) even with so small a quantity of liquor; consequently, if more liquor, expanded under a large surface, were used, a pair of scales might afford as nice an hygrometer as any kind yet invented. The same author suggests, that oil of sulphur per campaanum, or oil of tartar per deliquium, or the liquor of fixed nitre, might be substituted in lieu of the oil of vitriol.

But among all the inventions the following seems best calculated both for dispatch and accuracy. A (ibid. n° 7.) represents a thin piece of sponge, so cut as to contain as large a superficial as possible. This hangs by a fine thread of silk, upon the beam B, and is exactly balled from another thread of silk at D, strung with the smallest lead shot, at equal distances, and so adjusted as to cause the index E to point at G, in the middle of the graduated arch F G H when the air is in a middle state between the greatest moisture and the greatest dryness. I, shews a little table or shelf for that part of the silk and shot which is not suspended to reft upon.

HYLE, or Hylec, among alchemists, denotes their first matter, or the original chaos of things.

HYLEG, or Hylec, in astronomy, signifies a planet, or the point in the heavens which at a person’s nativity, is accounted the significator of life. See Nativity.

HYMEN, in anatomy, a membrane, sometimes of a circular, sometimes of a semilunar figure, and sometimes of a form different from both. It is always found in young girls, and flops a part of the vagina. In these it has a small aperture, and a longer in adults who have not conversed with men. After the first coitus it is not to be found; it is always destroyed by it, and if it has not been injured before, some blood always follows the rupture of it.

In the heathen mythology, Hymen was the god of marriage, and new-married women offered sacrifices to this deity. He was represented crowned with sweet marjoram, and sometimes with roses; carrying in one hand a torch, and in the other a flame-coloured veil, to represent the blusses of a virgin.

HYMENÆA, in botany, a genus of the polygamy trinecta class of plants, the flower of which is papilionaceous, and its fruit a large legumen or pod, of an ovoar-oblong figure, obtufe, and unilocular, with numerous oval seeds, surrounded with fibres and a farinaceous matter.

HYMENÆAL, something belong to marriage, so called from hymen. See the articles HYMEN and MARRIAGE. The hymenæal song is otherwise called epithalamium. See Epithalamium.

HYMN, a religious song. The hymns sung in the christian church, as distinguiushed from the psalms, are pieces of poetry composed by pious, but not inspired authors. The use of music in religious worship has prevailed in all nations from the remotest ages. The antient heroes were of opinion, that it appeased the anger of the gods, for which reason their public devotion was generally attended with a concert of voices and instruments.

Music has likewise been consecrated to religion, both by the Jews and Chriftians; and the former made use of trumpets, drums and cymbals, joined with the voices of the levites and people: but the music of the antient christians was plain and solemn, and consisted only in singing hymns, or psalms, with joint voices.

The priscillians preferred to sing, among their apocryphal writings, the hymn which our bleffed Lord sung with his disciples, after his last supper. But it is generally supposed, that they sung the hymn which the Jews were used to sing after eating the passover.

HYOIDES, in anatomy, a bone which adheres to the bafe of the tongue. In young subjects the os hyoides is composed of three bones, a base, occupying its middle part, and two lateral ones, called its horns. In adults there are often overlooked
at the junctures of these with the bafe, two other fruitle, very small, and thence overlooked by most writers: these are nearly of the shape of a wheat-corn, and may therefore be called offa triticca: there are ligaments fixed to these, by means of which they adhere to the styloide processes. And, finally, in these ligaments themselves, sometimes, tho’ very rarely, there are found some other little bones. Vefaliius met with fix of these: and some others after him have reckoned eleven bones to the formation of the os hyoides. The ufe of the os hyoides is to give a firm basis to the tongue: and therefore several muftcles of the tongue and larynx, serving to the necessary motions of both, are inserted into it.

HYOSCYAMUS, Hen-bane, in botany, a genus of the pentandria monogyne class of plants, the flower of which consists of a single infundibuliform petal, with a short cylindrical tube, and an erecto-patent limb lightly divided into five obtuse segments, one of which is broader than the rest: the fruit is a capsule of an ovato-obtuse figure, with a line marked on each side: it contains two cells, with numerous seeds. The root of this plant, according to Dale, is an excellent refrigerant and emollient, but is said to occasion some of plants, the roots of which the middle one is hollow, compressed, and erect: the fruit is a long, compressed pod, incurvated, and articulated: the seeds are of a roundish figure, but compressed, and are placed singly in the articulations of the pod. This plant is an opiate.

HYPER, into, a greek preposition, frequently used in composition, where it denotes excess; its literal signification being above, or beyond.

HYPERBATON, in grammar, a figurative construction inverting the natural and proper order of words and sentences. The several species of the hyperbaton are the anaphrope, the hyferton-proteron, the hypallage, the synchysis, the mesis, parenthesis, and the hyperbaton, stringly so called. See ANASTROPE, &c.

HYPERBATON, stringly so called, is a long retention of the verb, which completes the sentence, as in the following example from Virgil.

Interea reges: ingenti mole Latinus
Quadrinugo vebitur curru, cui tempora circum
Aurati his sex radii fulgentia cingunt.
Solis ovi speciem: bigis it Turnius in albis,
Bina manu lato crispsans hastilia ferro
Hinc pater Eneas Romanis floris origo,
Sidereo flagrants cypho & cælebis armis;
Et juxta Ascanius magne fpes altera Romae
Procedunt castris.

HYPERBOLA, in geometry, the section GEH (Plate CXLI. n° 1.) of a cone ABC, made by a plane, fo that the axis, EF, of the section inclines to the opposite leg of the cone, BC, which in the parabola is parallel to it, and in the ellipse

HYPANTE, or Hyperpante, a name given by the Greeks to the fealt of the presentation of Jefus in the temple. This word, which signifies lowly or humble meeting, was given to this feast, from the meeting of old Simon and Anna, the prophetis in the temple, when Jefus was brought thither.

HYPATE, in antient mufe, an appellation given to the lowest chord of a tetra-chord. Thus hypate hypaton, was the lowest chord of the hypaton tetrachord, and answered to our § natural of the lowest octave of the organ; or to the lowest mi of Guido’s scale. The hypate melon was the last note of the hypaton, and the first of the melon tetrachord. See the article DIAGRAM.
ellipses intercepts it. The axis of the hyperbolical section will meet also with the opposite side of the cone, when produced above the vertex, at D.

Definitions. 1. If at the point E (ibid. n° 2.) in any plane, the end of the rule E H be so fixed, that it may be freely carried round, as about a center; and at the other end of the rule H there is fixed the end of a thread shorter than the rule, and let the other end of the thread be fixed at the point F in the same plane; but the distance of the points E F must be greater than the excess of the rule above the length of the thread; then let the thread be applied to the side of the rule E H by the help of a pin G, and be stretched along it; afterwards let the rule be carried round, and in the mean time let the thread kept stretched by the pin be constantly applied to the rule: a certain line will be described by the motion of the pin, which is called the hyperbola. But if the extremity of the same rule, which was fixed in the point E, is fixed in the point F, and the end of the thread is fixed in the point E, and the same things performed as before; there will be described another line opposite to the former, which is likewise called an hyperbola; and both together are called opposite hyperbolas. These lines may be extended to any greater distance from the points E, F, viz. if a thread is taken of a length greater than that distance.

2. The points E and F are called the foci. 3. And the point C, which bisects the right line between the two focus’s, is called the center of the hyperbola, or of the opposite hyperbolas.

4. Any right line passing thro’ the center, and meeting the hyperbola, is called a transverse diameter; and the points in which it meets them, their vertices: but the right line, which passes thro’ the center, and bisects any right line terminated by the opposite hyperbola’s, but not passing thro’ the center, is called a right diameter. 5. The diameter which passes thro’ the foci, is called the transverse axis. 6. If from A or a, the extremities of the transverse axis, there is put a right line A D equal to the distance of the center C from either focus, and with A, as a center, and the distance A D, there is a circle described, meeting the right line, which is drawn thro’ the center of the hyperbola at right angles to the transverse axis, in B b; the line B b, is called the second axis. 7. Two diameters, either of which bisects all the right lines parallel to the other, and which are terminated both ways by the hyperbola or opposite hyperbolas, are called conjugate diameters. 8. Any right line not passing thro’ the center, but terminated both ways by the hyperbola or opposite hyperbolas, and bisected by a diameter is called an ordinate applied, or simply an ordinate to that diameter: the diameter likewise, which is parallel to that other right line ordinately applied to the other diameter, is said to be ordinarily applied to it.

9. The right line which meets the hyperbola in one point only, but produced both ways falls without the opposite hyperbolas, is said to touch it in that point, or is a tangent to it. 10. If thro’ the vertex of the transverse axis a right line is drawn equal and parallel to the second axis, and is bisected by the transverse axis, the right lines drawn thro’ the center and the extremities of the parallel line are called asymptotes. 11. The right line drawn thro’ the center of the hyperbola, parallel to the tangent, and equal to the segment of the tangent between the asymptotes, and which is bisected in the center, is called the second diameter of that which is drawn thro’ the point of contact. 12. A third proportional to two diameters, one of which is the transverse, the other second to it, is called the Latus rectum, or parameter of that diameter, which is the first of the three proportionals. And, 13. Lastly, n° 5. If upon two right lines A a, B b, mutually bisected each other at right angles, the opposite hyperbolas A G, a g are described; and if upon the same right lines there are described two other opposite hyperbolas B K, b k, of which the transverse axis B b, is the second axis of the two first; and the second axis of the two last, A a, is the transverse axis of the two first; these four are called conjugated hyperbolas, and their asymptotes shall be common.

Prop. I. (ibid. n° 2.) The square of the half of the second axis is equal to the rectangle contained by the right lines between the foci and the vertex’s of the transverse axis. Let A a be the transverse axis, C the center, E and F the foci, and B b the second axis, which is evidently bisected in the center C, from the definition; let A B be joined: then since (by def. 6.) A B and C F are equal; the squares of 5 A C
HYPERBOLA.
AC and CB together will be equal to the square of CF, that is, \( (6.2.) \) to the square of AC and the rectangle AF \( a \) together; wherefore taking away the square of AC which is common, the square of CB will be equal to the rectangle AF \( a \).

Prop. II. If from any point G (ibid. n° 3, 4) of the hyperbola, a right line GD is drawn at right angles to the transverse axis AA, and if from the same point there is drawn the right line GF to the focus nearest to that point; the half of the transverse axis CA will be to the distance of the focus from the center, viz. CF, as the distance of the perpendicular CD, is to the sum of the half of the transverse axis, and the right line drawn to the focus.

Let GE be drawn to the other focus, and on the axis \( aA \) produced, let there be let off AH equal GF; then with the center G, and the distance GF, describe a circle cutting the axis \( aA \) in K and F, and the right line EG in the points L and M; then since EF is double CF, and FK double FD, EK shall also be double CD; and since EL or AA, is double CA, and LM double GF or AH, EM shall also be double CH; but because of the circle EL or AA: EF: EK: EM: and taking their halves, it will be as CA: CF: CD: CH.

Prop. III. (ibid. n° 3, 4.) the same things being supposed, if from A the extremity of the transverse axis nearest to the point G, there is set off a right line A H on the axis produced, equal to the distance of the point G from the focus F, nearest to the said extremity; the square of the perpendicular GD shall be equal to the excess of the rectangle EHF, contained under the segments betwixt H (the extremity of the right line A H) and the foci, above the rectangle AD \( a \) contained under the segments cut off betwixt the perpendicular and the extremities of the axis.

For since the right line CH is any how cut in A, the squares of CA and CH together will be equal to twice the rectangle ACH, and the square of AH, \( (7.2.) \) i.e. because CA, CF, CD, CH are proportionals, to twice the rectangle FCD, and to the square of AH or GF; that is, to twice the rectangle FCD and the squares of FD and DG, that is, to the squares of FC, CD, and DG, \( (7.2.) \) whereas the two squares of CA and CH are equal to the three squares of FC, CD, and DG; and taking away the squares of CA and CF from both sides, the remaining rectangle EHF, will be equal to the remaining rectangle AD \( a \) and to the square of DG \( (6.2.) \).

Prop. IV. (ibid. n° 3, 4.) If from any point G of the hyperbola, there is drawn a right line parallel to the second axis BB, meeting the transverse axis AA in D; the square of the transverse axis shall be to the square of the second axis, as the rectangle contained under the segments of the transverse axis betwixt the parallel and its extremes, to the square of the parallel.

Prop. V. (ibid. n° 4.) If from any point G of the hyperbola there is drawn a right line parallel to the transverse axis AA, meeting the second axis in N; the square of the second axis, shall be to the square of the transverse, as the sum of the squares of the half of the second axis and its segment betwixt the center and the right line, to the square of the line itself; that is, \( CB^2: CA^2: CB^2 + GD^2: CA^2 + \) the rectangle AD \( a \); that is, as \( CB^2 + CN^2 \) is to \( CD^2 \) or \( GN^2 \).

Prop. VI. (ibid. n° 5.) It is another property of the hyperbola, that the asymptotes, DD, EE, do not absolutely meet with the curve. See Asymptote.

Prop. VII. If through any point F (ibid. n° 5.) of the hyperbola, there is drawn a right line IF \( L \) parallel to the second axis, and meeting the asymptotes in I and L; the rectangle contained under the right lines which are intercepted betwixt the asymptotes and the hyperbola, is equal to the square of the half of the second axis, that is, \( CB^2 - IF^2 = HL \).

Prop. VIII. (ibid. n° 6.) If from any point F of the hyperbola, there is drawn to the transverse diameter, AB, a right line ordinately applied to it \( FG \); and from the extremity of the diameter there is drawn AH perpendicular to it, and equal to the \( latus \) \( rectum \); the square of the ordinate shall be equal to the rectangle applied to the \( latus \) \( rectum \), being of the breadth of the abscissa betwixt the ordinate and the vertex, and which exceeds it by a figure like and alike situated to that which is contained under the diameter and the \( latus \) \( rectum \).

For join BH, and from the point G let there be drawn CM parallel to AH, and meeting BH in M, and through M let there be drawn MN \( L \) parallel to AB meeting \( AH \) in N, and let the rectangles 10 F MNHO,
HYPERBOLAE, in ancient music, the upper or last tetrachord or fourth. It was thus called from its being high or shrill, when compared with the other fourths. It was conjoint to another below it, called diezeugmenon. See the articles DIAGRAM and DIEZEUGMENON.

HYPERBOLE, in rhetoric, a figure, whereby the truth and reality of things are excessively either enlarged, or diminished. See the article EXAGGERATION.

The word is greek, ἡπερβολή, superlatio; formed of the verb ἀπερβάλλων, εὐστρεφεῖ on, to exceed, surpass by far.

The character of an hyperbole is to exaggerate or extenuate the idea of the things spoken of, beyond the bounds of truth, or even probability. As, he ran swifter than the wind; he went slower than a tortoise, &c. Hyperboles, says Seneca, lie without deceiving; they lead the mind to truth by fictions; they convey the sentiment intended, tho' by ex- \fend it in terms which render it incredible. The hyperbole promises too much, in order to make you conceive enough.

Aristotle observes, that hyperboles are the favourite figures of young authors, who love excess and exaggeration; but that philosophers shouid not use them without a great deal of reserve. The pitch to which an hyperbole may be carried, is a point of great delicacy. To carry it too far, is to destroy it: it is of the nature of a bowstring, which by immoderate tension, slackens; and frequently has an effect quite contrary to that intended.

Those hyperboles are best, which are latent, and are not taken for hyperboles. For this reason they should scarce ever be used but in a passion, and in the middle of some important incident: such is the hyperbole of Herodotus, speaking of the Lacedemonians, who fought at Thermopylae: "They defended themselves for some time with the arms that were left them, and at last with their hands and teeth; till the Barbarians, continually shooting, buried them as it were, with their arrows." Now what likelihood is there, that naked men should defend themselves with their hands and teeth against armed men; and that...
HYPERCATALECTIC, in the Greek and Latin poetry, is applied to a verse, which has one or two syllables too much, or beyond the regular and just measure: as,

Muse forores sunt Mineruae. Alfo, Muse forores Palladis iugent.

The Greek and Latin verses are distinguished, with respect to their measure, into four kinds, catalectic, catalectic, brachycatalectic, and hypercatalectic. See ACATALECTIC, &c.

The hypercatalectic is also called the hyperpreter.

HYPERDULIA, in the church of Rome, a species of worship paid to the holy virgin; being greater than the dulia, or worship paid to the saints, but less than the latria or supreme worship paid to the deity. See ADORATION AND WORSHIP.

HYPERICOIDES, a plant otherwise called ascyrum. See ASCYRUM.

HYPERICUM, St. John's Wort, a genus of the polyadelpheia polyandria class of plants, the flower of which consists of five oblong, obtuse, patent petals: the fruit is a roundish capsule, with two, three or five cells, containing a great number of oblong small seeds. See PL. CXXXVIII. fig. 2.

This genus comprehends the androcephalum and ascyrum of Tournefort.

St. John's wort is recommended as a vulnerary, detergent, and diuretic: it resolves coagulated blood, destroys worms, and promotes the mensis and urine.

HYPERMETRE, in the antient poetry the name with hypercatalectic. See the article HYPERCATALECTIC.

HYPERSARCOSIS, in medicine and surgery, an excess of flesh, or rather a fleshly excrescence, such as those generally arising upon the lips of wounds, &c. See WOUND AND EXCRESCEENCE.

HYPERTHYRON, in the antient architecture, a sort of table used after the manner of a frieze, over the jaums of doric doors and gates, and the lintels of windows. It lies immediately under the corona, and our workmen usually call it the king-piece.

HYPHEN, an accent, or character, in grammar, implying that two words are to be joined, or connected into one compound word, and marked thus -. See PRE-ESTABLISHED, five-leaved, &c.

Hyphens also serve to connect the syllables of such words as are divided by the end of the line.
HYPNOTIC, in the materia medica, such medicines as any way produces sleep, whether called narcotics, hypnotics, opiates, or soporifics. Authors are of various opinions in regard to the manner wherein hypnotics operate. See the article Narcotics.

HYPNUM, in botany, a genus of mosses of the cryptogamia class of plants, consisting of flasks and leaves, and producing membranaceous capsules; these capsules stand on pedicles, which grow on the ax of the leaves, and have at their base a kind of squamous covering, formed of a matter quite different from the leaves of the plant; the capsules of the hypnum have all their calyptrae; they are of different shapes, but usually long; likewise the squamous involucrum at the base of the pedicle is called by Dilhienius perichaetum, and is the greater characteristic of the hypna, no mosses of any other genus having it in this form. See plate CXXXIX. fig. 2.

HYPOCAUSTUM, among the Greeks and Romans, a subterraneous place, wherein was a furnace, to heat the baths. See the article Bath.

Another sort of hypocaustum was a kind of kiln, to heat their winter-parlours. Among the moderns, it is that place where the fire is kept, that warms a stove or hot-house.

HYPOCHERIS, in botany, a genus of the finge-xha-polymnia-equalis class of plants, the compound flower of which is imbricated, uniform, and consists of numerous hermaphroditic small flowers, that are all equal; the partial flower is monopetalous, ligulated, linear, truncated, and divided into five segments; there is no pericarpium; the cup is convivent and globo-acuminated; the seed is single, oblong, and ending in a pubescent pedicle, covered with down.

HYPOCHONDRIA, in anatomy, that part of the body on both sides, which lies under the supraviscular ribs, and is extended to the ilia; comprehending not only the muscles, but the internal viscera.

HYPOCHONDRIAC Passion, a superficial and flatus affection of the stomach and intestines, arising from a preternatural constitution of the peristaltic motion, caused by the stagnation of the blood and vital fluids between the nervous and muscular coats of the intestines. This disease is attended with such a train of symptoms, that it is a difficult task to enumerate them all; for there is no part of the body that is not, sooner or later, a sufferer by its tyranny. It begins with tensions and windy inflations of the stomach and intestines, an uncertain appetite, sometimes quite decayed, and sometimes strong; the aliment is ill digested, breeding acid and vicid crudities; there is a preffing heavy pain in the stomach, chiefly after meals; a violent heart burn, very acid belchings and vomiting, bringing up such acid stuff that the teeth are not only set on edge, but the very linnen or sheets sometimes corroded. In the intestines, about the navel, there are felt heavy excruciating pains; in the groins intestines the pains are more acute. Sometimes there is a looseness; sometimes a most offensive contivnence, with a retention of the wind, which when it breaks out, either upwards or downwards, is attended with an alleviation of the symptoms; but they soon rage again, with as great a violence as ever. The urine is generally thin, limp, and pale; but sometimes it has a copious sediment mixed with fabulous concretions, and often apes a fit of the gravel. In the breast there is a great straining, a difficulty of breathing, and a fluttering and palpitation of the heart. As the disease increases, the patient is troubled with the head-ach, a noise in the ears, with difficulty of hearing; the eyes are clouded, some have double vision, or a pain and drinsets of the eyes, and in the tongue a moist troublesome burning pain, fixed to a certain space, with a plentiful excretion of spittle. At length the animal functions are impaired, the mind is disturbed on the most trivial occasions, and is hurried into the most perverse commotions; the patient entertains wild and extravagant fancies, the memory grows weak, and the reason fails. Some symptoms affect the whole body, which is covered with blotches, or copious sweats; the strength decays, the limbs are languid and unapt for labour; the body becomes tabid, the joints are tormentcd sometimes with a blunt, and sometimes with a cutting pain; at last, all the secretions, especially the fanguineous, are perverted. In short, as Dr. Sydenham observes, it imitates all sorts of distempers so exactly, as to require the utmost sagacity of a physician, to distinguish it from an essential disease of any part.

The remote causes of this disorder are, an hereditary disposition to it, a sedentary studious life, fadsnes, cares, trouble
HYPOCYSTIS, in pharmacy, an infipid juice, obtained from the seffile al-

rum
HYP

rum, much resembling the true egyptian acacia. See the article ASARUM.

They gather the fruit, while unripe, and express the juice, which they evaporate over a very gentle fire, to the consistsence of an extract, and then form into cakes, and expose them to the sun to dry.

Hypocyft is an astringent, and that of considerable power; it is good against diarrhoeas and haemorrhages of all kinds, and may be used in repellant gargariums in the manner of the acacia; but it is very rarely met with genuine in our shops, the german acacia being usually fold under its name.

HYPOGASTRIC, an appellation given to the internal branch of the iliac artery. See the articles ARTERY and Iliac.

HYPOGASTRIC VEINS arise on each side from the iliacs; andsend out branches to the rectum. See the article VEIN.

HYPOGASTRUM, in anatomy, the lower part of the abdomen. See the article AbDOMEN.

HYPOMDCHLION, in mechanics, the fame with fulcrum. See FULCRUM.

HYPOPHELLOCARPENDRON, in botany, a plant called by LINNÆUS LEUCODENDRON. See LEUCODENDRON.

HYPOPITYS, in botany, a plant other-wise called monotropa. See the article Monotropa.

HYPOPYON, in medicine, a collection of purulent matter under the cornea of the eye. See the article Eye.

As to the cure of an hypopyon, it should first be attempted by violently shaking the patient's head, in a supine posture, and pressing the eye before, with the fingers, in order to remove, or at least loosen the matter.

But if this proves unsuccessful, the patient being seated in the couching for a cataract, an incision is made with a lancet, through the cornea, below the pupil, and about the space of a line from the white of the eye, and that large enough to discharge the matter and aqueous humour; pressing the eye gently by the fingers, and taking care left you wound the uvea: then a compres, moistened with a proper collyrium, is to be applied every third or fourth hour to the eye. If the matter be too thick to be discharged, the needle, which is also employed for making fetons, is to be used. The instruments should be wrapped up, so that only the point be bare. In this case, St. Yves advises to introduce a small probe, or inject some cold water with a syringe, and continue this till the whole pus be dissipated, after which the wound may be healed.

HYPORCHEMA, in the greek poetry, a poem, consisting of divers kinds of verse, and of different lengths; but always full of short, or pyrrhichic feet.

HYPOSTASIS, among divines, signifies a person, or substance; chiefly used in speaking of the persons of the Trinity. See the article Trinity.

HYPOSTASIS, in medicine, denotes the sediment of urine.

HYPOTHeca, in the civil law, the same with mortgage in the common law. See the article Mortgage.

HYPOTHENAR, in anatomy, the abductor muscle of the little finger. See the article Abductor.

HYPOTHENUSE, in geometry, the longest side A C (plate CXXXVII. fig. 2.) of a right-angled triangle ABC; or it is that side which subtends the right angle B.

Euclid, lib. I. proposition XLVII. demonstrates, that, in every rectilinear right-angled triangle, the square of the hypotenuse AC (ibid.) is equal to the squares of both the other sides AB, CB or, that $AC^2 = AB^2 + CB^2$.

This celebrated problem was discovered by Pythagoras, who is said to have sacrificed a hecatomb to the Muses, in gratitude for the discovery.

HYPOTHESIS, in general, denotes something supposed to be true, or taken for granted, in order to prove or illustrate a point in question.

An hypothesis is either probable or improbable, according as it accounts rationally or not for any phenomenon; of the former kind we may reckon the copernican system and Huygen's hypothesis concerning the ring of Saturn; and the ptolemaic system may be esteemed an instance of the latter. See the article Copernican.

Hypotheses, however elegant and artful, ought to be first proved by repeated observations and confirmative experience, before they are received as truths. See the article Experimental Philosophy.

HYPOTHETICAL propositions. See the article Proposition.

HYPOTRACHELION, in architecture, denotes a little frieze in the tufcan and doric capitals, between the astragal and annulets, called likewise colerin, gorgerin, &c. By some it is applied to the neck.
HYS [1691] HYS

seek of any column, or that part of the capital thereof, below the astragal.

YPOTYPOSIS, in rhetoric, signifies a lively description.

YPOTYPOSIS, in anatomy, a membrane that separates two cavities: such is the diaphragm.

YPSILOIDES, in anatomy, the fame with the os hyoides. See the article HYOIDES.

YSOP, hylfop, in botany, a genus of the *dIdynamia-gymnofermia* class of plants, the flower which is monopetalous and ringent; the upper lip being erect, roundish, and emarginated, and the lower one divided into three short segments, the middle one of which is hollow and cordated; the flower is succeeded by four small seeds, which are roundish and of a brown colour. See plate CXXXIX. fig. 3.

Hylfop is attenuant and difcutient, and is recommended in disorders of the lungs, when they are loaded with a foul and thick matter, it strengthens the stomach and affists digestion; and by its acrimony, and power of attenuating the viscous matter in the lungs, promotes expectoration, and is therefore good in asthma: its good effects in the stomach are of the fame kind, depending on its attenuating and abettering the viscous phlegm lodged there, which impedes the discharge of its proper functions. It is also good in diseases of the head.

It is best taken in infusion, in the manner of tea, not made fo strong as to be disagreeable to the palate, and often repeated. A simple water of it, which retains much of its taste, smell, and virtues, is kept in the shops; they used also to have a syrup of it, but that has of late been disfregarded.

Externally, hylfop is greatly recommended inbruises: the blackness settling under the eyes from blows is carried off very readily by a cataplasm of the leaves, or only a little bundle of them fewed up in a linen-rag, and applied to the part: and Ray gives us an account from Mr. Boyle, of a violent contusion of the thigh, from the kick of a horse, very happily cured by this herb, boiled as a cataplasm; he tells us, the violent pain was alfo instantly removed, and the very mark and blackness taken off in a few hours.

HYSTERICS, or HYSTERIC PASSION, in medicine, a spasmotico-convulsive affection of the nervous system, proceeding from the womb, and caufed by the retention or corruption of the blood and lymph in its vessels; and more or lefs inflicting the nervous parts of the whole body, by means of the nerves of the os sacrum, the loins, and the whole spinal marrow.

Hoffman, contrary to the sentiments of Willis, will not allow the uterus to be a nervous part; for he affirms that the hysteric passion, which is attributed to a vice in the womb, is owing to spafmatic, convulsive, and epileptic disorders, all which arife from a fault of the genus nervum. But Alfric observes, that the effects of impressions are various, according to the degree of their intensity; thus, tickling the nofe with a feather, will caufe sneezing; of the fauces, vomiting; while a violent impression only caufes simple pain; which is the caufe of the uterus in the hysteric passion: for the caufes of this difeafe, from observation, are the preternatural oscillations of the uterine arteries, on the approach of the menefes, or their suppression, when they are diffended with blood; an irritation of the uterus from the fluor albus; various tumours in the uterus; the acrimony of the feminal fluids. These afficcions of the uterus draw the other parts into conflent, as poifons in the stomach produce convulsions, a syncope, and sweats. This difeafe has been very improperly confounded with the hypochondriac passion: for a strangulation of the fauces, an intercepted breathing even to suffocation, a fainting away, a loss of voice, a profound sleep, are the true, proper, and effential signs and symptoms of this uterine difeafe.

An hysteric fit is, according to Hoffman, generally preceded with a pressing pain of the forehead, temples, or eyes, with an effusion of tears, a dimnes of fight, a dulness of the mind and fenses, a loathing of all things. When the fit comes on, the patient is exceeding collyve, and yet has a strong stimulus to discharge her urine, which is as clear as water; the breathing is uneasy, difficult, and short; and a languor seizeth the whole body: to thesucceed a pain in the loins, a great shivering and shaking; the belly is hard and inflamed; afterwards the navel is drawn inwards, and outwardly leaves a great pit; then they feel a fort of a globe arises from the lower part of the belly to the hypochondria and diaphragm; soon after the heart begins to flutter and beat with a hard, unequal, and sometimes intermitting pulse; the extreme parts grow col'd,
When they begin to come to themselves, the pulse, which was before weak, languid, and obscure, becomes brisk, soft, and strong; heat returns to the extreme parts, the face looks ruddy, the wind forces its way upwards, there is a rumbling in the belly, and at length the patients, waking as it were out of a profound sleep, have the voice, sense, motion restored; yet they complain of a sudden suppression of the menses, and others again break out into immoderate laughter, and regaining their voice, say a great many filthy things.

The hysterical passion attacks women that are pregnant, or in child-bed; widows that are full of blood, after some grievous passion of the mind; or maids, after a sudden suppression of the menes. This disease, according to the last mentioned writer, may be caused by whatever promotes a more plentiful afflux of the blood and genitonal fluid to the uterine parts, or impedes the eruption of the menes, or occasions their suppression: hence maids and widows are most subject thereto; also women of a sanguine and bilious constitution, who live high, drink generous wines, feed on high-seasoned aliment, and are subject to violent passions and commotions of the body and mind: on the other hand, those who live a sedentary and quiet life, feed on coarse, acid, low diet, who have omitted usual bleeding, who are oppressed with forrows, cares, and disappointments, are liable to this disease; for by these the blood is thickened, the solid parts weakened, and consequently the flowing of the menes rendered more difficult. Likewise, sudden terror, and the body being exposed to uncommon cold during the time of the menstrual flux, by giving it a check, procures hysterical spasms. Some are subject to the same disorder from the smell of perfumes.

However dreadful and cruel this disease may appear, yet it is not very dangerous in itself, unless ill managed, or the patient be exceeding weak and valutudinary: it is most apt to turn into convulsions and an epilepsy.

In the cure, it must be carefully observed, whether the woman is plethoric, or exhausted of blood and strength. In the former case, the spasms or convulsions are more violent and copious; bleeding is a present help, and many have been brought to themselves who were seemingly dead, if the florid colour of their face had not shewn to the contrary.

In the fit it will be proper to apply fetid things to the nose, such as foetida, preparations of castor, partridges feathers burnt, &c. For women in child-bed, a girdle made of ruffia leather, and bound pretty tight, is excellent. Likewise clutters made with roots and seeds of lovage, which are specifics, camomile-flowers, elder-flowers, veronica, the carminative seeds boiled in whey; to which may be added oil of elder, dill, or camomile. Externally plasters made of opopanax, bdellium, galbanum, fagapenum, and afa foetida, may be applied to the navel. Some greatly recommend fumigations for the uterus, of mufk, civet, florax, and benzoin.

Inwardly, the patient may take thirty or forty drops of tincture of castor, in cold water; or if she can swallow them, the following pills: take myrrh, fagapenum, opopanax, afa foetida, fafron, and the heriaca andromache, of each half a dram; adding sometimes fix or eight grains of camphire and laudanum opiatum. From each crucible of this must ten pills be made, two of which are to be taken every hour, with a due quantity of water of camomile-flowers.

Some hysterical disorders, according to Dr. Mead, obferve the lunar phasæs, and partake of the nature of an epilepsy; they seldom require bleeding, and purging should be used with caution. Emetics are of greater service, especially a little before the fit. In the fit, the Dr. observes, the belted medicines are those which repair the lofs of spirits, as ruffian castor, gum ammoniac, and salt of amber, in pills. Take gum ammoniac, two drams; ruffian castor, one dram; salt of amber, half a dram; with a sufficient quantity of the peruvian balsam; make this mass into small pills, and let the dose, which is one crucible, be repeated as occasion requires.
Out of the fit, he prefers native cinnamon, and wild valerian-root, as most proper for correcting the juices. To prevent its degenerating into a chronic disease, particularly the hypochondriac passion, Hoffman advices that care should be taken to keep the menes regular, which must be done by balsamies, composed of myrrh and amber, with bitter and carminative extracts, especially zedoary and orange-peel, made into an elixir with a moderately spirituous menstruum: this frequently helps the digestion, and promotes a regular menstrual discharge.

But it is necessary to observe, that, in hysterical cases, the same remedies have a different effect on different women: some cannot bear fetid medicines, which to others are an immediate relief: some have fallen into a terrible syncope, and have come to themselves by sprinkling cold water on the face, when more powerful and spirituous things have failed. Others cannot endure hot things inwardly; nor outwardly, as baths, fomentations, liniments, and nervous applications. Anodynes and opiates, which procure ease and rest to some, are very injurious to others who are greatly debilitated, and whose nerves are weak. Some have recovered from a violent paroxysm by a draught of cold water, which given to others has increased the disorder.

When purging is necessary, it will be best to prescribe currants, well saturated with a gentle decoction of rhubarb. Sydenham prescribes the peruvian bark, morning and evening, in a scruple at a time, as an excellent remedy in hysterical convulsions.

In the fits, besides the remedies already mentioned, Attrac recommends a few grains of civet, or musk, alone, or tied in a thin rag, and introduced into the vagina, which helps to discharge the morbid and noxious humours of the uterus. Out of the fit, he observes that mirth and exercise have alone often cured this distemper. The bolt remedies are caffer, aë fætida, galbanum, tagapenum, and myrrh; five grains in powder is a dose, or ten drops of the tinctures; as also gentle purges of cassia, manna, or infusion of sena. Hysteria, a common symptom of the hypochondriac passion, attended with a most violent pain about the pit of the stomach; as also with a vomiting of a greenish humour, and great sinking of the spirits. After a day or two the pain goes off, but upon the slightest motion or perturbation of the mind it soon returns again.

Neither bleeding nor cathartics have any place in the cure. According to Sydenham, it will be proper first to advise the patient to drink upwards of a gallon of poflet-drink, to clear the stomach of its impurities, by throwing it up again, that the paregoric may not be hindered: afterwards give twenty-five drops of the thebain tincture, in an ounce of the spirit of cinnamon-water. This last is to be repeated, at due intervals, till the symptoms disappear; that is, the effect of one dose must be known, before another is given: yet sometimes in plethoric bodies, it the strength will permit, it is better to prepare the way by bleeding and purging, or both, for an anodyne.

But if the hysterical colic comes on by fits, the following may be tried in the intervals, or when the fit is off; take large doses of the ballam of Peru, that is, twenty, thirty, or forty drops, in a spoonful of the finest and whitest sugar; this may be taken twice or thrice in a day. HYSTEROLOGY, the same with hyletron proteron. See the next article.

HYSTERON PROTERON, in grammar and rhetoric, a species of the hypelbaton, wherein the proper order of construction is so inverted, as that the part of any sentence which should naturally come first is placed last, as in this of Terence, valet & vivit, for vivit & valet; and in the following of Virgil, moriamur & in media arma ruamus, for in media arma ruamus & moriamur.

HYSTEROPHORUS, a plant called by Linnaeus parthenium. See the article PARTHENIUM.

HYSTEROPOTMI, in grammar and rhetoric, a species of the hypelbaton, wherein the proper order of construction is so inverted, as that the part of any sentence which should naturally come first is placed last, as in this of Terence, valet & vivit, for vivit & valet; and in the following of Virgil, moriamur & in media arma ruamus, for in media arma ruamus & moriamur.

HYSTEROTOMIA, in anatomy, an anatomical dissection of the uterus or womb. See the article UTERUS.

HYSTEROTOMOTOCY, among chirurgical writers, the same with the caesarian section. See CAESARIAN.

HYSTRIX, or HISTRIX, in zoology. See the article HISTRIX.

HYTHE, or HITHE. See HITHE.
or i, the ninth letter, and third vowel of the alphabet, is pronounced by throwing the breath suddenly against the palate, as it comes out of the larynx, with a small hollowing of the tongue, and nearly the same opening of the lips: and talk as in pronouncing a or e. Its sound varies; in some words it is long, as high, mind, &c. in others short, as bid, bid, sin, &c. in others again, it is pronounced like y, as in collie, onion, &c. and in a few, it sounds like e, as in machine, magazine, &c. No English word ends in i, e being either added to it, or else the t turned into j.

But besides the vowel, there is the jod consonant; which because of its different pronunciation, has likewise a different form, thus J, j. In English, it has the soft sound of g; nor is used, but when g soft is required before vowels, when g is usually hard: thus we say, jack, jet, join, &c. instead of gack, get, goin, &c. which would be contrary to the genius of the English language. See the article English.

I, used as a numeral, signifies no more than one, and stands for so many units as it is repeated times: thus I, one; II, two; III, three, &c. and when put before a higher numeral, it substracts itself, as IV, four; IX, nine, &c. but when set after it, so many are added to the higher numeral, as there are I's added: thus VI is 5 + 1, or six; VII, 5 + 2, or seven; VIII, 5 + 3, or eight. The ancient Romans likewise used I for 100, C for 1000, CCC for 3000, CC for 200, and CCC for 300,000. Farther than this, as Pliny observes, they did not go in their notation; but when necessary, repeated the last number, as CCCCCC, CCCCCC for 200,000; CCCCCC, CCCCCC for 300,000; and so on.

I, used as an abbreviation, is often used for the whole word Jesus, of which it is the first letter.

JAAR, a river of the bishopric of Liege, which falls into the Maes, at Maestricht.

JABAJAHITES, a modern sect of Mahometans, who teach that the knowledge of God extends not to all things, but is perfected by experience; and that he governs the world according to the course of contingent events, as not having had from eternity a perfect knowledge of all things future. This doctrine is looked up on, by the other Mussulmen, as impious and blasphemous.

JABLUNKA, a town of Silezia, in the territory of Treffen: east long. 19°, north lat. 45° 37'.

JABOTAPITA, in botany, the same with the ochna of Linneus. See OCHNA.

JACATRA, or BATAVIA. See BATAVIA.

JACCA, a city and bishop's see of Arragon, in Spain, sixty miles north of Saragossa; west long. 50°, and north lat. 42° 50'.

JACEA, Knapweed, in botany, is comprehended by Linneus among the centaurs. See CENTAURIA.

JACENT, a termed applied by Helmont to nature, when a disease is risen to a height, and the morbid matter strives to suppress the vital flame.

JACK, in mechanics, an instrument of common use for raising heavy timber, or very great weights of any kind. See plate CXLII. fig. 1. n° 1.

But as the wheel-work of it is shut up in the strong piece of timber C B, we have given a representation of it (ibid. n° 2.) where you must suppose the rack A B at least four times as long in proportion to the wheel Q, it being here so much contracted; and the teeth, which will then be four times more in number, to be contained about three in an inch. Then if the handle H P be seven inches long, five turns of it, that is five times twenty-two inches, or 110 inches, will be the velocity of the power: whilst the weight raised by the claw A, or depressed by the claw B, moves one inch: for as the pinion of the handle has but four leaves, and the wheel Q twenty-three, there must be five revolutions of the handle to turn the wheel once round; whose three-leaved pinion, R, will in that revolution just move the rack A B three teeth or one inch.

This might have been also known without seeing, or even knowing, the number of the teeth of the wheel and pinions, by
by measuring a revolution of the handle in n° 1. and comparing the space gone through by it with the space gone through by the ends of the rack A or B. Sometimes this machine is open behind, from the bottom almost up to the wheel Q, to let the lower claw, which in that case is turned up at B, draw up any weight; and when this is effected to a sufficient height, it is prevented from falling down again by putting the end of the hook S (ibid. n° 1.) fixed to a staple, over the curved part of the handle at b.

All parts of this machine must be made very strong, but chiefly those which immediately sustain the weight.

The common kitchen jack is a compound engine; where the weight is the power applied to overcome the friction of the parts, and the weight with which the spit is charged; and a steady and uniform motion is obtained by means of the fly. See the article Fly.

JACK, in ichthyology, a name sometimes given to the lucius or pike. See the article Lucius.

Jack-Flag, in a ship, that hoisted up at the spirit-fall top-mast head. See Flag.

Jack-Daw, in ornithology, a species of corvus, with a black and grey head, a brownish black body, and the wings and tail black.

It is one of the smallest of the crow-kind, but an erect and well-shaped bird. See the article Corvus.

Jackall, in zoology, an animal of the dog-kind, with a slender snout. See the article Canis.

It is a very beautiful creature, and so like a dog, as to be mistaken at first sight for some mungrel breed of that animal. See plate CXLII. fig. 2.

Its size is that of a small hound; and, in the East, where it is a native, there are vast packs of them, often more than 200 in a company, which hunt animals they would never dare to attack single. It is not impossible that lions and other beasts of prey may be alarmed by the cries of these animals in their chase, and fall in and rob them of their prey; but the general opinion of their attendance on the lion, is fabulous.

Jacob's Staff, a mathematical instrument otherwise called crofs-staff. See the article Cross-staff.

JACOB'S EASTRUM, a plant otherwise called othonna. See OTHONNA.

JACOBEOIDES, a species of solidago. See the article Solidago.

JACOBINE, or Jack, in ornithology, a very small sort of pigeon, with a range of feathers inverted quite over the hinder part of the head; bearing some resemblance to a friar's hood, whence the name.

Jacobine monks, the same with the dominicans. See Dominicans.

Jacobites, a term of reproach bestowed on the perfons, who vindicating the doctrines of passive-obedience and non-resistance with respect to the arbitrary proceedings of princes, disallow of the late revolution, and affect the supposed rights, and adhere to the interests of the late abdicated king James and his family.

Jacobites, in church-history, a sect of christians in Syria and Mesopotamia; so called either from Jacob, a Syrian, who lived in the reign of the emperor Mauriccius; or from one Jacob, a monk, who flourished in the year 550.

The Jacobites are of two sects, some following the rites of the latin church, and others continuing separated from the church of Rome. There is also at present a division among the latter, who have two rival patriarchs, one of whom resides at Caramit, and the other at Derzapharan. As to their belief, they hold, but one nature in Jesus Christ; with respect to purgatory and prayers for the dead, they are of the same opinion as the Greeks, and other eastern christians: they consecrate unleavened bread at the eucharist, and are against confession, believing that it is not of divine institution.

Jacobite monks, religious, of the sect of Jacobites, in Armenia, Mesopotamia, &c.

JACOBUS, an ancient gold-coin worth twenty-five shillings. See Coin.

JADE-STONE, the name given to a hard, greyish-green species of Jasper, of which the Turks generally make the handles of the flares of great power. See the article Jasper.

Jaffa, antiently called Joppa, is a port-town of Palestine in astatic Turky, situated thirty miles north-west of Jerusalem: east long. 36°; north lat. 32° 20'.

Jafnapatam, a port-town at the north end of the island of Ceylon, in the East Indies; subject to the Dutch: east long. 79°, north lat. 10°.

JAGENDORF, a city of Silezia, twelve miles north-west of Troppaw: east long. 17° 6', north lat. 50° 8'.

St.
St. JAGO, the chief of the Cape Verd islands, in Africa, 500 miles west of Cape Verd; subject to Portugal; west long. 24°, north lat. 15°.

St. JAGO, the capital of the island of Cuba, 100 miles north-west of Jamaica; west long. 76° 30', north lat. 20°.

St. JAGO, the capital of the province of Chili, in south America, situated fix miles west of the mountains of Andes, and eighteen east of the Pacific ocean; west long. 77°, south lat. 35°.

JAGO DE LA VEGA, or Spanish Town, the capital of Jamaica, situated at the south-east part of the island, about seven miles north-west of Port Passage and the bay of Port Royal; east long. 76° 30', north lat. 18° 20'.

JAGODNA, a town of European Turkey, in the province of Servia, situated on the river Moraw: east long. 28°, north lat. 43° 20'.

JAICZA, a city of European Turkey, in the province of Bosnia, fifty miles north-east of Bosnia: east long. 18°, north lat. 45° 5'.

JALAP, jalapa, in botany, a plant of the pentandra-monogynia class, called by Linnaeus mirabilis. See Mirabilis.

Jalap-root is compact and firm, of a wrinkled surface, and of the deepest brown colour within, most disagreeable to the taste, and which takes fire most readily, and burns most briskly when held to the flame of a candle.

With us it is of use in extemporary prescriptions, given in the form of boluses and draughts. Its dose is from twenty to thirty or thirty-five grains. Its common corrections are ginger and cream of tartar; but nature has indeed prepared it so well to our hands, that it needs no addition. The best method of giving it is in a draught made with white wine, and prepared at least twelve hours before the time when it is to be taken; in which case, the wine has power to open the body of the medicine, and prepare it for acting with the greater ease. It is an excellent purgative in dropical and all other cases where serous humours are to be evacuated. The only caution necessary in the use of it is, that it should not be given in acute fevers, nor to persons of dry and hot constitutions; for in these cases, it is liable to the same mischief as other acrid purgatives, and will sometimes bring on heat and inflamations in the viscera.

The preparations of jalap in use with us, are a tincture, an extract, and a resin. To prepare the tincture, take of the root of jalap, eight ounces, put it into a quart of proof-spirit; and after digestion drain off the spirit.

This tincture purges briskly, and is of use in all cases where the root in infin- dence is proper; its dose is from half a dram to two drams.

The extract is made thus: pour upon jalap-root powdered, rectified spirit of wine, and with a due heat draw a tincture, then boil the residue several times in water; after straining, draw off the spirit from the first tincture till it begins to thicken; infusiate also the strained decoctions; then mix the two extracts, and with a gentle fire reduce them to the consistence of a pill.

The two extracts will thus unite into an uniform mass, and retain all the virtues of the root. This extract is of the same virtue as the former tincture, and its dose is from ten to twenty grains.

To prepare the resin, take any quantity of the root of jalap well bruised, pour on it as much spirit as will rise four inches above the root, digest them in a sand heat till the tincture is extracted; filtrate the tincture; then distil off one half of the spirit; pour to what remains a sufficient quantity of water, and the resin of the jalap will be precipitated to the bottom in the form of turpentine. Wash it several times in fresh water, and dry it for use by a very gentle heat.

This purges the most violent of all the preparations of jalap; its dose is from ten to twelve grains; but the extract is greatly preferable to it on all occasions.

JALOFFS, a country and people of Africa, lying on the north side of the river Gambie, near its mouth: west long. 14°, north lat. 13° 40'.

JAM, or JAMB, among carpenters, &c. See the article JAMB.

JAMAGOROD, a town of the province of Ingria, in Russia, situated twelve miles south-east of Narva: east long. 28°; north lat. 59° 15'.

JAMAICA, an island of America, situated in the Atlantic ocean, between 76° and 79° of west longitude, and between 17° and 18° odd minutes north latitude, near 5000 miles south-west of England, 100 miles south of the island of Cuba, and 350 miles north of Terra Firma. The island lies east and west, and is about 140 miles long, and 60 broad. The wind sets on the shore almost all the day in every
JAM [1697]

every part of the island, and off the shore in the night; it sometimes sails, but the people there never see foot or snow. The produce of the island is chiefly sugar, but there are plantations of coffee, of the cocoa or chocolate tree, of indico, tobacco, pepper, cotton, woods for dying, and the mahogany and machinal wood, ginger, medicinal drugs and gums. The common diseases of the country are fevers, fluxes, and the dry gripes. *Ambica·pepper, pimenta, or pimento,* in the materia medica. See Pimenta.

Ambica·wood, a name sometimes given to Brazil. See the article Brazil.

Ambana, the chief town of a province of Arabia, also of the same name: east long. 47° 15', north lat. 25°.

Amba, or Jaum, among carpenters, an appellation given to door-posts, as also to the upright posts at the sides of window-frames.

Amba's, among bricklayers, &c. denote the upright sides of chimneys, from the heath to the mantle-tree.

Amba, a city of the hither India, and the capital of the province of the same name, situated 240 miles north-east of Delhi: east long. 82°, north lat. 34°.

Ambic, in antient poetry, a sort of verse, so called from its conflicting either wholly, or in great part, of iambus's. See the article Iambus.

Ruddiman makes two kinds of iambic, viz. dimeter and trimeter: the former containing four feet, and the latter six. And as to the variety of their feet, they conflict wholly of iambus's, as in the two following verses of Horace.

1 2 3 4 5 6

Dim. Inar·fet a·fno·fia·fet

Trim. Suis | & | sparo | ma | vi | ritus | ruit.

Or, a dactylus, iambus, anapaestus, and sometimes tribrachys, obtain in the odd places; and the tribrachys also in the even places, excepting the last. Examples of all which may be seen in Horace, as:

1 2 3 4 5 6

Caudi|a|tra|e|vit|de|pes

Vide| pra|pro|ran|t|e|do|num|

Trimeter.

Quo| culpa|cels|o| ruit,|ti| aut|ur| der|deris.

Priu|que| ca|la|e,| de| et| in| fer|mari.

Altius|bus| at|que| canibus| bonum| id| hoc|torem.

Pau|dium|que| lep|r aut| ad| venant|la|que| gruen.

Ambolifer, in botany, a genus of the *Adianta-monogyna* class of plants, the flower of which consists of four petals, and is of an infundibuliform shape.

Jambus, in antient poetry, a simple foot consisting of a short and a long syllable, as piet. See the article Foot.

Jamby, a town on the east side of the island of Sumatra, in the East Indies, situated in 101° east long., and in 1° 30' south lat.

James, or knights of St. James, a military order in Spain, first instituted about the year 1170, by Ferdinand II. king of Leon and Galicia. The greatest dignity belonging to this order is grand master, which has been united to the crown of Spain. The knights are obliged to make proof of their descent from families that have been noble for four generations, on both sides: they must also make it appear that their said ancestors have neither been Jews, Saracens, nor Heretics; nor have ever been called into question by the inquisition. The novices are obliged to serve six months in the galleys, and to live a month in a monastery; they observe the rule of St. Austin, making no vows but of poverty, obedience, and conjugal fidelity.

St. James's Day, a festival of the Christian church observed on the 25th of July, in honour of St. James the greater, son of Zebedee.

Epistle of St. James, a canonical book of the New Testament, being the first of the Catholic or general epistles; which are so called, as not being written to one but to several Christian churches.

This general epistle is addressed partly to the believing and partly to the infidel Jews; and is designed to correct the errors, taken the ungodly zeal, and reform the indecent behaviour of the latter; and to confirm the former under the great hardships they then did, or shortly were to suffer, for the sake of Christianity.

James-town, once the capital of Virginia in America, and of James-county, situated in a peninsula on the north side of James, or Poughatun river, in west long. 76° 30', north lat. 37° 30'.

Jampnum, a word formerly used in fines of lands, &c. where it denotes gory or ground: it is supposed to be derived from the French jaune, yellow; because the flowers of furze or gorse are of that colour.

Janeiro, a province of Brazil, in South America, situated between 44° and 49° of west long., and between the tropic of capricorn and 22° of south lat.
JANIKAW, or JANOWITS, a town of Bohemia, situated forty-five miles south­east of Prague.

JANITOR, in anatomy, a name used by some affected writers for the pylorus. See the article PYLORUS.

JANITRIX, in anatomy, a name given to the vena porta. See VENA.

JANIZARIES, an order of the turkish infantry, reputed the grand signior's guards, and the main strength of the ottoman army.

The janizaries were at first composed only of the sons of christians, delivered up as a tribute by their parents, in return for the privilege of enjoying liberty of conscience; and were taken at twelve years of age, to the end that forgetting their country and religion, they might know no other parent besides the sultan. Of late, however, this custom has been left off, the fine for the free exercise of their religion being generally paid in money.

Their dress, which is given them by the grand signior every year, on the first day of ramazan, is a long velt with short sleeves, which they tie about their waists with a linnen-faithstriped with many colours, and adorned at both ends with gold or silver fringe, and over this they wear a loose upper velt of blew cloth. They wear no turban, but instead of it a felt cap, and a long hood of the same stuff, which hangs over their shoulders; and on days of ceremony, they adorn themselves with long feathers stuck in a case in the front of their bonnets. The arms of the janizaries in Europe are, in time of war, a full, or a musquet, and a cartouch-box, which hangs at their left side: but in Asia, where powder and fire­arms are more scarce, they carry a bow and arrows with a poignard.

Their pay is from two alpers a day to twelve; for when they perform some important service, or have children, their pay is increased. All the turkish infantry are at present generally called by the name of janizaries, but such only are really so, who derive their institution from ottoman I. and their peculiar privileges from Amurath III. which do not amount to above 25000 men: however, their being exempted from the payment of taxes, and the performance of public duties, induce abundance of persons to bribe the officers to take them under their protection, and to make them pafs for janizaries, without receiving any pay. By means of this intermixture of the real janizaries with those admitted by corruption, their number at present amounts to above 100,000. And yet not accounting any but such as are effectively janizaries, their body has sometimes been so formidable as to dethrone the ottoman monarchs, and suddenly to change the whole face of the empire.

Janizaries are also certain officers at Rome, otherwise called participantes. See the article PARTICIPANTES.

JANSENISTS, in church-history, a sect of the roman-catholics in France, who follow the opinions of Jan­senius, bishop of Ypres, and doctor of divinity of the universities of Louvain and Douay, in relation to grace and predestination.

In the year 1640, the two universities just mentioned, and particularly father Molina and father Leonard Cellus, thought fit to condemn the opinions of the jesuits on grace and free­will. This having set the controversy on foot, Jan­senius opposed to the doctrine of the jesuits the sentiments of St. Augustin, and wrote a treatise on grace, which he entitled Augustinus. This treatise was attacked by the jesuits, who accused Jan­senius of maintaining dangerous and heretical opinions; and afterwards, in 1642, obtained of pope Urban VIII. a formal condemnation of the treatise wrote by Jan­senius: when the partisans of Jan­senius gave out that this bull was spurious, and composed by a person entirely devoted to the jesuits. After the death of Urban VIII. the affair of janeniuin began to be more warmly controverted, and gave birth to an infinite number of polemical writings concerning grace; and what occasioned some mirth, was the titles which each party gave to their writings: one writer published, The torch of St. Augustin, another found snuffers for St. Augustin's torch, and father Veron formed a gag for the jan­ennis, &c. In the year 1650, sixty­eight bishops of France subscribed a letter to pope Innocent X. to obtain an enquiry into, and condemnation of the five following propositions, extracted from Janenius's Augustinus: I. Some of God's commandments are impossible to be observed by the righteous, even though they endeavour, with all their power, to accomplish them. II. In the state of corrupted nature, we are incapable of re­fitting inward grace. III. Merit and demerit in a state of corrupted nature, does not depend on a liberty which ex­cludes
chudes necessity, but on a liberty which excludes constraint. IV. The semipelagians admitted the necessity of an inward preventing grace for the performance of each particular act, even for the beginning of faith, but they were heretics in maintaining that this grace was of such a nature, that the will of man was able either to refuse or obey it. V. It is semipelagianism to say, that Jesus Christ died, or shed his blood, for all mankind in general.

In the year 1652, the pope appointed a congregation for examining into the dispute in relation to grace. In this congregation Jansenius was condemned, and the bull of condemnation, published in May 1653, filled all the pulpits in Paris a day or two's time. In the same year, 1656, pope Alexander VII. issued out another bull, in which he condemned the five propositions of Jansenius. However, the Jansenists affirm, that these propositions are not to be found in his book; but that some of his enemies having cauied them to be printed on a sheet, inserted them in the book, and thereby deceived the pope. At last Clement XI. put an end to the dispute by his constitution of July 17, 1705; in which, after having rectified the constitutions of his predecessors in relation to this affair, he declares, "That in order to pay a proper obedience to the papal constitutions concerning the present question, it is necessary to receive them with a respectful silence." The clergy of Paris, the same year, approved and accepted this bull, and none dared to oppose it.

This is the famous bull unigenitus, so called from its beginning with the words unigenitus dei filius, &c. which has occasioned so much confusion in France.

JANUARY, in chronology, the first month of the year, so called from Janus, one of the antient Roman deities, painted with two faces; one whereof was supposed to look towards the new year, and the other towards the old. See the articles YEAR, MONTH, &c.

JAPAN, or islands of JAPAN, are situated between 130° and 144° of east long, and between 30° and 40° north lat.

JAPAN-EARTH, catechu, in the materia medica. See the article CATECHU.

JAPANNING, the art of varnishing and drawing figures on wood, &c. in the manner as is done by the natives of Japan.
not sharp-pointed, fixed in a wooden handle, and called a tracing-pencil, go over and trace as much of the drawing as you think proper: thus, by means of the whiting, you will have the gross form of the draught, and such other lines as will be a direction to you how to perform what you would have done. 3. Having done this, if you draw in gold-size, use fine cinnabar mixt with gum-water, and with a small pencil dip it into it, go over all the lines made by the chalk; this will hold it so as not to come off. 4. If you work your metals or colours in gum-water, then trace over your design with gum-water mixt with gold or brass-duft, by either of these ways when it is dry and finished, viz. either in gum-water or gold-size, you may compleat and finiSh your work.

Method of japanning wood. The wood being prepared as before directed, it is japanned with black, as follows. 1. Take of the thickest lac-varnish, six ounces; and lamp-black, enough to colour it: with this wash over your piece three times, letting it dry thoroughly between each time; then, with the same varnish, wash it over three other several times, letting it dry as before, and rinse it smooth between each washing. 2. Then take the following: of thickest feed-lac varnish, six ounces; and Venice turpentine, one ounce; wash over your work with it, mix it, letting it stand twelve hours between the first and the third last varnishes.

3. Your work being thus far done, take the following japan-varnish: of the finest feed-lac varnish, fix ounces; of lamp-black, a sufficient quantity; mix them, and with that let your work be washed twelve times, standing twelve hours between the first and the last varnish washing. 4. Then letting it stand to dry for six or seven days, polish it with tripoli and a rag, as before directed: but in polishing you must work at it only till it is almost smooth, and then let it stand by for two days: afterwards polish it again, almost enough; then let it stand for six days, after which rinse the polishing of it; finally, clear it up with oil and lamp-black, by which means you will have a good black japan scarce at all inferior to the true japan.

For a white japan. 1. Lay the ground with ising-glass size mixed with as much whiting scraped into it as will make it of a proper thickness; with this whiten your work once over, and being thoroughly dry, do it over again; and in like manner repeat it the third time; after which let it stand for twelve hours, covering it from dust; rinse it with Dutch rushing as near the grain of the wood as is proper. 2. Then taking first ingle-glass size, and make white, so much as will make the size of a fair body, mix them well together, and with this go over your work three several times, letting it dry between each time, and rinse it as before. 3. Then take white flanchor boiled in fair water, till it is somewhat thick, wash over the whole work twice with it, blood-warm; letting it dry as before. 4. Letting it stand for a day or two, it being first washed with rectified spirit of wine, to clear it from the dust, dip a pure clean pencil into the finest white varnish, and do over the work five or seven times; and if this be well done, it will give a finer gloss than if it were polished: if it be not well done, polishing will be necessary, for which reason you must give it five or six varnishes more. In polishing you must make use of the finest tripoli; and instead of lamp-black and oil, must use putty and oil, and conclude with white starch mixed with oil.

Common red japan. 1. Take ising-glass size, fine vermilion, a sufficient quantity, as much as is proper; with the former mixture do your work over four times: first warming it by the fire, letting it dry each time, and rinsing it as before. 2. This being done, wash it over eight times with ordinary feed-lac varnish, and let it by for twelve hours; then rub it again, but slightly, to make it look smooth. 3. And, lastly, for an exquisite outward covering, wash it ten times with the best lac-feed varnish; let it lie seven days to dry, and then polish it with tripoli, and clear it up with oil and lamp-black.

A deeper red japan may be made by mixing fine lapis draconis, in powder, with the varnish; and a pale red japan may be had by mixing so much white lead with it, as to make it of whatever degree of paleness you please.

Blue japan. 1. Take gum-water what quantity you please, and a sufficient quantity of white lead; grind them well upon a marble; take ising-glass size what quantity you please, and of the finest and best milled, a sufficient quantity; mix them well together; then add to them of the white lead, ground as before, so much
much as will give it a sufficient body; mix all together to the confidence of a paint. 2. Do your work over with this mixture three or four times, till you perceive the blue to lie with a good and fair body, letting it dry thoroughly between each time: if your blue is too pale, put more smalt among your size, without any white lead, and so vice versa. 3. Then rub it smooth, and go over it again with a stronger blue; and when it is dry, wash it three times with the clearest umber-glaze size alone, and let it stand for two days to dry, covering it. 4. Warm your work gently at the fire, and with a pencil varnish it over with the finest white varnish, repeating it seven or eight times, letting it stand to dry two days as before. After which repeat again the washes seven or eight times in like manner. 5. Let it now stand for a week, and then polish it as before, and clear it up with lamp-black and oil.

Chefnut-coloured Japan. Take Indian red, grind it with umber-glaze size upon a porphyrine-tone, till they are as soft and as fine as butter: then mix a little white lead, which grind strongly; and, lastly, lamp-black, in due proportion.

A tortoise-shell Japan. First lay a white ground, as before directed: then with proper colours, as vermilion, auripigment, &c. duly mixed with turpentine-varnish, break and cloud or shadow the white ground with any irregular fancy at pleasure, in imitation of tortoise-shell; then let it stand to dry, and striking it here and there with reddish-yellow varnish, mixed with a little cinnabar, cloud the work up and down, touching it up also with varnish mixed with lamp or ivory-black. Having done this, varnish it five or six times over with the finest white varnish, letting it dry between every washing.

Japanning with gold size. The size being laid over that part only which you intend to gilt, as already directed, let it remain there till it is so dry, that when you put your finger on it, it be glutinous and clammy, but not so moist that the particles should come off with your fingers. It is in this temper that the gold is to be applied: then take a piece of washing-leather, or the like, and wrapping it round your fore-finger, dip it in the gold-duft, and rub it where your gold-size is laid; for it will stick no where but on the size, and if any gold-duft lies about your work, brush it away with a fine clean varnish-brush. Then, with your pencil, draw that part with gold-size also which is designed for your copper, and letting it dry as in the former case, cover it over with copper-duft in the same manner. Having done this, lay your silver-size, and when it is dry, as before, lay on your silver-duft, as in the two former. But it is to be observed, that the metalline colours are to be laid successively one after another, letting each be covered and thoroughly dry before you enter upon a different colour. After all these, the other colours which are not metalline are to be laid on with gum-water, reserving the rock, &c. for the last part of the work. Let your size be of a due confidence, neither too thick nor too thin, that it may run smooth and clean. See the article size.

Japanning metals with gum-water. Take gum-water, put it into a nutcell-shell, with which mix so much of your metal or colour as may give it a proper confidence, so that it may run fine and smooth; having prepared and well mixed your metals and colours, lay on your design; your gum-water, being thoroughly dried, you are to run it over with fine seed-lac varnish, and afterwards polish and clear it.

Laying speckles or fireings on Japan work. To do this, either on outside or inside boxes, drawers, &c. mix your speckles with ordinary lac-varnish, so much as may make it fit to work, but not so thick as for colour, and mix them well with a proper brush. Warm the work to be done gently by the fire, and with a pencil wash it over with the former mixture, and when it is dry repeat it again, and so often till your speckles lie as thick and even as you desire. When it is thoroughly dry, go over and beautify the work three or four times with seed-lac varnish mixt with turpentine, and so let it dry, and the work is finished, except you have a mind to polish it. But if you polish it, you must wash it eight or ten times over with the best seed-lac varnish, letting it stand to dry every time, and afterwards polish it, as before directed. All sorts of coloured speckles may be thus used, except those of silver, the laying on of which requires the best and finest of the lac-varnish, or the best white varnish, which must make it fit for polishing; but if you have not a mind to polish it, fewer washes of the varnish will be sufficient.
and fix inches in diameter; hemorrhages of various sizes and shapes, but
the more usual standard as to size, is between four and six inches in diameter;
but there are masses of it found of a foot or more in diameter, and others no larger
than a horse-bean. It is generally simple and unmixed; but if it be variegated at
all, it is always with white, and this is diffused not in streaks or veins, but in
clouds. It is capable of a very fine polish, and when the white clouds are well diffused, is very beautiful, and in pieces not too thick, is tolerably pellucid, when held up against the light.

It is recommended as an astringent, and ordered to be taken in powder against hemorrhages of all kinds. The antients wore it as an amulet to prevent abortion, and tied it, on this occasion, to the belly of the person; and they were of opinion that it was able to stop hemorrhages by being only worn on the arm. At present we give no credit to any thing of this marvellous kind, and consequently the virtues of this, as well as of the other semi-pellucid gems, is greatly out of repute.

JASPER-CAMEA, in natural history, the dull, broad-zoned, green and white cameo; being a very elegant species much resembling the common cameo in all things but colour. See CAMEA.

JASPONYX, in natural history, the purest horn coloured onyx, with beautiful green zones, which are composed of the genuine matter of the finest jaspers. See the articles JASPER and ONYX.

JASQUES, a port-town of Persia, situated on the gulf of Ormuz: east long. 58°, north lat. 25°.

JATRALIPTA, or JATRALIPTES, in grecian antiquity, an officer of the gymnasium, whose employment it was to anoint the athlete.

JATRALIPTES is also an appellation given to physicians, who pretend to cure all difeases by external unctions.

JATROPHA, the cassada-plant, in botany, a genus of the monacia-poly-andria class of plants, the male flower of which is monopetalous, and of a saucer or funnel-like shape, with a very short tube, and the limb divided into five segments: the stamina are ten initiated filaments, alternately shorter: the female flower is rofaceous, consisting of five petals; and the fruit is a roundish, trilocular capsule, with a roundish seed in each cell. See the article CASSAVA.

JAVA, an island of the East Indies, situated...
Aundice, or Bally, a small island on the coast of Java Major, and separated from it by a narrow channel.

Avelin, baflas, in antiquity, a sort of spear, five feet and an half long; the shaft of which was of wood, with a steel point.

Every soldier, in the Roman armies, had seven of these; which were very light and slender.

Aundice, in medicine, a disease which is principally discovered by the yellow tincture of the skin, but most distinctly in the coats of the eyes, where it gives the first notice of its invasion.

The symptoms, according to Sydenham, are heaviness, inactivity, lassitude of the whole body, anxiety, uneasiness about the hypochondria, sickness at the stomach, oppression in the breast, difficult respiration, a dry and harsh skin, costiveness of the bowels, hard white excrement, yellow high-coloured urine, which will tincture linen or paper with a yellow hue: there is a bitter taste in the mouth, and all objects seem to be discoloured.

The immediate cause of a jaundice, says Towne, is an obstructed excretion of the bile from the vesica felleis and liver into the duodenum, which being forced back upon the liver, mixes with the blood, by which it is carried into the whole body, whence the skin and urine will be tinctured with the colour of the bile. See the articles Bile and Liver.

This obstruction may be occasioned by any thing in the duct that plucks up the passage, or by external pressure which closes its mouth; or by spasms contracting the fibres thereof. Hence we may see why the jaundice succeeds the flatulent colic, why pregnant women are subject to it, and why spasms of hypochondrial and hysterical persons produce the same effect. Sudden frights, the generation of too great plenty of bile, scirrhous tumours, or ulcers of the liver, obstructions of the meninges, obstrual intermitting fevers, and the bites of venomous animals, will also produce this disease.

Hoffman thinks emetics highly proper in the cure of a jaundice, if the disease does not proceed from violent anger, spasms of the stomach. a cardialgia, a spasmodic colic, or a stone lodged in the cystic duct, exciting a violent uneasiness about the precordia; and that when a bilious abscess lodging in the duodenum, and closing up the orifice of the ductus choledochus intercepts the passage of the bile, or when a tenacious, moveable, and not highly concreted bilious matter plugs up the hepatic ducts, emetics are of singular efficacy in evacuating it. A scruple of ipecacuanha, with a grain of tartar emetic, will be a proper dose; or two grains of tartar emetic in a draught of generous wine, or in an infusion of manna, drinking-water gruel after it.

In this case, Huxham, after emetics, thinks cathartics will be proper, compounded of aloetis and mercurials.

Then saponaceous attenuants, preparations of tartar, and volatiles, and laft of all chalybeats; but the laft are not to be given till the humours are sufficiently attenuated, otherwise an incurable schirrus of the liver may ensue. He also recommends the terra foliata, otherwise called tartarum regeneratum, and, by the college, sal diureticus, as the greatest diffolvent and the most powerful remedy in this disease. Its dose is from five grains to a scruple, and upwards.

Saponaceous medicines are often given with the same intention in this disease with success, thus: take castile soap, three ounces; powder of the rhapsontic plant, and species of hiera picra, of each half an ounce; as much of the syrup of orange-peel as is sufficient to make an electuary, of which the patient is to take from half a dram to a whole dram twice a day. After some time, with the above precaution, may be added half an ounce of feel-filings: or take gum ammoniac, two drams; powder of squills, one dram; castile soap, three drams; and a sufficient quantity of white sugar: make ten pills out of every dram, three of which are to be taken every morning, and as many at night going to bed.

These are attenuants which should be preceded with gentle purgatives; for Hoffman affirms, that all drastic purgatives are prejudicial, as they encrease spasms, throw the blood into violent commotions, and impair the strength: therefore, besides those which Huxham has directed above, the following formula may be sometimes proper. Take of good rhapsontic powder, half a dram; cream of tartar, one dram; simple cinnamon-water, three ounces, and syrup of roses, two drams, for a draught.
When a jaundice succeeds the colic, Sydenham is of opinion that all purgatives are to be omitted, rhubarb only excepted; and this is not to be prescribed without evident reason: but if the jaundice comes on without any preceding colic, then the purgatives already mentioned may be given; and if the disease does not yield to this method, the doctor is of opinion that chalybeate waters will be proper.

In a stubborn jaundice, Allen recommends aethiops mineral.

When a jaundice is attended with a haemorrhage, it is always dangerous in the opinion of Huxham, because it denotes a most acrimonious and dissolved state of the blood; in which case he thinks attenuants, aloetica, volatile, and chalybeat, little better than poison; whereas acids, diluents, demulcents, and mineral waters, are very beneficial. Hemp-seed boiled in milk till it breaks, is often advantageous: the dose is five ounces twice a day. Or an emulsion of white poppy-seeds and sweet almonds after moderate bleeding, if the patient is feverish, and the pulse will allow it, and gentle purging.

Sylvius observes that many children are afflicted with this distemper soon after they are born, and that some are often born with it. It is his opinion, that this disease may often arise, without any obstruction of the biliary duct.

The remedies, which cure the jaundice, are not so safely given to children as to adults; however, the following powder, given in the nurse's milk twice or three times a day, seldom fails of curing this disease in children. Take engilfiorion and bezoar mineral, of each one grain; and being beat to powder, let them be mixed. When the body is bound, the best purgative is rhubarb, and particularly the syrup of succory with rhubarb.

JAU · RAJA, in botany, the same with the rajania of Linnaeus. See RAJANIA.

JAW, maxilla, in anatomy. See the article MAXILLA.

In fractures of the lower jaw, after the patient is commodiously seated against the light, and his head held firm by an assistent, the surgeon is to introduce the thumb or fore-finger of one hand into his mouth, applying his other hand externally; and by this means, to press the fragments of the jaw on each side, till they have regained their former situation, which may be known by the regular disposition of the teeth. When properly reduced, they must be covered internally first with a plaster, and then a compress dipt in spirit of wine; and another compress, fewed to a piece of paste-board in the form of a half jaw, is to be laid on externally. These are to be kept on by the bandage with four heads, perforated in the middle to let in the chin. But whenever the jaw is found to be fractured on both sides, it is usual to apply internally, after the compress dipt in spirit of wine, another made of thin paste-board, perforated in the middle, and accommodated to the figure of the chin. The patient should live upon broths and loops, and avoid all talking, till the jaw is grown firm; and at the same time take care not to lie flat either on the back or face.

The lower jaw is indeed seldom luxated, because held very firm by strong ligaments and muscles; but when this happens, whether from a blow, or by opening the mouth too wide in yawning, the chin is distorted on the opposite side, and the mouth gapes open; and when luxated on both sides, then the mouth not only gapes open, but the chin also hangs down. When the luxation is only on one side, the cure is usually not so very difficult; but when both heads are dislocated, and not properly restored to their places, it always occasions the worst of symptoms, as violent pains, inflammations, convulsions, fevers, vomitings, and at length death. But if an expert surgeon comes in time, the luxation is not very difficult to reduce.

When this happens, the patient is to be directly seated on a low stool, so that an assistent may hold his head firmly back against his breast; then the surgeon is to thrust his two thumbs as far back into the patient's mouth as he well can; but they are to be first wrapped round in a handkerchief, to prevent them from slipping or being hurt; and his other fingers are to be applied to the jaw externally: when he has got firm hold of the jaw, it is to be strongly pressed, first downwards, then backwards, and lastly upwards, but so as that all may be done in an instant, by which means the elapsed heads of the jaw may be easily shoved into their former cavities; but the surgeon ought to be always careful to watch his thumbs quickly out of the patient's mouth, lest they should be compressed, bruited or bit, by reducing the jaw into its place.
ICE [1705] ICE

If the jaw be out on one side only, every thing is to be done in the same manner; only observing that the luxated side is to be forced more strongly downwards and backwards than the sound one. As for bandages, there seems no great occasion for them in this case, unless the luxation has remained some time before it was reduced; for then it may not be improper to apply, for several days, the four-headed bandage, with some strengthening spirit, which may be taken off when the patient intends to eat.

JAWER, a city of Silezia, capital of the duchy of Jawer, situated in 16° 12′ east long. and 51° 8′ north lat.

JAZY, a city of European Turkey, capital of Moldavia, situated on the river Pruth, in east long. 28° 40′, north lat. 47° 15′.

IBERIA, the ancient name of Spain, as well as of Georgia in Asia.

IBERIS, SCIATICA-CRESS, in botany, a genus of the tetradynamia filiculosa class of plants, the corolla whereof consists of four unequal petals, vertically oval, obtuse, and patent; the fruit is a little pod erect, roundish, compressed, surrounded by an acute bifid margin on the upper side, and containing two cells: the seed, in each cell, is single and roundish.

IBEX, in zoology, an animal of the goat-kind, with extremely long nodose horns, which bend backwards, and are of a blackish colour, and annulated on the surface. The body is of a dark dusky colour, and is less in proportion to the height than that of the common goat: it has a great resemblance to the deer-kind; the legs are also perfectly like those of the deer, straight, elegant, and slender. It is frequent in many parts of Europe, and, notwithstanding its vast horns, runs and leaps with surprising force and agility. See plate CXLII. fig. 4.

IBIS, a bird which was very useful to the Egyptians for destroying serpents, locusts, and caterpillars; and, on that account, had divine honours paid it. It is all over black, and about the size of the curlew, with the head of a cormorant, and the long neck of a heron.

IBURG, a town of Westphalia, in Germany, twelve miles south of Osnabrug.

ICE, glacier, in physiology, a solid, transparent, and brittle body, formed of some fluid, particularly water, by means of cold. See FROST and FREEZING.

The younger Lemery observes, that ice is only a re-establishment of the parts of water in their natural state; that the mere absence of fire is sufficient to account for this re-establishment; and that the fluidity of water is a real fusion, like that of metals exposed to the fire; differing only in this, that a greater quantity of fire is necessary to the one than the other. Galileo was the first that observed ice to be lighter than the water which composed it: and hence it happens, that ice floats upon water, its specific gravity being to that of water as eight to nine. This rarefaction of ice is owing to the air-bubbles produced in the water by freezing; and being considerably large in proportion to the water frozen, render the body so much specifically lighter: and these air-bubbles growing large, acquire a great expansive power, so as to burst the containing vessels, though ever so strong. It has been imagined, that this bursting of the vessels by frozen water, was owing to the contraction of the solid parts of the vessel upon the ice, and not to the internal expansion; but the florentine academicians shewed the contrary by the following experiment: they filled a hollow globe of pure gold with cold water, then, folding up the orifice, exposed it to a freezing air; having first fitted it to a metallic ring, somewhat less than a great circle of the sphere, and carefully marked the part of the sphere where the edge of the ring touched it. While the water froze in the globe, they observed the external surface to be so much enlarged, that the metallic ring remarkably ascended towards the vertex from the greatest horizontal circle: whence the globe expanded much more than the ring contracted by the cold; as was plain from comparing this ring with another, originally made of the same size.

But snow-water, or any water long boiled at the fire, freezes slower, and affords a more solid ice, with fewer bubbles, than other water not so treated. And pure water long kept in vacuo, and froze afterwards there, freezes much sooner with the same degree of cold, than water unpurged of air, and exposed to the atmosphere; whilst ice thus made of water from which the air was extracted, is much harder, more ponderous, equal, and transparent than common ice. Whence it is certain, that the air naturally contained in water, being brought together by the freezing cold, occasions its greater rarefaction and levity: and in this manner ice has been procured, that would not float upon water. If finely powdered
ed sea-fall, sal gem, or sal ammoniac be put to powdered ice or snow, in a freezing feacon, and they be well mixed together, the salts will immediately begin to dissolve, and the coldness grow much more intense; and this, so far as we yet know, to a certain degree, whatever were the degrees of cold in the bodies before their mixture. Alcohol also being thus mixed with ice, increases its coldness: the pure, saline, and acid spirits of sea-fall, nitre, aqua fortis, and aqua regia, the stronger they are, the more intense cold they produce when mixed with ice.

Hence, to make the most perfect ice, we should take the purest water, and perfectly purge it of air by the air-pump, and then freeze it in the severest frost: thus we shall obtain ice of the greatest hardness, densifi
ty, purity, transparency, and gravity; the true physical characters of ice to the senses: tho’ even this ice, so far as we now know, would immediately melt into water with a heat of thirty degrees. Whence it follows, that the most natural cold cannot convert pure water into snow, crystal, or gems; for this artificial cold is above forty degrees stronger than that, where water is said to be frozen into rock-crystal: for by all the experiments that have been made, no increase of cold has made ice at all more difficult to melt than common ice.

Ice-house, a building contrived to preserve ice for the use of a family in the summer-faison.

Ice-houses are more generally used in warm countries, than with us, particularly in Italy, where the meanest person who rents a house, has his vault or cellar for ice. However as ice is much more used in England that it was formerly, it may not be amiss to give some directions for the choice of their situation, for the manner of building them, and for the management of the ice.

As to the situation, it ought to be placed upon a dry spot of ground; because wherever there is moisture, the ice will melt; therefore in all strong lands which retain the wet, too much pains cannot be taken to make drains all round them. The place should also be elevated, and as much exposed to the sun and air as possible.

As to the figure of the building, that may be according to the fancy of the owner; but a circular form is most proper for the well in which the ice is to be preserved, which should be of a size and depth proportionable to the quantity to be kept; for it is proper to have it large enough to contain ice for two years consumption, so that if a mild winter should happen, in which little or no ice is to be had, there may be a stock to supply the want. At the bottom of the well there should be a space of about two feet deep, let to receive any moisture that may drain from the ice; over this space should be placed a strong wooden grate, and from thence a small drain should be laid under ground, to carry off the wet. The sides of the well should be built with brick, at least two bricks thick; for the thicker it is, the less danger there will be of the well being affected by any external cause. When the well is brought up within three feet of the surface, there should be another outer-arch or wall begun, which should be carried up to the height of the top of the intended arch of the well; and if there be a second arch turned over this wall, it will add to the goodness of the house: the roof must be high enough above the inner arch to admit of a door-way to get out the ice. If the building is to be covered with slates or tiles, reeds should be laid considerably thick under them, to keep out the sun and external air; and if these reeds are laid the thickness of six or eight inches, and plastered over with lime and hair, there will be no danger of the heat getting thro’ them. The external wall may be built in what form the proprietor pleases; and as these ice-houses are placed in gardens, they are sometimes so contrived as to have an handsome alcove-seat in front, with a small door behind it, through which a person might enter to take out the ice; and a large door on the other side, fronting the north, with a porch wide enough for a small cart to back in, in order to shoot down the ice near the mouth of the well, which need not be more than two feet diameter, and a stone so contrived as to shut it up in the exactest manner: all the vacant space above and between this and the large door should be filled up with barley-straw. The building thus finished, should have time to dry before the ice is put into it.

It is to be observed that upon the wooden grate, at the bottom of the well, there should be laid some small faggots, and if upon these a layer of reeds is placed smooth for the ice to lie upon, it will be better than straw, which is commonly used. As to the choice of the ice, the thinner
**ICH**

thinner it is, the easier it may be broken to powder; for the smaller it is broken, the better it will unite when put into the well. In putting it in, care must be taken to ram it as close as possible; and also to allow a vacancy of about two inches, all round, next the side of the well, to give passage to any moisture occasioned by the melting of some of the ice. When the ice is put into the well, if a little fait-petre be mixed with it at every ten inches or a foot in thickness, it will cause it to unite more closely into a solid mass. *Miller’s Gard. Diet.*

**ICH DIEN,** the motto of the prince of Wales’s arms, signifying, in the high dutch, *I serve.*

It was first used by Edward the black prince; to shew his subjection to his father king Edward III.

**ICHNEUMON,** in zoology, the name of the bluith meles, with uniform claws. See the article *Meles.*

This animal is truly of the badger-kind, and indeed very much resembles the common badger in almost every particular. It is about the size of a large cat; the head is of a blue colour, approaching to black, especially about the nose; and all the rest of the body is of a grey colour, like that of our common badger, the under part being darker than the back or sides.

**ICHNEUMON** is also the name of a genus of flies, of the hymenoptera order, with a triple sting at the anus.

**ICHNOGRAPHY,** in perspective, the view of any thing cut off by a plane parallel to the horizon, just at the base of it. Among painters it signifies a description of images, or of ancient statues of marble and copper, of busts and semi-busts, of paintings in fresco, mosaic works, and antique pieces of miniature.

**ICHNOGRAPHY,** in architecture, a description or draught of the platform or ground-work of a house, or other building. Or it is the geometrical plan or platform of an edifice or house, or the ground-work of an house or building, delineated upon paper, describing the form of the several apartments, rooms, windows, chimney’s, &c. See the article *Building.*

The drawing or designing of this is properly the business of the master architect, or surveyor; it being, indeed, the most difficult of any.

**ICHNOGRAPHY,** in fortification, denotes the plan or representation of the length and breadth of a fortress, the distinct parts of which are marked out, either on the ground itself, or on paper.

**ICHOGLANS,** the grand signior’s pages, serving in the seraglio.

Those are the children of christian parents, either taken in war, purchased, or presents from the viceroys and governors of distant provinces: they are the most sprightly, beautiful, and well made that can be met with; and are always reviewed and approved of by the grand signior himself, before they are admitted into the seraglios of Pera, Constantinople, or Adrianople, being the three colleges where they are educated, or fitted for employments, according to the opinion the court entertains of them.

**ICHOR,** properly signifies a thin watry humour, like serum; but is sometimes also used for a thicker kind, flowing from ulcers, called also fannies.

**ICHTHYOCOLLA,** *isinglass,* in the materia medica, &c. a preparation from the fish known by the name of huso. See the article *Huso.*

This is a tough and firm substance, of a whitish colour, and in some degree transparent; it is light, moderately hard, very flexible, and of scarce any smell, and very little taste. We usually receive it in twisted pieces of an oblong and rounded figure, and bent in the shape of a horse-shoe: this our druggists usually beat and pull to pieces, and sell it in thin shreds like skins, which easily dissolve; besides this kind of round isinglaf, we meet with some in small thin square cakes, white and very transparent; these are the finest of all. But isinglaf, of whatever shape, is to be chosen clean, whitish, and pellucid.

The method of preparing the ichthyocolla is this: they cut off all the fins of the huso, close to the flesh, and take out the bladder, stomach, and intestines; they wash these very clean, and then cut them in pieces, and throwing them into a large quantity of water, they let them steep four and twenty hours, and after this they kindle a fire under the vessel, and keep the liquor just boiling till the greater part of the matters are disolved; they then stir the whole briskly about; then strain it through flannels, and let the liquor by to cool. When there is a large quantity of fat usually formed upon it, which is carefully skimmed off, and the clear liquor is poured off from the grosser parts which fubside, it is put over the fire again, and gently evaporated and skimmed.
ed again, all the time, till by trials they find, that, on letting a spoonful of it cool, it will harden into the consistence of glue. Great care is taken to keep the fire very gentle, to prevent burning towards the end of this evaporation. They then pour it out upon a large, smooth, wooden table; and as it cools, form it into the masses we meet with it in, by cutting and rolling it up.

The greatest quantity of horseflesh is made in Russia. We have it principally from Holland, the Dutch contracting for the most of it, before it is made.

It is an excellent agglutinant and strengthener, and is often prescribed in jellys and broth, but rarely enters any compositions of the regular medicinal form. It is the most efficacious as well as the most safe and innocent of all the ingredients used for cleaning wines, upon which account the wine-coopers use a much greater quantity of it than the apothecaries.

A very valuable glue is also made of this drug, which is a proper form to keep it for the wine-coopers use.

**ICHTHYOGY**, δ的职业, the science of fishes, or that branch of zoology which treats of fishes. See the article FISH. Artedi defines ichthyology to be the science or art of distinguishing all the parts of fishes, and calling them by their proper names; also of giving every fish its generic and specific name; and lastly, to commemorate some of its remarkable qualities. See plate CXLIII.

We have already, under the article FISH, given the general distribution of fishes into the classes of plagiuri, chondropterygious, branchiopterygious, acanthopterygious, and malacopterygious fishes, with the peculiar characters of each class; and in the annexed Plate of Ichthyology, there is delineated a fish of each class, in the order above mentioned.

As to the plagiieri, or cetaceous fishes, they agree in many particulars with hairy quadrupeds, and are distinguished into genera by much the same characters, especially the teeth; but besides these, the number of fins is also of use in arranging them into distinct genera.

The chondropterygious or cartilaginous fishes differ from each other in the figure of their whole body, the number of foramina or apertures of the gills, &c. by which they are most commodiously subdivided into genera; since the characters of the first class are here so various as to differ in the different species of the same genus. The characters by which these two classes of fishes may be subdivided into distinct genera, are simple and obvious: but it is a matter of greater difficulty to fix upon invariable characters, by which the other classes may be subdivided in the same manner. The multitude of genera contained under each of them, added to the great resemblance to be found between really distinct genera, make it no easy task to distinguish these genera from each other, which is best done by establishing the generical characters upon such external parts as are most constant and uniform in the same genus, and least common to other genera.

From many instances produced by Artedi, it appears, 1. That the figure of the fins and tail is of no use in determining the genera of those fishes. 2. That the figure of the back, breast, and belly, and even of the whole body, with respect to length and breadth, is of no service for establishing generical distinctions. 3. That the figure of the head, mouth, eyes, nostrils, and other parts belonging to the head, is indeed of the utmost consequence in distinguishing the different genera; but as this figure is common to several other-wise distinct genera, it is rather serviceable in establishing the orders, than genera of fishes. 4. The same may be observed of the figure of the scales, and the situation of the several external parts of fishes, as the mouth, nostrils, eyes, fins, &c. these, though of great use in the description of fishes, afford no distinctive characters of the genus, as being common to several. 5. Neither is the number of fins or teeth to be reckoned a general character; since this varies in fishes undoubtedly of the same genus.

Having thus shewn what properties of fishes are not, he next considers those which are sufficient generical characters; and observes, that of all the external parts, the only ones to be found in all the spinoidea fishes, and yet different in each genus, are the little bones of the membrana branchiating, or membrane of the gills. These bones are found in almost all fishes that have bones, though more conspicuous in some than in others, by reason of the different thickness of the membrane; and the number of them is more constant in the same genus, than that of the fins: thus, all the gadi have constantly

```plaintext
ICH [1708] ICH
```
constantly seven of these little bones in the branchiostegal membrane of each side; all the species of perch have likewise seven; the cyprinid, three; the cotti, fix; the clupeæ, eight; the eel, fourteen; and so of others. There are only two known genera of ipinole fish, wherein the number of these bones is not the same in all the species of the same genus, viz. the salmon and coregonus; these bones in different species of salmon being ten, eleven, and fifteen; and in the different species of coregonus, seven, eight, nine, and ten; and it is very remarkable, that this difference only takes place in fishes, the species of which are so very like each other, as to be known to belong to the same genus at first sight. Hence it follows, that the number of these little bones in the branchiostegal membrane affords the first and most essential character for distinguishing the genera of cathomorous and osteopterygious fishes. This however is not sufficient alone; it being also necessary, besides the same number of these bones in the membrane of the gills, 1. That the fishes belonging to each genus, should have the same external figure. 2. That the situation, no less than the number of their fins, be the same. 3. The teeth should also have the same situation. 4. The disposition of the scales should also be the same. 5. The figure and disposition of the other external and internal parts, particularly of the stomach and its appendices, the intestines, air-bladder, &c. should also agree.

If these characters are found to correspond, there can be no doubt but the genus founded on them is just and natural. However, it must be observed, that these characters are not to be expected in full perfection in all the fishes belonging to one and the same genus. But three of these, viz. the same number of bones in the branchiostegal membrane, the same external figure, and the same disposition of the fins, are essential to the sameness of the genus; the other characters being only additional to these.

ICHTHYOLOGIST, an author who has written professedly of fishes. Ichthyologists are very numerous; but those who have treated this subject with most accuracy and judgment, are Ariosto, Bellonius, Rondeletius, Salvian, Gesner, Willughby, Ray, and Artedi; especially this last author, who is universally acknowledged to be the best on this subject; and next to him come Willughby and Ray.

ICHTHYPERIA, in natural history, a name given by Dr. Hill to the bony palettes and mouths of fishes, usually met with either spiny, in single pieces, or in fragments. They are of the same substance with the Bufontia, and are of very various figures, some broad and short, others longer and slender; some very gibbous, and others plainly arched. They are likewise of various sizes, from the tenth of an inch to two inches in length, and an inch in breadth. See Bufontia.

ICHTYS, ϊςος, in antiquity, a celebrated acrostic of the ephesian Jsh, the first words of each verse of which were, ΙΙΝΟΣ ΒΟΝΟΣ ΧΑΝΟΝ ΑΓΙΟΝ, that is, Ιωάννης Χριστός Δε Θεος Ερωτός; and the initial greek letters form the word ϊςος, whence the name.

ICKWORTH, a town of Suffolk, six miles east of St. Edmunds bury.

ICONIUM, the same with Cogni. See the article COGI.

ICONOCLASTS, ἰκονοκλασταί, in church-history, an appellation given to those persons, who, in the VIIIth century, opposed image-worship; and is still given by the church of Rome, to all christians who reject the use of images in religious matters. See the article IMAGE.

ICOSAHEDRON, in geometry, a regular solid, consisting of twenty triangular pyramids, whose vertices meet in the center of a sphere, supposed to circum­scribe it; and, therefore, have their heights and bases equal: wherefore the solidity of one of those pyramids multiplied by 20, the number of bases, gives the solid content of the icosahedron.

If fig. 1. n.² place CXLIV. be nicely drawn on pasteboard, cut half through, and then folded up neatly together, it will represent an icosahedron. ibid. n.².

ICOSANDRIA, in the linæan system of botany, a class of plants, the twelfth in order, the characters of which, in so far as it differs from the polyandria, are these; the cup of the flower is monophyl­lous and hollow, with the corolla affixed by the unguis to its sides, and about twenty stamens inserted either into the side of the cup, or corolla. See the article BOTANY.

The term icosandria is here taken in a lax and indeterminate sense, so as to comprehend all plants with more than twelve stamens, and for the most part not much
IDE [1710]

much exceeding twenty. However, the characteristic of the class is rather to be taken from the manner of infection, than number of the stimuli.

To this class belong the causcus or torch-thistle, the amygdalus or almond-tree, the cerasus, or cherry, &c. See the articles CACTUS, ALMOND, &c.

ICTERIC DISEASE, the same with the jaundice. See the article JAUNDICE.

ICTIAR, in the turkish affairs, an officer who has gone through all the degrees of preferment in his respective body, and consequently has a right to a seat in the divan. See the article DIVAN.

IDA, a mountain in the island of Candi or Crete; also another in Natolia, or lesser Asia, celebrated by the poets for the judgment of Paris on the beauty of the three goddesses, Minerva, Juno, and Venus, to the last of whom he gave the preference.

IDANHA VELHA, a city of Portugal, in the province of Estremadura, forty-six miles north-east of Portalegre.

IDEA, in general, the image or remembrance of a thing, which, though not seen, is conceived by the mind. See the article IMAGE.

In logic, idea denotes the immediate object about which the mind is employed, when we perceive or think of any thing.

To account for the formation of our ideas, it is obvious, that the first thing we perceive, in taking a view of what passes within us, is, that we receive impressions from a variety of external objects; that distinct notices are thereby conveyed into the understanding, and that we are conscious of their being there. This attention of the mind to the object's acting upon it, is by logicians called simple apprehension. It is therefore by this means that we come to be furnished with all those ideas about which our thoughts are employed. For when we look at the sun, moon, a man, a tree, or any other object without us, the image or appearance thereof is immediately conveyed to the soul by the organ of light; and these images the mind has a power or faculty of renewing or calling up again to its view at pleasure, even when the objects that first produced them are removed. Now our ideas are nothing else than these renewed representations of what we have at any time perceived or felt, by means of which things are again brought under the view of the mind; and by variously combining these ideas together, the mind can upon many occasions form to itself representations even of things that never perhaps had any real existence in nature, as mountains of gold, &c.

As to the origin or source of our ideas, it is to be observed, that they all have their first rise, and are derived into the understanding, either from the senses, or reflecting upon what passes within ourselves; or, to speak in the language of logicians, from sensation or reflection. From these two great inlets of knowledge the understanding is supplied with all the materials of thinking. For outward objects acting upon our senses,rouze in us a variety of perceptions, according to the different manner in which they affect us; and it is thus that we come by the ideas of light and darkness, heat and cold, sweet and bitter, rough and smooth, and all other impressions which are termed sensible qualities, and which are wholly derived to us from without, and are as numerous as the outward objects that produced them, and the different ways in which our senses are affected by them.

This inlet to knowledge, as comprehending all the notices conveyed into the mind by the impulses of external objects upon the organs of sense, is called sensation. But there is yet another source of impressions arising from the attention of the mind to its own acts, when it takes a view of the perceptions lodged there, that were originally furnished by the senses. For these giving the mind an opportunity of exerting its several powers, when we turn the eye of the soul inwards upon them, and take a view of the various ways in which it employs itself about them, we find all our thoughts under whatever form they appear, are attended with consciousness, and that the understanding is enriched with a new set of perceptions no less distinct than those conveyed in by the senses. It is thus that we come by the ideas of perceiving, thinking, doubting, remembering, willing, &c. which are the different acts and workings of the mind itself, represented to us by our own consciousness of what passes within us. This second source of ideas is called reflection, and presupposes sensation. Besides these two sources there are other ideas derived into our understandings by all the ways of sensation and reflection, as the ideas of pleasure, pain, power, existence, unity, succession, &c. See SENSATION and REFLECTION.
From these simple beginnings, all our knowledge, all our discoveries, take their rise; for we can have no perception of the operations of our minds, until they are exerted; nor can they be exerted before the understanding is furnished by the senses with the ideas about which to employ them; as therefore these ideas that give the first employment to our faculties are evidently the perceptions of sense, it is plain that all our knowledge must begin here. Nor shall we amongst all our discoveries, or that infinite variety of conceptions whereof they consist, be able to point out one original idea, which is not derived from sensation or reflection, or one complex idea that is not made up of those original ones. This will appear more obvious, if it is considered, that to such as aredefinitemany of any of the ideas by which the perceptions of sense are usually admitted, all the ideas thence arising are absolutely lost; for a blind man can have no idea of light or colours, nor a deaf man form any conception of sound; and the same may be said of the other senses. Hence it follows, that the mind in the reception of all ideas by sensation is wholly passive, and the perceptions produced correspond to the impressions made upon it, are just as nature furnished them, and have no dependence on our will. For when we see a tree, a house, a man, or any other object, they necessarily appear each under its proper form, nor is it in our power to receive from them other ideas than they are fitted to produce.

In tracing the progress of the mind further, we find by experience, that being thus provided with its original characters and notices of things, it has a power of combining, modifying, comparing and examining them in an infinite variety of lights; by which means it is enabled to enlarge the objects of its perception, and thereby to acquire an inexhaustible treasure of other ideas, distinct from the former, though resulting from them; and by the various comparison of its ideas according to such combinations of them as best suits its ends, to exert itself in acts of judging and reasoning, and to push on its views of things from one discovery to another; and thus we see the progress of the soul in its advances to knowledge from the first dawning of perception. See Knowledge. Ideas are variously divided by logicians, but the most natural as well as most useful division of them is into simple and complex ideas; as this division not only comprehends our ideas in all their varieties, but suggests and represents to us the manner and order in which they are introduced into the mind.

Simple ideas, are such of our perceptions, or original notices of things, as are conveyed into or exist in the mind under one uniform appearance, without variety or composition, and are not distinguishable into different ideas. Under this head are included all those ideas that come into the mind by sensation; for the external objects conveyed at once into the understanding many different ideas all united together, and making as it were one whole, and the the qualities of bodies that affect our senses are in the things themselves so mixed and united, that there is no separation between them; yet the ideas they produce in the mind are simple and unmixed, and are conceived each under a form peculiar to itself, which cannot be divided into two or more different ideas. Thus the ideas of colour, extension and motion, may be taken in at one and the same time, from the same body; yet these three perceptions are as distinct in themselves, as if all proceeded from different objects, or were exhibited to our notice at different times. Again, some of our simple ideas we acquire purely by means of one sense; as the ideas of colours and sounds, by the eyes and ears; of tastes and smells, by the palate and nose; rough and smooth, by the touch; others we gain by several senses, as space, extension, figure, &c. others again of our simple ideas are suggested to us by the attention of the mind to what passes within itself, or reflection only, as our ideas of consciousiefs, perception, volition; others by sensation and reflection jointly, as those of pain, pleasure, power, existence, unity, &c.

Of simple ideas, it is proper to observe, 1. That they are such as can only be conveyed into the mind, by the proper channels or avenues provided by nature for that purpose. 2. That many of our simple ideas are not images or resemblances of anything inherent in the objects that produced them, as is usually thought. In order to comprehend this aright, we must distinguish between the primary and secondary qualities of bodies that produce these ideas. Primary qualities are such as are inseparable from the body in what state forever it be, and such
as our senses constantly find in every particle of matter, as solidity, extension, figure, &c. Secondary qualities are such as are, in reality, nothing in the objects themselves, but only powers to produce various sensations in us by means of their primary qualities; that is, by the figure, bulk, texture, &c. of their particles, as colours, sounds, taste, smell, &c.—Now the ideas of primary qualities are in some sense resemblances of them, and their patterns do really exist in the bodies themselves; but the ideas produced in us by those secondary qualities, have no resemblance of them at all; for there is nothing like our ideas existing in the bodies themselves that occasion them; and what we call blue, red, sweet, hot, &c. are in the bodies we denominate from them, no other than a power to produce these sensations in us.

Complex ideas, are those notions or conceptions of things that result from the various combinations and union of our simple ideas. These are of two principal kinds, namely, such as are derived from without, and represent those combinations of simple ideas, that have a real existence in nature, and are conceived to exist in any particular subject without us; and such as are formed by the mind itself, arbitrarily uniting and putting together its ideas. Of the first kind are all our ideas of particular substances, as gold, silver, iron, a tree, a man, a horse, &c. in which the confused idea of substance, such as it is, is always the chief. And it is to be observed, that the mind in the reception of these, as well as of simple ideas, is wholly passive.

Of the second kind of complex ideas are all those arbitrary collections of different ideas, which the mind by its own powers occasionally puts together, by compounded, comparing, diversifying and uniting its original notices, either for use in the commerce of life, or in its pursuit for further knowledge; such are our ideas of stated lengths, whether of duration or space, of numbers, and of many human actions; of which it is to be observed, that they are manifestly the creatures of the mind: for as in the perception of our other ideas, the mind was passive; in the formation of these, it is active.

This last class of our complex ideas, may again be subdivided, according to the different acts of the mind excited in framing them, into compound ideas, abstract ideas, and ideas of relations.

Compound idea, is an assemblage of many simple ideas united together by the mind, and considered by it as one picture or representation, and these may be considered as of two kinds. 1. Such as are only variations, or different combinations of the same simple idea without the mixture of any other, as a dozen, a score, which are no more than different assemblages of so many units, &c. 2. Such as are compounded of simple ideas of several sorts put together to make one complex one, as beauty, ingratitude, treason, &c. See Mode.

Abstract or general idea, the idea of some general quality, or property considered simply in itself, without any respect to a particular subject. Abstract ideas are formed by the mind by separating from any of its conceptions, all those circumstances that render it particular, or the representative of any simple determinate object; by which means, ideas taken from particular things become general, and in place of standing for individuals, are each made to denote or represent a whole class of things. Thus, for instance, upon seeing a triangle, or circle, the mind by leaving out the consideration of their particular dimension, and everything else peculiar to them as they immediately affect the sight, and retaining only the notion of what is common to all triangles or circles, such as their figure or shape, formeth a general or abstract idea applicable to every triangle or circle. And the mind proceeding still further by excluding the consideration of their particular configuration, and whatever is peculiar to them, as figures of a particular form, and retaining only the notion of what is common to all geometrical figures, formeth an idea that is still more abstracted or general, applicable to every geometrical figure whatever.

In the same manner does the mind form the notion of whiteness in general, by leaving out the consideration of snow, milk, and every particular substance from which we have at any time received that idea. See the articles Abstract Idea, Abstraction and General Terms.

Ideas of relations are a kind of complex ideas arising from the consideration or comparison of one idea with another, by examining their mutual respects, connections,
Ideas are also divided by logicians into adequate and inadequate, clear and obscure, real and fantatical.

Adequate ideas are such as perfectly represent those archetypes which the mind supposes them taken from, in all their parts and properties. The idea of a circle, which represents it as a round figure bounded by a curve line, whose parts are all equally distant from a point in the center, is an adequate idea thereof. Inadequate ideas are such as do but partially, or imperfectly, represent those archetypes to which they are referred. See the article Adequate, &c.

Clear or distinct ideas are such as represent the objects to us so, as that when they occur to us again, we can not only readily know them, but easily distinguish them from all others; the contrary whereof is what are called obscure or confused ideas. For instance, the most illiterate, upon seeing the sun or moon, have to clear an idea of them, as easily to know and distinguish them again from any other planet or fixed star; but have not so distinct or clear an idea of Jupiter, Mars, or the other planets when once pointed out to them, as to know them again from one another, or from the fixed stars.

Real ideas are such as have a foundation in nature, or a conformity with the real being or existence of things.

Fantastical ideas are such as have no foundation in nature, or a conformity with the real being or existence of things, nor any archetypes to which they have a conformity.

Identity, sameness, denotes that by which a thing is itself, and not any thing else; in which sense, identity differs from similitude as well as diversity. The idea of identity we owe to that power which the mind has of comparing the very being and existence of things, whereby considering any thing as existing at any certain time and place, and comparing it with itself as existing at any other time and place, we accordingly pronounce it the same, or different. Thus when we see a man at any time and place, and compare him with himself when we see him again at any other time or place, we pronounce him to be the same we saw before. See the article Similitude and Diversity.

To understand identity aright, we ought to consider the essence and existence, and the ideas these words stand for; it being one thing to be the same substance; another, the same man; and a third, the same person. For, suppose an atom existing at a determined time and place, it is the same with itself, and will continue so to be at any other instant as long as its existence continues; and the same may be said of two or any number of atoms, whilst they continue together; the mass will be the same; but if one atom be taken away, it is not the same mass. In animated beings it is otherwise, for the identity does not depend on the cohesion of its constituent particles, any how united in one mass; but on such a disposition and organization of parts, as is fit to receive and distribute life and nourishment to the whole frame. Man therefore, who hath such an organization of parts partaking of one common life, continues to be the same man, tho' that life be communicated to new succeeding particles of matter vitally united to the same organized body; and in this confits the identity of man, considered as an animal only. But personal identity, or the sameness of an intelligent being, confits in a continued consciousness of its being a thinking being, endowed with reason and reflection, capable of pain or pleasure, happiness or misery, that considers itself the same thing in different times and places. By this consciousness every one is to himself, what he calls self, without considering, whether that self be continued in the same or divers substances; and so far as this consciousness extends backward to any past action, or thought, so far extends the identity of that person, and makes it the object of reward and punishment. Hence it follows, that if the consciousness went with the hand, or any other limb when sever'd from the body, it would be the same self that was just before concerned for the whole. And if it were possible for the same man to have a distinct incommunicable consciousness at different times, he would without doubt at different times make different
IDEOT, or IDIOT. See IDIOT.

IDES, idus, in the ancient Roman calendar, were eight days in each month; the first of which fell on the 11th of March, May, July, and October; and on the 11th day of the other months.

Thus they called the 11th day of March, May, July and October; and to the nones.

This method of reckoning time is still retained in the chancery of Rome, and in the calendar of the breviary.

IDIOM, idius, among grammarians, properly signifies the peculiar genius of each language, but is often used in a synonymous sense with dialect. See the articles LANGUAGE and Dialect.

IDIOPATHY, in physis, a disorder peculiar to a certain part of the body, and not arising from any preceding disease; in which sense, it is opposed to sympathetic. Thus, an epilepsy is idiopathic, when it happens merely thro' some fault in the brain; and sympathetic, when it is the consequence of some other disorder.

IDIOSYNCRASY, among physicians, denotes a peculiar temperament of body, whereby it is rendered more liable to certain disorders, than persons of a different constitution usually are. See the article Temperament.

IDIOT, or IDEOT, a person that is born a natural fool.

Such a person is not to be prosecuted for any crime, as not having knowledge to distinguish good from evil; yet it is said, that if a man has so much knowledge as to measure a yard of cloth, sell or number twenty-pence in small money, or regularly to name the days of the week, or to beget a child, he shall not, by our laws, be accounted an idiot.

The king has a right to the custody of an idiot's lands, and to receive the profits of the same during his life, without committing waste; and finding him and his family, if he have any, necessaries.
thing belonging to an idol. Of this the Jews, after they had smarted for their idolatry, were so sensible, that they thought it unlawful to use any vessel that had been employed in sacrificing to a false god; to warm themselves with the wood of a grove, after it was cut down; or to shelter themselves under its shade. But the preaching of the Christian religion, wherever it prevailed, entirely rooted out idolatry, as did also that of Mahomet, which is built on the worship of one God. It must not, however, be forgotten, that the protestant christians charge those of the church of Rome with paying an idolatrous kind of worship to the pictures or images of saints and martyrs; before these, they burn lamps and wax-candles; before their image, they burn incense, and kneeling offer up their vows and petitions: they, like the pagans, believe that the saint to whom the image is dedicated, presides in a particular manner about its shrine, and works miracles by the intervention of its image; and that if the image was destroyed or taken away, the saint would no longer perform any miracle in that place.

**IDYLLION**, **idyllion**, in ancient poetry, is only a diminutive of the word **idyl**, and properly signifies any poem of moderate extent, without considering the subject. But as the collection of Theocritus's poems, were called idyllia, and the pastoral pieces being by far the best in that collection, the term idyllion seems to be now appropriated to pastoral pieces. See the article **Pastoral Poetry**.

So very different are our modern idylls from those of the antients, by introducing none but allegorical shepherds, that a literal translation of Theocritus's idyllions; however well executed, would be relished only by people of taste, and those too-well acquainted with the simplicity and manners of the antients.

**JEALOUSY**, in general, denotes the fear of a rival; but is more especially understood of the supposition, which married people entertain of each others fidelity and affection.

**Bitter-waters of Jealousy**, in Jewish antiquity, certain consecrated waters, which a woman was obliged to drink, in order to clear herself of the crime of adultery, whereof her jealous husband accused her; the consequence of which draught was, that if innocent she suffered no harm, but if guilty her belly swelled, &c.
JEH [1716] JEO

JEAN DE ANGELI, a town of Guienne, in France, thirty-five miles south-east of Rochelle.

JEAN DE LUZ, a port of France, in the province of Gascony, situated near the frontiers of Spain: west long. 1° 32', north lat. 43° 50'.

JEAN DE MAURIENNE, a city in the duchy of Savoy, thirty miles south-east of Chambery: east long. 6° 8', north lat. 45° 16'.

JEAN DE PIED DE PORT, a town of the province of Navarre, in France, situated on the river Nive, on the frontiers of Spain: west long. 1° 25' north lat. 43° 16'.

JECORINUS, in ichthyology, a fish, otherwise called hepatus. See Hepatus.

JEUR, the liver, in anatomy. See the article Liver.

JECUR UTERINUM, a name sometimes given to the placenta. See the article Placenta.

JECUR, or JEER, or, being brought to the ship, is a large rope, reeved through double or treble blocks, lashed at the mallet head, and on the yard, in order to hoist or lower the yards.

JEER-ROPE, in a ship, is a rope received thro' double or treble blocks, lashed at the mallet head, and on the yard, in order to hoist or lower the yards.

JEERS, or, being brought to the jeers, in the sea-language, signifies a person's being punished at the jean-captain, by having his arms extended cross-wise, and tied to the captain-bar when thrulth thro' the barrel, and standing thus, with a heavy weight about his neck. In this posture he is obliged to continue till he is either brought to confess some crime of which he is accused, or has suffered the punishment which the captain has sentenced him to undergo.

JEHOVAH, one of the scripture names of God, signifying the Being who is self-existent, and gives existence to others. See the article God.

JEHONIAH, one of the scripture names of God, signifying the Being who is self-existent, and gives existence to others. See the article God.

JEHOVAH, one of the scripture names of God, signifying the Being who is self-existent, and gives existence to others. See the article God.

So great a veneration had the Jews for this name, that they left off the custom of pronouncing it, whereby its true pronunciation was forgotten. They call it tetragrammaton, or the name with four letters; and believe, that whoever knows the true pronunciation of it cannot fail to be heard by God.

JEJUNUNUM, in anatomy, the second of the small guts, so called because it is usually found empty. This is owing to the fluidity of the chyle, the greater stimulus of the bile in it, and the abundance of the lacteal vessels with which it is furnished. Its situation is in the region above the navel; it has a great many connivent glands. Its beginning is where the duodenum ends; and it terminates, where these valves are obliterated: its length is different in various subjects; but is usually between thirteen and sixteen spans. See Intestines.

JEKYL, a small island in the mouth of the river Alatamaha, in Georgia, fortified by Mr. Oglethorp.

JEMPTERLAND, Jemptia, a province of Sweden, bounded by Angermania on the north; by Medelpadia on the east, by Helwagia on the south, and by Norway on the west.

JENA, a city of Germany, in the circle of Upper Saxony, and the Landgraviate of Thuringia: east long. 11° 44', north lat. 51°.

JENDE, a great lake, in the province of Finland, in Sweden.

JENISA, a large river of Russia, that runs from south to north thro' Siberia, and falls into the frozen ocean in 73° of east longitude, and 70° of north lat.

JENKOPING, a city of Sweden, in the province of Gotland, situated ninety miles south-east of Gottenburg: east long. 14° 50', north 57° 30'.

JENNET, or GENET, in the manage. See the article Genet.

JENNY-WREN, a name sometimes given to the wren. See the article Wren.

JENO, or GENO, a town of upper Hungary, twenty miles south of Great Warradin, and subject to the house of Austria.

JENTLING, in ichthyology, the blue chub, a fish caught in the Danube, and larger than the common chub. See the article Chub.

JE-DAILE, or JEFAYLE, in law, a term used for an oversight in pleading, or other proceedings at law.

The finding of these defects or omissions, was formerly often practiced by the
the council; and when the jury came into court, in order to try the issue, they said, this inquest you ought not to take; and after verdict they would say to the court, to judgment you ought not to go: but several statutes have been made to avoid the delays occasioned by such suggestions; and a judgment is not to be stayed after verdict for mistaking a sum of money, or in the day, month, year, &c. where the name are rightly named in any preceding record.

JERSEY, an island in the English channel, fifteen miles west of the coast of Normandy, and eighty miles south of Portland in Dorsetshire: west long. 2° 20', north lat. 49° 20'.

It is about 30 miles in circumference, and contains twelve parishes, the chief town is St. Hilary. Though the island is subject to England, the habitants are still governed by Norman laws, and the courts of England have no jurisdiction there.

New Jersey, a province in North America, which may be bounded on the north by a line drawn from the river Delaware to Hudson's river, which divides it from New-York; by the Atlantic Ocean, on the east; by the same ocean on the south, and by Delaware bay and river, which separates it from Pennsylvania, on the west. It lies between 74° and 76° of west long., and between 39° and 41° of north lat., and is about 140 miles in length, and 60 in breadth. It is subject to England. The chief towns are Burlington, Perth-Amboy, and Elizabeth Town. It produces corn, black-cattle, furs, and pipe-staves.

JERUSALEM, the capital city of Judea, or Palestine, in Asiatik Turky, situated thirty miles east of the Levant, or Mediterranean Sea, and ninety miles south of Damascus: east long. 36°, north lat. 32°.

It stands on a high rock, with steep ascents on every side, except on the north, and is surrounded with a deep valley, which is again incompanied with hills. The city is at present three miles in circumference, and has a little altered its situation; for Mount Calvary, which was formerly without the walls, stands now in the middle of the city, and Mount Sion, which stood near the center, is now without the walls.

JESI, a city of Italy, in the province of Ancona, and territory of the pope: east long. 14° 40', north lat. 43° 45'.

JESSE, a branched candlestick, or sconce; an useful ornament, first introduced into our churches about the year 1100.

JESSELMERE, the capital of the province of the same name in the East-Indies, subject to the Mogul; east long. 73° 20', north lat. 27°.

JESSO, or YEDSO, a country of Asia, which lies north of Japan, and is said to extend north-east to the continent of America; east long. 140°, north lat. 40°.

JESUAT, a province of India, bounded by Patan on the north, and by Bengal on the south; subject to the mogul.

JESUITES, or the society of Jesus, a most famous religious order in the romish church, founded by Ignatius Loyola, a native of Guipufcoa in Spain, who in the year 1538, assembled ten of his companions at Rome, principally chosen out of the university of Paris, and made a proposal to them to form a new order; when, after many deliberations, it was agreed to add to the three ordinary vows of chastity, poverty, and obedience, a fourth; which was, to go into all countries whether the pope should please to send them, in order to make converts to the romish church. Two years after, pope Paul III. gave them a bull, by which he approved this new order, giving them a power to make such statutes as they should judge convenient: on which, Ignatius was created general of the order; and in a short time spread over all the countries of the world, to which Ignatius sent his companions; while he reigned at Rome, from whence he governed the whole society.

The entire society is composed of four sorts of members; novices, scholars, spiritual and temporal coadjutors, and professed members. The novices continue so two years, after which they are admitted to make the three simple vows, of chastity, poverty, and obedience, in the presence of their superiors: the scholars add some spiritual exercises to their studies. The spiritual coadjutors assist the professed members, and also make the three simple vows: the temporal coadjutors, or lay-brothers, take care of the temporal affairs of the society; and the professed members, which compose the body of the society, besides the three simple vows, add a special vow of obedience to the head of the church in every thing relating to millions among idolaters and heretics. They have professed houses for their professed members.
JEV  [1718]

JEW, any precious stone, or ornament bejewelled with them. See the articles Diamond, Ruby, &c.

JEWEL-Office, an office belonging to the crown, that has the charge of fashioning and weighing the king's plate, and delivering it out by warrants from the lord chamberlain.

The principal officer is the master of the jewel-office, who has a salary of 450l. per annum.

JEWS, those who profess obedience to the laws and religion of Moses, before whom every man worshipped God according to the inclination of his own heart.

How far the religious ceremonies of the Jews were copied from those of the Egyptians, among whom they had so long sojourned, or how far they were typical of something future, are questions which we leave to be discussed by divines. But as to the religion of the modern Jews, it is a manifest absurdity; since being without a temple, sacrifices, &c., it cannot be considered as fulfilling any longer.

Be this as it will, we shall subjoin a few of their miscellaneous customs, as related by Leo of Modena, an author of their own.

When a Jew builds an house, he must leave part of it unfurnished, in remembrance that the temple and Jerusalem now lie desolate. They lay great stress upon frequent washings. They abstain from meats prohibited by the levitical law; for which reason, whatever they eat must be dressed by Jews, and after a manner peculiar to themselves. Every Jew is obliged to marry, and a man who lives to twenty unmarried, is accounted as actually living in sin.

The Jews, it is said, were formerly at the diopul of the chief lord where they lived, and likewise all their goods. A Jew may be a witness by our law, being sworn on the Old Testament, and taking the oaths to the government.

For a farther account of the Jews, see the articles Caraites, Circumcision, Levites, Passover, Pharisees, Rabbins, Sadducees, Sanhedrim, Synagogue, Talmud, &c.

JEW's EARS, auricula juda, in botany. See Auricula.

This fungus is seldom found unlefs on the lower parts of the trunks of eldertrees; whence it is called fambucusin.

JEVY, a town of Germany, in the circle of Westphalia, sixteen miles north-east of Embden: vast long, 7° 5', north lat. 51° 39'.
is in great repute among the common people, who cure themselves of sore throats with a decoction of its milk. This, tho' by no means a pleasant medicine, is however a very efficacious one.  

**Jew's Stone,** *lapis judaicus,* in the materia medica, an extraneous fossil, being nothing but the petrified spine of a large *echinus marinus.* It is of the figure of an olive, and is furrowed and ridged alternately in a longitudinal direction. It is solid, considerably heavy, and difficult to break; being, indeed, a petrefaction solely composed of spar, and that tolerably pure. Hence, it is said to be a great diuretic and lithotrity; and that it possesses the former of these virtues is very certain, but it is not equally sure that it has any thing of the other. It acts in water, being diuretic. The *lapis judaicus,* hence, it is said to be a stone of some virtue.  

**Jewish Hours,** in chronology. See the article *Hour.*  

**JEZIDES,** among the Mahometans, a term of similar import with heretics among Christians.

The jezides are a numerous sect inhabiting Turkey and Persia, so called from their head *Jeziel,* an arabian prince, who slew the sons of Ali, Mahomet's father-in-law, for which reason he is reckoned a parricide, and his followers heretics. There are about 200,000 jezides in Turkey and Persia; who are of two sorts, black and white. The white are clad like those of others, but they are great lovers of the heathens, being more fond of Jesus Christ than of Mahomet, and are never circumcised but when forced it. They are extremely ignorant, and believe both the Bible and the Koran without reading either of them: they make vows and pilgrimages, but have no places of religious worship. All the adoration they pay to God consists of some songs in honour of Jesus Christ, the Virgin, Moses, and sometimes Mahomet; and it is a principal point of their religion never to speak ill of the devil, lest he should retract the injury, if ever he should come to be in favour with God again, which they think possible: whenever they speak of him, they call him the Angel Peacock. They bury their dead in the first place they come at, rejoicing as at a festival, and celebrating the entry of the deceased into heaven. They go in companies like the Arabians, and change their habitations every fifteen days. When they get wine, they drink it to excess, and it is said, that they sometimes do this with a religious purpose, calling it the blood of Christ. They buy their wives, and the market-price is two hundred crowns for all women, handsonce or not, without distinction.  

**IGLAW,** a town of Germany, in the province of Moravia, situated on the river Igla, on the frontiers of Bohemia; subject to the house of Austria: east long. 15° 7', north lat. 49° 16'.  

**IGNATIUS'S BEAN,** *faba St. Ignatii,* in the materia medica; See FEBA.

**IGNAVUS,** in zoology, an animal called in English the flound, and by authors Bradypus. See BRADYPUS and SLOATH.

**IGNIS, FIRE,** in physisology, chemistry, &c. See the article FIRE.

**IGNIS-AQUA,** Helmont's name for the salt. See ALKAHEST.

**IGNIS-FATUUS,** in meteorology, a meteor otherwise called will with a whip. See the article WILL WITH A WHIP.

**IGNIS GEBHENÆ,** the name with the universal disintegrant, or alkheist. See the article ALKAHEST.

**IGNIS JUDICI,** in our old custom, a purgation by fire. See ORDEAL.

**IGNISPICUM,** in antiquity, a species of pyromancy, wherein predictions were drawn from the fire used in sacrifices. See PYROMANCY AND DIVINATION.

**IGNITION,** in chemistry, the heating metals red-hot, without melting them. Lead and tin are too soft, to bear ignition; which takes effect only in the harder metals, as gold and silver, but especially iron.

10 K 2
IGNORAMUS, in law, a term which signifies we are ignorant. This is used when the grand jury impaneled on the inquisition of criminal causes, reject the evidence as too weak to make good the indictment or indictment brought against a person, so as to bring him upon his trial by a petty jury; in which case, they indorse this word on the back of the bill of indictment. In consequence of which, all further proceedings against the party accused are stopped, and the supposed offender is delivered without further answer.

IGNORANCE, ignorantia, the privation or absence of knowledge. See the article KNOWLEDGE.

The causes of ignorance, according to Locke, are chiefly these three. 1. Want of ideas. 2. Want of a discoverable connection between the ideas we have. 3. Want of tracing and examining our ideas. See the article IDEA.

As to the first of these causes, he observes, that all the simple ideas we have, are confined to the observation of our senses, that all the simple ideas we have, from ours, it is not for us to determine; but to say or think there are species of creatures have to penetrate into the nature and inmost constitutions of things, we know not. This we know, but no better an argument than if a blind person, who had no manner of idea of any such thing, would be able to say or think there are several sorts of people as different in eyes, feet, ears, and senses, as different from ours, as other species of animals and other species of beings, infinitely different from those of our little spot of the earth, may be in other planets, to the knowledge of which, even of their outward figures and parts, we can no way attain while we are confined to this earth, there being no natural means, either by sensation or reflection, to convey their certain ideas into our minds?

There are other bodies in the universe no less concealed from us by their insatiable. These insensible corpuses being the active parts of matter, and the greater instruments of nature, on which depend all their secondary qualities and operations, our want of precise distinct ideas of their primary qualities, keeps us in incurable ignorance of what we desire to know about them. Did we know the mechanical affections of rhubarb or opium, we might as easily account for their operations of purging and causing sleep, as a watchmaker can for the motions of his watch. The dissolving of silver in aqua fortis, or gold in aqua regia, and not vice versa, would be then perhaps no more difficult to know, than it is to a smith to understand why the turning of one key will open a lock, and not the turning of another. But while we are destitute of senses, acute enough to discover the minute particles of bodies, and to give us ideas of their mecha-
mechanical affections, we must be content to be ignorant of their properties and operations; nor can we be assured about them any farther, than some few trials we make, are able to reach: but whether they will succeed again another time, we cannot be certain. This hinders our certain knowledge of universal truths concerning natural bodies: and herein our reason carries us very little beyond particular matters of fact. And therefore I am apt to doubt, that how useful and experimental philosophy in beyond particular matters of far soever human dill very bodies which are nearest to us, and want herein our reason phyical extent even of material beings: to which if we add the most from our knowledge, of which we probably are, which are yet more remote from our knowledge, of which we have no cognizance, we shall find this cause of ignorance, conceal in an impenetrable obscurity, almost the whole intellectual world; a greater certainly, and a more beautiful world than the material. For bating some very few ideas of spirit, which we get from our own minds by reflection, and from thence the best we can collect of the father of all spirits, the author of them and us, and all things, we have no certain information, so much as of the existence of other spirits, but by revelation; much less have we distinct ideas of their different natures, states, powers, and several constitutions, in which they either agree or differ one from another, and from us. And therefore in what concerns their different species and properties, we are under an absolute ignorance.

The second cause of ignorance is the want of a discoverable connection between those ideas we have: where we want that, we are utterly incapable of universal and certain knowledge; and are, as in the former case, left only to observation and experiment. Thus the mechanical affections of bodies, having no affinity at all with the ideas they produce in us, we can have no distinct knowledge of such operations beyond our experience; and can reason no otherwise about them, than as the effects or appointment of an infinitely wise agent, which perfectly surpasses our comprehensions.

The operation of our minds upon our bodies is as inconceivable. How any thought should produce a motion in body, is as remote from the nature of our ideas, as how any body should produce any thought in the mind. If experience did not convince us that it is so, the consideration of the things themselves would never be able, in the least, to discover it to us.

In some of our ideas there are certain relations, habitudes and connections visibly included in the nature of the ideas themselves, that we cannot conceive them separable from them by any power whatsoever: in these only, we are capable of certain and universal knowledge. Thus the idea of a right-lined triangle, necessarily carries with it an equality of its angles to two right ones. But the coherence and continuity of the parts of matter, the production of sensation in us, of colours and sounds, &c. by impulse and motion, being such in which we can discover no natural connection with any ideas we have, we cannot but ascribe them to the arbitrary will and good pleasure of the wise architect.

The things which we observe always proceed regularly, we may conclude, act by a law that is set them, but yet by a law that we know not; by which, tho' causes work steadily, and effects constantly flow from them, yet their connections and dependencies not being discoverable in our ideas, we can only have an experimental knowledge of them. Several effects come every day within the notice of our senses, of which we have so far sensible knowledge; but of the causes, manner, and certainty of their production, we must for the foregoing reasons be content to be ignorant. In these we can go no farther than particular experience informs us of matter of fact; and by analogy, guess what effects the like bodies are, upon other trials, like to produce.

The third cause of ignorance is our want of tracing those ideas we have, or may have, and finding out those intermediate ideas which may shew us what habitude of agreement or disagreement they may have one with another. Thus many are ignorant of mathematical truths, for want of application in enquiring, examining, and by due ways comparing those ideas.
IGNORANCE, in law, is a want of knowledge of the laws, which will not excuse a person from suffering the penalty inflicted on the breach of them: for every one is obliged, at his peril, to know the laws of the land. An infant who is just arrived at the age of discretion, and who may therefore be supposed to be ignorant of the law, is punishable for crimes; but at the same time infants of tender age, who are naturally ignorant, are excused. This is also the case with respect to persons who are non compos mentis. See INFANT, LUNATIC, &c.

IGUANA, in zoology, an American species of lizard, with a long round tail, five toes on each foot, and the crest of the throat and the dorsal future dentated. See the article LIZARD.

IHOR, the capital of the province of Ibor, in Malacca, near the south cape of the further peninsula of India, subject to the Dutch: east long. 101°, north lat. 3°. JIG, or GIGG, in music. See GIGG.

ILCHESTER, a borough-town of Somersetshire, fourteen miles south of Wells. It sends two members to parliament.

ILDEFONSO, a palace belonging to the king of Spain.

ILEX, the HOLM-OAK, or EVER-GREEN-OAK, in botany, a genus of the tetraodria-tetragynia class of plants, the flower of which consists of one plain petal, divided into four roundish, hollow, and open segments, cohering only at their bottoms: the fruit is a roundish berry, with four cells, each of which contains a single hard, oblong, and obtuse seed, gibbous on one side, and angular on the other. The wood of these trees is accounted very good for many sorts of tools and utensils, as mallet-heads, mall-balls, chairs, wedges, beetle-pins, &c. as also for palisadoes. It likewise affords the most durable charcoal in the world. The kermes, or species known by the name of the holm-oak, is of a much lower stature than the other species of ever-green oaks; seldom growing to the height of a tree. See KERMES.

ILHEOS, or RIO DE ILHEOS, a province of Brazil in South America, subject to Portugal. It is bounded by the bay of All-saints on the north, and by the Atlantic ocean on the east.

ILIAC PAssion, in medicine, a pain in the small intenstines, apt to turn to an inflammation, in which their peristaltic motion is inverted, and their contents, and even the excrements themselves, are voided by the mouth in vomiting. Nothing will pass down, not so much as a farthing. It is often attended with fatal symptoms.

This disease, according to Hoffman, is preceded with coltveness, which is soon followed with most sharp and violent pains, with an inflammation, diffention, and a tumour of the umbilical region, which feels hard to the touch; the body is so hard bound, that neither wind nor excrements can pass downwards: soon after the wind first makes its way upward, there comes on a naufea, and a frequent vomiting of a bilious and pituitous matter; the breathing grows difficult, and whatever is eaten or drank is soon thrown up again; reddish faces, with a flinking sneeze, are afterward forced up by vomiting: this is succeeded by lists of strength, a preternatural heat, a hard and contracted pulse, with great thirst: the urine is red, and is voided with difficulty. When the case becomes desperate, a hicoughing and delirium appear; the nerves are distended, the body is all in a cold sweat, and violent convulsions and fainting fits put an end to the patient. This disease may proceed from a rupture, either of the scrotum or the groin; from poison, from any thing that flies up the passage thro' the small guts, such as hard, dry food, chestnuts, pea-biscuits, quinces, pears, unripe acerb fruit, when eaten in large quantities; to which drinkings, &c.

To the cure, Sydenham thinks it necessary first of all to bleed in the arm, and afterwards, in an hour or two, exhibit a powerful clyster; the smoke of tobacco blown into the bowels through an inverted pipe, he recommends as the most efficacious remedy: this may be repeated some time after, unless the effect of the first renders it unnecessary. If the disease will not yield to this, a pretty strong cathartic is advisable: thus, take of the pill of simpie colocynt, half a dram; of calome, one scruple; and as much as is sufficient of the ballam of Peru. Make the whole into four pills to be taken out of a spoonful of sirup of violets, taking no liquor upon them left they
they cannot be retained: or, take reft of
frammomny, or inftead of it, reft of jalap,
twelve grains; calomel, one fcruple; re
duce them into power, taking this out of
a fpoonful of cow’s milk: take one
or two fpoonfuls of the fame milk after
swallowing them. If the patient can
not retain this, let him take twenty-five
drops of the thebaic tincture in half an
ounce of fpirituous cinnamon-water; and
when the vomiting and pain remit, let
the cathartic be repeated; and if the
pain returns, give the anodyne again,
and repeat it every fourth or fifth hour
till the inteftines are easy, and the ca
thartic begins to pafs downwards. When
it has done working, give the following
draught: take of fpirituous water of cin
namon, two ounces; of thebaic tincture,
twenty-five drops; of which make a
draught, which is to be repeated twice
or thrice a day, till the vomiting and
pains quite ceafe: afterwards it will be
advice to give a paregoric, at bed-
time, for ferveral nights.

Hoffman advises, after the pains are miti
gated by anodynes, that a cataplafm
should be applied to the hypogastric re
gion, to stop the vomiting and hic
coughing, which may be compos’d of
equal parts of old venice-treacle, and
express’d oil of nutmegs, with the addi
tion of oil of mint and camphire. This
done, a gentle laxative of manna, cream
do’ tartar, and oil of fmeet almonds may
be given with a more happy success, if
the excrements have been long retained.

When there is an inflamation, nothing
is better than fix or eight grains of puri
fied nitre, and half a grain of camphire
mixtured with fome antifpafmodic powder,
and then taken in a convenient vehicle.
Outwardly apply a liniment of axuniga
humana, or any other penetrating fat,
and a dram of camphtire.

But when other things fail in the cure
of the iliac paffion, recours fis moft be had
to quickfiver; half a pound or a pound
at moft is sufficient, with fat broth or
oil; and the patient fhould lie on his
right fide, or walk gently about the
room, that its defcent may be easier ;
but if there is an actual inflamation,
the quickfiver fhould not be ufed. Opis
ates may be ufed to mitigate the pain,
provided they are exhibited in the be
ginning after bleeding, or before there is
any figns of a mortification. Clyperfes
are generally very advantageous, for they
relax the fpasm of the grofs inteftines,
and for this purpose warm water with
spirit of marfhmallows will be fuficient:
they fhould be given very foon after the
first attack. When the iliac paffion pro
ceeds from an incarcerated hernia, then
Heil:er recommends bleeding as of the
greateft advantage. See HERNIA.

ILIACUS MUSCULUS, in anatomy, a broad,
thurth muscle, lying on the infide of the
ili: os. It is fixed by flefly fibres to
the internal labium of the creit of the os
ilium, to that of the flope between the
two anterior fibres, to the infides of thefe
fibres, to the fuperior half of the inflide
of this bone, and to the adjacent lateral
part of the os facrum. All thefe fibres,
contracting by degrees, run obliquely
towards the lower part of the mufculus
p’oa, uniting with it; and being fixed
by a kind of aponeurosis to the outfe of
its tendon, all the w: to the little
trochanter.

ILIAD, ili:es, in literary history, the name
of an antient epic poem, the firft and finel:
of thofe compos’d by Homer.

The poet’s design in the iliad was to
flew the Greeks, who were divided into
fveral little fates, how much it was
their interett to prefervc a harmony and
good understanding among themfelves:
for which end, he fets before them the
 calamities that befel their anceftors from
the wrath of Achilles, and his misun-
derftanding with Agamemnon; and the
advantages that afterwards accrue to
them from their union. The iliad is
divided into twenty-four books, or rhaps
dodies, which are marked with the letters
of the alphabet.

The critics maintain the iliad to be the
firft, and yet the beft epic poem that ever
appeared in the world. Ariftotle’s poe-
tics are almofi wholly taken up about it,
forming precepts from that poet’s prac
tice. Some authors tell us, that Homer
invented not only poetry, but all other
arts and fciences; and that there are
vifible marks of a perfect knowledge of
every one of them to be feen in the iliad.

There is a ftranslation of this noble poem
into our language, by the late ingenious
Mr. Pope; being, perhaps, the moft ele
gant, and moft in imitation of the or
iginal, of any attempt that way in any
language whatever.

ILIUM, in anatomy, the third and laft
of the small guts, is situat’d principally be
low the navel, near the offa ili: ; whence
its name. Its length is various: some
times not more than fifteen, sometim:
twenty
IMAGE, in a religious sense, is an artificial representation or similitude of some person or thing, used either by way of decoration and ornament, or as an object of religious worship and veneration; in which last sense, it is used indifferently with the word idol. See Idol.

There is no doubt but that these images, or idols, were at first of the plainest and most simple materials; and as in the early ages people had but little skill in sculpture, it is probable that they made choice of such materials as were most easily wrought and fashioned into the intended figure; from hence it is not unlikely that the first images were made of earth, and that to give them some beauty, they were painted with different colours. Thus Pliny tells us, that Tarquinius Priscus caused a statue of Jupiter Capitolinus to be made of earth and painted red. Next to earth, wood seems to have been the most common material for images; but in length of time they were made of brass, silver, and gold. For the worship of images, see the articles Gods and Idolatry.

The worship of images among the christians, occasioned great contests both in the eastern and western churches; but at length this worship, in spite of all opposition made against it, was allowed and enjoined.

The Roman catholics boast of the miraculous effects of the images of their saints. The image of Jesus Christ, which feeling itself wounded with a dagger by an impious wretch, laid its hand upon the wound, is famous at Naples. It is pretended that the image of St. Catherine of Sienna, has often driven out devils, and wrought other miracles: and that the lady of Lucca, when insulted by a soldier, who threw a stone at her, and had like to have broken the head of the child Jesus, whom she held on her right arm, immediately set him on her left, and the child liked sitting on that arm so well, that since that accident, he has never changed his situation.

As to the greek church, tho' they reject the use of graven images and statues, they pay a boundless veneration to pictures, and upon solemn festivals plant the picture of the saint to whom the church is dedicated in the center of the church; and every person present salutes our
our blessed Lord, they kiss its feet; if the virgin Mary, its hands; but if it be any other faint, they approach it with more familiarity, and kiss its cheek. Before these pictures they also address their prayers.

**IMAGINATION**, a power or faculty of the mind, whereby it conceives and forms ideas of things communicated to it by the outward organs of sense.

Lord Bacon, having divided the doctrine of the mental faculties into logics and ethics, considers the imagination as performing the office of an agent or embassy on both sides, and affixing alike in the judicial and ministerial capacity. Senes, according to him, commits all sorts of notions to the imagination, and reason afterwards judges of them. In like manner, reason transmits select and approved notions to the imagination before the decree is executed; for imagination always precedes and exciting voluntary motion, and is therefore a common instrument both to the reason and the will; only it has two faces, that turned towards reason bearing the effigy of truth, but that towards action, the effigy of goodness, yet so as to appear the effigies of fitters.

Mr. Boyle says, that there are many instances in physic-books of diseases arising from imagination, particularly where the disease is excessively dreaded; adding, that he knew a lady who had the small-pox by this means: nor is it only in women that imagination has these effects, for he tells us of a man whose hair was suddenly changed from a fear of his going to be put to death. The remembrance of a loathsome potion will often produce a horror; attended with a sensible commotion of the whole body, and a kind of convulsion about the stomach. Shame, we see, occasions the blood to be plentifully thrown up into the face, as will also great and sudden joy. Longing in women may be supposed to create great alteration in the body of the mother, since it will leave such lasting and strong impressions upon that of the infant. And Mr. Boyle tells us of a young lady who washing in St. Winifred's well, and fixing her eyes very attentively upon the red pebble-stones which in a scattered order made a large part of those that appeared through the water, a while afterwards grew big, went her time, and was delivered of a child, whose skin was plentifully spotted with spots of the colour and magnitude of these stones.

We have had lately an ingenious poem, in English, upon the pleasures of the imagination; and Addison's essays upon that subject in the Spectator, as well as Hutchinson's treatise on beauty and virtue, to deserve the attention of such as desire to be informed in this branch of philosophy.

**IMAMI**, a name applied by the mahometans to him who is head of the congregations in their mosques; and by way of eminence to him who has the supreme authority both in respect to spiritual and temporal.

There are subordinate imams in each town who represent the chief imam, but only with respect to religion. When the imam of the musulman religion is mentioned without distinction, it is always restricted to the rightful and lawful successor of Mahomet, the fountain both of secular and sacred jurisdiction. The mahometans are not perfectly agreed concerning the dignity of some of the circumstances of this office: some hold the imamate to be settled by divine right, like the aaronical priesthood, in one family; others think it not so unalterably tied to genealogy and descent, as to hinder its passing from one family to another; and they say that an imam may be deposed for vicious conduct, and his office conferred on another.

The sheikhs, or disciples of Ali, maintain, that this privilege belongs to the family of Ali exclusive of all others; Ali being sole heir to Mahomet: hence, they own no person for the head of religion, who cannot prove his descent in a right line from this first imam. There are imams belonging to particular mosques, who are in the nature of our parish-priests.

**IMBARGO, or EMBARGO**, in naval affairs. See the article _Embargo_.

**IMBECILITY**, a languid, inanimate state of body; which, being greatly impaired, is not able to perform its usual exercises and functions.

**IMBEZLE**, signifies to steal, pilfer, or purloin, and also to waste or diminish goods, &c. entrusted to a person's charge and care. Imbezlers of wool forfeit double damages, and may be committed to the house of correction till paid; and servants embezling their master's goods to the value of 40s. are deemed guilty of felony without benefit of clergy.

**IMBIBING**, the action of a dry porous body, that absorbs or takes up a moit or fluid
IMITATION, in
IMBRICATED, among botanists, an
IMENSITY, in
they call
a contrary motion, which
calls
notes is only imitated,
Sumetimes the
the
condition wherein each
ing
from the imitation
ing
is, by following the genius of the
PUBLIC.
Imitation, says be, ought not to be
two arts, as
tion, since the
Du Bos observes, that the principal merit
of poems and pictures, conflicts in the imita-
tion of such objects as would have exci-
ted real passions; and that the passions
which these imitations give rise to, are
only superficial, and not so strong as
that of the object imitated, and are there-
fore soon effaced. He also maintains,
that the imitation of tragic objects in
poems and pictures, afford most pleasure:
we listen, therefore, with pleasure to those
unhappy men who make a recital of
their misfortunes by means of a paint-
er's pencil, or of a poet's verbes; but,
as Diogenes Laertius observes, it would af-
lict us extremely, were we to hear them
bewailing their sad disasters in perion.
The too great impressions these imita-
tions make upon man, was the reason
of Plato's excluding them from his re-
public. Poets and painters cannot choo-
too engaging a
subject for their imita-
tion, since the principal charm of these
two arts, as Du Bos observes, proceeds
from the imitation of objects capable of
engaging us.
Imitation, says he, ought not to be
fervile, but like that which Horace,
Virgil, and many other good writers
made use of, who preceded them; that
is, by following the genius of the lan-
guage in which they composed, and tak-
ing nature for their first model.
IMITATION, in music, a particular way of
composition wherein each part is made
to imitate the other, either throughout
the whole piece, which is one of the
kinds of canon; or only during some
measures, which is a simple imitation.
Sometimes the motion or figure of the
notes is only imitated, and that often by
a contrary motion, which makes what
they call a retrograde imitation.

Imitation differs from a fugue, says Mr
Broard, in regard to the former the re-
petition must be a second, third, sixth
seventh, or ninth, either above or below
the first voice or guide; to which it may
be added, that it may be at any interval,
and differs properly from fugue, in that
in imitation the intervals may not be pre-
ciely the same; whereas were the repre-
tition to an unison, fourth, fifth, or oc-
tave, higher or lower, and the intervals
exactly the same in the comes and guide,
it would be a fugue.
IMMACULATE, something without
flain, chiefly applied to the conception
of the holy virgin. See CONCEPTION.
IMMANENT, in logic. The schoolmen
distinguishing two kinds of actions, the one
transient, which pass from the agent to
the patient, the other immanent, which
continue in the agent. See ACT.
IMMATERIAL, something devoid of
matter, or that is pure spirit: thus
God, angels, and the human soul are
immortal beings. See the articles GOD,
ANGEL, and SOUL.
IMMEDIATE, whatever is capable of
producing an effect without the interven-
tion of external means; thus we say,
an immediate cause, in opposition to a me-
diate or remote one. See CAUSE.
IMMEDIATE MODE. See MODE.
IMMEMORIAL, in law, an epithet given
to the time or duration of anything,
whence beginning we know nothing of.
In a legal sense, a thing is said to be of
time immemorial, or time out of mind, that
was before the reign of king Edw. II.
IMMENITY, an unlimited extension, or
which no finite and determinate space,
repeated ever so often, can equal. See
the article INFINITY.
IMMERETTA, a province of a{"cian
Turky, situated between Georgia and the
Euxine sea.
IMMERSION, that act by which any
thing is plunged into water, or other
fluid. See the article FLUID.
It is used in chemistry for a species of cal-
cination, when any body is immersed in a
fluid to be corroded; or it is a species of
lotion, as when a substance is plunged
into any fluid in order to deprive it of a
bad quality, or communicate to it a good
one.
IMMERSION, in astronomy, is when a star
or planet is so near the sun with regard
to our observations, that we cannot see
it; being, as it were, enveloped and hid
in the rays of that luminous. It also
denotes
denotes the beginning of an eclipse of the moon, or that moment when the moon begins to be darkened, and to enter into the shadow of the earth; and the same term is also used with regard to an eclipse of the sun, when the disk of the moon begins to cover it. In this sense emersion stands opposed to immersion, and signifies the moment wherein the moon begins to come out of the shadow of the earth, or the sun begins to show the parts of his disk which were hid before. See the article Eclipse.

Immersion is frequently applied to the satellites of Jupiter, and especially to the first satellite; the observation whereof is of so much use for discovering the longitude. The immersion of that satellite is the moment in which it appears to enter within the disk of Jupiter, and its emersion the moment when it appears to come out.

The immersions are observed from the time of the conjunction of Jupiter with the sun, to the time of his opposition; and the emersions from the time of his opposition to his conjunction.

The peculiar advantage of these observations is, that during eleven months of the year, they may be made at least every other day. The perfection of this theory and the praxis thereon, we owe to Mr. Cassini.

IMMORTAL, that which will last to all eternity; as having in it no principle of alteration or corruption; thus God and the human soul are immortal. See the articles God and Soul.

IMMUNITY, a privilege or exemption from some office, duty, or imposition, as an exemption from tolls, &c. Immunity is more particularly understood of the liberties granted to cities and communities.

IMMUTABILITY, one of the divine attributes, founded on the absolute perfection of the deity. See God.

The immutability of God is two-fold, physical and moral. The first confits in this, that the divine essence does not, nor possibly can, receive any alteration; and the moral is mutability is founded on the perfection of his nature, whereby he always wills the same things, or such as are best on the whole.

IMOLA, a city of Italy, seventeen miles east of Bologna, subject to the pope.

IMPALED, in heraldry; when the coats of arms of a man and his wife who is not an heiress are borne in the same escutcheon, they must be marshalled in pale; the husband's on the right side, and the wife's on the left: and this the heralds call baron and femme, two coats impaled.

If a man has had two wives, he may impale his coat in the middle between theirs; and if he has had more than two, they are to be marshalled on each side of his in their proper order.

IMPALPABLE, that whose parts are so extremely minute that they cannot be distinguished by the senses, particularly by that of feeling.

IMPANATION, a term used by divines, to signify the opinion of the lutherans with regard to the eucharist, who believe that the species of bread and wine remain together with the body of our Saviour after consecration.

IMPELING, in law, signifies the writing down or entering into a parchment, lift or schedule, the names of a jury summoned by the sheriff to appear for such public services as juries are employed in. See the article Panel.

IMPARLANCE, in law, a petition in court for a day to consider or advise what answer the defendant shall make to the plaintiff's action; and is the continuance of the cause till another day, or a longer time given by the court.

An imparlance is general or special; general is when it is entered in general terms, without any special clause therein; special is where the defendant declines a further day to answer. And this last imparlance is of use to plead some matters, which cannot be pleaded after a general imparlance.

It is said that imparlance was formerly from day to day, but now it is from one term to another. In case the plaintiff amends his declaration after the same is delivered or filed, the defendant may in course imparl to the next term afterwards, unless the plaintiff pays costs; but if he does, and they are accepted, the defendant may not have an imparlance. Likewife the not delivering a declaration in time, is sometimes the cause of imparlance; and when the plaintiff declares, yet does not proceed in three terms after, in such case the defendant may imparl to the next succeeding term. But there are divers causes wherein imparlannces are not to be given, as where a person is sued by an attorney or any other privileged person of the court in an affize, one may not imparl except good cause be given, nor shall there be
IMPARSONNEE, or a parson impeached, in law. See the article Parson.

IMPASSIBLE, that which is exempt from suffering, or cannot undergo pain or alteration. The flowers place the soul of their wife man in an impalpable, or impervious state. See the article Stoic.

IMPASTATION, the mixture of various materials of different colours and confinences, baked or bound together with some cement, and hardened either by the air or by fire.

IMPASTING, in malady, a term used for a work made of scur, or flc, beaten and wrought up in manner of a paste. Some authors are of opinion, that the obelisks and the huge antique columns still remaining, were made by impastation.

IMPASTING, or Empasting, in painting. See the article Empasting.

IMPATIENS, touch-me-not, in botany, a genus of plants otherwise called balsamina. See Balsamina. This plant is said to be strong a diuretic, as to bring on a diabetes.

IMPEACHMENT, an accusation and prosecution for treason and other crimes and misdemeanors. Any member of the lower house of parliament may impeach any one belonging either to that body, or to the house of lords. The method of proceeding, is to exhibit articles on the behalf of the commons, by whom managers are appointed to make good their charge. These articles are carried to the lords, by whom every person impeached by the commons is always tried; and if they find him guilty, no pardon under the great seal can be pleaded to such an impeachment. 12 Will. III. cap. ii.

IMPEACHMENT OF waife, is a prohibition or restraint from committing of waife up on lands or tenements. This term also signifies a demand of satisfaction for waife committed by a tenant, who has only a particular estate in the land granted, as for life or years. Yet a person that holds lands on lease containing this clause, viz. to hold without impeachment of waife, has thereby such an interest in the lands, &c. that he may commit waife without being impeached or questioned for it.

IMPEDEMENTS, in law, are such hindrances as put a stop, or stay, to a person's looking for his right by due course of law.

IMPEFECS, under impediments are those that are either under age, or under cover, that are non compos mentis, in prison, beyond sea, &c. who by our statutes are allowed time to claim and prosecute their rights, after such impediments are removed, especially in case of fines levied.

IMPELENTRABILITY, in philosophy, that property of body, whereby it cannot be pierced by another; thus, a body, which is filled a space as to exclude all others, is said to be impenetrable. See the articles Body, Extension, &c.

IMPETING. A FIVE, one of the moods of a verb, used when we would command entreat or advise: thus, go, read, take pity, be advised, are imperatives in our language; but in the learned languages, this mood has a peculiar termination to distinguish it from others, as i, or ito, go; urge, or legite, read, &c. and not only so, but the termination varies, according as you address one or more persons, as audi and audite; audi, audite, audite, &c.

IMPERATOR, in roman antiquity, a title of honour conferred on victorious generals, by their armies, and afterwards confirmed by the senate.

IMPERATORIA, master-wort, in botany, a genus of the pantentaria agy- nia class of plants, the general corolla of which is uniform; the single flowers are composed each of five inflexo-cordate and nearly equal petals; the fruit is naked, round, compressed, and separable into two parts; the seeds are two, oval, furrowed with two lines on one side, and surmounted with a broad margin.

The root of this plant is cordial and sudorific, and is an ingredient in many compositions.

IMPERATRIX, in botany, the name with meum, or spiguel. See the article Meum.

IMPERFECT, something that is defective, or that wants some of the properties found in other beings of the same kind; thus moths are called imperfect plants, because almost all the parts of fruition are wanting in them; and for the like reason, in the appellation imperfect given to the fungi and submarine plants. See Moss, Fungi, and Submarine.

IMPERFECT FLOWERS, those otherwise called flamineous. See the article Stama

IMPERFECT NUMBERS, such whose aliquot parts taken together, do either exceed or fall short of that whole number of which they are parts; they are either abundant
abundant or deficient. See the articles ABUNDANT and DEFICIENT.

IMPERFECT TENSE, in grammar, a tense that regards some præterite tense, or denotes the thing to be at that time present, and not quite finished; as scribebem, I was writing.

IMPERIAL, something belonging to an emperor or empire, as imperial crown, imperial chamber, imperial cities, imperial diet, &c. See CROWN, CHAMBER, CITY, DIET, &c.

IMPERIAL is also a city and port-town of the province of Chili, in South America, situated in west lon. 80°, north lat. 39°.

IMPERSONAL VERB, in grammar, a verb from which the nominative of any certain person cannot be prefixed; or, as others define it, a verb distinct of the two first and primary persons, as decet, oportet, &c. The impersonal verbs of the active voice end in i, and those of the passive in tur; they are conjugated thro' the third perfon singular of almost all the tenses and moods: they want the imperative, instead of which we use the present of the subjunctive; as penitet, pugnetur; nor, but a few excepted, are they to be met with in the supines, participles, or gerunds.

IMPETIVOUS, a thing not to be perverted, nor passed through, either by reason of the closeness of its pores, or the particular configuration of its parts.

IMPETIGO, in medicine, a name by which the leprosy of the Greeks is sometimes called. See LEPROSY.

IMPETIGO is also a species of itch, attended with dry scales or scurf, and an uneasy pruriginous itching. See ITCH.

IMPETRATION, in law, the obtaining any thing by request or prayer: but in our old statutes, it is taken for the pre-obtaining of church benefices in this realm, from the court of Rome, which lie in the disposition and gift of the king and other lay-patrons of this land.

IMPETUS, in mechanics, the force with which one body impels or strikes another. See MOMENTUM, GUNNERY, &c.

IMPING, in falconry, the inferring of a feather in the wing of an hawk, in the place of one that is broken.

IMPLANTATION, the same with transplantation. See TRANSPANTATION.

IMPLEAD signifies to sue or prosecute by due course of law.

IMPLEMENT'S is used for all things necessary for a trade, or the furniture of an household; in which sense, it is frequent- ly used in wills, conveyances of moveables, &c.

IMPICITITE, something tacitly comprised or understood; that is, contained in a discourse, clause, or proposition, not in express terms, but only by induction and consequence.

IMPLICATION, in law, is where something is implied, that is not expressed by the parties themselves in their deeds, contracts, and agreements.

In this case, the want of words may be supplied by implication. Thus, where a husband by will devises all the goods in his house, to his wife; and after her decease, bequeatheth his house and those goods to his son, it is implied, in law, that the widow is to have the house for life; because though the son might have had it, he is not mentioned by will to have any thing till after the decease of the mother. But it is otherwise, where a person devises part of his lands to his wife for life, and the part so devised, with all the rest of his lands to the youngest son, and his heirs, after the wife's decease: in this case, as there is no express devise of the rest of the lands to the wife, she cannot have them by implication; for since the eldest son, who is heir at law, is not excluded, he shall have them during his mother's life, and till the devise to the youngest son takes effect.

IMPORTATION, in commerce, the bringing merchandize into a kingdom from foreign countries; in contradistinction to exportation. See EXPORTATION.

We shall here give some of the principal laws relating to the importation of goods into this kingdom. Goods imported without entry, or paying customs, are forfeited; and the lord-treasurer, the barons of the exchequer, or chief magistrates of the place where the offence was committed, or next adjoining to it, may grant a warrant to any person, who, with the assistance of a constable, may break open doors, chests, &c. and take thence any prohibited or unaccustomed goods; but this is to be done, within one month after the offence was committed. But if false information is given, the person wrongfully accused, may recover costs and damages. See the article DUTY.

No ship or vessel arriving from beyond sea is to be above three days in falling from Gravelend to the place of discharge on the river Thames, unless hindered by contrary winds or other impediment. And no ship bound for the port of London is to
to touch or stay at any place adjoining to any shore, between Gravesend and Chelte-
quay. True entries are to be made of all such ships lading, upon oath of the ma-
ter or purser for that voyage; also where the took in her lading, where she was
built, how manned, who were the owners, and who the master during the voyage.
In all out-ports, ships are to come direct-
ly to the place of unlading, and make true entries as aforesaid, upon penalty of the
forfeiture of 100l.

After any ship is cleared, and the watch-
men and tidesmen discharged from their attendance, if there be found on board
any concealed goods that have not paid the duty inwards, the master, or other
person taking charge of the ship, shall forfeit 100l.

Porters, carmen, watermen, &c. assist-
ing in landing uncustomed goods, shall,
on conviction, for the first offence, be
committed to the next jail till they find
security for their good behaviour; and
for their second offence, they are to be
committed to prison for two months,
without bail or mainprize, or till they are
discharged by the court of exchequer, or
each of them pay 5l. to the sheriff of the
county.

No merchant-denizen shall cover a stran-
ger's goods, but shall, by himself or
agent, sign one of his bills of every en-
try, with the mark, number, and con-
tents of every parcel of goods, without
which no entry shall pass. And no chil-
dren of aliens under the age of twenty-
one years, shall have entry made in their
names, nor be permitted to trade.

Merchants, trading into the port of Lon-
don, shall have free liberty to lade and
 unlade their goods at any of the lawful
quays between the Tower and London-
bridge, from sun-rising to sun-setting,
from September 1st, to March 10; and
between six o'clock in the morning and
six in the evening, from March 10, to
September 1st; giving notice thereof to
the respective officers, appointed to attend
the lading and unlading of goods. And
such officers as shall refuse to be present,
shall forfeit 5l. for every default.

To prevent combination between im-
porters, and feizers of goods unlawfully
imported or exported, none shall seize
them but the officers of the customs, or
such as shall be authorized so to do by the
lord treasurer, under-treasurer, or a spe-
cial commission from his majesty, under
the great or privy seal.

If any feizer of prohibited or unaccustom-
ed goods does not make due prosecution
thereof, it is lawful for the custom-house
officers, or others deputed thereto, to
make seizure of such goods, and they
shall be, in law, adjudged the first true
informers and feizers, and have the ben-
efit thereof, notwithstanding any law and
statute to the contrary.

All foreign goods permitted to be landed
by bills at sight, bills at view or suffrance,
shall be landed at the most convenient
quays and wharfs, as the officers of the
customs shall direct; and there, or at the
king's storehouse of the respective ports,
shall be measured, weighed, numbered,
&c. by the officers appointed, who shall
perfect the entry, and subscribe their
names to it, and the next day make their
report to the custom, collector, or com-
ptroller; or in default thereof, shall
forfeit 100l.

Any merchant who shall import goods,
shall have liberty to break bulk in any law-
ful port or quay, the master or purser first
making oath of the true contents of the
ship's lading. No English merchant shall put
on shore in Scotland or Ireland, any mer-
chandize of the growth or produce of any
of his majesty's plantations, unless the
same have been first landed in England,
Wales, or Berwick, and paid the duties
with which they are chargeable, under the
penalty of forfeiting the ship and goods,
three fourths to the king, and one fourth
to the informer, or he that shall sue for
the same: but if a ship be disabled, or
driven into any port of Ireland, and un-
able to proceed on her voyage, her goods
may be put on shore, under the hands of
the principal officers of the customs there
residing, till the goods can be put on
board some other vessel, to be transport-
ed to some part of England or Wales.

Natives of England or Ireland may import
into England, directly from Ireland, any
hemp, flax, thread, yarn, and linen, of
the growth and manufacture of Ireland,
custom-free; the chief officer importing
bringings a certificate from the chief office
in Ireland, expressing the particulars of
the goods, with the names and places of
abode of the exporters thence, and of such
as have sworn that the said goods are
bona fide, of the growth and manufacture
of that kingdom, and who they are con-
figured to in England; and the chief offi-
cer shall make oath, that the said goods
are the same that are on board, by virtue
of that certificate.

IMPOSITION
IMPOSITION of hands, a religious ceremony, in which a bishop lays his hand upon the head of a person, in ordination, confirmation, or in uttering a blessing. This practice is also generally observed by the dissenters at the ordination of their ministers, when all the ministers present place their hands upon the head of whom they are ordaining, while one of the body prays for a blessing on him and his future labours.

Imposition of hands was a Jewish ceremony, introduced not by any divine authority, but by custom; it being the practice of those people, whenever they prayed for any person, to lay their hands on his head. Our Saviour observed the same ceremony both when he conferred his blessing on the children, and when he cured the sick: the apostles also laid hands on them, upon whom they conferred the Holy Ghost. In the ancient church, imposition of hands was even practised in marriage, which custom is still observed by the Abyssinians.

However, the use of this term, which in its original signification was general, is now restrained, by custom, to the laying on of hands practised in ordination.

IMPOSSIBLE, that which cannot be done or effected.

A proposition is said to be impossible, when it contains two ideas, which mutually destroy each other, and which can neither be conceived nor united together in the mind: thus, it is impossible, that a circle should be a square, because we conceive clearly that squareness and roundness destroy each other by the contrariety of their figure.

Impossibilities are of three kinds, viz. metaphysical, physical, and moral. A thing is metaphysically impossible, when it cannot be done even by divine power; as that a square should be round, &c. those ideas, as was already observed, destroy each other, imply a contradiction, and are, literally speaking, nothing at all, in regard that what is affirmed, is at the same time denied: this impossibility is otherwise termed absolutely impossible. A thing is said to be physically impossible, that cannot be done by any natural powers, as the resurrection of the dead: this is otherwise termed impossible creature, or impossible with regard to the creature.

A thing is morally impossible, when, of its own nature, it is possible; but yet is attended with such difficulties, as that, all things considered, it appears impossible: thus, it is morally impossible that all men should be virtuous, or that a man should throw the same number with three dice an hundred times successively.

But with greater propriety a thing is said to be morally impossible, when it is repugnant to good sense and decency, or contrary to the laws of nature: thus the lawyers say, omne turpe est impossibile: those conditions are impossible, therefore, which sense and decorum do not allow to be performed, though in themselves very possible to those who have no regard to good sense, &c.

IMPOST, in law, signifies in general a tribute or custom, but is more particularly applied to signify that tax which the crown receives for merchandises imported into any port or haven. See Duty. Some, notwithstanding, differing in imposts from customs, which latter are rather the profits arising to the king from goods exported. See the article Customs.

IMPOSTS, in architecture, the capitals of pillars, or pilasters, which support arches. An impost, sometimes called chapel, is a sort of plinth, or little cornice, which crowns a pier, and supports the first stone wherein an arch or vault commences. The imposts are conformable to their proper orders. The tufcan has only a plinth; the doric has two faces crowned; the ionic, a larnax, or crown over the two faces, and its mouldings may be carved; the corinthian and composite have a larnax, frieze, and other mouldings. See the articles Tuscan, Doric, &c.

The projections of the imposts must not exceed the naked of the pilaster; sometimes the entablature of the order serves for the impost of the arch, and this has a very grand and stately appearance. The impost is a thing very essential to the composition of the ordnances, information that without it, in the place where the curve-line of the arch meets with the perpendicular line of the pillar, there always seems a kind of elbow.

IMPOSTHUME, in surgery, &c. the name with absces. See Abscess.

IMOTENCE, or IMPOTENCY, in general, denotes want of strength, power, or means to perform any thing. Divines and philosophers distinguishing two sorts of impotency, natural and moral; the first is a want of some physical principle, necessary to an action; or where a being is absolutely defective; or not free: and
and at liberty to act: the second only imports a great difficulty, as a strong habit to the contrary, a violent passion, or the like.

Impotency is, more particularly, used for a natural inability to coition. Impotence with respect to men, is the same as sterility in women; that is, an inability of propagating the species. There are many causes of impotency, as a natural defect in the organs of generation, which seldom admits of a cure: accidents, or diseases; and in such cases the impotence may, or may not be remedied, according as these are curable or otherwise. But there is reason to believe that the most frequent causes of impotency are preposterous methods of venery, and too often repeated venereal injuries. See the article *GONORRHEA*.

Dr. James thinks that a sudden impotence happening to a man not accustomed to any disorders of that kind, and not accountable for from any preceding accidents, is a fore-runner of some great disorder; and that, in such cases, provocatives are very dangerous, because it is possible they may increase the disorder which causes the impotency, and make it fatal. Hippocrates advises a man who has a mind to get children, not to get drunk, nor drink white-wine, but that which is strong and unmixed, nor to use the warm bath.

Another principal cause of impotency is the vicious habit of drinking spirits, that is, drams and the like.

**IMPRATICABLE CASE**, in algebra, that otherwise called irreducible. See the article *IRREDUCIBLE*.

**IMPRECACTION**, a curse, or wish that evil may befall any one. See the article **EXECRATION**.

**IMPREGNATION**, the getting a woman with-child. See *PREGNANCY*.

The term impregnation is also used, in pharmacy, for communicating the virtues of one medicine to another, whether by mixture, coction, digestion, &c. See the articles *MIXTURE*, *COCTION*, &c.

**IMPRESSION** is applied to the species of objects, which are supposed to make some mark or impression on the senses, the mind, and the memory. The peripatetics assert, that bodies emit species resembling them, which are conveyed to the common sensum, and there are rendered intelligible by the active intellect; and when thus spiritualized, are called expressions, or express species, as being expressed from the others.

**IMPRESSION** also denotes the edition of a book, regarding the mechanical part only; whereas edition, besides this, takes in the care of the editor, who corrected or augmented the copy, adding notes, &c. to render the work more useful. See the article *EDITOR*.

**Privilege for Impression.** See the article *PRIVILEGE*.

**IMPREST, Auditor of.** See the article *AUDITOR*.

**IMPREST-MONEY**, the money paid at the enlisting of soldiers.

**IMPRISONMENT**, the state of a person restrained of his liberty, and detained under the custody of another. No person is to be imprisoned but as the law directs, either by the command or order of a court of record, or by lawful warrant; or the king's process, on which one may be lawfully detained. And at common law, a person could not be imprisoned unless he were guilty of some force and violence, for which his body was subject to imprisonment, as one of the highest executions. Where the law gives power to imprison, in such case it is justifiable, provided he does it in pursuance of a statute, exactly pursues the statute in the manner of doing it, for otherwise it will be deemed false imprisonment, and of consequence it is unjustifiable. Every warrant of commitment for imprisoning a person, ought to run, "Till delivered by due course of law," and not "Until farther order," which has been held ill, and thus it also is, where one is imprisoned on a warrant not mentioning any cause for which he is committed.

A person being sent to prison by a warrant from a secretary of state, without assigning any cause, &c. it was adjudged, that he ought to be discharged for that reason. Persons may also, by bail or habeas corpus, be discharged from their imprisonment in any case bailable. See the article *HABEAS CORPUS*, *BAIL*, *PRISON*, and *PRISONER*.

**IMPROPER FRACTIONS**, in arithmetic. See the article *FRACTION*.

**IMPROPRIATION**, a parasang or ecclesiastical living, the profits of which are in the hands of a layman; in which sense, it stands distinguished from appropriation, which is where the profits of a benefice are in the hands of a bishop, college, &c. though these terms are often
often used promiscuously. See the article Appropriation.

Impulse, or impulsive force, in mechanics, the same with impetus. See the article Impetus.

Impurity, in the law of Moses, is any legal defilement. Of these there were several sorts; some were voluntary, as the touching a dead body, or any animal that died of itself, or any creature that was esteemed unclean; or the touching things holy, by one who was not clean, or was not a priest; the touching one who had a leprosy, one who had a gonorrhoea, or who was polluted by a dead creature, &c. Sometimes these impurities were involuntary, as when any one inadvertently touched bones, or a sepulchre, or any thing polluted; or fell into such diseases as pollute, as the leprosy, &c.

The beds, cloaths, and moveables which had touched any thing unclean, contrasted also a kind of impurity, and in some cases communicated it to others. These legal pollutions were generally removed by bathing, and lasted no longer than the evening. The person polluted plunged over head in the water, and either had his clothes on when he did so, or washed himself and his clothes separately. Other pollutions continued even forty days after the leper was cured, that is to say, until he had been delivered, offered a sacrifice of two birds, one of which was killed, and the other set at liberty. He who had touched a dead body, or had been present at a funeral, was to be purified with the water of expiation, and this upon pain of death. The woman who had been delivered, offered a turtle and a lamb for her expiation; or if she was poor, two turtles or two young pigeons.

These impurities, which the law of Moses has expressed with the greatest accuracy and care, were only figures of other more important impurities, such as the sins and iniquities committed against God, or faults committed against our neighbour. The saints and prophets of the Old Testament were sensible of this; and our Saviour, in the gospel, has strongly inculcated, that they are not outward and corporal pollutions which render us unacceptable to God, but such inward pollutions as infect the soul, and are violations of justice, truth, and charity.

Imputation, in general, the charging something to the account of one, which belonged to another; thus, the afferors of original sin maintain, that Adam's sin is imputed to all his posterity. See the article Original Sin.

In the same sense, the righteousness and merits of Christ are imputed to true believers. See the article Justification.

Inaccessible, something that cannot be come at, or approached, by reason of intervening obstacles, as a river, rock, &c. It is chiefly used in speaking of heights and distances. See the articles Height and Distance.

Inactivity of matter. See Inertia.

Inadequate idea. See Idea.

Inalienable, that which cannot be legally alienated or made over to another; thus the dominions of the king, the revenues of the church, the estates of a minor, &c. are inalienable, otherwise with a reserve of the right of redemption.

Inamelling, or enamelling. See the article Enamelling.

Inanimate, a body that has either lost its soul, or that is not of a nature capable of having any.

Inantit, n, among physicians, denotes the figure of the stomach when empty, in opposition to repletion.

Inarching, in gardening, is a method of grafting, commonly called grafting by approach, and is used when the stock intended to graft on, and the tree from which the graft is to be taken, stand so near, or can be brought so near, that they may be joined together. The method of performing it, is as follows: take the branch you would match, and having fitted it to that part of the stock where you intend to join it, bore away the skin and wood on one side, about three inches in length. After the same manner cut the stock or branch in the place where the graft is to be united, so that the rind of both may join equally together; then cut a little tongue upwards in the graft, and make a notch in the stock to admit it; so that when they are joined,
joined, the tongue will prevent their slipping, and the graft will more closely unite with the stock. Having thus placed them exactly together, tie them with some bux, or other soft tying; then cover the place with grafting clay, to prevent the air from entering to dry the wound, or the wet from getting in to rot the stock. You should also fix a stake in the ground, to which that part of the stock, together with the graft, should be fastened, to prevent the wind from breaking them asunder, which is often the case, when this precaution is not observed. In this manner they are to remain about four months, in which time they will be sufficiently united, and the graft may then be cut from the mother tree, observing to slope it off close to the stock; and if at this time you cover the joined parts with fresh grafting-clay, it will be of great service to the graft. This operation is always performed in April or May, and is commonly practiced upon myrtles, jasmines, walnuts, firs, pines, and several other trees that will not succeed by common grafting, or budding.

INAUGURATION, the coronation of an emperor or king, or the consecration of a prelate; so called from the ceremonies used by the Romans, when they were received into the college of augurs. See CORONATION, CONSECRATION, &c.

INCA, or YNCA, a name given by the natives of Peru to their kings, and the princes of the blood. Pedro de Cieca, in his Chronicle of Peru, gives the origin of the incas, and says, that that country was, for a long time, the theatre of all manner of crimes, of war, dissention, and the most dreadful disorders, till at last two brothers appeared, one of whom was called Mangacapa; of this peril, the Peruvians relate many wonderful stories. He built the city of Cusco, made laws, established order and harmony by his wise regulations, and he and his descendants took the name of inca, which signifies king or great lord. These incas became so powerful, that they rendered themselves masters of all the country from Paflo to Chili, and from the river Maule on the south, to the river Augasfango on the north; these two rivers forming the bounds of their empire, which extended above thirteen hundred leagues in length. This they enjoyed till the divisions between inca Guacap and Atabalipa, which the Spaniards laying hold of, made them-
In the burning of incense made part of the daily service of the antient Jewish church. The priests drew lots to know who should offer it; the destined person took a large silver dish, in which was a certain full of incense; and being accompanied by another priest, carrying some live coals from the altar, went into the temple. There, in order to give notice to the people, they struck upon an instrument of brass placed between the temple and the altar; and being returned to the altar, he who brought the fire left it there, and went away. Then the officer of incense having said a prayer or two, waited the signal, which was the burning of the holocaust, immediately upon which he set fire to the incense, the whole multitude continuing all the time in prayer. The quantity of incense offered each day, was half a pound in the morning, and as much at night.

One reason of this continual burning of incense might be, that the multitude of victims, that were continually offered, would have made the temple smell like a slaughter-house, and consequently have inspired the comers rather with disgust and aversion than awe and reverence, had it not been overpowered by the agreeable fragrance of those perfumes.

Incontinent, a term used by Dr. Wallis to express such moments, or first principles, which, though of no magnitude in themselves, are notwithstanding capable of producing it. Thus, a point is inceptive of a line, and a line inceptive of surface, &c.

Incense is a rich perfume, with which the antient pagans, and the Roman Catholics fill, perfume their temples, altars, &c. The burning of incense made part of the daily service of the antient Jewish church. The priests drew lots to know who should offer it; the destined person took a large silver dish, in which was a certain full of incense; and being accompanied by another priest, carrying some live coals from the altar, went into the temple. There, in order to give notice to the people, they struck upon an instrument of brass placed between the temple and the altar; and being returned to the altar, he who brought the fire left it there, and went away. Then the officer of incense having said a prayer or two, waited the signal, which was the burning of the holocaust, immediately upon which he set fire to the incense, the whole multitude continuing all the time in prayer. The quantity of incense offered each day, was half a pound in the morning, and as much at night.

One reason of this continual burning of incense might be, that the multitude of victims, that were continually offered, would have made the temple smell like a slaughter-house, and consequently have inspired the comers rather with disgust and aversion than awe and reverence, had it not been overpowered by the agreeable fragrance of those perfumes.

Inceptiveness, a term used by Dr. Wallis to express such moments, or first principles, which, though of no magnitude in themselves, are notwithstanding capable of producing it. Thus, a point is inceptive of a line, and a line inceptive of surface, &c.
The angle $PCB$, is called the angle of reflection, and is always equal to the angle of incidence $ACP$; which is thus proved: Every ray of light goes the shortest way that possibly it can: thus, if you suppose the ray $AC$, (ibid.) to fall on the plain glass or surface $EG$, and thence be reflected to $B$, so that the angle $ACE$ be equal to $BCG$; then will $AC$ and $CB$, be the two shortest lines that can possibly be drawn from the points $A$ and $B$, to the point of incidence $C$ in the plane $EG$: for instance, they will be shorter than $AD + DB$, or any others. For produce $CB$ to $F$, and draw $DF$, because the vertical angles $ECF$ and $BCG$ are equal, the arch $EF$ is equal to $BG$, equal to $AE$ by the supposition; but it is plain, that $FC = AC = CB$; wherefore $FB (= AC + CB)$ is less than $DF + DB = AD + DB$; and so it will be in every case. Wherefore, since the ray must go the nearest way, the angle of incidence will always be equal to that of reflection: For the two angles $ECA$, and $BCG$, being thus equal, their complements $ACP$ and $PCB$ must also be equal, and may be thus proved. Produce the ray $AC$ directly till it meet with the perpendicular $GH$ in $H$: then make $GK$ equal $GH$, and produce $CB$ to $K$. Say $CK$ is the reflected ray, and that the angle $PCK$ is equal to $PCA$: for $PC$ being drawn perpendicular to the plane $EG$, the angle $ECA + ACP$ are equal to the angles $GCB + KCP$; because they are both equal to a right angle. But $ECA$ is equal to $GCH$, which is equal to $GCK$ by construction; and therefore the angle of incidence, $ACP$, is equal to the angle of reflection, $PCB$, Q.E.D.

It is likewise demonstrated in optics, that the sines of the angles of incidence, and refraction, are to each other reciprocally as the refractions of the medium. And Sir Isaac Newton, in his Optics, says, the sine of incidence is either accurately, or very nearly in a given ratio to the sine of refraction. And that the angles of reflection, and refraction, lie in one and the same plane with the angle of incidence. Whence, if that proportion be known in any inclination of the incident ray, it's known in all the inclinations, and thereby the refractions in all cases of incidence on the same refracting body may be determined. Thus, if the refraction be made out of air into water, the sine of incidence of the red light is to the sine of its refraction as 4 to 3. If out of air into glass, the sines are as 17 to 11. In light of other colours, the sines have other proportions; but the difference is so little, that it need seldom be considered.

Suppose therefore, that $R.S.$ (ibid. n° 2.) represents the surface of reflecting water, and that $C$ is the point of incidence in which any ray coming in the air from $A$ in the line $AC$, is reflected or refracted, and I would know whither this ray shall go after reflection or refraction: I erect upon the surface of the water, from the point of incidence, the perpendicular $CP$, and produce it downwards to $Q$, and conclude from what has been said, that the ray after reflection and refraction, shall be found somewhere in the plane of the angle of incidence, $ACP$, produced. I let fall therefore, upon the perpendicular $CI$, the sine of incidence $AD$; and if the reflected ray be defined, I produce $AD$ to $B$, so that $DB$ be equal to $AD$, and draw $CB$. For this line $CB$ shall be the reflected ray, the angle of reflection $BCP$, and its sine $ED$, being equal to the angle and line of incidence. But if the refracted ray be defined, I produce $AD$ to $H$, so that $DH$ may be to $AD$ as the sine of refraction to the sine of incidence, that is, (if the light be red) as 3 to 4; and about the center $C$, and in the plane $ACP$, with the radius $CA$, describing a circle $ABE$, I draw parallel to the perpendicular $CPQ$, the line $HE$ cutting the circumference in $E$, and joining $CE$, this line $CE$ shall be the line of the refracted ray. For if $EF$ be let fall perpendicularly on the line $PQ$, this line $EF$ shall be the sine of refraction of the ray $CE$, the angle of refraction being $ECQ$; and this same $EF$ is equal to $DH$, and consequently in proportion to the sine of incidence $AD$ as 3 to 4.

INCIDENT, in law, something that inseparably belongs to another: thus, a court barron is incident to a manor.

INCIDENT, in poetry, denotes much the same with epithete. See EPILOGUE.

INCISIVE, an appellation given to whatsoever cuts or divides: thus, the fore-teeth are called dentes incisivi, or cutters; and medicines of an attenuating nature, incidents, or occasion medicines. See the articles Teeth and Attendant.
INCLÉ, a kind of tape made of linnen-yarn, which on importation pays for every dozen pounds, a duty of 11. 5s. 8d. 40. d. and draws back 11. rs. 20. d. on exportation; for the dozen pieces in rolls, containing thirty-six yards each, 10s. 3d. 40. d. and draws back 10s. 5d. 40. d. and for every pound weight of whitened or bleached linnen-yarn, known by the name of unwrought inde, or short spindle, 3d.

INCLINATION, is a word frequently used by mathematicians, and signifies the mutual approach, tendency or leaning of two lines, or two planes towards each other, so as to make an angle.

Inclination of a right line to a plane, is the acute angle, which that line makes to the horizon, and perpendicular drawn from any point where it is cut by a perpendicular drawn from any point of the inclined plane.

Inclination of the axis of the earth, is to the horizon, and perpendicular to the ecliptic. The greatest inclination of Saturn, according to Kepler, is 2° 30'; of Jupiter, 2° 20'; of Mars, 2° 30'; of Venus, 3° 20'; of Mercury, 6° 54'. According to de la Hire, the greatest inclination of Saturn is 2° 35'; of Jupiter, 2° 19'; of Mars, 2° 51'; of Venus, 3° 25'; of Mercury, 6° 52'.

Inclination of a plane in dialling, is the arch of a vertical circle, perpendicular both to the plane, and the horizon, and intercepted between them. To find this, let AB (plate CXLIV. fig. 3.) be a plane inclined to the horizon HR; apply to the plane AB a quadrant DCF, so as the plummet CE may cut off any number of degrees on the limb as EF: I lay the arch DE is the measure of the angle of inclination AHB; for draw BG perpendicular to HR, then because CE is parallel to BG, the angle ECF is equal to CBG; but DC is equal to GBH, being both right angles, therefore the angle DCF = ECF, is equal to the angle GBH = CBG; that is, DCE is equal to AHB or E.D.

INCLINED PLANE, in mechanics, one that makes an oblique angle with the horizon.

If a force, with a given direction, supports a height upon an inclined plane; that force is to the weight, as the sine of the inclination of the plane to the sine of the angle which is made by the line in which the force acts, and the line perpendicular to the plane. Thus, let AB (plate CXLV. fig. 1. n° 1.) be the inclined plane, P the weight supported, and DPV the direction of the force which supports the weight. Let PC be drawn perpendicular to AB; and from the point C, let CB be drawn parallel to the horizon, and perpendicular to the common section of the plane and the horizon, meeting the plane in B; and CA perpendicular to the horizon and also to CB, meeting the plane in A, and the line in which the force acts in V.

Now P may be conceived to be held unmoved by three forces acting together, one of which is the force of the weight itself tending downwards in a line parallel to VC, viz. PH; the second is the force acting in the line DPV, and the third is the reaction of the plane itself, acting in the line CP, perpendicular to the plane; but these three forces are to each other as the sines of the triangle VPC, as will be evident by drawing a line through P parallel to VC, and completing the parallelogram H.P. The force, therefore, is to the weight which it sustains, as PV to VC; that is, as the sine of the angle VCP, or ABC, to the sine of the angle CPV, or C.P.D. Q.E.D.

Therefore the force by which any heavy body would descend on any inclined plane, to the force of the descent on the perpendicular, is as the sine of the angle of the plane's inclination to the radius. For practice therefore, let the weight of any body be W, and P the power wanted to sustain it on an inclined plane. I say, by this theorem. R. = W; sine incl. = P. The three first of which are given, wherefore the fourth is found by trigonometrical calculation, thus. Let a body weigh 9999 pounds; what power will sustain it from descending on a plane inclined to the horizon with an angle of 34 degrees? Answer, 5592 pounds. See the work.

Weight 9999. 3·999957
S. L. incl. = 34° 9·747562
13·747519
Radius 10.000000
5592 = 3·747519 = the power.
If the points V and A coincide, that is, if the force acts according to the direction BA, the angle CPD, will be a right angle; and therefore, in that case, the force is to the weight as the sine of the inclination of the plane to the radius, or as the height AC to its length AB: And in this case, the force which is required to support a given weight is least of all; because the proportion of the sine of the inclination of the plane to the radius, is less than its proportion to any other line whatever. If the point V falls above A; the greater the angle APV is, so much the more force is necessary to support the given weight upon the plane AB. In this case, that by increasing the angle APV, the proportion of the sine of the angle ABC to the sine of the angle CPD is also increased, till PV, AV, becoming parallel, and the angles VC, CPD for that reason equal, the force and the weight will also become equal. So likewise if the point V falls below A, as at w, the force required to support the given weight, is again increased; the angle APV being increased, till PW, WC become equal, and then the force and the weight will become equal again. Further, when the lines PA, PC coincide, and the angle wPC by that means vanishes, the sine of the angle ABC will bear an infinite proportion to the sine of that; that is, no finite force whatsoever, acting in a line perpendicular to the plane, will be able to support the weight upon the plane. If the line in which the force acts be parallel to the base of the plane, the weight is to the force which supports it, as BC to CA, or as the base of the plane to the height of it. If from the point P (ibid. n° 2.) PF be let fall perpendicular to BC; and from the point C, CG perpendicular to VP; it will easily appear, that PV is to VC (that is, the force is to the weight) as CF to CG. Wherefore the force and the weight will then support one another upon an inclined plane, when they are from each other reciprocally as perpendiculars drawn from the point C to the lines in which they act; (or, if GCF be looked upon as an angular balance moveable about the center C) reciprocally as the velocities of the Points G and P reckoned upon the lines in which the forces act.

If it should be required to lift up a very heavy body, as W or w (ibid. n° 3.), the height CB, it would be impracticable to raise it up in the line CB without a power whose intensity is equal to that of the weight; and even in that case very inconvenient to do it, especially in building. But if an inclined plane AB be laid ariling from the horizontal line AC, from whence the weight is to be raised, a less power than the weight will serve for that purpose, unless it pushes the body directly against the plane (as in the direction WT) or draws the body away from the plane (as from W towards e, t, or L) or in any direction on that side of the line e.

The direction in which the body can most easily be drawn or pushed up the plane is the line Ww M, parallel to the plane, and passing thro' the center of the weight; for whether the power divides a plane & K (in a direction perpendicular to it) along the line WM, or the power P (by its descent to P) draws it in the same line, the velocity of the power will be equal to the line Ww, the space described by the center of gravity of the weight, whilst the same weight rises only the perpendicular height ZB (=nW) or has the said line properly to express its velocity. If the body was a cylinder, as a rolling stone, and the plane TM were to pass thro' the gudgeons or axis of the said stone, it is evident that the cafe would be the same; and as the weight P has its rope running over the roller (or upper pulley) M, the line PP will be the velocity of the power. Therefore in this case the weight (if kept in equilibrio) will be to the power as Ww (=TB) to wY (=BZ) or as the hypothenuse AB is to the perpendicular BC, which (by Eucl. q. 6.) are in the same proportion; and consequently, if the power be never so little increased, it will draw the weight up the plane.

That the power acts with the greatest advantage, whilst it draws in the line of direction Ww (parallel to the plane) is evident, because if, one end of the said plane of direction remaining fixed at W, the other should move towards B, or beyond it, then the body would be partly drawn against the plane, and therefore the power must be increased in proportion to the greatest difficulty of traction: And if the end w of the line abovementioned should be carried to D, or beyond it, the power must be also increased, inasmuch as it endeavours to lift the body off from the plane.

If the power draws in a line of direction WB (ibid.) parallel to the base of the plane;
plane; then, in order to keep the weight W in equilibrium by the power \( \pi \), the said power must be to the weight, as \( ZB \) to \( ZT \), or as the perpendicular BC to the base AC of the triangle ABC. For if we suppose the pulley R at so great a distance from W, that the line of direction WR may not sensibly alter its horizontal position, whilst the body W rises the height BZ, in such manner that \( \pi W = \pi Y \), and not W \( \pi \) will be the velocity of the power. So that the velocity of the power, to that of the weight will not be as the hypothenuse to the perpendicular, as in the former case, but as the base to the perpendicular in the triangle ABC. If the powers be increased just enough to overcome the friction of the plane, and draw up the body W, let the pulley R be lifted up gradually to \( r \), so as to keep the line WR parallel to itself till it comes to \( w r \), and the power will be descended to \( \pi \), when the weight is come to \( w B \). But \( \pi \), together with the distance \( \pi r \), is equal to \( \pi \), or \( W Y \), &c. And this traction, being constantly made in the angle WBT, is the case.

For the motion of the loaded cylinder upon an inclined plane, see CYLINDER.

INCLINED TOWERS, whose whole tops hang so far over, as to appear dangerous to people walking below. Such is that represented in plate CXLV. fig. 2. where PP is the perpendicular let fall from the top of the tower to TT the horizontal plane. Now the reason why such towers do not fall, is owing to their centers of gravity being supported; thus C, the center of gravity of the tower here represented, is supported by the perpendicular CO, so that it cannot fall; but had the tower been built higher to A, so as to transfer the center of gravity from C to E, the tower must have fallen, since the perpendicular CE is not supported, as falling without the foundation of the tower.

INCLINERS, or INCLINING DIALS. See the article DIAL.

INCLUSION, in husbandry, the fence or hedge made to inclose lands. See the articles FENCE and HEDGE.

A very good inclosure may be made of elder-flicks, or truncheons, cut ten or twelve feet long, and stuck into the bank slope-wise, so as to make a checker-work. These make the specified shelter of any; and when the trees are grown up, they are valuable for the turner's use. They succeed extremely well in watery places; and when planted on the banks of rivers, they prevent them from being undermined by the current.

The throwing down inclosures is an offence punishable by our antient statutes; yet if the lord of a manor incloses part of the waste, and does not leave sufficient room for the commoners, they may break down such inclosure, or have a writ of affize.

INCOGNITO, or INCOG, is applied to a person that is in any place, where he would not be known: but it is more particularly applied to princes, or great men, who enter towns, or walk the streets without their ordinary train, or the usual marks of their distinction and quality.

INCOMBUSTIBLE, something that cannot be burnt, or consumed by fire.

Authors talk much of a combustible cloth, made of the aileftus. See ASBESTUS. In the Philosophical Transactions, No 276, we have an account of an incombushtile lint, which is a peculiar species of aileftus, or earth-flax, which is never formed into compact masses as the other species are, but is always found in loose filaments, very fit to be wrought into cloth. It is found only, so far as yet known, in the county of Aberdeen in Scotland.

The antient Romans spun their aileftus into cloths, in which they wrapped up the dead bodies, before committing them to the funeral pile, in order to preserve their ashes distinct from those of the wood. What they had for this purpose, seems, by all accounts, to have been very short; but this species would be much more proper, as being seven or eight inches long.

INCOMMENSURABLE, a term in geometry, used where two lines, when compared to each other, have no common measure, how small soever, that will exactly measure them both. And in general, two quantities are said to be incommensurable, when no third quantity can be found that is an aliquot part of both.

Such are the diagonal and side of a square; for tho' each of those lines have infinite aliquot parts, as the half, the third, &c. yet not any part of the one, be it ever so little, can possibly measure the other, as is demonstrated in prop. 117. lib. x. of Euclid.

Rappus, lib. iv prop. 17. speaks also of incommensurable angles. As to surfaces which cannot be measured by a common surface, they are said to be incommensurable in power.

INCOM-
INCPIRASSATING, in pharmacy, is such as have no common divisor, that will divide them both equally.

INCOMPATIBLE, that which cannot sub sist with another, without destroying it: thus cold and heat are incompatible in the same subject, the strongest overcoming and expelling the weakest.

INCORPORATION, in pharmacy, is much the same as impalement, being a reduction of dry substances to the consistency of a paste, by the admixture of some fluid; thus pills, boluses, troches, and plasters are made by incorporation. Another incorporation is, when things of different consistencies, are by digestion reduced to one common consistency.

INCORPORAL, a thing, or substance, which has no body; as God, angels, and the soul of man.

INCORRUPTIBLE, that which cannot be corrupted. See Corruption.

INCORRUPTIBLES, or INCORRUPTIBLES, in church-history, heretics which had their original at Alexandria, in the time of the emperor Julian. Their distinguishing tenet was, that the body of Jesus Christ was incorruptible from his conception, by which they meant that after and from the time he was formed in the womb of his holy mother, he was not susceptible of any change or alteration, not even of any natural and innocent passions, as hunger, thirst, &c. so that he eat without any occasion before his death, as well as after his resurrection.

INCRASSATING, in pharmacy, &c. the rendering fluids thicker by the mixture of other substances let fluid; or by the evaporation of the thinner parts. Incrassating medicines are such as reduce the too fluid blood and juices to a proper consistency, and a due condensation.

INCRUSTATION, in surgery, the induction of a crust or eschar upon any part. Among maions, incrustation signifies the lining or coating of a wall, either with glossy stones, rulites, marble, pottery, or stucco-work, and that either equally or in panels and compartments.

INCULSTERED, or INCULSTATED COLUMN, is a column consisting of several pieces, or slips of some precious marble mafficated or cemented round a mould of brick, or other matter.

INCUBATION, the action of a hen, or other fowl brooding on her eggs.

INCUBUS, or NIGHT MARE, in medicine, the name of a disease which consists in a spasmotick contraction of the muscles of the breast, usually happening in the night, and attended with a very painful difficulty of respiration and great anxiety. The most obvious symptom of this disease is a tension like that of some great weight laid upon the breast: this is attended with so violent a cohesion of respiration, that the person becomes unable to move any part of his body, or to utter any distinct or articulate sound. This whole complaint goes off as soon as any one limb is moved, but there is often times an universal latitudine of the whole body left behind it, which remains for some space of time.

This disease attacks people in the night-time, in a sort of middle state, between sleeping and waking; and commonly, as Willis observes, when the stomach is oppressed with aliment of a hard digestion, especially if the patient lies on his back. Those of a plethoric habit are most subject to it; and among them, such particularly as have a great thickness of the blood: as also persons who are subject to hypochondriac complaints, and to disorders of the spleen.

Hence the cau ses of this disease are a stagnation of the blood in plethoric habits, where it is thick about the vena portae, which nature is endeavouring to throw off by means of those spasmotick motions which constitute this disease, and very often crudities in the prime vize become additional causes, and exasperate the complaint. Physicians esteem this disease of no danger; but Junker thinks it is much to be suspected, that many of these people, who are found dead in their beds, perish by it.

When this dis temper returns so often as to call for the advice of a physician, the method is to give gentle purges, three or four times, with the digestive medicines: such as gum ammoniacum, or the tartarum vitriolatum: on the intermediate days after this, bleeding in the foot is proper; and when this has been done, powders of nitre and cinna bar usually complete the cure. If they fail, the common method in hypochondriac cæles is to be used. When there are crudities in the prime vize which exasperate this disease, then, after the purges, gentle bitters and other medicines are to be given, which will restore the tone of the stomach. Gentian-root and orange-peel in intuition, are very good for this purpose.
When it happens wholly from a load on the stomach, a gentle vomit alone will perform the cure. To prevent returns of this distemper, the patient should eat light suppers, and moist accustom himself to lie on one or the other side, never on the back, nor with his head very low.

Heider observes, that those who have troubled dreams, or walk in their sleep, are to be cured in the same manner, as proceeding from the same cause.

INCUMBENT, a clerk, or minister who is resident on his benefice: he is called incumbent, because he does, or at least ought, to bend his whole study to discharge the cure of his church.

INCUMBRAVIT, or QUARE INCUMBRAVIT, in law. See QUARE.

INCURATION of the rays of light, their bending out of a refrangible or straight course, occasioned by refraction. See the article REFRACTION.

INCUS, in anatomy, a bone of the internal ear, somewhat resembling one of the anterior dente molares.

In the incus, we are chiefly to observe with what the French engineers call redent; the anterior dentes molares.

INDENTED LINE, in fortification, the trench and parapet, occasioned by refraction. See SERRATED.

INDENTED LEAF, among botanists, is one notched round its verge. See SERRATED.

INDEPENDENTS, a sect of protestants in England and Holland, so called from their independency on other churches, and their maintaining that each church or congregation has sufficient power to act and perform every thing relating to religious government within itself, and is no way subj ect or accountable to other churches or their deputies.

They therefore disallow parochial and provincial subordination, and form all their congregations upon a scheme of co-ordinancy. But tho' they do not think it necessary to assemble synods; yet if any be held, they look on their resolutions, as prudential councils; but not as decisions, to which they are obliged to conform.

As to their service, they pray publicly for kings, and all in authority; they read and expound the scripture, and administer the sacraments of baptism and the Lord's Supper. Their public officers are pastors, teachers, ruling elders, and deacons. Their church courts lie all within the compacts of admonition and excommunication.

The present independents differ from the presbyterians...
INDEX

preliterals only in their church government, in being generally more attached to the doctrines distinguished by the term orthodoxy, such as original sin, election, reprobation, &c. and in administering the Lord's Supper at the close of the afternoon's service. See PRELITERANS. The several acts of baptisms are all independents with respect to church government; and, like them, administer the Lord's Supper in the evening, whereas the preliterals administer it after the forenoon's service. See ANABAPTISTS.

INDETERMINATE, in general, an appellation given to whatever is not fixed, and of what nature it is, one which is capable of an indefinite number of solutions. See EQUATION.

INDEX, in anatomy, the name with the fore-finger. See FINGER.

INDEX, in arithmetic and algebra, shews to what power any quantity is involved, and is otherwise called exponent. See the article EXPONENT.

INDEX of a logarithm, that which shews how many places the absolute number belonging to a logarithm, doth consist; and of what nature it is, whether an integer or fraction. Thus, in this logarithm 2.523421, the number 2 standing on the left hand of the point is called the index; because it shews that the absolute number, answering to the above logarithm, consists of three places: for the number is always one more than the index.

If the absolute number be a fraction, then the index of the logarithm hath a negative sign, marked thus 2.523421. See the article LOGARITHM.

INDEX of a globe, the little style or gnomon, which being fixed on the pole of the globe, and turning round with it, points out the hours upon the hour circle. See the article GLOBE.

Expurgatory INDEX, a catalogue of prohibited books in the church of Rome. The first catalogues of this kind were made by the inquisitors, and these were afterwards approved of by the council of Trent, after some alteration was made in them by way of retrenchment, or addition. Thus an index of heretical books being formed, it was confirmed by a bull of Clement VIII. in 1595, and printed with several introductory rules; by the fourth of which, the use of the scriptures in the vulgar tongue is forbidden to all persons, without a particular licence: and by the tenth rule it is ordained, that no book shall be printed at Rome, without the approbation of the pope's vicar, or some person delegated by the pope; nor in any other places, unless allowed by the bishop of the diocese, or some person deputed by him, or by the inquisitor of heretical pravity.

The Trent index being thus published, Philip II. of Spain ordered another to be printed at Antwerp, in 1571, with considerable enlargements. Another index was published in Spain, in 1584, a copy of which was snatched out of the fire when the English plundered Cadiz. Afterwards there were several expurgatory indexes, printed at Rome and Naples, and particularly in Spain.

INDIA PROPER, or HITHER INDIA, a large peninsula in Asia, bounded on the north by Ubec Tartary, and Thibet; on the east, by another part of Thibet, the kingdom of Asem, Ava, and Pegu; on the south by the bay of Bengal, and the Indian ocean; and by the same ocean and Persia on the west: situated between 66° and 92° of east longitude, and between 7° and 40° of north latitude; being about 2000 miles in length from north to south, and 1500 miles in breadth from east to west, where broadest; tho' the southerly part of the peninsula is not 300 miles broad. All the country within these limits is either subject or tributary to the great Mogul. It is frequently called Indoffan, a name supposed to be derived from the river Indus, on its western frontier: it is also called the Mogulistan, from the imperial family now upon the throne, who trace their pedigree from Tamerlane, a Mogul Tartar.

The produce of this country, and what the Europeans import from thence, is chiefly chintz, callicoes, muslins, some silk, pepper, and diamonds, which are purchased by most nations with silver; but the Dutch frequently barter spices for them, which makes the India trade doubly advantageous to them.

INDIA beyond the Ganges, is a country bounded by Thibet and Botian on the north; by China, Tonquin, and Cochinchina on the east; by the Indian Ocean on the south; and by the hither India, the bay of Bengal, and the Straits of Malacca on the west: is situated between 92° and 104° of east longitude, and between the equator and 30° degrees of north latitude: being near 2000 miles in
in length from north to south; but of a very unequal breadth; in which limits are comprehended the kingdoms of Alem, Ava, Pegu, Laos, Siam, Cambodia and Malacca, governed by as many Indian princes; only the Dutch have usurped the dominion of Malacca. In this country there are a vast number of elephants, and consequently a great deal of ivory; our merchants also meet with gold and precious stones, canes, opium, and such other articles as are usually found within the tropics.

**INDIAN BERRY, cocculus indicus, in commerce, &c.** See Cocculus. It is as little used in the shops, being esteemed poisonous. Fishermen have a way of mixing it in paste, which when eaten greedily by the fish, intoxicate them to such a degree as to make them for a time appear lifeless, and float upon the water; and the good women use it, mixed with flaveacre, for destroying vermin in children's heads.

**INDIAN LEAF,** the leaf of a large and lofty tree, called malabathrum, which grows in Malabar, principally upon the mountains. The antients have said much of the virtues of the malabathrum; they call it vomatic, sudorific and cephalic. Dioscorides ascribes to it all the virtues of the Indian spikenard, and says, that it poissifies them in a superior degree: but at present it is utterly disregarded, and only kept in the shops as an ingredient in the theraica, mithridate, and some other compositions.

**INDICATION, in physic, whatever serves to direct the physician how to act.** There are four sorts of indications, 1. The prophylactic or preventative, which directs what is necessary to be done, in order to preserve health, and avert threatened diseases. 2. Curative, shewing how to remove diseases actually formed. 3. Palliative, or mitigatory, which relates to the mitigation of the symptoms, when too violent to be neglected till the termination of the disease. 4. Vital, which relates to the immediate preservation of life.

**INDICATIVE, in grammar, the first mood, or manner, of conjugating a verb, by which we simply affirm, deny, or ask something; as, amant, they love; non amant, they do not love; amavert, do they love?**

**INDICATIVE COLUMN.** See Column.

**INDICAVIT, in law, a writ or prohibition that lies for a patron of a church, whose clerk is sued in a spiritual court by another clerk for tythes, amounting to a fourth part of the profits of an advowson; for then the suit belongs to the king's court.** This writ cannot be had before the defendant is libelled in the ecclesiastical court, a copy of which must be produced in the court of chancery, before the writ is granted; and brought before judgment is given in the spiritual court, otherwise the indicative will be void.

**INDICATION, in chronology, a cycle of fifteen years.** See Cycle. The Roman or papal indication, which is that used in the pope's bulls, begins on the first of January; and by it the popes have dated their acts ever since Charlemagne made them sovereigns. But besides this, there are other two kinds of indication mentioned by authors, viz. that of Constantinople, beginning on the first of September; and the imperial or easteranian indication, which commenced on the 14th of September.

**INDICATION is also used for the convoking an ecclesiastical council or assembly.** See the article Council.

**INDICTIVE FEAST DAYS, indicativa feria, the same with those called concepitive.** See the article Feriae.

**INDICTMENT, in law, is a bill or declaration of complaint, at the suit of the king, drawn up in form of law, and exhibited against a person, and afterwards preferred to the grand jury or inquest, who are to find whether the complaint be true or not.** An indictment differs from an accusation only in this, that the preferrer of the bill is not tied to the proof thereof, under any penalty, except there appear to be a conspiracy. As indictments are purely for the good and quiet of the common-wealth, they are to be preferred for criminal, not civil matters. They are used in cases of high treason, and petit treason, felony, and trepasies of all kinds, and in all pleas of the crown; though they cannot be used for injuries of a private nature, that neither concern the king nor the public; and therefore all indictments ought to be brought for offenses committed against the common-law, or against statutes; and not for every slight misdemeanor. A person cannot be indicted of suspicion of felony, but of the very crime itself.
and then if he be not in custody, the sheriff is commanded to attach his body by a capias, &c. A person indicted for felony may have counsel allowed to speak for him, as to matter of law only: but such as are indicted for treason may have a copy of their indictment before trial, in order to advise with counsel; and such indictments are to be found within three years after the offence committed, unless the treason be directly against the king's person.

Indictments must be certain in every point, and charge some particular offence; also goods stolen must be particularly set down, and the offence laid positively, and not by way of recital. There must also be expressed the christian name, surname, and addition of the offender, with the day, year, and place in which the offence was committed, as also the nature of the offence. In an indictment for murder, the length, depth, or other dimension of the wound must be expressed, that a judgment may be formed whether it was mortal: and in felony, the value of the things stolen is to be particularly mentioned, in order that it may appear whether the offender has been guilty of grand or petit larceny. A mistake in spelling the defendant's surname is not a sufficient cause for abating the indictment, provided it sounds like it. If a word of consequence be omitted in an indictment, it renders the whole naught; but the café is not the same, where a word of form is omitted, or where there is an omission of a synonymous word, if the sense is not injured. In case one part of an indictment is inconsistent with another part of it, the indictment becomes void; tho' where the sense is plain, the court will dispense with a small inconsistency. Indictments are amendable the same term they are brought into court, but not afterwards; and in criminal prosecutions, the amendment must be only such as is permitted by the common law. Indictments for crimes committed, ought to be laid in the county where they were done; for otherwise, upon pleading the general issue, not guilty, if it appears that the offence was committed in another county or place different from that in the indictment, the defendant will be acquitted. An offender is subject to indictment, for a felony committed against a person unknown; yet some body must be proved to be the proprietor upon the trial, or else the property will be presumed to be in the prisoner, he having pleaded not guilty. An indictment being at the king's suit, the professour is a good witness to prove the charge contained in it; and no damage can be given to the party aggrieved, except it be particularly grounded on some statute. Indictments before justices of the peace may be removed by certiorari into the king's-bench.

INDIES, east and west. See INDIA and AMERICA.

INDIGESTION, in medicine, a crudity, or want of due coction, either in the food, an humour of the body, or an excrement. See CRUDITY and DIGESTION.

INDIGETES, a name which the antients gave to some of their gods. There are various opinions about the signification of this word; some maintaining it was given to all the gods, in general; and others only to the demi-gods, or great men deified. Others say, it was given to such gods as were originally of the country, or rather such as were the gods of the country that bore this name. Others again, hold, that it was affixed to such gods as were patrons and protectors of particular cities.

INDIGNATORIUS MUSCULUS, a muscle of the eye, otherwise called abducens, and rectus exterior: it has this appellation from its drawing the eye outwards, thereby occasioning the appearance of fovea. See the article EYE.

INDIGO, in commerce, a preparation of the juice of a plant, called by some anil, the characters of which are these: the cup is plane; the alæ of the flower are convinent at their upper edges, and are of the same figure with the vexillum. It is one of the diadelphi decandria class of Linnaeus. This plant grows to about two feet high, with roundish leaves; and is a native of both the East and West-Indies. As to the indigo blue, it is a fecula, or settling, made by means of water and oil olive out of the leaves of the anil, or indigo plant: there is a difference between that made by the leaves only, and that which is made of the leaves and small branches. The choice of the former sort is that which bears the surname of Serquife, from a village of that name some leagues from Surat in the East-Indies. It is made also about Biana and Coila near Agra; and also in the kingdom of Golconda. In making the fecula of anil, in order to make indigo of
of it, they cut the herb with a fickle, when the leaves begin to fall upon touching them; and after they have stripped them from the branches, they put them into a sufficient quantity of water in a vessel called the steeping vat; and let them infuse there thirty or thirty-five hours; after which they turn the cock, in order to let the water run off, which is become of a green colour inclining to blue, into a vessel called the lees of a churn, where it is worked by means of a roller or turner of wood, the ends of which are pointed and faced with iron; this they work till the water abounds with a lather; then they cast into it a little oil of olive, that is, one pound into such a quantity of the liquor, as will yield seventy pounds of indigo, such as is saleable; and as soon as the said oil is thrown in, the lather separates into two parts, so that you may observe a quantity curdled like milk is when ready to break: then they cease working, and let it stand to settle; which when it has done some time, they open the pipe or cock of the vessel, in order to let the water clear off, that the fecula which is subsided may remain behind at the bottom of the vessel like the lees of wine. Then taking it out, they put it into straining bags of cloth, to separate what water was left: after which they convey it into chests or boxes that are shallow, to dry it; and being dried, it is what we call indigo.

Choose the indigo of Serguiffe in flat cakes, of a moderate thickness, neither too soft nor too hard, of a deep violet colour, light, and such as swims on water; and when broken, has no white spots in it; and, lastly, such as is copperish or reddish on being rubbed with one's nail, and has the least dust and broken pieces in it.

The other sort of indigo is also the secula made from the anil, and differs nothing from the former, but as it is made of the whole plant, flake and leaf; the beet of which kind is that which bears the name Guatimala, that comes from the West Indies. In choosing this indigo, it should be as near the other kind as can be; but the surest proof of its goodness is its burning upon the fire like wax, and leaving only a little ashes behind. The second sort of indigo is that of St. Domingo, differing nothing from the Guatimala, only that it is not of so lively a colour; the third is the Jamaica indigo; the fourth is that of the Leeward islands; all which are better or worse, according as they are more or less neat and pure.

The use of the indigo is for the dyer and land-drifters, serving the lust to put among their linens. The painters use it to grind with white for painting in blue; for if it is used alone and neat, it turns black; ground with yellow, it makes a green: some confectioners and apothecaries prettily use this to colour flagons, with which to make conserves and syrups of violets, by adding some orice.

From and after the 25th of March 1745, all persons who shall import into Great Britain, from any of the British colonies in America, in vessels trading and manned as by law directed, any good and merchantable indigo, free from any false mixtures and fit for dyers use, being the product of the colony from whence the same was imported, shall be entitled to six-pence for every pound thereof, to be paid out of the customs upon demand by the collector of the port where the same is imported. If any person make entry of foreign-made indigo under the name of British plantation made, or shall mix any foreign indigo or any false mixture with that made in the British plantations, in order to claim the premium, he shall forfeit the said indigo; and in case of such mixture, the quantity so mixed, both foreign and British plantation made, and double the value thereof, shall be forfeited by the person making such mixture.

Indigo of Turkey, of the West Indies, or rich indigo, as also dust indigo, and that of the British plantations, pay no duty on importation, and consequently have no draw-back on exportation.

INDIRECT modes of fyllogifm, in logic, are the five modes of the fourth figure, expressed by the barbarous words barap, cepontes, dabitis, yapelfma, friffon. See Mode and Figure.

It is the conversion of the conclusion which renders the modes indirect; for instance, a fyllogifm in daris, and another in dabitis, would be perfectly alike were it not for that conversion; the propositions having the same quantity and the same quality, and the middle term being the subject in the major and the attribute in the minor, in both it remains then that to make a distinction, that which is the subject of the conclusion in daris, be the attribute in the conclusion of...
IND [1746] IND

of dabilitis; and that which is the attribute
in the first, the subject in the last.
DA- Every thing that promotes salva-
vation is advantageous:
BI- There are afflictions which pro-
mote salvation:
1. Therefore, there are afflictions
which are advantageous.
DA- Every thing that promotes sal-
vation is advantageous:
BI- There are afflictions which pro-
mote salvation:
TIS. Therefore, some things promoting
salvation are afflictions.

INDIVIDUAL, individuum, in logic, a
particular being of any species, or that
which cannot be divided into two or more
beings equal or alike.
The usual division in logic is made into
genera or genus's, those genera into spe-
cies, and those species into individuals.
See the articles GENUS and SPECIES.
The schoolmen make a four-fold distinc-
tion of individuals, viz.
Individuum vagum, that which, tho' it
signifies but one thing, yet may be any
of that kind: as when we say a man, a
certain person, or one said fo and fo;
the but one person is meant, yet that
one person, for aught that appears to the
contrary, may be any body.
Individuum determinatum, is when the
thing is named and determined, as Plato,
Socrates, mount Atlas: this is also called
individuum signatum.
Individuum demonstratum, is when
some demonstrative pronoun is used in
the expression, as this man, that woman.
Individuum ex hypotheni, or by supposi-
tion, is when an universal name or term
is restrained by the supposition to a par-
ticular thing; as when we say the son of
Mary, instead of Christ; the writer of the
trojan war, instead of Homer.

INDIVISIBLE, among metaphysicains.
A thing is said to be indivisible absolute,
absolutely indivisible, that is a simple
being, and consists of no parts into which
it may be divided. Thus God is indi-
vissible in all respects, as is also the hu-
mom kind, not having extension or other
properties of body.

INDIVISIBLE secundum quid est, indivisible
with respect to what it now is, a substance
which, though it consists of parts into
which it may be divided, yet never can
be so divided as to remain the same:
thus a measure or number is said to be
indivisible, for if from a foot-line, for
example, any thing is deducted, it is no
more a foot-line; and if from the num-
ber three any thing is subtracted, it is no
longer the same number. See the next
article.

INDIVISIBLES, in geometry, the elements
or principles into which any body- or
figure may be ultimately resolved; which
elements are supposed infinitely small:
thus a line may be said to consist of
points, a surface of parallel lines, and a
solid of parallel and similar surfaces;
and therefore, because each of these elements
is supposed indivisible, if in any figure a
line be drawn through the elements per-
pendicularly, the number of points in
that line will be the same as the number of
the elements; whence we may see that a
parallelogram, prism, or cylinder, is re-
olvable into elements or indivisibles, all
equal to each other, parallel and like to
the base; a triangle into lines parallel
to the base, but decreasing in arithmetical
proportion, and so are the circles which
constitute the parabolic conoid, and those
which constitute, the plane of a circle, or
surface of an isosceles-cone. See the ar-
ticle INFINITESIMALS.

A cylinder may be resolved into cylin-
drical curve surfaces, having all the fame
height, and continually decresing in-
wards, as the circles of the base do-on
which they insist.
The method of indivisibles is only the
ancient method of exhaustions, a little
disguised and contracted. It is found of
great use in shortenig mathematical de-
monstrations, of which take the follow-
ing inistance in the famous proposition of
Archimedes, viz. that a sphere is two
thirds of a cylinder circumscribing it.
Suppose a cylinder, an hemisphere, and
an inverted cone, (plate CXLV. fig. 4.)
to have the same base and altitude, and
to be cut by infinite planes all parallel
to the base, of which $ag$ is one. It is
plain the square of $ab$ will be every where
equal to the square of $ke$ (the radius of
the sphere) the square $bc=eb$ square;
and consequently, since circles are to one
another as the squares of the radii, all
the circles of the hemisphere will be equal
to all those of the cylinder, deducting
thence all those of the cone: wherefore
the cylinder, deducting the cone, is equal
to the hemisphere: but it is known, that
the cone is one third of the cylinder, and
consequently the sphere must be two
thirds of it. Q.E.D.
INDORSEMENT, in law, any thing written on the back of a deed, as a receipt for money received.

There is likewise an indorsement, by way of affirmation, on bills of exchange and notes of hand; which is done, by writing a person's name on the back thereof. See the article BILL.

INDRAPORE, a dutch settlement on the west coast of Sumatra, in the East Indies.

INDUCEMENT, in law, signifies what may be alleged as a motive; and, in our law, it is used specially in several cases; as, there is an inducement to actions, to a traverse in pleading, and to an offence committed, &c. It has been held that a general indebitus is insufficient, where it is the ground of an action; but where it is only the inducement to it, as in consideration of receipt for money received.

There is likewise an indorsement, by writing a person's name on the back of a deed, as a way of assignation, on bills of exchange and promissory notes.
of this power: however, they still carry on a great trade with them to the Indies, where they are purchased at two reals a piece, and sometimes more.

The pope likewise grants indulgences to persons at the point of death, that is, he grants them, by a brief, power to choose what confessor they please, who is authorized thereby to absolve them from all their sins in general.

INDULGENCE, in the church of Rome, the power of presenting to benefices granted to certain persons by the pope. Of this kind is the indulgents of kings and sovereign princes, in the romanish communion, and that of the parliament of Paris granted by several popes. By the concordat for the abolition of the pragmatic function, made between Francis I. and Leo X. in 1516, the French king has the power of nominating to bishoprics, and other confessional benefices, within his realm. At the same time, by a particular bull, the pope granted him the privilege of nominating to the churches of Brittany and Provence. In 1648, pope Alexander VIII. and in 1668, Clement IX. granted the king an indulgence for the bishoprics of Metz, Toul, and Verdun, which had been yielded to him by the treaty of Munster; and in 1668, the same pope Clement IX. granted him an indulgence for the benefices in the counties of Rouillon, Artois, and the Netherlands. The cardinals likewise have an indulgence granted them by agreement between pope Paul IV. and the sacred college in 1552, which is always confirmed by the popes at the time of their election. By this treaty the cardinals have the free disposal of all the benefices depending on them, and are empowered likewise to bestow a benefice in commendam.

INDULTO, a duty, tax, or custom paid to the king of Spain, for all such commodities as are imported from the West Indies in the galleons. See GALLEONS.

INDUS, a large river of Asia, which rises in the mountains which separate Tartary from India, and discharges itself into the Indian ocean.

INERTIA of matter, in philosophy, is defined by Sir Isaac Newton to be a passive principle by which bodies resist in their motion or rest, receive motion in proportion to the force impressing it, and resist as much as they are resisted. It is also defined by the same author to be a power implanted in all matter, whereby it resists any change endeavored to be made in its state.

This power then coincides with the vis resistitendi, or power of resisting, whereby every body endeavors, as much as it can, to persevere in its own state, whether of rest or uniform rectilinear motion; which power is still proportionable to the quantity of matter in any body: for since natural bodies consist of a mass of matter, that, of itself, is not able to induce any change in its state, if bodies were once at rest, it is necessary that they should always remain in that state of rest, unless there is applied a new force to produce motion in them: but if they were in motion, the same energy or force would always preserve the motion; and therefore bodies would always retain their motion, and would always proceed forward in the same right line with the same tenour, since they cannot of themselves acquire either rest or a retardation, or a change of their direction to turn on one side or the other.

There are some philosophers who readily enough acknowledge, that no body can move of itself, that is, pass from rest to motion of itself; but then they are not as willing to grant, that bodies once moved cannot of themselves arrive at rest, by reason they see the motions of projectiles languish by degrees, and at last the moving bodies themselves come to rest. See PROJECTILES.

But as no mode or accident can of its own accord, or by itself, be destroyed, and as all effects produced by transient causes do remain always, unless there be some new and extraneous cause that destroys them; so likewise motion once commenced, will be continued always, unless it be hindered by some external cause: nor is it more in the power of a body once moved, to lay aside its motion or energy to move, and return of itself to rest, than it can put off the figure that it has been once formed into, and acquire a new one, without some extrinsic cause. Therefore, as there is in all bodies a certain force, or rather inactivity, whereby they oppose every change; from which cause it proceeds, that they are very difficulty put out of their state, whatever it is: but that inactivity is the same in moving bodies as in those at rest, nor do bodies less resist the action, whereby they are brought from motion.
to rest, than that whereby they pass from rest to motion; that is, there is not required a less force to put a stop to the motion of any body, than was before necessary to impress that motion on the same body. Whence since the vis inertiae, or inactivity of matter, always equally resists equal changes, it will not be less powerful to continue a body in motion, which has begun to move, than to preserve a quiescent body in the same state of rest.

There are some philosophers who suppose body of its own nature to be as indifferent to motion as to rest; but by this indifference they do not, we suppose, mean such a disposition in bodies, whereby they do not in the least resist rest or motion: for on this supposition it would follow, that any body, however great, and moved with the swiftest velocity, might be stopped by any the smallest force; or if the great body was at rest, it might be moved by any body, however small, without the least loss of velocity in the impelling body: that is, any small body impinging on a greater one, would carry that greater body along with it, without the least loss of its motion; and each body after the impulsion would be jointly carried along with that celerity that the small body had at first, which we all know is absurd. This indifference, therefore, is not placed in a non-resistance to motion from a state of rest, or to rest from a state of motion; but in this only, that a body of its own nature is not more propens to motion than to rest, nor more resists to pass from a state of rest to motion, than to return again from that motion to the same state of rest: besides, any quiescent body may be moved by any force; and an equal force, acting in a contrary direction, will be able to destroy that motion; and in this, this indifference consists.

Since, according to this law, a body once in motion always continues in that motion, the philosophers ask, Why all projectiles lose by degrees their motion? Why do they not proceed in infinitum? If motion did not of its own nature decay, a stone thrown at the beginning of the world, would by this time have gone through an immense and almost infinite space. And so indeed it would, if its motion had been in vacuo, or in free spaces, and without any gravity. But since all projectiles are carried either thro' the air, or on the rough surfaces of other bodies, they must be necessarily retarded: for since all bodies in motion must drive and thrust out of its place the resisting air, or overcome the roughness of the superficies upon which they are moved, they will lose all that force and motion that is constantly employed in overcoming these obstructions, and consequently the motion of projectiles will be continually diminished: but if there was no resistance in the medium, no roughness in the superficies on which they were moved, no gravity that continually forces the bodies towards the earth, motion would always continue the same, without any retardation at all. So in the heavens, where the medium is exceedingly rare, the planets do continue their motions for a very long time; and upon ice, or any other very smooth surface without any roughness, heavy bodies in motion are not soon brought to rest.

INFALLIBLE, something that cannot err, or be deceived. See ERROR.

One of the great controversies between the protestants and papists, is the infallibility which the latter attribute to the pope; though, in fact, they themselves are not agreed on that head, some placing this pretended infallibility in the pope and a general council. See the articles COUNCIL and POPE.

INFAMY, in law, is a term which extends to forgery, perjury, gross cheats, &c. by which a person is rendered incapable of being a witness or juror, even tho' he is pardoned for his crimes. See the articles FORGERY, PERJURY, &c.

INFANT, infant, in medicine, denotes a young child. See the articles CHILD and DELIVERY.

It being a matter of great importance how tender infants are treated, we shall lay down some rules for the direction of the diet, regimen, and other non-naturals, as well with regard to the infant as the nurse.

As soon, therefore, as the child is brought into the world, it ought, immediately after the ligature and cutting off the umbilical vessels, to be washed in a warm bath, prepared of water alone, or a mixture of wine and water. The midwife too should be allowed a convenient place and time to examine the child, and set to rights any parts that may be ill-formed by the birth. She should likewise stroke the belly with the hollow of her hand, in order to excite a discharge of the fæces. If the new-born infant is found
found to be weakly, it should be refresh
ed by washing it with warm wine, rub
bing it gently, anointing the breast, back, and crown of the head with some analeptic spirits; or by breathing strongly into its mouth, after chewing cloves one, be
ning it gently, anointing the
analeptic quantity
of water.

ence. or
in
hequently
for want of a
dige, by thus
too great
excrements, be reasonably
are fitted
cliforders.
dence has
should
in the
world with their intestines replete with the body,
fall into a consumption, and
are subject to ruptures and many other
disorders.
The next care is, that infants, who
for want of a discharge by stool in
the mother's womb, always come into the
world with their intestines replete with
excrements, be seasonably purged. But
in case the weak nature of the infant
should not be sufficient of itself, provi
dence has kindly furnished the mother
with thin serous milk, whose de
terging and diluting quality opens the
body much better and with greater safety
than the most select evacuants, and no
danger is to be dreaded from it, unless
that milky liquor flows from an impure
spring; or the mother, from the diffi
culty of the birth, be agitated by con
vulsive motions; or unless any other circum
stances concur which forbid the
use of a medicine elaborated by nature
in the breasts of women: in which case,
if the infant has not a stool within
twenty four hours, it may be proper to
give it a very small quantity of solutive
syrup of soves, or a clyster of whey and
honey.

As to a proper diet, milk deservedly
constitutes the principal, and the univer
sal aliment; because it supplies both
meat and drink at a single time, is
grateful to the stomach, and for this
purpose it was wisely ordered by the
Creator, that women, immediately after
their delivery, should accumulate a suffi
cient quantity of it in their breasts. As
infants are nourished by the breasts ei
ther of the mother or a hired nurse, it
is certainly the duty of parents, and
those entrusted with the health of chil
dren, to take care that they generate
pure and temperate milk. This is best
obtained by their observing an exact me
thod of diet, and avoiding all those
things which communicate any taint to
the milk, even imperceptible to the ten
nes, and especially such as are capable
of producing distempers. Particularly
let the nurse, if there be a necessity for
one, be healthy, in the flower of her age,
from twenty to thirty, rather lean than
fat, of good morals, compos'd in mind,
neither melancholy, passionate, nor a
drunken; nor let her milk be too stale;
but her diet be regular, and great care
must be taken that she does not at
once pass from a hard and sparing diet,
to one that is delicate and plentiful. But
nothing less than an absolute necessity
should prevail on a mother to suffer her
tender progeny to be delivered up to a
mercenary nurse; since this is a bar
barity exceeding every thing to be met
with in the brute creation: for not only all the disorders incident to
the body, but even those of the mind it
self, are communicated to the fucking
child.

It often happens that the milk is corrupted by various sudden causes, by which either
the mother or the nurse may be affected;
and here precautions are necessary to pre
vent impending danger: the milk is ex
tremely vitiated by the terror of the
woman who gives suck; and confe
quently the best preservative against the
injury arising from it, is not to give the
breast immediately after a fright. The
same holds true with respect to anger;
and since the injury done to the milk by
violent passions, upon its long continu
ance in the breasts, endangers both the
child and the nurse, to prevent this, the
milk should be seasonably extracted.
It sometimes happens that either the in
fant is incapable of sucking the milk out
of the breasts, or the nurse, from illness,
or some other cause, is incapable of aff
ording it: In this case, other proper a
liments are to be provided, among which
are sweet whey, barley-broth, water
gruel, emulsions of almonds, barley
boiled to the consistence of a pulp,
with the addition of the yolk of an egg;
sweet kinds of pap, made of flour, or
crums of bread boiled in water, given
with or without milk: but chewing vic
tuals and giving it to a child, ought by
no means to be allowed; because by
such malversation, not only the mol\f
ible part of the pap is sucked out, but any
infection of the saliva and corrupted
teeth are easily communicated to infants.

When children arrive at such an habit
as to be capable of digesting other aliments, care should be taken not to give them food of a hard consistence; they ought not to eat salt meat in great quantities, unripe fruit, bread not duly fermented, or too new; nor ought they to eat much of any kind of sweet meats.

As to the prevention of the diseases in infants, nothing is more useful both for the nurse and the child, than infusions of such herbs as sweeten the blood, made in water: and here an infusion of betony, aEt glaciers which increaseth the milk, and prevents dangerous symptoms, the greatest care ought to be taken to which purpose those medicines are highly proper.

Since milk flagging in the stomach and duodenum soon grows acid and coagulated, and thus excites a thousand dangerous symptoms, the greatest care ought to be taken to prevent what is attended with such dangerous consequences; for which purpose those powders are extremely efficacious which contain crabs-eyes, egg-shells, the root of florentine orris, saffron, the seeds or oil of annise, &c. of which a dose may be given twice or three times a week. And since the health of infants greatly depends upon a due and sufficient discharge of the excrements by stool, and the preservation of the tone of the stomach and intestines, gentle laxatives, if necessary, should be sometimes interposed; but strong and acrid purges, as rhubarb, sorrel, or fennel, and the like, are improper and pernicious. They ought not to take aloe s on account of the heat it occasions, nor the leaves of senna because of the colic which it produces: nor are these prejudicial only when given to children, but also when given to the nurses; for being mixed with the milk, they often throw the tender infants into convulsions. Sydenham rightly observes, that children, in the first month, are often seized with the epilepsy from too frequent stools; and Galen justly asserted, that the bodies of children ought not to be exiccated with purgatives, which would prevent their growing. And, really, it is inexplicable how much the tender and weak stomachs of new born infants are prejudiced by purgatives.

Diseases of Infants may be reduced to the following heads. 1. Retention of the meconium, or first stools, already taken notice of. 2. Aphthæ, or thufii, which affect the whole mouth, and even intestines: for this Heister advises a grain or two of mercurius dulcis, given in two drams of sylur syrup of roes: he would have the nurse, likewise, take rhubarb, and the absorbent powders; and externally, Shaw would have the ulcers touched frequently with a mixture of honey of roes, and oil of vitriol. 3. Chaffing, or galling, of the flesh, already treated of under the article Excoriation. 4. Colitivenes, for which Heister recommends two or three grains of rhubarb in sylur syrup of roes, or a solution of manna, till the child's belly is opened; and afterwards the teffaceous powders. 5. Coughs of infants seldom prove obilinate, usually giving way to pectoral syrups, or a little spermaceti; relaxing the bowels at the same time with rhubarb, given in sylur syrup of roes. In very bad cases, a few drops of spirit of sal-armoniac, given pretty, has a very good effect; and if the child be almost choked, a quarter of a grain of cinnabar, taken as a vomit, will snatch it from the jaws of death. Oil of sweet almonds is likewise very good; as are flowers of nilphur, in phlegmatic habits. 6. Crusta Lactea, or scabby eruptions, otherwise called achores, already treated of under the articles Achor and Crusta. 7. Atrophy, or consumption, for the cure of which, the crudities of the bowels should be evacuated by gentle laxatives, now and then repeated, to which a few grains of mercurius dulcis must always be added; or even the purgative salts may be prescribed. Externally, baths of soft-water, with aromatic herbs, with friction of the joints while in the bath, and frequent motion, are recommended. 8. Convulsion, if owing to acrimonious humours in the bowels, is cured by gentle doses of syrup of rhubarb, with the absorbent powders; but when epileptic, cinnabar is to be given freely in powders; and when owing to worms, mercurius dulcis is the biet of all medicines. 9. Diarrhoes of infants is already treated of under its proper article. 10. Stoppage of the nofe sometimes happens, infomuch that they can scarce breathe, suck, or swallow; for the cure of which, after a suitable purge, disolve two or three grains of white vitriol in half an ounce of marroram-water; then filter it, and apply it now and then to the nostrils with a nen-rag. Or you may apply oil of sweet almonds, impregnated with oil of mar-
Running of the eyes and ears is a very common complaint, which is cured by small doses of the decoction of pimpernel-root, saffafiras, and gentle laxatives, in which a grain or two of calomel is mixed. 12. Vomiting is rather accounted falutary than otherwise; but when too violent, it may be remedied by gentle catharters. 13. Suppression of urine is cured by giving half a scruple of some neutral cathartic, and the like catheter, which is much easier in girls than boys. 14. Fevers of children, see FEVER. 15. Difficulty of teething, see DENTITION. 16. Imperforations of the necessary parts, so that there is no passage for the stools or urine; in which the assistance of the surgeon must be speedily called in, or the infant is lost. 17. Jaundice, or a yellowness of the skin, see JAUNDICE. 18. Worms in children, see WORMS. 19. Rickets feldom attack children before they are nine months old, see RICKETS. 20. Gripes, and other disorders of the bowels, are generally owing to corrupted milk; the cure of which consists in the use of antacids, mild cathartics, and catheters of the same intention, with gentle carminatives. Sometimes, indeed, the gripes are so violent as not to be cured without two drops of the thebaic tincture in a little syrup of roes. Absorbents are also deemed excellent in these disorders, as they cure the gripes, relieves them, and watching in infants, as certainly as opium eases pain in adults.

INFANTS. See LIP.

INFANT, in law, signifies a person under the age of one and twenty. An infant may bind himself apprentice, and if he serve seven years, may have the benefit of his trade; but if he be guilty of misbehaviour, the master may give him gentle correction, or complain to a justice of peace and have him punished. He may also bind himself for the payment of necessaries, such as meat, drink, washing, apparel and learning, though not by bond with a penalty: infants are not obliged to pay for clouds, unless it be proved that they were for their own wearing, and convenient and necessary for them to wear according to their degree and estate; and though an infant may buy necessaries, he cannot borrow money to do it; for the law will not trust him with money, except at the peril of the lender, who must either see it thus laid out, or take care to lay it out himself in such necessaries. If an infant is the defendant in an action, the plaintiff has fix years to commence his action in after the infant comes of age; and an infant who is a plaintiff, has also fix years, after he comes of age, to sue, by the statute of limitations. If an infant grants leases for a term of years, he may, at his full age, either confirm the lease, or bring trespass against the lessor for the occupation. Also a lease granted to an infant may be avoided by waving the land before the rent day expressed therein. An infant may purchase lands, where such purchase is intended for his benefit, though at his full age he may either avoid or confirm such purchase; and, in case an infant fell lands by deeds indented and inrolled, he may avoid the same. However, infants are bound by all acts of necessity, as in presents and benefices, admittances and grants of copyhold estates, affenting to legacies, and conditions annexed to lands, whether an estate comes by grant or by descent.

INFANTRY, all the sons and daughters of the kings of Spain and Portugal, except the eldest; the princes being called infants, and the princesses infantes.

INFANTRY, in military affairs, denotes the whole body of foot-soldiers. See the articles FOOT and SOLDIERS.

INFECTION, among physicians, the fame with contagion. See CONTAGION.

INFERNAL-STONE, lapis infernalis. See the article LAPIS.

INFINITE, that which has neither beginning nor end: in which sense God alone is infinite. See the article GOD.

Infinite is also used to signify that which has had a beginning, but will have no end, as angels and human souls. This makes what the schoolmen call infinitum a parte prop.; as, on the contrary, by infinitum a parte aequi, they mean that which has an end but had no beginning.

INFINITE, or INFINITELY GREAT LINE, in geometry, denotes only an indefinite or indeterminate line, to which no certain bounds, or limits, are prefixed.

INFINITE QUANTITIES. The very idea of magnitudes infinitely great, or such as exceed any assignable quantities, does include a negation of limits: yet if we nearly examine this notion, we shall find that
that such magnitudes are not equal among themselves, but that there are really besides several infinite length and infinite area, three kinds of infinite solidities; all of which are quantitates sui generis, and that those of each species are in given proportions.

Infinite length, or a line infinitely long, is to be considered either as beginning at a point, and so infinitely extended one way, or else both ways from the same point; in which case the one, which is a beginning infinity, is the one half of the whole, which is the sum of the beginning and ceasing infinity; or, as may be said, of infinity a parte ante and a parte post, which is analogous to eternity in time and duration, in which there is always as much to follow as is past, from any point or moment of time: nor doth the addition or subduction of finite length, or space of time, alter the cafe either in infinity or eternity, since both the one or the other cannot be any part of the whole.

As to infinite surface, or area, any right line, infinitely extended both ways on an infinite plane, does divide that infinite plane into equal parts, the one to the right, and the other to the left of the said line; but if from any point, in such a plane, two right lines be infinitely extended, so as to make an angle, the infinite area, intercepted between those infinite right lines, is to the whole infinite plane as the arch of a circle, on the point of concourse of those lines as a center, intercepted between the said lines, is to the circumference of the circle; or, as the degrees of the angle to the 360 degrees of a circle: for example, right lines meeting at a right angle do include, on an infinite plane, a quarter part of the whole infinite area of such a plane.

But if two parallel infinite lines be supposed drawn on such an infinite plane, the area intercepted between them will be likewise infinite; but at the same time will be infinitely less than that space, which is intercepted between two infinite lines that are inclined, though with never so small an angle; for that, in the one case, the given finite distance of the parallel lines diminishes the infinity in one degree of dimension; whereas, in a sector there is infinity in both dimensions: and consequently the quantities are the one infinitely greater than the other; and there is no proportion between them.

From the same consideration arise the three several species of infinite space or solidity; for a parallelopiped, or a cylinder, infinitely long, is greater than any finite magnitude, how great soever; and all such solids, supposed to be formed on given bases, are as those bases in proportion to one another. But if two of these three dimensions are wanting, as in the space intercepted between two parallel planes infinitely extended, and at a finite distance, or with infinite length and breadth, with a finite thickness, all such solids shall be as the given finite distances one to another; but these quantities, though infinitely greater than the other, are yet infinitely less than any of those wherein all the three dimensions are infinite. Such are the spaces intercepted between two inclined planes infinitely extended; the space intercepted by the surface of a cone, or the sides of a pyramid, likewise infinitely continued, &c. of all which notwithstanding, the proportions one to another, and to the \(\frac{1}{3}\) of, or vaft abyss of infinite space (wherein is the locus of all things that are or can be; or to the solid of infinite length, breadth and thickness taken all manner of ways) are easily assignable; for the space between two planes is to the whole as the angle of those planes to the 360 degrees of the circle. As for cones and pyramids, they are as the spherical surface intercepted by them is to the surface of the sphere, and therefore cones are as the verfös lines of half their angles to the diameter of the circle; these three sorts of infinite quantity are analogous to a line, surface, and solid; and, after the same manner, cannot be compared, or have no proportion the one to the other.

INFINITESIMALS, among mathematicians, are defined to be infinitely small quantities.

In the method of infinitesimals, the element, by which any quantity increases or decreases, is supposed to be infinitely small, and is generally expressed by two or more terms, some of which are infinitely less than the rest, which being neglected as of no importance, the remaining terms form what is called the difference of the proposed quantity. The terms that are neglected in this manner, as infinitely less than the other terms of the element, are the very same which arise in consequence of the acceleration, or retardation, of the generating motion, during the infinitely small time in which the element is generated; so that the remaining terms express the elements that would
would have been produced in that time, if the generating motion had continued uniform: therefore those differences are accurately in the same ratio to each other as the generating motions or fluxions. And hence, though in this method infinitesimal parts of the elements are neglected, the conclusions are accurately true without even an infinitely small error, and agree precisely with those that are deduced by the method by fluxions.

For example, (pl. CXLVI. fig. 1. n° 1.) when DG, the increment of the base AD, of the triangle ADE, is supposed to become infinitely little, the trapezium DGHE (the simultaneous increment of the triangle) consists of two parts, the parallelogram EG, and the triangle EIH; the latter of which is infinitely less than the former, their ratio being that of one half DG to Ad: therefore, according to this method in fluxions, the part EIH is neglected, and the remaining part, viz. the parallelogram EG is the difference of the triangle ADE. Now it was shown, (see the article Fluxions,) that EG is precisely that part of the increment of the triangle ADE which is generated by the motion with which this triangle flows, and that EIH is the part of the same increment which is generated in consequence of the acceleration of this motion, while the base, by flowing uniformly, acquires the augment DG, whether DG be supposed finite or infinitely little.

Example 2. The increment DELM HG (ibid. n° 2.) of the rectangle AE, consists of the parallelograms EG, EM, and Ib; the last of which, Ib, becomes infinitely less than EG or EM, when DG and LM, the increments of the sides, are supposed infinitely small; because Ib is supposed to EG as LM to AL, and to EM as DG to AD; therefore, Ib being neglected, the sum of the parallelograms EG and EM is the difference of the rectangle AE: and the sum of EG and EM is the space that would have been generated by the motion with which the rectangle flows continued uniformly, but that Ib is the part of the increment of the rectangle which is generated in consequence of the acceleration of this motion, in the time that AD and AL, by flowing uniformly, acquire the augment DG and LM. The same may be observed in propositions wherein the fluxions of quantities are determined; and thus the manner of investigating the differences, or fluxions of quantities, in the method of infinitesimals, may be deduced from the principles of the method of fluxions.

For instead of neglecting EIH because it is infinitely less than EG, n° 1. (according to the usual manner of reasoning in that method) we may reject it; because we may thence conclude, that it is not produced in consequence of the generating motion DG, but of the subsequent variations of this motion. And it appears why the conclusions in the method of infinitesimals are not to be represented as if they were only near the truth, but are to be held as accurately true.

In order to render the application of this method easy, some analogous principles are admitted, as that the infinitely small elements of a curve are right lines, or that a curve is a polygon of an infinite number of sides, which being produced, give the tangents of the curve; and by their inclination to each other measure the curvature. This is as if we should suppose, when the base flows uniformly, the ordinate flows with a motion which is uniform for every infinitely small part of time, and increases or decreases by infinitely small differences at the end of every such time.

But however convenient this principle may be, it must be applied with caution and art on various occasions. It is usual therefore, in many cases, to resolve the element of the curve into two or more infinitely small right lines; and sometimes it is necessary, if we would avoid error, to resolve it into an infinite number of such right lines, which are infinitesimals of the second order. In general, it is a postulatum in this method, that we may depend to the infinitesimals of any order whatever, as we find it necessary; by which means, any error that might arise in the application of it may be discovered and corrected by a proper use of this method itself. For an example of this, see Maclaurin's Fluxions, article 498.

It is likewise to be observed, when the value of a quantity that is required in a philosophical problem becomes, in certain particular cases, infinitely great or infinitely little, the solution would not be always just though such magnitudes were admitted. As when it is required to find by what centripetal force a curve could be described about a fixed point that is either in the curve, or is so situated,
ated, that a tangent may be drawn from it to the curve, the value of the force is found infinite at the center of the forces in the former case, and at the point of contact in the latter; yet it is obvious, that an infinite force could not influence the line described by a body that should proceed from either of these points, into a curve; because the direction of its motion in either case passes thro' the center of the forces, and no force, how great soever, that tends towards the center could cause it to change that direction. But it is to be observed, that the geometrical magnitude by which the force is measured, is no more imaginary in this than in other cases, where it becomes infinite; and philosophical problems have limitations that enter not always into the general solution given by geometry. But to obviate these scruples, which the brief manner of proceeding in the method of infinitesimals is apt to suggest to such as enter on the higher parts of geometry, after having been accustomed to a more strict and rigid kind of demonstration in the elementary parts. To such it may seem not to be consistent with the perfect accuracy that is required in geometrical demonstration, that, in determining the first differences, any part of the element of the variable quantity should be rejected, merely because it is infinitely less than the rest, and that the same part should be afterwards employed for determining the second and higher differences, and resolving some of the most important problems. Nor can we suppose that their scruples will be removed, but rather confirmed, when they come to consider what has been advanced by some of the most celebrated writers on this method, who have expressed their sentiments concerning infinitely small quantities in the preceding terms; while some of them deny their reality, and consider them only as incomparably less than finite quantities, in the same manner as a grain of sand is incomparably less than the whole earth; and others represent them, in all their orders, as no less real than finite quantities. From what has been said, it will appear that a satisfactory account may be given for the more brief way of reasoning used in the method of infinitesimals; and that when we investigate the first differences, we may reject the infinitesimal part of the element, not merely because they are infinitely less than the other parts; but because the quantities generated, and their mutual relations, depend upon the generating motions, and are discovered by them. The same infinitesimal parts of the element, however, may serve for measuring the acceleration or retardation of those motions from that term, or of the powers which may be conceived to accelerate or retard them at that term: and here the infinitely small parts of the element that are of the third order, are neglected for a similar reason, being generated only in consequence of the variation of those powers from that term of the time. In this manner we presume some satisfaction may be given to the scrupulous (who may be apt to demur at the usual way of reasoning in this method) while nothing is neglected without accounting for it; and thus the harmony may appear to be more perfect between the method of fluxions and that of infinitesimals.

But, however safe and convenient this method may be, some will always scruple to admit infinitely little quantities, and infinite orders of infinitesimals, into a science that boasts of the most evident and accurate principles, as well as of the most rigid demonstrations; and therefore in this article, more unexceptionable propositions have been used. In order to avoid such propositions, Sir Isaac Newton considers the simultaneous increments of the flowing quantities as finite, and then investigates the ratio, which is the limit of the various proportions, which those increments bear to each other, while he supposes them to decrease together, till they vanish; which ratio is the same with the ratio of fluxions.

INFIRMARY, a kind of hospital, where the weak and sickly are properly taken care of. See Hospital.

INFLAMMABILITY, that property of bodies, which disposes them to kindle, or catch fire. See the articles FIRE, FLAME, HEAT, &c.

According to Dr. Shaw, the oil, contained in bodies, is the sole principle of their inflammability. See FUEL.

From many experiments have found, that all those parts of vegetables, which are capable by fire of making a true flame, are easily miscible among each other, when pure, simple, and inflammable. Thus alcohol, which is the only known body perfectly inflammable, however prepared, provided it be pure, may be intimately mixed with any other alcohol prepared in any other manner, without
spirit of nitre, a dram of oil of vitriol, and three drams of oil of turpentine. This experiment, performed with turpentine instead of its oil, is extremely diverting, as the flame not only continues longer, but there are a great many successful explosions.

**INFLAMMATION, in surgery and medicine, is defined to be a preasure and attrition of the red arterial blood, flaginating in the smallest canals, produced by the motion of the rest of the blood, thrown into a violent and forcible commotion, by means of a fever. See the article Fever.**

This definition of an inflammation is taken from its causes. Others define it from its symptoms to be a species of tumour attended with a burning heat, pain, redness, stiffness, and a continual pulsation and prickling. See **TUMOUR**.

Inflammations are either external, being such as fall properly under the business of surgery, and are cured by manual operations and topical remedies; or internal, being such whose cure is to be expected chiefly from the use of internal remedies.

**General division of external Inflammations.** External inflammations, seared in the common integuments, are generally termed phlegmons but when lighter, they are called furuncles. The inflammation which is not fixed deep, but only spreads superficially on the skin, is usually distinguished by the name of an erysipelas; and the inflammatory tumour that arises at the fingers-ends, is termed paronychia; when the inflammation fixes in the groin or armpits, the tumour is called a bubo; when under the ears, parotis. If an inflammation seizes the hands and feet from extreme cold, chilblains arise: other inflammations have also particular names, according to the particular part of the body they possess.

**General causes of external Inflammations.** The cause of a phlegmon, or an external inflammation, arises generally from too thick or viscid a state of the blood, flaginating in the anastomoses of the smallest arteries and veins, so that the blood being sent in larger quantities than it can pass thro' those vessels, must of consequence excite the fore-mentioned general symptoms of an inflammation, and must occasion great disorders at every part where such flagination is made. And the no part of the body, whether
external or internal, nor the bones themselves are exempt from this kind of inflammation, yet it more frequently happens in the fat and glands than any where else.

With regard to the cause whence that goes in the body, the external or internal application of too sharp and stimulating substances, sticking plasters, oily and fat things, with abundance of the like nature, which stop up the pores of the skin, and impede the free course of the blood. When the forementioned symptoms are under the articles inflammation and stagnation in those vessels, called external, and the latter internal. Among the external causes are placed in the first rank all wounds, fractures, luxations, contusions, punctures by thorns and splinters, with a too great compression of the vessels, whether by too strict a bandage, or otherwise. To these causes may be added burns of all sorts, extreme cold, too violent a motion of the body, the external or internal application of too sharp and stimulating substances, sticking plasters, oily and fat things, with abundance of the like nature, which stop up the pores of the skin, and impede the free course of the blood. Amongst the internal causes, the same author reckons any thing acrimonious in the fluids, as in the febrity; as also from the blood's abounding in too great quantities, or being of too thick a consistence; or lastly, when it circulates in the body with too violent a motion: for by this means the groffer particles of the blood are drove, and, as it were, wedg'd into us, as to what they can readily find a passage through, and this, more especially, when a broken cold is spread over a body that is in a great heat. In short, every thing will produce an obstruction which makes the parts of the blood too gross and bulky, or too much contracts the mouths of the small vessels.

General crises and cure of inflammations. Inflammations terminate variously, according to their different degrees of violence, the causes from whence they arise, the parts which they affect, and the particular constitution of the patient, with several other circumstances which also prejudice to us what shall be the end of the inflammation. But the several ways wherein an inflammation terminates are chiefly four. It is either, 1. So difpersed and resolved as to vanish without leaving any considerable injury in the part affected, and which afterwards recovers its former vigour, and is of all others, the best course it can take; or else, 2. the inflammation suppurates, and degenerates into an abcess, so as to leave ever after some damage in the organ; or else, 3.

the inflammation degenerates into a gangrene, or sphaecelus; or lastly, into a hard tumour, commonly called a scirrhus, which grows more compact in the part affected, as the inflammation remains or goes off.

As to the resolution and dispersion of an inflammation, that is usually practicable, when it is only of a milder kind, in a found habit of body, when the blood is not yet too vitious nor vehement in its motion; and this treatment we have delivered already under the article DISPERSION.

But suppuration follows, when the inflammation is more violent, the circulation more rapid, but yet the mafs of blood somewhat temperate, and without much acrimony: the treatment of an inflammation that terminates in a suppuration, the reader will find delivered under the articles SUPPURATION, ABSCESSE, &c.

When the foregoing symptoms are much more violent, and when the blood is at the same time more acrimonious and rapid than it ought to be, the inflammation generally terminates in a gangrene, the nature and treatment of which fee under the article GANGRENE.

But if the inflamed part be full of glands, and the blood very thick, glutinous, and inspissated, the small blood-vessels are then so strongly stuffed up with the glutinous blood, that they are compressed together, the parts lose their sensation, and are converted into a hard tumour, which is thence called a scirrhus. See the article SCIRRHUS.

Inflammation in the breasts, a disorder most incident to child-bearing women, and almost constantly happens in a few days after their delivery. If the milk should be propelled too plentifully and forcibly into the breast, which at such times frequently happens; and if the mother should then be seized with cold, fear, anger, or a sudden perturbation of mind, the fangiferous and latififerous vessels being thence obstructed, the breasts must then become inevitably tumid, which will be attended with great heat, redness, reluctance, and violent pain. The same accident often happens to women that give suck even a long time after their lying in, and is sometimes the case of those who have no milk, all proceeding from the causes already mentioned; and Heister gives us an instance of a man's breast being in.
flamed by means of a great fright. These inflammations do not, according to that author, always happen to be equally intense and violent; for sometimes it seizes the whole breast; sometimes only one side; and at other times occupies only a small part of the breast; sometimes the inflammation lies very near the skin; at other times very deep; and at one time it has urgent symptoms, and at another, it sits easy on the part.

This disorder may be speedily removed in women of condition, and such as do not suckle their children, if some of the plfer of sperma ceti spread on linen be applied warm all round the breast soon after parturition; being perforated in the middle, to transmit the papilla or nipple; the acception of the milk being also repelled by a very tight bandage. Among the internal remedies, the most proper are such as bring down the lochia puerperum, when they do not flow in sufficient plenty of themselves: the principal remedies for this purpose are the essence of myrrh, amber, the essence of saffron, elixir proprietatis, &c. Lastly, with respect to the proper drink, it must be carefully observed to diminish the quantity of milk by want of meat and drink, upon which account the patient should be recommended to drink small broth, tea, or the like watry liquors: and if the mother be desirous of suckling the infant, there can be no better preservative against the inflammations of the breasts. But when the inflammation is fixed, the cure must be attempted either by dispersion or suppuration, for the method of which see Dispersion, and Suppuration.

But if it happens that the tumour will neither yield to dispersion nor suppuration, and is in danger of turning to a feirrhus, or cancer, the patient must be kept in good spirits, and the plfer of sperma ceti be constantly attained on the tumour, by which means it will probably either grow less, or else vanish.

For other kinds of external inflammations, see the articles Furuncle, Brysipelas, Paronychia, Bubo, Pariotis, &c.

But internal inflammations, or such whose cure is to be expected chiefly from the use of internal remedies, are in particular as follow.

Inflammation of the bladder, that attended with an acute, burning, precluding pain, in the region of the pubes, a fever, and a continual tenesmus, or desire of going to stool, and a perpetual striving to make water.

Other symptoms of this disease are a rumbling of the bowels, gripping pains, great anxiety of the precordia, difficult breathing, want of appetite, and vomiting, coldness of the extreme parts, a hard, quick, unequal, contracted pulse, inquietude, and sometimes convulsions. There is another kind which is more superficial, and is either rheumatic or erysipelas, in which the fever is more easily and speedily cured, by promoting a diaphoretic; and persons in years, who are affected with the scurvy, gout, rheumatism, or violent head-aches, are most subject to it, especially if they catch cold from a north wind. The former arises commonly from the stoppage of the menis, bleeding, piles, or other usual fanguinary evacuations, and not seldom from a virulent gonorrhoea, unskillfully suppressed by astringents; or when treated by medicines of too sharp and hot a nature.

This disease is mortal, if it terminates in an ulcer, or mortification; the latter is immediate death.

The cure must be attempted, says Hoffman, with bleeding in the foot, if a suppression of the menis or haemorrhoidal flux be the cause. If it proceeds from the scurvy, &c. recourse must he had to gentle diaphoretics, diluents, and remedies which obviate the acrimony of the humours, such as decoctions of the root of scorzomera, china, skirrets, and fennel. Also infusions in the manner of tea of the tops of yarrow, flowers of mallows, winter cherries, and seed of daucus made with milk, and sweetened with syrup of marshmallows. To these may be added emulsions of the four cold feuds. If the patient be colitive, manna will be proper with antimionated nitre, to which rhubarb may be joined, as occasion requires. If the disease is violent, diaphoretic powders with nitre, in a larger proportion than ordinary, as also five grains of saffron, and two of camphire, with the emulsions aforesaid. Externally anti-spaminodics and gentle diuretics will be proper; for which purpose it was Hoffman's method to apply bladders, filled with a decoction of emollient flowers. If the tenesmus and difficulty of urine arise from spains, there is nothing better than the vapours of a decoction in milk of the flowers of melissa, elder, chamomile;
Inflammation, and mallow, and the tops of yarrow. This decoction may be put into a clove-flool, and the patient sit over it.

Inflammation of the brain. See the article Phrensy.

Inflammation of the diaphragm. See the article Paraphrenitis.

Inflammation of the eyes. See the article Ophthalmia.

Inflammation of the fauces. See the article Quinsy.

Inflammation of the intestines, according to Boerhaave, is an inflammation contracting the intestines, and dropping up the passage through them; attended with a vehement fixed, burning pain, which is irritated by things taken inwardly. When the inflammation is in the upper part of the intestines, the stomach will be greatly distended with wind. When the pain is exasperated, it produces contractions of the diaphragm and abdominal muscles, vomiting, and painful inflations, with rumblings and sharp griping pains, which may bring on the iliac passion, or twisting of the guts. Hoffman says, that when there is a burning pain in the abdomen, with a preternatural heat of the whole body, as also a quick pulse, loss of strength, anxiety and inquietude, the heat of the disease may justly be suspected to be in the intestines. If the pain is above the navel, and below the stomach, attended with a fever, nausea, and reaching, it is a sign that that part of the colon is affected, which lies beneath the stomach, and is extended from the right to the left side. If the pain lies in the right hypochondrium, under the spurious ribs, it shews that part of the colon to be inflamed where it joins with the ilium. When the complaint is on the left side, under the loins, where the psoas muscle is placed, it is a sign that the colon, and that part of the mesentery joined thereto, is the seat of the disease, especially when it adheres to the peritoneum: but when the pain is in the middle of the abdomen about the navel, it shews the small guts are certainly affected. In all which cases the pain is supposed to be attended with a fever. Arbuthnot advises, that this disease be carefully distinguished from a colic, proceeding from a cold cause, because what is good for the latter is poison in the former. It must have a speedy remedy, or it will soon, according to that writer, and in the iliac passion, or a mortification. Besides copious bleeding, he thinks, there is scarcely any other method of cure than fomenting and relaxing the bowels with emollient liquids taken warm, both by the mouth and in olyters, and this every hour. Warm fomentations, or young, vigorous, and found animals applied to the body are extremely beneficial.

Boerhaave directs, that the patient should only be nourished with broth, in which gently detergent roots have been boiled. After bleeding and olyters, if the pain continues violent, Hoffman is of opinion that there will be no manner of danger in giving opiates, by which means the excruciating pain will be alleviated, and the spains appeased, and a breathing sweat will follow. When this is done, and the fever abated, there will be no occasion to continue the dilating, relaxing and moistening medicines, but rather the nervous and corroborating; such as the preparations of amber, especially the salt and tincture; the former of which may be given in a bolus from six to fifteen grains, and the latter from twenty to eighty drops, in any convenient vehicle.

If the patient survives three days, and the acuteness of the pain abates with a chills and shivering throughout the body, it is a sign of a suppuration, and within fourteen days the imposthume will break, and if it falls into the cavity of the abdomen, it will corrupt the whole mass of fluids, putrify the visceræ, and turn to an ulcus, whence the patient will die of a consumption. In this case, Boerhaave and Arbuthnot recommend whey and chalybeat waters, as likely to prove most beneficial. The imposthume may also turn either to a gangrene or icirrhous, both which are mortal.

Inflammation of the kidneys. See the article Nephritis.

Inflammation of the liver. When the liver is inflamed, it compresses the stomach, diaphragm, and the neighbouring visceræ of the abdomen; it stops the circulation of the fluids, hinders the generation and excretion of the gall, and all digestion; it produces a great many bad symptoms, as the jaundice, with all the diætes depending thereon. See the article Hepatitus.

A fever, an inflammation, and pungent pain on the region of the liver, and diaphragm, attention of the hypochondriæ, yellowness of the skin and eyes, and a
INFLAMMATION [1760]

Boerhaave says, that this disease, if not suddenly cured, is generally mortal; therefore, that as soon as it is discovered, plentiful bleeding is necessary, that the patient's drink should be very soft, anti-philogistic, and emollient; and also that clysters of the same kind should be administered to him.

Arbuthnot advises, that the patient should totally abstain from every thing that has acrimony in it; even the cooling nitrous faltes, which are beneficial in other inflammations, irritate too much. Vomits, cordials, and spiritsuous liquors, are little better than poison; milk generally curdles. Aliments must be given frequently, and by a spoonful at a time, for any diffusion increases the inflammation. A thin gruel of barley, oatmeal, whey, with a very little sugar, or honey, or chicken broth, are proper aliments: whey-emulsions, barley-water, and emollient decoctions are proper drinks. If poisons of the caustic kind or metallic medicines ill-prepared cause the inflammation, oily fat things are proper, as new milk, cream, oil of sweet almonds, or oil of olives taken often and plentifully, according to Hoffman. If in the cholera morbus an inflammation is apprehended, he advises absorbents and burnt hart's horn, with gelatinous decoctions of calves and neat's feet, or hartshorn-gellies, and water gruel. Outwardly he recommends the following liniment as useful in all cases; take oil of sweet almonds, two ounces; camphire, one dram; make a liniment, with which anoint frequently the precordia, applying a hot linnen-cloth over it. The following epitaph he recommends as an excellent dicutient and luidorific. Take of the vinegar of rofes, two ounces; spirit of wine camphorated, two drams; tincture of faffon, and tincture of caftor, of each one dram; nitre, half a dram; let this epitaph be applied warm to the region of the foamach.

If there happens an impoffhume, honey, and even honey of rofes, taken inwardly, is, according to Arbuthnot, a good cleaner; and decoctions of comfrey-roots, healing.

INFLAMMATION of the womb or uterus, appears from extraordinary heat and a fixed pain in the groin, with an acute fever, a pain in the loins and belly, an inflation of the abdomen, a stimulus to make water and to go to stool, heat, and a difficulty of urine.

OTHER
Other symptoms, according to Alfric, are a tumour, pain, heat, and tension of the hypogaltric region, redness of the os uteri, and great heat of the vagina. If the fore-part of the uterus is affected, there is a dytury; if the back part, a tenefmus; frequent faintings and cardialgia, a burning fever; or, if the inflammation is violent, a lypisia, in which the external parts or extremities are cold, and the internal burn, and the pulse is imperceptible; a delirium and phrensy; the breasts swell, in proportion as the inflamed uterus.

Hoffman distinguishes this disease into the superficial and more profound. He says, that it is easily formed in child-bed women, and frequently accompanies the milk-fever, and may be cured in a few days if rightly managed. But that when it is more intense, and attended with grievous symptoms without remission, it kills on the seventh, ninth, or eleventh day; a white miliary fever generally prevemes, which is the worst omen, as it generally ends in a mortification, ulcer, suppuration.

Women in childbed sometimes have the womb inflamed, from the fault of an unskilful midwife, or hard labour; or the lochia being stopped by pains or hysterical spasms, dread or cold: wherefore proper precautions should be taken to prevent it, for which purpose Hoffman advises to keep them under a gentle diaphoretic regimen, and to allay the almost feverly heat; to which end oil of almonds may be chicken-broth with scorzonera-root, succory and shavings of hartthorn boiled therein.

In women out of child-bed, the inflammation generally happens in the neck of the uterus and the vagina, and then besides the foregoing things, the same author recommends the application of epimens to the pubes, uterine infeotions, pellaries, and suppositories: the epithem may be of arquebufade water, four ounces; essence of saffron, camphorated spirit of wine, of each two ounces; nitre, a dram, dissolved in elder-flower water; and, as circumstances require, mixed with vinegar of rue, or scordium, and applied with a double cloth. The injection may consist of asses-milk with flowers of elder, myrrh, and saffron, and a little nitre may be added to the decoction. The tenefmus may be appeased with emollient half baths, or with one ounce of oil of sweet almonds, and twelve grains of saffron, injected into the anus. These remedies are useful in case of a suppuration.

If it proceeds from external causes, and there is a fever, pain in the groin, difficulty of urine, and coltivefens, bleed first in the arm, and then in the foot; give a clyster, and apply melilot-plaster, two ounces; sperma ceti, half an ounce; gum ammoniac, two drams; saffron, one dram; camphire, half a dram, mixed together; not omitting gentle diaphoretics and diuretics.

INFLAMMATORY DISEASES. To these may be referred the several diseases mentioned in the preceding article, either attended with a fever, as well as leffer inflammations without a fever; besides all chronic disorders arising from inflammations, the chief whereof are old coughs, consumptions and the rhematism, without a fever. See COUGH, &c.

Hoffman lays down this as an axiom, for all practitioners to observe; that in all inflammatory diseases of the nervous and membranaceous...
Inflammatory fevers are distinguished into two stages; the first, whilst the pulse continues hard, in which it is proper to bleed; the second, when the inflammatory symptoms still remaining, the pulse is too low for that evacuation; in this state blisters are the chief remedy, and which, except in a few singular cases, are not to be used sooner. If the blisters are large, it is better to apply them gradually, than many at a time. See the articles fever and inflammation.

Inflection, or point of inflection, in the higher geometry, is the point where a curve begins to bend a contrary way. See the article flexure.

To determine the point of inflection in curves, whose semi-ordinates CM, CM (pl. CXLVI. fig. 2. n0. 1. and 2,) are drawn from the fixed point C; suppose CM to be infinitely near CM, and make $mH = MM$; let $TM$ touch the curve in M. Now the angles $CMT$, $CMm$, are equal; and so the angle $CMH$, while the semi-ordinates increase, does decrease, if the curve is concave towards the center C, and increases if the convexity turns towards it. Whence this angle, or, which is the same, its measure will be a minimum or maximum, if the curve has a point of inflection or retrogression; and so may be found, if the arch TH, or fluxion of it, be made equal to $x$, or infinity. And in order to find the arch TH, draw $mL$, so that the angle $TMl$ be equal to $mCL$; then if $CM = y$, $mL = x$, $mT = t$, we shall have $y : x : t : xl$.

Again, draw the arch $HO$ to the radius CH; then the small right lines $mT$, $OH$, are parallel, and so the triangles $OLH$, $mLR$, are similar; but because $HL$ is also perpendicular to $mL$, the triangles $LHI$, $mLR$, are also similar.

hence $\frac{x}{t} = \frac{y}{\ell}$; that is, the quantities $mT$, $mL$, are equal. But $HL$ is the fluxion of $HI$, which is the distance of $CM = y$; and $HL$ is a negative quantity, because while the ordinate $CM$ increases, their difference $rH$ decreases; whence $xx + xy = yy = 0$, which is a general equation for finding the point of inflection, or retrogradation.

Inflection, in grammar, the variation of nouns and verbs, by declension and conjugation. See declension and conjugation.

Inflex leaf, among botanists, one whole point bends inward, towards the stem of the plant. See the article leaf.

Affluence, a quality supposed to flow from the heavenly bodies, either with their light or heat; to which astrologers idly ascribe all fabulous events.

Influent fever, the same with a nervous one. See the article fever.

Inforced, and infcrment. See reinforced and reinforcement.

In forma pauperis, in law. See the article forma.

Information, in law, is nearly the same in the crown-office, as what in our other courts is called a declaration. It is sometimes brought by the king, or his attorney-general, or the clerk of the crown-office; and at other times by a private person, who informs or sues, as well for the king as himself, upon the breach of some popular statute, in which a penalty is given to the party that will sue for it. It differs from an indictment, which must be found by the oaths of ten men at least; for an information is only the allegation of the person that brings it. An information lies for offences at common-law, as batteries, conspiracies, nuisances, contempt, libels, sedition words, &c. and in many cases by statute, on which the offender is rendered liable to a fine, or other penalty: an information also lies against the inhabitants of a town, for not repairing the highways, for going armed in affray of the peace, &c. and in general for any offence against the public good, or the principles of justice: but where an information brought is only for vexation, the defendant may bring an information against such vexatious informer. All informations brought by informers on penal statutes, where a certain sum is allowed him, must be brought in the county where the offence was committed; and within a year after the fact was done; but a party aggrieved, not being a common informer, is not obliged to bring his information in the proper county; for he may lay it in what county he pleases. If an informer, without leave of the court, compounds with the defendant, he forfeits 10l. and may be set in the pillory.
Where an information is exhibited for 

INFUSION, in botany, a method of obtaining the virtues of plants, roots, &c. by steeping them in a hot or cold liquid. Hot infusions are made by pouring boiling water, or any other menstruum, on the drugs whose virtues we would extract: thus, in order to obtain the common infusion of fena, take the leaves of fena, an ounce and a half; of crystals of tartar, three drams; of the leffer cardamom-seeds hulked, two drams: boil the crystals of tartar in a pint of water till they are dissolved, then pour the water, while boiling hot, upon the fena and the root; and when the liquor is cold, strain it off. But all tinctures and infusions of ingredients, whose principal virtues depend upon their lighter or more volatile and spirituous parts, should not be made by steeping them in a hot, but in a cold menstruum; and if such infusions be required rich and strong, they are to be made so, not by suffering the menstruum to be heated, or to remain long upon the ingredients, but by adding fresh ingredients several times to the same liquor, infusing them quick, and each time keeping out the ingredients that have been once used: by this means we shall procure the full virtues of simples, unaltered in their nature, yet exalted or concentrated to such a degree, that a few spoonfuls of the liquor shall contain the spirit or quintessence of a pound of the plant. This is an effect not to be expected from fire, which almoft constantly alters the nature of things committed to it; nor could a valuable essence of violets, jacinths, lilies, borage-flowers, or any flower or plant of an extremely fine odoriferous spirit, be procured by heat, as it readily may
may, by steeping these flowers in cold water, cold vinegar, cold wine, and the like; and frequently pouring the tincture upon fresh flowers, till the liquor becomes strongly impregnated.

INGANNO, in music, is when having done every thing proper for ending a cadence, a mark of silence is placed instead of the final, which the ear naturally expects, and is deceived. See Cadence.

INGELSHEIM, a town of Germany, in the palatinate of the Rhine, eight miles south-west of Mentz: east longit. 7° 40', north lat. 56°.

INGOLSTAT, a town of Germany, situated on the river Danube, thirty miles south-west of Ratibon: east lon. 11° 30', and north lat. 43° 24'.

INGOT, a mark of gold or silver, melted down and cast in a mould, but not coined or wrought. See Gold and Silver.

INGRAVING, or Grafting, in gardening. See Grafting.

INGRAILED, or Engrailed, in heraldry. See the article Engrailed.

INGRAVING, or Engraving. See the article Engraving.

INGREDIENTS, in pharmacy, whatever simple medicines enter the composition of a compound one.

INGRESS, in astronomy, signifies the sun's entering the first signe of one of the four cardinal signs, especially aries.

INGRESS, EGRESS, and REGRESS, in law, words frequently used in leaves of lands, which signify a free entry into, a going out of, and returning from some part of the premises leased to another.

INGRESSU, in law, a writ of entry, termed also a precipe quod reddat. See the articles Entry and Precipe.

INGRIA, a province of Russia, bounded by the lake Ladoga, the river Nieva, and the gulph of Finland on the north, by Novogorod on the east and south, and by Livonia on the west.

INGROSSER, one who buys up great quantities of any commodity, before it comes to market, in order to raise the price.

If a person gets into his hands, otherwise than upon a demise or grant of lands, any corn growing, butter, cheese, fish, or other victuals, within the kingdom, with intent to sell the same again at a high price, he shall be deemed an unlawful ingroser. But the buying of corn to be ground into meal, or for making of flour, in order to sell it again; or barley and oats to make malt and oatmeal, are not included in this statute. Foreign corn and victuals, except fish, are also exempted; as are licenced badgers, fenners, butchers, poulterers, &c. that buy in their own ways of dealing, and are not guilty of forefalling, or selling the same again at unreasonable prices by retail. A merchant who imports victuals or merchandize into this kingdom, may dispose of the same in gros; yet the person who purchases them of him, may not do so, since by that means the price would be enhanced. If this was allowed, a monied man might ingroste into his hands a whole commodity, with an intent to sell it again at what price he thought proper: but the ingressing the whole of any commodity is inadmissible, and the offender, whether he sell any part of them or not, is subject both to a penalty and to corporal punishment, by common law.

INGROSSER also signifies a clerk or person who copies records, deeds, or other instruments of law, on skins of parchment.

INGROSSING of a fine, is the chirurgist's making the indentures of a fine, and also the delivery of it to him on whom it is levied. See the article Chirurgist.

INGUEN, in anatomy, the same with what is otherwise called groin, or pubes. See the article Pubes.

INGUNAL, in anatomy, &c. any thing belonging to the groin. Hence, INGUINAL HERNIA is a hernia in that part called by surgeons bubonocele. See the article Bubonocele.

INHARMONICAL
INHARMONICAL RELATION, in music, is much the same with discord. See the articles DISCORD and RELATION.

INHUMATION, in chemistry, a method for the combustion of certain substances.

INHIBITION, a writ or order of the court to an inferior, and is of the nature of prohibition granted in cases of prohibition attending it; yet the injection of proper medicines in apoplexies, quinzenes, and hydrophobia, wherein no medicine at all can be taken by the mouth, deserves to be tried.

Anatomical Injection, the filling the vessels with some coloured substance, in order to make their figures and ramifications visible.

For this purpose, a fine red injection is prepared thus: pour a pint of oil of turpentine on three ounces of vermillion, stir them well together, and then strain all through a fine linen-cloth. If a green injection is wanted, distilled verdigris may be used instead of the vermillion.

An coarse injection may be made of one pound of tallow, five ounces of white-wax, three ounces of oil of olives, melted together, and adding two ounces of Venice-turpentine; and when this is dissolved, three ounces of vermilion or verdigris are to be thoroughly mixed with the other ingredients, and the whole strained through a linen-cloth.

For the manner of preparing bodies to be injected, see the article PREPARATION.

INITIATED, in antiquity, a term chiefly used in speaking of persons who were admitted to a participation of the sacred mysteries among the heathens. See the article MYSTERY.

INJUNCTION, in law, is a writ or kind of prohibition granted in several cases; and for the most part grounded on an interlocutory order or decree, made in the court of chancery or exchequer, for staying proceedings either in courts of law, or ecclesiastical courts. An injunction is obtained either for not appearing and putting in an answer in due time, upon equity confessed, or upon matter that appears.
**INK**

pears on record. If it be for staying suits in other courts, it is grantable on suggestion of some matter, by which the plaintiff is rendered incapable of making his defence there, either for want of witnesses, from his being cited at law for what in equity he ought not to pay, or because the court, in which he is sued at law, acts erroneously, or denies him the benefit of the law, &c. Sometimes it is used on the defendant's non-appearance, to give a complainant possession of lands, &c. and sometimes for staying suits, in which last case an affidavit must be first made, of waste committed in lands, &c.

This writ is directed not only to the party himself, but to all and singular his counsellors, attorneys, and solicitors; and, therefore, if any attorney, after having been served with an injunction, proceeds against the party that obtained it, the court, out of which it issued, will commit him to the fleet-prison for contempt: but as an injunction ought not to be granted in a criminal case, To whenever this happens, the court of king's bench may break it, and protect those that proceed in contempt of it.

**INJURY**, any wrong done to a man's person, reputation, or goods. See the articles **ASSAULT, TRESPASS, &c.**

**INK**, atramentum, a black liquor generally made of an infusion of galls, copperas and a little gum arabic. See the article **GALLS, COPPERAS, &c.**

To make a very good ink for writing: take three ounces of good galls, reduced to powder, which infuse in three pints of river or rain-water, letting it in the sun or a gentle heat, for two days; then take common copperas, or green vitriol, three ounces, powder it, put it into the infusion, and set it in the sun for two days more; lastly, shake it well, and add an ounce of good gum arabic.

To make the London powder-ink: take ten ounces of the clearest nut-galls, which reduce to a fine powder; then add two ounces of white copperas, four ounces of roman vitriol, and of gum arabic or sandarach an ounce; pound and sift them very fine. This powder, though whitish itself, will, when put into water, turn it to a good black ink: an ounce of the powder serves to make a pint of ink.

To make a shining ink: take gum arabic and roman vitriol, each an ounce; galls well bruised, a pound; put them into rape-vinegar, or vinegar made of clear small beer; let them in a warm place, stir them often till the liquor becomes black, and then add to a gallon of this preparation an ounce of ivory-black, and a quarter of a pint of feed-lac-varnish.

To make a shining japan or china ink: take an ounce of lamp-black, and clarify it in an earthen pipkin, to take out the drofs; two drams of indigo; half a dram of peach-black; one dram of black endive, burnt; reduce them to a very fine powder, and then take a moiety of fig-leaf-water, another part of milk, and a very little gum arabic, and mixing all the ingredients well together, make them up for use.

**Printing Ink** is made by boiling or burning linseed-oil till it is pretty thick, adding a little rosin to it, while hot, and then mixing this varnish with lamp-black.

Printing-ink, on its being imported from abroad, pays 7 s. 8 d. the hundred weight, of which 6 s. 9 d. is repaid on its exportation.

**INK** is also an appellation given to any coloured liquor, used in the fame manner as the atramentum, or black ink; as red, green, blue, yellow, &c. inks.

Red ink is made thus: take wine-vinegar a pint; rapings of brazil, one ounce; alum, half an ounce; boil them gently, and add five drams of gum arabic: dissolve the gum, strain the ingredients, and keep the liquid for use.

Green ink is made by boiling verdigris with argol, in fair water, and adding a little gum arabic.

Blue ink is made by grinding indigo with honey and the white of eggs, and making it fluid with water.

Yellow ink is made by an infusion of saffron in water, with a little alum and gum arabic.

**Sympathetic Ink**, a liquor with which a person may write, without the letters appearing, till some means be taken to render them legible.

Of this kind are the glutinous juices of plants, or any other thick and viscid fluids, provided they have no remarkable colours themselves; for being written on white paper, nothing will appear, till some fine powder of any coloured earth is thrown over the paper, whereby the letters become legible: the reason of this is evident, as the powder sticks only to the letters formed by the invisible but viscid liquor.

Another sort of sympathetic inks are made of infusions, the matter of which easily
INN [1767] INN

easily burns to a charcoal: thus, if a scruple of sal amoniac be dissolved in two ounces of fair water, letters written therewith will be invisible till held before the fire; for the sal amoniac being burnt to a charcoal, by a heat not strong enough to scorch the paper, the letters are thereby rendered visible.

Another sort of sympathetic inks are made of a solution of lead in vinegar, and a lixivium of lime and orpiment; for if a letter be written with the former, nothing will appear: but to conceal the affair still more, some different subject may be written above it, with a black ink made of burnt cork and gum-water; then, if a piece of cotton, wetted with the said lixivium, be rubbed over the paper, the sentence that was visible will disappear, and the invisible one, before written with the solution of lead, will be seen in its place very black and strong.

INLAGATION, the restoring an outlawed person. See OUTLAWRY.

INLAND bills of exchange, those payable in distant parts of this kingdom.

If any such bills be lost, or miscarry, within the time limited for payment, the drawer is obliged to give other bills of the same tenor; security being given, if demanded, in case the lost bill be found again. In case the party on whom an inland bill of exchange shall be drawn, shall refuse to accept the same, the party to whom payable shall cause such bill to be protested for non-acceptance, as in case of foreign bills; for which protest he shall pay two shillings, and no more. See BILL, ACCEPTANCE, PROTEST, &c.

INLAYING, the art of marquetry. See the article MARQUETRY.

INN, a place appointed for the entertainment and relief of travellers.

Inns are licensed and regulated by justices of the peace, who oblige the landlord to enter into recognizances for keeping good order. If a person who keeps a common inn, refuses to receive a traveller into his house as a guest, or to find him victuals and lodging, on his tendering a reasonable price for them, he is liable to an action of damages, and may be indicted and fined at the king's suit. The rates of all commodities sold by inn-keepers, according to our ancient laws, may be ascertained and fined by the inn-keeper, and all manner of victuands, at reasonable prices, without taking any thing for litter, may be fined and imprisoned, &c., by 21 Jac. I. cap. xxi. Where an inn-keeper harbours thieves, persons of an infamous character, or suffers any disorder in his house, or sets up a new inn where there is no need of one, to the hindrance of ancient and well governed inns, he is indictable and fineable; and by statute, such inn may be suppressed. Action upon the cafe lies against any inn-keeper, if a theft be committed on his guest, by a servant of the inn, or any other person not belonging to the guest; though it is otherwise where the guest is not a traveller, but one of the same town or village, for there the inn-keeper is not chargeable; nor is the matter of a private tavern answerable for a robbery committed on his guest: it is said, that even though the travelling guest does not deliver his goods, &c., into the inn-keeper's possession, yet if they are stolen, he is chargeable. An inn-keeper is not answerable for any thing out of his inn, but only for such as are within it; yet where he, of his own accord, puts the guest's horse to graze, and the horse is stolen, he is answerable, he not having the guest's orders for putting such horse to graze. The inn-keeper may justify the stopping of the horse, or other thing of his guest, for his reckoning, and may detain the same till it be paid. Where a person brings his horse to an inn, and leaves him in the stable, the inn-keeper may detain him till such time as the owner pays for his keeping; and if the horse eats out as much as he is worth, after a reasonable appraisement made, he may sell the horse, and pay himself; but when a guest brings several horses to an inn, and afterwards takes them all away except one, this horse so left may not be sold for payment of the debt for the others; for every horse is to be sold, only to make satisfaction for what is due for his own meat.

INNS of COURT, are colleges in London, for the study of the laws of England, with all conveniences for the lodging and entertainment of the professors and students.

In these colleges, there are not only such students as study the laws of this kingdom, in order to render themselves capable of practising in the courts of law at Westminster; but also such other gentlemen of fortune as apply themselves to this study, in order to know and vindicate their rights, and to render themselves more serviceable to their country.
Our inns of court, which are numerous, and justly famed for the production of men of learning, are governed by masters, principals, benchers, stewards, and other officers, and have public halls for exercises, readings, &c. which the students are obliged to attend and perform for a certain number of years, before they can be admitted to plead at the bar. These societies have not, however, any judicial authority over their members; but instead of this they have certain orders among themselves, which have, by consent, the force of laws: for lighter offences, persons are only excommunicated, or put out of commons; for greater, they lose their chambers, and are expelled the college; and when once expelled out of one society, they are never received by any of the others. The gentlemen in these societies may be divided into benchers, outer-barristers, inner-barristers, and students.

The four principal inns of court are the Inner-temple, Middle-temple, Lincoln's inn, and Gray's inn; the other inns are the two ferjeant's inns; and the others, which are less considerable, are Clifford's inn, Symond's inn, Clement's inn, Lion's inn, Furnival's inn, Staple's inn, Thavies inn, Barnard's inn, and New-inn. These are mostly taken up by attorneys, solicitors, &c. but they belong to the inns of court, who send yearly some of their barristers, to read to them.

**INN AND INN**, a game on dice, very much practised at an ordinary, may be played by two or three, each having a box in his hand. There are four dice, and you may drop what you please, six-pences, shillings, &c. or guineas. Every inn, you drop; and every inn-and-illn, you sweep all: likewise, if you throw out, if but two play, your adversary wins all; but if three play, the stake may be divided between the other two, or played for.

Here you are to observe, that out, is when you have thrown no doublets on the four dice; inn, is when you have thrown two doublets of any fort; and inn-and-inn, is when you throw all doublets, whether of any fort, or otherwise; as four aces, &c. or two aces, &c. and two of any other denomination. The battle may be for as much or as little as you please, and is not ended till every penny of that money be won: this seems just, since in a battle of ten pounds, a gentleman hath been reduced to five shillings, and yet hath won the battle at last.

Like all other games, this too has its tricks; we shall only mention one instance by way of example: a gentleman who had spent the greater part of his patrimony, bethought himself how he should retrieve it; and having been a considerable loser by gaming, he fixed on this as the basis of his future settlement; accordingly he at length contrived a box, not screwed within as usual, which, nevertheless, was so well painted as to look exactly like a screwed box; it was likewise half board wide at top, and, narrow at bottom, so that he had the dice wholly under his own management. In short, with this box, and the artful placing of the dice, he won a thousand pounds the first night, at the game of inn-and-inn; next night he won an estate of two hundred a year; on which he forswore all gaming for the future, well knowing how many have been ruined by it.

**INN**, in geography, a large river which rises in a mountain of the Alps, in the country of the Grifons, runs north-east through Tyrol and Bavaria, and discharges itself into the Danube.

**INN**, or **INNER**, in the manage, is applied differently according as the horse works to the right or left, upon the volt; or as he works along by a wall, a hedge, or the like: for in moving by a wall, the leg next the wall is called the outer leg, and the other the inner leg: and upon volts, if a horse works to the right, the right heel is the inner heel, and the right leg the inner leg; but if he works to the left, the left heel is the inner heel, &c. At present, riding-masters, in order to be more easily understood, generally use the terms right and left, instead of outer and inner.

**INNATE IDEAS**, those supposed to be stamped on the mind, from the first moment of its existence, and which it constantly brings into the world with it: a doctrine, which Mr. Locke has abundantly refuted. See the article IDEA.

**INNERKEITHING**, a port-town of Scotland, in the county of Fife, situated on the north shore of the frith of Forth, ten miles north-west of Edinburgh.

**INNERLOCHY**, or **FORT WILLIAM**, a fortres erected in the highlands of Scotland, at the mouth of a bay or lake in the county of Lochaber, twenty-eight miles
INNOCENT'S-DAY, a festival of the christian church, observed on December 28, in memory of the massacre of the innocent children by the command of Herod, king of Judea; who being alarmed at hearing that an infant was born king of the Jews, and imagining that his own kingdom was in danger, sent orders to have all the children slain that were in Bethlehem, and the adjacent country.

The greek church in their calendar, and the Abyssinians of Ethiopia in their offices, commemorate fourteen thousand infants on this occasion.

INNOMINATA OSSA, in anatomy, three bones, which compose the extreme part of the trunk of a human body. These, though single in adults, are in infants three perfectly distinct bones, each of which has its peculiar name; the upper one is called the ileum; the anterior one, the os pubis, or os pectinis; and the posterior one, the os ischiium. These are joined by the intervention of cartilage, as it were in the middle of that singular cavity called the acetabulum, and continue visibly distinct to the age of puberty; after which they coalesce, and form one entire bone so perfectly, that there is not the least vestige remaining that they ever were separate.

The innominata offa are joined on each side, in the hinder part, to the os sacrum, by ligaments and cartilages, and form a very firm and strong, though somewhat moveable articulation with it; and with this bone they also form the cavity called the pelvis; they also cohere with the os sacrum on each side, by means of two peculiar and very robust ligaments, each being a finger's breadth broad, and two or three finger's breadth long.

The use of these bones is to support and sustain the spina dorsi, and indeed all the parts above themselves; to make a firm and proper juncture of the other parts of the body with the thighs; to serve for the place of origin to several muscles; to form the cavity of the pelvis, and to defend its contents from external injuries.

INNOVATION, or NOVATION. See the article Novation.

INNUENDO, a word that was frequently used in declarations of slander, and law-pleadings, when there were in latin, in order to ascertain a person or thing before mentioned; but now, instead of the word innuendo, we say, meaning to and so.

The practice of stretching innuendos, it is observed, has of late years, in some particular cases, too much prevailed amongst us: however, it has been held, that an innuendo cannot make that certain which was uncertain before; nor will the law allow words to be enlarged by an innuendo, so as to support an action on the caufe for uttering them. In slander, the person and words should both of them be distinctly specified, and not want an innuendo to make them out; and therefore an innuendo will not render an action for a libel good, where the preceding matter imports no scandal.

INOCULATION, in medicine, the art of transplanting a distemper from one subject to another, by infliction, particularly used for engraving the smallpox. See the article Pox.

The design of this operation is to communicate by art a milder species of the smallpox to the infant or adult patient, than that received by the natural infection; and this by engraving some of the variolous matter, in order to which a small incision is to be first made, with a scalpel or lancet, through the skin of the arm, and having infected a small particle of the purulent matter, taken from a mild kind of the pock, the little wound is then to be dressed with some dry lint, and covered with a plaster. After the operation, the patient must constantly keep his chamber, the air of which should be moderately warm, and his diet regulated by some prudent physician, by which means this disorder will shew itself in seven or eight days, without any malignant symptoms, and if assisted by a proper regimen, and a moderate warmth, it usually runs gently through its several stages. When the patient has once had the disorder this way, though ever so mild, it is certain from experience, that they never have it again; and therefore the opinion of those seems to be well grounded, who think that the propagation of the smallpox by inoculation might be of general use and benefit to mankind, in preserving the lives of some, and the most important members of others, as the face, eyes, hearing, viscera, &c.

HISTORY informs us, that the disorder was this way propagated many hundred years ago, among the Greeks, Turks, and Chinese,
INOCULATION [1770]

CHIRURGE, whereas it is but of late years that the European nations have come into it, among which the English seem to have approved and followed it most. The experiment succeeded so well in the hands of the British physicians, that King George I. countenanced the fame in all his dominions, and from thence the practice prevailed with success in Germany, particularly in the dominions of Hanover.

It must, however, be confessed, that there were many, both among the French and English, who endeavoured to suppress and vilify the practice in their writings; but it is thought by Heister, that all their objections have been sufficiently answered and obviated by Dr. Jurin and other able physicians.

Heister declares himself of opinion, that so far from thinking the practice fatal or mischievous, he rather firmly believes it might, under a proper management, be of the greatest use and benefit to the lives and healths of mankind; for, as he judges, the small pox arise from a pejtilential virus or matter lodged in the blood, from the very first day of the birth, which breaks out almost in every person, sooner or later, and the more early usually the better, as it is seldom we observe the pox favourable in those more advanced in years; so that the matter seems to multiply itself in the blood, and augment with the patient's age. If, therefore, the disorder be procured of a mild kind by this operation, and the blood cleared of its latent virus, while small in quantity, and the infant young, he doubts not but many might by this means be not only preserved from death, but even conducted safely through the several stages of the disease, without the infults of its most malignant symptoms. We are convinced from experience, as well as reason, that, the disorder which breaks out from a natural infection, is generally more severe and fatal than that produced by art; and no wonder it should be so, since in the last, the physician has the opportunity of choosing the most favourable season, and of preparing his patient before-hand, by a proper regimen, diet, and medicines.

In the Phil. Trans. vol. xlvi. we have a new method of inoculation, discovered by Mr. Brooke, and communicated by him, in a letter, read before the Royal Society, May 14, 1752, to Dr. Parsons, secretary to the Society for foreign corre-

Inoculation, or Budding, in gardening, is commonly practised upon all sorts of stone-fruit, as nectarines, peaches, apricots, plumbs, cherries, as also upon oranges and jasmines; and, indeed, this
is preferable to any sort of grafting for most sorts of fruit. The method of performing it is as follows: you must be provided with a sharp penknife with a flat haft, which is to raise the bark of the stock to admit the bud; and some found bafs-mat, which should be soaked in water, to increase its strength, and render it more pliable; then having taken off the cuttings from the trees you would propagate, you must choose a smooth part of the stock about five or six inches above the surface of the ground, if designed for dwarfs; but if for standards, they should be budded six feet above ground. Then with your knife make an horizontal cut across the rind of the stock, and from the middle of that cut make a slit downwards, about two inches in length, so that it may be in the form of a T; but you must be careful not to cut too deep, lest you wound the stock; then having cut off the leaf from the bud, leaving the foot-talk remaining, you should make a cross cut, about half an inch below the eye, and with your knife split off the bud, with part of the wood to it: this done, you must with your knife pull off that part of the wood which was taken with the bud, observing whether the eye of the bud be left to it or not; for all those buds which lose their eyes in stripping, are good for nothing: then having gently raised the bark of the stock with the flat haft of your penknife clear to the wood, thrust the bud therein, observing to place it smooth between the rind and wood of the stock, cutting off any part of the rind belonging to the bud, that may be too long for the slit made in the stock; and so having exactly fitted the bud to the stock, tie them closely round with bafs-mat, beginning at the under part of the slit, and so proceeding to the top, taking care not to bind round the eye of the bud, which should be left open.

When your buds have been inoculated three weeks or a month, those which are fresh and plump, you may be sure are joined; and at this time you should loosen the bandage, which, if it be not done in time, will injure if not destroy the bud. The March following cut off the stock flopping, about three inches above the bud, and to what is left fasten the shoot which proceeds from the bud: but this must continue no longer than one year; after which the stock must be cut off close above the bud. The time for inoculating is from the middle of June to the middle of August: but the most general rule is, when you observe the buds formed at the extremity of the same year's shoot, which is a sign of their having finished their spring growth. The first sort commonly inoculated is the apricot, and the last the orangetree, which should never be done till the latter end of August. And in doing this work, you should always make choice of cloudy weather; for if it be done in the middle of the day, when the weather is hot, the shoots will periphere so fast, as to leave the buds destitute of moisture.

INORDINATE PROPORTION, is where there are three magnitudes in one rank, and three others proportional to them in another, and you compare them in a different order. Thus suppose the numbers in one rank to be 2, 3, 9; and those of the other rank 8, 24, 36; which are compared in a different order, viz. 2:3:24:36; and 3:9:8:24. Then rejecting the mean terms of each rank, you conclude 2:9:8:36.

INOSCULATION, in anatomy, the same with anastomosis. See ANASTOMASIS.

INQUEST, in law, signifies an inquiry made by a jury, in a civil or criminal cause, by examining witnesses. See the article JURY.

There is also an inquest of office, used for the satisfaction of the judges, and sometimes to make inquiry whether a criminal be a lunatic or not; upon which inquest, if it be found that the criminal only feigns himself to be a lunatic, and at the same time refuses to plead, he may be dealt with as one standing mute. See the article MUTE.

Where a person is attainted of felony and escapes, and afterwards on being re-taken denies that he is the same man, inquest must be made into the identity of the person by a jury, before he can be executed.

INQUIRENDO, in law, an authority given to one or more persons, to inquire into something for the advantage of the king.

INQUISITION, in law, a manner of proceeding by way of search or examination used on the king's behalf, in cases of out-lawry, treason, felony, self-murder, &c. to discover lands, goods, and the like, forfeited to the crown. Inquisition is also had upon extents of lands, tenements, &c. writs of ejectment, and where
INQ. [1772.] INS.

where judgment being lial by default, damages and costs are recovered.

INQUISITION, in the church of Rome, a tribunal in several roman-catholic countries, erected by the popes for the examination and punishment of heretics. This court was founded in the twelfth century by father Dominic and his followers, who were sent by pope Innocent III. with orders to excite the catholic princes and people to extirpate heretics, to search into their number and quality, and to transmit a faithful account thereof to Rome. Hence they were called inquisitors; and this gave birth to the formidable tribunal of the inquisition, which was received in all Italy, and the dominions of Spain, except the kingdom of Naples and the Low Countries.

This diabolical tribunal takes cognizance of heresy, judaism, mahometsianism, sodomy, and polygamy; and the people stand in so much fear of it, that parents deliver up their children, husbands their wives, and masters their servants, to its officers, without daring in the least to murmur. The prisoners are kept for a long time, till they themselves turn their own accusers, and declare the cause of their imprisonment; for they are neither told their crime, nor confronted with witnesses. As soon as they are imprisoned their friends go into mourning, and speak of them as dead, not daring to solicit their pardon, lest they should be brought in as accomplices. When there is no shadow of proof against the pretended criminal, he is discharged, after suffering the most cruel tortures, a tedious and dreadful imprisonment, and the loss of the greatest part of his effects. The sentence against the prisoners is pronounced publicly, and with extraordinary solemnity. In Portugal they erect a theatre capable of holding three thousand persons, in which they place a rich altar, andraile seats on each side in the form of an amphitheatre. There the prisoners are placed, and over-against them is a high chair, whither they are called, one by one, to hear their doom, from one of the inquisitors.

These unhappy people know what they are to suffer, by the cloaths they wear that day. Those who appear in their own cloaths, are discharged upon payment of a fine; those who have a fanto benito, or strait yellow coat without breeves, charged with St. Andrew's cross, have their lives, but forfeit all their effects: those who have the resemblance of flames, made of red serge, fewed upon their fanto benito, without any cross, are pardoned, but threatened to be burnt if ever they relapse: but those who, besides these flames, have on their fanto benito, their own picture, surrounded with figures of devils, are condemned to expire in the flames. The inquisitors, who are ecclesiastics, do not pronounce the sentence of death; but form and read an act, in which they say, that the criminal being convicted of such a crime, by his own confession, is with much reluctance delivered to the secular power to be punished according to his demerits: and this writing they give to the seven judges, who attend at the right side of the altar, who immediately pass sentence. For the conclusion of this horrid scene, see the article ACT of faith.

INQUISITORS, in law, persons who have power by their office to make inquiry in certain cases; as sheriffs, and coroners on view of the body, &c.

INROLLMENT, in law, is registering any lawful act, as a statute or recognizance acknowledged, a deed of bargain and sale, &c. in the rolls of chancery, king's bench, common pleas, or exchequer, at the husting of Guildhall, London, or at the quarter-sessions. Inrollments of deeds must be recorded in court, and for the sake of perpetuity ingrossed on parchment: yet it is said that inrolling a deed does not make it a record, which is an entry on parchment of judicial matters controverted in a court of record; and of which the court is to take notice: but the inrolling of a deed, is only a private act of the parties concerned, of which the court takes no notice at the time when it is done, tho' the court gives way and accedes to it. All deeds may be inrolled at common law, and tho' by accident a seal is broke off, it will not hinder it. A deed when inrolled must be acknowledged before a matter in chancery, or a judge of the court where it is inrolled; which being the officer's warrant for its inrollment, such inrollment will be allowed as good proof of the existence of the deed itself.

Clerk of Inrollments. See the article Clerk of inrollments.

INSCONCED, in the military art, part of an army that have fortified themselves with a fence or small fort, in order to defend some pafs, &c.

INSCRIBED,
INSCRIBED, in geometry. A figure is said to be inscribed in another, when all its angles touch the sides or planes of the other figure. See the articles HEXAGON, PENTAGON, &c.

INSCRIPTION, a title or writing carved, engraved, or affixed to any thing, to give a more distinct knowledge of it, or to transmit some important truth to posterity.

The inscriptions mentioned by Herodotus and Diodorus Siculus, sufficiently shew that this was the first method of conveying instruction to mankind, and transmitting the knowledge of history and sciences to posterity; thus the ancients engraved upon pillars both the principles of sciences, and the history of the world. Pisistratus carved precepts of husbandry on pillars of stone; and the treaties of confedernacy between the Romans and Jews, were engraved on plates of brass. Hence, antiquarians have been very curious in examining the inscriptions on ancient ruins, coins, medals, &c.

INSECTS, in zoology, a numerous class of animals, whose bodies are neither regularly covered with hair, feathers, or scales, as in the generality of other animals; but either with a hard, and as it were horny substance, or with a soft and tender skin; and of which the far greater part, that is, all the insects with a hard covering to their bodies, have on their heads antennae, otherwise called horns and feelers.

The most general sub-division of insects is into two series, viz. the winged and naked ones; each of which comprehends several subordinate orders of genera, each containing numerous species.

The several orders of the first series are the coleoptera, hemiptera, neuroptera, lepidoptera, hymenoptera, and diptera; and those of the second series, are the aptera, reptilia, zoophyta, tectacea, and lithophyta: of all which we have treated under their respective articles. See the articles COLEOPTERA, HEMIPTERA, NEUROPTERA, &c.

Generation of Insects. See the article Generation.

Transformation of Insects. See the article Transformation.

INSERTION, in anatomy, the close conjunction of the vessels, tendons, fibres, and membranes of the body with some other parts. See the articles TENDON, MUSCLE, &c.

INSIDANT DISEASES, those which shew no evident symptom, but lie concealed in the body, ready to break forth on the least provocation, as it were by surprize.

INSINUATION, in our law, a clandestine creeping into a person's mind, or favour; but, among the civilians, it bears a different signification; as the insinuation of a will is the first production of it, viz. the leaving it in the hands of the regifter, in order to the procuring a probate thereof.

INSIPID, an appellation given to things without taste. See the article TASTE.

INSITION, in gardening, the same with grafting. See the article GRAFTING.

INSOLUTION, in chemistry, the suffering matters to stand and digest in the heat of the sun, instead of that of a furnace. See FIRE and HEAT.

INSOLVENT, a term applied to persons unable to pay their debts. See the articles DEBT and DEBTOR.

INSPICIENDO VENTRE, in law. See the article VENTRE.

INSPIRATION, among divines, implies the conveying of certain extraordinary and supernatural notices or motions into the soul.

In discoursing upon the argument concerning the inspiration of the scripture, the learned Du Pin alleges the testimony of the Jews, the authority of our Saviour and his apostles, and the universal consent of the christian church.

1. It cannot be in the least doubted, but that the ancient Jews were thoroughly persuaded that the books in their canon were written by prophets divinely inspired; they looked upon the law of Moses as the law of God himself, and on the pentateuch as the foundation of their religion; they had even the evidence of their lefles, that Moses was sent by God, that he conversed familiarly with him, and was afflicted by him in an extraordinary manner; witnesses the many miracles which God wrought by him, and his divine providence and protection being vouchsafed to him in an unusual manner; so that, upon the whole, they had all imaginable evidence that the laws and historical narrations of Moses were all of them penned by inspiration from heaven. As to the other canonical books collected by Ezra, it cannot be questioned, with any colour of reason, but that Ezra, in drawing up his canon and sacred books, made choice of those which had the character of divinely inspired.

INSPICENDO VENTRE, book.
INSPIRED WRITINGS, and had been always acknowledged as such by the universal consent of the Jewish nation; and the synagogue looked upon this canonical system as prophetic and divinely inspired. See CANON AND BIBLE.

2. From the unexceptionable testimony of the Jews, M. Du Pin proceeds to allege the authority of our Saviour and his apostles. It is upon the evidence of these books that our Saviour proves himself to be the Messiah, and by them that he confutes the Jews. The apostles followed their master's doctrine in this as well as in all other things: these books they made use of to authorise the gospel they preached, and to prove that the prophecies concerning the Messiah were fulfilled in the person of Jesus Christ.

3. From these authorities he proceeds to the testimony of the primitive church: those who were instructed by our Saviour and his apostles, had not only the same regard for the books of the Old Testament as the Jews themselves had, but likewise by universal consent received the gospels and epistles of the apostles as writings penned by the inspiration of the holy ghost. The primitive Christians being fully persuaded of this truth, received the apostles' doctrine with entire submission, and looked upon it as no other than the instruction of Jesus Christ and of God himself. See the article CHRISTIAN RELIGION.

INSPISSATING, in pharmacy, an operation whereby a liquor is brought to a thicker consistence, by evaporating the thicker parts. See INCRASSATING.

INSPRUCK, a city of Germany, in the circle of Austria, capital of the county of Tyrol, situated on the river Inn, in east long. 11° 26', north lat. 47° 12'.

INSTALLMENT, the initiating or establishing a person in some dignity. This word is chiefly used for the induction of a dean, prebendary, or other ecclesiastical dignity, into the possession of his stall, or other proper seat in the cathedral to which he belongs. It is also used for the ceremony whereby the knights of the garter are placed in their rank in the chapel of St. George at Windsor, and on many other like occasions. It is sometimes termed installment. See GARIER.

INSTANT, such a part of duration wherein we perceive no succession; or it is that which takes up the time only of one idea in our minds.

The schoolmen distinguish three kinds of infants; a temporary, a natural, and a rational infant.

Temporary infant is a part of time immediately preceding another; thus the last infant of a day precedes, immediately and really, the first infant of the following day.

Natural infant is what we otherwise call a priority of nature, which obtains in things that are subordinated in acting, as first and second causes, or causes and their effects; for the nature of things requires, that if there be a second cause there must be a first; and that there must be a cause, if there be an effect. See the article CAUSE.

Rational infant is not any real infant, but a point which the understanding conceives to have been before some other infant, founded on the nature of the thing which occasioned it to be conceived: for instance, if God made several things voluntarily, which he could otherwise have let alone, there is a reasonable foundation to conceive God such as he is in himself, before he had made any of these voluntary determinations; but as there was no real infant when God had not formed any determination, this infant is called a rational infant, by way of opposition to an infant of time.

INスタURATION, the re-establishment or restauration of a religion, a church, or the like, to its former state.

INSTEP, in the manage, is that part of a horse's hind leg which reaches from the ham to the pattern-joint; and which, when the horse is in his natural posture of standing, should be large, flat, and in a perpendicular line with the ground: for when the insteps do not stand perpendicularly, it is a certain sign of weakness either in the reins or hinder quarters.

INSTINCT, an appellation given to the sagacity and natural inclinations of brutes, which supplies the place of reason in mankind. See REASON AND BRUTE.

INSTITUTES, in literary history, a book containing the elements of the roman law, and constitutes the last part of the civil-law. See CIVIL-LAW.

The institutes are divided into four books, and contain an abridgment of the whole body of the civil-law; being designed for the use of students.

INSTITUTION, in general, signifies the establishing or founding something. In the canon and common law, it signifies
fies the investing a clerk with the spiritualities of a rectory, &c. which is done by the bishop, who utfs the formula, "I institute you rector of such a church, "with sure of souls, and receive your "care and mine." This makes him a complete parson as to spirituality, but not as to temporality, which depends on induction. See the article INDUCTION.

The term institutions is also used, in a literary sense, for a book containing the maxims of medicine, institutions of rhetoric, &c.

INSTRUCTIVE COLUMN, in architecture. See the article COLUMN.

INSTRUMENT, in general, whatever is subvenient to a cause in producing any effect. See CAUSE and EFFECT.

A common case of mathematical instruments contains several compasses, a sector, scale, drawing-pen, and protractor. See the articles COMPASSES, SECTOR, SCALE, &c.

A case of pocket instruments for surgeons, which they ought always to carry about with them, contains lancets of different sizes; scissors, fit for several uses; forceps, plain and furnished with teeth; incision-knives, straight and crooked; a spatula, probes, needles, &c. See the articles LANCET, SCISSARS, FORCEPS, &c.

The following instruments used by surgeons, pay on their importation according to these rates. Trepanns, the dozen pay 1s. 11½ d. and draw back on exportation, is. 8½ d. Bullet-skrews, the dozen, pay 9½ d. and draw back 8½ d. Incision-shears, paices, or tooth-drawers and pliculanes, the dozen pay 11½ d. and draw back 10½ d. Sets, the bundle, containing sixteen, pay 4½ d. and draw back 4½ d. More if made of iron, for every 112 pounds, 4 s. 8½ d. and draw back 4 s. 8½ d. if made of steel, the 112 pounds pay 5 s. 1½ d. the whole of which is returned on exportation: but if they are made of silver, they are to pay as plate. See PLATE.

INSTRUMENT, in law, some public act, or authentic deed, by which any truth is made apparent, or any right or title established in a court of justice. See DEED.

INSTRUMENTS, in music, are either played on by means of wind, as the organ, violin, &c. See the articles ORGAN, FLUTE, HARPSCORD, &c.

INSULATED, insulatus, in architecture, an appellation given to such columns as stand alone, or free from any contiguous wall, &c. like an island in the sea; whence the name. See COLUMN.

INSULT, infultus, in medicine, signifies the accession of the paroxysm of intermittent diseases. See the articles INTERMITTING and PAROXYSM.

INSULT, in the art of war, the same with assault. See the article Assault.

INSUPER, over and above, a term used by the auditors of the exchequer in their accounts; thus, where a certain sum is charged to a person's account, they say, so much remains, insuper, to the accountant.

INSURANCE, or Assurance, in law and commerce, a contract or agreement whereby one or more persons, called insurers, affurers, &c. oblige themselves to answer for the loss of a ship, house, goods, &c. in consideration of a premium paid by the proprietors of the things insured.

Insurances are of various kinds, as on ships or parts of ships, on merchandise singly, and on ships and goods jointly; and these are again branched out to run either for a time stipulated, or to one single port, or out and home, with liberty to touch at the different places mentioned in the policy. Insurances may likewise be made on goods sent by land, or by boats, &c. on rivers; and this is frequently done, more especially on jewels, and other things of great value. They may likewise be made on ships and goods, lost or not lost, which is commonly done when a ship has been long missing; and those words being inserted in the policy, oblige the under-writers to pay, though the ship was lost at the time of making such insurance, except the assured had then certain knowledge of the ship's being wrecked; in which case the subscription shall not oblige, as this is accounted a mere fraud. So likewise if a person get more insured than the ship is worth, with a villainous design to destroy her, this fraudulent act will not oblige the insurers, but expose the proprietors to suffer death for their knavery. If a ship is insured from the port of London to any foreign port, and before the break ground is burnt, the insurers are not liable; unless the words of the insuranc...
urance are, at and from the port of London; but if she has once broke ground, and after being driven back, takes fire, the insurers are answerable. An insurance made on prohibited goods is not binding, unless they were not prohibited till after the insurance was made. Where the policy expressly mentions that the ship is to depart with convoy, it is intended that she shall, if possible, keep with the convoy during the voyage, and if she depart wilfully from the convoy, it is a fraud; but if having departed with convoy, she by fires or weather loses the convoy, and is taken, the insurers are liable. If there be thieves on board among themselves, the matter of the ship is to answer for that, and not the insurers; for tho' the words of the policy inure against loll's by thieves, yet assailing thieves are only here intended. An insurance made in a foreign country, may be fued in England by the common law, if the insurers come here. Where the policy is against restraint of princes, that does not extend to a navigation carried on against the law of nations, or where there shall be a seizure for not paying of customs, or the like. If goods be injured as the goods of an ally, when they are the goods of an enemy, it is a fraud, and the insurance not good. If a man pays money on a policy of insurance, supposing a loss where there was none, this shall be money received for the use of the insurer, for which he may maintain an action. Damages happening to goods in their own nature perishable, are not to be borne by the insurer. A suppression of the truth, or a false allegation, is insufficient to discharge the policy; for it is a general rule, that the injured ought to inform the insurer of all material circumstances that were come to his knowledge, at the time of making the policy, in order that the contract may be fairly adjusted; which being a contract upon chance, cannot be done, if one party knows more than the other; for equality in contracts, by the law-merchant, is essential; but a proof of an intention to make a deviation, will not avoid the policy before the deviation is actually made.

By an act made in 19 Geo. II. it is determined, that after the first day of August, 1746, no assurance shall be made on ships or lading by way of gaming or wagering, or without benefit of salvage to the insurer: that it shall not be lawful to make re-assurance, unless the assurer shall become insolvent, or become a bankrupt, or die; in which cases such assurer, or his executors, &c. may make re-assurance to the amount of the sum before assured, provided it be expressed in the policy to be a re-assurance. That all sums of money lent on bottomry or at respondentia, upon any ships belonging to his majesty's subjects, bound to or from the East Indies, shall be lent only on the ship or merchandise, laden, or to be laden, on board such ship, and shall be so expressed in the condition of the bond; and the benefit of salvage shall be allowed to the lender, his agents or assigns, who alone shall have a right to make assurance on the money so lent; and no borrower of money on bottomry, &c. shall recover more on any assurance, than the value of his interest in the ship or merchandise, exclusively of the money so borrowed; and in case it shall appear, that the value of his share in the ship or merchandise does not amount to the full sum borrowed, such borrower shall be responsible to the lender for so much of the money borrowed, as he hath not laid out on the ship or merchandise, with lawful interest for the same, together with the insurance and all other charges, to the proportion which the money not laid out shall bear to the whole money lent, notwithstanding the ship and merchandise be totally lost.

Whenever advice is received of the loss of a ship or goods insured, application is to be made to the insurers, and the vouchers produced; and if they are satisfied they will pay the money; but if they have cause to scruple the doing it, the insured must pay till the insurers can obtain a more satisfactory account; but if nothing be heard of the ship in any reasonable time, the insurers will be obliged to pay the money agreed upon. The policies made of insurances are to be stamped within three days after the ship is insured, on the penalty of paying 10l.

The principal offices for the insurances of ships and merchandise in London, are the Royal-exchange assurance, and the London-assurance, both of which are established by act of parliament. These offices also insure houses and other buildings, goods, wares, and merchandise, from loss or damage by fire; and the former of them also assure lives.

The Royal-exchange insurance, on a
brick or stone building, insures any sum not exceeding 200l. at 5s. per annum and any larger sum not exceeding 1000l. after the rate of 2s. 6d. per cent. per annum. Above 1000l. and not exceeding 2000l. at 3s. 6d. per cent. Above 2000l. and not exceeding 3000l. at 4s. 6d. per cent. On goods and merchandise, the property of men, tallow-chandlers, oilmen, innholders, &c. deposited in brick houses, pay 8s. per annum for insuring 200l. and after the rate of 4s. per cent. for any greater sum not exceeding 1000l. and 5s. per cent. for all insurances above 1000l. and not exceeding 2000l. On a timber or plaster building with goods and merchandise together, any sum, not exceeding 500l. may be insured for 12s. per annum, and larger sums at the above rates. The goods belonging to hazardous trades, as distillers, chemists, apothecaries, colourmen, tallow-chandlers, oilmen, innholders, &c. deposited in brick houses, pay 8s. per annum for insuring 200l. and after the rate of 4s. per cent. for any greater sum not exceeding 1000l. and above 1000l. and not exceeding 2000l. 5s. per cent. but when the houses and goods are put together, the price of insurance is 4s. per cent. per annum without any other charge except the policies.

The London insurance has the following annual premiums.

<table>

The friendly society insurance, has some very extraordinary regulations, the principal of which is, that every one of the assured becomes a member of the society; and when any loss happens, contributes in proportion to the sum he has insured, to make good the damage; on which account he pays only 1s. 4d. per cent. per annum premium, and 6s. 8d. per cent. as a caution; but what is unexpended of the 6s. 8d. is returned to the party insured at the end of seven years. We have also insurances for lives, in virtue of which, when the person insured dies, a sum of money becomes payable to the person on whose behalf the policy of insurance was granted. The principal insurance office of this kind, is that of the amicable society for a perpetual assurance, kept in Serjeant's inn, Fleet-street, London. In this office, after paying the charges of the policy, and 10s. entrance-money, each person pays 5l. per annum, by quarterly payments, and from these payments, the dividends, which usually amount to 100l. and upwards, are to arise. All persons admitted are to be between the ages of twelve and forty-five, and in a good state of health. Any person is allowed to have two or three insurances or numbers on the same life, whereby such person will be intitled to a claim on each number so insured; and every claimant is empowered to put in a new life, in the room of one deceased, within twelve calendar months next after the end of the current year. By becoming
members of this society, clergymen, physicians, lawyers, tradesmen, and all whole income ceases at the time of their death, may, in all probability, leave to their families a claim of not less than 100l. for every 5l. annually paid in.

The value of insurances upon lives, depends upon the probability of the continuance of any proposed life or lives, during any proposed term. Any questions of this kind may be determined from Dr. Halley’s table, and from the principles of the Doctrine of Chances. But, as far as we can learn of the practice on such occasions, the premiums paid to insurers are generally higher than any computation founded on observations concerning the probabilities of human life, will warrant. Thus it is not usual to make a person pay 5 per cent. for the insurance of his life for a twelvemonth, that is, in case the person dies within the year, the insurer is to pay 100l. for every 5l. received. Now it appears from Dr. Halley’s table, which estimates the probability of life low enough, that 5 per cent. is an adequate value only for a life of an advanced age, such as sixty-four. See the article Life.

INTACTÆ, in conics, an appellation sometimes given to the asymptotes. See the article Asymptotes.

INTAGLIOS, precious stones on which are engraved the heads of great men, inscriptions, and the like; such as we frequently see set in rings, seals, &c.

INTAKERS, a sort of robbers in the north of England, who formerly received the booty which their confederates the out partners, brought from the borders of Scotland.

INTEGRÆ, in arithmetic, a whole number, in contradistinction to a fraction. See Number and Fraction.

INTEGRAL, or INTEGRANT, in philosophy, appellations given to parts of bodies which are of a similar nature with the whole: thus filings of iron have the same nature and properties as bars of iron. Bodies may be reduced into their integrant parts by triture or grinding, limation or filing, solution, amalgamation, &c. See Grinding, &c.

INTENDMENT, in law, is the intention, design, or true meaning of a person or thing, which frequently supposes what is not fully expressed: but the intention of parties in deeds and contracts is much regarded by the law, yet it cannot take place against the rules of law.

INTENTION of crimes; this, in case of treason, where the intention is proved by circumstances, is punishable in the same manner as if it was put in execution. So if a person enter a house in the night-time, with an intent to commit burglary, it is felony; also an assault, with an intent to commit a robbery on the highway, is made felony, and punished with transportation. 7 Geo. II. c. 21.

INTERCALARY, intercalaris, in chronology, an appellation given to the odd day inserted in leap-year; which was so called from ida, calare, to proclaim, it being proclaimed by the priests with a loud voice. See the articles Bisextile and Leap-year.

INTERCEPTED AXIS, in conic sections, the same with abscissa. See Abscis.

INTERCESSION, in roman antiquity, the act of a tribune of the people, or other magistrate, whereby he inhibited the act of another magistrate. The tribunes had an unlimited power to intercede or control the acts of every other magistrate, who could only inhibit the acts of inferior magistrates. See the article Tribune.

INTERCOLUMNIATION, in architecture, denotes the space between two columns, which is always to be proportioned to the height and bulk of the columns.

Some authors have laid down the following proportions for the intercolumniations, at a medium, viz. in the tuscian order, it must be equal to four diameters of the column below; in the doric, to three; in the ionic, to two; in the cassinian, to two and a quarter; and in the composite, to one and an half.

INTERCOMMONING, in law, is when the commons of two manors lie together, and the inhabitants of both have, time out of mind, caused their cattle to feed promiscuously on them.

INTERCOSTAL, in anatomy, an appellation given to such muscles, nerves, arteries and veins as lie between the ribs. See the article Rib.

The intercostal muscles are thin flabby plates, two between each pair of ribs, one external and the other internal. The intercostal nerves are branches of the fifth and sixth pair; the intercostal arteries are branches of the two subclavians; and the...
INTERDICT. an ecclesiastical censure, by which the church of Rome forbids the performance of divine service in a kingdom, province, town, &c. This censure has been frequently executed in France, Italy and Germany; and in the year 1170, pope Alexander III. put all England under an interdict, forbidding the clergy to perform any part of divine service, except baptizing of infants, taking confessions, and giving absolution to dying penitents. But this censure being liable to the ill consequences of promoting libertinism and a neglect of religion, the succeeding popes have very seldom made use of it.

There was also an interdict of persons, who were deprived of the benefit of attending on divine service. Particular persons were also antiently interdicted of fire and water, which signified a banishment for some particular offence: by this censure no person was allowed to receive them, or allow them fire or water; and being thus wholly deprived of the two necessary elements of life, they were doubtless under a kind of civil death.

INTEREST, is the premium or money paid for the loan or use of money; and is distinguished into two kinds, simple and compound.

Simple interest is that which is paid for the principal, or sum lent, at a certain rate or allowance made by law, or agreement of parties, whereby so much as 5l. or 6l. or any other sum, is paid for 100l. lent out for one year, and more or less proportionally for greater or leser sums, and for more or less time. For example, if it is 5l. to 100l. for one year, it is 5l. 10s. for half a year, and 10l. for two years: also 10l. for one year of 200l. and 5l. for half a year; and so on, for other sums and times. Thus, as the law, or agreement of parties, fixes a certain ratio, or, as we call it, rate of interest, which is so much on the 100l. for one year; from this we can easily find the proportional interest on 1l. for one year, being plainly the part of the interest of 100l. so if this is 5l. that is .05l. if this is 6l. that is .06l. and this is 5l. 10s. or 6l. that is .053l. Wherefore, if we understand the rate of interest to be the interest of 1l. for one year, the more common questions about simple interest will relate to these four things, viz. any principal sum, its interest, the time in which it gives that interest, and the rate, or interest of 1l. for one year, according to which that principal, interest and time are adjusted to one another.

From which we have four problems; in the rules whereof we suppose the principal and interest expressed in the denomination of pounds, by reducing what is less than 1l. to a decimal of 1l. and the time to be expressed in years, and decimal parts of one year.

Prob. I. Having any principal sum, and time, with the rates of interest given, to find the interest of that sum for that time and rate.

Rule: Multiply the principal rate and time continually into one another, the product is the interest sought.

Observe, if we express the principal by p, the interest by r, the time by t, and the rate by r, then this rule is thus represented, n = pir.

Example: The rate of interest being .05l. what is the interest of 85l. for 4 years and 3 quarters, or 4.75 years

Answer. 20l. 35l. 9d. = 20.1875l. = 85 x 4.75 x .05.

Which is thus performed:

<table>
<thead>
<tr>
<th>p</th>
<th>85</th>

</tbody>
</table>

Prob. II. Having the rate, principal and interest, to find the time.

Rule: Divide the interest by the product of the rate and principal, the quote is the time: thus, t = r.

Example: The rate .05l. principal 85l. interest 20l. 35l. 9d. or 20.1875l. the time is 4.75 years, or 4 3/4 years.

Thus, 4.75 = 20.1875 or 20.1875 / 85 x .05 = 4.75

Demonstration:
Demonstration: This rule is deduced from the former; thus, since \( n = trp \), then dividing both sides by \( rp \), it is \( \frac{n}{r} = t \).

Prob. III. Having the principal, interest, and time, to find the rate.
Rule: Divide the interest by the product of principal and time, the quote is the rate: thus, \( \frac{n}{tr} = r \).

Example: \( n = 20.1875 \), \( t = 4.75 \) years, \( p = 8.5 \). Then \( r = \frac{20.1875}{4.75 	imes 0.5} = 0.05 \) = \( 0.05 \) years.

Demonstration: Since \( n = trp \), divide both sides by \( tp \); it is \( \frac{n}{tp} = r \).

Prob. IV. Having the rate, time and interest, to find the principal.
Rule: Divide the interest by the product of rate and time, the quote is the principal; thus, \( \frac{n}{tr} = p \).

Example: \( n = 20.1875 \), \( t = 4.75 \) years, \( r = 0.05 \). Then \( p = \frac{20.1875}{4.75 \times 0.05} = 2.0875 \).

Demonstration: Since \( n = trp \), divide both sides by \( tr \), the quote is \( \frac{n}{tr} = p \).

Scholium: If the interest of any sum for any time is added to the principal, this total or sum is called the amount, (viz. of the principal and its interest for that time.) And then from these four things, viz. the amount, which we call \( a \), the principal, the time and rate, arise four problems; for having any three of these the fourth may always be found. Thus,

Prob. V. Having the principal, time and rate, to find the amount.
Rule: Find the interest by prob. I. add it to the principal, the sum is the amount. Thus, by prob. I. the interest is \( pt \); therefore the amount is \( a = pt + p \). The reason is evident.

Note: Because \( p = t \times p \), and \( p = t \times p \); therefore \( trp + p = rt + 1 \times p = a \).

And so the rule may be expressed thus: to the product of the rate and time add unity, and multiply the sum by the principal, the product is the amount.

Example: What is the amount of \( 2.46 \) principal in \( 2 \) years and \( \frac{1}{2} \), or \( 2.5 \) years, the rate of interest being \( .05 \)? Answer \( 2.46 + 30.75 = 276.75 \). For the interest is \( 246 \times .05 \times 2.5 = 30.75 \). Or thus, \( .05 \times 2.5 = .125 \), to which add \( 1 \), it is \( 1 + .125 \), which multiplied by \( 2.5 \), produces \( 276.75 \).

Prob. VI. Given the principal, amount and time, to find the rate.
Rule: Take the difference between the principal and amount, and divide it by the product of the time and principal, the quote is the rate; thus, \( \frac{a - p}{tp} = r \).

Example: Suppose \( a = 276.75 \), \( p = 246 \), \( t = 2.5 \) years; then \( r = \frac{276.75 - 246}{2.5 \times 0.5} = 51 \).

Demonstration: Since by prob. V. \( a = trp + p \), take \( p \) from both sides, it is \( a - p = trp \); then divide both by \( tp \), it is \( \frac{a - p}{tp} = r \).

Prob. VII. Given the amount, principal and rate, to find the time.
Rule: Take the difference of the amount and principal, and divide it by the product of the principal and rate, the quote is the time; thus \( t = \frac{a - p}{rp} \).

Example: Suppose \( a = 276.75 \), \( p = 246 \), \( r = .05 \). Then \( t = 2.5 \) years, \( 276.75 - 246 = 30.75 \).

Dividing by \( .05 \), \( \frac{246 \times .05}{2.5} = 30.75 \).

Demonstration: In the last problem, \( a - p \) was equal to \( trp \); and dividing both by \( rp \), it is \( \frac{a - p}{rp} = t \).

Prob. VIII. Given the amount, rate, and time, to find the principal.
Rule: Add \( 1 \) to the product of the rate and time, and by that sum divide the amount, the quote is the principal; thus,

\( p = \frac{a}{rt + 1} \).

Example: \( a = 276.75 \), \( r = .05 \), \( t = 2.5 \) years; then \( p = \frac{246}{2.5 \times .05 + 1} = .125 \).

Demonstration: By prob. V. it is \( a = \frac{r + 1 \times p}{rt + 1} \); therefore dividing both sides by \( rt + 1 \), it is \( \frac{a}{rt + 1} = p \).

Compound Interest is that which is paid for any principal sum, and the simple interest due upon it for any time, accumulated into one principal sum. Example:
In what time will $256.1.10s.$ amount to in 7 years, at 5 per cent. per annum, compound interest?

Here is given $p = 256.5$, $t = 7$, and $R = 1.05$, which being involved until its index $= t$ (viz. 7) will become $R' = 1.40710$. Then $1.40710 \times 256.5 = 360.92115 = a = 360.185.5d.$, which is the answer required.

Example II. What principal or sum of money must be put out to raise a flock of 360.1.185.5d. in seven years, at 5 per cent. per annum, compound interest?

Here is given $a = 360.92115$, $R = 1.05$ and $t = 7$ to find $p$ by theorem II. Thus $R' = 1.40710$ (360.92115 = a) 256.5 = $p$. That is, $p = 256.1.10s.$ which is the sum or principal required.

Example III. In what time will 256.1.10s. raise a flock of (or amount to) 360.1.185.5d. allowing 5 per cent. per annum, compound interest?

Here is given $p = 256.5$, $a = 360.92115$, $R = 1.05$. To find $t$ by theorem III.

$R' = \frac{a - 360.92115}{1.40710}$, which being continually divided by $R = 1.05$ until nothing remain, the number of those divisions will be $t = 7$.

Thus $1.05 \times 1.40710 (1.3490, and 1.05) (1.3400), 1.2762, and 1.05 (1.2762), 1.155$, and so on until it become 1.05 (1. which will be at the seventeenth division.

Therefore it will be $t = 7$, the number of years required by the question.

Example IV. If 256.1.10s. will amount to, or raise a flock of 360.1.185.5d. in 7 years time, what must the rate of interest be, per cent. per annum?

Here is given $p = 256.5$, $a = 360.92115$, and $t = 7$; query $R$. By theorem III.

$R' = 1.40710$; as before in the last example. And if $R' = R - 1.40710$, then $R = 7 \sqrt{1.40710}$, which may be thus extracted.
INTEREST, in law, is generally taken for INTERECTION, in
INTERIM, bare interest:

\[
\begin{align*}
1 & \quad r + e = R, \\
2 & \quad r^2 + 7r^6 e + 21r^4 e, \quad & \text{or} & \quad R^2 = 1.40710 = G \\
3 & \quad 7r^6 e + 21r^4 e, \quad & \text{or} & \quad G - r^7 \\
3 & \quad 7r^6 e + 21r^4 e, \quad & \text{or} & \quad G - r^7 \\
4 & \quad re + 3e = G - r^7 \quad & \text{or} & \quad 7r^5 = D \\
4 & \quad re + 3e = G - r^7 \quad & \text{or} & \quad 7r^5 = D \\
5 & \quad e = \frac{D}{r^4 + 3e}
\end{align*}
\]
Let \( r = 1 \), then \( D = 0.0575 \).

Operation.

\[
\begin{align*}
r & = 1.007 \quad 0.0575(0.05) \\
+ e & = 0.055 \quad 1.05 = \text{R}.
\end{align*}
\]

Then \( 1.05 : 100 : 1.5 \) the rate per cent. required.

INTEREST, in law, is generally taken for a chattel real, or a lease for years, &c. but more for a future term.

An estate in lands, &c. is better than a bare interest therein; yet, according to the legal sense of the word, an interest extends to estates and titles which a person has in or out of lands, &c. for by grant of a person's whole interest in land, a revocion, as well as possession, in simple fee, paffes.

INTERJECTION, in grammar, an indeclinable part of speech, signifying some passion or emotion of the mind.

As the greatest part of the expressions used on these occasions are taken from nature alone, the real interjections, in most languages, are monosyllables; and as all nations agree in these natural passions, so do they agree in the signs and indications of them, as of love, mirth, &c.

The greeks confound their interjections with adverbs, and the hebrews confound them with their adverbs and prepositions, calling them all by the general name particle.

INTERIM, a name given to a formulary, or kind of confection of the articles of faith, obtruded upon the protestants after Luther's death by the emperor Charles V. when he had defeated their forces; so called because it was only to take place in the interim (mean time) till a general council should have decided all points in dispute between the protestants and the romanists. It retained most of the doctrines and ceremonies of the romanists, excepting that of marriage, which was allowed to priests, and communion to the laity under both kinds. Most of the protestants rejected it. There were two other interims, one of Leipsic, the other of Franconia.

INTERLOCUTORY ORDER, in law, an order that does not decide the cause, but only some matter incident thereto, which happens between the beginning and end of a cause; as when, in chancery or exchequer, the plaintiff obtains an order for an injunction until the hearing of the cause; which order, not being final, is called interlocutory.

INTERLOPERS, are properly those who, without due authority, hinder the trade of a company or corporation lawfully established, by dealing in the same way.

INTERLUDE, an entertainment exhibited on the theatre between the acts of a play, to amuse the spectators while the actors take breath and shift their dress, or to give time of changing the scenes and decorations.

In the antient tragedy, the chorus sung the interludes, to shew the intervals between the acts. In after times, they made use of the pantomimes to relieve the audience, that they might not grow weary of the play; a practice which can never be mentioned to their honour: for it is certain evidence of a bad taste, when the audience cannot bear to fit out a dramatic entertainment, without being relieved by such low diversions. But we have not the least reason to wonder at this, who have seen, in our own time and nation, rope and ladder-dancers, and other notable artists of this clafs, not only admitted upon the stage, but received there with the utmost applause. Interludes now are generally songs, dances, or concerts of music. Ariosto and Horace give it for a rule, that interludes should consist of songs founded on the principal parts of the drama.

INTERLUNIUS MORBUS, the same with the epilepsy. See EPILEPSY.

INTERMEDIATE, is usually understood of the space of time elapsed from any certain point to any other.

INTERMEWING, in falconry, is a hawk's mewing, from the first change of her coat, till the turn white.

INTERMITTENT, or INTERMITTING FEVERS, such fevers as go off and soon return again, in opposition to those which
which are continual. See the article FEVER.

These fevers are distinguished into various classes, according to the interval of time between the relapse into them, as tertian fever, quartan fever, &c. See the articles TERTIAN, QUARTAN, &c.

It may be observed, that intermittents in general are either vernal, and rage from February till August; or autumnal, and rage from August to February. Fevers of this kind begin with an agitation, pandiculation, weariness, weakness, cold, swelling, &c. between the relapse into them, as tertian fever, quartan fever, &c.

February is the acute and dangerous kind, which is generally owing to an excessive heat. This is the stage, in which there generally appears a sudden anxiety, a large sweat, a remission of all the symptoms, a thick urine, with a large and free motion of the fluids. The cure requires that we observe, that an intermitting fever, says Dr. Mead, is not carried off by the peruvian bark with a proper degree of certainty, without promising a vomit, or a purge, or both, is not unknown to physicians; but to join some mild cathartic to this remedy will perhaps appear new in practice. For it is commonly thought among us, that this medicine has little or no effect, unless the patient be colive while he takes it; but long experience has taught me, continues the doctor, that it is quite necessary to add a small quantity of rhubarb to this febrifuge, so as to procure two flats at least every day; nor have I ever observed that this procedure has lessened its virtue, but rather rendered it more efficacious.

However, the doctor observes, that it sometimes happens that this febrifuge fails in true intermittents, which failure he ascribes generally to a bad habit of body, in which case the physician should use his best endeavours to discover in what part the fault lies; and it will be commonly found to be in the viscera and glands of the abdomen. Upon this account, he thinks it necessary to prescribe some purges, and sometimes vomits; and in the intermediate days, deobstruents and stomachics; the best of which are aromatic bitters, and preparations of steel.

INTERNAL, in general, signifies whatever is within a thing.

Euclid (lib. r. prop. 32.) proves, that the sum of the three angles of every triangle is equal to two right angles; whence he deduces several useful corollaries. See the article TRIANGLE.

He likewise deduces, from the same proposition, this theorem, viz. that the sum of the angles of every rectilinear figure, is equal to twice as many right angles, as the figure hath sides, excepting or subtracting four.

INTERNODIUM, among botanists, denotes the space between two knots or joints of the stalks of barley, oats, and the like plants.

INTEROSSEUS, in anatomy, an appellation given to the muscles which move the fingers and toes, from being situated between the bones of those parts. See the articles MUSCLE, FLEXOR, &c.
INTERPOLATION, among critics, denotes a spurious passage, insinuated into the writings of some ancient author.

One great rule with regard to the expunging interpolations, is, that the restitution be perfectly agreeable to the rest of the work.

INTERPRETER, in general, denotes a person who explains the words or writings of another, so as to make them intelligible to those who did not understand them before.

INTERREGNUM, the time during which the throne is vacant, in elective kingdoms; for in such as are hereditary, like ours, there is no such thing as an interregnum.

INTERREX, the magistrate who governs during an interregnum.

In ancient Rome, this magistrate was continued even after the expulsion of their kings.

INTERMENT, the act of burying the dead. See the article Burial.

INTERROGATION, or point of Interrogation, in grammar, a character of this form (?) serving to denote a question.

INTERROGATION, in rhetoric, is a figure, whereby the orator proposes something by way of question; which, if it must be owned, greatly enlivens the discourse.

INTERROGATORIES, in law, are questions written down, and demanded of the witnesses examined in a cause, more especially in the courts of chancery. These interrogatories must relate only to the necessary point, and be either drawn up or perused, and also signed by counsel; but care must be taken that they are not calculated to lead a person in what he has to say, by putting words as it were into his mouth, as, did you not see such a thing done? the depositions taken upon such interrogatories will be suppressed; for they ought not to lean to one side more than another, and therefore should be expressed after this manner, did you see or not see? The examiners, and also the commissioners who examine the witnesses produced on interrogatories, must examine only one interrogatory at a time, and not ask any idle questions, or let down impertinent answers.

INTERRUPTION, in matters of proportion, signifies the same with disjunction, or disjunct proportion. See the article Discrete.

Interruption is noted thus, (:) and intimates the breaking off the ratio in the middle of four disjunct or discrete proportions; as, A: B: C: D, that is as A is to B, so is C to D. See the articles Proportion, Ratio, &c.

INTERRUPTION is likewise a figure in rhetoric, wherein a person, to shew his passion, breaks off his discourse suddenly and abruptly.

INTERSECTION, in the mathematics, signifies the cutting of one line or plane by another: thus, we say, that the mutual intersection of two planes is a right line. See Line and Plane.

INTERSIDING, in husbandry, is laying one kind of soil or mould upon another, as clay on sand, sand on earth, &c.

INTERSPINALES colli, in anatomy, small fleshly muscles of the neck, arising from the superior parts of each double spinal process of the neck, except of the second vertebra; and inserted into the inferior parts of all the double spines. When these muscles act, they draw the spines of the vertebrae of the neck nearer each other.

INTERSTELLAR, a word used by some authors to express those parts of the universe that are without and beyond our solar system.

In the interstellar regions are supposed to be several other planetary systems moving round each fixed star as the center of their motion, as the sun is that of ours. And if it be true, as is not improbable, that each fixed star may be thus a sun to some habitable orbs that may move round it, the interstellar world will be infinitely the greater part of the universe.

INTERSTICES, in architecture, those small pieces of timber that lie horizontally between the formers, or between them and the fell, or riven.

INTERTRANSVERSALES colli, in anatomy, certain muscles situated among the transverse apophyses of the vertebrae: they arise from the lower vertebra, and are inserted into that next above: they are of the same size and figure with the intertransversales.

INTERVAL, in music, the difference between two sounds, in respect of acute and grave; or, that imaginary space terminated by two sounds, differing in accentus or gravity.

When two or more sounds are compared in this relation, they are either equal or unequal in the degree of time: such as are equal are called unifons, with regard to each other, as having one tune; the other, being at a distance from each other, constitute what we call an interval in music.
Music; which is properly the distance in
time between two sounds.
Intervals are distinguished into simple
and compound.
A simple interval, is without parts or
divisions. Such are the octave, and all
that are within it; as the second, third,
fourth, fifth, sixth, and seventh, with
their varieties.
A compound interval, consists of several
less intervals; such are all those greater
than the octave; as the ninth, tenth,
eleventh, twelfth &c. with their varieties.

<table>
<thead>
<tr>
<th>Table of intervals, simple and compound.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intervals</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>Simple</td>
</tr>
<tr>
<td>Double</td>
</tr>
<tr>
<td>Triple</td>
</tr>
<tr>
<td>Quadruple</td>
</tr>
</tbody>
</table>

Those in the upper line are the simple
intervals, the other three the compound
ones, i.e. such as are either doubled,
tripled, or quadrupled.

To reduce a compound interval to a
simple one, Mr. Brofard gives this rule:
From the denominator thereof take feven,
and what remains is the simple inter-
val; as from a thirteenth take six, there
remains six, which fews the thirteenth to be the sixtieth doubled; again,
from twenty-six take fifteen three times,
which are twenty-one, and five remaines;
therefore, fays he, the twenty-sixtith ap-
ppears to be the fifth quadrupled.

But this distinction, into simple and com-
 pound, regards practice only, because
there is really no such thing as a leaf
interval. Besides by a simple interval
here, is not meant the leaf practised, but
such as tho' it were equal to two or more
lefter, which are in use; yet, when we
would make a found move fo far up and
down, we always pa" immediately from
one of its terms to the other.

What is meant then by a compound in-
terval, will be very plain; it is such whole
terms are in practice, taken either in im-
mediate succession, or such where the
found is made to rife and fall from the
one to the other, by touching some inter-
mediate degrees; fo that the whole be-
comes a composition of all the intervals
from one extreme to the other.

What we now call a simple interval, the
antients called diatem; and our com-
 pound one, they called system. Each of
these has differences; even of the simple,
there are some greater and some lefter,
but they are always discord; but of the
compound or system, some are concord,
and others discord. Unions, 'tis plain,
cannot possibly have any variety; for
when there is no difference, as in unifo-
mance, which flows from a relation of
of equality, 'tis evident there can be no
distinction: unions therefore are often
called concords, (tho' they may not pro-
perly be fo called). But an interval de-
pending on a difference of time, or a
relation of inequality, admits of variety;
and fo the terms of every interval, ac-
cording to their particular relation or
difference, make either concord or dis-
cord. Some indeed have restrained the
word concord to interval, making it in-
clude a difference of time: But this is
precautious; for as the word concord signifies
an agreement of sounds, it is certainly
applicable to unions in the first degree.

Intervals, 'tis plain, may differ in magni-
tude, and there may be an infinite variety,
according to the possible degrees of tune;
for there is no difference fo great or fo
little, but a greater or leffer may possibly
be conceived: 'tis true, with regard to
practice, there are limits which are the
greatest and leaf intervals our ears can
judge of, and which may actually be pro-
duced by voice or instrument.

The degrees of tune are proportionable
to the number of vibrations of the ho-
norous body, in a given time; or the
velocity of their courses and recources.
Now these differences in tune constitute,
as has been already said, the intervals in
music; these therefore must be greater or
leffer, as the differences are; and 'tis the
quantity of these, which is the subject of
the mathematical part of music.

There intervals are measured, not in the
simple differences or arithmetical ratios
of the numbers expressing their vibrations
or lengths; but in their geometric ratios,
and vice versa: it is however to be ob-
served, that in comparing the equality
of the intervals, the ratios expressing
them, must be all of one species, other-
wise
While this absurdity would follow, that the same sounds may make different intervals. To determine in general, which of two or more intervals is the greatest, take all the ratios as proper fractions, and the least fraction will be the greatest interval.

The antients were extremely divided about the measuring of intervals. Pythagoras and his followers measured them by the ratios of numbers. They supposed the differences of gravity and acuteness to depend on the different velocities of the motions that cause found; and thought therefore, that they could only be accurately measured by the ratios of those velocities; which ratios were first investigated by Pythagoras, on occasion of his passing by a smith's shop, and observing a concord between the sounds of the hammers striking on the anvil. Aristozenus opposed this: he thought reason and mathematics had nothing to do in the cafe, and that sense was the only judge in the dispute; the other being too subtle, to be of any use. He therefore determined the fifth, found out the tone, which he settled as an interval by various additions and subfractions, made of those mentioned one with another. Ptolemy keeps a middle way between the two; he finds fault with one for despising reason, and with the other for excluding sense; and shews how these two might mutually assist each other in this matter. Aristozenus says, there are two principal differences in intervals; the first is that of magnitude, and the other as being concord and discord; for, says he, every concord differs in magnitude from every discord; which may be interpreted, that every interval is of a different compass or extent from another. As concords and discords, intervals have many differences; but of those, magnitude is the principal. But Euclid reckons five differences of intervals, first in magnitude; second, in kind; third, in being either concord or discord; fourth, in being simple or compounded; and lastly, rational or irrational. First then, intervals differ in magnitude, in which respect some are called minor, such as dionysus, diatessaron, and diapason. In the genus or kind, intervals differ, as being either diatonic, chromatic, or enharmonic, i.e., divided as each of these require. As concords and discords they differ; the concords are diatessaron, diapente, diapason, and the like; and all intervals less than a fourth or diatessaron, are dissonant, as well as those situated between the concords. And lastly, they differ as to rational and irrational: rational intervals are such as we can distinguish by numbers, as the tone, hemitomion, ditonion, tritone, &c. The irrational are such whole magnitudes vary in an irrational manner; i.e., so that we cannot find a certain proportion between their two extremes in numbers.

But in the modern system of music, intervals are founded on certain ratios or proportions expressible in numbers, which may all be analyzed into the prime numbers 2, 3, and 5. And all intervals may be found from the octave, fifth, and third major, which respectively correspond to those numbers. These are the musician's elements, from the various combinations of which, all the agreeable variety of relations of sounds result. And Dr. Pepusch, in the Phil. Trans. n° 481, affirms us, it may be looked on as the standard of truth; and that every interval that occurs in music is good or bad, as it approaches to, or deviates from what it ought to be on these principles. Mr. Euler, in his Nov. Theor. Mus. defines an interval, the measure of the difference of an acute and grave found: thus, suppose three founds $a, b, c$, of which $c$ is the most acute, $a$ the most grave, and $b$ the intermediate found. It appears, that the interval between the founds $a$ and $c$, is the aggregate of the intervals between $a$ and $b$, and between $b$ and $c$. Therefore, if the interval between $a$ and $b$, be equal to that between $b$ and $c$, which happens when $a:b:c:d$; the interval between $a$ to $c$, will be double the interval $a$ to $b$, or $b$ to $c$. This being considered, it will appear that intervals ought to be expressed by the measures of the ratios, constituting the founds forming those intervals; but ratios are measured by the logarithms of fractions, the numerators of which denote the acute founds, and the denominators the grave. Hence the interval between the founds $a$ and $b$, will be expressed by the logarithm.
Logarithm of the fraction \( \frac{b}{a} \) which is usually denoted by \( \log_{10}\frac{b}{a} \); or, which comes to the same, by \( \log \frac{b}{a} \). The interval therefore of equal founds, \( a \) to \( a \), will be null, as \( \log 1 = 0 \). The interval called an octave, or diyaton, will be expressed by the logarithm of 2; and the interval of the fifth or diapente, will be \( \log \frac{5}{4} = L \frac{3}{4} - L \frac{2}{3} \). From whence it appears, that whereas intervals are incommensurable, so that no interval, however small, can be an aliquot part, both of the octave and fifth. The like may be said of the intervals \( L \frac{3}{4} \) and \( L \frac{2}{3} \), and others whose logarithms are dissimilar. But intervals expounded by logarithms of numbers, which are powers of the same root, may be compared. Thus the interval of the numbers

\[
\log 27 : \log 8 = L \frac{3}{4} - L \frac{2}{3}.
\]

The ratio of the number so found, to that of the octave or fifth, may be incommensurable, yet an approximating ratio of such may be found. Thus the measure of the octave is \( L = 0 \), and the measure of the fifth is \( L \frac{3}{4} - L \frac{2}{3} = 0.1760913 \). Euler. ibid. p. 74.

But tho' the logarithms of numbers, which are powers of the same root, be incommensurable, yet an approximating ratio of such may be found. Thus, the measure of the octave is \( L = 0 \), and the measure of the fifth is \( L \frac{3}{4} - L \frac{2}{3} = 0.1760913 \). Euler. ibid. p. 74.

**INTERVALS, in gardening and husbandry,** the spaces left between the several rows of plants sown or set in gardens or fields. See the article HUSBANDRY.

**INTESTATE, in law,** a person that dies without making a will; in which case, a distribution of his personal estate, after his debts and funeral charges are paid, is to be made among the wife and children of the deceased, or for want of such, among the next of kin. Here the statute, immediately upon the intestate's death, vests an interest in the persons intitled, so that if one dies before the distribution, his share is to go to his executors and administrators, and not to the survivors of the next akin to the intestate. See the article ADMINISTRATOR.

**INTESTINES, in anatomy,** long cylindrical, hollow, and membranaceous bodies; or rather, one such continued body, or tube, reaching from the stomatch to the anus.

In that we are to observe, 1. Their length, which is usually fix times the height of the person they belong to. 2. Their wonderful circumvolutions, and the ues of them. 3. Their connection by means of the mesentery, with the vertebre of the loins. 4. Their number, which tho' properly, as already observed, but one, yet is it usually made fix, where-of three are called the final intestines, intellina tenuia, \( \omega \cdot \alpha \iota \zeta \nu \varepsilon \iota \tau \iota \alpha \iota \nu \) the omentum, jejunum, and ilium; and the other three, the larger intestines, intellina crudata, \( \omega \iota \zeta \nu \varepsilon \iota \tau \iota \alpha \iota \nu \) the cecum, colon, and rectum. See the articles OMENTUM, JEJUNUM, &c.

The structure and substance of the intestines are membranaceous; being formed, in every part, of five coats or tunics. The first is the common coat, from the peritoneum, and is membranous. The second is cellular, and is called by late writers, tunica cellulae Ruychii; it is continuous with the mesentery, and is to be discovered by inflating it: this coat, in fat animals, frequently contains abundance of fat. The third is muscular; it is composed of a double series of fibres, in part longitudinal, and in part annular; and these affit the motion of the guts. The fourth coat is nervous: it is furnished with abundance of cellulae,
The use of the intestines, especially of the small guts, admit of little or no hopes of a cure; yet as the great guts sometimes admit of the future to advantage, it is better to use a doubtful remedy than none: besides that, by means, the discharge of the chyle and feces into the cavity of the abdomen, which would occasion great mischief, is prevented.

Small wounds of the intestines, not exceeding the size of a goose-quill, should by no means be stitched, but left to nature; as they frequently unite much sooner this way, than if irritated by the future. But large wounds are to be stitched up with the glover's future, before the intestine is returned.

To perform this, you are to be provided with a small needle threaded with silk; an affillant should take hold of one part of the gut by a fine piece of linen well aired, while the surgeon should hold the other part in his left hand, and few up the whole wound after the glover's manner, leaving very small spaces, not more than the twentieth of an inch each, between each of the stitches. The last stitch should be fastned with a knot, but the other end must hang about a foot out of the abdomen, by means of which the silk may be drawn out when the intestine is healed. After this is performed, the wound of the abdomen is next to be taken care of, and stitched up, keeping the lower or depending part of the
the wound open with a tent; till all the prerternatural fluids are discharged out of the cavity of the abdomen, and till the union of the wound in the intestines shall give leave to draw away the silk with which the future was performed on it. See the article Gastrography.

As the modern surgeons, however, have found that few are faved who have received any large wound in the intestines, and that in those few who do recover, the wounded parts, from the fnefes of the coat of the gut, do not properly unite, but rather adhere to the inner part of the peritoneum, or to the omentum, or to some other of the intestines, they rather choose now to let alone the operation of the future of the gut, and substitute a gentler method of cure. They put a waxed thread through a fine needle, and with this they fasten the wounded part of the intestine to the internal orifice of the wound in the abdomen. The thread that in this cafe hangs out of the abdomen, is to be fo firmly fixed by the application of fliccking-plaifters to the wound, that the intestine cannot recede from the part to which it was faftened, nor can it evacuate any of its contents into the cavity of the abdomen. When this operation is well performed, the intestine eafily adheres to the internal part of the abdomen, and the patient suffers infinitely lefs pain and hazard, than from the former way of making the future. The fame method of cure alfo is the proper one for wounds of the stomach, where they are within the reach of the hand, and it is sometimes crowned with succefs.

Where any part of the intestines is carried away, the cafe is plainly desperate; yet some of the late eminent surgeons having observed, that the lips of the intestines, fo wounded, would sometimes unexpectedly adhere to the wound in the abdomen, took this hint from nature toward a cure in such desperate cafes. Whenever, therefore, a surgeon is called in a cafe of this kind, after diligently examining the state of the upper part of the intestine which has suffered the loss of substance, he should fitch it to the external wound; for by this means the patient may not only be faved from instant death, but there have been instances where the wounded intestine has been so far healed, that the fnefes which used to be voided by the anus, have been voided by the wound in the abdomen. And this, tho' from the neceffity of wearing a tin or filver pipe, or keeping cloths constantly upon the part to receive the excrement, may feem to be very troublesome; yet it is surely far better to part with one of the conveniencies of life, than to part with life itfelf; besides, the excrements that are voided by this paflage, are not fo offensive in fmeel, as tho' voided per anum.

The fame method of cure may conveniently alfo be put in practice, where any part of the intestine is mortified, by having been thrust out of the abdomen; for in this cafe if you tie up the mesenteric arteries, the corrupted or mortified part of the intestine may be cut off, and the remaining found part made to adhere to the wound of the abdomen. And it is surely better to try this method and fave if it be only a few by it, than to leave all in this unhappy situation to perifh without help.

INTESTINAL, something belonging to, or feated in the intestines. See the preceding article.

Heilpr gives the name of intestinal fever to a species of fever called by others mesenteric. See Mesenteric.

To this species he alfo refers the dysenteric, catarhral, and petechial fevers. See Fever, Dysentery, Petechial, &c.

INTRADY, ENTRY, in the italian muic, is much the fame with prelude or overture. See the article Prelude.

INTRENCHMENT, or Retrenchment, in the art of war. See the article Retrenchment.

INTRIGUE, or INTREACH, an assemblage of events or circumstances, occurring in an affair, and perplexing the perfons concerned in it.

In this cafe, it is used to signify the nodus or plot of a play or Romance; or that point wherein the principal characters are most embarrassed, through the artifice and opposition of certain perfons, or the unfortunate falling out of certain accidents and circumftances.

In tragedy, comedy, or an epic poem, there are always two designs; the firit and principal is that of the hero of the piece. The fecd contains the designs of all tho' who oppose him; these opposite caufes produce opposite effefts; to wit, the efforts of the hero for the execution of his design, and the efforts of tho' who thwart it. As thofe caufes and designs are the beginning of the action, fo thofe efforts are the middle, and there form a
INTRUSION and diffusion in the verse of the scene where the mind perceives the agree-
ment or catastrophe commences when the knot begins to unravel, and the difficulties and doubts begin to clear up.

The intrigue of the Iliad is twofold, the age entered upon his lands, and kept out of the question of the reader or hearer is soon resolved or catastrophe.

As to the choice of the intrigue, and the manner of unravelling it, it is certain they ought both to spring naturally from the ground and subject of the poem. Boffu gives us three manners of forming the intrigue of a poem; the first is that already mentioned; the second is taken from the fable and design of the poet; in the third the intrigue is so laid, as that the solution follows from it of course.

INTRINSIC, a term applied to the inner, real, and genuine values, properties, &c. of any thing, in opposition to their extrinsic or apparent values, &c. See the article EXTRINSIC.

INTRUSION, in law, obtains where an ancestor dies seized of an estate, or inheritance-which is expectant upon an estate for life, and the tenant for life dies; after which a stranger enters before the heir, in which case he is said to intrude. Bracton says, that intrusion signifies any unlawful entry upon lands, &c. by a person who has no right to the same, in prejudice of the person to whom they are legally descended. The difference between an intruder and an abator, according to Fitzherbert, is this, viz. that an abator enters into lands, &c. void by the death of a tenant in fee, whilst an intruder enters on lands void by the death of a tenant for life or years. An entry on the king's lands and political upon the death of a tenant, &c. is termed intrution against the king, for which an information may be exhibited; tho' before office is found, he that occupies the land shall not be an intruder, and yet the king is entitled to the profits thereof after the tenant's estate is ended.

INTRUSION DE GARD, was a writ formerly in use, where an infant or person within age entered upon his lands, and kept out of his lord.

INTRUSIONE, is a writ which lies against an intruder at the suit of him that has the fee, &c. If a person has only an estate, he may not have this writ, but is to bring a writ of formedon.

INTUITION, among logicians, the act whereby the mind perceives the agreement or disagreement of two ideas, immediately by themselves, without the intervention of any other; in which case, the mind perceives the truth as the eye doth the light, only by being directed towards it. Thus the mind perceives that white is not black, that three are more than two, and equal to one and two. See the article IDEA.

This part of knowledge, says Mr. Locke, is irresistible, and, like the sun-shine, forces itself immediately to be perceived as soon as ever the mind turns its view that way. It is on this intuition that all the certainty and evidence of our other knowledge depends; this certainty every one finds to be so great, that he cannot imagine, and therefore cannot require, a greater. See the articles JUDGMENT, KNOWLEDGE, DEMONSTRATION, &c.

INVALID, a person wounded, maimed, or disabled for action by age, &c. For the colleges or hospitals built for the reception and accommodation of invalids, or soldiers and seamen worn out and disabled in the service, see the articles COLLEGE and HOSPITAL.

INVECTED, in heraldry, denotes a thing fluted or furrowed. Invected is just the reverse of inuigral, in which the points are turned outward to the field, whereas in invected they are turned inward to the ordinary, and the small semicircles outward to the field. See plate CXL. fig. 5.

INVECTIVE, in rhetoric, differs from reproof, as the latter proceeds from a friend, and is intended for the good of the person reproved; whereas the invective is the work of an enemy, and entirely designed to vex and give uneasiness to the person against whom it is directed.

INVENTION,
INVENTION, denotes the act of finding any thing new, or even the thing thus found.

Invention is, according to lord Bacon, of two very different kinds, the one of arts and sciences, the other of mechanical or liberal arts; nor to deduce the operations of the one, or the axioms of the other: but only leaves us this instruction, "To believe every artifit in his own art."

His lordship further maintains, that men are hitherto more obliged to brutes than men, as the manner of their temples filled with the images of beasts, No wonder, therefore, as the manner of their temples filled with the images of beasts, rather than men, as the institution of useful things, and origin of sciences, rather than logic.

Invention is therefore used for a subtilty of mind, or somewhat peculiar in a man's genius, which leads him to the discovery of things new; whence we say a man of invention.

Invention, according to Du Bos, is that part which constitutes the principal merit of works, and distinguishes the great genius from the simple artit.

Invention, in rhetoric, being one of the second divisions of invention, according to Bacon, signifies the finding out and choosing of arguments which the orator is to use for proving his point, or moving his hearers passions.

This invention, in the opinion of that philosopher, cannot properly be called invention, which is the discovery of things not yet known, and not the recollecting things that are known; the only use and office of this rhetorical invention being out of the stock of knowledge already laid up, to select such articles as make for the purpose. The same author divides the methods of procuring a flock of matter for discourse into two; the first of which is either by marking out and indicating the parts wherein a thing is to be searched after, which he calls the topical way; and the second is by laying up arguments for use that were composed before hand, and which he calls the promptuary way. See the articles TOPICAL and PROMPTUARY.

Cicero wrote four books upon invention, whereof two only are remaining. Invention, according to this author, is the principal part of oration.

Invention, in poetry, is applied to whatever the poet adds to the history of the subject he has chosen, as well as to the new turn he gives it.

Invention, in painting, is the choice which the painter makes of the objects that are to enter the composition of his piece.

M. Felibien gives the general name invention to every thing that depends on the genius of the painter, as the ordonnance, the disposition of the subject, and even the subject itself, when it is new. He also distinguishes invention into two kinds, that which arises immediately from the mind of the painter, and that which he borrows from some other: the first is when he absolutely invents the subject himself; and the second, when he borrows it from history, fabre, c.

Mr. de Flines observes, that invention is different from disposition, and that it is those two things together that form composition; for after having made a good choice of objects proper for the subject, they may be ill disposed, and then, tho' the invention be ever so good, the disposition will be faulty, and the piece will displease.

Invention is also used for the discovery of a thing hidden. Hence, INVENTION OF THE HOLY CROSSES. See the article INVENTORY OF THE CROSS.

INVENTORY in law, is a schedule containing all the goods and chattles of a deceased person that belonged to him at the time of his death, together with the value of the same, as appraised by two or more indifferent persons.

Executors, as well as administrators, are to deliver in upon oath to the ordinary indented inventories, one part of which is to remain with the ordinary, and the other part with the executor or administrator. This is required for the benefit
of the creditors and legatees, that the executor or administrator may not conceal any part of the personal estate from them. The statute ordains, that the inventory shall be exhibited within three months after the peron's decease; yet it may be done afterwards, for the ordinary, may dispense with the time, and even with its being ever exhibited, as in cases where the creditors are paid, and the will is executed.

INVERARY, a parliament-town of Scotland, in the county of Argyle, of which it is the capital, situated on Lochfin, forty-five miles north-west of Glasgow: west long. 5°, north lat. 56° 28'.

INVERNESS, a parliament and port-town of Scotland, the capital of the county of Inverness, situated at the mouth of the river Neils: west long. 4° north lat. 57° 46'.

INVERSE, is applied to a manner of working the rule of three, or proportion, which seems to go backward, or contrary to the order of the common or direct rule. See the articles Rule of three and Proportion.

INVERSE method of fluxions. See the article Fluxions.

INVERSE planting. See Planting.

INVERSION, the inverting or turning any thing backwards.

INVERSION, in grammar, is where the words of a phrase are ranged in a manner not so natural as they might be. It is a considerable beauty either in verse or prose, when we have it from an able hand; it gives vigour and variety to a sentence, and keeps the mind in an agreeable suspense and expectation of a marvellous turn and conclusion.

INVERURY, a parliament-town of Scotland, in the county of Aberdeen, situated on the river Don, ten miles west of Aberdeen.

INVESTIGATION, properly denotes the searching or finding any thing out by the tracts or prints of the feet; whence mathematicians, schoolmen, and grammarians, come to use the term in their respective researches.

Investigation of a theme, in grammar, is the finding out the primitive tenor, mood, and person of any verb, far removed from its source. To understand a greek author, it is absolutely necessary to be well acquainted with the method of investigating a theme. This theme, in the greek tongue, is the present tenor of the indicative mood.

Clenard was the first who introduced this term into grammar; he gives the title invesitatio thematis to that part where he teaches the manner of finding whence any person or tenor of a verb proceeds, and of reducing it to its primitive word, or finding its indicative.

INVESTITURE, in law, a giving livery of seisin or possession. There was antiently a great variety of ceremonies used upon investitures; as at first they were made, by a certain form of words; and afterwards, by such things as had the greatest resemblance to the thing to be transferred: thus where lands were intended to pafs, a turf, &c. was delivered by the granter to the grantee. In the church, it was customary for princes to make investiture of ecclesiastical benefices, by delivering to the persons they had chosen, a pastoral staff and a ring.

INULA, in botany, a genus of the genus-nepeta-polygamia-supervilua class of plants, with radiated flowers: the receptacle is naked; the down is simple; and the anther terminate in stam at their bases.

INVOCATION, in theology, the act of adoring God, and especially of addressing him in prayer for his assistance and protection. See the articles Adoration and Prayer.

The difference between the invocation of God and of the saints, as practised by the papists, is thus explained in the catechism of the council of Trent. "We beg of God, says the catechism, to give us good things, and to deliver us from evil; but we pray to the saints, to intercede with God, and obtain those things which we stand in need of. Hence we use different forms in praying to God, and to the saints: to the former we say, hear us, have mercy on us; to the latter we only say, pray for us." The council of Trent expressly teaches, that the saints who reign with Jesus Christ, offer up their prayers to God for men, and condemn those who maintain the contrary doctrine. The protestants reject and cenfe this practice as contrary to scripture, deny the truth of the fact, and think it highly unreasonable to suppose that a limited finite being should be in a manner omnipresent, and at one and the same time hear and attend to the prayers that are offered to him in England, China, and Peru; and from thence infer, that if the saints cannot hear their requisits, it is inconsistent with common sense
Invocation, in poetry, an address at the beginning of a poem, wherein the poet calls for the assistance of some divinity, particularly of his muse, or the deity of poetry.

The invocation is said to be absolutely necessary in an epic poem, as the poet relates things which he could not be supposed to know, unless he were inspired by some deity. Besides, it serves his readers as an example of piety, which ought nothing of the necessary in an epic poem, as the poet must relate things which he could not be leaving them.

In the course of an epic poem, it is true, several invocations occur, particularly in Homer's poems, and the first is a request to the muse to acquaint him with the events, as when Virgil describes the metamorphosis of Æneas's fleet into sea nymphs: but the first invocation is always the most considerable.

In the invocation, Boffa considers two things: the first is what the poet requests; and the second, to what deity he addresses his request. As to the first, Homer has closely joined the invocation to the proposition, that he seems to invoke his muse for the whole work. Virgil, on the contrary, only requests his muse to furnish him with a part of his subject: he even mentions the particular part, which Virgil describes the metamorphosis of Æneas's fleet into sea nymphs: but the first invocation is always the most considerable.

As to the deity invoked, the same author observes, that it must always be the divinity that presides over poetry in general, or that which presides over the particular subject of the work. Ovid's invocation in his metamorphoses, and likewise Lucretius's, is of this latter kind; those of Homer and Virgil are of the former: they only invoke the muse, and thus distinguish between the deities who preside over poetry, and those who preside over the actions of the poem, and have parts in it. Lord Shaftsbury observes, that an invocation appears cold from a modern poet.

Invoice, an account in writing of the particulars of merchandise, with their value, custom, charges, &c. transmitted by one merchant to another in a distant country.

One copy of every invoice is to be inserted verbatim in the invoice-book, for the merchant's private use; and another copy must, immediately upon shipping the goods, be dispatched by post, or otherwise, to the correspondent. This copy is commonly drawn out upon a sheet of large post-paper, to the end of which is subjoined a letter of advice. It must here be observed, that when a merchant ships off goods for his own account, the invoice sent to the factor contains only the quantity of goods, but nothing of the cost and charges; and the letter subjoined consists of instructions signifying in what manner the employer inclines to have his goods disposed of, and returns made.

Invoice-book, this book is paged, and contains copies of the invoices of goods sent to sea: for a merchant is obliged to send his correspondent an invoice of all the goods he consigns to him, so it is reasonable that he should keep a copy of it for himself. For the further uses of invoice-books, see Book of invoices.

Involucrum, among botanists, that sort of calyx or cup, which surrounds a number of flowers together, every one of which has, besides this general cup, its own particular perianthium. See the article Calyx.

The involucrum consists of a number of little leaves, disposed in a radiated manner.

Involution, in algebra, the raising of a quantity from its root to any power assigned. See Quantity and Power.

Any simple quantity is involved by multiplying the exponent by that of the power required: thus, a raised to the power 3, 4, &c. power, is only to multiply its exponent 3, 4, &c. and, in general, the power expressed by \( m \), of any quantity, is raised by multiplying its exponent by \( m \).

Thus, the second power of \( a \) is \( a^{2x} = a^2 \); its third power, or cube, is \( a^{3x} = a^3 \); and the \( m \)th power of \( a \) is \( a^{mx} \).

The square of \( abc \) is \( a^2 b^2 c^2 \), the cube is \( a^3 b^3 c^3 \), and the \( m \)th power is \( a^m b^m c^m \).

The coefficients must also be raised to the same power by a continual multiplication of itself by itself, as often as unit is contained in the exponent of the power required. Thus, the square of \( 3a \) is \( 3x \).
$3 \times a^2 = 9a^2$; and the cube of $ab$ is $3 \times 3 \times 3 \times a^3b^3 = 27a^3b^3$.

As to the signs, when the quantity to be involved is positive, it is obvious that all its powers must be positive too; and when the quantity to be involved is negative, then all its powers whose exponents are even numbers must be positive; because any number of multiplications of a negative, if that number be even, gives a positive. The power then can only be negative when its exponent is an odd number, though the quantity to be involved be negative.

The involution of any compound quantity is performed by a continual multiplication of it by itself, as in the binomial $a+b$. Thus,

$a+b = \text{root.}$

$= a + b$

$a^2 + ab$ $+ ab + b^2$

$a^2 + 2ab + b^2$ $=$ the square, or second power.

$x + a + b$

$a^3 + 2a^2b + ab^2$ $+ a^2b + 2ab^2 + b^3$

$a^3 + 3a^2b + 3ab^2 + b^3$ $=$ cube, or third power.

$x + a + b$

$a^5 + 3a^4b + 3a^3b^2 + ab^3$ $+ a^3b + 3a^2b^2 + 3ab^3 + b^4$

$a^5 + 4a^4b + 6a^3b^2 + 4ab^3 + b^4$ $=$ biquadratic, or fourth power.

$x + a + b$

$a^6 + 5a^5b + 10a^4b^2 + 10a^3b^3 + 5a^2b^4 + ab^5$ $+ a^5b + 5a^4b^2 + 10a^3b^3 + 10a^2b^4 + 5ab^5 + b^6$

$a^6 + 6a^5b + 15a^4b^2 + 20a^3b^3 + 15a^2b^4 + 6ab^5 + b^6$ $=$ fifth power.

If the powers of $a - b$ are required, they will be found the same as the preceding; only the terms, in which the exponent of $b$ is an odd number, will be negative, because an odd number of multiplications of a negative produces a negative: thus, the cube of $a - b$ will be found to be $a^3 - 3a^2b + 3ab^2 - b^3$; where the second and third term are negative, the exponent of $b$ being an odd number in these terms. In general, the terms of any power of $a - b$ are positive and negative by turns. But the reader will find a general theorem, for raising a binomial to any power required, under the article BINOMIAL.

If a quantity, consisting of three or more terms, is to be involved, it may be distinguished into two parts, which are to be raised to any power in the same manner as a binomial; and then, by the same rules, you may substitute, instead of the powers of these compound parts, their values: thus, $a + b + c = a + b + c$

$= a + b + 2c \times a + b + c^2 = a^2 + 2ab + b^2 + 2ac + 2bc + c^4$. And, $a + b + c^2 = a + b + 3c \times a + b + c^4 = a^2 + 3ab + 3a^2b + 3ab^2 + 3a^2c + 6abc + 3b^2c + 3ac^2 + 3bc^2 + c^3$. In these examples, $a + b + c$ is considered as compounded of the compound part $a + b$, and the simple part $c$; and then the powers of $a + b$, are formed by the binomial theorem, and substituted for $a + b^2$, and $a + b^3$. The reverse of involution is called evolution, or the extraction of roots; that is, the finding the roots of the powers of any quantity, whether simple or compound. See the article EXTRACTION.

JOACHIMITES, in church-history, the disciples of Joachim a cistercian monk, who was an abbot of Flora in Calabria,
The jobomites were particularly fond of certain ternaries: the Father, they said, operated from the beginning till the coming of the Son; the Son, from that time to theirs, which was the year 1560; and from that time the Holy Spirit was to operate in his turn. They also divided every thing relating to men, to doctrine, and the manner of living, into three classes, according to the three persons in the Trinity: the first ternary was that of men; of whom the first class was that of married men, which had lasted during the whole period of the Father; the second was that of clerks, which had lasted during the time of the Son; and the last was that of the monks, in which there was to be an uncommon effusion of grace by the Holy Spirit: the second ternary was that of doctrine, viz. the Old Testament, the New, and the everlasting Gospel; the third they ascribed to the Father, the second to the Son, and the third to the Holy Spirit: a third ternary consisted in the manner of living, viz. under the Father, men lived according to the flesh; under the Son, they lived according to the flesh and the Spirit; and under the Holy Ghost, they were to live according to the spirit only.

JOANNA, one of the islands of Comoro, situated between the north-west part of Madagascar and Zanguebar, in Africa: east long. 45°, south lat. 12°.

JOB, or Book of Job, a canonical book of the Old Testament, containing a narrative of a series of misfortunes which happened to a man whose name was Job, as a trial of his virtue and patience; together with the conferences he had with his cruel friends, on the subject of his misfortunes, and the manner in which he was restored to ease and happiness. This book is filled with those noble, bold, and figurative expressions, which constitute the very soul of poetry.

Many of the Jewish rabbins pretend that this relation is altogether a fiction: others think it a simple narrative of a matter of fact, just as it happened; while a third sort of critics acknowledge that the groundwork of the story is true, but that it is wrote in a poetical strain, and decorated with peculiar circumstances, to render the narration more profitable and entertaining.

The time is not set down, in which Job lived. Some have thought that he was much antecedent than Moses, because the law is never cited by Job or his friends, and because it is related that Job himself offered sacrifices. Some imagine that this book was wrote by himself; others say, that Job wrote it originally in Syriac or Arabic, and that Moses translated it into Hebrew; but the rabbins generally pronounce Moses to be the author of it, and many Christian writers are of the same opinion.

The worship of Job is of great antiquity among the Greeks and Latins: the Greeks celebrate his festival on May 6, and the Latins keep it on the same month. A great number of churches and chapels are dedicated to this holy man, particularly in Spain and Italy; and he is invoked principally against the leprosy, the itch, the soul diseased, and the like distempers.

JOBBER, in law, a person that buys and sells cattle for others. Hence flock-jobbers are persons who buy and sell flocks for other persons.

IOGUIS, among the East-Indians, a kind of hermits, who generally stand under trees, or near their pagods. Some of them go stark naked, holding their arms across over their heads, and continue in that posture all their lives: others lie on the ground, with one leg higher than the other, and their arms raised above their head; and these wretched penitents infensibly lose the use of their arms and legs: some confine themselves in cages, set on the top of a thick stake, fixed in the ground, and these cages are so small, that they put the penitent to prodigious torture: some holding a fable in one hand, and a kind of shield in the other, go up a kind of crane, where hooking themselves to an iron, which runs a considerable way into their backs, they spring forward into the air, flourishing their fables, and launching out into extravagant piracies of their idols: and others plunge into the Ganges, in hopes of being devoured by a crocodile, fancying that by this means they shall obtain the happiness of the next life. These miserable wretches are considered by the Indians as perfect models of piety and holiness: they are followed by persons of both sexes, who make a vow of devoting themselves to their service, and are wholly employed in soothing their voluntary sufferings by offering them alms and refreshments. They call the pious to their devotions by ringing a little bell; and when they hold their spiritual conversations, they sit close in a ring, and
JOI

set up a banner, made of several pieces of stuff, fastened at the end of a stick.

JOHN, or Gospel of St. John, a canonical book of the New Testament, containing a recital of the life, actions, doctrine, and death of our Saviour Jesus Christ, written by St. John the apostle and evangelist. See the article GOSPEL.

St. John wrote his Gospel at Ephesus, after his return from the isle of Patmos, at the desire of the christians of Asia. St. Jerome says, he would not undertake it, but on condition they should appoint a public feast, to implore the assistance of God; and that the feast being ended, St. John, filled with the Holy Ghost, broke out into these words, “In the beginning was the word,” &c. The antients assign two reasons for this undertaking: the first is, because, in the other three Gospels, there was wanting the history of the beginning of Jesus Christ’s preaching, till the imprisonment of John the Baptist; which, therefore, he applied himself particularly to relate. The second reason was, in order to remove the errors of the christians, ebionites, and other commotions of the wonderful Baptist; Jesus says, he would not undertake into these words, wanting all the actions, and less curious works. However, a general action of trepass, and a special action on the cafe, may be joined in one action; and any actions may be joined, in which the plea, not guilty, goes to all.

JOINERY, the art of working in wood, or of fitting various pieces of timber together.

It is called by the French menuisier, q. d. small work, to distinguish it from carpentry, which is employed about large and less curious works. See the article CARPENTRY.

In the annexed plate (CXLVII.) are represented the tools employed in this art; where A is a work-bench; B, the hook; c, the fivet; d, the hold-fast; a, a, a, holes in the legs of the bench; e, e, maillets; B, B, B, &c. planes of several sorts; where B1 is called a fore-plane; B2, a cutter; B3, a strike-block; B4, a smoothing-plane; B5, a rabbet-plane; B6, the plough; C, C, C, chisels of several sorts; C1 and C3 being called skewers; C 2, a paring-chisel; C 4, a skew-former; C 5, a mortise-chisel; C 6, a gouge; D is a square, being called the handle; b, the tongue; c, the outer square; and d, the inner square; E, E, hand-faws; F, the bevil, with its tongue moveable upon a center; G, a gage; H, a piercer; a, being its head; b, the pad; c, the flock; and d, the bit: I, a gimblet; K, an augre; a, a being its handle; and b, its bit; L, a hatchet; M, a frame or bow-faw; N, a whip-faw; O, a tenant-faw; Q, a compass-faw; R, a hammer; and S, a foot-rule, to measure their work with.

JOIN, in general, denotes the juncture of two or more things. The joints of the human body are called by anatomists articulations. See the article ARTICULATION.

The term join is also applied to the separation between the stones or bricks of a building, usually filled with mortar, plaster, or cement: also by carpenters, to the several manners of assembling or fitting pieces of wood together; as a dovetail joint, &c.

Stiffness of the Joints; in surgery and medicine, sometimes proceeds from the bones being broken, bruised, or wounded, especially about the extreme parts, which being

JOIGNY, or JOYNDER, in law, signifies a joining of two persons in the same action: as for instance, if there are two joint-possessors of goods, and these are taken from one of them, they may both join in an action to recover them. An action against the owners of a ship, on account of goods damaged, must be brought against all of them: and where there are several partners in trade, and one has the management, actions must be brought against all the partners jointly. In ac-

tions personal, several wrongs may be joined in one writ; yet this cannot be done where some things are founded on a tort, and some on a contravention, because they require a different plea and a different process. However, a general action of trespass, and a special action on the case, may be joined in one action; and any actions may be joined, in which the plea, not guilty, goes to all.
Instruments used in Joinery
being kept in one posture, in order for
cure, the synovia of the joints becomes
thick, and depraves or quite abolishes its
motion; or it may proceed from the bo-
ny juice proceeding from broken bones,
and infiltrating itself into the joint. Hoft-
man says, diseases of the joints sometimes
proceed from spasms of the ligaments.
If difficulty of motion proceeds from long
reft, it is to be treated with emollient and
reolving fomentations, ointments, oils,
and the hot fat of animals, often rubbed
upon the joint; at the same time using
a gentle flexure, till the motion is gradu-
ally restored. If these will not do, then
warm emollient baths must be used, or
hot-bath-water, till the inflipitated liquor
is dissolved, and the motion as much as
possible restored. If it proceeds from the
juice of broken bones, or the nodous
gout, it is incurable, if the former remedies will not do.

JOINT-EXECUTORS, in law, are when two
or more persons are appointed such by
will; in which case they are accounted
but as one single person, so that the ac-
tions done by one of them are taken to
be the acts of all, because they all repre-
sent the person of the testator; thus,
where two joint-executors are possessed
of a lease for years, in right of their testa-
tor, one of them may tell the term with-
out the others joining; and in like man-
ner, where one joint-executor gives a re-
lease, the other is bound by it, each hav-
ing an authority over the whole estate;
but a joint-executor is not charged with
the acts of his companion, any farther than
he is actually possessed of the goods of the
testator; however, if joint-executors en-
ter into an agreement, that each shall in-
termeddle with particular parts of the
testator's estate, in that case, each be-
comes chargeable for the whole, by agree-
ment. It has been held, that two joint-
executors cannot plead separate pleas, be-
cause their testator, if living, on an action
brought against him, could have been
allowed but one plea; and that if all the
executors are not named in an action
brought by joint-executors, the action
will abate. As to legatees, the receipt
of one executor charges not the other.

JOINT-LIVES, in law, is where any thing
is granted or given to two or more during
their lives. See the article LIFE.

JOINT-TENANTS, are such as hold lands
or tenements jointly by one title; as
where a man grants lands, &c. to two
persons and their heirs; such persons, dur-
ing their joint-tenancy, must jointly plead
as well as be jointly sued, which is com-
mon to them with coparceners of lands.
See the article COPARCENERS.

Every joint-tenant in an estate has a right
to his own share, and may give lease or
forfeit the same; he may make a lease, but
not a deed of feoffment, or grant, to any
besides his companion. Joint-tenants can-
not singly dispose of more than the part
that belongs to them; for where they join
in any gift or grant of lands, in the judg-
ment of the law, each gives but his re-
spective part; therefore, if one joint-
tenant grants a rent-charge out of his part,
after his death the survivor shall have the whole land discharged, because
the land will be his by survivorship; but
where a lease for years is made by a
joint-tenant, it cannot be avoided by the
survivor. Sometimes joint-tenants enter
into covenants, not to take advantage of
each other by survivorship; and, indeed,
they, as well as tenants in common of
inheritance, are bound by statute to make
partition, in the same manner as copar-
ceners.

JOINTURE, in law, generally signifies a
settlement of lands and tenements, made
on a woman in consideration of mar-
rriage. See the article MARRIAGE.
It also signifies a covenant, by which the
husband, or some friends of his, assure
lands, &c. to his wife for the term of
her life. See the article ANNUITY.
Here it is observable, that an estate set-
tled in jointure, which comes from the
ancestors of the wife, and is not of the pur-
chase of the husband, or some ancestor of
his, will not be accounted a good jointu-
re. Where no estate of inheritance is re-
ferred to the husband and his heirs, but
the estate is granted to the wife for life,
or in tail, the remainder to a stranger;
this will not be a legal jointure, although
the same is made by the husband or his
ancestor.

In order to make a perfect jointure able
to the statute 27 Hen.VIII. cap. x.
several things are to be observed: 1. That
it be made to take effect for the wife's
life, either in possession or profit, pre-
ently after the decease of her husband.
2. That it be for the term of her own
life, or for a greater estate: it may how-
ever be limited to continue no longer
than she remains a widow, &c. 3. That
it be expressed to be in satisfaction of her
whole dower, and not a part thereof.

4. That, though it may be made either before or after marriage, yet, if before, the wife cannot waive it, and claim her dower at common law: but if made afterwards, she may, at the death of her husband. It is here said, that all other settlements in lieu of jointures, that are not pursuant to this statute, are jointures at common law, and no bars to claim of dower. See Dower.

Upon the husband's death, the wife may enter on her jointure, and is not driven to a real action, as she is to recover dower at common law. Wherefore, on a lawful eviction of her jointure, she shall be endowed according to the rate of her husband's lands, of which she was entitled to dower by the common law; and should she be evicted of part of her jointure, she shall have dower for so much thereof. A husband committing treason shall not occasion a forfeiture of the wife's jointure; yet some-coverts committing the fame, or felony, are liable to forfeit their jointures; and upon conviction of recusancy, they incur the forfeiture of two parts in three of their jointures, as well as dowers.

JOINTRESS, or JOINTER, the person on whom a jointure is settled. See the preceding article.

Where an estate, settled on a wife, is a jointure by law, and the jointress makes any alienation thereof, either by fine, feoffment, &c., with another husband, such alienation shall be a forfeiture of the estate so settled, as a jointure: but a jointress may, by lease, demit, and grant an estate for forty years, &c., if the lease is long, or for life, without incurring a forfeiture. In case the jointress covinously suffers a recovery to bar the heir, he may enter pemently upon the lands, &c.

JOINVILLE, a town of Champaign, in France, situated on the river Marne: east longitude 5° 15', and north latitude 48° 27'.

JOISTS, or JOISTS, in architecture, those pieces of timber framed into the girders and timbers, on which the boards of the floor are laid.

Joists are from six to eight inches square, and ought seldom to lie at a greater distance from each other than ten, or, at most, twelve inches, nor ought they ever to bear a greater length than ten feet, or to be less into the wall than eight inches. All joists on the back of a chimney ought to be laid with a trimmer, at six inches distance from the back.

Some carpenters furf their joists, as they call it; that is, they lay two rows of joists, one over another, the undermost of which are framed level with the under side of the girder; and the uppermost, which lie cross the lower ones, lie level with the upper side of the girder.

JONAH, or Prophecy of JONAH, a canonical book of the Old Testament, in which it is related, that Jonah was ordered to go and prophecy the destruction of the Ninevites; but that disobediently attempting a voyage another way, he was discovered by the rising of a sudden tempest, and cast into the sea, where he was swallowed up by a whale, which having lodged him three days and three nights in his belly, disgorged him upon the shore, whereupon being sensible of his past danger and surprising deliverance, he betook himself to the journey and embassy, to which he was appointed; and arriving at Nineveh, the metropolis of Assyria, he, according to his commission, boldly laid open to the inhabitants, their sins and miscarriages, and proclaimed their sudden overthrow; upon which the whole city, by prayer and fasting, and a speedy repentance, happily averted the divine vengeance, and escaped the threatened ruin.

IONIA antiently was a province of the lesser Asia, or Natolia, bounded by Etolia on the north, Lydia on the east, Caria on the south, and the Archipelago on the west.

IONIC ORDER, the third of the five orders of architecture, being a kind of mean between the robust and delicate orders. See plate CXLVIII, fig. 1.

The first idea of this order was given by the people of Ionia, who, according to Vitruvius, formed it on the model of a young woman of an elegant shape, dressed in her hair; whereas the doric had been formed on the model of a strong robust man. The ionic order is distinguished from the composite, in that it has none of the acanthus-leaves in its capital; and from the tufcan and doric, by the channels and flutings in its shaft. The capital of this order is adorned with volutes, and its cornice with dentiles. The proportions of the ionic pillar, as they are taken from the famous one in the temple of Fortuna Virilis at Rome, now the church of St. Mary the Egypti-
an, are these: 1. The entire order from the supercifices of the area to the cornice, are twenty-two modules, or eleven diameters. 2. The column with its base contains eighteen modules. 3. The entablature contains four modules. 4. The volute of the capital is of an oval form. 5. The columns in this order are often hollowed, and furrowed with twenty-four gutters or channels, called flutings: these flutings are not always concave from the top of the shaft to the bottom, but for that third of it next the base, they are filled up with a kind of rods or canes; and in the other two thirds they are left hollow, or striated, in imitation of the folds or plaits of a garment.

When this order was first invented, its height was but sixteen modules; but the antients, to render it still more beautiful than the doric, augmented its height, by adding a base to it.

Mr. Le Clerc makes its entablament four modules and ten minutes, and its pedestal six entire modules; so that the whole order makes twenty-eight modules ten minutes.

This order is at present used properly in churches and religious houses, courts of justice, and other places of tranquility and devotion.

This order has one advantage above any of the rest, which consists in this, that the fore and hind parts of its capital are different from its sides; but this is attended with an inconvenience, when the ordonnance is to turn from the front of the building to the side; to obviate which, the capital may be made angular, as is done in the temple of Fortuna Virilis.

Scamozzi, and some other modern architects, have introduced the upper part of the composite capital, in lieu of the ionic, imitating that of the temple of Concord, whose four sides are alike. To render it a little more beautiful, the volute may be made a little oval and inclining.

For the base, cornice, freeze, and pedestal of this order, see the articles Base, Corniche, &c.

Ionic dialect, in grammar, a manner of speaking peculiar to the people of Ionia.

At first it was the same with the antient Attic; but passing into Asia, it did not arrive at that delicacy and perfection to which the Athenians attained. The Ionians generally changed the a into η, as σφις into σφι: they put the η and ι for ε, and αι for ια, as αυξηδιος for αυξηνα; and ωνυλικος for ἀπονη. They also change a and ι into η, ωι into ωι, ει into ει and ει, ηι into ηι and ιι, and ει into ει, as βασιδιος into βασιζε, ανείαδιοκος into ανείαζε, ομοία into ομοίαζε, ανείαδιοκος into ανείαζε, μοιαωδιος into μοιαωδες, μικρωδιος into μικρωδες, &c. These also insert the η and ι, as στεινος for στενος, and μικρωδιος for στεινος.

Ionic sect was the first of the antient sects of philosophers; the others were the italic and eleatic. The founder of this sect was Thales, who being a native of Miletus in Ionia, occasioned his followers to assume the appellation of ionic: Thales was succeeded by Anaximander, and he by Anaximenes, both of Miletus; Anaxagoras Clazomeniactus succeeded them, and removed his school from Asia to Athens, where Socrates was his scholar.

It was the distinguishing tenet of this sect that water was the principle of all natural things.

Ionic transmigration was antiently a very celebrated epocha; it took its rise from the retreat of the athenian colonies, who, upon the death of Codrus, put themselves under the command of his son Neleus, and established the twelve cities of Ionia in Asia. These colonies, according to Eratosthenes, were established fifty years after the return of the Heraclidae; and, according to Martham, seventy-seven years after the taking of Troy.

Jovial, jovialis, among chemists, &c. something belonging to tin, as the bezoardicum joviale. See Bezoardicum and Tin.

Jonk, or Jonque, in naval affairs, is a kind of small ship, very common in the East-indies: these vessels are about the bigness of our fly-boats; and differ in the form of their building, according to the different methods of naval architecture used by the nations to which they belong. Their sails are frequently made of mats, and their anchors are made of wood.

Jonthlaspi, in botany, a plant called by Linnaeus clypeola. See Clypeola.

Joshua, a canonical book of the Old Testament, containing a history of the wars and transactions of the people of Canaan; the second, which begins at the twelfth chapter, is a description of that country,
country, and the division of it among the tribes; and the third, comprised in the two last chapters, contains the renewal of the covenant he caused the Israelites to make, and the death of their victorious leader and governor. The whole comprehends a term of seventeen, or, according to others, of twenty-seven years.

**JOURNAL**, a day-book, register, or account of what passes daily.

**JOURNAL, or DAY-BOOK**, among merchants, is that wherein the transactions, recorded in the waste-book, are prepared to be carried to the ledger, by having their proper debtors and creditors ascertained and pointed out, for a more distinct account of which, see the article **BOOK**.

**JOURNAL, at sea**, is a register kept by the pilot and others, wherein notice is taken of everything that happens to the ship from day to day, with regard to the winds, the rhumbs, the rake, soundings, &c. and in order to enable him to adjust the reckoning, and determine the place where the ship is. For the method of correcting a journal at sea, by making proper allowances for the lee-way, variation, &c. see the articles **LEE-WAY, VARIATION, RECKONING**, &c.

The remarkable occurrences of the whole day being finished in the log-book, if the latitude by account agree with the latitude by observation, the ship's place will be truly determined; if not, then the reckoning must be corrected, before it be placed in the journal. See the article **LOG-BOOK**.

The form of the journal, together with an example of two days work, is as follows. N. B. To express the days of the week, the seamen commonly use in their books the characters by which the sun and planets are expressed, viz. D denoting Sunday, J Monday, T Tuesday, W Wednesday, T Thursday, F Friday, and S Saturday.

**JOURNAL is also a name common for weekly essays, news-papers, &c., as the Gray's Inn Journal, the Westminster Journal, &c.**

**JOURNEYMAN**, properly one who works by the day only; but it is now used for any one who works under a master, either by the day, the year, or the piece.

**JOURNEYS-ACCOUNTS**, in law, signifies as soon as possible: thus, when a writ is rendered void by the death of the defend-
IPECACUANHA, JOYNERY. See JOINERY.

IPECACUANHA, in the materia medica, a west-indian root, of which there are two kinds, distinguished by their colour, and brought from different places, but both possessing the same virtues, though in a different degree. The one is grey, and brought from Peru; the other is brown, and is brought from the Brazils: and these are indifferently sent into Europe under the general name of ipecacuanha.

These two sorts have been by some supposed to be the roots of two different plants, but this is a mistake; the only difference is, that one grows in a different place, and in a richer and moister soil, and is brown, as the latter is apt to operate with difficulty of breathing, and spitting of blood, and sometimes with bleeding at the nose, and a great swelling and inflammation of the face, eyes, and throat; these symptoms generally go off in a day or two of themselves, but if they are more than ordinary violent, it may be proper to bleed for them.

Ipecacuanha, however, is an excellent, mild, and safe emetic, and is also a noble restringent; and given in doses too small to vomit, is the greatest of all remedies for a dysentery. Its dose, as an emetic, is from six or eight to thirty grains, and the best way of taking it is in white wine, in which it should have first stood four and twenty hours. In dyfenteries the patient is first to take such doses of it as will vomit him, and afterwards to continue the use of it for a long time, at the rate of three or four grains, in any form, twice a day. Small doses of ipecacuanha are an excellent remedy in diarrheas of a more simple kind; and in the flor albus, we hardly know a better medicine.

IPECACUANHA is also a name given by the people of Virginia to a species of Filipendula. See the article FILIPENDULA.

IPECAUANA, American Jasmine, in botany; a genus of the pentandria monogyne class of plants, the corolla whereof consists of a single infundibuliform petal; the tube is nearly cylindric, and very long; the limb is patent, and divided into five semi-lanceolate plane segments; the fruit is a roundish capsule, containing three cells; the seeds, of which there are several in each cell, are of an oval figure. This plant is by some reckoned a species of the convolvulus. See plate CXLIV. fig. 4.

IPSWICH, a borough and port-town of Suffolk, situated on the river Orwell, twenty-four miles south-east of Bury. It sends two members to parliament.

IRELAND, an island of the Atlantic ocean, subject to Great Britain; situated between 4° and 10° west longitude, and between 41° and 56° north latitude; being bounded by the Northern ocean on the north, by St. George's channel, which divides it from Great Britain, on the east, and by the Atlantic and Western ocean on the south and west. This country is two hundred and fifty miles long, and one hundred and fifty broad; distant from Holyhead, in north Wales, fifty miles, and from Galloway, in Scotland, fifteen miles. It is divided into four large provinces.
The iris is a circular part of the uvea of the eye. See Eye. The iris is a circular variously coloured part, which surrounds the pupil; it is in some persons blue, in others black, brown, grey, &c., each of which has its peculiar beauty, and is suited to the complexion of the person who has it.

IRIS, in botany, a genus of the *trianthra-monogyina* class of plants, under which is comprehended the xiphion, syfirincium, and hermodactylus of authors, the characters of which are these: the flower is monopetalous, but divided into fixed and oblong segments; the three exterior ones being reflex, or bent back, and the three inner ones erect and more acute; the fruit is an oblong, angular, and trilocular capsule, containing a great number of seeds. See plate CXLIV. fig. 5.

The florentine, or dry iris-root, is an astringent and expectorant, and accordingly given with success in asthmatic and disorders of the breast and lungs; the dose is from ten to fifteen grains in powder. The juice of the fresh root of our common iris is an excellent medicine in dropsies; and the best way of giving it is in white wine, an ounce or two for a dose: it works both by vomit and flux, and carries off a very great quantity of phlegm. It is also ordered as a termulatory, to be snuffed up the nose, in complaints of the head, which it eases very much, by bringing away the over-abundant phlegm.

IRON, ferrum, in natural history, the lightest of all metals excepting tin, but considerably the hardest of them all. It is, when pure, naturally malleable and ductile under the hammer; but that in a less degree than either gold, silver, lead, or copper. When wrought into steel, or when in the impure state from its first fusion, in which it is called cast iron, it is scarce malleable at all: the most ductile iron in the world also, on being only heated and suddenly quenched in cold water, loses much of this quality.

Iron is extremely capable of rust; more so than any other metal; it is very numerous; it requires the strongest fire of all the metals to melt it; it must be a very good furnace that will make iron run without the blast of bellows; but it is found, when once heated to a proper degree, this blast will effect that without the assistance of the farther heat of any fuel being employed in it; for if an iron-bullet, made red-hot, be suspended at a distance from the fire, and the blast of a strong pair of bellows forcibly directed against it in that condition, it will in a little time melt and run down in drops, by the mere effect of the current of the air they convey to it. Iron is less simple in its composition than any of the heavier metals: it contains, indeed, a sulphur so imperfectly blended with the rest of its constituent matter, that it will readily get loose from it, and in a strong heat will appear in visible flames. It is the most difficult of all the metals to be amalgamated with mercury; the metallurgical authors in general, have said that it will not amalgamate with it at all; but, from the success of some late attempts towards making this union between them, it appears to be not impossible, that a method may be found of doing it. Iron is less fixed in the fire, than most of the other metals; it manifestly fumes and sparkles, when exposed to a moderately fierce degree of it; it loses also a part of its weight in this heat, and much more when in fusion. Iron is remarkable for the effect fire has on it, in rendering it more ductile; most of the other metals are brittle, while they are hot; but this is most of all malleable, as it approaches nearest to fusion. It grows red-hot long before it melts, and is known to be approaching towards that state, by its becoming whiter, and by its sparkling: if taken from the fire, as soon as it runs, it is found to be more malleable for the fusion; but if it be kept long in that state, its sulphur diffipates in a form of white smoke; the metal after this becomes much more brittle, and in fine runs into a bluish glafs.

Iron, exposed to the focus of a great burning glafs, instantly grows red-hot, then turns whitish, sparkles and flames, and immediately after melts; soon after this the greatest part of it flies off in sparks, which appear very bright, and, if caught upon paper, are found to be so many little globular bodies, all hollow like bomb-shells: the remainder runs into a bluish or purplish glafs; and this glafs, exposed again to the fame focus, on a piece of charcoal, takes up, from the vegetable fuel, the sulphur or inflammable principle it had lost, and be-
comes true iron again. Upon the whole, the effects of a common, and those of a solar fire, on this body, concur to prove, that it consists of vitriolic salt, a vitrifiable earth, and a peculiar bituminous matter, not found in any of the other metals. When perfectly pure, it readily melts with gold and silver, and unites with them in fusion; but if it be impure, it separates itself, and forms a distinct regularus above the surface of the other. On being heated red-hot, it increases in bulk and in weight; but it returns to its former gravity and dimensions when cold.

Iron is soluble in all the stronger acids; spirit of nitre, or aqua fortis, succeed most readily in the solution of it; but, beside these, and all the other acids, it is to be dissolved also by a multitude of weaker menstruums, among the rest even by common water; for on lying long in this fluid, it communicates a manifest taint to it, and contracts a rust, and throws off a yellow ochre. All salts, except the alkaline ones, readily dissolve iron; nay the very air has so much power over it in this respect, that the people who deal in utensils made of it, are obliged to cover them with some oily or fatty sub stance, to make them retain their polish. To this may be added, that iron is the most easily of all metals destroyed by many other means: it neither resists the force of lead nor of antimony; but, on being fused with them, it almost immediately vitrifies, and is carried off in form of fcorie.

The great test of iron, is its answering to, or being attracted by, the magnet or lodestone; but then it must be in its true metallic state, for many of its ores will not answer in any part to this trial. Experiments, however, prove, that iron may be produced by art, out of almost every thing we know. Earths of almost all kinds afford iron by calcination; and all the parts of animals and vegetables, as well their fluids as their solids, yield it by the same means: if any plant, or part, or juice of a plant, be burnt to ashes, or the flesh, bones, blood, or fat of any animal, be treated in the same manner, iron will be found in the ashes, and that in so perfect a state, that it answers readily to the magnet. Honey, wax, and all other vegetable sub stances, collected by animals, contain iron, and it may be separated from them pure, in the same manner; finally, our Dr. Litter takes great pains to prove, that this metal is found in, nay, and is the basis of the stone in the bladder.

Iron in the bowels of the earth, when it enters the composition of crystals in spar s, seems to be two very different operations of the same metal; they sometimes con cur, as there are found purple rhombic crystals of iron, and yellow cubic ones of lead; but in general it is much more frequent to be coloured hexagonal prisms, and colourless cubes and rhombs. Among the gems, the amethyst, garnet, and hyacinth owe their colours to iron; and this metal has the same effect in the preparation of the facitious gems, as in the natural ones; for, properly managed, it communicates a purple or red colour in various shades and degrees, to glasses and to vitrified sub stances of all kinds.

True native iron is not to be expected in the midst of masses of its ore, but in detached prongs or filaments in the fissures of rocks, the whole substance of which is rich in that metal: such have been all the genuine specimens of this rich fossil, and such their place of formation.

The ores of iron generally discover themselves to be such, either by their resemblance to wrought iron in structure and look, or by the yellowish or purplish tinge they are coloured with. Those which have most of all the appearance of the metal they contain, are usually the richest.

There is an iron-ore found in Sweden and Germany, particularly in the Harts forest, which usually lies in the largest fissures of the strata, in great lumps, and is very hard, heavy, and of a bluish grey colour; this, when broken, has so much of the sparkling appearance of the metal, that a person unaccustomed to these subjects, might easily mistake it for real pure iron. This is the richest iron-ore known, unless we except some of the haematites. We have an ore very like this in the forest of Dean, in Gloucestershire, which is at this time worked to great advantage. Another kind we have in Derbyshire, which is also common to Sweden and Germany; it resembles the former, but that it is harder; and when broken, it is not so bright and sparkling. There are also other very rich ores of a dusky brown colour, with a tinge of purple; of this kind are those worked at this time in Suffolk, under the name of the cabala-vein. Another of the rich kinds, less common with us, is of a bluish purple, with a few bright triangles in it; but this is much inferior.
inferior to the two former of those above-mentioned.
The poorer ores of iron are generally of a more lax and friable texture, and of a yellowish or reddish hue, or else of a mixed colour between these, and with a cast of brownish or blackish in it: but the most singular of all the ores of iron is a white one, which appears only like a debayed crystal, having not the least sign of metal in it. The common ochres, as well the yellow as the red, are also to be ranked among the number of the ores of iron; they are very rich in that metal, and are even worked for it in some places to great advantage: nor are we to omit the mention of those elegant bodies which hang from the roofs of caverns in iron-mines, in form of icicles; these are truly talcaceous of iron; they are generally produced in large clusters together, and called by the miners bruith-ore: these are almost all iron. The crullated ferruginous bodies, common in our gravel-pits about London, are also very rich in iron, and have been worked for it in places where they are sufficiently plentiful. The red subflance called finit, is likewise a very rich iron-ore; this is much like the common Derbyshire redde, but finer and heavier.

**Introduction**: Iron from its ore, in a close vessel. Roast for a few minutes in a tift under the muffel, and with a pretty strong fire, two centners of the small weight of your iron-ore grossly pulverized, that the volatiles may be dissipated in part, and the ore itself be softened, in case it should be too hard. When it is grown cold, beat it extremely fine, and roast it a second time, as you do the copper-ore, but in a much stronger fire, till it no longer emits any smell; then let it grow cold again.

Compose a flux of three parts of the white flux with one part of the fusible pulverized glass, or of the like arsenie unphosphorous flonize, and add glass, 3/4 and coal-dust, of each one half part: add of this flux three times the quantity of your roasted ore, and mix the whole very well together; then choose a very good crucible, well rubbed with lute within, to stop the pores, which may be here and there uneen; put into it your ore mixed with the flux, cover it over with common salt, and shut it close with a tile, and with lute applied to the joints. Put the wind-furnace upon its bottom part, having a bed made of coal dust, introduce besides into the furnace, a small grate, supported on its iron-bars, and a stone upon it, on which the crucible may stand as upon a support; surround the whole with hard coals, not very large, and light them at top: when the vessel begins to grow red, which is indicated by the common salt's ceasing to crackle, flop with gros lute, or windlor-loam, the holes of the bottom part, except that in which the nozzle of the bellows is receiv'd; blow the fire, and excite it with great force, adding now and then fresh fuel, that the vessel may never be naked at top. Having thus continued your fire in its full strength for three quarters of an hour, or a whole hour, take the vessel out of it, and strike the pavement on which it is set, that the small grains of iron that happen to be dispered, may be collected into a regulus, which you will find after having broken the vessel.

**Preparations of Iron**, in medicine, are, 1. the crude filings, reduced to an impalpable powder, greatly recommended in female disorders.

2. The crocus martis. See Crocus.

3. The flores martiales, or flowers of iron. See the article Flos.

4. The salt martis, or salt of iron, which is prepared thus: mix together a quart of water, and eight ounces of the oil of vitriol; pour the oil of vitriol in by a little at a time: put the mixed liquor into a glass-veifel, and add to it four ounces of the filings of iron: when the ebullition is over, evaporate the liquor to a pellicle, and set it to shoot, there will then be a green vitriol or salt found in clear crystalls; dry them for use.

This salt is one of the most powerful preparations of this metal; it opens obstructions of all kinds, strengthens the viscera, is an excellent medicine in cachexies, and destroys worms.

5. Tincture of iron, with spirit of salt, is made thus: take filings of iron, half a pound; Glauber's spirit of sea-salt, three pounds; rectified spirit of wine, three pints: digest the spirit of salt and the filings together, without heat, as long as the spirit will work upon them; then after the faces have fusbled, pour off the clear liquor, evaporate it to one pound, and to this add the spirit of wine.

This has the fame virtues as the crocus martis. See the article Crocus.

6. Chalybeate, or steel-wine, is made in the following manner: take filings of iron, four ounces; cinnamon and mace,
of each half an ounce; of rhenish wine, two quarts; infuse them a month, without heat, often shaking the vessel, and then filter it off for use.

This wine is an excellent stimulant and aperient; a moderate glass may be drank once or twice a day, or it may be mixed in apozems of the aperient vegetables.

Duties upon IRON. Amy Spanish, spruce, and Swedish iron imported in any other ship or vessel than such as is English built, and of which the master, and at least three-fourths of the mariners are English, pays on importation, 21. 17s. 10d. the ton, and draws back on exportation, 21. 14s. 6d. The same imported in English-built ships, and so navigated, to pay on importation, 21. 8s. 6½d. the ton, and draw back on exportation, 21. 5s. 2½d. Iron flit or hammered into rods, commonly known by the name of rod-iron, pays on importation, 8s. 6¼d. the hundred wt. and draws back on exportation, 8s. 7½d. Ditto from Ireland, pays 3s. 10½d. and draws back, 3s. 4½d. Iron drawn or hammered, less than three fourths of an inch square, pays on importation, 8s. 6¼d. the hundred weight, and draws back on exportation, 8s. 7½d. Unwrought iron of Ireland, pays on importation, 11. 6s. 11½d. the ton, and draws back on exportation, 21. 3s. 7½d. Unwrought iron of all other places, not otherwise rated, imported in British ships, pays on importation, 21. 8s. 6½d. the ton, and draws back on exportation, 21. 5s. 2½d. and in foreign ships, pays on importation, 21. 17s. 10½d. and draws back on exportation, 21. 14s. 6½d. Iron-wares manufactured, not otherwise rated, or not prohibited by law, pay per hundred weight on importation, 12s. 4½d. and draw back on exportation, 11s. 5½d. Iron ore the ton, pays on importation, 2s. 4½d. and draws back on exportation, 2s. 2½d. Backs for chimneys, large, the 100 piece, pay on importation, 4s. 9½d. and draw back on exportation, 4s. 5½d.

Bands for kettles, the hundred wt. pay on importation, 12s. 4½d. and draw back on exportation, 11s. 5½d. Fire irons, the groce, pay on importation, 12s. 11½d. and draw back on exportation, 12s. 8½d. More for every hundred weight on importation, 4s. 8½d. and draw back on exportation, 4s. 3½d. Hoops the hundred wt. pay on importation, 9s. 9½d. and draw back on exportation, 9s. 2½d. Stoves, the piece, pay on importation, 19s. 3d. and draw back on exportation, 16s. 10½d. More for every hundred weight on importation, 4s. 8½d. and draw back the same. Iron kettle, the piece, pay 1s. 2½d. and the 100 draw back, on exportation, the same; and besides for every hundred weight on importation, 7s. 8½d. and draw back, on exportation, 6s. 6d.

Pig or bar-iron, from the British plantations in America, is imported free; but all such iron must be stamped with a mark, denoting the colony, or place where it was made, and a certificate produced of the oath of the exporter, signed by two of the principal officers of such colony; and the master, or commanding officer of the ship, or vessel, importing such iron, must make oath, that the iron so imported, is the same as that mentioned in the certificate.

IRON-SICK, in the sea-language, is laid of a ship or boat, when her bolts or nails are so eaten with rust, and so worn away, that they occasion hollows in the planks, whereby the vessel is rendered leaky.

IRON-WOOD, sideroxylon, in botany. See the article SIDEROXYLON.

IRON-WORT, sideritis, in botany. See the article SIDERITIS.

IRONY, in rhetoric, is when a person speaks contrary to his thoughts, in order to add force to his discourse; whence, Quintilian calls it diversiloquium. Thus, when a notorious villain is scornfully complemented with the titles of a very honest and excellent person; the character of the person commented, the air of contempt that appears in the speaker, and the exaggeration of the commendations, sufficiently discover the distortion or irony.

10 X. Ironic
Ironical exhortation is a very agreeable kind of trope; which, after having set the inconveniences of a thing in the clearest light, concludes with a feigned encouragement to pursue it. Such is that of Horace, when, having beautifully described the noise and tumults of Rome, he adds ironically,

Go new, and study tuneful verse at Rome!

IROQUOIS, the name of five nations in north America, in alliance with the British colonies. They are bounded by Canada on the north, by the British plantations of New-York and Pennsylvania on the east and south, and by the lake Ontario on the west.

IRRADIATION, the act of emitting subtle effluvia, like the rays of the sun, every way. See EFFLUVIA.

IRRATIONAL, an appellation given to surd numbers and quantities. See the articles NUMBER, QUANTITY, and SURD.

IRREGULAR, something that deviates from the common forms, or rules; thus we say an irregular fortification, an irregular building, an irregular figure, &c.

See the articles FORTIFICATION, &c.

IRREGULAR, in grammar, such inflections of words as vary from the general rules; thus we say, irregular nouns, irregular verbs, &c.

The distinction of irregular nouns, according to Mr. Ruddiman, is into three kinds, viz. variable, defective, and abundant; and that of irregular verbs into anomalous, defective and abundant.

See ABUNDANT, DEFECTIVE, &c.

IRREGULAR, among castulls, is applied to a person who is unqualified for entering into orders; as being base-born, notoriously defamed, &c. and by that means rendered incapable of holding a benefice, or discharging any of the sacred functions.

IRREGULAR BODIES, are solids not terminated by equal and similar surfaces.

IRREGULAR COLUMN, in architecture, a column which does not only deviate from the proportions of any of the five orders, but whose ornaments, whether in the shaft or capital, are absurd and ill chosen.

IRREPLEVIALE, or IRREPLEVISABLE, in law, signifies any thing that neither may nor ought to be reprieved. It is said, that it is against the nature of a defter for rent, to be irrepleviable.

IRRTIS, a great river, which runs from north to south through Russia, falls into the river Oby, and makes part of the boundary between Asia and Europe.

IRWIN, a port-town of Scotland, in the bailiwick of Cunningham, situated at the mouth of the river Irwin, on the Firth of Clyde: west long. 4° 40', north lat. 55° 35'.

ISABELLA, a fortress of the Austrian Netherlands, situated on the west side of the river Scheld, opposite to Antwerp, in east long. 4° 20', north lat. 51° 15'.

ISAIAH, or Prophecy of ISAIAH, a canonical book of the Old Testament. Isaiah is the first of the four greater prophets, the other three being Jeremiah, Ezekiel, and Daniel. This prophet was of royal blood, his father Amos being brother to Azariah, king of Judah. The five first chapters of this prophecy relate to the reign of Uzziah; the vision, in the sixth chapter, happened in the time of Jotham; the next chapters to the fifteenth, include his prophecies under the reign of Ahaz; and those that were made under the reigns of Hezekiah and Manasseh, are related in the next chapters to the end.

The title of this prophet is noble, sublime and florid. Grotius calls him the Demosthenes of the Hebrews. He had the advantage, above the other prophets, of improving his diction by conversing with men of the greatest parts and eloquence, and this added a sublimity, force, and majesty to what he said. He impartially reproved the vices of the age in which he lived, and openly displayed the judgments of God that were hanging over the Jewish nation; at the same time denouncing vengeance on the Assyrians, Egyptians, Ethiopians, Moabites, Edomites, Syrians, and Arabians, who were instrumental in inflicting those judgments. He foretold the deliverance of the Jews from their captivity in Babylon, by the hands of Cyrus king of Persia, an hundred years before it came to pass; but the most remarkable of his predictions are those concerning the Messiah, in which he not only foretold his coming in the leath, but all the great and memorable circumstances of his life and death.
of one cell: the seed is single, ovated, and contained in the center of the fruit. This plant is much used by dyers, as also in medicine, as an astringent, a vulnerary, and for stopping the menes.

ISCHÆMUM, SCHOENANTH, in botany, a genus of plants, thus characterized by Scheukzer: the male and female flowers are separate, but stand near each other; the male is a small bivalve glume, placed on the calyx of the female flower, which is a biforous glume: the seed is single, and involved in the calyces and corollae.

The whole plant is of a fragrant aromatic smell, and is accounted cephalic, but little used at present.

ISCHIÀ, an island in the Neapolitan Sea, situated fifteen miles west of the city of Naples, in 14° 49', east long. and 41° north lat.

ISCHIADIC, in anatomy, a name given to two crural veins, called the greater and lesser ischiæ. See VÉIN.

It signifies also a disease or pain of the hip; being a species of arthritis, seated in the joint of the hip, and commonly called sciatica. See the article SCIATICA.

ISCHIAS, one of the ischiatic veins. See VÉIN, and the preceding article.

ISCHIUM, in anatomy, the name of a bone described under the article INNOMINATA. See INNOMINATA.

ISCHURY, eXHIBIS, in medicine, a disease consisting in an entire supression of urine. As the causes of an ischury are various, they ought, according to Heister, to be carefully distinguished from each other. When it proceeds from an inflammation of the kidneys, the pain and heat are principally in that region attended with a fever; if from a stone in the kidneys, it is accompanied with vomiting; if from a stone in the bladder, there is a violent pain in the bladder, which is extended to the very extremity of the urethra; a mucus, or pus, is excreted with pale urine; and upon proper examinations, the stone may be felt: but the most certain sign, is searching the bladder with a catheter. When this disorder arises from a stone in the urethra, it may be easily felt. If from an inflammation of the neck of the bladder, there is a tumour and pain in the perineum, as often as the place is touched; but it may be felt perceived by thrusting the finger into the anus, and turning it up towards the bladder, for a tumour will be perceived by the physician, and by the patient a burning and pressing pain; and when a catheter is introduced into the urethra, an impediment will be felt near the neck of the bladder, which will hinder it from proceeding farther. See the article CÁTHETER.

When the urinous passages are obstructed by solid bodies, that is, the pelvis of the kidneys, the ureters or neck of the bladder, or the urethra, from a stone contained therein; if it be small, those diuretics will be proper which are mentioned in a fit of the gravel or stone, to which may be added a decoction of eryngo-root and epfa-root, or felters-waters, taken often therewith. But if the stone is large and cannot be excreted by this means, strong diuretics are highly hurtful; and it must be cured by section. See the article LITHOTOMY.

If the urine is suppressed from an inflammation of the kidneys or bladder, recourse must be had to the treatment and medicines preferred for the disorders under the article INFLAMMATION.

When the spungy substance of the urethra is swelled with blood, and as it were inflated, a copious bleeding is the principal remedy. See GONORRHOEA.

If a spasm affects the neck of the bladder, it must be treated with antispasmodic powders, diuretic waters, and infusions with emulsions and lenient oils now and then, such as salt oil, oil of sweet almonds, poppy or linseed; externally, cataplasmis, ointments, clysters, and baths of the emollient and demulcent kind, with gentle opiates. See SPÁSM.

If the disease proceeds from the belly, as sometimes happens in old persons, wherein there is no pain, the belly and perineum must be treated with frictions and fomentations of strengthening, nerve and spirituous remedies, with cataplasmis of onions, and other stimulants applied to the bladder, with clysters of the same sort of herbs. When the urine is very urgent, it must be evacuated by a catheter, which must be repeated as often as occasion requires. See PALSY.

If the disorder proceeds from blood remaining in the bladder, or its neck, the concretion is to be resolved and expelled with warm infusions of digestive herbs drunk like tea; such as ground ivy, arnica, chervil, with tincture of tartar, liquor of the terra foliata of tartar, with digestive powders of crab's eyes, saturated with the juice of oranges or lemons, sperma ceti, &c. but if all these fail, the catheter

10 X 2
iselastics, isenach, isernia, isla, feath.

Catheter is to be introduced into the neck of the bladder, to break the concretion, and evacuate the urine. See the article Resolvent, &c.

When there is an ulcer in the bladder, infusions of vulnerary absorbent roots and herbs must be given, with musciages and soft balsamics, especially balsam of Mecca, with a moderate use of quicksilver, especially if the cattle is venereal. See the article Ulcer.

If there is a difficulty of urine in pregnant women, towards the last months, the best remedy is to caufe the pressure on the part; but if that will not do, to use a catheter.

Lastly, if it proceeds from a swelling of the prostate glands, or it is become suppous’d, it must be treated as such; but if these remedies fail, the bladder must be pierced with a trocar; and when the perforation is made, the water must be evacuated as in the drope. This instrument must be left in the wound, and fastened in such a manner, that it does not fall out, so that the urine may be made as often as there is occasion. It is a troublesome operation, but the only one left.

Iselastics, a kind of games, or combats, celebrated in Greece and Asia, in the time of the roman emperors.

The victor at these games had very considerable privileges conferred on him, after the example of Augustus and the Athenians, who did the like to conquerors at the olympic, pythian, and ithmian games. They were crowned on the foot immediately after their victory, had pensions allowed them, were furnished with provisions at the public cost, and were carried in triumph to their country.

Iesenach, a town of Germany in the circle of Upper Saxony, situated in east long. 10° 12’, north lat. 51°.

Iensenarts, a town of Germany, in the circle of Austria, and dukedom of Storia, situated thirty-five miles north-west of Grazt.

Isernia, a town of Naples, in the province of Molisl, situated in east long. 15° 15’, north lat. 41° 36’.

Isia, feasts and sacrifices antiently solemnized in honour of the goddess Isis.

The Isis were full of abominable impurities, and for that reason those who were initiated, were obliged to take an oath of secracy: they held for nine days consecutively, but were so abominable, that the senate abolished them at Rome, under the consufhip of Piso and Gabinius.

Isinglass, ichthyocolla, in the materia medica, &c. See Ichthyocolla.

Isis, in botany, the name by which Linnaeus calls the coral-plant. See Coral.

Island, a tract of dry land, encompassed with water, in which fene it stands contradistinguish from continent, or terrâ firma. See Continent.

Several naturalists are of opinion, that the islands were formed at the deluge; others think, that there have been new islands formed by the casting up of vast heaps of clay, mud, sand, &c. others think they have been separated from the continent by violent storms, inundations, and earthquakes. Thefe last have observed, that the East-Indies, which abound in islands more than any other part of the world, are likewise more annoyed with earthquakes, tempefts, lightnings, vulcanos, &c. than any other part. Others again conclude, that islands are as antient as the world, and that there were some at the beginning, and among other arguments, support their opinion from Gen. x. 5. and other passages of scripture.

Varenius thinks, that there have been islands produced each of these ways. St. Helena, Afcension, and other steep rocky islands, he supposos to have become by the sea’s over-flowing their neighbouring campaigns: but by the heaping up huge quantities of sand, and other terrestrial matter, he thinks the islands of Zealand, Japan, &c. were formed. Sumatra and Ceylon, and most of the East-Indian islands, he thinks, were rent off from the main land; and concludes, that the islands of the Archipelago were formed in the same way, imagining it probable, that Deucalion’s flood might contribute towards it. The antients had a notion that Delos, and some other few islands, rose from the bottom of the sea, which, how fabulous soever it may appear, agrees with later observations. Seneca takes notice, that the island Thera笋 rose thus out of the Egean sea in his time, of which the mariners were eyewitnesses. They had also an opinion that there are some islands which swim in the sea. Thales, indeed, thought that the whole earth which we inhabit floated in the sea: but floating islands are not only probable, but well attested. See the article Floating.
ISO [1899] ISO

ISLE, in general, denotes the same with island, only frequently used in a diminutive sense.

ISLE DE DIEU, an island in the Bay of Biscay, on the coast of France, situated fourteen miles west of the coast of Poitou.

ISLE of France, a province of that kingdom, in which the capital city of Paris is situated, being bounded by Picardy on the north, by Champain on the east, by Orleans on the south, and by Normandy on the west.

ISLES, in architecture, denote the sides or wings of a building. See BUILDING.

ISLOCK, or ILOCK. See ILOCK.

ISNARDIA, in botany, a genus of the tetrandria monogynia class of plants; having no corolla: the fruit is formed of the square base of the cup: it has four cells, and in them a few seeds of an oblong figure.

ISNY, a free imperial city of Germany, in the circle of Swabia, situated in eait long. 10° north lat. 47° 36'.

ISOCRATIONAL, ISOCRONE, or ISOCRONOUS, is applied to such vibrations of a pendulum, as are performed in the same space of time, as all the vibrations or swings of the same pendulum are, whether the arches it describes be longer or shorter: for when it describes a shorter arch, it moves so much the flower, and when a long one proportionally faster.

ISOCRONAL LINE, that in which a heavy body is supposed to descend without any acceleration. See ACCELERATION.

Mr. Leibnitz, in the Acta Erud. Lips. for Feb. 1689, shews, that an heavy body with a degree of velocity acquired by the descent from any height may descend from the same point by an infinite number of isochronal curves, all which are of the same species, differing from one another only in the magnitude of their parameters: such are all the quadrato-cubical paraboloids, and consequently similar to one another. He shews also there, how to find a line in which a heavy body descending shall recede uniformly from a given point, or approach uniformly to it.

ISOLA, a port-town and bishop's see of the hither Calabria, fifteen miles south of St. Severino.

ISOMERIA, a term sometimes used for the reduction of equations. See the article EQUATION.

ISOPERIMETRICAL FIGURES, in geometry, are such as have equal perimeters, or circumferences. See the article CIRCUMFERENCE.

1. Of isoperimetrical figures, that is the greatest that contains the greatest number of sides, or the most angles, and consequently a circle is the greatest of all figures that have the same ambit as it has. See the article CIRCLE.

2. Of two isoperimetrical triangles, having the same base, whereof two sides of one are equal, and of the other unequal, that is the greater whole two sides are equal. See TRIANGLE.

3. Of isoperimetrical figures, whose sides are equal in number, that is the greatest which is equilateral and equiangular. From hence follows that common problem of making the hedging or walling that wall in one acre, or even any determinate number of acres, a fence or wall in any greater number of acres whatever. In order to the solution of this problem, let the greater number of a square be supposed a square. Let x be one side of an oblong, whose area is a; then will \( a \) be the other side; and \( 2a + 2x \) will be the ambit of the oblong, which must be equal to four times the square root of \( b \); that is, \( 2a + 2x = 4\sqrt{b} \).

Whence the value of \( x \) may be easily had, and you may make infinite numbers of squares and oblongs that have the same ambit, and yet shall have different given areas. See the operation:

Let \( \sqrt{b} = d \)

Then \( 2a + 4x \)

\[
\frac{x}{x} = 4d
\]

\[
a + 2xx = 2dx
\]

\[
2xx - 2dx = -a
\]

\[
xx - dx = \frac{a}{2}
\]

\[
xx - dx + \frac{1}{2}dd = \frac{-a + \frac{1}{2}dd}{2}
\]

\[
x = \sqrt{\frac{a}{2} + \frac{1}{2}dd + \frac{1}{2}}
\]

Thus if one side of the square be 10; and one side of an oblong be 19, and the other 1: then will the ambit of that square and oblong be equal, viz. each 40, and yet the area of the square will be 100, and of the oblong but 19.

ISOPYROM, in botany, a genus of the polyandria digynia class of plants, the corolla of which consists of five equal, ovated and patent petals: the fruit is composed of two crooked, lunated pods, with
ISOCELES-TRIANGLE, in geometry, one that has two equal sides, as A B C (pl. CXLVIII. fig. 2.) where the side A B is equal to A C.

In every isosceles triangle, the angles A B C, A C B, subtended by the equal sides, are equal; and a line A D bisecting the base B C in D, is perpendicular to it, as is easily demonstrated. See the article TRIANGLE.

ISPAHAN, or SPAHAWN, the capital city of Eyrac Agem, and of all Persia: it is of an oval form, and twelve miles in circumference: east long. 50°; north lat. 32° 30'.

ISPIDA, the King-Fisher, in ornithology, a genus of the picc-order of birds, with a beak of a trigonal figure, somewhat arcuated, compressed, and its two chaps equal: there are four toes on each foot, with only one of them placed behind.

This is a very numerous genus, the species of which are chiefly distinguished by their size and different colours.

ISSUE, in law, has several significations, it being sometimes taken for the children begotten between a man and his wife; sometimes, for profits arising from amercements and fines; and sometimes, for the profits issuing out of lands or tenements: but this word generally signifies the conclusion, or point of matter, that issues from the allegations and pleas of the plaintiff and defendant in a cause tried by a jury of twelve men.

There are two kinds of issues in relation to causes, that upon a matter of fact, and that upon a matter of law: that of fact is where the plaintiff and defendant have fixed upon a point to be tried by a jury: and that in law is, where there is a demurrer to a declaration, &c. and a joinder in demurrer, which is determinable only by the judges. Issues of fact are either general or special: they are general, when it is left to the jury to find whether the defendant has done any such thing as the plaintiff has alleged against him; and special, where some special matter, or material point alleged by the defendant in his defence, is to be tried. General issue also signifies a plea in which the defendant is allowed to give the special matter in evidence, by way of excuse or justification; this is granted by several statutes, in order to prevent a prolixity in pleading, by allowing the defendant to give any thing in evidence, to prove that the plaintiff had no cause for his action.

In real actions, the issues are triable by a jury of the county in which the cause of action arises. Issues are to be certain and single, and joined upon the most material point in question, so that the whole matter in dispute between the parties may be tried. On a joint action of trespass by many persons, only one issue must be joined; and where several offences are charged against a defendant, he ought to take all but one by protestation, and then offer an issue on that one, and no more; though in an action for damages, every part, according to the loss the plaintiff has sustained, is to be put in issue. Where a good issue is joined between the parties, it cannot afterwards be waved, without the consent of both parties: but where the defendant pleads the general issue, and does not enter the fame, he may within four days of term wave such issue, and plead specially: so if a defendant pleads in abatement, he may any time after wave his special plea, and plead the general issue, except a rule be made for him to plead as he will stand by it: but in case the plaintiff omits entering the issue the term it is joined, the defendant in the first five days of the next term, may alter his plea, and plead de novo: and when the plaintiff will not try the issue, after the fame is joined, within the time required by the course of law, the defendant may give him a rule to enter it, and if he does not then try it he shall be nonsuitcd.

Issues on seriffs, are such amercements and fines to the crown, as are levied out of the issues and profits of the lands of seriffs, for their faults and negligence: but these issues, on shewing a good and sufficient cause, may be taken off before they are elfreated into the exchequer.

Issues are also leviable upon jurors, for non-appearance; though upon a reasonable excuse, proved by two wittneses, the justices may discharge the same.

Issues, in surgery, are little ulcers made disdainfully by the surgeon in various parts of the body, and kept open by the patient, for the preservation or recovery of his health.

The parts in which issues are generally made, are either the upper part of the head; the neck; the arms, betwixt the biceps and deltoide muscle, and near the insertion of the laft; in the thigh, especially
especially within side, immediately above the knee, in a cavity easily felt by the fingers; and, lastly, in the legs, on their interior side, in a cavity immediately below the knee.

There are several methods of making issus, but the most ready one is by incision, which is performed thus: first mark the proper place with ink; then elevating the integuments between the thumb and fore-finger of the surgeon and an affitant on each side, you next proceed to make an incision thro' them, either with the scalpel or lancet, big enough to admit a pea, which being inserted and covered with a plaster and compres, nothing more than your finger is wanting to compleat the operation. Thus by cleaning and dressing the wound every morning and evening with a fresh pea, it by degrees, in a day or two, degenerates into a little ulcer, which, being covered of the diseased matter, which should be carefully cleansed or wiped off at every dressing.

There is a second method of making issus by wounding the skin with an actual cautery, or red hot iron, which is usually included in sort of capitula, or cafe of iron (plate CXLIX. fig. 2.) to conceal it from terrifying the patient. When the case BB is fixed upon the proper part for the issue, the red-hot iron C, is then pressed down upon the integuments, and the echar, or burn, is next to be dressed with fresh butter or baflicon, till by repeating the dressing every day, it separates, and then the ulcer formed, is to be filled with a pea, and dressed as before.

The third method of making issus is by the application of potential cauteries, or corroding medicines; in order to which a piece of plaster is first perforated, and then applied, so as its aperture may cover the place marked with ink for the issue; a piece of the cautic is then put into the aperture of the plaster, and retained close down upon the skin, with some scraped lint, a small compres, and a large plaster; and lastly, with a larger compres and bandage. The patient is then to be ordered to rest for about fix or eight hours, more or less, according to the strength of the cautic, which time being elapsed, and the dressings removed, the echar is to be treated as before directed in an actual cautery.

In which ever of these methods the issue is made, it must be dressed at least twice every day, especially if it runs well, and in the summer-season: and at each dressing you must put in a fresh pea, and cover it with a clean plaster, or a piece of waxed paper or silk, or an ivy-leaf retained with compres and bandage. But the deligation for issus is much more commodiously performed with a leathern swath, fastened by clasps, than by a circular linen-roller. In this manner issues are to be kept open, till the patient is recovered of the disorder for which they were made.

Issues are chiefly made for various disorders in the head, eyes, ears, teeth, the sciatica, and other painful disorders, which are this way frequently relieved or cured. But in stubborn disorders it is frequently necessary to make two or more issues to produce any considerable effect, as one in each arm, or in one arm and leg of the same side.

In order to close an issue, little more is required than to discharge the pea, and to refrain from putting in any more, by which means alone it will close up in a short time: but if any proud flesh should arise, it may be amputated, or else removed with burnt alum. Lastly, it is observable, that when the issues of people far advanced in years cease to make their wonted discharge, and turn of a livid and blackish hue, it is a sign that they are invaded by some desperate disorder, and that life itself is very near its period.

Isthmia, or Isthmian games, so called, one of the four solemn games which were celebrated every fifth year in Greece; so called from the corinthian isthmus, where they were kept.

These games, according to some, were instituted in honour of Paulemon, or Melicertes the son of Athamas king of Thebes, and Ino. Others report, that they were instituted by Theseus, in honour of Neptune. Others again are of opinion, that there were two distinct solemnities observed in the Isthmus, one to Melicertes, and another to Neptune. These games were held so farred and inviolable, that when they had been intermitted for some time, through the oppression and tyranny of Cypæus king of Corinth, after the tyrant's death the Corinthians, to renew the memory of them, employed their utmost power and industry. The victors were rewarded with garlands of pine-leaves; afterwards, parsley was given them: but at length, the pine was returned, and to this was added...
ITALIAN COINS. See Coin.
ITALIAN MEASURES. See Measure.
ITALIC CHARACTERS, in printing. See the article LETTER.
ITALIC, or ITALIAN HOURS, the twenty-four hours of the natural day, accounted from the sun-setting of one day, to the same again the next day. See HOUR.
ITALIC SECT, the name of a sect of ancient philosophers, founded by Pythagoras; so called, because that philosopher taught in Italy, spreading his doctrine among the people of Tarentum, Metapontus, Heraclea, &c. This sect divided itself into four others, viz. the HERACLITIC, ELEATIC, &c.
ITALY, a country situated between seven and nineteen degrees east long., and between thirty-eight and forty-seven degrees north latitude, bounded by Switzerland, and the Alps, which separate it from Germany, and the Gulf of Venice, on the east; by the Mediterranean Sea, on the south; and by the same Sea and the Alps, which separate it from France, on the west; and if we include Savoy, which lies indeed on the west side of the Alps, between Italy and France, we must extend it a degree farther west: this is usually described however with Italy, as it is contiguous to Piedmont, and has the same sovereign, being a province of the king of Sardinia's dominions. Italy is said to resemble a boot, and is in length from north-west to south-east 600 miles; the breadth is very unequal; in the north, which may be called the top of the boot, it is 400 miles broad from east to west, in the calf of the leg, or middle, it is about 120 miles broad; and towards the south, about the instep, eighty miles broad; and comprehends the following countries or subdivisions. 1. In the north are the duchies of Savoy, Piedmont, and Montferrat; the territories of Genoa; the duchies of Milan, Mantua, Parma, Modena, and the territories of Venice. 2. In the middle of Italy, are the duchy of Tuscany, the pope's dominions, and the state of Lucca. 3. And in the south is the kingdom of Naples.
ITCH, a cutaneous disease, arising from a corruption of a serous lymphatic matter, sometimes attended with mild, sometimes with more obstinate and dangerous symptoms.
The itch of the milder sort appears either with moist or dry pustules at first about the joints, and from thence spreads by...
by degrees over all the body, the head
only excepted. In the moist fort, to
which children and the fanguineo-phleg-
matic are most fubject, the puitules are
more full of a purulent matter, attended
with a light inflammation, which is man-
ifested from a rednes that appears about
them, till it fuppurates. The dry fort
attacks chiefly tho' that are lean, old,
or are of a melancholico-choleric confti-
tuation. In thefe the puitules are much
lefs, and excite a moft intolerable itching,
especially in the night-time. The
moft ufual places where the eruptions
appear very numerous, and the itching
is great, are between the fingers, on
the arms, hams, and thighs.

This difeafe is truly and properly a dif-
eafe of the skin, because it often is fafely
cured by topics alone, if timely applied.
It is contagious, and may be caught by
drawing on a glove or frocking,
cured by topics alone, if timely applied.
less, and excite a

Some think it owing to an impurity in the
vicera: it
affecteds the
in the

The milder fort of itch
kind is more easy than the dry. While
it is recent and superficial, it much soon-
er yields to remedies than when it is
deep, and has infected the mafs of blood.
And the cafe is still worfe, if there be a
fault in the vicera: it is more difficult
in old persons, than in young; in a leuco-
phlegmatic, or hydroptic disposition, as
also in a very dry hefie one, it is hard to
cure; and when it becomes universal, it
may bring on the leproty.

The patient fhould avoid shell-fish, and
all falted and high-feaoned meats; as
also wine, spirituous liquors, frog-wine,
and every thing elfe that may inflame
the blood: for this reafon a flenier
diet is fett, unlefs perfpiration be
obftructed. If the body is plethoric, the
cure is begun by bleeding, and after-
wards by purging; but instead of purg-
ing, it is common to give flowers of ful-
phur with good fucces. Willis, and
many others, have a great opinion of the
efficacy of sulphur ufed both internally
and externally; to which Turner afents,
extcept in hefie and consumptive cafes;
but Shaw thinks it not to be depended
on, when outwardly ufed: yet it is very
certain, that poor people find a great deal
of benefit who drink it inwardly with
milk, and ufe it outwardly with butter
or hog's lard.

Juncker, from Stahl, calls the following
things fpecifics againft the acrimony of
the itch, taken internally, viz. sulphur
with nitre and arcanum duplicatum, bal-
sam of sulphur with oil of sweet almonds,
tincture of sulphur, and crude antimony.
Outwardly he advises mercurial oint-
ments, and fulphureous lixiviums; but in
the dry itch, he thinks baths more proper
made of the root of burdock, the sharp-
pointed dock, and mineral fountain-water.
Turner prefers the fal. tart. to moft
other remedies, it thoroughly purging
and cleaning the blood if taken inward-
ly; and made into a lixivium with spring-
water, is an excellent wash outwardly.
Harman, in an obfinate itch, propropes
a diaphoretic of the white flowers of an
omony to be taken twenty days toge-
er.

When the blood is thought to be foul,
it will be proper to ufe diet-drinks of the
roots of china, farfaparilla, oxylapathum,
scorzonera, chichory, glycyrrhiza, poly-
podium, the banks of falfafras, cinnamon,
and the like.

The moft stubborn itch will generally
yield to the following ointment, if proper
 evacuations have been prefcrib'd. Take
quickfiver, three drams; native cin-
nabar, one dram; venice-turpentine, half
dr.; hog's lard; half an ounce; oil of
sweet almonds, two drams. Mix and
divide this into eight equal parts, one of
which is to be rubbed into the legs and
arms every other night, or at greater in-
tervals, if there are any signs of fuliva-
tion: great care muft be taken that the
patient gets no cold, while he ufe this
medicine; if he feels any griping pains,
or if his breath begins to flink, the ufe of
it is immediately to be fulpended. It
has been a very common practice to cure
the itch by quickfiver-girdles, but Tur-
ner thinks them too hazardous to be
brought into regular practice. See the
article GIRDLE.

If this difafe fhould prove fo stubborn
ITTNERANT JUDGES, JUBILEE, a time of public and solemn festivity among the ancient Hebrews. This was kept every fiftieth year: it began about the autumnal equinox, and was proclaimed by sound of trumpet throughout the country. At this time all slaves were released, all debts annulled, and all lands, houses, wives and children, however alienated, were restored to their first owners. During this whole year all kind of agriculture was forbidden, and the poor had the benefit of the harvest, vintage, and other productions of the earth, in the same manner as in the sabbatic, or seventh year. As this was designed to put the faculties in mind of their Egyptian servitude, and to prevent their impeding the like upon their brethren, it was not observed by the gentile provincials.

The Christians, in imitation of the Jews, have likewise established jubilees, which began in the time of pope Boniface VIII. in the year 1300, and are now practiced every twenty-five years; but these relate only to the pretended forgivenesses of sins, and the indulgences granted by the church of Rome: together with the privilege of performing a thousand frolics in masquerade. The ceremony of the jubilee observed at Rome, begins in the following manner: the pope goes to St. Peter's church, to open the holy gate, which is walled up, and opened only on this occasion; and, holding a golden hammer in his hand, he knocks at the gate three times, repeating these words, *aperite mihi portas jubilae,* &c. *Open to me the gates of righteousness,* I will go into them, and I will praise the Lord, *Psal. cxviii.* upon which the masons fall to work, and break down the wall that stops up the gate: which done, the pope kneels down before it, and the penitentaries sprinkle him with holy water. Then, taking up the crofs, he begins to sing *te deum,* and enters the church, followed by the clergy. In the mean time, three cardinal-legates are sent to open the three other holy gates which are in the churches of St. John of Lateran, St. Paul, and St. Mary the Greater. When the holy year is expired, the holy gates are shut in this manner: the pope, after he has blessed the stones and mortar, lays the first stone, and leaves there twelve boxes of gold and silver medals; after which the holy gates are walled up as before, and continue so till the next jubilee.

JUCA TAN, or YUCATAN, a peninsula of Mexico, situated between 89° and 94° west long, and between 16° and 21° north lat. Its chief town is Campeachy. See the article CAMPEACHY.

JUDÆA AURICULA. See AURICULA.

JUDAI CRUS LAPIS, in the materia medica, the petrified spine of an echinus. See the article JEW'S STONE.

JUDAISM, the religious doctrines and rites of the Jews. See JEW.

JUDAS'TREE, *filicastrum,* in botany. See the article SILICA STRUM.

JUDDOCK, in ornithology, the English name of a small species of snipe, called also the gel or jack-snipe, and by authors gallinago minima.

JUDE, or the general epistle of JUDE, a canonical book of the New Testament, written against the heretics, who by their disorderly
disorderly lives and impious doctrines, corrupted the faith and good morals of the Christians. St. Jude draws them in lively colours, as men given up to their passions, full of vanity, conducting themselves by worldly wisdom, and not by the spirit of God.

In the early ages of Christianity, several rejected this epistle because the apocryphal books of Enoch and the ascension of Moses are quoted in it. Nevertheless, it is to be found in all the antient catalogues of the sacred writings; and Clement of Alexandria, Tertullian and Origen, quote it as written by Jude, and reckon it among the books of sacred scripture.

St. Jude's Day, the same with that of St. Simon. See the article Simon.

Judea, or Palestine. See Palestine.

Judenburg, a city of Strinia, in Germany: east long. 15°, north lat. 47° 22'.

Judge, a chief magistrate of the law, appointed to hear criminal causes, to explain the laws, and to pass sentence according to the verdict brought in, by the foreman of the jury. See Jury.

A judge, on his being created, takes an oath of office, that he will serve the king, and indirectly administer justice to all men, without respect of persons; that he will take no bribe; give no counsel, where he is a party; nor deny right to any, even though the king by his letters, or by express words, command the contrary; and that he may have no temptation to break his oath, he enjoys his office and a settled salary for life, and it is not in the power of the crown to deprive him of either. He is to execute his office in person, and cannot act by a deputy, nor transfer his power to another: yet where there are several judges in a court of record, the act of any one of them is effectual, provided their commission does not require more: so likewise what is carried by a majority present, is the act of the court: but where they are equally divided in opinion, the cause is to be removed into the exchequer-chamber, and for that purpose a rule is to be made, and the record certified, &c. Some things done by judges at their chambers, are accounted as done by the court: and that they may be prepared to hear what is to come before them, they are to have a paper of the causes to be heard, sent to them by the attorneys the day before they are spoken to; that if upon reading the record of a case any special matter that arises should appear doubtful, they may satisfy themselves by consulting books.

To support their dignity and authority, the judges of the courts of record are exempted from all prosecutions whatsoever, except in parliament, where alone they may be punished for anything they have done amiss in their own courts as judges: but yet if a judge should so far forget his dignity as to turn solicitor in a cause which he is to judge, and extrajudicially tamper with witnesses, or attempt to work upon jurors, he may be dealt with in a manner suitable to the character to which he has so basely degraded himself. As the judge is the substitute of the king, and is designed to distribute that justice which he cannot administer in person, he cannot be challenged like a jury, nor have any action brought against him for what he acts as a judge: while he is on the bench his person is in a manner sacred, so that to kill a judge of any of the inferior courts of Westminster, or of assize, on the place of administering justice, is treason; and drawing a weapon upon him in any of the courts of law, is to be punished with the loss of the right hand, the forfeiture of lands and goods, and perpetual imprisonment.

On the other hand, a judge cannot sit as judge in his own cause: if he is guilty of taking a bribe, he is punishable by loss of office, fines and imprisonment; and if a judge, who has no jurisdiction, passes judgment of death, and his sentence is executed, both he, and the officer who executes it, is guilty of felony.

Itinerant Judges. See Itinerant.

Book of Judges, a canonical book of the Old Testament, so called from its relating the state of the Israelites under the administration of many illustrious persons who were called judges, from their being both the civil and military governors of the people, and who were raised up by God upon special occasion, after the death of Joshua, till the time of their making a king. In the time of this peculiar polity, there were several remarkable occurrences, which are recorded in this book. It acquaints us with the gross impiety of a new generation which sprang up after the death of Joshua, and gives us a short view of the dispositions of heaven towards this people, sometimes relieving and delivering them, and at others, severely chastising them by the hands of their enemies.
JUDGMENT, among logicians, a faculty into two parts: the one containing the history of the judges from Othniel to Sampson; which ends with the sixteenth chapter: the other containing several memorable actions, which were performed in or about the time of the judges, from the seventeenth chapter to the end of the book. The author of this book is wholly unknown; some ascribe it to Samuel, others to Hezekiah, and others to Ezra.

JUDGMENT, among logicians, a faculty or rather act of the human soul, whereby it compares its ideas, and perceives their agreement or disagreement. See the article KNOWLEDGE.

Not satisfied with the bare view and contemplation of its ideas, the mind assembles them together, and compares them one with another. In this complicated view of things, it readily discerns that some agree, and others disagree; and accordingly joins or separates them. Thus upon comparing the idea of two added to two, with the idea of four, we at first glance perceive their agreement, and pronounce them equal. Again, that white is not black, and that four and two do not make eight, are truths the mind as readily perceives.

This is the first and simplest act of the mind, in determining the relations of things; when by a bare attention to its own ideas, comparing any two of them together, it can at once see how far they are connected or disjoined. The knowledge thence derived is called intuitive, as requiring no pains or examination; and the act of the mind assembling its ideas together, and joining or disjoining them, according to the result of its perception, is what logicians call judgment. See the articles IDEA, PERCEPTION, KNOWLEDGE, &c.

In common discourse, however, the term judgment is seldom confined to self-evident truths; but rather signifies those conjectures that we form, which do not admit of undoubted certainty, and where we are left to determine by comparing the various probabilities of things. Thus a man of sagacity, who seldom mistakes in the opinions he frames of characters and actions, is said to judge well, or think judiciously. Hence it might not be improper to change the common names of the two first operations of the mind, calling the one simple apprehension, and the other intuition. See the articles APPREHENSION and INTUITION.
of the os hyoïdes, and to the tongue; those which are under its vertex being called raninae. But besides these branches, its trunk terminates in a digiverticulum, called the jugular sack, and brings back the blood from the sinuses of the dura mater, and from the brain. See Vein.

There are also certain glands in the anterior part of the neck, called jugular. See the article GLAND.

IVICA, or YVICA, the capital of an island of the same name, fifty miles east of Valenciennes in Spain: east long. 1°, north lat. 59°.

JUICE, denotes the sap of vegetables when expressed. See the article SAP.

Under this head, Quincy tells us, we have nothing either in official or extemporaneous prescription, unless the acacia and liquorice-juice. See Acacia and Liquorice.

But besides these, there are other infulphated juices, frequently used in medicine; as scammony, aloes, gamboge, opium, catechu, eucalyptus, &c. See the articles Scammony, Aloes, &c.

Juice of lemons, the pipe, pays on importation, 11. 10s. 4½d. and draws back on exportation, 11. 8s. 6½d. Juice of limes, the gallon, pays, on importation, 2½d. and on exportation draws back 2½d.

JUICE is also used to denote the liquors of animals, as the nervous juice, the pancreatic juice, &c.

JUJUBES, jujube, in the materia medica, the name of a fruit of the pulpy kind, produced on a tree called by authors ziziphus, which Linnaeus makes a species of rhamnus. See Rhamnus.

This fruit is of an oblong figure, and somewhat resembles a large olive in its shape and size; its usual length is about an inch, and its thickness somewhat more than half an inch. It is wrinkled on the surface deeply and irregularly, and when cut or broken, is found to consist of a thick pulp, of a dusky yellowish red colour, under which there lies a whitish and soft pulpous fuggous matter, enclosing a stone of an oblong figure. It has but little smell, but is of a sweetish and refinous taste. It is to be chosen new, large, plump, and full of pulp, and of a sweet and pleasant taste.

The jujubes have been made a general ingredient in pectoral decoctions; but they are now seldom used on these occasions, and
JUL [1818] JUL

...and are scarce at all heard of in prescription, or to be met with in our shops.

JULEP, in pharmacy, a medicine composed of some proper liquor, and a syrup or sugar of extemporaneous preparation, without decoction, designed for the concoction or alteration of the humours, or restoring the strength.

Dispensatory writers mention several kinds of juleps. 1. The camphorated julep, thus prepared: take of camphire, one dram; of double refined sugar, half an ounce; of boiling water, a pint. First grind the camphire with a little rectified spirit of wine, till it is softened; then with the sugar, till they are perfectly united; lastly, add the water by degrees; and, when the mixture has stood in a covered vessel, till it is cold, strain it off. 2. Chalk-julep, thus made: take of the whitest chalk prepared, one ounce; of double refined sugar, six drams; of gum arabic, two drams; of water, a quart. Mix all together. 3. The musk-julep, thus prepared: take of damask rose-water, six ounces; of musk, twelve grains; of double refined sugar, one dram. Grind the musk and sugar together, and gradually add the rose-water. Besides these, there are several other preparations made up in the form of juleps, and denominated from their uses, balsamic, cephalic, carminative, strengthening, &c. juleps.

JULIA, or JULIS. See JULIS.

JULIAN, or St. JULIAN, a harbour on the coast of Patagonia, in south America, where ships bound to the South seas usually touch: west long. 74°, north lat. 49° 15'.

JULIAN PERIOD, in chronology, a system or period of 7930 years, found by multiplying the three cycles of the sun, moon, and indiction into one another. See the article CYCLE.

This period was called the julian, not because invented by Julius Caesar; for the julian epocha was not received till the year 4569, but because the system consists of julian years. This epocha is not historical, but artificial, being invented only for the ease of true epochas: for Scaliger, considering that the calculation was very intricate in using the years of the creation, the years before Christ, or any other epocha whatever, in regard that another person could not understand what year this or that writer meant; to remove such doubts in the computation of time, he thought of this period; which commencing 719 years before the beginning of the world, the various opinions concerning other epochas may commodiously be referred to it. See EPoCHA.

The most remarkable uses of the julian period are as follow. 1. That we can explain our mind to one another, for every year in this period has its peculiar cycles, which no other year in the whole period has; whereas, on the contrary, if we reckon by the years of the world, we must first enquire how many years any other epochas from the creation to the year of Christ, which multiple-inquisition is troublesome and full of difficulties, according to the method of other periods. 2. That the three cycles of the sun, moon, and indiction, are easily found in this period. 3. That if it be known how the chronological characters are to be found in this period, and how the years of any other epochas are to be connected with the years of it, the same characters also may, with little labour, be applied to the years of all other epochas. See CHARACTER and EPoCHA.

JULIERS, the capital of the duchy of the same name, situated on the river Rer, twenty miles west of Cologn, and as many east of Maeltricht: east long. 6°, north lat. 50° 45'.

JULIS, or JULIA, in ichthyology, names given to the variegated little labrus, with two large teeth in the upper jaw. See the article LABRUS.

JULPHA, or Old JULPHA, once the capital of Armenia, but now in ruins, the inhabitants being transplanted to a town within a mile of Iphahan, called New Julpha, and there they carry on a foreign trade with all the countries in Asia. The situation of Old Julpha was in east long. 46°, north lat. 39°.

JULUS, in botany, the same with what is otherwise called catkins or ammaceous flowers. See AMENTACEOUS.

JULUS is also the name of an insect very common among rubbish, and called in English the gally-worm: it is furnished with a great number of feet, has the power of rolling itself up like a ball when touched, and is esteemed a very valuable medicine in the jaundice and suppuration of wine.

JULY, in chronology, the seventh month of the year, so called in honour of Julius Caesar; before whose time it was known by the name of quintilis, as being the fifth month of the old roman year. See the articles MONTH and YEAR.

JUMENTA,
JUMENTA, in zoology, the name by which Linnaeus calls the fifth order of quadrupeds, the characteristic of which is, that the teeth of all the animals belonging to it are placed in a different manner from the other five orders. See the article Quadruped.

To this order belong the elephant, rhinoceros, hippopotamus, horse, and hog. See Elephant, Rhinoceros, &c.

JUNCAGO, in botany, the flower and sometimes number of feeds. This is the flower of the article Juncoides. It is composed of three oblong petals; the male flower has no pedicle, there is no fruit; the female flower has no corolla; but all that is wanting is placed in a long pedicle, which arises out of a calyx growing from the upper part of the surface: it has neither calyx nor corolla, but consists of an anthera, which is at first of an oval figure, but afterwards opens into four segments, and remains in this state a long while on the plant; the female flower has no pedile, there is no visible calyx or corolla, but all that is seen is a number of feeds lying naked in a cluster, and sometimes only a single one. This is the lichenifrum of Dilleniis, and the muscoides of Micheli.

JUNIPER, juniperus, in botany, a genus of the dioecia monadelphia class of plants, without any male corolla; the female flower consists of three rigid and acute petals; the fruit is a roundish, fleshy berry; and the seeds are three oblong ovsicles, convex on one side, and angulated on the other. Juniper-berries are to be chosen fresh, plumpy, full of pulp, and of a strong taste; and these, when used in medicine, are powerful aternuats, diuretics, and carminatives: they dissolve vivid humours in the first pallsage, and are consequently a remedy for the flatulencies which these disorders occasion. They are given in cases of the gravel and other nephritic complaints, in infarctions of the visera, and in suppurations of the meninges, and are often made ingredients in clysters. The berries chewed, or the essentia oil taken only in a few drops, give the urine the fame sweet violet-tenant that it has after taking turpentine. But these berries are not to be given indiscriminately; for in hot habits, they often counteract the very purposes intended to be answered by them, and their use succeeded with heat, and even suppression of urine, flatulencies, and swellings of the stomach and intestines: therefore in all cases, where there is danger of an inflamaation, either in the prime vias, or in the kidneys, the use of juniper-berries is to be avoided. We keep no preparation of them in the shops, except the essential oil made by distillers with water in the usual way; and this is seldom made at home, but the imported kind is commonly adulterated with oil of turpentine. We used to keep a distilled spirituous water of juniper in the shops, but the vulgar getting an opinion of its being a pleasant dram, the making of it became the business not only of the apothecary, but of the distiller, who sold it under the name of geneva. See the article Geneva.

JUNK, in the tea-language, old cables cut into short pieces, and given to boat-swains for making iвabs, plats, and nippers; as also to the ship-carpenters, and to poor people, to be picked into oakum, for caulking ships, &c.

JUNO, in astronomy, the name by which some call the second of Jupiter's satellites. See the article Jupiter.

JUNTA, Junto, or Juncto, in matters of government, denotes a select council for taking cognizance of affairs of great consequence, which require secrecy. In Spain and Portugal, it signifies much the same with convention, assembly, or board among us: thus we meet with the junta of the three estates, of commerce, of tobacco, &c. See Board, &c.

IVORY, ebur, in natural history, &c. a hard, solid and firm substance, of a white colour, and capable of a very good polish. It is the tusk of the elephant, and
is hollow from the base to a certain height, the cavity being filled up with a compact medullary substance, seeming to have a great number of glands in it. It is observed that the Ceylon-ivory, and that of the island of Achem do not become yellow in the wearing, as all other ivory does; for this reason the teeth of these places bear a larger price than those of the coast of Guinea.

The duty on ivory, on its being imported into this kingdom, is £s. 11½ d. the pound, out of which a drawback of £s. 8½ d. the pound, is allowed on its exportation.

To soften IVORY and other bones, lay them for twelve hours in aqua fortis, and then three days in the juice of beets, and they will become so soft that they may be worked into any form. To harden them again, lay them in strong vinegar. Dioscorides says, that by boiling ivory for the space of six hours with the root of mandragoras, it will become of a fine coral-red; make a lye of wood-ashes, of which take two quarts, pour it into a pan upon one pound of brasil; to this add one pound of alum; boil it for half an hour; then take it off, and put in the ivory or bone, and the longer either of these continue in the liquor, the redder they will be.

Staining and marbling of IVORY. 1. Of a fine coral-red; make a lye of wood-ashes, of which take two quarts, pour it into a pan upon one pound of brasil; to this add one pound of alum; boil it for half an hour; then take it off, and put in the ivory or bone, and the longer either of these continue in the liquor, the redder they will be. 2. Of a fine green; take two parts of verdigras, and one part of sal-armoniac; grind them well together, pour strong white wine vinegar on them, and putting your ivory into this mixture, let it lie covered till the colour has penetrated, and is as deep as you would have it. If you would have it spotted with white, sprinkle it with wax; or if you would have it marbled, cover it with wax, and scrape it off in veins, having all the lines uncovered which you desire to have stained. 3. Of black; take lathipe and quick-lime, of each an equal quantity; put them in rain-water over the fire till it begins to boil; in this put the bone or ivory, stirring them well about with a flick; and afterwards, when you see the ivory receive the colour, take the pan from the fire, stirring the ivory all the while till the liquor is cold. 4. Marbling upon ivory is performed thus; melt bees-wax and tallow together, lay it over the ivory, and with an ivory bodkin open the strokes that are to imitate marbling; pour the solution of some metal on them, and when it has stood a short time, pour it off; when it is dry, cover the strokes again with wax, and open some other veins with your bodkin for another metallic solution; and this repeat to the number of colours you design to give it. The solution of gold gives it a purple; of copper, a green; of silver, a lead-black; of iron, a yellow and brown. By this method you may also imitate tortoise-shell and several other substances on ivory.

IVORY-BLACK. See IVORY BLACK.

JUPITER, 2d, in astronomy, one of the superior planets, remarkable for its great brightness. See the articles PLANET and COPERNICAN SYSTEM.

Jupiter appears almost as large as Venus, but is not altogether so bright; he is eclipsed by the moon, by the sun, and even by mars. He has three appendages, called zones, or belts, which Sir Isaac Newton thinks are formed in his atmosphere. In these are several maculae, or spots; from whose motion the motion of Jupiter round its axis is said to have been first determined. See plate CXLVIII. fig. 3. Its orbit is situated between those of Saturn and Mars, and is therefore called one of the superior planets: it has a rotation round its axis in 9 hours 56 minutes; and a periodical revolution round the sun in 4332 days, 12 hours, 20', 5". It is the biggest of all the planets; its diameter to that of the sun appears, by astronomical observations, to be as
JUP  [1821]\n
1077 is to 10000; to that of jupiter, as 1077 to 889; to that of the earth, as 1077 to 104. The force of gravity on its surface is to that on the surface of the sun, as 797.15 to 10000; to that of jupiter, as 797.15 to 534.337; to that of the earth, as 797.15 to 407.832. The density of its matter is to that of the sun, as 7404 to 10000; to that of jupiter, as 7404 to 6011; to that of the earth, as 7404 to 3921. The quantity of matter contained in its body is to that of the sun as 797.15 to 10000; to that of jupiter, as 797.15 to 534.337; to that of the earth, as 797.15 to 407.832.

The mean distance of jupiter from the sun is 5201 of those parts, whereas the mean distance of the earth from the sun's 10000, though kepler makes it 5196 of those parts. Mr. Cafini calculates jupiter's mean distance from the earth to be 115000 semidiameters of the earth. Gregory computes the distance of jupiter from the sun to be above five times as great as that of the earth from the sun; whence he gathers, that the diameter of the sun, to an eye placed in jupiter, would not be a fifth part of what it appears to us; and therefore his disk would be twenty-five times less, and his light and heat in the same proportion.

The inclination of jupiter's orbit, that is, the angle formed by the plane of its orbit, with the plane of the ecliptic, is 10 degrees; its eccentricity is 250; and Huygens computes his surface to be four hundred times as large as that of the earth.

As jupiter is one of the three superior planets, that is, one of the three which are above the sun, hence it has no parallax, its distance from the earth being too great to have any sensible proportion to the diameter of the earth. Though it be the greatest of all the planets, yet its revolution about its axis is the swiftest. Its polar axis is observed to be shorter than its equatorial diameter; and sir Isaac Newton determines the difference to be as 8 to 9; so that its figure is a spheroid, and the swiftness of its rotation occasions this spheroid to be more sensible than that of any other of the planets.

Jupiter has four moons, or satellites, that attend him, which, at different distances, and with different periods, perform constant revolutions round him; that which is next to him, is no further removed than 2 3 of his own diameters, and turns round in 1 day, 18 hours and an half. The second, at the distance of 4 1 diameters, describes its orbit in the space of 3 days and 13 hours. The third is removed from jupiter 7 of his diameters, and finishes its circulation in seven days 4 hours. The furthermost completes its period in the space of 16 days, 16 1/2 hours, at the distance of 12 diameters of jupiter. These jovial planets were first discovered by galileo, by the help of the telescope which he first invented, and by them he increased the number of the celestial bodies, and called them medicean stars, in honour of the dukes of toscany, with whose name he dignified them.

The orbits of jupiter's moons lie nearly in the plane of the ecliptic, which is the reason why their motion is apparently in a right line, and not circular, as it really is. To understand this, let S (plate CXLIX, fig. 1.) be the sun, T the earth in its orbit TH, I the planet jupiter in his orbit AIB, and in the center of the four orbits of his moons. Then, because the plane of those orbits does nearly pass through the eye, the real motion of the satellite in the periphery will be apparently in the diameter of the orbit, which is at right angles to the line joining the center of the earth and jupiter.

Thus supposing the earth at R, if DC be drawn through the center of jupiter perpendicular to RI, the motion of each moon and their places will appear to be in that line. Thus, if the exterior moon be at E or F, it will appear to be at I either upon or behind the center of jupiter; if the moon move from E to K, it will appear to have moved from I to L; and when it moves from K to C, it will appear to move from L to C. Again, while the satellite moves from C to M, it will appear to move from C to L; and as it goes from thence to F, it apparently moves from L to I. Thus also, on the other side of the orbit, while the satellite describes the quadrant FD, its apparent motion will be from I to D; and then from D to I again, as its comes from D to E.

Whence, since this is the case of each satellite, it appears, that while each satellite describes the remote half of its orbit CFD, its apparent motion will be direct, or from west to east along the line CD; and while it describes the other half DEC, its apparent motion is retrograde, or from east to west back again along the same line.
THESE four moons must make a very pleasing spectacle to the inhabitants of Jupiter, if there are any; for sometimes they rise altogether, sometimes they are all in the meridian, ranged one under another; and sometimes all appear in the horizon, and frequently undergo special eclipses; the observations whereof are of special use in determining the longitude.

The day and night are of the same length in Jupiter all over his surface, viz. five hours each; the axis of his diurnal rotation being nearly at right angles to the plane of his annual orbit. Though there be four primary planets below Jupiter, yet an eye placed on his surface would never perceive any of them; unless, perhaps, as spots passing over the sun's disk, when they happen to come between the eye and the sun. The parallax of the sun, viewed from Jupiter, will scarce be sensible, no more than that from Saturn, neither being much above twenty seconds; so that the sun's apparent diameter in Jupiter will not be above six minutes. The outermost of its satelites will appear almost as big as the moon does to us; viz. five times the diameter and twenty-five times the disk of the sun.

Doctor Gregory adds, that an astronomer in Jupiter would easily distinguish two kinds of planets, four nearer him, viz. the satellites; and two, viz. the sun and Saturn, more remote: the former, however, will fall vastly short of the sun in brightness, notwithstanding the great disproportion in the distances and apparent magnitude. From these four different moons, the inhabitants of Jupiter will have four different kinds of months, and the number of moons in their year will not be less than 4560. These moons are eclipsed as often as, being in opposition to the sun, they fall within the shadow of Jupiter; and again, as often as, being in conjunction with the sun, they project their shadows to Jupiter, they make an eclipse of the sun to an eye placed in that part of Jupiter where the shadow falls. But in regard the orbs of these satelites are in a plane which is inclined to, or makes an angle with, the plane of Jupiter's orbit, their eclipses become central when the sun is in one of the nodes of these satelites; and when out of this position, the eclipses may be total, though not central, because the breadth of Jupiter's shadow is nearly duplicé to that of the breadth of any of the satelites; and the apparent diameter of any of these moons is nearly quintuple the apparent diameter of the sun. It is owing to this remarkable inequality of diameters, and the small inclination the plane of the orbits of the satelites has to the plane of Jupiter's orbit, that in each revolution there happen eclipses both of the satelites and of the sun; though the sun be at a considerable distance from the nodes. Further; the inferior among these satelites, even when the sun is at the greatest distance from the nodes, will occasionally eclipse and be eclipsed by the sun to an inhabitant of Jupiter; though the remotest of them, in this case, escapes falling into Jupiter's shadow, and Jupiter into his, for two years together. To this it may be added, that one of these satelites sometimes eclipses another where the phases must be different, nay frequently opposite to that of the satellite falling into the shadow of Jupiter just mentioned; for in this the eastern limb immerses first, and the western immerses last; but in the others, it is just the reverse. The shadow of Jupiter, though it reaches far beyond its satelites, yet falls much short of the distance of any planet; nor could any other planet, Saturn alone excepted, be immersed in it, even though it were infinite. Nor could the shadow of Jupiter reach that of Saturn, unless Jupiter's diameter were half of that of the sun: whereas, in effect, it is not one ninth of it. The courses of Jupiter's satelites, and their various eclipses, would render navigation very sure and easy on the globe of Jupiter. Even we, at this distance, can make very good use of them: these eclipses being found one of our best means for determining the longitude at sea. See the article Longitude.

JUREA, or JURA, a strong city in Italy, in the province of Piedmont, situated on the river Doria, subject to the king of Sardinia: east long. 7° 36'; north lat. 45° 22′.

JURISDICTION, in law, signifies the power and authority with which any person is invested in administering justice in cases of complaint laid before him. Jurisdictions are either ecclesiastical or secular; ecclesiastical belongs to bishops and their deputies. See Bishop.

Secular jurisdiction belongs to the king and his judges. The courts and judges...
JURISPRUDENCE, the science of what is just or unjust; or the knowledge of laws, rights, customs, statutes, &c. necessary for the administration of justice.

JURIS UTTRUM, in law, is a writ in behalf of a clergyman whose predecessor has alienated the lands belonging to his church. This writ is also granted in order to try whether free alms belong to a church where they are transferred. A successor of a deceased clergyman may also have this writ against a man, who intrudes into lands and tenements; a vicar may also have this writ against the parson, for the glebe of his vicarage, &c.

JUROR, in law, signifies any person sworn on a jury. See the next article.

JURY, a certain number of men sworn to enquire into and try a matter of fact, and to declare the truth upon such evidence as shall appear before them. Juries are, in these kingdoms, the supreme judges in all courts and in all causes in which either the life, property or reputation of any man is concerned: this is the distinguishing privilege of every Briton, and one of the most glorious advantages of our constitution; for as every one is tried by his peers, the meanest subject is as safe and as free as the greatest.

All criminal causes must first be tried by a grand jury, which commonly consists of twenty-four men of greater note than the petit jury, who are chosen indifferently out of the whole county, and no man can suffer the disgrace of being tried in any ignominious cause, without their first finding him guilty; if they find him innocent, he is immediately discharged; but if otherwise, they only find an indictment, on which he is tried; and finally acquitted or convicted by the verdict of the petit jury, who are not only to be returned from the county where the fact was done, but near neighbours, such as are most sufficient and least suspicious; to prevent partiality, the names of the persons impannelled are written on several pieces of paper of equal size, and delivered by the under-sheriff to the judge's martial, who causes them to be rolled up, all in the same manner, and put together in a box, and when any cause is brought to trial, some different person is to draw out twelve of these papers, and the persons whose names are drawn, if not challenged, are to be the jury to try the cause; and in case any are challenged, and set aside, or do not appear, then a further number is to be drawn till there is a full jury. See the article CHALLENGE.

When a jury-man is sworn, he must not depart from the bar on any account whatsoever till the evidence is given, without leave of the court; and if that be obtained, he must have a keeper with him. As soon as the whole evidence is summed up, the jury are to be kept together till they are all of one mind, and unanimous in bringing in their verdict, without being admitted to the speech of any person, and without meat, drink, fire or candle. They are fineable if they agree to cast lots for their verdict, and also for being tampered with in relation to it. But as they are the sole judges of the fact, they are not fineable for giving a verdict contrary to the sentiments of the court; nor even for giving it contrary to what may appear plain evidence, because the law presumes that they may have some other evidence besides what is given in court; but where any corruption appears, a jury may be attainted for going contrary to evidence; and if a juror takes any thing either of the plaintiff or defendant for giving a verdict, he is to pay ten times as much as he has taken, or suffer a year's imprisonment; yet in trying causes, juries are to have their charges allowed them by the court. In all cases of difficulty, it is safest for the jury to find the special matter, and to leave it to the judges to determine how the law stands upon the fact.

Infants, persons of seventy years of age, and upwards, clergymen, apothecaries, &c. are exempted from serving upon juries; and barons, and all above them, are not to serve in an ordinary jury.
JURORS, in London, must not only be housekeepers, but must have land or goods worth one hundred pounds; and they may be examined on oath as to that point. 3 Geo. II. c. 25.

The qualifications of a jury-man for a county, is ten pounds per annum, either in freehold or copyhold estate within the same county; but cities, boroughs, and corporate towns, are excepted by the statutes: however, no attorney-general, or his deputy, shall only return twelve, puruant to the statute.

And if he return twelve, pursuant to the statute, he is liable to be required by the king's attorney-general. According to usage, the sheriff should return twenty-four jurors, in order to speed the trial in case of challenge, sicknes, &c. and should he only return twelve, puruant to the writ, he is liable to be amerced. By 4 and 5 W. and M. no sheriff, bailiff, &c. under the penalty of ten pounds, shall return any person to serve on a jury, who has not been duly summoned fifteen days before his appearance, nor under the like penalty shall he accept of money or other reward for excusing the appearance of a jurymen: jurymen neglecting to appear, shall be fined in a sum not exceeding five pounds, nor less than forty shillings; except they can give a reasonable excuse for their non-appearance: and, in case a jurymen does appear, but refuses to be sworn, or to give a verdict, an attachment may be issued against him.

Lifts of jurors, according to the statutes of 4 and 5 W. and M. and 7 and 8 W. III. are now to be made from the rates of each parish, and fixed on the doors of churches, &c. twenty days before Michaelmas, that public notice may be given of persons omitted who are qualified, or of persons inserted who are not so: after which, the lists being settled by the justices of the peace at the quarter-sessions, duplicates are to be delivered to the sheriffs by the clerks of the peace; and the names contained in these lists must be entered alphabetically by the sheriffs in a book to be kept for that purpose, together with their additions and places of abode. The sheriffs are liable to be fined for returning other persons; and also if they return jurors that have served two years before. Sheriffs, on the return of writs of quo warranto, are to annex a panel of the names of a competent number of jurors, mentioned in the lists, and not less than forty-eight in any county, nor more than seventy-two, unless they are otherwise directed by the judges, which jurors shall be summoned to serve at the assizes, &c.

When it is conceived that an indifferent and impartial jury will not be returned by the sheriff, a special jury is allowed; in which case the court, upon a motion made, will order the sheriff to attend the secondary of the king's bench, with his book of sealholders of the county, and the secondary is to mark a jury, in the presence of the attorneys on both sides; also, if a cause of consequence is to be tried, the court of king's bench, on a motion upon an affidavit made, will make a rule for the secondary to name forty-eight freeholders, out of which each party is to strike out twelve, one at a time, the plaintiff's attorney beginning first, and the remainder of the jurors will be the jury for the trial: though the nomination of a special jury ought to be in the presence of the attorneys on each side; yet in case either of them neglects, or refuses to attend, the secondary may proceed, and strike out twelve for the attorney that makes default. By 3 G. II. c. 25. on the motion of the prosecutor, plaintiff or defendant, on trials of libels or indictments, and in all actions whatsoever, the courts of Westminster are authorised to order a special jury to be struck in the same manner as upon trials at bar. Where a special jury is ordered by a rule of court, in any cause arising in a city, corporation, &c. this jury is to be taken out of the lists or books of the persons qualified, which are to be produced by the sheriffs, &c. before the proper officer. The same indulgence is granted both to merchants and foreigners; for where two merchants are plaintiff and defendant, the court may be moved for a jury of merchants to try the issue between them; and if either of the parties in the suit be an alien, the jury, at the desire of the party, is to be composed of half foreigners and half English. See the articles PEERS and VERDICT.

JURY-MAST, whatever is set up in room of a malt that has been left in a forum or in an engagement, and to which a leet yard, ropes and sails are fixed. JUS, in its general acceptation, signifies law or right. JUS ACCRESCENDI, in law, is the right of survivorship between two joint tenants. JUS CORON[.]E, signifies, in general, the rights of the crown. These are a part of the laws of the kingdom, though
they differ in many things from the general laws relating to the subject. See the article King.

**Jus duplicatum**, in law, is a double right, and is used when a person has the possession of a thing, as well as a right to it.

**Jus gentium**, the law of nations, or the laws established between different kingdoms and states, in relation to each other. See the article Law.

**Jus hereditatis**, the right or law of inheritance.

**Jus patronatus**, in the canon-law, is the right of presenting a clerk to a benefice; or a kind of commission granted by the bishop to inquire who is the rightful patron of a church. This commission is directed to six clergymen, and six laymen who reside near the church, and these are to inquire, 1. Whether the church is void? 2. Who made the last presentation? 3. Who is the rightful patron? &c. See the article Patron.

**Jus possessionis**, in law, is a right of fein or possession, as jus proprietas is the right of ownership of lands, &c.

**Jus presentationis**, in law, the right a patron enjoys of presenting his clerk to the ordinary, to be admitted, instituted, and inducted into a church.

**Jus recuperandi, intrandi**, &c. signify a right of recovering and entering into lands, &c.

**just**, a sportive combat on horseback, man against man, armed with lances. The difference between juits and tournaments, according to Du Cange, consists in this, that the latter is a genus of which the former is only a species. Tournaments included all kinds of military sports and engagements, which were made out of gallantry and diversion. Juits were those particular combats, where the parties were near each other, and engaged with lance and sword: add, that the tournament was frequently performed by a number of cavaliers, who fought in a body; whereas the juit was a single combat of one man against another. Though the juits were usually made in tournaments, after a general encounter of all the cavaliers, yet they were sometimes singly and independent of any tournament.

Antiently juits and tournaments made a part of the entertainment of all solemn feasts and rejoicings. The Spaniards borrowed these exercises from the Moors, and call them *juego de camas*, reed or cane-plays. Some take them to be the same with the *ludus trojanus*, antiently practiced by the youth of Rome.

He who appeared for the first time at a juit, forfeited his helmet, or casque, unless he had forfeited before at a tournament.

**Justice**, *justitia*, in a moral sense, is one of the four cardinal virtues, which gives every person his due.

**Justice**, *justiciarius*, in a legal sense, a person deputed by the king to administer justice to his subjects, whose authority arises from his deputation, and not by right of magistracy.

In the courts of king's bench and common pleas there are two judges titled justices, each of whom retains the title of lord during the time of his continuing in office. The first of these, who is titled lord chief justice of England, has a very extensive power and jurisdiction in pleas of the crown, and is particularly intrusted not only with the prerogative of the king, but likewise the liberty of the subject. He hears all pleas in civil causes brought before him in the court of king's bench, and also the pleas of the crown; while, on the other hand, the lord chief justice of the common pleas has the hearing of all civil causes between common persons. Besides the lords chief justices, there are several other justices appointed by the king for the execution of the laws; such as the lords justices in eyre of the forests, who are two justices appointed to determine all offences committed in the king's forests; justices of assize, who, by a special commission, were formerly sent to hear causes in this or that county, for the ease of the subject; and these judges continue twice a year to pass the circuits by two and two throughout all England, dispatching the different business they meet with by different commissions; for they have one commission to take assizes, another of oyer and terminer, that is, to hear and determine causes, and another of goal-delivery; from whence they are called justices of oyer and terminer, of goal-delivery, &c. They are also called justices of nisi prius, and so denominated from the words used in a common form of adjournment of a cause in the court of common pleas. See Nisi prius.

**Justices of the peace**, are persons appointed by the king's commission to keep the peace of the county in which they reside; and some of these, who are of superior rank or quality, are called justices
justices of the quorum, and without the presence or assent of these, or at least one of them, no business of importance can be dispatched. Justices of the peace ought to be appointed out of the most sufficient persons in the county, as well as those of the greatest reputation. They ought to possess an estate of at least 100l. per annum, in freehold or copyhold, for life, or for the term of twenty-one years, without incumbrances; and if a justice of the peace, not thus qualified, présumes to act in that office, he is liable to the penalty of 100l. Every justice of the peace has a separate authority for doing all the different acts relating to his office, as for commitments, binding to the good behaviour, &c. they are authorized to take informations against persons committing treason, to grant warrants for apprehending them, and committing them to prison: they may also commit all felons in order to bring them to trial; and at the same time, they are to bind over the accusers to prosecute at the assizes: and if they neglect to certify such examinations and informations at the next goal-delivery, or do not bind over the prosecutors, they are liable to be fined. Where any person is esteemed dangerous, and likely to break the peace, a justice may require a recognizance with curing sureties for his good behaviour, a large penalty of such person for his keeping the peace, and on his not procuring sureties for his good behaviour, he may send him to prison: but where a person hears of a peace-warrant being out against him, he may go to another justice, and there give surety of the peace, by which means he will prevent his being held on the first warrant. Justices of the peace frequently make up petty quarrels and breaches, where the king is not intitled to a fine; but they are not to take money for making agreements: if a justice is guilty of any misdemeanor, an information will lie against him in the king's bench, where he may be punished by fine and imprisonment. Two or more justices of the peace have power jointly to take indictments, and try offenders at the quarter-sessions: and in many cases they are empowered, by statute, to act where their commission does not extend: they are to hold their sessions four times a year, on the first week after Epiphany, Easter, St. Thomas a Becket, which is the 7th of July, and Michaelmas: at the quarter-sessions they may try persons for petit-larceny, and other small felonies; but felonies of a higher nature are to be tried at the assizes.

Justices within liberties, are justices of the peace who have the same authority in cities or other corporate towns, as the others have in counties, and their power is the same, only the last have the assize of ale and beer, wood and vitiulates, &c.

Justice-seat, is the highest forest court, always held before the lord chief justice in eyre of the forest; in which court fines are set for offences, and judgments given.

Justicia, in botany, a genus of the di-andria monogynia class of plants, the corolla whereof consists of a single petal; the tube is gibbous; the limb reniform; the upper lip is oblong and emarginated; the lower lip is of the same length with that, and is reflex and obtusely trident: the fruit is an oblong, obtuse capsule, narrow at the base, composed of two valves, and containing two cells; the partition placed contrarywise to the valves, opens by an elastic ungues: the seeds are roundish.

Justiciari, in our old laws, an officer instituted by William the conqueror, as the chief officer of state, who principally determined in all cases civil and criminal. He was called in Latin capitulis justiciarius totius anglie.

Justiciary, or court of Justiciary, in Scotland, a court of supreme jurisdiction in all criminal cases. This court came in place of the justice-eyre or justice-general, which was laid in the person of the earl of Argyle, who transacted for it with king Charles I. but being made justice-general of all the islands, which gave rise to great debates between himself and some hereditary sheriffs there, that jurisdiction was taken away by parliament in 1672, and was erected into a justice or criminal court, confiding of a justice-general alterable at the monarch's pleasure, justice clerk, and five other judges, who are lords of the seignior. This court commonly sits upon Mondays, and has an ordinary clerk, who has his commission from the justice-clerk. They have four macers, and a doomeyer appointed by the lords of the seignior. The form of the process is this: the clerk raises a libell or indictment upon a bill passed by any of the lords of that court; at the instance of the pursuer, against the defendant or criminal, who is immediately committed to prison after citation.
cition. When the party, witnesses, great affize, or jury of forty-five men, are cited, the day of compleance being come, fifteen of the great affize is chosen to be the affize upon the pannel, or prisoner at the bar. The affize sits with the judges to hear the libel read, witnesses examined, and the debates on both sides, which is written verbatim in the adjournal books. The king's advocate pleads for the pursuer, being the king's cause, and other advocates for the pannel. The patent petals, with their points bent; the afoil or absolve the party accused; or, if relevant, then the affize or jury of fifteen is removed into a closer room, none rarely taken being present with them, where they choose their chancellor and clerk, and consider the libel, deposition, and debates; and bring in their verdict of the pannel sealed guilty or not guilty: if not guilty, the lords absolve; if guilty, they condemn and declare their sentence of condemnation, and command the sentence to be pronounced against the pannel by a macer and the mouth of the doomster.

The lords of the juficiary, likewise go circuits twice a year into the country. See the article Circuit.

JUSTICIES, a writ directed to a sheriff, by virtue of which he is empowered to hold a plea of debt in his county-court for a sum above 40s. thro' by his ordinary power he has only cognizance of sums under 40s.

JUSTIFICATION, in law, signifies a maintaining, or shewing a sufficient reason in court, why the defendant did what he is called to answer. Pleas in justification must set forth some special matter: thus, on being fined for a trespass, a person may justify it by proving, that the land is his own freehold; that he entered a house, in order to apprehend a felon; or by virtue of a warrant, to levy a forfeiture; or, in order to take a distress; and in an assault, that he did it out of necessity.

JUTES, the antient inhabitants of Jutland, in Denmark.

JUTLAND, a peninsula of Denmark, antiently called the Cimbrian Sherione, situated between 8° and 11° of east long. and between 55° and 58° of north lat. bounded by the Categate sea, which separates it from Norway, on the north; by the same sea, which divides it from the danish islands and Sweden, on the east; by Holstein, on the south; and by the German ocean, on the west. It is divided into north and south Jutland; the south being usually called Sleflwic. The whole is about 180 miles in length, and 90 in breadth.

IVY, beterea, in botany, a genus of the pentandria monogynia class of plants, the corolla whereof consists of five oblong, patent petals, with their points bent: the fruit is a globose berry, having only one cell: the seeds are five in number, large, gibbous, and angulated on one part. The qualities of this plant, in medicine, are drying and astringent; but it is rarely taken inwardly: it is more frequently used externally, for drying and healing aches: the berries are frequently given by the common people as a febrifuge: they purge up and down. A gum that diffils from the trunk of the ivy-tree, upon being any ways cut, is reckoned a notable caustic, and is said to destroy the nits of the head.

Ground-Ivy, hedera terriformis. See the article Ground-Ivy.

IXIA, in botany, a genus of the triandria monogynia class of plants, the corolla whereof consists of six oblong, equal, lanceolated petals: the fruit is a roundish, triquetrous capsule, composed of three valves, and containing three compressed cells, in each of which is a single roundish seed.

IXORA, in botany, a genus of the tetran-dria-monogynia class of plants, the corolla whereof consists of a single petal; the tube is cylindric, very long and flender; the limb is plane, and divided into four oval segments; the fruit is a berry of a roundish figure, with only one cell; the seeds are four in number, convex on one side, and angular on the other.

JYNX, the wry-neck, in ornithology, a genus of bird of the pye-kind, the beak of which is smooth, and the noftiris hollowed: the tongue is very long, and of a rounded form, resemb'ing a worm: the toes are four in number, two before and two behind.

Of this genus there is only one known species, called, from its singular manner of twisting its head about, the wry-neck. It is about the size of a lark, and is called by authors jynx, torquilla, turbo, &c.
K.

or k, the tenth letter, and seventh consonant of our alphabet; being formed by the voice, by a guttural expression of the breath through the mouth, together with a depression of the lower jaw, and opening of the teeth. Its sound is much the same with that of the hard c, or qs; and it is used, for the most part, only before e, i, and n in the beginning of words; as ken, kill, know, &c. It used formerly to be always joined with c at the end of words, but is at present very properly omitted: thus, for publick, music, &c. we say, public, music, &c. However, in monosyllables, it is still retained, as jack, block, mock, &c. Tho' it is seldom used in words derived from the French, as being altogether from the French, as being altogether

The letter k is derived from the Greek kappa, k or ς; it being unknown to the Romans, tho' we sometimes meet with kalendae instead of calendae. As a numeral, K denotes 250; and with a line over it, K 250000.

KAABA, or CAABA. See CAABA.

KABBALA, or CABBALA. See the article CABBALA.

KADARI, or CADARJ. See CADARI.

KAM, KAN, or CHAM. See the article CHAM.

KAMINECK, a city of Livonia, situated on the river Nieper, in the Ukraine, 100 miles south-west of Buda. east long. 7° 6', north lat. 47°.

KANISHIA, a town situated on the river Drave, in lower Hungary, 100 miles south-west of Buda: east long. 17° 6', north lat. 47°.

KANOF, or KANDOW, a town of Russia, situated on the river Nipper, in the Ukraine, seventy miles south-east of Kiow: east long. 32°, north lat. 50°.

KAOLIN, one of the substances whereof china-ware is made; being no other than a kind of talc reduced to powder, and made into a paste with water. The peculiar property of kaolin is, that it is very difficultly, if at all vitrifiable: so that being mixed with potash, a substance easily vitrifiable, the mixture produces a semi-vitrification in the fire, which is what we call china or porcelain. See the article PORCELAIN.

Talc, therefore, seems the only substance capable of supplying the place of kaolin, in the manufacture of European porcelain; as being not only very difficultly
KEEPER, or Kestrel. See the article Kestrel.

KATOIVINDEL, in botany, the same with the phexin of Linnaeus. See the article Phoenix.

KAUSBEUREN, an imperial city of Germany, thirty-two miles south of Augsburg; east long. 10° 45', north lat. 47° 50'.

KAY, or Key, the same with wharf. See the article Wharf.

KEBLA, an appellation given by the ma-

KEGDE-ANCHOR, in the sea-language, is when rant where it is

KEELON, a fortres

KEIL, a city of Germany, in the

KELLINGTON, a borough-town of

KEEPER of the private seal, is also a lord by his office, thro' whose hands all grants, pardons, &c. pass before they come to the great seal, and even some things pass this officer's hands which do not pass the great seal at all. This officer is also one of the privy-council, yet was antiently called clerk of the privy seal. His duty is to put the seal to no grant, &c. without a proper warrant, nor with warrant where it is against law, or inconvenient, but shall first acquaint the king therewith.

KEIL, a fortres situated on the Rhine, in the circle of Swabia, in Germany, opposite to Strasburg.

KEISERWAERT, a strong town of Germany in the circle of Westphalia, and duchy of Berg, situated on the Rhine, twenty-five miles north of Cologn: east long. 5° 8', north lat. 51° 30'.

KELLINGTON, a borough-town of Cornwall, thirteen miles south of Launceston, which sends two members to parliament.

Kelp, a fixed salt, or particular species of pot-ash, procured by burning the weed called kali. See Kali.

Kelp, the ton, containing twenty hundred weight, each hundred weight containing 112 lb. pays on importation, 14s. 4d., and draws back on exportation, 12s. 11 7/10 d.

KELSO, a town of Scotland, in the shire of Mers, or Roxburgh, situated on the north side the Tweed, twenty miles south west of Berwick.

KEMPFERIA, or Kãmpferia, in botany. See Kãmpferia.

KEMPSEN, a city of Germany, in the circle of Swabia, situated on the river Iller: east long. 10° 7', north lat. 47° 38'.

KENDEL, a market-town of Wessmoreland, twenty-two milks south-west of Appleby.

KENKs,
K E R [1830]

KENKS, in the sea-language, doublings in a rope or cable, when handed in and cut, so that it does not run easy; or when any rope makes turns or twists, and does not run free in the block, then it is said to make kenks.

KENNINGTON, a pleasant village in the county of Middlesex, two miles west of London; where is a royal palace, with large and fine gardens.

KEN'T, a county bounded by the river Thames, on the north; by the ocean, on the east; by Sussex, and the Straits of Dover, on the south; and by Surrey on the west.

KERMAN, the capital of the province of Kerman, or Carimania, in Persia, long. 66°30', north lat. 30°.

KERMES, according to the arrangement of Linnaeus, is a species of the coccus. See the article Coccus.

The female of this species, which is what we know by the name kermes in the shops, is, when full grown, of a roundish figure, and of a deep purplish blue colour, covered with a fine whitish or greyish dust, like that on the surface of a ripe plum; in this state it is not easy to distinguish its limbs, or indeed its natural form; its being distorted by young at this period altering, and in a manner destroying its figure. It adheres in this state to the leaves and young shoots of the ilex, and is collected thence for the shops: before this period, it runs about on the branches, and has its form more regular. The male is a very small fly, which would scarce be thought to belong to the same species, if it were not seen impregnating the females; its body is oblong, its head small, its eyes little and black, and its wings whitish, and full of brown and somewhat rigid nerves. It is the female that is gathered for use.

Kermes, as brought to us, is a small roundish body, of the bigness of a pea: when cut, it is found to be a mere branaceous bag, containing a multitude of little distinct granules, which are soft and juicy. It is a very valuable commodity, and serves to two very great uses; the dyers in scarlet finding it as valuable in their way, as the physicians in theirs. The kermes intended for the dyers is best kept whole, only destroying the principle of life in the eggs, by means of vinegar; but that intended for medicinal purposes, is more properly managed in another way: they are to be gathered when fully distended, and while yet perfectly covered with bloom, and are to be immediately put into a mortar, and bruised to pieces. After which they are to be set in a cool place for seven or eight hours, in which time their juice will be rendered much less tough and viscous than it was on the first bruising; after this, it is to be pressed pretty strongly, in order to get out the whole. The liquor thus drawn, is to be set by for some hours to settle; the clear juice is then to be decanted off, and an equal quantity of fine sugar is to be added to it, with which it is to be boiled over a very gentle fire, to the consistency of a syrup, which is called kermes-juice in the shops. It will keep a long time, and the confection of alkermes is generally made from it. See Alkermes.

The kermes is in great esteem as a restorative, and is said to strengthen the stomach, and assist digestion, at the same time that it invigorates and enlivens in an uncommon manner. It is also in great esteem among the midwives, as a cordial and strengtheners for lying-in-women, and as a preventer of abortions. The people who prepare kermes for the dyers, often let the eggs hatch as they lie in drying, and then sprinkling them with vinegar, they kill them, and form them into a sort of cakes, which keep very well a long time.

Kermes-mineral, pulvis carthaminorum, in pharmacy, a preparation of antimony, made up in the following manner. Take of antimony, four pounds; solution of fixt nitre per deliquium, one pound; rain water, three pounds; boil them two hours, and then filter the boiling decoction; after this, it is to be set by twenty-four hours, and it will fall a yellowish or saffron-coloured powder, the fluid becoming clear. This fluid being then poured off by inclination, the powder must be washed by repeated afusions of warm water, and four ounces of spirit of wine being burnt upon it, afterwards kept for use.

This powder, according to Quincy, is a most efficacious deobstruent, and therefore extremely useful in scrophulous oblitinate, phthisic, and all such cases as arise from glandular obstruction, as likewise in chloretic, cachetic, and hysterical habits, where the vitiated state of the blood has impared the vis vitalis, and debilitated the secretive powers; it has been recommended also in fevers; but the use of medicines of this class is not yet enough
KERNING, among falt-makers, the cryf­
KERRY, KESTRIL, or KETCH-DOL

enough authorized by experience, to
render such a practice eligible.
The doses given, have been from one grain
to four; but it is best to begin first with
the smallest dose, especially with young
persons, as the force of its operation varies
greatly in different constitutions.
KERNING, among falt-makers, the crys-
tallizing of falt. See SALT.
KERRY, a county of Ireland, in the pro-
vince of Munfter, bounded by the river
Shannon, which divides it from Clare,
on the north; by Limeric and Cork,
on the east; by another part of Cork, on
the south; and by the Atlantic Ocean,
on the weft.
KESSEL, a town of Upper Gelderland,
in the quarter of Roermonde, situated on
the river Meule: east long. 6°, north
lat. 51° 25'.
KESTRIL, or KASTRIL, in ornithology,
the yellow-legged falcon, with a brown
back, a spotted breast, and a rounded
tail, with a broad black facia, towards
the end. It is a very beautiful bird,
about the size of a pigeon, and very bold.
It is known among authors, by the names
of tinnunculus and cenchrus, and is also
called in English, the funnel or windhover.
See plate CXLIX. fig. 5.
KETCH-DOLT, a game with dice and
tables, wherein the firft throws, and lays
down from the heap of men without the
tables, more or less, according to what
he throw, suppose fice deuce; then if the
other throw either fice or deuce, and draw
them not from his adverfaries tables to
the fame point in his own, but takes
them from the heap, and lays the ace
down, he is dolret, and fo lofeth the
game: nay, if he but touch a man of
the heap, and then recoillef himself, the
lofs is the fame. Good gamers will
never be dolret; in which cafe, they
 strife who fhall fill up their tables firft,
and he that bears them off firft wins the
game. See BACK-GAMMON.

with two mafts. See SHIP.
KEY

[1832]

KID

in that case be seven different orders of the degrees of an octave, proceeding from the seven different letters, with which the terms of the scale are marked. Any given found therefore, i.e. a found of any determinate pitch of tune, may be made the key of the piece, by applying it to the seven natural notes arising from the division of an octave, and repeating the octave above and below at pleasure: the given note is applied as the principal note or key to the piece, by making frequent closes or cadences upon it; and in the progress of the melody, no other than these seven natural founds can be admitted, while the piece continues in that key.

Here too it must be added with respect to the two different divisions of the octave, that a sound may belong to the same key, that is, have a just musical relation to the same fundamental in the one kind of division, and be out of the key in respect of the other. Now a piece of music may be carried through several keys, that is, it may begin in one key, and be led out of that into another, by introducing some found foreign to the first, and so on to another: but a regular piece of music must not only return to the first key, but those keys too must have a particular connection with the first. It may be added, that those other keys must be none of the natural founds of the principal key, though not any of them at pleasure.

From the distinctions already observed, it is evident, that there are but two different species of keys, which arrive according as we join the greater or lesser third, these being always accompanied with the sixth and seventh of the same species; the third greater, for instance, with the sixth and seventh greater, and the third lesser with the sixth and seventh lesser. And this distinction is expressed under the name of a sharp key, which is that with the third greater, &c. and the flat key with the third lesser, &c. whence it is plain, that how many different cafes ever there be in a piece, there can be but two keys, if we consider the essential difference of keys; every key being either flat or sharp, and every sharp key being the same as to melody, as well as a flat one. See MODULATION, and HARMONY.

To distinguish accurately between a mode and a key, Mr. Malcolm has given us this definition, viz. An octave with all its natural and essential degrees, is a mode with respect to the constitution or manner of dividing it; but with respect to its place in the scale of music, it is a key. See MODE and MELODY.

Key, is also used for an index, or explanation of a cipher. See CIPHER.

Keys of an organ, harpsichord, &c. those little pieces in the forepart of those instruments, by means whereof the jacks play, so as to strike the strings. There are in number twenty-eight, or twenty-nine. In large organs, there are several lets of the keys, some to play the secondary organ, some for the main body, some for the trumpet, and some for the echoing trumpet, &c. in some there are but a part that play, and the rest are only for ornament. There are twenty flats in the large keys, which make half notes. See the article ORGAN, &c.

Key-stone of an arch, or vault, that placed at the top or vertex of an arch, to bind the two sweeps together.

This, in the tufcan and doric orders, is only a plain stone, projecting a little; in the ionic, it is cut and waved somewhat like confoles; and, in the corinthian and composite orders, it is a confole, enriched with sculpture.

Key-stones made in the manner of confoles, and placed projecting in the middle of arches and porticos, are particularly designed to sustain the weight and prejudice of the entablature, where it happens to be very great between the columns; for which reason, they should be made so as to be a real support, and not stand for mere ornaments, as they too frequently do.

KIAM, a great river of China, which, taking its rise near the west frontier, crosses the whole kingdom eastward, and falls into the bay or gulf of Nanking, a little below that city.

KIAMSI, a province of China, bounded by that of Nanking on the north, and by that of Canton on the south.

KIDDERMINSTER, a market-town twelve miles north of Worcester.

KIDNEYS, rect., in anatomy, are two red viscera of an oblong figure, situated at the loins, one on each side; their hollow side being turned inward, and their convex side outward. They are placed near the lowest spurious ribs; but their situation is not exactly regular; for in some subjects they are a little higher, and in others a little lower; and one of them is not unfrequently placed a little above the other; it is not always the same kidney.
Kidney that is placed highest; but sometimes the right, and sometimes the left; however, they are sometimes perfectly even.

The kidneys are connected with the loins, the lower ribs, the colon, the succenturiati, the renal vessels, and the ureters. They have two membranes, the one robust and common, called the adiopite membrane; this surrounds them but loosely, and is furnished with its own proper vessels. The other membrane is proper, and is very thin, and every where applied closely to the substance of the kidneys.

The length of the kidneys is five or six fingers, the breadth three, and the thickness about a finger and a half. Its surface, in adults, is smooth and equal; but in the fetus in human subjects, and in grown animals of many kinds, it is irregularly divided, as it were, into a number of lobes.

The vessels of the kidneys, are, like those of the liver, included in a membrane, from the peritonen. The arteries and veins are large, and called emulgent vessels; these are produced from the aorta and vena cava. The nerves are from the plexus renalis; and there is a large excretory duct, called the ureter. There are also a number of lymphatics, passing to the receptaculum chylii.

The substance of the kidneys is firm and hard, and is of two kinds. 1. The exterior, or cortical, which, according to Malpighi, is glandulous; but according to the discoveries of Ruych, is throughout elegantly vacuolous. 2. The interior, which is tubulous, and expressed by the name of tubuli urinarii Bellini: this terminates in ten or twelve papillae, which open by a multitude of apertures into the pelvis; but these papillae are not found in all subjects.

The use of the kidneys is to secrete the urine from the blood, into the pelvis. See the articles PE LVIS, SUC CEN TURIATI, URETERS, BLADDER, and URETIIRA. In plate CL. fig. 1. are represented the kidneys, glandula succenturiate, bladder, and male-organs of generation, with their vessels. A, A, are the kidneys; B, B, the glandula succenturiate; C, C, the emulgent vessels, together with those distributed over the membranes of the kidneys; D, D, the hypogastric vessels, which branching off from the iliacs, are distributed in the urinary bladder and penis; E, E, the course of the ureters; F, F, the course of the spermatic vessels, in which several appear cut off, being those distributed in the peritonen; G, the urinary bladder; H, H, the vasa deferentia; I, I, the testicles; K, the urachus cut off; L, the penis, M, M, the erector-muscles.

Inflammation of the Kidneys. See the article NEPHRITIS.

KIGGELARIA, in botany, a genus of the directa decandra class of plants, in which the corolla of both the male and female flower consists of five lanceolate, hollow petals; and its fruit is a coraceous globule and unilocular capsule, containing a number of roundish seeds.

KILDARE, the capital of a county of the same name, in Ireland, twenty-seven miles south west of Dublin.

KILDERKIN, a liquid measure, containing two firkins. See the articles FIRKIN and MEASURE.

KILKENNY, a county of Ireland, in the province of Leinster, bounded by Queen's County, on the north; by the county of Wexford, on the east; by Waterford, on the south; and by the county of Tipperary, on the west. It is also the name of the capital of that county, and is situated in west long. 7° 15'; north lat. 53° 30'.

KIMBOLTON, a market-town of Huntingdonshire, nine miles south-west of Huntington.

KINDRED, in law, persons related to another, whereof the law of England reckons three degrees or lines, viz. the descendent, ascendent, and collateral line. See LINE, DEGREE, DIRECT, &c.

On there being no kindred in the descending line, the inheritance passes to the collateral one. See INHERITANCE.

KING, in the general acceptance of the word, is a person who has a supreme authority, with the power of levying taxes, making laws, and enforcing an obedience to them: but in England, which is a limited monarchy, the power of the king is greatly restrained; which is so far from diminishing his honour, that it adds a glory to his crown; for while other kings are absolute monarchs over unnumberable multitudes of slaves, the king of England has the distinguished glory of governing a free people, the leaft of whom is protected by the laws: he has great prerogatives, and a boundless power in doing good; and is at the same time only restrained from acting inconsistently with his own happiness, and that of his people. He has all the ensigns of royalty,
ty, and all the marks of sovereignty; but while he has the power of making treaties, of sending and receiving ambassadors, of conferring titles of honour, creating privy councillors, officers of state, and judges, and may raise men and arms both for sea and land, he cannot force his subjects to maintain them, or raise one tax by his sole authority: he has the privilege of coinage money, but he cannot force the meanest subject to part with his property: he can pardon a criminal, but he cannot put a tax on property: he cannot put a sovereign alfent as a law; yet he can neither alter nor make new laws by his authority, and all the marks of sovereignty: he may at his coronation, take an oath to govern his people according to the laws of God, the true source of all justic, and where this court meets with an offence contrary to law, it may punish it. It frequently proceeds on indictments found before other courts, and removed by certiorari into this. Persons illegally committed to prison, though by the king and council, or either of the houses of parliament, may be bailed in it; and in some cases, even upon legal commitments. Writs of mandamus are issued by this court, for the restoring of officers in corporations, &c. unjustly turned out, and freemen wrongfully disfranchised.

The court of king's bench is now divided into a crown side and plea-side; the one determining criminal, and the other civil causes: in the first it determines criminal matters of all kinds, where the king is plaintiff; such as treasons, felonies, murders, rapes, robberies, riots, breaches of the peace, and all other causes that are prosecuted by indictment, information, &c. On the plea-side, it determines all personal actions commenced by bill or writ; as actions of debt, upon the cafe, detinue, trover, ejectment, trespas, waife, &c. against any person in the custody of the marshal of the court, as every person sued here is supposed to be by law. The officers of this court on the crown-side are the clerk and secondary of the crown;
KIN

[1835]

KIT

KINROSS, a town of Scotland, in the shire of Fife, situated on the lake of Loch Leven, twenty miles north of Edinburgh.

KINSALE, a port-town of Ireland, in the county of Cork and province of Munster, situated on the river Bandon, fourteen miles south of the city of Cork: west lon. 8° 20', and north lat. 51° 12'.

KIRK, a saxon term, signifying the same with church. See the article CHURCH.

KIRK-MOTE, a term formerly used for a synod. See the article SYNODE.

KIRK-OSWALD, a market-town of Cumberland, twelve miles south of Carlisle.

KIRRISBRIGHT, a parliament-town of Scotland, which ranks with Dumfries, Annan, &c. situated on a bay of the Irish sea, sixty miles west of Carlisle: west lon. 4° 5', and north lat. 54° 38'.

KIRKWALL, the capital of the Orkney islands, and situated in that of Pomona, is a parliament-town, which claffes with Dingwall, Tain, &c. west lon. 25', and north lat. 59° 45'.

KITCHEN, a room appropriated for dress ing meat, and furnished with fuitable accommodations and utenfils for that pur po ele.

Clerk of the KITCHEN, an officer of the king's houfhold, whole office is to buy provifions.

KITCHEN-GARDEN, a piece of ground laid out for the cultivation of fruit, herbs, pulfe, and other vegetables used in the kitchen.

A kitchen-garden ought to be fitu ted on one fide of the houfe, near the fables, from whence the dung may be easily conveyed into it; and after having built the wall, borders fhoiild be made under them, which, according to Miller, ought to be eight or ten feet broad: upon thofe borders expo ed to the fouth, many forts of early plants may be fown; and upon thes
KLEIN, in botany, a genus of the

KNARESBOROUGH, in old law-books, an

KNAVE, in old law-books, an appella-

tion given to a man servant, or even to a

male child.

KNAUTIA, in botany, a genus of the

tetrandria-monogynia class of plants, the

compound flower of which is equal,

whereas the proper corolla is unequal,

monopetalous, and quadrifid at the limb,

with a tube of the length of the cup; the

seeds are single, or one for each proper

corolla, tetragonal; they are hairy at the

top, and contained in a common recep-
tacle.

KNEE, genus, in anatomy, the articula-
tion of the thigh and leg-bones. See the

articles Femur, Tibia, Patella, &c.

The two principal motions of this joint

are flexion and extension: in the former

of these the leg may be brought to a very

acute angle with the thigh, by the con-
dyles of the thigh-bone being round and

smoothed so far backwards; and in per-
forming this, the patella is pulled down

by the tibia. When the leg is to be ex-

tended, the patella is drawn upwards,

and the tibia forwards, by the exten-

fornules, which, by means of the pro-

turator joint, and this thick bone with its

ligament, have the chord with which they

act, at a considerable angle, and there-
fore act with advantage: but, in order

that the body may be supported by a firm

perpendicular column, they are restrained

by the posterior cros-ligament, from pull-
ing the leg farther than to a straight line-
with the thigh; and when this is done,

the thigh and leg are almost immo-

vable as if they were one continued

bone: but when the joint is a little bent,

the posterior ligament is relaxed, and the

patella not tightly braced; therefore the

superficial cavities of the tibia will allow

this bone to be moved a little to either

side, or with a small rotation; which is

done by the motion of the external cavi-

ty backwards and forwards on the inter-
nal, which serves as a kind of axis. The

rotation of the leg outwards, is of great

advantage to us, in crossing our legs on

several necessary occasions; though it is

wisely ordered by providence, that this

motion should not be very great, since

this would have occasioned frequent lux-

ations. While all these motions are per-
forming, the only part of the tibia that

moves immediately on the condyles, is

only so much as is within the cartilagi-

nous rings, which by the thickness of their

outfides, make the cavities of the tibia

more horizontal, by raising their external

fide, where the surface of the tibia plants

downwards; by which means the motions

of this joint are more equal and steady

than
KNIGHT, [1837] KNIGHT

than they would otherwife have been. The cartilages are fitted to do this good office in the different motions and postures of the member, by being capable of changing a little their situation; and this also contributes to make the motions larger and quicker.

Luxation of the Knee, in surgery, is the receding of the tibia from under the lower extremity of the thigh-bone; which happens sometimes on the outside, sometimes on the inside, and sometimes backwards, but very rarely or never forwards, by reason the patella prevents it. When the knee is but slightly luxated, the patient is to be seated on a bed, bench, or table, and one assistant is to hold the thigh firm above the knee, and the other to extend the leg, while the surgeon in the mean time replaces the bones by his hand and knee; but when this method is not sufficient, surgeons make use of slings, pulleys, and other instruments. See plate CL. fig. 2. which represents a polypafton, or compound pulley, A and B being two hooks, by which the instrument is fastened on both sides; C, the rope, by drawing which an extension is made in the luxated limb; and D and E, the two pulleys, consisting of several wheels, whereby the force of the drawer is greatly increased. See PULLY.

They ought, however, to be here very careful, lest they make the extension too violent in children and young people, as to separate the epiphyles from the bones, to which they are not yet firmly united, for by that means a worse disorder and lameness will be brought on. After the luxation of the knee is rightly reduced, it is to be properly bound up, and placed in a straw case; and the rest must be managed as in the luxation of the patella. See the article PATELLA.

Knee, in a ship, a crooked piece of timber, bent like a knee, used to bind the beams and futtocks together, by being bolted fast into them both. These are used about all the decks.

Carling-Knees, in a ship, those timbers which extend from the sides to the hatchway, and bear up the deck on both sides.

KNIFE, a well known instrument, made for cutting. Surgeons have several kinds of knives; some for dividing the flesh to the bone, in the upper and lower extremities; these are commonly falciform, or hooked, as represented in plate CL. fig. 3. n° 1. though Heister, in most cases, prefers the small straight knife, ibid. n° 2. Other incision-knives are double-edged, like that represented ibid. n° 3. and, finally, there are other feller falchform incision-knives, for cutting away excrescences, which the others cannot conveniently reach.

All sorts of knives are prohibited to be imported.

KNIGHT, eques, among the Romans, a person of the second degree of nobility, following immediately that of the senators. See the article EQUES. Part of the ceremony whereby this honour was conferred, was the giving of an horse; for each had an horse at the public charge, and received the sash of a horsemanship, to serve in the wars. When the knights were taken in among the senators, they resigned the privilege of having an horse kept for them at the charge of the public: then it becomes necessary, in order to be a knight, that they should have a certain revenue, that their poverty might not disgrace the order; and when they failed of the prescribed revenue, they were expunged out of the list of knights, and thrust down among the plebeians. Ten thousand crowns is computed to have been the revenue required. The knights at length grew so very powerful, that they became a balance between the power of the senate and people; they neglected the exercises of war, and betook themselves principally to civil employments in Rome.

KNIGHT, in a more modern sense, properly signifies a person, who, for his virtue and martial prowess, is by the king ranked above the rank of gentlemen, into an higher class of dignity and honour. Knighthood was formerly the first degree of honour in the army, and usually conferred with a great deal of ceremony, on those who had distinguished themselves by some notable exploit in arms: the ceremonies at their creation have been various; the principal was a box on the ear, and a stroke with a sword on the shoulder; they put on him a shoulder-belt, and a gilt sword, spurs, and other military accouterments; after which being armed as a knight, he was led to the church in great pomp. Camden describes the manner of making a knight-batchelor among us, which is the lowest, though the most ancient order of knighthood, to be thus: the person kneeling, was gently struck on the shoulder by the prince, and accosted

11 B
KNIGHT is KNIGHTS-ERRANT, a pretended order of KNIGHTS, a kind of heroes that travelled the world in search of adventures, redressing wrongs, rescuing damsel, and taking all their perceptions, and is therefore palpable to run upon the beams abait the foremast, and is therefore called the fore-knight; and the other, standing abait the mainmast, is called the main knight.

KNOT, a part of a tree, from which shoots out branches, roots, or even fruit. The use of the knots of plants, is to strengthen the stem: they serve also as fases, to filtrate, purify, and refine the juices ailed up for the nourishment of the plant.

KNOTS of a rope, among seamen, are distinguished into three kinds, viz. whole-knot, that made so with the lays of a rope that it cannot flip, serving for sheets, tacks, and stoppers; bow-line-knot, that so firmly made, and fastened to the cringles of the stays, that they must break or the line split before it flips; and sheepshank-knot, that made by shortening a rope without cutting it, which may be presently loosened, and the rope not the worse for it.

KNOT of the log line, at sea, are the divisions of it. See the article LOG.

KNOWLEDGE, is defined, by Mr. Locke, to be the perception of the connection and agreement, or disagreement and repugnancy, of our ideas. See IDEA.

In the introduction to this work, we have given a general distribution of knowledge, according to its objects; and shall here confider it with regard to its foundation, degrees, extent, reality, and manner of improvement.

Foundation and degrees of KNOWLEDGE.

There are several ways wherein the mind becomes possessed of truth, each of which is called knowledge.

1. There is actual knowledge, when the mind has a present view of the agreement or disagreement of any of its ideas, or of the relations they have one with another. This is called intuitive knowledge; and whatever is deduced from our intuitive perceptions, by a clear and connected series of proofs, is said to be demonstrated, and produces absolute certainty in the mind; and hence the knowledge, obtained in this manner, is called science, because, in each step of the procedure, it carries its own evidence along with it, and leaves no room for doubt or hesitation. And what is highly worthy of notice, as the truths of this class express the relations between our ideas, and the same relations must ever and invariably subsist between the same ideas, or our deductions in the way of science, constitute what we call eternal, necessary, and immutable truths. If it be true that the whole is equal to all its parts, it must be so unchangeably; because the relation of equality being attached to the ideas themselves, must ever intervene where the same ideas are compared. Of this nature all are the truths of natural religion, morality and mathematics, and in general, whatever may be gathered from the bare view and consideration of our ideas. See INTUITION and DEMONSTRATION.

2. Another
2. Another ground of human knowledge is experience; from which we infer the existence of those objects that surround us, and fall under the immediate notice of our senses. When we see the sun, or cast our eyes towards a building, we not only have ideas of those objects within ourselves, but ascribe to them a real existence out of the mind. It is also by the information of the senses, that we judge of the qualities of bodies; as when we say that snow is white, fire hot, or feel hard. For as we are wholly unacquainted with the internal structure and constitution of the bodies that produce these sensations in us, by, and are unable to trace any connection between that structure and the sensations themselves, it is evident, that we build our judgments altogether upon observation, ascribing to bodies such qualities as are answerable to the perceptions they excite in us. But this is not the only advantage derived from experience, for to that too we are indebted for all our knowledge regarding the co-existence of sensible qualities in objects, and the operations of bodies one upon another. Ivory, for instance, is hard and elastic; this we know by experience, and, indeed, by that alone: for being altogether strange to the true nature both of elasticity and hardness, we cannot, by the bare contemplation of our ideas, determine how far the one necessarily implies the other, or whether there may not be a repugnance between them: but when we observe them to exist both in the same object, we are then assured, from experience, that they are not incompatible; and when we also find that snow is hard and not elastic, and that air, though elastic, is not hard, we also conclude, upon the same foundation, that these ideas are not necessarily conjoined, but may exist separately in different objects. In like manner, with regard to the operations of bodies one upon another, it is evident, that our knowledge this way is all derived from observation. Aqua-regia dissolves gold, as has been found by frequent trial, nor is there any other way of arriving at the discovery. Naturalists may tell us, if they please, that the parts of aqua-regia are of a texture apt to infinuate between the corpuscles of gold, and thereby loosen and shake them asunder. If this be a true account of the matter, I believe it will, notwithstanding, be allowed, that our conjecture in regard to the conformation of the bodies, is deduced from the experiment, and not the experiment from the conjecture. To this head we may likewise refer whatever knowledge arises from testimony. See the article Experimental Philosophy.

3. A third foundation of knowledge is memory: when a man, having once evidently perceived certain truths, he ever afterwards readily affents to them whenever they come to be reflected on. This may be called habitual knowledge, whereby a man may be said to know all those truths which are lodged in his memory, by a former, clear and full perception; and is of two sorts: the one is of such truths laid up in the memory, as whenever they occur to the mind, it actually perceives the relation there is between those ideas; and this is in all those truths where the ideas themselves, by an immediate view, discover their agreement or disagreement one with another. The other is of such truths, of which the mind having been convinced, it retains the memory of the conviction without the proofs. Thus a man that remembers certainly, that he once perceived the demonstration that the three angles of a triangle are equal to two right ones, knows it to be true when that demonstration is gone out of his mind, and possibly cannot be recollected; but he knows it in a different way from what he did before; namely, not by the intervention of those intermediate ideas whereby the agreement or disagreement of those in the proposition was at first perceived; but by remembering, that is knowing, that he was once certain of the truth of this proposition, that the three angles of a triangle are equal to two right ones. The immutability of the same relations between the same immutable things, is now the idea that shews him, that if the three angles of a triangle were once equal to two right ones, they will always be so. And hence he comes to be certain, that what was once true is always true; what ideas once agreed will always agree; and consequently, what he once knew to be true, he will always know to be true as long as he can remember that he once knew it.

Extant and limits of human Knowledge.

1. It is evident that we can have no knowledge farther than we have perception of the agreement or disagreement of our ideas, whether by intuition, demonstration.
We cannot have an intuitive knowledge that shall extend itself to all our ideas and all that we know about them, because we cannot examine and perceive all the relations they have to each other; thus we cannot intuitively perceive the equality of two extensions, the difference of whose figures makes their parts incapable of an exact immediate application. 3. Demonstrative knowledge cannot reach to the whole extent of our ideas, because we cannot always find such proofs as will connect them together, with an intuitive knowledge in all the parts of the deduction. Thus, though we have the ideas of a square, a circle, and equality, yet we, perhaps, shall never be able to find a square exactly to a circle. The affirmations, or negations we make concerning the ideas we have, being reduced by Mr. Locke to these four, viz. identity, co-existence, relation and real existence, he examines how far our knowledge extends to each of these.

1. As to identity and diversity, our intuitive knowledge is so far extended as our ideas themselves, and there can be no idea in the mind which it does not presently, by an intuitive knowledge, perceive to be what it is, and to be different from any other.

2. As to the agreement or disagreement of our ideas of co-existence, our knowledge herein is very defective, though the greatest and most material part of our knowledge concerning substances consists in it.

As to the powers of substances, which makes a great part of our enquiries about them, our knowledge reaches little further than experience, because they consist in a texture and motion of parts which we cannot by any means come to discover.

3. As to the third fort, the agreement or disagreement of our ideas in any other relation; this is the largest field of knowledge, and it is hard to determine how far it may extend. This part depending on our incapacity in finding intermediate ideas, that may shew the habituates and relations of ideas, it is difficult to tell when we are at an end in such discoveries.

4. As to the fourth part of knowledge, viz. of the real actual existence of things, we have an intuitive knowledge of our own existence, a demonstrative knowledge of the existence of God, and a sentitive knowledge of the objects that present themselves to our senses. See the article Existence.

Reality of human Knowledge. It is evident, says Mr. Locke, that the mind knows not things immediately, but by the intervention of the ideas it has of them. Our knowledge therefore is real only so far as there is a conformity between our ideas and the reality of things. But how shall we know when our ideas agree with things themselves? It is answered, there are two sorts of ideas that we may be assured agree with things: these are,

1. Simple ideas, which, since the mind can by no means make to itself, must be the effect of things operating upon the mind in a natural way, and producing therein those perceptions which, by the will of our maker, they are ordained and adapted to. Hence it follows, that simple ideas are not fictions of our fancy, but the natural and regular productions of things without us really operating upon us, which carry with them all the conformity our state requires, which is to represent things under those appearances they are fitted to produce in us. Thus the idea of whiteness, as it is in the mind, exactly answers to that power which is in any body to produce it there. And this conformity between our simple ideas and the existence of things, is sufficient for real knowledge. See Ide.

2. All our complex ideas, except only those of substances, being archetypes of the mind's own making, and not referred to the existence of things as to their originals, cannot want any conformity necessary to real knowledge.

3. But the complex ideas which we refer to archetypes without us, may differ from them, and so our knowledge about them may come short of being real, and such are our ideas of substances. These must be taken from something that does or has existed, and not be made up of ideas arbitrarily put together, without any real pattern. Herein, therefore, is founded the reality of our knowledge concerning substances, that all our complex ideas of them must be such, and such only, as are made up of simple ones, as have been discovered to co-exist in nature, and our ideas being thus true, though not perhaps very exact copies, are the subjects of real knowledge of them. Whatever ideas we have, the agreement we find they have with others, will be knowledge; if those ideas be abstract, it will
Improvement of human Knowledge. The sentiments of the same author upon the improvement of our knowledge are as follow: it being the received opinion among men of letters, that maxims are the foundations of all knowledge, and that sciences are each of them built upon certain precognitae, from whence the understanding was to take its rise, and by which it was to conduct itself in its enquiries in the matters belonging to that science, the beaten road of the schools was to lay down, in the beginning, one or more general propositions called principles or foundations, whereon to build the knowledge that was to be had of that subject. That which gave occasion to this way of proceeding, he supposes to have been the good success it seemed to have in the mathematics, which of all other sciences have the greatest clearness, certainty, and evidence in them; but if we consider it, we shall find that the great advancement and certainty of real knowledge men arrive at, in these sciences, was not owing to the influence of these principles, but to the clear, distinct, and complete ideas their thoughts were employed about, and the relation of equality and excess so clear between some of them, that they had an intuitive knowledge, and by that a way to discover it in others, and this without the help of those maxims. See the article Axiom.

The way to improve in knowledge, is not to swallow principles with an implicit faith, and without examination, which would be apt to mislead men, instead of guiding them into truth; but to get and fix in our minds clear and complete ideas, as far as they are to be had, and annex to them proper and constant names; and thus barely by considering our ideas, and comparing them together, and observing their agreement or disagreement, their habits and relations, we shall get more true and clear knowledge by the conduct of this one rule, than by taking up principles, and thereby putting the mind into the dispoal of others.

We must, therefore, if we proceed as reason avails, adapt our methods of inquiry to the nature of the ideas we examine, and the truth we search after. General and certain truths are only founded in the habits and relations of abstract ideas; therefore a sagacious methodical application of our thoughts, for the finding out these relations, is the only way to discover all that can with truth and certainty be put into general propositions. By what steps we are to proceed in these, is to be learned in the schools of the mathematicians, who from very plain and easy beginnings, by gentle degrees, and a continued chain of reasonings, proceed to the discovery and demonstration of truths, that appear at first sight above human capacity. This may reasonably be said, that if other ideas, that are real as well as nominal essences of their species, were pursued in the way familiar to mathematicians, they would carry our thoughts farther, and with greater evidence and clearness, than probably we are apt to imagine.

In our knowledge of substances, we are to proceed in quite a different method; the bare contemplation of their abstract ideas (which are but nominal essences) will carry us but a very little way in the search of truth and certainty; here experience much teach us what reason cannot, and it is by trying alone that we can certainly know what other qualities co-exist with those of our complex idea; for instance, whether that yellow, heavy, fusible body we call gold, be malleable or not, which experience (however it prove in that particular body we examine) makes us not certain that it is so in all or any other yellow, heavy, fusible bodies, but that which we have tried; because it is no consequence, one way or other, from our complex idea. As far as our experience reaches, we may have certain knowledge, and no farther. It is not denied, but that a man accustomd to rational and regular experiments, shall be able to see farther into the nature of bodies and their unknown properties, than one that is a stranger to them; but this is only judgment and opinion, not knowledge and certainty. This makes our author suspect that natural philosophy is not capable of being made a science from experiments and historical observations: we may draw advantages of ease and health, and thereby increase our stock of conveniencies for this life; but beyond this, he fears, our talents do not reach, and guises that our faculties are not
not able to advance farther. See the article Experimental Philosophy.

The ways to enlarge our knowledge as far as we are capable, seem, to be these two: the first is, to get and settle in our minds, as far as we can, clear, distinct, and constant ideas of those things we would consider and know. For it being evident, that our knowledge cannot exceed our ideas; where they are either imperfect, confused, or obscure, we cannot expect to have certain, perfect, or clear knowledge. The other is the art of finding out the intermediate ideas, which may shew us the agreement or disagreement, or repugnancy, of other ideas, which cannot be immediately compared. That these two, and not the relying on maxims, and drawing consequences from some general propositions, are the right method of improving our knowledge in the ideas of other modes, besides those of quantity, the confideration of mathematical knowledge will easily inform us; where we shall find, that he who has not clear and perfect ideas of those angles or figures, of which he desires to know anything, is thereby utterly incapable of any knowledge about them.

Our knowledge, as in other things, so in this also, has to great a conformity with our sight, that it is neither wholly necessary, nor wholly voluntary. Men that have eyes, cannot choose but receive some ideas by them; and if they have memory, they cannot but retain some of them; and if they have any distinguishing faculty, they cannot but perceive the agreement or disagreement of some of them, one with another: as he that has eyes, if he will open them by day, cannot but see some objects, and perceive a difference in them, yet he may choose whether he will turn his eye towards an object, curiously survey it, and observe accurately all that is visible in it; but what he does see, he cannot see otherwise than he does: it depends not on his will to see that black, which appears yellow. Just thus it is with our understanding; all that is voluntary in our knowledge is the employing or withholding any of our faculties from this or that sort of objects, and a more or less accurate survey of them; but they being employed, we will have no power to determine the knowledge of the mind one way or other; that is done only by the objects themselves, as far as they are clearly discovered.

Knoxia, in botany, a genus of the tribe monogynia class of plants, the flower of which consists of a single infundibuliform petal; and its seeds are two, and falcated.

Kollow, the name of a black kind of earth found in several parts of the kingdom. See the article Earth.

Koningsburg, a city of Poland, the capital of ducal Prussia and of the king of Prussia's Polish dominions, situated on the river Pregel, near a bay of the Baltic sea, seventy miles north-east of Dantzick; east lon. 21°, and north lat. 42° 40'.

Koran, or Alcoran. See Alcoran.

Kos, in Jewish antiquity, a measure of capacity, containing about four cubic inches; this was the cup of blessing, out of which they drank when they gave thanks after solemn meals, like that of the pasover.

Kur, the ancient Cyrus, a river of Persia, which rises in the mountains of Georgia, and running south-east by Telif, unites its streams with the river Arras (the ancient Arraxes) and falls into the Caspian sea, south of Baku.

Kutuchta, among the Calmuc-Tartars, the name of their high-priest, or sovereign pontiff; formerly only the deputy of the delai-lama, or high-priest of the Tartars, but at present independent on him.

End of the Second Volume.
